Revision History

Document number		996161-2022-Beehive#1-Drilling-EP-Rev4			
Rev	Date	Purpose	Prepared	Reviewed	Approved
4	04/10/2023	Re-issued to NOPSEMA for assessment	Aventus Consulting	J. Chung, R. Doughty, N. Persad, L. Rollheiser, A. Felix	J. Korenek, N. Groves
3	15/12/2022	Re-issued to NOPSEMA for assessment	Aventus Consulting	J. Chung, R. Doughty, N. Persad, J. Funk	P. Woods, N. Groves, B. Smith
2	14/07/2022	Issued for NOPSEMA assessment	Aventus Consulting	J. Chung, R. Doughty, N. Persad, J. Funk	P. Woods, N. Groves, B. Smith
1	27/06/2022	Issued for NOPSEMA completeness check	Aventus Consulting	J. Chung, N. Persad, R. Doughty, J. Funk	P. Woods, N. Groves, B. Smith
0	29/04/2022	Issued for public exhibition	Aventus Consulting	J. Chung, R. Doughty, N. Persad, J. Funk, L. Duthie, P. Harrick	P. Woods, N. Groves, B. Smith
B	02/03/2022	Draft for EOG review	Aventus Consulting	J. Chung, N. Persad, R. Doughty, L. Duthie	N/A
A	27/01/2022	Draft for internal review	Aventus Consulting	G. Pinzone	N/A

Environment Plan Team

Name	Title	Project role
Giulio Pinzone	Principal Environmental Consultant	Project Manager, co-author
Chris Ryan	Principal Environmental Consultant	Contributing author
Leonie Chapman	Senior Environmental Consultant	Contributing author
Lucy Muir	Environment Lead (MCC)	Contributing author
Jannina Stillitano	Senior Environmental Consultant	Co-author
Siena Adorno	Environmental Consultant	Co-author
Lachlan McLennan	Environmental Consultant	Co-author
Jenni Hillman	Cultural Heritage Consultant (Xenith)	Contributor

Front cover image: The Noble Tom Prosser jack-up mobile offshore drilling unit, warm stacked in Port of Darwin
(Photo credit: G. Pinzone, Aventus Consulting).

Table of Contents

1.	Introduction	1
1.1.	Background	1
1.2.	Purpose	1
1.3.	Titleholder and Liaison Person	3
1.4.	Scope of this Plan	4
1.5.	Environment Plan Summary	4
2.	Activity Description	5
2.1.	Activity Location	5
2.2.	Timing	6
2.3.	Project Management	6
2.4.	Reservoir Characteristics	8
2.5.	Drilling Operation	9
2.6.	Pre-drilling Geophysical Activities	12
2.7.	Drilling Program	12
2.8.	Plug and Abandonment	23
2.9.	Well Control	24
2.10.	Response to a Loss of Well Control	25
2.11.	Drilling Summary	28
3.	Environmental Regulatory Framework	32
3.1.	EOG Environmental Policy	32
3.2.	Commonwealth Legislation	32
3.3.	State and Territory Legislation	34
3.4.	Government Guidelines	34
3.5.	International Industry Codes of Practice and Guidelines	35
3.6.	Australian Industry Codes of Practice and Guidelines	38
4.	Consultation	41
4.1.	Relevant Persons Consultation – Background and Legislative Requirements	41
4.2.	Relevant Persons Consultation – Key Duties	42
4.3.	Public Exhibition of the EP	68
5.	Description of the Existing Environment	69
5.1.	The Environment That May Be Affected	69
5.2.	Regional Context	72
5.3.	Coastal Environment	88
5.4.	Biological Environment	89
5.5.	Conservation Values and Sensitivities	139
5.6.	Heritage Values	141

5.7.	Socio-economic environment	142
6.	Environmental Impact & Risk Assessment Methodology	161
6.1.	Step 1 – Establish the Context	162
6.2.	Step 2 – Communicate and Consult	162
6.3.	Step 3 – Identify Risks	162
6.4.	Step 4 – Analyse the Risks	164
6.5.	Step 5 – Evaluate the Risk	167
6.6.	Step 6 – Treat the Risk	175
6.7.	Step 7 – Monitor and Review	175
7.	Environmental Impact Assessment – Planned Activities	176
7.1.	IMPACT 1 – Physical Presence - Seabed Disturbance	178
7.2.	IMPACT 2 – Physical Presence - Displacement of Other Marine Users	184
7.3.	IMPACT 3 – Routine Emissions – Light	190
7.4.	IMPACT 4 – Routine Emissions – Atmospheric	210
7.5.	IMPACT 5 – Routine Emissions – Underwater Sound	220
7.6.	IMPACT 6 – Discharge of Drill Cuttings and Muds	242
7.7.	IMPACT 7 – Discharge of Cement	264
7.8.	IMPACT 8 – Routine Discharges – Putrescible Waste	270
7.9.	IMPACT 9 - Routine Discharges – Sewage and Grey Water	276
7.10.	IMPACT 10 - Routine Discharges – Cooling and Brine Water	282
7.11.	IMPACT 11 – Routine Discharges – Bilge Water and Deck Drainage	288
8.	Environmental Risk Assessment – Unplanned Events	296
8.1	RISK 1 – Accidental Release of Waste Overboard	298
8.2	RISK 2 – Vessel Collision with Megafauna	312
8.3	RISK 3 – Introduction and Establishment of Invasive Marine Species	323
8.4	RISK 4 – Interference with Other Marine Users	335
8.5	RISK 5 – Unplanned Discharge of Drilling Fluids, Chemicals or Hydrocarbons	341
8.6	RISK 6 - Marine Diesel Oil Release	350
8.7	RISK 7 – Loss of Well Control and Major Oil Spill	359
9.	Environmental Risk Assessment – Hydrocarbon Spill Response	441
9.1.	Source Control – Relief Well Drilling	442
9.2.	Monitor and Evaluate	447
9.3.	Dispersant Application	455
9.4.	Containment and Recovery	494
9.5.	Shoreline Protection & Deflection	501
9.6.	Shoreline Clean-up	516
9.7.	Oiled Wildlife Response	531
9.8.	Waste Management (Support Activity)	542

10. Implementation Strategy	552
10.1. Activity Organisational Structure	552
10.2. Roles and Responsibilities	552
10.3. HSE Management	557
10.4. Training and Awareness	559
10.5. Environmental Emergencies and Preparedness	561
10.6. Simultaneous Operations	563
10.7. Incident Management	563
10.8. Management of Change	566
10.9. Record Keeping	568
10.10. Assurance, Reporting and Review	569
10.11. Summary of Implementation Strategy Commitments	574
11. References	577

1. Introduction

1.1. Background

EOG Resources Australia Block WA-488 Pty Ltd (hereafter referred to as EOG) is the titleholder of exploration permit WA-488-P and proposes to drill the Beehive-1 exploration well within Commonwealth marine waters approximately 80 kilometres (km) off the Western Australian (WA) coastline, located in the Joseph Bonaparte Gulf (JBG), WA (Figure 1.1). This is referred to as 'the activity' throughout this document.

1.2. Purpose

EOG proposes to undertake the activity using a jack-up mobile offshore drilling unit (MODU) with auxiliary activities including support vessels and helicopters. The activity will be conducted entirely within Commonwealth waters in accordance with the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGs Act 2006) and Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (herein referred to as the OPGGS(E)).

This Environment Plan (EP) covers all operations associated with the activity. It aims to secure acceptance of the activity from the National Offshore Petroleum Safety and Environment Management Authority (NOPSEMA) by demonstrating that EOG will manage the environmental impacts and risks of the activity (as defined in Section 1.4.1 of this EP) to As Low as Reasonably Practicable (ALARP) and to an acceptable level.

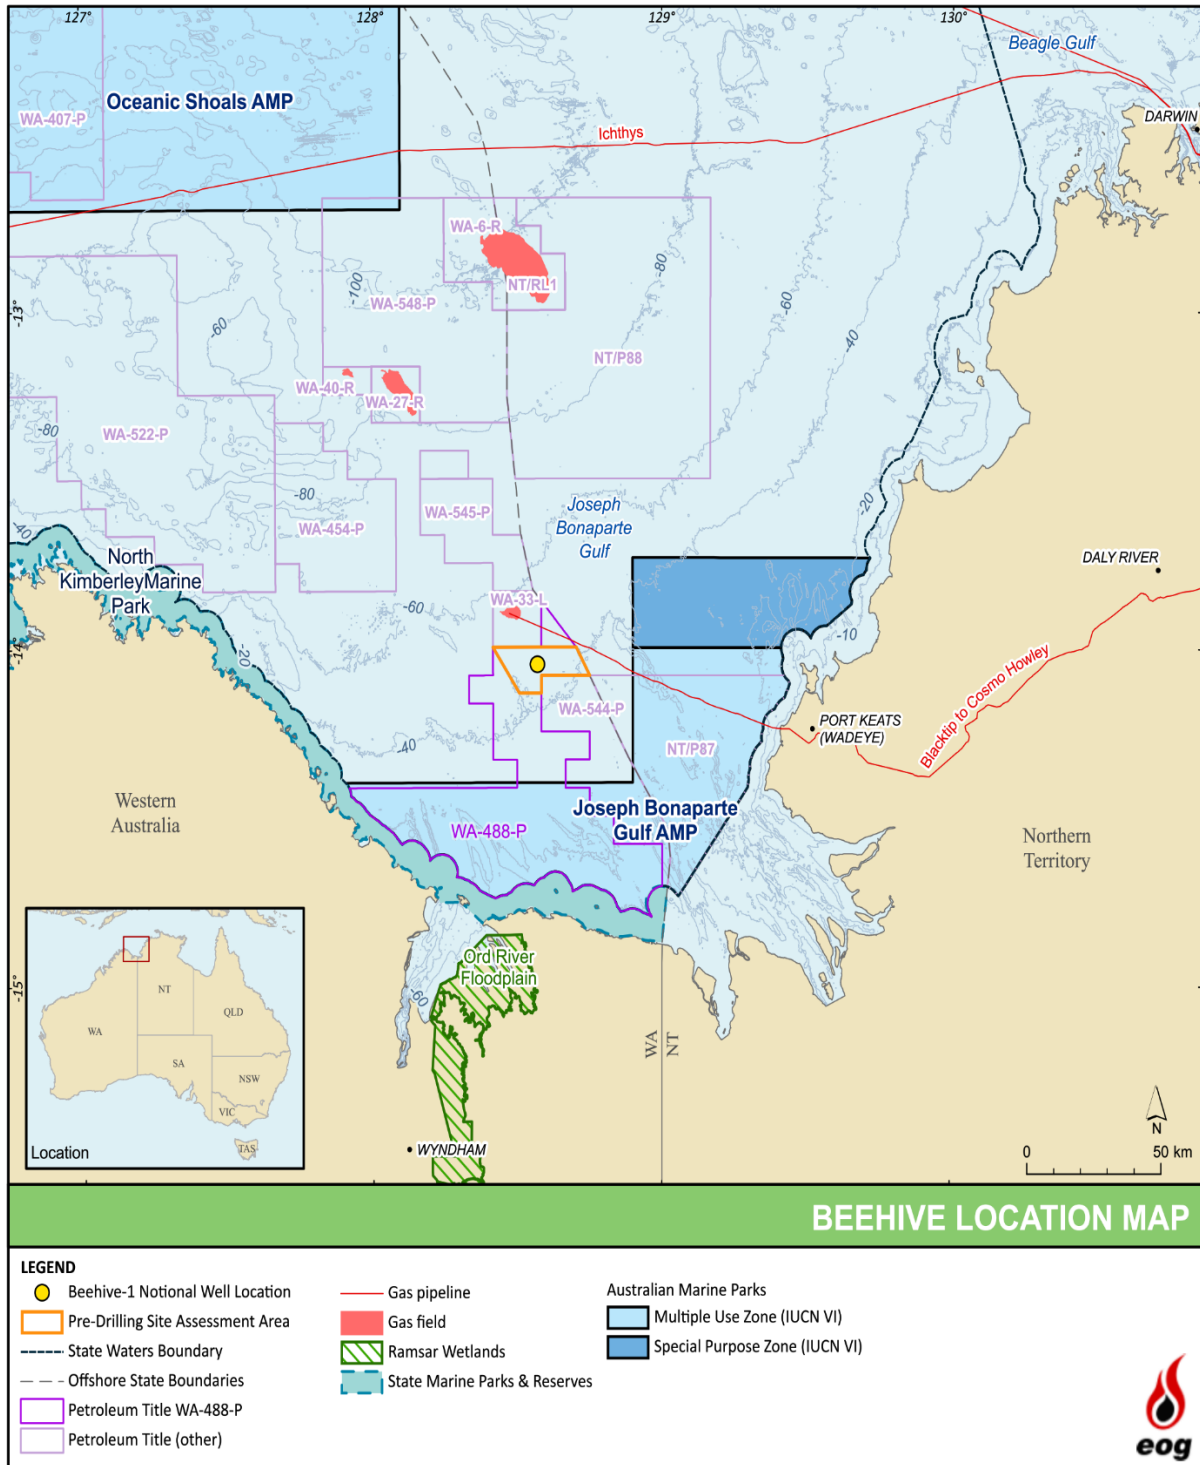

Figure 1.1. Location of Beehive-1 in WA-488-P

1.3. Titleholder and Liaison Person

EOG Resources, Inc. (as the parent company of EOG) was established in 1985 and is listed on the New York Stock Exchange. It is one of the largest independent crude oil and natural gas exploration and production companies in the United States of America (USA) with hydrocarbon reserves in the USA and Trinidad & Tobago. The company has a market cap of approximately USD\$77 billion (AUD\$112 billion) as of 14th of September 2023 and employs around 2,800 people.

EOG Resources, Inc. is the USA based parent company of EOG Resources Australia Block WA-488 Pty Ltd, the Australian entity responsible for the proposed development of permit area WA-488-P.

The Titleholder for this activity is:

EOG Resources Australia Block WA-488 Pty Ltd
Suite 406, Level 4, 20 Bond Street,
Sydney, NSW, 2000, Australia

The nominated liaison person for this EP is outlined in Table 1.1.

Table 1.1. Titleholder nominated liaison details

Parameter	Details
Name	Jonathan Chung
Position	Director, Business Development International
Address	1111 Bagby Street, Sky Lobby 2, Houston, Texas 77007 USA
Telephone number	+1 713-651-7000
Email address	australia@eogresources.com

EOG will notify NOPSEMA of any change in titleholder, a change in the titleholder's nominated liaison person, or a change in the contact details for either the titleholder or the liaison person including changes to the activity or the EP in accordance with the details provided in Table 1.2.

Table 1.2. OPGGS notification requirements – change of contact details and end of activity

Regulation requirements	OPGGS(E)
A change of Titleholder, change in the Titleholder's nominated liaison person or a change in the contact details for either the Titleholder or the liaison person. Notification to be provided within 7 days of the change.	Regulation 15(3)
The end of operation of the EP (i.e., at completion of the activity). To be reported using proforma (FM1408) on the NOPSEMA website.	Regulation 25A
The end of an activity (i.e., within 10 days of completion of the activity). To be reported using proforma (FM1405) on the NOPSEMA website.	Regulation 29

1.4. Scope of this Plan

The activity (as defined in Regulation 6 of the OPGGS(E)) is defined as:

The physical process of drilling a well, from the time that the drill rig first jacks down its legs on site until the time it jacks up its legs and departs the operational area.

This EP has been prepared in accordance with the OPGGS(E) for assessment and acceptance by NOPSEMA. In brief, this EP includes a description of:

- The nature of the activity (location, layout, operational details);
- Stakeholder consultation activities;
- The environment affected by the activity;
- Environmental impacts and risks (including emergency incidents);
- Mitigation and management measures;
- Environmental performance outcomes, standards and measurement criteria;
- How impacts and risks are demonstrated to be ALARP and acceptable;
- The implementation strategy to ensure that the environmental impacts and risks are managed in a systematic manner; and
- Reporting arrangements.

1.5. Environment Plan Summary

Table 1.3 provides a summary of this EP as required by Regulation 11(4) of the OPGGS(E).

Table 1.3. EP Summary of material requirements

EP Summary requirement	EP section
The location of the activity	Section 2.1
A description of the receiving environment	Chapter 5 & Appendix 11
A description of the activity	Chapter 2
Details of the environmental impacts and risks	Chapters 7 & 8
The control measures for the activity	Chapters 7 & 8
The arrangements for ongoing monitoring of the titleholder's environmental performance	Chapter 9
Response arrangements in the oil pollution emergency plan (OPEP)	OPEP
Consultation already undertaken and plans for ongoing consultation	Chapter 4
Details of the titleholder's nominated liaison person for the activity	Section 1.3

2. Activity Description

This chapter provides a description of the proposed Beehive-1 exploration drilling program in accordance with Regulation 13(1) of the OPGGS(E).

2.1. Activity Location

The activity described in the EP is proposed to be conducted within Commonwealth petroleum exploration permit area WA-488-P, located in the Petrel Sub-basin (Bonaparte Basin) in the JBG, WA (see Figure 2.1).

Coordinates for the well location are provided in Table 2.1, noting that this may shift up to 1,500 m from this location based on continuous refinement during the well planning process. The operational area defines the spatial boundary of the proposed activity and for the purposes of this EP, the operational area is set as a 500 m radius around the final well location (which reflects the area of the Petroleum Safety Zone [PSZ] that will be gazetted around the MODU while it is on location).

Table 2.1. Coordinates for the proposed Beehive-1 well

Degrees, minutes, seconds		Eastings and northings	
Latitude	Longitude	Easting (m)	Northing (m)
14° 03' 16.41" S	128° 34' 14.54" E	453,651.86	8,446,199.05

GDA2020, UTM 52S.

The distances of key natural and socio-economic features from the Beehive-1 well are listed in Table 2.2.

Table 2.2. Distance to key features from Beehive-1

Feature	Distance and direction from Beehive-1
Natural features	
Closest mainland point	80 km south
Lacrosse Island (WA)	81 km south-southwest
Cape Domett (WA)	87 km south-southwest
Dorcherty Island (NT)	97 km east
Marine protected areas (nearest points)	
Joseph Bonaparte Gulf Australian Marine Park (AMP)	35 km east
North Kimberley Marine Park (WA)	68 km south
Oceanic Shoals AMP	158 km northwest
Petroleum infrastructure	
Blacktip gas export pipeline (nearest point)	12 km north-northeast
Blacktip unmanned wellhead platform	20 km northwest

Feature	Distance and direction from Beehive-1
Towns	
Port Keats (Wadeye), NT	103 km east-southeast
Wyndham (WA)	173 km south-southwest
Kununurra (WA)	190 km south
Darwin (NT)	300 km northeast

2.2. Timing

The activity is scheduled to commence no earlier than 1st of January 2024 and will be completed no later than 31st of December 2025. The start of the activity depends primarily on EP acceptance and MODU availability.

Drilling activities are estimated to take approximately 55 days, or up to approximately 100 days if re-spud or mitigating problems is required, or a Drill Stem Test (DST) is performed. The drilling duration may be subject to change based on geological conditions and potential for operational challenges. Operations will be conducted 24 hours per day, seven days per week.

2.3. Project Management

AGR Australia Pty Ltd (AGR) is the Drilling Management Contractor (DMC) appointed to this project by EOG. AGR is responsible for assisting EOG in project management and well delivery services for Beehive-1.

AGR's management system is accredited to ISO 9001:2015 (Quality Management Systems) and ISO 14001:2015 (Environmental Management Systems) and governs all of the group business as documented in the AGR Management System Manual.

The AGR Well Delivery Process (WDP) is a central component of the AGR Management System (see Section 9.3.2). This standardised management system process (approved by EOG) ensures that well activity is planned and managed efficiently and with due consideration to good oilfield practice, local and international standards as they relate to well design, operations planning, construction and then subsequent suspension or abandonment operations.

The AGR WDP is primarily split into five phases, namely:

- Phase 1; Project Scoping – describes the process from initial client contact through to the submission and approval of a formal proposal and the contract management responsibilities between AGR and the client or titleholder;
- Phase 2; Initial Planning – describes the initial engineering planning and design work in order to identify and select a preferred option;
- Phase 3; Detailed Well Planning – describes the detailed engineering planning and design work to take the preferred option through to the detailed operations guidelines;
- Phase 4; Operations – describes how AGR manages their daily operations on behalf of the titleholder; and
- Phase 5; Reporting and Review – describes how AGR analyse and report on the performance of the well and the planning.

The proposed activity is part of AGR's WDP Phase 4 (operations).

Figure 2.1. Location of the Beehive-1 well in the Joseph Bonaparte Gulf

2.4. Reservoir Characteristics

EOG is targeting the Sunbird (primary) and Tanmurra (secondary) formations. There are numerous large gas discoveries in the region close to Beehive. These are tied back to the Permian, gas-prone source rocks. Although the Lower Carboniferous oil-prone source rocks could be in the present-day gas window, filling the Beehive structure with gas, oil is the higher likelihood and therefore that is what EOG has selected as the basis for well blowout modelling.

EOG narrowed down oils in the region with a similar API to be Jabiru, Puffin, Mutineer-Exeter and Legendre crudes (all of which have APIs between 42° and 44°). Based on having an API closest to that expected at Beehive-1, together with being the most conservative in terms of the residual components, EOG has determined that Jabiru crude is the most analogous oil. Nearby oil samples from the Turtle and Barnett fields would have been ideal since they are sourced from the same petroleum system, but no crude assay information is available from those discoveries as those oils were only tested, not produced.

Table 2.3 presents the properties of the oil based on the crude oil assay for Jabiru. Jabiru is from a different petroleum system but has comparable oil properties to what is expected at Beehive. EOG has determined that the API gravity most likely for the Beehive-1 oil target is 43° (light crude).

Table 2.3. Compositional analysis of Jabiru crude oil

Element	Unit of measurement	Measurement
API gravity	°API	42.3
Specific gravity	60°F	0.8143
Density @ 15°C	g/ml	0.8139
Total sulphur	wgt %	0.05
Flash point	°C	<15
Total nitrogen	ppm	170
Water content	Vol %	0.025
Pour point	°C	18
Wax content	wgt %	5.9
Wax melting point	°C	47
Viscosity @20°C	cST	3.694
Viscosity @40°C	cST	2.462
Asphaltenes	wgt %	0.45
Nickel	ppm	<0.5
Vanadium	ppm	<1.0
Mercury	ppm	<0.01

2.5. Drilling Operation

This section provides details on the drilling activity relating to the MODU, support vessels, helicopter and supply base for the activity.

2.5.1. MODU

The well will be drilled using a jack-up MODU (drill rig) (such as that shown in Photo 2.1, the *Noble Tom Prosser*). Jack-up MODUs are typically used for drilling in water depths of less than 150 m. The characteristics of jack-up MODUs are generally similar, regardless of which rig is used, and the following points describe jack-up MODUs:

- Among the MODUs being considered are the two jack-up MODUs that have recently worked or are working in WA, being the *Noble Tom Prosser* and the *Valaris Rig 107*.
- The MODU will be towed into position by support vessels.
- Once in the desired location and with the MODU stationary, the legs are lowered to be in complete contact with the seabed, the rig hull is raised ± 3 m draft and then zero air gap when rig stabilisation activities are conducted (pre-loading).
- When pre-loading activities are completed, the MODU raises itself approximately 20 m above the sea surface. At this point, the drilling derrick is cantilevered over the edge of the MODU in readiness for drilling. Figure 2.2 provides a simplified overview of this process.

Photo 2.1. The *Noble Tom Prosser* jack-up MODU

Figure 2.2. Simplified outline of the MODU positioning process

Environmental Credentials

EOG's screening of potential MODUs will involve ensuring that the MODU has, at a minimum, the following current and valid environmental credentials in place:

- International Oil Pollution Prevention (IOPP) certificate in accordance with International Convention for the Prevention of Pollution from ships (MARPOL) Annex I (enacted under the Australian Maritime Safety Authority (AMSA) Marine Orders Part 91, Marine Pollution Prevention – Oil);
- International Sewage Pollution Prevention (ISPP) certificate in accordance with MARPOL Annex IV (enacted under AMSA Marine Orders Part 96, Marine Pollution Prevention – Sewage);
- International Air Pollution Prevention (IAPP), Engine International Air Pollution Prevention (EIAPP) and International Energy Efficiency (IEE) certificates and Ship Energy Efficiency Management Plan (SEEMP) in accordance with MARPOL Annex VI (enacted under AMSA Marine Orders Part 97, Marine Pollution Prevention – Air Pollution);
- International Anti-fouling System certificate in accordance with the International Convention on the Control of Harmful Anti-fouling Systems on Ships 2008 (enacted under AMSA Marine Orders Part 98, Marine Pollution Prevention – Anti-fouling Systems);
- Shipboard Marine Pollution Emergency Plan (SMPEP) in accordance with MARPOL Annex I (enacted under AMSA Marine Orders Part 93, Marine Pollution Prevention – Noxious Liquid Substances); and

- Shipboard Garbage Management Plan (GMP) in accordance with MARPOL Annex V (enacted under AMSA Marine Orders Part 95, Marine Pollution Prevention – Garbage).

EOG will arrange for an inspection of the MODU (e.g., condition survey, hazardous area and equipment survey, Blowout Preventer (BOP) and control system acceptance) by an independent MODU inspection contractor to ensure that the MODU is in good operating order. In addition, EOG will also conduct its own audit of the contractor's HSE management systems and pre-drilling inspection against the EP commitments to ensure that systems and processes meet legislative and activity requirements.

Regulatory Jurisdiction

The MODU is considered part of a 'petroleum activity' (as defined by Regulation 4 of the OPGGS(E)) while within the operational area and therefore subject to the OPGGS Act. While on location, hydrocarbon spills to sea from the MODU will be combatted in accordance with the MODU's SMPEP and the activity-specific OPEP (99616-2022-Beehive#1-OPEP-RevA).

An application for a temporary PSZ (an area encompassing a 500 m radius) around the MODU will be submitted to NOPSEMA to cover the duration of drilling. When the MODU is outside the gazetted PSZ (e.g., on tow to or from location) but within Australian waters, it comes under the regulatory jurisdiction of the *Navigation Act 2012* (Cth), which is administered by AMSA. Accordingly, this EP does not cover MODU activities while outside the PSZ.

2.5.2. Support Vessels

Typically, two support vessels will be required to assist the MODU; however, this EP accounts for up to four (used for towing, equipment and material transfers, standby operations and emergency response). The support vessels are yet to be contracted but are usually offshore multiple purpose or anchor handling vessels.

Equipment and material transfers may include, but are not limited to, crew supplies, hydrocarbons (diesel, engine oil, hydraulic fluids, grease, etc.), bulk drilling products, MODU and drilling equipment and parts, and waste. MODU cranes will be used for transfers between the MODU and support vessels.

Bulk products will also be transferred via hose from the support vessels and the MODU. Such products include drilling fluids and solids, brine, drilling water, cement and fuel oil (diesel).

At least one support vessel will remain on standby within a short distance of the MODU. This is to ensure that the 500 m PSZ around the MODU is maintained, and to provide support in the event of an emergency or unplanned event (e.g., spills to the marine environment).

Support vessels will not anchor within 500 m of the MODU but may anchor in the permit area during the activity. No at-sea refuelling of support vessels will take place within the operational area.

Environmental Credentials

As part of the Invitation to Tender process, an initial screening of potential vessels will be conducted to ensure they have, at a minimum, current and valid environmental credentials that are the same as for the MODU described previously.

Regulatory Jurisdiction

The support vessels are considered part of the 'petroleum activity' while they are within a 500-m radius of the MODU (the PSZ). While a support vessel is located within this area, hydrocarbon spills to sea from the support vessels will be combatted in accordance with the vessel SMPEP and/or the activity-specific OPEP (depending on the size of the spill).

When the support vessels are outside the PSZ (e.g., steaming to or from location, or holding position outside the PSZ) and remain within Australian waters, they come under the regulatory jurisdiction of the *Navigation Act 2012* (Cth), which is administered by AMSA. Accordingly, this EP does not cover activities performed by the support vessels while outside the PSZ.

The 500 m radius PSZ limit has been selected because within this zone, the support vessels must comply with the MODU operating procedures as detailed in the MODU's Facility Safety Case. Outside of this zone, the support vessels operate as trading ships as defined in Section 6(1) of the *Navigation Act 2012* (Cth), and the combat of hydrocarbon spills is the responsibility of the vessel operator and AMSA in line with the National Plan for Maritime Environmental Emergencies (NatPlan) (AMSA, 2020).

2.5.3. Aviation Support

Helicopters will be used primarily for crew change and medical evacuation, and occasionally equipment and material transfers. Helicopter flights will occur several times a week dependent on the progress of the drilling program and logistical constraints. Refuelling of helicopters may take place on the MODU.

Regulatory Jurisdiction

As with the support vessel, a helicopter is considered part of the 'petroleum activity' while it is within the 500m radius PSZ around the MODU. This EP does not cover activities performed by the helicopters while outside the PSZ.

At all times, helicopter operations come under the regulatory jurisdiction of the *Air Navigation Act 1920* (Cth), *Civil Aviation Safety Regulations 1998* (Cth) and the *Federal Aviation Regulations*, which are managed by the Civil Aviation Safety Authority (CASA).

2.6. Pre-drilling Geophysical Activities

As outlined in Chapter 2 of the NOPSEMA-accepted Beehive Pre-Drill Seabed Assessment (PDSA) EP (996161-2022-Beehive#1-PDSA-EP-Rev2), there is the potential that some geophysical activities may need to be repeated immediately prior to MODU mobilisation. This would likely be limited to side-scan sonar and specifically excludes two-dimensional (2D) shallow seismic surveying.

The purpose of this additional site clearance survey would be to reconfirm the absence of seabed hazards and meet the warranty requirements of the MODU owner. If this additional site clearance survey is required after the end of August 2022, it is included in the scope of this EP. Alternatively, a Remotely Operated Vehicle (ROV) may be deployed from one of the support vessels or from the MODU prior to jacking up to undertake the site clearance survey to meet the MODU owner's warranty requirements.

In accordance with Regulation 31 of the OPGGS(E), EOG refers the reader to following sections of the PDSA EP (available [here](#)) to describe the possible investigations that may take place:

- Section 2.4 – description of geophysical investigations (excluding 2D shallow seismic); and
- Section 2.7 – description of typical vessels.

Any geophysical activities required immediately prior to the MODU mobilisation will occur within the same activity area as that outlined in Section 2.1 of the PDSA EP, which includes this activity's operational area.

2.7. Drilling Program

The Beehive-1 well will be drilled as a vertical well to target the Sunbird (primary) and Tanmurra (secondary) formations.

The well design includes drilling a conductor hole (and run conductor) and surface hole section (and run) to set the surface casing. The surface wellhead and BOP will be installed and tested before the well is drilled to total depth (TD). The planned TD is approximately 5,090 m total vertical depth subsea (TVDSS), however, the TD may be less or more depending on the geology and operational issues.

The following phases describe the planned drilling activity:

- Move the MODU to location, position MODU, pre-load and jack-up to operational elevation;
- Drill conductor hole and run conductor;
- Drill surface hole section;
- Run and cement surface casing;
- Install surface wellhead and BOP;
- Perform pressure test;
- Drill intermediate hole section(s);
- Run and cement intermediate strings;
- Drill remaining sections to well TD;
- Run well evaluation program (wireline logging, sidewall cores, formation testing, vertical seismic profiling [VSP], possibly a DST);
- Plug and Abandon (P&A) the well; and
- Demobilise the MODU.

The prognosed formation tops, depth uncertainties and lithological descriptions for Beehive-1 are illustrated in Figure 2.3. Note all depths are relative to mean sea level (MSL). This geological prognosis has been used to ensure the proposed well design achieves the evaluation objectives of the target formations and mitigates the potential formation-related drilling risks per the offset well experience.

Table 2.4 describes the notional Beehive-1 design.

Figure 2.3. Beehive-1 planned well design

Table 2.4. Notional Beehive-1 design

Well section	Description
36" (914 mm) hole 30" (762 mm) conductor	A 36" hole will be drilled and 30" diameter, 1.0" wall thickness, X-56 conductor will be set approximately 125 m below the mudline in accordance with offset well design. It is planned to cement the 30" conductor to the seabed using an inner drill pipe string and tag in sub.
26" (660 mm) hole 20" (508 mm) surface casing	Section TD in the 26" hole section is planned to be in the Mt Goodwin shale at 855 m MSL. The shoe depth will also provide sufficient shoe strength for drilling to the next casing point. 20" casing will then be set ~5 m off bottom and cemented in place with the BOPs installed thereafter. Based on the shallow hazards analysis commissioned by EOG, encountering shallow gas to this shoe depth has been assessed as low risk.
17½" (444 mm) hole 13⅝" (340 mm) intermediate casing	The 13⅝" shoe is planned to be set within the Keyling formation at 2,300 m MSL. Section TD is based on pushing the 13⅝" shoe as deep as possible, maximising shoe strength to circulate out any overpressure kick in the 12¼" hole section with the next casing point planned to be within the anticipated overpressure.
12¼" (311 mm) hole 9⅝" (244 mm) intermediate/ production casing	The 12¼" hole section will be drilled from the 13⅝" casing shoe to the 9⅝" casing point towards the base of the Aquitaine formation.
8 ½" (216 mm) hole to TD 7" (178 mm) production liner	The 8½" hole section will be drilled from the 9⅝" casing shoe to planned well TD of 5,090 mRT (metres below rotary table) with a +/-200 m depth uncertainty. In a success case, a 7" production liner with a +/- 100 m liner lap is planned to facilitate DST operations. Pip tags may be included in the casing as a reference point for the TCP string.
<i>Contingency:</i> 6" (154 mm) hole 4½" (114 mm) production liner	In the event the 9⅝" casing is set early and the 7" liner is set as a drilling liner above the Sunbird Formation, the well will then be drilled to TD in 6" hole. In a success case, a 4½" production liner will be run to facilitate DST operations. A 6" contingency will also enable drilling to planned TD to evaluate the Tanmurra secondary target if it evidently becomes beneficial to set the 7" liner shallower.

2.7.1. Drilling Contingencies

Should drilling difficulties be experienced meaning the well cannot progress, a contingency option exists to cement up the existing hole above the trouble zone and side-track drill the well around the problem. Side-track drilling would only be exercised should drilling difficulties be experienced; this is not considered a new stage of the petroleum activity. A contingency liner is planned to mitigate some possible downhole problems should the need arise.

These activities may require an increase in the excavated rock volume (i.e., cuttings), drilling fluids and cement consumed.

2.7.2. Drilling Fluids and Cuttings

Drilling fluids (or muds) will be used during the drilling program to provide a range of functions, including:

- Control of formation pressures (i.e., providing a hydrostatic head by managing mud density maintains well stability and prevent a blowout);
- Transport of drill cuttings out of the hole to the MODU;

- Maintenance of drill bit and assembly (i.e., lubrication, cooling and support); and
- Sealing of permeable formations to prevent formation invasion.

Drilling Fluid Program

Only water-based mud (WBM) will be used for the well.

The conductor hole section will be drilled using seawater and pre-hydrated gel (PHG) sweeps to clean the hole, and hole displaced to PHG to provide stability for running the conductor. This fluid will exit the well at the seabed while drilling the hole and installing the conductor casing. As with the drilling fluids, cuttings for the conductor hole section will exit the wellbore at the seabed.

Once the conductor casing is installed, and a closed circulating system is established, the remainder of the well will be drilled with WBM systems, as outlined in Table 2.5. WBM will be discharged from the MODU at the sea surface. As a contingency measure, if losses are noted when drilling the conductor, cuttings and muds may be discharged by opening a valve on the conductor above the seabed (rather than from surface).

Cuttings for the remaining hole sections to TD will be discharged at sea level after being removed from the WBM system through the solids control system. The solids control system comprises shale shakers, and if required to remove ultra-fine solids in the recovered drilling fluid, centrifuges.

Aqueous-based lost circulation material (LCM) will be available to pump should downhole losses occur.

Per AGR's Wells Standard (AP-WDP-S01), approved by EOG, a minimum 200 psi overbalance is required over prognosed pore pressures to maintain primary well control. Lower overbalances are acceptable in surface hole sections where an overbalance of 200 psi may not be possible.

The selection of drilling fluids to be used during the drilling program is undertaken through an evaluation of the technical, safety and environmental attributes. A well-specific Drilling Fluid Program will be prepared by the drilling fluids contractor and endorsed by AGR and EOG prior to spud.

The Drilling Fluid Program will contain details of the well data, drilling fluid-related risk assessment, load out list, logistics plan, execution plan and procedures. This Drilling Fluid Program will be implemented by the wellsite mud engineers (24 hr coverage).

The calculated volumes of drill cuttings to be generated and drilling and completion fluid solids discharged are outlined in Table 2.5.

Drill Fluid Additives

Seawater or drill water is the primary constituent of drilling fluids. Inert drilling fluid additives are added to the seawater or drill water to form a WBM. The WBM additives (by name/brand and volume) likely to be used in the drilling program, and their toxicity ratings, are not available at this stage. However, the key additives used in WBM are xanthum gum (viscosifier), bentonite (viscosifier) and barite (weighting agent), which are all inert substances (they have no toxicity, see 'Drill Fluid Toxicity' section).

Table 2.5. Estimated drilling cuttings and mud solids discharge volumes for Beehive-1

Bore diameter (inches)	Well interval	Cuttings	Mud solids		Discharge duration (days)
		Volume discharged (m³)	Type	Volume discharged (m³)	
36"	Conductor hole	80.4	Seawater & sweeps	19.5	0.2
26"	Surface hole	360.1	Gel/polymer WBM	75.0	1.2
17½"	Intermediate hole	322.9	Potassium chloride (KCl) WBM	81.3	2.4
12¼"	Production hole	172.3	High performance WBM	32.7	5.7
8½"	Production liner	29.7		8.8	3.1
	Mud solids discharged at sea surface at well completion			53.9	0.2
	Total	965.4		271.2	12.8

Drill Fluid Toxicity

In the absence of Australian standards (AS) regarding the suitability of drilling mud chemical additives, the Offshore Chemical Notification Scheme (OCNS) is used as a basis for selecting environmentally acceptable chemicals in the Australian offshore petroleum industry. The OCNS manages chemical use and discharge by the United Kingdom (UK) and Netherlands offshore petroleum industries. The scheme is regulated in the UK by the Department of Energy and Climate Change using scientific and environmental advice from the UK's Centres for Environment, Fisheries and Aquaculture Science (CEFAS) and Marine Scotland.

The OCNS uses the Harmonised Mandatory Control Scheme (HMCS) developed through the Oslo-Paris (OSPAR) Convention 1992. This ranks chemical products according to Hazard Quotient (HQ), calculated using the Chemical Hazard and Risk Management (CHARM) model. The CHARM model requires the biodegradation, bioaccumulation and toxicity data of the product to be provided.

Under the OSPAR Convention, organic-based compounds used in production, completion and workovers, drilling and cementing are subject to the CHARM model. The CHARM model calculates the ratio of the 'Predicted Effect Concentration' (PEC) against the 'No Effect Concentration' (NOEC) expressed as a Hazard Quotient (HQ), which is then used to rank the product. The HQ is converted to a colour banding to denote its environmental hazard, which is then published on the Definitive Ranked Lists of Approved Products (by the OCNS on its [website](#)). Gold has the lowest hazard, followed by silver, white, blue, orange and purple (having the highest hazard).

Products not applicable to the CHARM model (i.e., inorganic substances, synthetic-based muds (SBM), hydraulic fluids or chemicals used only in pipelines) are assigned an OCNS grouping A – E, with 'A' having the greatest potential environmental hazard and 'E' having the least. Products that only contain substances termed PLONORs (Pose Little or No Risk to the environment) are given the OCNS 'E' grouping (Figure 2.4). Data used for the assessment includes toxicity, biodegradation and bioaccumulation.

EOG will specify in the drilling fluid tender that only chemicals highly ranked under the OCNS rating system (i.e., 'Gold' or 'Silver' [CHARM] and 'E' or 'D' [non-CHARM], or equivalent) may be used in the drilling fluid design. Where a chemical has not been ranked under OCNS, the drilling fluids contractor will conduct a 'pseudo rating' using toxicity and environmental data for the individual substances of a product. The rating is conducted following the hazard assessment process outlined by CEFAS for the OCNS scheme ([link](#)). This will aim to understand the potential environmental impacts that may occur from discharge of the chemical. EOG will provide final approval for use of chemicals with those that have been risk assessed by the contractor.

Source: NOPSEMA (2015)

Figure 2.4. Illustration of hazard ranking bands for chemical products classified under the OCNS

Chemical Substitution

Chemicals that are hazardous to the marine environment are subject to substitution warnings under the HMCS. The UK follows and applies the OSPAR harmonised pre-screening scheme and complies with registration, evaluation and authorisation of chemicals (REACH) recommendation to replace chemical substances identified as candidates for substitution. These substances are flagged with a substitution warning on the product template.

CEFAS recommends that during the selection of chemical products, operators consider the magnitude of their Risk Quotient (RQ) and the presence of hazardous substances and encourages operators to select products without a substitution warning. Chemicals that have a substitution warning will only be used if a justification for their use is provided, along with an assessment of the environmental impact from the chemical. EOG will provide final approval for use of chemicals with a substitution warning.

Chemical review process

AGR and EOG will review all chemicals nominated by the drilling fluids contractor against the Definitive Ranked Lists of Approved Products (current at the time) to ensure that only 'Gold' or 'Silver' [CHARM] and 'E' or 'D' [non-CHARM] rated chemicals are nominated and that none of the chemicals nominated have a substitution warning.

Where for technical reasons a chemical does not meet the requirements regarding its hazard rating or has a substitution warning in place, AGR and EOG will review and assess the chemical proposed to ensure environmental risks are reduced to ALARP and acceptable levels. This will be managed using AGR's MoC process (described in Section 9.8). The risk assessment will consider the chemical's end fate, volumes, concentrations and environmental impacts.

Fluids Disposal

Where applicable, drilling fluids will be recycled between sections. Between the 17½" and the 12¼" hole sections, mud will be transferred from one section to the next.

At the end of the drilling program, any drilling fluid (mud and brine) remaining in the mud tanks will be discharged overboard. This volume will be minimised through careful mud management. Any dry,

unopened sacks of chemicals left over at the end of drilling will be left on board for the next operator to use or returned to shore. The decision on the end fate of leftover materials will be documented to ensure the final decision is environmentally acceptable. The decision list in order of preference is provided in Table 2.6.

Table 2.6. End fate of unused brines, powders and bulks

Order of preference	End Fate	Justification
1	Retain for use by EOG The stock may be transferred to a vessel for storage until it can be used by AGR/EOG on a subsequent well as the MODU is planned to go to another operator at the end of this activity.	This will depend on the ability to transfer the material(s) to a vessel. For example, piping may not be adequate for transferring of some materials and powder may be difficult to transfer if it has been dispensed into holding tanks on board to MODU already.
2	Sell to next operator If the stock cannot be used by EOG, then it may remain on board the MODU for use by the next operator.	The implementation of this option is dependent on demand and commercial agreements.
3	Transfer to another MODU If the stock cannot be used by the next operator on the MODU, then it may be transferred to another operator for use on a different MODU.	The implementation of this option is dependent on demand and commercial agreements, and the feasibility of transfer of the materials into a suitable transfer vessel for transport elsewhere.
4	Transfer to shore for use by supplier or onshore disposal Stock may be returned to shore for use by the supplier or for disposal.	This will depend on the ability to transfer the material(s) to a vessel. For example, piping may not be adequate for transferring of some materials and powder may be difficult to transfer if it has been dispensed into holding tanks on board to MODU already. The cost benefit analysis of this option would need to consider vessel emissions and discharges as well as the implications of potential landfill disposal of naturally occurring materials (e.g., bentonite and cement).
5	Overboard disposal Powder would be discharged as a slurry, brines would be discharged as is.	Under normal circumstances, the remaining materials will be minimal (<100 m ³ of cement/barite/bentonite). The toxicity of the chemicals overboarded is low due to the chemical selection process adopted.

2.7.3. Cement Program

Cementing operations will be undertaken to provide zonal isolation between different formations as required, maintain well integrity, provide structural support of the casing and to set a temporary suspension plug or P&A plugs to abandon the well. Cement will provide the main barrier for isolation of the wellbore from reservoir conditions whether the well is P&A or temporarily suspended. The final cement plan will be confirmed once a cement service provider has been selected, though it is currently planned that the first three sections of the well will use Class G cement, while the lower two sections will use a high-temperature blend (HTB) cement.

The notional cement program is outlined below:

- 30" conductor – the conductor will be cemented to the seabed with any returns discharged directly to the seabed. It is planned to pump 100-200% excess while cementing the conductor in place, however efforts will be made to reduce this by stopping the cement pumping operations once cement returns are observed at the seabed.
- 20" surface casing – the surface casing is planned to be at least 300 m above the casing shoe, with returns monitored at surface. It is planned that 50-100% excess cement will be pumped during this cement job to account for hole washout and losses that may occur during the cementation job.
- 13 $\frac{3}{8}$ " intermediate casing – the 13 $\frac{3}{8}$ " casing is planned to be cemented to ± 550 m MSL, with returns monitored at surface. It is planned that 10-25% excess cement will be pumped during this cement job to account for hole washout and losses that may occur during the cementation job.
- 9 $\frac{5}{8}$ " intermediate/production casing – the 9 $\frac{5}{8}$ " casing is planned to be cemented back to ± 550 m MSL, with returns monitored at surface. Top of cement for this casing string may change through the well design phase. It is planned that 10-25% excess cement will be pumped during this cement job to account for hole washout and losses that may occur during the cementation job.
- 7" production liner – if run, the production liner will be cemented to the top of the liner for zonal isolation for the DST. Although a caliper log will be run, it is planned that 10% or more excess cement will be pumped during this cement job to account for losses that may occur during the cementation job.

Abandonment cement plugs will be set as required to safely temporarily suspend or P&A the well. The final abandonment program will ensure moveable hydrocarbons (if identified while drilling) are isolated in line with a NOPSEMA-accepted Beehive-1 Well Operations Management Plan (WOMP).

During cementing operations, surface cementing equipment and lines will need to be flushed, washed and cleaned with water to prevent hard setting. The residual cement and wash water will be discharged to sea after each cement job (see Section 7.7).

Cement spacer in well returns and residual surface tank volumes will also be discharged to sea during cementing operations.

Cement Disposal

Cement will be discharged overboard as part of the cement program, with only required cement mixed to ensure minimal wastage. There will be some excess cement discharged directly at the seabed during the cementing of the conductor casing string. Although cementing details are yet to be finalised, planning 100-200% excess is common for the conductor casing cement job to account for losses and over-gauge hole conditions. Once quality cement returns are detected at the seabed, cement mixing will cease and displacement will commence, with a minimal quantity of cement being deposited at the seabed during the displacement. Table 2.7 presents the estimated discharge volumes associated with the cement program.

At the end of the drilling program, and assuming the MODU moves directly to another operator, remaining dry cement will be retained on board for the next operator. Failing that, the cement will be discharged overboard as a slurry.

Table 2.7. Estimated cement discharge volumes

Cementing activity	bbl	m ³
Discharge of cement slurry during system testing.	50	8
Dry cement from the bulk tanks that may be blown overboard during windy conditions in preparation for the cement job.	30-60	5-10
Washing the cement unit and flushing cement hoses to prevent curing (for each of the five cementing operations). This is usually done with seawater or compressed air after every cementing operation (5 x casing strings, 3 x cement plugs).	20 for each cementing operation, total of 160	3 each (total of 24)
Cement overspill at the seabed during cementing of the top hole (30") cement job.	220	35
Total	460-490	72-77

2.7.4. Well Evaluation

Well evaluation involves the collection of data on the well and surrounding formation. Downhole formation evaluation will be carried out via Logging While Drilling (LWD)/Measurement While Drilling (MWD) and wireline logging, which may include VSP. No conventional coring is planned. Formation evaluation involving DST operations will include flaring at surface.

Radioactive sources used in downhole tools for logging purposes will be managed in accordance with the MODU Safety Case so that occupational health and safety risks to people are managed to an acceptable and ALARP level.

Further details on these well evaluation activities are provided herein.

Measure/Logging While Drilling

As part of the drilling operation, the drilling bottom hole assembly (BHA) will incorporate MWD and LWD sensors. The MWD tools will provide a directional survey log of the wellbore, plus key drilling dynamics parameters while drilling.

The LWD tools will be utilised to gather key geological parameters while drilling to inform progress and anticipate upcoming intervals for logging operations.

MWD/LWD logs may include, but are not limited to:

- Direction survey;
- Pressure, temperature and vibration;
- Resistivity, gamma ray;
- Neutron and density; and
- Sonic response.

Wireline Logging

Conventional wireline logging operations will be conducted in both the 12¼" and 8½" holes if feasible. The objective of the wireline logging is to gather more detailed reservoir information than is available via LWD, carry out sampling of the Sunbird target, improve depth control of seismic and prove up

rates of various lithologies for the potential drilling of a future Beehive-2 well. A well test program will be prepared. Wireline logs may include:

- Quad combo (resistivity, gamma ray, neutron, density);
- Image Log and Dipole sonic;
- Formation pressure testing and fluid sampling;
- Nuclear magnetic resonance;
- Rotary and percussion sidewall cores; and
- Cased hole - cement evaluation.

The primary objective of the cased hole logging program will be to acquire cement bond logs to confirm wellbore isolation and cement integrity. As a contingency, further logs may be conducted in the cased hole sections resulting from tool failures in the open hole logging operations.

Vertical Seismic Profiling

As a subset of the wireline logging operation, EOG intends to conduct zero offset VSP. The VSP will enable a high-resolution 2D image of the well and surrounding area to be obtained and improve tie-in to seismic survey data for the area. The sound source will be held over the side of the MODU by the crane. The notional VSP details are as outlined in Table 2.8.

Table 2.8. Notional VSP details

Parameter	Details
Number of airguns	4
Sound source volume	150 cubic inches (cui) (for a total of 600 cui)
Pressure	2,000 psi
Number of shots	150
Source effort	13.8 Bar-m
Duration	4 hours
Depth below sea level	4 m

DST Operations

In a success case, a well clean up flow and well production test(s) will be conducted after running the DST string. Each well test is expected to take approximately 3-5 days, with all flaring operations via high efficiency well effluent burner heads. Multiple zones may be tested, but the decision on which zones to test cannot be made until after logs are evaluated.

The well clean up flow will not be continuous during this period, as there will be shut-ins between the flows. An example of a single zone DST schedule would be less than 1 day flaring, followed by a half-day shut-in. This would then be followed by the longest period of flaring (approximately 1.5 days), and a longer shut-in, with another short (<0.25 day) period at the end. These periods may be adjusted as the data is analysed in real time.

Due to the carbonate formation, it may be necessary to perform a matrix acid stimulation of the perforated intervals. The acid stimulation treatments include acid, solvent and chemical treatments

to improve the permeability of the near-wellbore formation, enhancing the productivity of a well. Acid simulation is a process of injecting a fluid into the formation, either an acid or solvent at pressures below the fracturing pressure, to improve the production or injection flow capacity of a well. In carbonates, acid stimulation creates new, highly conductive channels (wormholes) that bypass damage.

2.8. Plug and Abandonment

At the completion of drilling, the well will be P&A. This isolates the well and mitigates the risk of a potential release of hydrocarbons (assuming a success case) to the environment. The P&A operations involve setting a series of cement plugs within the well, including above and between any hydrocarbon bearing intervals. AGR's standards for P&A align with the *Well Decommissioning Guidelines* (Oil & Gas UK, 2018).

The possible final P&A condition of the well is as per the schematic in Figure 2.5 (in the case of a dry hole, where a production liner is not run).

Figure 2.5. Conceptual P&A schematic (dry hole case)

The final abandonment plan will be confirmed once the well has been drilled and logged to ensure that the barriers are located at the necessary depths. The casing strings will be cut 1-3 m below the

mudline and pulled back to surface and the depth of the cut will be measured. In so doing, all infrastructure and equipment will be removed from the seabed such that nothing is left behind when the MODU departs the location. This meets the requirements of Section 572 ('Maintenance and removal of property etc. by titleholder') of the OPGGS Act.

2.9. Well Control

Well control is the process implemented to prevent a blowout from occurring. Primary well control is provided by the hydrostatic pressure of the drilling fluid having sufficient density to overcome any bottom hole pressure. Many steps are taken to ensure proper density of the drilling fluid is always maintained. Constant monitoring of the mud returns and pit levels help ensure that in the event the bottom hole pressure ever exceeds the hydrostatic pressure of the mud and the well tries to flow formation fluids (kick) into the wellbore, the drilling crew will shut in the BOPs (the secondary control). By shutting in the BOPs, the well flow stops and steps are taken to increase the mud density to overcome the bottom hole pressure.

In addition to well control procedures implemented by the drilling crew, front end engineering design with input from EOG's geological team will design the well such that sufficient kick tolerance is managed from top to bottom of the hole while drilling. This is to ensure maximum anticipated surface pressure is known ahead of time and that properly designed surface equipment is used for the well construction.

2.9.1. Blowout Preventer

A BOP is a mechanical device designed to seal off a well at surface when required. The system is made up of a number of different types of closing mechanisms consisting of:

- Rams (opposing pistons that move horizontally across the top of the well, creating a seal around the drill string, casing or completion tubing);
- Blind shear rams that are capable of shearing drill pipe and sealing the wellbore; and
- Annular preventers (which deploy an elastomer donut-like device) can also be used to close off the well around various sizes of pipe.

A BOP rated to a minimum of 10,000 psi working pressure will be installed and pressure tested prior to deployment and upon initial latch-up with the wellhead.

Response to the Loss of Well Control

The following outlines the steps that would initially be taken in response to a well kick:

- If secondary controls are required, an annular preventer or pipe ram is closed to prevent any further influx from the reservoir into the well if there is pipe in the hole (otherwise blind/shear rams are closed if there is no pipe in the hole).
- If there is pipe in the hole, the pipe rams will be closed (there are three for redundancy).
- Lastly, the blind shear rams can shear the drill pipe (if required) and seal the well completely.

The BOP will only be removed once suitable barriers are in place and are tested. This will occur:

- After setting the cements plugs in the well, if the well is abandoned; and
- For any unplanned BOP maintenance or weather suspension reasons.

The BOP design is based on API standards, best practice and anticipated formation pressures. This is discussed in detail in the WOMP.

2.10. Response to a Loss of Well Control

The nature of the Loss of Well Control (LoWC) leading to a hydrocarbon release will determine the type of source control activities required and the duration of the response. Source control activities evaluated for Beehive-1 include:

- Containment; and
- Relief well drilling.

In the event of a blowout during drilling, reservoir modelling indicates that the worst-case discharge would be released through the 8½" (216 mm) open hole (no obstruction in the well) from a net pay zone of 330 m with zero mechanical skin factor for a period of 77 days (the time required to source a MODU, drill a relief well and kill the well). The oil and gas flow rates are provided in Table 2.9. The flow rates and volumes have been calculated by EOG based on the following guidance:

- SPE Technical Report Calculation of Worst-Case Discharge (WCD) (SPE-174705-TR, 2016);
- NOPSEMA Information Paper Source control planning and procedures (N-04750-IP1979, June 2021c); and
- NOPSEMA Guidance Note Oil Pollution Risk Management (N-04750-GN1488, July 2021b).

The global upstream petroleum industry has developed and continues to advance innovative technologies to respond to a well blowout.

Table 2.9. Predicted worst-case flow rates and volumes

Flow rates and release volumes	Release volume
Oil	
Initial oil flow rate (bbl/day) (m ³ /day)	72,572 (11,539)
77-day oil average oil flow rate (bbl/day) (m ³ /day)	64,270 (10,219)
77-day oil cumulative release volume (MMbbl) (m ³)	4.9 (786,858)
Gas	
Initial gas flow rate (mmcf/day)	131
77-day average gas flow rate (mmcf/day)	116
77-day gas cumulative release volume (Bcf)	8.9
Water	
Initial water flow rate	N/A
77-day average water flow rate (bbl/day)	N/A

EOG has a contract in place with a well control service provider (Wild Well Control) that allows it to access personnel and equipment to respond to a well control response anywhere in the world. EOG has also a contract in place with Oil Spill Response Limited (OSRL) (which will include coverage for Australia) and has in place a contract with the Australian Marine Oil Spill Centre (AMOSOC) for hydrocarbon spill response resources that allows EOG to access personnel and equipment to respond to a hydrocarbon spill.

2.10.1. Capping and Containment

A capping stack is a piece of equipment that can be placed over a blown out well and act as a cap. The purpose is to prevent the flow of hydrocarbons to the environment and thus establish a barrier to the flow of hydrocarbons to the ocean.

For this activity, a capping and containment approach is not feasible because these systems are designed for subsea wellhead applications and therefore not suitable for jack-up MODU surface stack systems (which will be used for Beehive-1).

2.10.2. Relief Well

A relief well is a longer-term response option to stop uncontrolled flow from a well (i.e., 'kill' a well) and to permanently abandon the well. A relief well is drilled to intersect the well that is flowing out of control to provide a conduit to pump high density fluid into the well, and thus stop well flow. EOG will execute its Relief Well Plan (RWP) immediately after a blowout incident and in parallel with other response activities.

Relief Well Planning

A relief well requires the mobilisation of a suitable MODU and the drilling of an interception well through which the failed well can be killed and made safe.

The scope of activities involved with drilling a relief well is the same as drilling a standard well, though it would be a highly deviated well due to the need to drill from outside a safety zone. A RWP (2021-006-03-29-01) has been prepared as part of the Source Control Emergency Plan (SCERP) by AGR for Beehive-1. This plan:

- Describes industry guidelines relevant to relief well drilling;
- Describes the process in place to monitor for and rapidly source a suitable MODU; and
- Provides a relief well drilling program and schedule.

Further details on the RWP are provided herein.

Rig Specification & Provision for Procurement

The selection of a suitable MODU to undertake relief well activities will be based on the closest available unit that meets the criteria listed in Table 2.10. Given the water depth in the vicinity of the Beehive-1 location (~40 m), it is assumed only jack-up MODUs would be capable of undertaking the activities. Two suitable jack-up MODUs have been identified as likely to be working within Australian waters during the planned drilling window for Beehive-1 and have an Australian Safety Case, which are the *Valaris 107* and *Noble Tom Prosser*. However, one of these MODUs will likely be contracted to drill the primary Beehive-1 well.

Any relief well schedule will be driven largely by the rig mobilisation period. It is assumed that the most likely location of the jack-up MODU not contracted to drill Beehive-1 would be from the North West Shelf area, which is approximately 10-14 days mobilisation time away from the Beehive-1 location. It is expected that any ongoing operations can be safely suspended and the relief well MODU can be mobilised to the Beehive-1 location within the timeframe for the Safety Case Revision to be developed and accepted by NOPSEMA, assumed to be 24 days. The availability of suitable MODUs will continue to be monitored and their status updated within the RWP on a monthly basis to ensure any assumptions on the timely execution of relief well remain valid.

Table 2.10. Relief well rig specification

Parameter	Details
MODU type	Jack-up
Water depth	~40 m
Drilling depth rating	Minimum 6,000 m
Well control equipment rating	18 $\frac{3}{4}$ " BOP, minimum 10,000 psi
Pumping capability	3 x 2,200 HP mud pumps, 7,500 psi circulating system
Regulatory requirements	Australian Safety Case in place

Relief Well Construction and Long-lead Requirements

As per Beehive-1, a standard 18 $\frac{3}{4}$ ", 10 K psi surface wellhead system configured for a 30" x 20" x 13 $\frac{3}{8}$ " x 9 $\frac{5}{8}$ " casing program and standard Oil Country Tubular Goods (OCTG) weights and grades (well loads expected to be very similar to Beehive-1) would be required for the purposes of executing a relief well. The relief well design is consistent with the original Beehive-1 well design setting 30" conductor, 20" surface casing and 13 $\frac{3}{8}$ " intermediate casing at the same TVDs. The final 9 $\frac{5}{8}$ " casing string will be set as deep as possible (~30 m above the intercept point) to provide the maximum formation fracture gradient for containing the dynamic kill whilst still also facilitating a positive alignment for penetrating into the target well.

The availability of standard long-lead equipment for the construction of the relief well has been identified as likely from local operator and/or vendor inventory and will be confirmed closer to the planned drilling window as planning for Beehive-1 progresses. High-level specification and means of provision of long lead and drilling equipment for executing a relief well for Beehive-1 is outlined in the RWP. Prior to spudding of Beehive-1, EOG will have in place access agreements to other operators' relief well contingency equipment (e.g., OCTG and wellheads) as required to ensure any assumptions on the timely execution of a relief well remain valid.

Relief Well Location and Trajectory

The relief well design assumes the surface location for a relief well would be approximately 1 km northeast/east/southeast from the primary Beehive-1 well location as shallow hazards appear to be present to the west based on data collected from the geophysical survey in 2022. Therefore, the preferred relief well location is currently eastward of the Beehive-1 well location. This will be confirmed/adjusted based on the information that will be obtained from the geotechnical investigations performed prior to the start of Beehive-1 drilling.

For the most likely scenario of a well blowout (i.e., in the 8 $\frac{1}{2}$ " hole) for the worst-case scenario (drill pipe above deepest casing shoe), the relief well is designed to set 9 $\frac{5}{8}$ " casing ~30 m prior to intersecting the Beehive-1 wellbore at the 9 $\frac{5}{8}$ " casing shoe at 4,250 m TVDRT. The relief well design is based on kicking off below the 13 $\frac{3}{8}$ " casing shoe at ~1,200 m TVDRT building at 2.0°/30 m to a maximum inclination of ~23°, allowing for wireline ranging tools to be run. Once the relief well is within ~50 m (centre to centre) from the target wellbore ~670 m (MD) above the planned interception point (start of locating phase), active ranging can begin to detect the target wellbore. After initial ranging, the tool will then be pulled out of the hole and directional drilling will continue until the next planned proximity ranging point, where again the ranging tool would measure the distance and direction to the original well. This process would continue with separation maintained so as to avoid intercepting the target well shallower than planned. The relief well trajectory during the tracking

phase is designed to drop at $2.0^{\circ}/30$ m, bypassing the target wellbore ~ 490 m TVD above the planned interception point. The relief well will continue to be drilled alongside the target wellbore maintaining a separation of ~ 10 m with ranging performed as required and the relief well turned to align with the blowout well intercept point. Once the relief well and the target wellbores are aligned ~ 30 m above the desired intercept point at the Beehive-1 $9\frac{5}{8}$ " casing shoe, $9\frac{5}{8}$ " casing would be set before the relief well intercepts the blowout well with a closure angle of $\sim 4.6^{\circ}$. The relief well trajectory is shown in Figure 2.6.

Relief Well Project Schedule

The RWP indicates it would take 77 days (11 weeks) to perform the well kill (including MODU mobilisation), as detailed in Table 2.11. The time estimate for drilling the relief well and well kill is 53 days.

AEP Mutual Assistance Agreement

The Australian Energy Producers (AEP) developed the Memorandum of Understanding for Mutual Assistance (known as the Mutual Assistance Agreement, MAA) that facilitates the transfer of a MODU between operations in the event of a drilling emergency that requires a relief well to be drilled.

EOG has signed up to the MAA.

2.11. Drilling Summary

The key drilling activity parameters are summarised in Table 2.12.

Figure 2.6. Relief well trajectory

Table 2.11. Relief well schedule

Activity	Duration (days)	Comments
Planning (prior to Beehive-1 drilling)		
Initial relief well planning	>3 months prior to spud	Relief well complexity assessment. Relief well location identification and initial design. MODU and long-lead equipment specification and identification. Signatory to AEP Memorandum of Understanding (MoU) and Operators equipment access agreements in place as required. Prepare RWP. Regional rig status update (monthly).
Execution (post-blowout)		
Suitable MODU identified	0-1	Provision for relief well aid is confirmed. Detailed relief well design is initiated.
Develop SCR	1-2	Meet NOPSEMA to discuss imminent SCR.
SCR submitted to NOPSEMA	2-16	
SCR review process	16-23	Dialogue with NOPSEMA to optimise assessment process.
MODU mobilised	20-23	Spud equipment loaded onto MODU. Specialised equipment mobilised.
SCR accepted by NOPSEMA	24	
Relief well drilling	24-77	Blowout is killed.
Total	77	

Table 2.12. Key drilling parameters

Parameter	Details
Location and timing	
Exploration permit	WA-488-P
Operational area	500 m radius PSZ around the MODU
Water depth	40 m
Start date (earliest)	1 st of January 2024 (earliest), completed no later than 31 st of December 2025
Duration of activity	Approximately 55-100 days
MODU and support services	
MODU	Jack-up yet to be contracted
Support vessels	Two, yet to be contracted
Marine base	Yet to be decided, most likely from Darwin
Aviation support	Yet to be contracted
Drilling details	
Well depth	5,090 (+/- 200 m) MD/TVD-MSL
Drill cuttings volume (est)	965 m ³
Drilling fluid	WBM
Mud solids discharge volume (est)	271 m ³
Cement discharge volume (est)	72-77 m ³
Well evaluation	LWD, mud logging, electric line logging (including VSP), potential well test

3. Environmental Regulatory Framework

In accordance with Regulation 13(4) of the OPGGS(E), this chapter describes the legislative requirements that apply to the activities described in this EP.

3.1. EOG Environmental Policy

In accordance with Regulation 16(a) of the OPGGS(E), EOG's Safety and Environmental Policy is provided in Figure 3.1. The policy provides a public statement of the company's commitment to minimise adverse effects on the environment and to improve environmental performance.

3.2. Commonwealth Legislation

A summary of the key Commonwealth legislation and regulations relevant to the environmental management of the activity is provided below. Details of the most pertinent legislation and regulations are provided in **Appendix 1**.

Offshore Petroleum and Greenhouse Gas Storage Act 2006

The OPGGS Act sets up a system for regulating the exploration for and recovery of petroleum in offshore areas and provides for the grant of exploration permits, retention leases, production licences, infrastructure and pipeline licences, among other things.

Under this Act, NOPSEMA is responsible for the administration of the occupational health and safety, structural integrity and environmental management provisions. Offshore areas start 3 nautical miles (nm) from the baseline from which the territorial sea is measured and extend seaward to the outer limits of the continental shelf.

Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009

The OPGGS(E) addresses all licensing and environmental issues for offshore petroleum and greenhouse gas (GHG) activities in Commonwealth waters. This EP has been prepared in accordance with Part 2 of the OPGGS(E) for NOPSEMA's assessment.

The OPGGS(E) requires the preparation of an EP prior to conducting a petroleum activity for acceptance by NOPSEMA. The EP is an activity-specific document that provides a detailed impact and risk assessment and describes how identified risks will be managed. Upon EP acceptance, the activity may commence.

Environment Protection and Biodiversity Conservation Act 1999

The *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) is the key legislation regulating projects that may have an impact on matters of national environmental significance (MNES). The Commonwealth Department of Climate Change, Energy, the Environment and Water (DCCEEW) is the Regulator of the EPBC Act. Activities that may have impacts to MNES are required to prepare and submit a Referral to the DCCEEW for determination on the level of environmental impact assessment (EIA) required.

In February 2014, NOPSEMA became the sole designated assessor of petroleum and GHG activities in Commonwealth waters in accordance with the Minister for the Environment's endorsement of NOPSEMA's environmental authorisation process under Part 10, section 146 of the EPBC Act. Under the streamlined arrangements, impacts on the Commonwealth marine area by petroleum and GHG activities are assessed solely through NOPSEMA. As such, an EPBC Act Referral has not been prepared and submitted to the DCCEEW for this activity.

Safety & Environmental Policy

Our Goal

Conduct our operations in a responsible manner to avoid harm to people and the environment.

Our Commitment

EOG Resources, Inc. will conduct its business with a commitment to safeguard people and to protect the environment. Good safety and environmental performance is critical to the success of our business and is the responsibility of every EOG Resources, Inc. employee and contractor.

Our Focus Areas

- **Planning** – Make safety and environmental matters an integral part of our business planning, training, development, and decision-making.
- **Compliance** – Conduct our business in a manner designed to comply with all applicable safety and environmental laws and regulations and apply responsible standards where such laws or regulations do not exist.
- **Continuous Improvement** – Strive to continuously drive safety and environmental performance improvement through setting goals, training, monitoring progress and utilizing data-driven decision making and adaptive management.
- **Communication** – Communicate openly with our customers, employees, contractors, neighbors, appropriate officials, public interest groups, shareholders and other stakeholders, regarding significant safety and environmental matters.
- **Leadership** – Provide leadership, professional staff, training, support, and other resources necessary for the implementation of safety and environmental programs that are designed to ensure each individual knows their responsibilities and feels empowered to speak up and take appropriate action.
- **Engagement** – Engage with regulators, industry groups, and others to develop sound, effective laws and regulations, policies and procedures to protect the environment, employees, contractors and the general public and to raise the standards of our industry.
- **Transparency** – Make consistent, informed decisions by promoting knowledge sharing, data stewardship and collaboration within the organization, and with stakeholders.

Rev. May 2021

Figure 3.1. EOG Safety and Environmental Policy

3.3. State and Territory Legislation

The relevant WA and NT territory legislation is provided in **Appendix 1**. Legislation for these jurisdictions is only likely to be triggered in the event of an emergency situation, such as an oil spill, that requires response activities to be conducted in state or territory waters. Incident reporting requirements under state and territory legislation and regulations is provided in Chapter 9 of this EP.

3.4. Government Guidelines

This EP has been developed in accordance with the NOPSEMA Guidance Note for *Environment Plan Content Requirements* (N04750-GN1344, September 2020). This document provides guidance to the petroleum industry on NOPSEMA's interpretation of the OPGGS(E) to assist titleholders in preparing EPs.

Other relevant government guidelines that have been incorporated or taken into consideration during the preparation of this EP include:

EPs

- Environment plan assessment (NOPSEMA Policy N-04750-PL1347, May 2020a).
- Reducing marine pest biosecurity risks through good practice biofouling management (NOPSEMA Information Paper N-04750-IP1899, July 2020b).
- Environment plan decision making (NOPSEMA Guideline GL1721, June 2021a).
- Oil spill modelling (NOPSEMA Environment Bulletin, April 2019).
- Acoustic impact evaluation and management (NOPSEMA Information Paper, N-04750-IP1765, June 2020c).
- Petroleum activities and Australian marine parks (NOPSEMA Guidance Note, N-04750-GN1785, June 2020d).

Oil Pollution Emergency Plans (OPEPs)

- Oil spill modelling (NOPSEMA Environment Bulletin, April 2019).
- Oil pollution risk management (NOPSEMA Guidance Note N-04750-GN1488, July 2021b).
- Technical Guideline for the Preparation of Marine Pollution Contingency Plans for Marine and Coastal Facilities (AMSA, January 2015).
- Offshore Petroleum Industry Guidance Note Marine Oil Pollution: Response and Consultation Arrangements (WA Department of Transport, Version 5.0, July 2020).
- WA Oil Spill Contingency Plan (Department of Transport, Version 1.0, January 2015).
- NT Oil Spill Contingency Plan (Department of Transport Marine Safety, Version 5.0, May 2014 - in revision 2021).
- Advisory Note for Offshore Petroleum Industry Consultation with Respect of Oil Spill Contingency Plans and Environmental Plans (AMSA, 2013).

Operational and Scientific Monitoring Programs (OSMPs)

- Operational and scientific monitoring programs (NOPSEMA Information Paper, N-04750-IP1349, October 2020e).

EPBC Act

- EPBC Act Policy Statement 1.1 – Significant Impact Guidelines – Matters of National Environmental Significance (DoE, 2013).
- EPBC Act Policy Statement 2.1 - Interaction between offshore seismic exploration and whales, Industry guidelines (DEWHA, 2008a).

3.5. International Industry Codes of Practice and Guidelines

A number of international codes of practice and guidelines are relevant to environmental management of the activity. Those of most relevance are described in this section in chronological order. The Commonwealth legislation outlined in **Appendix 1** lists the conventions and agreements that are enacted by, or whose principles are embodied in, that legislation.

While none of the codes of practice or guidelines described in this section have legislative force in Australia (with the exception of MARPOL and the Minamata Convention on Mercury), they are considered to represent best practice environmental management (BPEM). Aspects of each code or guideline relevant to the impacts and risks presented by the activity are outlined in the demonstrations of acceptability throughout Chapters 7 and 8.

3.5.1. MARPOL

The key international convention relating to marine environmental matters is the International Convention for the Prevention of Pollution from Ships (MARPOL). This convention was adopted in November 1973 by the International Maritime Organisation (IMO), with ongoing additions and amendments. MARPOL aims to prevent and minimise pollution (routine discharges and accidents) from ships generally larger than 400 gross tonnes. It contains six annexes and is in force in more than 170 countries.

In Commonwealth waters, MARPOL is given effect through the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* and via Marine Orders made under the *Navigation Act 2012*, administered by AMSA. Table 3.1 lists the annexes of the Convention and identifies how they are given effect under Commonwealth legislation (with WA and NT legislation also included in the event of ingress into State or Territory waters being required in an emergency situation).

3.5.2. Environmental Management in the Upstream Oil and Gas Industry (2020)

These guidelines were released in August 2020 by the International Association of Oil & Gas Producers (IOGP) and the International Petroleum Industry Environmental Conservation Association (IPIECA). They supersede the United Nations Environment Programme Industry and Environment (UNEP IE) Environmental Management in Oil and Gas Exploration and Production guidelines released in 1997 prepared by the International Exploration and Production Forum (E&P Forum), the precursor to the IOGP.

These guidelines provide descriptions of upstream oil and gas activities environmental management practices. Chapter 4 of the guidelines lists the environmental impacts and mitigation measures associated with offshore activities and provide a useful benchmark for BPEM for this activity.

Table 3.1. Commonwealth, WA and NT legislation enacting the MARPOL Convention

Annex (entry into force in Australia)	Commonwealth waters (<i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983 & Navigation Act 2012</i>)	WA waters (<i>Pollution of Waters by Oil and Noxious Substances Act 1987</i>)	NT waters (<i>Marine Pollution Act 1999</i>)	General requirements for operating in Commonwealth, WA and NT state waters
I Regulations for the Prevention of Pollution by Oil (1988)	AMSA Marine Orders Part 91; Marine Pollution Prevention – Oil.	Part II – Pollution by oil.	Part 2 – Prevention of pollution by oil.	Addresses measures for preventing pollution by oil from regulated Australian vessels or foreign vessels, and specifies that: <ul style="list-style-type: none"> • An IOPP is required; • A SMPEP is required; • An oil record book must be carried; • Oil discharge monitoring equipment must be in place; and • Incidents involving oil discharges are reported to AMSA.
II Regulations for the Control of Pollution by Noxious Liquid Substances in Bulk (1988)	AMSA Marine Orders Part 93; Marine Pollution Prevention – Noxious Liquid Substances.	Part III - Pollution by noxious substances.	Part 3 – Prevention of pollution by noxious substances in bulk.	Addresses measures for preventing pollution by 250 noxious liquid substances carried in bulk from regulated Australian vessels or foreign vessels, and specifies that: <ul style="list-style-type: none"> • An international pollution prevention (IPP) is required; • A SMPEP is required; • A cargo record book must be carried; • Incidents involving noxious liquid substance discharges are reported to AMSA; • The discharge of residues is allowed only to reception facilities until certain concentrations and conditions (which vary with the category of substances) are complied with; and • No discharge of residues containing noxious substances is permitted within 12 nm of the nearest land.
III Prevention of Pollution by harmful Substances Carried by Sea in Packaged Form (1995)	AMSA Marine Orders Part 94; Marine Pollution Prevention – Harmful Substances in Packaged Form.	Not enacted.	Part 4 – Prevention of pollution by packaged harmful substances.	Addresses measures for preventing pollution by packaged harmful substances (as defined in the International Marine Dangerous Goods (IMDG) code, which are dangerous goods with properties adverse to the marine environment, in that they are hazardous to marine life, impair the taste of seafood and/or accumulate pollutants in aquatic organisms) from regulated Australian vessels or foreign vessels, and specifies that: <ul style="list-style-type: none"> • The packing, marking, labelling and stowage of packaged harmful substances complies with Regulations 2 to 5 of MARPOL Annex III; • A copy of the vessel manifest or stowage plan is provided to the port of loading prior to departure; • Substances are only washed overboard if the Vessel Master has considered the physical, chemical and biological properties of the substance; and • Incidents involving discharges of dangerous goods are reported to AMSA.
IV Prevention of Pollution by Sewage from Ships (2004)	AMSA Marine Orders Part 96; Marine Pollution Prevention – Sewage.	Not enacted.	Not enacted.	Addresses measures for preventing pollution by sewage from regulated Australian vessels or foreign vessels, and specifies that: <ul style="list-style-type: none"> • An ISPP is required; • The vessel is equipped with a sewage treatment plant (STP), sewage comminuting and disinfecting system and a holding tank approved by AMSA or a recognised organisation; • The discharge of sewage into the sea is prohibited, except when an approved STP is operating or when discharging comminuted and disinfected sewage using an approved system at a distance of more than 3 nm from the nearest land; and • Sewage that is not comminuted or disinfected has to be discharged at a distance of more than 12 nm from the nearest land.
V Prevention of Pollution by Garbage from Ships (1990)	AMSA Marine Orders Part 95; Marine Pollution Prevention – Garbage. * Not made under the <i>Navigation Act 2012</i> .	Not enacted.	Part 6 – Prevention of pollution by garbage.	Addresses measures for preventing pollution by garbage from regulated Australian vessels or foreign vessels, and specifies that: <ul style="list-style-type: none"> • Prescribed substances (as defined in the IMO 2012 <i>Guidelines for the Implementation of MARPOL Annex V</i>) must not be discharged to the sea; • A Garbage Management Plan must be in place; • A Garbage Record Book must be maintained; • Food waste must be comminuted or ground to particle size <25 mm while en route and no closer than 3 nm from the nearest land (or no closer than 12 nm if waste is not comminuted or ground); and • It is prohibited to discharge wastes including plastics, cooking oil, packing materials, glass and metal.
VI Prevention of Air Pollution from Ships (2007)	AMSA Marine Orders Part 97; Marine Pollution Prevention – Air.	Not enacted.	Not enacted.	Addresses measures for preventing air pollution from regulated Australian vessels or foreign vessels, and specifies that: <ul style="list-style-type: none"> • An IAPP certificate is in place; • An EIAPP certificate is in place for each marine diesel engine installed; • An IEE certificate is in place; • Specifies that incineration of waste is permitted only through a MARPOL-compliant incinerator, with no incineration of Annex I, II and III cargo residues, polychlorinated biphenyls (PCBs), garbage containing traces of heavy metals, refined petroleum products and polyvinyl chlorides (PVCs); • Marine incidents are reported to AMSA; • Sets limits on sulphur content of fuel oil (3.5% m/m); • A bunker delivery note must be provided to the vessel on completion of bunkering operations, with a fuel oil sample retained; and • Emissions of ozone depleting substances (ODS) must not take place and an ODS logbook must be maintained.

3.5.3. Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (2019)

The Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019) aims to identify best available techniques (BAT) and best risk management approaches for key environmental issues associated with onshore and offshore oil and gas exploration and production activities. The BATs included are not prescriptive nor exhaustive but included as a point of comparison with documents such as this EP to ensure the desired environmental outcomes commensurate with BAT can be achieved for the European context.

3.5.4. World Bank Group EHS Guidelines (2015)

The Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015) is a technical reference document with general and industry-specific examples of good international industry practice. These guidelines are applied when one or more members of the World Bank Group are involved in a project.

The document contains measures considered to be achievable in new facilities, using existing technology, at reasonable costs. The guidelines are designed to be tailored to the applicable hazards and risks established for a given project.

While the World Bank Group is not involved in financing or assessing this activity, control measures adopted for this activity that adhere to these guidelines can be referenced as examples of BPPEM.

3.5.5. Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (2015)

The International Association of Drilling Contractors (IADC) developed the Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (2015) for drilling contractors to provide, among other things, a demonstration to external stakeholders that their management system's risk reducing measures meet agreed stakeholder expectations.

These guidelines present broad environmental (along with health and safety) considerations for achieving BPPEM. The guidelines are recommended for use as a demonstration of good industry practice for drilling contractors.

3.5.6. Minamata Convention on Mercury (2013)

The Minamata Convention on Mercury is an international treaty that seeks to protect human health and the environment from emissions and releases of mercury and mercury compounds caused by humans. Australia ratified the convention on the 7th of December 2021. Countries that have ratified the convention are bound to put controls in place to manage the discharges, emissions and disposal of mercury and mercury compounds. In Australia, the convention is regulated via the Recycling and Waste Reduction Act 2020 (Cth). In particular, the Recycling and Waste Reduction (Mandatory Product Stewardship – Mercury-added Products) Rules 2021 made under the Act give effect to Australia's obligations under Article 4(5) of the Minamata Convention.

Mercury is a highly toxic heavy metal that can harm the immune system, brain, heart, kidney and lungs of humans and animals, and cause serious harm to ecosystems through bioaccumulation. The effects of mercury exposure can occur at very low concentrations. For this activity, the Minamata Convention applies to trace volumes of mercury that may be contained with drilling fluids (particularly barite), and is addressed in Section 7.6 of the EP.

3.5.7. IPIECA: Best Practice Guidelines

IPIECA is the International Petroleum Industry Environmental Conservation Association, established in 1974 (since 2002, IPIECA stopped using the full title). As of March 2022, IPIECA's members comprise

74 members, comprising oil and gas exploration and production companies, associations and contractors.

IPIECA's vision is for an oil and gas industry whose operations and products meet society's environmental and social performance expectations, with a focus on the key areas of climate and energy, environment, social and reporting. It develops, shares and promotes good practices and knowledge to help the industry improve its environmental and social performance. IPIECA's work is embodied in publications that are made freely available on its website (www.ipieca.org).

Relevant guidelines have been referenced in this EP (and associated OPEP) as relevant, primarily in the areas of atmospheric emissions and oil spill response and preparedness.

EOG has applied IPIECA's Mapping the Oil and Gas Industry to the Sustainable Development Goals: An Atlas (July 2017) to the activity. Goal 14 (Conserve and sustainably use the oceans, seas and marine resources for sustainable development) is the most relevant to this survey, and has been met by fulfilling the following:

- Incorporating environmental assessments into management plans – this EP satisfies this sub-goal; and
- Accident prevention, preparedness and response – the OPEP and OSMP demonstrate that EOG takes prevention, preparedness and response seriously and is well prepared to act in the event of an environmental emergency.

3.5.8. ITOPF Oil Spill Response Technical Information Papers

The International Tanker Owners Pollution Federation Limited (ITOPF) was established in 1968 to promote effective response to marine spills of oil, chemicals and other hazardous substances by providing five core services (spill response, claims analysis and damage assessment, information services, contingency planning and advice and training and education). Membership of ITOPF comprises owners or demise charterers of tankers, defined as any ship (whether or not self-propelled) designed, constructed or adapted for the carriage by water in bulk of crude petroleum, hydrocarbon products or other liquid substances. While this definition excludes MODU and MODU operators becoming members of ITOPF, owners of support vessels servicing MODUs may become members.

More broadly, ITOPF's series of 17 Technical Information Papers relate to marine pollution, including the effects of oil pollution, contingency planning for marine oil spills and responding to oil spills assist the upstream petroleum industry in preparing for and responding to oil spills.

In this EP (and associated OPEP), these ITOPF guidelines have been referenced to support the oil spill response strategies.

3.6. Australian Industry Codes of Practice and Guidelines

There are few Australian industry codes of practice or guidelines regarding environmental management for offshore petroleum exploration. Those that do apply to this activity are briefly discussed in this section in chronological order.

Aspects of each code or guideline relevant to the impacts and risks presented by the activity are described in the 'demonstration of acceptability' throughout Chapters 7 and 8 of this EP.

3.6.1. Australian Biofouling Management Requirements (2022)

The Australian Biofouling Management Requirements (DAWE, 2022a) entered into force on the 15th of June 2022 (under the Biosecurity Amendment (Biofouling Management) Regulations 2021) and contain vessel operator obligations for the management of biofouling within Australian territorial

seas. Vessels entering Australian waters need to demonstrate they have adopted one of three accepted management techniques. The measures outline in this EP are designed to comply with these requirements.

3.6.2. Australian Ballast Water Management Requirements (2020)

The Australian Ballast Water Management Requirements (DAWR, 2020, v8) detail the mandatory ballast water management requirements and provide information on ballast water pump tests, reporting and exchange calculations.

The measures outlined in this EP are designed to minimise the risk of introducing harmful aquatic organisms into Australian waters.

3.6.3. National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (2017)

The National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (DoEE, 2017a) provides a framework for identifying megafauna species (principally whales, dolphins, turtles and whale sharks) most at risk from vessel collision and outlines mitigation measures to reduce this risk.

The measures outlined in this EP are designed to minimise the risk of colliding with megafauna.

3.6.4. Australian National Guidelines for Whale and Dolphin Watching (2017)

The Australian National Guidelines for Whale and Dolphin Watching (DoEE, 2017b) principally apply to commercial marine tourism operations involves in whale and dolphin watching, outlining measures to comply with the EPBC Act and minimise disturbance to these cetaceans.

In the context of this activity, EOG will apply these guidelines to the support vessels so that approach distances to cetaceans are adhered to.

3.6.5. National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (2009)

The National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (DAFF, 2009) provides a generic approach to a biofouling risk assessment and practical information on managing biofouling on hulls and niche areas.

The measures outlined in this EP are designed to minimise the risk of introducing harmful aquatic organisms into Australian waters.

3.6.6. AEP Code of Environmental Practice (2008)

In Australia, the petroleum exploration and production industry operates to an industry code of practice developed by the AEP; the *AEP Code of Environmental Practice* (CoEP) (2008). This code provides guidelines for activities that are not formally regulated and have evolved from the collective knowledge and experience of the oil and gas industry, both nationally and internationally.

The AEP CoEP covers general environmental objectives for the industry, including planning and design, assessment of environmental risks, emergency response planning, training and inductions, auditing and consultation, and communication. For the offshore sector specifically, it covers issues relating to geophysical surveys, drilling and development and production.

The AEP CoEP has been used as a reference for the EIA and Environmental Risk Assessment (ERA) in this EP to ensure that all necessary environmental issues and controls for petroleum exploration have been incorporated into the management of this activity.

3.6.7. National Strategy for Ecologically Sustainable Development (1992)

The National Strategy for Ecologically Sustainable Development (ESDSC, 1992) defines the goal of Ecologically Sustainable Development (ESD) as *“development that improves the total quality of life, both now and in the future, in a way that maintains the ecological processes on which life depends.”* Section 3A of the EPBC Act defines the principles of ESD as:

- Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations;
- If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation;
- The principle of inter-generational equity – that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations;
- The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; and
- Improved valuation, pricing and incentive mechanisms should be promoted.

Ensuring that any petroleum activity is undertaken in a manner consistent with the ESD principal is a core aim of the OPGGS(E) and it has been taken into consideration in the demonstrations of acceptability in this EP (see Chapter 6).

4. Consultation

EOG is required to consult with relevant persons in preparation of this EP. As defined by NOPSEMA, consultation is a two-way process where information is shared between titleholders and relevant persons that provides an opportunity for relevant persons who may be affected by an offshore petroleum activity to raise concerns, seek information about how they will be affected and how the titleholder intends to manage the activity so that impacts and risks are ALARP and acceptable.

This chapter documents the process that was followed to undertake the consultations in accordance with OPGGS(E) along with a summary of the outcomes of that process. This chapter demonstrates that EOG has carried out consultation as required by applicable law and that the measures adopted as a result of the consultations are reasonable and appropriate. This chapter describes consultation undertaken by EOG between September 2021 and 2023 for the proposed activity, including a public comment period undertaken between 9 May and 8 June 2022.

4.1. Relevant Persons Consultation – Background and Legislative Requirements

The Federal Court of Australia's appeal decision in December 2022 (*Santos NA Barossa Pty Ltd v Tipakalippa* [2022]) (the Decision), sets forth the requirements for consultation in accordance with OPGGS(E). At the time of the Decision, this EP was under assessment by NOPSEMA; following which, EOG revised its methodology to reflect the intent of the Decision. To guide the consultation process, EOG developed a Relevant Persons Consultation and Engagement Plan (RPCEP) (**Appendix 2**) that outlines EOG's revised consultation and engagement activities. The RPCEP lists the requirements for consultation in accordance with relevant NOPSEMA regulations, policies, guidance and information papers and was informed by the guiding principles of the International Association for Public Participation (IAP2).

The consultation process was informed by the following regulations, policies and guidance:

- OPGGS(E):
 - Regulation 11A – defines 'Relevant Persons', requires that the titleholder must give each relevant person sufficient information and time to make an informed decision of the possible consequences of the activity on their functions, interests or activities.
 - Regulation 14(9) – requirement for ongoing consultation to be incorporated into the Implementation Strategy of the EP.
 - Regulation 16(b) – the EP must contain a summary and full text of stakeholder consultation.
- NOPSEMA policies, guidance, and information papers, including:
 - PL1347 - Environment plan assessment policy (May 2020).
 - GL1721 - Environment plan decision making (December 2022).
 - GL1887 - Consultation with Commonwealth agencies with responsibilities in the marine area (January 2023).
 - GL2086 - Consultation in the course of preparing an environment plan (May 2023).
 - GN1344 - Environment plan content requirements (September 2020).
 - GN1488 - Oil pollution risk management (July 2021).
 - GN1785 - Petroleum activities and Australian Marine Parks (June 2020).
 - GN1847 - Responding to public comment on environment plans (September 2020).
 - Brochure - Consultation on offshore petroleum environment plans: Information for the

community (May 2023).

- Other relevant guidance, including:
 - Australian Fisheries Management Authority: Petroleum industry consultation with the commercial fishing industry (available at <https://www.afma.gov.au/sustainability-environment/petroleum-industry-consultation>).
 - Western Australian Department of Primary Industries and Region Development (DPIRD): Guidance statement for oil and gas industry consultation with the Department of Fisheries (July 2013).
 - Western Australian Department of Transport (DoT): Offshore Petroleum Industry Guidance Note – Marine Oil Pollution: Response and Consultation Arrangements (July 2020).
 - Petroleum activities and Australian Marine Parks (Guidance note - Petroleum Activities and Australian Marine Parks.pdf (nopsema.gov.au)).
 - Australian Institute of Aboriginal and Torres Strait Islander Studies (AIATSIS) Engaging with Traditional Owners Guidance (December 2020).

4.2. Relevant Persons Consultation – Key Duties

EOG identified seven key legislative duties it must discharge in carrying out consultation with relevant persons in preparation of this EP. This chapter and EOG's RPCEP (Appendix 2) summarise these duties by describing what EOG committed to do and what EOG did to fulfil these commitments. References are made throughout this chapter to demonstrate these commitments were achieved.

The key legislative duties required of titleholders under the OPGGS(E) are to:

1. Consult with relevant persons (Regulation 11A(1));
2. Provide sufficient information to relevant persons (Regulation 11A(2));
3. Describe the relevant values and sensitivities of the environment that may be affected by the activity (Regulation 13(2)(b));
4. Allow a reasonable period for relevant persons to assess the sufficient information (Regulation 11A(3));
5. Assess the merit of each objection or claim (Regulation 16(b)(ii));
6. Respond to each objection or claim (Regulation 16(b)(iii); and
7. Ensure consultation is ongoing if appropriate.

4.2.1. Duty 1: Consult with Relevant Persons

Titleholders are required to consult with relevant persons as defined by OPGGS(E). EOG undertook a comprehensive multi-level approach to identify, invite and consult with relevant persons whose functions, interests, or activities may be affected by the proposed activities.

Regulation 11A(1) of the OPGGS(E) defines a 'relevant person' as:

- A. Each Department or agency of the Commonwealth to which the activities to be carried out under the EP, or the revision of the EP, may be relevant;
- B. Each Department or agency of a State or the Northern Territory to which the activities to be carried out under the EP, or the revision of the EP, may be relevant;

- C. The Department of the responsible State Minister, or the responsible Northern Territory Minister.
- D. A person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP, or the revision of the EP; and
- E. Any other person or organisation that the titleholder considers relevant.

In September 2021, EOG commenced consultation with relevant persons for the proposed activities described in this EP. This identified 62 relevant persons with whom EOG consulted. In July 2022, to continue to improve and enhance its consultation processes, EOG began to update its consultation methodology and identification of relevant persons. This process was informed by feedback from NOPSEMA as well as an understanding of evolving best practices, which in part emanated from the Santos NA Baross Pty Ltd v Tipakalippa [2022] FCAFC 193 decision (see Schedule C of the RPCEP at Appendix 2 for EOG's summary of key implications from this case). This included re-evaluating the functions, interests and activities of those parties within the environment that may be affected (EMBA, see Section 5.1) and how they could be impacted by the proposed activity. After the revised approach, and at the time of this EP submission, 530 relevant persons have been identified and consulted.

Identifying Relevant Persons

Subject-centered groups

Section 3.4 of the RPCEP (Appendix 2) specifically describes the tailored consultation approach undertaken, following guidance by the DCCEEW under the EPBC Act, to identify subject-centred groups. Table 4.1 provides a summary of strategies used by EOG to identify subject-centred groups in order to locate relevant persons. Information about each of these subject-centred groups that supports the identification of relevant persons can be found in materials published by the DCCEEW under the EPBC Act including:

- Plans of Management - including for World and National Heritage places, Ramsar wetlands, Australian Marine Parks (AMPs), Commonwealth Reserves and Commonwealth Heritage places;
- Recovery Plans - for listed threatened species and ecological communities;
- Policy Statements - including impact significance guidelines and industry specific guidelines; and
- Other material - including management principles, online databases, factsheets and other publications.

Table 4.1. Tailored consultation approaches conducted for subject-centred groups

Subject-centred Group	Tailored strategy to identify relevant persons
Marine users	<ul style="list-style-type: none"> • EOG posted notices at ports, boat launches, and ramps within the EMBA to connect with a wide variety of marine users (Table 4.4).
Tourism operators	<ul style="list-style-type: none"> • Online searches for cruise operators, marine tours and recreational experiences such as marine mammal observations, diving, recreational fishing and thrill-seeking experiences. • Online searches for marine-based community or sporting events.

Subject-centred Group	Tailored strategy to identify relevant persons
First Nations Peoples	<p>The following activities were undertaken to identify First Nations Peoples:</p> <ul style="list-style-type: none"> • Visited local government authority websites (shire or municipal council) that often include acknowledgement of Traditional Owners. • Searched state and territory government websites that include information about Traditional Owners in their jurisdictions, especially in the context of information about local offices. • Searched online for states' and territories' Aboriginal and Torres Strait Islander consultative bodies. • Contacted land councils representing the local Aboriginal or Torres Strait Islander communities. • Online searches for Native Title groups and corporations on the prescribed bodies corporate (PBC) website. • Registered searches on the National Native Title Tribunal (NNTT) website. • Geospatial searches by completing the forms on the NNTT website. <p><i>Note:</i> EOG categorises any person with Native Title claims of any standing (i.e., claim or determination) as a relevant person.</p> <p>Methods of identifying First Nations Peoples that may be relevant persons included:</p> <ul style="list-style-type: none"> • Assessed the values and sensitivities of the EMBA. • Desktop research of any public Sea Country information within the EMBA of each specific activity. <ul style="list-style-type: none"> ○ AMP management plans. ○ Aboriginal group Healthy Country Plans. • Engaged with First Nations groups such as land councils and PBC to seek who they represent; how First Nations groups or individuals should be consulted as relevant persons; and if there are any groups or persons that EOG had not identified. • Provided information via written correspondence, information flyers, and the project-specific website, and continued to engage with additional relevant persons or organisations as they were identified. • Advertised in Aboriginal-owned publications, <i>Koori Mail</i> and <i>The Kimberley Echo</i> newspapers, to invite consultation with any person who may have a function, interest or activity that may be affected by the activity. Use of Aboriginal-owned publications allows for persons that have not yet been identified to self-identify as relevant.
Port users	<ul style="list-style-type: none"> • Contacted harbourmasters to enquire about frequent users. • Online searches for businesses located at wharves in regional ports.
Petroleum titleholders	<ul style="list-style-type: none"> • Queried the National Electronic Approvals Tracking System (NEATS) database to find titles and titleholders within the EMBA. • Queried the NOPSEMA EP database to find other titleholders with activities within the EMBA. • Subscribed to the NOPSEMA EP submissions pages for all activities within the EMBA.
Commercial fishers	<ul style="list-style-type: none"> • Requested data from the Commonwealth, WA and NT fishing authorities to understand historical fishing activity within the EMBA. • Visited local ports to find local fishers who operate in the EMBA. • Contacted all state-licensed fishers.

Subject-centred Group	Tailored strategy to identify relevant persons
	<ul style="list-style-type: none"> • Contacted all Commonwealth fishing license holders. • Queried and reviewed the Fisheries Research and Development Corporation (FRDC) website, including the annual State of the Fisheries Report (www.fish.wa.gov.au). • Engaged with the Western Australia Fishing Industry Council, Inc (WAFIC).
Recreational fishers	<ul style="list-style-type: none"> • Engaged with recreational fishing associations to advertise in newsletters/circulars or websites. • Requested contact details for license holders. • Requested to engage with advisory bodies or reference groups to establish the best approach to identify relevant persons.
Native Title Prescribed Bodies Corporate and Land Councils	<ul style="list-style-type: none"> • Sought contact details of land councils from the NNTT. • Online searches for Native Title PBC on the PBC website. • Cross-referenced PBC contact details with the Office of the Registrar of Indigenous Corporations.
Conservation groups	<ul style="list-style-type: none"> • Reviewed previously submitted EPs on the NOPSEMA website. • Online searches for conservation groups with interests in similar activities. • Online searches for new articles and current campaigns related to similar activities.
Fishing associations	<ul style="list-style-type: none"> • Identified target species within the EMBA through online research. • Requested contact details for license holders.
Other marine users	<ul style="list-style-type: none"> • Online searches for groups who use or have a connection to the marine environment; focused on marine users proximate to the EMBA.
Commercial shipping	<ul style="list-style-type: none"> • Contacted harbourmasters in the EMBA and shipping agents to enquire about frequent users. • Online searches for businesses located at wharves in regional ports.
Local councils	<ul style="list-style-type: none"> • Queried the WA and NT Electoral Commission and Government databases for councils, shires and cities proximate to the activity. <p><i>Note: NOPSEMA guideline GL1887 identifies the government agencies as a relevant person as they have responsibilities within the Commonwealth marine area.</i></p>
Educational bodies	<ul style="list-style-type: none"> • Contacted the Department of Education to identify relevant institutions and research programs. • Contacted universities to identify any relevant research programs. <p><i>Note: For this category, the exposure thresholds for monitoring potential impacts of the activity were used rather than the socio-economic thresholds, because this is more relevant to the likely activities of research institutions.</i></p>
Commerce	<ul style="list-style-type: none"> • Online searches for news articles or press releases about marine-based businesses in the area.
Ports and harbours	<ul style="list-style-type: none"> • Reviewed automatic information system (AIS) data of vessel activities along the coast to establish frequented ports. • Reviewed the WA and NT boat ramp databases. • Contacted local councils, cities and shires for listing of local boat ramps and users.

Subject-centred Group	Tailored strategy to identify relevant persons
Heritage groups	<ul style="list-style-type: none"> • Contacted WA and NT heritage organisations to identify relevant persons. • Queried the Australian Heritage Database. • Queried the Australasian Underwater Cultural Heritage Database.

The outcome of the approaches listed in Table 4.1 resulted in the complete list of relevant persons applicable to the proposed activity, presented in Appendix 3 and Appendix 4 (named individual fishing licence holders). In addition to the strategies listed in Table 4.1, the following strategies as stated in the RPCEP, were also considered but not undertaken because the databases or systems were not in place to accomplish these strategies:

- Request Tourism Australia and Tourism WA to query databases of local businesses along the coastline within the socio-economic risk EMBA; and
- Enquire with local Chambers of Commerce to identify marine-based tourism operators and local marine-based businesses in the region.

The subject-centred strategies used to search for relevant persons in Table 4.1 were primarily focused on persons within and proximate to the EMBA. Furthermore, the communication strategies discussed in the following sections specifically targeted persons proximate to the activity (see also Section 5 of the RPCEP in **Appendix 2**).

Public Outreach

To complement the proactive and comprehensive searches for relevant persons via subject-centred groups, EOG also undertook a broader approach to raise public awareness, so persons not contacted as part of the tailored consultation could learn the details of the Beehive Project and self-identify as a relevant person. Each public outreach activity is listed in this section and fully described in the RPCEP (**Appendix 2**).

EOG Australia website

The EOG Australia website (<https://www.eogresources.com/australia/>) provides an overview of EOG Australia. In March 2022, a short summary (which remains available) of the proposed exploration drilling activity and activity map was posted, along with links to the project-specific online consultation hub, summary Fisheries Compensation Protocol, WA-488-P permit details, current geophysical, geotechnical and drilling EPs, and information flyers.

Establish a Dedicated Project-specific website

EOG launched a project-specific website (<https://klarite.mysocialpinpoint.com.au/beehive>) on 11 May 2023 as the central tool to convey information and updates about the proposed activity, potential environmental impacts and risks and control measures to mitigate them. The nature of the internet allows anyone in Australia and further extending to anyone in the world with internet access, to learn and choose to engage with the project in any manner they wish, thus removing geographic limitations for consultation. This platform provides opportunity for users to self-identify as a relevant person and request consultation with EOG. The website includes a feedback form and EOG contact information including telephone number, mailing address, and email address. The project-specific website will remain available throughout the EP assessment process and throughout the activity as the central place for updates on the activity.

A link to the project-specific website was included on the EOG Australia website. EOG project information, project map, QR code and link to the project-specific website were also included in public notices in print media (Table 4.2), and posted on notice boards at boat ramps, ports, local councils and other prominent community gathering sites within the EMBA, as listed in Table 4.4. This central tool allows users to review the project information at their own pace on their own schedule and ensures all relevant project information is made available anytime, anywhere.

The project-specific website invites the user to explore the following:

- *Consultation Information*
 - What are the consultation requirements? Provides information to all relevant persons so they can make an informed assessment of how their functions, interests and activities may be affected by the proposed activities.
 - What should I do if I want to be included in consultation? Provides a user-friendly, readily accessible means to register per activity as a relevant person.
 - What should I do if I don't want to be consulted? Provides a user friendly, readily accessible means to opt out of consultation per activity.
 - What happens if I don't respond to the information provided to me through the consultation process? Provides details on EOG's actions if party contacted by EOG does not respond.
- *Relevant Person Information*
 - What is a Relevant Person and how do I know if I am one? Describes what it means to be a relevant person and provide access to the Beehive Consultation Survey if user is unsure if they are a relevant person.
 - How do I advise EOG if I believe I am a Relevant Person? Provides the variety of ways available to register as a Relevant Person.
 - What are my rights and obligations as a Relevant Person? Provides detail of the regulations regarding information shared during consultation.
 - I think someone I know could be a Relevant Person, what should I do? Provides EOG contact information to share with others.
- *What is an Environment Plan?* Provides background information on the purpose of an EP.
 - Description of the activity.
 - Description of the existing environment.
 - Environmental impact and risk assessment.
 - Environmental management measures and commitments.
 - Environmental spill response measures contained within an OPEP.
 - Summary of the consultation record.
- *Interactive Project-specific Information:*
 - Beehive Geotechnical Assessment
 - EP Status.
 - Activity Summary.
 - Activity Map.

- Geotechnical Assessment Information.
 - Geotechnical Assessment Interactive Map.
 - Current EP
 - Information Flyers.
- Beehive-1 Exploration Drilling
 - EP Status.
 - Activity Summary.
 - Activity Map.
 - Drilling Activity Information.
 - Drilling Interactive Map.
 - Current OPEP.
 - Information Flyers.
- *Beehive Consultation Survey and Feedback*
 - Relevant Persons
 - Identify functions, interests, or activities that may be affected.
 - Activity-specific surveys.
 - Opt-in/Opt-out of consultation process.
 - Confidentiality Statement.
 - Provide feedback.
 - General Public
 - Sign-up for project updates.
 - Confidentiality Statement.
 - Provide feedback.

Through the Beehive Consultation Survey, users are able to determine whether their activities, interests or functions have the potential to be affected by the project and the option to self-identify as a relevant person. The consultation survey provides relevant persons and the general public opportunity to provide feedback and comments, make suggestions for improvements, and sign up to receive project updates and information flyers. EOG's confidentiality policy is declared within the feedback form, with respondents having to elect whether their information be made public or removed from any documents made public, prior to submitting their information.

Public Notices in Print Media

Twelve advertisements were published in Australian national, regional and local newspapers, as listed in Table 4.2 (Appendix 5). The advertisements included a link/QR code for the project-specific website along with contact details (email address and phone number) for readers to provide EOG with comments on the proposed activity. In addition, seven newspaper advertisements, also listed in Table 4.2, were published in the weeks leading up to the Beehive Information Sessions (listed in Table 4.5) to notify the public of, and provide details relating to the proposed project information sessions.

Table 4.2. Newspaper advertising of the proposed activity

Newspaper	Coverage	Publication date
Associated with EP submission to NOPSEMA for assessment		
The West Australian	Regional (WA)	3 December 2022
The Australian	National	3 December 2022
NT News	Regional (NT)	3 December 2022
NT News – Online	Regional (NT)	3 December 2022 - 1 January 2023
The Kimberley Echo	Local (WA)	8 December 2022
Koori Mail – Edition 791	National	14 December 2022
Associated with Beehive information sessions listed in Table 4.5		
The West Australian	Regional (WA)	13 May 2023
Koori Mail – Edition 801	National	17 May 2023
The Kimberley Echo	Local (WA)	18 May 2023
The Kimberley Echo	Local (WA)	25 May 2023
The West Australian	Regional (WA)	25 May 2023
Koori Mail – Edition 802	National	31 May 2023
The Kimberley Echo	Local (WA)	1 June 2023
Advertising for EP feedback		
Koori Mail - Edition 803	National	14 June 2023
The Kimberley Echo	Local (WA)	15 June 2023
The West Australian	Regional (WA)	15 June 2023
NT News	Regional (NT)	29 June 2023
NT News - Online	Regional (NT)	29 June - 29 July 2023
The Australian	National	2 July 2023

Publication of Information Flyers

Information flyers have been produced periodically since 2021 to provide relevant persons and the general public specific information about the activity (Table 4.3, Appendix 6). Information flyers were used to introduce EOG and the Beehive project, provide descriptions of the geotechnical, geophysical and drilling processes, and to discuss the purpose of the EP relative to regulatory requirements. Tailored subject-centred flyers were created for relevant persons that requested more information or information in a different form.

The information flyers provided a description of the relevant persons consultation process, an invitation to consult with EOG, a QR code for the project-specific website, and contact details. The flyers were emailed to relevant persons, accessible through the project-specific website and the EOG Australia website, and appended to written correspondence as necessary.

Table 4.3. Beehive-1 information flyers

Flyer	Date	Focus
1	15 September 2021	Geophysical and geotechnical investigations
2	1 December 2021	Update on geophysical and geotechnical investigations
3	28 February 2022	Drilling program
4	11 May 2022	Updates on geophysical and geotechnical investigations and drilling program
5	27 June 2022	Updates on drilling program and geotechnical investigations and EP status
6	May 2023	Updates on drilling program and geotechnical investigations, EP status and introduction to the project-specific website

Public Notices at Prominent Locations

Public notices were developed to span a broader and more general audience that might otherwise not receive or have access to notifications provided by email, in print media or on internet platforms. During February and June 2023, public notices were distributed in high-traffic areas throughout the EMBA on notice boards, boat ramps, ports, local councils and other prominent community gathering sites, listed in Table 4.4.

Public notices specifically tailored for relevant subject-centred groups and individual persons were created and displayed in specific areas frequented by subject-centred relevant persons (e.g., fishers, tourism operators) within the EMBA. The primary purpose of the public notices was to inform the general public of the activity and invite consultation with relevant persons. Public notices provided the project-specific website QR code so that the public could access information about the activity, determine if they are a relevant person, and contact EOG.

Table 4.4. Public Notice Posting Locations

Town	Location	Posting Date
Ardyaloon	One Arm Point Boat Ramp	19 February 2023 & 8 June 2023 (Updated)
Broome	Town Beach Boat Ramp	18 February 2023 & 9 June 2023 (Updated)
	Gantheaume Beach Boat Ramp	18 February 2023 & 9 June 2023 (Updated)
	Entrance Point Boat Ramp	18 February 2023 & 9 June 2023 (Updated)

Town	Location	Posting Date
Kununurra	IGA Supermarket	16 February 2023 & 12 June 2023 (Updated)
	Coles Supermarket	16 February 2023 & 12 June 2023 (Updated)
	Shire of Wyndham / East Kimberley Service Centre	16 February 2023 & 12 June 2023 (Updated)
	Red Sun Sports and Casual Gear	12 June 2023
Darwin	Dinah Beach Cruising Yacht Club	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Best Foods Frances Bay Village	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Frances Bay Village Marina	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Cullen Bay Marina	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Darwin Trailer Boat Club	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Craigs Fishing Tackle Shop	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Anaconda Darwin	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	Fishing & Outdoor World Darwin	13 – 16 February 2023 & 16 – 17 June 2023 (Updated)
	BCF Darwin	13 – 16 February 2023
	BCF Palmerston	13 – 16 February 2023
	Compleat Camping & Angler Darwin	13 – 16 February 2023
Dundee Beach	The Lodge of Dundee	15 February 2023 & 18 June 2023 (Update)
Wagait Beach	Wagait Beach Supermarket	15 February 2023 & 18 June 2023 (Update)

Access to self-identify as a relevant person

The project-specific website (<https://klarite.mysocialpinpoint.com.au/bee hive>) was specifically designed to convey information about the proposed activity, and enable users no matter their location to determine whether they are a relevant person. Through the Beehive Consultation Survey, users are able to determine whether their activities, interests or functions have the potential to be affected by the project and thereby self-identify as a relevant person. The consultation survey also directs relevant persons to either request to consult with EOG or opt out of the consultation process. Relevant persons can also sign up for updates and information flyers, or specifically request to be excluded from all correspondence. EOG's confidentiality policy is declared within the consultation survey, with respondents having to elect whether their information be made public or removed from any documents made public, prior to submitting their information. The below information can be found on the website main page along with a link to the Beehive Consultation Survey.

Relevant Person Information – per Public Outreach section above.

- Beehive Consultation Survey and Feedback - per Public Outreach section above.

For those who do not have access to the internet or otherwise do not interact online, EOG contact information (telephone numbers and mailing address) was provided in advertisements in print media, public notices, and information flyers.

Request relevant persons identify other relevant persons

To amass as great an assemblage of relevant persons as possible, each person contacted was encouraged to share information about the project and thereby identify other relevant persons. This request was included in written correspondence, made during in-person meetings and project information sessions, and included on the project-specific website. In addition, the Beehive Consultation Survey on the project-specific website specifically includes the following instructional dialogue:

Relevant Person Information

- *“I think someone I know could be a Relevant Person, what should I do?”* — Please share this website with them and encourage them to contact us.

The Beehive Consultation Survey and Feedback form also explains that EOG is *“seeking to engage with any other person to improve our environmental management of this activity”*.

Consultation

This section describes how EOG has consulted with relevant persons.

Invite co-design of the consultation process for each relevant person

Utilising the methods previously outlined, relevant persons were invited to engage with EOG in co-design of the consultation process to ensure that the consultation process was adapted to the nature of the relevant person and their interests. Written correspondence was the primary means used to conduct formal consultation between EOG and relevant persons. Phone calls were used to follow up on initial correspondence to ensure receipt of initial email correspondence. In-person meetings and information sessions were also conducted to request input and invite co-design of the consultation process.

EOG utilised land councils and registered PBCs to facilitate consultation with Aboriginal and Torres Strait Islander relevant persons. EOG has engaged with the Tiwi Land Council (TLC), Kimberley Land Council (KLC) and Northern Land Council (NLC). These land councils have provided feedback to EOG on identifying and consulting with Traditional Owners and in some cases have assisted in co-designing appropriate strategies and plans for engagement.

During consultation, KLC engaged in the co-design of consultation with their organisation. The KLC advised EOG to directly contact the Aboriginal stakeholders within the KLC boundaries. KLC also recommended, and EOG did utilise, the services of KRED Enterprises to undertake project information sessions (see *“Face-to-face meetings”*).

Customised communication appropriate to relevant persons

A variety of communication methods were employed respective of the preferred methods requested by the different subject-centered groups. Written correspondence is the primary means used to conduct consultation between EOG and relevant persons. If a relevant person requested more information, or the information in a different form, subject-specific flyers were created to tailor the information to the relevant person that made the request. This includes information provided to the TLC, Balanggarra Aboriginal Corporation (BAC) and Tuna Australia. In-person

information sessions were held for Native Title holders, Aboriginal land holders and Traditional Owners, as this was expressed as a preferred form of communication. The full list of communication methods is described below. Communication records are included as 'sensitive information' (in accordance with OPGGS(E) Regulation 9(8)) in Appendix 7.

Written Correspondence

Written correspondence is the primary means used to conduct consultation and is tailored specifically to communicate appropriately with relevant persons. It has been used to initiate (or continue) consultation with authorities, organisations and subject-centred groups. Written correspondence was used to provide notifications on project milestones and availability of activity-specific online information, and to request input and invite co-design of the consultation process. Written correspondence has also been used to respond to enquiries and to request any remaining feedback that had not been previously addressed.

Phone Calls and Virtual Meetings

The EOG consultation team utilised phone calls and virtual meetings to maintain rapport and continue consultation with relevant persons, to confirm receipt of correspondence and offer opportunity to ask questions and clarify information provided through written correspondence and other media. All relevant persons were encouraged to provide feedback and present their concerns regarding the project.

Information Sessions

In addition to the distribution of EP-specific information (emails, letters, QR code to project-specific website, etc.), consultation specifically undertaken during the development of this EP included several in-person information sessions, as listed in Table 4.5.

Table 4.5 Beehive-1 information sessions

Location	Date	Number of attendees
Derby	6 June 2023	0
Broome	7 June 2023	2
Ardyaloon	8 June 2023	2
Kununurra	12 June 2023	0
Kalumburu	13 June 2023	12
Wyndham	14 June 2023	0

Requested Information Sessions

EOG recognises that some consultation activities may be inappropriate to carry out if it is contrary to group norms, cultural traditions, or without support of representative bodies. Therefore, if requested by a relevant person who is a representative body, project information sessions beyond those listed in Table 4.5 were made available. Such information sessions were tailored to the requesting representative body and might include face-to-face in-person meetings with specific agendas, or open forums at strategic locations proximate to the activity for community members to meet with the EOG consultation team and discuss concerns.

Face-to-face Meetings

EOG attended in-person meetings, beginning with a meeting with the BAC on 1 August 2022 in Perth, followed by a BAC board meeting in Kununurra on 7 September 2022.

Meetings with the TLC (27 February 2023), KLC (1 March 2023) and NLC (8 March 2023) were conducted to further facilitate consultation with Aboriginal and Torres Strait Islander relevant persons. With respect to Native Title holders, Aboriginal land holders and Traditional Owners, information was prepared to communicate details of the project and potential impacts and risks, including possible effects on Native Title and traditional country, as well as resources integral to culture and customs.

EOG aimed to fully understand who needed to be consulted with regarding the Beehive project, who the land councils represented and what if any on-the-ground consultation was required. EOG utilised the list of questions below as a guide to facilitate understanding what additional consultation efforts were needed:

- Who do you represent (or do not represent)?
- What is the nature and capacity in which this representation exists? Traditions, culture, legal, etc.
- What does your framework for consultation with your constituents look like?
- Do you find community meetings a beneficial means of providing information to your constituents?
- Do you or your constituents find the ability to view detailed information and provide comments on a project-specific website helpful?
- What can EOG provide you/your organisation that would be helpful in your undertaking of consultation on EOG's activity?
- Are you aware of anyone else we should consult with?
- Can you tell us about your traditions, values, sensitivities, etc. and how they may be affected by our activities? Can you provide us any written material that would be helpful as we elevate your concerns?
- Can you describe your connection to Sea Country, and how our activities may impact them?
- Are there any topics we failed to raise or questions we didn't ask that you would like to discuss?

EOG has made specific efforts to engage with First Nations peoples, as presented in Section 3.4.3 of the RPCEP (**Appendix 2**), to inform EOG about cultural features of the EMBA. In fulfilling these objectives, EOG has:

- (1) Engaged with the First Nations groups such as land councils and PBCs to seek who they represent, how First Nations groups or individuals should be consulted as relevant persons, and if there are any groups or persons which EOG had not identified;
- (2) Provided information via written correspondence, subject-centred information flyers, and the project-specific website, and consistently engaged with additional relevant persons or organisations as they were identified;
- (3) Advertised in *Koori Mail* and in *The Kimberley Echo*, regional print media serving Aboriginal people and communities in Northern Australia; and
- (4) Held six project information sessions across the Kimberley region (see Table 4.5).

Determination of Representation of the Land Councils

Both the TLC and the NLC expressed a preference that EOG's consultation activities be conducted through these land councils, as representatives for their constituents. In contrast, the KLC saw the organisation as a relevant person in its own right but advised EOG to directly contact the Aboriginal peoples within the KLC boundaries. KLC recommended that EOG use the services of KRED Enterprises (KRED) if they elected to undertake project information sessions.

KRED is an Aboriginal-owned and operated organisation with an established presence in the Kimberley region that provides a wide range of services in the area. These services include consultation planning and facilitation by Aboriginal people, with Aboriginal people in mind.

As a result of these discussions, the decision was made by EOG to conduct project information sessions across the Kimberley region. EOG engaged KRED to leverage their well-established Kimberley network to provide support and guidance in planning the information sessions, confirm the suggested locations for meetings and secure suitable venues based on their familiarity with local communities. In addition, KRED sent follow-up emails on behalf of EOG containing the media-published project information session notice to the affected PBC and community Chief Executive Officers for the Ardyaloon and Kalumburu communities. This project information session notice was first published in the *Koori Mail*, *The Kimberley Echo* and *The West Australian*. In doing so, KRED provided communications from an organisation familiar to other members of the Kimberley region.

As listed in Table 4.5, six information sessions were held across the Kimberley region. To facilitate accessibility for participants, the following materials were made available during the sessions:

- Information flyer #6 (see Table 4.3);
- A map of the project location;
- NOPSEMA brochure "*Consultation on offshore petroleum environment plans: Information for the community*";
- Business cards with EOG contact information and a QR code linking to the project-specific website;
- Where wi-fi accessible or phone service allowed, a tablet with access to project-specific website; and
- Attendance registers—including provisions for attendees to choose: individual or organisational representation, their attendance to be treated as sensitive information, requests for further information.

Confidentiality and sensitive information

As stated in Section 5.6 of the RPCEP (**Appendix 2**), EOG has communicated the legislative requirements around sensitive information. Throughout the consultation process and in all communications, EOG has reminded relevant persons and the general public of their right to request that any information provided during the consultation not be made publicly available. While that information must still be included in the EP submitted to NOPSEMA as "*sensitive information*", it would be excluded from the information published on NOPSEMA's website. This declaration has been included in public notices, information flyers, written correspondence, and in the Beehive Consultation Survey and Feedback form on the project-specific website.

On the main page of the project-specific website, it reads:

“As a Relevant Person, you may request that information you provide during the consultation not be made publicly available. That information must still be included in the EPs submitted to NOPSEMA as sensitive information but will be excluded from information published on NOPSEMA’s website”.

Furthermore, EOG’s confidentiality policy was declared within the Beehive Consultation Survey and Feedback form, with respondents having to elect whether their information be made public or removed from any documents made public, prior to submitting their information. The statement of confidentiality also noted that information would be included in the EP submitted to NOPSEMA as “sensitive information” but excluded from information made publicly available on NOPSEMA’s website.

As a specific example of the confidentiality notice provided by EOG in its communications, information flyer #6 (May 2023) provided the following confidentiality statement:

*Note: you may request that information you provide during the consultation not be made publicly available. That information must still be included in the environment plan submitted to NOPSEMA as sensitive information but will be excluded from information published on NOPSEMA’s website. * The Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (including the definitions, sections 9(8), and 11A(4)) indicate that, if requested, information that you or your organisation provides, along with personal information, will be considered “sensitive information”. Environment plans published by NOPSEMA on its website do not include any information deemed as sensitive.*

Protocol for unresponsive relevant persons

All attempts to contact relevant persons subsequent to the mail out of information flyers were recorded in EOG’s consultation management system. If after multiple attempts to contact relevant persons, no response had been received, the following actions were employed to ensure compliance with EOG's requirement to consult with relevant persons on the proposed activity:

- Multiple phone calls, written correspondence and emails;
- Follow-up after 20 business days (4 weeks) from issue of initial consultation materials;
- Final follow-up prior to the resubmission of the EP; and
- Use of other broader consultation methods, including newspaper advertising and information flyers.

All of the above strategies were implemented to contact relevant persons multiple times.

4.2.2. Duty 2: Provide Sufficient Information

In accordance with OPGGS(E) Regulation 11A(2), titleholders must provide sufficient information to each relevant person during the consultation process. To achieve this, EOG committed to the process as outlined in the RPCEP and implemented the information and outreach actions summarised below.

Tailor information to relevant persons functions, interests, activities

Project-specific website

The project-specific website includes the Beehive Consultation Survey and Feedback form, which clearly defines “functions”, “interests” and “activities” to enable potential relevant persons to accurately self-identify as a relevant person. The interactive map enables users to determine whether their functions, interests or activities have potential to be affected by the project. Through the survey, users can specify their interests relative to the project and to identify those aspects of the project for which they desire more information or information in a specific manner.

The consultation survey provides relevant persons and the general public opportunity to provide feedback on the proposed activity, make suggestions for improvements, and sign up to receive project updates and information flyers. The project-specific website allows relevant persons to review the information at their own pace on their own schedule and ensures that all current project information is made available anytime, anywhere.

The website includes interactive self-guided links as listed in Section 4.2.1 so that individuals could access specific information relevant to their unique functions, interests and activities.

EOG’s confidentiality policy is declared within the feedback form, with respondents having to elect whether their information be made public or removed from any documents made public, prior to submitting their information.

Information flyers

In recognition of the needs and particular interests of specific relevant persons and groups, tailored subject-centred flyers were created for relevant persons that requested more information or information in a different form.

4.2.3. Duty 3: Describe the Environment that may be Affected by the Activity

In accordance with OPGGS(E) Regulation 13(2)(b), titleholders are expected to use consultation with relevant persons to improve the description of the environment that may be affected by the activity and increase predictive certainty of the impact assessment. To discharge this duty, EOG committed to the processes as outlined in the RPCEP. The following is a summary of how EOG completed each commitment.

Engage relevant persons

Relevant persons were invited to communicate information about their environment and sensitivities through the project-specific website, phone calls, and written correspondence, as described in Section 4.2.1. Furthermore, EOG made specific efforts to engage with First Nations peoples to inform EOG about cultural features of the EMBA. EOG has engaged with land councils and PBCs, provided information via written correspondence, specific subject-centred information flyers and consistently engaged with additional relevant persons or organisations as they were identified.

Publicise the EMBA / Invite feedback

EOG has published the description of the environment in the following locations that have been available to relevant persons throughout consultation: the project-specific website, Beehive-1 Drilling Interactive Map and Comment Portal, information flyers #3, 5 and 6, email correspondence, and relevant persons-specific requested information packets. Additionally, this EP

was published on NOPSEMA's website with an invitation for public comment, for 30 days from 9 May 2022 until midnight on 8 June 2022. EOG advertised the EP's publication in national, regional and local print media (see Table 4.2).

Online interactive access to project maps and communications

EOG developed the project-specific website, launched 11 May 2023, as the central tool to convey information about the proposed activity, potential environmental risks and controls in place. The website's interactive map allows users to view the proposed drilling activity in context with other spatial features—depicting the Beehive-1 well location, AMPs and state marine parks, and the EMBA. The interactive map allows users to place comments directly on the map to share feedback regarding the activity with EOG. This feature enables precise and easy communication of location-based environmental values and sensitivities.

The website also provides a comment form, an email address, mailing address and telephone number for alternative methods of contact. As of 22 September 2023, the following user statistics for the drilling part of the website are:

- 359 total visits;
- 112 unique users;
- 78 document downloads;
- 0 survey responses; and
- 0 comments posted to the interactive drilling map.

Additionally, throughout the relevant persons consultation process other forms of communication, telephone numbers, a mailing address, and email addresses have been shared with relevant persons. Relevant persons could contact the EOG team directly and share location-based information.

4.2.4. Duty 4: Reasonable Period for Relevant Persons to Assess the Sufficient Information

As required by OPGGS(E) Regulation 11(A)(3), consultation must allow a reasonable period for relevant persons to review the proposed activities. The consultation period, described in **Appendix 2**, states that consultation with relevant persons during the development of an EP will generally run for 30 calendar days (four weeks).

All relevant persons consulted for this activity have had a significant amount of time (far greater than 30 days) to assess the information provided by EOG and make comment, claims and objections, as noted by the following drilling-specific timeline of consultation:

- 28 February 2022 – issue Information Flyer #3 to 62 relevant persons;
- 9 May 2022 - this EP was published on NOPSEMA's website, with an invitation for public comment. The 30-day public exhibition of the EP closed at midnight 8 June 2022;
- 12 May 2022 - EOG placed advertisements with *NT News*, *The Australian*, and *The West Australian* newspapers, advising of the EP's publication and inviting public comments;
- July 2022 - EOG updated its methodology and identification of relevant persons, resulting in a total of 530 relevant persons;
- 21 September 2022 – Mail-out Information Flyers #1-5 to fishing license holders and newly

identified relevant persons;

- 28 October 2022 – Mail-out campaign to follow up on 21 September 2022 communications;
- 3 December 2022 to 29 July 2023 - EOG placed 12 separate public notices in print media (see Table 4.2);
- 11 May 2023 - EOG launched its project-specific website, as discussed in Sections 4.2.1 and 4.2.3;
- 29 May 2023 – Email and letter campaign to issue Information Flyer #6 to provide updated project details and further request potential relevant persons to engage with EOG regarding the activity;
- 13 February 2023 to 18 June 2023 - Public Notices (see Table 4.4) with project information and map, QR code and link to the project-specific website were posted on notice boards, boat ramps, ports, local councils and prominent community gathering sites throughout the EMBA.
- 5 July 2023 – Email, telephone and letter campaign to follow up on May 2023 communications;
- 31 July 2023 – Mail-out campaign to follow up on communications to date and seek feedback for the Environment Plan;
- 10 August 2023 – Email campaign to follow up on communications to date and seek feedback for the Environment Plan; and
- 18 August 2023 – Telephone campaign to follow up on communications to date and seek feedback for the Environment Plan.

Appendix 8 provides a complete summary of consultations undertaken with dates of consultation indicating length of time each relevant person had sufficient information.

4.2.5. Duty 5: Assessment of Merit of Objections and Claims

As required by OPGGS(E) Regulation 16(b)(ii), titleholders are obligated to assess objections or claims from relevant persons and provide a response to each relevant person about each objection or claim. Titleholders are also required to adopt appropriate measures as a result of the consultations with relevant persons. This section provides a summary of how EOG fulfilled this duty.

EOG recognises and respects each relevant person's need to be identified and included in the fulfillment of the consultation processes and therefore followed a stringent process to assess the merit of objections and claims from relevant persons to ensure that their concerns were recognised and fully addressed. Written correspondence was used to respond to enquiries and to request any remaining feedback that had not been previously addressed.

The EOG consultation team followed a standard protocol to assess the merit of claims and objections to the EP and provide feedback to all relevant persons with regards to enquiries, objections or claims. All objections and claims were recorded in EOG's consultation management system and assessed based on the following criteria:

- Relevance to environmental management of the activity;

- Relevance to the persons' functions, interests, and activities; and
- Whether the objection or claim can be resolved through the adoption of additional control measures, an activity design variation, or through changes to the Implementation Strategy for the EP.

For objections or claims found to have merit, EOG incorporated measures that avoid, manage or mitigate the objection or claim into this EP. For objections and claims found to not have merit with regards to the criteria, the claim was recorded and reasons documented. In all instances, each claim or objection was recorded and the relevant person responded to via written correspondence providing an explanation of EOG's assessment of merit and a request for additional feedback in an effort to uncover any remaining objections or claims. Additional claims were again considered relative to the merit criteria and the process repeated until the relevant person's claim or objection had been satisfactorily considered.

Despite best efforts to resolve all objections and claims, EOG understands that relevant persons may not agree with its assessment of merit regarding their objection or claim. Such circumstances do not preclude EOG's submittal of this EP to NOPSEMA for assessment.

Appendix 8 provides a complete list of consultation undertaken with relevant persons. Full records of all correspondence with relevant persons are provided in Appendix 7 (Sensitive Matters Report), which is submitted to NOPSEMA separately to this EP.

Table 4.6 provides a summary of the objections and claims raised by relevant persons during the consultation process, and how EOG has addressed this.

Table 4.6. Summary of relevant person objections and claims

Theme	Relevant persons	Objections and claims raised by relevant person	Measures adopted by EOG in response to objections and claims
Prior to public exhibition of the EP (i.e., pre-9 May 2022)			
Drill cuttings and muds	NT DITT – Fisheries (Demersal fishery)	A fisheries representative expressed concerns over the cumulative effects of smothering of benthic fauna from drill cuttings and muds (during the geotechnical survey phase) and the possible flow-on effect this could have on biota and higher trophic organisms including fish stocks that straddle the WA/NT border.	EOG discussed the results of the impact assessment for this hazard with the relevant person and where this information could be found in the publicly available PDSA EP. The relevant person stated he was satisfied with the outcome of the discussion.
Consultation reach	NT DITT – Fisheries (Demersal fishery)	The fisheries representative stated that it was important to engage with the NTSC to elicit concerns relevant to NT commercial fisheries.	EOG agrees with this and advised the NT DITT that consultation with the NTSC was taking place.
Potential for oil spill impacts	WA DoT	The WA DoT stated that they must be consulted if there is a risk of a hydrocarbon spill entering WA state waters.	EOG committed to providing the DoT with a copy of the OPEP at the time of its submission to NOPSEMA in line with the DoT's guidance for the preparation of OPEPs. EOG will provide the DoT a copy of the OPEP at the time of submission to NOPSEMA.

Theme	Relevant persons	Objections and claims raised by relevant person	Measures adopted by EOG in response to objections and claims
	WAFIC	WAFIC wants assurance that if a hydrocarbon spill occurs, baseline scientific data on the marine environment will be collected, that a desktop emergency training exercise includes commercial fishing interests, that there is support to the commercial fishing industry with regards to traceability of fish products to manage tainting risks, there is an OSMP in place and there is a commitment to financial adjustment to the commercial fishing industry.	EOG has incorporated these requirements in the EP, OPEP and OSMBIP.
	Project Sea Dragon	The project representative expressed concern for water quality and impacts on an aquaculture water intake at Forsyth Creek in the event of a hydrocarbon spill.	EOG has incorporated water quality monitoring requirements into the OSMBIP. The creek is nominated as a priority protection area in the OSMBIP.
	BAC	The BAC expressed concern for damage to Country, including important coastal cultural sites as well as a number of tourism endeavours run by the Balangarra people, in the event of an oil spill and a spill response.	The risk assessment for spill response at the shoreline factors in the need to consult with Traditional Owners.
Consultation with regards to Sea Country	DNP	The DNP stated that Aboriginal groups have responsibilities for managing the JBG AMP and should be consulted.	EOG has consulted with Aboriginal groups with interests in management of the JBG AMP.
Notification requirements	ACMA AHO AMSA DNP DoD WA DMIRS WA DoT	Various government agencies (Commonwealth and WA) provided routine and emergency notification details and requirements.	These have been incorporated into the EP and OPEP as relevant.
Subsequent to public exhibition of this EP (i.e., post-8 June 2022)			
Impacts of an oil spill to marine parks	CCWA	The submitter expressed concerns about hydrocarbon spill impacts to marine parks, specifically the Joseph Bonaparte Gulf AMP, North Kimberley Marine Park, Ord River Floodplain, King Shoals Sanctuary Zone and Cape Domett Special Protection Zone.	EOG revised Appendix 11 of this EP (existing environment of the spill EMBA) to provide more detail about these areas, along with updating the oil spill risk assessment (Section 8.7) where necessary. The proposed control measures for a LoWC were reviewed and found to be ALARP and acceptable. Appendix 13 was added, providing more information on the probability of

Theme	Relevant persons	Objections and claims raised by relevant person	Measures adopted by EOG in response to objections and claims
			contact to protected areas in the event of a LoWC, and an assessment of consistency of oil spill response activities with the relevant management plans. See Section 4.2.7 for more details.
Greenhouse gas (GHG) emissions	CCWA	The submitter expressed concern about Scope 3 GHG emissions.	EOG responded to the relevant person that scope 3 GHG emissions are not relevant for the assessment of the activity as it is an exploration well that will not be producing hydrocarbons for combustible use by EOG or any third parties. The EIA (Section 7.4) was reviewed and updated with additional information about scope 1, 2 and 3 GHG emissions, and the impacts are assessed to be ALARP and acceptable.
Consultation with a wider range of relevant persons was required	CCWA	The submitter claimed that EOG inappropriately applied the IAP2 consultation criteria by removing some key components, thus reducing its responsibilities to meaningfully consult with stakeholders.	In response to this comment and the Decision (see Section 4.1), EOG reviewed its approach to consultation. This approach is described in this chapter. This resulted in consultation with a much larger number of Traditional Owner representatives and commercial fishing companies.
Subsequent to the identification of additional relevant persons (from July 2022 onwards)			
Notification requirements	WA DBCA	Various government agencies provided routine and emergency notification details and requirements.	These have been incorporated into the EP and OPEP as relevant.
Sensitive receptors	WA DBCA	The DBCA noted the many marine parks, islands and coastal reserves in the spill EMBA that may be impacted in the event of a large hydrocarbon spill. They asked that the necessary baseline values of these areas be understood. If baseline data is not available, they requested that EOG establish what baseline information is available in order to be available to undertake Before-After, Control-Impact (BACI) studies in the event of a large spill.	Chapter 5 and Appendix 11 describe all conservation values in the impacts EMBA and spill EMBA. The Ord River Nature Reserve was added to Appendix 11 (previously only the Ramsar wetland description for this site was included). The OSMBIP already includes baseline data references for priority protection areas.
		The relevant person also suggested using the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds as a best-practice industry standard for managing potential impacts of light	The light pollution guidelines were already referenced in the EIA in Section 7.3 of the EP.

Theme	Relevant persons	Objections and claims raised by relevant person	Measures adopted by EOG in response to objections and claims
		pollution on marine fauna.	
	Individuals at information sessions at Kalumburu and Broome	A number of individuals raised general concerns regarding the impacts of drilling on marine receptors including fishing areas (for oysters, scallops, fish, crabs, sting rays), turtles, whales, dugongs, and species of cultural significance such as turtles and dugong.	All species of conservation and cultural significance have been described in Chapter 5 and/or Appendix 11 of this EP, augmented with information about cultural relevance where information was available. Impacts are assessed in Chapter 7 and risks assessed in Chapter 8.
		A number of individuals raised general concerns regarding the impacts of drilling on coastal receptors including Aboriginal rock art and camping locations.	Specific geographic locations for the areas of concerns were not provided to EOG, but coastal cultural sensitivities have been factored into the shoreline spill response strategies, whereby such receptors will be designated as no-go areas.
	CSIRO	Concerns were raised about the impacts to post-larval and juvenile redleg banana prawns, including their migration, as a result of turbidity in the water column (from drill cuttings and muds discharges) and underwater sound. The potential impacts to sawfish (<i>Pristis</i> spp) and their habitats were also raised as a concern.	EOG responded to the CSIRO noting that Section 7.6.1 of the Beehive-1 Drilling EP presents the environmental impact assessment for the discharge of drilling cuttings and muds, with the impact to the Northern Prawn Fishery determined to be 'negligible'. The matrix-type design of the jack-up rig legs allows for water to flow through the legs, meaning there will be negligible impact on prawn movements. There is minimal underwater sound generated by jack-up drill rigs, even while drilling (EP Section 7.5). If VSP is undertaken, the area expected to be affected by sound greater than 160 dB (sound levels greater than that affecting the behaviour of marine invertebrates such as prawns) is less than 500 m from the sound source. With regards to noise impacts, potential impacts to marine mammals and crustaceans are assessed in Section 7.5 and have been assessed as 'negligible'. <i>Pristis</i> spp (sawfish) are described and have their habitats mapped in Section 5.4.4 of the EP, with impacts and risks to fish addressed in Chapters 7 and 8.
OPEP review	WA DoT	In line with DoT guidance, the DoT reviewed the OPEP that was submitted to NOPSEMA, and suggested various corrections and	EOG has modified the OPEP in accordance with the DoT advice.

Theme	Relevant persons	Objections and claims raised by relevant person	Measures adopted by EOG in response to objections and claims
		improvements.	
Impacts to tuna fisheries	Tuna Australia	Tuna Australia provided a Position Statement to EOG asking for information in a written succinct manner including estimated boundaries for extent of planned activity impacts as well as activities within the operational area.	EOG created a fact sheet tailored for Tuna Australia, which provided detailed information about the location of tuna fisheries in relation to the project area and potential risk, as well as demonstrating that the EP has control measures in place to reduce these risks to ALARP.
		Tuna Australia provided a Service Agreement, mandating an hourly fee be paid with a minimum hour commitment, in order for consultation to proceed.	EOG's response referred to NOPSEMA's brochure GL2086 <i>Consultation in the course of preparing an environment plan</i> (May 2023) which indicates that there is no requirement in law for titleholders to pay relevant persons' costs associated with consultation. EOG explained to Tuna Australia that it had consulted with the individual Southern Bluefin Tuna and Western Tuna and Billfish fishery license holders and peak representative bodies (the fishing zones for those fisheries overlap the spill EMBA). EOG also noted that the ABARES fishing data indicates there is no recent fishing effort near the project area for any tuna fisheries. At the time of this EP submission, EOG has not received any further response from Tuna Australia. See Section 4.2.7 for more details.
Engagement process	Bardi & Jawi Niimidiman Aboriginal Corporation (BJNAC)	The BJNAC emailed EOG their draft Resourcing Protocol Agreement seeking to enter into an executed agreement with EOG prior to fully engaging with EOG. The BJNAC stated that the draft Resourcing Protocol Agreement had been prepared to align with the findings in the Court in the Santos decision around the requirements for consultation. The draft agreement seeks an explicit consent right for the BJNAC in respect of EOG's activity.	The consent requirement included in the draft Resourcing Protocol Agreement does not align with legislative requirements or NOPSEMA's published guidance. As a result, EOG has sought an opportunity to hold a discussion with the BJNAC to better understand the contents of the rights being sought by them in the proposed Resourcing Protocol Agreement. At the time of this EP submission, EOG has not received any further response from the BJNAC. Based on Section 280 of the OPGGS Act 2006, EOG's assesses that there is no merit to the consent right being sought by the BJNAC. See Section 4.2.7 for more details.

Theme	Relevant persons	Objections and claims raised by relevant person	Measures adopted by EOG in response to objections and claims
Impacts to commercial fisheries	WAFIC	WAFIC provided input to EOG's fisheries compensation protocol.	EOG took WAFIC's feedback into account when finalising the fisheries compensation protocol (a summary of the protocol is provided in Appendix 9). See Section 4.2.7 for more details.
Potential for oil spill impacts	Project Sea Dragon	As per the 'Prior to public exhibition' part of this table. The only difference being that the relevant person advised that water pumping from Forsyth Creek is scheduled to commence in 2024.	As per the 'Prior to public exhibition' part of this table.
Spill response	Individual at information session in Broome	The relevant person stated that the Indigenous Salt Water Advisory Group (ISWAG) may be able to assist in the event of responding to a spill event.	The ISWAG is contactable via the Kimberley Land Council (Land and Sea Unit). Their contact details have been added to the OPEP.

4.2.6. Duty 6: Titleholder Responsiveness

As required by OPGGS(E) Regulation 16(b)(iii), titleholders must respond to each relevant person's objections or claims. The EOG consultation team manages all website content, in-person meetings and activities, written correspondence and phone calls to ensure that the consultation process is adequate and appropriate to targeted relevant persons, and that every claim and objection receives a response.

Feedback is handled via written correspondence and telephone contact. Written correspondence has been used to respond to enquiries and to request any remaining feedback that had not been previously addressed. Phone calls are used to maintain rapport and continue formal consultation with relevant persons, to confirm receipt of correspondence and offer opportunity to ask questions and clarify information provided through written correspondence and other media.

Appendix 8 provides a complete list of consultation undertaken with relevant persons and demonstrates that EOG has responded to all questions, objections and claims.

4.2.7. Duty 7: Consultation Shall Be Ongoing

Based on the fact that EOG has executed in its entirety the methodology set forth in its RPCEP and fulfilled its requirements for the purposes of compliance with the OPGGS(E), relevant persons consultation has been fulfilled. However, titleholders are obligated to maintain ongoing consultation. Therefore, until the EP has been accepted by NOPSEMA and the project is completed, relevant persons can provide feedback to EOG. This section summarises how EOG is fulfilling this duty.

Ongoing Consultation Matters

EOG remains in ongoing consultation with multiple relevant persons. As summarised below and further described in Appendix 7 (Sensitive Matters Report), the ongoing consultation matters continue with WAFIC, NPFI, CCWA, Tuna Australia, and the Bardi and Jawi Niimidiman Aboriginal Corporation (BJNAC).

WAFIC

On 7 November 2022, EOG emailed WAFIC to request review of the Draft Commercial Fisheries Compensation Protocol (Draft CFCP) and provide updates to the Beehive-1 exploration drilling and geotechnical assessment phases with links to the EOG Australia website and the EP submittals on the NOPSEMA website. On 5 December 2022 WAFIC responded with specific details regarding the Draft CFCP and comments to the drilling and geotechnical activities. On 24 May 2023, EOG provided specific responses to the WAFIC's 5 December email. WAFIC again, on 3 July 2023, provided a detailed response, to which EOG responded on 18 July 2023 to address WAFIC's previous comments. At the time of this EP submission, EOG has not received further correspondence from WAFIC.

Northern Prawn Fishing Industry (NPFI)

On 18 September 2021, EOG sent an email introducing the Beehive-1 drilling and geotechnical phases. In response, on 28 September 2021 the NPFI emailed EOG requesting additional information, which was provided by EOG via email on 28 September 2021. EOG sent a follow-up email on 27 October 2021 to request feedback. On 9 November 2021, EOG emailed NPFI to provide an update and request feedback on earlier correspondence. On 10 November 2021, the NPFI emailed EOG with a summary of concerns, to which EOG emailed a response on 12 November 2021 specifically addressing the NPFI's concerns.

On 24 May 2023 EOG emailed the NPFI to provide an update on the Beehive-1 project; on 19 June EOG emailed NPFI to follow up on the 24 May email. On 20 June 2023 the NPFI responded and on 20 June 2023 EOG replied to confirm receipt of NPFI's email. On 3 August 2023 the NPFI emailed EOG reiterating their concerns as stated in their November 2021 correspondence. EOG responded that day confirming receipt of their email and again on 24 August 2023 with a detailed reply to each of NPFI's concerns. On 24 August 2023, EOG received an automated reply informing that the NPFI contact was unavailable and indicating 11 September as the earliest possible date of response. On 12 September 2023, EOG emailed the NPFI with an updated timeline on the EP submittal and a request for assistance regarding specific items that the NPFI had identified in previous correspondence. At the time of this EP submission, EOG has not received further response from the NPFI.

CCWA

CCWA initiated correspondence with EOG on 8 June 2022 and EOG provided a response on 26 June 2022. On 23 May 2023 EOG emailed CCWA, with an update on the exploration drilling and geotechnical assessment projects, a May 2023 information flyer, and links to the EOG Australia website and to the EP submittals exhibited on the NOPSEMA website, specifically requesting that CCWA provide feedback. As a follow-up, EOG emailed CCWA on 6 July 2023 and 28 July 2023, again requesting feedback regarding the project. CCWA responded on 17 August 2023 requesting additional time to provide feedback, to which EOG responded on 24 August 2023, asking CCWA to provide clarification regarding their anticipated response time. At the time of this EP submission, EOG has not received a response from CCWA.

Tuna Australia

Tuna Australia emailed EOG on 25 May and 28 May 2023, providing a Position Statement and a copy of Tuna Australia's form of Service Agreement.

Tuna Australia's Position Statement asked for "information in a written succinct manner including estimated boundaries for extent of planned activity impacts (i.e., artificial light, noise, discharges, etc.) as well as activities within the operational area." As part of its response, EOG provided Tuna Australia with a Beehive Project Fact Sheet July 2023 – Tuna Australia. The fact sheet provided detailed information about the location of tuna fisheries in relation to the project area and potential risk, as well as demonstrating that the EP has control measures in place to reduce these risks to ALARP.

In regard to Tuna Australia's Service Agreement, mandating an hourly fee be paid with a minimum hour commitment, EOG's response referred to NOPSEMA's brochure, GL2086 *Consultation in the course of preparing an environment plan* (12 May 2023), which indicates that there is no requirement in law for titleholders to pay relevant persons' costs associated with consultation.

Moreover, EOG consulted with the individual Southern Bluefin Tuna and Western Tuna and Billfish fishery license holders and peak representative bodies in that the fishing zones for those specific fisheries overlap the geotechnical and drilling EMBA's. Further, EOG noted, based on ABARES data (see Section 5.6.1 of Appendix 11) that no recent fishing effort has occurred near the project area for any of the tuna fisheries.

EOG does not believe there is merit in entering into a Service Agreement with Tuna Australia for the following reasons:

- (1) Guidance provided by NOPSEMA's guideline 2086;
- (2) The lack of fishing in the area for the last three years;
- (3) The fact that EOG is consulting directly with the fisheries that overlap the EMBA; and
- (4) The limited scope of the activity being proposed.

EOG provided Tuna Australia a response to this effect on 19 July 2023. Tuna Australia reiterated its position on 25 August 2023, whereby EOG responded 12 September 2023 confirming its views as set out above. At the time of this EP submission, EOG has not received a response from Tuna Australia.

Bardi and Jawi Niimidiman Aboriginal Corporation

On 5 June 2023, the BJNAC emailed EOG their draft Resourcing Protocol Agreement seeking to enter into an executed agreement with EOG prior to fully engaging with EOG. The BJNAC stated that the draft Resourcing Protocol Agreement proffered had been prepared to "align with the findings in the Court in the *Santos* decision around the requirements for consultation." However, the draft agreement seeks an explicit consent right for the BJNAC in respect of EOG's activity. This consent requirement included in the draft Resourcing Protocol Agreement does not align with legislative requirements or NOPSEMA's published guidance.

As a result, EOG has sought an opportunity to hold a discussion with the BJNAC (via an email on 19 July 2023 and again on 24 August 2023) to better understand the contents of the rights being sought by them in the proposed Resourcing Protocol Agreement. At the time of this EP submission, EOG has not received any further response from the BJNAC. Based on Section 280 of the OPGGS Act 2006, EOG does not believe there to be merit to the consent right being sought by the BJNAC.

4.3. Public Exhibition of the EP

In accordance with OPGGS(E) Regulations 9(AB) and 11(B), NOPSEMA published this EP (Revision 0) on the NOPSEMA website, so that members of the general public could view and comment on the contents of this EP. Once published, the EP was available for a period of 30 days between 9 May and 8 June 2022. Table 4.2 lists the print media in which EOG placed advertisements so as to promote the availability of the EP in order to seek public comment.

The public exhibition process is another avenue in which to identify relevant persons. In the case of this Beehive-1 drilling EP, only one commenter responded and raised several matters. These were addressed by EOG in the 'Titleholder Report', which is available on the NOPSEMA website (https://info.nopsema.gov.au/environment_plans/587/show_public).

5. Description of the Existing Environment

In accordance with OPGGS(E) Regulation 13(2), this chapter provides a description of the EMBA by the activity, together with its values and sensitivities. Regulation 4 of the OPGGS(E) defines the environment as:

- Ecosystems and their constituent parts, including people and communities;
- Natural and physical resources;
- The qualities and characteristics of locations, places and areas;
- The heritage value of places; and
- The social, economic and cultural features of the above-listed matters.

The key sources of information used in developing this chapter include the:

- EPBC Act Protected Matters Search Tool (PMST) database (DCCEEW, 2022a), conducted for the impacts EMBA on 4th March 2022, repeated on 5th September 2022 and again on 25th of September 2023, with the search for the flaring EMBA undertaken on 23rd of January 2023 and again on 25th of September 2023 (Appendix 10);
- Species Profile and Threats (SPRAT) Database (DCCEEW, 2022b);
- The Northwest Marine Bioregional Plan Bioregional Profile (DEWHA, 2008b);
- Marine bioregional plan for the North Marine Region (NMR) (DSEWPC, 2012);
- National Conservation Values Atlas (NCVA) (DCCEEW, 2022c);
- Species recovery plans, conservation advice and scientific publications; and
- Seabed Habitats and Hazards of the JBG and Timor Sea, Northern Australia (Przeslawski *et al.*, 2011).

Where appropriate, descriptions of the JBG environment (beyond the immediate impacts EMBA) are provided for context. The relevant values and sensitivities considered in this chapter are inclusive of but not limited to the matters protected under Part 3 of the EPBC Act.

5.1. The Environment That May Be Affected

The spatial extent of the EMBA is divided into that for planned activities (impacts) and unplanned activities (risks).

5.1.1. Planned Activities

The extent of the EMBA for each of the impacts from the project is listed in Table 5.1 (see also Chapter 7). This indicates that the greatest extent of the EMBA for planned activities is no greater than a 20-km radius from Beehive-1. This EMBA is simply referred to as the 'impacts EMBA' (Figure 5.1) and is the area of focus for the description of the environment in this chapter.

The impacts EMBA for flaring is estimated to extend to 42 km; this distance is included in the PMST search results despite uncertainty as to whether flaring will take place (see Section 2.7.4). The flaring EMBA is disused further within sections 5.4.6 (Marine Reptiles) and 5.4.7 (Avifauna) due to these species being particularly vulnerable to artificial lighting.

Figure 5.1. The impacts EMBA

Table 5.1. Extent of the impact EMBA

Planned event	Extent of EMBA (radius around Beehive-1)	EIA section
Seabed disturbance	Tens of metres	7.1
Displacement of marine users	500 m	7.2
Light glow	20 km	7.3
	Extends to 42 km if flaring is undertaken. See earlier notes.	
Air emissions	Hundreds of metres	7.4
Underwater sound	Hundreds of metres	7.5
Drill cuttings discharges	1.55 km	7.6
Drill muds discharges	6.95 km	7.6
Cement discharges	6.95 km	7.7
Putrescible waste	100 m	7.8
Treated sewage discharges	50 m	7.9
Cooling water discharges	100 m	7.10
Bilge water discharges	100 m	7.11

5.1.2. Unplanned Activities

The EMBA for unplanned activities is defined by modelling of the loss of well control (LoWC), noting that the EMBA from an MDO spill is contained within the broader LoWC EMBA. The description of the existing environment for the EMBA defined by the LoWC is provided in Appendix 11.

The boundary for the EMBA associated with a LoWC is defined by the hydrocarbon spill thresholds defined in the *NOPSEMA Bulletin #1 Oil Spill Modelling* (NOPSEMA, 2019). This bulletin uses hydrocarbon contact values of four oil phases (surface, dissolved, entrained and accumulated shoreline) that pose differing environmental risks to define the outer extent of the EMBA (Table 5.2).

The low contact values used to inform the extent of the socio-economic EMBA are useful for establishing scientific monitoring parameters and identifying potential socio-economic impacts (the socio-economic EMBA); however, they may not be at concentrations that are ecologically significant (NOPSEMA, 2019). Therefore, in addition to the socio-economic EMBA, an ecological EMBA has also been derived from the stochastic spill modelling using hydrocarbon thresholds that are identified by NOPSEMA (2019) as having the potential to cause impacts to ecological receptors (see Table 5.2).

The socio-economic EMBA and the ecological EMBA are referred collectively as the 'spill EMBA', and the environment of the spill EMBA is described in Appendix 11.

Table 5.2. Oil spill thresholds used to define the spill EMBA

Hydrocarbon phase	Exposure values	
	Socio-economic EMBA	Ecological EMBA
Shoreline	Low – 10 g/m² (equivalent to 10 ml/m ² , or 2 teaspoons) Potential for some socio-economic impact.	Moderate – 100 g/m² (equivalent to 100 ml/m ²) Area likely to cause environmental impacts and to require clean-up effort.
		High – 1,000 g/m² (equivalent to 1 litre/m ²) Area likely to require intensive clean-up effort.
Sea surface (floating)	Low – 1 g/m² (equivalent to 1,000 L/km ²) Approximates socio-economic effects and planning area for scientific monitoring.	Moderate – 10 g/m² (equivalent to 10,000 L/km ²) Lower limit for harmful contact to birds and marine mammals.
		High – 50 g/m² (equivalent to 50,000 L/km ²) Approximates surface oil slick and informs response planning.
Dissolved	Low – 10 ppb Planning area for scientific monitoring as potential water quality trigger exceedance.	Moderate – 50 ppb Potential toxic effects, particularly sub-lethal effects to sensitive species.
		High – 400 ppb Toxic effects, including lethal effects to sensitive species.
Entrained	Low – 10 ppb Planning area for scientific monitoring as potential water quality trigger exceedance.	High – 100 ppb To inform risk evaluation.

5.2. Regional Context

Under the EPBC Act, management of Australian offshore waters is divided into six marine bioregions. Marine bioregional plans describe the marine environment and conservation values (protected species, protected places and key ecological features) of the marine region, sets broad biodiversity objectives, identify regional priorities, and outlines strategies and actions to achieve these (DCCEEW, 2022a).

The impacts EMBA is located within the Northwest Marine Region (NWMR). Based on the Integrated Marine and Coastal Regionalisation of Australia (IMCRA) Version 4.0, the impacts EMBA is situated completely within the 'Northwest Transition' provincial bioregion (CoA, 2006), as illustrated in Figure 5.3 and the 'Bonaparte Gulf' mesoscale bioregion (Figure 5.3).

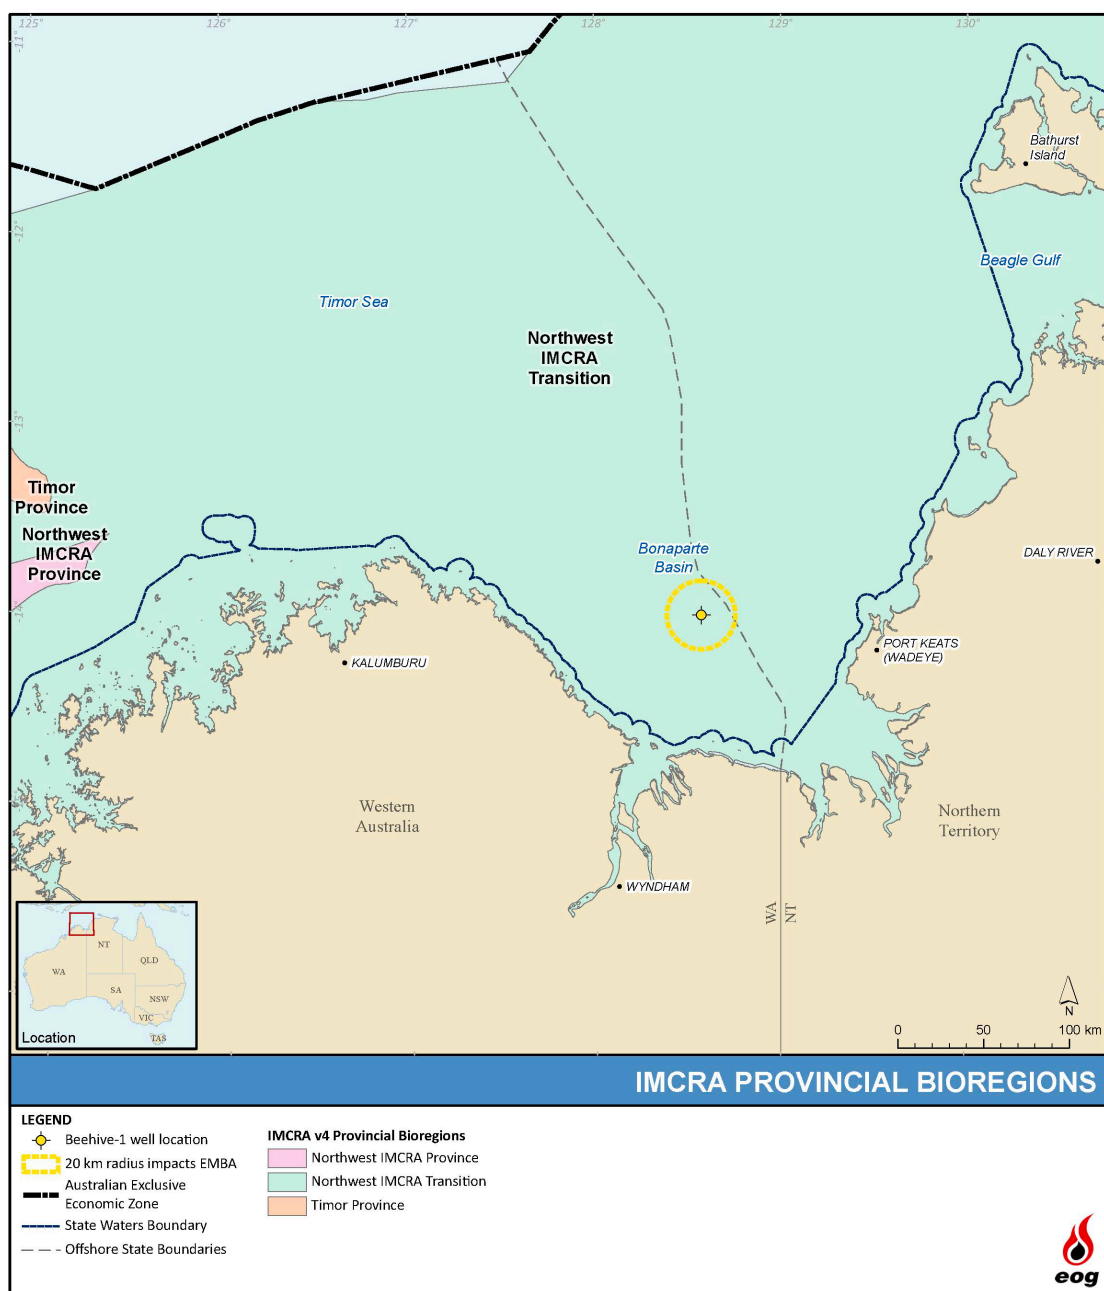

Figure 5.2. Provincial bioregion overlapped by the impacts EMBA

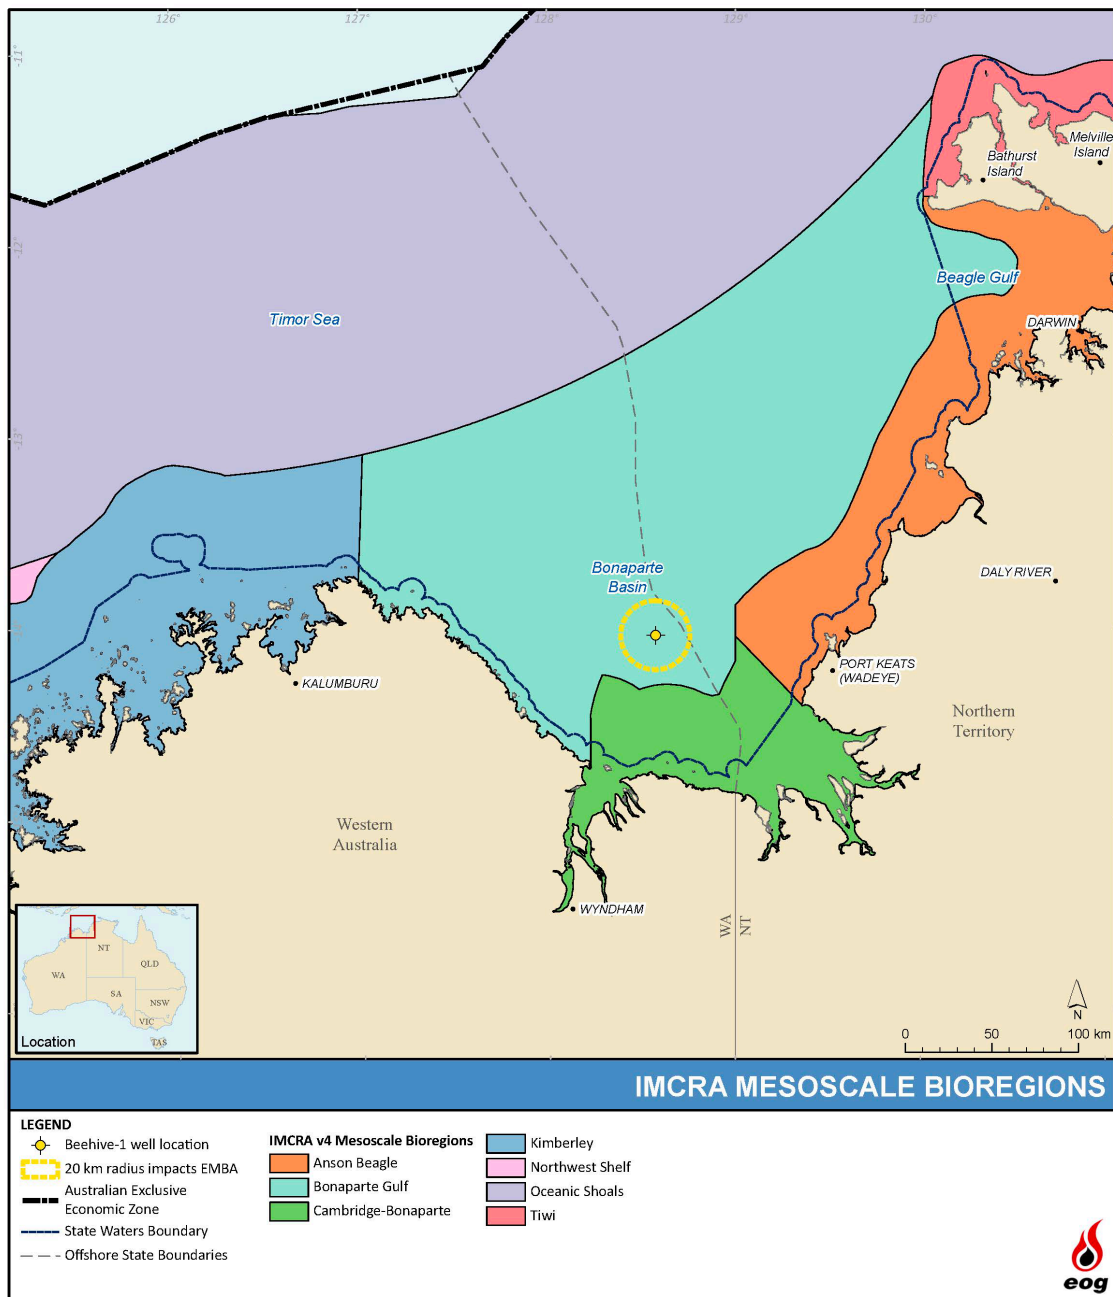

Figure 5.3. Mesoscale bioregion overlapped by the impacts EMBA

5.2.1. Climate

The impacts EMBA is located in a region with a pronounced tropical monsoonal climate consisting of two distinct seasons known as the northwest monsoon ('wet season') and southeast monsoon ('dry season').

The northwest monsoon occurs from late October to mid-March. Regular and high rainfall is a characteristic of the northwest monsoon, mainly over coastal areas and during cyclones. This is caused by large amounts of moisture being gathered as the monsoon crosses the sea from the Asian high-pressure belt on its way to the intertropical convergence zone, which drifts southward close to, or over, northern Australia. The southeast monsoon occurs from May to mid-October. This originates from the southern hemisphere high-pressure belt and is relatively dry and cool (DSEWPac, 2012a).

Temperature and Rainfall

Wadeye Airport (Port Keats), located on the NT mainland approximately 85 km east of Beehive-1, is the location of the nearest meteorological station. Data collected from 1997 to 2019 show that the highest maximum temperature (mean of 34.4°C) occurs in April, October and November, whilst the lowest maximum temperature (mean of 16.8°C) occurs in July (BoM, 2021a). Data collected from 1997 to 2019 at the Wadeye Airport weather station show that the mean annual rainfall is 1,317.8 mm, with the highest rainfall in January (312.2 mm) and the least in August (0.7 mm) (BoM, 2021a). Typically, the majority of rain occurs from December to March (mean of 1,025 mm).

Winds

Wind patterns in the region are controlled by the seasonal migration of high-pressure cells from latitudes 25-30°S in winter to 35-40°S in summer (Pearce *et al.*, 2003). Sea surface wind data spanning five years sourced from the NCEP/NCAR global reanalysis project shows two predominant (general) directions:

1. West to northwest winds prevail during the months of September to February; and
2. Easterly to south-easterly winds prevail from April to July (Kalnay *et al.*, 1996; Kistler *et al.*, 2001).

March and August are transitional periods with a higher variability in wind directions. Wind speed and direction used in the stochastic spill modelling are provided in Table 5.3 and presented in Figure 5.4 (RPS, 2021).

Cyclones

Tropical cyclones are common in the region, resulting in severe storms with gale force winds and a rapid rise in water levels. The cyclone season typically occurs between November and April (BoM, 2022).

Table 5.3. Predicted average and maximum winds for the wind station nearest the impacts EMBA for 2010-2019 (inclusive)

Season	Month	Avg. wind speed (knots)	Maximum wind speed (knots)	General direction (from)
Summer	January	13.2	44.9	West-northwest
	February	11.4	35.2	
Transitional	March	9.7	46.2	Variable
Winter	April	9.3	32.7	Southeast
	May	11.7	28.8

5.2.2. Oceanography

Currents

Broad-scale ocean circulation of the North Australian Shelf is dominated by the Indonesian Throughflow current system. Circulation in the JBG is dominated by tidal and wind driven currents according to the season (Figure 5.5) (Przeslawski *et al.*, 2011).

Table 5.4 provides the average and maximum combined surface current speeds (ocean plus tides) located within the impacts EMBA. This data indicates that surface currents flow predominantly along the northwest to southeast axis. The monthly current speeds averaged between 0.33 to 0.40 m/s and reached a peak of 0.96 to 1.17 m/s.

Figure 5.6 illustrates the monthly surface current rose plots located at the Beehive-1 location from 2010 to 2019 (inclusive). Figure 5.7 presents the major ocean currents in north-western Australian waters.

Table 5.4. Predicted average and maximum surface current speeds within the impacts EMBA from 2010-2019 (inclusive)

Season	Month	Avg. current speed (m/s)	Maximum current speed (m/s)	General direction (towards)
Summer	January	0.35	1.10	Northwest and southeast
	February	0.37	1.12	
Transitional	March	0.40	1.05	
Winter	April	0.39	1.06	
	May	0.35	1.17	
	June	0.34	1.07	
	July	0.35	0.96	
	August	0.37	1.15	
Transitional	September	0.39	1.10	
Summer	October	0.37	1.09

Figure 5.7. Ocean currents along the Northwest Australian continental shelf

Sea Temperature and Salinity

Sea surface temperatures and salinity in the region are heavily influenced by the Indonesian Throughflow, which transports warm, low salinity water from the western Pacific Ocean through to the Indian Ocean (DSEWPC, 2012). During the northwest monsoon, a thermocline flow of relatively cool water dominates resulting in the tropical Indian Ocean being cooled rather than warmed. The region typically has average sea surface temperatures of 28-30°C and salinities of 34-35 psu.

Tides

The JBG is subject to semi-diurnal tides with two high and low tides per day, and has the largest tidal energy observed anywhere in the world (>7 m) (Rothlisberg *et al.*, 2005). Within the Bonaparte Gulf mesoscale bioregion, tides range from 2-3 m offshore (microtidal) rising to 3-4 m inshore (mesotidal).

Waves

In the JBG, the Southern Ocean swell is higher in winter than in summer as a result of northerly migration of swell-generating storms. The wave period and significant wave height generated by this swell is highly dependent on the exact location within the basin. For example, the JBG is protected from the Southern Ocean swell; therefore, swells affecting the area are limited to those generated by cyclones or prolonged storm winds (Maxwell *et al.*, 2004).

The region is considered a moderate-energy environment except when influenced by tropical cyclones which generate short-term but major fluctuations in sea levels. Swells generated may have periods of 6-18 seconds and wave heights of 0.5-9 m and are dependent on the size, intensity, speed and relative location of the cyclone.

Water Quality

The Indonesian Throughflow brings in oligotrophic waters (low in nutrients) from the western Pacific Ocean through to the Indian Ocean (DEWHA, 2008b). Exceptions in the region occur in the event of local or regional upwelling activity at the shelf break, where deeper, cooler nutrient-rich water is brought to the surface (DEWHA, 2008b). These upwelling activities include, but are not limited to, internal wave and tide regimes, horizontal shear due to strong tidal currents and tropical cyclones. However, understanding of the nature and spatial distribution of biological productivity in the region is limited (DEWHA, 2008b).

Major inputs of fine silt sediments from the Ord, Victoria and Keep river systems occur during the wet season, creating vast areas of high turbidity, particularly in the southern part of the JBG. The sediments are deposited to form sand bars and mud flats which are themselves the source of high turbidity throughout the year as sediments are resuspended by tidal movements. Though there is only limited marine and nearshore water quality data available, as there are no major developments or population centres along the JBG coastline, the potential for existing pollution is limited.

Ambient Ocean Sound

Physical and biological processes contribute to natural background sound. Physical processes include that of wind, waves, rain and earthquakes, whilst biological noise sources include vocalisations of marine mammals and other marine species.

Wind is a major contributor to noise between 100 Hz and 30 kHz and can reach 85-95 dB re $1\mu\text{Pa}^2/\text{Hz}$ under extreme conditions (WDCS, 2004). Rain may produce short periods of high

underwater sound with a flat frequency spectra to levels of 80 dB re $1\mu\text{Pa}^2/\text{Hz}$ and magnitude 4 earthquakes have been reported to have spectral levels reaching 119 dB re $1\mu\text{Pa}^2/\text{Hz}$ at frequency ranges of 5-15 Hz.

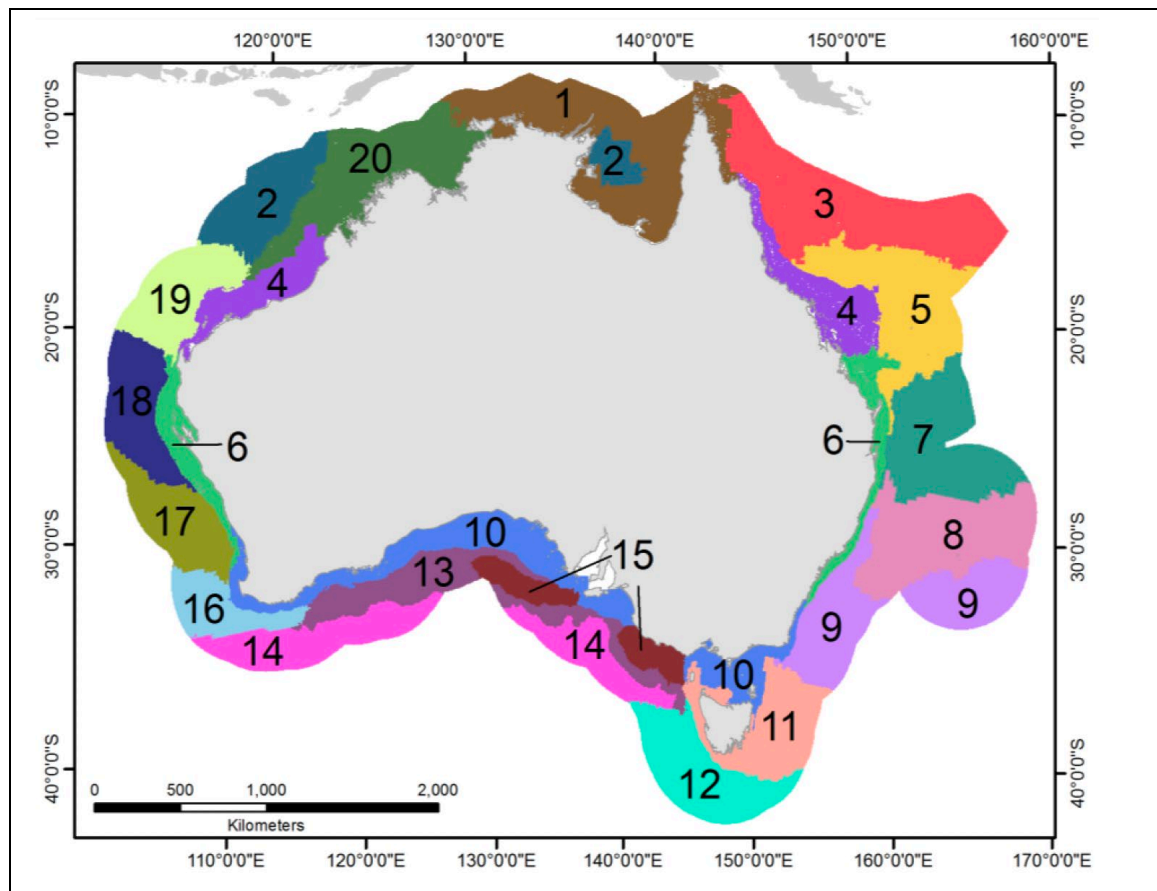

Turnpenny and Nedwell (1994) found that in sensitive species such as the cod, continuous ambient sound alone resulted in auditory masking, and that sound had to be 20 dB above ambient sound to be audible. Table 5.5 presents a comparison of biological and anthropological sounds in the marine environment.

Table 5.5. Sound intensity and pressure (dB re $1\mu\text{Pa}$ @ 1 m from source) for some common marine sources

Source	Sound intensity (dB re $1\mu\text{Pa}$)	Frequency (Hz)	Reference
Natural sound			
Ambient sea sound	80-120	Varied	2
Undersea earthquake	272	50	2
Seafloor volcanic eruption	255+	Varied	2
Lightning strike on sea surface	250	Varied	2
Iceberg calving, shoaling and disintegration	220-245	Varied	4
Bottlenose dolphin click	Up to 229	Up to 120,000	2
Breaching whale	200	20	2
Blue whale vocalisations	190	12 – 400 (16 – 25 dominant)	2
Blue whale moans	188	12 – 390 (16 – 25 dominant)	1
Southern right whale vocalisations	172-186	30 – 2,200 (50 – 500 dominant)	1
Humpback whale vocalisations	144-174	30 – 8,000 (song) (120 – 4,000 dominant) 50 – 10,000 (social calls)	1, 3
Sperm whale clicks	Up to 235	100 – 30,000	2
Anthropogenic sound			
Seismic acoustic source (32 guns)	178-210	Most energy 5 to 200 Hz	1
Ship sound (close to hull)	200	10 – 100	2
Fishing trawler	158	100	3
7 m outboard motorboat	156	630	3
Tanker (179 m)	180	60	3
Supertanker (340 m)	190	7	3
Containership (274 m)	181	8	3
Navigation transponders	180 – 200	7,000 – 60,000	3
Side scan sonar (SSS)	220 – 230	50,000 – 500,000	3

Source	Sound intensity (dB re 1 μ Pa)	Frequency (Hz)	Reference
Bottom profilers	200 – 230	400 – 30,000	3
Helicopter flyover (Bell 212)	142 – 155	162	1, 3
Drill rig (Ocean Bounty semi-submersible)	145 maximum (>120 for 1% of time at 5.1 km)	20 – 1,000 (15-30 dominant)	5
FPSO (maximum at Griffin Venture)	176	10 – 500 (up to 2,000)	6

Erbe *et al* (2021) have classified the marine acoustic zones of Australia based on 10 km x 10 km grids that are characterised by sea surface temperature, salinity and sound speed profiles (for the month of July). The study resulted in the creation of 20 acoustic zones around Australia, with the impacts EMBA occurring within zone 20 ('Western Tropical Shelf') (Figure 5.8). Zone 20 is described as having shallow water with a wide sandy continental shelf and a hot sea surface that is strongly downward refracting (Erbe *et al.*, 2021). For zone 20 at 40 m water depth (the water depth at Beehive-1), the sound speed profile gradients ranged between -0.03 and 0.04 (m/s)/s.

Source: Erbe *et al* (2021).

Figure 5.8. Map of the 20 acoustic zones of the Australian EEZ for the Austral winter

5.2.3. Physical Environment

Bathymetry

The benthic environment of the JBG is linked to its geomorphic features, with the majority of the area characterised by infaunal plains, with some localised reefs and outcrops supporting sponge gardens. Water depth in the impacts EMBA ranges from 40-50 m. Bathymetry in parts of the south of the JBG is strongly influenced by the strong tidal movement and channels of the Ord, Keep, Victoria and Fitzmaurice rivers. A series of extensive sandbars, known as the King Shoals and Medusa Banks, have been generated in the southwest by the strong outflows of sediment-laden water from the Cambridge Gulf. Similar sandbars can be found in the southeast of the JBG. Bathymetry of the JBG and the impacts EMBA is presented in Figure 5.9.

Figure 5.9. Bathymetry of the impacts EMBA and surrounds

The geophysical survey undertaken by Fugro for EOG in June 2022 around the proposed Beehive-1 site (Fugro, 2022) found that the bathymetry of the drill site is 45.6 m MSL with a 0.35° slope. The area immediately around the drill site is generally flat with a regional gradient of less than 1° to the west (Figure 5.10).

Figure 5.10. Bathymetry around the Beehive-1 location

Seabed

Seabed morphology in parts of the JBG is influenced by the strong tidal movement and channels of the Ord, Keep, Victoria and Fitzmaurice rivers. A series of extensive sandbars, known as the King Shoals and Medusa Banks (near Lacrosse Island, at the mouth of Cambridge Gulf, about 50 km south of the impacts EMBA), have been generated by the strong outflows of sediment-laden water from Cambridge Gulf. Similar sandbars can be found in the southeast of the JBG. Beehive-1 is located on the 'shelf' geomorphic feature, which is typically characterised by extensive sediment plains and high sediment deposition from the coastal rivers to the south, while the impacts EMBA also overlaps the 'tidal-sandwave/sand-bank' geomorphic feature (Figure 5.11).

The geophysical survey undertaken around the proposed Beehive-1 site (Fugro, 2022) found that the topographical features in the survey area include broad undulations, terraces with uneven surfaces, local ridges, scarps and smooth seafloor areas. Seabed features found in the survey are listed below and illustrated in Figure 5.12:

- Low to moderate undulations and low to moderate acoustic reflectivity – inferred as silts and sands (medium to coarse);
- Moderate undulations and moderate acoustic reflectivity – inferred as sands (medium to coarse);

- Uneven and moderate acoustic reflectivity – inferred as sands (medium to coarse) and shells; and
- Uniform low acoustic reflectivity – inferred as silts, sandy silt and silty sand (fine).

At the Beehive-1 location, the seabed is inferred as sands (medium to coarse) and shells (see Figure 5.12), and the data from the shallow seismic survey indicates these sediments are 5.5 m deep in the top unit. The acoustic reflectivity (hardness) of the Beehive-1 location (generated from the side-scan sonar data) confirms an absence of seabed features around the drill site such as rocky reefs (Figure 5.13).

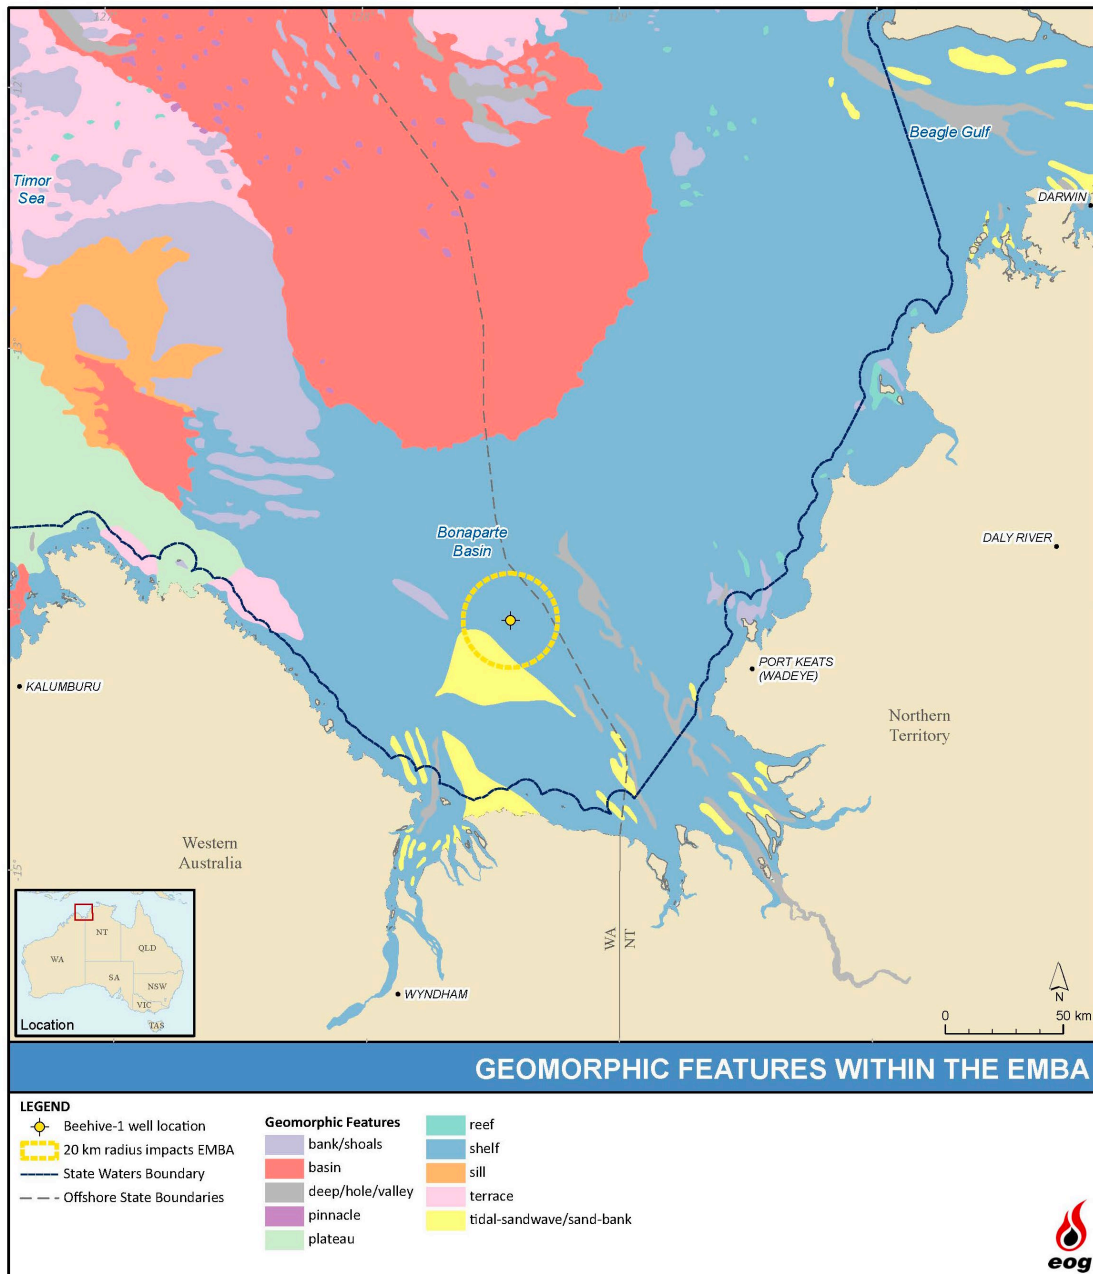

Figure 5.11. Geomorphic features of the impacts EMBA and surrounds

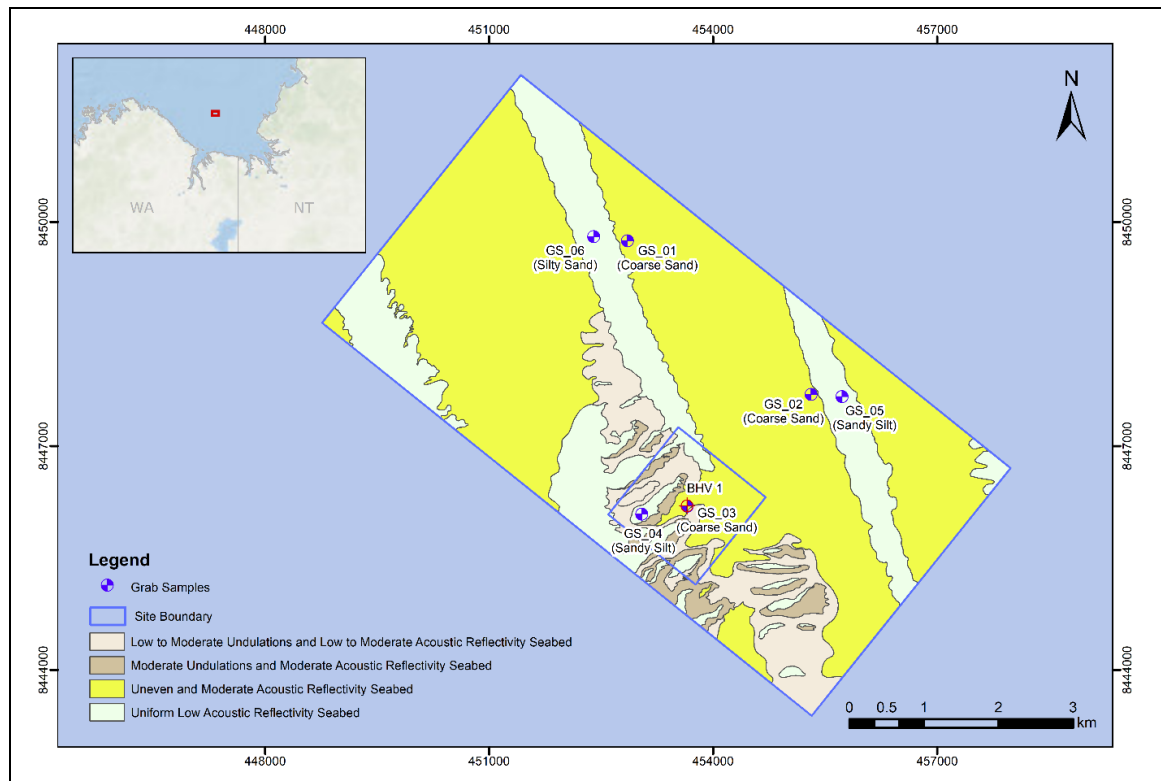

Figure 5.12. Seabed around the Beehive-1 location

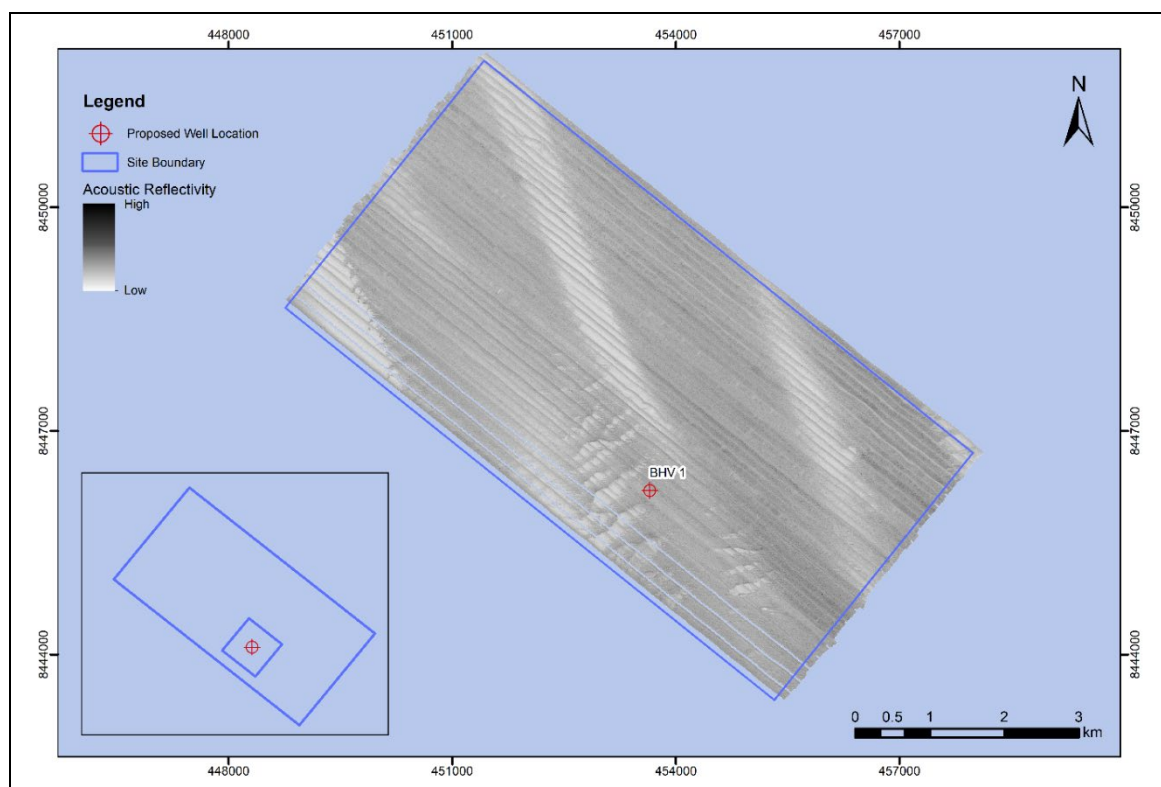

Figure 5.13. Acoustic reflectivity around the Beehive-1 location

Sedimentology

The sedimentology of the NWMR is varied due to the diversity of physical features from coral reefs to major canyons that act as conduits for sediment and nutrient transport (DSEWPC, 2012). Sedimentology in the NMR is also varied, with physical features including shallow canyons, which mainly consist of calcium carbonate, based sediments, as well as limestone pinnacles and reefs (DEWHA, 2008b).

The continental shelf in the JBG is the widest in Australia, extending up to 400 km from the shore. The sedimentology of the JBG is unique, with most of the inner shelf being characterised by relatively flat expanses of soft sediment seabed with localised rocky outcrops, gravel deposits and sands banks. The soft sediments in the region typically consist of sandy and muddy substrate, occasionally made up of patches of coarser sediments (Baker *et al.*, 2008). The inner shelf section of the JBG receives significant loads of sediments from several large rivers including the Daly and Victoria rivers (Przeslawski *et al.*, 2011).

The distribution of seabed sediments in the JBG, and in particular within the Sahul Shelf, reflects the present-day oceanographic condition and displays a distinct seaward fining pattern (Lees 1992, in Baker *et al.*, 2008). Sediment sampling undertaken by Environmental Resource Management Australia Pty Ltd (ERM) in 2010 and 2011 (within WA-6-R and NT/RL1, 96 km north of the impacts EMBA) confirms that the area is mainly dominated by sand, with similar proportions of smaller gravel, silt and clay (ERM, 2011).

The top layer of sediment in the JBG from ~3 km to 35 km offshore is expected to be greater than 1 m in depth and consists of sand and gravel with variable proportions of clay. This material is primarily alluvium, derived from sedimentary sandstones and basal conglomerate. Sonar images indicate some minor paleochannels in this area containing mega-ripple or sand waves. These sediments are generally unconsolidated coarse sand, fine gravel interspersed with areas of flat and featureless seabed containing very soft to firm gravelly clays (Woodside, 2004).

The main drainage channels for the Victoria River System occur from approximately 35 km to 58 km offshore. This area is dynamic as currents and tidal influence are constantly changing the seabed features in the area. Due to the dynamic nature of the channels, the thickness of the top layer of sediment is expected to be variable. A top layer greater than one metre in depth and consisting of sands and gravels with variable proportions of clay is expected from 59 km to 65 km offshore, with some minor paleochannels occurring. The influence of alluvial inputs diminishes from around 60 km offshore to the Blacktip Wellhead Platform (WHP), which is located 20 km northwest of Beehive-1. This top layer increases to greater than two metres in depth from 66 km offshore and the sediments range from loose silty/clayey sands from 66 km to 75 km and very soft clayey silt and silty clay from 75 km offshore to the Blacktip WHP location (Woodside, 2004). Again, the seabed alternates between flat and featureless seabed containing very soft to firm silty clay and an area of hummocky seabed containing mega-ripple or sand waves, though the seabed is generally flat to gently sloping from about 66 km offshore to the Blacktip WHP location (Woodside, 2004).

5.3. Coastal Environment

The coastal environment is outside the impacts EMBA and is described in Appendix 11.

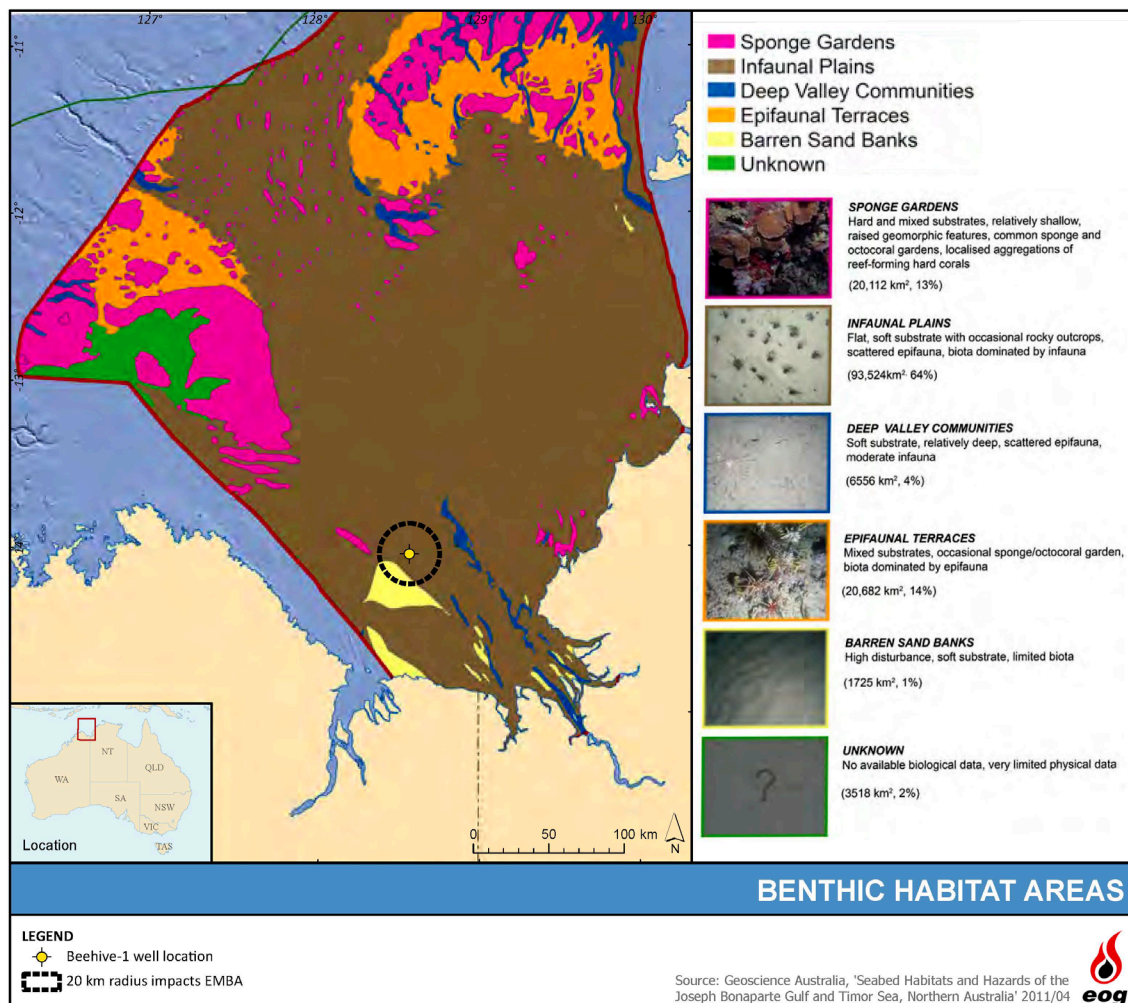

5.4. Biological Environment

The sources listed at the start of this chapter have been used in the preparation of this section. Additionally, biologically important areas (BIAs) are identified for those species that may occur within the impacts EMBA. BIAs are spatially defined areas, defined by the DCCEEW based on expert scientific knowledge, where aggregations of individuals of a species are known, or likely, to display biologically important behaviour such as breeding, foraging, resting or migration (DCCEEW, 2022a). The BIAs do not represent a species' full distribution range.

The PMST identifies that in total, there are 20 threatened species and 38 migratory species (or habitat for such species) that may occur in the impacts EMBA.

5.4.1. Benthic Assemblages

The benthic environment of the JBG is linked to its geomorphic features, with the majority of the area characterised by infaunal plains, with some localised reefs and outcrops supporting sponge gardens. Figure 5.14 illustrates the habitat types in the JBG, with the impacts EMBA located within infaunal plains and barren sand banks, which are primarily characterised by flat soft substrate with occasional rocky outcrops, scattered epifauna, biota dominated by infauna (Przeslawski *et al.*, 2011).

Source: Przeslawski *et al* (2011)

Figure 5.14. Generalised habitat map showing likely distribution of habitats and biological communities in the impacts EMBA and surrounds

Studies conducted on the infauna within the Blacktip Project area (the closest sampling station, located 20 km northwest of Beehive-1 and thus within the impacts EMBA) found infauna to be diverse and abundant, with two major phyla, Arthropoda (crustaceans) and Annelida (polychaete worms), contributing over 80% of the total number of individuals (Woodside, 2004). Recorded Arthropoda species include tanaids (shrimps), brachyurans (crabs) and gammarid amphipods. The Annelida were diverse comprising of 36 families, with the most abundant families being Terebellidae, Spionidae, Onphidae, Maldanidae and Ampharetidae. Members of these families are mainly tube-dwelling worms that feed on detrital material on the surface or in the surface sediments. Other abundant infauna are the Cnidaria (hydroids, soft corals), Mollusca (mainly bivalves) and Echinodermata (brittle stars, sea urchins).

The Blacktip baseline studies found that infauna species richness and abundance in the JBG was related to sediment particle size. Richness and species abundance increased with distance from the mouth of the Victoria River (100 km southeast of the impacts EMBA), which coincided with an increasing proportion of fine particles in the sediment (Woodside, 2004). Sites near the Victoria River mouth generally had coarser sediments and lower species richness and abundance. The Blacktip sampling sites supported a richer assemblage than sites closer to the Victoria River mouth (Woodside, 2004).

During this survey, 135 nominal species were identified. However, faunal abundance was low with only 528 individuals recorded and only 14 species recording more than 10 individuals across all the offshore samples. The composition of the infaunal community was somewhat unusual. Continental shelf infauna is generally dominated by polychaete worms. However, nearly three times as many crustaceans were collected as polychaetes. Bryozoans and hydroids were the next most abundant group after the crustaceans, and nearly as many molluscs and echinoderms were collected as polychaetes. The most abundant species was a porcelain crab followed by a brittle star (Woodside, 2004).

The study also observed that sites near the Victoria River mouth, which generally had coarser sediments, had a greater proportional abundance of crustaceans and cnidarians (hydroids and soft corals) compared to sites further offshore, which supported a predominantly detritus feeding infauna (Woodside, 2004).

Crustaceans

In a study of prawn trawl bycatch in the JBG, which included sampling locations close to the impacts EMBA, Tonks et al (2008) found that four crustacean species dominated the invertebrate component of the bycatch: *Charybdis callianassa* (Portunidae); *Trachypenaeus gonospinifer* (Penaeidae); *Metapenaeopsis novaeguineae* (Penaeidae); and *Solenocera 90ertebrate90* (Solenoceridae).

The dominant prawn species of the JBG are the penaeid species, namely tiger prawn (*Penaeus esculentus*), banana prawn (*P. merguensis*) and red-legged banana prawn (*P. indicus*). These species occur in coastal waters to depths of approximately 200 m and are widely distributed through sub-tropical and tropical waters from WA to New South Wales (NSW) (Jones and Morgan, 1994). Shallower inshore waters act as nursery grounds for juveniles, such as the river and tidal creek systems of the JBG. Small numbers of prawns can also be found in mangrove habitats. More is known about the distribution and abundance of prawns in the JBG compared to other crustaceans due to their commercial significance.

As discussed in detail in Section 5.8.1, prawns are commercially caught in areas of the JBG, mainly in the west of the gulf and in Fog Bay, NT (more than 200 km to the northeast of the impacts

EMBA). The juvenile prawns that migrate offshore to the fishery come from mangrove nursery habitats from the Victoria River in the east of the JBG, to the Ord River and Cambridge Gulf in the west, forming a very extensive migration throughout the lower region of the JBG. This migration is likely to be from February to April and October to December. Migration of the juveniles is thought to be triggered by rainfall and river discharge. The areas most intensely fished for prawns are located in the Gulf of Carpentaria (over 900 km east of the impacts EMBA).

Prawns

There are several prawn species present in the JBG that occupy benthic habitats and prey on micro-organisms, small shellfish, worms and decaying organic matter. Several of the species develop their juveniles in nearshore estuarine and mangrove habitat before moving further offshore in adulthood. Based on information from the NPFI, commercial prawn species such as banana, tiger and endeavour prawns may spawn within the activity area during the warmer months of the year. The habitat, distribution and reproduction of these species is presented in Table 5.6 based on several sources of literature, and Figure 5.15 illustrates the spawning periods for the key commercial prawn species.

Based on information from the NPFI, commercial prawn species such as banana, tiger and endeavour prawns may spawn within the impacts EMBA during the warmer months of the year. Banana prawns spawn offshore throughout the year with two spawning peaks: the late dry season (September-November) and the late wet season (March-May).

Endeavour prawns spawn throughout the year, with blue endeavour prawns having spawning peaks in March and September and red endeavour prawns have a spawning peak in September to December. Based on the endeavour prawn spawning habitat preferences it is unlikely that they would spawn in the impacts EMBA.

Brown tiger prawns peak spawning period is between July and October. A twelve-month-old female prawn can produce hundreds of thousands of eggs at a single spawning and may spawn more than once in a season. The eggs sink to the bottom after release, where they hatch into larvae within about 24 hours. Less than 1% of these offspring survive the two-to-four-week planktonic larval phase to reach suitable coastal nursery habitats where they may settle. After one to three months on the nursery grounds, the young prawns move offshore onto the fishing grounds. See Section 5.7.1 for more information.

Molluscs

The JBG has relatively low mollusc species diversity due to the restricted number of habitats available and silty conditions, with less than 100 species (mainly bivalves) recorded in the region (Walker *et al.*, 1996). Many different types of molluscs are found in the mangroves, including clams (Walker *et al.*, 1996). The soft sediment infaunal plains habitat that dominates the impacts EMBA does not provide extensive hard substrate for bivalve molluscs or other fixed invertebrates to attach and reproduce (Przeslawski *et al.*, 2011).

Silver lipped pearl oysters are known to be sparsely distributed in the JBG up to the 100 m isobath. Primary spawning occurs from the middle of October to December, with a smaller secondary spawning occurring in February and March (Hart *et al.*, 2015). Pearling licensees have not raised any concerns with EOG regarding the presence of pearl oysters or pearling activities in and around the impacts EMBA.

During in-person meetings held in Broome and Kalumburu as part of the relevant persons consultation process, some individuals raised concerns about the potential impacts of drilling on scallops. The available literature indicates that scallops are scarce within the activity area and surrounds. Marine ecological surveys of the Joseph Bonaparte Gulf AMP (16 km east of the impacts EMBA) conducted in 2023 did not report the presence of scallops (Udyawer *et al.*, 2023). Additionally, the eco-narrative of Joseph Bonaparte Gulf AMP (Galaiduk *et al.*, 2019) also did not indicate the presence of scallops. The only scallop species that are abundant enough to be commercially fished in WA waters are saucer scallops (*Amusium balloti*), which are found between Broome and east of Esperance and are particularly abundant in Shark Bay and Abrolhos Islands (outside of the impacts EMBA and the spill EMBA) (DPIRD, 2013).

Reefs, Shoals and Banks

Coral reefs are habitats with high diversity of corals, associated fish and other species of both commercial and conservation importance. No reef habitats have been identified within the impacts EMBA. The closest identified coral reef habitat is located within the JBG Australian Marine Park (JBG AMP). Reefs, shoals and banks present within the spill EMBA are described in Section 5.3.1 of Appendix 11.

Table 5.6. Key prawn species habitat, distribution, and reproduction in the JBG

Species	Habitat	Stock structure & distribution	Spawning
Banana prawns Redleg banana prawn (<i>Penaeus indicus</i>) White banana prawn (<i>P. merguensis</i>)	<p>Banana prawns live in tropical and sub-tropical coastal waters and are found over muddy and sandy bottoms in coastal waters and estuaries (AFMA, 2021).</p> <p>White banana prawns can generally be found at depths of 16-25 m but can occur to depths of 45 m, while red-legged banana prawns are found at depths of 35-90 m (AFMA, 2021).</p> <p>Juvenile redleg banana prawns are found in estuarine habitats up to 120 km south and 240 km east-southeast of the southern and eastern limits of the <i>P. indicus</i> fishery in the JBG. Although mangrove habitats are the closest inshore habitats to the fishery, they are not used by <i>P. indicus</i>.</p> <p>Given the habitat preference for <i>P. indicus</i>, the larvae resulting from spawning in the fishing grounds rely on tides and currents. Move large distances to the south and east to their nursery habitats (Loneragan <i>et al.</i>, 2002). This implies that the emigrating juveniles and sub-adults migrate from the mangrove nursery habitats, north and west, across shallower sand substrates (30-40 m deep) to the deep-water fishery (on mud substrates about 50-80 m deep).</p> <p>Juvenile white banana prawns are found in estuarine habitats in the western part of JBG, about 50 km to the southwest of the <i>P. indicus</i> fishery.</p>	<p>Banana prawn species are mainly found in tropical and sub-tropical waters around Australia from Shark Bay in WA to the NT and Queensland coastlines (including waters in Torres Strait between Australia and Papua New Guinea) (AFMA, 2021).</p> <p>The 93 vertebral stock structure of banana prawn is uncertain.</p> <p>Redleg banana prawns are widely distributed across the Indo-West Pacific Ocean. In the JBG, a single separate stock is assumed for stock assessment and management purposes (Patterson <i>et al.</i>, 2021).</p> <p>In the NPF, there is some evidence of white banana prawn sub-stock structuring associated with significant river catchments and their annual flow regimes; however, there is an absence of clear evidence on biological stock structure, status is determined for a single fishery-level stock (Patterson <i>et al.</i>, 2021).</p>	<p>Banana prawns reach reproductive maturity at approximately 6 months of age (AFMA, 2021). They spawn offshore throughout the year with two spawning peaks: the late dry season (September – November) and the late wet season (March – May) (AFMA, 2021) (see Figure 5.12).</p> <p>Banana prawns are serial spawners. Each female lays several egg batches each year. Females produce 100,000 to 450,000 eggs per year. Eggs hatch within 24 hours of fertilisation (AFMA, 2021).</p> <p>Less than 1% of larvae survive the 2-4 week planktonic larval phase to reach suitable coastal nursery habitats where they settle, however there are no written records to verify these statistics other than postlarval and juvenile mortality are known to be high (Rob Kenyon CSIRO Division of Marine Research, pers.comm. February 2022).</p> <p>After 1-3 months in the nursery grounds, the young prawns migrate offshore. Migration of the main cohort occurs November-March. A possible second cohort migrates April-June. Migration is thought to be triggered by rainfall and river discharge.</p> <p>Juveniles reach sexual maturity at 6 months and have a lifespan of 1-2 years (Yearsley <i>et al.</i>, 1999).</p>

Species	Habitat	Stock structure & distribution	Spawning
Tiger prawns Brown tiger prawn <i>(Penaeus esculentus)</i> Grooved tiger prawn <i>(P. semisulcatus)</i> .	Tiger prawns live in coastal waters to depths of 200 m (AFMA, 2021). Adult brown tiger prawns are found over coarse sediments and adult grooved tiger prawns are found in fine mud sediments (AFMA, 2021). Juvenile tiger prawns are found in shallow waters, often where seagrass beds are present, and sometimes on top of coral reef platforms (AFMA, 2021).	Brown tiger prawns are endemic to tropical and subtropical waters of Australia, while grooved tiger prawns have a wider Indo–West Pacific distribution. There is some genetic evidence of separation of brown tiger prawn stocks from the east and west coasts of Australia (Patterson <i>et al.</i> , 2021). Assessment of stock status for the brown tiger and grooved tiger is undertaken at the management unit level – NPF (Commonwealth) (Patterson <i>et al.</i> , 2021).	For brown tiger prawns, spawning occurs throughout the year, in both inshore and offshore areas, while grooved tiger prawns spawn in offshore areas (AFMA, 2021). Brown tiger prawns have a spawning peak between July and October (see Figure 5.12) (AFMA, 2021). Grooved tiger prawns have a spawning peak in August–September, with a secondary peak in February (see Figure 5.12) (AFMA, 2021). Females produce about 186,000 eggs (brown tiger prawns) and 365,000 eggs (grooved tiger prawns) per year depending on their body size. Eggs hatch within 24 hours of fertilisation (AFMA, 2021). There is little to no information available on the spawning locations of tiger prawns (Rob Kenyon CSIRO Division of Marine Research, pers.comm. February 2022). Juveniles reach sexual maturity at about 6 months and have a lifespan of 2 years (Yearsley <i>et al.</i> , 1999).
Endeavour prawns Blue endeavour prawn <i>(Metapenaeus endeavouri)</i> Red endeavour prawn <i>(M. ensis)</i> .	Endeavour prawns live in tropical coastal waters (AFMA, 2021). Blue endeavour prawns are found over sandy or mud-sand substrates to depths of about 60 m, while red endeavour prawns prefer muddy substrates and have been found to depths of 95 m (AFMA, 2021). Juvenile blue endeavour prawns are commonly associated with seagrass beds in shallow estuaries, while juvenile red endeavour prawns are more widely distributed across seagrass beds, mangrove banks, mud flats and open channels (AFMA, 2021).	Endeavour prawn fisheries are located in Shark Bay, Exmouth Gulf, the north coast of WA, the Gulf of Carpentaria, the Torres Strait and the east coast of Queensland. Little is known about the biological stock structure of the populations of blue and red endeavour prawns. Assessment of stock status for each species is undertaken at the NPF (Commonwealth) management level (Patterson <i>et al.</i> , 2021).	Spawning occurs throughout the year (AFMA, 2021). Blue endeavour prawns have spawning peaks in March and September, while red endeavour prawns have a spawning peak in September to December (see Figure 5.12) (AFMA, 2021). There is little to no information available on the spawning locations of endeavour prawns (Rob Kenyon CSIRO Division of Marine Research, pers.comm. February 2022). Females produce about 296,000 eggs per year (AFMA, 2021). Juveniles reach sexual maturity at 6 months and have a lifespan of 1-2 years (Yearsley <i>et al.</i> , 1999).

Note: AFMA and CSIRO were contacted by EOG in February 2022 to verify gaps in information specifically spawning locations for banana prawns, tiger prawns and endeavour prawns. Where available, data is referenced within the table.

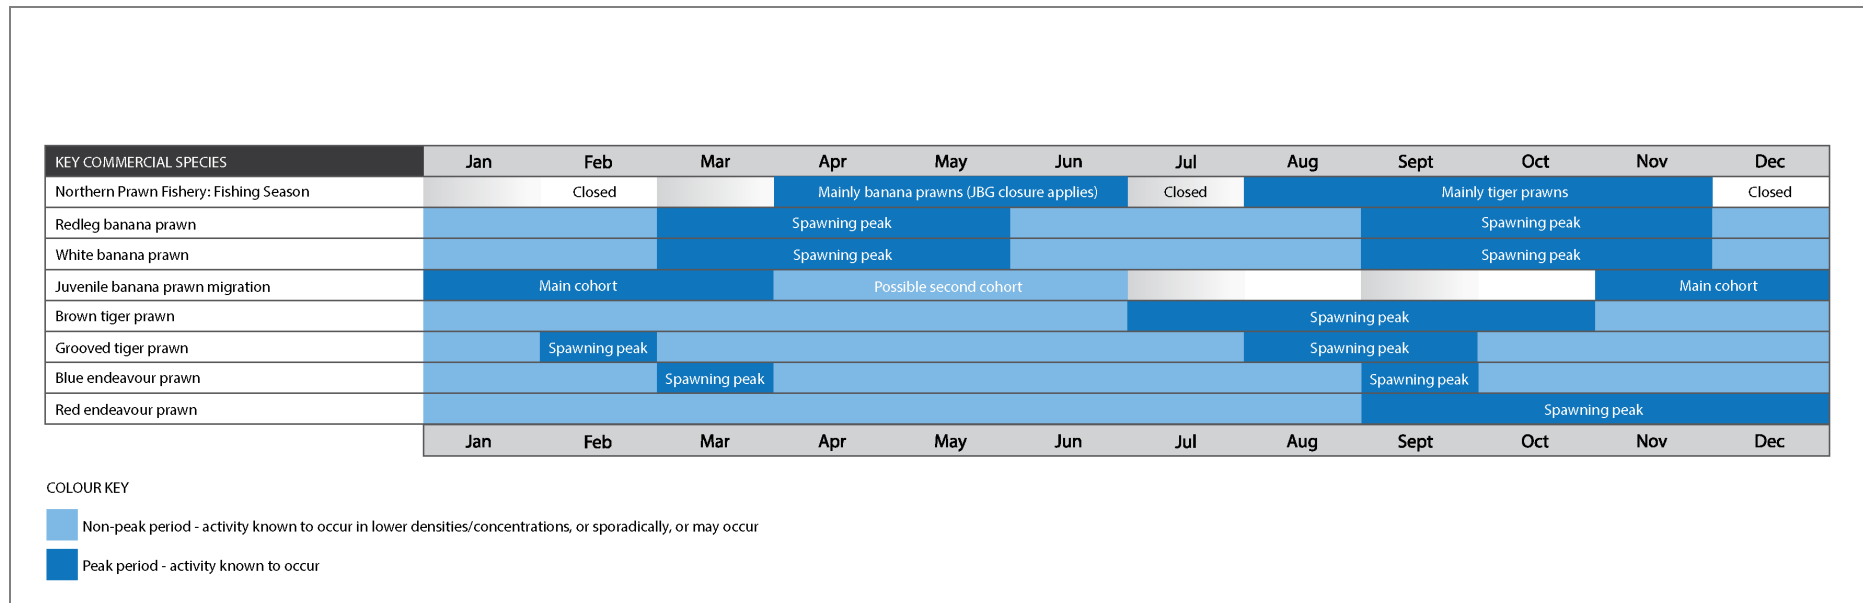

Figure 5.15. Commercial prawn species spawning periods

5.4.2. Flora

Marine flora, such as macroalgae, seagrass beds and mangroves occur in shallow waters outside the impacts EMBA. As such, these are described in Section 5.3.2 of Appendix 11.

5.4.3. Plankton

Phytoplankton

Phytoplankton (photosynthetic microalgae) comprise 13 divisions of mainly microscopic algae, including diatoms, dinoflagellates, gold-brown flagellates, green flagellates and cyanobacteria and prochlorophytes (McLeay *et al.*, 2003). Phytoplankton drift with the currents, although some species have the ability to migrate short distances through the water column using ciliary hairs. Phytoplankton has the capacity to multiply rapidly in response to bursts of nutrient availability and are 96% consumed by zooplankton that in turn are consumed by other marine fauna species.

Zooplankton

Zooplankton is the faunal component of plankton, comprising small crustaceans (such as krill), fish eggs and fish larvae. Zooplankton includes species that drift with the currents and also those that are motile. Nutrients and planktonic organisms (including many species of larval recruits) are transported to and from the JBG by the southerly movement of the Indonesian Throughflow and the southeast and northwest monsoonal wind-driven currents (Brewer *et al.*, 2007).

5.4.4. Finfish, Sharks and Rays

There are 37 fish species listed under the EPBC Act that are known to occur, likely to occur or may occur in both the flaring and the impacts EMBA (Table 5.7) (DCCEEW, 2022a). Of these, there are six shark, four sawfish and 24 syngnathiforme (seahorses, pipefishes and their relatives) species. Seven species are listed as threatened and 11 are migratory (five of the migratory species are also listed as threatened). Figure 5.16 illustrates the likely temporal presence and absence of these fish species in the impacts EMBA. The species listed as threatened or migratory are described in this section.

The flaring EMBA PMST results for finfish, sharks and rays was identical to the species detected within the impacts EMBA. In light of this, the flaring EMBA will not be discussed further.

Table 5.7. EPBC Act-listed finfish, sharks and rays that may occur in the impacts and flaring EMBA

Scientific name	Common name	EPBC Act Status			Type of presence in impacts EMBA	Type of presence in flaring EMBA	BIA intersected by impacts EMBA?	BIA intersected by flaring EMBA?	Recovery Plan in place?

Definitions

EPBC Act	Description
Listed threatened species	A native species listed in Section 178 of the <i>EPBC Act</i> as either extinct, extinct in the wild, critically endangered, endangered, and vulnerable or conservation dependent.
Listed migratory species	A native species that from time to time is included in the appendices to the Bonn Convention and the annexes of JAMBA, CAMBA and ROKAMBA, as listed in Section 209 of the <i>EPBC Act</i> .
Listed marine species	As listed in Section 248 of the <i>EPBC Act</i> .

	Congregate	Congregation/aggregation known to occur in area

Figure 5.16. Likely temporal presence and absence of EPBC Act-listed threatened fish species in the impacts EMBA

The exact locations and timing of spawning and/or aggregations of fish and shark species are unknown, but the DPIRD provide an indication of species that may spawn within the North Coast bioregion, which includes the JBG (DoF, 2013a) (Table 5.8).

Table 5.8. Peak spawning/aggregation times for key commercial fish species in the North Coast Bioregion

Common name	Species name	Spawning / aggregation times
Blacktip shark	<i>Carcharhinus tilstoni</i> & <i>C. limbatus</i>	November – December
Goldband snapper	<i>Pristipomoides multidens</i>	January – April
Pink snapper	<i>Pagrus auratus</i>	May – July
Rankin cod	<i>Epinephelus multiinotatus</i>	August – October
Red emperor	<i>Lutjanus sebae</i>	October, January, March
Sandbar shark	<i>Carcharhinus plumbeus</i>	October – January
Spanish mackerel	<i>Scomberomorus commerson</i>	August – November

Threats and pressures on fish

Several of the fish species listed in Table 5.8 are subject to pressures, which are described in various recovery plans and conservation advice. Table 5.9 summarises the pressures listed in the plans/advice relevant to each of these species that could result from drilling activities.

Table 5.9. Summary of threats to fish species

Species	Recovery Plan, Management Plan or Conservation Advice	Key threat/s relevant to drilling
Great white shark	Recovery Plan for the White Shark (<i>Carcharodon carcharias</i>) (DSEWPC, 2013b)	Ecosystem effects as a result of habitat modification
Northern river shark	Approved conservation advice for Glyphis garricki (northern river shark) (TECC, 2014)	Habitat degradation and modification
	Sawfish and River Sharks Multispecies Recovery Plan (DoE, 2015a)	Habitat degradation and modification
Dwarf sawfish	Approved Conservation Advice for <i>Pristis 102ertebr</i> (dwarf sawfish) (DEWHA, 2009)	Habitat degradation
	Sawfish and River Sharks Multispecies Recovery Plan (DoE, 2015a)	Habitat degradation and modification
Largetooth sawfish	Approved Conservation Advice for <i>Pristis pristis</i> (large sawfish) (DoE, 2014a)	Habitat degradation and modification
	Sawfish and River Sharks Multispecies Recovery Plan (DoE, 2015a)	Habitat degradation and modification
Green sawfish	Approved Conservation Advice for green sawfish (DEWHA, 2008c)	Habitat degradation and modification
	Sawfish and River Sharks Multispecies Recovery Plan (DoE, 2015a)	Habitat degradation and modification

Species	Recovery Plan, Management Plan or Conservation Advice	Key threat/s relevant to drilling
Whale shark	Conservation Advice for <i>Rhincodon typus</i> (whale shark) (TSSC, 2015d)	Boat strike Habitat disruption from mineral exploration Marine debris
Scalloped hammerhead shark	Listing Advice <i>Sphyrna lewini</i> (scalloped hammerhead) (TSSC, 2018a)	None. Historic and current fishing.

Great white shark (EPBC Act: Vulnerable, Listed migratory)

The great white shark (*Carcharodon carcharias*) is widely distributed and located throughout temperate and sub-tropical waters with their known range in Australian waters including all coastal areas except the NT (DCCEEW, 2022b). Studies of the great white shark indicates that they appear to be largely transient, with a few longer-term residents; however, individuals are known to return to feeding grounds on a seasonal basis (Klimey and Anderson, 1996). Observations of adult white sharks are more frequent around fur-seal and sea lion colonies whilst juveniles are known to congregate in certain key areas. There are no biologically important aggregation, breeding or foraging areas intersected by the impacts EMBA.

Shortfin mako shark (EPBC Act: Listed migratory)

The shortfin mako (*Isurus oxyrinchus*) is a pelagic species with a circumglobal, wide ranging oceanic distribution in tropical and temperate seas (Mollet *et al.*, 2000). It is widespread in Australian waters, recorded in offshore waters all around the continent's coastline with exception of the Arafura Sea, the Gulf of Carpentaria and Torres Strait (DCCEEW, 2022b). Shortfin makos are also highly migratory and travel large distances (DCCEEW, 2022b). Due to their widespread distribution in Australian waters, their presence in the impacts EMBA is likely to be limited to transiting individuals.

Longfin mako shark (EPBC Act: Listed migratory)

The longfin mako is widely distributed; however, it is rarely encountered and can be found along the WA coastline as far south as Geraldton (Last and Stevens, 2009). There is limited research into the species within Australian waters; however, Sepulveda *et al* (2004) recorded southern Californian juveniles favoured surface waters, while larger adults were frequently observed at depths of up to 250 m. Whilst assumed to be a deep-dwelling shark, sightings on the ocean surface, and the species' diet, suggest a greater depth range (Reardon *et al.*, 2006). Though there is limited information about the longfin mako, their presence in the impacts EMBA is likely to be limited to transiting individuals.

Whale shark (EPBC Act: Vulnerable, listed migratory)

The whale shark (*Rhincodon typus*) is a filter-feeding shark and is the largest known species of fish in the world (DCCEEW, 2022b). It is considered to be an oceanic and coastal species, commonly seen far offshore but also closer inshore near coral atolls (DCCEEW, 2022b). Whale sharks generally prefer tropical to warm temperate waters where surface sea temperature ranges from 21° to 25 °C (DCCEEW, 2022b).

In Australian waters the whale shark is commonly seen in waters off northern WA, NT and Queensland with only very occasional sightings off Victoria and South Australia (Last and Stevens,

1994). The movements of whale sharks are not well documented; however, they are known to seasonally aggregate (March and April) in shallow tropical waters off the North West Cape in WA (DCCEEW, 2022b). While the whale shark foraging BIA is not intersected by the impacts EMBA, it may migrate through it.

Northern river shark (EPBC Act: Endangered)

The northern river shark (*Glyphis garricki*) is an elasmobranch capable of living and moving between freshwater and seawater. The species utilises rivers, tidal sections of large tropical estuarine systems, macro tidal embayments, inshore and offshore marine habitats. The species is listed as endangered under the EPBC Act, based partly on its limited geographic distribution (TSSC, 2014a). Within Australia, the northern river shark is known to occur in WA and the NT, occupying both marine and freshwater environments including the JBG, Daly River, Adelaide River and the South and East Alligator Rivers (TSSC, 2014a) (Figure 5.17). Whilst northern river sharks have been observed well offshore, the extent to which this occurs is unknown (TSSC, 2014a). Individuals may be present within the impacts EMBA.

Oceanic whitetip shark (EPBC Act: Listed migratory)

Within Australian waters, the oceanic whitetip shark (*Carcharhinus longimanus*) is found from Cape Leeuwin, WA, through parts of the NT and down the east coast of Queensland and NSW to Sydney (Last and Stevens, 2009). It has not been recorded within the Gulf of Carpentaria or the Arafura Sea. The oceanic whitetip shark is a circum-global deep-water pelagic species inhabiting tropical to warm-temperate waters (Compagno, 1984). Oceanic whitetip sharks prefer water temperatures above 20°C and can reach depths of >180 m (Castro *et al.*, 1999). Given the species distribution in deep offshore waters, the species is unlikely to occur within the impacts EMBA.

Reef manta ray (EPBC Act: Listed migratory)

The reef manta ray (*Manta alfredi*) has a circum-global range in tropical and sub-tropical waters with sightings between waters off Perth, all along the northern coastline of Australia to the waters off the Solitary Islands, NSW (Marshall *et al.*, 2011a). While this species tends to inhabit nearshore environments, it is known to occurs in waters as deep as 300 m and has been sighted around offshore coral reefs, rocky reefs and seamounts (Marshall *et al.*, 2011a). In addition, it makes seasonal migrations of several hundred kilometres (Marshall *et al.*, 2011a). Despite there being no known aggregation sites within close proximity to the operational, reef manta rays may be present in the impacts EMBA as transiting individuals.

Giant manta ray (EPBC Act: Listed migratory)

The giant manta ray (*Manta birostris*) has a widespread distribution along the coast of Australia and is known to seasonally migrate between aggregation sites (Marshall *et al.*, 2011b). The giant manta ray is commonly sighted along productive coastlines with regular upwelling, oceanic island groups and particularly offshore pinnacles and seamounts (Marshall *et al.*, 2011b).

This species has also been recorded within the Oceanic Shoals AMP, which is located 138 km north-northwest of the impacts EMBA (Nichol *et al.*, 2013). Despite there being no known aggregation sites within close proximity to the impacts EMBA, giant manta rays may be present in it as transiting individuals.

Figure 5.17. Northern river shark presence in the impacts EMBA and surrounds

Narrow sawfish (EPBC Act: Listed migratory)

The narrow sawfish lives in coastal and estuarine habitats across northern Australia and is generally restricted to shallow waters (less than 40 m) (D’Anastasi *et al.*, 2013). The species is known to occur in the Gulf of Carpentaria but its distribution and migration is largely unknown. The narrow sawfish has the potential to occur within the impacts EMBA because it has been caught as bycatch by the NPF in these areas (Tonks *et al.*, 2008).

Dwarf sawfish (EPBC Act: Vulnerable, Listed migratory)

The dwarf sawfish (*Pristis 106ertebr*) usually inhabits shallow (2–3 m deep) coastal waters and estuarine habitats. Its distribution is considered to extend north from Cairns around the Cape York Peninsula in Queensland, across northern Australian waters to the Pilbara coast in WA (DCCEEW, 2022b). The dwarf sawfish uses its rostrum to stun schooling fish by sideswiping or threshing while swimming through a school. The main prey species is popeye mullet (*Rhinomugil nasutus*). The main threats to dwarf sawfish are habitat loss and entanglement in fishing nets. Adult dwarf sawfish are known to occur in the impacts EMBA (Figure 5.18).

Largetooth sawfish (EPBC Act: Vulnerable, Listed migratory)

Largetooth sawfish (*Pristis pristis*) utilise both freshwater (juvenile) and marine (adult) environments during the different stages of its lifecycle (TSSC, 2014b). Within Australia, largetooth sawfish have been recorded in numerous drainage systems across northern WA, NT and northern Queensland (TSSC, 2014b). The freshwater sawfish feeds on fishes and benthic invertebrates. The saw is used to stun schooling fish, such as mullet, and for extracting molluscs and small crustaceans from the benthic sediment. The impacts EMBA overlaps areas where adult largetooth sawfish are known to occur (Figure 5.19).

Green sawfish (EPBC Act: Vulnerable, Listed migratory)

The green sawfish (*Pristis zijsron*) occurs in both inshore and offshore marine coastal waters of northern Australia. Its current known distribution stretches from Broome, WA around northern Australia and down the east coast as far as Jervis Bay, NSW (DCCEEW, 2022b). The main threats to green sawfish are habitat loss and entanglement in fishing nets.

The impacts EMBA overlaps areas where adult sawfish are known to occur and is adjacent to waters where juveniles are known to occur (Figure 5.20). It has also been caught as bycatch from the NPF in the area overlapped by the impacts EMBA and therefore is likely to be present (Tonks *et al.*, 2008).

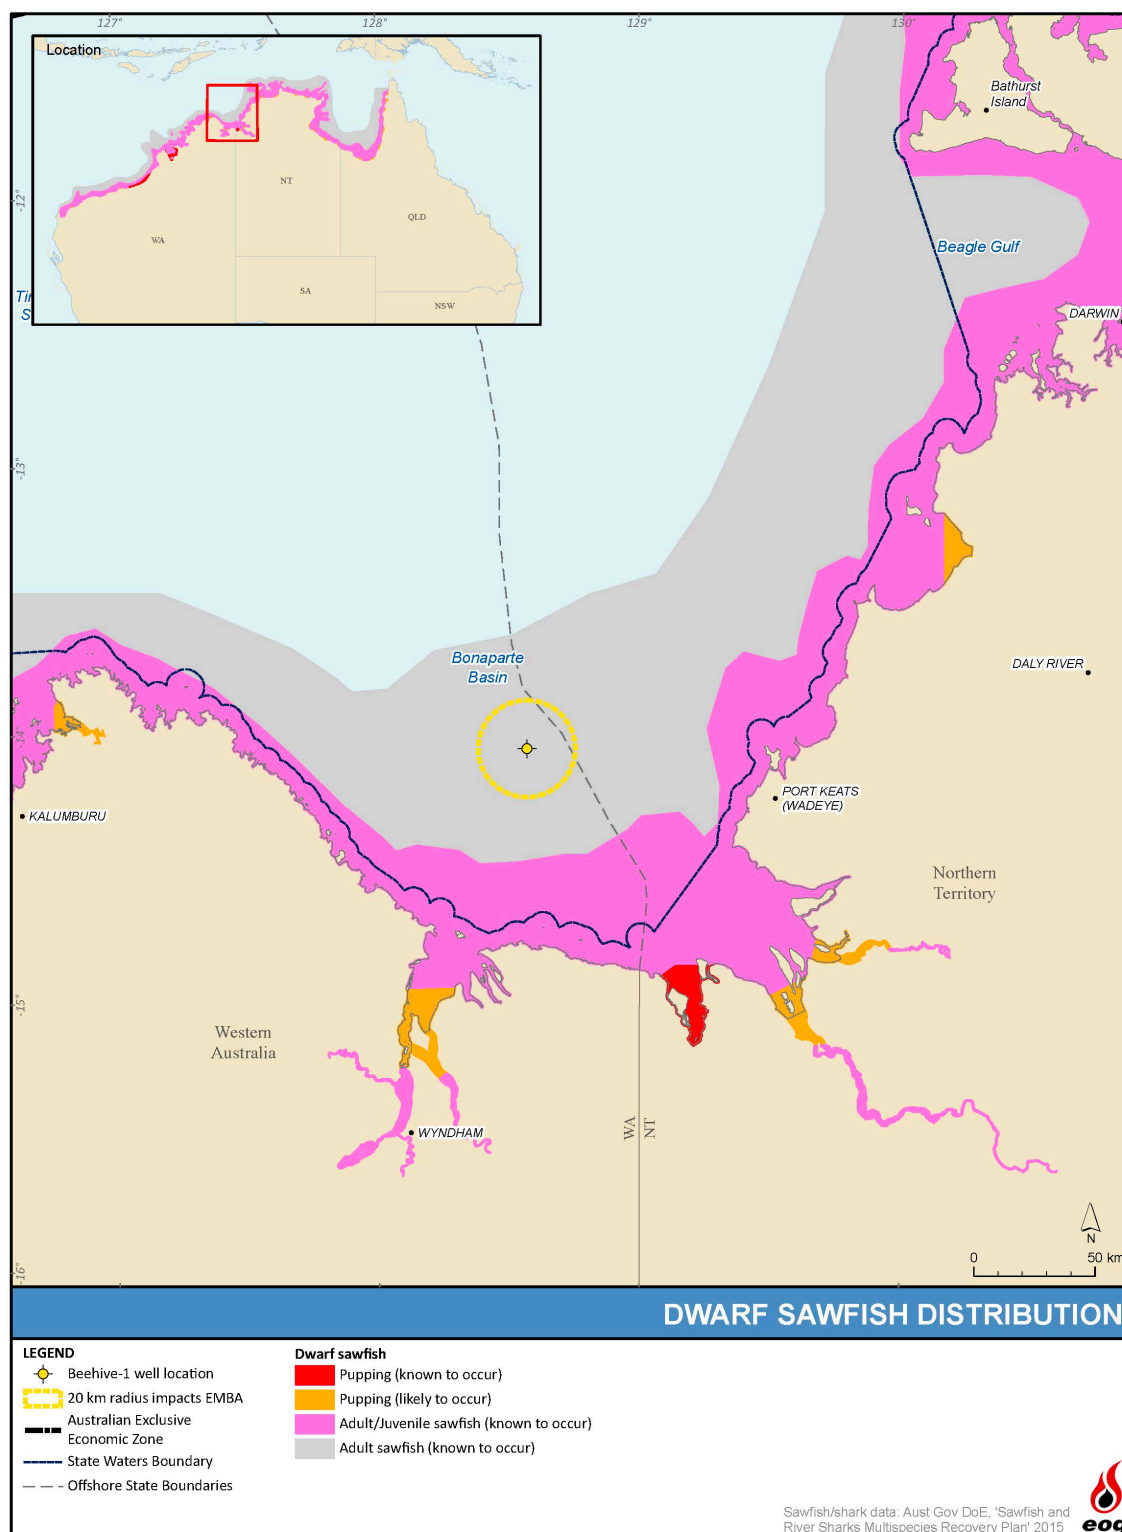

Figure 5.18. Dwarf sawfish presence in the impacts EMBA and surrounds

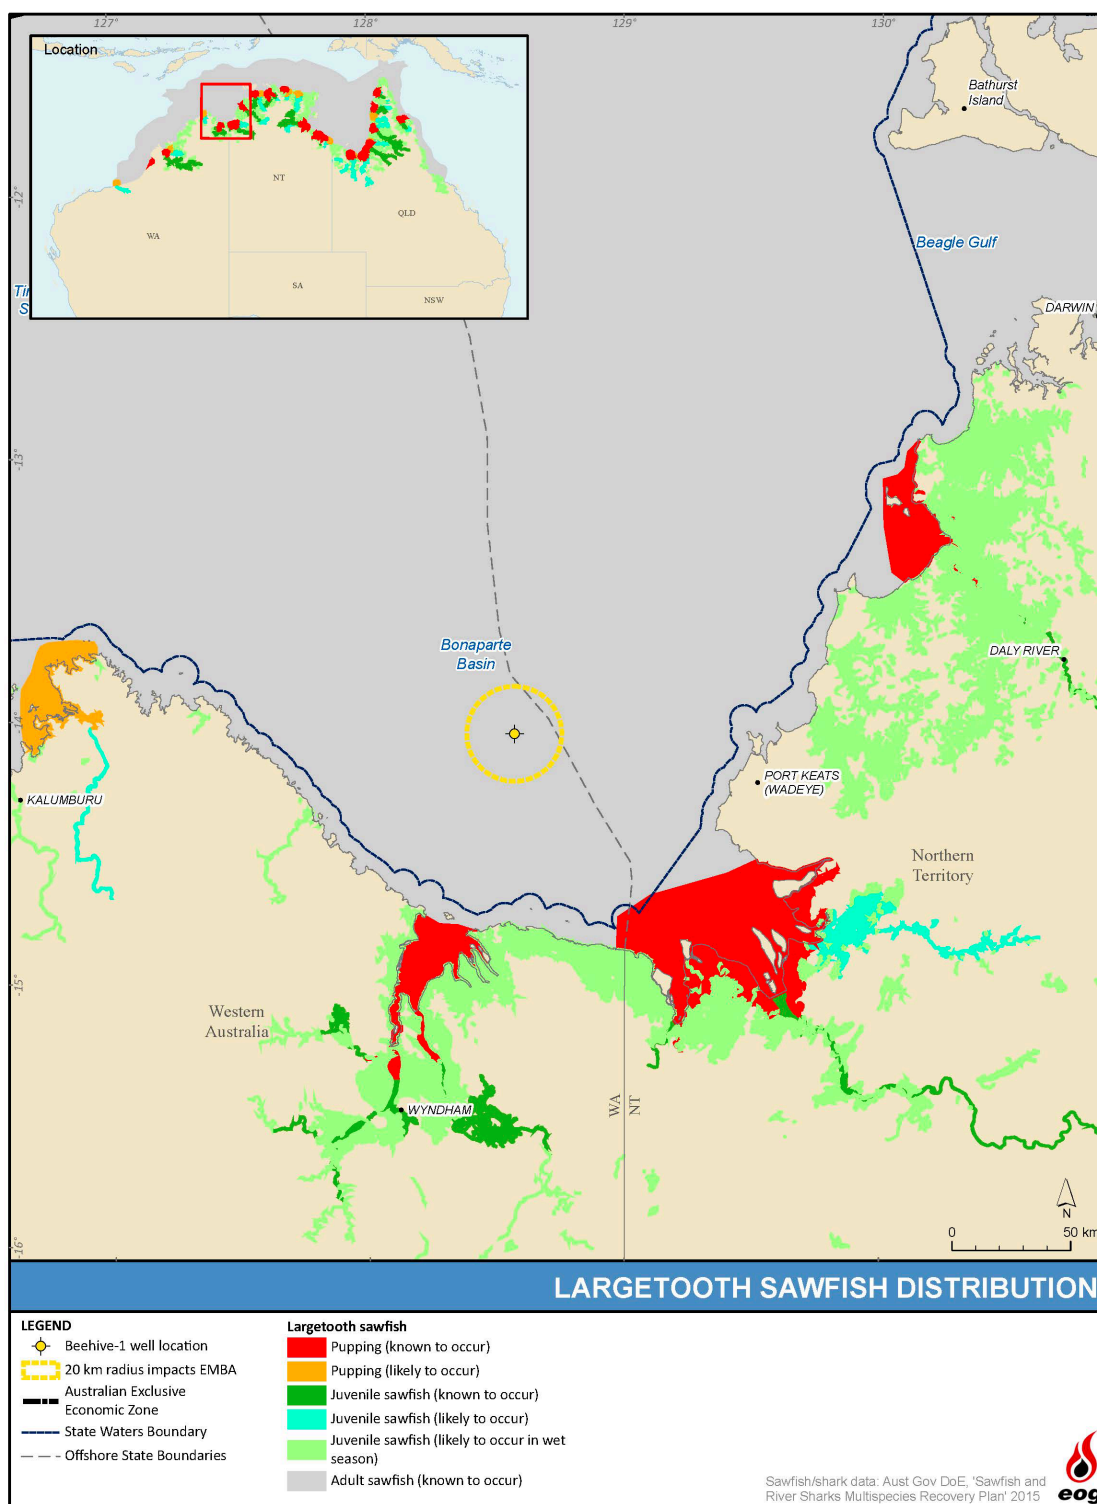

Figure 5.19. Targettooth sawfish presence in the impacts EMBA and surrounds

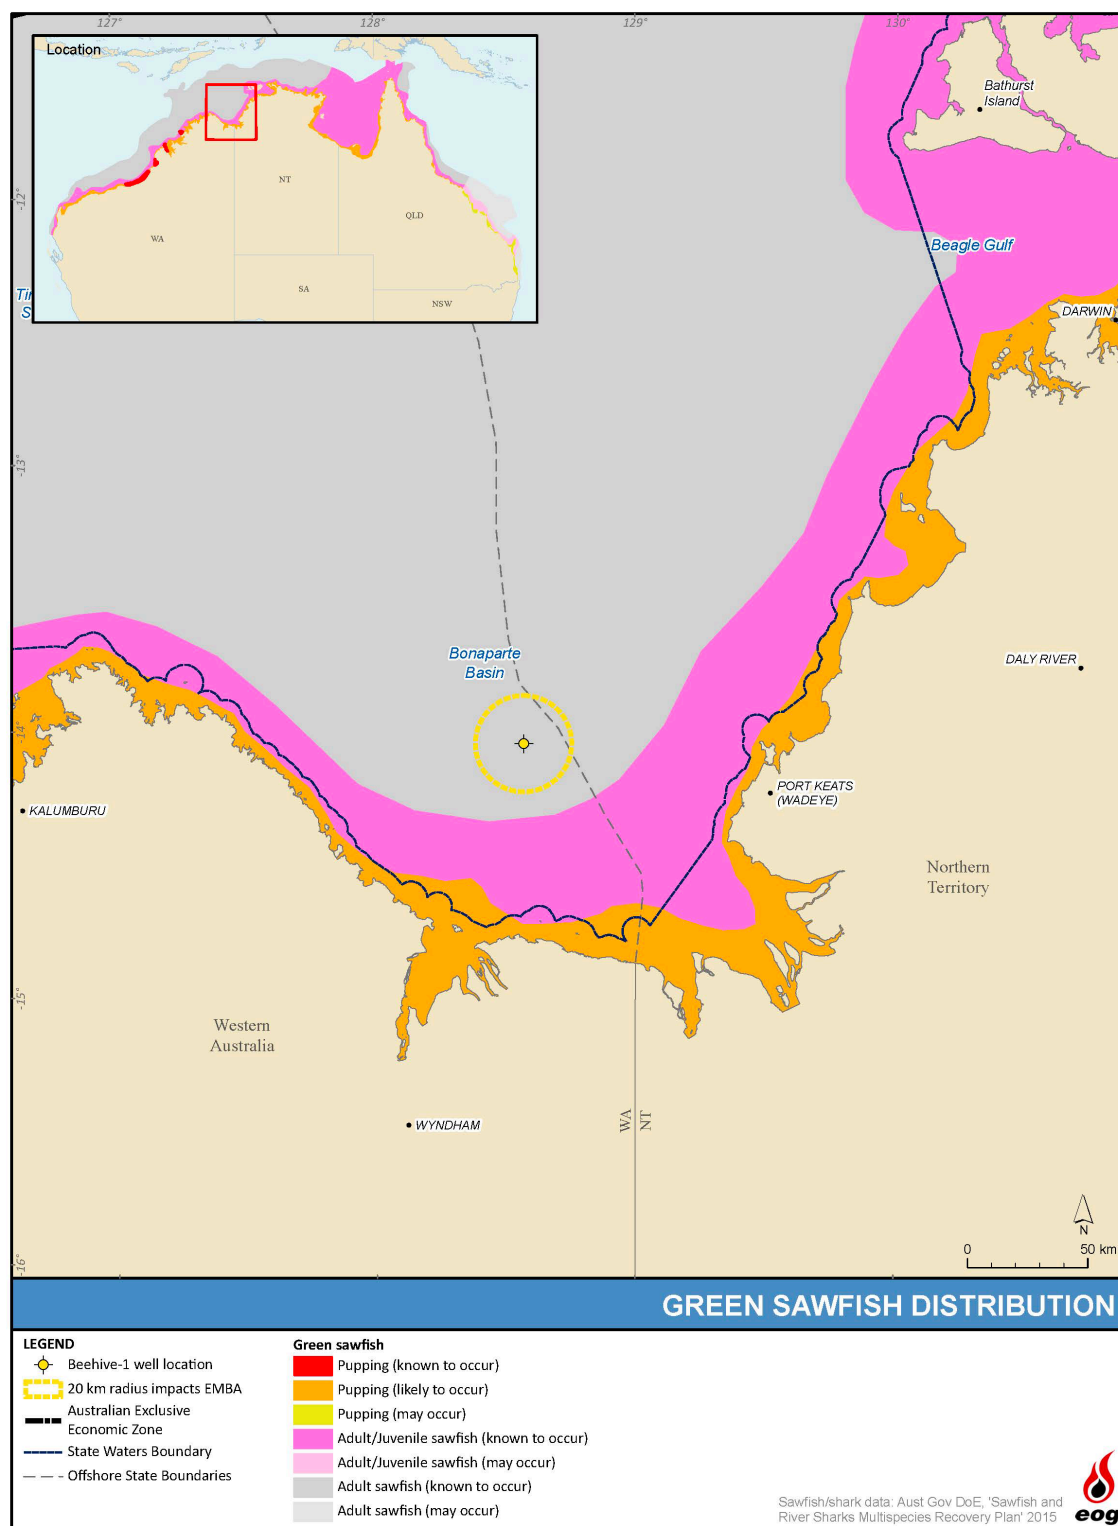

Figure 5.20. Green sawfish presence in the impacts EMBA and surrounds

Scalloped hammerhead shark (EPBC Act: Conservation Dependent)

The scalloped hammerhead shark (*Sphyrna lewini*) was listed as Conservation Dependent in 2018 (TSSC, 2018a). This species is a long-lived large slender shark (growing up to 3.5 m) with a laterally expanded skull shaped like a hammer, known as a cephalofoil (TSSC, 2018a).

The scalloped hammerhead shark has a circum-global distribution in tropical and sub-tropical waters, ranging widely over shallow coastal shelf waters but rarely venturing into or across deep ocean waters (TSSC, 2018a). In Australia, the species range occurs from the southern coast of WA, across the north coast and extending south along the Australian coast to south of Sydney (TSSC, 2018a). Little is known of the scalloped hammerhead's movements in Australia, though it is known to sometimes form large migratory schools (Last & Stevens, 2009). Their diet is reported to comprise ray-finned fish and cephalopods, suggesting a pelagic life (Last & Stevens, 2009). Adult females are rarely caught inshore and may live in deeper water, only moving into shallower coastal waters to mate and give birth (Last & Stevens, 2009). The pups remain in the shallow inshore waters for the first few years of their lives (TSSC, 2018a).

The scalloped hammerhead shark is threatened by fishing (TSSC, 2018a). Given the species' wide distribution in Australian tropical and sub-tropical waters and its preference for the continental shelf, it may occur within the impacts EMBA.

Sygnathids (EPBC Act: Listed marine species)

Twenty-four (24) species identified in the EPBC Act PMST are sygnathiformes, which includes seahorses, seadragon, pipehorse and pipefish. They are all listed as 'may' occur within the impacts EMBA. The majority of these fish species are associated with seagrass meadows, macroalgal seabed habitats, reefs and sponge gardens located in shallow, inshore waters (e.g., protected coastal bays, harbours and jetties) less than 50 m deep. They are sometimes recorded in deeper offshore waters, where they depend on the protection of sponges and rafts of floating seaweed such as *Sargassum*. It is unlikely that sygnathid species occur in high numbers in the impacts EMBA given the likely absence of reef and seagrass habitat that they prefer.

5.4.5. Marine Mammals

The PMST indicates that five whale species, ten dolphin species and the dugong are likely to occur or may occur within or migrate through the impacts EMBA (DCCEEW, 2022a). These species are presented in Table 5.10 and a description focused on threatened or migratory species follows. Figure 5.21 illustrates the likely temporal presence and absence of cetaceans in the impacts EMBA.

Table 5.10. EPBC Act-listed marine mammals that may occur in the impacts EMBA

Figure 5.21. Likely temporal presence and absence of EPBC Act-listed threatened marine mammal species in the impacts EMBA

Threats and pressures on marine mammals

Four of the whale species listed in Table 5.10 are subject to pressures, which are described in various recovery plans and conservation advice. Table 5.11 summarises the pressures listed in the plans/advice relevant to each of these whale species relevant to drilling activities.

Table 5.11. Summary of threats to marine mammals

Species	Recovery Plan, Management Plan or Conservation Advice	Key threat/s relevant to drilling
Blue whale	Conservation management plan for the blue whale 2015-2025 (DoE, 2015b)	Noise interference Habitat modification (marine debris) Vessel disturbance (collisions)
Humpback whale	Conservation advice <i>Megaptera novaeangliae</i> (humpback whale) (TSSC, 2015a)	Noise interference Habitat degradation Vessel disturbance and strike
Sei whale	Conservation advice <i>Balaenoptera borealis</i> (sei whale) (TSSC, 2015b)	Noise interference Habitat degradation
Fin whale	Conservation advice <i>Balaenoptera physalus</i> (fin whale) (TSSC, 2015c)	Pollution Vessel strike

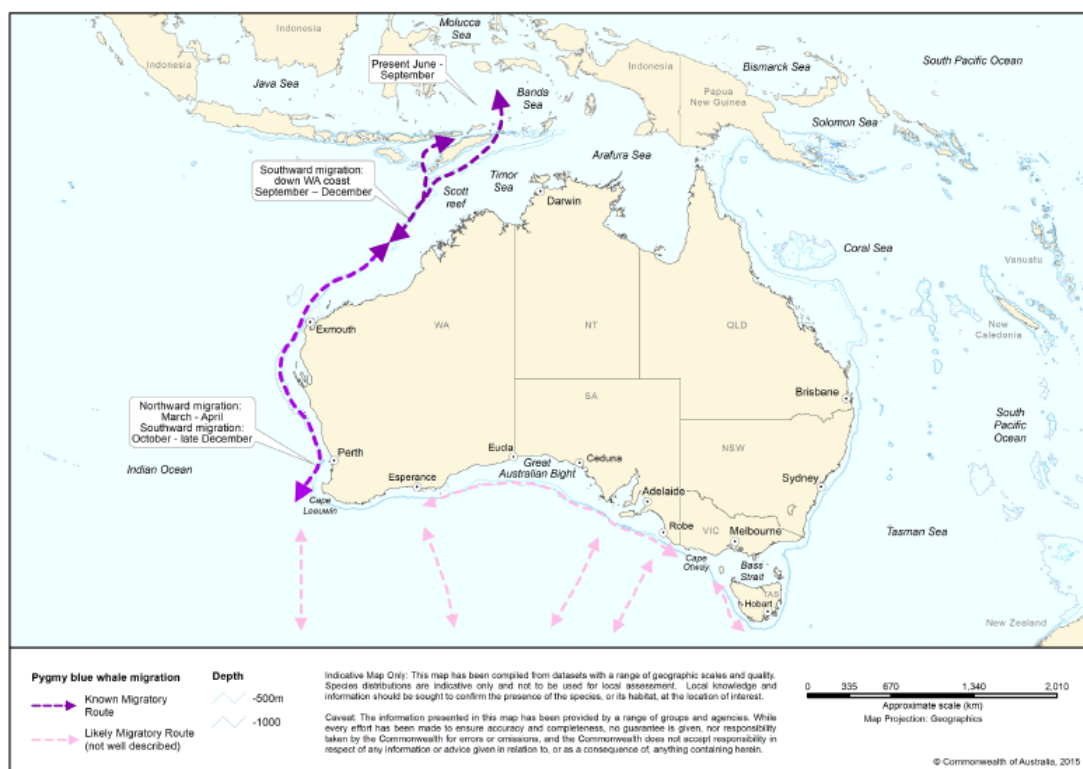

Blue whale (EPBC Act: Endangered, Listed migratory)

Blue whales (*Balaenoptera musculus*) are the largest living animals, growing to a length of over 30 m and weighing up to 180 tonnes (DoE, 2015b). In Australia, there are two recognised sub-species of blue whale; the Antarctic blue whale (*Balaenoptera musculus intermedia*) and the pygmy blue whale (*B. m. breviceauda*).

Blue whales have a worldwide distribution but tend to move between warm water (low latitudes) for breeding and cold water (high latitudes) for feeding. Pygmy blue whales are thought to migrate from Australian feeding areas to breeding grounds that include Indonesia (based on sightings in Indonesia in the austral winter), while Antarctic blue whale winter migratory destinations include lower latitudes of the Pacific and Indian Oceans (DoE, 2015b). Thus, the pygmy blue whale is more likely to be encountered in tropical waters and hence the information provided herein is based on the pygmy blue whale.

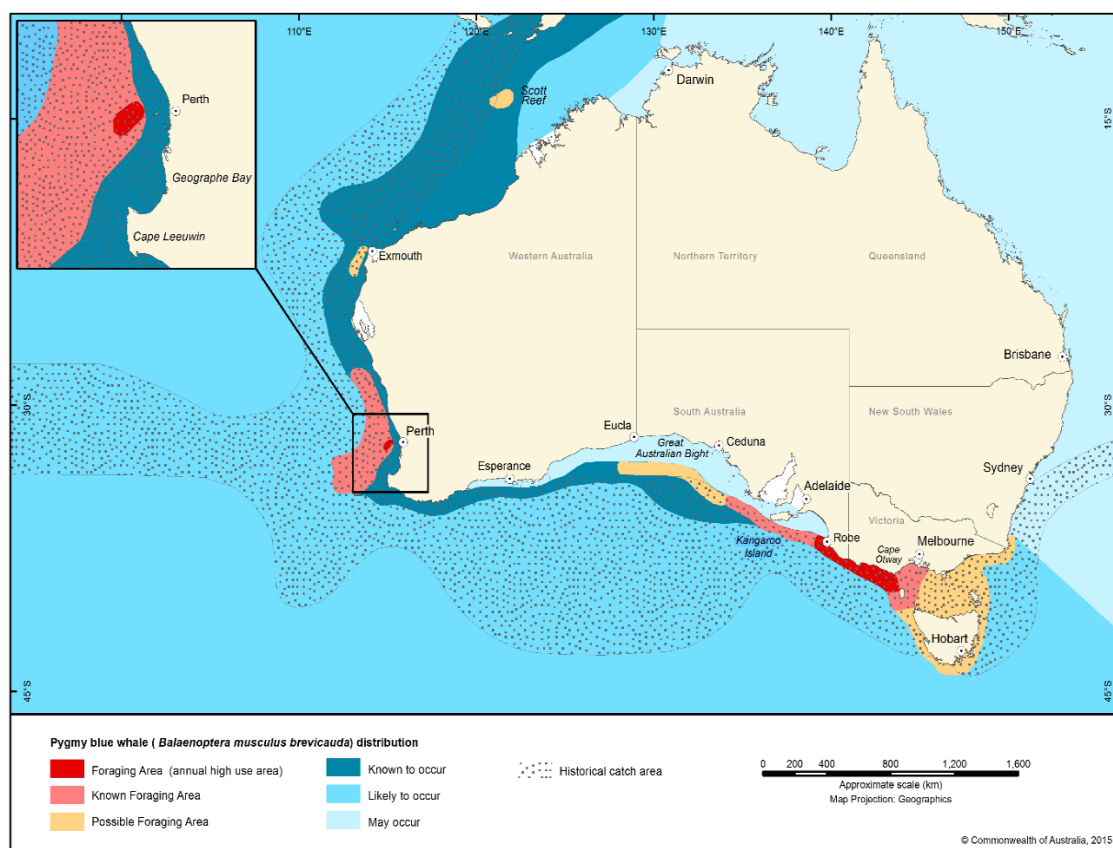

Tracking of pygmy blue whales identified that they migrate north from the Perth Canyon (known feeding area) in March/April reaching Indonesia by June where they remain until at least September (DoE, 2015b). Southern migration from Indonesia may occur from September and finish by December after which the animals may make their way slowly northwards towards the Perth Canyon by March/April (Double *et al.*, 2014). Blue whale migration is thought to follow deep oceanic routes, and a tagging study by Double *et al.* (2014) identified that the shallowest waters occupied was ~1,300 m. Figure 5.22 shows the migration of pygmy blue whales around Australia.

There is a foraging, migration and distribution BIA located off the North West Shelf (Figure 5.23), which is not intersected by the impacts EMBA. Though there are no BIAs that are intersected by the impacts EMBA, the impacts EMBA occurs within the 'may occur' distribution of the species (DoE, 2015b).

Source: DoE (2015a)

Figure 5.22. Pygmy blue whale migration routes

Source: DoE (2015a)

Figure 5.23. Pygmy blue whale BIAs

Sei whale (EPBC Act: Vulnerable, Listed migratory)

Sei whales (*B. borealis*) are primarily found in deep water oceanic habitats and their distribution, abundance and latitudinal migrations are largely determined by seasonal feeding and breeding cycles (TSSC, 2015b). The global population is estimated to have declined by 80% over the previous three generation period (TSSC, 2015b). Sei whales were the most commonly observed whales during Australian National Antarctic Research Expedition voyages in the 1960s and 1970s, with the majority recorded south of 60°S in the Southern Ocean (TSSC, 2015b).

These whales are thought to complete long annual seasonal migrations from subpolar summer feeding grounds to lower latitude winter breeding grounds (TSSC, 2015b); details of this migration and whether it involves the entire population are unknown. There are no defined foraging and feeding areas nor are there known mating or calving areas in Australian waters.

In the Australian region, sei whales occur within Australian Antarctic Territory waters and Commonwealth waters, and have been infrequently recorded off Tasmania, NSW, Queensland, the Great Australian Bight, NT and WA (TSSC, 2015b). There are no known mating or calving areas in Australia.

Based upon the species preference for deep offshore waters, the wide-ranging nature of this species, and the small number of sei whale sightings in Australia, there is likely to be a low likelihood of sei whales migrating through the impacts EMBA.

Fin whale (EPBC Act: Vulnerable, Listed migratory)

The fin whale (*B. physalus*) is the second largest whale species after the blue whale, growing up to 27 m long and weighing up to 70 tonnes (TSSC, 2015c). Fin whales are considered a cosmopolitan species and occur from polar to tropical waters, and rarely in inshore waters. The full extent of their distribution in Australian waters is uncertain but they occur within Commonwealth waters and have been recorded in most state waters and from Australian Antarctic Territory waters (TSSC, 2015c).

Fin whales are generally thought to undertake long annual migrations from higher latitude summer feeding grounds to lower latitude winter breeding grounds (TSSC, 2015c). It is likely they migrate in November – May between Australian waters and Antarctic feeding areas (the Southern Ocean), sub-Antarctic feeding areas (the Southern Subtropical Front) and tropical breeding areas (Indonesia, the northern Indian Ocean and south-west South Pacific Ocean waters) (TSSC, 2015c). Migration patterns are not well understood. In Australia, there are confirmed records of fin whales for all coastal waters except in NSW and the NT, but the available information suggests that the species is more commonly present in deeper water (DEH, 2005a) of the Indonesian Archipelago, using north western Australia as a migration route.

Based on the fin whale preference for deep offshore waters, there is likely to be a low likelihood of fin whales migrating through the impacts EMBA.

Bryde's whale (EPBC Act: Listed migratory)

The Bryde's whale (*Balaenoptera edeni*) is restricted to tropical and temperate waters and has been recorded off all Australian states with exception of the NT (Bannister *et al.*, 1996). Bryde's whales can be found in both oceanic (500 to 1,000 m isobath) and inshore waters (<200 m isobath) (DCCEEW, 2022b). Population estimates are not available for Bryde's whales, globally or in Australia, and no migration patterns have been documented in Australian waters (DCCEEW, 2022b). Bryde's whale is considered to be a fairly opportunistic feeder and it appears that the

coastal and offshore forms may be distinguished by their prey preferences, with the smaller coastal form feeding on schooling fishes, such as pilchard, anchovy, sardine, mackerel, herring and others. In contrast, the larger offshore form appears to feed on small crustaceans, such as euphausiids, copepods, pelagic red crabs and cephalopods.

There are no feeding or breeding BIAs within the impacts EMBA for this species, and there is a low likelihood of Bryde's whale migrating through the impacts EMBA.

Humpback whale (EPBC Act: migratory)

Humpback whales (*Megaptera novaeangliae*) have a global distribution. In Australia, they occur along the east and west coasts during their annual migrations. The whales migrate north from their Antarctic feeding grounds around May each year, and reach the tropical calving grounds in the NWMR in early June (DCCEEW, 2022b). The exact timing of migration varies each year by up to six weeks in response to water temperature, sea ice distribution, predation risk, prey abundance and the location of feeding grounds (DEWR, 2007).

Humpback whales travel northbound from North West Cape, along the continental shelf and pass the west of the Muiron, Barrow and Montebello Islands, peaking in late July (Jenner *et al.*, 2001). Southbound migrations are more diffuse and irregular with no obvious peak. The southerly migration extends parallel to the coast on the 20-30 m depth contour from Lacepede Islands (north of Broome) (Jenner *et al.*, 2001; DEWHA, 2008a). An increase in southerly migrating individuals may be observed between the North West Cape and the Montebello Islands around November (Jenner *et al.*, 2001).

In the NWMR, humpback whales are known to have breeding and foraging grounds between Broome and the northern end of Camden Sound, with the highest concentrations occurring between June and September (DEWHA, 2008b). Camden Sound appears to be the northern most limit for the majority of the west coast whales (Jenner *et al.*, 2001).

Given the well-known distribution of humpback whales in Australia, it is unlikely that this species migrates through the impacts EMBA.

Omura's whale (EPBC Act: not listed)

Omura's whale (*Balaenoptera omurai*) may occur in and around the impacts EMBA but is not listed under the EPBC Act. It is understood that DCCEEW is considering listing this species and as such, it is described briefly here. It is listed under the International Union for the Conservation of Nature (IUCN) Red list as 'data deficient.'

Omura's whale was first described in 2003 and is morphologically similar to but genetically distinct from the Bryde's and sei whales (Cerchio *et al.*, 2019). This species is widely distributed in tropical and warm-temperate locations in all ocean basins except the central and eastern Pacific Ocean. Field research indicates Omura's whale has a strong preference for shallow water, on-shelf habitat, with only short ventures into adjacent deep waters (Cerchio *et al.*, 2019).

Cerchio *et al.* (2019) report that there have been several accounts of Omura's whale along Australia's northwest coast, from Exmouth (WA) into the Timor Sea. McPherson *et al.* (2016) recorded Omura's whale calls around the Barossa and Caldita gas fields (440-470 km northeast of the impacts EMBA) in 2014-15 as part of the monitoring undertaken for ConocoPhillips Australia's Barossa Development proposal. The calls were primarily observed from May to August, with no detection of the species' calls from November to late December.

Given the limited information available for this species, it is assumed that it may migrate through the impacts EMBA.

Killer whale (EPBC Act: Listed migratory)

The killer whale (*Orcinus orca*) (the largest member of the dolphin family) is thought to be the most cosmopolitan of all cetaceans and appear to be more common in cold, deep waters, though they have often been observed along the continental slope and shelf particularly near seal colonies (Bannister *et al.*, 1996). The killer whale is widely distributed from polar to equatorial regions and has been recorded in all Australian waters with concentrations around Tasmania. The only recognised key locality in Australia is Macquarie Island and Heard Island in the Southern Ocean (outside the EMBA) (Bannister *et al.*, 1996).

The habitat of killer whales includes oceanic, pelagic and neritic (relatively shallow waters over the continental shelf) regions, in both warm and cold waters (DCCEEW, 2022b). The breeding season is variable, and the species moves seasonally to areas of food supply (Bannister *et al.*, 1996; Morrice *et al.*, 2004). The impacts EMBA and EMBA are unlikely to represent important habitat for this species. Therefore, killer whales are unlikely to be present in the impacts EMBA or EMBA.

Australian humpback dolphin (EPBC Act: Listed migratory)

Australian humpback dolphins (*Sousa sahulensis*) are found primarily in coastal waters and feed mainly on fish associated with coastal-estuarine waters (DCCEEW, 2022b). In Queensland and the NT, Australian humpback dolphins are mainly found in water less than 20 km from the nearest river mouth, and in water less than 15–20 m deep (DCCEEW, 2022b). They are generally found in river mouths, mangroves, seagrass beds, tidal channels and inshore reefs. They are known to have resident groups that forage, feed, breed and calve in state and territory waters. Calves may be born throughout the year, but peaks in summer and spring have been reported.

Humpback dolphin foraging BIAs are located along the Kimberley coastline, including breeding, and calving. A breeding BIA for the species are also located in Darwin Harbour (approximately 300 km north-east of the drill site). Foraging BIAs are also located in Van Diemen Gulf and Port Essington (Cobourg Peninsula). Given their habitat preferences, it is unlikely that this species occurs in the impacts EMBA.

Indian Ocean bottlenose dolphin (Arafura/Timor Sea populations) (EPBC Act: Listed migratory)

The Indian Ocean bottlenose dolphin (Arafura/Timor Sea) (*Tursiops aduncus*) resemble common bottlenose dolphins (*T. truncatus*) in their general colour pattern, but can be differentiated from the *T. truncatus* by the absence of a blaze on the dorsal cape and by the presence of ventral spotting in sexually mature individuals (DCCEEW, 2022b).

Indian ocean bottlenose dolphins occur in tropical and sub-tropical coastal and shallow offshore waters of the Indian Ocean, Indo-Pacific Region and the western Pacific Ocean and occur in estuarine and coastal waters of northern Australia, including the eastern Indian Ocean and Arafura/Timor Seas (DCCEEW, 2022b). The total population size of this species is not known, though it is likely that this species is common in inshore and nearshore waters of eastern, western and northern Australia where they feed on a range of fish and cephalopods (DCCEEW, 2022b). There is limited information regarding the Arafura/Timor Sea populations of the Indian ocean bottlenose dolphin, the EPBC Act recognises them as a separate population and lists them as migratory. Additionally, the Arafura/Timor Sea populations are listed on Appendix II of the *review of small cetaceans* (Culik, 2004), where insufficient data was reported regarding present knowledge about the population, and their migration patterns were reported as ‘possible’. Culik

(2004) emphasise that more research is needed to establish the range and importance of different species, subspecies and their populations of the Indian ocean bottlenose dolphin. Although there is a sparsity of research available on the Arafura/Timor Sea populations, it is likely they will be encountered within the impacts EMBA due to the location of the EMBA being within the Timor Sea. Movement patterns in Australia are variable, and include year-round residency in small areas, long-range movements and migration (DCCEEW 2022b). The largest threat to the species is bycatch in trawl nets and gillnets and habitat degradation (DCCEEW, 2022b).

It is likely that spotted bottlenose dolphins occur in the impacts EMBA, either residing in the area or migrating through.

Australian snubfin dolphin (EPBC Act: listed migratory, listed marine)

Australian snubfin dolphins (*Orcaella brevirostris*) occur mostly in protected shallow waters close to the coast, and close to river and creek mouths, including the shallow coastal waters and estuaries along the Kimberley coast and Cambridge Gulf (DCCEEW, 2022b). Within Australian waters, Australian snubfin dolphins have been recorded almost exclusively in coastal and estuarine waters (DCCEEW, 2022b). All available data on the distribution and habitat preferences of Australian snubfin dolphins indicate that they mainly occur in one location: shallow coastal and estuarine waters of Queensland, NT and northern WA (DCCEEW, 2022b). Australian snubfin dolphins share similar habitat preference with Australian humpback dolphins, with these two species potentially occurring in the same area through most of their Australian range (DCCEEW, 2022b).

Feeding primarily occurs in shallow waters (less than 20 m) close to river mouths and creeks (DCCEEW, 2022b). This includes a variety of habitats, from mangroves to sandy bottom estuaries and embayments, to rock and/or coral reefs. Prey for this species includes fish of the families Engraulidae, Clupeidae, Chirocentridae, Anguillidae, Hemirhamphidae, Leiognathidae, Apogonidae, Pomadasysidae, Terapontidae and Sillaginidae, typically associated with shallow coastal waters and estuaries in tropical regions (DCCEEW, 2022b).

Off the WA Kimberley coast, the development of infrastructure, mostly associated with the petroleum industry and iron ore activities, and seismic surveys and petroleum explorations are of concern and are suspected to have an impact at the local level at all affected sites. This threat to Australian snubfin dolphins is considered likely to continue into the future, with the potential to increase its impact as habitat degradation and loss increase with increased human population requirements (DCCEEW, 2022b).

Dugong (EPBC Act: Listed migratory, Listed marine)

Dugongs (*Dugong dugon*) inhabit protected shallow coastal areas, such as wide shallow bays and mangrove channels. They feed on seagrass, and major concentrations of dugongs tend to coincide with sizeable seagrass beds. Research undertaken in the NT, including aerial surveys, has focused on dugong populations in the Gulf of Carpentaria and in the northern parts of the NT, such as the Tiwi Islands and Coburg Peninsula. No surveys have been undertaken in the JBG, therefore little is known about the distribution of dugongs in the Gulf. However, as high turbidity in the JBG limits the development of seagrass beds, dugongs are not expected to be abundant (Woodside, 2004).

Though not abundant in the JBG, dugongs have been reported to occur along the coastline from Cape Hay to Pearce Point with the main populations concentrated around Dorchester Island (Woodside, 2004), approximately 102 km east of the drill site. The closest dugong foraging BIA is

located south of Ashmore Reef (585 km to the west of the impacts EMBA), with additional foraging BIA on the Kimberley coastline off the Dampier Archipelago.

During the relevant persons consultation process, the cultural significance of dugongs was brought to EOG's attention during in person meetings in June 2023, by the Yawuru People and Ardyaloon community. The cultural significance of the dugong is described in Section 5.3.5 of Appendix 11.

Based on their habitat preferences, dugongs are unlikely to be present in the impacts EMBA.

5.4.6. Marine Reptiles

Six species of marine turtle are listed in the PMST results as known or likely to occur within both the impacts EMBA and flaring EMBA (Table 5.12) (DCCEEW, 2022a). Three of the turtle species are listed as endangered with the other three listed as vulnerable. Additionally, 17 species of sea snake are identified as 'may occur' in the impacts EMBA, along with the saltwater crocodile being 'likely to occur.' The flaring EMBA detected an additional two species of sea snake, both of which have a presence of 'may occur' and are not threatened. The species listed as threatened or migratory are described in this section. Ecological stages and temporal occupation of the turtle species is presented in Figure 5.24. The flaring EMBA is considered within the species discussion due to their sensitivity to artificial light.

During the relevant persons consultation process, the cultural significance of sea turtles was brought to EOG's attention during in-person meetings in June 2023, by the Tiwi Land Council, Yawuru People, and both the Ardyaloon and Kalumburu community. The cultural significance of turtles is described in Section 5.3.6 of Appendix 11.

Table 5.12. EPBC Act-listed marine reptiles that may occur in the impacts EMBA

Threats and pressures on marine reptiles

Five of the turtle species listed in Table 5.12 are subject to pressures, which are described in various recovery plans and conservation advice. Table 5.13 summarises the pressures listed in the plans/advice relevant to each of these species relevant to drilling activities.

Table 5.13. Summary of threats to marine reptiles

	National Light Pollution Guidelines for Wildlife including marine turtles, seabirds and migratory shorebirds	Artificial light

Leatherback turtle (EPBC Act; Endangered, listed migratory)

The leatherback turtle (*Dermochelys coriacea*) is a pelagic feeder found in tropical, sub-tropical, and temperate waters throughout the world. Whilst it is less abundant off the northern Australian continental shelf, it is occasionally sighted in the Gulf of Carpentaria and near the Cobourg Peninsula (460 km northeast of the impacts EMBA) (DSEWPC, 2012).

No major nesting has been recorded in Australia, with isolated nesting recorded in Queensland and the NT (DSEWPC, 2012). The closest confirmed inter-nesting site for the leatherback turtle is at Cobourg Peninsula (DCCEEW, 2022b).

Leatherback turtles forage on pelagic soft bodied creatures (such as jellyfish, squid, salps, siphonophores and tunicates) all year round in Australian waters (DCCEEW, 2022b). No habitat critical to the survival of the leatherback turtle occurs within the impacts or flaring EMBA. Habitat critical to the survival of a species is defined by the MNES (2013) as areas that are necessary for activities such as foraging, breeding, roosting, or dispersal, areas necessary for the long-term maintenance of the species, areas necessary to maintain genetic diversity and long-term evolutionary development, or areas necessary for the reintroduction of populations or recovery of the species. Such habitat may be but is not limited to habitat identified in a recovery plan for the species as habitat critical for that species, and/or habitat listed on the Register of Critical Habitat maintained by the minister under the EPBC Act (Commonwealth of Australia, 2013).

The species may be present in the impacts and flaring EMBA.

Loggerhead turtle (EPBC Act: Endangered, listed migratory)

The loggerhead turtle (*Caretta caretta*) has a global distribution throughout tropical, sub-tropical and temperate waters. In Australia, the loggerhead turtle occurs in waters of coral and rocky reefs, seagrass beds, and muddy bays throughout eastern, northern and WA (DCCEEW, 2022b).

While nesting is mainly concentrated on sub-tropical beaches in southern Queensland and from Shark Bay to the North West Cape in WA between November and March, foraging is more widespread. Loggerhead turtles show fidelity to both their foraging and breeding areas and can migrate over 2,600 km between the two (DCCEEW, 2022b). The WA stock forage from Shark Bay through to Arnhem Land, NT (DCCEEW, 2022b).

Juveniles feed on algae, pelagic crustaceans, molluscs and flotsam, whilst as an adult the species feeds on gastropod molluscs, clams, jellyfish, starfish, coral, crabs and fish (DCCEEW, 2022b). Loggerhead turtles are known to forage around the pinnacles of the Bonaparte Basin and the carbonate bank and terrace system of the Sahul Shelf KEFs. The foraging BIA for the loggerhead turtle is not intersected by the flaring or impacts EMBA (Figure 5.25).

No habitat critical to the survival of the loggerhead turtle occurs within the impacts or flaring EMBA.

Given the proximity of the foraging BIA, it is likely that loggerhead turtles will be present in both the impacts and flaring EMBA.

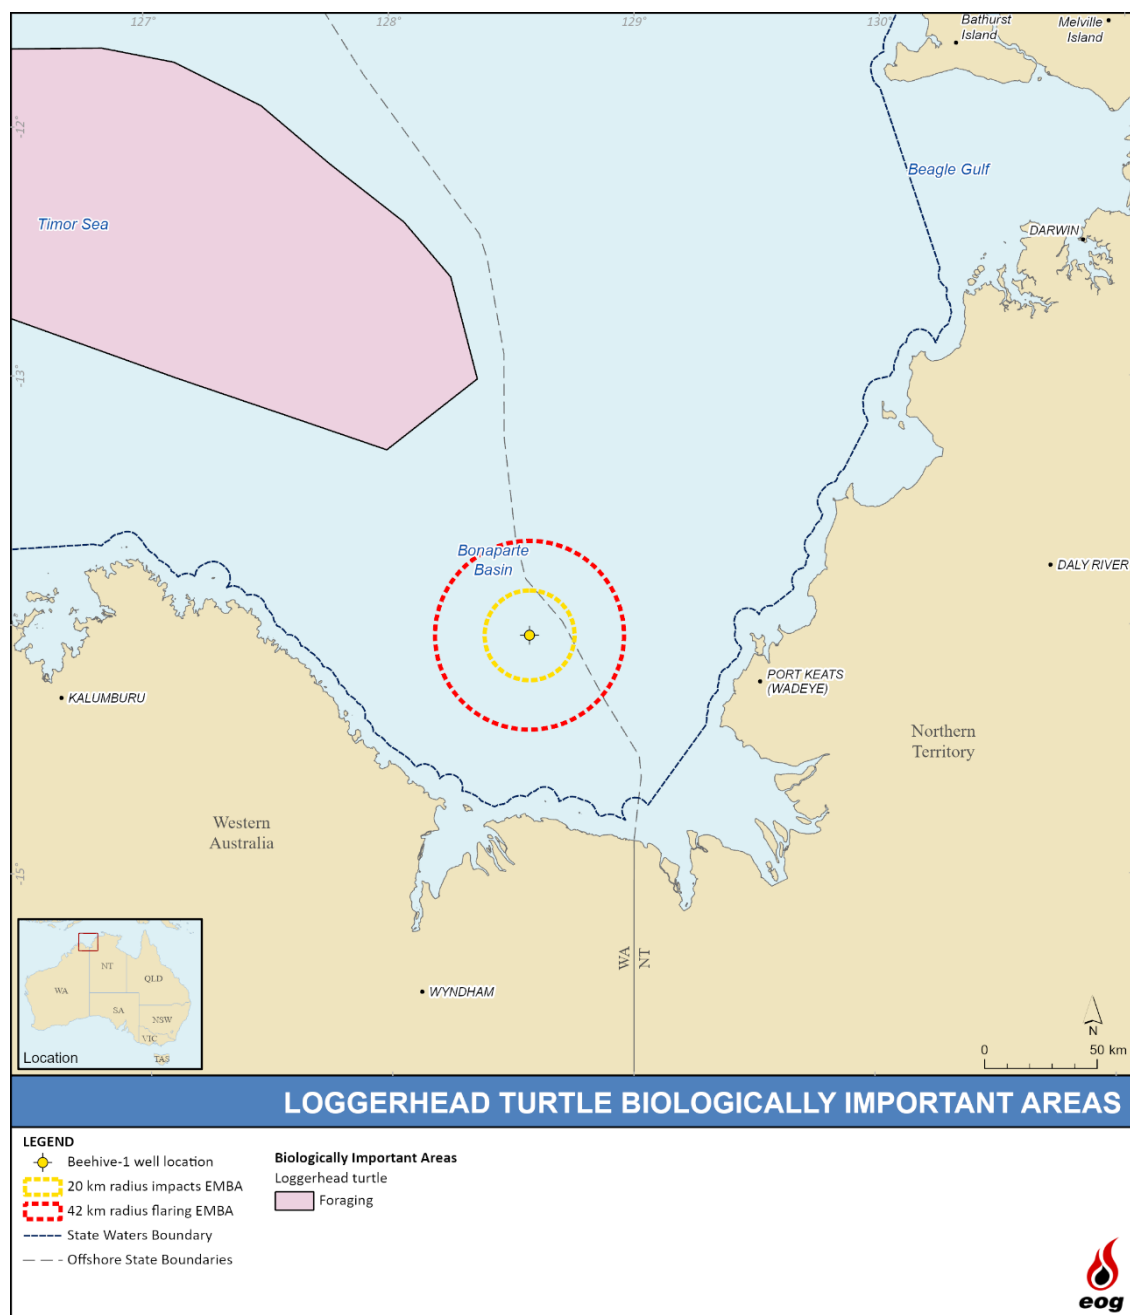

Figure 5.25. Loggerhead turtle BIA near the impacts and flaring EMBA

Green turtle (EPBC Act: Vulnerable, listed migratory)

Green turtles (*Chelonia mydas*) nest, forage and migrate across tropical northern Australia (DCCEEW, 2022b) and are commonly found foraging and nesting in the Gulf of Carpentaria (DSEWPC, 2012). In WA, nesting is between November and March and green turtles can migrate over 2,600 km between their feeding and nesting grounds (DCCEEW, 2022b). The pinnacles of the Bonaparte Basin are thought to be a KEF where green turtles move between foraging and nesting grounds (DSEWPC, 2012). The species primarily forages in shallow benthic habitats (<10 m) such as tropical tidal and subtidal coral and rocky reef habitat or inshore seagrass beds, feeding on seagrass beds or algae mats (Hazel *et al.*, 2009; DCCEEW, 2022b). Large feeding aggregations of green turtles are present at Ashmore Reef and is the only reef recorded on the Sahul Shelf where such large numbers of green turtles gather to feed.

The NCVA identifies that the impact and flaring EMBA overlap with a foraging BIA for this species (Figure 5.26). The closest nesting and inter-nesting BIAs are located 286 km west of the impacts EMBA along the northwest Kimberley coastline. Within foraging areas, adult green turtles feed on seagrass, sponges and algae (DCCEEW, 2022b).

No habitat critical to the survival of the green turtle occurs within the impacts or flaring EMBA.

Flatback turtle (EPBC Act: Vulnerable, listed migratory)

The flatback turtle (*Natador depressus*) is only found in Australian waters and some nearby waters in Indonesia and Papua New Guinea. It nests and forages in northern Australia. Breeding occurs all year round; however, in northern Australia most nesting occurs between June and August (DCCEEW, 2022b). Flatback turtle nesting is widespread across the islands and mainland beaches east of Dampier Peninsula in winter, with Cape Domett (87 km south of the impacts EMBA) reported to support the highest density (Whiting *et al.*, 2008). Flatback turtles nest at Cape Domett throughout the year. The Recovery Plan for Marine Turtles in Australia 2017 -2027 (DoEE, 2017c) notes that the peak nesting period at Cape Domett is July to September. The Cape Domett nesting population appears to be one of the largest known nesting populations of this species, with an estimated yearly population in the order of several thousand turtles (Whiting *et al.*, 2008).

The 60 km inter-nesting buffer for flatback turtles in the Recovery Plan for Marine Turtles in Australia (DoEE, 2017c) is based primarily on the movements of tagged inter-nesting flatback turtles along the North West Shelf reported by Whittock *et al.* (2014). However, these movements were confined to longshore movements in nearshore coastal waters or travel between island rookeries and the adjacent mainland (Whittock *et al.*, 2014). There is no evidence to date to indicate flatback turtles swim out into deep offshore waters during the inter-nesting period. Flatback turtle hatchlings do not have an offshore pelagic phase. Instead, hatchlings grow to maturity in shallow coastal waters thought to be close to their natal beaches (DoEE, 2017c). Flatback turtle hatchlings do not undertake oceanic migrations like the juveniles of other turtle species do, but spend their juvenile life phase within continental shelf waters. Both the impacts and flaring EMBA intersect an inter-nesting BIA, as illustrated in Figure 5.27.

Adult flatback turtles are primarily carnivorous, feeding on soft-bodied invertebrates. Juveniles eat gastropod molluscs, squid, siphonophores, and limited data indicate that cuttlefish, hydroids, soft corals, crinoids, molluscs and jellyfish are also eaten (DCCEEW, 2022b). The species has been recorded foraging in depths less than 10 m to over 40 m on the carbonate bank and terrace system of the Sahul Shelf KEF and around the pinnacles of the Bonaparte Basin KEF.

The impacts EMBA is on the cusp of an area identified as habitat critical to the survival of the flatback turtle, and the flaring EMBA overlaps a small portion of habitat critical to the survival of the flatback turtle as illustrated in Figure 5.27. The habitat critical to the survival of the flatback turtle refers to nesting activity that occurs between August to September.

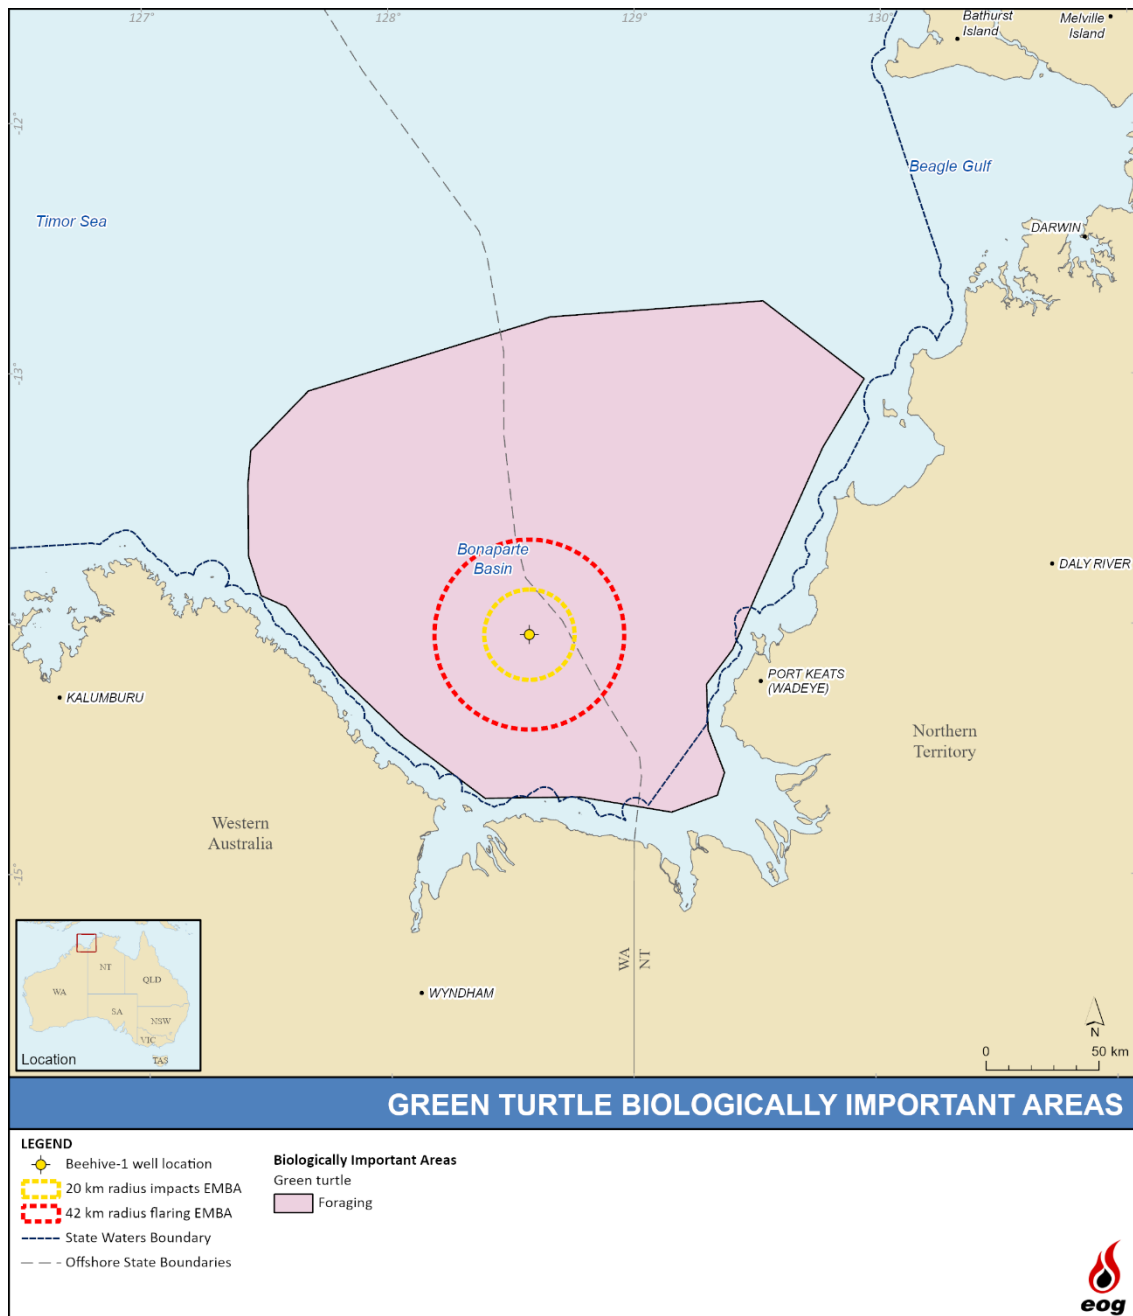

Figure 5.26. Green turtle BIA overlapped by the impacts and flaring EMBA

Olive Ridley turtle (EPBC Act: Endangered, listed migratory)

The olive ridley turtle (*Lepidochelys olivacea*) has a worldwide tropical and sub-tropical distribution and is known to occur in both WA and the NT (DSEWPC, 2012c). While nesting has been recorded in WA, it is far more common in the NT (DSEWPC, 2012).

Although olive ridley turtles nest all year round, nesting activity peaks around April to November, with the majority of nesting occurring from the Arnhem Land coast (including Bathurst Island, outside the EMBA) to the northwest coast of Cape York Peninsula (outside of the EMBA) (DSEWPC, 2012). After nesting, Olive Ridley turtles are known to migrate up to 1,050 km to various foraging areas (DCCEEW, 2022b), including the pinnacles of the Bonaparte Basin and the carbonate bank and terrace system of the Sahul Shelf KEF (DSEWPC, 2012).

The olive ridley turtle is known to primarily forage in soft-bottom habitats ranging in depths from 6 – 35 m, though they are also known to forage in pelagic waters (DEWHA 2008a). Adult turtles forage for crabs, shrimp, tunicates, jellyfish, salps and algae in depths ranging from several metres to over 100 m (DCCEEW, 2022b). The impacts and flaring EMBA do not overlap with any identified habitat critical to the survival of the olive ridley turtle (Figure 5.28) with the waters surrounding Bathurst Island being the closest area of habitat critical to the survival of this species. The NCVA identifies that the impacts and flaring EMBA overlap with a foraging BIA for this species (Figure 5.28); hence it is possible that individuals could be encountered in the impacts and flaring EMBA, though nesting is unlikely to occur in the coastal sections of the impacts and flaring EMBA.

Hawksbill turtle (EPBC Act: Vulnerable, listed migratory)

Hawksbill turtles (*Eretmochelys imbricate*) are found in tropical, sub-tropical and temperate waters in all the oceans of the world (DoEE, 2019e). The hawksbill turtle is commonly found in the NWMR, nesting extensively along the coasts and foraging in the region.

As a juvenile, the hawksbill turtle feeds on plankton and then feeds on sponges, hydroids, cephalopods, gastropods, jellyfish, seagrass and algae as an adult (DCCEEW, 2022b). The species is also highly migratory, moving up to 2,400 km between foraging and breeding areas (DSEWPC, 2012). Due to genetic variability, Australia's population is considered to comprise two distinct stocks; one in WA and the other in the northeast of Australia (DSEWPC, 2012). These distinct populations are also known to have significantly different breeding seasons.

Hawksbill turtles forage in waters ranging from 1.5 m to 84 m deep, and Fossette et al (2021) report that 17% of satellite tagged turtles (total n=42) foraged in waters greater than 20 m. Fossette et al (2021) reported less than a quarter of foraging area overlapped with designated foraging BIAs for hawksbill turtles (none of which are intersected by the flaring or impacts EMBA) and/or Commonwealth and State-managed protected areas.

The northeast sub-population breeds throughout the year with a peak nesting period during July to October (DSEWPC, 2012), while in the WA population breeding peaks around October to January. There are no BIAs or habitat critical to the survival for the species located within the impacts or flaring EMBA. The species may be encountered in the impacts and flaring EMBA as transient individuals.

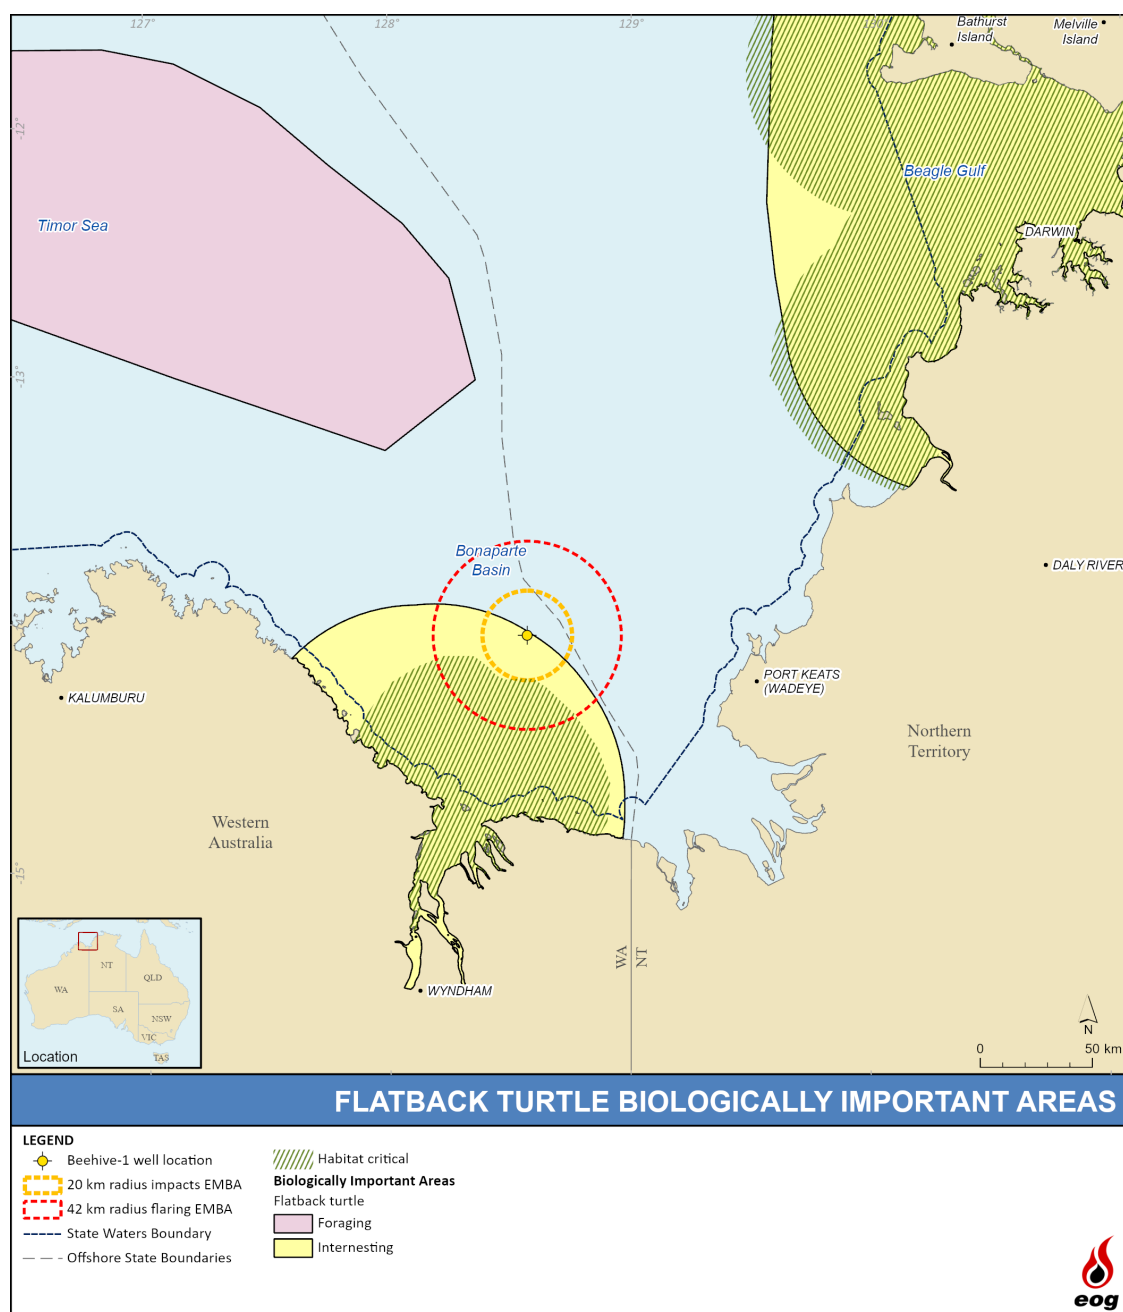

Figure 5.27. Flatback turtle BIA and critical habitat overlapped by the impacts and flaring EMBA

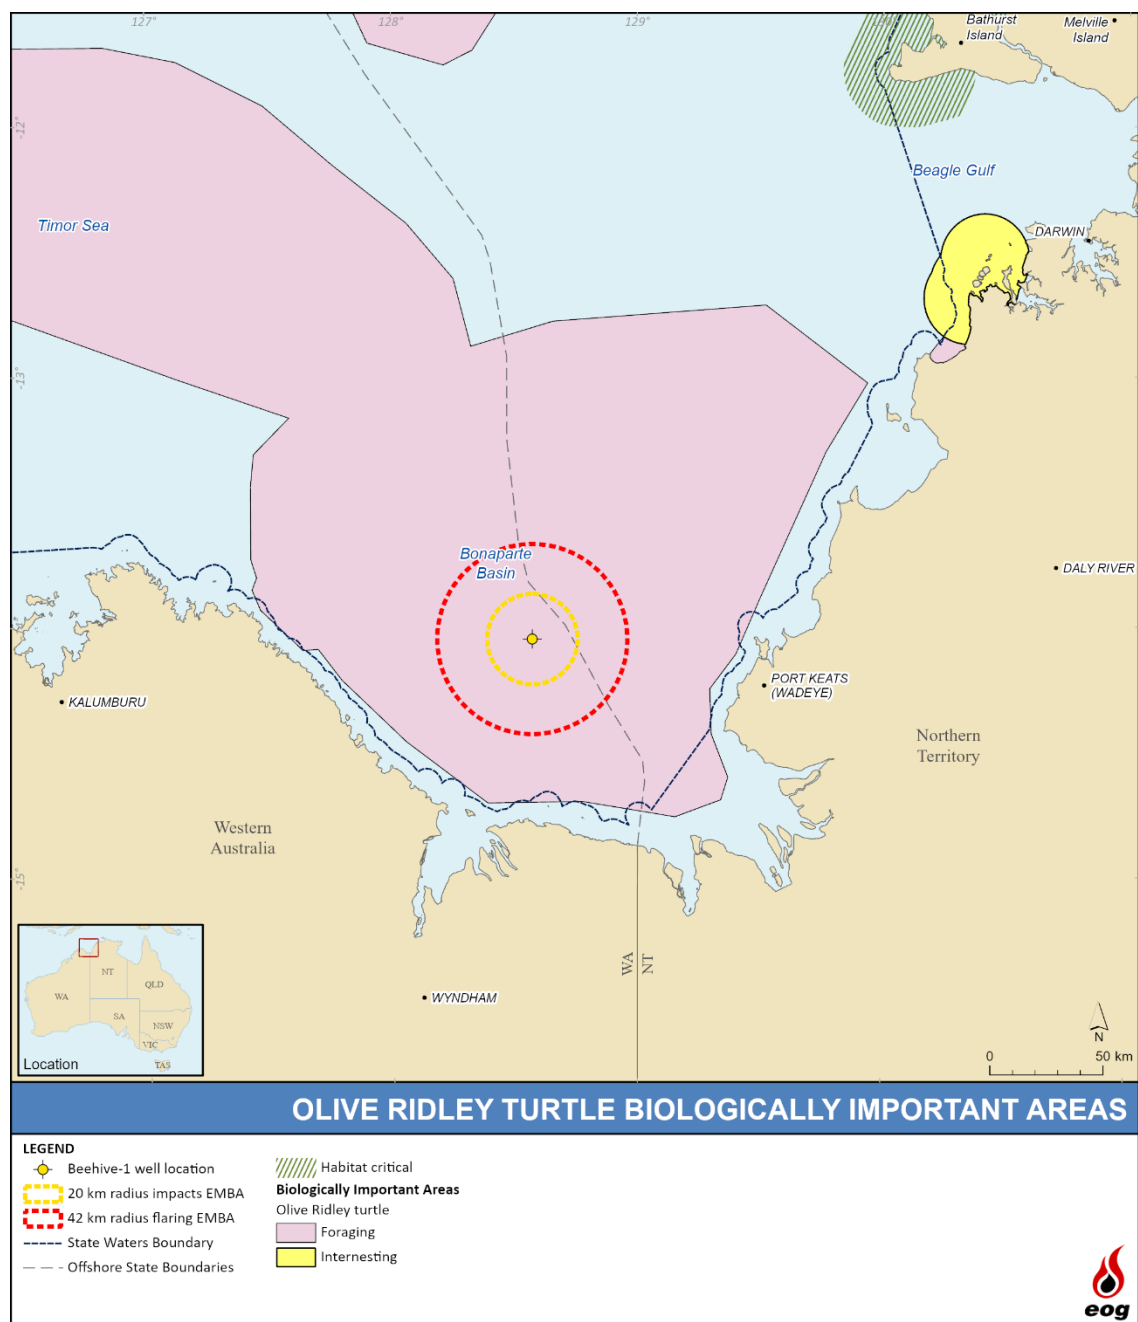

Figure 5.28. Olive Ridley turtle BIA and critical habitat overlapped by the impacts and flaring EMBA

Saltwater crocodile (EPBC Act: Listed migratory)

The saltwater crocodile (*Crocodylus porosus*) is distributed from King Sound, WA throughout coastal NT to Rockhampton in Queensland, where it can be found in coastal waters, estuaries, lakes, inland swamps and marshes up to 150 km inland from the coast (DCCEEW, 2022b).

Preferred nesting habitat of the saltwater crocodile includes elevated, isolated freshwater swamps that do not experience the influence of tidal movements. Floating rafts of vegetation also provide important nesting habitat. In the NT, most nest sites are found on the northwest banks of rivers (DCCEEW, 2022b). The species nest during the wet season with peak nesting during January and February. While sightings of saltwater crocodiles far out to sea have been recorded, it is more likely to be encountered in coastal areas than in the impacts EMBA.

Sea snakes

Sea snakes occur in tropical and subtropical waters around the world and are reported to occur in offshore and nearshore waters in northern Australia, mostly in shallower waters around reefs and inshore environments (DEWHA, 2008b).

Of the 17 species of sea snake listed in the PMST that may occur in the impacts area, the leaf-scaled sea snake (*Aiphyurus foliosquama*) is listed as Critically Endangered due to its restricted geographic range and severe reduction in numbers from 2000-2010 caused by coral reef bleaching, which reduces fish diversity and abundance and therefore a food source (DSEWPC, 2010). Unsustainable and illegal fishing are reported as the most significant direct threat to this species (DSEWPC, 2010).

This species is most likely to occur along the WA coast from Shark Bay north to the Eighty Mile Beach (outside the impacts EMBA), and less likely from there north to the western part of the JBG (also outside the impacts EMBA). The leaf-scaled sea snake occurs mostly on reef flats or in shallow waters of outer reef edges to depths of 10 m, and is known from Ashmore and Hibernia reefs (600 km west of the impacts EMBA) (DSEWPC, 2010). The habitat preferences of the leaf-scaled sea snake means it is not likely to occur in the impacts EMBA.

5.4.7. Avifauna

There are ten bird species (five migratory wetland species and five migratory marine species) listed in the PMST that 'may occur' in the impacts EMBA (Table 5.14), and the flaring EMBA includes an additional two species; the common sandpiper (*Actitis hypoleucos*) and the lesser crested tern (*Thalasseus bengalensis*) (DCCEEW, 2022a). Three of these birds are listed as threatened. The birds listed in Table 5.14 are listed in the following international conventions that aim to protect the birds themselves and their habitat:

- Republic of Korea Migratory Birds Agreement 2006 (ROKAMBA);
- Agreement between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment 1986 (CAMBA);
- Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention) 1979;
- Agreement between the Government of Australia and the Government of Japan for the Protection of Migratory Birds and Birds in Danger of Extinction and their Environment 1974 (JAMBA); and

- Convention on Wetlands of International Important especially as Waterfowl Habitat 1971 ('Ramsar Convention', see also Section 5.4.4).

Seabirds that occur within Australia or migrate regularly are considered in the Wildlife Conservation Plan (WCP) for Seabirds 2020 (Commonwealth of Australia, 2020). The plan seeks to facilitate the protection and conservation of EPBC Act listed seabirds (excluding those that are threatened).

Figure 5.29 illustrates the likely temporal presence and absence and ecological stages of these bird species in the impacts EMBA. The species listed as threatened are described here. In brief, the five seabird species listed in Table 5.14 (the frigatebirds, common noddies, streaked shearwaters and tropic bird) are birds with widespread global distributions and no breeding in or near the impacts EMBA. The flaring EMBA PMST includes a breeding BIA for the lesser crested tern, which is described in this section.

Red knot (EPBC Act: Endangered, Listed Migratory)

The red knot (*Calidris canutus*) is a small migratory shorebird that is common in all the main suitable habitats around the coast of Australia and with a global distribution and extremely large range (TSSCa, 2016). Very large numbers are regularly recorded in northwest Australia, with Eighty Mile Beach and Roebuck Bay being particular strongholds. In WA, it is widespread on the coast from Ningaloo Reef and Barrow Island to the southwest Kimberley coastline. In the NT it is mainly recorded in Darwin. Red knots feed in intertidal mudflats or sandflats exposed during low tide and during high tide, they feed in lakes and other inundated areas (TSSCa, 2016). They roost on sandy beaches, spits and islets and mudflat (TSSCa, 2016).

The species does not breed in Australia. Based on its habitat preferences, this species is not likely to occur within the impacts or flaring EMBA's but may fly over them.

Curlew sandpiper (EPBC Act: Critically Endangered, Listed Migratory)

The curlew sandpiper (*Calidris ferruginea*) is a migratory species with a global distribution and in Australia, they occur around the coasts and is also quite widespread inland, though in smaller numbers (TSSC, 2015e). They are rarely recorded in the northwest Kimberley, around Wyndham and Lake Argyle, and in the NT, they are mostly recorded around Darwin, north to Melville Island and Cobourg Peninsula (TSSC, 2015e). Curlew sandpiper habitat in Australia occurs in intertidal mudflats in sheltered coastal areas and non-tidal swamps, lakes and lagoons close to the coast, where they feed on invertebrates and seeds (TSSC, 2015e). The main threats to the species are human disturbance, habitat loss and degradation from pollution, altered water regimes and invasive plants (TSSC, 2015e).

The species does not breed in Australia. Based on its habitat preferences, this species is not likely to occur within the impacts or flaring EMBA's but may fly over them.

Eastern curlew (EPBC Act: Critically Endangered, Listed Migratory)

The eastern curlew (*Numenius madagascariensis*) is the world's largest migratory shorebird, with a wingspan of 110 cm (DoE, 2015c). It does not breed in Australia and while here, it has a coastal distribution around the whole country (DoE, 2015c). Eastern curlews feed on crustaceans and insects in soft sheltered intertidal sandflats or mudflats, open and without vegetation or covered with seagrass, often near mangroves, on saltflats and in saltmarsh, rockpools and among rubble on coral reefs, and on ocean beaches near the tideline (DoE, 2015c). They typically roost in large flocks on sandy spits, sandbars and islets and among coastal vegetation (DoE, 2015c). During the

non-breeding season in Australia, they feed mainly on crustaceans and insects (DoE, 2015c). Based on its habitat preferences, the eastern curlew is not likely to occur within the impacts or flaring EMBA but may fly over them.

Lesser crested tern (EPBC Act: Listed Migratory)

The lesser crested tern (*Sterna bengalensis*) inhabits tropical and sub-tropical sandy and coral coasts and estuaries (DSEWPC, 2012). In Australia, lesser crested terns are found on coasts and in coastal waters, primarily in northern Australia. The species occurs around most of the NT, with the highest density of confirmed sightings along the coast to the south-west of Darwin (DSEWPC, 2012).

The species breeds on low-lying islands, coral flats, sandbanks and flat sandy beaches, and may move nesting sites from one year to the next (DSEWPC, 2012). Lesser crested terns forage for small pelagic fish and prawns in the surf and over offshore waters in areas of reef and deeper shelf waters (DSEWPC, 2012). The lesser crested tern is listed as having a 'known occurrence' within the flaring EMBA, and a breeding BIA is also present in proximity to the flaring EMBA (Figure 5.30). It is likely the lesser crested tern occurs within the flaring EMBA but not the impacts EMBA.

Table 5.14. EPBC Act-listed bird species that may occur in the impacts EMBA

Scientific name	Common name	EPBC Act Status			Type of presence in impacts EMBA	Type of presence in flaring EMBA	BIA intersected by impacts EMBA?	BIA intersected by flaring EMBA?	Recovery Plan in place?

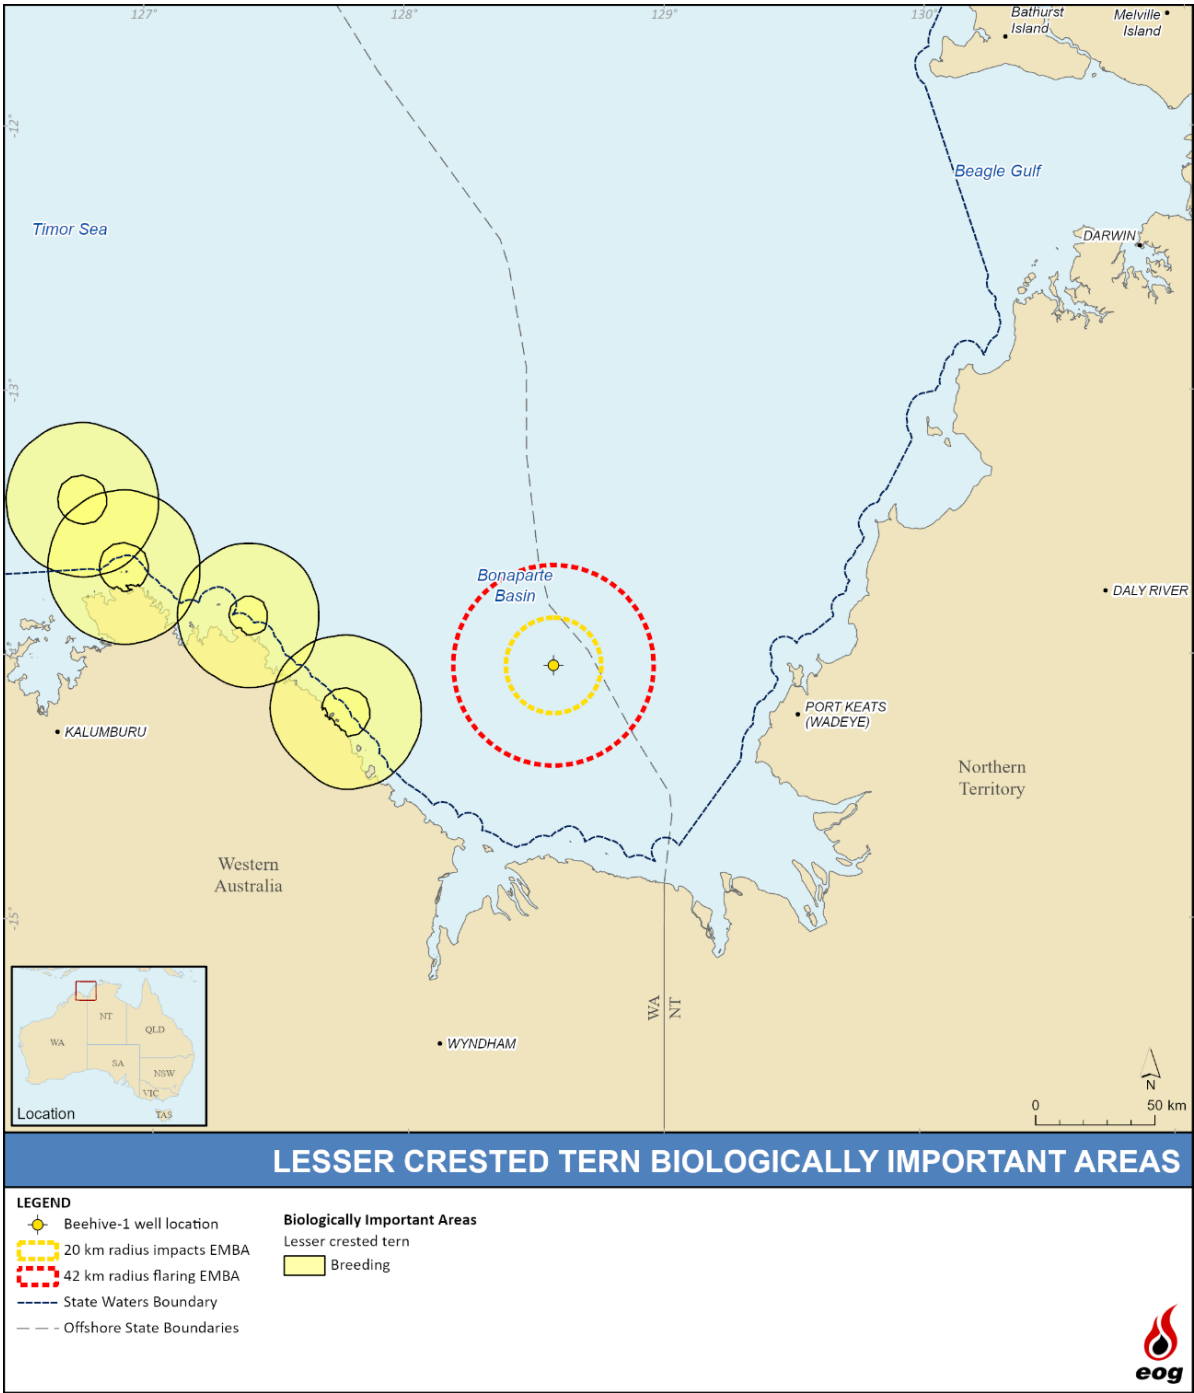

Figure 5.30. Lesser crested tern BIA in relation to the impacts and flaring EMBA

Threats and pressures on birds

Three of the shorebirds listed in Table 5.14 are subject to pressures, which are described in various recovery plans and conservation advice. Table 5.15 summarises the pressures listed in the plans/advice relevant to each of these species that could result from drilling activities.

Table 5.15. Summary of threats to birds

Species	Recovery Plan, Management Plan or Conservation Advice	Key threat/s relevant to drilling
Red knot	Conservation advice for <i>Calidris canutus</i> (red knot) (TSSC, 2016a)	Pollution/contamination Disturbance Direct mortality (bird strike from aircraft)
Curlew sandpiper	Conservation advice for <i>Calidris ferruginea</i> (curlew sandpiper) (TSSC, 2015e)	Human disturbance Degradation from pollution
Eastern curlew	Conservation advice for <i>Numenius madagascariensis</i> (eastern curlew) (DoE, 2015c)	Human disturbance Degradation from pollution
All seabirds and shorebirds	Threat Abatement Plan for the impacts of marine debris on the 138 vertebrate wildlife of Australia's coasts and oceans (DoEE, 2018)	Marine debris (plastics)
	National Light Pollution Guidelines for Wildlife including marine turtles, seabirds and migratory shorebirds	Artificial light
All EPBC Act listed seabirds (excluding those that are threatened)	Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020)	Light pollution Acute pollution Chronic pollution Climate change Shipping

5.4.8. Marine Pests

It is widely recognised that marine pests can become invasive and cause significant impacts on economic, ecological, social and cultural values of marine environments. Impacts can include the introduction of new diseases, altering ecosystem processes and reducing biodiversity, causing major economic loss and disrupting human activities (Brusati and Grosholz, 2007).

The Marine Pests Interactive Map (DAFF, 2021) indicates that the major port likely to be used to support the activity (e.g., Darwin) is not known to harbour any marine pests. However, DAFF (2021) notes that the following species are listed to keep watch for in the Port of Darwin due to their high potential for accidental introduction:

- Asian green mussel (*Perna viridis*) – typically inhabits soft sediment bottoms from the low tide mark to shallow waters up to 42 m deep. Juveniles are bright green then turn brown in adults.
- American slipper limpet (*Crepidula fornicata*) – competes with native species for food and space and may alter sediment characteristics by removing suspended sediments from the

water column. Its likely habitat includes mud, rocks and sand within shores and shallow waters.

- Black striped false mussel (*Mytilopsis salleri*) – affects the productivity of commercial fisheries and aquaculture by competing with native species for food and space. The species usually inhabits shallow waters up to a few metres deep.
- Charru mussel (*Mytella charruana*) – successful invasive species globally due to its great dispersal ability and tolerance for a wide variety of habitats. Typically found on rocky or hard substrates in shallow waters.

5.5. Conservation Values and Sensitivities

The conservation values and sensitivities within the impacts EMBA are described in this section, with Table 5.16 providing an outline of the conservation categories described.

Table 5.16. Conservation values in the impacts EMBA

Category	Conservation classification	EP section
MNES under the EPBC Act	Australian Marine Parks (AMP)	5.5.1
	World Heritage-listed properties	5.5.2
	National Heritage-listed places	5.5.3
	Wetlands of international importance	5.5.4
	Nationally threatened species and threatened ecological communities	5.4
	Migratory species	5.4
	Great Barrier Reef Marine Park	Not applicable.
	Nuclear actions	Not applicable.
	A water resource, in relation to coal seam gas development and large coal mining development	Not applicable.
Other areas of national importance	Commonwealth heritage-listed places	5.5.6
	Key Ecological Features (KEF)	5.5.7
	Nationally important wetlands (NIW)	5.5.8
State protected areas	State/territory protected areas	5.5.9

5.5.1. Australian Marine Parks

The impacts EMBA does not overlap any AMPs. The closest AMP is the JBG AMP, located 15 km to the east of the impacts EMBA and 35 km east of Beehive-1. AMPs in the spill EMBA are described in Section 5.4.1 of Appendix 11.

5.5.2. World Heritage-Listed Properties

World Heritage Listed-properties are examples of sites that represent the best examples of the world's cultural and heritage values, of which Australia has 20 properties (DCCEEW, 2022d). In Australia, these properties are protected under Chapter 5, Part 15 of the EPBC Act.

There are no World Heritage Properties within or adjacent to the impacts EMBA. The closest World Heritage Property is Kakadu National Park (onshore), which is located over 400 km northeast of the impacts EMBA. World Heritage-listed places intersected by the spill EMBA are described in Section 5.4.2 of Appendix 11.

5.5.3. National Heritage-Listed Properties

The National Heritage List is Australia's list of natural, historic and Indigenous places of outstanding significance to the nation (DCCEEW, 2022e). These places are protected under Chapter 5, Part 15 of the EPBC Act.

There are no National Heritage-listed places within or adjacent to the impacts EMBA. The closest National Heritage Place is the 'West Kimberley', which is located 51 km south-southwest of the impacts EMBA and 71 km south-southwest of Beehive-1.

National Heritage-listed places intersected by the spill EMBA are described in Section 5.4.3 of Appendix 11.

5.5.4. Wetlands of International Importance

Australia has 66 wetlands of international importance ('Ramsar wetlands') that cover more than 8.3 million hectares (as of September 2021) (DCCEEW, 2022f). Ramsar wetlands are those that are representative, rare or unique wetlands, or are important for conserving biological diversity, and are included on the List of Wetlands of International Importance developed under the Ramsar Convention. These wetlands are protected under Chapter 5, Part 15 of the EPBC Act.

There are no Ramsar wetlands within or adjacent to the impacts EMBA. The closest Ramsar wetland is the 'Ord River Floodplain', which is located 70 km south of the impacts EMBA and 90 km south of Beehive-1.

Ramsar wetlands intersected by the spill EMBA are described in Section 5.4.4 of Appendix 11.

5.5.5. Threatened Ecological Communities

The Australian Government is responsible for identifying and protecting MNES through the EPBC Act. Threatened Ecological Communities (TECs) are a MNES under the EPBC Act. TECs provide wildlife corridors and/or habitat refuges for many plant and animal species, and listing a TEC provides a form of landscape or systems-level conservation (including threatened species).

There are no TECs within or adjacent to the impacts EMBA. The closest TEC is the 'Holothuria Banks', which is located 237 km west of the impacts EMBA and 257 km west of Beehive-1.

TECs intersected by the spill EMBA are described in Section 5.4.5 of Appendix 11.

5.5.6. Commonwealth Heritage-listed Places

Commonwealth Heritage-listed places are natural, indigenous and historic heritage places owned or controlled by the Commonwealth (DCCEEW, 2022g). In Australia, these properties are protected under Chapter 5, Part 15 of the EPBC Act.

There are no Commonwealth Heritage-listed places within or adjacent to the impacts EMBA. Commonwealth Heritage-listed places intersected by the spill EMBA are described in Section 5.4.6 of Appendix 11.

5.5.7. Key Ecological Features

KEFs are components of the marine ecosystem that are considered to be important for biodiversity or ecosystem function and integrity of the Commonwealth Marine Area. There are no KEFs within or adjacent to the impacts EMBA. The closest KEF is the 'Carbonate bank and terrace system of the Sahul Shelf', which is located 6 km west of the impacts EMBA and 26 km east of Beehive-1. KEFs intersected by the spill EMBA are described in Section 5.4.7 of Appendix 11.

5.5.8. Nationally Important Wetlands

NIWs are considered significant for a variety of reasons, including their importance for maintaining ecological and hydrological roles in wetland systems, providing important habitat for animals at a vulnerable or particular stage in their life cycle, supporting 1% or more of the national population of any native plant or animal taxa or for its outstanding historical or cultural significance (DCCEEW, 2022h).

There are no NIWs within or adjacent to the impacts EMBA. The closest NIW is the Ord Estuary System, which is located 70 km south west of the impacts EMBA and 90 km east of Beehive-1.

NIWs intersected by the spill EMBA are described in Section 5.4.8 of Appendix 11.

5.5.9. State/Territory Protected Areas

The impacts EMBA does not overlap any State- or Territory-managed protected areas. State and territory marine protected areas intersected by the spill EMBA are described in Section 5.4.9 of Appendix 11.

5.6. Heritage Values

Cultural heritage includes both tangible and intangible values, the definition of cultural heritage has evolved in recent decades as non-tangible cultural heritage continues to develop. Non-tangible cultural heritage includes oral traditions, performing arts, social practices, rituals, festive events, knowledge, and practices concerning nature and the universe or the knowledge and skills to produce traditional crafts (UNESCO, 2022). Tangible cultural heritage includes artefacts, monuments, a group of buildings and sites and museums that have a diversity of values including symbolic, historic, artistic, aesthetic, ethnological or anthropological, scientific, and social significance. Cultural heritage also captures natural heritage such as culturally significant landscapes (UNESCO, 2009).

A search of the WA inHerit cultural heritage database (Government of Western Australia, 2021) does not identify any cultural heritage places within the proposed location of Beehive-1 or within the impacts EMBA. This section describes the cultural heritage values of the impacts EMBA, which are broadly categorised as Indigenous and non-Indigenous (maritime archaeology).

5.6.1. Aboriginal Heritage

First Nations people have a strong continuing connection with the area that extends back some 50,000 years. The existence of any unknown Aboriginal sites or artefacts of significance within the offshore waters of northern Australia is considered highly unlikely.

A search of the WA Department of Aboriginal Affairs' Aboriginal Heritage Inquiry System (AHIS) does not identify any registered Aboriginal heritage sites, other heritage sites or Aboriginal heritage survey areas within the proposed Beehive-1 location or impacts EMBA.

During the relevant persons consultation process, a Tiwi Islands Land Council anthropologist stated that due to the proposed location of Beehive-1, there are no cultural impacts relating to the Tiwi Islands.

Sites within the spill EMBA are listed in Section 5.5.1 of Appendix 11. Information on the values and sensitivities of First Nations people closer to the coast (outside the impacts EMBA) is described in Sections 5.6.3 and 5.6.4 of Appendix 11.

Sea Country is described in section 5.5.4 of Appendix 11.

5.6.2. Maritime Archaeological Heritage

Historic shipwrecks are recognised and protected under the *Underwater Cultural Heritage Act* 2018, which aims to protect historic wrecks and associated relics. Under the Act, all wrecks more than 75 years old are protected, together with their associated relics regardless of whether their actual locations are known.

A search of the National Shipwreck and Relic database identifies no shipwrecks within the impacts EMBA. Shipwrecks within the spill EMBA are listed in Section 5.5.2 of Appendix 11.

5.6.3. Native Title

According to the National Native Title Tribunal (NNTT) Register, there are no Native Title determination or application areas within the impacts EMBA. The Native Title areas within the spill EMBA are described in Section 5.5.3 of Appendix 11.

5.7. Socio-economic environment

This section describes the social and economic environment of the impacts EMBA.

5.7.1. Commercial Fishing

Several Commonwealth, WA and NT commercial fisheries are licensed to operate in the impacts EMBA. These are described in the following sections.

Commonwealth-managed Fisheries

Commonwealth fisheries are managed by AFMA under the *Fisheries Management Act 1991* (Cth). Their jurisdiction covers the area of ocean from 3 nm from the coast out to the 200 nm limit (the extent of the Australian Fishing Zone [AFZ]). Commonwealth commercial fisheries with jurisdictions to fish in the impacts EMBA are the:

- Northern Prawn Fishery (NPF).
- North West Slope Trawl Fishery;
- Southern Bluefin Tuna (SBT) Fishery;
- Western Tuna and Billfish Fishery (WTBF); and
- Western Skipjack Tuna Fishery (WSTF);

Of these fisheries, only the NPF has evidence of recent (within the last three years) fishing activity in the impacts EMBA. During the relevant persons consultation process, AFMA stated that the NPF has a historic catch and effort around the proposed Beehive-1 location, catching red-legged banana prawns. The NPFI and CSIRO confirmed during the relevant persons consultation process

that there is a low fishing effort/catch in the proposed Beehive-1 location, with most fishing occurring north and northwest of the proposed Beehive-1 location for adult prawns.

Table 5.17 summarises the key facts and figures of the NPF and Figure 5.30(a;b) illustrates the overlap between the fishery and the impacts EMBA. Commonwealth-managed fisheries intersected by the spill EMBA are described in Appendix 11.

Table 5.17. Commonwealth-managed NPF

Target species	Redleg banana prawn (<i>Fenneropenaeus indicus</i>) White banana prawn (<i>F. merguensis</i>) Brown tiger prawn (<i>Penaeus esculentus</i>) Grooved tiger prawn (<i>P. semisulcatus</i>) Blue endeavour prawn (<i>Metapenaeus endeavouri</i>) Red endeavour prawn (<i>M. ensis</i>)
Fishing season	The NPF operates in two seasons; <ul style="list-style-type: none"> • First – April to June, when banana prawns are the key catch species. • Second – August to November, when tiger prawns are the key catch species.
Fishing methods, vessels and licences	Otter trawl is the primary fishing method. In the 2021 fishing season, there were 54 active vessels in the fishery. An increase of two vessels compared to 2020. The primary landing ports are Darwin (NT), Cairns and Karumba (Qld).
Catch data and other information	Catch data and economic value available for the last five years: <ul style="list-style-type: none"> • 2021 – 5,390 tonnes valued at \$76.6 million. • 2020 – 4,767 tonnes valued at \$84.9 million. • 2019 – 8,581 tonnes valued at \$117.1 million. • 2018 – 6,778 tonnes valued at \$98.2 million. • 2017 – 6,602 tonnes valued at \$118.1 million.

Sources: Patterson *et al* (2022, 2021; 2020; 2019; 2018;).

Northern Prawn Fishery

Prawn species reach a commercial size at six months of age and can live for up to two years. Growth rates vary considerably between species and sexes, with females generally growing faster and to a larger size than males. The larger the prawn, the higher the price.

Most species are sexually mature at six months, but fertility increases with age. Females can produce hundreds of thousands of eggs at a single spawning at twelve months old and may spawn more than once in a season. After spawning in offshore waters, the eggs sink to the bottom after release, where they hatch into larvae within about 24 hours. Usually <1% of these offspring survive the two-to-four-week planktonic larval phase to reach suitable coastal nursery habitats where they may settle. After one to three months in the nursery grounds, the young prawns move offshore into the fishing grounds.

NPF catch in the JBG is comprised primarily of banana prawns (mainly *F. indicus* and some *F. merguensis*), with banana prawn catch being more than double that of tiger prawns and endeavour prawns in 2019 combined (Patterson *et al.*, 2020). The JBG comprises about 30,000 km² of the westernmost portion of the NPF (see Figure 5.31). Fishing for *F. indicus* is permitted day and night in both NPF fishing seasons. Fishing takes place in waters 35–75 m deep,

with most fishing effort between 50 m and 60 m. The trawling regime for this species is similar to the tiger prawn sub-fishery in other regions of the NPF, where the total duration of individual trawls is usually about 3 hours long. Although the JBG fishery comprises less than 5% of the area of the NPF, it contributes about 65% of the NPF's redleg banana prawn catch and around 20% of the NPF's total banana prawn catch (combined *F. merguensis* and *F. indicus*) (Loneragan *et al.*, 2002).

Research to date indicates that *F. indicus* prawns spawn offshore near to the fishing area throughout the year with two spawning peaks: the late dry season (September to November) and the late wet season (March to May). The larvae move inshore and then wash out as juveniles with the wet season floods. The migration of juvenile *P. indicus* in the JBG (as described in Table 5.5) is illustrated in Figure 5.32. Loneragan *et al.* (2002) reported that the offshore fishery for *F. indicus* occurs in water depths of 50 – 80 m in the north western offshore waters of the JBG, deeper than the majority of the waters of the impacts EMBA.

During the relevant persons consultation process, the NPF stated that the redleg banana prawn moves within the proposed Beehive-1 location throughout its life cycle. Larvae and postlarvae are transported south and southeast from their offshore spawning grounds where they are fished, towards their coastal nursery habitats in mangrove forest and mudbanks. The Victoria River and Forsyth Creek, along with other rivers feeding into the Cambridge Gulf, support prime estuarine habitats for prawns. Juvenile prawns then migrate back to adult prawn habitats in the northwest central region of the JBG at depths of around 60-80 m deep.

Figures 5.31a-c show the NPF fishing intensity in relation to the impacts EMBA for the past three fishing seasons (2019, 2020 & 2021). All three years demonstrate low fishing intensity occurs within the impacts EMBA.

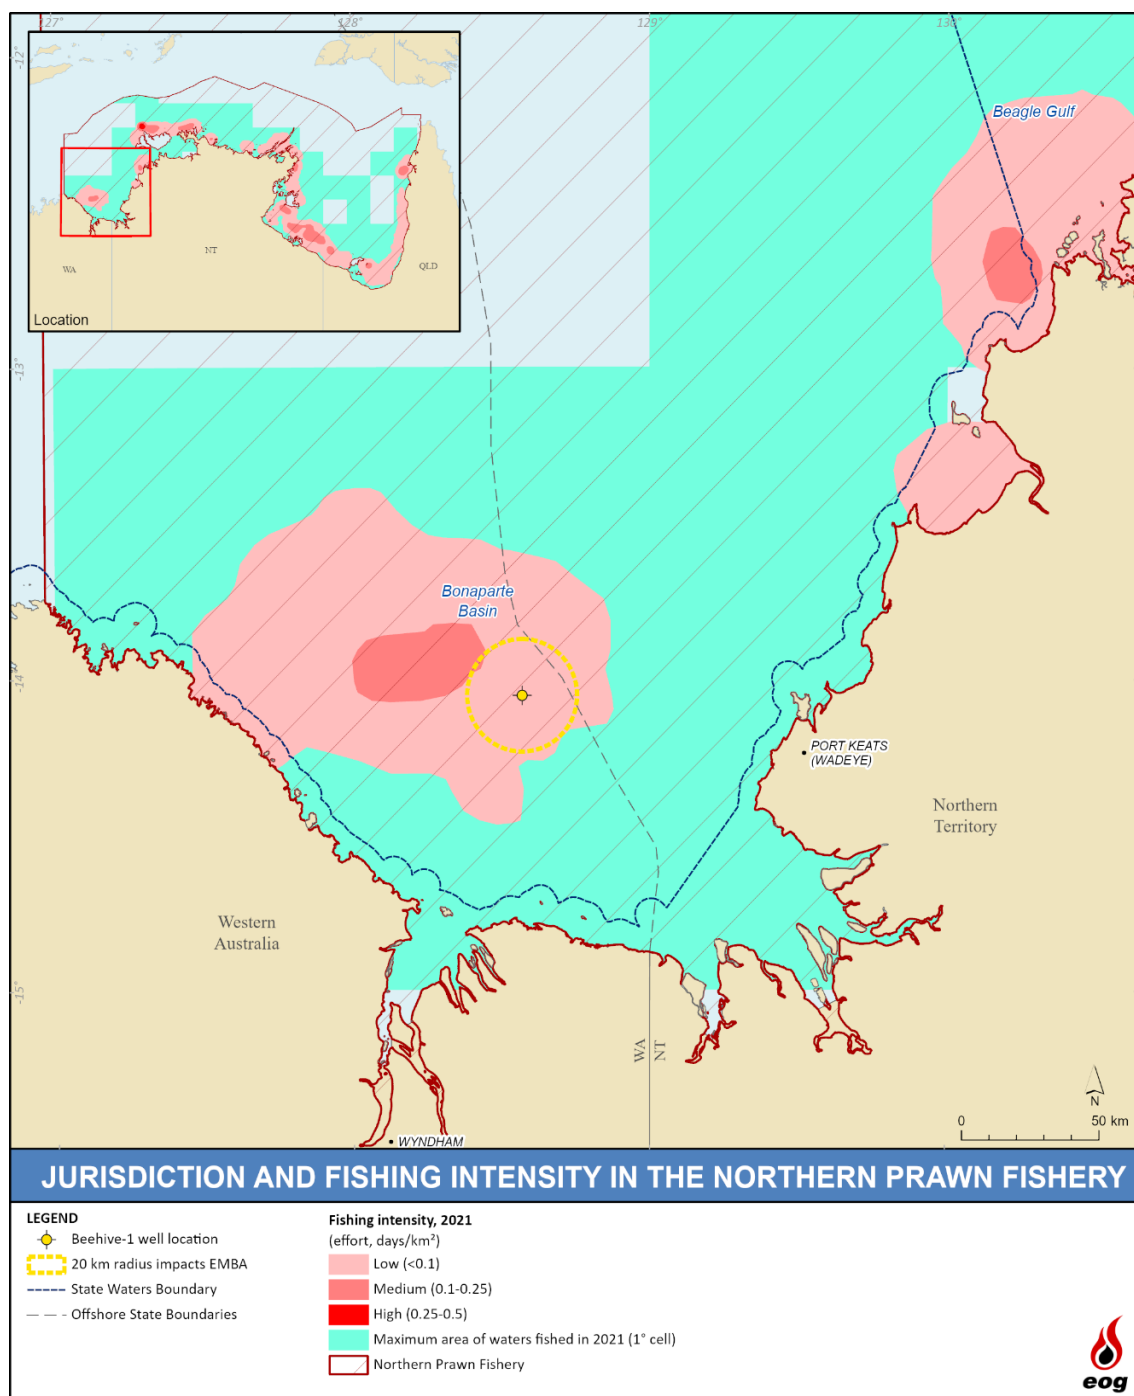

Figure 5.31a. NPF fishing intensity in the impacts EMBA (2021)

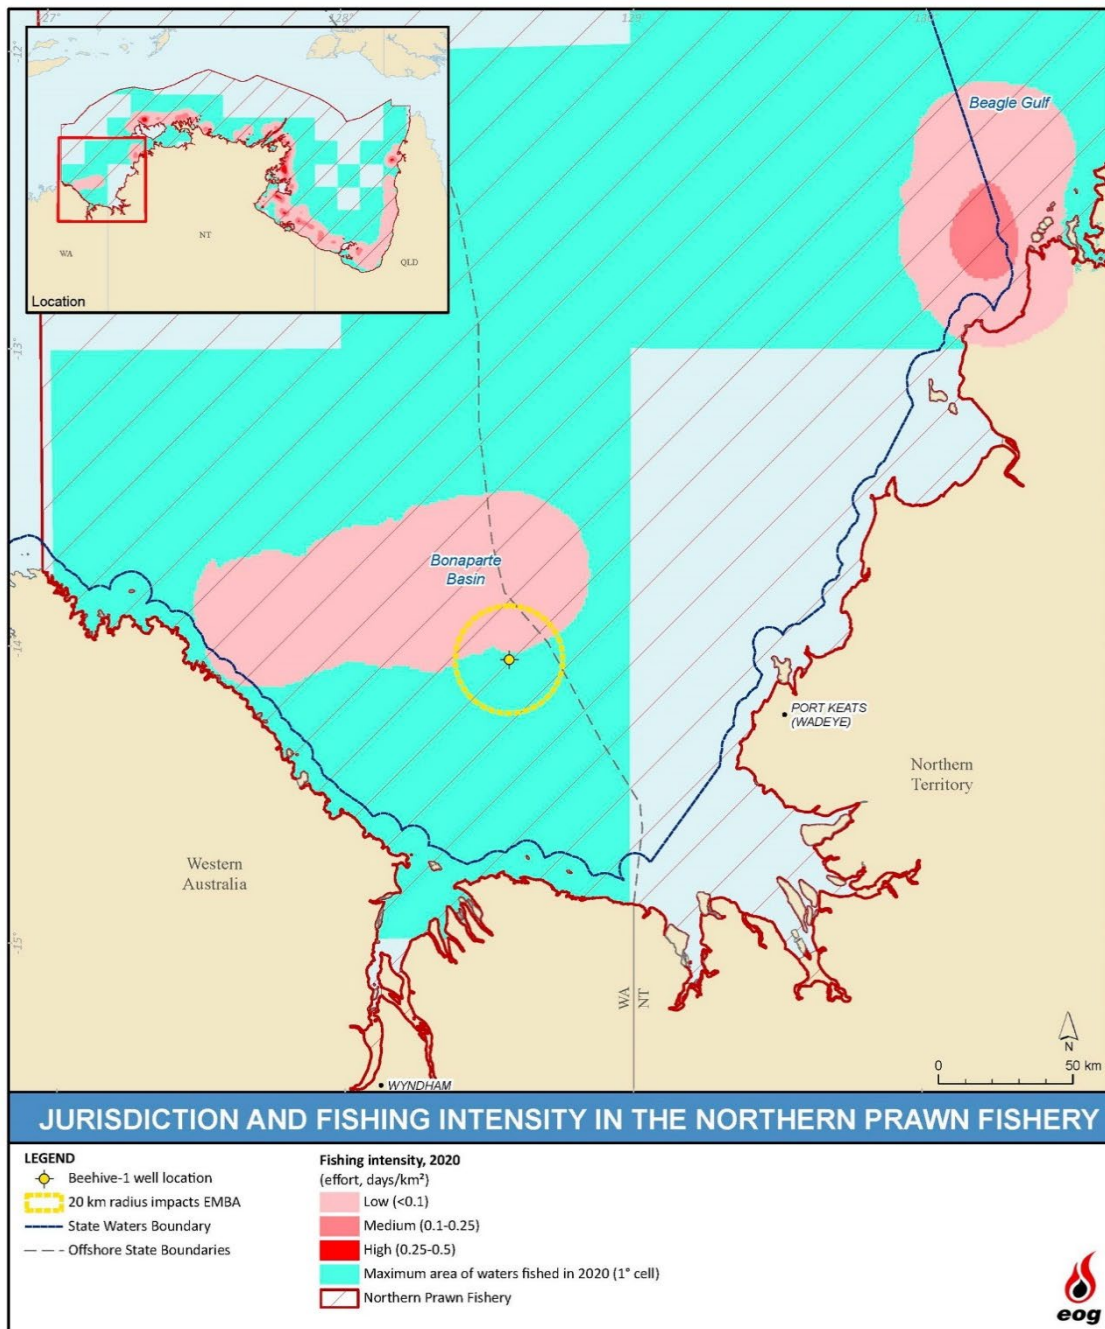

Figure 5.31b. NPF fishing intensity in the impacts EMBA (2020)

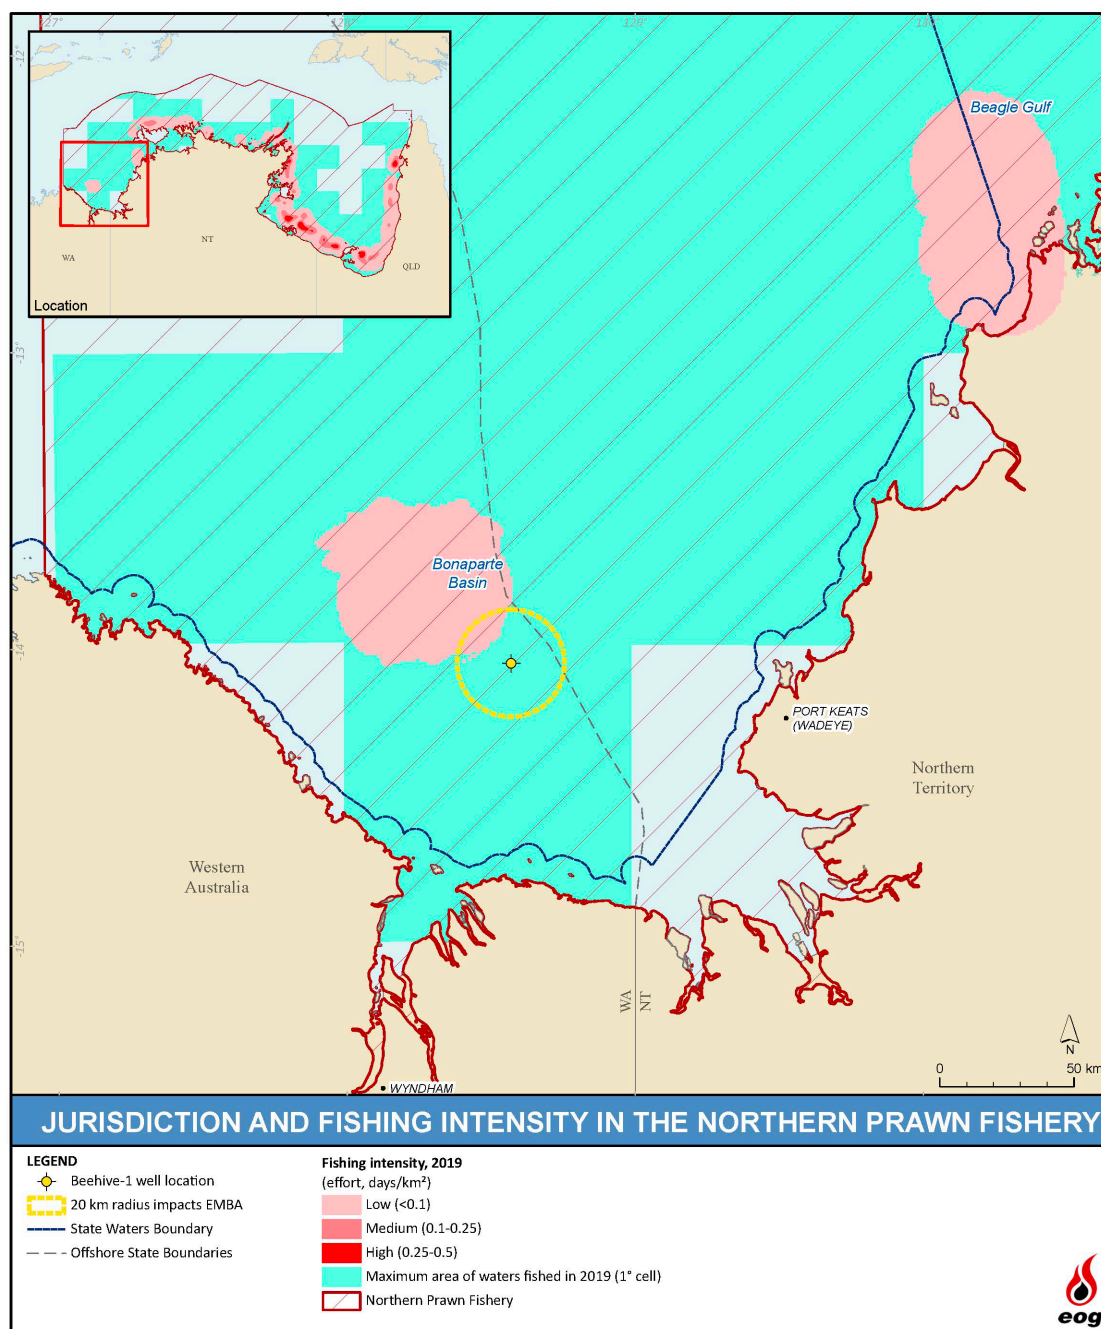

Figure 5.31c. NPF fishing intensity in the impacts EMBA (2019)

Source: Loneragan *et al* (2002).

Figure 5.32. Size and the probable advection envelope for post-larval redleg banana prawn (*Fenneropenaeus indicus*) in the JBG

A seasonal closure for the NPF in the JBG exists in the period 31 March –15 June (Figure 5.33) (AFMA, 2021). The seasonal closure is an exclusion zone in place for all licence holders within the NPF, and the purpose of this closure is to protect small juvenile prawns as they migrate offshore to deeper waters in the southern JBG, where the adults are targeted during the trawling operations (AFMA, 2021). Any catch south of the seasonal closure line is taken in the second fishing season only (August to November), whereas catch taken north of the closure line is taken during both the first and second seasons. The impacts EMBA is located within this exclusion zone.

Due to the large tidal range (6–8 m) in the JBG and its reputed influence on prawn abundance in the region, red-legged banana prawns are fished on the neap tides, when tidal range and currents are minimal (Tonks *et al.*, 2008). Thus, over a tide cycle, fishing effort is high on the late spring-neap, neap and early neap-spring tides, and low to non-existent at other times when the fleet moves to fishing grounds north of Melville Island and Port Essington, outside the JBG. The extra steaming time that this fishing pattern generates, together with the remoteness of the JBG and the lower price of redleg banana prawns in comparison to other species of prawns, makes the JBG a less attractive area to fish than other parts of the NPF. As a result, the annual fishing effort in the JBG fishery is mostly dependent on the catch levels elsewhere in the NPF; if catches are good elsewhere, effort in the JBG is low (Loneragan *et al.*, 2002).

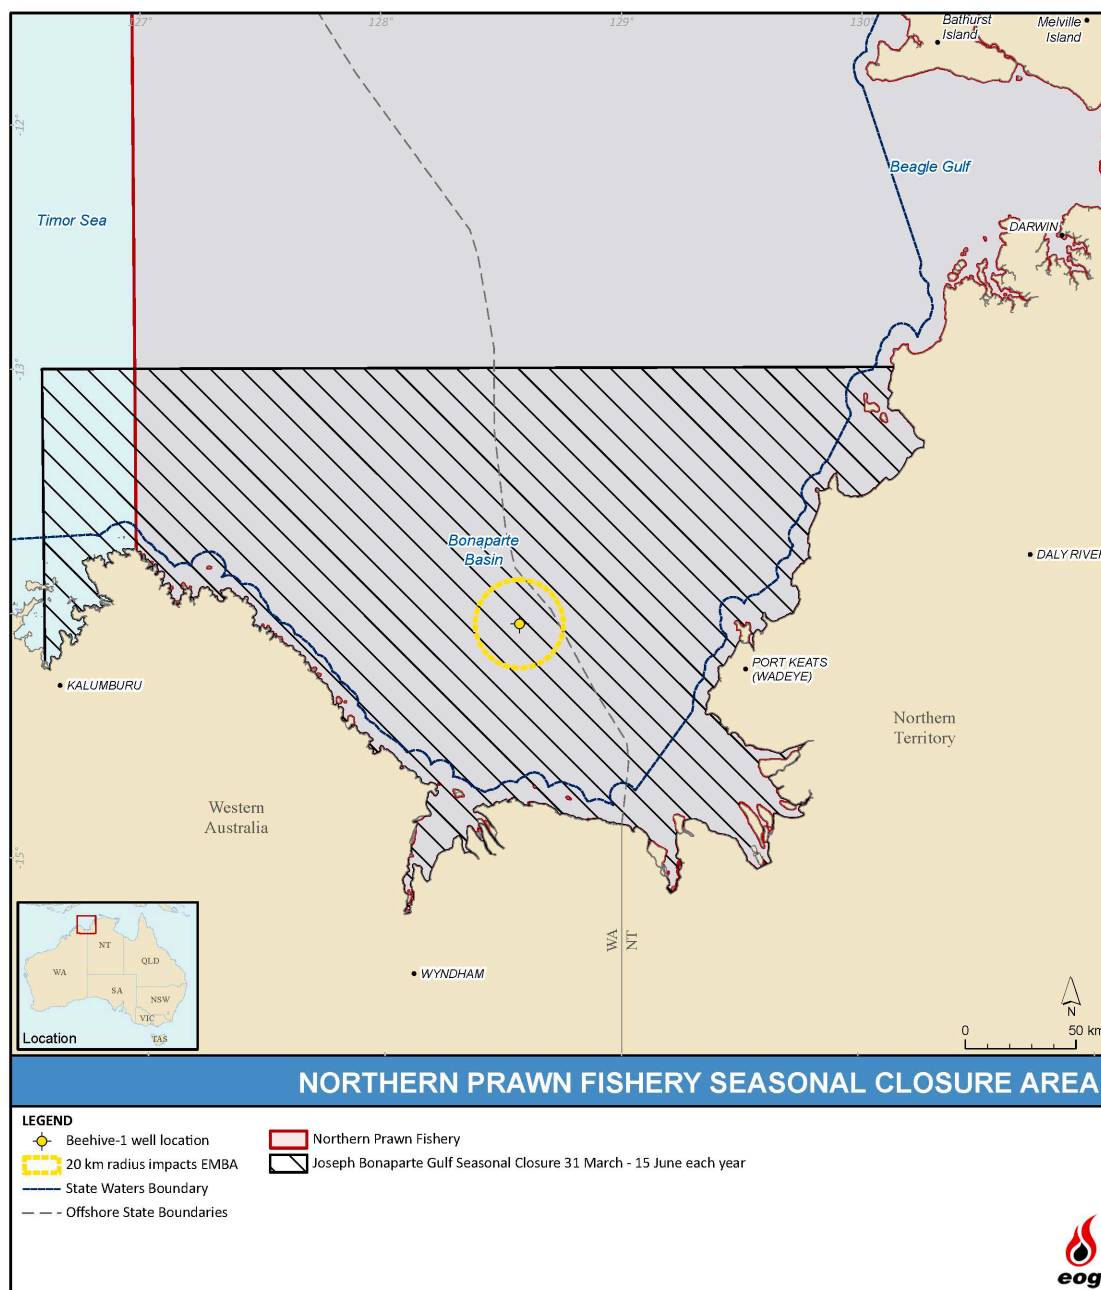

Figure 5.33. JBG closure area of the NPF

Western Australia-managed Fisheries

Western Australian-managed commercial fisheries that are authorised to harvest in the waters of the impacts EMBA include the following (noting that not all actively fish):

- Northern Demersal Scalefish Managed Fishery (NDSMF);
- Mackerel Managed Fisheries (MMF) (Area 1 – Kimberley);
- Kimberley Crab Managed Fishery (North Coast Crab Fishery) (KCMF);
- Kimberly Prawn Managed Fishery;
- Kimberley Gillnet and Barramundi Fishery;

- Pearl Oyster Managed Fishery (Zone 3)
- Abalone Managed fishery (Area 8);
- Marine Aquarium Fish Fishery; and
- Specimen Shell Fishery.

Through its consultation process with the WA DPIRD, EOG identified that only the NDSMF and MMF may fish in the impacts EMBA. Table 5.18 presents information for the fisheries that have recent evidence of fishing in the impacts EMBA. Western Australian-managed fisheries intersected by the spill EMBA are described in Section 5.6.1 of Appendix 11.

Northern Territory-managed Fisheries

The NT DITT confirms there are no NT-managed commercial fisheries that fish within the impacts EMBA. Throughout the relevant persons consultation process, the NT demersal fishery confirmed that no NT fisheries operate in within the impacts EMBA due to the location being wholly within a WA waters.

Northern Territory-managed fisheries intersected by the spill EMBA are described in Section 5.6.1 of Appendix 11.

Table 5.18. Western Australian-managed commercial fisheries with recent fishing effort in the impacts EMBA

Fishery	Target species	Fishing activity in the impacts EMBA?	Fishing season	Fishing methods, vessels and licences	Catch data and other information
NDSMF – Kimberley sector, Fishing Area 2, Zone A (Figure 5.34)	Targets predominately goldband snapper (<i>Pristipomoides multidentis</i>), crimson snapper, red emperor (<i>Lutjanus sebae</i>) bluespotted emperor (<i>Lethrinus punctulatus</i>), saddletail snapper (<i>L. malabaricus</i>), rankin cod (<i>Epinephelus multinotatus</i>), brownstripe snapper (<i>L. vitta</i>), rosy threadfin bream (<i>Nemipterus furcosus</i>) and spangled emperor (<i>Lethrinus nebulosus</i>).	1,544 tonnes was caught in the Kimberley sector in 2021, with the majority of the catch (1,406t) was landed in Zone B, 325 km west of the impacts EMBA.	Assumed to be year-round.	Although permitted to use handlines, droplines and traplines, since 2002 the fishery has been essentially trap based. Seven vessels actively fished in 2021 (employing at least 23 people).	<p>Catch data available for the last five years* for the whole fishery:</p> <ul style="list-style-type: none"> • 2021 – 1,544 t. • 2020 – 1,419 t. • 2019 – 1,507 t. • 2018 – 1,297 t. • 2017 – 1,317 t. <p>The economic value of the fishery is \$10-20 million.</p>
MMF - Area 1 (Kimberley) (Figure 5.35)	Spanish mackerel (<i>Scomberomorus commerson</i>)	The WA DoF reports that catch rates in the Kimberley are generally decreasing, partially due to changes in operators but also a decline in spawning stock after the 2016 northern heat pulse during the spawning period.	Fishing was primarily from May to November in 2019.	A total of 16 vessels operated during 2021 across the fishery, employing 30-40 people. In 2014, only three vessels operated in the Kimberley region. Trolling and handline are the only allowable fishing methods.	<p>Catch data available for the last five years* for the whole fishery:</p> <ul style="list-style-type: none"> • 2021 – 248 t, valued at \$2.5-3 million. • 2020 – 299 t. • 2019 – 291 t. • 2018 – 213 t. • 2017 – 283 t.

Newman et al. (2023); Newman et al. (2021); Gaughan and Santoro (2021; 2020; 2018); Gaughan et al (2019), Fletcher et al (2017).

* 2022 and 2023 catch data was not available at the time of EP preparation.

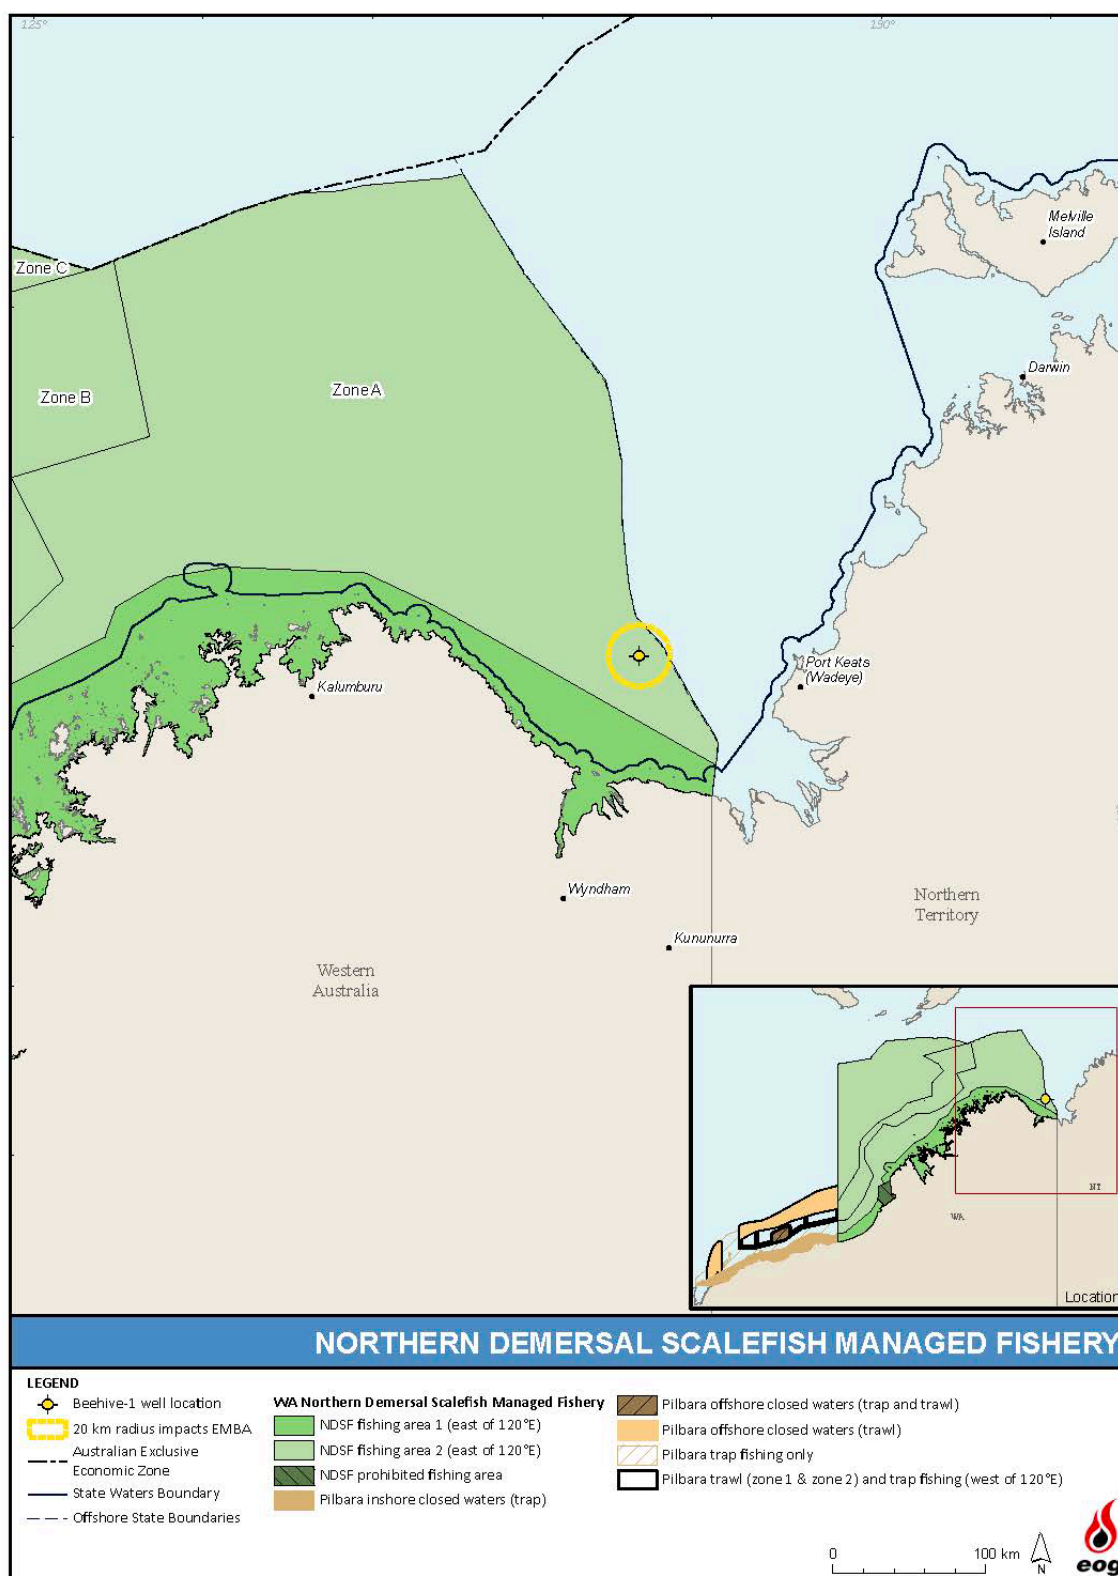

Figure 5.34. WA Northern Demersal Scalefish Fishery overlapped by the impacts EMBA

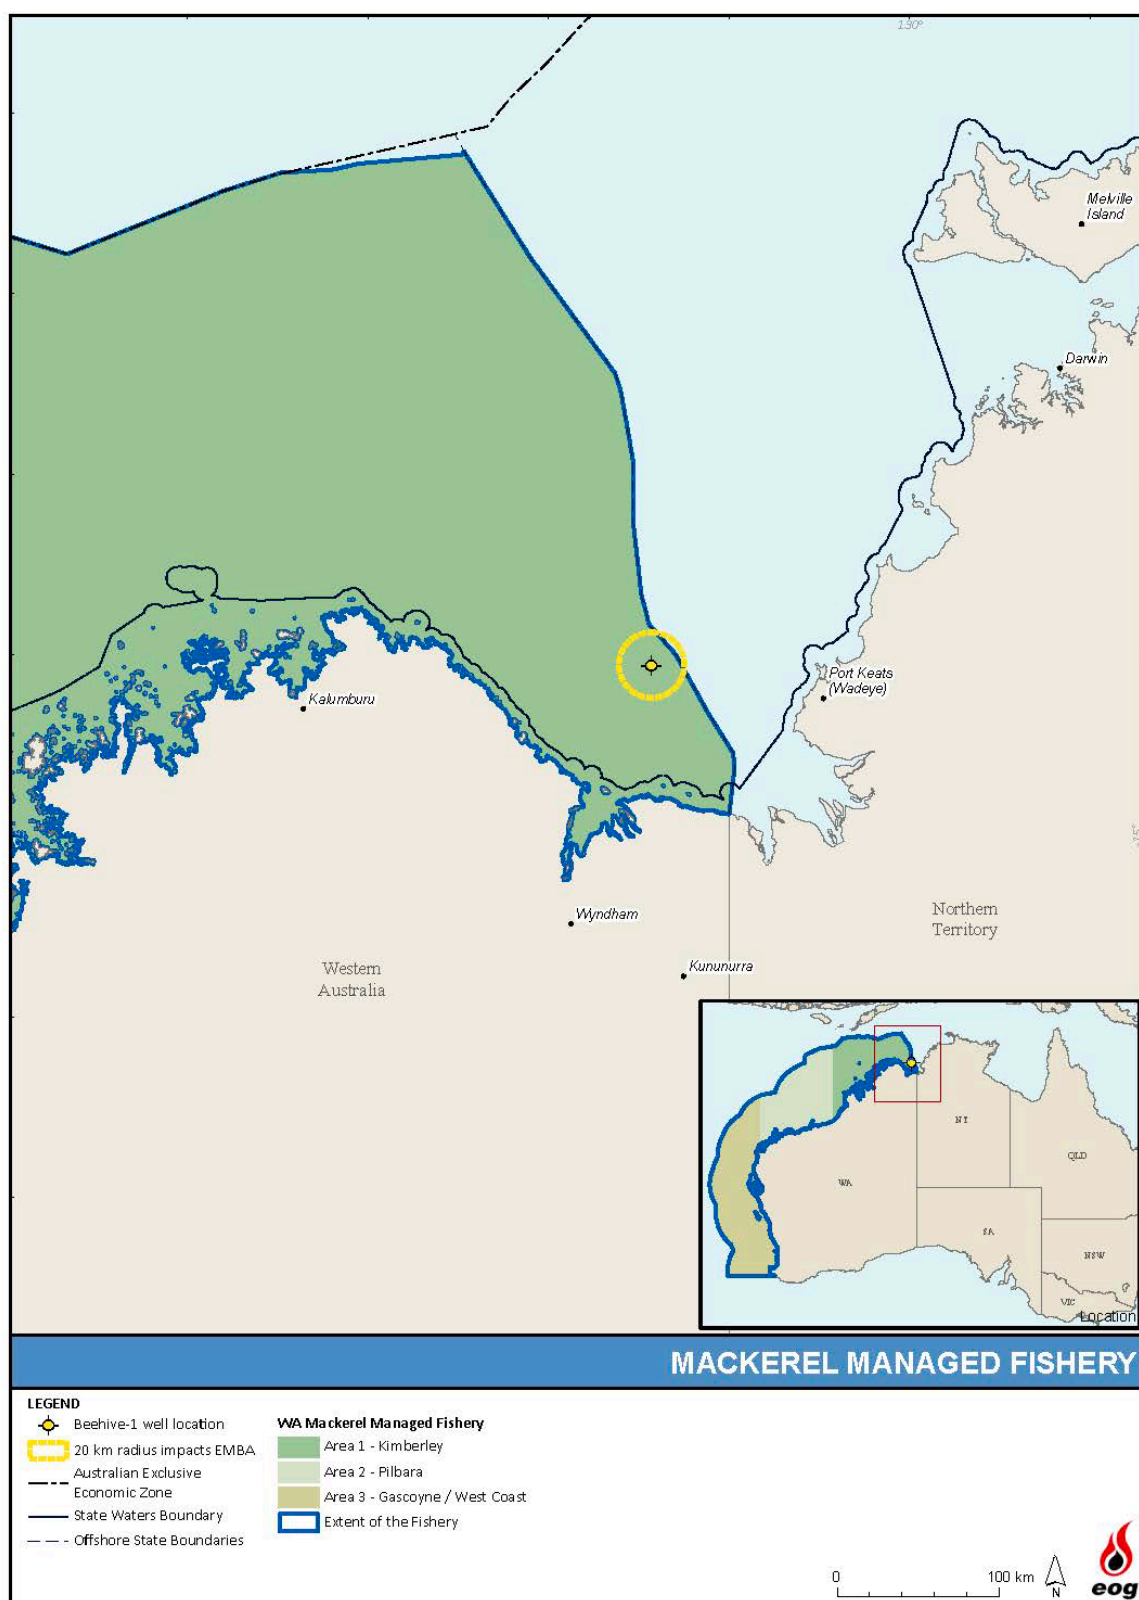

Figure 5.35. WA Mackerel Managed Fishery overlapped by the impacts EMBA

5.7.2. Recreational Fishing

Within the North Coast Bioregion, recreational fishing is experiencing significant growth, with a distinct seasonal peak in winter (Gaughan and Santoro, 2018). Offshore islands, coral reefs and continental shelf provide species of major recreational interest including tropical snapper, cods, coral and coronation trout, sharks, trevally, tuskfish, tunas, mackerels and billfish (Gaughan and Santoro, 2018).

Recreational fishing activities are primarily based out of Darwin, located 280 km northeast of the impacts EMBA. Given the long distance between the impacts EMBA and the mainland (60 km at its closest point) and main population areas (e.g., Wadeye), recreational fishing activities in the impacts EMBA are not expected.

During the relevant persons consultation process, AFANT have not raised any issues regarding recreational fishing in or around the impacts EMBA. RecFish West have also confirmed during the relevant persons consultation process that their activities are unlikely to be impacted by the proposed Beehive-1 location.

5.7.3. Traditional Fishing

Traditional Aboriginal fishing in NT waters predominately occurs within inshore tidal waters. Approximately 85% of the NT's intertidal zone is recognised as Aboriginal land under the *Aboriginal Land Rights (Northern Territory) Act*. In the NT, there are generally three recognised Aboriginal fishery zones, which extend to 3 nm, 15 nm and 200 nm from the coast. Almost all Aboriginal fishing effort is concentrated within the 3 nm coastal waters boundary (93%) (65 km from the impacts EMBA at its closest point), with fishing spanning the entire coastline, though it is mostly focused around the Tiwi Islands (275 km northeast of the impacts EMBA). Aboriginal activities within the coastal waters of the Tiwi Islands includes fishing and hunting (including for turtles and dugongs) and gathering (e.g., turtle eggs).

Hunting, subsistence fishing and shell collecting are recognised as occurring in the Kimberley region (DNP 2018a; DPaW 2016b, Smyth 2007). The land and sea country of the Balanggarra people extends from Napier-Broome Bay to Cambridge Gulf and Wyndham in the JBG, inshore from where the impacts EMBA lies. In the past, the Balanggarra people speared fish along the rocky shoreline and in shallow waters. Saltwater fish, turtles, dugong, mud crabs and cockles continue to be important food sources for the Balanggarra people today (DPaW, 2016b). The Miriwung Gajerrong land and sea country extends from the Cambridge Gulf to the NT. In the past, the Miriwung Gajerrong people would hunt, fish and gather bush tucker in tidal areas such as mangroves, with fishing and hunting still practiced today (DPaW, 2016b).

5.7.4. Coastal Settlements

The coastline adjacent to the JBG is sparsely populated, with the townships of Wadeye, NT (85 km east) and Wyndham, WA (163 km south) being the closest and the city of Darwin (280 km northeast of the impacts EMBA) being the largest nearby city.

5.7.5. Tourism

The JBG is very remote and therefore has not been significantly developed for tourism. For up to five months of the year, access to the JBG region is restricted to boat or helicopter access due to wet season rains, and road access to areas of Aboriginal freehold land requires prior permission from the Northern Land Council (NLC) (Woodside, 2004).

There are no attractions (e.g., known reefs, shipwrecks, canyons) in the impacts EMBA or immediate surrounds to attract tourists. Charter boats operating out of Darwin and Broome/Derby may occasionally visit or pass through the JBG. No scuba diving or snorkelling sites or dive shops or clubs have been identified in the JBG or adjacent townsites. The presence of saltwater crocodiles and other potentially dangerous fauna generally makes these waters unsuitable for such activities.

During the relevant persons consultation process, Oolin Sunday Island Cultural Tours confirmed that their operations will not be disrupted by the Beehive-1 drilling.

5.7.6. Offshore Energy Exploration and Production

The Bonaparte Basin is an established hydrocarbon province with a number of commercial operations. The closest operation is the Blacktip Gas Field, located in adjacent permit WA-33-L and operated by ENI Australia (Figure 5.36). The Blacktip Gas Field consists of an unmanned WHP, two producing wells, flowlines and a subsea gas export pipeline (GEP) that runs from the WHP to shore near Wadeye, NT. The Blacktip GEP is located 12 km northeast of Beehive-1 and is overlapped by the impacts EMBA. Vessels servicing the Blacktip WHP and GEP may occasionally pass through the impacts EMBA. There are numerous exploration and production permits and leases throughout the WA, NT and Commonwealth waters within the spill EMBA, and these are described in Section 5.6.6 of Appendix 11.

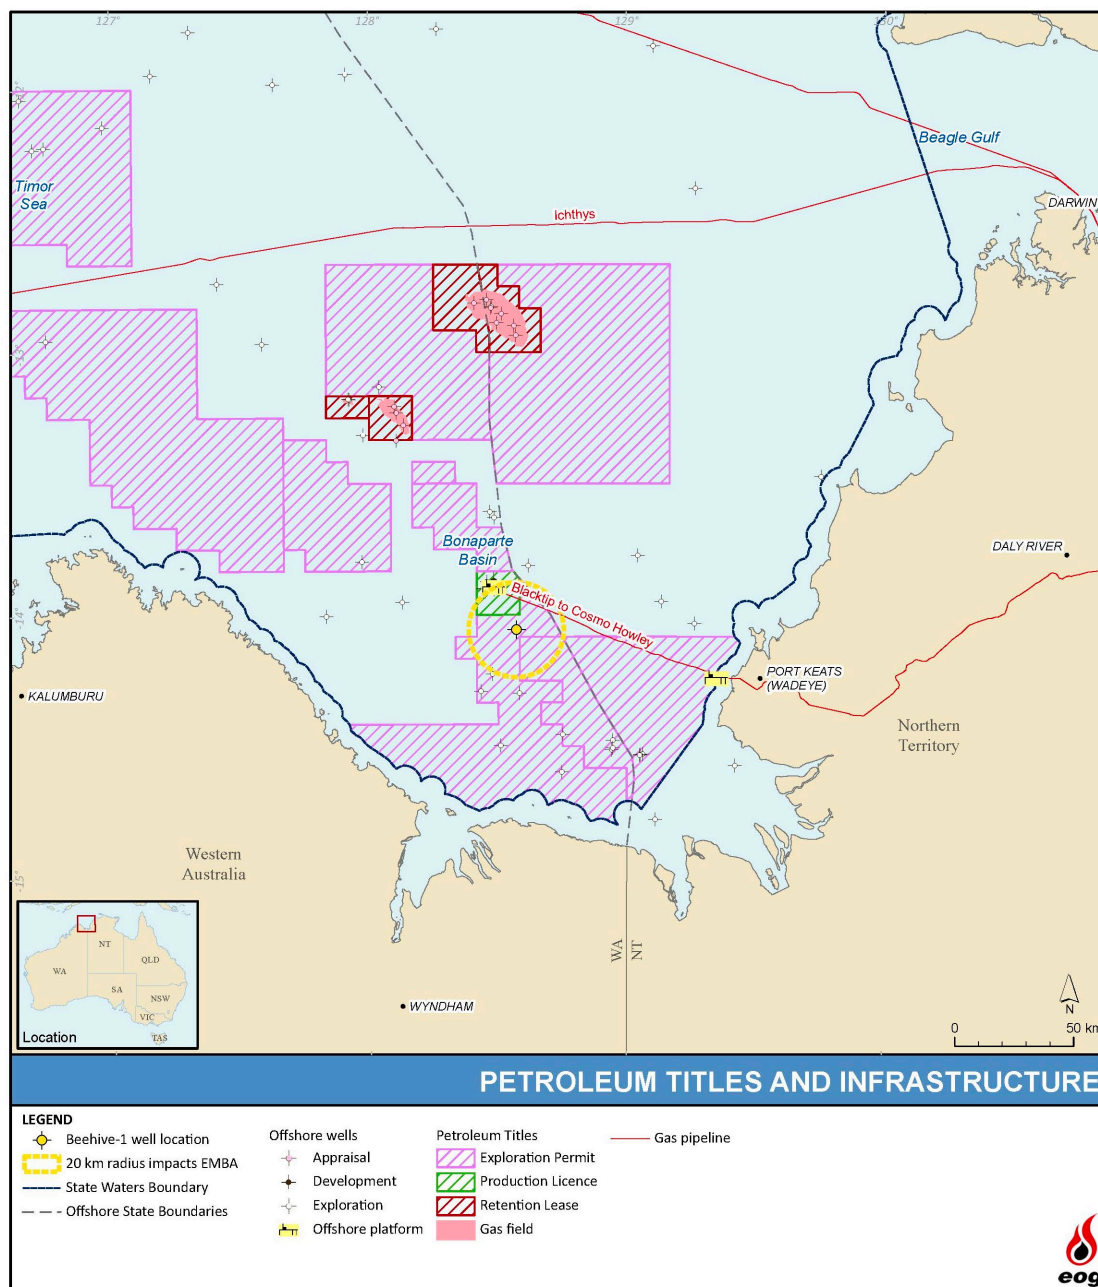

Figure 5.36. Petroleum activity in the impacts EMBA

5.7.7. Commercial Shipping

The closest major commercial shipping port is Darwin, located 280 km northeast of the impacts EMBA and 300 km northeast of Beehive-1. The location of the Darwin Port relative to Asia and the region's offshore oil and gas fields makes the surrounding area a key shipping region. Very low levels of shipping traffic occur through the impacts EMBA. Using Automatic Identification System (AIS) data from AMSA and spatial analysis, it was determined that there is also a low level of shipping traffic in and immediately around the impacts EMBA and that vessels in this area are mainly transiting and not lingering. An analysis of the shipping traffic for the 2021 calendar year recorded from the impacts EMBA (20-km radius around the drill site) is presented in Table 5.19. This shipping traffic is also illustrated in Figure 5.37, which shows that the impacts EMBA is located south of the major shipping lanes coming out of Darwin, which contributes to the very low level of shipping traffic recorded in the area. The concentration of shipping activity in the northwest

part of the impacts EMBA is associated with the Blacktip WHP. The highest volume of traffic is recorded in the months of June, July and August, with the latter months likely to occur outside the activity window.

Table 5.19. Commercial shipping traffic recorded in the impacts EMBA

5.7.8. Defence Activities

The impacts EMBA is overlapped by a defence training area, which is a maritime military zone administered by the Australian Defence Force (Figure 5.38). This is an area where exercises such as operational flying training or live weapon firing may occur. The DoD has advised that military flying training may take place over the activity area, with aircraft flying as low as 500 feet above the water.

There is also an Air-to-Air Refuelling (AAR) and Airborne Early Warning and Control (AEW&C) airspaces that overlap the impacts EMBA.

Australian Border Force and Australian Defence Force vessels undertake civil and maritime surveillance within the region with the primary purpose of monitoring the passage of illegal entry vessels and illegal fishing activity within these areas. Refugees seeking asylum in Australia are also known to utilise the area, travelling between Indonesia and Australia.

The DoD 'Where Is UXO' database indicates there is no potential for unexploded ordnance (UXO) to occur within the impacts EMBA (Figure 5.39). The DoD advised EOG during the relevant persons consultation process that beyond the data presented in this database, there are no records of specific UXO in the area.

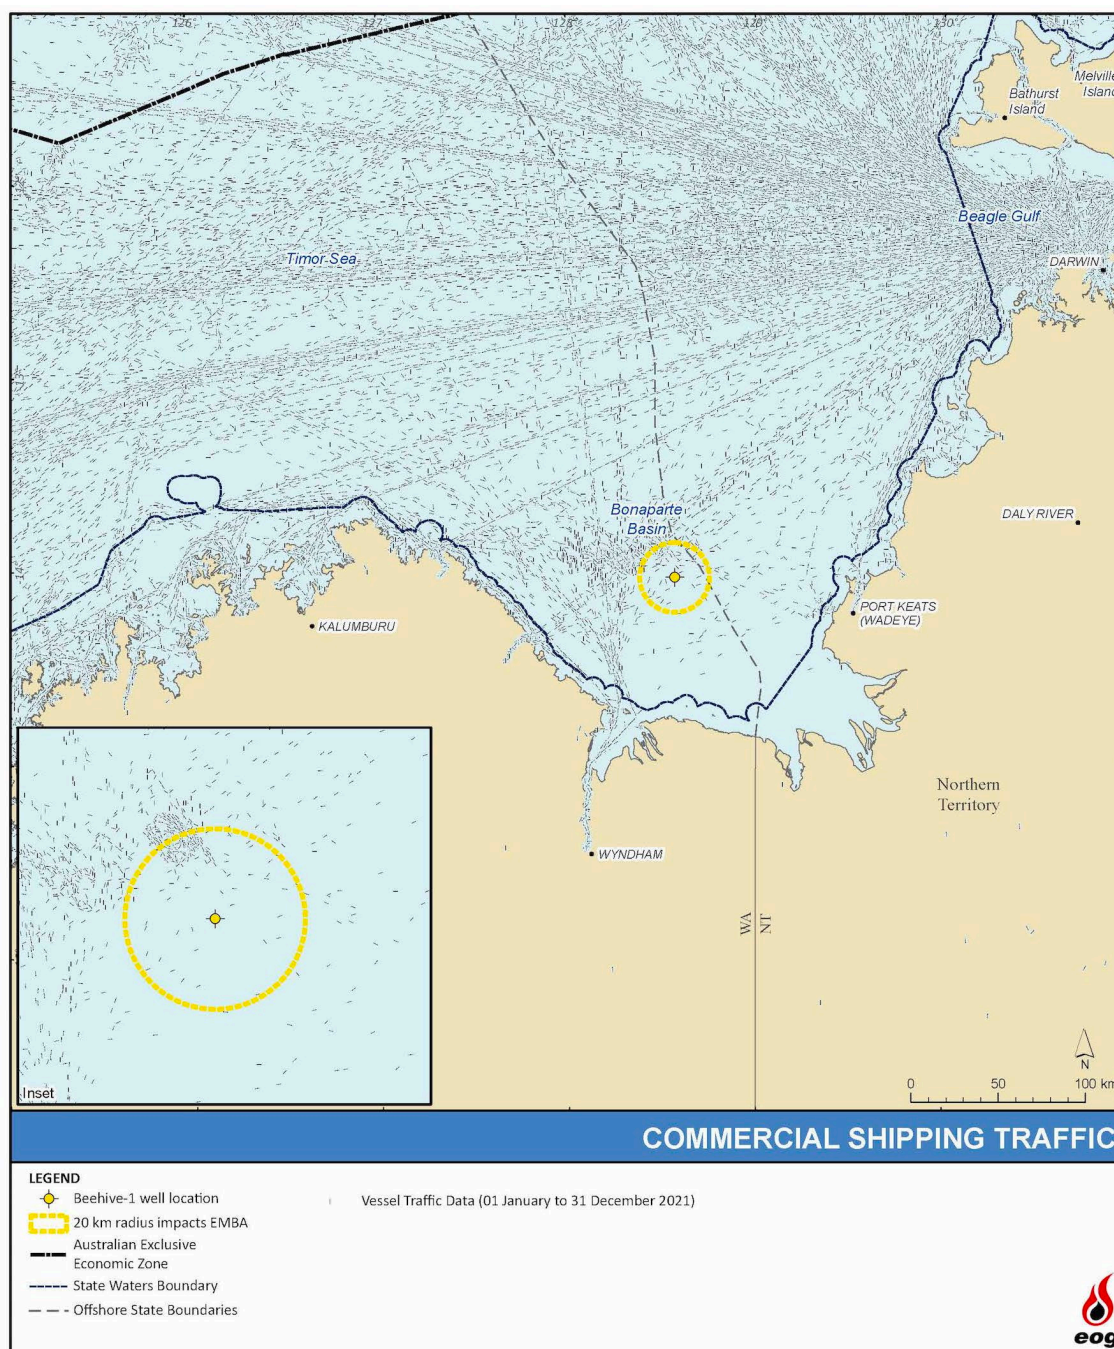

Figure 5.37. Commercial shipping traffic in the impacts EMBA

5.7.9. Submarine Cables

Submarine telecommunication cables provide telephone and internet connections across the world; they are laid on the ocean floor and are often thousands of kilometres in length.

During the relevant persons consultation process, the Australian Communications and Media Authority (ACMA) confirmed that there are no submarine protection zones declared by ACMA that occur within proximity to the proposed Beehive-1 location. The closest known submarine cable to the proposed Beehive-1 location is the Australian Singapore cable, which is 2,402 km west of the proposed Beehive-1 location and 2,387 km west of the impacts EMBA.

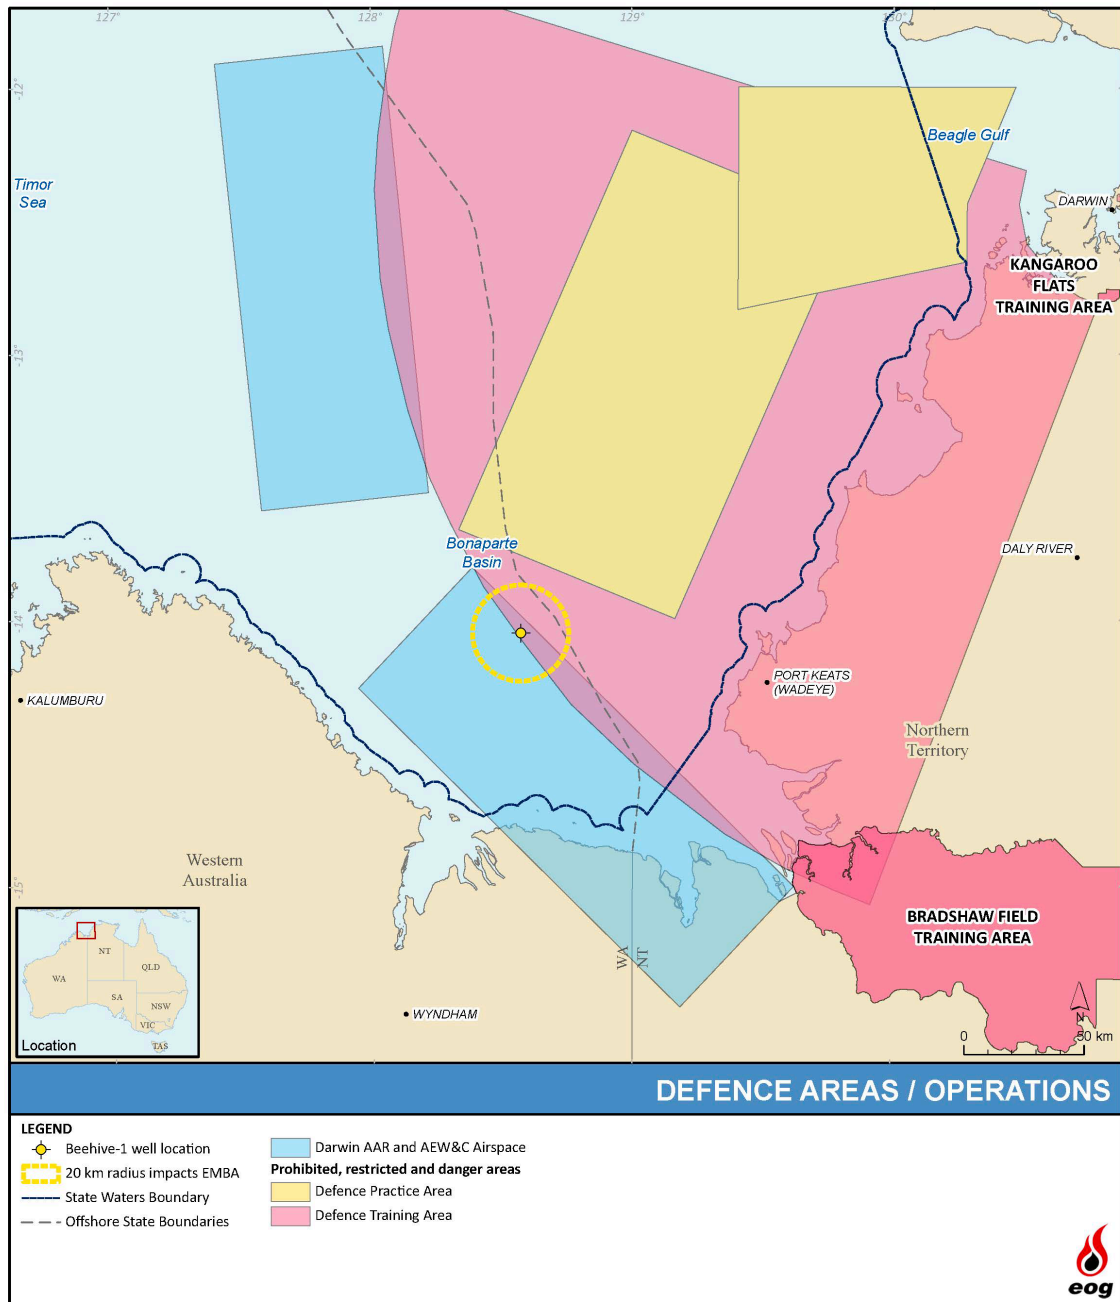

Figure 5.38. Defence areas overlapped by the impacts EMBA

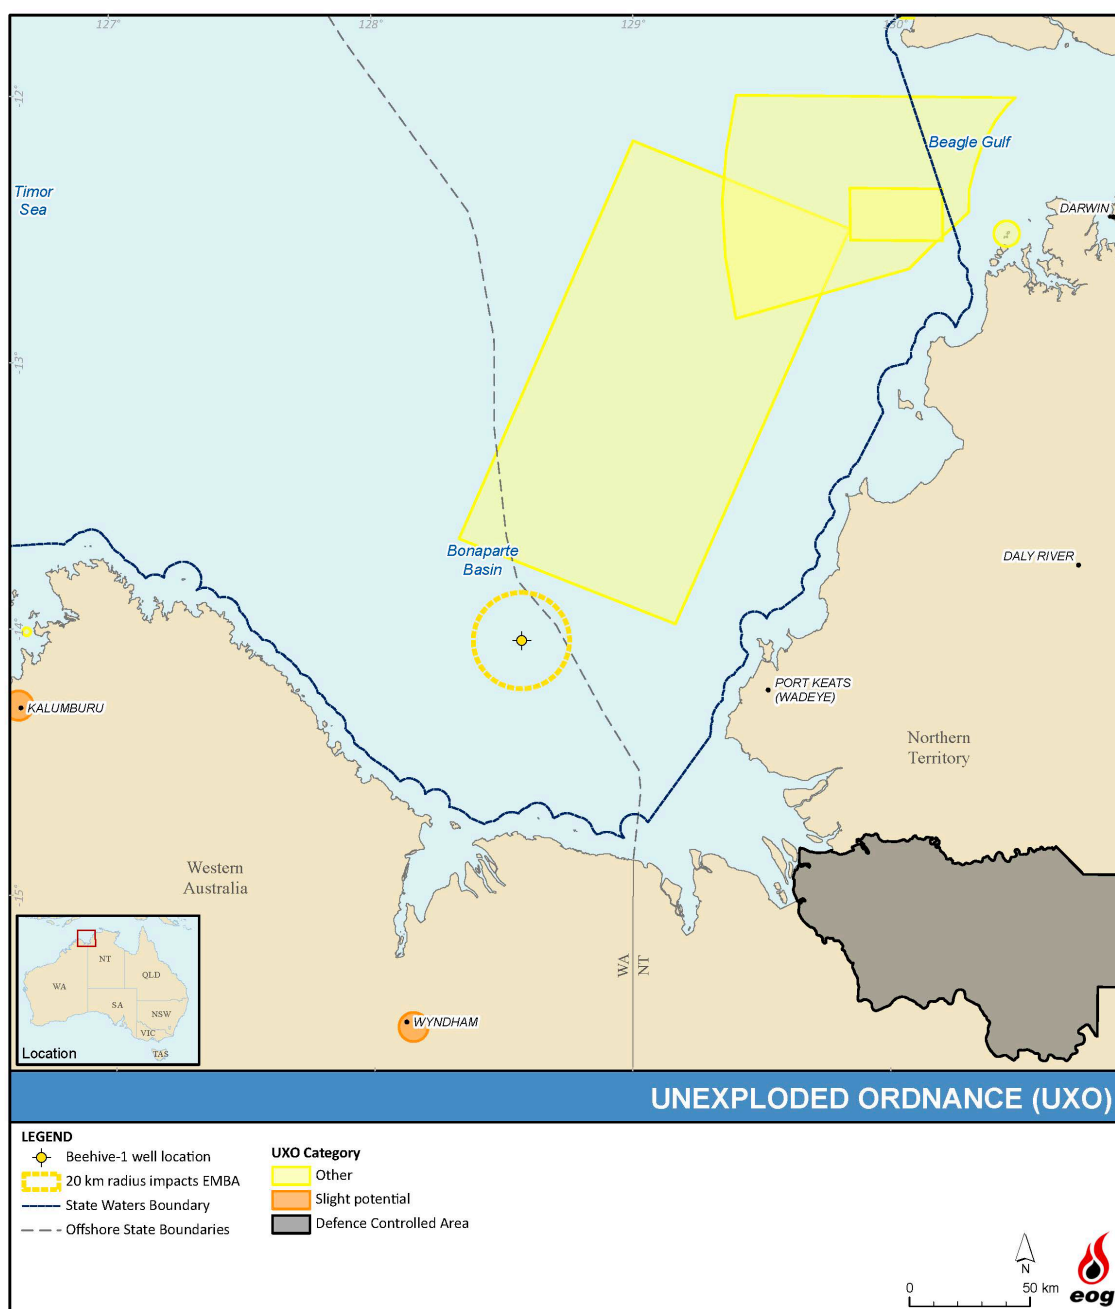

Figure 5.39. Unexploded ordnance risks near the impacts EMBA

6. Environmental Impact & Risk Assessment Methodology

As required under Regulation 13(5) of the OPGGSI, this chapter describes the environmental impact and risk assessment methodology used in this EP.

The EOG Environmental Management System defines the company's requirements to mitigate and manage environmental risks at all levels within the business, and this risk management framework is described in this section. This framework is consistent with the Australian and New Zealand Standard for Risk Management (AS/NZS ISO 31000:2018, *Risk Management – Principles and Guidelines*).

Figure 6.1 outlines the risk assessment management process, with each step of this process described in this chapter. Note that for simplicity, this process is called a risk assessment process, even though impacts and risks are defined differently (see Section 6.3.1 for more information).

Figure 6.1. Risk management framework

6.1. Step 1 – Establish the Context

The first step in the risk assessment process is to establish the context. This involves:

- Understanding the regulatory framework in which the activity takes place (described in the ‘Environmental Regulatory Framework’ in Chapter 3);
- Defining the activities that will cause impacts and create risks (outlined in the ‘Activity Description’ in Chapter 2);
- Understanding the concerns of stakeholders and incorporating those concerns into the design of the activity where appropriate (outlined in Chapter 4, ‘Stakeholder Consultation’); and
- Describing the environment in which the activity takes place (the ‘Existing Environment’ is described in Chapter 5 and Appendix 11).

Once the context has been established, the hazards of the activity can be identified, along with the impacts and risks of these hazards. This process is described in the following sections.

6.2. Step 2 – Communicate and Consult

In accordance with Regulations 11A and 14(9) of the OPI(E), EOG has consulted with relevant persons in the development of this EP to obtain information about their functions, activities and interests and assess how the activity may impact on these. This information has been used to inform the impact and risk assessment in the EP. The stakeholder consultation process is described in detail in Chapter 4.

6.3. Step 3 – Identify Risks

The steps used to identify the risks associated with each aspect of the activity include:

- Identify each hazard associated with the activity;
- Identify the sensitive environmental resources within and adjacent to the activity area;
- Identify the impacts and risks associated with each hazard;
 - For impacts, identify the environmental consequence of the impacts.
 - For risks, identify the likelihood (probability) of the risk occurring and the consequence if it does occur.
- Identify control measures; and
- Assign a level of risk to each potential environmental impact using a risk matrix.

In accordance with this framework, all risks must be reduced to a level that is considered to be ALARP (see Section 6.8.1).

A targeted risk assessment workshop was undertaken by EOG on the 1st of June 2022 to review the key drilling impacts and risks associated to ensure all necessary controls were adopted. The workshop involved drilling and environment project members. Following the review of the key hazards and their associated impacts and risks, control measures were also reviewed to ensure the impact consequence or risk rating is ALARP.

An assessment of what is ‘reasonably practicable’ with regard to the adoption of control measures requires professional judgements to be made against the relevant matrices using the advice of

technical experts as well as published standards, availability of mitigation measures and industry practice.

6.3.1 Definitions

The OPGGS(E) Regulations 14(5)(6) require that the EP detail and evaluate the environmental impacts and risks for an activity, including control measures used to reduce the impacts and risks of the activity to ALARP and an acceptable level. This must include impacts and risks arising directly or indirectly from all activity operations (i.e., planned events) or potential emergency conditions or incidents (i.e., unplanned events).

In its *Environment Plan content requirements* guidance note (N-04750-GN1344, September 2020g), NOPSEMA distinguishes between environmental impacts and risks. For context, Table 6.1 provides the definitions of impacts and risk according to I OPGGS(E) and international risk management standards.

For this activity, EOG has determined that impacts and risks are defined as follows:

- **Impacts** result from **planned** events – there *will* be consequences (known or unknown) associated with the event occurring. Impacts are an inherent part of the activity. For example, drill cuttings will be generated and discharged overboard and this will have consequences for marine life.
 - For impacts, only a consequence is assigned (likelihood is irrelevant given that the event will occur) (as per the risk matrix in Table 6.2).
- **Risks** result from **unplanned events** – there *may* be consequences if an unplanned event occurs. Risks are not an inherent part of the activity. For example, a hydrocarbon spill may occur if a support vessel collides with another vessel, but this is not a certainty. The risk of this event is determined by multiplying the consequence of the impact (using factors such as the type and volume of hydrocarbons and the nature of the receiving environment) by the likelihood of this event happening (which may be determined objectively or subjectively, qualitatively or quantitatively).
 - For risks, the consequence and likelihood are combined to determine the risk rating (see Table 6.2).

Table 6.1. Definitions of impact and risk

Source	Impacts	Risks
OPGGG(E) (Regulation 4)	Any change to the environment, whether adverse or beneficial, that wholly or partially results from an activity.	Not defined.
Environment Plan content requirements Guidance Note (N-04750-GN1344, September 2020g)	A planned event, an inherent part of the activity.	Not defined.
Environment Plan decision making Guideline (N04750-GL1721, June 2021a)	Any change to the environment, whether adverse or beneficial, that wholly or partially results from an activity.	Not defined.
NOPSEMA website (Environment > Assessment Process > Environment Plans > Titleholder FAQs)	Impact assessment is concerned with events that are reasonably certain to occur.	Risk assessment is concerned with events that may possibly occur.
ISO AS/NZS 31000: 2018 (Risk management – Principles and guidelines)	Not defined.	The effect of uncertainty on objectives.
ISO AS/NZS 14001: 2016 (Environmental management systems – Requirements with guidance for use)	Not defined.	The effect of uncertainty on objectives.
ISO AS/NZS 4360: 2004 (Risk management)	Not defined.	The chance of something happening that will have an impact on objectives.
HB203: 2012 (Managing environment-related risk)	Any change to the environment or a component of the environment, whether adverse or beneficial, wholly or partly resulting from an organisation's environmental aspects.	The effect of uncertainty on objectives. The level of risk can be expressed in terms of a combination of the consequences and the likelihoods of those consequences occurring.

6.4. Step 4 – Analyse the Risks

When analysing risk, the following must be considered:

- Identify the maximum credible consequence (being the reasonable worst case but non-fanciful outcome) arising from the impact or risk without introducing controls ('inherent' consequence). Then do the same after controls are introduced to determine the 'residual' consequence.
- Identify the likelihood of the risk event occurring ('remote' through to 'likely'), considering the controls identified and their effectiveness (inherent and residual).
- For risks, determine the level of risk using the matrix, being the intersection of consequence and likelihood.

6.4.1. Consequence Criteria

‘Consequence’ refers to the maximum credible outcome of an event affecting a receptor, value or use. EOG’s consequence criteria are presented in Table 6.2. Where there is uncertainty or incomplete information, a conservative assessment is made on the basis of the maximum credible consequence. Consequence criteria have been developed to consider the extent, severity and duration of the impact or risk. Assigning a consequence criteria to a hazard also takes into account:

- Past records;
- Relevant experience;
- Industry practice and experience;
- Relevant published literature;
- Quantitative or engineering modelling; and
- Specialist or expert judgement.

Table 6.2. Consequence criteria

Consequence	Definition
Beneficial	<ul style="list-style-type: none"> • Likely to cause enhancement to the environment or socioeconomic benefits.
Negligible	<ul style="list-style-type: none"> • No changes, or small adverse changes unlikely to be noticed or measurable against background conditions.
Minor	<ul style="list-style-type: none"> • Adverse changes that can be monitored and/or noticed, but are within the scope of existing variability and do not meet any of the ‘severe’ or ‘moderate’ impact definitions.
Moderate	<p>One or more of the following:</p> <ul style="list-style-type: none"> • Localised, occasional violations of air or water quality standards or guidelines. • Localised contamination of sediments. • Localised damage to sensitive habitats such as hard bottom areas, chemosynthetic communities, mangroves or wetlands. • A few deaths or injuries of protected species, occasional, temporary disruption of their critical activities (e.g., breeding, nesting, nursing), and/or localized damage to their critical habitat. • Localised, short-term interference with fishing activities, recreation or tourism. • Localised damage to or contamination of beaches, parks, tourism areas, or other recreational resources. • Localised, short-term adverse impacts on the economy or socio-economic conditions.
Severe	<p>One or more of the following:</p> <ul style="list-style-type: none"> • Extensive, continual violation of air or water quality standards or guidelines. • Extensive, persistent contamination of sediments. • Extensive damage to sensitive habitats such as hard bottom areas, chemosynthetic communities, mangroves, or wetlands. • Extensive damage to non-sensitive habitats to the extent that ecosystem function and ecological relationships would be altered. • Numerous deaths or injuries of a protected species, continual disruption of their critical activities (e.g., breeding, nesting, nursing), and/or destruction of their critical habitat. • Extensive, continual interference with fishing activities, recreation, or tourism. • Extensive, persistent damage to or contamination of important cultural, historical or religious sites or tourism areas.

	<ul style="list-style-type: none"> • Extensive, persistent adverse impacts on the economy or socio-economic conditions. • A threat to public health or public safety. • Substantial public controversy or social unrest.
--	---

6.4.2. Likelihood Criteria

‘Likelihood’ refers to the chance of an event happening and the maximum credible consequence occurring from that event. EOG’s likelihood criteria are presented in Table 6.3.

Table 6.3. Likelihood criteria

Probability	Definition
Likely	Can reasonably be expected to occur one or more times during the project. Impacts of most routine project activities are in this category.
Occasional	Not planned or expected, but could occur at some time during the project.
Rare	Highly unlikely; exceptional conditions may allow the event to occur during the project.
Remote	Has occurred before in the industry but is extremely unlikely to occur during the project.

6.4.3. Risk Matrix

Risk levels are assessed using the matrix presented in Table 6.4. The risk is evaluated by ‘multiplying’ likelihood and consequence. The recommended form of treatment action, escalation and monitoring for each risk level is provided in Table 6.5. The ‘initial’ rating (pre-treatment) and ‘residual’ risk rating (with control measures adopted) for each impact and risk is provided in Chapter 7.

Table 6.4. EOG risk assessment matrix

		Consequence				
		Beneficial	Negligible	Minor	Moderate	Severe
Likelihood	Likely	Beneficial	Negligible	Low	Medium	High
	Occasional	Beneficial	Negligible	Low	Medium	High
	Rare	Beneficial	Negligible	Negligible	Low	High
	Remote	Beneficial	Negligible	Negligible	Low	Medium

Table 6.5. Risk treatment action

Risk rating	Treatment action
HIGH The risk is intolerable	<ul style="list-style-type: none"> For an operational activity, the risk shall be reduced as soon as possible, typically within a timescale of not more than a few weeks. For commercial risks, review the risks and where practicable reduce by additional mitigation measures such as hedging, insurance, etc. Repeat threat identification and risk evaluation processes to verify and, where possible, quantify the risk estimation; determine the accuracy and uncertainty of the estimation. Modify the threat, the frequency or consequence to reduce the risk ranking to 'medium' or 'low.' Where the risk ranking cannot be reduced to 'medium' or 'low', to demonstrate ALARP it is necessary to review if it is reasonably practicable to remove threats, reduce frequencies and/or reduce the severity of consequences, and if it is reasonably practicable, these risk treatment actions shall be applied. If it is not reasonably practicable, no further action is required and ALARP is demonstrated. For an operational activity, the reduction to 'medium' or 'low' or demonstration of ALARP shall be completed as soon as possible; typically within a timescale of not more than a few months.
MEDIUM The risk is tolerable	<ul style="list-style-type: none"> Determine the management plan for the threat to prevent occurrence and to monitor changes that could affect the classification. Management responsibility must be specified – monitor to determine if risk changes and needs to be reassessed.
LOW The risk is tolerable	<ul style="list-style-type: none"> Review at the next review interval. Manage by routine procedures – reassess at next review.
NEGLIGIBLE The risk is tolerable	<ul style="list-style-type: none"> Review at the next review interval. Manage by routine procedures – reassess at next review.

6.5. Step 5 – Evaluate the Risk

The purpose of impact and risk evaluation (herein referred to simply as risk assessment) is to assist in making decisions, based on the outcomes of analysis, about the sorts of controls required to reduce an impact or risk to ALARP. Planned and unplanned events are subject to risk assessment in the same manner. Risk evaluation also considers the following:

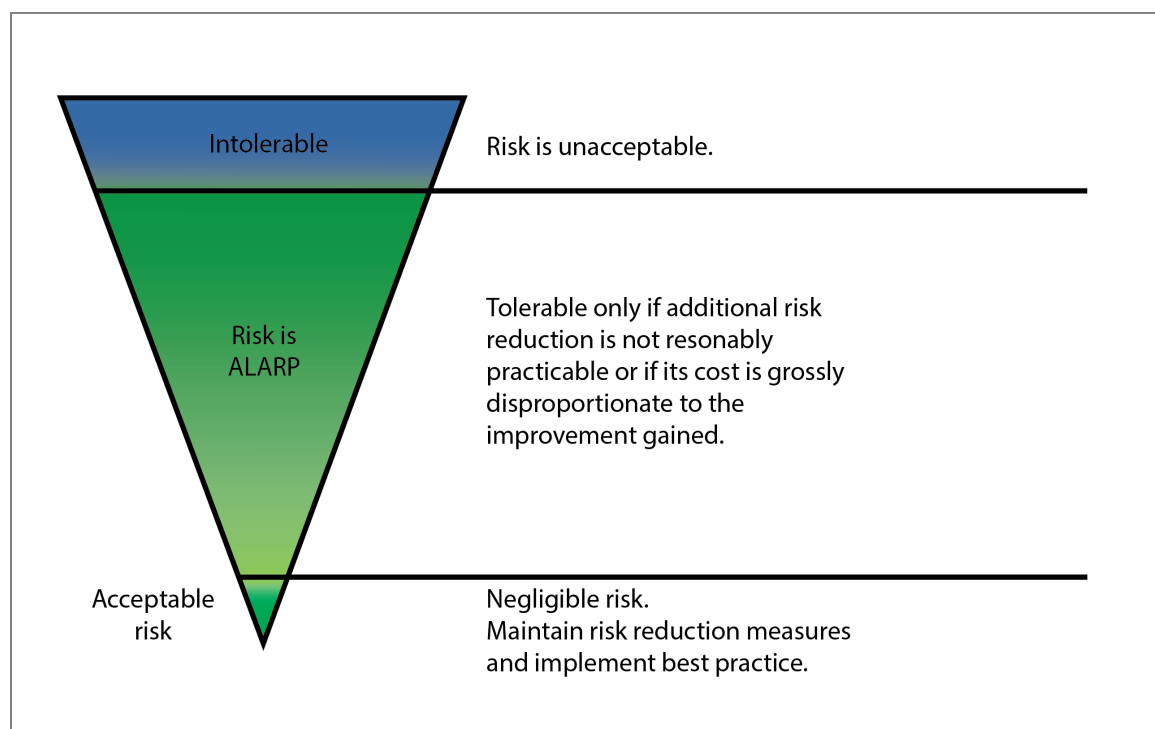

- Defining the level of risk (higher and lower order impacts and risks);
- Demonstration of ALARP;
- Uncertainty of impacts and risks;
- Demonstration of acceptability; and
- Principles of ESD.

Each of these considerations is described in more detail in this section.

6.5.1. Demonstration of ALARP

The ALARP principle states that it must be possible to demonstrate that the cost involved in reducing the risk further would be grossly disproportionate to the benefit gained. The ALARP principle arises from the fact that infinite time, effort and money could be spent attempting to reduce an impact or risk to zero. This concept is shown diagrammatically in Figure 6.2. EOG's approach to demonstrating ALARP includes:

- Systematically identifying and assessing all potential environmental impacts and risks associated with the activity;
- Where relevant, applying industry 'good practice' controls to manage impacts and risks;
- Assessing available and feasible control measures for their environmental benefit and cost, which is summarised in a cost-benefit analysis; and
- For higher order impacts and risks, implementing further controls if feasible and reasonably practicable to do so.

Source: CER (2015).

Figure 6.2. The ALARP Principle

There is no universally accepted guidance to applying the ALARP principle to environmental risk assessments. For this EP, the guidance provided in NOPSEMA's *Environment Plan decision making guideline* (N-04750-GL1721, June 2021a) has been applied and augmented where necessary. The level of ALARP assessment is dependent upon the:

- Residual impact and risk level (high versus low); and
- The degree of uncertainty associated with the assessed impact or risk.

An iterative risk evaluation process is employed until such time as any further reduction in the residual risk ranking is not reasonably practicable to implement. At this point, the impact or risk is reduced to ALARP. The determination of ALARP is outlined in Table 6.6.

Table 6.6. Alignment of EOG consequence and risk ratings with ALARP ratings

Consequence rating	Beneficial	Negligible	Minor	Moderate	Severe
ALARP level – planned event	Broadly acceptable	Tolerable if ALARP			Intolerable
Residual impact category	Lower order			Higher order	
Risk rating	Beneficial	Negligible	Low	Medium	High
ALARP level – unplanned event	Broadly acceptable	Tolerable if ALARP			Intolerable
Residual risk category	Lower order risks				Higher order risks

A description of how the ALARP process is applied to the risk assessment process for the project is presented in this section.

Hierarchy of Controls

EOG demonstrates ALARP, in part, by adopting the ‘Hierarchy of Controls’ philosophy (Figure 6.3). The hierarchy of controls is a system used across hazardous industries to minimise or eliminate exposure to hazards. The hierarchy of controls is, in order of effectiveness:

- Elimination;
- Substitution;
- Engineering controls;
- Administrative controls; and
- Personal protective equipment (PPE) – this has not been included here as it is specific to the assessment of safety risks rather than environmental management.

Although commonly used in the evaluation of occupational health and safety hazard control, the hierarchy of controls philosophy is also a useful framework to evaluate potential environmental controls to ensure reasonable and practicable solutions have not been overlooked. To this effect, the assessment of control measures presented in the impact and risk assessment tables in Chapters 7 and 8 of this EP take into account the hierarchy of controls, in the order listed above.

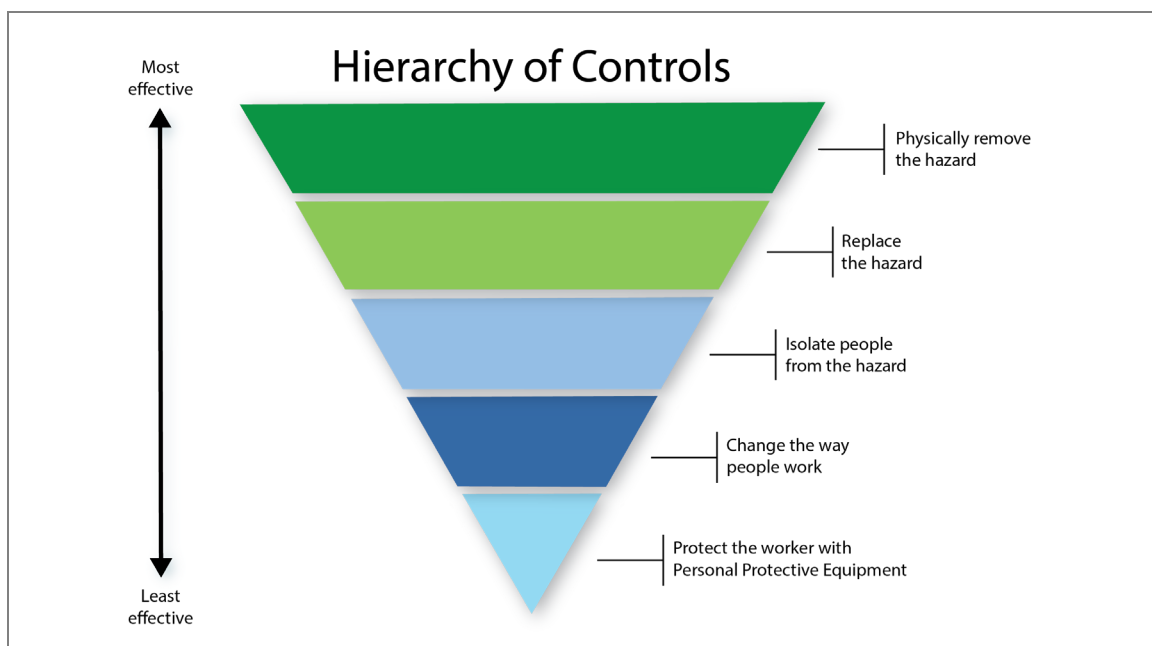

Figure 6.3. The Hierarchy of Controls

Assessing the Suitability of Available Control Measures

NOPSEMA's *Environment Plan decision making guideline* (N-04750-GL1721, June 2021a) states that in order to demonstrate ALARP, a titleholder must be able to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure. This process is applied in the demonstration of ALARP sections in the impact and risk assessment tables throughout Chapters 7 and 8. When deciding on whether to implement proposed control measures in the impact and risk assessment tables in Chapter 7, the issues outlined in Table 6.7 are considered.

Table 6.7. Considerations for the adoption of control measures

Consideration	Question
Environmental benefit (EB)	<ul style="list-style-type: none"> Does it provide a clear or measurable reduction in environmental impact or risk? What are the environmental benefits to receptors if the measure is adopted?
Cost (C)	<ul style="list-style-type: none"> What is the relative cost (which includes money, time, and resources) that may be borne by EOG if the control measure is adopted? Does it introduce additional risk in other operational areas (e.g., will the implementation of a control measure have an impact elsewhere (such as additional emissions and discharges or safety risks to personnel))? Is it technically feasible and can it be implemented?
Evaluation (Ev)	<ul style="list-style-type: none"> Is it consistent with national or industry standards and practices? Will the change be effective, taking into account the: <ul style="list-style-type: none"> Sensitivity of the receptor; Current level of risk with the existing controls; Amount of additional risk reduction that the control will deliver; Level of confidence that the risk reduction impact will be achieved; and Resources, schedule and cost required to implement the control.

Reducing impacts and risks to ALARP is an ongoing process and new risk reduction measures may be identified at any time, including during the activity. EOG actively encourages recording and review of observations through its incident management system. Incidents and lessons learned within EOG and from the wider industry are reviewed and utilised to identify hazards and controls.

Defining the Level of Risk

Lower-order Environmental Impacts and Risks

NOPSEMA defines lower-order environmental impacts and risks as those where the environment or receptor is not formally managed, less vulnerable, widely distributed, not protected and/or threatened and there is confidence in the effectiveness of adopted control measures. Impacts and risks are considered to be lower-order and ALARP when, using EOG's risk matrix (see Table 6.4), the residual:

- Impact consequence is rated as 'beneficial', 'negligible' or 'minor'; or
- Risk rating is 'beneficial', 'negligible', 'low' or 'medium' (see also Table 6.5).

In these cases, applying 'good industry practice' (see Section 6.8.3) control measures is sufficient to manage the impact or risk to ALARP.

Higher-order Environmental Impacts and Risks

NOPSEMA defines higher-order environmental impacts and risks as those that are not lower order risks or impacts (i.e., where the environment or receptor is formally managed, vulnerable, restricted in distribution, protected or threatened and there is little confidence in the effectiveness of adopted control measures). Impacts and risks are considered to be higher-order when, using the EOG risk matrix (see Table 6.4), the residual:

- Impact consequence is rated as 'moderate' or 'severe'; or
- Risk rating is 'high' (see also Table 6.5).

In these cases, further controls must be considered as per Section 6.8.3.

Uncertainty of Impacts and Risks

Based upon the level of uncertainty associated with the impact or risk, the following framework from the Guidance on Risk Related Decision Making (Oil & Gas UK, 2014) (Figure 6.3) provides the decision-making framework to establish ALARP.

This framework provides appropriate tools, commensurate to the level of uncertainty or novelty associated with the impact or risk (referred to as the Decision Type A, B or C). The decision type is selected based on an informed decision around the uncertainty of the risk. Decision types and methodologies to establish ALARP are outlined in Table 6.8.

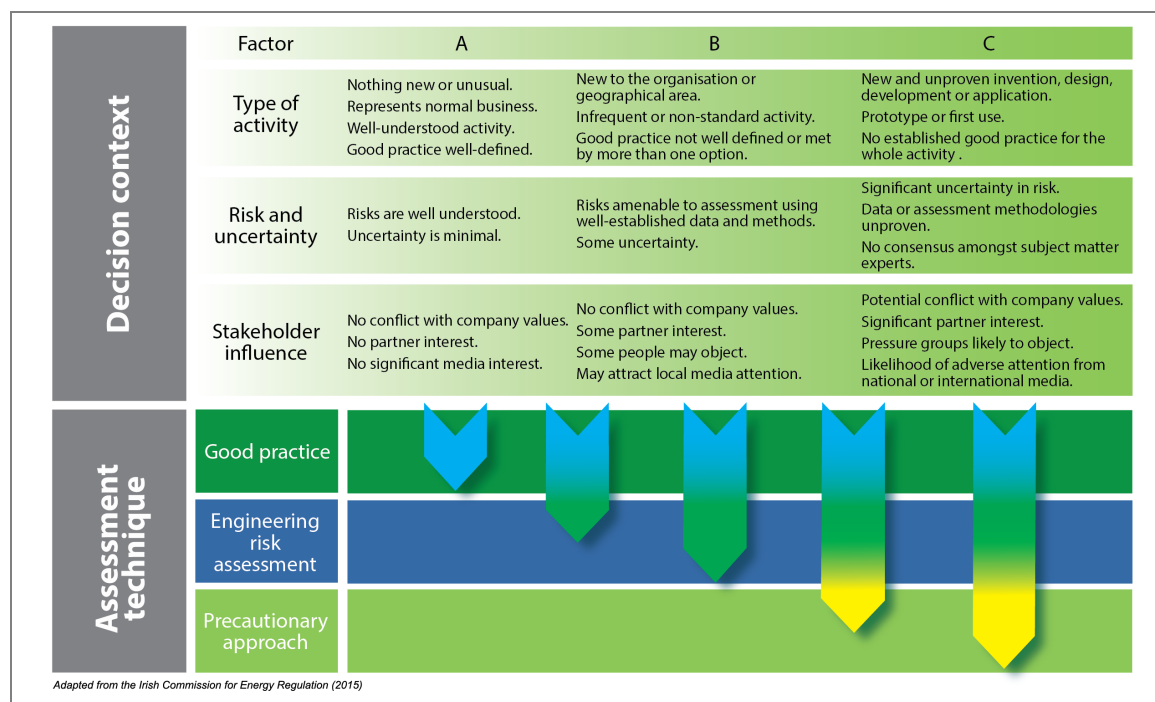

Figure 6.4. Impact and risk 'uncertainty' decision-making framework

Table 6.8. ALARP decision-making based upon level of uncertainty

Decision type	Decision-making tools
A	<u>Good industry practice</u> Identifies the requirements of legislation, codes and standards that are to be complied with for the activity. Applies the 'Hierarchy of Controls' philosophy, which is a system used in the industry to identify effective controls to minimise or eliminate exposure to impacts or risks. Identifies further engineering control standards and guidelines that may be applied over and above that required to meet the legislation, codes and standards.
B	<i>In addition to decision type A:</i> <u>Engineering risk-based tools</u> Engineering risk-based tools to assess the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost benefit analysis to support the selection of control measures identified during the risk assessment process.
C	<i>In addition to decision type A and B:</i> <u>Precautionary Principle</u> Application of the Precautionary Principle is to be applied when good industry practice and engineering risk-based tools fail to address uncertainties.

The decision-making tools outlined in Table 6.8 are explained further here.

Good Practice

In the absence of an Australian definition, the OGUK (2014) and the Irish Commission for Energy Regulation (CER) (2015) define 'Good Practice' as:

The recognised risk management practices and measures that are used by competent organisations to manage well-understood hazards arising from their activities.

NOPSEMA has not endorsed any ‘approved codes of practice’ or standards to give them a legal status in terms of good practice. Good practice is taken to refer to any well-defined and established standard or codes of practice adopted by an industrial/occupational sector, including ‘learnings’ from incidents that may yet be incorporated into standards.

Good practice can also be used as the generic term for those standards for controlling risk that have been judged and recognised as satisfying the law when applied to a particular relevant case in an appropriate manner. For this EP, sources of good practice, adapted from CER (2015) are the relevant:

- Commonwealth, state and territory legislation and regulations (outlined in Section 3.2 and Section 3.3);
- Government guidance (outlined in Section 3.4);
- International conventions (outlined in Section 3.5); and
- Industry standards (outlined in Section 3.6).

Good practice also requires that hazard management is considered in a hierarchy, with the concept being that it is inherently safer to eliminate a hazard than to reduce its frequency or manage its consequences (CER, 2015). This being the case, the ‘hierarchy of controls’ philosophy is applied to reduce the risks associated with hazards (described in Section 6.8.1).

Engineering Risk Assessment

All impacts and risks that require assessment beyond that of good practice (i.e., decision type A) are subject to an engineering risk assessment. Engineering risk-based tools can include, but are not limited to, engineering analysis (e.g., structural, fatigue, mooring, process simulation) and consequence modelling (e.g., ship collision, dropped object) (CER, 2015). A cost-benefit analysis to support the selection of control measures identified during the risk assessment process may also be undertaken.

Precautionary Principle

All impacts and risks that do meet decision type A or type B and require assessment beyond that of good practice and engineering risk assessment are subject to the ‘Precautionary Principle’. CER (2015) states that if the assessment, taking account of all available engineering and scientific evidence, is insufficient, inconclusive or uncertain, then the precautionary principle should be adopted in the hazard management process. While there is no globally-recognised definition of the Precautionary Principle, it is generally accepted to mean:

Uncertain analysis is replaced by conservative assumptions which will increase the likelihood of a risk reduction measure being implemented.

The degree to which this principle is adopted should be commensurate with the level of uncertainty in the assessment and the level of danger (hazard consequences) believed to be possible.

Under the precautionary principle, environmental considerations are expected to take precedence over economic considerations, meaning that an environmental control measure is more likely to be implemented. In this decision context, the decision could have significant economic consequences to an organisation.

6.5.2. Demonstration of Acceptability

Regulation 13(5)(c) of the OPGGS(E) requires the EP to demonstrate that environmental impacts and risks are acceptable. EOG considers a range of factors to demonstrate the acceptability of the environmental impacts and risks associated with its activities. This evaluation works at several levels, as outlined in Table 6.9. The criteria for demonstrating acceptability were developed based on EOG's interpretation of NOPSEMA's *Environment Plan decision making guideline* (N-04750-GL1721-GL1721, June 2021a).

Table 6.9. Acceptability criteria

Test	Question	Acceptability demonstrated
<i>Internal context</i>		
Policy compliance	Is the proposed management of the hazard aligned with EOG's Safety and Environmental Policy?	The impact or risk must be compliant with the objectives of the policy.
Management System Compliance	Is the proposed management of the hazard aligned with EOG's Safety and Environment Management System?	Where specific EOG procedures, guidelines or expectations are in place for management of the impact or risk, acceptance is demonstrated.
<i>External context</i>		
Stakeholder engagement	Have relevant persons and stakeholders raised any concerns about activity impacts or risks? If so, are control measures in place to manage those concerns?	Merits of claims or objections raised by relevant persons and stakeholders must have been adequately assessed and additional control measures adopted where appropriate.
<i>Legislation, industry standard and best practice</i>		
Legislative context	Do the control measures meet the expectations of existing Commonwealth, WA or NT legislation?	The proposed control measures align with legislative requirements.
Industry practice	Do the control measures align with international and Australian industry guidelines and practices?	The proposed control measures align with relevant industry guidelines and practices.
Environmental context	What are the overall impacts and risks to MNES and other areas of conservation significance? Do control measures align with the aims and objectives of marine park management plans and species conservation advice, recovery plans or threat abatement plans?	There are no long-term impacts to MNES and the proposed control measures ensure that impacts or risks are not inconsistent with the aims and objectives of marine park management plans and species conservation advice, recovery plans or threat abatement plans.
ESD Principles*	Are the control measures aligned with the principles of ESD?	The EIA presented throughout Chapter 7 is consistent with the principles of ESD.

*See Table 6.10 for more information.

Principles of Ecologically Sustainable Development

Based on Australia's National Strategy for Ecologically Sustainable Development (Council of Australian Governments, 1992), Part 3A of the EPBC Act defines ESD as:

Using, conserving and enhancing the community's resources so that ecological processes, on which life depends, are maintained and the total quality of life, now and in the future, can be increased.

Table 6.10 outlines the principles of ESD as defined under the EPBC Act and describes how this EP aligns with these principles.

Table 6.10. Assessment of ESD principles

Principle		EP demonstration
A	Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations.	This principle is inherently met through the EP assessment process.
B	If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.	Serious or irreversible environmental damage resulting from the activity has been eliminated through the activity design (see Chapter 2). None of the residual impacts is rated higher than 'moderate' and none of the residual risks is rated higher than 'medium.' Scientific certainty has been maximised by employing a spill EMBA as a risk assessment boundary.
C	The present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations.	The EP assessment methodology ensures that risks from the activity are managed to be ALARP and acceptable.
D	The conservation of biodiversity and ecological integrity should be a fundamental consideration in decision making.	This principle is considered for each hazard in the adoption of environmental controls (i.e., environmental performance outcomes and environmental performance standards) that aim to minimise environmental harm. There is a strong focus in this EP on conserving biodiversity and ecological integrity by understanding the marine environment and commercial fishing activity in the activity area and EMBA (Chapter 5) and implementing control measures to minimise impacts and risks (Chapter 7).
E	Improved valuation, pricing and incentive mechanisms should be promoted.	This principle is not relevant to this activity.

6.6. Step 6 – Treat the Risk

The activity environmental impact and risk register (discussed in Section 6.2) and this EP record the environmental control measures (e.g., measures to prevent, minimise and mitigate impacts and risks) that were determined by a qualified and experienced team familiar with the activity and the sensitivities of the existing environment. These control measures are listed throughout the impact assessment and risk assessment tables in Chapters 7 and 8.

6.7. Step 7 – Monitor and Review

Monitoring and review activities are incorporated into the impact and risk management process to ensure that control measures are effective and efficient in both design and operation. This is achieved through the environmental performance outcomes and standards and measurement criteria that are assigned to each environmental hazard.

The monitoring and review process is undertaken to support the compliance reporting process and is an opportunity to identify emerging risks that have arisen, that need to be analysed and addressed, if required. Monitoring and review of activities are described in the Implementation Strategy (Chapter 9).

7. Environmental Impact Assessment – Planned Activities

This chapter presents the EIA for the environmental impacts identified for the activity using the methodology described in Chapter 6, as required under Regulations 13(5)(6) of the OPGGS(E).

This chapter presents the control measures, Environmental Performance Objectives (EPOs), Environmental performance Standards (EPSs) and measurement criteria required to manage (i.e., avoid, minimise or mitigate) the identified impact. The following definitions are used in this section, as defined in Regulation 4 of the OPGGS(E):

- **Control measure** – a system, an item of equipment, a person or a procedure, that is used as a basis for managing environmental impacts and risks;
- **EPO** – a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level (i.e., the environmental objective);
- **EPS** – a statement of the performance required of a control measure; and
- **Measurement criteria** – defines the measure by which environmental performance will be measured to determine whether the EPO has been met.

A summary of the impact consequence rankings and risk ranking for each hazard identified and assessed in this chapter is presented in Table 7.1a.

Table 7.1a. Activity environmental impacts summary

Identifier	Hazard	Inherent	Residual
Impacts			
1	Physical presence - seabed disturbance	Negligible	Negligible
2	Physical presence - displacement of other marine users	Negligible	Negligible
3	Routine emissions - light	Negligible	Negligible
4	Routine emissions - atmospheric	Negligible	Negligible
5	Routine emissions – noise		
	- Plankton	Negligible	Negligible
	- Crustaceans (i.e., prawns)	Negligible	Negligible
	- Fish (with and without swim bladders)	Negligible	Negligible
	- Marine mammals	Negligible	Negligible
	- Marine reptiles (i.e., turtles)	Negligible	Negligible
	- Avifauna	Negligible	Negligible
6	Routine discharges - drill cuttings and muds	Negligible	Negligible
7	Routine discharges - cement	Negligible	Negligible
8	Routine discharges - putrescible waste	Negligible	Negligible
9	Routine discharges - sewage and grey water	Negligible	Negligible
10	Routine discharges - cooling and brine water	Negligible	Negligible
11	Routine discharges - bilge water and deck drainage	Negligible	Negligible

The following sections assess environmental impacts (arising from planned events, being events that do or will happen), as listed in Table 7.1 and presented pictorially in Figure 7.1.

Figure 7.1. Simplified pictorial representation of impacts arising from the planned activities during Beehive-1 drilling

7.1. IMPACT 1 – Physical Presence - Seabed Disturbance

7.1.1. Hazard

The following elements of the activity will result in seabed disturbance:

- MODU positioning – pinning of the jack-up MODU's legs to the seabed, with the spud cans penetrating the seabed sediments to a depth of about 16 m (based on previous drilling at the nearby Blacktip field).
- Drilling – the drilling activity will result in the generation of drill cuttings and discharge of cement and drilling muds, which will be deposited either directly at the seabed or settle to the seabed when discharged at the sea surface. Seabed disturbance resulting from the discharge of drilling cuttings, muds and cement is addressed in Section 7.6 and Section 7.7, respectively.
- Support vessel anchoring – the use of anchors (when vessels are on standby or in an emergency).

7.1.2. Known and Potential Environmental Impacts

Seabed disturbance has the potential to impact on marine receptors because of:

- Physical removal or disturbance of seabed sediments; and
- Increase in turbidity of the water column near the seabed.

These impacts will result in localised and temporary disturbance, displacement or smothering of benthic habitats and fauna. The area of benthic habitat that will be disturbed is limited to that occupied by the well itself (1 m²), the three spud cans (with a diameter of 18 m each, each one occupies an area of 254 m²) and the support vessel anchors (~5 m³ each). This will result in a total of 769 m² of seabed disturbance, noting that the support vessels are highly unlikely to anchor in the same position each time, so this figure may be slightly higher. There are no listed shipwrecks present within the impacts EMBA (see Section 5.6.2), therefore impacts to shipwrecks are not discussed further.

7.1.3. EMBA

The EMBA for seabed disturbance created by MODU positioning is likely to be restricted to tens of metres around each leg ('soft pinning' is usually only required when approaching a platform, and as such, furrows created in this process will not be created for this activity). Receptors that are known to occur or may occur within this EMBA are:

- Benthic species; and
- Demersal fish species.

7.1.4. Evaluation of Environmental Impacts

Physical removal of seabed sediments

Within the activity area, there are no known sensitive seabed features (such as reef, sponge gardens, seagrass meadows or scallop beds), so MODU positioning will not result in a loss of sensitive or geographically restricted habitats. Surveys of seabed disturbance from anchoring activities indicate that recovery of benthic fauna in soft sediment substrates (such as the sandy seabed that dominates the activity area) occurs between 6 to 12 months after the disturbance was created (URS, 2001). The anchor depression acts as a trap for marine detritus and sand, which will quickly fill and be recolonised by benthic organisms (Currie and Isaac, 2005). The area impacted

by spud cans and the well bore is extremely small and will not pose a threat to seabed habitats or fauna communities.

The area that will be disturbed is very small compared with the overall extent of the sandy seabed habitat in the region and consequently, there will be no long-term impacts to the diversity and abundance of benthic fauna, with impacts being extremely localised.

Water column turbidity

Turbidity may occur when seabed sediments are stirred up during the drilling process and during jack-up and jack-down of the MODU legs. Any turbidity created is likely to be within the limits of natural variability when considering the turbidity created by tides and storm events in the shallow waters of the activity area. This turbidity would limit light penetration into the water column but given its temporary nature, it would be unlikely to inhibit any macroalgae growth. Benthic fauna living in sediment (endobenthos) or on sediment (epibenthos) may be temporarily displaced by this turbidity.

Given the dominance of soft sediments (sand) in the activity area, it is expected that holes created by coring activities will rapidly collapse in on themselves, leaving only shallow pock marks in the seabed that will be rapidly filled in and colonised, as described above.

Direct mortality of benthic fauna

Mortality of benthic fauna may result in areas that are directly disturbed, or disturbed as a result of suspended sediments settling back onto the seabed. The area that will be disturbed is very small compared with the overall extent of the habitat in the region and consequently, there will be no long-term impacts to the diversity and abundance of benthic fauna populations, with impacts being extremely localised and temporary.

7.1.5. Impact Assessment

Table 7.1b presents the impact assessment for seabed disturbance.

Table 7.1b. Impact assessment for seabed disturbance

Summary		
Summary of impacts	Removal/disturbance of seabed sediments. Turbidity of the water column at the seabed.	
Extent of impacts	Localised – around individual points of disturbance.	
Duration of impacts	Temporary – returning to pre-impact condition soon after impact.	
Level of certainty of impacts	HIGH – the impacts of disturbance to seabed sediments are well known.	
Impact decision framework – context	Decision type	A - good industry practice required.
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.

Defined acceptable level	Seabed disturbance is limited to the areas required for MODU positioning		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Seabed disturbance is kept to the minimum area necessary for safe operations (IMP-01:EPS-01, -02, -03).	Elimination	Yes	EB: Reduces the footprint of seabed disturbance. C: No additional cost due to the nature of the activity. Ev: The environmental benefits outweigh the negligible costs.
No anchoring of support vessels.	Elimination	No	EB: Reduces the area of seabed disturbance. C: Cost of additional diesel fuel will be substantial (tens of thousands of dollars). Ev: The featureless seabed of the activity area (verified through the geophysical survey) means there is no environmental benefit in preventing vessels from anchoring if they need to. Anchoring, if required, will save the volume of fuel consumed and reduce associated atmospheric emissions.
Installation of support vessel mooring	Substitution	No	EB: Reduces the area of seabed disturbance from vessel anchors C: Additional vessel-based activity to install at least one mooring on location. Ev: Given the short duration of the activity, and the featureless seabed in the vicinity, the installation of a mooring is not considered necessary. Vessels will be on DP most of the time and therefore the requirement to anchor will be limited.
Avoid objects being dropped overboard (IMP-01:EPS-04, -05, -06, -07).	Elimination	Yes	EB: Reduces the likelihood of seabed disturbance from dropped objects overboard. C: No additional cost due to the nature of the activity. Ev: The environmental benefits outweigh the negligible costs.
Large objects dropped overboard from the MODU will be retrieved wherever possible	Engineering	No	EB: The MODU will not have an inspection class ROV onboard – this is only standard on semi-submersible MODUs. Only an observation class ROV will be available. The retrieval of large objects from the seabed is therefore not possible. C: Significant cost (hundreds of thousands of dollars) involved in having an inspection class ROV onboard during the campaign.

			Ev: The environmental benefits are outweighed by the substantial costs.
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Seabed disturbance is kept to the minimum area necessary for safe operations.	(IMP-01:EPS-01) The MODU will be pinned directly on location and will not undergo a soft-pinning exercise, thereby preventing the creation of scour channels in the seabed.	The MODU positioning report confirms direct pinning occurred.	
	(IMP-01:EPS-02) MODU-specific jack-up procedures are used to ensure compliance with stability criteria, reduce the risk of foundation shift or failure.	The MODU positioning report confirms MODU-specific jack-up procedures were used.	
	(IMP-01:EPS-03) Vessel anchoring will only occur in locations deemed suitable from the results of the PDSA.	PDSA report identifies suitable seabed for anchoring (i.e., absence of sensitive seabed habitat such as rocky reef).	
Avoid objects being dropped overboard.	(IMP-01:EPS-04) Large bulky items are securely fastened to or stored on the deck to prevent loss to sea.	A completed pre-departure inspection checklist verifies that bulky goods are securely sea-fastened.	
	(IMP-01:EPS-05) The crane/A-frame handling and transfer procedure is in place and implemented by crane operators (and others, such as dogmen) to prevent dropped objects.	Completed handling and transfer procedure checklist, permits to work (PTWs) and/or risk assessments verify that the procedure is implemented prior to each transfer.	
	(IMP-01:EPS-06) The crane/A-frame operators are trained to be competent in the handling and transfer procedure to prevent dropped objects.	Training records verify that crane operators are trained in the loading and unloading procedure.	
	(IMP-01:EPS-07) Visual inspection of lifting gear is undertaken every quarter by a qualified competent person (e.g., maritime officer) and lifting gear is tested regularly in line with the MODU/vessel planned maintenance system (PMS).	Inspection of PMS records and Lifting Register verifies that inspections and testing have been conducted to schedule.	
Large objects dropped overboard from the MODU will be reported.	(IMP-01:EPS-08) Large objects left behind at the end of the activity (that cannot be retrieved) will be reported internally and to NOPSEMA.	Incident report/s verify that the report was issued to NOPSEMA.	
Impact Consequence (residual)			
Negligible			
The consequence of seabed disturbance is assessed as negligible because:			
<ul style="list-style-type: none">• Impacts are extremely localised, thereby reducing temporary turbidity in water column;• Spud can depressions will collapse in on themselves and fill in quickly with sediments and recolonise with benthic fauna; and• There is an absence of sensitive habitats in the activity area.			

Demonstration of ALARP		
A ‘negligible’ residual impact consequence is considered to be ALARP and a ‘lower order’ impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.		
Demonstration of Acceptability		
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual consequence is negligible, which is considered acceptable.	
External context	<p>The NT DITT raised concerns regarding the discharge of drill cuttings and muds from the drilling campaign. As this is related to seabed disturbance, the concern is included here for completeness.</p> <p>EOG explained what the potential impacts were to benthic invertebrates and pointed the relevant person to the Drilling EP for more detail, which was on public exhibition at the time of the discussion. At the conclusion of the discussion, the relevant person was satisfied that the impacts would be minimal.</p>	
Legislative context	There is no legislation associated with seabed disturbance.	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for offshore marine use (physical disturbance) in Section 4.3.2 of the guidelines. In addition, this EP addresses the point of undertaking an environmental assessment to identify protected areas and local sensitivities.</p> <ul style="list-style-type: none">• Reduce footprint (IMP-01: EPS-01, -02).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	Not applicable. There is no guidance in these guidelines regarding seabed disturbance.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>Section 2.3.13 (marine operations and site assessment) of this guideline states that location-specific seabed assessments are undertaken to assure suitability of the equipment for the operating environment.</p> <p>Section 3.2.3.3 (foundation stability for jack-ups) also states that obtaining and analysing geotechnical data and information from seabed surveys should be undertaken. This will be achieved by conducting the geophysical and geotechnical (G&G) investigations and using the results to guide the placement of the MODU.</p> <p>Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection</p>

		plans should be prepared. The EP satisfies this requirement.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	Not applicable. There is no guidance regarding seabed disturbance.
	AEP CoEP (APPEA 2008)	The EPS developed for this activity meet the code's following objectives for offshore drilling operations: <ul style="list-style-type: none"> To reduce the impacts to benthic communities to acceptable levels and to ALARP.
Environmental context	MNES	
	AMPs	This hazard will not impact the conservation values of nearby AMPs.
	Ramsar wetlands	This hazard will not impact any Ramsar wetlands.
	TECs	This hazard will not impact any TECs.
	Nationally threatened and migratory species	This hazard will not impact any threatened or migratory species.
	Other matters	
	KEFs	This hazard will not impact any KEFs.
	NIWs	This hazard will not impact any NIWs.
	State marine parks	This hazard will not impact any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	None triggered by this hazard.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	EOG considers the impacts from seabed disturbance to be acceptable because: <ul style="list-style-type: none"> It will adhere to the company's Safety and Environmental Policy; The residual consequence rating is negligible; An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. Relevant legislation and industry best practice will be complied with; Seabed disturbance will not have long-term or significant impacts on MNES; The management of seabed disturbance is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; 	

	<ul style="list-style-type: none"> The management of seabed disturbance is not inconsistent with the aims of relevant marine reserve management plans; and The management of seabed disturbance is not inconsistent with ESD principles.

7.2. IMPACT 2 – Physical Presence - Displacement of Other Marine Users

7.2.1. Hazard

The physical presence of the MODU and support vessels undertaking the activity necessitates the temporary displacement of other marine users from around the MODU for the safety of other marine users and the MODU crew. This will result in the temporary displacement of other marine users such as commercial fishing vessels and merchant vessels from areas in which they would normally operate. Displacement of other marine users differs from interference with other marine users, which is addressed in Section 8.4.

7.2.2. Known and Potential Environmental Impacts

The known and potential impacts of the displacement of other marine users are:

- Diversion from a planned travel route and additional time to re-join the planned route;
- Increased fuel use (and cost) as a result of this diversion; and
- Temporary exclusion from fishing grounds.

7.2.3. EMBA

Other marine users will be excluded from operating within a 500-m radius of the MODU (in line with the PSZ and NTM) so as to avoid potential damage to the MODU. Receptors in the EMBA may include:

- Commercial fishing vessels; and
- Merchant shipping vessels.

7.2.4. Evaluation of Environmental Impacts

Merchant Shipping

As illustrated in Figure 5.49 and detailed in Table 5.17, the activity area and the immediate surrounds has recorded 35 vessel trips (tankers, cargo ships, fishing vessels, etc) over a 12-month period and therefore overlaps an area of low shipping traffic. This is primarily due to its location south of the major shipping routes travelling to and from the Port of Darwin (Figure 5.49).

The temporary exclusion of other marine users is likely to result in a negligible increase in travel time and fuel cost to individual marine users because of the very small exclusion zone and short-term nature of the activity. In the context of the marine voyages undertaken by vessels in the region, a negligible increase in travel time and fuel use in order to divert around the path of the MODU undertaking drilling activities will have a negligible consequence.

Fisheries

The primary fishery with recent fishing history in the activity area is the NPF. Historically, the activity timing (first few months of the year) would fall within the banana prawn fishing season. However, under an agreement between AFMA and the NPFI, the JBG will be closed to prawn fishing for the first fishing season, from 1st April to 15th June (until 2026). Thus, the activity will be undertaken at a time when the activity area is not open for fishing, thereby eliminating the potential for displacement with license holders of this fishery.

The WA-managed NDSMF and MMF may operate within the activity area. Given the short duration of the activity, the small area of potential displacement and the low volume of catch recorded from the activity area, the consequence of temporary displacement to these fisheries will have a negligible consequence.

7.2.5. Impact Assessment

Table 7.2 presents the impact assessment for displacement with other marine users.

Table 7.2. Impact assessment for displacement of other marine users

Summary		
Summary of impacts	Presence of the MODU and support vessels will temporarily displace other marine users (i.e., commercial fishing vessels, merchant shipping, etc) resulting in temporary exclusion in the area immediately around the vessel.	
Extent of impacts	Highly localised – 500 m around MODU.	
Duration of impacts	Short-term – minutes for a third-party vessel detour.	
Level of certainty of impacts	HIGH – the impacts associated with displacement of other marine users is well understood.	
Impact decision framework context	Decision type	A - good industry practice required.
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.
Defined acceptable level	Displacement of other marine users is no greater than the necessary for the reasonable exercise of rights afforded under the OPGGS Act. No unplanned interactions with other marine users.	
Impact Consequence (inherent)		
Receptor		Consequence

Merchant shipping	Negligible		
Commercial fisheries	Negligible		
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Do not conduct the activity in waters available to fisheries.	Eliminate	No	EB: Eliminates the potential for displacement of fishers by conducting the activity only in waters that are closed to fishing. C: The activity objectives could not be met if confined to areas closed to fishing. Ev: There are low numbers of fishers working in the activity area and the area is closed to the NPF during the activity timing. The activity area does not represent critical fishing grounds for any WA-managed fisheries. The cost of implementing this control is grossly disproportionate to the environmental benefit.
Reduce the exclusion zone (PSZ) to the smallest area possible for safe operations (IMP-02:EPS-01).	Administrative	Yes	EB: The exclusion zone (and thus extent of displacement) is reduced to the lowest possible extent necessary to achieve its aim and is linked to the minimum safe distance from the MODU. C: No cost to gazette the PSZ. Ev: Reducing the extent of displacement to the smallest area possible for safe operations outweighs the cost.
Conduct the activity during the NPF JBG closure period (1 st April to 15 th June) (IMP-02:EPS-02).	Eliminate	Yes	EB: Eliminates the potential for displacement of NPF fishers by conducting the activity only when JBG waters are closed to prawn fishing. C: No additional cost. Ev: Reducing the impact of displacement by conducting the activity at a time when a major stakeholder will not be present outweighs the cost.
Communicate the required area of displacement for the duration of the activity. (IMP-02:EPS-03, -04).	Administrative	Yes	EB: Informed stakeholders allows for planning so as to avoid or minimise displacement. C: Minimal cost to communicate with other marine users ahead of the activity through EOG notifications and the NTM. E: The benefit of avoiding or minimising displacement outweighs the minimal cost to implement this control measure.
Compensate for economic loss due to a spill associated with a	Administrative	Yes	EB: Affected third-party marine users are compensated for any economic loss due to interference, thereby mitigating the potential socio-economic consequences.

LoWC (IMP-02:EPS-05).			C: Minor costs to prepare the procedure and administer the claims process. Potentially significant costs for a claim or claims. Ev: The principal of the control measure is to ensure that other marine users are no worse off as a result of drilling so that all parties maintain their rights to access the ocean. The benefits outweigh the high costs of potential claims.
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Displacement is limited to the area necessary for safe operations.	(IMP-02:EPS-01) The exclusion zone is limited to a 500-m radius around the MODU, as gazetted through the PSZ.	The PSZ is gazetted by NOPSEMA and available on its website.	
	(IMP-02:EPS-02) EOG provides pre-activity notification to commercial fisheries at least one month prior to activity commencement to ensure they are aware of the activity timing and safety exclusion zone requirements.	Consultation records verify that notifications to fisheries were provided at least one month ahead of the activity starting.	
	(IMP-02:EPS-03) EOG provides pre-activity notification to the AHO at least three weeks prior to activity commencement to enable the promulgation of the NTM.	NTM is issued prior to the commencement of the activity and includes activity MODU/vessel details, location and timing.	
There is no economic loss to other marine users as a result of drilling Beehive-1.	(IMP-02:EPS-05) EOG makes its fisheries compensation procedure (summary available in Appendix 9) available to fishing associations, companies or individuals who have requested it so that they are able to make a claim for losses. The procedure contains: <ul style="list-style-type: none">• Philosophy of shared ocean access;• A commitment that EOG consults with fishers and fishing associations who may be impacted by EOG activities;• A commitment that a fisher should not suffer an economic loss as a direct result of an EOG activity;• A method for calculating economic loss for direct impact;• A claims procedure and forms; and• How to manage disagreements.	Email correspondence verifies the fisheries compensation procedure was provided to those that requested it.	
		Completed claims forms are available for any lodged claims.	
Impact Consequence (residual)			
Receptor		Consequence	
Merchant shipping		Negligible	

Fisheries	Negligible	
The impact of displacement of other marine users is assessed as negligible because:		
<ul style="list-style-type: none">• The activity will be of a short duration;• The area of displacement is extremely small and will not result in negligible increased time and fuel use for third-party vessels to divert around the activity vessel;• The activity will be conducted during the NPF JBG closure period; and• Thorough consultation has been undertaken in the development of the activity to minimise the impact of temporary displacement.		
Demonstration of ALARP		
A ‘negligible’ residual impact consequence is considered to be ALARP and a ‘lower order’ impact. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.		
Demonstration of Acceptability		
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	The NPFI expressed concerns regarding displacement of prawn fishing. This is addressed through the development of the fisheries compensation procedure.	
Legislative context	<p>The EPS outlined in this table align with the requirements of:</p> <ul style="list-style-type: none">• OPGGS Act 2006 (Cth).<ul style="list-style-type: none">○ Section 280 – requires that a person carrying on activities in an offshore area under the permit, lease, licence, authority or consent must carry on those activities in a manner that does not interfere with navigation or fishing (among others) to a greater extent than is necessary for the reasonable exercise of the rights and performance of the duties of the first person.	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed guidelines and codes of practice demonstrates that BPEM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for offshore physical presence in Section 4.3.1 of the guidelines, which include:</p> <ul style="list-style-type: none">• Develop exclusion zones in consultation with key stakeholders, including local fishing communities; raise awareness of exclusion zones with all stakeholders (IMP-02:EPS-01).• Issue a ‘NTM’ through the relevant government agencies, detailing the area of operations (IMP-02:EPS-04).

		<ul style="list-style-type: none"> Ensure all vessels adhere to International Regulations for Preventing Collisions at Sea (COLREGS), which set out the navigation rules to be followed to prevent collisions between two or more vessels. Optimise vessel use to ensure the number of vessels required and length of time that vessels are on site is as low as practicable.
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There are no guidelines specifically regarding physical presence for offshore activities.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>There is no specific guidance regarding displacement of other marine users.</p> <p>Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	There are no guidelines specifically regarding physical presence for activity vessels.
	AEP CoEP (APPEA 2008)	<p>The EPS developed for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> To reduce disturbance to fishing operations or other marine users to ALARP and to an acceptable level. To reduce the risk of collision with other vessels in accordance with maritime standards.
Environmental context	MNES	
	AMPs	This hazard will not intersect nearby AMPs.
	Ramsar wetlands	This hazard will not intersect any Ramsar wetlands.
	TECs	This hazard will not intersect any TECs.
	Nationally threatened and migratory species	This hazard will not have any impacts on threatened or migratory species.
	Other matters	
	KEFs	This hazard will not intersect any KEFs.
	NIWs	This hazard will not intersect any NIWs.
	State marine parks	This hazard will not intersect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	None triggered by this hazard.

ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).
Statement of acceptability	<p>EOG considers the impacts from displacement of other marine users to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Safety and Environmental Policy; • The residual consequence rating is negligible; • An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved; • Input from engagement with relevant persons has been considered and incorporated into the design of the activity; and • Relevant legislation and industry best practice will be complied with.
Environmental Monitoring	
<ul style="list-style-type: none"> • Continuous bridge monitoring from the support vessels. 	
Record Keeping	
<ul style="list-style-type: none"> • Consultation records. • Operational reports. • NTM. • Incident reports. 	

7.3. IMPACT 3 – Routine Emissions – Light

7.3.1. Hazard

Light emissions will occur from the MODU and support vessels due to:

- Vessel navigation lighting will be maintained while vessels are on location for maritime safety purposes;
- MODU deck lighting will be maintained for the safety of personnel working on deck;
- Flaring from the MODU (if DST is undertaken); and
- Underwater light from ROV activities.

7.3.2. Known and potential environmental impacts

The known and potential impacts of lighting are:

- Light glow may act as an attractant to light-sensitive species (e.g., seabirds, turtles, squid, zooplankton), in turn affecting predator-prey dynamics (due to attraction to or disorientation from light); and
- Continuous lighting may result in localised alterations to normal marine fauna behaviours.

7.3.3. EMBA

According to the National Light Pollution Guidelines for Wildlife (DCCEEW, 2023), if there is important habitat for seabirds (e.g., foraging BIAs) and turtles (e.g., nesting beaches) within 20 km of a project, an EIA should be undertaken. The 20 km buffer is based on the observed grounding of seabirds in response to a light source at least 15 km away and observed disorientation of turtle hatchlings to a light source 18 km away (DCCEEW, 2023).

Based on a MODU deck height of 20 m above the sea, the MODU (and therefore light) would be visible from 16 km away (calculated based on average human height, not birds in the air or turtles at the sea surface). For vessels, this distance would be slightly less. Although there are no bird BIAs or turtle nesting beaches within 20 km of the drilling location, the 20-km radius light EMBA from drilling activities (not including DST) has been adopted as a very conservative EMBA for light emissions in line with DCCEEW (2023).

Light-sensitive receptors that occur within this EMBA, either as residents or migrants, are:

- Plankton;
- Turtles;
- Pelagic fish; and
- Seabirds.

If DST is undertaken, the light from flaring may be visible over a larger distance for a short period of time (approximately 3 days). Light modelling was undertaken for Santos' Dorado development (northwest WA) for flaring from an FPSO (Pendoley Environmental, 2020). This study indicated that the flare is no longer directly visible at 42.4 km, when the flare drops below the horizon. As the flare drops below the horizon, radiance declines rapidly and is no longer visible.

The flare boom for the DST is slightly elevated above the deck. For the MODU being considered, the main deck is 22.8 m above MSL and the EverGreen Burner would be ~2.0 m above the main deck. This is lower than the height of a flare on a typical FPSO and therefore distances that the flare would be visible are considered conservative. Lighting impacts are not only related to the amount of artificial light, but also the types of light and the wavelengths that the different light types emit. Measurements of light emitted from a MODU recorded peak wavelengths between 530 to 620 nm, which is within the range that is visible to marine turtles and seabirds (300 to >700 nm) (Woodside, 2019). Light emitted from a natural gas flare recorded peak wavelengths between 750 to 900 nm (Pendoley, 2000 in Woodside, 2019). While this peak is outside the visible spectrum that is most disruptive to wildlife, including marine turtles and seabirds (DCCEEW, 2023), light emissions from gas flares tend to be high intensity, which is also an important factor. Therefore, light emissions from gas flares may pose a potential risk to wildlife.

7.3.4. Evaluation of environmental impacts

The lighting levels associated with the MODU and support vessels are not considered to be significantly different from other commercial shipping activity in the impacts EMBA (see vessel types in Section 5.7.7), nor will it be a permanent additional contribution of artificial light in the JBG.

The additional lighting experienced during a DST (if performed) will result in a larger EMBA, conservatively estimated at 42 km, for short periods of time (i.e., a 3-5 day period per zone with less than 1.5 days continuous flaring during each zone).

Turtles

Artificial light can disrupt critical behaviours in turtles such as adult nesting and hatchling orientation, sea finding and dispersal ability and can reduce the reproductive viability of turtle stocks (DCCEEW, 2023). Female turtles nest on sandy tropical and sub-tropical beaches predominantly at night where they rely on visual cues to select nesting beaches and orient on land. Most turtle hatchlings emerge at night and must rapidly orient for and find the ocean to avoid predation. Hatchlings orient for the ocean using both topographic and brightness cues, whereby

they move toward the brighter oceanic horizon and away from the darkened silhouettes of the sand dunes on the beach (DCCEEW, 2023). This critical sea finding behaviour can be disrupted by artificial lights that disorient or misorient the movement of hatchling in a direction other than the sea, which often leads to mortality from predation, exhaustion or dehydration (DCCEEW, 2023).

The operational area is located 80 km from the nearest shoreline, which far exceeds the recommended 20 km buffer for artificial light applied to turtle nesting locations for drilling activities, and is also outside the 42 km EMBA from flaring. Therefore, lighting from the MODU, flaring and support vessels is not predicted to impact turtle hatchlings at any potential nesting locations. Although hatchlings have been found to be attracted to light sources in the nearshore environment (Wilson *et al.*, 2018), the offshore waters of the operational area and its long distance from shorelines means that the impact of lighting on hatchling dispersal will be negligible (e.g., the nearest nesting beaches are at Cape Domett for green turtles, 87 km to the south of the operational area). The light EMBA from routine drilling and from flaring (Figure 7.2) overlaps the following turtle BIAs and habitat critical to the survival of marine turtles:

- Green turtle – foraging BIA;
- Flatback turtle – inter-nesting BIA;
- Olive Ridley turtle – foraging BIA; and
- Flat back turtle – nesting - habitat critical to the survival of marine turtles.

Table 7.3 presents a comparison of the routine light EMBA and flaring EMBA overlaps with the turtle BIAs and habitat critical to the survival of marine turtles. Habitat critical to the survival of turtles is discussed in Section 5.4.6.

Table 7.3. Comparison of the light EMBA's percentage overlap with turtle BIAs and habitat critical to the survival of marine turtles.

BIA/Habitat critical to the survival of marine turtles	Light EMBA (20 km radius)	Flaring EMBA (42 km radius)
BIA		
Loggerhead turtle (see Figure 5.25)	0%	0%
Green turtle – foraging (see Figure 5.26)	2.9%	13%
Flatback turtle – inter-nesting (see Figure 5.27)	6%	24%
Olive Ridley turtle – foraging (see Figure 5.28)	2.9%	13.05%
Habitat critical to the survival of marine turtles		
Flat back turtle – nesting (see Figure 5.27)	0.06%	16.67%

These BIAs are associated with adult foraging turtles, so light emissions from the activity are anticipated to have a negligible consequence because lighting will not interfere with the behaviour of their prey and therefore disruption to normal foraging behaviour will not be negatively impacted.

Although the light EMBA's overlap important inter-nesting habitat, the number of individuals likely to be present is expected to be limited. Suitable inter-nesting habitat for flatback turtles is defined as water depths shallower than 16 m (Whitlock *et al.*, 2016b; Pendoley, 2019). The flaring light EMBA reaches water depths between 25-65 m, so suitable inter-nesting habitat will not be impacted. Inter-nesting olive ridley turtles remain relatively close to nesting beaches during the nesting period (in comparison to post-nesting movements); tagged turtles remained within 48 km

of the nesting beach in waters typically <30 m water depth (Hamel *et al.*, 2008). Inter-nesting may occur year-round with a peak expected between April and June with increased potential for inter-nesting females to occur during this time.

If individual turtles are present, light emissions are unlikely to be of concern. There is no evidence, published or anecdotal, to suggest inter-nesting turtles are impacted by light from offshore vessels, and nothing in their biology would indicate this as a plausible threat (Pendoley, 2019; Witherington and Martin, 2003). Potential impacts to foraging turtles are limited to local attraction to prey species attracted to light (Kebodeaux, 1994). Marine turtles do not feed during the breeding season (Limpus *et al.*, 2013), and light is not a cue to inter-nesting behaviours. Therefore, potential impacts of artificial light to inter-nesting turtles are not considered likely.

Adult turtles have been observed feeding on prey presumed to be attracted by lights of oil production platforms in the Gulf of Mexico (Kebodeaux, 1994). However, illuminating fishing nets has been shown to reduce the bycatch of green turtles as they are thought to alert them to the presence of a net (Ortiz *et al.*, 2016). This suggests that, although aggregation of foraging turtles may occur around light sources as a secondary response to effects of light on prey distribution, light does not appear to act as a cue to foraging behaviour.

Light pollution is identified as a threat to turtles in the Recovery Plan for Marine Turtles 2017-2027 (DoEE, 2017c). An assessment of relevant interim recovery objectives and targets with the activity is provided in Table 7.4.

Table 7.4. Assessment of the relevant interim recovery objectives and targets of the Recovery Plan for Marine Turtles 2017-2027 (DoEE, 2017c) with the activity

Interim Objective or Target	Assessment
<i>Interim Objective 3: Anthropogenic threats are demonstrably minimised.</i>	
Target 3.1: Robust and adaptive management regimes that lead to a reduction in anthropogenic threats to marine turtles and their habitats are in place.	The EPS listed in Table 7.7 will reduce the impact of light emissions on turtles to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this recovery target.
Target 3.2: Threat mitigation strategies are supported by high quality information.	The activity will not have any impacts on this recovery target.

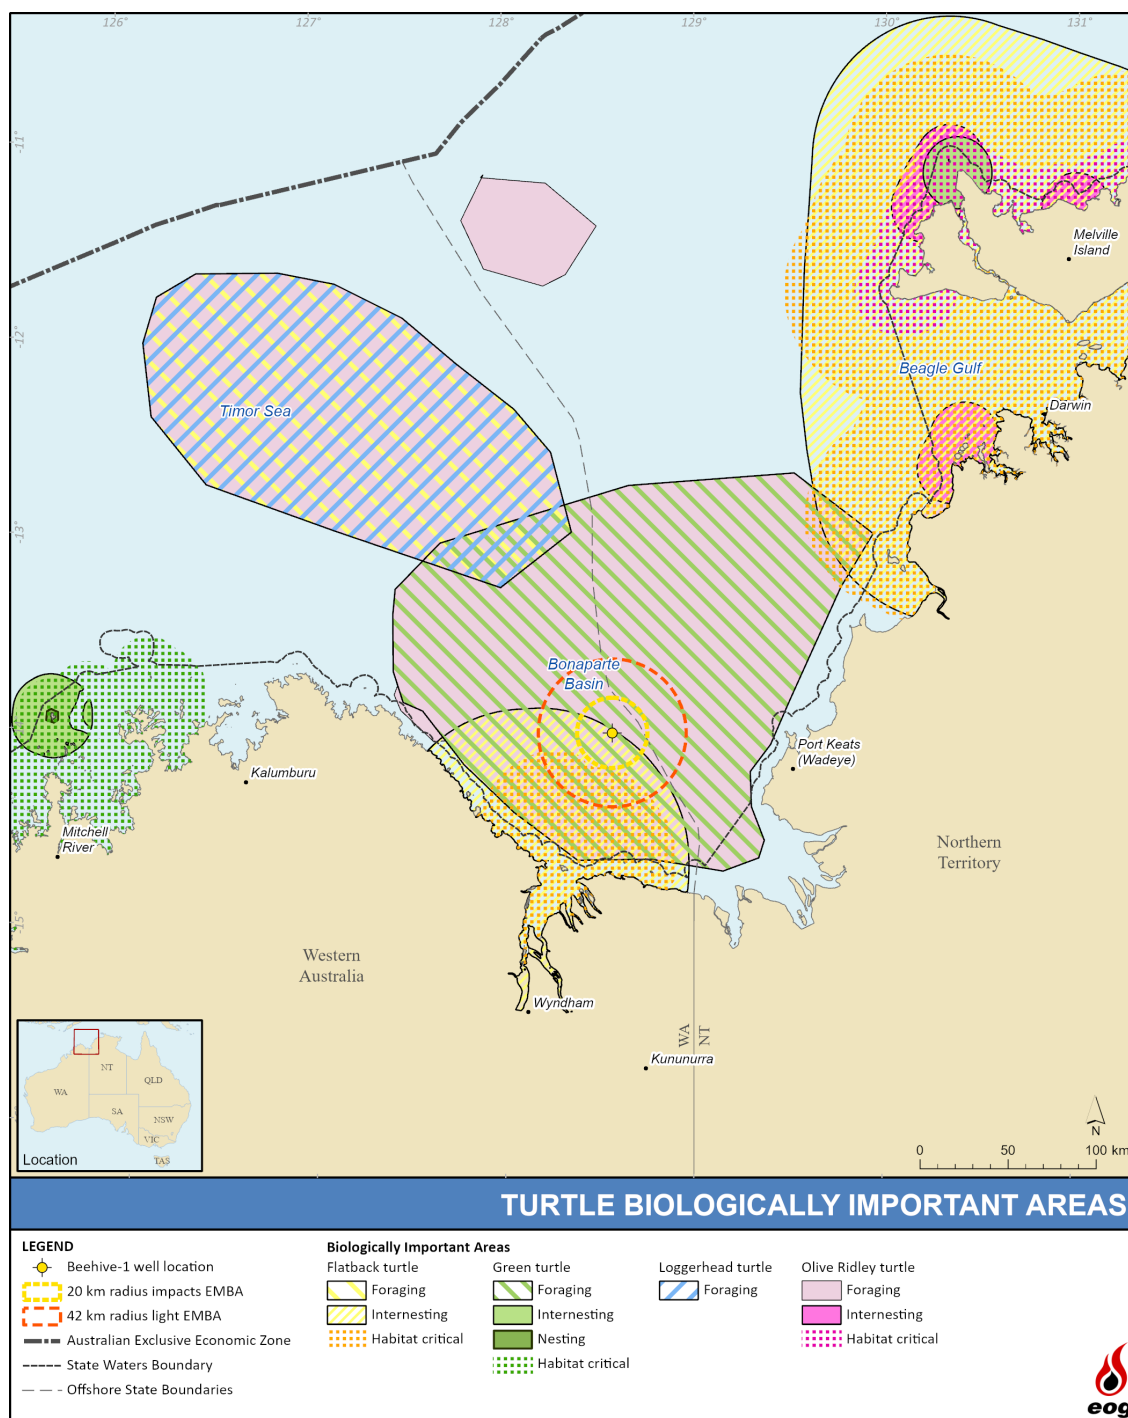

Figure 7.2. Turtle BIAs and habitat critical to the survival of marine turtles in the light EMBA

Fish and plankton

Fish and zooplankton may be directly or indirectly attracted to lights. Experiments using light traps have found that some fish and zooplankton species are attracted to light sources (Meekan *et al.*, 2001), with traps drawing catches from up to 90 m (Milicich *et al.*, 1992). Lindquist *et al.* (2005) concluded from a study of larval fish populations around an oil and gas platform in the Gulf of Mexico that an enhanced abundance of clupeids (herring and sardines) and engraulids (anchovies), both of which are highly photopositive, was caused by the platforms' light fields. The concentration of organisms attracted to light results in an increase in food source for predatory species and marine predators are known to aggregate at the edges of artificial light halos. Shaw *et al.* (2002), in a similar light trap study, noted that juvenile tunas (Scombridae) and jacks (Carangidae), which are highly predatory, may have been preying upon concentrations of zooplankton attracted to the light field of the platforms. This could potentially lead to increased predation rates compared to unlit areas.

Overall, an increase in fish activity around the MODU and support vessels may occur at night-time, but this is highly localised and short-term and therefore expected to have negligible impacts to the local and regional food web.

Cetaceans

There is no evidence to suggest that artificial light sources adversely affect the migratory, feeding or breeding behaviours of cetaceans. Cetaceans predominantly utilise acoustic senses to monitor their environment rather than visual sources (Simmonds *et al.*, 2004), so light is not considered to be a significant factor in cetacean behaviour or survival and will therefore have a negligible impact.

Seabirds

Seabirds may be attracted to light glow at night-time. Bright lighting can disorientate birds, thereby increasing the likelihood of seabird injury or mortality through collision with the MODU and support vessels, or mortality from starvation due to disrupted foraging at sea (Wiese *et al.*, 2001 in DSEWPC, 2011b; Rajkhowa, 2014). This disorientation may also result in entrapment, stranding, grounding and interference with navigation (DCCEW, 2023). The DCCEW (2023) notes that seabird fledglings may be affected by lights up to 15 km away. Studies conducted between 1992 and 2002 in the North Sea confirmed that artificial light was the reason that birds were attracted to and accumulated around illuminated offshore infrastructure (Marquenie *et al.*, 2008) and that lighting can attract birds from large catchment areas (Wiese *et al.*, 2001). The light may provide enhanced capability for seabirds to forage at night.

The WCP for seabirds (2020) identifies light pollution as minor threat to seabirds. Vessels are listed as a problematic source of light and offshore oil platforms and flaring have also been identified as impact light sources. Artificial lighting has the potential to interfere with nocturnal breeding behaviours of some seabirds. Fledglings are more vulnerable to artificial light compared to adults, due to their naivety on their first flight (Commonwealth of Australia, 2020).

There are no seabird BIAs that are intersected by the light EMBA from routine activities or during flaring (Figure 7.3). Therefore, impacts to seabird breeding colonies from light emissions are not expected to occur. However, there is potential for foraging seabirds to be present at the time of the activity. Given the short duration of the activity and its distance from breeding colonies, the consequence of light emissions on seabird populations will be negligible.

Marine Parks

Management of the JBG AMP is covered by the North Marine Parks Network Management Plan 2018 (DNP, 2018a). This plan identifies light emissions associated with habitat modification and marine pollution as a pressure on the AMP network. The light EMBA from day-to-day drilling activity does not intersect any AMPs (it is located 16 km from the boundary of the JBG AMP) or other marine protected areas (see Figure 7.3).

However, the 42 km light EMBA from flaring will overlap parts of the western and southern edges of the JBG AMP during DST (3.5% overlap in total), with no overlap of the North Kimberley Marine Park. The JBG AMP's key values are its submerged features and nearshore ecosystems (outside of the light EMBA). The submerged features are not considered at risk of impacts from flaring lighting emissions. The JBG AMP supports a range of species including marine turtles and the Australian snubfin dolphin. Impacts to turtles from the flaring light EMBA are described earlier in this section, and there is no evidence to suggest that artificial light sources adversely affect the migratory, feeding or breeding behaviours of cetaceans. Therefore, flaring will not have a significant impact on the values of the JBG AMP.

Community

The distance of the closest point of the operational area from the nearest shoreline (80 km) and nearest town (Wadeye, 83 km) means that MODU and support vessel lighting in the activity area will not be visible from land. Visual impacts to these communities from lighting will not occur.

National Light Pollution Guidelines for Wildlife

Table 7.5 provides an assessment of the light management options for seabirds as outlined in Table 8 of the National Light Pollution Guidelines for Wildlife (DCCEEW, 2023). Where management options have been deemed as feasible, they have been assessed and adopted as a control measure and associated EPS have been developed (Table 7.7).

Table 7.6 provides an assessment of the light management options for turtle nesting beaches as outlined in Table 5 of the National Light Pollution Guidelines for Wildlife (DCCEEW, 2023) against the activity. Where management options have been deemed as feasible, they have been assessed and adopted as a control measure and associated EPS have been developed (Table 7.7).

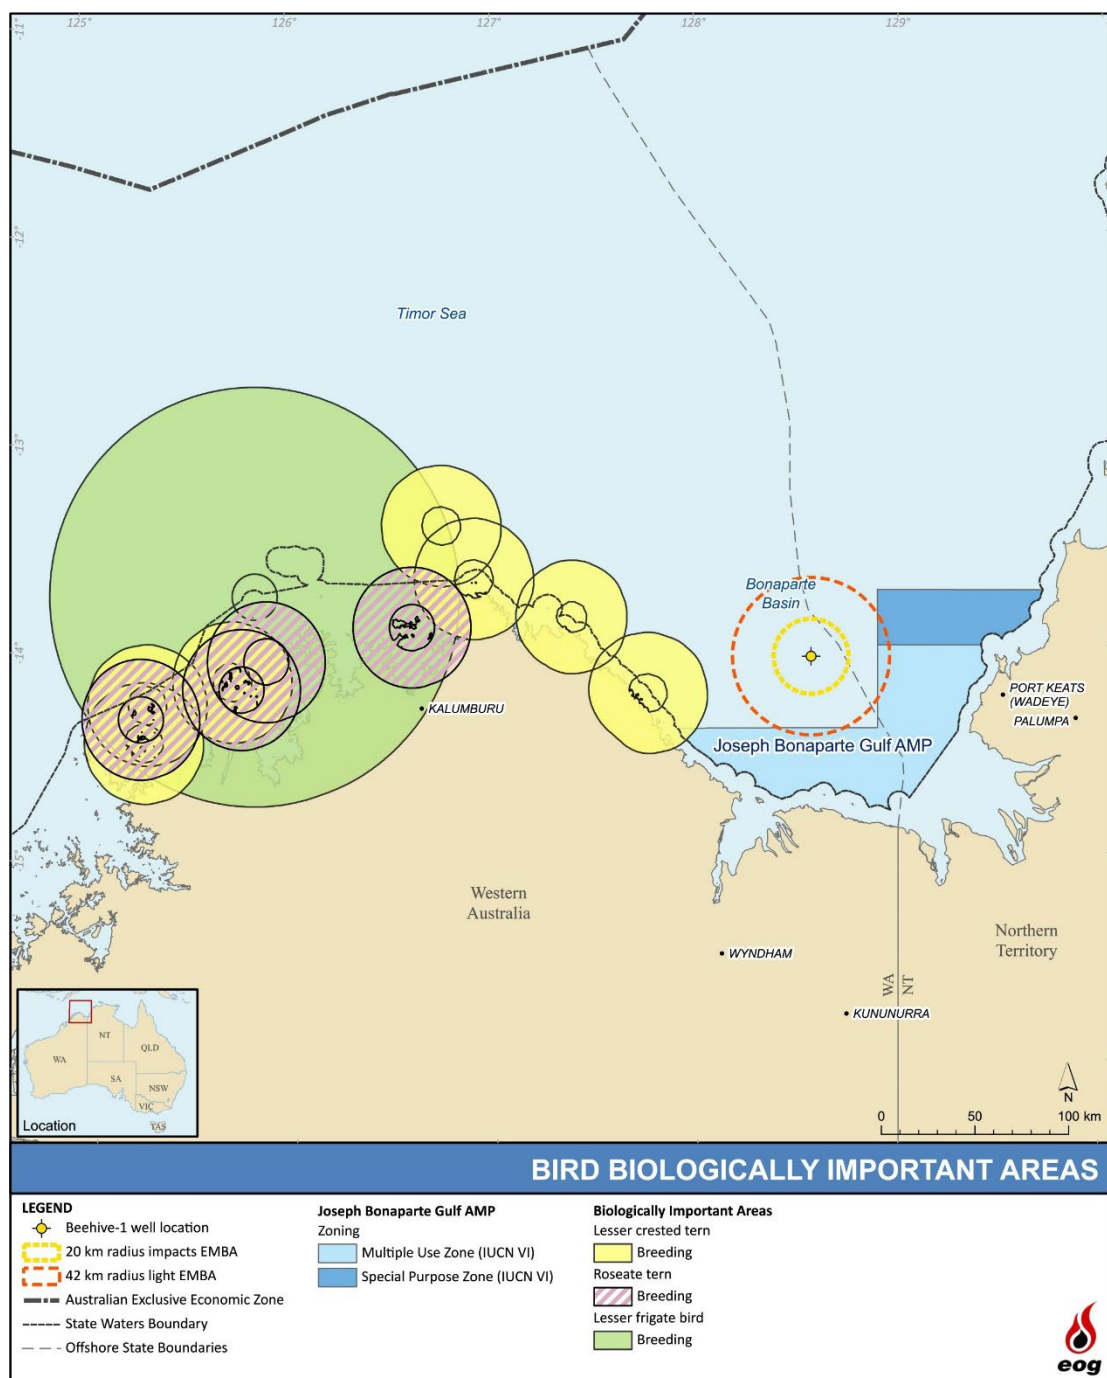

Figure 7.3. Seabird BIAs closest to the light EMBA

Table 7.5. Assessment of the light management options for seabirds from the National Light Pollution Guidelines for Wildlife (DCCEW, 2023)

Management option	Achievable?	Justification
Implement management actions during the breeding season.	Yes	Achievable management actions are identified in this table and in Table 7.7 (adopted control measures and associated EPS).
Maintain a dark zone between the rookery and the light sources.	Yes	The nearest shoreline (and thus potential rookery location) is 80 km away on the southern coast of the JBG. As such, there is a large dark zone between the rookery and the activity area.
Turn off lights during fledgling season.	No	Drilling operations are conducted 24-hours a day and light is necessary for navigational and personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).
Use curfews to manage lighting.	No	As above.
Aim lights downwards and direct them away from nesting areas.	Yes	Where practicable, lights will be directed towards working areas for the safety of personnel (see Table 7.7).
Use flashing/intermittent lights instead of fixed beam.	No	Drilling operations are conducted 24-hours a day and light is necessary for personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).
Use motion sensors to turn lights on only when needed.	No	As above.
Prevent indoor lighting reaching outdoor environment.	Yes	Blinds will be lowered on portholes and windows at night where this does not interfere with safe work practices (see Table 7.7).
Manage artificial light on jetties, wharves, marinas, etc.	N/A	Not applicable to this activity.
Reduce unnecessary outdoor, deck lighting on all vessels and permanent and floating oil and gas installations in known seabird foraging areas at sea.	Yes	Lighting will be reduced to that required for safe operations and by maritime legislative requirements (see Table 7.7). Flaring (if undertaken), will be undertaken only intermittently over the course of 3-5 days per zone.
Night fishing should only occur with minimum deck lighting.	N/A	Not applicable - fishing is not permitted from the MODU or support vessel.

Management option	Achievable?	Justification
Avoid shining light directly onto fishing gear in the water.	N/A	Not applicable - fishing is not permitted from the MODU or support vessel.
Ensure lighting enables recording of any incidental catch, including by electronic monitoring systems.	N/A	Not applicable - fishing is not permitted from the MODU or support vessel.
Avoid shining light directly onto longlines and/or illuminating baits in the water.	N/A	Not applicable - fishing is not permitted from the MODU or support vessel.
Vessels working in seabird foraging areas during breeding season should implement a seabird management plan to prevent seabird landings on the ship, manage birds appropriately and report the interaction.	N/A	The MODU and support vessels are equipped with lighting required under legislation to identify itself to other vessels, reduce the risk of at-sea collision and provide for the safety of its crew. Most seabirds in the region are migratory, with no breeding areas (i.e., islands) within 75 km of the activity area.
Use luminaires with spectral content appropriate for the species present.	No	The activity vessel is equipped with lighting required under legislation to identify themselves to other vessels, reduce the risk of at-sea collision and provide for the safety of crews. Most seabirds in the region are migratory, with no breeding areas (i.e., islands) within 80 km of the activity area. See Table 7.7 for adopted control and associated EPS.
Avoid high intensity light of any colour.	No	As above.
Shield gas flares and locate inland and away from seabird rookeries.	No	The activity may involve flaring, but the flare is not able to be shielded. Beehive-1 is located a long distance from seabird rookeries, so this management option is not required.
Minimise flaring on offshore oil and gas production facilities.	Yes	Flaring (if undertaken), will be undertaken only intermittently over the course of 3-5 days per zone.
In facilities requiring intermittent night-time inspections, turn on lights only during the time operators are moving around the facility.	N/A	The MODU and support vessels are equipped with lighting required under legislation to identify themselves to other vessels, reduce the risk of at-sea collision and provide for the safety of crews.
Ensure industrial site/plant operators use head torches.	No	Drilling operations are conducted 24-hours a day and lighting of all areas is necessary for personnel safety. As such, the use of head torches is not necessary. Lighting will be reduced so far as is practicable and in accordance with maritime requirements and personnel safety. See Table 7.7 for adopted control and associated EPS.

Management option	Achievable?	Justification
Supplement facility perimeter security lighting with computer monitored infrared detection systems.	N/A	Not applicable to this activity.
Tourism operations around seabird colonies should manage torch usage so birds are not disturbed.	N/A	Not applicable to this activity.
Design and implement a rescue program for grounded birds.	No	Due to the distance between the operational area and seabird rookeries, grounding of birds is unlikely to occur and thus a rescue program is not necessary.

Table 7.6. Assessment of the light management options for turtle nesting beaches from the National Light Pollution Guidelines for Wildlife (DCCEEW, 2023)

Management option	Achievable?	Justification
Implement light management actions during the nesting and hatching season.	Yes	Achievable management actions are identified in this table and in Table 7.7 (adopted control measures and associated EPS).
Avoid direct light shining onto a nesting beach or out into the ocean adjacent to a nesting beach.	Yes	The nearest shoreline (and thus potential nesting location) is 80 km away on the southern coast of the JBG. As such, the MODU and support vessel lighting will not shine on to the beach or the ocean adjacent to the beach.
Maintain a dune and/or vegetation screen between the nesting habitat and inland sources of light.	N/A	Not applicable to this activity.
Maintain a dark zone between turtle nesting beach and industrial infrastructure	Yes	The nearest shoreline (and thus potential nesting location) is 80 km away on the southern coast of the JBG. As such, there is a large dark zone between the coast and the activity area.
Install light fixtures as close to the ground as practicable.	No	Drilling operations are conducted 24-hours a day and light is necessary for navigational and personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).
Use curfews to manage lighting.	No	Drilling operations are conducted 24-hours a day and light is necessary for navigational and personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).
Aim lights downwards and direct them away from nesting beaches.	Yes	Where practicable, lights will be directed towards working areas for the safety of personnel (see Table 7.7).
Use flashing/intermittent lights instead of fixed beam.	No	Drilling operations are conducted 24-hours a day and light is necessary for navigational and personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).
Use motion sensors to turn on lights only when needed.	No	Drilling operations are conducted 24-hours a day and light is necessary for navigational and personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).

Management option	Achievable?	Justification
Prevent indoor lighting reaching beach.	Yes	Blinds will be lowered on portholes and windows at night where this does not interfere with safe work practices (see Table 7.7).
Limit the number of beach access areas or construct beach access such that artificial light is not visible through the access point.	N/A	Not applicable to this activity.
Work collectively with surrounding industry/private land holders to address the cumulative effect of artificial lights.	N/A	Not applicable to this activity.
Manage artificial light at sea, including on vessels, jetties, marinas and offshore infrastructure.	Yes	Achievable management actions are identified in this table and in Table 7.7 (adopted control measures and associated EPS).
Reduce unnecessary lighting at sea.	Yes	Flaring (if undertaken), will use a boom that extends past the deck and over the sea. If undertaken, it will be intermittent over the course of 3-5 days per zone. Achievable management actions are identified in this table and in Table 7.7 (adopted control measures and associated EPS).
Avoid shining light directly onto longlines and/or illuminating baits in the water.	N/A	Not applicable to this activity – no fishing is allowed from the MODU or support vessels.
Avoid lights containing short wavelength violet/blue light.	No	The MODU and support vessels are equipped with lighting required under legislation to identify themselves to other vessels, reduce the risk of at-sea collision and provide for the safety of its crew. Most seabirds in the region are migratory, with no breeding areas (i.e., islands) within 80 km of the activity area. See Table 7.7 for adopted control and associated EPS.
Avoid white LEDs.	No	As above.
Avoid high intensity light of any colour.	No	As above.
Shield gas flares and locate inland and away from nesting beach.	No	The activity may involve flaring, but the flare is not able to be shielded. Beehive-1 is located a long distance from seabird rookeries, so this management option is not required.

Management option	Achievable?	Justification
Industrial/port or other facilities requiring intermittent night-time light for inspections should keep the site dark and only light specific areas when required.	No	Drilling operations are conducted 24-hours a day and light is necessary for navigational and personnel safety. Lighting will be reduced to the furthest extent possible for safe operations (see Table 7.7).
Industrial site/plant operators to use head torches.	No	Drilling operations are conducted 24-hours a day and lighting of all areas is necessary for personnel safety. As such, the use of head torches is not necessary. Lighting will be reduced so far as is practicable and in accordance with maritime requirements and personnel safety. See Table 7.7 for adopted control and associated EPS.
Supplement facility perimeter security lighting with computer monitored infra-red detection systems.	N/A	Not applicable to this activity.
No light source should be directly visible from the beach.	Yes	The nearest shoreline (and thus potential nesting location) is 80 km away on the southern coast of the JBG. As such, the MODU and support vessel lighting will not be visible from the beach.
Manage light from remote regional sources (up to 20 km away).	Yes	The nearest shoreline (and thus potential nesting location) is 80 km away on the southern coast of the JBG. As such, the MODU and support vessel lighting will not be visible from the beach.

7.3.5. Impact Assessment

Table 7.7 presents the impact assessment for light emissions.

Table 7.7. Impact assessment for light emissions

Summary			
Summary of impacts	Light glow may act as an attractant to light-sensitive species (e.g., seabirds, turtles, fish, zooplankton), in turn affecting predator-prey dynamics (due to attraction to or disorientation from light).		
Extent of impacts	Localised for most marine fauna, and up to 15 km for turtle hatchlings and 20 km for seabirds during day-to-day drilling activities, and up to 42 km during flaring.		
Duration of impacts	Temporary – short-term (duration of activity) (and up to 3-5 days for flaring).		
Level of certainty of impacts	HIGH – the impacts of light glow on marine fauna are well known.		
Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	The impacts of light emissions to EPBC Act-listed threatened and migratory bird species and marine turtles are not inconsistent with their in-force recovery plans or wildlife conservation plans/advice.		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Exclude night-time operations.	Eliminate	No	EB: Eliminates impact of night-time light emissions on sensitive species (e.g., seabirds and turtles foraging at night). C: Would double the duration of the activity and therefore double activity costs. Ev: Increased impacts in other areas due to a longer presence on location, including increase in waste discharges, air emissions, displacement of commercial fishers. The high costs associated with extending the activity are grossly disproportionate to the benefits. Lighting is required by law for navigational and safety purposes.
Manage the timing of the activity to avoid sensitive periods.	Eliminate	No	EB: Reduces potential for impacts on turtles during critical life stages from light emissions. C: Timing of the activity is subject to multiple factors and turtle activity can occur all year round, with breeding from June-August. Ev: Impacts to nesting females, emerging hatchlings and dispersing hatchlings at sea are not expected to

			<p>result in changes at the individual, population or genetic stock level. A seasonal exclusion would not avoid all turtle nesting, internesting and hatchling activity but may avoid the known peaks. The impact assessment determined the risk to hatchlings from light emissions is low and not inconsistent with the requirements of the Recovery plan for marine turtles in Australia 2017–2027.</p>
Do not flare.	Eliminate	No	<p>EB: Eliminates impact of artificial light on sensitive species (e.g., seabirds and turtles).</p> <p>C: in a success case, not being able to test the well using DST (which involves flaring) compromises the objectives of the drilling program and would it make it extremely difficult to predict future steps. Flaring is a pre-requisite for declaring a discovery (which is the objective of this activity).</p> <p>Ev: The high costs associated with not being able to evaluate the well sufficiently are grossly disproportionate to the benefits of temporary additional light.</p>
Keep MODU and support vessel external lighting to levels required for navigation, and safety of deck operations (IMP-03:EPS-01).	Engineering	Yes	<p>EB: This keeps light to the minimum required to meet legislated navigation requirements whilst reducing the likelihood of impacts to fauna from MODU and support vessel lighting.</p> <p>C: No additional activity costs. MODU and support vessel lighting is a legislative requirement for safe navigation and deck operations.</p> <p>Ev: Good practice is well defined and established in Marine Orders (Part 30 and Part 59) for MODUs and vessels. Lighting is required to provide navigational safety and meet legislative requirements. Lighting is reduced to the lowest practicable level to allow for safe work practices and legislative compliance.</p>
Install lighting shields.	Engineering	No	<p>EB: Reduces light spill to the marine environment through physical barriers.</p> <p>C: These are not standard fixtures on vessels. There will be significant time and cost to install these, and they may reduce safety of deck operations.</p> <p>Ev: External lighting is necessary for safe navigation and deck operations. The cost of this control measure outweighs the minimal benefit this control measure would have.</p>
Use of lighting with wavelengths that are less intrusive to marine fauna.	Engineering	No	<p>EB: Some marine fauna are less sensitive to particular light wavelengths.</p> <p>C: High cost of sourcing specialised globes.</p> <p>Ev: Lighting will be managed in accordance with the relevant Australian and international standards to ensure that personnel and vessel safety is not compromised. This control measure is unlikely to result in reduced impact due to the diversity of species present in the region; no single light wavelength can reduce risks for all fauna groups.</p>

			This control measure would result in negligible benefit at a high cost.
Use of dark, matte surfaces on MODU and support vessels.	Engineering	No	<p>EB: Would reduce reflection and scattering of light that results in skyglow.</p> <p>C: Additional cost to repaint surfaces. Some areas may require lighter surfaces to manage heat conduction for health and safety. Unlikely to result in a material light reduction.</p> <p>Ev: The high financial cost would be grossly disproportionate to negligible environmental benefits. May compromise human health and safety in some circumstances.</p>
Direct lighting to working areas only on the MODU and support vessels (IMP-03:EPS-02).	Engineering	Yes	<p>EB: Reduces light spill to the marine environment.</p> <p>C: No additional costs.</p> <p>Ev: Good practice and well established in the industry. Environmental benefits can be achieved with minimal cost.</p>
Periodically inspect lighting on-board to confirm it complies with lighting standards (IMP-03:EPS-03).	Administrative	Yes	<p>EB: Provides mechanism to inspect the implementation of control measures and their associated environmental benefits.</p> <p>C: Cost of time only.</p> <p>Ev: Good practice and well established in the industry. Environmental benefits can be achieved with minimal cost.</p>
Lower blinds on non-essential portholes and windows at night (IMP-03:EPS-04).	Administrative	Yes	<p>EB: Reduces light spill to the marine environment.</p> <p>C: No additional cost. Involves only time to discuss this during crew inductions and in undertaking routine inspections.</p> <p>Ev: Good practice and well established in the industry. Environmental benefits can be achieved without cost.</p>
Implementation of Well Test Plan to minimise flaring overall (IMP-03:EPS-05).	Administrative	Yes	<p>EB: Ensures well test crew follow set procedures, thereby ensuring efficient flaring for minimal periods of time.</p> <p>C: The preparation of a Well Test Plan is standard practice for well testing contractors, whereby the cost is factored into the contract and not an extra cost per se.</p> <p>Ev: Environmental benefits outweigh the low costs.</p>
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
External lighting conforms to that required by maritime safety standards.	<p>(IMP-03:EPS-01) External lighting is managed in accordance with:</p> <ul style="list-style-type: none"> AMSA Marine Orders Part 30 (Prevention of Collisions). 	Vessel class certifications are current.	

	<ul style="list-style-type: none">AMSA Marine Orders Part 59 (Offshore Support Vessel Operations).	
Lighting is reduced to limit the localised attraction of marine fauna.	(IMP-03:EPS-02) Lighting is directed to working areas (rather than overboard) to minimise light spill to the ocean.	Completed environmental checklists and photos verify that lighting standards are inspected and lighting is directed inboard where practicable.
	(IMP-03:EPS-03) Lighting is periodically inspected to ensure it complies with lighting standards and relevant control measures.	
	(IMP-03:EPS-04) Blinds will be lowered on all non-essential portholes and windows at night.	Completed environmental checklists and photos verify that blinds are drawn each night.
	(IMP-03:EPS-05) In accordance with the Well Test Plan, flaring is limited to the minimum time required to safely undertake the DST and achieve data collection requirements.	DDRs record the duration of flaring.
	(IMP-03:EPS-06) All crew are informed of the artificial lighting control measures during the environmental awareness induction.	Induction presentation includes requirements to minimise artificial lighting.
Induction attendance list verify crew are aware of these measures.		
Impact Consequence (residual)		
Negligible		
The consequence of light emissions is assessed as negligible because:		
<ul style="list-style-type: none">The activity is short-term;There are no seabird breeding colonies or turtle nesting beaches within the light EMBA;Wildlife potentially vulnerable to light (e.g., seabirds and turtles) will not be displaced from foraging habitat; andThe control measures adopted are commensurate with the inherent level of impact consequence.		
Statement of ALARP		
A ‘negligible’ residual impact consequence is considered to be ALARP and a ‘lower order’ impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.		

Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	There have been no objections or claims made by relevant persons regarding light emissions.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • COLREGS 1972. • <i>Navigation Act 2012</i> (Cth): <ul style="list-style-type: none"> ○ Part 3 (Prevention of Collisions). ○ AMSA Marine Orders Part 21 (Safety of Navigation and Emergency Procedures). ○ AMSA Marine Orders Part 27 (Safety of Navigation and Radio Equipment). ○ AMSA Marine Orders Part 30 (Prevention of Collisions). ○ AMSA Marine Order 58 (Safe Management of Vessels). 	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed guidelines and codes of practice demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS listed in this table meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Light emissions - minimise external lighting to that required for navigation and safety of deck operations (IMP-03:EPS-02, -03, -04).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There are no guidelines specifically regarding lighting for offshore activities.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>There is no specific guidance regarding lighting emissions.</p> <p>Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>The EPS listed in this table are in accordance with these guidelines with regard to:</p> <ul style="list-style-type: none"> • Ship collision (item 120). To avoid collisions with third-party vessels, offshore facilities should be equipped with navigational aids that meet national and international requirements, including navigational lights on vessels (IMP-03:EPS-01).

	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> • To reduce the impact of light to ALARP and an acceptable level. • To reduce the risk of collision with other vessels in accordance with maritime standards and to an acceptable level.
	Light-specific guidance	
	The National Light Pollution Guidelines for Wildlife (DCCEW, 2023)	<p>The EPS listed in this table meet the following management actions related to activities associated with the MODU and support vessels:</p> <ul style="list-style-type: none"> • Maintain a dark zone between the rookery and the light sources. • Aim lights downwards and direct them away from nesting areas (IMP-03:EPS-02). • Prevent indoor light reaching outdoor environment (IMP-03:EPS-04). • Reduce unnecessary outdoor, deck lighting on all vessels in known seabird foraging areas at sea (IMP-03:EPS-02). <p>An assessment of the activity against the management actions of these guidelines is included in Table 7.5 for seabirds and Table 7.6 for turtles.</p>
Environmental context	MNES	
	AMPs	The lighting EMBA from the DST will overlap up to 3.5% of the JBG AMP, which is designated to protect submerged features (not affected by lighting), marine turtles and dolphins. Impacts may be limited to behavioural impacts to individual adults only and not inconsistent with the objectives of this AMP management plan.
	Ramsar wetlands	This hazard will not reach any Ramsar wetlands.
	TECs	This hazard will not reach any TECs.
	Nationally threatened and migratory species	The activity will be managed in a manner such that nationally threatened and migratory species will not be impacted by localised and temporary light emissions.
	Other matters	
	KEFs	This hazard will not reach any KEFs.
	NIWs	This hazard will not reach any NIWs.
	State marine parks	This hazard will not reach any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Table 7.6 demonstrates that light emissions will not be inconsistent with the objectives of the Recovery Plan for Marine Turtles 2017-2027 (DoEE, 2017c).</p> <p>The EPS outlined within this table mitigate the risk of artificial light on seabirds identified as a threat by</p>

		the WCP for seabirds (Commonwealth of Australia, 2020).
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of Acceptability	<p>EOG considers the impacts from light emissions to be acceptable because:</p> <ul style="list-style-type: none">• It will adhere to the company’s Safety and Environmental Policy;• The residual consequence rating is negligible;• An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved.• Relevant legislation and industry best practice will be complied with;• Light emissions will not have long-term or significant impacts on MNES;• The management of lighting is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species;• The management of lighting is not inconsistent with the aims of relevant marine reserve management plans; and• The management of lighting is not inconsistent with ESD principles.	
Environmental Monitoring		
<ul style="list-style-type: none">• Periodic lighting inspections.		
Record Keeping		
<ul style="list-style-type: none">• Vessel class certification.• Completed environmental inspections checklists.• Photos.		<ul style="list-style-type: none">• Induction presentation.• Induction attendance sheet.

7.4. IMPACT 4 – Routine Emissions – Atmospheric

7.4.1. Hazard

The use of fuel to power the MODU and support vessels will result in emissions of GHGs such as carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O), along with non-GHG such as sulphur oxides (SO_x) and nitrogen oxides (NO_x).

The following activities generate atmospheric emissions from the MODU and support vessels:

- Combustion of marine diesel oil (MDO) from engines, generators, cranes and other fixed and mobile equipment;
- Flaring (if undertaken);
- Painting and paint storage, resulting in the release of fugitive volatile organic compounds (VOCs) as vapours;
- Release of ozone-depleting substances (ODS) from refrigerants (R134a, R407C and R410A) used in the centralised air-conditioning system during maintenance activities; and
- When transferring dry bulk products used for drilling (e.g., barite, bentonite), tank venting is necessary to prevent tank overpressure. The vent air will contain minor quantities of product particles, which will suspend in the air or settle on the sea surface.

Atmospheric emissions from fuel combustion from the helicopter will also be generated, but are considered negligible given the jurisdiction for the helicopter is a 500-m radius from the MODU.

Greenhouse gases comprise a large part of atmospheric emissions and are measured in units called carbon dioxide equivalent (CO₂-e). This means that the amount of a GHG that an entity emits is measured as an equivalent amount of carbon dioxide which has a global warming potential of one. For example, one tonne of methane released into the atmosphere will cause the same amount of global warming as 25 tonnes of carbon dioxide. So, the one tonne of methane is expressed as 25 tonnes of carbon dioxide equivalence, or 25 t CO₂-e (CER, 2022).

Greenhouse gas emissions from industry and business are reported as Scope 1, 2 and 3, and are defined by the World Business Council for Sustainable Development, the World Resources Institute and the CER (2022) below:

- Scope 1 – direct emissions released to the atmosphere as a result of an activity, or series of activities at a facility level (e.g., burning of diesel in company-owned vehicles or used in on-site plant and equipment, such as a MODU).
- Scope 2 – indirect emissions released to the atmosphere associated with the import of energy from another source (e.g., use of electricity produced by the burning of coal in another facility).
- Scope 3 – other indirect emissions, other than energy imports that are a direct result of the operations of the organisation, but from sources not owned or operated by them and due to upstream or downstream activities (e.g., combustion of hydrocarbons extracted by a future Beehive well and sold to the market).

Only Scope 1 emissions will be generated by the Beehive-1 drilling campaign, as estimated below:

- MODU – combustion emissions will be expelled from exhaust stacks about 22-25 m above deck level to ensure adequate aerial dispersion. For a drilling campaign undertaken in Bass Strait using a jack-up MODU in late 2019 and early 2020, the average daily diesel consumption was 14,500 litres. This would result in the generation of about 39 tonnes of carbon dioxide equivalent (CO₂-e) per day. For the estimated duration of this, this will result in the emissions of 2,145 t CO₂-e (55 days) to 3,900 t CO₂-e (100 days).
- Support vessels – during the same drilling campaign in Bass Strait, the two support vessels consumed an average of 6,400 litres of diesel per day. This would result in the generation of about 17 tonnes of CO₂-e each day. For the estimated duration of this activity, this will result in the emissions of 935 t CO₂-e (55 days) to 1,700 t CO₂-e (100 days).
- Flaring – if flaring is undertaken, and assuming a worst-case calculation of flowing 37,333 bbl oil (with an associated 67.2 MMscf of gas) for the testing of two zones over a period of 3-5 days, it is estimated that 19,877 t CO₂-e would be generated.

7.4.2. Known and Potential Environmental Impacts

The known and potential environmental impacts of atmospheric emissions are:

- Localised and temporary decrease in air quality due to gaseous emissions and particulates from MDO combustion; and
- Addition of GHG to the atmosphere (influencing climate change).

7.4.3. EMBA

The EMBA for atmospheric emissions associated is the local air shed, likely to be within hundreds of meters of the MODU and support vessels, both horizontally and vertically. Sensitive receptors that may occur within this EMBA, either as residents or migrants, are seabirds. The health of the

workforce on the MODU and support vessels, with regard to atmospheric emissions, is considered and assessed in other health and safety project documents.

7.4.4. Evaluation of Environmental Impacts

Localised and temporary decrease in air quality from diesel combustion

The combustion of MDO fuel can create continuous or discontinuous plumes of particulate matter (soot or black smoke) and the emission of non-GHG, such as SO_x and NO_x. Inhaling this particulate matter can cause or exacerbate health impacts to humans exposed to the particulate matter, such as offshore project personnel or residents of nearby towns (e.g., respiratory illnesses such as asthma) depending on the amount of particles inhaled. Similarly, the inhalation of particulate matter may affect the respiratory systems of fauna. In the activity area, this is limited to seabirds overflying the MODU and support vessels.

Particulate matter released from the MODU and support vessels is not likely to impact on the health or amenity of the nearest human coastal settlements (e.g., Port Keats (Wadeye) (NT) or Wyndham (WA)), as offshore winds will rapidly disperse and dilute particulate matter. This rapid dispersion and dilution will also ensure that seabirds are not exposed to concentrated plumes of particulate matter from MODU and support vessel exhaust points and therefore has a negligible impact consequence.

Contribution to the GHG effect

The use of fuel to power engines, generators and any mobile/fixed plant will result in gaseous emissions of GHG such as carbon dioxide, methane and nitrous oxide.

The latest state and territory GHG inventory data notes that annual GHG emissions from WA were 91.85 Mt CO₂-e (DCCEEW, 2022). The emissions from the operation of the MODU and support vessels, assuming a 100-day campaign, equate to 0.0056 Mt CO₂-e. This represents 0.0056% of WA's 2019 annual GHG emissions.

If flaring is undertaken at the volumes noted in Section 7.4.1, an estimated 0.019 Mt CO₂-e could be emitted. This represents 0.020% of WA's 2019 annual GHG emissions.

While these emissions add to the GHG load in the atmosphere, which adds to global warming potential, they are tiny on a state, national and global scale, representing an insignificant contribution to overall GHG emissions and therefore has a negligible impact consequence. The activity is similar to other shipping and industrial activities contributing to the accumulation of GHG in the atmosphere.

Tank venting

Tank venting is a necessary safety control, and any dust emissions will be negligible and limited to the immediate vicinity of the MODU and support vessels. The quantities of gaseous emissions are relatively small and will quickly dissipate into the surrounding atmosphere. Air emissions will be similar to other MODUs and vessels operating in the region for both petroleum and non-petroleum activities.

7.4.5. Impact Assessment

Table 7.8 presents the impact assessment for atmospheric emissions.

Table 7.8. Impact assessment from atmospheric emissions

Summary			
Summary of Impacts	Decrease in air quality due to gaseous emissions and particulates from MDO combustion and contribution to the incremental build-up of GHG in the atmosphere (influencing climate change).		
Extent of impacts	Localised (local air shed for air quality), widespread (for GHG).		
Duration of impacts	Temporary (duration of activity) – emissions are rapidly dispersed and diluted.		
Level of certainty of impact	HIGH – the impacts of atmospheric emissions are well known.		
Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	Atmospheric emissions are managed in accordance with legislated requirements.		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
No incineration of wastes from MODU or support vessels during the activity.	Eliminate	No	EB: Eliminates a source of atmospheric emissions. C: Increased health risk from long-term onboard storage of wastes. If shore transfers are involved, there is an increase in fuel usage and other routine discharges and emissions. Ev: Health and safety risks outweigh the benefit given the high energy offshore locations. The low cost of onboard incinerations outweighs the high cost of transporting waste to shore.
Use incinerators and engines with higher environmental efficiency.	Substitution	No	EB: Reduces the volume of emissions and improves air quality. C: MODU and support vessels are not yet contracted, so it is unreasonable to commit a contractor to potentially swapping out equipment, likely at significant cost. Ev: Cost to implement control measure is disproportionate to the low environmental benefit.
Use low sulphur (<0.5% m/m) MDO (IMP-04:EPS-01).	Engineering	Yes	EB: Reduces SOx emissions to the environment. This has been a MARPOL requirement since the start of 2020.

			<p>C: Some additional cost, but this is factored into the MODU and support vessel contract costs. This is a legislative requirement.</p> <p>Ev: Environmental benefits can be achieved with little additional cost.</p>
Implementation of a PMS for combustion equipment (IMP-04:EPS-02).	Engineering	Yes	<p>EB: Reduces the volume of emissions through improved equipment efficiency.</p> <p>C: Negligible; maintenance is part of routine MODU and support vessel operations.</p> <p>Ev: Benefits of ensuring efficient MODU and support vessel combustion processes outweigh the negligible costs.</p>
IAPP certification (IMP-04:EPS-03).	Engineering	Yes	<p>EB: Reduces the volume of emissions.</p> <p>C: Negligible; certification and re-certification costs are factored into routine MODU and support vessel operations.</p> <p>Ev: Benefits of ensuring MODU and support vessels comply with emissions reduction standards outweighs the negligible cost.</p>
SEEMP (IMP-04:EPS-04).	Engineering	Yes	<p>EB: Improved energy efficiency reduces the volume of emissions.</p> <p>C: Negligible; certification and re-certification costs are factored into routine MODU and support vessel operations.</p> <p>Ev: Benefits of ensuring MODU and support vessels comply with emissions reduction standards outweighs the negligible cost.</p>
ODS procedure (IMP-04:EPS-05).	Engineering	Yes	<p>EB: Reduces emissions associated with global warming.</p> <p>C: Negligible; maintenance of equipment with ODS potential (e.g., HVAC) is part of routine MODU and vessel operations.</p> <p>Ev: Benefits of ensuring MODU and support vessels comply with ODS reduction standards outweighs the negligible cost.</p>
Waste incineration managed in accordance MARPOL and Marine Orders (IMP-04:EPS-06, -07, -08).	Engineering	Yes	<p>EB: Reduced impacts to air quality.</p> <p>C: Negligible; waste incineration in accordance with MARPOL requirements is part of routine MODU and support vessel operations.</p> <p>Ev: Benefits of ensuring MODU and support vessels comply with MARPOL requirements outweighs the negligible cost.</p>
Support vessels have the option to anchor rather than burning fuel to remain on	Engineering	Yes	<p>EB: Reduced fuel consumption results in fewer emissions to air.</p> <p>C: None.</p>

station (IMP-04:EPS-09).			Ev: Benefits of allowing the support vessels to anchor in an area of seabed free of seabed sensitivities saves considerable fuel and therefore minimises emissions to air.
Use a high-efficiency well effluent burner head (IMP-04:EPS-10).	Engineering	Yes	EB: Maximises combustion through proper atomisation of oil droplets, which eliminates or significantly reduces smoke and oil fallout. C: High-efficiency well effluent burners are an industry standard, so there is little additional cost in specifying this type of burner. Ev: Good practice and well established in the industry. Environmental benefits can be achieved with minimal additional cost.
Implementation of Well Test Plan (IMP-04:EPS-10, -11, -12, -13)	Administrative	Yes	EB: Ensures well test crew follow set procedures, thereby minimising the likelihood of liquid dropouts, reducing the risk of poor-quality incineration of hydrocarbons entering the atmosphere and ensuring efficient flaring for minimal periods. C: The preparation of a Well Test Plan is standard practice for well test contractors, whereby the cost is factored into the contract and not an extra cost per se. Ev: Environmental benefits outweigh the low costs.
Monitor fuel use (IMP-04:EPS-14).	Administrative	Yes	EB: May minimise excessive fuel use and associated air emissions by rapidly detecting abnormalities with fuel consumption patterns. C: Negligible; such monitoring is part of routine MODU and vessel operations. Ev: Benefits of avoiding excessive fuel consumption and unnecessary air emissions outweighs the minimal cost.

Environmental Controls and Performance Measurement

EPO	EPS	Measurement criteria
Combustion systems operate in accordance with MARPOL Annex VI (Prevention of Air Pollution from Ships) requirements.	(IMP-04:EPS-01) Only low-sulphur (<0.5% m/m) MDO will be used in order to minimise SOx emissions.	Bunker receipts verify the use of low-sulphur marine grade diesel.
	(IMP-04:EPS-02) All combustion equipment is maintained in accordance with the PMS (or equivalent).	PMS records verify that combustion equipment is maintained to schedule.
	(IMP-04:EPS-03) Vessels >400 gross tonnes possess equipment, systems, fittings, arrangements and materials that comply with the applicable requirements of MARPOL Annex VI.	IAPP Certificate is current.

	(IMP-04:EPS-04) Vessels >400 gross tonnes and involved in an international voyage implement their SEEMP to monitor and reduce air emissions.	SEEMP records verify energy efficiency records have been adopted.
	(IMP-04:EPS-05) Vessels >400 gross tonnes must ensure that firefighting and refrigeration systems are managed to minimise ODS.	ODS record book is available and current.
Solid combustible waste will only be burned within an incinerator, and only if logistics don't allow for the timely removal of waste from the vessel.	(IMP-04:EPS-06) Only a MARPOL VI-approved incinerator is used to incinerate solid combustible waste (food waste, paper, cardboard, rags, plastics).	IMO incinerator certificate verifies the incinerator meets MARPOL requirements.
	(IMP-04:EPS-07) Incineration is only conducted when the MODU and support vessels are >12 nm from the shore.	Incineration records include geographic coordinates to verify incineration took place >12 nm of the shore.
	(IMP-04:EPS-08) Oil and other noxious liquid substances will not be incinerated.	The Oil Record Book and Garbage Record Book verify that waste oil and other noxious liquid substances are transferred to shore for disposal.
Support vessels anchor in preference to burning fuel to remain on station.	(IMP-04:EPS-09) Anchoring occurs in preference to burning fuel when the vessels are required to maintain station.	DDRs note when the support vessels are on anchor.
The duration of and emissions from flaring are kept to ALARP.	(IMP-04:EPS-10) A high-efficiency well effluent burner head is used during flaring.	DDR verifies the use of a high-efficiency well effluent burner head for flaring.
	(IMP-04:EPS-11) Well flaring is limited to the minimum time required to safely undertake the DST.	DDRs record the duration of flaring.
	(IMP-04:EPS-12) Burner pilots remain ignited during the well test to minimise the likelihood of liquid dropouts.	Well test daily report verifies that burner pilot remained ignited during the well test.
	(IMP-04:EPS-13) Dedicated MODU deck crew are in place to watch for liquid dropouts, who then notify the Well Test Supervisor as soon as liquid dropout is observed so that the well test process can be quickly shut down and corrected before re-commencing.	Well test daily report includes details of flare watch for liquid dropouts.
Fuel use will be measured, recorded and reported.	(IMP-04:EPS-14) Fuel use will be measured, recorded and reported for abnormal consumption, and in the event of abnormal fuel use, corrective action is taken to minimise air pollution.	Fuel use is recorded in the DD Rs.

Impact Consequence (residual)	
Negligible	
<p>The consequence of atmospheric emissions is assessed as negligible because:</p> <ul style="list-style-type: none"> • The activity is of a temporary nature; • The activity is located far offshore in a high energy offshore environment and air emissions will not impact on air quality in coastal towns; • The quantities of gaseous emissions are relatively small and will dissipate into the surrounding atmosphere; and • Management of atmospheric emissions will comply with legislated requirements. 	
Demonstration of ALARP	
<p>A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.</p>	
Demonstration of Acceptability	
Policy compliance	EOG's Safety and Environmental Policy objectives are met.
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.
External context	<p>The CCWA raised concerns about GHG emissions arising from Scope 3 emissions. As an exploration drilling campaign, Scope 3 emissions will not be generated from the activity, so impacts from such emissions do not apply. Only in the <i>unlikely</i> event of a commercially successful exploration and appraisal drilling campaign that proceeds to development planning, would Scope 3 emissions be relevant and credibly calculable.</p> <p>The CCWA also claims that the EP downplays the cumulative and residual effects of GHG emissions. EOG has not downplayed such emissions. The emissions will occur and will contribute to the GHG effect, but are very small at a state, national and global context. Additional details have now been quantified to demonstrate this.</p>
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Navigation Act 2012</i> (Cth): <ul style="list-style-type: none"> ○ Chapter 4 (Prevention of Pollution). ○ AMSA Marine Order Part 79 (Marine pollution prevention – air pollution). • <i>Protection of the Sea (Prevention of Pollution by Ships) Act 1983</i> (Cth): <ul style="list-style-type: none"> ○ Part IIID (Prevention of Air Pollution). ○ AMSA Marine Orders Part 97 (Air Pollution), enacting MARPOL Annex VI (especially Regulations 6, 14, 16). • <i>National Greenhouse and Energy Reporting Act 2007</i> (Cth).
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPPEM will be implemented for this activity.

	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS listed in this table meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> Section 4.4.3 - Combustion emissions; <ul style="list-style-type: none"> Use of high efficiency equipment to minimise power demand (IMP-04: EPS-04). Selection of low sulphur diesel (IMP-04: EPS-01). Regular plant maintenance (IMP-04: EPS-02). Regular maintenance and emission control devices on vehicles and machinery (IMP-04: EPS-02).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	The EPS listed in this table meet these guidelines for offshore activities with regard to management of fugitive emissions (item 22). The BAT are met for the MODU and vessels.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>No guidance provided regarding the management of atmospheric emissions.</p> <p>Section 2.4.4 specifies that equipment used for monitoring discharges or emissions should be correctly calibrated and operated, and that sampling and analysis procedures are based on sound field practices.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Air emissions (item 11). The overall objective to reduce air emissions (all IMP-07 EPS except EPS-07). Air emissions (item 12). During equipment selection, air emission specifications should be taken into account, as should the use of very low sulphur content fuels and/or natural gas (IMP-04: EPS-01).
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> To reduce the impact of air emissions to ALARP and an acceptable level. To reduce GHG emissions to ALARP and an acceptable level (All IMP-07 EPS).
Environmental context	MNES	
	AMPs	This hazard will not directly affect nearby AMPs.
	Ramsar wetlands	This hazard will not directly affect any Ramsar wetlands.
	TECs	This hazard will not directly affect any TECs.

	Nationally threatened and migratory species	This hazard will not directly affect threatened or migratory species.
	Other matters	
	KEFs	This hazard will not directly affect any KEFs.
	NIWs	This hazard will not directly affect any NIWs.
	State marine parks	This hazard will not directly affect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>The Recovery Plans and Conservation Advice for the Blue, Sei, Fin and Humpback Whales list climate change as a key threat, though the most pervasive threats are whaling, vessel strike and entanglement.</p> <p>The Recovery Plan for Marine Turtles in Australia lists climate change as a key threat. Atmospheric emissions resulting from the activity are not inconsistent with this recovery plan.</p> <p>The Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020) lists climate variability and change as a threat, though none of the seabirds known to occur in the impacts EMBA are listed as being of high risk from exposure to climate change.</p> <p>The Wildlife Conservation Plan for Migratory Shorebirds (DoE, 2015d) lists climate variability and change as a threat, though coastal habitat loss and habitat modification are the key threats.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	<p>EOG considers the impacts from atmospheric emissions to be acceptable because:</p> <ul style="list-style-type: none">• It will adhere to the company’s Safety and Environmental Policy;• The residual consequence rating is negligible;• An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved.• Relevant legislation and industry best practice will be complied with;• Atmospheric emissions from the activity will not have long-term or significant impacts on MNES;• The management of air emissions will ensure it is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species;• The management of air emissions will ensure it is not inconsistent with the aims of relevant marine reserve management plans; and• The management of air emissions will ensure it is not inconsistent with ESD principles.	
Environmental Monitoring

Record Keeping	
<ul style="list-style-type: none"> • PMS records. • Fuel use records. • Bunkering receipts. • Waste manifests (for incineration). 	<ul style="list-style-type: none"> • ODS record books. • Oil record books. • Garbage record books.

7.5. IMPACT 5 – Routine Emissions – Underwater Sound

7.5.1. Hazard

The following activities will generate underwater sound:

- MODU operations – sound generated by engines, onboard machinery and drilling equipment (principally the mechanical operation of the drill string);
- Placement and installation of the MODU;
- Support vessel operations – engine noise transmitted through the hull, propeller cavitation or dynamic positioning (DP);
- Helicopter operations – movements within the PSZ;
- Flaring; and
- Acoustic downhole profiling operations – VSP.

7.5.2. Known and Potential Environmental Impacts

The effects of underwater sound are generally well understood with regard to potential mortality and/or physiological injury for species in the water column, however, uncertainty lies in understanding the spatial and temporal extents of behavioural disturbances and the potential effects on populations and requires the application of context-specific information.

The potential environmental impacts to marine fauna from high levels of underwater sound are:

- Physical injury to auditory tissues or other air-filled organs;
- Hearing impairment, temporary threshold shift (TTS – the temporary loss of hearing sensitivity caused by excessive noise exposure) or permanent threshold shift (PTS – a permanent loss of hearing sensitivity caused by excessive noise exposure, considered an auditory injury);
- Direct behavioural effects through disturbance or displacement, and consequent disruption of natural behaviours or processes (e.g., migration, resting, calving or spawning); and
- Indirect behavioural effects by impairing/masking the ability to navigate, find food or communicate, or by affecting the distribution or abundance of prey species.

The potential impacts on individual animals from exposure to elevated sound levels above ambient sound levels in a given area depends on a number of factors, including the extent of sound propagation underwater, its frequency characteristics and duration, its distribution relative to the location of the organisms, the sensitivity and range of spectral hearing among species (Carroll *et al.*, 2017).

Drilling

Fixed platforms such as jack-up MODUs have lower radiated sound levels than floating platforms (NCE, 2007) because they do not use thrusters or propellers to maintain station. Equipment

operating onboard these facilities can contribute to marine environment sound however, airborne and structure-borne (vibration) pathways are considered more significant on floating platforms where equipment can be located below the water line (NCE, 2007).

Underwater noise produced from platforms standing on metal jack-up supports is relatively low given the small surface areas available for sound transmission and also given the location of machinery above the waterline. It is therefore expected that the dominant pathway for sound generation is structure-borne (i.e., vibration from machinery passing through the legs) (NCE, 2007).

Support Vessels

There will be several support vessel trips per week between the MODU and the supply base, with one support vessel 'on station' close to the MODU at all times. The support vessels will generate low levels of sound. This is generated from propeller cavitation (the dominant sound source), hydrodynamic flow around the hull and from onboard machinery (Popper *et al.*, 2014). It is unlikely that engine sound levels will be greater than that of any other similarly sized vessel normally operating in the area (such as vessels supporting the nearby Blacktip operations).

The sound levels and frequency characteristics of underwater sound produced by vessels are related to vessel size and speed. When idle or moving at slow speed within the PSZ, vessels generally emit low-level noise. The typical sound levels generated by vessels are:

- Tugboats, crew boats, supply ships and many research vessels in the 50-100 m size class – 165-180 dB re 1 μ Pa range (Gotz *et al.*, 2009);
- Vessels up to 20 m size class – 151-156 dB re 1 μ Pa (Richardson *et al.*, 1995);
- Trawlers – peak at around 175 dB re 1 μ Pa (Gotz *et al.*, 2009); and
- Large ships – levels exceeding 190 dB re 1 μ Pa (Gotz *et al.*, 2009).

Noise from vessels acts to increase the sound in the water column above ambient noise levels. For example, noise emissions from idling vessels are low, however noise from thrusters and strong thrusts from the main engines have been recorded at levels of up to 182 dB re 1 μ Pa at 1 m (McCauley, 1998). Under this mode of operation, McCauley (1998) measured underwater broadband noise of approximately 137 dB re 1 μ Pa at 405 m. Levels of 120 dB re 1 μ Pa extended for a distance of approximately 3-5 km from the source, depending on water depth, seabed composition and other factors.

Under normal operating conditions when the vessel is idling or moving between sites, vessel noise would be detectable over only a short distance. For example, Woodside (2003) found that vessel noise levels rarely (<1% of the time) exceeded a threshold of 120 dB re 1 μ Pa (i.e., less than ambient underwater sound intensity in the activity area) from an acoustic monitoring site 5.1 km from the source when a drilling support vessel was holding position using dynamic positioning bow thrusters.

Helicopters

There will be several return helicopter flights each week to transport personnel and equipment to the MODU during drilling operations (see Section 2.6.3). Sound emitted from helicopter operations is typically below 500 Hz (Richardson *et al.*, 1995). Sound travelling from a source in the air (e.g., helicopter) to a receiver underwater is affected by both in-air and underwater propagation processes, which are further complicated by processes occurring at the air-seawater surface interface. The received sound level underwater depends on the altitude of the sound source and lateral distance from the receiver, receiver depth, water depth, and other variables.

The angle at which the line from the aircraft and receiver intersects the water surface is important. In calm conditions, at angles above 13° from the vertical much of the sound is reflected and does not penetrate into the water (Richardson et al., 1995; NRC, 2003). Therefore, strong underwater sounds are detectable for a period roughly corresponding to the time the helicopter is within a 26° cone above the receiver. This 'zone of ensonification' can be enlarged in rough seas and can also be enlarged in shallow waters (Richardson et al., 1995).

Most air traffic supporting offshore installations involves turbine helicopters flying along straight lines. Usually, a helicopter can be heard in air well before and after the brief period it passes overhead and is heard underwater. Sound pressure in the water directly below a helicopter is greatest at the surface and diminishes with increasing receiver depth. The peak received level diminishes with increasing helicopter altitude, but the duration of audibility often increases with increasing altitude. Richardson et al (1995) reports figures for a Bell 214 helicopter (considered to be one of the loudest) being audible in air for four minutes before it passed over underwater hydrophones but detectable underwater for only 38 seconds at 3 m depth and 11 seconds at 18 m depth.

VSP

The VSP program for Beehive-1 includes the use of four airguns with a total sound source volume of 600 cui, performing acoustic pulses for a duration of 8 hours (see Section 2.7.4). VSP involves placing a number of receivers in the well bore and transmitting impulsive sound energy to them from a sound source hung over the MODU just below the sea surface. VSP uses highly directional sound energy that is focussed towards the seabed, but it also ensonifies the surrounding water column.

Each discharge of the sound source generates a short, discrete, low frequency sound impulse, which are much lower than those generated during large-scale 2D or three dimensional (3D) marine seismic surveys (MSS). The underwater sound generated by VSP is loudest directly under the source and rapidly decreases with distance from the source.

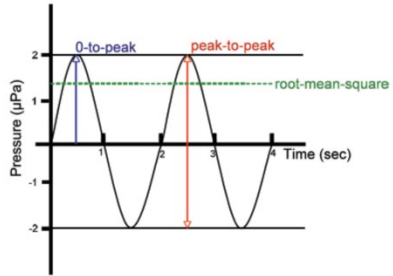

Based on VSP modelling undertaken by Jasco Applied Sciences (McPherson *et al.*, 2017) for the Gular-1 appraisal well undertaken in a water depth of 26 m for a 600 cui airgun array, it is expected that the sound source is expected to generate a peak sound pressure level (SPL) of 239 dB re 1 μ Pa pk @ 1 m and per-pulse sound exposure level (SEL) up to 215 dB re 1 μ Pa².s @ 1 m.

Modelling of VSP undertaken by Chevron Australia and reported in Chevron (2010) using 3 x 250 cui air guns at a source depth of 5 m recorded an amplitude spectrum peak of 190 dB re 1 μ Pa @ 1 m from the source. The results reported also demonstrated that the received source level did not exceed 160 dB re 1 μ Pa².s at a distance of 500 m from the source and 170 dB re 1 μ Pa².s at 100 m from the source.

Terminology

Activities that generate underwater sound can affect marine fauna by interfering with aural communication, eliciting changes in behaviour and, potentially, causing either acute or chronic physiological damage. Table 7.9 defines the acoustic terms used throughout this section.

Table 7.9. Acoustic terminology used in this EIA

Term	Definition
Sound	A time-varying pressure disturbance generated by mechanical vibration waves travelling through a fluid medium such as air or water.
Decibel (dB)	Sound is measured on a logarithmic scale that expresses the ratio of two values of a physical quantity. It is used to measure the amplitude or 'loudness' of a sound. As the dB scale is a ratio, it is denoted relative to some reference level, which must be included with dB values if they are to be meaningful. The reference pressure level in underwater acoustics is 1 micropascal (μPa), whereas the reference pressure level used in air is 20 μPa , which was selected to match human hearing sensitivity. As a result of these differences in reference standards, sound levels in air are not equal to underwater levels. There are four main metrics for underwater sound (ISO/DIS 18405.2:2017) – SEL, SPL, PK and PK-PK, all described in this table.
Frequency	The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). 1 Hz is equal to 1 cycle per second.
Source level	A measure of sound pressure at a nominal distance of 1 m from a theoretical point source that radiates the same total sound power as the actual source. It is a theoretical value for a seismic source because a seismic source is not a point source, but rather, comprises individual elements in a defined area. Source level can be expressed as an SPL, SEL or PK. Unit: dB re 1 $\mu\text{Pa}^2\text{m}^2$ (pressure level) or dB re 1 $\mu\text{Pa}^2\text{m}^2\text{s}$ (exposure level).
Impulse/Pulse	The terms used to refer to the discharge of a seismic source are impulse and pulse, therefore the terms used to describe a single discharge are per-impulse or per-pulse. Impulsive sound is sound that is typically brief and intermittent with rapid (within a few seconds) rise time and decay back to ambient levels (NOAA, 2013). Airguns used for seismic surveys are a good example of impulsive sound.
Sound exposure level (SEL)	A measure related to the sound energy in one or more pulses, or the ratio of the time-integrated squared sound pressure to the specified reference value. Unit: dB re 1 $\mu\text{Pa}^2\text{s}$
SEL _{24hr}	SEL is specified in terms of either per-impulse (per-pulse) or accumulation period. In this report, the accumulation period applied is 24 hours, and therefore the SEL is referred to as either per-impulse SEL or SEL _{24h} .
Zero-to-peak sound pressure (PK) <i>Impulsive sounds</i>	The greatest magnitude of the sound pressure during a specified time interval. PK levels are modelled to assess <u>mortality</u> and <u>potential mortality</u> to fish larvae and eggs, fish and turtles. A simple sound wave and three common methods to characterise the loudness of sounds, including zero-to-peak sound pressure, are illustrated below in the PK graph. Unit: dB re 1 μPa . 
Peak-to-peak sound pressure (PK-PK) <i>Impulsive sounds</i>	Sum of the peak compressional pressure (highest pressure variation) and the peak rarefactional pressure (lowest pressure variation) during a specified time interval. PK-PK is the difference between the minimum and maximum instantaneous sound pressure levels in a stated frequency band attained by an impulsive sound. Unit: dB re 1 μPa . See also the PK graph.

Term	Definition
Root-mean-square sound pressure level (SPL)	<p>The decibel ratio of the time-mean-square sound pressure, in a stated frequency band, to the square of the reference sound pressure over the duration of the acoustic event (i.e., the duration of a single seismic pulse).</p> <p>Because the SPL represents the effective sound pressure over the full duration of the acoustic event rather than the maximum instantaneous peak pressure (PK or PK-PK), it is regularly used to represent the effective or perceived loudness of a sound and to assess the potential for a <u>behavioural</u> response from marine fauna.</p> <p>Unit: dB re 1 μPa.</p> <p>See also the PK graph.</p>
Particle motion	<p>The motion caused by a sound wave of a given infinitesimal part of the medium relative to the medium as a whole, and it is an integral part of any sound field. Particle motion is directional (unlike pressure) and is typically described using three-dimensional vector notation.</p> <p>Particle motion levels can be expressed in a variety of units related to displacement; velocity or acceleration. Acoustic particle velocity is the time derivative of particle displacement, and likewise, acceleration is the time derivative of velocity.</p> <ul style="list-style-type: none"> • Sound particle velocity (v) - contribution to velocity of a material element caused by the action of sound, in units of metre per second (m/s). It is the physical speed of a particle in a material moving back and forth in the direction of the pressure wave. • Sound particle acceleration (a) - the contribution to acceleration of a material element caused by the action of sound, in units of metre per second squared (m/s^2). It is the rate of change of the velocity with respect to time. <p>Benthic invertebrates (e.g., scallops) and many types of fish are sensitive only to particle velocity or acceleration rather than pressure, however, limited measurements of data are available on the levels of particle motion that may result in effects. Some measurements are available from studies on bivalves and therefore modelled particle motion values have been referenced for this EIA.</p>
Transmission loss	<p>The decibel reduction in sound level between two stated points that results from sound spreading away from an acoustic source subject to the influence of the surrounding environment. It can also be referred to as propagation loss.</p>
TTS in hearing	<p>TTS is the temporary loss of hearing sensitivity caused by excessive noise exposure. Exposure to sufficiently intense sound may lead to an increased hearing threshold in any living animal capable of perceiving acoustic stimuli (Finneran, 2016). If this shift is reversed and the hearing threshold returns to normal, the effect is called a TTS. The onset of TTS is often defined as threshold shift of 6 dB above the normal hearing threshold (Southall <i>et al.</i>, 2016).</p> <p>Impairment to the hearing apparatus of a marine animal may result from a fatiguing stimulus measured in terms of sound exposure level (SEL), which considers the sound level and duration of the exposure signal. Intense sounds may also damage the hearing apparatus independent of duration, so an additional metric of peak pressure (PK) is needed to assess acoustic exposure impairment risk.</p>
PTS in hearing	<p>PTS is the permanent loss of hearing sensitivity caused by excessive noise exposure. It is considered an auditory injury. If a TTS does not return to normal, the residual shift is called a PTS.</p>
Behavioural response	<p>The context of sound exposure plays a critical and complex role in behavioural responses in marine mammals (Gomez <i>et al.</i>, 2016). For example, different species (and different individuals or groups within a species) may respond differently to varying levels of sound depending on their behaviours and motivation at the time (depending on whether they're foraging, socialising, resting or mating) and other factors such as the type of sound, duration of exposure, and the suddenness of the onset of the received sound (Ellison <i>et al.</i>, 2012; Gomez <i>et al.</i>, 2016).</p> <p>The national marine fisheries service (NMFS) in the USA uses an impulsive noise criteria threshold of 160 dB re 1 μPa (SPL) for potential behavioural disturbance to marine mammals (NMFS, 2018). The threshold for behavioural response represents</p>

Term	Definition
	<p>the level at which a moderate behavioural response may occur, such as changes in swimming speed, direction and dive profile, localised deviations in migratory patterns, brief to moderate shift in group distribution, short term cessation or modification of vocal behaviour. (McCauley <i>et al.</i>, 2000a; Southall <i>et al.</i>, 2007; Tyack, 2008). Avoidance, however, is not directly related to sound level thresholds but also influenced by the state of the individuals (e.g., their reproductive, health and foraging condition) and the context of exposure. It is considered that avoidance behaviour represents only a minor effect on either the individual or the species unless avoidance results in displacement of whales from areas of biological importance such as nursery, resting or feeding areas during an important period for the species.</p> <p>Higher received levels are not always associated with stronger behavioural responses and vice versa, and a clear dose-response relationship has not been identified (Southall <i>et al.</i>, 2007). In addition, a behavioural response does not necessarily equate to a significant avoidance or deviation in cetacean movements that would actually displace individuals or the population from the wider area. Similarly, proximity of the animal to the sound source, irrespective of received level, has been identified as an influencing factor, with behavioural response in humpback whales being both dependent on the proximity of whale to the vessel source and also the received level (i.e., at the same received level no behavioural response was detected when the source was greater than 3 km away) (Dunlop <i>et al.</i>, 2018).</p>
Masking	<p>Acoustic masking may occur when a noise impedes the ability of an animal to perceive a signal (Wood <i>et al.</i>, 2012; Erbe <i>et al.</i>, 2015). For this to occur the noise must be loud enough, have similar frequency content to the signal, and must happen at the same time (Wood <i>et al.</i>, 2012).</p> <p>Masking and the potential effects of masking on communication and listening space of marine mammals are not fully understood and remain an area of active research (Terhune <i>et al.</i>, 1979; Cunningham & Mountain, 2014; Tennessen & Parks, 2016; Cholewiak <i>et al.</i>, 2018; Dunlop, 2017; 2018; Gabriele <i>et al.</i>, 2018; Putland <i>et al.</i>, 2018). Currently, there are no specific received level thresholds for reliably assessing or regulating masking responses to seismic noise (Gomez <i>et al.</i>, 2016).</p>

7.5.3. EMBA

The EMBA for underwater sound is unlikely to be beyond several hundred metres at most from the sound source, dependent on the species and associated thresholds, as outlined in this chapter. Receptors that are known to occur or may occur within the underwater sound EMBA, either as residents or migrants, are:

- Plankton;
- Benthic invertebrates (i.e., prawns);
- Pelagic fish;
- Marine mammals;
- Marine reptiles; and
- Seabirds.

The focus of this EIA is on EPBC-listed species that are sensitive to underwater sound, these being pelagic fish, marine mammals (whales) and marine reptiles (turtles).

7.5.4. Evaluation of Environmental Impacts

MODU noise

The MODU will generate noise from the operation of on-board machinery, including diesel engines, mud pump, ventilation fans (and associated exhaust) and electrical generators, and also (during drilling) from the drill string and bit. In general, fixed platforms such as jack-up MODUs transmit less noise underwater than a semi-submersible platform or a drill vessel due to the smaller surface area in contact with the water column.

Gales (1982) cited in NCE (2007), reports that underwater sound measured from platforms did not exhibit markedly different characteristics from those engaged in production, and that none of the measured sound could be directly related to the mechanical action of the drill bits. It is therefore believed that most sound associated with drilling is created by the operation of the MODU itself (and sound radiated through the MODU structure).

In the same study (Gales, 1982; cited in Richardson *et al.*, 1995) it was identified that platform noise was so weak that it was nearly undetectable even when alongside the platform during sea states ≥ 3 . At the near-field measurement locations (ranges 9–61 m), the received sound levels were 119–127 dB re 1 μ Pa (Richardson *et al.*, 1995).

Studies performed on the Spartan 151 jack-up MODU in Alaska's Cook Inlet in shallow waters (18–37 m water depth) verified the underwater acoustic levels as a function of range from the MODU (Marine Acoustics, 2011). Primary sources of MODU-based acoustic energy were identified as originating from the diesel engines, mud pump, ventilation fans and electrical generators. The study identified maximum sound levels were periodic (impulsive <1 second) with received levels at approximately 127 dB re 1 μ Pa to a maximum range of 1.2–1.4 km in the frequency range 8.9–44.7 Hz. Levels in the infrasonic band (i.e., frequencies <20 Hz) between 8.9–11.2 Hz and 11.2–14.1 Hz infrequently exceeded 120 dB re 1 μ Pa at ranges less than 1.7 km and never more than 1 second at a time.

On this basis, emissions predominantly below 120 dB re 1 μ Pa with non-continuous (less than 1 second) levels exceeding this to a range of approximately 1.4 km in the frequency band 8.9 Hz to 44.7 Hz (infrasonic and low frequency) as measured in that study is expected to be indicative of the low frequency sound levels emitted by the jack-up MODU during drilling activities.

In addition, an acoustic monitoring program commissioned by Santos conducted during an exploratory drilling program in 2003, indicated that the drilling operation was not audible between 8 and 28 km from the MODU (McCauley, 2004), with most sound above 120 dB SPL RMS confined within a 2 km to 4 km radius of the MODU.

Sound generation and frequency bands from the operation and drilling activities associated with the MODU would be expected to be similar to the sound levels described above. This sound level is lower than the recorded ambient sound in the activity area (that varies from a minimum of 148 dB re 1 μ Pa_{2.s} SEL to a maximum of 163 dB re 1 μ Pa_{2.s} SEL, see Section 5.2.2 under Ambient Ocean Sound) and is therefore likely to have a negligible impact on marine fauna.

Vessel noise

The MODU will be supported by two support vessels that typically emit low levels of sound from propeller cavitation (the dominant sound source), thrusters, hydrodynamic flow around the hull and from onboard machinery (Popper *et al.*, 2014). Support vessels will likely use DP to maintain position, and cavitation from the thrust propellers while in DP mode can be a significant source of underwater sound, however the source will cycle on-off and not be present for most of the time.

It is unlikely that engine sound levels will be greater than that of any other similarly-size vessel normally operating in the area (such as vessels supporting the offshore oil and gas operations in the area, commercial shipping vessels, and merchant vessels).

The sound levels and frequency characteristics of underwater sound produced by vessels are related to vessel size and speed. When idle or moving at slow speed between investigation sites, vessels generally emit low-level noise. The typical sound levels generated by vessels are:

- Tugboats, crew boats, supply ships and many research vessels in the 50-100 m size class – 165-180 dB re 1 μ Pa range (Gotz *et al.*, 2009);
- Vessels up to 20 m size class – 151-156 dB re 1 μ Pa (Richardson *et al.*, 1995);
- Trawlers – peak at around 175 dB re 1 μ Pa (Gotz *et al.*, 2009); and
- Large ships – levels exceeding 190 dB re 1 μ Pa (Gotz *et al.*, 2009).

Noise from vessels acts to increase the sound in the water column above ambient noise levels. For example, noise emissions from idling vessels are low, however noise from thrusters and strong thrusts from the main engines have been recorded at levels of up to 182 dB re 1 μ Pa at 1 m (McCauley, 1998). Under this mode of operation, McCauley (1998) measured underwater broadband noise of approximately 137 dB re 1 μ Pa at 405 m. Levels of 120 dB re 1 μ Pa extended for a distance of approximately 3-5 km from the source, depending on water depth, seabed composition and other factors.

Under normal operating conditions when the vessel is idling or moving between sites, vessel noise would be detectable over only a short distance. For example, Woodside (2003) found that vessel noise levels rarely (<1% of the time) exceeded a threshold of 120 dB re 1 μ Pa (i.e., slightly less than ambient underwater sound intensity in the activity area) from an acoustic monitoring site 5.1 km from the source when a drilling support vessel was holding position using dynamic positioning bow thrusters.

Temporary and permanent threshold shifts are very unlikely to occur in any marine species as a result of vessel operations. The sounds produced by the vessels during this activity will not be outside the range of other anthropogenic sound and ambient underwater sound of the activity area (see ‘ambient ocean sound’ in Section 5.2.2).

Helicopter noise

Several helicopter flights each week will transport personnel and equipment to the MODU during drilling operations (see Section 2.5.3). Sound emitted from helicopter operations is typically below 500 Hz (Richardson *et al.*, 1995).

Sound travelling from a source in the air (e.g., helicopter) to a receiver underwater is affected by both in-air and underwater propagation processes, which are further complicated by processes occurring at the air-seawater surface interface. The received sound level underwater depends on the altitude of the sound source and lateral distance from the receiver, receiver depth, water depth, and other variables.

The angle at which the line from the aircraft and receiver intersects the water surface is important. In calm conditions, at angles above 13 from the vertical much of the sound is reflected and does not penetrate into the water (Richardson *et al.*, 1995; NRC, 2003). Therefore, strong underwater sounds are detectable for a period roughly corresponding to the time the helicopter is within a 26° cone above the receiver. This ‘zone of ensonification’ can be enlarged in rough seas and can also be enlarged in shallow waters (Richardson *et al.*, 1995).

Most air traffic supporting offshore installations involves turbine helicopters flying along straight lines. Usually, a helicopter can be heard in air well before and after the brief period it passes overhead and is heard underwater. Sound pressure in the water directly below a helicopter is greatest at the surface and diminishes with increasing receiver depth. The peak received level diminishes with increasing helicopter altitude, but the duration of audibility often increases with increasing altitude.

Richardson et al (1995) reports figures for a Bell 214 helicopter (considered to be one of the loudest) being audible in air for four minutes before it passed over underwater hydrophones but detectable underwater for only 38 seconds (at 3 m depth) and 11 seconds (at 18 m depth). This means that as a conservative case, helicopter sound may be audible underwater for up to two minutes per flight per to and from the MODU. This provides an indication of the low level of received noise that may be expected from a helicopter.

Given the short time of audibility underwater (0.14% of a day) and low frequency of helicopter flights, impacts from helicopter sound to sound-sensitive marine fauna are assessed as negligible.

VSP

Noise emissions from VSP operations on marine fauna is considered to be low given its short duration (12 to 24 hours) and small air-gun array (600 cui array) as compared to conventional seismic survey arrays (typically 2,500 to 3,500 cui) that operate continuously for weeks or months.

Biological Impacts

The impacts of impulsive and non-impulsive noise in the operational area are assessed in Section 7.1.4 of the Beehive-1 PDSA EP (available [here](#)), which was accepted by NOPSEMA in March 2022. The impacts of MODU and support vessel operations are expected to be similar to these.

For VSP operations, the impact assessment provided here is based on VSP modelling undertaken by Jasco Applied Sciences (McPherson et al., 2017) for the Gular-1 appraisal well undertaken in a water depth of 26 m for a 600 cui airgun array. A summary of the results for the VSP modelling is presented in Table 7.10.

Table 7.10. Summary of the maximum horizontal distances to noise effect criteria from VSP operations for per-pulse (PK) modelled sites in the water column and at the seabed

Fauna group	Behavioural	Injury			Mortality/ potential mortality
		TTS	PTS	Recoverable injury	
Water column					
Plankton	-	-	-	-	84 m
Fish (with no swim bladders, including sharks)	(N) High (I) Moderate (F) Low	922 m	-	30 m	30 m
Fish (with swim bladders)	(N) High (I) High (F) Moderate	922 m	-	84 m	84 m
Fish eggs and larvae	(N) Moderate (I) Low (F) Low	922 m	-	84 m	84 m
Low-frequency cetaceans (LFC)	2,900 m	20 m	*	-	-
Mid-frequency cetaceans (MFC)		*	*	-	-
High-frequency cetaceans (HFC)		350 m	200 m	-	-
Turtles	1,856 m	N/A	N/A	-	84 m

Seabed					
Sponges and corals	-	-	-	-	*
Molluscs	-	-	-	304 m	-
Crustaceans	-	-	-	304 m	-
* Threshold not reached.			N (near) = tens of metres.		
- No exposure criterion is available to model.			I (intermediate) = hundreds of metres.		
N/A Not assessed.			F (far) = thousands of metres.		

The following impact assessment is based on species-specific for underwater sound on the various groups of biological receptors in the activity area. Where available, threshold criteria associated with behavioural and physiological impacts for sensitive receptors have been used to compare measured and predicted sound levels for different sound sources to assess potential impacts.

Impacts to Plankton

Plankton (described in Section 5.4.3) is very widely dispersed throughout the ocean and is transported by prevailing wind and tide-driven currents. They cannot take evasive behaviour to avoid anthropogenic sound sources. However, the potential for impacts is limited due to their widespread distribution and rapid population growth rates. This means that only a small percentage of a cohort will be exposed at any one time. Invertebrate plankton species that have gas-filled flotation organs (such as cephalopods) are more likely to be affected by underwater noise.

Impacts to plankton are likely to be insignificant at both a local and population level or compared with natural variability and mortality rates for plankton organisms. The estimated distance for mortality of plankton (84 m) from VSP modelling also indicates a very localized area of impact.

Based on this evaluation, the impact consequence for plankton resulting from underwater noise generated by VSP is negligible at an ecosystem and population level.

Impacts to Fish and Sharks

Fish species known to occur within the impacts EMBA are listed and described in Section 5.4.4. All fish studied to date are able to detect sound, with the main auditory organs in teleost (bony) fish being the otolithic organs of the inner ear (Carroll et al., 2017). Hearing in fish primarily involved the ability to sense acoustic particle motion via direct inertial stimulation of the otolithic organs or their equivalent. Many species also have the ability to sense sound pressure using an indirect path of sound stimulation involving gas-filled chambers such as the swim bladder (Carroll et al., 2017).

Limited research has been conducted on responses from elasmobranchs (sharks and rays, including juveniles) to underwater sound. This may be because sharks and rays differ from bony fish in that they have no accessory organs of hearing (i.e., a swim bladder) and therefore are unlikely to respond to acoustic pressure (Myrberg, 2001). Elasmobranchs sense sound via the inner ear and organs and as they lack a swim bladder it is thought that they are only capable of detecting the particle motion component of acoustic stimuli (Myrberg, 2001).

Based on the VSP modelling results in Table 7.10, it is expected that any impacts to fish and sharks from VSP will be highly localised and have no lasting effect, with the main impact being temporary behavioural changes (avoidance) for those individuals that are close to the VSP array at the time of operations. Impacts to species with BIAs in the operational area (see Section 5.4.4), such as the northern river shark (adults/juveniles may occur), dwarf sawfish (adults known to occur), largetooth sawfish (adults known to occur), green sawfish (adults known to occur) are expected to be the same. Underwater sound is not listed as a threat for these species (see Table 5.7 in Section 5.4.4). As such, the impact consequence from VSP operations are assessed as minor.

The available evidence indicates sharks will generally avoid sound sources, so the likely impacts on sharks are expected to be limited to short-term behavioural responses, such as avoidance of waters around the VSP. For the purposes of this EIA, sharks are included in the same group as fish without swim bladders and for the reasons outlined above, along with the fact that the Recovery Plan for the White Shark (DSEWPC, 2013) does not list anthropogenic sound as a threat to this species, impacts to sharks are considered to be negligible.

The activity will not have a 'significant' impact on endangered or vulnerable fish species (see Section 5.4.4) when assessed against the EPBC Act Significant Impact Guidelines 1.1 (DoE, 2013), as outlined in Table 7.11.

Table 7.11. Assessment against EPBC Act Significant Impact Guidelines for Fish

Significant impact guideline	Assessment
Lead to a long-term decrease in the size of a population.	Underwater sound generated from drilling activities will not lead to a long-term decrease in the size of a population given the short duration of the activity and the small size of the VSP array and the short duration of VSP operations. Impacts are localised and temporary.
Reduce the area of occupancy of the species.	The area of occupancy may be temporarily reduced given fish primarily respond by avoiding emitted sound from sound sources, however there will be no long-term reduction in the area of occupancy of fish.
Fragment an existing population into two or more populations.	Underwater sound generated from drilling activities will not split up a single fish population into two or more populations.
Adversely affect habitat critical to the survival of a species.	Underwater sound generated from drilling activities will not affect habitat critical to the survival of a species. is no overlap between underwater noise emissions and critical fish habitat.
Disrupt the breeding cycle of a population.	Underwater sound generated from drilling activities will not disrupt the breeding cycle of a population. There is no overlap between underwater noise emissions and fish breeding sites.
Modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline.	Underwater sound generated from drilling activities will not modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline. Impacts will be localised and temporary. Habitats for site-attached fish, such as rocky reef, do not occur in the activity area or immediate surrounds.
Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat.	The activity will not result in the introduction of IMS.
Introduce disease that may cause the species to decline.	The activity will not result in the introduction of disease.
Interfere with the recovery of the species.	Recovery of threatened fish species will not be interfered with given there is no overlap between underwater sound emissions and areas critical to species recovery (such as breeding or migration).

Impacts to Cetaceans

The impacts of underwater sound on cetaceans are assessed in Section 7.1.4 of the Beehive-1 PDSA EP (available [here](#)), which was accepted by NOPSEMA in March 2022.

This VSP modelling results presented in Table 7.10 indicate that mortality to cetaceans from VSP operations is not predicted. The maximum distance at which the NMFS (2018) marine mammal behavioural response criterion of 160 dB re 1 μ Pa could be exceeded was modelled as 2,900 m (2.9 km). TTS and PTS are predicted to only affect HFC (species such as porpoises, that are not known to occur in the impacts EMBA), and even then to only a few hundred metres from the sound source. Given that threatened and other whale species are not likely to occur in the impacts EMBA at the time of drilling (see Figure 5.17), the impacts of VSP on whales are expected to have a negligible impact consequence. Dolphins are classified as MFC, and the VSP modelling results in Table 7.10 indicate that impacts will be limited to behavioural impacts (e.g., avoidance) within a 2,900 m radius of the sound source. Given the short-term nature of VSP, the impacts will be limited to short-term avoidance.

The proposed drilling activity will not have a 'significant' impact on threatened cetacean species (see Section 5.4.5) when assessed against the EPBC Act Significant Impact Guidelines 1.1 (DoE, 2013) as outlined in Table 7.12.

Table 7.12. Assessment against EPBC Act Significant Impact Guidelines for Cetaceans

Significant impact guideline	Assessment
Lead to a long-term decrease in the size of a population.	Underwater sound generated from drilling activities will not lead to a long-term decrease in the size of a population.
Reduce the area of occupancy of the species.	Underwater sound generated from drilling activities will not lead to a reduction in the area of occupancy of cetaceans.
Fragment an existing population into two or more populations.	Underwater sound generated from drilling activities would not be expected to split up a single population into two or more populations.
Adversely affect habitat critical to the survival of a species.	Underwater sound generated from drilling activities will not affect habitat critical to the survival of a species. There is no overlap between underwater noise emissions and critical habitat for cetaceans.
Disrupt the breeding cycle of a population.	Underwater sound generated from drilling activities will not disrupt the breeding cycle of a population. There is no overlap between underwater noise emissions and cetacean breeding sites.
Modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline.	Underwater sound generated from drilling activities will not modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline. Impacts will be localised and temporary.
Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat.	The activity will not result in the introduction of IMS.
Introduce disease that may cause the species to decline.	The activity will not result in the introduction of disease.
Interfere with the recovery of the species.	Recovery of threatened cetaceans will not be interfered with given there is no overlap between underwater sound emissions and areas

Significant impact guideline	Assessment
	critical to species recovery (such as areas of calving, breeding or migration).

Impacts to Turtles

Turtle BIAs overlapped by the impacts EMBA include that for the green turtle (foraging), flatback turtle (inter-nesting) and olive-ridley turtle (foraging) (see Section 5.4.6).

The impacts of underwater sound on turtles are assessed in Section 7.1.4 of the Beehive-1 PDSA EP (available [here](#)), which was accepted by NOPSEMA in March 2022.

This VSP modelling results presented in Table 7.10 indicate that mortality or potential mortality to turtles from VSP operations is only likely within 84 m of the sound source. Based on the limited data in regard to noise levels that illicit a behavioural response in turtles, a level of 166 dB re 1 μ Pa drawn from NSF (2011) is typically applied, both in Australia and by NMFS, as the threshold level at which behavioural disturbance could occur (Table 7.13).

Table 7.13. Exposure criteria for seismic sources – turtles

Mortality and potential mortal injury	Distance from the source	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
210 db 24 _{hr} SEL or >207 dB peak	Near	Moderate	Moderate	Low	Moderate
	Intermediate	Low	Low	Low	Low
	Far	Low	Low	Low	Low

Distance from the source

Near = tens of metres.

Intermediate = within hundreds of metres.

Far = thousands of metres.

In the worst-case, recoverable injury and TTS for any turtles present near the VSP operations could occur within tens of metres (per Table 7.13). Behavioural changes, such as avoidance and diving, may occur for individuals within tens of metres of the sound source. This will not result in short- or long-term population impacts to turtles. The impact consequence level is assessed as negligible.

Impacts to Crustaceans

Although there are no threatened crustacean species in the impacts EMBA, crustaceans are assessed here given the presence of the commercially important NPF (see Section 5.7.1). Crustaceans such as banana and tiger prawns that are present in the impacts EMBA are described in Section 5.4.1.

The impacts of underwater sound on crustaceans are assessed in Section 7.1.4 of the Beehive-1 PDSA EP (available [here](#)), which was accepted by NOPSEMA in March 2022.

There are no established criteria to model for the effects of underwater sound on crustaceans, so comparisons can only be made to results from acoustic studies. This VSP modelling results presented in Table 7.10 indicate that the distance to effects for recoverable injury (based on a PK-PK of 202 dB re 1 μ Pa from Payne et al (2008)) is 304 m (noting there are no comparison criteria for behaviour, TTS, PTS or mortality).

Based on a Q1 start for the drilling activity, VSP operations may overlap with the spawning period for grooved tiger prawn and blue endeavour prawn, along with migration of juvenile banana prawns (see Figure 5.12 in Section 5.4.1).

Impacts to crustaceans (prawns) will have a negligible impact consequence at both an individual level and local population level based on the following:

- The sound will be temporary (several hours) and localised;
- The activity is 80 km from inshore habitats favoured as nursery grounds for juveniles and therefore will not be impacted by underwater sound generated from VSP; and
- Lethal effects to crustaceans have not been observed (Christian *et al.*, 2003; Parry and Gason 2006; Payne *et al.*, 2008; Day *et al.*, 2016a).

Impacts to Avifauna

There are no threatened seabird species or seabird BIAs in the impacts EMBA.

In the event that individual birds or flocks are present in the impacts EMBA area during VSP operations, an indirect impact may occur if sound pulses cause changes to the abundance or behaviour of prey species (fish). However, the extent to which temporary 'descending' or 'tightening' responses of schooling prey fish such as pilchards (if it occurs) affects availability to birds either positively or negatively, is not known. As described in the previously, the effects to fish from VSP will be very localised and short-term, and it is not likely that measurable impacts to predatory seabirds will be therefore occur.

Seabird species that may forage in the activity area (see Section 5.4.7) all have considerable foraging habitat present throughout JBG, will all listed as migratory. The short distance to behavioural effects for fish (tens to hundreds of metres for behavioural impacts) means that any temporary dispersal of fish due to VSP would not result in any significant decrease in availability of prey species that is of biological significance for seabird populations.

There are no thresholds or assessment criteria for noise impacts to birds. As most seabirds spend very little time under the water surface, and when they do it is for several seconds at a time, impacts to seabirds are predicted to be negligible. The operational area does not contain spatially limiting food sources, with JBG providing abundant foraging grounds.

7.5.5. Impact Assessment

Table 7.14 presents the impact assessment of underwater sound generated from the activity on biological receptors.

Table 7.14. Impact assessment for noise emissions on biological receptors

Summary		
Summary of impacts	Physiological or pathological impacts to local populations of marine fauna and avifauna from noise emissions generated during the drilling activity.	
Extent of Impact	Ten of metres and/or up to several hundred metres (due to VSP operations) depending on the source of sound.	
Duration of Impact	Very short-term (several minutes for helicopters) to the duration of drilling (support vessel movements, drilling sound).	
Level of certainty of impacts	Moderate to high.	
	Decision type	A – good industry practice required.

Impact decision framework context	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk and uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	<ul style="list-style-type: none">• No population level impacts to marine fauna and avifauna from the activity.• Anthropogenic noise in BIAs will be managed such that turtles will continue to utilise the area without injury or displacement from foraging, migration and interesting areas.		
Impact consequence (inherent)			
Receptor		Consequence rating	
Plankton		Negligible	
Fish – with swim bladders		Negligible	
Fish – without swim bladders		Negligible	
Marine mammals		Negligible	
Turtles		Negligible	
Marine invertebrates (crustaceans)		Negligible	
Avifauna		Negligible	
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
EPBC Policy Statement 2.1 – Part A (Standard management procedures) for VSP operations (IMP-05: EPS-01, -03 & -04)	Engineering & administrative	Yes	<p>EB: Improved ability to spot and identify marine fauna at risk of impact from underwater sound generated by VSP equipment.</p> <p>C: Little additional cost – time to induct VSP and deck crew and ensure compliance.</p> <p>Ev: Standard management procedures in Part A of the policy statement must be followed by all vessels conducting seismic surveys irrespective of location and time of year. The policy statement notes that these procedures should be sufficient in areas where there is a low likelihood of encountering whales, as is the case in the JBG.</p>

EPBC Policy Statement 2.1 – Part A (Standard management procedures) – soft-start procedures for VSP.	Engineering	No	<p>EB: Improved ability to avoid or minimise impacts of underwater sound to marine fauna.</p> <p>C: Cost associated with the extra time to undertake VSP, likely to be several hours. This would be in the order of \$100,000 for the MODU time alone.</p> <p>Ev: The airguns used for VSP have a much lower sound source volume (600 cui) compared to traditional seismic surveys (up to 3,500 cui) that the Policy Statement 2.1 has been prepared for. Sound will also be generated by the support vessels, acting as a ‘warning’ to sound-sensitive species. This, the short duration of VSP and with the low likelihood of whales being in the activity area at the time of drilling means the high cost of implementing this control is disproportionate to the low risk.</p>
Environmental awareness induction (IMP-05: EPS-02).	Administrative	Yes	<p>EB: Ensures VSP and deck crew are aware of their obligations regarding implementation of EPBC Policy Statement 2.1 when conducting VSP operations, thereby minimising impacts to megafauna.</p> <p>C: Minimal additional cost to prepare and present induction.</p> <p>Ev: Presenting inductions to ensure VSP and deck crew are aware of their obligations is an industry standard. The environmental benefits outweigh the minor costs.</p>
EPBC Policy Statement 2.1 – Part B (Additional management measures) – use of a Marine Mammal Observer (MMO) during VSP operations)	Administrative	No	<p>EB: Improved ability to spot and identify marine fauna at risk of impact from underwater sound generated by activity equipment.</p> <p>C: About \$20-30,000 to contract two MMOs (back-to-back operations, based on day rate, travel and accommodation) for the duration of VSP operations plus standby time.</p> <p>Ev: The use of MMOs is covered by Part B (Additional Management Procedures) of the policy statement. Adoption of Part B (either all or parts thereof) is recommended in areas and/or seasons that have a moderate to high likelihood of encountering whales. The likelihood of encountering whales in the activity area during the activity window is low, so the use of an MMO is not considered necessary. Crew on the MODU can implement EPBC Policy Statement 2.1 with support of constant bridge observations from crew on the support vessels.</p>

Undertake site-specific acoustic modelling and develop a noise management plan as per the Approved Conservation Advice for <i>Megaptera noveangliae</i> (humpback whale).	Administrative	No	EB: Increase the knowledge of potential impacts and potential reduction in impacts to whales. C: Several thousand dollars to undertake site-specific acoustic modelling and prepare the management plan. Ev: There is no environmental benefit with this control measure as there are no humpback whale BIAs in or near the activity area and the timing of the activity is outside the humpback whale migration period on the North West Shelf.
Vessels and helicopters will comply with EPBC Regulations 2000 – Part 8 Division 8.1 (IMP-05: EPS-03).	Administrative	Yes	EB: Reduces the risk of physical and behavioural impacts to cetaceans from vessels and helicopters. C: Operational costs to adhere to marine fauna interaction restrictions, such as vessel speed and direction, are based on legislated requirements. Ev: Standard management procedures in Regulations 8.07 must be followed.
MODU machinery and support vessel engines and thrusters/DP are well maintained (IMP-05: EPS-05).	Engineering	Yes	EB: Efficient engines, thrusters and other rotating equipment are likely to result in lower sound and vibration, thereby minimising impacts to sound-sensitive marine fauna. C: Maintenance costs can be significant. Ev: Planned maintenance is necessary to maintain MODUs and support vessels in sea-worthy condition. EOG would not hire a MODU or vessel that is not sea-worthy, so there are no alternative to implementing this control measure.
Environmental Controls and Performance Measurement			
Performance outcome	Performance standard (control)		Measurement criteria
VSP and pre-drilling geophysical operations			
No displacement or injury to threatened marine fauna from drilling or pre-drilling activities	(IMP-05:EPS-01) Geophysical and VSP team members, with the support of dedicated MODU deck crew and support vessel bridge crew, will implement parts of Part A of EPBC Policy Statement 2.1 during VSP and any pre-drill geophysical activities. Specifically:		
	A.3.1: <i>Pre Start-Up Visual Observations</i> <ul style="list-style-type: none">Pre-start visual observations out to 3 km for 30 minutes.If a whale or turtle is observed during the pre-start observations, delay soft start for 30 minutes.If no whales or turtles are observed, activate acoustic equipment.		Daily operations reports verify procedure was followed as required.

<p><i>A.3.4: Operations procedure</i></p> <ul style="list-style-type: none"> • If a whale or turtle is observed within the shutdown zone of the source (500 m), the airguns will be shut down. • VSP can recommence after the whale or turtle has been observed to move outside the shutdown zone or if the whale has not been sighted for 30 minutes. 	<p>Daily operations reports verify procedure was followed as required.</p>
<p><i>A.3.6 Night-time and low visibility procedure</i></p> <ul style="list-style-type: none"> • Wherever practicable, commence VSP operations during daylight hours. • Night-time and low visibility operations will not commence if there have been 3 or more whale-instigated shutdown in the preceding daylight hours. 	<p>Daily operations reports verify procedure was followed as required.</p>
<p>(IMP-05: EPS-02) Environmental awareness induction will be provided to MODU, geophysical, VSP and support vessel crew prior to start of the activity. This includes:</p> <ul style="list-style-type: none"> • Providing the policy statement to the Vessel Masters and Drilling Supervisor. • Providing photos/pictures of the different megafauna expected in the area at the time of the activity, including in the form of posters for display. • Instructions on the pre-start, shut-down and re-start requirements (as listed in IMP-05:EPS-01). • Instructions on distance estimation, including the specification that marine binoculars with reticles are used. • Instructions on how to detect marine megafauna based on observations on the water surface and surrounds. • Instructions on data to be recorded for marine megafauna sightings, including time of observation, type and number of species observed and estimated location coordinates. 	<p>Induction presentation and signed attendance sheet.</p>
<p>(IMP-05: EPS-03) Support vessel and helicopter activities will be undertaken in accordance with EPBC Regulations 2000 – Part 8, Division 8.1. Specifically:</p>	<p>Flight reports verify in the event of a cetacean sighting, that caution zone and</p>

	<ul style="list-style-type: none">• Vessels will not knowingly travel faster than 6 knots within 300 m of a whale or 150 m of a dolphin;• Vessels will not knowingly get closer than 100 m of a whale or 50 m of a dolphin;• If a cetacean approaches, the vessel within the above zones, the vessel will avoid rapid changes in engine speed or direction;• Helicopters will not fly lower than 1650 ft when within 500 m horizontal distance of a cetacean except when landing or taking off and will not approach a cetacean from head on.	interaction management actions were implemented.
Cetacean sightings are reported to the DCCEEW.	(IMP-05:EPS-04) <i>EPBC Act Policy 2.1 – Part A.4</i> EOG will report cetacean sightings online to the DCCEEW within 2 months of activity completion (through the online Cetacean Sightings Application where possible or via email).	Transmittal of sighting records are available to verify reports were made.
MODU and support vessel operations		
MODU engines and support vessel engines and thrusters/DP are well maintained.	(IMP-05: EPS-05) Engines and thrusters are maintained in accordance with manufacturer’s instructions via the PMS to ensure they are operating efficiently.	PMS records verify that engines and thrusters are maintained to schedule.
Impact consequence (residual)		
Receptor	Consequence rating	
Plankton	Negligible	
Fish – with swim bladders	Negligible	
Fish – without swim bladders	Negligible	
Marine mammals	Negligible	
Turtles	Negligible	
Marine invertebrates (crustaceans)	Negligible	
Avifauna	Negligible	
The consequence of underwater sound emissions is assessed as negligible because:		
<ul style="list-style-type: none">• Underwater sound emissions are localised and temporary;• BIAs for cetaceans (as one of the more sound-sensitive fauna groups) do not occur in the impacts EMBA;• The activity avoids temporal overlap with whales that may migrate through the region; and• Distances to effect for underwater sound are very low.		

Demonstration of ALARP		
A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
Management system compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard	The residual impact consequence is negligible, which is considered acceptable.	
External context	No objections or claims have been raised by relevant persons regarding underwater sound emissions during the activity.	
Legislative context	The performance standards outlined in this EP align with the requirements of: <ul style="list-style-type: none"> • EPBC Act 1999 (Cth): <ul style="list-style-type: none"> ○ Section 229, 229A – all cetaceans protected in Australian waters, and it is an offence to kill, injure or interfere with a cetacean. • EPBC Act Policy Statement 2.1 (Interaction between offshore seismic exploration and whales) management procedures. 	
Industry practice	The consideration and adoption of the controls outlined in the below-listed codes of practice and guidelines demonstrates that BP EM is being implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	The EPS developed for this activity take into account the management measures listed for exploration in Section 4.4.1 of the guidelines, which include: <ul style="list-style-type: none"> • Considering sensitive locations and times of year for critical activities of species that are present.
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There are no guidelines specifically regarding underwater sound for offshore activities.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	There is no guidance specific regarding underwater sound.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	Guidelines met with regard to: <ul style="list-style-type: none"> • Noise (item 74). The preparation of this EP meets the objectives of these guidelines, whereby sensitive areas for marine life are identified, and stop procedures are in place when marine mammals are sighted within 500 m of the activity (IMP-05: EPS-01).

	AEP CoEP (APPEA 2008)	<p>The EPS developed for this activity meet the code's following objectives:</p> <ul style="list-style-type: none"> • Reduce the impact on cetaceans and other marine life to ALARP and an acceptable level (IMP-05: EPS-01, -02 & -03). • To reduce the impacts to benthic communities to ALARP and an acceptable level.
	Underwater sound-specific	
	EPBC Act Policy Statement 2.1 – Interaction between offshore seismic exploration and whales (2008a)	The standard management procedures in Part A of the guidelines have been adopted (IMP-05: EPS-01 & -03).
	EPBC Regulations 2000 – Part 8, Division 8.1	The standard management procedures in Part 8, Division 8.1, Regulation 8.07 have been adopted (IMP-05: EPS-04).
Environmental context	MNES	
	AMPs	This hazard will not reach levels above ambient sound at AMPs.
	Ramsar wetlands	This hazard will not reach levels above ambient sound at any wetlands.
	TECs	This hazard will not reach levels above ambient sound at TECs.
	Nationally threatened and migratory species	This hazard will not reach levels above ambient sound for threatened and migratory species.
	Other matters	
	KEFs	This hazard will not reach levels above ambient sound at KEFs.
	NIWs	This hazard will not reach levels above ambient sound at NIWs.
	State marine parks	This hazard will not reach levels above ambient sound at state marine parks, which are located around islands and along mainland coastlines.

	<p>Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans</p> <p>The Conservation Management Plan for the Blue Whale (DoE, 2015b) and the Conservation Advice for the Humpback Whale (TSSC, 2015a); Sei Whale (TSSC, 2015b) and Fin Whale (TSSC, 2015c) identify noise interference as a threat to these species. The plans state that the risk of physical impacts is minimised by the implementation of EPBC Act policy Statement 2.1, which this activity is implementing.</p> <p>The Recovery Plan for the White Shark (DSEWPC, 2013) does not list anthropogenic sound as a threat to this species.</p> <p>The Recovery Plan for the Sawfish and River Sharks (DoE, 2015) does not list anthropogenic sound as a threat to this species.</p> <p>The Conservation Advice of the Whale Shark (TSSC, 2015d) does not list anthropogenic sound as a threat to this species.</p> <p>The Recovery Plan for Marine Turtles in Australia (DoEE, 2017c) identifies noise interference as a threat to turtles, and for acute noise such as seismic surveys, states that surveys planned to occur inside important inter-nesting habitat should be scheduled outside the nesting season. This is not triggered by this activity given the absence of turtle BIAs in the EMBA.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).
Statement of acceptability	<p>EOG considers the impacts from underwater sound to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Safety and Environmental Policy; • The residual consequence rating is negligible; • An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. • Relevant legislation and industry best practice will be complied with; • Underwater sound emissions from the activity will not have long-term or significant impacts on MNES; • The management of underwater sound emissions will ensure it is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; • The management of underwater sound emissions will ensure it is not inconsistent with the aims of relevant marine reserve management plans; and • The management of underwater sound emissions will ensure it is not inconsistent with ESD principles.
Environmental Monitoring	
<ul style="list-style-type: none"> • Monitoring for megafauna.

- VSP operations reports.
- Transmittal of sighting records to DCCEEW.
- Induction presentation and attendance sheets.
- PMS records.

7.6. IMPACT 6 – Discharge of Drill Cuttings and Muds

7.6.1. Hazard

Cuttings (and adhered fluids) are discharged directly to the seabed during riserless drilling and discharged from the MODU to the sea surface while drilling with the riser connected. Cuttings and adhered muds disposed from the MODU form a turbid plume, within which the larger particles (90-95%) fall to the seabed close to the discharge point, while the finer particles form an upper plume before dispersing, with a dilution factor of at least 10,000 within 100 m of the discharge point (Hinwood *et al.*, 1994).

Drill cuttings from upper well sections generally accumulate in an approximate 80 x 80 m area around the well, commonly an ellipsoid shape according to tide and current behaviour (Hinwood *et al.*, 1994). When cuttings from the lower sections of the well are discharged at the sea surface, the larger sediment particles settle rapidly to the seabed, generally with 90% of the discharge volume falling within 100 m of the discharge point (Hinwood *et al.*, 1994).

The physical deposition of these cuttings, combined with the properties of the adhered fluids, may have an impact on flora and fauna and benthic habitat, depending on the discharge volumes, exposure levels and the sensitivity of the species themselves.

While drilling the deeper sections of the well, WBM will be circulated and continuously recycled to the surface. The WBM is circulated to surface to separate cuttings from the fluid and in turn allows the mud to be pumped back down into the well. Cuttings are separated from the WBM using shale shakers and hydro-cyclones to remove as much WBM for reuse as possible. The cuttings with residual mud are intermittently discharged from the MODU from a discharge hose above sea level. Periodically, different solids control devices within the mud treatment system may also discharge to sea. The mud treatment system is continuously monitored for operability by the mud engineer and drilling fluid properties assessed at least twice daily by the Drilling Supervisors and Drilling Fluids Engineer to optimise separation efficiency. A bulk discharge of waste WBM will occur at the end of drilling the well, which is expected to last no longer than 4 hours.

Because WBM will be used rather than synthetic-based mud or oil-based mud, no heavy metals will be contained within the mud. As such, issues relating to the bioaccumulation of heavy metals as a result of the discharge of drilling muds does not apply to this activity.

At the completion of drilling, the well will be either P&A or TA (see Section 2.8), with either completion brine or WBM left in the wellbore. This means that the drilling fluid in the MODU tanks will be discharged, as the mud is formulated specific to each well section and cannot be re-used.

Drill Cuttings and Fluid Solids Discharge Modelling

EOG commissioned RPS to undertake dispersion modelling of drill cuttings and muds based on the well design described in Section 2.7. Table 7.15 summarises the estimated volume of drill cuttings and unrecoverable mud solids for each well interval and the end-of-well mud discharge.

Table 7.15. Estimated volume of drill cuttings and unrecoverable mud solids for each well interval

Bore diameter (inches)	Well interval	Cuttings	Mud solids		Discharge duration (days)
		Volume discharged (m³) ¹	Type	Volume discharged (m³) ^{2,3}	
36"	Conductor hole	80.4	Seawater & sweeps	19.5	0.2
26"	Surface hole	360.1	Gel/polymer WBM	75.0	1.2
17½"	Intermediate hole	322.9	Potassium chloride (KCl) WBM	81.3	2.4
12¼"	Production hole	172.3	High performance WBM	32.7	5.7
8½"	Production liner	29.7		8.8	3.1
	Mud solids discharged at sea surface at well completion			53.9	0.2
	Total	965.4		271.2	12.8

¹ Hole washout included 20% over-gauge for hole sizes > 12.1/4", 5% for hole sizes 12.1/4" and lower. ² Seawater is not included in the estimated drilling fluid volume discharged for conductor hole. ³ Solids determined as 10% of total mud system.

Modelling Methodology

The following information is taken from the RPS modelling report (2022a). MUDMAP is a three-dimensional plume model used to aid in assessing the potential environmental effects from operational discharges such as drill cuttings, drilling fluids and produced water. The model has been applied to hundreds of assessments in over 35 countries, including Australia.

The model itself is an enhancement of the Offshore Operators Committee (OOC) model and calculates the fates of discharges through three distinct stages, as defined by laboratory and field studies:

- Stage 1, Convective descent – free fall of the combined mass of fluids and cuttings;
- Stage 2, Dynamic collapse stage – the collapse of the combined mass as it meets the seabed (or water surface); and
- Stage 3, Dispersion stage – the transport and dispersion of discharged fluids and particles by the local currents. For cuttings and drilling mud particles that have higher density than seawater, this phase also calculates sinking and settlement to the seabed.

Each stage plays an integral role on different time and distance scales. Settling under currents is selective for particle size, with the larger particles (rock chips to sand) tending to settle quickly, forming a pile that aligns with the predominant water current axis. Smaller particles (especially silts and clays) will remain suspended for longer periods and will therefore be dispersed more widely by the ambient current conditions. Dispersion of the finer discharged material tend to be

enhanced with increased current speeds and water depth and with greater variation in current direction over time and depth. Along with the advanced analyses tools, MUDMAP can simulate six classes of material (or 36 subcategories), each with unique density and particle-size distribution. During the dispersion stage, the model particles are transported in three dimensions according to the current data and horizontal and vertical mixing coefficients at each time step according to the governing equations.

MUDMAP has been extensively validated and applied for discharge operations in Australian coastal waters. The input data used to setup the dispersion model included:

- Volume and discharge duration of the cuttings and unrecovered muds;
- Particle size distributions and associated settling velocities of discharged cuttings and unrecoverable muds;
- Bulk density of the discharged cuttings and unrecoverable muds;
- Temperature and salinity profile of the receiving waters;
- The orientation of the discharge pipe;
- The height/depth of the discharge point relative to mean sea level; and
- Depth-varying current data to represent local physical forcing.

Table 7.16 provides a summary of the discharge configuration and the estimated volume of cuttings and muds used as input into the discharge model. Each simulation represented the sequential completion of each discharge operation with the sequence and rate of discharges set to represent the proposed drilling and discharge plan. Simulations were run for a longer period than the discharge duration to allow finer sediments to settle out of suspension or to disperse.

Table 7.16. Input data used for the drill cuttings and dispersion modelling

Parameter/description	Values/configuration
Volume of cuttings discharged near the seabed	80.4 m ³
Volume of mud solids discharged near the seabed	19.5 m ³
Volume of cuttings discharged near the sea surface	885 m ³
Volume of mud solids discharged near the sea surface	251.7 m ³
Total volume of cuttings discharged	965.4 m ³
Total volume of mud solids discharged	271.2 m ³
Density of drill cuttings	2,600 kg/m ³
Density of drilling mud solids	4,200 kg/m ³
Duration of discharge [simulation discharge]	12.8 days [17.3 days]
Depth of near – seabed discharge	2 m above seabed
Depth of near – sea surface discharge	0 m (sea surface)
Water depth	40 m
Orientation of discharge pipe	Vertically downwards
Stochastic modelling approach and conditions	Randomly selected start simulation dates between January–December (2010–2019).

Parameter/description	Values/configuration
	25 simulations per quarter (Q1: January–March, Q2: April–June, Q3: July–September and Q4: November–December).

As the well will be drilled using a conventional drilling approach, the particle sizes for cuttings and drilling muds were represented by literature data for conventional drilling (Table 7.17). It is important to note that grain size has a greater influence on the rate of settling than density (Neff, 2005), and grain sizes are expected to vary between 0.016 mm and 6 mm in diameter. The model was set up with four main particle classes to represent large, medium and light cuttings, and drilling fluid solids (i.e., mud particles). The fall velocities for the various size classes were derived from empirical data provided by Dyer (1986).

A stochastic modelling approach was following with one hundred simulations modelled per well (or 25 per quarter per well). Each discharge simulation for the respective well had the same information but different commencement times, and thus, prevailing current conditions were different. This approach ensured that the cuttings and muds experienced a wide range of current conditions (speeds and directions). The results from all 100 simulations per well, were integrated to identify the overall area of exposure on the seabed and in water. The outputs are presented as contours relative to the maximum predicted bottom thickness of deposited material on the seabed or total suspended solids (TSS) concentrations.

Table 7.17. Discharged grain sizes, settling velocities and percentage distributions for the cuttings and drilling muds, based on conventional hole drilling using sea water and sweeps and WBM

Class	Grain size (mm)	Settling velocity (cm/s)	Well section consisting of cuttings & drilling fluids (composition %)	Class proportion (composition %)
Large cuttings	6	53.62	8.6	40.3
	5	49.46	8.6	
	2	28.55	8.6	
	1	12.73	5.8	
	0.5	7.5	5.8	
	0.45	6.6	2.9	
Medium cuttings	0.4	6	2.9	16.9
	0.35	5	2.8	
	0.3	4	2.8	
	0.25	3.1	2.8	
	0.2	2.3	2.8	
	0.15	1.6	2.8	
Light cuttings	0.1	0.8	2.8	14.3
	0.05	0.22	2.8	
	0.04	0.15	2.9	

Class	Grain size (mm)	Settling velocity (cm/s)	Well section consisting of cuttings & drilling fluids (composition %)	Class proportion (composition %)
	0.03	0.08	2.9	
	0.02	0.04	2.9	
Drilling muds solids	0.063	0.34	0.4	28.5
	0.05	0.22	1.6	
	0.035	0.11	3.7	
	0.026	0.06	6	
	0.02	0.038	7.4	
	0.016	0.026	9.4	
Total composition (%)			100	100

Settling velocities per grain size sourced from Dyer (1986).

Reporting Thresholds

The following information on thresholds is taken from RPS (2022a). The MUDMAP model can predict sediment concentrations and thickness to very low levels that may not be practical or ecologically significant; therefore, thresholds were carefully selected for reporting the model-predicted outcomes.

Based on available literature, thresholds of 1-10 mm and above 10 mm were used to define low and high exposure levels for this study, respectively (Table 7.18). In addition, Trannum et al (2009) reports a significant decrease in species count, abundance of individuals, Shannon-Wiener diversity, and biomass of marine animals with increasing depth of deposited cuttings (3-24 mm). Furthermore, a study by Kjeilen-Eilertsen et al (2004) reports that depositional thicknesses greater than 9.6 mm are likely to cause smothering impacts on benthic ecosystems, including corals. A study by Smit et al (2008) established that a thickness threshold of greater than 6.5 mm would be needed before potential harm to benthic macrofauna occur.

As a conservative measure, a thickness of 0.05 mm was adopted as a minimum reporting threshold for modelling (Table 7.18). Assuming newly settled cuttings and drilling muds will be less compact due to incorporation of water between grains of sediment deposits, a bulking factor of 2.5 was applied to predicted bottom thicknesses to account for porosity.

The minimum reporting threshold for TSS concentrations used for this study is 5 mg/L. Nelson et al (2016) reports <10 mg/L as a minimal or no effect, whilst concentrations above 10 mg/L have a sublethal effect to pelagic biota. Furthermore, IOGP (2016) cite that very high concentrations (>1,830 mg/L) of TSS has been shown to result in mortality of pelagic biota. Hence, a threshold range of 10-1,830 mg/L and greater than 1,830 mg/L were used to define low and high exposure, respectively (see Table 7.18).

Table 7.18. Reporting thresholds for sediment thickness and TSS concentrations for the drill cuttings and muds discharge modelling

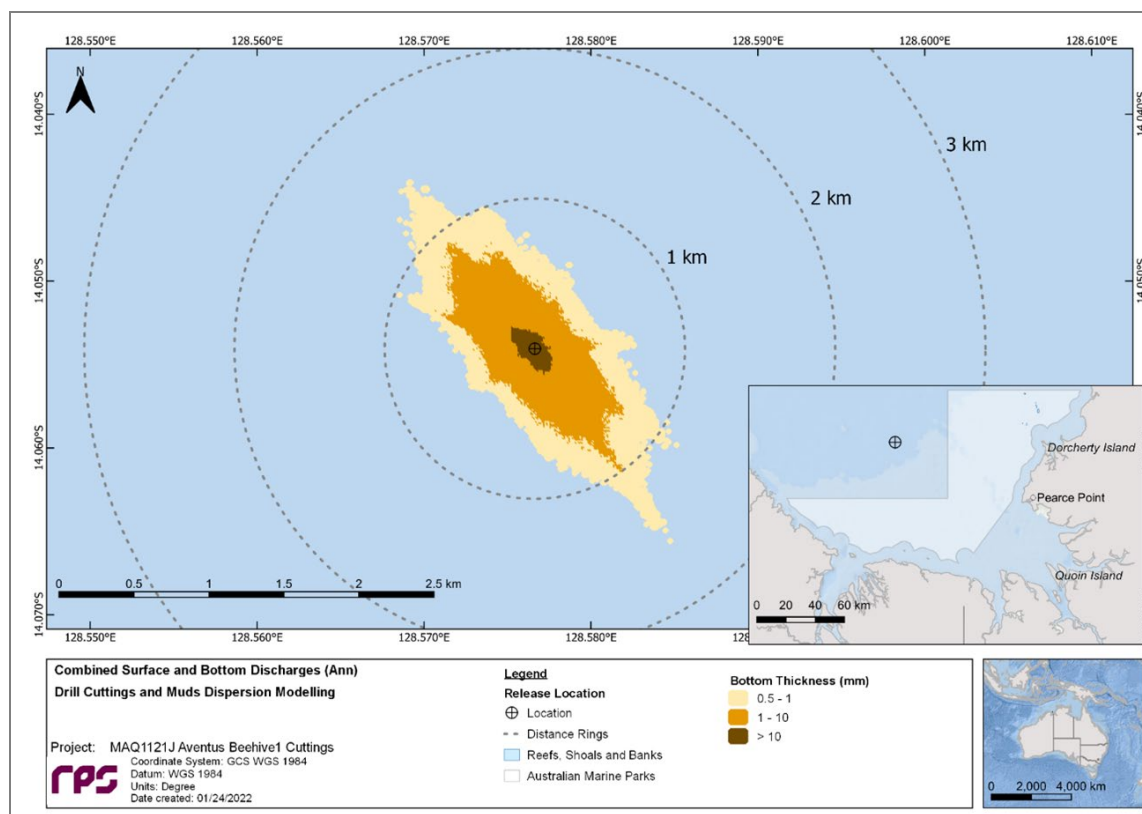

Reporting criteria	Total sediment thickness (mm)	TSS concentration (mg/L)
Minimum reporting threshold	0.05	5
Low exposure	1 – 10	10 – 1,830
High exposure	> 10	> 1,830

Stochastic Modelling Results – Sediment Thickness

Figure 7.4 illustrates the predicted coverage and sediment thickness from the combined near-seabed and sea surface drill cuttings and unrecoverable muds discharges from all 100 simulations. Table 7.19 presents the same results.

The total area of coverage on the seafloor above the minimum reporting threshold is 1.45 km², which was predicted to occur up to a maximum distance of 1.55 km from the release location (i.e., drill rig). In comparison, the area of coverage based on the low (1-10 mm) and high (>10 mm) exposure thresholds was 0.70 km² and 0.05 km², respectively. The maximum distance from the release location to the low and high exposure thresholds was 1.0 km and 0.21 km, respectively.

Table 7.20 provides a summary of the stochastic dispersion modelling assessment for each of the year's four quarters, presenting the predicted maximum bottom thickness, total area of coverage and the maximum distance (and direction from the platform) to the minimum threshold. The maximum distance from the platform above the minimum threshold ranged from 1.23 km (Q4) to 1.55 km (Q3). The maximum distance from the well to the low (1–10 mm) and high (>10 mm) exposure thresholds ranged between 0.81 km (Q1) to 1.00 km (Q3) and 0.17 km (Q4) to 0.21 km (Q2), respectively. Given the orientation of the currents, the furthest extents of exposure occurred in a northwest or southeast direction.

Source: RPS (2022).

Figure 7.4. Predicted maximum thickness at each grid cell from all 100 simulations used to define the area of greatest extent from the discharge of drill cuttings and unrecoverable muds for all quarters

Table 7.19. Predicted annual area of coverage and maximum distance as a function of sediment thickness

Sediment reporting thickness (mm)	Reporting criteria	Collective assessment of all combined simulations		
		Area of coverage of cuttings and muds ≥ 0.05 mm thickness (km ²)	Percentage of modelled area covered by sediment	Maximum distance from the release location (km)
0.05 – 0.1	Minimum reporting threshold	0.70	48.3	1.55
1 – 10	Low exposure	0.70	48.3	1.00
> 10	High exposure	0.05	3.4	0.21
Total		1.45	100	

Results are based on the collective assessment of all 100 individual simulations (near-seabed and surface discharges).

Maximum sediment thicknesses (or height of sediment mounds) ranged between 866 mm (Q3) and 1,036 mm (Q4) at the immediate vicinity (<10 m) of the well location. The maximum distance of deposited material from the release location above the minimum threshold ranged from 1.23 km (Q4) to 1.55 km (Q3), whilst the total area of coverage ranged between 0.97 km² (Q2) and 1.28 km² (Q1).

Table 7.20. Predicted maximum sediment thickness, area of coverage and maximum distance to the minimum reporting threshold from combined near-seabed and sea surface drilling on a quarterly basis

Drilling start period	Maximum stochastic bottom thickness (mm)	Total stochastic area of coverage (km ²) ≥ 0.05 mm predicted bottom thickness (minimum threshold)	Maximum distance (km) from the release location to ≥ 0.05 mm thickness (minimum threshold)	Maximum distance (km) from the release location to ≥ 1 mm thickness (low exposure)	Maximum distance (km) from the release location ≥ 10 mm predicted bottom thickness (high exposure)
Q1	966	1.28	1.29	0.81	0.18
Q2	871	0.97	1.38	0.90	0.21
Q3	866	1.03	1.55	1.00	0.18
Q4	1,036	1.06	1.23	0.85	0.17

Results are based on 25 simulations, each with a 12.8 day discharge period.

The modelling results demonstrated that the settlement of the cuttings and drilling muds occurred predominantly along a northwest–southeast axis, coinciding with the dominant current directions at the release location. Given the similarity in the seasonal current speeds and directions, there was no discernible differences to the predicted areas of exposure. However, the modelling results indicate that the maximum bottom thicknesses and area of coverage(s) of the exposure thresholds is directly attributable to the height of discharge. When the cuttings and muds were discharged from the surface, the sediments travelled further spread over a larger area forming a thinner pile on the seabed. Whilst the cuttings and muds discharged near-the seabed settled bottom discharges were unable to travel as far, this resulted in settling closer to the well location and a larger localised mound.

Stochastic Modelling Results – TSS Concentrations

Figure 7.5 illustrates the maximum instantaneous TSS concentrations at each grid cell from all 100 individual simulations (near-seabed and sea surface discharges) used to define the area of greatest extent from the discharge of drilling muds (at the completion of drilling) on an annualised basis.

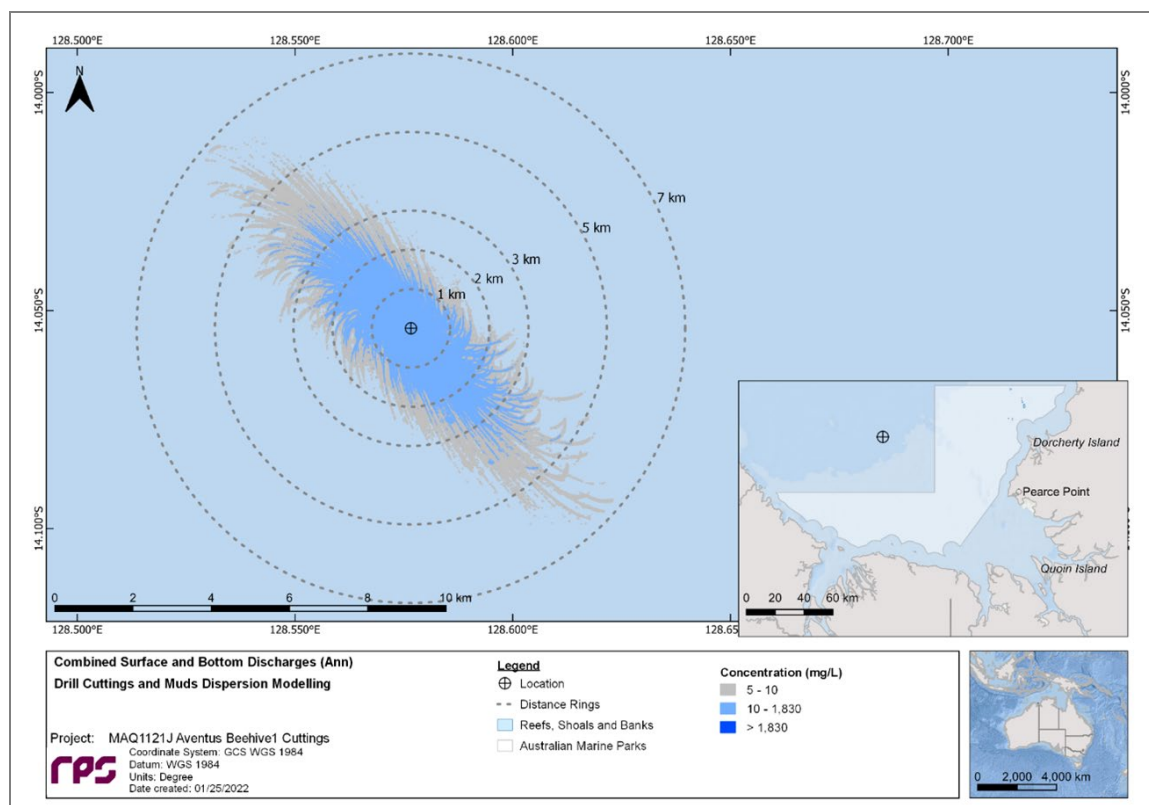

The total area of coverage above the minimum reporting threshold was 22.6 km², which was predicted to occur up to a maximum distance of 6.95 km from the drilling site. In comparison, the area of coverage based on the low (10-1,830 mg/L) exposure thresholds was 12.2 km². The maximum distance from the drilling site to the low exposure thresholds was 6.38 km (Table 7.21). The area of coverage based on the high (>1,830 mg/L) exposure threshold was predicted to occur within 30 m from the release location.

Table 7.22 presents the maximum instantaneous TSS concentrations resulting from the near-bottom and sea surface discharges (including waste muds discharges) and distances for each threshold and the area of coverage based on the minimum threshold for quarters one to four.

Table 7.21. Predicted area of coverage and maximum distance as a function of instantaneous TSS concentration

Maximum instantaneous TSS concentration (mg/L)	Reporting criteria	Collective assessment of all combined simulations		
		Area of coverage of maximum instantaneous TSS concentrations (km ²)	Percentage of area covered (%)	Maximum distance from release location (km)
5 – 10	Minimum reporting threshold	10.40	46.0	6.95
10 – 1,830	Low exposure	12.20	54.0	6.38
> 1,830	High exposure	<0.01	<0.01	0.03
Total		22.6	100	

Results are based on the collective assessment all 100 individual simulations (i.e. 100 combined near-seabed and surface discharges).

Source: RPS (2022).

Figure 7.5. Predicted maximum instantaneous TSS concentrations in each grid cell from all 100 simulations (near-seabed and sea surface discharges) used to define the area of greatest extent from the discharge of muds on an annualised basis

Table 7.22. Predicted maximum instantaneous TSS concentrations resulting from the near-bottom and sea surface discharges and area of coverage and maximum distances based on the minimum reporting threshold at the end of drilling on a quarterly basis

Drilling start period	Maximum instantaneous TSS concentration (mg/L)		Total stochastic area of coverage (km ²), 5 mg/L TSS concentration (minimum threshold)	Maximum distance (km) from the release location ≥5 mg/L TSS concentration (minimum threshold)	Maximum distance (km) from the release location ≥10 mg/L TSS concentration (low threshold)	Maximum distance (km) from the release location to ≥1,830 mg/L TSS concentration (high exposure)
	Near-bottom discharge	Sea surface discharge				
Q1	13,274	1,578	14.50	6.95	4.96	0.03
Q2	8,376	778	13.61	6.69	6.38	0.02
Q3	13,190	1,021	15.09	6.69	5.38	0.02
Q4	8,213	792	14.05	6.66	4.13	0.02

Results are based on 25 combined simulations per quarter, each with a 12.8 day discharge period.

The maximum instantaneous concentrations occurring in the lower and upper water column as a result of the near-bottom and surface discharges, were 13,274 mg/L (Q1) and 1,578 mg/L (Q1), respectively. In all instances the concentrations were very localised and occurred within a maximum distance of 30 m from the release location. The maximum distance from the release location for TSS concentrations, equal to or above the minimum 5 mg/L threshold was 6.95 km (Q1). The maximum distance to the low (10–1,830 mg/L) exposure threshold was 6.38 km (Q3) and within 30 m for the high exposure threshold (>1,830 mg/L) to be triggered (see Table 7.22). The TSS concentrations occurred predominantly along a northwest–southeast axis, coinciding with the dominant current directions at the release location.

7.6.2. Known and Potential Environmental Impacts

The known and potential environmental impacts of the discharge of drill cuttings and fluids discharges are:

- Localised and temporary increase in total suspended solids (TSS) (i.e., turbidity) of the water column;
- Smothering of benthic habitat and fauna; and
- Alteration of benthic substrate.

7.6.3. EMBA

The EMBA for drill cuttings and unrecovered muds discharges is up to 1.55 km from the well for sediment deposition and 6.95 km in a in a northwest to southeast direction from the well for TSS, as outlined in Section 7.6.1. Receptors known to occur or may occur within this EMBA are:

- Plankton;
- Benthic habitat and fauna; and
- Pelagic marine fauna.

7.6.4. Evaluation of Environmental Impacts

Increased Turbidity of the Water Column

During riserless drilling, the larger particles of the drill cuttings will settle in the immediate vicinity of the well, with smaller particles spreading further from the source aided by ocean currents. Once the riser is installed, drill cuttings are discharged just below the sea surface resulting in dissipation of the cuttings over a larger area. Hinwood et al (1994) and Neff (2005) note that within 100 m of the discharge point, a drilling cuttings and fluid plume will have diluted by a factor of at least 10,000, while Neff (2005) states that in well-mixed oceans waters (noting the activity area is considered a moderate-energy environment except when influenced by tropical cyclones), drilling mud is diluted by more than 100-fold within 10 m of the discharge.

When WBM and WBM-coated cuttings are discharged to the ocean, the larger particles, representing about 90% of the mass of the mud solids, form a plume that settles quickly to the bottom (or until the plume entrains enough seawater to reach neutral buoyancy). About 10% of the mass of the mud solids form another plume in the upper water column that drifts with prevailing currents away from the platform and is diluted rapidly in the receiving waters (Neff, 2005; 2010). Neff (2005) states that although the total volumes of WBM and cuttings discharged to the ocean during drilling a well are large, the impacts in the water column environment are minimal, because discharges of small amounts of materials are intermittent. Drilling mud solids do not increase to high concentrations in the water column and affect only small parcels of water.

Periodic, minor increases in the turbidity and suspended particulate material concentrations in the upper water column during cuttings and mud discharges are unlikely to have an environmentally significant effect on phytoplankton, zooplankton and pelagic animal communities in the vicinity of the drill site (Neff, 2005).

Water column turbidity increases as a result from the suspended solids, with a subsequent minor decrease in available light in the water column, which may temporarily reduce primary production. Impacts to fauna may include obstructions to respiratory processes and other physiological processes as well as behavioural changes due to a reduction in visibility and available oxygen (due to reduction in primary production).

The impacts from cuttings discharge are expected to be restricted to a small area around the drilling site. The quantity of material discharged is extremely small compared with the water volume in which the material is dispersing, thus water quality is expected to quickly return to background levels close to the source of the discharge once the discharge ceases.

There are no known water column sensitivities (e.g., shoals, banks, reefs) located within the area of impact, so impacts to site-dependent species are not predicted. TSS concentrations above the minimum reporting threshold are not predicted to reach the Joseph Bonaparte Gulf AMP (located 35 km east of the drill site). As such, the consequence of this impact is considered negligible.

Smothering of Benthic Habitat and Fauna

The modelling results indicate that the volume of drill cuttings and muds discharged over the course of the campaign is 965.4 m³ and 271.2 m³, respectively, over a total of 12.8 days of discharge (which occurs intermittently, not consecutively).

In high energy environments, drill cuttings and muds do not tend to accumulate on the seabed because they are redistributed by bottom currents soon after deposition (Neff, 2010). This is

expected to be the case in the impacts EMBA because it is strongly influenced by large tidal ranges that contribute to the vertical mixing of surface layers and sediments (see Section 5.2.3).

Once particulate material has settled onto the seabed it requires energy to re-suspend similar to existing sediments present on the seabed. Re-suspension volumes are a function of the surface area available to re-distributing currents, tides and storm events (i.e., induced wave stress). Redistribution is expected in areas of shallow water (<50 m) and strong seabed currents (Breuer *et al.*, 2004). Because the activity area has a water depth of 40 m, the surface layer of deposited sediment is expected to re-suspend during strong currents (e.g., during storms), however the magnitude of re-suspension is expected to be of a similar order to re-suspension of existing seabed sediments and should not result in a material impact to benthic habitats/fauna.

The main disturbance to the seabed is smothering and burial of sessile benthic and epibenthic fauna (Hinwood *et al.*, 1994). Studies undertaken on faunal counts/diversity have shown no significant effects of drill cuttings as a function of thickness with respect to settling communities (i.e., recolonization) (Setvik, 2010). This is consistent with the findings of Daan & Muldur (1996) that identified no adverse impacts on benthic communities from WBM cuttings one year after deposition, even as close as 25 m from a former discharge site. Field and laboratory studies support that benthic fauna are not significantly harmed from WBM if the exposure is of short duration and the cuttings are rapidly diluted. Impacts of WBM are generally limited to within 100 m of the discharge point and recovery is well within one year (Setvik, 2010). Studies indicate that benthic infauna and epifauna recover relatively quickly, with substantial recovery within 3-10 years (Jones *et al.*, 2012).

There are no areas of seabed sensitivity likely to be impacted by cuttings deposition (such as KEFs or coral reefs), with areas of low and high exposure limited to soft substrate seabed. The modelling results predict that drill cuttings will not reach the Joseph Bonaparte Gulf AMP.

Impacts to the dominant seabed habitat of infaunal plains (flat, soft substrate with occasional rocky outcrops supporting sponge gardens) and barren sand banks (supporting limited biota) (see Section 5.4.1) within the operational area and impacts EMBA area will be temporary, with rapid re-colonisation of benthic infauna within the deposited cuttings soon after the cessation of drilling. Infaunal communities (dominated by polychaetes and other crustaceans) and epifauna (i.e., prawns) potentially occur in and around the activity area will not be impacted by sedimentation due to the very small area of exposure (0.05 km²) to high sedimentation deposits (>10 mm).

On the basis of the modelling results, it is possible that smothering of benthic habitat (1-10 mm) may occur in an area of 0.70 km² extending a maximum distance of 1.0 km from the drilling site. For sediment thickness >10 mm (that may cause harm to benthic macrofauna), the area of impact is limited to 0.05 km² extending a maximum distance of 210 m from the around the drill site.

Taking into account that the Beehive-1 exploration well location is located entirely within the 'shelf' geomorphic feature of the JBG, typically characterised by extensive sediment plains and high sediment deposition and influenced by strong tidal movement, the impact of smothering of benthic habitat is expected to be short term (months up to a year). Species re-settlement within one year of the drilling campaign would be expected as per quoted studies of cuttings distribution offshore Australia. This impact area is miniscule compared with the available benthic habitat available throughout the JBG.

The Carbonate bank and terrace system of the Sahul Shelf KEF (described in Appendix 11) is located 26 km west of the drill site and therefore outside the impact area. For these reasons, the impact consequence of smothering of benthic habitat is negligible.

Impacts to Fisheries

There is little commercial fishing in the impacts EMBA. The only fishery that may operate in or immediately around the activity area is the Commonwealth-managed NPF (see Section 5.7.1). Fish species known to occur in the region are common and widely distributed and there is no spatially limiting habitat for the fin fish and benthic species known to occur in the impacts EMBA.

The modelling indicates cuttings and mud plumes will not impact a significant area of muddy and sandy substrates of coastal waters and estuaries (habitat for banana and tiger prawns) given the very small area of exposure (0.05 km²) to high sedimentation (>10 mm). In addition, there are no known sensitive benthic ecosystems in the activity area such as shoals, banks, reefs, seagrass meadows or mangroves (relevant to juvenile prawns) in or around the impacts EMBA.

The temporary nature of the drilling mud plumes, the rapid settling of cuttings and exclusion of fishing activities within the 500-m PSZ around the MODU means that there will be few if any impacts to the NPF from cuttings and muds discharges. Therefore, the impact to the NPF is considered to be negligible.

Alteration of Benthic Substrate

Modelling indicates that the maximum height of a sediment mound forming around the well is predicted to range between 0.866 m and 1.036 m. These sediment mounds are predicted to be limited to within the immediate vicinity (i.e., 10 m) of the drilling location. This will alter the nature of the seabed in this localised area for up to a year.

A cuttings mound will result in complete smothering of benthic fauna, though the mounds themselves (if they don't become quickly redistributed with ocean currents) will provide new habitat for benthic fauna to colonise. The cuttings mound may be readily and rapidly reworked into existing seabed sediments by natural process including movement through bottom currents and infauna burrowing.

Potential Toxicity Impacts to Marine Fauna

The non-toxic nature of the WBM means that acute or chronic toxicity impacts to fauna, especially immobile benthic fauna smothered by the cuttings, will not occur. The lack of toxicity and low bioaccumulation potential of the drilling muds means that the effects of the discharges are highly localised and are not expected to spread through the food web (Neff, 2010).

Metals present in drilling fluid generally resemble that of marine sediments, albeit with concentrations of some metals higher than clean marine sediments (Neff, 2005).

Barite is one of the main constituents used in WBM, and its use results in elevated levels of barium (Ba) in cuttings. Other chemicals of concern in cuttings, either because of their potential toxicity and/or abundance in WBM are arsenic (As), chromium (Cr), cadmium (Cd), copper (Cu), iron (Fe), lead (Pb), mercury (Hg), nickel (Ni) and zinc (Zn), (Breuer *et al.*, 2004).

Dissolved barium and any heavy metal contaminants present in the barite may slowly leach out of an anoxic cuttings pile (Neff *et al.*, 2005). Breuer *et al.* (2008) has also observed that metals in cuttings migrate either upward to the overlying water (Ba, Mn, and Fe) or diffuse downward (Cr, Cu and Pb), where they become incorporated into iron monosulfides. The exposure of these iron monosulfides to oxygen as a result of transport of oxygen into the cuttings via bioturbation or advection and/or pile resuspension may then lead to the release of the associated metals into the water column (Saulnier and Mucci, 2000; Huerta-Diaz *et al.*, 1998).

In a stable cuttings pile with little physical disturbance or bioturbation, it is probable that the fraction of the total cuttings pile metals that is in the dissolved, bioavailable fraction remains low. It is probable that some dissolved metals diffuse into the overlying water column and escape from the pile, as identified by Neff *et al* (2005). However, this efflux is not sufficient to raise the concentration of metals above natural background levels to an ecologically significant extent (Hartley *et al.*, 2003). There is no indication that the levels of trace metals in fish and shellfish collected close to offshore installations are significantly above natural background concentrations (Bakke *et al.*, 2013).

Marine fauna that are exposed in the laboratory or field to cuttings in sediments do not bioaccumulate significant quantities of metals (Hartley *et al.*, 2003). There is some evidence of a limited bioavailability of a few metals, such as Pb and Zn, which are present in cuttings piles; however, doubt remains that metal bioaccumulation in marine fauna from cuttings piles is sufficient to cause harmful effects in marine fauna living on or near cuttings piles (OSPAR, 2019). Modelling of cuttings pile relocation (disturbance and re-deposition) has confirmed that potential impacts of metals are minimal and disturbance of cuttings drilled with WBM is not expected to result in any significant impact (OSPAR, 2019).

Neff (2010) identifies that field and laboratory studies performed in temperate and cold water environments have shown that any metals present in drill cuttings are not bio-accumulated by marine organisms, primarily because they exist as extremely insoluble inclusions in cuttings minerals. Many field surveys investigating the concentrations of metals and hydrocarbons in tissues of marine animals in the vicinity of offshore WBM and cuttings discharges have shown that metals and hydrocarbon concentrations in tissues of marine animals near drilling platforms are similar to concentrations in tissues of the same or similar species well away from and out of the influence of the drilling platforms (Neff, 2010).

Numerous studies have been carried out in the Gulf of Mexico to test and evaluate a range of biological, biochemical and chemical methodologies to detect and assess chronic sub-lethal biological impacts near long-duration activities associated with oil and gas exploration and production. Contaminant concentrations at most locations studied were below levels thought to induce biological responses (Kennicutt *et al.*, 1996). Therefore, discharges associated with this activity are not expected to have long-term effects due to bioaccumulation.

Based on this information, the bioavailability of metals within cuttings generated from drilling activities is low and thus the impacts from disturbed cuttings drilled with WBM to marine fauna and habitats are expected to be minor.

7.6.5. Impact Assessment

Table 7.23 presents the impact assessment for discharge of drill cuttings and muds.

Table 7.23. Impact assessment for discharge of drill cuttings and muds

Summary	
Summary of impacts	Increased water column turbidity and smothering of benthic habitat.
Extent of impacts	Localised (up to several kilometres), in the direction of the dominant water currents (northwest to southeast direction).
Duration of impacts	Temporary (days for TSS plumes, months for deposited cuttings).

Level of certainty of impacts	HIGH – the impacts of drill cuttings and fluids discharges are well studied and understood.		
Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	Discharges of drill cuttings and muds are managed to reduce volume and toxicity impacts to biodiversity or ecological integrity.		
Impact Consequence (inherent)			
Receptor		Consequence	
Water column		Negligible	
Seabed habitats		Negligible	
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Recover drill cuttings from the seabed	Elimination	No	EB: Eliminates potential for benthic habitat smothering from cuttings deposition on the seabed. C: Significant additional cost (potentially hundreds of thousands of dollars) Ev: Additional cost and longer MODU time on location required to implement this control is not commensurate with the negligible consequences associated with the discharge of drill cuttings.
Cuttings reinjection	Elimination	No	EB: Avoids all impacts associated with the discharge of cuttings and muds overboard by reinjecting them down the well annulus. C: This would compromise the integrity of the well and is not justified for a single well program. An additional injection well would need to be drilled to implement this control measure, which would cost millions of dollars and add to the routine impacts and risks associated with drilling. Ev: Costs are considered grossly disproportionate given the negligible impact consequences of overboard discharges at this location.
Onshore cuttings disposal ('skip and ship')	Elimination	No	EB: Avoids all impacts associated with the discharge of cuttings and muds overboard. C: Significant storage space is required on the MODU before cuttings and muds can be pumped to a vessel. There are limited facilities at the Port of Darwin or Port of Broome to handle this waste

			<p>in the necessary volumes. There are the usual impacts and risks associated with numerous vessel movements between the MODU and shore bases. It would cost millions of dollars to implement this control measure.</p> <p>Ev: Costs are considered grossly disproportionate given the negligible impact consequences of overboard discharges at this location.</p>
Do not use drilling muds	Elimination	No	<p>EB: Elimination of impacts associated with TSS and smothering of benthic habitats.</p> <p>C: Drilling muds are required to enable the hole to be drilled. Mud prevents the wellbore from collapsing and enables the well objectives to be met.</p> <p>Ev: Costs to the program outweighs the benefits.</p>
No discharge of bulk powders	Elimination	No	<p>EB: At the end of the drilling program, any dry, unopened sacks of chemicals left over will be left on board for the next operator to use or returned to shore. Open sacks however cannot be transferred back to vessels for transport, and therefore are mixed into a slurry and discharged overboard if the stock cannot be used, sold or returned to shore (see Table 2.6).</p> <p>C: The design of the piping and the tanks on the MODU is such that the reverse pumping of dry bulks back to marine vessels or to shore is not possible. Therefore, return of excess open dry bulk powders to shore is not a feasible option.</p> <p>Ev: The potential environmental impacts are negligible due to the chemical selection process and therefore the benefit is negligible. Disposal volumes are minimal due to careful stock management.</p>
Use of riserless mud recovery (RMR)	Engineering	No	<p>EB: RMR has the advantage of potentially reducing the volume of WBM discharged to the environment as well as preventing cuttings accumulation at the seabed and provides an opportunity to recover and re-use the WBM drilling fluids.</p> <p>C: Cost associated with changes to equipment and change to the well design with installation estimated at several million dollars including rig-up and rig-down, rental and interfacing of the package.</p> <p>RMR equipment requires additional space on the MODU and additional crew and introduces additional operational and maintenance and risks. RMR is traditionally used on subsea wellhead systems to enable a closed mud system (weighted and/or inhibited) before the subsea</p>

			<p>BOP and marine riser is installed. In this case, WBM and cuttings go through the MODU's solids control system and cuttings are discharged at sea surface.</p> <p>There are some examples of RMR being used on jack-up MODUs where a closed system is required before the BOP is installed. Implementing RMR on a jack-up MODU would require a bespoke system to connect to the 30" conductor at the tension deck level of the MODU and divert the returns back to the solids control system.</p> <p>Ev: The cost outweighs the minimal environmental benefit given that WBM is being used. Cuttings discharge would be no different as cuttings would both be released at sea level. In the RMR case, cuttings passing through the solids control system would have less WBM entrained on them, but the residual mud recovered in this process would be discharged anyway.</p>
Extended cuttings dump chute to below sea surface	Engineering	No	<p>EB: Releases drilled solids (cuttings) deeper in the water column, thereby potentially reducing the spatial extent and turbidity plume.</p> <p>C: Costs associated with re-design, engineering, fabrication, installation and the risk of issues during the activity whereby the chute is blocked. May inhibit the distribution of cuttings in the upper sections of the water column, leading to a smaller area of concentrated deposition.</p> <p>Ev: Chute does not reduce the volume of cuttings discharged and increases costs and risks to operational activities. The low environmental impact of the WBM discharges and the short duration of discharge in a low sensitivity environment results in no significant increased environmental benefit.</p>
Implement a slim well design	Engineering	No	<p>EB: A slim well design would result in a reduction in diameter of the well and reduce the overall volume of cuttings discharged to sea.</p> <p>C: Cost of ~\$2 million for additional engineering and equipment rental. Risks to well objectives whereby the equipment required for well evaluation (sidewall coring, LWD tools) may not fit in a narrower hole which could result in a requirement for side-tracking (an additional cost and additional time on location and increase in discharges to sea). In the event of hole problems or the technical requirement to set a drilling liner, there is no smaller hole size available,</p>

			<p>which would result in the well being completed and a change in well design or re-drill required.</p> <p>Ev: Disproportionate cost compared to the small benefit gained in reducing the volume of WBM cuttings, but also presents a high risk of not achieving the objectives of drilling the well in the first instance, as it may require the well to be re-drilled to reach the target.</p>
Establish a closed circulating system early in the program	Engineering	No	<p>EB: Provides an opportunity to re-use drilling fluids, thereby reducing environmental discharges. Does not reduce the overall volume of drilled cuttings discharged to sea.</p> <p>C: Additional monetary costs, but can also lead to an increase in well design risk due to additional back pressure applied by use of a conductor (to bring the drilling fluid up to the rotary table) and can lead to stuck pipe and lost circulation.</p> <p>Ev: Significant costs and increased risks to well design outweigh the benefits given the low sensitivity of the seabed in the area.</p>
Use a centrifuge and dryer	Engineering	No	<p>EB: Reduces the volume of drilling fluids from cuttings more than the use of shakers alone. This is typically only used when drilling with synthetic-based mud (SBM).</p> <p>C: Centrifuges and driers are prone to mechanical failure. Most MODUs do not have this as part of their standard fit out, so there would be significant cost to mobilise this equipment to the MODU.</p> <p>Ev: Costs to the program outweighs the benefits, especially because SBM is not being used for Beehive-1.</p>
Use WBM fluids for drilling rather than synthetic-based muds (IMP-06: EPS-01, -02)	Engineering	Yes	<p>EB: Eliminates ecotoxicity impacts to benthic fauna.</p> <p>C: Minor cost in selection of WBM rather than synthetic-based muds.</p> <p>Ev: Environmental benefit outweighs the cost to implement the measure.</p>
Implement quality control limits for barite (concentration of mercury and cadmium) (IMP-06: EPS-03).	Engineering	Yes	<p>EB: Eliminates ecotoxicity impacts to benthic fauna.</p> <p>C: Minor cost in selection of barite with low mercury and cadmium concentrations.</p> <p>Ev: Environmental benefit outweighs the cost to implement the measure.</p>
Fluids Program (IMP-06: EPS-03, -04, -05, -06)	Administrative	Yes	<p>EB: Ensures drill fluids are managed in accordance with well-established industry processes.</p> <p>C: No additional cost.</p>

			Ev: The environmental benefits outweigh the costs to implement the measure.
Minimum mud release duration	Administrative	No	EB: Extends the release duration for muds, thereby reducing concentration of muds in the water column. C: Cost of additional MODU time. Ev: The environmental benefits are outweighed by the costs to implement the measure in light of the absence of sensitive environmental receptors around the drilling location.
Environmental Controls and Performance Measurement			
EPO	EPS		Measurement criteria
Only low toxicity, readily biodegradable and non-bioaccumulating WBM and additives will be used.	(IMP-06: EPS-01) The contractor ensures that, wherever feasible, only PLONOR, 'D'/'E' (non-CHARM) or 'Gold'/'Silver' (CHARM) OCNS-rated base fluids and additives (that do not have a substitution warning) are used in the drilling fluid system to minimise ecotoxicity impacts to marine fauna.		The Mud Chemical Inventory verifies that all chemicals are PLONOR, 'D'/'E' (non-CHARM) or 'Gold'/'Silver' (CHARM) OCNS-rated.
	(IMP-06: EPS-02) Where for technical reasons an additive is required that: <ul style="list-style-type: none"> Is not rated as PLONOR, 'D'/'E' (non-CHARM) or 'Gold'/'Silver' (CHARM); or Has a substitution warning; or Has not been registered with CEFAS (and therefore does not have a rating), Then a risk assessment will be completed to understand the environmental risk of discharge to sea. This will include: <ul style="list-style-type: none"> A pseudo-ranking using the OCNS process (where possible); Consideration of end fate, volumes and concentrations; and Final approval by EOG of the use of the chemical. 		MoC documentation verifies that, for products that do not meet IMP-06:EPS-01, a risk assessment is completed and approved by EOG prior to discharge of the chemical.
	(IMP-06: EPS-03) When selecting barite, AGR will ensure that the contaminant limit concentrations are at or below the following: <ul style="list-style-type: none"> Mercury (Hg) – 1 mg/kg (1 ppm) dry weight in stock barite. Cadmium (Cd) – 3 mg/kg (3 ppm) dry weight in stock barite. 		Mud inventory demonstrates containment limits are not breached.
Mud operations are managed to ensure cuttings discharges are	(IMP-06: EPS-04) In accordance with the Fluid Program, the shaker screens are used during drilling to maximise fluid separation from cuttings prior to overboard disposal.		Daily Mud Report indicates shaker screens are used.

optimised to minimise adhered muds.	(IMP-06: EPS-05) Operation of the separation treatment system is monitored on a full-time basis by the Derrickman/Shaker-Hand to ensure efficient system performance.	Performance of the system is logged by the Mud Engineer in Daily Fluids Reports.
	(IMP-06: EPS-06) Drilling fluid testing is performed by the Mud Engineer working under the direction of the Drilling Supervisor. The EOG subject matter expert will monitor the fluid testing on a daily basis.	Mud Engineer verifies through Daily Fluids Report that fluids properties have been tested and system optimisation activities actioned.
Impact Consequence (residual)		
Receptor	Consequence	
Water column	Negligible	
Seabed habitats	Negligible	
<p>The impact of drill cuttings and mud discharges is assessed as negligible because:</p> <ul style="list-style-type: none">• The activity will be of a short duration;• The area of impact on the seabed is extremely small;• There is an absence of site-attached fauna in the water column and absence of sensitive benthic habitats in the impacts EMBA;• The impacts EMBA is distant from the Carbonate bank and terrace system of the Sahul Shelf KEF;• The seabed is widely represented in the region and pre-impact conditions will be rapidly re-established.		
Demonstration of ALARP		
<p>A ‘negligible’ residual impact consequence is considered to be ALARP and a ‘lower order’ impact. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.</p>		
Demonstration of Acceptability		
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	<p>The NT DITT raised concerns regarding the discharge of drill cuttings and muds from the drilling campaign.</p> <p>EOG explained what the potential impacts were to benthic invertebrates and fauna in the water column and pointed the relevant person to the Drilling EP for more detail, which was on public exhibition at the time of the discussion. At the conclusion of the discussion, the relevant person was satisfied that the impacts would be minimal.</p>	
Legislative context	<p>The EPS outlined in this table align with the requirements of:</p> <ul style="list-style-type: none">• OPGGS Act 2006 (Cth).<ul style="list-style-type: none">○ Section 460(2) – a person carrying on activities in an offshore area under the permit must carry on those activities in a manner that does not interfere with....the conservation of the resources of the sea and seabed.....to a greater extent than is necessary for the reasonable	

	exercise of the rights and performance of the duties of the first person.	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed guidelines and codes of practice demonstrates that BP EM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for drilling wastes (cuttings and muds) in Section 4.5.8 of the guidelines, which include:</p> <ul style="list-style-type: none"> Select drilling fluid components to include the least ecotoxic options available that are suitable for the project (IMP-06: EPS-01, -02). Solids control equipment available onboard the drill rig to reduce the amount of residual drill fluids on cuttings prior to discharge (IMP-06: EPS-04, -05, -06).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	<p>The EPS developed for this hazard reflect the BAT in Section 17.2 of the guidance document, being:</p> <ul style="list-style-type: none"> Ensure engineering design for handling of drill cuttings/muds accounts for the minimisation of potential for environmental impact and exposure to hazardous materials in the event of a planned discharge or unplanned release (IMP-06: EPS-01, -02). For geographical areas where no previous environmental baseline survey has been performed, carry out an environmental baseline survey prior to drilling (geophysical survey undertaken). Ensure that the handling of drill cuttings and drilling muds is addressed as part of management measures detailed in an EIA (IMP-06: All EPS). Where it is planned to discharge drill cuttings into the marine environment, perform analysis as part of a specialist technical study (specialist study conducted). Implement additional approaches as considered necessary to manage risks for specific operations, including but not limited to avoiding the use of oil-based muds, avoid cuttings and mud discharges in sensitive environments, discharge to achieve maximum dispersion of solids on the seabed (IMP-06: EPS-01).
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>No specific environmental guidance regarding cuttings and mud management (Section 3.3.2).</p> <p>One of the key objectives is to describe the details of the mud treatment equipment/systems that discharge to the environment, which has been outlined in this section.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> 51 - The selection of a drilling fluid should be made after evaluating its technical suitability and environmental impact. The use of fluids that contain diesel as the principal component of the drilling mud liquid phase is not good practice for offshore drilling programs and should be avoided (IMP-06: EPS-01, -02, -03).

	(World Bank Group, 2015)	<ul style="list-style-type: none"> 56 - Feasible alternatives for the disposal of spent WBM and cuttings from well sections drilled with either WBM or non-aqueous drilling fluids (e.g., SBM) should be evaluated. Options include injection into a dedicated disposal well offshore, injection into the annular space of a well, and containment and transfer to shore for treatment and disposal. When no alternative options are available, residual WBM might be discharged to sea at the end of a drilling program, provided that the overall EIA conducted for the site has considered this scenario, demonstrating the environmental acceptability of this practice. 57 - When discharge to sea is the only alternative, a drilled cuttings and fluid disposal plan should be prepared, taking into account cuttings and fluid dispersion, chemical use, environmental risk and necessary monitoring. Discharge of cuttings to sea from wells drilled with non-aqueous drilling fluids should be avoided. If discharge is necessary, cuttings should be treated before discharge (IMP-06: All EPS).
	AEP CoEP (APPEA 2008)	<p>The EPS developed for this activity meet the code's following objectives for drilling:</p> <ul style="list-style-type: none"> To reduce the impact on other marine resource users to ALARP and to an acceptable level. To reduce risks to public safety to ALARP and an acceptable level.
Environmental context	MNES	
	AMPs	This hazard will not intersect nearby AMPs.
	Ramsar wetlands	This hazard will not intersect any Ramsar wetlands.
	TECs	This hazard will not intersect any TECs.
	Nationally threatened and migratory species	This hazard will not have any impacts on threatened or migratory species.
	Other matters	
	KEFs	This hazard will not intersect any KEFs.
	NIWs	This hazard will not intersect any NIWs.
	State marine parks	This hazard will not intersect any state marine parks.

ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).
Statement of acceptability	<p>EOG considers the impacts from discharge of drill cuttings and muds to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Safety and Environmental Policy; • The residual consequence rating is negligible; • An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. • Relevant legislation and industry best practice will be complied with; • Discharge of drill cuttings and muds will not have long-term or significant impacts on MNES; • The management of drill cuttings and mud discharges will ensure it is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; • The management of drill cuttings and mud discharges will ensure it is not inconsistent with the aims of relevant marine reserve management plans; and • The management of underwater sound emissions will ensure it is not inconsistent with ESD principles.
Environmental Monitoring	
<ul style="list-style-type: none"> • Mud chemical inventory. • Mud volumes discharged overboard. • Separation treatment system monitoring. 	
Record Keeping	
<ul style="list-style-type: none"> • DDRs • Daily mud report (including chemical inventory). • End-of-well fluids report. • MoC documents. • Incident reports. 	

7.7. IMPACT 7 – Discharge of Cement

7.7.1. Hazard

Activities that use cement are:

- Drilling – cement is used on board the MODU to cement the drill casing in place (sealing the annulus); and
- P&A – cement is used for setting abandonment plugs.

Cement is usually mixed as required ('on-the-fly') and hence waste is minimal. See Table 2.7 for the discharge volumes expected while drilling Beehive-1. Bulk dry cement remaining onboard the MODU at the completion of drilling will be left on the MODU for use by the next operator. Failing that, the cement will be mixed with seawater and discharged overboard as a slurry.

7.7.2. Known and Potential Environmental Impacts

Cement discharges, like drill cuttings, can impact the environment through:

- Localised and temporary increased turbidity of the water column;
- Smothering of benthic habitat and fauna; and

- Alteration of benthic substrate.

7.7.3. EMBA

The EMBA for cement discharges is likely to be within the immediate vicinity of the discharge points (e.g., tens of metres to several hundred metres). Receptors that may occur within this EMBA, either as residents or migrants, are:

- Plankton;
- Benthic fauna;
- Benthic habitat (sand substrates);
- Demersal fish; and
- Pelagic fish.

7.7.4. Evaluation of Environmental Impacts

Water column turbidity

Similar to drill cuttings dispersion and settling (see Section 7.6.4), cement discharges from the MODU (i.e., cement hose and equipment flushing) will form a turbid surface plume, where the larger, coarser components of the cement will precipitate. This would be expected to settle on the seabed within a radius of 100-200 m from the MODU. The remaining finer components are rapidly dispersed by ocean currents, aiding dispersion and dilution, and minimising water column turbidity. Although turbidity can decrease the available oxygen and light at the water surface (thereby reducing planktonic photosynthetic activity), the brief discharge periods and small volumes discharges result in only localised and temporary impacts.

Smothering of benthic habitat and fauna/alteration of seabed substrate

The minor volumes of cement that will be discharged at the seabed during cementing of the top hole section will result in localised smothering of benthic habitat and fauna. The discharge of cement on sandy seabed habitat will not result in impacts to sensitive benthic communities and this seabed type is widely represented in the region. A small area of hardened cement around the drill site will provide a surface for colonisation by epifauna that is not readily available in or around the activity, so there will be no net loss of seabed habitat.

Given the mobile nature of the sandy seabed sediments (see Section 5.2.3), any unconsolidated cement on the seabed will rapidly shift and disperse. Should colonising benthic species be present, impacts to them and their habitats will therefore be insignificant.

Toxicity impacts to marine fauna

Cement is considered inert (with the key component Portland cement being mostly calcium silicates, and aluminate and aluminoferrite). Portland cement is classified as non-CHARMable 'E' PLONOR under the OCNS.

While the cementing program has not yet been finalised, cement additives will be of low toxicity (according to OSPAR rankings, in line with drill fluids). As such, these constituents of the cement will have negligible chronic or acute toxicity impacts to benthic fauna or other fauna exposed to the cement.

In summary, cement discharges are small in volume, inert, unlikely to result in permanent smothering of benthic impact and are generally restricted to a highly localised area around the drill site (other than cement fines that rapidly disperse through the water column).

7.7.5. Impact Assessment

Table 7.24 presents the impact assessment for cement discharges.

Table 7.24. Impact assessment for cement discharges

Summary			
Summary of impacts	Localised and temporary turbidity of the water column, smothering of benthic habitat.		
Extent of impacts	Localised – tens to hundreds of metres from the discharge point in the direction of dominant water currents.		
Duration of impacts	Short-term – intermittently during drilling.		
Level of certainty of impacts	HIGH – the impacts associated with cement discharges are well understood.		
Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	Cement discharges are limited to the necessary amount to safely complete the well.		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
No cement discharges	Eliminate	No	EB: Eliminates impacts to benthic communities and the water column. C: Cementing is essential to maintain well integrity and the well cannot be drilled without cement. This is not an option. Ev: Cement discharges are a necessary component of safely completing the well casing. Adopting this measure would pose significant risks to the project.
Skip-and-ship (take cement discharges to shore)	Eliminate	No	EB: No cement discharges to the marine environment. C: Very high cost associated with vessel movements between the MODU and port, and onshore disposal costs. Increased vessel

			<p>movements result in increased fuel use and associated GHG emissions.</p> <p>Ev: Environmental benefit is outweighed by the significant cost to implement this measure, especially given the negligible impact.</p>
No discharge of excess cement powder as a slurry at end of well	Elimination	No	<p>EB: At the end of the drilling program, any dry, unopened cement left over will be left on board for the next operator to use or returned to shore. Open sacks however, cannot be transferred back to vessels for transport, and therefore are mixed into a slurry and discharged overboard if the stock cannot be used, sold or returned to shore (see Table 2.6).</p> <p>C: The design of the piping and the tanks on the MODU is such that the reverse pumping of dry bulks back to marine vessels or to shore is not possible. Therefore, return of excess open dry bulk powders to shore is not usually a feasible option,</p> <p>Ev: The potential environmental impacts are negligible due to the chemical selection process and therefore implementing this measure has negligible benefit. Disposal volumes are minimal due to careful stock management.</p>
Chemical selection process (IMP-07: EPS-01, -02)	Engineering	Yes	<p>EB: Ensures only low-toxicity chemicals are used in the cement system.</p> <p>C: Minor cost.</p> <p>Ev: Environmental benefit outweighs the minor cost to implement this measure.</p>
Cement program (IMP-07: EPS-03, -04)	Administrative	Yes	<p>EB: Ensures cement jobs are conducted in accordance with procedures and processes in order to minimise losses.</p> <p>C: No additional cost.</p> <p>Ev: Environmental benefit outweighs the cost to implement this measure.</p>

Environmental Controls and Performance Measurement

EPO	EPS	Measurement criteria
Only low toxicity cement additives will be used.	(IMP-07: EPS-01) The Cement Engineer ensures that only PLONOR, 'D'/'E' (non-CHARM) or 'Gold'/'Silver' (CHARM) OCNS-rated cement additives are used to minimise ecotoxicity impacts to marine fauna.	The Cement Chemical Inventory verifies that all additives are PLONOR, 'D'/'E' (non-CHARM) or 'Gold'/'Silver' (CHARM) OCNS-rated.
	(IMP-07: EPS-02) Where for technical reasons a cement additive is required that:	MoC documentation verifies that, for products that do not meet IMP-07:EPS-01 , a risk assessment is

	<ul style="list-style-type: none"> Is not rated as PLONOR, 'D'/'E' (non-CHARM) or 'Gold'/'Silver' (CHARM); or Has a substitution warning; or has not been registered with CEFAS (and therefore does not have a rating), <p>A risk assessment will be completed to understand the environmental risk of discharge to sea. This will include:</p> <ul style="list-style-type: none"> A pseudo-ranking using the OCNS process (where possible); Consideration of end fate, volumes and concentrations; and Final approval by EOG of the use of the chemical. 	completed and approved by EOG prior to discharge of the chemical.
Cement losses to the seabed during top hole cementing operations are minimised.	(IMP-07: EPS-03) Cementing will take place in accordance with the Cement Plan.	The Cement Job Report notes details the pumping schedule.
Cement remaining at the completion of drilling is managed so as to avoid or minimise its discharge overboard.	<p>(IMP-07: EPS-04) As far as is practicably reasonable, all remaining cement slurry will be used in the casing job.</p> <p>Where cement cannot be transferred to the next operator at the completion of drilling, it will be mixed with seawater and discharged overboard.</p> <p>(IMP-07: EPS-05) Bulk dry cement will not be discharged overboard (unless in an emergency situation).</p>	<p>Records are available to verify that, in order of preference:</p> <ul style="list-style-type: none"> Effort was made to transfer cement to the next operator, and if that was not possible, then; Effort was made to minimise the inventory of cement on board, and if that was not possible then; Any leftover cement slurry was used in well plugs.
Impact Consequence (residual)		
Negligible		
<p>The impact of cement discharges is assessed as negligible because:</p> <ul style="list-style-type: none"> The discharges will be small in volume and intermittent; and The area of impact extremely small; There is an absence of known sensitive seabed features in the activity area (e.g., shoals, reefs); and The sandy seabed is well represented in the region. 		
Demonstration of ALARP		
<p>A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.</p>		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	

EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	<p>The NT DITT raised concerns regarding the discharge of drill cuttings and muds from the drilling campaign. While the conversation did not relate to cement discharges, the concern is included here for completeness.</p> <p>EOG explained what the potential impacts were to benthic invertebrates and fauna in the water column and pointed the relevant person to the Drilling EP for more detail, which was on public exhibition at the time of the discussion. At the conclusion of the discussion, the relevant person was satisfied that the impacts would be minimal.</p>	
Legislative context	<p>There are no legislative controls regarding offshore cement discharges.</p> <p>In the absence of Australian regulations or guidelines, cement additive selection complies with the North Sea OCNS, which implements the OSPAR Convention.</p>	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed guidelines and codes of practice demonstrates that BPEM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IEPCA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for offshore cement management Section 4.5.8 of the guidelines, which include:</p> <ul style="list-style-type: none"> Volume of cement to be used for each well to be planned to minimise excess bulk at the end of campaign and volumes discharged into the ocean (IMP-07: EPS-04).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding cement management.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	No guidance is provided regarding cement management.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	No guidance is provided regarding cement management.
	AEP CoEP (APPEA 2008)	<p>The EPS developed for this activity meet the code's following objectives for offshore drilling:</p> <ul style="list-style-type: none"> To reduce the risk of release of material into the marine environment to ALARP and to an acceptable level. To reduce the impacts to benthic communities to acceptable levels and to ALARP.

Environmental context	MNES	
	AMPs	This hazard will not intersect nearby AMPs.
	Ramsar wetlands	This hazard will not intersect any Ramsar wetlands.
	TECs	This hazard will not intersect any TECs.

7.8. IMPACT 8 – Routine Discharges – Putrescible Waste

7.8.1. Hazard

The generation of food waste (putrescible waste) from the MODU and support vessel galleys will result in the overboard discharge of this waste. The average volume of putrescible waste

discharged overboard depends on the number of Persons on Board (POB) at any time, and the types of meals prepared.

Based on a MODU that has regularly worked in Australian waters, the typical volume of macerated waste discharged overboard is about 50 grams per person. Based on an assumed maximum POB of:

- MODU – assumed maximum POB for 120, equating to a discharge of ~7 kg/day.
- Support vessels – assumed POB of 30 for two vessels, equating to a discharge of 1.5 kg/day.

This waste is likely to float for a short time and if not consumed by fauna (such as pelagic fish and seabirds) quickly at the sea surface, it will become water-logged and sink through the water column.

NERA (2017) estimates the volume of putrescible waste to be in the order of 1-2 kg (0.001-0.002 m³) per person per day. While this is likely to be an over-estimate, based on the same POB numbers listed above, an estimated 150-300 kg (0.15 – 0.3 m³) of putrescible waste may be generated and discharged overboard daily.

7.8.2. Known and Potential Environmental Impacts

The known and potential environmental impacts of putrescible waste discharges are:

- Temporary and localised increase in the nutrient content of waters surrounding the discharge point; and
- An associated increase in scavenging behaviour of marine fauna and seabirds (at the sea surface or within the water column).

7.8.3. EMBA

The EMBA for putrescible waste discharges is likely to be the top 10 m of the water column and a 100 m radius from the discharge point. This is based on modelling of continuous wastewater discharges undertaken by Woodside for its Torosa South-1 drilling program (in the Scott Reef complex, WA).

In addition to the quality of the receiving waters, receptors that may occur within this EMBA, either as residents or migrants, are:

- Plankton;
- Pelagic fish;
- Marine mammals;
- Marine reptiles; and
- Seabirds.

7.8.4. Evaluation of Environmental Impacts

The overboard discharge of macerated food wastes creates a localised and temporary increase in the nutrient load of near-surface waters. This in turn acts as a food source for scavenging marine fauna and/or seabirds, whose numbers may temporarily increase as a result. The rapid consumption of putrescible waste by scavenging fauna, its physical and microbial breakdown,

together with the absence of habitats nearby sensitive to increased nutrients, ensures that the impacts of such discharges are insignificant and therefore have a negligible impact consequence.

7.8.5. Impact Assessment

Table 7.25 presents the impact assessment for putrescible waste discharges.

Table 7.25. Impact assessment for putrescible waste discharges

Summary			
Summary of impacts	Increase in nutrient content of near-surface waters around the discharge point, which may lead to an increase of scavenging behaviour of pelagic fish and seabirds.		
Extent of impacts	Localised – up to 100 m horizontally and 10 m vertically from the discharge point.		
Duration of impacts	Intermittent and temporary – until the discharge is completely consumed (likely to be several hours).		
Level of certainty of impacts	HIGH – the impacts of putrescible waste discharges on marine fauna are well known.		
Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	Putrescible waste discharges to sea meet legislated requirements such that there are no adverse impacts to biodiversity, ecological integrity or human health.		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Store all putrescible waste onboard for onshore disposal.	Eliminate	No	EB: Eliminates impacts to water quality and scavenging behaviour by marine fauna. C: Additional cost due to onshore disposal, additional fuel usage required to transfer wastes to shore, increased health and safety risk involved with storing organic wastes onboard in a tropical environment. The discharge of macerated putrescible waste (and unmacerated putrescible waste when >12 nm from shore) is permitted by legislation. Ev: Cost of this control measure is grossly disproportionate to the negligible consequence.
GMP (IMP-08: EPS-01).	Engineering	Yes	EB: Reduces probability of garbage being inappropriately discharged to sea, reducing potential impacts to fauna.

			C: Negligible; part of routine MODU and vessel operations. Ev: Benefits of ensuring responsible and compliant garbage handling outweighs negligible cost.
Putrescible waste is treated as per MARPOL Annex V requirements prior to discharge (IMP-08: EPS-02, -03, -04).	Engineering	Yes	EB: Reduces probability of putrescible waste being inappropriately discharged to sea, reducing impacts to water quality and marine fauna. C: Negligible; part of routine MODU and vessel operations. Occasional high costs of replacing the macerator. Ev: Benefits of ensuring responsible and compliant putrescible waste handling outweighs minimal costs.
Environmental induction for MODU and vessel crews (IMP-08: EPS-05).	Administrative	Yes	EB: Reduced likelihood of inappropriate waste disposal to the sea. C: Negligible; part of routine MODU and vessel operations. Ev: Environmental benefits can be achieved with little additional cost.
Environmental Performance Objectives and Measurement			
EPO	EPS	Measurement criteria	
Putrescible waste discharges meet MARPOL Annex V requirements.	(IMP-08: EPS-01) A MARPOL Annex V-compliant GMP is in place (for vessels >100 GRT tonnes or certified to carry 15 persons or more) that sets out the procedures for minimising, collecting, storing, processing and discharging garbage.	A GMP is in place, readily available onboard and kept current.	
	(IMP-08: EPS-02) A macerator is on board the MODU and vessels, functional, in use and set to macerate putrescible waste to a particle size ≤25 mm using to ensure rapid breakdown upon discharge.	PMS records verify that the macerator is functional and regularly maintained or replaced.	
	(IMP-08: EPS-03) Records of food waste disposal to be maintained in a Garbage Record Book.	A Garbage Record Book is in place and verifies waste discharge locations and volumes.	
	(IMP-08: EPS-04) Only macerated putrescible waste (≤25 mm) is discharged overboard (noting that un-macerated putrescible waste is permitted to be discharged as the MODU and support vessels will be >12 nm from shore). Un-macerated putrescible waste is only discharged overboard in the event of macerator malfunction or other emergency.		
	(IMP-08: EPS-05) Waste management and housekeeping requirements are communicated to all MODU and vessel crews to ensure discharges are in accordance with MARPOL Annex V.	MODU and vessel induction includes waste management requirements.	
Impact Consequence (residual)			
Negligible			

The consequence of putrescible waste discharges is assessed as negligible because of:

- The temporary duration of the activity;
- The intermittent nature of the discharge;
- The small discharge volumes;
- Maceration of the waste prior to discharge;
- High dilution and dispersal factor in open waters;
- The long distance from shore;
- Rapid consumption by fauna;
- High biodegradability and low persistence of the waste; and
- The absence of sensitive habitats in the activity area.

Demonstration of ALARP

A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.

Demonstration of Acceptability

Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	No objections or claims have been made by relevant persons with regard to putrescible waste discharges.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Navigation Act 2012</i> (Cth): <ul style="list-style-type: none"> ○ Chapter 4 (Prevention of Pollution). ○ AMSA Marine Order 95 (Marine Pollution Prevention - garbage). • <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> (Cth): <ul style="list-style-type: none"> ○ Section 26F (which implements MARPOL Annex V). 	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS listed in this table meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Section 4.5.1 - organic (food) waste from the kitchen should, at a minimum, be macerated to <25 mm prior to discharge to sea, in compliance with MARPOL Annex V requirements (IMP-08: EPS-02 and -04).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	<p>The EPS listed in this table meet these guidelines for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Environmental monitoring (item 26). The BAT guidelines are met for the activity with regard to monitoring waste streams.

	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>There is no specific guidance regarding putrescible waste discharges.</p> <p>Section 2.3.6.2 (management of waste) of the guideline states that, among other things, waste management and disposal options should be evaluated.</p> <p>Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Other waste waters (item 44). Food waste from the kitchen should, at a minimum, be macerated to acceptable levels and discharged to sea, in compliance with MARPOL requirements (IMP-08: EPS-04).
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> To reduce the volume of wastes produced to ALARP and to an acceptable level.

7.9. IMPACT 9 - Routine Discharges – Sewage and Grey Water

7.9.1. Hazard

The use of ablution, laundry and galley facilities by MODU and support vessel crew will result in the discharge of sewage and grey water. The composition of sewage and grey water (when untreated) may include:

- Particulate matter – such as solids composed of floating, settleable, colloidal and dissolved matter, substances that affect aspects of aesthetics such as ambient water colour, the presence of surface slicks/sheens and odour.
- Chemical contaminants – including:
 - Nutrients (e.g., ammonia, nitrite, nitrate and orthophosphate);
 - Organics (e.g., volatile and semi-volatile organic compounds, oil and grease, phenols, endocrine disrupting compounds); and
 - Inorganics (e.g., hydrogen sulphide, metals and metalloids, surfactants, phthalates, residual chlorine);
- Biological pathogens – including bacteria, viruses, protozoa and parasites.

Total volumes of sewage and grey water typically generated at offshore facilities range between 0.04 and 0.45 m³ per person per day (NERA, 2017). Assuming a POB of 120 on the MODU and 30 on both support vessels (a total of 150 people), this equates to between 6 and 68 m³ of sewage and grey water generated daily.

NERA (2017) states that most large vessels generate 5-15 m³ wastewater per day, the majority of which is grey water (wastewater from showers, laundry, galley and wash basins).

7.9.2. Known and Potential Environmental Impacts

The known and potential environmental impact of treated sewage and grey water discharges is:

- Temporary and localised increase in the nutrient content of surface waters around the MODU and support vessels; and

- An associated increase in scavenging behaviour of marine fauna and seabirds (at the sea surface or in the water column).

7.9.3. EMBA

The EMBA for sewage and grey water discharges associated with MODU and support vessel activities is likely to be the top 10 m of the water column and a 50 m radius from the discharge point. This is based on modelling of continuous wastewater discharges (including treated sewage and greywater) undertaken by Woodside for its Torosa South-1 drilling program (in the Scott Reef complex), which found:

- Rapid horizontal dispersion of discharges occurs due to wind-driven surface water currents;
- Vertical discharge is limited to about the top 10 m of the water column due to the neutrally buoyant nature of the discharge; and
- A concentration of a component within the discharge stream is reduced to 1% of its original concentration at no less than 50 m from the discharge point under any condition (Woodside, 2008).

In addition to the quality of the receiving waters, receptors that may occur within this EMBA, either as residents or migrants, are:

- Plankton;
- Pelagic fish;
- Marine mammals;
- Marine reptiles; and
- Seabirds.

7.9.4. Evaluation of Environmental Impacts

Water quality

Nutrients in sewage, such as phosphorus and nitrogen, may contribute to eutrophication of receiving waters (although usually only still, calm, inland waters), causing algal blooms, which can degrade aquatic habitats by reducing light levels and producing certain toxins, some of which are harmful to marine life and humans. Given the tidal movements and currents in the open oceanic waters of the JBG, eutrophication of receiving waters will not occur. Sewage will be treated through a sewage treatment plant (STP) to a tertiary level, so there are no impacts relating to the release of chemicals and pathogens in untreated sewage.

Grey water can contain a wide variety of pollutant substances at different strengths, including oil and some organic compounds, hydrocarbons, detergents and grease, metals, suspended solids, chemical nutrients, food waste, coliform bacteria and some medical waste. Grey water is treated through the STP, so pollutants will be largely removed from the discharge stream.

The effects of sewage and sullage discharges on the water quality at Scott Reef were monitored for a drill rig operating near the edge of the deep-water lagoon area at South Reef. Monitoring at stations 50 m, 100 m and 200 m downstream of the rig and at five different water depths confirmed that the discharges were rapidly diluted in the upper 10 m water layer and no elevations in water quality monitoring parameters (e.g., total nitrogen, total phosphorous and selected metals) were recorded above background levels at any station (Woodside, 2011).

Treated sewage and grey water discharges will be rapidly diluted in the surface layers of the water column and dispersed by currents. The biological oxygen demand of the treated effluent is unlikely to lead to oxygen depletion of the receiving waters (Black *et al.*, 1994), as it will be treated prior to release. On release, surface water currents will assist with oxygenation of the discharge.

Biological receptors

Plankton forms the basis of all marine ecosystems, and plankton communities have a naturally patchy distribution in both space and time (ITOPF, 2011a). They are known to have naturally high mortality rates (primarily through predation), however in favourable conditions (e.g., supply of nutrients), plankton populations can rapidly increase. Once the favourable conditions cease, plankton populations will collapse and/or return to previous conditions. Plankton populations have evolved to respond to these environmental perturbations by copious production within short generation times (ITOPF, 2011a).

Any potential change in plankton diversity, abundance and composition as a result of treated sewage and grey water discharges is expected to be very low (given the waste stream is treated) and localised (as outlined in the EMBA) and is likely to return to background conditions within tens to a few hundred metres of the discharge location (NERA, 2017). Accordingly, impacts higher up the food chain (e.g., fish, reptiles, birds and cetaceans) are expected to be negligible.

7.9.5. Impact Assessment

Table 7.26 presents the impact assessment for the discharge of treated sewage and grey water.

Table 7.26. Impact assessment for the discharge of treated sewage and grey water

Summary		
Summary of impacts	Reduction in water quality around the discharge point, increase in nutrients.	
Extent of impacts	Localised – up to 50 m horizontally and 10 m vertically from the discharge point.	
Duration of impacts	Temporary – until the discharge is completely diluted (likely to be minutes to hours).	
Level of certainty of impact	HIGH – the impacts of sewage and grey water discharges to water quality are well known.	
Impact decision framework context	Decision type	A - good industry practice required.
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.
Defined acceptable level	Sewage and grey water discharges to sea meet legislated requirements such that there are no adverse impacts to biodiversity, ecological integrity or human health.	
Impact Consequence (inherent)		
Negligible		
Assessment of Proposed Control Measures		

Control measure	Control type	Adopt	Justification
No discharge of treated sewage and grey water at sea.	Eliminate	No	EB: Eliminates biodegradable waste stream that may result in decreased water quality and scavenging behaviour by marine fauna. C: Additional cost of transport to port for onshore disposal, associated increase in emissions (such as GHG) and increased health and safety risk involved with storing organic wastes onboard, particularly in a tropical environment. Discharges are permitted by legislation. Ev: Cost is grossly disproportionate to the negligible consequence associated with the discharges.
Sewage and grey water treatment and discharges are managed in accordance with MARPOL Annex IV (IMP-09: EPS-01, -02, -03, -04)	Engineering	Yes	EB: Reduces potential impacts of inappropriate discharge and ensures compliance with Marine Order 96 and MARPOL requirements as appropriate for vessel class. C: Cost of installing and maintaining STPs can be high, but are part of routine MODU and support vessel operations. Ev: Environmental benefits outweigh the costs.
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Water pollution is avoided by treating sewage and grey water prior to discharge.	(IMP-09: EPS-01) The STPs meet MARPOL standards.	ISPP certificates are valid and verify the installation of MARPOL-approved STPs.	
	(IMP-09: EPS-02) The STPs are maintained in accordance with the MODU and support vessels' PMS.	PMS records confirm that the STPs are maintained to schedule.	
	(IMP-09: EPS-03) All sewage and grey water is treated in the STPs prior to overboard discharge.	No reports of discharge being diverted around the STP in DDRs.	
	(IMP-09: EPS-04) In accordance with Regulation 11 of MARPOL Annex IV (as enacted by Marine Order 96), sewage is comminuted, disinfected and discharged from the support vessels: <ul style="list-style-type: none">When they are >3 nm from the nearest shore.At a moderate rate while proceeding en route at a speed not less than 4 knots. In the event of a STP malfunction or other emergency, untreated sewage and grey water can be discharged (because they are >12 nm from shore when in the operational area).	Records verify that treated sewage is only discharged when the support vessel is >3 nm from shore and at a speed not less than 4 knots (unless the STP has malfunctioned or in an emergency).	
Impact Consequence (residual)			
Negligible			

The consequence of treated sewage and grey water discharges is assessed as negligible because of:

- The temporary and intermittent nature of the discharges;
- The consistent movement of the support vessels;
- Low discharge volumes;
- Treatment of the waste stream prior to discharge;
- High dilution and dispersal factor in open waters;
- The long distance from shore;
- High biodegradability and low persistence of the waste; and
- Absence of sensitive habitats in the activity area.

Demonstration of ALARP

A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.

Demonstration of Acceptability

Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	No objections or claims have been made by relevant persons regarding treated sewage and grey water discharges.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Navigation Act 2012 (Cth)</i>: <ul style="list-style-type: none"> ○ Chapter 4 (Prevention of Pollution). ○ AMSA Marine Order 95 (Marine Pollution Prevention - sewage). • <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983 (Cth)</i>: <ul style="list-style-type: none"> ○ Section 26D (which implements MARPOL Annex IV). 	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed in Section 4.5.1 - offshore discharges (sewage and grey water):</p> <ul style="list-style-type: none"> • Grey and sewage water from showers, toilets, and kitchen facilities should be treated in an appropriate on-site marine sanitary treatment unit (IMP-09: EPS-03). • Sewage units to be in compliance with MARPOL Annex V requirements (IMP-09: EPS-01).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production	There are no guidelines for offshore activities with regard to managing sewage and grey water discharges.

	(European Commission, 2019)	
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>While Section 3.4.5 of the guideline states that the arrangements for sewage and grey water discharges are to be described, there is no specific guidance regarding sewage and grey water discharges.</p> <p>Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Other waste waters (item 44). Grey and black water should be treated in an appropriate on-site marine sanitary treatment unit in compliance with MARPOL (IMP-09: EPS-01, -03).
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> To reduce the volume of wastes produced to ALARP and to an acceptable level.
Environmental context	MNES	
	AMPs	This hazard will not impact the conservation values of the JBG AMP.
	Ramsar wetlands	This hazard will not intersect any Ramsar wetlands.
	TECs	This hazard will not intersect any TECs.
	Nationally threatened and migratory species	This hazard will not have any significant impacts on threatened or migratory species.
	Other matters	
	KEFs	This hazard will not intersect any KEFs.
	NIWs	This hazard will not intersect any NIWs.
	State marine parks	This hazard will not intersect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	None triggered by this hazard.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of Acceptability	<p>EOG considers the impacts from treated sewage discharges to be acceptable because:</p> <ul style="list-style-type: none"> It will adhere to the company's Safety and Environmental Policy; The residual consequence rating is negligible; An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. 7.10. IMPACT 10 - Routine Discharges – Cooling and Brine Water

7.10.1. Hazard

Seawater is used as a heat exchange medium for cooling machinery engines and other equipment on the MODU and support vessels. Seawater is drawn up from the ocean, where it is de-oxygenated and sterilised by electrolysis (by release of chlorine from the salt solution) and then circulated as coolant for various equipment through the heat exchangers (in the process transferring heat from the machinery) and is then discharged to the ocean at depth (not at surface). Upon discharge, it will be warmer than the ambient water temperature and may contain low concentrations of residual biocide and scale inhibitors if they are used to control biofouling and scale formation.

The maximum cooling water discharge rate for the MODU and support vessels that may be used is unknown. Also unknown is the temperature at which the heat exchangers are designed to discharge the cooling water at (though this is generally several degrees Celsius above ambient sea temperature). The volume depends on the equipment being cooled, but for this activity, it is likely to be tens of cubic meters each day.

Brine water (hypersaline water) is created through the desalination process that creates freshwater for drinking, showers, cooking etc. This is achieved through reverse osmosis (RO) or distillation resulting in the discharge of seawater with a slightly elevated salinity (~10-15% higher than seawater). The freshwater produced is then stored in tanks on board. Upon discharge, the concentration of the brine is (based on other modern vessels) likely to range from 44-61 ppm, which is 9-26 ppm higher than seawater salt concentration (35 ppm). Brine concentration is dependent on throughput and plant efficiency.

7.10.2. Known and potential environmental impacts

The known and potential environmental impacts of cooling water and brine discharges are:

- Temporary and very localised increase in sea water temperature, causing thermal stress to marine fauna;
- Temporary and very localised increase in sea surface salinity, potentially causing harm to fauna unable to tolerate higher salinity; and

- Potential toxicity impacts to marine fauna from the ingestion of residual biocide and scale inhibitors.

7.10.3. EMBA

The EMBA for cooling water and brine discharges associated with MODU and vessel activities is likely to be the top 10 m of the water column and a 100 m radius from the discharge point. This is based on modelling of continuous wastewater discharges undertaken by Woodside for its Torosa South-1 drilling program (in the Scott Reef complex) (Woodside, 2008).

In addition to the quality of the receiving waters, receptors that may occur within this EMBA, either as residents or migrants, are:

- Plankton;
- Pelagic fish;
- Marine mammals;
- Marine reptiles; and
- Seabirds.

7.10.4. Evaluation of Environmental Impacts

Temporary and localised increase in seawater temperature

Once in the water column, cooling water will remain in the surface layer, where turbulent mixing and heat transfer with surrounding waters will occur. Prior to reaching background temperatures, the impact of increased seawater temperatures down current of the discharge may result in changes to the physiological processes of marine organisms, such as attraction or avoidance behaviour, stress or potential mortality.

Modelling of continuous waste water discharges (including cooling water) undertaken by Woodside for its Torosa South-1 drilling program in the Scott Reef complex found that discharge water temperature decreases quickly as it mixes with the receiving waters, with the discharge water temperature being less than 1°C above background levels within 100 m (horizontally) of the discharge point, and will be within background levels within 10 m vertically (Woodside, 2008). As such, impacts to most receptors are expected to be negligible even within this mixing zone.

Temporary and localised increase in sea surface salinity

Brine water will sink through the water column where it will be rapidly mixed with receiving waters and be dispersed by ocean currents. Walker and MacComb (1990) found that most marine species are able to tolerate short-term fluctuations in water salinity in the order of 20-30%, and it is expected that most pelagic species passing through a denser saline plume would not suffer adverse impacts. Other than plankton, pelagic species are mobile and would be subject to slightly elevated salinity levels for a very short time as they swim through the 'plume.' As such, impacts to receptors are expected to be negligible.

Potential toxicity impacts

Scale inhibitors and biocide are likely to be used in the heat exchange and desalination process to avoid fouling of pipework. Scale inhibitors are low molecular weight phosphorous compounds that are water-soluble, and only have acute toxicity to marine organisms about two orders of magnitude higher than typically used in the water phase (Black *et al.*, 1994). The biocides typically used in the industry are highly reactive and degrade rapidly and are very soluble in water (Black *et al.*, 1994).

These chemicals are inherently safe at the low dosages used, as they are usually ‘consumed’ in the inhibition process, ensuring there is little or no residual chemical concentration remaining upon discharge and thus have a negligible impact consequence.

7.10.5. Impact Assessment

Table 7.27 presents the impact assessment for the discharge of cooling and brine water.

Table 7.27. Impact assessment for the discharge of cooling and brine water

Summary			
Summary of impacts	Increased sea surface temperature and salinity around the discharge point. Potential toxicity impacts to marine fauna from residual biocide and scale inhibitors.		
Extent of impacts	Localised – up to 100 m horizontally and 10 m vertically from the discharge point.		
Duration of impacts	Temporary – duration of the activity.		
Level of certainty of impact	HIGH – the impacts of sea surface temperature and salinity increases on marine fauna are well known.		
Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	Cooling water and brine discharges to sea meet legislated requirements such that there are no adverse impacts to biodiversity, ecological integrity or human health.		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Store brine onboard prior to discharge onshore.	Elimination	No	EB: Eliminates impacts to the marine environment. C: Very high costs associated with MODU and vessel modifications to enable onboard storage. Ev: Cost outweighs the environmental benefit given the minor inherent consequence.
Low toxicity chemicals (IMP-10: EPS-01).	Substitution	Yes	EB: Reduces potential water quality impacts through use of environmentally suitable chemicals.

			C: Low toxicity chemicals are generally more expensive than higher toxicity chemicals, but not by high margins. Ev: The minimal additional cost is outweighed by the environmental benefits.
Biocide dosing (IMP-10: EPS-02).	Engineering	Yes	EB: Minimises the likelihood of out-of-specification discharges. C: Negligible; part of routine MODU and support vessel operations. E: Environmental benefits can be achieved with negligible additional cost.
Freshwater generation volumes (IMP-10: EPS-03).	Engineering	Yes	EB: Minimises the volume of brine discharges. C: Negligible; part of routine MODU and support vessel operations. E: Environmental benefits can be achieved with negligible additional cost.
PMS (IMP-10: EPS-04).	Engineering	Yes	EB: Minimises the likelihood of out-of-specification discharges. C: Negligible; part of routine MODU and vessel operations. E: Environmental benefits can be achieved with little additional cost.
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Only the minimum required low-toxicity chemicals are used in the cooling and brine water systems.	(IMP-10: EPS-01) Only OCNS ‘Gold’/’Silver’ (CHARM) or ‘D’/’E’ (non-CHARM)-rated chemicals (i.e., low toxicity) are used in the cooling and brine water systems.	Chemical inventories records verify that biocides and scale inhibitors are of low toxicity.	
	(IMP-10: EPS-02) Biocide dosing kept to a minimum in accordance with the equipment manufacturer’s specifications.	PMS data verifies minimum biocide dosage.	
The RO plant and equipment that requires cooling by water is well maintained.	(IMP-10: EPS-03) Freshwater generation will be limited to volumes necessary for operational requirements.	Tank volumes verify minimum requirement for freshwater generation.	
	(IMP-10: EPS-04) Plant and equipment that requires cooling by water is maintained in good working order in accordance with the PMS.	PMS records verify that equipment that requires cooling is well maintained.	
Impact Consequence (residual)			
Negligible			

The consequence of cooling and brine water discharges is assessed as negligible because of the:

- Temporary nature of the activity;
- Support vessels will be constantly moving;
- Low discharge volumes;
- Intermittent nature of the discharge;
- 'Consumption' of the chemicals prior to discharge;
- High dilution and dispersal factor in the open waters of the JBG; and
- Absence of sensitive habitats in the activity area.

Demonstration of ALARP

A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.

Demonstration of Acceptability

Policy compliance	EOG's Safety and Environmental Policy objectives are met through implementation of this EP.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	No objections or claims have been made by relevant persons regarding cooling and brine discharges.	
Legislative context	There are no legislative controls regarding cooling and brine water discharges.	
Industry practice	The consideration of the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for offshore discharges (cooling water and desalination brine) in Section 4.5.3 of the guidelines:</p> <ul style="list-style-type: none"> • Biocide dosing kept to a minimum in accordance with the equipment manufacturer's specifications (IMP-10: EPS-02). • Freshwater generation to be limited to volumes necessary for operational requirements (IMP-10: EPS-03).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There are no guidelines for offshore activities with regard to managing cooling and brine water discharges.
	Health, Safety and Environmental Case Guidelines for Mobile	There is no specific guidance regarding cooling and brine water discharges.

	Offshore Drilling Units (IADC, 2015)	Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Cooling water (items 41 & 42). Antifouling chemical dosing to prevent marine fouling of cooling water systems should be carefully considered and appropriate screens to be fitted to the seawater intake to avoid entrainment and impingement of marine flora and fauna (IMP-10:EPS-02). The cooling water discharge depth should be selected to maximise mixing and cooling of the thermal plume to ensure it is within 3°C of ambient seawater temperature within 100 m of the discharge point. Desalination brine (item 43). Consider mixing desalination brine from the potable water system with cooling water or other effluent streams.
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> To reduce the volume of wastes produced to ALARP and to an acceptable level.
Environmental context	MNES	
	AMPs	This hazard will not impact the conservation values of nearby AMPs.
	Ramsar wetlands	This hazard will not intersect any Ramsar wetlands.
	TECs	This hazard will not intersect any TECs.
	Nationally threatened and migratory species	This hazard will not have any significant impacts on threatened or migratory species.
	Other matters	
	KEFs	This hazard will not intersect any KEFs.
	NIWs	This hazard will not intersect any NIWs.
	State marine parks	This hazard will not impact the conservation values of nearby AMPs.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	None triggered by this hazard.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of Acceptability	<p>EOG considers the impacts from cooling water and brine discharges to be acceptable because:</p> <ul style="list-style-type: none"> It will adhere to the company's Safety and Environmental Policy; 	

	<ul style="list-style-type: none"> • The residual consequence rating is negligible; • An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. • Relevant legislation and industry best practice will be complied with; • Cooling water and brine discharges will not have long-term or significant impacts on MNES; • The management of cooling water and brine discharges is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; • The management of cooling water and brine discharges is not inconsistent with the aims of relevant marine reserve management plans; and • The management of cooling water and brine discharges is not inconsistent with ESD principles.

7.11. IMPACT 11 – Routine Discharges – Bilge Water and Deck Drainage

7.11.1. Hazard

Bilge tanks on the MODU and support vessels receive fluids from closed deck drainage and machinery spaces that may contain contaminants such as oil, detergents, solvents, chemicals and solid waste. An oily water separator (OWS) then treats this water prior to discharge overboard in order to meet the MARPOL requirement that no greater than 15 ppm oil-in-water (OIW) is discharged overboard. The volume of these discharges is small and intermittent (as required, based on bilge tank storage levels). Where no OWS is present, these fluids are retained in tanks for onshore disposal.

MODU and support vessel decks that are not bunded and drain directly to the sea may lead to the discharge of contaminated water, caused by ocean spray and rain ('green water') or deck washing activities capturing trace quantities of contaminants such as oil, grease and detergents, or a chemical (e.g., hydraulic fluids, lubricating oils) or hydrocarbon spill or leak washed overboard.

7.11.2. Known and Potential Environmental Impacts

The known and potential environmental impacts of the discharge of bilge water and deck drainage are:

- Temporary and localised reduction of surface water quality around the discharge point; and
- Acute toxicity to marine fauna through ingestion of contaminated water in a small mixing zone.

7.11.3. EMBA

The EMBA for bilge and deck water discharges is likely to be the top 10 m of the water column and less than a 100 m radius from the discharge point. This is based on modelling of continuous

wastewater discharges undertaken by Woodside for its Torosa South-1 drilling program in the Scott Reef complex (Woodside, 2008).

In addition to the quality of the receiving waters, receptors that may occur within this EMBA, either as residents or migrants, are:

- Plankton;
- Pelagic fish;
- Marine mammals;
- Marine reptiles; and
- Seabirds.

7.11.4. Evaluation of Environmental Impacts

Temporary and localised reduction of surface water quality

Small volumes and low concentrations of oily water (<15 ppm) from bilge discharges and traces of chemicals or hydrocarbons discharged to the ocean through open deck drainage may temporarily reduce water quality.

Given the absence of sensitive habitat types in the water column of the EMBA for these discharges, the greatest risk will be to plankton and pelagic fish. These discharges will be rapidly diluted, dispersed and biodegraded to undetectable levels within a very small mixing zone (as per the EMBA) and thus have a negligible impact consequence.

Potential toxicity impacts

While small volumes and low concentrations of oily water from bilge discharges may temporarily reduce water quality, such discharges are not expected to induce acute or chronic toxicity impacts to marine fauna or plankton through ingestion or absorption through the skin.

In the event a OWS malfunction and discharge of off-specification water, toxicity impacts may occur to marine fauna swimming through the discharge, though this is only likely in a highly localised mixing zone (meaning that few individuals would be exposed), meaning it will have a negligible impact consequence.

7.11.5. Impact Assessment

Table 7.28 presents the impact assessment for the discharge of bilge water and deck drainage.

Table 7.28. Impact assessment for the discharge of bilge water and deck drainage

Summary	
Summary of impacts	Increased sea surface temperature and salinity around the discharge point. Potential toxicity impacts to marine fauna from residual biocide and scale inhibitors.
Extent of impacts	Localised – up to 100 m horizontally and 10 m vertically from the discharge point.
Duration of impacts	Intermittent during MODU and vessel operations.
Level of certainty of impacts	HIGH – the impacts of oily water discharges to the ocean are well known.

Impact decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	Bilge water discharges and deck drainage meet legislated discharge requirements such that there are no adverse impacts to biodiversity, ecological integrity or human health.		
Impact Consequence (inherent)			
Negligible			
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Store treated bilge onboard for disposal onshore.	Eliminate	No	EB: Eliminates oily water discharge, thereby eliminating potential impacts to water quality and marine fauna. C: Significant cost of re-designing and configuring storage space on the MODU and vessels. Ev: Cost to implement control measures outweighs the benefit given the negligible inherent consequence.
Oily water treatment system (IMP-11: EPS-01, -03, -04).	Engineering	Yes	EB: Oily water is treated prior to discharge, thereby reducing impacts to water quality and marine fauna. Complies with Marine Order 91 and MARPOL requirements. C: Significant cost to install, but it is legislated requirement and part of routine MODU and support vessel operations. Ev: Benefits to the marine environment outweigh the costs.
Maintain bilge water systems (IMP-11: EPS-02).	Engineering	Yes	EB: Efficient OWS ensures MARPOL requirements are met and impacts to water quality and marine fauna are minimised. C: Minor costs to maintain the OWS and part of routine MODU and support vessel operations. Ev: Benefits to the marine environment outweigh the costs.
Bundling of hydrocarbons and chemical storage areas (IMP-11: EPS-07, -08)	Engineering	Yes	EB: Reduces the likelihood that a spill will be discharged overboard. C: Minor equipment installation and maintenance costs. Ev: Environmental benefit outweighs the costs.

SMPEP (IMP-11: EPS-05, -09, -10).	Administrative	Yes	<p>EB: Documented and coordinated response to a spill reduces the area of impact to the marine environment.</p> <p>C: Minor equipment installation cost and maintenance costs, minor costs in time of training crew.</p> <p>Ev: Environmental benefit outweighs the costs.</p>
Use of non-toxic, biodegradable deck cleaning product selection (IMP-11: EPS-06).	Administrative	Yes	<p>EB: Avoids toxic water discharges.</p> <p>C: Minor additional cost of environmentally acceptable deck cleaning products.</p> <p>Ev: Environmental benefits outweigh the minimal cost.</p>
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
No discharge of bilge water unless compliant with MARPOL Annex I requirements.	(IMP-11: EPS-01) For vessels >400 gross tonnes, all bilge water passes through a MARPOL-compliant OWS set to limit OIW to <15 ppm prior to overboard discharge.	IOPP certificate is current.	
	(IMP-11: EPS-02) The OWS is maintained in accordance with the PMS.	PMS records verify that the OWS is maintained to schedule.	
	(IMP-11: EPS-03) The OWS is calibrated in accordance with the PMS to ensure the 15 ppm OIW limit is met.	PMS records verify that the OWS is calibrated to schedule.	
	(IMP-11: EPS-04) The residual oil from the OWS is pumped to tanks and disposed of onshore.	The Oil Record Book verifies that waste oil is transferred to shore.	
Level 1 spills (<10 m ³) of oil or oily water overboard are rapidly responded to by the MODU and support vessel contractor.	(IMP-11: EPS-05) The MODU or vessel-specific SMPEPs are implemented in the event of an overboard spill of hydrocarbons or chemicals.	Incident report verifies that the SMPEP was implemented.	
Planned open deck discharges are non-toxic.	(IMP-11: EPS-06) Deck cleaning detergents are biodegradable.	Safety Data Sheets (SDS) verify that deck cleaning agents are biodegradable.	
Hydrocarbon or chemical spills to deck are prevented from being discharged overboard.	(IMP-11: EPS-07) Hydrocarbon and chemical storage areas (process areas) are bunded and drain to the bilge tank.	Site inspections (and associated completed checklists) verify that bunding is in place and piping and instrumentation diagrams (P&IDs) verify that they drain to the bilge tank.	
	(IMP-11: EPS-08) Portable bunds and/or drip trays are used to collect spills or leaks from equipment that is not contained	Site inspections (and associated completed checklists) verify that portable	

	within a permanently bunded area (non-process areas).	bunds and/or drip trays are used in non-process areas as required.
Personnel are competent in spill response and have appropriate resources to respond to a spill.	(IMP-11: EPS-09) The MODU and support vessel crews are competent in spill response and have appropriate response resources in order to prevent or minimise hydrocarbon or chemical spills discharging overboard.	Training records verify that MODU and support vessel crews receive spill response training.
	(IMP-11: EPS-10) Fully stocked SMPEP response kits and scupper plugs or equivalent drainage control measures are readily available and used in the event of a spill to deck to prevent or minimise discharge overboard.	Site inspections (and associated completed checklists) verify that fully stocked spill response kits and scupper plugs (or equivalent) are available on deck in high-risk locations.
		Review of incident reports indicate that the spills of hydrocarbons or chemicals to deck are cleaned up.
Impact Consequence (residual)		
Negligible		
<p>The consequence of bilge water discharges and deck drainage is assessed as negligible because the:</p> <ul style="list-style-type: none"> • Activity is of a temporary nature; • Support vessels will be constantly moving; • Discharges will be low volume and intermittent; • High energy offshore waters of the JBG will aid in dilution of discharges; and • EMBA does not contain sensitive habitats. 		
Demonstration of ALARP		
<p>A 'negligible' residual impact consequence is considered to be ALARP and a 'lower order' impact. The adopted controls and associated EPS have lowered the impact to the point that any additional or alternative control measures either fail to lower the impact any further or are grossly disproportionate to the residual impact consequence.</p>		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual impact consequence is negligible, which is considered acceptable.	
External context	There have been no objections or claims raised by relevant persons regarding bilge water discharges and deck drainage.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Navigation Act 2012</i> (Cth): <ul style="list-style-type: none"> ◦ Chapter 4 (Prevention of Pollution). ◦ AMSA Marine Order 91 (Marine Pollution Prevention - oil). • <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> (Cth): 	

	<ul style="list-style-type: none"> ○ Part II (Prevention of pollution by oil). ○ Part III (Prevention of pollution by noxious substances). 	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for offshore discharges (deck drainage and bilge water) in Section 4.5.2 of the guidelines:</p> <ul style="list-style-type: none"> • MODU and vessels must have an IOPP Certificate (for vessels >400 gross tonnes) and equipped with MARPOL/IMO-compliant oil/water treatment system (as appropriate to vessel class) (IMP-11: EPS-01). • Hydrocarbon and chemical storage areas are to be bunded with no residues/spills permitted to enter the overboard drainage system unless it first goes through a closed drainage treatment system (IMP-11: EPS-07, -08). • MODU and vessels to maintain an Oil Record Book (applicable to vessels >400 gross tonnes), including the discharge of dirty ballast or cleaning water (IMP-11: EPS-04). • Discharge into the sea of oil or oily mixtures is prohibited except when the OIW of the discharge without dilution does not exceed 15 ppm (IMP-11:EPS-01, -03). • Contaminated deck drainage and bilge water to be contained and treated prior to discharge. If treatment is not possible, these waters should be contained and shipped to shore for disposal. • Extracted hydrocarbons from OWS to be stored in suitable containers and transported to shore for treatment and/or disposal by a certified waste oil disposal contractor (IMP-11: EPS-04).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	<p>The EPS listed in this table meet these guidelines for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Management of drain water (item 24). The BAT are met for MODU and vessel operations with regard to ensuring deck coaming is in place, maintaining a chemical inventory, implementing an inspection, maintenance and repair schedule and ensuring that personnel are trained in the use of spill kits (IMP-11: EPS-09).
	Health, Safety and Environmental Case Guidelines for Mobile	While Section 3.2.3.2 (ballast and bilge systems for jack-ups) of the guideline states that bilges be kept clean, there is no specific guidance regarding discharges.

	Offshore Drilling Units (IADC, 2015)	Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	Guidelines met with regard to: <ul style="list-style-type: none"> Other waste waters (item 44). Bilge waters from machinery spaces in the MODU and vessels should be routed to the closed drain system or contained and treated before discharge to meet MARPOL requirements (IMP-11: EPS-01). Deck drainage water should be routed to separate drainage systems. This includes drainage water from process and non-process areas. All process areas should be banded to ensure that drainage water flows into the closed drainage system (IMP-11: EPS-07).
	AEP CoEP (APPEA 2008)	The EPS for this activity meet the code's following objectives for offshore drilling operations: <ul style="list-style-type: none"> To reduce the risk of release of substances into the marine environment to ALARP and to an acceptable level.
Environmental context	MNES	
	AMPs	This hazard will not impact the conservation values of nearby AMPs.
	Ramsar wetlands	This hazard will not intersect any Ramsar wetlands.
	TECs	This hazard will not intersect any TECs.
	Nationally threatened and migratory species	This hazard will not have any significant impacts on threatened or migratory species.
	Other matters	
	KEFs	This hazard will not intersect any KEFs.
	NIW	This hazard will not intersect any NIWs.
	State marine parks	This hazard will not intersect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	None triggered by this hazard.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of Acceptability	EOG considers the impact from bilge water discharges and deck drainage to be acceptable because: <ul style="list-style-type: none"> It will adhere to the company's Safety and Environmental Policy; The residual consequence rating is negligible; 	

	<ul style="list-style-type: none"> • An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. • Relevant legislation and industry best practice will be complied with; • Bilge water discharges and deck drainage will not have long-term or significant impacts on MNES; • The management of bilge water discharges and deck drainage is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; • The management of bilge water discharges and deck drainage is not inconsistent with the aims of relevant marine reserve management plans; and • The management of bilge water discharges and deck drainage is not inconsistent with ESD principles.

8. Environmental Risk Assessment – Unplanned Events

This chapter presents the environmental risk assessment (ERA) for the environmental risks identified for the activity using the methodology described in Chapter 6, as required under Regulations 13(5)(6) of the OPGGS(E).

This chapter presents the control measures, EPO, EPS and measurement criteria required to manage (i.e., avoid, minimise or mitigate) the identified risks. The definitions for these terms as listed at the start of Chapter 7 apply here. A summary of the risk rankings for each hazard identified and assessed in this chapter is presented in Table 8.1.

Table 8.1. Summary of environmental risk rankings

Identifier	Hazard	Inherent	Residual
1	Accidental release of waste overboard	Low	Negligible
2	Vessel collision with megafauna	Low	Negligible
3	Introduction and establishment of IMS	High	Medium
4	Interference with other marine users	Medium	Low
5	Unplanned discharge of drilling muds, chemicals or hydrocarbons	Negligible	Negligible
6	MDO release	Negligible	Negligible
7	Loss of Well Control		
	- Benthic fauna	High	Medium
	- Macroalgal and seagrass	High	Medium
	- Coral	High	Medium
	- Mangroves and saltmarsh	High	Medium
	- Sandy beaches	High	Medium
	- Rocky shores	Low	Low
	- Plankton	Low	Low
	- Fish	Low	Low
	- Marine mammals	High	Medium
	- Marine reptiles	High	Medium
	- Seabirds and shorebirds	High	Medium
	- Commercial fisheries	High	Medium
	- Protected areas	High	Medium
8	Hydrocarbon spill response activities		
	- Source control; relief well	Negligible	Negligible
	- Monitor and evaluate	Negligible	Negligible
	- Dispersant application	Low	Low
	- Nearshore containment and recovery	Negligible	Negligible

Identifier	Hazard	Inherent	Residual
	- Shoreline protection and deflection	Negligible	Negligible
	- Shoreline assessment and clean up	Low	Low
	- Oiled wildlife response	Low	Low
	- Waste management	Negligible	Negligible
	Faunal receptors		
	- Fauna disturbance	Negligible	Negligible
	- Fauna injury	Negligible	Negligible
	- Fauna death	Negligible	Negligible

The following sections assess the environmental risks associated with the activity, and Figure 8.1 presents a simplified pictorial representation of these risks.

Figure 8.1. Simplified pictorial representation of the risks associated with the drilling activity

8.1 RISK 1 – Accidental Release of Waste Overboard

8.1.1 Hazard

The handling and storage of materials and waste on board the MODU and support vessels has the potential to result in accidental overboard disposal of hazardous and non-hazardous materials, waste, chemicals and fuel, creating marine debris and pollution.

Small quantities of hazardous and non-hazardous materials are used in routine operations and maintenance and waste is created, and then handled and stored on the MODU or support vessels. In the normal course of operations, solid and liquid hazardous and non-hazardous materials and wastes will be stored until it is disposed of via port facilities for disposal, reuse or recycling at licensed onshore facilities. However, accidental releases to sea are a possibility, especially in poor weather and ocean conditions when items may roll off or be blown off the deck.

The following non-hazardous materials and wastes will be disposed of to shore, but have the potential to be accidentally dropped or disposed overboard due to poor waste management (e.g., overfull bins), strong winds, high seas or crane operator error:

- Paper and cardboard;
- Wooden pallets;
- Scrap steel, metal and aluminium;
- Glass;
- Foam (e.g., ear plugs); and
- Plastics (e.g., hard hats).

The following hazardous materials (defined as a substance or object that exhibits hazardous characteristics, is no longer fit for its intended use and requires disposal, and as outlined in Annex III to the Basel Convention, may be toxic, flammable, explosive and poisonous) may be used and waste generated through the use of consumable products and will be disposed to shore, but may be accidentally dropped or disposed overboard or could be lost as a result of hose connection failure, overfilling of tanks or emergency disconnection of hoses:

- Hydrocarbons, hydraulic oils and lubricants;
- Hydrocarbon-contaminated materials (e.g., oily rags, pipe dope, oil filters);
- Batteries, empty paint cans, aerosol cans and fluorescent tubes;
- Contaminated personal protective equipment (PPE);
- Laboratory wastes (such as acids and solvents); and
- Larger dropped objects (that may be hazardous or non-hazardous) may be lost to the sea through accidents (e.g., crane operations) include:
 - Sea containers;
 - Towed equipment;
 - ROV; and
 - Entire skip bins/crates.

8.1.2 Potential Environmental Risks

The risks of the release of hazardous and non-hazardous materials and waste to the ocean are:

- Marine pollution (litter and a temporary and localised reduction in water quality);
- Acute toxicity to marine fauna through ingestion or absorption;
- Injury and entanglement of individual animals (such as seabirds and seals); and
- Localised (and normally temporary) smothering or pollution of benthic habitats.

8.1.3 EMBA

The EMBA for the accidental disposal of hazardous and non-hazardous materials and waste is likely to extend for kilometres from the release site (as buoyant waste drifts with currents) or localised for non-buoyant items that sink and settle on the seabed.

Receptors susceptible to waste that may occur within this EMBA, either as residents or migrants, are:

- Benthic fauna;
- Benthic habitat (sandy seabed);
- Pelagic fauna (fish, cetaceans and turtles); and
- Seabirds.

The EPBC Act-listed species documented as being negatively impacted by the ingestion of, or entanglement in, harmful marine debris (and known to occur in the operational area or EMBA) are:

- The six turtle species (loggerhead, green, flatback, olive ridley, leatherback and hawksbill);
- Sawfish and river sharks;
- Seabirds (Australian noddies, shearwaters); and
- Cetaceans (Australian snubfin dolphin, Australian humpback dolphin, PBW).

8.1.4 Evaluation of Environmental Risks

Non-hazardous Materials and Waste

If discharged overboard, non-hazardous wastes can cause smothering of benthic habitats as well as injury or death to marine fauna or seabirds through ingestion or entanglement (e.g., plastics caught around the necks of turtles or ingested by seabirds and fish). For example, the TSSC (2015d) reports that there have been 104 records of cetaceans in Australian waters impacted by plastic debris through entanglement or ingestion since 1998 (humpback whales being the main species).

Marine fauna including cetaceans, turtles and seabirds can be severely injured or die from entanglement in marine debris, causing restricted mobility, starvation, infection, amputation, drowning and smothering (DoEE, 2018). Seabirds entangled in plastic packing straps or other marine debris may lose their ability to move quickly through the water, reducing their ability to catch prey and avoid predators, or they may suffer constricted circulation, leading to asphyxiation and death. In marine mammals and turtles, this debris may lead to infection or the amputation of flippers, tails or flukes (DoEE, 2018). Plastics have been implicated in the deaths of a number of marine species including marine mammals and turtles, due to ingestion.

The following turtles may be at risk from waste at sea:

- Green turtle – foraging BIA is overlapped by the operational area. They generally feed in shallow waters far from the operational area, so their risk of ingesting waste (such as plastics) is low given their distance of their preferred habitats from Beehive-1.
- Flatback turtle – inter-nesting BIA is overlapped by the operational area. Their foraging BIA is about 90 km from the operational area, but because adults consume soft-bodied invertebrates, they may be at risk of ingesting plastic wastes floating in the ocean. This risk is low given the distance of the foraging BIA from the operational area.
- Olive ridley turtle – foraging BIA is overlapped by the operational area. Although this species forages primarily at the seabed, they also consume soft-bodied invertebrates and therefore may be at risk of ingesting plastic wastes floating in the ocean. This risk is moderate given the foraging BIA overlaps the operational area.

If dropped objects such as skip bins are not retrievable (e.g., by crane), these items may permanently smother small areas of seabed (tens of square metres), resulting in the loss of benthic habitat. However, as with most subsea infrastructure, the items themselves are likely to become colonised by benthic fauna over time (e.g., sponges and corals) and become a focal area for sea life, so the net environmental impact is likely to be neutral. The benthic habitats in this EMBA are broadly similar to those elsewhere in the region (e.g., extensive sandy seabed, see Section 5.4.1), so impacts to small areas of seabed will not result in the long-term loss of benthic habitat or species diversity or abundance. Seabed substrates can rapidly recover from temporary and localised impacts.

Hazardous Materials and Waste

Hazardous materials and wastes released to the sea cause pollution and contamination, with either direct or indirect effects on marine organisms. For example, chemical or hydrocarbon spills can (depending on the volume released) impact marine life from plankton to pelagic fish communities, causing physiological damage through ingestion or absorption through the skin. Impacts from an accidental release would be limited to the immediate area surrounding the release, prior to the dilution of the chemical with the surrounding seawater. In an open ocean environment such as the JBG, it is expected that any minor release would be rapidly diluted and dispersed, and thus temporary and localised. The absence of particularly sensitive seabed habitats and the widespread nature of the sandy seabed present in the activity area further limits the extent of potential impacts.

Solid hazardous materials, such as paint cans containing paint residue, batteries and so forth, would settle on the seabed if dropped overboard. Over time, this may result in the leaching of hazardous materials to the seabed, which is likely to result in a small area of substrate becoming toxic and unsuitable for colonisation by benthic fauna. The benthic habitats of the activity area are broadly similar to those elsewhere in the region (e.g., extensive sandy seabed), so impacts to very small areas of seabed will not result in the long-term loss of benthic habitat or species diversity or abundance.

All hazardous waste will be safely transported offshore in suitable receptacles and disposed of at appropriately licensed facilities, by licenced contractors, so impacts such as illegal dumping or disposal to an unauthorised onshore landfill that is not lined are highly unlikely to result from the activity.

The conservation advice for the humpback whale (TSSC, 2015c) lists entanglement from marine debris as a threat to the species. Marine debris includes plastic garbage such as bags, bottles, ropes, derelict fishing gear and non-biodegradable floating materials lost or disposed of at sea.

There have been 104 records of cetaceans in Australian waters impacted by plastic debris through entanglement or ingestion since 1998. The vast majority (92.2%) of cetacean incidents relate to entanglement (TSSC, 2015c), and humpback whales dominated the available records, with around 48 entanglement incidents recorded. An assessment of the entanglement management actions against the activity is provided in Table 8.2. Though the relevant management actions target the commercial fishing industry, the guiding principle of the management action has been applied to the activity.

Table 8.2. Assessment of the relevant management actions of the Approved Conservation Advice for the Humpback Whale

Management Action	Assessment
<i>Reducing commercial fishing entanglement</i>	
Commonwealth and state governments with the pot and set net fishing industries to develop and implement codes of conduct to minimise interactions between commercial fishers and humpback whales.	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with these management actions.
Investigate alternative fishing techniques and technologies to reduce the risk of entanglement.	

TSSC (2015c).

The Threat Abatement Plan for the Impacts of Marine Debris on the Vertebrate Wildlife of Australia's Coasts and Oceans (DoEE, 2018) lists specific management actions and objectives. Given that the activity has the potential (albeit low) to contribute to marine debris, an assessment of the management actions and objectives has been provided in Table 8.3.

Table 8.3. Assessment of the objectives and management actions of the Threat Abatement Plan for the Impacts of Marine Debris on the Vertebrate Wildlife of Australia's Coasts and Oceans

Objective and associated management actions	Assessment
<i>1. Contribute to long-term prevention of the incidence of marine debris</i>	
Establish a threat abatement plan (TAP) team to coordinate actions for the life of the TAP.	The activity will not have any impacts on this management action.
Limit the amount of single-use plastic material lost to the environment in Australia.	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with these management actions.
Encourage development of a circular economy in Australia.	The activity will not have any impacts on this management action.
Encourage innovation in recovery and waste treatment technologies.	The activity will not have any impacts on this management action.
Improve management of abandoned, lost and discarded fishing gear.	The activity will not have any impacts on this management action.
Improve shipping waste management.	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a

Objective and associated management actions	Assessment
	manner that is not inconsistent with these management actions.
2. Understand the scale of impacts from marine plastic and microplastic on key species, ecological communities and locations	
Update the list of marine debris impacted EPBC Act-listed vertebrate species as scientific evidence is published.	The activity will not have any impacts on this management action.
Monitor relevant ecological research to determine if further EPBC Act-listed ecological communities are threatened by marine debris.	The activity will not have any impacts on this management action.
Identify locations where aggregations of debris intersect with the temporal and spatial distribution of EPBC Act-listed species, especially during vulnerable life stages (e.g., whale and turtle migrations).	The activity will not have any impacts on this management action.
Build understanding related to plastic and microplastic pollution.	The activity will not have any impacts on this management action.
Survey marine plastic pollution in the Southern Ocean, sub-Antarctic islands and other high value offshore island environments.	The activity will not have any impacts on this management action.
Determine the relevance of microplastics to the Australian Government's Science and Research Priorities and corresponding Practical Research Challenges.	The activity will not have any impacts on this management action.
3. Remove existing marine debris	
Support beach-based clean-up efforts.	The activity will not have any impacts on this management action.
Improve the effectiveness of Australian Government grants in relation to marine debris outcomes.	The activity will not have any impacts on this management action.
Remove derelict fishing gear from Australia's oceans and coasts.	The activity will not have any impacts on this management action.
Develop understanding of the potential for biological breakdown of plastic to prevent it entering the marine environment or aid its removal.	The activity will not have any impacts on this management action.
4. Monitor the quantities, origins, types and hazardous chemical contaminants of marine debris, and assess the effectiveness of management arrangements for reducing marine debris	
Continue collection of data in long-term beach surveys.	The activity will not have any impacts on this management action.
Develop a nationally consistent monitoring system for land-based plastic pollution.	The activity will not have any impacts on this management action.
Maintain a national database for long-term marine debris beach survey data and promote	The activity will not have any impacts on this management action.

Objective and associated management actions	Assessment
standard methods for collecting and ongoing monitoring of beach clean-up debris.	
Assess the effectiveness of Australia's product stewardship and waste management in reducing the levels of plastics entering the marine environment.	The activity will not have any impacts on this management action.
Continue to monitor persistent organic pollutant contamination using plastic resin pellets from Australian beaches.	The activity will not have any impacts on this management action.
Regularly assess mean surface plastic loads and associated hazardous chemical contaminants across Australian jurisdictions and territories.	The activity will not have any impacts on this management action.
Enhance collection of data related to ghost net retrievals from Commonwealth waters across northern Australia.	The activity will not have any impacts on this management action.
Improve understanding of the impact and origins of ghost nets.	The activity will not have any impacts on this management action.
5. Increase public understanding of the causes and impacts of harmful marine debris, including microplastic and hazardous chemical contaminants, to bring about behaviour change.	
Raise the profile of marine debris impacts on marine vertebrate species, especially EPBC Act-listed threatened species.	The activity will not have any impacts on this management action.
Improve public communication about consumer waste and litter.	The activity will not have any impacts on this management action.

DoE (2018).

Marine debris is identified as a threat to turtles in the Recovery Plan for Marine Turtles 2017-2027 (DoEE, 2017c). As such, an assessment of relevant interim recovery objectives and targets with the activity is provided in Table 8.4.

Table 8.4. Assessment of the relevant interim recovery objectives and targets of the Recovery Plan for Marine Turtles 2017-2027 with the activity

Interim Objective or Target	Assessment
<i>Interim Objective 3: Anthropogenic threats are demonstrably minimised.</i>	
Target 3.1: Robust and adaptive management regimes that lead to a reduction in anthropogenic threats to marine turtles and their habitats are in place	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this recovery target.
Target 3.2: Threat mitigation strategies are supported by high quality information	The activity will not have any impacts on this recovery target.

DoEE (2017c).

Habitat degradation and modification (e.g., through the presence of marine debris following accidental discharge) are a listed threat in the Sawfish and River Sharks Multispecies Recovery Plan

(DoE, 2015a). Threatened species addressed in this plan that are relevant to the activity include the largetooth sawfish, green sawfish, dwarf sawfish and the northern river shark. An assessment of the relevant objectives and management actions of the Sawfish and River Sharks Multispecies Recovery Plan (DoE, 2015a) with the activity is provided in Table 8.5.

Table 8.5. Assessment of the relevant recovery objectives and relevant actions of the Sawfish and River Sharks Multispecies Recovery Plan with the activity

Objective or management action	Assessment
<i>Objective 5: Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species</i>	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this objective.
Action 5a. Ensure all future developments will not significantly impact upon sawfish and river shark habitats critical to the survival of the species or impede upon the migration of individual sawfish or river sharks.	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this management action.
Action 5b. Determine the effect of river and estuarine barriers on the movements of sawfish and river sharks and undertake an audit of barriers to establish whether removal or modification is feasible to allow for the riverine migration of sawfish and river sharks.	The activity will not have any impacts on this management action.
Action 5c. Identify risks to important sawfish and river shark habitat and measures needed to reduce those risks.	The activity will not have any impacts on this management action.
Action 5d. Implement measures to reduce adverse impacts of habitat degradation and/or modification	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this management action.
<i>Objective 6: Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life.</i>	The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this objective.
Action 6a. Assess the impacts of marine debris including ghost nets, fishing gear and plastics on sawfish and river shark species.	The activity will not have any impacts on this management action.
Action 6b. Partner with marine debris organisations to support initiatives that reduce marine debris likely to impact on sawfish and river sharks.	The activity will not have any impacts on this management action. The EPS listed in Table 8.6 will reduce the likelihood of accidental discharge of wastes to the ocean to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this management action.

DoE (2015c).

8.1.5 Risk Assessment

Table 8.6 presents the risk assessment for the accidental disposal of hazardous and non-hazardous materials and waste.

Table 8.6. Risk assessment for the accidental release of waste overboard

Summary			
Summary of risk	Marine pollution (litter and a temporary and localised reduction in water quality), injury and entanglement of individual animals (such as seabirds, cetaceans, turtles and sawfish) and smothering or pollution of benthic habitats.		
Extent of risks	Non-buoyant waste may sink to the seabed near where it was lost. Buoyant waste may float long distances with ocean currents and winds.		
Duration of risks	Short-term to long-term, depending on the type of waste and location.		
Level of certainty of risk	HIGH – the effects of inappropriate waste discharges are well known.		
Risk decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	No unplanned release of hazardous or non-hazardous solid waste or materials.		
Risk Assessment (inherent)			
Likelihood		Consequence	Risk rating
Occasional		Minor	Low
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Transfer wastes from the MODU and support vessels to shore-based facilities during the activity.	Eliminate	No	EB: Reduces likelihood of accidental waste disposal through transfer to shore-based facilities, noting that there are risks of waste overboard during the transfer process. C: High costs for the use of a dedicated vessel to take waste, which also results in additional routine vessel impacts and risks. Ev: Cost to implement is grossly disproportionate to the benefit given the low inherent risk rating.
MODU and vessel wastes are managed in accordance with the GMP (RSK-01: EPS-01, -02, -03, -04).	Engineering	Yes	EB: Reduces the likelihood of waste being discharged to sea, reducing potential impacts to marine fauna and water quality. C: Negligible; it is a standard MARPOL requirement. Minor administrative cost to produce documents and educate personnel.

			Ev: Benefits of ensuring responsible waste management outweighs the negligible cost.
Recover accidentally discharged solid wastes or lost equipment (if safe to do so) (RSK-01: EPS-05)	Administrative	Yes	EB: Removes debris from the environment, thereby reducing impacts to marine fauna and water quality. C: Medium to high costs dependent on the duration of down-time to retrieve materials. Ev: Environmental benefit of recovering marine debris outweighs the costs.
Handling and storage procedures (RSK-01: EPS-06, -12, -13, -14, -15).	Administrative	Yes	EB: Reduces the likelihood that materials will be accidentally lost overboard. C: Negligible; it is a standard maritime requirement. Minor administrative cost to produce documents and educate personnel. Ev: Environmental benefit outweighs the negligible costs.
Dropped object prevention procedure (RSK-01: EPS-07, -09, -10, -11).	Engineering	Yes	EB: Reduces the likelihood that materials will be accidentally lost overboard and impacts on marine fauna and water quality. C: Negligible; it is a standard maritime requirement. Minor administrative cost to produce documents and roll out to personnel. Ev: Environmental benefit outweighs the negligible costs.
PMS (RSK-01: EPS-08)	Engineering	Yes	EB: The maintenance of lifting equipment minimises the likelihood of dropped objects. C: Negligible; it is a standard maritime requirement. Minor administrative costs associated with maintaining the PMS. Ev: Environmental benefit outweighs the negligible costs.
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
No unplanned release of hazardous or non-hazardous solid wastes or materials.	(RSK-01: EPS-01) A MARPOL Annex V-compliant GMP is in place for the vessel (if >100 gross tonnes or certified to carry 15 persons or more) that sets out the procedures for minimising, collecting, storing, processing and discharging garbage.		A GMP is in place, readily available on board and kept current.
	(RSK-01: EPS-02) Waste is stored, handled and disposed of in accordance with the GMP. This includes measures including:		GMP is available and current.
			Inspections verify that waste is stored and handled according to its waste classification.

	<ul style="list-style-type: none"> No discharge of general operational or maintenance wastes or plastics or plastic products of any kind. Waste containers are covered with secure lids to prevent solid wastes from blowing overboard. All solid wastes are stored in designated areas before being sent ashore for recycling, disposal or treatment. Any liquid waste storage on deck must have at least one barrier to minimise the risk of spills to deck entering the ocean. This can include containment lips on deck (primary bunding) and/or secondary containment measures (bunding, containment pallet, transport packs, absorbent pad barriers) in place. Correct segregation of solid and hazardous wastes. 	<p>Inspections verify that waste receptacles are properly located, sized, labelled, covered and secured for the waste they hold.</p> <p>A licensed shore-based waste contract is in place for the management of onshore waste transport and disposal.</p>
	(RSK-01: EPS-03) MODU and vessel crews and visitors are inducted into waste management procedures to ensure they understand how to implement the GMP.	Induction and attendance records verify that all crew members are inducted.
	(RSK-01: EPS-04) Waste types and volumes are tracked and logged.	Waste manifest is available and current.
	(RSK-01: EPS-05) Solid waste that is accidentally discharged overboard is recovered if reasonably practicable.	Incident records are available to verify that credible and realistic attempts to retrieve the materials lost overboard were made.
	(RSK-01: EPS-06) A chemical locker is available, bunded and used for the storage of all greases and non-bulk chemicals (i.e., those not in tote tanks) so as to prevent discharge overboard.	Site inspection verifies that greases and chemicals are stored in a chemical locker.
	(RSK-01: EPS-07) Large bulky items are securely fastened to or stored on the deck to prevent loss to sea.	A completed pre-departure inspection checklist verifies that bulky goods are securely sea-fastened.
Avoid objects being dropped overboard	(RSK-01: EPS-08) The MODU and vessel PMS are implemented to ensure that lifting equipment remains in certification and fit for use at all times to minimise the risk of dropped objects.	PMS records verify that lifting equipment is maintained to schedule and in accordance with Original Equipment Manufacturer (OEM) requirements.
	(RSK-01: EPS-09) The crane handling and transfer procedure is in place and implemented by crane operators (and others, such as dogmen) to prevent dropped objects.	Completed handling and transfer procedure checklist, permit to work (PTW) and/or risk assessments verify that the procedure is implemented prior to each transfer.

	(RSK-01: EPS-10) Crane operators are trained to be competent in the handling and transfer procedure to prevent dropped objects.	Training records verify that crane operators are trained in the loading and unloading procedure.
	(RSK-01: EPS-11) Visual inspection of lifting gear is undertaken every quarter by a qualified competent person (e.g., maritime officer) and lifting gear is tested regularly in line with the MODU and vessel PMS.	Inspection of PMS records and Lifting Register verifies that inspections and testing have been conducted to schedule.
Chemicals and hydrocarbons are stored and transferred in a manner that prevents bulk release.	(RSK-01: EPS-12) All hydrocarbons and chemicals are stored within secure receptacles within bunded areas or dedicated chemical lockers that drain to bilge tanks.	Visual inspection verifies that hydrocarbons and chemicals are stored within secure receptacles within bunded areas or dedicated chemical lockers that drain to bilge tanks.
	(RSK-01: EPS-13) MODU and vessel PMS is implemented to ensure the integrity of chemical and hydrocarbon storage areas and transfer systems are maintained in good order.	Vessel PMS records verify that chemical and hydrocarbon storage areas and transfer systems (e.g., bunds, tanks, pumps and hydraulic hoses) are maintained to schedule and in accordance with OEM requirements.
	(RSK-01: EPS-14) Where hydrocarbons and chemicals are stored within open draining decks, receptacles are stored on/in temporary bunds.	Visual inspection verifies that where hydrocarbons and chemicals are stored within open draining decks, receptacles are stored on/in temporary bunds.
	(RSK-01: EPS-15) Crane transfers of bulk chemicals and hydrocarbons are undertaken in accordance with the vessel contractor lifting and loading procedure, or equivalent, and under a PTW.	PTW records verify that crane transfers of bulk chemicals and hydrocarbons are undertaken in accordance with the procedure.
Risk Assessment (residual)		
Likelihood	Consequence	Risk rating
Rare	Minor	Negligible
<p>The risk of accidental discharge of waste to the ocean is assessed as negligible because:</p> <ul style="list-style-type: none"> Volumes of waste generated will be small due to the nature of the activity; and Implementation of the control measures reduces the likelihood to accidental discharge of waste to the ocean to ALARP. 		
Demonstration of ALARP		
<p>A 'negligible' residual risk rating is considered to be ALARP and a 'lower order' risk. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.</p>		

Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 9 outlines the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual risk is negligible, which is considered acceptable.	
External context	No objections or claims have been raised by relevant persons regarding accidental release of wastes to the ocean.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Navigation Act 2012 (Cth)</i>: <ul style="list-style-type: none"> ○ Chapter 4 (Prevention of Pollution). ○ Marine Orders Part 94 (Marine pollution prevention – packaged harmful substances). ○ Marine Orders Part 95 (Marine pollution prevention – garbage). • <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983 (Cth)</i>: <ul style="list-style-type: none"> ○ Part III (Prevention of pollution by noxious substances). ○ Part IIIA (Prevention of pollution by packaged harmful substances). ○ Part IIIC (Prevention of pollution by garbage). 	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this activity are in line with the management measures listed for hazardous waste and non-hazardous waste discharges in Sections 4.6.2 and 4.6.3 of the guidelines, which include:</p> <ul style="list-style-type: none"> • Segregating hazardous and non-hazardous wastes prior to disposal (RSK-01: EPS-01). • Managing hazardous waste in accordance with their SDS and tracking it to final destination. • Not deliberately discharging waste overboard.
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	<p>The EPS listed in this table meet these guidelines for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Risk management for handling and storage of chemicals (item 19). The BAT are met for the activity with regard to implementing chemical transfer procedures and ensuring chemicals are stored in separate, labelled containers (RSK-01: EPS-12, -14, -15).
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>The EPS developed for this activity meet the following requirements.</p> <ul style="list-style-type: none"> • Section 2.3.6.2 (management of waste) of the guideline states that regulatory requirements should be identified, waste tracking methods be developed and that waste minimisation opportunities should be identified.

		<ul style="list-style-type: none"> Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Waste management (items 46). Materials should be segregated offshore and shipped to shore for reuse, recycling or disposal. A waste management plan should be developed and contain a mechanism allowing waste consignments to be tracked (RSK-01: EPS-01). Hazardous materials management (item 72). Principles relate to the selection of chemicals with the lowest environmental and health risks.
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling activities:</p> <ul style="list-style-type: none"> To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level (All EPS for RSK-01).
	Waste management-specific	
	Guidelines for the Development of GMPs (IMO, 2012)	The MODU and vessels' GMPs are developed in accordance with these guidelines (RSK-01: EPS-01) .
	International Dangerous Goods Maritime Code (IMO, 2014)	The storage and handling of dangerous goods on the vessels is managed in accordance with this code (RSK-01: EPS-02, -06, -12, -14) .
Environmental context	MNES	
	AMPs	<p>The unplanned discharge of solid or hazardous waste is highly unlikely to intersect nearby AMPs.</p> <p>The North Marine Parks Network Management Plan 2018 (DNP, 2018a) identifies marine debris as a threat to the AMP network. The EPS listed in this table aim to minimise the generation of marine debris and potential for accidental discharge and are aligned with the strategies outlined in the plan.</p>
	Ramsar wetlands	The unplanned discharge of solid or hazardous waste is highly unlikely to reach Ramsar wetlands.
	TECs	The unplanned discharge of solid or hazardous waste is highly unlikely to reach any TECs.
	Nationally threatened and migratory species	The unplanned discharge of solid or hazardous waste is highly unlikely to have any impacts on threatened or migratory species.

	Other matters	
	KEFs	The unplanned discharge of solid or hazardous waste will not affect any KEFs.
	NIWs	The unplanned discharge of solid or hazardous waste is highly unlikely to reach any NIWs.
	State marine parks	The unplanned discharge of solid or hazardous waste is highly unlikely to reach any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	Assessments of the activity against the following species have been undertaken and presented earlier, and the control measures adopted ensure the activity will be conducted in a manner that is not inconsistent with each plan: <ul style="list-style-type: none">• The conservation advice for humpback whales (TSSC, 2015b) - Table 8.2.• Threat Abatement Plan for the Impacts of Marine Debris on Vertebrate Wildlife of Australia’s coasts and oceans (DoEE, 2018) - Table 8.3.• Recovery Plan for Marine Turtles 2017-2017 (DoEE, 2017c) - Table 8.4.• The Sawfish and River Shark Multispecies Recovery Plan (DoE, 2015c) - Table 8.5.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	EOG considers the risk of accidental discharge of waste to the ocean to be acceptable because: <ul style="list-style-type: none">• It will adhere to the company’s Safety & Environmental Policy;• The residual risk rating is negligible;• An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons has been considered and incorporated into the design of the activity;• Relevant legislation and industry best practice will be complied with;• Accidentally discharged wastes will not have long-term or significant impacts on MNES;• The management of wastes is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species;• The management of wastes is not inconsistent with the aims of relevant marine reserve management plans; and• The management of wastes is not inconsistent with ESD principles.	
Environmental Monitoring		
<ul style="list-style-type: none">• Waste tracking.		

Record Keeping	
<ul style="list-style-type: none"> Contractor pre-qualification reports. GMPs. Garbage Record Books. Crew induction and attendance records. 	<ul style="list-style-type: none"> Inspection records/checklists. Shore-based waste contract. Incident reports.

8.2 RISK 2 – Vessel Collision with Megafauna

8.2.1 Hazard

The movement of the drilling support vessels throughout the operational area on a 24-hr basis has the potential to result in collision with megafauna, this being marine mammals (whales, dolphins, dugong), whale sharks and turtles.

The MODU legs will not present a strike hazard to megafauna as they are stationary and readily detected and avoided by megafauna. In petroleum production provinces around Australia, marine mammals such as whales, dolphins and seals swim around platform jackets without any apparent risk of injury.

8.2.2 Potential Environmental Risks

The risks of vessel strike with megafauna are:

- Injury; and
- Death.

8.2.3 EMBA

The EMBA for vessel strike with megafauna is the immediate area around the support vessel.

8.2.4 Evaluation of Environmental Risks

Cetaceans

Cetaceans are naturally inquisitive marine mammals that are often attracted to offshore vessels, and dolphins commonly ‘bow ride’ with offshore vessels. The reaction of whales to the approach of a vessel is quite variable. Some species remain motionless when in the vicinity of a vessel while others are known to be curious and often approach ships that have stopped or are slow moving, although they generally do not approach, and sometimes avoid, faster moving ships (Richardson et al., 1995).

Peel et al (2016) reviewed vessel strike data (2000-2015) for marine species in Australian waters and identified the following:

- Whales including the humpback, pygmy blue, fin, Bryde’s, pygmy, sperm, and pygmy sperm were identified as having interacted with vessels. The humpback whale exhibited the highest incidence of interaction. A number of these species may migrate through the waters of the activity area (see Section 5.4.5).
- Dolphins including the Australian humpback, common bottlenose and Risso’s dolphin species were also identified as interacting with vessels. The common bottlenose dolphin exhibited the highest incidence of interaction. A number of these species may reside in or pass through the waters of the activity area (see Section 5.4.5).
- All turtle species present in Australian waters are identified as interacting with vessels. The green and loggerhead species exhibited the highest incident of

interaction. The presence of turtles in the activity area and EMBA is considered likely (see Section 5.4.6).

Collisions between vessels and cetaceans occur more frequently where high vessel traffic and cetacean habitat coincide (WDCS, 2006). There have been recorded instances of cetacean deaths in Australian waters (e.g., a Bryde's whale in Bass Strait in 1992), though the data indicates this is more likely to be associated with container ships and fast ferries (WDCS, 2006). Some cetacean species, such as humpback whales, can detect and change course to avoid a vessel (WDCS, 2006). The Australian National Marine Safety Committee (NMSC) reports that during 2009, there was one report of a vessel collision with an animal (species not defined) (NMSC, 2010).

The DoE (2015b) reports that there were two blue whale strandings in the Bonney Upwelling (western Victoria) with suspected ship strike injuries visible. When the vessels are stationary or slow moving, the risk of collision with cetaceans is extremely low, as the vessel sizes and underwater noise 'footprint' will alert cetaceans to its presence and thus elicit avoidance. Laist et al (2001) identifies that larger vessels moving in excess of 10 knots may cause fatal or severe injuries to cetaceans with the most severe injuries caused by vessels travelling faster than 14 knots. When the support vessels are operating within the operational area, they will be travelling very slowly or will be stationary, so the risk associated with fast moving vessels is eliminated for this activity.

The Conservation Management Plan for the Blue Whale (DoE, 2015b) lists 'vessel disturbance in the form of collisions' to be a threat that may inhibit the recovery of the species. An assessment of the relevant management actions listed in the Conservation Management Plan against the activity is provided in Table 8.7.

Table 8.7. Assessment of relevant management actions of the Conservation Management Plan for the Blue Whale with the activity

Management Action	Assessment
<i>Relevant Interim Recovery Objectives</i>	
4. Anthropogenic threats are demonstrably minimised.	Vessel disturbance in the form of collision is a threat to blue whales. The EPS listed in Table 8.13 will reduce the likelihood of vessel strike with blue whales to ALARP. Therefore, the activity will be managed in a manner that is not inconsistent with this interim recovery objective.
<i>Relevant Interim Recovery Objective Targets</i>	
Target 4.1: robust and adaptive management regimes leading to a reduction in anthropogenic threats to Australian blue whales are in place.	The EPS listed in Table 8.13 represent a robust and adaptive management regime for the activity with regard to blue whales. This results in a significant reduction in anthropogenic threats generated by the activity on blue whales. Therefore, the activity will be managed in a manner that is not inconsistent with this interim objective target.
Target 4.2: management decisions are supported by high quality information and high priority research projects identified in this plan are achieved or underway.	The information presented throughout this section and the subsequent EIA presented in Table 8.13 is based on high quality information, scientific literature and research projects. This in turn has informed the management decisions relevant to the activity. Therefore, the activity will be managed in a manner that is not inconsistent with this interim objective target.

Management Action	Assessment
<i>Relevant Action Areas</i>	
A.4. Minimising vessel collisions	The control measures adopted and associated EPS listed in Table 8.13 will reduce the likelihood of vessel strike with blue whales to ALARP. With control measures implemented, the activity will be managed in a manner that is not inconsistent with this management action.
<i>Relevant Actions</i>	
2. Ensure all vessel strike incidents are reported in the National Ship Strike Database.	Reporting of vessel strike incidents has been adopted for this activity and an appropriate EPS developed in Table 8.13. Therefore, the activity will be consistent with this action.
3. Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented.	This section of the EP provides an assessment of vessel strike risk and EPS have been adopted for the activity in Table 8.13. Therefore, the activity will be consistent with this action.

DoE (2015b).

The Approved Conservation Advices for the Sei Whale (TSSC, 2015b) and the Fin Whale (TSSC, 2015c) list vessel strike as a threat with a minor consequence rating. An assessment of the listed management actions with the activity is provided in Table 8.8.

Table 8.8. Assessment of relevant management actions of the Approved Conservation Advice for the Sei Whale and Fin Whale with the activity

Management Action	Assessment
Ensure all vessel strike incidents are reported in the National Vessel Strike Database.	Reporting of vessel strike incidents has been adopted as a control measure for this activity and an appropriate EPS developed in Table 8.13. Therefore, the activity will be consistent with this action.

TSSC (2015b;c).

The Approved Conservation Advice for the Humpback Whale (TSSC, 2015a) lists vessel strike as a threat to the species. An assessment of the listed management actions with the activity is provided in Table 8.9.

Table 8.9. Assessment of relevant management actions of the Approved Conservation Advice for the Humpback Whale with the activity

Management Action	Assessment
Maximise the likelihood that all vessel strike incidents are reported in the National Ship Strike Database. All cetaceans are protected in Commonwealth waters and, the EPBC Act requires that all collisions with whales in Commonwealth waters are reported. Vessel collisions can be submitted to the National Ship Strike Database at https://data.marinemammals.gov.au/report/shipstrike	Reporting of vessel strike incidents has been adopted for this activity as a control measure with an appropriate EPS developed in Table 8.13. Therefore, the activity will be consistent with this action.

Management Action	Assessment
Ensure the risk of vessel strike on humpback whales is considered when assessing actions that increase vessel traffic in areas where humpback whales occur and, if required appropriate mitigation measures are implemented to reduce the risk of vessel strike.	This section of the EP provides an assessment of vessel strike risk and EPS have been adopted for the activity in Table 8.13. Therefore, the activity will be consistent with this action.

TSSC (2015a).

There is a CMP in place for the southern right whale, but given it is unlikely to occur in the activity area, an assessment of the activity against this plan is not presented.

Table 8.10 provides an assessment of the objectives and relevant management actions of the National Strategy for Reducing Vessel Strike on Cetaceans and Other Marine Megafauna (DoEE, 2017a) with the activity.

Table 8.10. Assessment of the objectives and relevant management actions of the National Strategy for Reducing Vessel Strike on Cetaceans and Other Marine Megafauna with the activity

Relevant Objectives and Management Actions	Assessment
<i>Relevant objectives</i>	
Reduce the likelihood and severity of megafauna vessel collision.	The adopted EPS listed in Table 8.12 are aligned with best-practice mitigation measures, which will reduce the likelihood of vessel strike with megafauna to ALARP. Therefore, the activity will be consistent with this objective.
Identify and adopt best-practice mitigation measures and emerging technologies, and encourage the development of new mitigation measures.	
<i>Management actions</i>	
Develop a mitigation measures toolkit that provides guidance to stakeholders and managers on what measures are most suited to specific locations, species and vessel types.	The adopted EPS listed in Table 8.12 will reduce the likelihood of vessel strike with cetaceans to ALARP. Therefore, the activity will be consistent with these actions.
Develop and implement vessel strike management plans which identify appropriate mitigation measures in locations where the relative risk of vessel strike is higher, as determined by a risk assessment.	
Adaptive management principles, including the use of regular reviews are used during the implementation of mitigation measures.	

DoEE (2017a).

Turtles

The operational EMBA overlaps the following turtle BIAs (Figure 7.2):

- Green turtle – foraging;
- Flatback turtle – inter-nesting; and
- Olive Ridley turtle – foraging.

When these turtles are migrating through or foraging in the operational area, they may be at risk of colliding with support vessels when they surface to breathe and rest. However, only a small portion of their time is spent at the surface, as they typically spend more than 90% of their time underwater (Lutcavage and Lutz, 1997; Hochscheid *et al.*, 2010).

The Recovery Plan for Marine Turtles in Australia lists vessel strike as a threat to marine turtles (DoEE, 2017c). Table 8.11 presents an assessment of the relevant objectives and targets of the Recovery Plan for Marine Turtles in Australia with the activity.

Table 8.11. Assessment of the relevant interim recovery objectives and targets of the Recovery Plan for Marine Turtles 2017-2027 with the activity

Interim Objective or Target	Assessment
<i>Interim Objective 3: Anthropogenic threats are demonstrably minimised.</i>	
Target 3.1: Robust and adaptive management regimes that lead to a reduction in anthropogenic threats to marine turtles and their habitats are in place	The EPS listed in Table 8.12 will reduce the likelihood of vessel strike with cetaceans to ALARP and ensure the activity is conducted in a manner that is not inconsistent with this recovery target.
Target 3.2: Threat mitigation strategies are supported by high quality information	The activity will not have any impacts on this recovery target.

DoEE (2017c).

Whale sharks

The whale shark may occur in the operational area and are known to seasonally aggregate in shallow tropical waters off the North West Cape in WA in March and April (DCCEEW, 2022b). Given there is little spatial overlap between this species' known migration routes, and it's unlikely to be a temporal overlap with the drilling window, vessel collisions with whale sharks and the support vessels has a low risk of occurring.

Nevertheless, whale sharks do spend considerable time close to the surface. Whale sharks tagged off the WA coast (Wilson *et al.*, 2006; Gleiss *et al.*, 2013) spent approximately 25% of their time less than 2 m from the sea surface, which increases their vulnerability to vessel strike (DoEE, 2017b).

The Approved Conservation Advice (TSSC, 2015d) notes that the threat to the recovery of the species includes strikes from vessels.

Table 8.12. Assessment of the relevant conservation actions of the Conservation Advice for whale sharks with the activity

Interim Objective or Target	Assessment
Minimise offshore developments and transit time of large vessels in areas close to marine features likely to correlate with whale shark aggregations (Ningaloo Reef, Christmas Island and the Coral Sea) and along the northward migration route that follows the northern WA coastline along the 200 m isobath.	The activity is 300 km from the whale shark BIA, 1,700 km from known aggregation areas (Ningaloo Reef) and 450 km south of the 200 m isobath. The EPS listed in Table 8.13 will reduce the likelihood of vessel strike with whale sharks to ALARP.
Assess the impacts of offshore installations and associated environmental changes (light spill, chronic noise, changed water temperature, localised nutrient	The EIA presented in Chapter 7 of the EP indicates the emissions and discharges associated with this activity will have a negligible impact on marine fauna.

Interim Objective or Target	Assessment
levels) on whale sharks and mitigation options for these impacts.	
Conduct further research into the impacts of boat strike on whale sharks to determine the significance of the threat. Consider possible mitigation actions (collision avoidance systems) if required.	The activity will have no impacts on this research priority

TSSC (2015).

8.2.5 Risk Assessment

Table 8.13 presents the risk assessment for vessel collision or entanglement with megafauna.

Table 8.13. Risk assessment for vessel collision with megafauna

Summary			
Summary of risks	Injury or death of megafauna.		
Extent of risks	Localised – limited to individuals coming into contact with a support vessel.		
Duration of risks	Temporary (if individual animal dies or has a minor injury) to long-term (if there is a serious injury).		
Level of certainty of risk	HIGH – injury may result in the reduced ability to swim and forage. Serious injury may result in death.		
Risk decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	No collision with megafauna.		
Risk Assessment (inherent)			
Likelihood	Consequence	Risk rating	
Occasional	Minor	Low	
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Eliminate the use of support vessels.	Eliminate	No	EB: Eliminates the potential collision hazard. C: The activity could not proceed. Ev: The use of support vessels is the only way in which the activity can proceed. The cost of not using them is the cost of not fulfilling exploration obligations associated with the exploration permit and potential future lost hydrocarbon production.

No night-time/low visibility operations.	Eliminate	No	<p>EB: Reduces the likelihood of collision with megafauna.</p> <p>C: Doubles the length of time required to complete the activity and subsequent costs, resulting in increased impacts and risks in other areas such as routine discharges, greater collision risk due to additional time spent on-water, etc).</p> <p>Ev: Cost outweighs the environmental benefit given the low residual risk to marine megafauna populations.</p>
Restrict support vessel speed to no greater than 6 knots in the activity area.	Administrative	No	<p>EB: Reduces the risk of collision with megafauna.</p> <p>C: In the event of an emergency, the support vessels may need to travel at speeds >6 knots. There may be a human health or safety cost of not being able to do so.</p> <p>Ev: Preventing vessels from travelling at speed in the event of an emergency is not commensurate with the negligible risk rating for this hazard.</p>
Dedicated marine fauna observer (MFO) onboard the support vessels.	Administrative	No	<p>EB: Improves the ability to spot megafauna by allowing vessel Masters to focus on navigation duties, thereby reducing the risk of collision.</p> <p>C: Tens of thousands of dollars over the duration of the drilling program, increasing if sourcing MFOs and/or logistics issues means that MFOs cannot be sourced in time for the scheduled start date.</p> <p>Ev: The cost of dedicated MFOs on the support vessels is grossly disproportionate to the negligible residual risk associated with this hazard and in light of the low likelihood of high numbers of megafauna in the operational area.</p>
Australian National Guidelines for Whale and Dolphin Watching (2017) (giving effect to the 'interacting with cetaceans and whale watching' in EPBC Regulations Part 8) (RSK-02: EPS-01).	Administrative	Yes	<p>EB: Observation for megafauna reduces likelihood for potential collision or entanglement through directing the Vessel Master to slow down or move away to avoid megafauna.</p> <p>C: No additional cost for vessel crew to implement this control measure.</p> <p>Ev: Environmental benefits outweigh the costs.</p>
Environmental induction (RSK-02: EPS-02).	Administrative	Yes	<p>EB: Ensures vessel personnel are aware of obligations, which in turn reduces the risk of interactions with megafauna.</p> <p>C: Negligible; it is a standard on-water requirement. Minor administrative cost to prepare induction and present to crew.</p> <p>E: Environmental benefit outweighs cost.</p>

Notification and reporting of collisions with megafauna (RSK-02: EPS-03, -04).	Administrative	Yes	EB: Reduces risk of physical impacts to cetaceans from the activity vessels. C: No additional costs. Ev: Environmental benefit can be achieved without costs.
Environmental Controls and Performance Measurement			
EPO	EPS		Measurement criteria
No collision with megafauna.	(RSK-02: EPS-01) Through constant bridge watch, vessels comply with the <i>Australian National Guidelines for Whale and Dolphin Watching for Vessels</i> (DoEE, 2017b) when working within the activity area. This means: <ul style="list-style-type: none">• Caution zone (300 m either side of whales and 150 m either side of dolphins) – vessels must operate at no wake speed in this zone.• No approach zone (100 m either side of whales and 50 m either side of dolphins) – vessels should not enter this zone and should not wait in front of the direction of travel or an animal or pod/group.• Do not encourage bow riding.• If animals are bow riding, do not change course or speed suddenly.• If there is a need to stop, reduce speed gradually.• Recording all interactions.		Daily operations reports note marine megafauna interactions.
	(RSK-03: EPS-02) Vessel crew has completed an environmental induction covering the above-listed requirements for vessel and megafauna interactions.		Induction and attendance records verify that all crews have completed an environmental induction.
Vessel strike is reported to regulatory authorities.	(RSK-02: EPS-03) Vessel strike causing injury to or death of a cetacean is reported to the DCCEEW via the online National Ship Strike Database (https://data.marinemammals.gov.au/report/shipstrike) within 72 hours of the incident.		Electronic record of report submittal is available.
	(RSK-02: EPS-04) Injured megafauna is reported to the Wildcare Helpline on (08) 9474 9055 (for cetaceans travelling towards WA) or the Marine Wild Watch Hotline on 1800 453 941 (for cetaceans travelling towards the NT) as soon as possible. No attempts to disentangle megafauna should be made by vessel crew.		Incident report is available within the OMS.
Risk Assessment (residual)			
Likelihood	Consequence		Risk rating
Rare	Minor		Negligible

The risk of vessel strike with megafauna is assessed as negligible because:

- The activity is temporary in nature;
- The movement of the drilling support vessels throughout the operational area on a 24-hr basis and
- Implementation of the EPS will reduce the likelihood of vessel collision or entanglement with megafauna to ALARP.

Demonstration of ALARP

A 'negligible' residual risk rating is considered to be ALARP and a 'lower order' risk. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.

Demonstration of Acceptability

Policy compliance	EOG's Safety & Environmental Policy objectives are met.	
EMS compliance	Chapter 9 outlines the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual risk is negligible, which is considered acceptable.	
External context	No objections or claims have been raised by relevant persons regarding vessel strike with megafauna.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>EPBC Act 1999</i> (Cth): <ul style="list-style-type: none"> ○ Section 199 (failing to notify taking of listed species or listed ecological community). • <i>EPBC Regulations 2000</i> (Cth): <ul style="list-style-type: none"> ○ Part 8 (Interacting with cetaceans and whale watching). ○ AMSA Marine Notice 2016/15 – Minimising the risk of collisions with cetaceans. 	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this activity are in line with the management measures listed for collision with marine fauna in Section 4.7.5 of the guidelines:</p> <ul style="list-style-type: none"> • Monitoring for the presence and movement of large cetaceans and pinnipeds so that avoidance can be taken when marine fauna is observed to be on a collision course with vessels (RSK-02: EPS-01).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There are no guidelines for offshore activities with regard to minimising the risk of collisions with megafauna.

	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	There is no specific guidance regarding minimising the risk of megafauna collisions. Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	There are no guidelines regarding minimising the risk of vessel strike or entanglement with megafauna.
	AEP CoEP (APPEA 2008)	The EPS for this activity meet the code's following objectives for offshore drilling operations: <ul style="list-style-type: none"> To reduce the risks to the abundance, diversity, geographical spread and productivity of marine species to ALARP and to an acceptable level (all RSK-02 EPS).
	Megafauna collision-specific	
	The Australian Guidelines for Whale and Dolphin Watching (DoEE, 2017b)	The EPS listed in this table are aligned with the requirements of these guidelines (RSK-02: EPS-01).
	National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (DoEE, 2017a).	The EPS listed in this table are aligned with objective 3 of this strategy, which is to reduce the likelihood and severity of megafauna vessel collisions (RSK-02: EPS-01).
Environmental context	MNES	
	AMPs	The risk of collisions with megafauna will not have any effect on nearby AMPs.
	Ramsar wetlands	The risk of collisions with megafauna will not have any effect on Ramsar wetlands.
	TECs	The risk of collisions with megafauna will not have any effect on TECs.
	Nationally threatened and migratory species	<p>The low speed or stationary nature of the support vessels, along with the temporary nature of the activity, makes it unlikely that vessel strike with megafauna will occur.</p> <p>This section provides an assessment of the relevant management actions of the:</p> <ul style="list-style-type: none"> Conservation Management Plan for the Blue Whale (DoE, 2015b); Approved Conservation Advice for the Sei Whale (TSSC, 2015b); Approved Conservation Advice for the Fin Whale (TSSC, 2015c); Conservation advice for the humpback whale (TSSC, 2015a);

		<ul style="list-style-type: none"> Recovery Plan for Marine Turtles in Australia, DoEE, 2017c); and National Strategy for Reducing Vessel Strike on Cetaceans and Other Marine Megafauna (DoEE, 2017a). <p>The EPS adopted for the activity will reduce the likelihood of vessel collision or entanglement to ALARP, thereby enabling the activity to be conducted in a manner that is not inconsistent with these plans.</p>
	Other matters	
	KEFs	The risk of collisions with megafauna will not have any effect on KEFs.
	NIWs	The risk of collisions with megafauna will not have any effect on NIWs.
	State marine parks	The risk of collisions with megafauna will not have any effect on state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Vessel collisions are listed as a threat to cetaceans in the:</p> <ul style="list-style-type: none"> Conservation Management Plan for the Blue Whale (DoE, 2015b); Conservation advice for the sei whale (TSSC, 2015b); Conservation advice for the fin whale (TSSC, 2015c); and Conservation advice for the humpback whale (TSSC, 2015a). <p>The EPS listed in this table aim to minimise the risk of vessel strike with megafauna. This section provides an assessment of the activity against the management actions relevant to vessel strike and demonstrate that the activity will be managed in a manner such that it is not inconsistent with the relevant management actions of these plans.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Defined acceptable level	<p>EOG considers the risks of collision and entanglement with megafauna to be acceptable because:</p> <ul style="list-style-type: none"> It will adhere to the company's Safety & Environmental Policy; The residual risk rating is negligible; An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. Input from engagement with relevant persons has been considered and incorporated into the design of the activity; Relevant legislation and industry best practice will be complied with; Collisions with megafauna will not have long-term or significant impacts on MNES; 	

	<ul style="list-style-type: none"> Control measures in place to prevent collisions with megafauna are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; Control measures in place to prevent collisions with megafauna are not inconsistent with the aims of relevant marine reserve management plans; and The control measures are not inconsistent with ESD principles.
Environmental Monitoring	
	<ul style="list-style-type: none"> Constant bridge watch on support vessels.
Record Keeping	
	<ul style="list-style-type: none"> Vessel crew induction presentation and attendance records. Megafauna sighting records. Incident reports.

8.3 RISK 3 – Introduction and Establishment of Invasive Marine Species

8.3.1 Hazard

The DAWR (2018) defines marine pests (referred to in this EP as invasive marine species, IMS) as:

- Non-native marine plants or animals that harm Australia's marine environment, social amenity or industries that use the marine environment, or have the potential to do so if they were to be introduced, established (that is, forming self-sustaining populations) or spread in Australia's marine environment.

The following activities have the potential to result in the introduction of IMS in the activity area:

- Discharge of ballast water from the support vessels and MODU hull containing foreign species; and
- Translocation of foreign species through biofouling on support vessel hulls and niches (e.g., thruster tunnels, sea chests) and the MODU hull and legs.

Biofouling is the accumulation of aquatic microorganisms, algae, plants and animals on vessel hulls and submerged surfaces. More than 250 non-indigenous marine species have established in Australian waters, with research indicating that biofouling has been responsible for more foreign marine introductions than ballast water (DAWR, 2018).

Ballast water is estimated to be responsible for 30% of all marine pest incursions into Australian waters (DAWR, 2018). The DAWR declares that all saltwater from ports or coastal waters outside Australia's territorial seas presents a high risk of introducing foreign marine pests into Australia (AQIS, 2011), while DAWR (2018) notes that the movement of vessels and marine infrastructure is the primary pathway for the introduction of IMS.

The MODU

As a jack-up, the key IMS risks from the MODU come from the legs, as they are immersed in the water column for long periods, along with the spud cans that are immersed in seabed sediments. Ballast water is taken up from the jack-up MODU in the hull when it leaves a location (to assist with ballasting during the tow) and then discharged when it reaches a location.

The IMS risk for jack-up MODUs is lower when compared to semi-submersible MODUs because the legs are raised out of the water when towed between drilling locations, meaning that any

biofouling generally dehydrates and dies (and may dislodge) between locations and is therefore less likely to survive in a new location once the MODU is jacked down.

Support Vessels

Support vessels ballast and de-ballast to improve stability, even out vessel stresses and adjust vessel draft, list and trim, with regard to the weight of equipment on board at any one time.

8.3.2 Potential Environmental Risks

The risks of IMS introduction (assuming their survival, colonisation and spread) include:

- Reduction in native marine species diversity and abundance;
- Displacement of native marine species;
- Depletion of commercial fish stocks (and associated socio-economic effects); and
- Changes to conservation values of protected areas.

8.3.3 EMBA

The EMBA for IMS introduction is anywhere within the operational area (wherever vessel movements occur), though if IMS survive the introduction and go on to colonise and spread, this EMBA could extend to large parts of the JBG.

Receptors most at risk within this EMBA, either as residents or migrants, are:

- Benthic fauna (because of their limited ability to move to other suitable areas);
- Benthic habitat; and
- Pelagic fish.

8.3.4 Evaluation of Environmental Risks

Successful IMS invasion requires the following three steps:

1. Colonisation and establishment of the marine pest on a vector (e.g., vessel hull) in a donor region (e.g., home port).
2. Survival of the settled marine species on the vector during the voyage from the donor to the recipient region (e.g., operational area).
3. Colonisation (e.g., dislodgement or reproduction) of the marine species in the recipient region, followed by successful establishment of a viable new local population.

If successful invasion takes place, the IMS is likely to have little or no natural competition or predation, thus potentially outcompeting native species for food or space, preying on native species or changing the nature of the environment. It is estimated that approximately one in six introduced marine species becomes pests (AMSA, n.d). Because the eradication of IMS populations is innately extremely difficult, it is necessary that preventing their introduction (or failing this, early detection) is the key to managing this risk.

Marine pest species can also deplete fishing grounds and aquaculture stock, with between 10% and 40% of Australia's fishing industry being potentially vulnerable to marine pest incursion (AMSA, n.d). For example, the introduction of the Northern Pacific seastar (*Asterias amurensis*) in Victorian and Tasmanian waters was linked to a decline in scallop fisheries. Similarly, the ability of the New Zealand screw shell (*Maoricolpus roseus*) to reach densities of thousands of shells per square metre has presented problems for commercial scallop fishers (MESA, 2022). The ABC

(2000) reported that the New Zealand screw shell is likely to displace similar related species of screw shells, several of which occupy the same depth range and sediment profile.

Marine pests can also damage marine and industrial infrastructure, such as encrusting jetties and marinas or blocking industrial water intake pipes. By building up on vessel hulls, they can slow the vessels down and increase fuel consumption.

Activity-specific risk assessment

The Interactive Map for Marine Pests in Australia (DAFF, 2021) does not identify any known pests within the Port of Darwin. Given that this is the largest port in the region and the most likely port of call for the support vessels, the likelihood of IMS introduction from this port is therefore low.

The jack-up MODU to be used for drilling will be currently operating in northern Australian waters. prior to drilling Beehive-1, with steps already taken by previous operator(s) to reduce the risk of introducing IMS. This would lower the risk of introducing IMS to the JBG compared to the MODU coming directly from non-Australian waters (because any fouling species or IMS present in ballast waters are likely to have come from the region and therefore present a lower risk of being invasive species). In the unlikely event that Beehive-1 uses a MODU which is coming from outside the Northwest Marine Region or outside Australia, EOG would take the appropriate steps as adopted per the risk assessment to keep the risk of IMS introduction ALARP.

The unconsolidated sandy sediments of the activity area and surrounds (see Section 5.2.3), combined with its water depth (40 m) and distance from shore (80 km), reduce the risk of IMS establishment because IMS generally require hard substrate to attach to in the photic zone. Colonisation and spread is more likely in shallow, highly disturbed nearshore waters (such as ports and marinas) than open waters further offshore (Geiling, 2014) where the rate of dilution and the degree of dispersal are high (Paulay *et al.*, 2002).

The National Strategic Plan for Marine Pest Biosecurity (2018-2023) (DAWR, 2018) has five objectives and associated management activities. An assessment of the objectives and management activities of the National Strategic Plan for Marine Pest Biosecurity (2018-2023) against the activity is provided in Table 8.14.

Table 8.14. Assessment of the objectives and management activities of the National Strategic Plan for Marine Pest Biosecurity (2018-2023) against the activity

Objectives and Activities	Assessment
<i>Objective 1: Minimise the risk of marine pest introductions, establishment and spread</i>	The adopted EPS listed in Table 8.15 are aligned with best-practice mitigation measures, which will reduce the likelihood of introduction of IMS to ALARP. Therefore, the activity will be consistent with this objective.
1.1. Implement nationally consistent domestic ballast water regulations under the Biosecurity Act 2015 (Cwlth).	The adopted EPS listed in Table 8.15 are aligned with best-practice mitigation measures, which will reduce the likelihood of introduction of IMS to ALARP. Therefore, the activity will be consistent with these management activities.
1.2. Ensure the use of ballast water management systems in Australian waters meets accepted environmental standards.	
1.3. Investigate regulatory options to manage biosecurity risks associated with biofouling on vessels.	The activity will not have any impact on this management activity.

Objectives and Activities	Assessment
1.4. Review the National Biofouling Management Guidelines for marine sectors and update as required.	The activity will not have any impact on this management activity.
1.5. Investigate the benefits of an intelligence-gathering framework to monitor marine pest risk pathways and expand the International Biosecurity Intelligence System as appropriate.	The activity will not have any impact on this management activity.
<i>Objective 2: Strengthen the national marine pest surveillance system</i>	The activity will not have any impact on this objective.
2.1. Develop a national marine pest surveillance strategy.	The activity will not have any impact on this management activity.
2.2. Investigate Australia's current passive surveillance capability for marine pests and recommend possible improvements.	The activity will not have any impact on this management activity.
2.3. Promote tailored education and awareness materials to engage marine pest observer groups in passive surveillance activities.	The activity will not have any impact on this management activity.
2.4. Develop validation guidelines for marine pest molecular detection methods.	The activity will not have any impact on this management activity.
2.5. Validate molecular detection methods (including sampling methodology) for selected high-priority marine pest species.	The activity will not have any impact on this management activity.
2.6. Audit, maintain and share a database of marine pest identification capability.	The activity will not have any impact on this management activity.
2.7. Review surveillance information management needs and ensure an appropriate information system is in place.	The activity will not have any impact on this management activity.
2.8. Perform an audit of marine pest surveillance activities and data sets relevant to Australia.	The activity will not have any impact on this management activity.
<i>Objective 3: Enhance Australia's preparedness and response capability for marine pest introductions</i>	The activity will not have any impact on this objective.
3.1. Plan and implement a national program of marine pest emergency response exercises.	The activity will not have any impact on this management activity.
3.2. Develop a benefit–cost analysis framework to guide response efforts in the event of a nationally significant marine pest incursion.	The activity will not have any impact on this management activity.
3.3. Identify marine pest emergency response training needs.	The activity will not have any impact on this management activity.

Objectives and Activities	Assessment
3.4. Review the national Emergency Marine Pest Plan (EMP Plan) framework.	The activity will not have any impact on this management activity.
3.5. Plan and implement procedures to develop and update the EMP Plan rapid response manuals and related guidance materials.	The activity will not have any impact on this management activity.
<i>Objective 4: Support marine pest biosecurity research and development</i>	The activity will not have any impact on this objective.
4.1. Periodically review the national marine pest biosecurity research and development priorities.	The activity will not have any impact on this management activity.
4.2. Promote research coordination through the national marine pest research network.	The activity will not have any impact on this management activity.
4.3. Review the economic, environmental and social impacts of marine pests in Australia.	The activity will not have any impact on this management activity.
4.4. Conduct risk analyses of marine pest vectors and pathways, and make recommendations for improved management.	The activity will not have any impact on this management activity.
4.5. Assess the effectiveness of current management options for biofouling in niche areas.	The activity will not have any impact on this management activity.
<i>Objective 5: Engage stakeholders to better manage marine pest biosecurity</i>	The activity will not have any impact on this objective.
5.1. Identify and build a profile of marine pest biosecurity stakeholders.	The activity will not have any impact on this management activity.
5.2. Develop a national stakeholder engagement strategy for Marine Pest Plan 2018–2023 and the Marine Pest Sectoral Committee.	The activity will not have any impact on this management activity.
5.3. Design a targeted national campaign to improve awareness of marine pest biosecurity risks, management actions and shared responsibilities.	The activity will not have any impact on this management activity.
5.4. Review, update and maintain the www.marinepests.gov.au website.	The activity will not have any impact on this management activity.
5.5. Establish an independent national marine pest network.	The activity will not have any impact on this management activity.

8.3.5 Risk Assessment

Table 8.15 presents the risk assessment for the introduction of IMS.

Table 8.15. Risk assessment for the introduction of IMS

Summary			
Summary of risks	Reduction in native marine species diversity and abundance, displacement of native marine species, socio-economic impacts on commercial fisheries and changes to conservation values of protected areas.		
Extent of risk	Localised (isolated locations if there is no spread) to widespread (if colonisation and spread occurs).		
Duration of risk	Short-term (IMS is detected and eradicated, or IMS does not survive long enough to colonise and spread) to long-term (IMS colonises and spreads).		
Level of certainty of risk	HIGH – the impacts associated with IMS introduction are well known and the vectors of introduction are known. Regulatory guidelines controlling these vectors have been established.		
Risk decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	No introduction of IMS.		
Risk Assessment (inherent)			
Likelihood		Consequence	Risk rating
Occasional		Moderate	Medium
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
Use only locally/regionally sourced support vessels.	Elimination	Likely	EB: Eliminates the potential for introduction of IMS from non-Australian waters. C: This is not standard industry practice. This is a significant limitation on the activity, as there are very few if any drilling support vessels permanently based in Australia, so vessels must be sourced opportunistically if they are in-country when required, or else internationally (e.g., southeast Asia). There is no cost to the project in adopting this approach. However, this cannot be guaranteed. Ev: There are significant schedule and capability implications for the activity by restricting the choice of vessels. On balance, the cost to implement this control is disproportionate to the risk if other controls are adopted.
Do not exchange or discharge ballast water in the operational area.	Elimination	No	EB: Eliminates the potential for introduction of IMS. C: It is not feasible to implement this from a structural integrity or safety perspective, as

			<p>ballast water exchange is required to ensure the stability of vessels as they load and unload goods.</p> <p>Ev: The high risk to human safety outweighs any environmental benefits.</p>
International Anti-fouling System (IAFS) Certificate (RSK-03: EPS-02).	Engineering	Yes	<p>EB: Ensures that the MODU and support vessels have an anti-fouling coating and associated certificate to reduce the likelihood of transfer of IMS from their hulls to the activity area.</p> <p>C: Significant cost to the contractors to have the MODU and vessels inspected and anti-fouling paint applied (generally every 5 years). This is a legislated requirement.</p> <p>Ev: Environmental benefit outweighs the cost.</p>
Biofouling Management Plan and Biofouling Record Book (RSK-03: EPS-01, -03).	Administrative	Yes	<p>EB: Provides for operational guidance to vessels for planning and actions required to manage vessel biofouling, in addition to outlining measures for the control and management of vessel biofouling in accordance with IMO Guidelines. Thereby reducing the likelihood of IMS transfer and establishment in the activity area.</p> <p>C: Small cost involved with personnel undertaking inspections and audits.</p> <p>Ev: Environmental benefit outweighs the cost.</p>
Cleaning of immersible equipment (RSK-03: EPS-04).	Administrative	Yes	<p>EB: Reduces the likelihood of introducing IMS.</p> <p>C: Small cost involved in cleaning and verification during inspection.</p> <p>Ev: Environmental benefit outweighs cost.</p>
Ballast water management plan. (RSK-03: EPS-05, -06).	Administrative	Yes	<p>EB: Reduces likelihood of introducing IMS.</p> <p>C: Small costs associated with preparing and implementing the ballast water management plan and with maintaining record books and logs. This is a legislated requirement.</p> <p>Ev: Environmental benefit outweighs cost.</p>
Incident reporting (RSK-04: EPS-07).	Administrative	Yes	<p>EB: Alerts authorities to the known or potential introduction of IMS, thereby allowing authorities to deal with (or remove) the threat early so as to minimise environmental impacts.</p> <p>C: No cost.</p> <p>Ev: Environmental benefit outweighs the cost.</p>
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
<i>Biofouling</i>			
No introduction of IMS through hull fouling.	<p>(RSK-03: EPS-01) The MODU and support vessels are managed in accordance with the <i>National Biofouling Management Guidelines for the Petroleum Production and Exploration Industry</i> (CoA, 2009) to ensure they present a low biofouling risk. This means:</p>		Biofouling assessment reports prior to mobilising to site confirms acceptability to enter the operational area.

	<ul style="list-style-type: none"> Biofouling risk assessment is conducted to ensure there is a low risk of IMS introduction. Conducting in-water inspection by divers or inspection in drydock if deemed necessary (based on risk assessment). Cleaning of hull and internal seawater systems, if deemed necessary. Anti-fouling coating status taken into account, with antifouling renewal undertaken if deemed necessary. 	
	(RSK-03: EPS-02) The MODU and support vessels >400 gross tonnes carry a current IAFS Certificate that is compliant with Marine Order Part 98 (Anti-fouling Systems).	IAFS Certificates are available and current.
	<p>(RSK-03: EPS-03) The MODU and support vessels are managed in accordance with <i>The Australian Biofouling Management Requirements</i> (Version 1, 2022), which involves submitting information to the DCCEEW in its Pre-Arrival Report (PAR) specifying whether the MODU and vessel:</p> <ul style="list-style-type: none"> Maintain an effective Biofouling Management Plan (includes the plan, biofouling record book and supporting evidence); Have been cleaned of biofouling within 30 days of arriving in Australia; Have an alternative biofouling management method that has been pre-approved by the DCCEEW (includes approval document); Will be subject to in-water cleaning in Australia (if required, includes permissioning document from the relevant state or NT government). <p>EOG will only contract a MODU and support vessels that can demonstrate they have met these requirements.</p>	<p>The following documentation is current:</p> <ul style="list-style-type: none"> Accepted PAR; Biofouling Management Plan; Biofouling Record Book; Cleaning report and supporting photos or video; and Pre-approved alternative biofouling management method (if required).
Immersible equipment does not introduce IMS to the activity area.	(RSK-03: EPS-04) Immersible equipment (e.g., VSP equipment, ROV) is cleaned (e.g., biofouling is removed) prior to initial use on the MODU.	Records are available to verify that immersible equipment was cleaned prior to use.
<i>Ballast water</i>		
No introduction of IMS through ballast water.	<p>(RSK-03: EPS-05) Vessels fulfil the requirements of the <i>Australian Ballast Water Management Requirements</i> (DAWR, 2020, v8). This includes requirements to:</p> <ul style="list-style-type: none"> Carry a valid Ballast Water Management Plan (BWMP). 	<p>BWMP is available and current.</p> <p>BWR (or exemption) is submitted prior to entry to the activity area.</p> <p>A valid BWMC is in place.</p>

	<ul style="list-style-type: none"> • Submit a Ballast Water Report (BWR) through the Maritime Arrivals Reporting System (MARS). <ul style="list-style-type: none"> ◦ If intending to discharge internationally-sourced ballast water, submit BWR through MARS at least 12 hours prior to arrival. ◦ If intending to discharge Australian-sourced ballast water, seek a low-risk exemption through MARS. • Hold a Ballast Water Management Certificate (BWMC). • Ensure all ballast water exchange operations are recorded in a Ballast Water Record System (BWRS). 	An up-to-date BWRS is in place.
		An electronic Pre-Arrival Report (ePAR) is available and signed off by DAWR.
	<p>(RSK-03: EPS-06) As above, except a BWR is not required for domestic journeys (i.e., when moving between Australian ports and 200 nm of the coastline).</p> <p><i>Note: ballast water management is not required between Australian ports if:</i></p> <ul style="list-style-type: none"> • <i>Ballast water is taken up and discharged in the same place.</i> • <i>Potable water is used as ballast.</i> • <i>Ballast water was taken up on the high seas only.</i> • <i>The vessel receives a risk-based exemption from ballast water management.</i> 	As above, except for the BWR.
Reporting		
Known or suspected non-compliance with biosecurity measures are reported to regulatory agencies.	(RSK-03: EPS-07) Non-compliant discharges of domestic ballast water are to be reported to the DAWR immediately (contact details in Section 9.7.2).	Incident report notes that contact was made with the DAWR regarding non-compliant ballast water discharges.
Risk Assessment (residual)		
Likelihood	Consequence	Risk rating
Remote	Moderate	Low
<p>The risk of the introduction and establishment of IMS is assessed as low because:</p> <ul style="list-style-type: none"> • The control measures adopted are effective in reducing the risk to ALARP. 		
Demonstration of ALARP		
<p>A 'low' residual risk rating is considered to be ALARP and a 'lower order' risk. The adopted EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.</p>		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
OEMS compliance	Chapter 9 outlines the EP implementation strategy to be employed for this activity.	

Risk matrix standard compliance	The residual risk is low, which is considered acceptable.	
External context	No objections or claims have been raised by relevant persons regarding the introduction and establishment of IMS.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Biosecurity Act 2015 (Cth)</i>: <ul style="list-style-type: none"> ○ Chapter 4 (Managing biosecurity risk). ○ Chapter 5, Part 3 (Management of discharge of ballast water). ○ Biosecurity Regulations 2016. ○ Biosecurity Amendment (Biofouling Management) Regulations 2021. • <i>Protection of the Sea (Harmful Anti-fouling Systems) Act 2006 (Cth)</i>: <ul style="list-style-type: none"> ○ Part 2 (Application or use of harmful anti-fouling systems). ○ Part 3 (Anti-fouling certificates and anti-fouling declarations). ○ Marine Order 98 (Marine pollution – anti-fouling systems). • Ballast Water Management Convention and Resolution 127 (53) (Marine Environmental Protection Committee of the IMO) 2005. • Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (IMO). 	
Industry practice	The consideration and alignment of EPS to the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM is being implemented.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this activity are in line with the management measures listed for the introduction of IMS in Section 4.7.6 of the guidelines:</p> <ul style="list-style-type: none"> • Complying with the International Convention on the Control of Harmful Anti-fouling Systems on Ships (RSK-03: EPS-02). • Ensuring vessels of appropriate class have IAFS certificates (RSK-03: EPS-02). • Ensuring compliance with local regulatory guidelines.
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There are no guidelines for offshore activities with regard to minimising the risk of introducing IMS.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	There are no guidelines regarding preventing the introduction of IMS.
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> • To reduce the risk of introduction of marine pests to ALARP and to an acceptable level (All RSK-03 EPS).

		<ul style="list-style-type: none"> To reduce the impacts to benthic communities to ALARP and to an acceptable level.
	IMS-specific	
	Australian Biofouling Management Requirements (Version 1, 2022)	The EPS in this table reflect the guidance regarding biofouling management (RSK-03: EPS-03).
	Australian Ballast Water Management Requirements (DAWR, 2020, v8)	The EPS in this table reflect the guidance regarding ballast water management in the DAWR guide (RSK-03: EPS-05).
	Offshore Installations – Biosecurity Guide (DAWE, 2020, v1.4)	The EPS in this table reflect the guidance provided in the DAWE guide, which largely references other guidelines listed here.
	Anti-Fouling and In-Water Cleaning Guidelines (DoA/DoE, 2015).	The EPS in this table reflect the general guidance regarding managing fouling in the DoA/DoE guidelines, which have since been updated in the aforementioned DAWR (2020) quarantine guide.
	Guidelines for the Control and Management of Ships' Biofouling to Minimise the Transfer of Invasive Aquatic Species (IMO, 2011)	The EPS in this table reflect the guidance regarding minimising the transfer of IMS from biofouling.
	National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (DAFF, 2009)	The EPS in this table reflect the guidance regarding biofouling management in the DAFF guide (RSK-03: EPS-01).
Environmental context	MNES	
	AMPs	<p>The North Marine Parks Network Management Plan 2018 (DNP, 2018) identifies invasive species introduction via ballast water in shipping, fishing vessels and other vessels as a potential biosecurity pressure to the AMP network.</p> <p>The implementation of the EPS make it unlikely that IMS will be introduced to the activity area and spread to nearby AMPs.</p>
	Ramsar wetlands	The risk of introducing IMS is highly unlikely to affect Ramsar wetlands.
	TECs	The risk of introducing IMS is highly unlikely to affect TECs.
	Nationally threatened and migratory species	The threatened and migratory species within the spill EMBA are all highly mobile species. There are no EPBC Act-listed benthic species listed as occurring in the operational area; these are

		generally more susceptible to the effects of IMS than mobile fauna.
	Other matters	
	KEFs	The risk of introducing IMS is highly unlikely to affect KEFs.
	NIWs	The risk of introducing IMS is highly unlikely to affect NIWs.
	State marine parks	This hazard does not intersect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	The National Strategic Plan for Marine Pest Biosecurity (2018-2023) (DAWR, 2018) has five objectives. The EPS listed in this table are aligned with the plan’s objective to minimise the risk of marine pest introductions, establishment and spread (noting that the other four objectives do not apply to the activity).
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
	Is there a threat of serious or irreversible environmental damage?	Possibly, but the EPS aim to avoid this.
	Is there scientific uncertainty as to the environmental damage?	Yes. Individual species fill different ecological niches and understanding how one or more species are likely to behave outside their native habitat is generally unknown until it occurs.
Statement of acceptability	EOG considers the risks of introducing IMS to be acceptable because: <ul style="list-style-type: none">• It will adhere to the company’s Safety & Environmental Policy;• The residual risk rating is low;• An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved;• Input from engagement with relevant persons has been considered and incorporated into the design of the activity;• Relevant legislation and industry best practice will be complied with;• The management of IMS is not inconsistent with the aims of the National Strategic Plan for Marine Pest Biosecurity; and• The management of IMS is not inconsistent with ESD principles.

<ul style="list-style-type: none">• None required.		
Record Keeping		
<ul style="list-style-type: none">• Vessel contractor pre-qualification reports.• Biofouling risk assessment.• Ballast water risk assessments.• BWMP.• BWR.		<ul style="list-style-type: none">• BWMC.• BWRS.• IAFS Certificates.• DAWR-signed ePARs.

8.4 RISK 4 – Interference with Other Marine Users

8.4.1 Hazard

The presence of the MODU and support vessels may result in unplanned interference with other marine users and equipment, such as commercial fishing gear and merchant shipping.

8.4.2 Known and potential environmental impacts

The known and potential impacts of interference with other marine users are:

- Collision potential with third-party vessels (and damage in the case of collision); and
- Damage to or loss of fishing equipment and/or loss of commercial fish catches.

8.4.3 EMBA

The EMBA for interference with other marine users is anywhere within the operational area (wherever vessel movements occur), and more specifically the immediate area around the two intersecting vessels or equipment.

Receptors in the EMBA include:

- Commercial fishing vessels; and
- Merchant vessels.

8.4.4 Evaluation of Environmental Risks

Collision with other marine users

Interference from the MODU and support vessels undertaking the activity with other marine users is highly unlikely because:

- There is low shipping traffic in and around the activity area (see Section 5.7.7);
- The MODU will be highly visible from long distances;
- The support vessels are highly visible and move slowly around the MODU;
- Large vessels use sophisticated navigation aids;
- Navigational warnings and a PSZ will be in place; and
- Consultation has been undertaken with relevant persons prior to the activity.

In the event of interference with other marine users that results in a vessel-to-vessel collision, health and safety impacts are more likely than environmental impacts. Should the force of a collision be enough to breach a vessel hull (which is unlikely due to the generally low speed), an MDO spill may eventuate (the environmental consequences of which are addressed in Section 8.6).

Damage to or loss of fishing equipment

There is the remote possibility that fishing gear (e.g., NPF otter trawl nets) may get caught by the MODU legs if third-party commercial fishing vessels breach the 500-m radius PSZ with their gear deployed. This would likely result in the gear becoming detached from the fishing vessel and the loss of any associated catch. In addition to the cost of repairing or replacing this equipment, it could also result in the loss of income from caught fish during that fishing expedition. This is highly unlikely to occur because the size of the MODU ensures it is visible from long distances, meaning that fishers will not deploy trawl nets nearby.

The only fishery likely to be active in the activity area is the NPF. The NPF primarily operates from April to June and August to November. If the activity occurs commences in the first half of 2023, it will overlap with the NPF fishing season. Although there is a temporal overlap with the NPF fishing season, for the reasons outlined above, it will be unlikely to result in damage to or loss of fishing equipment.

Interference from the support vessels with commercial fishing vessels is unlikely, for the same reasons stated above.

8.4.5 Risk Assessment

Table 8.16 presents the impact assessment for interference with other marine users.

Table 8.16. Risk assessment for interference with other marine users

Summary			
Summary of risks	Presence of MODU and support vessels, resulting in the risk of vessel-to-vessel collision, damage to or loss of fishing equipment and loss of commercial fish catches.		
Extent of risks	Highly localised (within the activity area).		
Duration of risks	Short-term (minutes for a third-party vessel detour) to long-term (vessel collision).		
Level of certainty of risks	HIGH – the impacts associated with interference with other marine users is well understood.		
Risk decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	No interference with other marine users.		
Impact Consequence (inherent)			
Likelihood		Consequence	Risk rating
Occasional		Minor	Low
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
PSZ (RSK-04: EPS-01).	Engineering	Yes	EB: Minimises collision risk with the MODU, support vessels and third-party equipment through increased awareness. C: Minimal cost to prepare and issue notices to marine users. Ev: Benefits to safety for all parties outweighs the minimal costs.

Navigation equipment and procedures (RSK-04: EPS-03, -06, -08).	Engineering	Yes	<p>EB: Reduces the risk of collisions with other marine users.</p> <p>C: While the costs of navigation equipment are significant, it is standard on vessels and the costs of maintaining it are minimal. It is a legislative requirement.</p> <p>Ev: The safety benefits of having navigation equipment and procedures outweighs the cost.</p>
Relevant person notifications (RSK-04: EPS-02, -09).	Administrative	Yes	<p>EB: Ensures other marine users are aware of the activity and thus reduces likelihood of collision and interference.</p> <p>C: Minimal costs associated with EOG personnel preparing and issuing notifications and responding to stakeholders.</p> <p>Ev: Benefits outweigh the minimal cost.</p>
Continuous bridge watch (RSK-04: EPS-04).	Administrative	Yes	<p>EB: Reduces the risk of collisions with other marine users or their equipment (e.g., marker buoys).</p> <p>C: No additional cost. It is routine maritime practice that the vessel master and mates maintain bridge watch at all times.</p> <p>Ev: Environmental benefits are achieved with no additional cost.</p>
Crew qualifications. (RSK-04: EPS-05).	Administrative	Yes	<p>EB: Reduces the risk of vessel collision by ensuring crew possess appropriate qualifications to operate the vessels.</p> <p>C: Negligible; it is a standard maritime requirement that crew possess such qualifications.</p> <p>Ev: Environmental benefits can be achieved with negligible additional cost.</p>
Avoid drilling between 1 st August to 1 st December (4-month period) in any year in line with the request from the NPF.	Administrative	No	<p>EB: Reduces the risk of interfering with NPF trawl fishing operations during a key fishing period.</p> <p>C: Extremely high (tens of millions of dollars), if MODU availability aligns with the requested exclusion period. The costs are associated with 'warm-stacking' the MODU, paying a termination fee to the MODU operator for breach of contract and/or lost opportunity costs.</p> <p>Ev: The cost of this control measures is grossly disproportionate to low inherent risk to third-party marine users. Trawling will not be impacted outside of the 500-m radius PSZ around the MODU.</p>
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	

The EPS listed in 'displacement of other marine users' (see Section 7.4) also apply to this risk. Additional controls are provided here.

No incidents or complaints of spatial conflict with third-party vessels or fishing equipment.	(RSK-04: EPS-01) The AHO will be notified of the activity no less than three weeks prior to the activity commencing to enable the promulgation of a Notice to Mariners (NTM) that communicates the 500-m PSZ and 4.6 km (2.5 nm) cautionary area around the MODU for the duration of the activity.	NTM is issued via the AHO prior to the activity and includes details of the PSZ and cautionary area.
	(RSK-04: EPS-02) EOG notifies relevant persons ahead of the activity so that third-party marine users are aware of the MODU location and activity timing.	Stakeholder correspondence verifies that EOG contacted relevant persons about the timing and location of the activity.
	(RSK-04: EPS-03) The MODU and support vessels are readily identifiable to third-party vessels with lights, signals, AIS transponders and communication equipment.	Visual inspection and/or Offshore Vessel Inspection Database (OVID)/Common Marine Inspection Document (CMID) verify that the anti-collision monitoring equipment (e.g., 24-hour radar watch, Global Maritime Distress and Safety System (GMDSS) and Automatic Identification System [AIS]) is functional and in use.
	(RSK-04: EPS-04) The support vessels monitor the PSZ and cautionary area at all times using safe continuous watch.	Daily drilling reports/vessel bridge logbooks verify constant monitoring of the PSZ and cautionary area.
	(RSK-04: EPS-05) The support vessel masters and deck officers have valid SCTW certificates in accordance with AMSA Marine Order 70 (seafarer certification) (or equivalent) to operate radio equipment to warn of potential third party spatial conflicts (e.g., International Convention on Standards of Training, Certification and Watch-keeping for Sea-farers [STCW95], GDMSS proficiency).	Appropriate qualifications are available.
	(RSK-04: EPS-06) The support vessel masters issue warnings (e.g., radio warning, flares, lights/horns) to third-party vessels approaching the PSZ in order to prevent a collision with the MODU.	Radio operations communications log verifies that warnings to third-party vessels approaching the PSZ have been issued when necessary.
	(RSK-04: EPS-07) All incidents of spatial conflict with other marine users will be reported in the EOG incident register.	The incident register is current.
Vessel-to-vessel collisions are managed in	(RSK-04: EPS-08) The support vessel masters will sound the general alarm, manoeuvre the vessel to minimise the	Incident report verifies that the relevant safety procedure was implemented.

accordance with vessel-specific emergency procedures.	effects of the collision with the MODU and implement all other measures as outlined in the vessel or structure collision procedure (or equivalent).	
	(RSK-04: EPS-09) Vessel collisions will be reported to AMSA if that collision has or is likely to affect the safety, operation or seaworthiness of the vessel or involves serious injury to personnel.	Incident report verifies that AMSA were notified of a vessel collision.
Impact Consequence (residual)		
Likelihood	Consequence	Risk rating
Rare	Minor	Negligible
<p>The risk of interference with other marine users is assessed as negligible because:</p> <ul style="list-style-type: none"> • The activity will be temporary in nature; • There is low commercial shipping and fishing activity in and around the activity area; • Thorough consultation has been undertaken with relevant persons to understand the risks and avoid potential interference; and • The control measures adopted significantly reduce the likelihood of an incident of interference. 		
Demonstration of ALARP		
<p>A 'negligible' residual risk rating is considered to be ALARP and a 'lower order' risk. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.</p>		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met through implementation of this EP.	
EMS compliance	Chapter 9 outlines the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual risk is negligible, which is considered acceptable.	
External context	No objections or claims have been raised by relevant persons regarding interference with other marine users.	
Legislative context	<p>The EPS outlined in this table align with the requirements of:</p> <ul style="list-style-type: none"> • <i>OPGGs Act 2006 (Cth)</i>. <ul style="list-style-type: none"> ○ Section 280 – requires that a person carrying on activities in an offshore area under the permit, lease, licence, authority or consent must carry on those activities in a manner that does not interfere with navigation or fishing (among others). • <i>Navigation Act 2012 (Cth)</i>. <ul style="list-style-type: none"> ○ Chapter 6 (Safety of navigation), particularly Part 3 (Prevention of collisions). ○ AMSA Marine Orders Part 21 (Safety of Navigation and Emergency Procedures). ○ AMSA Marine Orders Part 27 (Safety of Navigation and Radio Equipment). 	

	○ AMSA Marine Order Part 30 (Prevention of Collisions).	
Industry practice	The consideration and alignment of EPS with the mitigation measures outlined in the below-listed guidelines and codes of practice demonstrates that BPEM will be implemented for this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this hazard are in line with the management measures listed for offshore physical presence in Section 4.3.1 of the guidelines, which include:</p> <ul style="list-style-type: none"> • Develop exclusion zones in consultation with key stakeholders, including local fishing communities; raise awareness of exclusion zones with all stakeholders (RSK-04: EPS-01, -07). • Issue a NTM through the relevant government agencies, detailing the area of operations (RSK-04: EPS-01). • Ensure all vessels adhere to International Regulations for Preventing Collisions at Sea (COLREGS), which set out the navigation rules to be followed to prevent collisions between two or more vessels (RSK-04: EPS-02, 04, -05). • Optimise vessel use to ensure the number of vessels required and length of time that vessels are on site is as low as practicable.
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	There is no specific guidance regarding collision avoidance and navigational lighting.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>There is no specific guidance regarding collision avoidance and navigational lighting.</p> <p>Section 2.3.6.1 (environmental protection) states that location- and well-specific environmental protection plans should be prepared. The EP satisfies this requirement.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	There is no specific guidance regarding collision avoidance and navigational lighting.
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meets the code's following objectives for offshore drilling operations:</p> <ul style="list-style-type: none"> • To reduce the impact on other marine resource users to ALARP and to an acceptable level (RSK-04: All EPS). • To reduce risks to public safety to ALARP and an acceptable level (RSK-04: All EPS).
Environmental context	MNES	
	AMPs	This hazard will not affect nearby AMPs.
	Ramsar wetlands	This hazard will not affect any Ramsar wetlands.

	TECs	This hazard will not affect any TECs.
	Nationally threatened and migratory species	This hazard will not affect threatened or migratory species.
	Other matters	
	KEFs	This hazard will not affect any KEFs.
	NIWs	This hazard will not affect any NIWs.
	State marine parks	This hazard will not affect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	None triggered by this hazard.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	EOG considers the risk of interference with other marine users to be acceptable because: <ul style="list-style-type: none">• It will adhere to the company’s Safety & Environmental Policy;• The residual consequence rating is negligible;• An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons has been considered and incorporated into the design of the activity; and• Relevant legislation and industry best practice will be complied with.	
Environmental Monitoring

Record Keeping		
<ul style="list-style-type: none">• Stakeholder communication records.• NTM.• PSZ gazettal.• Crew qualifications.• Radio communication logs.• Crew qualifications.• Incident reports.• Daily drilling reports.		

8.5 RISK 5 – Unplanned Discharge of Drilling Fluids, Chemicals or Hydrocarbons

8.5.1 Hazard

The following activities have the potential to result in unplanned discharges of small volumes (typically no greater than 5-10 m³) of drilling fluids, chemicals and hydrocarbons:

- MODU operations – crane transfers and bunkering operations;
- Well testing – liquid drop-out from incomplete combustion or discharge of oily water;
- Support vessel operations – crane transfers and bunkering operations; and
- Aviation operations – refuelling of the helicopter on the MODU.

Crane transfers or bunkering operations between support vessels and the MODU may result in accidental discharges of various products overboard or to deck, such as:

- Drilling muds;
- Bulk drilling chemicals (e.g., barite, bentonite);
- Bulk chemicals (e.g., pipe dope, BOP hydraulic fluids);
- Hydraulic oil from the cranes' electric prime movers;
- Helicopter aviation fuel (avgas [aviation gasoline] or diesel [Jet-A1]); and
- Assorted pumps, winches, power packs and generators.

Spills overboard may be caused by:

- Hose or connection failure (due to equipment condition or failure of a support vessel to keep station);
- Failure to align valves correctly during transfer to tanks;
- Overfilling of tanks on MODU or support vessel;
- Overfilling of aviation fuel tank on fuel unit or bulk storage tank of the MODU;
- Overfilling of helicopter on the MODU helideck;
- Dropped objects from crane transfers; and
- Accidental or emergency disconnection of the riser.

Fluids stored in tanks (or pits) are pumped between tanks or to mixing equipment using transport pumps. The pipes through which they are pumped are under pressure. Possible causes of spills during these transfers include:

- Leaks due to the condition of pipes, connections, flanges and valves;
- Leaks from pump packers;
- Leaks from blocked mixing hoppers;
- Loss of storage tank integrity; and
- Failure to align valves correctly during transfer to tanks.

Jet A1 fuel used for helicopter refuelling has been excluded from spill modelling and this assessment as only small volumes will be stored on the MODU (~6 m³), and spills of this fuel evaporate quickly due to the very high levels of light ends.

8.5.2 Potential Environmental Risks

The known and potential environmental risks of the unplanned discharge of small volumes of drilling muds, chemicals and hydrocarbons are:

- Temporary and localised reduction of water quality; and
- Acute toxicity to marine fauna through ingestion or absorption.

8.5.3 EMBA

The EMBA for the risk of discharge of drilling muds, chemicals and fuel is likely to range from tens to hundreds of metres depending on the product and volume spilled, so a precise EMBA cannot be calculated.

Receptors most at risk within this EMBA are:

- Water quality;
- Plankton;
- Pelagic fish;
- Seabirds;
- Marine mammals; and
- Marine reptiles.

8.5.4 Evaluation of Environmental Risks

The impact of the discharge of drilling muds is addressed in Section 7.6.2. The impacts of a small unplanned discharge of drilling muds will not vary significantly from the EIA presented in Section 7.6.5.

The risks associated with the discharge of chemicals in drilling muds is addressed in Section 7.6.4. The risks of an unplanned discharge of chemicals will not vary significantly, though the increased release volume means it will take longer to dilute and disperse through the water column.

The risks associated with the discharge of MDO is addressed in Section 8.6.2. The risks of a discharge of aviation fuel will be less than that resulting from a vessel collision due to the much smaller volumes involved, so the extent of spread will be less, and the high volatility of aviation fuel means a greater proportion of fuel will evaporate much faster than MDO.

Flaring associated with well testing may be interrupted by pressure drops, incomplete combustion, or higher than anticipated drilling fluid content in the flaring system. Efficient combustion in the flame depends on achieving good mixing between the fuel gas and air and on the absence of liquids. Where liquids are present (i.e., formation fluids) and not completely 'knocked out' upstream of the flare boom, minor quantities (in the order of litres) of formation fluids may accidentally reach the ocean. Hydrocarbon volumes released due to drop out from flaring are difficult to estimate. Given the automatic and manual systems in place during flaring, the accidental release of hydrocarbon is expected to be low (less than 2 m³) in the event of flare dropout. The risks from flaring of oil, gas or condensate are considered so minor that the OSPAR Commission concluded that there is no need to develop a background document (i.e., guideline) on the flaring of oil, gas or condensate (OSPAR, 2005).

Near the sea surface, fish are able to detect and avoid contact with surface slicks and as a result, fish mortalities rarely occur in open waters from surface spills (Volkman *et al.*, 2004). This, combined with their high mobility (that allows them to avoid exposure to toxic components for long periods), means that pelagic fish are generally not susceptible to impacts from hydrocarbon spills (Volkman *et al.*, 2004).

The WCP for seabirds (2020) identifies chronic pollution as an existing threat to seabirds. Chemical contamination has been described within the WCP as contributing to the decline of many seabirds by impairing their ability to reproduce successfully. Eggshell thinning, embryo viability and offspring deformities are noted as reproductive issues caused by chemical contamination (Commonwealth of Australia, 20202). The WCP also notes that organochlorines and heavy metals

degrade very slowly in the environment and therefore, is retained by organisms, and passed throughout the food chain.

In general, the small potential release volumes mean that such releases would be confined to a small area around the drill site and result in rapid dilution in the open ocean environment, meaning that the risk of toxic effects to marine fauna are low. The low commercial fishing activity and absence of fish BIAs and sensitive habitats in the operational area means the risks to the biological and socio-economic environments are low.

8.5.5 Risk Assessment

Table 8.17 presents the impact assessment for the unplanned discharge of small volumes of drilling muds, chemicals and hydrocarbons.

Table 8.17. Risk assessment for the unplanned discharge of drilling muds, chemicals and hydrocarbons

Summary				
Summary of risks	Temporary and localised reduction of water quality and acute toxicity to marine fauna through ingestion or absorption of small volumes of drilling muds, chemicals and hydrocarbons.			
Extent of risks	Highly localised – small mixing zone around the MODU			
Duration of risks	Temporary and short-term (several minutes for small deck spills or longer for larger spill)			
Level of certainty of risks	HIGH – the impacts associated with drilling fluid, chemical and hydrocarbon spills at sea are well known and documented.			
Risk decision framework context	Decision type	A - good industry practice required.		
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.		
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.		
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.		
Defined acceptable level	No unplanned release of drilling muds, chemicals and hydrocarbons.			
Impact Consequence (inherent)				
Likelihood		Consequence		Risk rating
Unlikely		Minor		Low
Assessment of Proposed Control Measures				
Control measure	Control type	Adopt	Justification	
Pre-acceptance inspection of MODU (RSK-05: EPS-01).	Administrative	Yes	EB: Ensures the storage tanks, equipment and bunding are in good working condition prior to the activity commencing, thereby reducing the likelihood of drilling fluid, chemical and hydrocarbon spills.	

			<p>C: Negligible; it is a standard maritime requirement. Minor administrative cost to produce documents and educate personnel.</p> <p>Ev: Benefits outweighs the low costs.</p>
Hydrocarbon and chemical storage and loading (RSK-05: EPS-02, 03 & 04).	Engineering	Yes	<p>EB: Reduces the likelihood that hydrocarbon and chemical storage will be accidentally lost overboard.</p> <p>C: Negligible; it is a standard maritime requirement. Minor administrative cost to produce documents and educate personnel.</p> <p>Ev: Environmental benefit outweighs the negligible costs.</p>
PTW system (RSK-05: EPS-05).	Administrative	Yes	<p>EB: Reduces the likelihood that hydrocarbon and chemical storage will be accidentally lost overboard by ensuring operations is undertaken via a PTW.</p> <p>C: Negligible; it is a standard maritime requirement. Minor administrative costs associated with maintaining the PTW.</p> <p>Ev: Environmental benefit outweighs the negligible costs.</p>
PMS (RSK-05: EPS-06).	Administrative	Yes	<p>EB: The maintenance of MODU storage systems and associated fittings minimises the likelihood of chemical and hydrocarbon lost overboard.</p> <p>C: Negligible; it is a standard maritime requirement. Minor administrative costs associated with maintaining the PMS.</p> <p>Ev: Environmental benefit outweighs the negligible costs.</p>
SMPEP (RSK-05: EPS-07, 08, 10 & 11).	Administrative	Yes	<p>EB: Ensures crew are well prepared to quickly respond to a spill, thereby minimising the volume spilled and the extent of sea affected.</p> <p>C: SMPEP should already be in place. Low costs to stock vessel with equipment and maintain it. This is standard maritime practice.</p> <p>Ev: Environmental benefit outweighs the low costs.</p>
Well Test Plan (RSK-05: EPS-09)	Administrative Engineering	Yes	<p>EB: Ensures well test crew follow set procedures, thereby minimising the likelihood of liquid dropouts.</p> <p>C: The preparation of a Well Test Plan is standard practice for well testing contractors, whereby the cost is factored into the contract and not an extra cost per se.</p> <p>Ev: Environmental benefits outweigh the low costs.</p>
Environmental Controls and Performance Measurement			

EPO	EPS	Measurement criteria
A pre-acceptance inspection of the MODU takes place.	(RSK-05: EPS-01) EOG's pre-acceptance inspection of the MODU confirms that storage tanks, equipment, bunding and machinery spaces are free of defects.	MODU pre-acceptance inspection records verify good condition of all equipment.
Hydrocarbons and chemicals stored on the MODU are stored in a manner that prevents bulk release.	(RSK-05: EPS-02) All hydrocarbons and chemicals are stored within secure receptacles within bunded areas or dedicated chemical lockers that drain to bilge tanks.	Visual inspection verifies that hydrocarbons and chemicals are stored within secure receptacles within bunded areas or dedicated chemical lockers that drain to bilge tanks.
	(RSK-05: EPS-03) Where hydrocarbons and chemicals are stored within open draining decks, receptacles are stored on/in temporary bunds.	Visual inspection verifies that where hydrocarbons and chemicals are stored within open draining decks, receptacles are stored on/in temporary bunds.
Hydrocarbons and chemicals are transferred to and from the MODU in a manner that prevents bulk release.	(RSK-05: EPS-04) Bulk liquid transfers are undertaken in accordance with the MODU bulk transfer/lifting procedure to reduce the risk of an unintentional release to the sea.	MODU bulk transfer/lifting procedure is available.
		Completed JSEA and/or PTW is available to verify the procedure was implemented.
The operation of the dump valve/s for the mud tanks will be managed under a Permit to Work (PTW) system.	(RSK-05: EPS-05) The mud dump valve/s are locked, with the keys remaining secure in a key locker. A PTW will be required to unlock the dump valve/s, which involves an assessment by the OIM regarding the need for a specific operation.	Visual inspection of key locker and dump valve/s verify its integrity.
		Daily Fluids Report allow for material balance assessment to determine discharge volume of weighted brine.
		PTW records verify that a PTW was prepared prior to unlocking the dump valve/s.
Planned maintenance will be undertaken on all MODU storage systems (bunds, hoppers), hose fittings and so forth.	(RSK-05: EPS-06) Planned maintenance is undertaken to the PMS schedule.	PMS records verify that maintenance work (and repairs where necessary) is undertaken.
The MODU management and crew are well prepared to respond to deck spills.	(RSK-05: EPS-07) The MODU OIM ensures that crew undertake spill response drills every three months in accordance with the SMPEP and drills and exercises matrix.	Records show that relevant crew have conducted quarterly spill response drills.
	(RSK-05: EPS-08) In accordance with the SMPEP, oil spill response kits are available in relevant locations around	Inspection/audit confirms that SMPEP kits are readily available on deck.

	the MODU, are fully stocked and are used in the event of hydrocarbon or chemical spills to deck.	Incident reports for MDO spills to deck record that the spill is cleaned up using SMPEP resources.
Release of oil and oily water during well testing is avoided.	(RSK-05: EPS-09) A Well Testing Plan will be in place and implemented so the following is achieved:	
	<ul style="list-style-type: none"> Separator tanks are installed upstream of the flare boom in order to remove liquids (formation water, completion fluids and/or oil) prior to flaring and thus reduce the chance of liquid dropouts. 	Well test daily report verifies the presence of separator tanks.
	<ul style="list-style-type: none"> A high-efficiency burner (e.g., 'Evergreen' burner) is installed on the flare boom to reduce the likelihood of liquid dropout. 	Well test daily report verifies that a high-efficiency burner was in use during well testing.
	<ul style="list-style-type: none"> Burner pilots remain ignited during the well test to minimise the likelihood of liquid dropouts. 	Well test daily report verifies that burner pilot remained ignited during the well test.
	<ul style="list-style-type: none"> Dedicated MODU deck crew are in place to watch for liquid dropouts, who then notify the Well Test Supervisor as soon as liquid dropout is observed so that the well test process can be quickly shut down and corrected before re-commencing. 	Well test daily report includes details of flare watch for liquid dropouts.
	<ul style="list-style-type: none"> Liquids stored in the separator tanks are treated through an oily water filtration system (to <30 ppm) prior to overboard discharge or shipped to shore for disposal. 	Well test daily report verifies that discharged fluids were treated to <30 ppm or shipped to shore for disposal.
	<ul style="list-style-type: none"> Oily water filtration equipment will be calibrated prior to use. 	Calibration results verify that the system is calibrated to <30 ppm.
	<ul style="list-style-type: none"> In the event of a flare drop-out or hydrocarbons being observed on the sea surface, then flaring (and if applicable, the well test), will cease and the event will be investigated and corrected before re-commencing. 	Incident report of flare drop-out or unplanned hydrocarbon release.
Reporting		
A bulk spill of chemicals or hydrocarbons at surface will be promptly reported internally and	(RSK-05: EPS-10) The MODU OIM will report a bulk spill to the AGR Drilling Supervisor and lead the onboard response in line with the SMPEP.	Incident reports and logs confirm that internal notifications were made in a timely fashion.

externally, and appropriately managed.		
A bulk spill of chemicals or hydrocarbons at surface will be promptly reported to external regulatory agencies.	(RSK-05: EPS-11) The Drilling Incident Management Team (DIME) Incident Controller will report to AMSA and NOPSEMA within 2 hours of EOG becoming aware of the spill (see Section 9.7.2).	Incident reports and logs confirm that regulatory authorities were notified within 2 hours of EOG becoming aware of the spill.
Impact Consequence (residual)		
Likelihood	Consequence	Risk rating
Rare	Minor	Negligible
<p>The risk of the unplanned discharge of bulk drilling muds, chemicals and hydrocarbons is assessed as negligible because:</p> <ul style="list-style-type: none"> • The volumes of chemicals and hydrocarbons on the MODU will be small; • Helicopter refuelling is unlikely to take place on the MODU; and • The control measures adopted significantly reduce the likelihood of an unplanned discharge of bulk drilling fluids, chemicals and hydrocarbons. 		
Demonstration of ALARP		
<p>A 'negligible' residual risk rating is considered to be ALARP and a 'lower order' risk. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.</p>		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met through implementation of this EP.	
EMS compliance	Chapter 10 outlines the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual risk is negligible, which is considered acceptable.	
External context	No objections or claims have been raised by relevant persons regarding accidental discharge of drilling fluids, chemicals and hydrocarbons.	
Legislative context	<p>The performance standards outlined in this EP align with the requirements of:</p> <ul style="list-style-type: none"> • Protection of the Sea (Prevention of Pollution from Ships) Act 1983 (Cth): <ul style="list-style-type: none"> ○ Section 9 (Prohibition of discharge of oil or oily mixture to sea). 	
Industry practice	The consideration and adoption of the controls outlined in the below-listed codes of practice and guidelines demonstrates that BPEM is being implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	As per the impact assessment table in Section 7.6 and Section 7.11.

	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	As per the impact assessment table in Section 7.6 and Section 7.11.
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	As per the impact assessment table in Section 7.6 and Section 7.11.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	As per the impact assessment table in Section 7.6 and Section 7.11.
	AEP CoEP (APPEA 2008)	As per the impact assessment table in Section 7.6 and Section 7.11.
Environmental context	MNES	
	AMPs	This hazard will not affect nearby AMPs.
	Ramsar wetlands	This hazard will not affect any Ramsar wetlands.
	TECs	This hazard will not affect any TECs.
	Nationally threatened and migratory species	This hazard is unlikely to have acute or chronic toxicity effects on threatened or migratory species.
	Other matters	
	KEFs	This hazard will not affect any KEFs.
	NIWs	This hazard will not affect any NIWs.
	State marine parks	This hazard will not affect any state marine parks.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	The EPS outlined within this table assist in mitigating the threat of chemical pollution on seabirds identified by the WCP for seabirds (2020).
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	EOG considers the risk of unplanned small discharges of drilling fluids, chemicals and hydrocarbons to be acceptable because: <ul style="list-style-type: none"> It will adhere to the company's Safety & Environmental Policy; The residual consequence rating is negligible; 	

	<ul style="list-style-type: none"> • An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved. • Input from engagement with relevant persons has been considered and incorporated into the design of the activity; and • Relevant legislation and industry best practice will be complied with.
Environmental Monitoring	
<ul style="list-style-type: none"> • Not applicable. 	
Record Keeping	
<ul style="list-style-type: none"> • Pre-acceptance MODU inspection records. • Inspection records. • Drill records. • Daily fluids reports. 	<ul style="list-style-type: none"> • PMS records. • PTWs and Job safety analysis (JSAs). • Incident reports.

8.6 RISK 6 - Marine Diesel Oil Release

8.6.1 Hazard

A release of MDO may occur from the support vessels as a result of refuelling, a vessel-to-vessel collision or a support vessel colliding with the MODU legs. The waters of the activity area and its surrounds are deep and bathymetry mapping indicates there are no sub-surface features (such as reefs or shoals) that present a risk of vessel grounding (see Figure 5.9), so this risk has been discounted for this risk assessment.

Only the vessel-to-vessel collision scenario has been taken forward for Oil Spill Trajectory Modelling (OSTM). The other scenarios are dismissed as having negligible risks or as non-credible, as discussed herein.

MODU refuelling

MODU refuelling is a closely supervised activity on board a MODU with strict controls on the transfer of fuel from support vessels to the MODU. The fuel transfer hoses are supplied by the MODU and generally have a capacity of 47 m³ (based on a re-fuelling hose 10 cm in diameter and 60 m long). The fuel transfer pump for jack-up MODUs is typically capable of supplying up to 33 m³/hr.

AMSA's guidance (AMSA, 2015) of using the fuel transfer rate multiplied by 15 minutes of flow (for supervised operations) to estimate the volume of MDO for spill modelling significantly over-estimates how long it would take to shut down re-fuelling operations and it is more likely to be around 5 minutes maximum based on industry experience. Fifteen minutes of flow from the pumps represents a potential loss of 8.25 m³ based on the maximum transfer pump rate. A spill of this volume in the operational area would rapidly evaporate and dilute with seawater, and would not reach shorelines, causing negligible environmental impacts (NOAA, 2006). Therefore, spill modelling for this scenario has not been undertaken.

Vessel collision with MODU

An errant vessel collision with the MODU is not a credible scenario for the loss of MDO from the MODU for the following reasons, and is therefore not modelled and assessed:

- A temporary PSZ will be gazetted around the MODU;

- One support vessel is present on location at all times to maintain guard and intercept any errant vessel;
- Jack-up MODU hulls are raised high above the water line (generally with an air gap of about 20 m), meaning that the tanks would not be pierced in the event of a collision with a large vessel; and
- The MDO tanks are located inboard and double-skinned (with mud, pre-load and potable tanks typically located on the outer edge of the hull), further ensuring that piercing of the MDO tanks (and fuel loss) is even more unlikely.

8.6.2 Potential Environmental Risks, EMBA and Evaluation of Environmental Risks

In line with OPGGS(E) Regulation 31 and Section 2.6 of NOPSEMA's *Environment Plan content requirement guidance note* (September 2020), EOG refers the reader to Sections 7.16.2, 7.16.3 and 7.16.4 of its PDSA EP (996161-2022-Beehive#1_PDSA-EP-Rev2, available [here](#)) that describes the environmental risks, EMBA and evaluation of environmental risks for an MDO spill. The volume chosen for that spill scenario took into account the typical fuel tank sizes on drilling support vessels (as well as vessels used to undertake geophysical and geotechnical investigations).

8.6.3 Risk Assessment

The risk assessment for an MDO release during the activity is provided in Table 8.19. The key difference with the PDSA activity is that refuelling of the MODU is likely to be required, so refuelling controls are included in this risk assessment.

Table 8.19. Risk assessment for an MDO spill

Summary			
Summary of risks	Temporary reduction in water quality. Potential toxicity impacts to marine life. Temporary fisheries closures.		
Extent of risks	EMBA is defined in Figure 7.10 to Figure 7.26 of the PDSA EP.		
Duration of risks	Short-term (several days, depending on level of contact, location and receptor).		
Level of certainty of risks	HIGH – the environmental impacts of spilled hydrocarbons are well understood.		
Risk decision framework context	Decision type	A - good industry practice required.	
	Activity	Nothing new or unusual, represents business as usual, well understood activity, good practice is well defined.	
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.	
	Stakeholder influence	No conflict with company values, no partner interest, no significant media interest.	
Defined acceptable level	No release of MDO to sea.		
Risk Assessment (inherent)			
Receptor	Consequence	Likelihood	Risk rating
Benthic fauna	Negligible	Rare	Negligible
Macroalgal communities	Negligible	Rare	Negligible

Plankton	Negligible	Rare	Negligible
Pelagic fish	Negligible	Rare	Negligible
Cetaceans	Negligible	Rare	Negligible
Marine reptiles	Minor	Rare	Negligible
Seabirds	Negligible	Rare	Negligible
Shorebirds	Negligible	Rare	Negligible
Sandy beaches	Negligible	Rare	Negligible
Rocky shores	Negligible	Rare	Negligible
Commercial fisheries	Negligible	Rare	Negligible
Assessment of Proposed Control Measures			
<i>Control measures in the 'interference with other marine users' and 'routine emissions – light' hazards are not repeated here. Only additional control measures are provided here.</i>			
Control measure	Control type	Adopt	Justification
No fuel bunkering	Elimination	No	<p>EB: Avoids the potential for a spill.</p> <p>C: The MODU has a finite storage volume that must be topped up in order to continue functioning. Without refuelling, the activity cannot continue and the objectives of the campaign cannot be met. At-sea bunkering of MODUs is a routine industry activity.</p> <p>Ev: The negligible environmental risk posed by this hazard does not justify banning bunkering at sea. This measure cannot be adopted.</p>
Support vessels refuel in port only (RSK-06:EPS-01)	Substitution	Yes	<p>EB: Reduces the risk of an at-sea spill.</p> <p>C: No additional cost. Vessels return to port regularly throughout the activity and therefore have the ability to refuel outside the operational area.</p> <p>Ev: Environmental benefits can be achieved without additional cost.</p>
MODU refuels in port only	Substitution	No	<p>EB: Reduces the risk of an at-sea spill.</p> <p>C: significant additional cost (and air emissions) associated with towing the MODU back to port for each bunkering event. Increases the duration of the campaign.</p> <p>Ev: The negligible environmental risk posed by at-sea bunkering does not justify this very expensive control measure.</p>
Refuelling procedure (RSK-06:EPS-02)	Engineering	Yes	<p>EB: Reduces the risk of hydrocarbon release to the sea.</p> <p>C: The costs of installing and maintaining the equipment, systems and processes for refuelling</p>

			on the MODU and support vessels is factored into day hire rates. Developing and implementing an refuelling procedure is routine industry practice. Ev: The benefits of having the procedure outweigh the costs.
SMPEP (RSK-06:EPS-08)	Administrative	Yes	EB: Ensures crew are well prepared to quickly respond to a spill, thereby minimising the volume spilled and the extent of sea affected. C: SMPEP should already be in place. Low costs to stock vessel with equipment and maintain it. This is standard maritime practice. Ev: Benefits outweighs the low costs.
OPEP (RSK-06:EPS-03, -05, -06)	Administrative	Yes	EB: Ensures EOG is well prepared to quickly respond to a spill, thereby minimising the extent of sea affected. C: Minimal cost to prepare OPEP and roll out training. This is standard industry practice. Significant costs for implementing response strategies and arranging call-off (standby) contracts for response resources. Ev: Environmental benefits outweigh the significant costs.
OSMP (RSK-06:EPS-07)	Administrative	Yes	EB: Ensures EOG is well prepared to quickly undertake operational and scientific studies, thereby supporting the future assessment of impacts resulting from the spill. C: High cost to prepare OSMP, detailed implementation plans and roll out training. This is standard industry practice. Low cost for putting call-off contracts in place and significant costs to implement the OSMP. Ev: Environmental benefits outweigh the significant costs.
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Preventative controls as per 'interference with other marine users' and 'routine emissions – light.' Additional controls are provided here.			
Preparedness (additional preparedness EPS are provided in Appendix B of the OPEP)			
No MDO is spilled at sea.	(RSK-06:EPS-01) No support vessel refuelling is undertaken at sea (this will be done in port).	Bunker log verifies that support vessel refuelling was undertaken in port.	
	(RSK-06:EPS-02) The MODU bunkering Procedure will be implemented in order to prevent an MDO spill. This will include (but is not limited to):		

	<ul style="list-style-type: none"> • A JSA and/or PTW is signed off for each bunkering event, taking into account spill response considerations. • Ensuring that the dry-break refuelling hose couplings assembly is in order to minimise the risk of a spill and hose floats are installed on the refuelling hose so that a hose leak is easily visible. • Ensuring that communications (visual and/or radio) between the MODU and the vessel will be tested by the MODU Chief Mate and Vessel Master prior to the commencement of bunkering. • Ensuring that fuel transfer hoses are replaced in accordance with the PMS or when they are visibly degraded. • The bunkering operation is supervised at all times. • Ensuring that bunkering only commences during daylight hours and in calm sea conditions. • Ensuring that tank level indicators and level alarms are provided in the control room for the bunkering tanks. 	<p>JSA and/or PTW records verify that spill response was taken into consideration.</p> <p>Completed refuelling checklist verifies that dry-break hose couplings and floats are installed on the refuelling hose assembly.</p> <p>PTW indicates that communications were tested between the MODU and vessel.</p> <p>Hose register and PMS indicates regular replacement of fuel hoses.</p> <p>Completed bunkering checklist verifies that bunkering was supervised.</p> <p>Completed bunkering checklist verifies that bunkering commenced in daylight hours and in calm sea conditions.</p> <p>Completed bunkering checklist verifies that the tank level alarms are functional.</p>
Emergency response		
MODU and/or support vessel crews promptly respond to a spill.	(RSK-06:EPS-03) A Beehive-1 OPEP and ERP are in place and tested in a desktop exercise by nominated Drilling Incident Management Team (DIMT) members.	The OPEP and ERP are current.
		OPEP and ERP training schedule is available and remains live.
		The training matrix is maintained as a live document and verifies that DIMT members are up to date with their training.
		OPEP and ERP exercise reports verify that exercises have been undertaken.
	(RSK-06:EPS-04) The MODU OIM and/or Vessel Master will authorise actions in accordance with the SMPEP (or equivalent according to class).	Incident reports verify that the SMPEP was implemented.
	(RSK-06:EPS-05) The Beehive-1 OPEP is implemented to limit the release of a Level 2 or 3 MDO spill.	Daily operations reports verify that the OPEP was implemented.
Recording & reporting		

EOG and regulatory authorities are promptly made of aware of near-misses and spills.	(RSK-06:EPS-06) EOG will report the MDO spill to regulatory authorities within 2 hours of the spill or becoming aware of the spill.	Incident report verifies that contact with regulatory agencies was made within 2 hours.	
Monitoring			
Characterise environmental impacts of a Level 2 or 3 spill.	(RSK-06:EPS-07) EOG will undertake operational and scientific monitoring in accordance with the OSMP.	Daily operations reports and overall study reports verify that the OSMP was implemented.	
Risk Assessment (residual)			
Receptor	Consequence	Likelihood	Risk rating
Benthic fauna	Negligible	Remote	Negligible
Macroalgal communities	Moderate	Remote	Negligible
Plankton	Moderate	Remote	Negligible
Pelagic fish	Moderate	Remote	Negligible
Cetaceans	Moderate	Remote	Negligible
Marine reptiles	Moderate	Remote	Negligible
Seabirds	Moderate	Remote	Negligible
Shorebirds	Moderate	Remote	Negligible
Sandy beaches	Moderate	Remote	Negligible
Commercial fisheries	Moderate	Remote	Negligible
The risk of an unplanned MDO release is assessed as negligible for all receptors because:			
<ul style="list-style-type: none">The control measures adopted are effective at reducing the likelihood of an unplanned MDO release to remote.			
Demonstration of ALARP			
A ‘negligible’ residual risk rating is considered to be ALARP and a ‘lower order’ impact. The adopted controls and associated EPS have lowered the risk to the point that any additional or alternative control measures either fail to lower the residual risk rating any further or are grossly disproportionate to the residual risk rating.			
Demonstration of Acceptability			
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.		
EMS compliance	Chapter 8 outlines the EP implementation strategy to be employed for this activity.		
Risk matrix standard compliance	The residual risk for each receptor is negligible, which is considered acceptable.		
Engagement	No concerns have been raised with regards to MDO spills for this activity.		

Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • <i>Navigation Act 2012</i> (Cth): <ul style="list-style-type: none"> ○ Chapter 4 (Prevention of Pollution). • <i>OPGGS Act 2006</i> (Cth): <ul style="list-style-type: none"> ○ Section 572A-F (Polluter pays for escape of petroleum). • <i>OPGGS(E)</i>: <ul style="list-style-type: none"> ○ Part 3 (Incidents, reports and records). • <i>Protection of the Sea (Prevention of Pollution by Ships) Act 1983</i> (Cth): <ul style="list-style-type: none"> ○ Section 11A (SOPEP). 	
Industry practice	<p>The consideration and alignment of EPS with the mitigation measures in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented in this activity</p>	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this activity are in line with the management measures listed for spills from vessels in Section 4.7.2 of the guidelines:</p> <ul style="list-style-type: none"> • Vessels having a SMPEP. • Vessels having radar fitted and maintaining appropriate lighting and navigation systems • Having safety exclusion zones around facilities.
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	<p>No guidance is provided regarding preventing or managing an offshore MDO spill, other than having a spill contingency plan in place. An OPEP is in place for the Beehive-1 PDSA.</p>
	Effective planning strategies for managing environmental risk associated with geophysical and other imaging surveys (Nowacek & Southall, 2016)	<p>The four practices outlined in this document have been considered (and adopted where practicable) in the development of performance standards for this EP and the survey design in general.</p>
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> • Section 75 (Spills): Conducting a spill risk assessment, implementing personnel training and field exercises, ensuring spill response equipment is available (OPEP). • Sections 76-79 (Spill response planning): A spill response plan should be prepared (OPEP).
	Environmental Manual for Worldwide Geophysical Operations (IAGC, 2013)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> • Section 8.6 (Hazardous materials): Ensuring that vessels carry a SMPEP, that spills are reported to local authorities and that oil spill response drills

		<p>are conducted at regular intervals (RSK-06: OPEP).</p> <ul style="list-style-type: none"> Section 8.8 (Vessel operations): Vessels must have oil absorbent materials available to respond to spills, and oil spills must be reported to local authorities (RSK-06: OPEP).
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore geophysical surveys:</p> <ul style="list-style-type: none"> To reduce the risk of any unplanned release of material into the marine environment to ALARP and an acceptable level.
Environmental context	MNES	
	AMPs	<p>The MDO EMBA intersects the JBG AMP. The AMP has the following relevant conservation value:</p> <ul style="list-style-type: none"> Carbonate banks and shoals. <p>As addressed in Table 7.54 to Table 7.63, the consequence of an MDO spill on these conservation values is negligible and unlikely to result in long-term ecological impacts.</p>
	Ramsar wetlands	There are no Ramsar wetlands intersected by the spill EMBA.
	TECs	There are no TECs identified in the spill EMBA.
	Nationally threatened and migratory species	Some nationally threatened species and migratory species have the potential to be present in the MDO spill EMBA, however as evaluated in the previous tables in this section, the consequence to individuals or populations of threatened and migratory species are considered negligible.
	Other matters	
	KEFs	<p>The MDO EMBA intersects the Carbonate bank and terrace system of the Sahul Shelf KEF.</p> <p>The conservation values of this KEF are related to its benthic environment (diverse corals, sponges and demersal fish), and as such are unlikely to be affected by MDO because MDO is unlikely to occur at anything other than low thresholds near the seabed.</p>
	NIWs	There are no NIWs that are intersected by the activity area or the spill EMBA.
	State marine parks	<p>The MDO EMBA intersects the North Kimberley MP, which has the following environmental values:</p> <ul style="list-style-type: none"> River estuaries; Turtle nesting beaches; Fringing reefs; Seabird and shorebird breeding sites; Marine mammal foraging habitat;

		<ul style="list-style-type: none">• Presence of pelagic finfish; and• Mangrove and intertidal mudflats. <p>Given that these values and sensitivities will not be exposed to hydrocarbon concentration that are likely to cause ecological impact, it is anticipated that the impact to these values will be negligible.</p>
	Species Conservation Advice / Recovery Plans / Threat Abatement Plans	<p>Marine pollution is a threat identified for the Australian lesser noddy, Abbott’s booby, red knot, curlew sandpiper, great knot, greater sand plover, lesser sand plover, Nunivak bar-tailed godwit, Northern Siberian bar-tailed godwit and eastern curlew. In general, population monitoring is the suggested action to deal with marine pollution. Table 7.60 outlines the potential risks of an MDO spill to these species.</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this. Table 7.58 outlines the potential risks of an MDO spill to these species.</p> <p>The WCP for seabirds (2020) identifies acute pollution (oil spills) as a moderate threat to seabirds. The EPS outlined within this table mitigate the chance of an oil spill, and therefore, reduce the probability of acute pollution impacts on seabirds.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	<p>EOG considers the risk of an MDO release to be acceptable because:</p> <ul style="list-style-type: none">• It will adhere to the company’s Safety & Environmental Policy;• The residual risk ratings are negligible;• An Implementation Strategy (described in Chapter 8) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons has been considered and incorporated into the design of the survey;• Relevant legislation and industry best practice will be complied with;• An MDO release will not have long-term or significant impacts on MNES;• The management of an MDO release is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species;• The management of an MDO release is not inconsistent with the aims of relevant marine reserve management plans; and• The management of an MDO release is not inconsistent with ESD principles.	
Environmental Monitoring		
<ul style="list-style-type: none">• As per the OPEP and OSMP.

8.7 RISK 7 – Loss of Well Control and Major Oil Spill

8.7.1 Hazard

A LoWC may occur in the highly unlikely event of all barriers on the well failing, which could result in a large-scale oil spill. As outlined in Section 2.10, the most credible worst-case release of light crude oil (using Jabiru crude as an analogue) is for an average daily release of 10,219 m³ over 77 days (the maximum time required to source a MODU, drill a relief well and kill the well). This would result in a maximum worst-case spill volume of approximately 786,794 m³.

Based on data from the Gulf of Mexico, UK and Norway from 1980-2004, it was estimated that for wells with a BOP installed, including shear rams and following the two-barrier principle, the frequency of a blowout was 3.1×10^{-4} (0.00031, or 0.031%) per exploration well drilled (OGP, 2010 in DNV, 2011). Since then, a number of additional controls and mitigation measures for well control have been introduced, based on learnings from the Macondo and Montara blowouts. The risk is expected to be even lower for this project with these additional measures:

- Additional shear rams on the BOP – three shear rams now use on BOPs. In addition, there are two variable pipe rams and one fixed diameter ram;
- Regular system and pressure testing of BOP is conducted; and
- Third-party verification of BOP testing and maintenance is conducted.

In this section, the risk assessment is based on a worst-case scenario assuming that the flow of oil has not stopped until day 77 and in the absence of spill response measures. Oil spill response actions that would reduce the impact in the event of a spill are discussed in Section 8.8.

8.7.2 Potential Environmental Risks

The known and potential risks of a LoWC are:

- A temporary to long-term and widespread reduction in water quality;
- Injury or death of exposed marine fauna and seabirds;
- Habitat damage, especially where the spill reaches shorelines; and
- Changes to the functions, interests or activities of other users (e.g., commercial fisheries).

8.7.3 EMBA

The outer boundary of the environment that may be affected (EMBA) by a loss of well control (LoWC) event during the Beehive-1 drilling activity was determined using the combined

stochastic results of oil spill trajectory modelling (OSTM) (RPS, 2022b) from 100 simulations per season (summer, winter, transitional) and applying the following thresholds:

- 1 g/m² floating oil thickness, which is considered to be below levels which would cause environmental harm and is more indicative of the areas perceived to be affected due to its visibility on the sea-surface
- 10 g/m² for accumulated (shoreline) oil, which represents the area visibly contacted by the spill
- 10 ppb for dissolved hydrocarbons corresponds generally with potential for exceedance of water quality triggers
- 10 ppb entrained hydrocarbons represents the low exposure zone and corresponds generally with potential for exceedance of water quality triggers.

The EMBA for a LoWC (sea surface, shoreline, entrained and dissolved hydrocarbons) is illustrated in Figure 8.4 to Figure 8.19. Receptors most at risk within this EMBA are those within the water column, whether resident or migratory, are:

- Water quality;
- Seabed sediments;
- Plankton;
- Invertebrates;
- Fish;
- Marine mammals;
- Marine reptiles;
- Seabirds and shorebirds;
- Shoreline habitats (sandy beaches, mangroves, tidal flats, mud flats, rocky shores);
- Values of protected areas; and
- Socio-economic values (e.g., commercial fisheries).

8.7.4 Oil Spill Trajectory Modelling

To understand the risks posed by a LoWC, EOG commissioned RPS to undertake OSTM for a worst-case spill of 786,858 m³ over 77 days (RPS, 2022b). The spill was tracked for 98 days for each of the three distinct seasons in the region:

- Summer – October to February;
- Transitional – March and September; and
- Winter – April to August.

The adopted exposure values are based primarily on the exposure values defined in NOPSEMA *Bulletin #1 Oil Spill Modelling* (April 2019), as listed in Table 5.2 of Chapter 5. Exposure values applied for surface, entrained, dissolved and shoreline accumulated hydrocarbons used in the modelling study are summarised in Table 8.21.

Stochastic modelling overlays the results of each of the 100 simulations per season to give the widest possible area that may be affected by a spill. This is used to determine the EMBA and

support risk assessments. It should be noted that no individual spill would cover the entire EMBA. For response planning purposes, the worst-case deterministic results of the modelling are used. The deterministic results are selected from the individual simulations which show the maximum volume of oil ashore and maximum length of shoreline affected.

The modelling included scenarios with and without the application of dispersants. The modelling showed that dispersant application decreased oil loads on shorelines and on the sea surface (see Appendix 12). As such, the maximum extent of the EMBA is based on a worst-case LoWC without dispersant use. The risk assessment presented in this section does include potential impacts from dispersant use, where applicable.

The OSTM report is provided in **Appendix 12**.

Modelling inputs

The modelling was undertaken using the crude oil properties outlined in Table 2.3. The boiling point ranges for the Jabiru analogue oil are presented in Table 8.19, and Table 8.20 presents the key physical properties of the oil.

Table 8.19. Boiling points and persistence of Jabiru crude

	Volatiles	Semi-volatiles	Low Volatiles	Residual Oil
Boiling Point (°C)	< 180	180-160	160-380	> 380
Carbon range	C ₄ to C ₁₀	C ₁₁ to C ₁₅	C ₁₆ to C ₂₀	>C ₂₀
Jabiru crude	24.2%	20.9%	33.9%	21.0%
Evaporation times	Up to 12 hrs	Up to 24 hrs	Several days	Slow
Persistence	Non-persistent			Persistent

Table 8.20. Key physical characteristics of Jabiru crude

Characteristic	Details
Density (kg/m ³)	813.9 at 15°C
API	42.3
Dynamic viscosity (cP)	3.0 at 20°C
Pour point (°C)	18
Oil property category	Group II
Oil persistence classification	Light persistent oil

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and subsurface releases and has been used to predict the weathering and fate of oil spills during and after major incidents including Montara (Australia), Macondo (USA) Bohai Bay (China) oil spill and the pipeline oil spill July 2013 in the Gulf of Thailand. The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, whether spilled at surface or discharged subsea.

The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and subsurface dispersant application. The SIMAP oil spill model includes advanced weathering algorithms, specifically focused on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on five years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico.

Biodegradation is included in the oil spill model. In SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil, a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

Table 8.21 outlines the key OSTM inputs.

Table 8.21. Summary of the OSTM inputs

Parameter	Details
Oil Type	Jabiru crude
Total spill volume	4,949,192 bbl (~786,858 m ³)
Release rate	Average of 64,275 bbl (10,219 m ³) per day
Release type	Sea surface
Release duration	77 days
Simulation duration	98 days
Number of simulations	100 per season (300 in total)
Surface oil concentration thresholds (g/m ²)	1 g/m ² – low exposure 10 g/m ² – moderate exposure 50 g/m ² – high exposure
Shoreline load threshold (g/m ²)	10 g/m ² – low exposure 100 g/m ² – moderate exposure 1,000 g/m ² – high exposure
Dissolved aromatic dosages to assess potential exposure (ppb)	10 ppb – low exposure 50 ppb – moderate exposure 400 ppb – high exposure
Entrained oil dosages to assess potential exposure (ppb)	10 ppb – low exposure 100 ppb – high exposure

Weathering

RPS conducted a series of model weather tests to illustrate the potential behaviour of the Jabiru crude oil when exposed to idealised and representative environmental conditions:

- A 1-hour release onto the water surface at a discharge rate of 25 m³/hr under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (25°C) and average air temperature (29°C). The slick was also subject to ambient tidal and drift currents.
- A 1-hour release onto the water surface at a discharge rate of 50 m³/hr under variable wind conditions (1-12 knots), assuming low seasonal water temperature (25°C) and average air temperature (29°C). The slick was also subject to ambient tidal and drift currents.

The first case is indicative of cumulative weathering rates under calm conditions that would not generate entrainment, while the second case may represent conditions that could cause a minor degree of entrainment. Both scenarios provide examples of potential behaviour during periods of a spill event once the oil reaches the surface.

The mass balance forecast for the constant-wind case (Figure 8.2) shows that 45.3% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 8.3), where the winds are of greater strength on average, entrainment of the crude oil into the water column is predicted to increase. Approximately 24 hours after the spill, 54.1% of the oil mass is forecast to have entrained and a further 42.8% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s). The increased level of entrainment in the variable-wind case will result in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of ~1.3% per day with an accumulated total of ~9.1% after 7 days, in comparison to a rate of ~0.3% per day and an accumulated total of ~2.4% after 7 days in the constant-wind case.

Table 8.22 summarises the mass balance for the calm wind and variable wind case at day 7. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over several weeks.

Figure 8.2. Proportional mass balance plot representing the weathering of crude oil spilled onto the water surface over 1 hour and subject to a constant 5 knots (2.6 m/s) wind speed at 25°C water temperature and 29°C air temperature

Figure 8.3. Proportional mass balance plot representing the weathering of crude oil spilled onto the water surface over 1 hour and subject to variable wind speeds (1-12 knots) at 25°C water temperature and 29°C air temperature

Table 8.22. Summary of the mass balance at day 7

Exposure metric	Calm wind conditions	Variable wind conditions
Surface/floating oil (%)	44.4	0
Shoreline (%)	0	0
Entrained (%)	3.6	44.5
Evaporated (%)	49.2	44.2
Decay (%)	2.4	9.1

Results are based on a 25 m³ surface release of crude oil over 1 hour, tracked for 7 days.

Exposure thresholds

The outputs of the OSTM are used to assess the environmental risk if a credible hydrocarbon spill scenario occurred, by defining which areas of the marine environment could be exposed to hydrocarbon concentrations that exceed exposure values that may result in impact to sensitive receptors.

The degree of impact will depend on the sensitivity of the biota contacted, the duration of the exposure and the toxicity of the hydrocarbon mixture making the contact. The toxicity of a hydrocarbon will change over time, due to weathering processes altering the composition of the hydrocarbon.

The OSTM considered four key physical or chemical phases of hydrocarbons that pose differing environmental and socio-economic risks:

- Surface hydrocarbons;
- Entrained hydrocarbons;
- Dissolved hydrocarbons; and
- Shoreline accumulated hydrocarbons.

The modelling used defined hydrocarbon exposure values (see Table 8.21), as relevant for risk assessment and oil spill planning, for the various hydrocarbon phases. To ensure conservatism in the environmental assessment process, the exposure values applied to the model are selected to adopt the most sensitive receptors that may be exposed, the longest likely exposure times and the more toxic hydrocarbons.

Modelling Results

This section presents the stochastic OSTM results. These are presented for the different hydrocarbon phases (surface, entrained, dissolved and shoreline) for each of the three modelling seasons (summer, winter and transition).

The results are calculated based on 100 simulations per season of a volume of 786,858 m³ over 77 days and tracked for 98 days. Section 10.1 of Appendix 12 presents the detailed tabulated results of the stochastic analysis, with the associated maps presented here:

- Surface/floating oil – Figures 8.4, 8.5 and 8.6, and zones of floating oil for the deterministic trajectory with the largest swept area above 1 g/m² in Figure 8.7;

- Shoreline oil - Figures 8.8, 8.9 and 8.10, and the deterministic trajectory with the largest volume of oil ashore in Figure 8.11;
- Dissolved hydrocarbons (0-10 m below the sea surface) – Figures 8.12, 8.13 and 8.14, and the deterministic trajectory with the largest area of dissolved hydrocarbons above 10 ppb in Figure 8.15; and
- Entrained hydrocarbons (0-10 m below the sea surface) – Figures 8.16, 8.17 and 8.18, and the deterministic trajectory with the largest area of entrained hydrocarbons above 10 ppb in Figure 8.19.

Note that the stochastic results shown in the following figures represent the cumulative results of 100 individual spill scenarios, not the result of an individual spill.

8.7.5 Evaluation of Environmental Risks

An environmental risk assessment for the receptors at risk from a LoWC at Beehive-1 is provided in this section, based on a literature review of the sensitivities of the receptors to oil. The defined spill EMBA is highly conservative as the stochastic modelling does not consider response actions to reduce the extent or impacts of a LoWC.

The criteria used to classify the sensitivity of receptors that may be affected by an oil spill, and thereby identify protection priorities, are presented in Table 8.23. These categories reflect environmental values in NatPlan (AMSA, 2020), the WA Oil Spill Contingency Plan (WA DoT, 2015) and the NT Oil Spill Contingency Plan (Dept of Transport Marine Safety, 2014).

The impacts of the LoWC on environmental and socio-economic receptors in the spill EMBA, and their sensitivity criteria, are described in Table 8.24 to Table 8.37. The assessment is divided into subtidal habitat, intertidal habitat and water column segments.

A summary of the sensitivity and location of these environmental receptors is provided in Table 8.23.

Table 8.23. Criteria used to determine receptor sensitivity in the spill EMBA

Table 8.24. Sensitivity and consequence evaluation of hydrocarbon exposure to subtidal communities - benthic assemblages

General sensitivity to oiling – benthic assemblages	
Sensitivity rating of benthic species and communities:	Low
A description of benthic fauna in the spill EMBA is provided in:	Appendix 11, Section 5.3.1
<p><u>Surface hydrocarbons</u></p> <p>Benthic species are generally protected from exposure to surface hydrocarbon. The primary modes of exposure for benthic communities in oil spills include:</p> <ul style="list-style-type: none"> • Direct exposure to dispersed oil (e.g., physical smothering) where bottom hydrocarbons stay at the ocean bottom; • Direct exposure to dispersed and non-dispersed oil (e.g., physical smothering) where oil sinks to seabed from higher depths of the ocean; • Direct exposure to dispersed and non-dispersed oil dissolved in sea water and/or partitioned onto sediment particles; and • Indirect exposure to dispersed and non-dispersed oil through the food web (e.g., uptake of oiled plankton, detritus, prey, etc.) (NRDA, 2012). <p>Adult marine invertebrates and larvae usually reside within benthic substrates and pelagic waters, rarely reaching the water's surface in their life cycle (to breed, breathe and feed). Therefore, surface hydrocarbons are not considered to pose a high risk to marine invertebrates except at locations where surface oil reaches shorelines.</p> <p>Acute or chronic exposure, through surface contact, and/or ingestion can result in toxicological risks. However, the presence of an exoskeleton (e.g., crustaceans) reduces the impact of hydrocarbon absorption through the surface membrane. Other invertebrates with no exoskeleton and larval forms may be more prone to impacts from hydrocarbons.</p> <p><u>Water column/seabed hydrocarbons</u></p> <p>Entrained and dissolved hydrocarbons can have negative impacts on marine invertebrates and associated larval forms, while impacts to adult species is reduced as a result of the presence of an exoskeleton. Localised impacts to larval stages may occur which could impact on population recruitment that year. If invertebrates are contaminated by hydrocarbons, tissue taint can remain for several months, although taint may eventually be lost. For example, it has been demonstrated that it took 2-5 months for lobsters to lose their taint when exposed to a light hydrocarbon (NOAA, 2002).</p> <p>Exposure to microscopic oil droplets may also impact aquatic biota either mechanically (especially filter feeders) or act as a conduit for exposure to semi-soluble hydrocarbons (that might be taken up by the gills or digestive tract) (McCay-French, 2009). Toxicity is primarily attributed to water soluble PAHs, specifically the substituted naphthalene (C₂ and C₃) as the higher C-ring compounds become insoluble and are not bioavailable. ANZECC/ARMCANZ (2000) identifies the following 96-hr LC₅₀ concentrations for naphthalene (a key primary PAH dissolved phase toxicant in crude oils):</p> <ul style="list-style-type: none"> • For the bivalve mollusc, <i>Katylsia opima</i>, a concentration of 57,000 ppb; and • For six species of marine crustaceans, a concentration between 850 and 5,700 ppb. 	

Other possible impacts from the presence of dispersed and non-dispersed oil include effects of oxygen depletion in bottom waters due to bacterial metabolism of oil (and/or dispersants), and light deprivation under surface oil (NRDA, 2012).

Surveys undertaken after the Montara well blowout in the Timor Sea in 2009 found no obvious visual signs of major disturbance at Barracouta and Vulcan shoals (Heyward *et al.*, 2010), which occur about 20-30 m below the water line in otherwise deep waters (generally >150 m water depth). Later sampling indicated the presence of low-level severely degraded oil at some shoals, though in the absence of pre-impact data, this could not be directly linked to the Montara spill. Levels of hydrocarbons in the sediments were, in any case, several orders of magnitude lower than levels at which biological effects become possible (Heyward *et al.*, 2010; Gagnon & Rawson, 2011).

Studies undertaken since the Macondo well blowout in the Gulf of Mexico (GoM) in 2010 have shown that fewer than 2% of the more than 8,000 sediment samples collected exceeded the EPA sediment toxicity benchmark for aquatic life, and these were largely limited to the area close to the wellhead (Felder *et al.*, 2014).

Studies of offshore benthic seaweeds in the northwest GoM prior to and after the Macondo well blowout at Sackett and Ewing banks (in water depths of 55-75 m) found a dramatic die-off of seaweeds after the spill (60 species pre-spill compared with 10 species post-spill) (Felder *et al.*, 2014). Benthic decapod assemblages (crabs, lobsters, prawns) associated with the seaweeds and benthic substrate also showed a strong decline in abundance at both banks post-spill (species richness on Ewing Bank reduced by 42% and on Sackett Bank by 29%), though it is noted that these banks are exposed to influences from Mississippi River discharges that vary year to year, so definitive links to the oil spill are not possible. It is noted, however, that petroleum residues were observed on Ewing Bank and it is possible that this may have caused localized mortalities, reduced the fecundity of surviving female decapods or reduced recruitment (Felder *et al.*, 2014). Felder *et al.* (2014) also notes that freshly caught soft-sediment decapod samples caught in early and mid-2011 near the spill site exhibited lesions that were severe enough to cause appendage loss and mortality.

Recovery of benthic habitats exposed to entrained hydrocarbons would be expected to return to background water quality conditions within weeks to months of contact. Several studies have indicated that rapid recovery rates may occur even in cases of heavy oiling (Committee on Oil in the Sea, 2003).

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	Not applicable to benthic fauna.
Water column (dissolved & entrained) (0-10 m from surface)	<p>The OSTM predicts extensive areas where is a high probability that medium and high exposure thresholds are reached for dissolved and entrained oil.</p> <p>For much of this area, water depths are greater than 10 m and therefore ecological impacts to benthic fauna are unlikely.</p> <p>In areas of exposure at the seabed, the impacts are likely to be as described in the description of sensitivities. Where such areas contain coral reefs, shoals and/or banks, contact with dissolved and entrained oil may result in toxicity effects and potential mortality (see following tables).</p> <p>One of the key values of the JBG AMP is the Carbonate bank and terrace system of the Sahul Shelf KEF (unique seafloor feature with ecological properties of regional significance). Most of the JBG AMP is in water depths greater than 10 m, so hydrocarbons in the top 10 m of the water column are not likely to have significant impacts on this AMP value.</p>

Shoreline	<p>The shoreline sectors predicted to have the highest average shoreline loading of oil at moderate or high thresholds across all seasons, and their dominant shoreline types, are (moving from west to east):</p> <ul style="list-style-type: none"> • Adele Island (WA) - sandy beach. • Browse Island (WA) - sandy beach, coral reef. • Wyndam-East Kimberley (WA) – tidal flats/mangroves, rocky shore, beach sediments. • Victoria-Daly (NT) - tidal flats/mangroves. • Thamarrurr (NT) - tidal flats/mangroves, sandy beach, rocky shore. <p>The OSTM predicts extensive shoreline exposure at thresholds that can cause biological impacts (224 km for at moderate threshold). The shoreline of the spill EMBA has a diverse array of benthic fauna, including molluscs (such as mussels) and crustaceans (such as crabs) that live in or on beach sediments, mangroves, mudflats and rocks. At the moderate and high loading thresholds, there is expected to be injury or mortality of exposed benthic fauna due to oil toxicity, which will likely result in bioaccumulation impacts further up the food chain when seabirds, shorebirds and other fauna consume them. How extensive this is depends on the volume that reaches the shoreline and where the oil is deposited.</p> <p>Oiling and contamination of benthic communities on the shorelines closest to the well is likely to result in temporary exclusion of members of the Wunambal Gaambera, Balanggarra, Ngaringin and/or Miriwung Gajerrong people using their traditional coastal country to seek food and other resources.</p>
Inherent impact consequence	Moderate

Table 8.25. Sensitivity and consequence evaluation of hydrocarbon exposure to subtidal communities – macroalgae and seagrasses

General sensitivity to oiling – macroalgal and seagrass communities	
Sensitivity rating of macroalgal species and seagrass communities:	Medium
A description of macroalgal species and communities in the spill EMBA is provided in:	Appendix 11, Section 5.3.2
<p>Macroalgae are generally limited to growing on intertidal and subtidal rocky substrata in shallow waters to 10 m depth where they have access to light to photosynthesise. Seagrasses generally grow in sediments in intertidal and shallow subtidal waters where there is sufficient light, and are common in sheltered coastal areas such as bays, lees of islands and fringing coastal reefs. Macroalgae and seagrass are also common features of shoals. As such, they may be exposed to subsurface entrained and dissolved hydrocarbons.</p> <p><u>Macroalgae</u></p> <p>Smothering, fouling and asphyxiation are some of the physical effects that have been documented from oil contamination in marine plants (Blumer, 1971; Cintron <i>et al.</i>, 1981). In macroalgae, oil can act as a physical barrier for the diffusion of CO₂ across cell walls (O'Brian & Dixon, 1976). The effect of hydrocarbons however is largely dependent on the degree of direct exposure and how much of the hydrocarbon adheres to algae, which will vary depending on the oils physical state and relative 'stickiness'. The morphological features of macroalgae, such as the presence of a mucilage layer or the presence of fine 'hairs' will influence the amount of hydrocarbon that will adhere to the algae. A review of field studies conducted after spill events by Connell <i>et al</i> (1981) indicated a high degree of variability in the level of impact, but in all instances, the algae appeared to be able to recover rapidly from even very heavy oiling. The rapid recovery of algae was attributed to the fact that for most algae, new growth is produced from near the base of the plant while the distal parts (which would be exposed to the oil contamination) are continually lost. Other studies have indicated that oiled kelp beds had a 90% recovery within 3-4 years of impact, however full recovery to pre-spill diversity may not occur for long periods after the spill (French-McCay, 2004).</p> <p>Intertidal macroalgal beds are more prone to oil spills than subtidal beds because although the mucous coating prevents oil adherence, oil that is trapped in the upper canopy can increase the persistence of the oil, which impacts upon site-attached species. Additionally, when oil sticks to dry fronds on the shore, they can become overweight and break as a result of wave action (IPIECA, 2002).</p> <p>The toxicity of macroalgae to hydrocarbons varies for the different macroalgal life stages, with water-soluble hydrocarbons more toxic to macroalgae (Van Overbeek & Blondeau, 1954; Kauss <i>et al.</i>, 1973; cited in O'Brien and Dixon, 1976). Toxic effect concentrations for hydrocarbons and algae have varied greatly among species and studies, ranging 0.002–10,000 ppm (Lewis & Pryor, 2013). The sensitivity of gametes, larva and zygote stages however have all proven more responsive to petroleum oil exposure than adult growth stages (Thursby & Steele, 2003; Lewis & Pryor, 2013).</p> <p>In addition to the potential impacts from direct smothering or exposure to entrained and dissolved hydrocarbons, the presence of entrained hydrocarbons within the water column can affect light qualities and the ability of plants to photosynthesise.</p>	

Seagrass

Seagrasses can be exposed to oil by direct contact (i.e., smothering) and by uptake by rhizomes through contaminated sediments. Exposure also can take place via uptake of hydrocarbons through plant membranes. In addition, seeds may be affected by contact with oil contained within sediments (NRDA, 2012). When seagrass leaves are exposed to petroleum oil, sub-lethal quantities of the WAF can be incorporated into the tissue, causing a reduction in tolerance to other stress factors (Zieman et al., 1984). The toxic components of petroleum oils are thought to be the PAH, which are lipophilic and therefore able to pass through lipid membranes and tend to accumulate in the thylakoid membranes of chloroplasts (Ren et al., 1994).

As such, the susceptibility of seagrasses to hydrocarbon spills will depend largely on distribution. Deeper communities will be protected from oiling under all but the most extreme weather conditions. Shallow seagrasses are more likely to be affected by dispersed oil droplets or, in the case of emergent seagrasses, direct oiling. Theoretically, intertidal seagrass communities would be the most susceptible because the leaves and rhizomes may both be affected.

Studies report that the phytotoxic effect of petroleum oil on seagrasses can lead to a range of sub-lethal responses including reduced growth rates (Howard & Edgar, 1994), bleaching, decrease in the density of shoots, reduced flowering success (den Hartog & Jacobs, 1980; Dean et al., 1998) and blackened leaves that can detach from the plant following oil contamination (den Hartog & Jacobs, 1980). Direct exposure, however, does not always induce toxic effects (Kenworthy et al., 1993; Dean et al., 1998), even under laboratory conditions (Wilson & Ralph, 2012).

Studies of actual spills have found no significant differences between oiled and un-oiled seagrass meadows comprising *Halodule uninervis*, *Halophila ovalis* and *Halophila stipulacea* following large spills of crude oil during the Gulf War (Kenworth et al., 1993). Similarly, a spill of heavy fuel oil contaminated by lighter fuel products in Gladstone Harbour (Queensland) did not result in measurably short- or long-term impacts on meadows of *Zostera capricorni*, *H. ovalis*, *H. decipiens*, *H. spinulosa* or *H. uninervis* (Taylor & Rasheed, 2011). Conversely, one laboratory study using Bass Strait crude and diesel fuel did observe mortality of affected seagrass, with slow recovery (Clarke & Ward, 1994).

One reason why seagrasses appear to be less vulnerable to oil impacts is that 50-80% of their biomass is in their rhizomes, which are buried in sediments, thus less likely to be adversely impacted by oil. Thus, even if the fronds are affected, the plant may still be alive and able to regrow (Zieman et al., 1984)

In addition to the effects described, the presence of entrained hydrocarbons within the water column can affect light qualities and the ability of seagrass to photosynthesise. Studies of photosynthetic impacts on seagrass used WAF of Tapis crude and IFO-180, with concentrations ranging from 3 – 522 mg/L-1, found minimal or no negative impacts (Wilson & Ralph, 2012).

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	Not applicable.
Water column (dissolved & entrained) (0-10 m from surface)	<p>The OSTM predicts extensive areas where there is a high probability that medium and high exposure thresholds are reached for dissolved and entrained oil.</p> <p>All nearshore environments along the coastline of the spill EMBA are expected to contain some degree of marine plant life presence, whether this be isolated or extensive seagrass meadows or stands of green, red and brown algae (seaweed), noting however that there is scant information about the presence of seagrasses north of Broome (WA). Seaweed is of course omnipresent in the marine environment.</p>

	<p>Areas where such subtidal communities are likely to be present include offshore islands, sheltered bays, crevices among rocky shores and offshore shoals.</p> <p>As per the sensitivity description, the impacts to macroalgae and seagrasses may result in toxicity effects and potential mortality. Any reduced growth rates or temporary loss of grass cover (noting that rhizomes growing in seabed sediments would remain intact) may result in dieback of seagrasses. This may lead to a temporary reduction in fish nursery habitat, with consequent losses in fish diversity and abundance. This may have longer-term impacts on the size of fish populations.</p> <p>Contaminated macroalgae consumed by fish, turtles, dugongs and shorebirds will result in some level of bioaccumulation up the food chain. How extensive this is depends on the concentration of oil in the water column, the level of contamination of the macroalgae and the species exposed. Dugongs feed exclusively on seagrasses. The ecological spill EMBA intersects a very small area of the dugong foraging BIA in the area north of Broome, noting that there is only a 1% probability of oil contact at the low threshold in this area. This is not expected to have ecological consequences and therefore dugong present in the area are unlikely to be impacted by a contaminated food source.</p>	
Shoreline	Addressed in 'water column'.	
Inherent impact consequence	Moderate	

Table 8.26. Sensitivity and consequence evaluation of hydrocarbon exposure to subtidal communities – coral

General sensitivity to oiling – corals	
Sensitivity rating of coral (intertidal):	High
Sensitivity rating of coral (subtidal):	Medium
A description of coral reefs in the spill EMBA is provided in:	Appendix 11, Section 5.3.2
<p>Experimental studies and field observations indicate all coral species are sensitive to the effects of oil, although there are considerable differences in the degree of tolerance between species. Differences in sensitivities may be due to the ease with which oil adheres to the coral structures, the degree of mucous production and self-cleaning, or simply different physiological tolerances.</p> <p>Direct contact of coral by hydrocarbons may impair respiration and also photosynthesis by symbiotic zooanthellae (Peter <i>et al.</i>, 1981; Knap <i>et al.</i>, 1985). Coral gametes or larvae in the surface layer where they are exposed to the slick may also be fouled (Epstein <i>et al.</i>, 2000). Larvae in the water column at the time of spawning are especially vulnerable to oil (Hook <i>et al.</i>, 2016). Physical oiling of coral tissue can cause a decline in metabolic rate and may cause varying degrees of tissue decomposition and death (Negri and Heyward, 2000). Oil may also cling to certain types of sediment causing oil to sink to the seafloor, covering corals in oiled sediment (IPIECA, 2011).</p> <p>Where corals come into direct contact with surface exposures (i.e., intertidal/shallow areas), they are more susceptible due to physical presence, than toxicity associated with dissolved oil components within the water column which, in some cases, may be more toxic than the floating surface slicks (Volkman <i>et al.</i>, 1994). A range of impacts is reported to result from toxicity including partial mortality of colonies, reduced growth rates, bleaching and reduced photosynthesis.</p> <p>Chronic effects of oil exposure have been consistently noted in corals and, ultimately, can kill the entire colony. Chronic impacts include histological, biochemical, behavioural, reproductive and developmental effects. Field studies of chronically polluted areas and manipulative studies in which corals are artificially exposed to oil show that some coral species tolerate oil better than other species (NOAA, 2010c).</p> <p>Reproductive stages of corals have been found to be more sensitive to oil toxicity. Fertilisation of coral species has been observed to be completely blocked in <i>Acropora tenuis</i> at heavy fuel oil concentrations of 0.15 mg/L⁻¹ (Harrison, 1994; 1999), with significant reductions in fertilisation of <i>A. millepora</i> and <i>A. valida</i> at concentrations between 0.58 and 5.8 mg/L⁻¹, in addition to developmental abnormalities and reduced survival of coral larvae at similar concentrations (Lane and Harrison, 2000). Lower concentrations of less than 0.1 mg/L⁻¹ crude oil were observed to inhibit larval metamorphosis in <i>A. millepora</i> (Negri & Heywood, 2000).</p> <p>Studies undertaken after the Montara spill (a light crude) in northwest Australia included diver surveys to assess the status of Ashmore, Cartier and Seringapatam coral reefs. These found that other than a region-wide coral bleaching event caused by thermal stress (i.e., caused by sea water exceeding 32°C), the condition of the reefs was consistent with previous surveys, suggesting that any effects of hydrocarbons reaching these reefs was minor, transitory or sub-lethal and not detectable (Heyward <i>et al.</i>, 2010). This is despite AMSA observations of surface slicks or sheen nears these shallow reefs during the spill (Heyward <i>et al.</i>, 2010). Surveys in 2011 indicated that the corals exhibiting bleaching in 2010 had largely survived and recovered (Heyward <i>et al.</i>, 2012), indicating that potential exposure to hydrocarbons while in an already stressed state did not have any impact on the healthy recovery of the coral.</p>	

In addition, surveys undertaken after the Montara blowout on the plateau areas of Barracouta and Vulcan shoals (Heyward *et al.*, 2010), which occur about 20-30 m below the water line in otherwise deep waters (generally >150 m water depth), and contain algae, hard coral and seagrass, found no obvious visual signs of major disturbance.

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	Not applicable.
Water column (dissolved & entrained) (0-10 m from surface)	<p>The OSTM predicts extensive areas where there is a high probability that medium and high exposure thresholds are reached for dissolved and entrained oil, which may impact coral reefs. Key areas within the ecological spill EMBA known to contain coral reef, and their risk of contact within the water column, are:</p> <ul style="list-style-type: none"> • JBG AMP (Cth) – 66-97% (dissolved) and 83-100% (entrained) probability of contact across the seasons. • Ashmore Reef AMP (Cth) – 0% (dissolved) and 0-14% (entrained) probability of contact across the seasons. • Cartier Island AMP (Cth) – 0% (dissolved) and 0-15% (entrained) probability of contact across the seasons. • Mermaid Reef AMP (Cth) – 0-2% (dissolved) and 2-5% (entrained) probability of contact across the seasons. • Browse Island (WA) – 1-13% (dissolved) and not reported (entrained) probability of contact across the seasons. • Heywood Shoal (Cth) – 0-4% (dissolved) and 19-38% (entrained) probability of contact across the seasons. • Mermaid Reef (Cth) – 0-3% (dissolved) and 0-5% (entrained) probability of contact across the seasons. • Vulcan Shoal (Cth) – 0-3% (dissolved) and 0-22% (entrained) probability of contact across the seasons. • Scott Reef (north & south) (WA) – 0-2% (dissolved) and 1-6% (entrained) probability of contact across the seasons. • Seringapatam Reef (WA) – 0% (dissolved) and 0-7% (entrained) probability of contact across the seasons. • Ashmore Reef (Cth) – 0% (dissolved) and 0-14% (entrained) probability of contact across the seasons. • Hibernia Reef (Cth) – 0% (dissolved) and 0-5% (entrained) probability of contact across the seasons. <p>As per the sensitivity assessment, the impacts to coral reef may result in localised or widespread areas of colony mortality, decreased growth rates, decreased survival of larvae, decreased gonadal development and increased bleaching (Hook <i>et al.</i>, 2016). Such impacts to coral reefs will have consequences for the fish and other species dependent on coral habitat. Corals also accumulate oil from the water column, which can persist and become biologically available to fish and other fauna that graze on them (Hook <i>et al.</i>, 2016). Recovery of coral reefs after exposure to oil can be slow and they may become overgrown by algae and become susceptible to other stressors, such as predators (Hook <i>et al.</i>, 2016).</p> <p>Impacts to coral reefs within AMPs and state marine parks may reduce the ecological values of those parks and possibly lead to lower ecotourism visits and associated loss of income for tourism businesses dependent on tourists.</p>

Shoreline		Addressed in 'water column'.
Inherent impact consequence:	Severe	

Table 8.27. Sensitivity and consequence evaluation of hydrocarbon exposure to intertidal communities – mangroves and salt marshes

General sensitivity to oiling – mangroves and salt marshes	
Sensitivity rating of mangroves and salt marshes:	High
A description of mangroves and salt marshes in the spill EMBA is provided in:	Appendix 11, Sections 5.2.3 & 5.2.4
<p>Mangrove and saltmarsh ecosystems are specially adapted to marine and estuarine conditions and play an important role in reducing wave energy at the coast and preventing shoreline erosion, with mangroves providing nursery habitat for many species of marine fauna (Hook <i>et al.</i>, 2016).</p> <p><u>Mangroves</u></p> <p>The impacts of surface hydrocarbons on mangroves include damage as a result of smothering of lenticels (mangrove breathing pores) on pneumatophores or aerial roots (Hook <i>et al.</i>, 2016), or by the loss of leaves (defoliation) due to chemical burning. It is also known that mangroves take up hydrocarbons from contact with leaves, roots or sediments, and it is suspected that this uptake causes defoliation through leaf damage and tree death (Wardrop <i>et al.</i>, 1987).</p> <p>Entrained and dissolved hydrocarbons may potentially impact mangrove communities through the sediment/mangrove root interface. Entrained and dissolved hydrocarbons contain contaminants that may become persistent in the sediments (e.g., trace metals, PAHs), leading to direct effects on mangroves due to direct uptake, or indirect effects due to impacts on benthic infauna and thus leading to reduced rates of bioturbation and subsequent oxygen stress on the plants root systems.</p> <p>The following information is from IPIECA (1993) and NOAA (2014). Oil slicks enter mangrove forests when the tide is high and are deposited on the aerial roots and sediment surface as the tide recedes. This process commonly leads to a patchy distribution of the oil and its effects because different places within the forests are at different tidal heights. Mangroves can be killed by heavy or viscous oil that covers the trees' breathing pores thereby asphyxiating the subsurface roots, which depend on the pores for oxygen. This is also likely to apply to oil emulsions that may flow into mangrove forests. Observed thresholds for impacts are likely to vary depending on the health of the system, the spilt hydrocarbon and the environmental conditions, however observations by Lin and Mendelssohn (1996), demonstrated that more than 1 kg/m² of oil during the growing season would be required to impact marsh or mangrove plants significantly.</p> <p>Mangroves can also be killed through the toxicity of substances in the oil, especially lower molecular weight aromatic compounds, which damage cell membranes in the subsurface roots. This in turn impairs the normal salt exclusion process, and the resulting influx of salt is a source of stress to the plants. The organisms among and on the mangrove trees are also affected by the oil. There may be heavy mortalities as a direct result of the oil penetrating burrows in the sediments, killing crabs and worms, or coating molluscs present on the sediment surface and aerial roots. Dead trees lead to loss of habitat for organisms living in the branches and canopy of the trees, and in the aerial root systems.</p> <p>Over time, several factors reduce the toxicity of oil that has been deposited in mangrove forests. The amount of oil in the soil is reduced by rain and tides. As the oil weathers, chemical changes such as oxidation make the residual oil less toxic. Eventually the soil can support mangrove growth once more, with the time-scale involved varying according to local conditions such as the amount of water circulation in the immediate area.</p> <p>White mangroves (<i>Avicennia marina</i>), which are found in pockets of the southern Australian coast, have been found to be highly susceptible to weathered crude oil, with field studies showing acute effects (mortality) of 96% to seedlings. Similar impacts may be expected for mangrove species in northern Australia. Observations from</p>	

oil spill in mangroves indicate mangrove stress occurs within the first two weeks of a spill (ranging from chlorosis to defoliation to death). Chronic effects to mangroves can be more difficult to detect than acute effects, with defoliation and death of mangroves taking place anywhere from 30 days to years after exposure to crude oil. Root and pneumatophore abnormalities have been reported as a response to chronic oil exposures (Hook *et al.*, 2016). Mendelssohn *et al* (2012) notes that PAHs are the most toxic contaminants and are persistent in marshes. The highest levels generally occur below the sediment surface, where there is limited oxygen and a concomitant shift from aerobic to anaerobic bacterial taxa. In a heavily contaminated mangrove forest, PAH concentrations increase with increasing substrate depth and decreasing oxygen content. PAH-degrading anaerobic bacteria have been identified in contaminated wetland sediments, but given their low oil-degradation capability, it is unlikely that anaerobic bacteria could greatly reduce PAH contamination, except at low concentrations of PAH.

Oil entrained within mangrove sediments can be available to invertebrates and fish inhabiting these systems, causing toxic impacts and changes in community structure (Hook *et al.*, 2016). Recovery from oil in mangrove habitats can be very slow because the sediments are anoxic, which slows the rate of oil degradation (Hook *et al.*, 2016).

Saltmarsh

The following information is from IPIECA (2004), except where otherwise stated.

As with mangroves, oil will readily adhere to both tidal and muted tidal marshes with the extent of coating varying according to the water level at the time of oiling. Large slicks will persist through multiple tidal cycles and will coat the entire stem from the high-tide line to the base. Once oil is deposited into saltmarshes, the low energy environment means that oil is not rapidly washed away. Following the *Deepwater Horizon* oil spill in the USA, studies demonstrated that oil deposited in oxic (well oxygenated) sediments degraded quickly (within 18 months), whereas oil in anoxic (low oxygen) sediments is expected to persist for decades (Hook *et al.*, 2016).

Saltmarsh vegetation offers a large surface area for oil absorption, which tends to trap oil. Additionally, many saltmarsh grasses, which can be dominant over large areas, have corrugated leaf surfaces that increases the holding capacity of oil.

Heavy oil coating will be restricted to the outer fringe of thick vegetation, although lighter oils can penetrate deeper, to the limit of tidal influence. Medium to heavy oils do not readily adhere to or penetrate the fine sediments composed of organic muds but can pool on the surface or in animal burrows and root cavities. Light oils can penetrate the top few centimetres of sediment and follow biological pathways burrows and cracks up to one meter deep.

Evidence from case histories and experiments shows that the damage resulting from oiling, and recovery times of oiled saltmarsh vegetation, are very variable. Lighter more penetrating oils are more likely to cause acute toxic damage than heavy or weathered oils.

In areas of light to moderate oiling where oil is mainly on perennial vegetation with little penetration of sediment, the shoots of the plants may be killed but recovery can take place from the underground systems. Good recovery commonly occurs within one to two years. Where thick deposits of viscous oil or mousse accumulate on the marsh surface, vegetation is likely to be killed by smothering and recovery will be delayed because persistent deposits inhibit recolonisation.

Oiling of shoots combined with substantial penetration of oil into sediments is more likely to happen with relatively fresh light crude oils (such as that predicted at Beehive-1) because these are less viscous. Damage to the underground systems and invertebrate communities results from the sub-surface oil, and recovery is delayed.

Abundant resident flora and fauna and high use by birds, fish and shellfish, means that oiling of saltmarsh environments can result in significant ecological impacts. Hook *et al* (2016) reports that there is expected to be a loss of invertebrate species diversity and abundance and productivity in oiled saltmarshes.

Damage to or dieback of saltmarshes can lead to coastal erosion (Hook *et al.*, 2016). Recovery may be delayed if the species composition is altered as tolerant species gain a competitive advantage. Following the *Deepwater Horizon* oil spill in the USA, studies of the impacts to saltmarshes found that recovery was underway within one year of the spill but proceeded the slowest in the areas closest to the shoreline (Hook *et al.*, 2016).

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	Not applicable.
Water column	Addressed in 'shoreline.'
Shoreline	<p>All of the shoreline sectors illustrated in Appendix 11 in the ecological spill EMBA have mangroves present (and likely saltmarshes), except for the Scott Reef/Browse Island and Ashmore Reef/Cartier Island sectors.</p> <p>The shoreline sectors with the highest probability of moderate to high exposure are:</p> <ul style="list-style-type: none"> Wyndham-East Kimberley (WA) Sector- up to 93% probability of contact, up to 408 m³ of oil. Specifically within this sector, the following WA Marine Oil Pollution Risk Assessment (WAMOPRA) shoreline cells (defined by the WA DoT) contain expanses of mangroves: <ul style="list-style-type: none"> East Cape Domett – WA/NT Border A, B (DoT Cell 1,2) - up to 49% probability of contact, up to 126.5 m³ oil. East Cape Domett – WA/NT C (Cambridge Gulf) (DoT Cell 3) - up to 52% probability of contact, up to 69 m³ oil. Aunty Islet – Thornburn Bluff (DoT Cell 9) - up to 63% probability of contact, up to 79.1 m³ oil. Cape Bernier – Elsie Island N (DoT Cell 10) - up to 38% probability of contact, up to 101.3 m³ oil. Cape Rulhieres – Unnamed Head B (King George River DoT Cell 13) - up to 75% probability of contact, up to 52.2 m³ oil. Cape Talbot - Cape Londonderry A (DoT Cell 15) - up to 35% probability of contact, up to 15.7 m³ oil. Cape Talbot - Cape Londonderry B (DoT Cell 16) - up to 16% probability of contact, up to 4.7 m³ oil. Low Island Point – Anjo A (Drysdale River – Napier Broome Bay – DoT Cell 17) - up to 33% probability of contact, up to 61.5 m³ oil. Cape Bougainville to Low Island Point B (DoT Cell 20) - no identified exposure. Cape Bougainville to Low island C & D; Crystal Head – Cape Bougainville (Cape Bougainville – DoT Cells 21, 22, 23) - up to 61% probability of contact, up to 63.5 m³ oil. Davidson Point - Crystal Head B (Mitchell river – DoT Cell 25) - no identified exposure. Victoria-Daly (NT) – up to 73% probability of contact, up to 258 m³ of oil; Thamarrurr (NT) – up to 74% probability of contact, up to 271 m³ of oil; and

	<ul style="list-style-type: none">Daly (NT) – up to 41% probability of contact, up to 200 m³ of oil (only during the summer period, minor quantities during winter and transition seasons). <p>All mangrove forests and saltmarshes are considered to be important because of their habitat values, which includes fish breeding and nurseries, shorebird feeding, roosting and breeding habitat, and shoreline protection. Any long-term damage to the health of these habitats resulting from oil exposure will result in loss of habitat and reduced protection of the shoreline.</p> <p>There are a number of NIWs along the coast close to Beehive-1 (Ord Estuary System, Legune Wetlands, Moyle Floodplain and Hyland Bay System, Daly-Reynolds Floodplain Estuary System, Finniss Floodplain and Fog Bay System). Damage to mangroves and saltmarsh within these NIWs will impact on their ecological values, including potential loss of habitat for sawfish species, crocodiles and various shorebird species, such as magpie geese that breed in the Legune Wetlands.</p>
Inherent impact consequence	Severe

Table 8.28. Sensitivity and consequence evaluation of hydrocarbon exposure to intertidal communities – sandy beaches

General sensitivity to oiling – sandy beaches	
Sensitivity rating of sandy beaches:	Low
A description of sandy beaches in the spill EMBA is provided in:	Appendix 11, Section 5.2.1
<p>Sandy beaches are regularly exposed to wave action and have low sediment total organic carbon and therefore generally a low abundance of marine life (Hook <i>et al.</i>, 2016). The low concentration of total organic carbon (TOC) and large particle size of sand means that oil deposited on the beach would not generally be retained. However, sandy beaches are important socio-economically, so hydrocarbons reaching this type of shoreline may attract attention that is disproportionate to its sensitivity (Hook <i>et al.</i>, 2016). Sediment grain sizes between 2 and 64 mm are not considered sensitive to oil spills because they are regularly cleaned by wave action and have low TOC and therefore a low diversity and abundance of marine life (Hook <i>et al.</i>, 2016).</p> <p>The depth of penetration in sandy sediment is influenced by:</p> <ul style="list-style-type: none"> • Particle size - penetration is great in coarser sediments (such as beach sand) compared to finer sediments and mud; • Oil viscosity – light oil quickly penetrates sandy sediments (compared to heavy oil); • Drainage – coarse beach sands allow for rapid drainage (it may reach depths greater than one metre in coarse well-drained sediments); and • Animal burrows and root pores - penetration into fine sediments is increased if there are burrows of animals such as worms, or pores left where plant roots have decayed. <p>Areas of heavy oiling (>1,000 g/m² threshold) would likely result in acute toxicity, and death, of many invertebrate communities, especially where oil penetrates into sediments through animal burrows (IPIECA, 1999). However, these communities would be likely to rapidly recover (recruitment from unaffected individuals and recruitment from nearby areas) as oil is removed from the environment. The results of exposure to oil may be acute (e.g., die off of amphipods and replacement by more tolerant species such as worms) or chronic (i.e., gradual accumulation of oil and genetic damage) (Hook <i>et al.</i>, 2016).</p> <p>For example, following the <i>Sea Empress</i> spill (in west Wales, 1996) many amphipods (sandhoppers), cockles and razor shells were killed. There were mass strandings on many beaches of both intertidal species (such as cockles) and shallow sub-tidal species. Similar mass strandings occurred after the <i>Amoco Cadiz</i> spill (in Brittany, France, 1978) (IPIECA, 1999). Following the <i>Sea Empress</i> spill, populations of mud snails recovered within a few months but some amphipod populations had not returned to normal after one year. Opportunists such as some species of worm may actually show a dramatic short-term increase following an oil spill (IPIECA, 1999). Long-term depletion of sediment fauna could have an adverse effect on birds or fish that use tidal flats as feeding grounds (IPIECA, 1999).</p> <p>In March 2014, small volumes of crude oil from an unidentified source (confirmed to not be offshore oil and gas production facilities) washed up along a 7-km section of sandy beach on the Victorian Gippsland coast as small (a few millimetres thick) granular balls (Gippsland Times, 2014; ABC News, 2014). AMSA (2014b) reported that no impacts were observed over the course of two months following the incident.</p> <p>The <i>Deepwater Horizon</i> Macondo well blowout resulted in oil washing up on sandy beaches of the Alabama coastline. The natural movement of sand and water through the beach system continually transformed and re-distributed oil within the beach system, and 18 months after the event, mobile remnant oil remained in various states</p>	

of weathering buried at different depths in the beaches (Hayworth *et al.*, 2011). Other results from beach sampling undertaken at Dauphin Island, Alabama, in May (pre-impact) and September 2011 (post-impact) found a large shift in the diversity and abundance of microbial species (e.g., nematodes, annelids, arthropods, polychaetes, protists, fungi, algae and bacteria). Post-spill, sampling indicated that species composition was almost exclusively dominated by a few species of fungi. DNA analyses revealed that the 'before' and 'after' communities at the same sites weren't closely related to each other (Bik *et al.*, 2012). Similar studies found that oil deposited on the beaches caused a shift in the community structure toward a hydrocarbonoclastic consortium (petroleum hydrocarbon degrading microorganisms) (Lamendella *et al.*, 2014).

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	Not applicable.
Water column	Not applicable.
Shoreline	<p>Much of the shoreline within the ecological spill EMBA is dominated by mangroves and rocky shores, interspersed with short sections of sandy beaches.</p> <p>The shoreline sectors with large areas of sandy beaches with the highest probability of moderate to high exposure are:</p> <ul style="list-style-type: none"> Wyndham-East Kimberley (WA) - up to 93% probability of contact, up to 408 m³ of oil. Specifically within this sector, the following WAMOPRA shoreline cells (defined by the WA DoT) contain expanses of sandy beaches: <ul style="list-style-type: none"> East Cape Domett to NT/WA Border (B) (Cape Domett – DoT Cell 2) - up to 38% probability of contact, up to 46.6 m³ oil. Easte Cape Dommet - WA/NT Border C (Lacrosse Island – DoT Cell 3) - up to 52% probability of contact, up to 69 m³ oil. Cape Bernier - Elsie Island N (Berkeley River - DoT Cell 10) - up to 38% probability of contact, up to 101.3 m³ oil. Cape Talbot – Cape Londonderry B (DoT Cell 16) - up to 16% probability of contact, up to 4.7 m³ oil. Low island Point – Anjo A (Sir Graham Moore Island – DoT Cell 17) - up to 33% probability of contact, up to 61.5 m³ oil Thamarrurr (NT) – up to 74% probability of contact, up to 271 m³ of oil; Daly (NT) – up to 41% probability of contact, up to 200 m³ of oil (only during the summer period); and Browse Island (WA) - up to 27% probability of contact, up to 57 m³ of oil. <p>Areas of low exposure loading to shoreline (<10 g/m²) are not expected to exhibit ecological harm.</p> <p>Areas of high oil loading may result in acute toxicity impacts and therefore reduced infauna diversity and abundance, such as the loss of amphipods and replacement by more tolerant species, such as worms (Hook <i>et al.</i>, 2016). This may then impact on species such as shorebirds and seabirds that feed on these animals.</p> <p>See Table 8.32 for impacts to turtles nesting in sandy beaches and Table 8.33 for shorebirds.</p>

	Due to the remoteness of the coastline of the socio-economic EMBA, there is predicted to be negligible impacts to the socio-economic values of sandy beaches. There is little tourism in this region and the year-round presence of crocodiles and seasonal presence of stinging jellyfish means beaches are not used recreationally like they are in other parts of Australia. Isolated sections of the western shoreline of Bathurst Island are predicted to have some shoreline contact only in the summer metocean season (4-9% probability of contact at the low threshold) with low shoreline loadings (4-12 m ³). These beaches are located over 50 km from the Aboriginal township of Wurrumiyanga on the island (and 25 km from Pirlangimpi on Melville Island) and is not predicted to have any significant impacts on traditional beach-based fishing or recreational activities.	
Inherent impact consequence	Moderate	

Table 8.29. Sensitivity and consequence evaluation of hydrocarbon exposure to intertidal communities – rocky shores

General sensitivity to oiling – rocky shores	
Sensitivity rating of rocky shores:	Low
A description of rocky shores in the spill EMBA is provided in:	Appendix 11, Section 5.2.2
<p>Cracks and crevices, rock pools, overhangs and other shaded areas provide habitat for soft bodied animals such as sea anemones, sponges and sea-squirts, and become places where hydrocarbons can become concentrated as it strands ashore. The same is true on stable boulder shores where the rich animal communities underneath the rocks are also the most vulnerable to hydrocarbon pollution.</p> <p>The vulnerability of a rocky shoreline to oiling is dependent on its topography and composition as well as its position. A vertical rock wall on a wave-exposed coast is likely to remain unoiled if an oil slick is held back by the action of the reflected waves. At the other extreme, a gradually sloping boulder shore in a calm backwater of a sheltered inlet can trap enormous amounts of hydrocarbons, which may penetrate deep down through the substratum. The complex patterns of water movement close to rocky coasts also tend to concentrate oil in certain areas. Some shores are well known to act as natural collection sites for litter and detached algae and oil is carried there in the same way. As on all types of shoreline, most of the oil is concentrated along the high tide mark while the lower parts are often untouched (IPIECA, 1995).</p> <p>It is not long before the waves and tides that carried the hydrocarbons onto the shore gradually remove it again, but the rate of such weathering is dependent on many factors. The wave exposure, weather conditions and the shore characteristics are most important. For example, a patch of oil on a rock exposed to heavy wave action is not going to remain there for long. However, it could take many years for the limited water movement in a sheltered bay to remove oil trapped under boulders or in gullies and crevices. Gradual leaching of this oil could result in constant low-level pollution of, for example, a rock pool. Microbial breakdown of the oil is rapid in tropical environments, such as that of northwest Australia. The presence of silt and clay particles can assist with oil removal by the process of flocculation. Grazing animals such as marine snails may also remove significant amounts of oil.</p> <p>As the oil is weathered it becomes more viscous and less toxic, often leaving little but a small residue of tar on upper shore rocks. This residue can remain as an unsightly stain for a long time but it is unlikely to cause any more ecological damage. Oil tends not to remain on wet rock or algae but is likely to stick firmly if the rock is dry (IPIECA, 1995). Rocky shorelines are generally considered not to be sensitive environments (Hook <i>et al.</i>, 2016).</p>	
Consequence evaluation based on the Beehive-1 OSTM	
Sea surface	Not applicable.
Water column	Not applicable.
Shoreline	<p>Much of the shoreline within the ecological spill EMBA is dominated by rocky shores. The shoreline sectors with the largest sections of rocky shorelines and with the highest probability of moderate to high exposure are:</p> <ul style="list-style-type: none"> Wyndham-East Kimberley - up to 93% probability of contact, up to 408 m³ of oil. Specifically within this sector, the following WAMOPRA shoreline cells (defined by the WA DoT) contain expanses of rocky shores:

	<ul style="list-style-type: none"> ○ Bare Hill – East Cape Domett E (DoT Cell 8) - up to 60% probability of contact, up to 40.2 m³ oil. ○ Aunty Islet - Thurburn Bluff (DoT Cell 9) - up to 63% probability of contact, up to 79.1 m³ oil. ○ Unnamed Head – Cape Rulhieres A (DoT Cell 11) - up to 84% probability of contact, up to 183.9 m³ oil. ○ Cape Rulhieres – Cape Bernier (DoT Cell 12) - up to 80% probability of contact, up to 55.7 m³ oil. ○ Cape Rulhieres - Unnamed Head B (King George River - DoT Cell 13) - up to 75% probability of contact, up to 52.2 m³ oil. ○ Cape Talbot – Cape Londonderry A (DoT Cell 15) - up to 35% probability of contact, up to 15.7 m³ oil. ○ Cape Talbot – Cape Londonderry B (DoT Cell 16) - up to 16% probability of contact, up to 4.7 m³ oil. ○ Low Island Point – Anjo A (DoT Cell 17) - up to 33% probability of contact, up to 61.5 m³ oil. ○ Cape Bougainville - Low Island Point A (DoT Cell 19) - up to 39% probability of contact, up to 24.4 m³ oil. • Thamarrurr (NT) – up to 74% probability of contact, up to 271 m³ of oil; • Daly (NT) – up to 41% probability of contact, up to 200 m³ of oil (only during the summer period); and • Browse Island (WA) - up to 27% probability of contact, up to 57 m³ of oil. <p>Areas of high oil loading may result in acute toxicity impacts and therefore reduced infauna diversity and abundance, such as the loss of macroalgae, lichen, sponges, bivalves and crustaceans (Hook <i>et al.</i>, 2016). The large tidal range in the northwest region is expected to result in stranded oil being removed by the next tide once it's deposited. In high energy regions, where waves are crashing into the rocks, weathering will be rapid and it is not expected that oil would remain for a long period of time. There are no threatened species in the ecological spill EMBA known to be dependent on rocky shores.</p>
Inherent impact consequence:	Moderate

Table 8.30. Sensitivity and consequence evaluation of hydrocarbon exposure to intertidal communities – tidal flats

General sensitivity to oiling – tidal flats	
Sensitivity rating of tidal flats	Medium
A description of tidal flats in the spill EMBA is provided in:	Appendix 11, Section 5.2.2
<p>Tidal flats (also referred to as mud flats) are often associated with mangrove or saltmarsh environments. Tidal flats provide sheltered habitats that can provide a nursery ground for many species of fish and crustacean and provide shelter or nesting areas for birds. Sediments within tidal flats are typically of small grain size/fine mud that are high in total organic carbon and consequently deficient of oxygen (i.e., anoxic). Any oil that is deposited into tidal flats is likely to be persistent, due to low wave energy and slow rates of biodegradation (Hook <i>et al.</i>, 2016). A survey of intertidal areas in Kuwait and Saudi Arabia conducted 12 years after the Gulf War oil spill found that oil was most persistent in tidal flat areas, with half of all samples taken still causing risk of environmental toxicity due to elevated PAH concentrations (Bejarano and Michel, 2010).</p> <p>Sedimentary infauna may be sensitive to oil. Studies have identified that small crustaceans (such as amphipods and crabs), some bivalves and surface grazing snails are sensitive to oil toxicity, whilst other taxa such as polychaete worms may have an opportunistic increase in abundance (Law <i>et.al.</i>, 2011). These species may also be sensitive to any clean-up efforts, especially those that translocate sediments. Oil that is present in these environments may be accumulated by sediment invertebrates and pose a risk to feeding migratory shorebirds (Velando <i>et al.</i>, 2010).</p> <p>Shorebird species foraging for invertebrates on exposed sand and mud flats at lower tides will be at risk of both direct impacts through contamination of individual birds (ingestion or soiling of feathers) and indirect impacts through the contamination of foraging areas that may result in a reduction in available prey items (Clark, 2010).</p> <p>Mud flats and samphire communities may be exposed to entrained/dissolved condensate above impact thresholds. Any impacts to benthic habitats are expected to be localised and of short to medium term with a moderate consequence.</p>

Sea surface	Not applicable.
Water column	Not applicable.
Shoreline	<p>The shoreline sectors with the largest sections (by length) of tidal flats and with the highest probability of moderate to high exposure are:</p> <ul style="list-style-type: none"> Derby-West Kimberley (WA) – the OSTM predicted there is no probability of moderate to high exposure, and a 2% probability of low exposure contact of up to 1.1 m³ of oil. Specifically within this sector, the following WAMOPRA shoreline cells (defined by the WA DoT) contain expanses of tidal flats: <ul style="list-style-type: none"> Shale Island – Raft Point (Wallcott Inlet – DoT Cell 45) – no identified exposure. Meda River Mouth Spit SW – Helpman Island B (Dot Cell 55) – no identified exposure.

	<ul style="list-style-type: none"> ○ Point Tormet - Meda River Mouth spit SW A, B (Derby - DoT Cell 56, 57) – no identified exposure. ○ Jangerie- Point Torment A, B (DoT Cell 58, 59) - no identified exposure. ● Wyndham-East Kimberley (WA) - up to 93% probability of contact, up to 408 m³ of oil. Specifically within this sector, the following WAMOPRA shoreline cells (defined by the WA DoT) contain expanses of tidal flats: <ul style="list-style-type: none"> ○ East Cape Domett – WA/NT Border C (Cambridge Gulf – DoT Cell 3) up to 52% probability of contact, up to 69 m³ oil. ○ Cape Bernier - Elsie Island N (Berkeley River - DoT Cell 10) up to 38% probability of contact, up to 101.3 m³ oil. ○ Cape Talbot - Cape Londonderry B (Drysdale River – DoT Cell 16) up to 16% probability of contact, up to 4.7 m³ oil. ○ Low Island Point – Anjo A (Drysdale River – DoT Cell 17) up to 33% probability of contact, up to 61.5 m³ oil. ○ Cape Bougainville - Low Island Point B (DoT Cell 20) – no identified exposure; ○ Davidson Point - Crystal Head A (Port Warrender - DoT Cell 24) up to 3% probability of contact, up to 1.1 m³ oil. ○ Davidson Point - Crystal Head B (Mitchell River – DoT Cell 25) – no identified exposure. <p>Areas of moderate to high loading may result in acute toxicity impacts and therefore reduced infauna diversity and abundance, such as the loss of bivalves and small crustaceans (Hook <i>et al.</i>, 2016).</p> <p>Species such as green sawfish, nunivak bar-tailed godwit and migratory shorebirds such as lesser sand plovers and eastern curlew are known to have a strong association (either habitat for fish and/or foraging for shorebirds) with tidal flats within the ecological spill EMBA.</p>
Inherent impact consequence:	Moderate

Table 8.31. Sensitivity and consequence evaluation of hydrocarbon exposure to oceanic communities - plankton

General sensitivity to oiling – plankton	
Sensitivity rating of plankton:	Low
A description of plankton communities in the spill EMBA is provided in:	Appendix 11, Section 5.3.3
<p>Plankton is found in nearshore and open waters beneath the surface in the water column. These organisms migrate vertically through the water column to feed in surface waters at night (NRDA, 2012). As they move close to the sea surface it is possible that they may be exposed to both surface hydrocarbons but to a greater extent, hydrocarbons dissolved or entrained in the water column.</p> <p>Phytoplankton is typically not sensitive to the impacts of oil, though they do accumulate it rapidly due to their small size and high surface area to volume ratio (Hook <i>et al.</i>, 2016). If phytoplankton is exposed to hydrocarbons at the sea surface, this may directly affect their ability to photosynthesize and would have implications for the next trophic level in the food chain (e.g., small fish) (Hook <i>et al.</i>, 2016). In addition, the presence of surface hydrocarbons may result in a reduction of light penetrating the water column, which could affect the rate of photosynthesis for phytoplankton in instances where there is prolonged presence of surface hydrocarbons over an extensive area such that the phytoplankton was restricted from exposure to light. Oil can affect the rate of photosynthesis and inhibit growth in phytoplankton, depending on the concentration range. For example, photosynthesis is stimulated by low concentrations of oil in the water column (10-30 ppb), but become progressively inhibited above 50 ppb. Conversely, photosynthesis can be stimulated below 100 ppb for exposure to weathered oil (Volkman <i>et al.</i>, 1994).</p> <p>Zooplankton (microscopic animals such as rotifers, copepods and krill that feed on phytoplankton) are vulnerable to hydrocarbons due to their small size and high surface area to volume ratio, along with (in many cases) their high lipid content (that facilitates hydrocarbon uptake) (Hook <i>et al.</i>, 2016). Water column organisms that come into contact with oil risk exposure through ingestion, inhalation and dermal contact (NRDA, 2012), which can cause immediate mortality or declines in egg production and hatching rates along with a decline in swimming speeds (Hook <i>et al.</i>, 2016).</p> <p>Plankton is generally abundant in the upper layers of the water column and acts as the basis for the marine food web, meaning that a hydrocarbon spill in any one location is unlikely to have long-lasting impacts on plankton populations at a regional level. Variations in the temporal scale of oceanographic processes typical of the ecosystem have a greater influence on plankton communities than the direct effect of spilled hydrocarbons. This is because reproduction by survivors or migration from unaffected areas would be likely to rapidly replenish any losses from permanent zooplankton (Volkman <i>et al.</i>, 1994).</p> <p>Field observations from oil spills show minimal or transient effects on marine plankton (Volkman <i>et al.</i>, 1994). Once background water quality conditions have re-established, the plankton community will take weeks to months to recover (ITOPF, 2011a), allowing for seasonal influences on the assemblage characteristics.</p>	
Consequence evaluation based on the Beehive-1 OSTM	
Sea surface	Plankton found in open water of the ecological spill EMBA is expected to be widely represented in the northwest region as a result of the southerly movement of the Indonesian Throughflow and the southeast and northwest monsoonal wind-driven currents (Brewer <i>et al.</i> , 2007). Plankton in the upper water column are likely to be directly (e.g., through smothering and ingestion) and indirectly (e.g., toxicity

Water column	from decrease in water quality and bioaccumulation) affected by surface, dissolved and entrained hydrocarbons at the moderate and high thresholds. Because the area affected by a spill will be smaller than that of the ecological EMBA (because the EMBA represents a combination of 100 random simulations, see also the deterministic OSTM results in Figures 8.7, 8.11, 8.15 and 8.19), once background water quality conditions are re-established following the natural weathering and dispersion of the hydrocarbons, plankton populations are expected to recover rapidly due to recruitment of plankton from surrounding waters.	
Shoreline	Not applicable.	
Inherent impact consequence:	Moderate	

Table 8.32. Sensitivity and consequence evaluation of hydrocarbon exposure to oceanic communities - fish

General sensitivity to oiling –fish	
Sensitivity rating of fish (normal range):	Low
Sensitivity rating of fish (spawning habitats):	Medium
A description of fish in the spill EMBA is provided in:	Appendix 11, Section 5.3.4
<p>The behaviours and habitat preferences of fish species (including sharks and rays) determine their potential for exposure to hydrocarbons and the resulting impacts. Demersal species may be susceptible to oiled sediments, particularly species that are site-restricted. Pelagic species that occupy the water column are more susceptible to entrained and dissolved hydrocarbons, however generally these species are highly mobile and as such are not likely to suffer extended exposure due to their patterns of movement. The exception would be in areas such as reefs and other seabed features where species are less likely to move away into open waters (i.e., they are site-attached).</p> <p>Fish are exposed to hydrocarbon droplets through a variety of pathways, including:</p> <ul style="list-style-type: none"> • Direct dermal contact (e.g., swimming through oil or waters with elevated dissolved hydrocarbon concentrations and other constituents, with diffusion across their gills (Hook <i>et al.</i>, 2016)); • Ingestion (e.g., directly or via food base, fish that have recently ingested contaminated prey may themselves be a source of contamination for their predators); and • Inhalation (e.g., elevated dissolved contaminant concentrations in water passing over the gills). <p>Exposure to hydrocarbons at the surface or entrained or dissolved in the water column can be toxic to fish. Studies have shown a range of impacts including changes in abundance, decreased size, inhibited swimming ability, changes to oxygen consumption and respiration, changes to reproduction, immune system responses, DNA damage, visible skin and organ lesions, and increased parasitism. However, many fish species can metabolise toxic hydrocarbons, which reduces the risk of bioaccumulation of contaminants in the food web (and human exposure to contaminants through the consumption of seafood) (NRDA, 2012).</p> <p>Sub-lethal impacts in adult fish include altered heart and respiratory rates, gill hyperplasia, enlarged liver, reduced growth, fin erosion, impaired endocrine systems, behavioural modifications and alterations in feeding, migration, reproduction, swimming, schooling and burrowing behaviour (Kennish, 1996). However, fish are highly mobile and unlikely to remain in the area of a spill for long enough to be exposed to sub-lethal doses of hydrocarbons.</p> <p>Fish are most vulnerable to hydrocarbon discharges during their embryonic, larval and juvenile life stages. Eggs and larvae of many fish species are highly sensitive to oil exposure, resulting in decreased spawning success and abnormal larval development (see 'Plankton').</p> <p>Since fish and sharks do not generally break the sea surface, the impacts of surface hydrocarbons to fish and shark species are unlikely to occur. Near the sea surface, fish are able to detect and avoid contact with surface slicks meaning fish mortalities rarely occur in the event of a hydrocarbon spill in open waters (Volkman <i>et al.</i>, 1994). As a result, wide-ranging pelagic fish of the open ocean generally are not highly susceptible to impacts from surface hydrocarbons. Adult fish kills reported after oil spills occur mainly to shallow water, near-shore benthic species (Volkman <i>et al.</i>, 1994).</p>	

Hydrocarbon in the water column can physically affect reef fish (that have high site fidelity and cannot move out of harm's way) exposed for an extended duration (weeks to months) by coating of gills, leading to lethal and sub-lethal effects from reduced oxygen exchange and coating of body surfaces that may lead to increased incidence of irritation and infection. Fish may also ingest hydrocarbon droplets or contaminated food, leading to reduced growth (Volkman *et al.*, 1994).

The threshold value for species toxicity in the water column is based on global data from French *et al* (1999) and French-McCay (2002, 2003), which showed that species sensitivity (fish and invertebrates) to dissolved aromatics exposure >4 days (96-hour LC₅₀) under different environmental conditions varied from 6 to 400 µg/L (ppb), with an average of 50 ppb. This range covered 95% of aquatic organisms tested, which included species during sensitive life stages (eggs and larvae). Based on scientific literature, a minimum threshold of 6 ppb over 96 hours or equivalent was used to assess in-water low exposure zones, respectively (Engelhardt, 1983; Clark, 1984; Geraci and St Aubin, 1988; Jenssen, 1994; Tsvetnenko, 1998). French-McCay (2002) indicates that an average 96-hour LC₅₀ of 50 ppb and 400 ppb could serve as an acute lethal threshold to 50% and 97.5% to biota, respectively.

Studies of oil impacts on bony fish report that light, volatile oils are likely to be more toxic to fish. Many studies conclude that exposure to PAHs and soluble compounds are responsible for the majority of toxic impacts observed in fish (e.g., Carls *et al.*, 2008; Ramachandran *et al.*, 2004). A range of lethal and sub-lethal effects to fish in the larval stage has been reported at water-accommodated fraction (WAF) hydrocarbon concentrations (48-hour and 96-hour exposures) of 0.001 to 0.018 ppm during laboratory exposures (Carls *et al.*, 2008; Gala, 2001). In contrast, wave tank exposures reported much higher lethal concentrations (14-day LC₅₀) up to 1.9 ppm for herring embryos and up to 4.3 ppm for juvenile cod (Lee *et al.*, 2011).

Toxicity in adult fish has been reported in response to crude oils, HFO and diesel (Holdway, 2002; Shigenaka, 2011). Uptake of hydrocarbons has been demonstrated in bony fish after exposure to WAF of between 24 and 48 hours. Danion *et al* (2011) observed PAH uptake of 148 µg/kg-1 after 48-hour exposures to PAH from Arabian Crude at high concentrations of 770 ppm. Davis *et al* (2002) report detectable tainting of fish flesh after a 24-hour exposure at crude concentrations of 0.1 ppm, marine fuel oil concentrations of 0.33 ppm and diesel concentrations of 0.25 ppm. The majority of studies, either from laboratory trials or of fish collected after spill events (including the *Hebei Spirit*, *Macondo*, and *Sea Empress* spills) find evidence of elimination of PAHs in fish tissues returning to reference levels within two months of exposure (Challenger and Mauseth, 2011; Davis *et al.*, 2002; Gagnon & Rawson, 2011; Gohlke *et al.*, 2011; Jung, 2011; Law, 1997; Rawson *et al.*, 2011).

The toxicity of dissolved hydrocarbons and dispersed oil to fish species has been the subject of a number of laboratory studies (AMSA, 1998). Generally, concentrations in the range of 0.1–0.4 mg/L dispersed oil have been shown to cause fish deaths in laboratory experiments (96-hour LC₅₀). No reported studies of the impacts of oil spills on cartilaginous fish (including sharks, rays and sawfish) were found in the literature. It is not known how the data on the sensitivity of bony fishes would relate to toxicity in cartilaginous fishes.

The assessment of effects on fish species in the Timor Sea as a result of the Montara well blowout (a light gas condensate), conducted from November 2009 to November 2010 undertaken by Gagnon & Rawson (2011), found that of the species studied (mostly goldband snapper *Pristipomoides multidens*, red emperor *Lutjanus sebae*, rainbow runner *Elegatis bipinnulata* and Spanish mackerel *Scomberomorus commerson*), all 781 specimens were in good physical health at all sites. Results show that:

- Phase 1 study (November 2009, immediately after the blowout ceased) - indicated that in the short-term, fish were exposed to and metabolised petroleum hydrocarbons, however no consistent adverse effects on fish health or their reproductive activity were detected.

- Phase 2 study (March 2010, 5 months after the blowout ceased) – indicated continuing exposure to petroleum hydrocarbons, as detected by elevated liver detoxification enzymes and PAH biliary metabolites in three out of four species collected close to the MODU, and elevated oxidative DNA damage.
- Phase 3 study (November 2010, 12 months after the blowout ceased) – showed a trend towards a return to reference levels with often, but not always, comparable biomarker levels in fish collected from reference and impacted sites. This evidence of exposure to petroleum hydrocarbons at sites close to the spill location suggest an ongoing trend toward a return to normal biochemistry/physiology (Gagnon & Rawson, 2011).

The main finding of the Gagnon & Rawson (2011) study concluded that there were no detectable petroleum hydrocarbons found in the fish muscle samples, limited ill effects were detected in a small number of individual fish, and no consistent adverse effects of exposure on fish health could be detected within two weeks following the end of the well release. Notwithstanding, fishes from close to the Montara well, collected seven months after the discharge began, showed continuing exposure to hydrocarbons in terms of biomarker responses. Two years after the discharge, biomarker levels in fishes had mostly returned to reference levels, except for liver size. However this was potentially attributed to local nutrient enrichment, or to past exposure to hydrocarbons. Fishes near Heyward Shoal, approximately 100 km southwest of the Montara well, had elevated biomarker responses indicating exposure to hydrocarbons, but were collected close to the Cornea natural hydrocarbon seep. Studies on the Montara discharge have shown recovery in terms of the abundance and composition of fishes, and toxicological and physiological responses of fishes.

Sampling from January 2010 to June 2011 by the University of South Alabama and Dauphin Island Sea Lab found no significant evidence of diseased fish in reef populations off Alabama or the western Florida Panhandle as a result of the Macondo well blowout in the Gulf of Mexico (BP, 2014).

No reports of oil spills in open waters have been reported to cause fish kills (though mortality in aquaculture pens has), which is likely to be because vertebrates can rapidly metabolise and excrete hydrocarbons (Hook *et al.*, 2016).

Recovery of fish assemblages depends on the intensity and duration of an unplanned discharge, the composition of the discharge and whether dispersants are used, as each of these factors influences the level of exposure to potential toxicants. Recovery would also depend on the life cycle attributes of fishes. Species that are abundant, short-lived and highly fecund may recover rapidly. However less abundant, long-lived species may take longer to recover. The range of movement of fishes will also influence recovery. The nature of the receiving environment would influence the level of impact on fishes.

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	<p>There is an extensive area in which moderate and high threshold hydrocarbons are predicted to occur on the sea surface.</p> <p>Fish associated with rafts of floating seaweed, such as syngnathid species, may come into contact with surface oil. Long exposure to the oil is likely to result in chronic toxicity effects, which is likely to lead to localised population reductions.</p> <p>The majority of fish tend to remain in the mid-pelagic zone, so they are not likely to come into contact with surface hydrocarbons.</p>
Water column	<p>Impacts to fish from exposure to hydrocarbons in the water column is likely to be spatially limited to the areas of moderate (for dissolved hydrocarbons) and high (for entrained hydrocarbons) threshold exposure and temporally limited due to the rapid weathering of the oil and the open, well-mixed waters of the JBG and Indian Ocean. NOAA (2013) and ITOPF (2011a) state that hydrocarbon spills in open water are so rapidly diluted that fish kills are rarely observed. Fish such as southern bluefin tuna and sharks such as the great white shark, shortfin mako</p>

	<p>and oceanic whitetip shark are highly mobile species and as such they are unlikely to remain in one area for a long period of time, minimising the risk that they would be exposed to toxic levels of hydrocarbons.</p> <p>Fish species with BIAs in the ecological spill area are:</p> <ul style="list-style-type: none"> • Dwarf sawfish – this species is known to occur as adults and juveniles in waters 2-3 m deep along the coast of the ecological spill EMBA. Pupping is known to occur in the Keep River Estuary (NT) west of the Victoria River estuary. If long sections of coastline are impacted by dissolved and entrained oil, this species may not have alternative habitat to retreat to, so chronic toxicity affects may occur to multiple individuals, resulting in population reductions. • Green sawfish – this species is known to occur as adults and juveniles in waters along the coast of the ecological spill EMBA south of Derby along the Pilbara coastline, and there are also pupping areas likely to occur south of Broome (outside the ecological EMBA). If long sections of coastline are impacted by dissolved and entrained oil, this species may not have alternative habitat to retreat to, so chronic toxicity affects may occur to multiple individuals, resulting in population reductions. • Whale shark – foraging BIA is located outside of the JBG, so in the event of a LoWC, it is unlikely to be exposed to oil at the moderate or high threshold based on deterministic OSTM. At low thresholds, there would be little to no ecological impacts to this species. They are also unlikely to be present in the region at the time of drilling. <p>Because vertebrate fish species can rapidly metabolise and excrete hydrocarbons (Hook <i>et al.</i>, 2016), PAH levels in fish are expected to return to pre-spill levels within several months. Impacts to individuals and some populations will occur but are likely to be short-term. Widespread effects to fish populations (in terms of diversity and abundance) are not expected as a result of a LoWC based on the information presented for 'sensitivity to oil' and because of the wide geographical distribution of many of the fish species known to occur in the ecological spill EMBA.</p>	
Shoreline	Not applicable.	
Inherent impact consequence:	Moderate	

Table 8.33. Sensitivity and consequence evaluation of hydrocarbon exposure to oceanic communities - marine mammals

General sensitivity to oiling – marine mammals	
Sensitivity rating of marine mammals (breeding, aggregation, feeding areas):	High
Sensitivity rating of marine mammals (migration)	Medium
A description of cetaceans in the spill EMBA is provided in:	Appendix 11, Section 5.3.5
<p>The pathways for exposure to oil to marine mammals (whales, dolphins and dugongs) is through:</p> <ul style="list-style-type: none"> • Internal exposure by consuming oil or contaminated prey; • Inhaling volatile oil compounds when surfacing to breathe; • Dermal contact, by swimming in oil and having oil directly on the skin and body; and • Maternal transfer of contaminants to embryos (NRDA, 2012; Hook <i>et al.</i>, 2016). <p>The effects of this exposure include:</p> <ul style="list-style-type: none"> • Hypothermia due to conductance changes in skin, resulting in metabolic shock (expected to be more problematic for non-cetaceans in colder waters); • Toxic effects and secondary organ dysfunction due to ingestion of oil; • Congested lungs; • Damaged airways; • Interstitial emphysema due to inhalation of oil droplets and vapour; • Gastrointestinal ulceration and haemorrhaging due to ingestion of oil during grooming and feeding; • Eye and skin lesions from continuous exposure to oil; • Decreased body mass due to restricted diet; and • Stress due to oil exposure and behavioural changes. <p>French-McCay (2009) identifies that a 10-25 µm oil thickness threshold has the potential to impart a lethal dose on marine species, however also estimates a probability of 0.1% mortality to cetaceans if they encounter these thresholds based on the proportion of the time spent at surface. Direct surface oil contact with hydrocarbons is considered to have little deleterious effect on whales, possibly due to the skin's effectiveness as a barrier to toxicity, and effect of oil on cetacean skin is probably minor and temporary (Geraci & St Aubin, 1988). Cetaceans in particular have mostly smooth skins with limited areas of pelage (hair covered skin) or rough surfaces such as barnacled skin. Oil tends to adhere to rough surfaces, hair or calluses of animals, so contact with hydrocarbons by whales and dolphins may cause only minor hydrocarbon adherence.</p>	

The physical impacts from ingested hydrocarbon with subsequent lethal or sub-lethal impacts are both applicable to entrained oil. However, the susceptibility of cetaceans varies with feeding habits. Baleen whales (such as blue, southern right and humpback whales) are not particularly susceptible to ingestion of oil in the water column but are susceptible to oil at the sea surface as they feed by skimming the surface. Oil may stick to the baleen while they ‘filter feed’ near slicks. Sticky, tar-like residues are particularly likely to foul the baleen plates.

The inhalation of oil droplets, vapours and fumes is a distinct possibility if whales’ surface in slicks to breathe. Exposure to hydrocarbons in this way could damage mucous membranes, damage airways or even cause death.

Toothed whales and dolphins may be susceptible to ingestion of dissolved and entrained oil as they gulp feed at depth. There are reports of declines in the health of individual pods of killer whales (a toothed whale species), though not the population as a whole, in Prince William Sound after the *Exxon Valdez* vessel spill (heavy oil) (Hook *et al.*, 2016).

It has been stated that pelagic species will avoid hydrocarbons, mainly because of its noxious odours, but this has not been proven. The strong attraction to specific areas for breeding or feeding (e.g., use of the Camden Sound as a nursery area for humpback whales) may override any tendency for cetaceans to avoid the noxious presence of hydrocarbons. So weathered or tar-like oil residues can still present a problem by fouling baleen whale feeding systems.

Dolphin populations from Barataria Bay, Louisiana, USA, which were exposed to prolonged and continuous oiling from the Macondo oil spill in 2010, had higher incidences of lung and kidney disease than those in the other urbanised environments (Hook *et al.*, 2016). The spill may have also contributed to unusually high perinatal mortality in bottlenose dolphins (Hook *et al.*, 2016).

As highly mobile species, in general it is very unlikely that cetaceans will be constantly exposed to concentrations of hydrocarbons in the water column for continuous durations (e.g., >96 hours) that would lead to chronic toxicity effects.

Dugong

Dugongs can be exposed to oil in the same manner as whales and dolphins, as well as through ingestion of contaminated seagrass and sediments. Hook *et al* (2016) reports that no studies specifically report on the sensitivities of dugong to oil. Given that dugong consume vast amounts of seagrass, if the seagrass is contaminated, there is a high likelihood that acute toxicity and mortality may eventuate, or chronic long-term effects may result (such as organ damage).

Consequence evaluation based on the Beehive-1 OSTM

Sea surface

Exposure to moderate and high thresholds of hydrocarbons at the sea surface is predicted to occur over a small portion of the JBG.

The BIAs for the following marine mammal species are listed in Table 5.8 of Appendix 11; pygmy blue whale, humpback whale, Australian humpback dolphin, Australian snubfin dolphin, Indo-Pacific spotted bottlenose dolphin, and dugong. None of these BIAs are overlapped by the extent of moderate and high threshold oil, so impacts such as coating of skin when they surface are not expected. The seasonality of the presence of these species in the region also means they may not all be present at the time of drilling.

Dugongs may be present along the Dampier Peninsula (the coastline north and south of Broome) and Cape Londonderry where seagrass meadows are present. In this area, the OSTM predicts no exposure for surface hydrocarbons. As such, there should be no ecological effects on individuals or dugong populations as they surface to breathe.

Water column	<p>The ecological spill EMBA for dissolved and entrained hydrocarbons overlaps with seasonal presence for most of the marine mammals described in Section 5.3.5 of Appendix 11, except for dugong, which are known to occur in Ashmore Reef, around the Dampier Peninsula and at Vansittart Bay (near Bougainville), where dissolved and entrained hydrocarbons are predicted to occur in low concentrations and therefore not have ecological impacts.</p> <p>Impacts to cetaceans from exposure to hydrocarbons in the water column is likely to be spatially limited to the areas of moderate (for dissolved hydrocarbons) and high (for entrained hydrocarbons) threshold exposure and temporally limited due to the rapid weathering of the oil and the open, well-mixed waters of the JBG and Indian Ocean. The impacts are likely to be as per those described in 'sensitivity to oil', with effects such as injury (infections, lesions, disease, reduced growth, growth abnormalities) or mortality as a result of ingestion of oil, contact with and absorption through skin and inhalation at surface.</p> <p>Of the threatened cetaceans known to occur in the ecological spill EMBA, effects are predicted below:</p> <ul style="list-style-type: none"> • Sei whale – prefers deep offshore waters, with no BIAs in the EMBA. They may be present in outer extents of the EMBA where water depths are deep, and these are the areas where the concentrations of dissolved and entrained hydrocarbons are low (due to distance from the well). Impact consequence to this species is therefore low. • Bryde's whale – may be present in the ecological spill EMBA, with no BIAs in the EMBA. If present during a spill, impact consequences may be as described in 'sensitivity to oil' and the severity would depend on the number of individuals exposed to oil. They mostly feed on pelagic fish (which are at low risk of impacts from a spill) and small crustaceans. • Blue whale – most likely to be present in the outer extents of the spill EMBA (northwest Australia) from September to December. This is outside the drilling period, so the impact consequence to this species is therefore negligible. • Fin whale – prefers deep offshore waters, with no BIAs in the EMBA. They may be present in outer extents of the EMBA where water depths are deep, and these are the areas where the concentrations of dissolved and entrained hydrocarbons are low (due to distance from the well). Impact consequence to this species is therefore low. <p>In general, the low likelihood of having high numbers of marine mammals in the ecological spill EMBA, the absence of resident populations, seasonality of movements, their highly mobile nature and absence of BIAs in and around the operational area (where hydrocarbon concentrations will be highest) means that the impacts of a LoWC are likely to be limited to a small number of individuals in localised areas. Displacement behaviours and sub-lethal biological effects could occur to cetaceans.</p> <p>Where dugongs may be present (see above), the OSTM predicts low exposure for entrained hydrocarbons and no exposure to dissolved hydrocarbons. Their foraging BIA is not overlapped by the ecological spill EMBA. As such, there should be no ecological effects on individuals or dugong populations.</p>
Shoreline	Not applicable.

Consequence evaluation based on an assessment against the EPBC Act *Significant Impact Guidelines 1.1* (DoE, 2013)

This hydrocarbon spill scenario will not have a 'significant' impact on threatened cetacean species (see Section 5.3.5) when assessed against the EPBC Act *Significant Impact Guidelines 1.1* (DoE, 2013), which are:

<ul style="list-style-type: none"> Lead to a long-term decrease in the size of a population. 	A spill would not lead to a long-term decrease in the size of a population given the small area of impact from a single spill, the rapid weathering of the crude and the low likelihood of a large portion of a cetacean population being present in the spill area at any one time.
<ul style="list-style-type: none"> Reduce the area of occupancy of the species. 	Given the small area of 'swept ocean' from a single spill, the rapid weathering of the crude, the area of occupancy may be temporarily reduced (noting that cetaceans may not necessarily avoid a spill at the surface or in the water column), but there will be no long-term reduction in the area of occupancy.
<ul style="list-style-type: none"> Fragment an existing population into two or more populations. 	In the event of a spill resulting from a LoWC, cetaceans have access to an expansive area of unpolluted waters. A spill would not be expected to split up a single population into two or more populations. A spill does not move quickly enough to result in a migrating population splitting to avoid a spill.
<ul style="list-style-type: none"> Adversely affect habitat critical to the survival of a species. 	The water quality of the impacted area would be temporarily reduced in the event of a spill. The portion of the oil that entrains or dissolves in the water column, where cetaceans spend the majority of their time, is dependent on ocean conditions during the spill (rough seas result in more entrainment than calm seas). The area affected by the oil is unlikely to form a significant part of marine mammal migration routes, so this habitat is not critical to their survival; they would be exposed to MDO for a very short period of time if a spill occurred during migration (minutes to hours).
<ul style="list-style-type: none"> Disrupt the breeding cycle of a population. 	Most of the cetacean species known to occur in the activity area and EMBA are not known to breed within these areas (other than the Australian snubfin dolphin, which breeds in Cambridge Gulf). Given the small area of 'swept ocean' from a single spill and the rapid weathering of the crude, it is highly unlikely that the breeding cycle of a cetacean population will be disrupted.
<ul style="list-style-type: none"> Modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline. 	The water quality of the ecological spill EMBA would be temporarily reduced in the event of a spill. Marine habitat will not be modified, destroyed, removed, isolated or decreased to the extent that one or more cetacean species will decline.
<ul style="list-style-type: none"> Result in invasive species that are harmful to a critically endangered or endangered species becoming 	A large-scale hydrocarbon spill is highly unlikely to result in the introduction and spread of IMS that are harmful to endangered marine mammals. Vessels that may be involved in the spill response strategies will be subject to strict IMS controls to ensure that ballast water is of 'low risk' and that hulls are free of IMS.

established in the endangered or critically endangered species' habitat.		
<ul style="list-style-type: none"> Introduce disease that may cause the species to decline. 		The risk of toxic impacts to individual species or populations is negligible due to the rapid weathering of the crude. The small extent of a single spill further reduces the risk to a small area. As such, it is unlikely that there would be a large number of 'oiled' cetaceans that may then become susceptible to disease.
<ul style="list-style-type: none"> Interfere with the recovery of the species. 		For all the reasons outlined above, a crude oil spill will not interfere with the recovery of a cetacean species.
Inherent impact consequence:	Severe	

Table 8.34. Sensitivity and consequence evaluation of hydrocarbon exposure to oceanic communities - marine reptiles

General sensitivity to oiling – marine reptiles	
Sensitivity rating of marine reptiles (Critical Habitats)	Very High
Sensitivity rating of marine reptiles (turtle breeding/inter-nesting):	High
Sensitivity rating of marine reptiles (migration/foraging):	Medium
A description of marine reptiles in the spill EMBA is provided in:	Appendix 11, Section 5.3.6
<p>Marine reptiles can be exposed to hydrocarbon through ingestion of contaminated prey, inhalation when surfacing to breathe or dermal exposure (Hook <i>et al.</i>, 2016). Sea turtles are vulnerable to the effects of oil at all life stages—eggs, post-hatchlings, juveniles, and adults in nearshore waters. Several aspects of sea turtle biology and behaviour place them at particular risk, including a lack of avoidance behaviour, indiscriminate feeding in convergence zones, and large pre-dive inhalations. Effects of oil on turtles include increased egg mortality and developmental defects, direct mortality due to oiling in hatchlings, juveniles, and adults; and negative impacts to the skin, blood, digestive and immune systems, and salt glands. Oil exposure affects different turtle life stages in different ways. Each turtle life stage frequents a habitat with notable potential to be impacted during an oil spill. Thus, information on oil toxicity needs to be organized by life stage. Turtles may be exposed to chemicals in oil in two ways:</p> <ul style="list-style-type: none"> Internally – eating or swallowing oil, consuming prey containing oil-based chemicals, or inhaling of volatile oil related compounds; and Externally – swimming in oil or dispersants, or oil or dispersants on skin and body. <p>Records of oiled wildlife during spills rarely include marine turtles, even from areas where they are known to be relatively abundant (Short, 2011). An exception to this was the large number of marine turtles collected (613 dead and 536 live) during the <i>Macondo</i> crude oil spill in the GoM, although many of these animals did not show any sign of oil exposure (NOAA, 2013a). Of the dead turtles found, 3.4% were visibly oiled and 85% of the live turtles found were oiled (NOAA, 2013a). Of the captured animals, 88% of the live turtles were later released, suggesting that oiling does not inevitably lead to mortality.</p> <p>Oil spill impacts to crocodiles is not well studied, with no papers available on toxicity of petroleum to crocodile species. While females generally nest near freshwater rivers and swamps, juvenile crocodiles are often forced out of their river habitat by large territorial males into coastal marine areas or open ocean. Saltwater crocodiles consume a variety of prey and have been observed on the beaches of northern Australia preying on turtle species, specifically nesting females, hatchlings and eggs (Ruberg <i>et al.</i>, 2021). As a result, crocodiles may be vulnerable to oil spills when swimming in the open ocean and could come in contact with oil when foraging on turtle eggs, nests and hatchlings (Ruberg <i>et al.</i>, 2021).</p> <p>Impacts to sea snakes during marine hydrocarbon spills are known from limited assessments, undertaken following the Montara spill in the Timor Sea in 2009. Two dead sea snakes were collected during the incident, one of which was concluded to have died as a result of exposure to the oil, with evidence of inhaled and ingested oil and elevated concentrations of PAHs in muscle tissues. The second snake showed evidence of ingestion by oil but no accumulation in tissues or damage to internal organs and it was concluded that the oil was unlikely to be the cause of death (Curtin University, 2009; 2010).</p>	

There is potential for contamination of turtle eggs to result in similar toxic impacts to developing embryos as has been observed in birds. Studies on freshwater snapping turtles showed uptake of PAHs from contaminated nest sediments, but no impacts on hatching success or juvenile health following exposure of eggs to dispersed weathered light crude (Rowe *et al.*, 2009). However, other studies found evidence that exposure of freshwater turtle embryos to PAHs results in deformities (Bell *et al.*, 2006, Van Meter *et al.*, 2006).

Turtles may experience oiling impacts on nesting beaches and eggs through chemical exposure, resulting in decreased survival to hatching and developmental defects in hatchlings. Turtle hatchlings may be more vulnerable to smothering as they emerge from the nests and make their way over the intertidal area to the open water (AMSA, 2015). Hatchlings that contact oil residues while crossing a beach can exhibit a range of effects including impaired movement and bodily functions (Shigenaka, 2003). Hatchlings sticky with oily residues may also have more difficulty crawling and swimming, rendering them more vulnerable to predation.

Ingested oil may cause harm to the internal organs of turtles. Oil covering their bodies may interfere with breathing because they inhale large volumes of air to dive. Oil can enter cavities such as the eyes, nostrils, or mouth. Turtles may experience oiling impacts on nesting beaches when they come ashore to lay their eggs, and their eggs may be exposed during incubation, potentially resulting in increased egg mortality and/or possibly developmental defects in hatchlings.

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	<p>Exposure to moderate and high thresholds of hydrocarbons at the sea surface is predicted to occur over a small portion of the JBG.</p> <p>The BIAs and critical habitats for marine turtle species are described and mapped in Section 5.4.6 of Appendix 11. There is significant overlap of the flatback turtle nesting critical habitat and inter nesting BIA (present all year, peaking in June-September); green turtle foraging BIA (present all all year, peaking in Nov-March); olive ridley turtle foraging BIA (present all year, peaking Apr-Nov) and lesser overlap with the loggerhead turtle foraging BIA (present all year, peaking Nov-March) with the moderate and high surface oil thresholds within the JBG.</p> <p>Exposure impacts relating to oil inhalation for individuals on surfacing during foraging activities is possible. For an individual spill, the moderate and high surface oiling areas are spatially limited and temporary before weathering and mixing disperses and dilutes the concentrations to low (non-ecological) levels.</p>
Water column	<p>The ecological spill EMBA for dissolved and entrained hydrocarbons overlaps with foraging and inter-nesting BIAs for the loggerhead, green, hawksbill, olive ridley and flatback turtles.</p> <p>Impacts to marine reptiles from exposure to hydrocarbons in the water column is likely to be spatially limited to the areas of moderate to high (for dissolved hydrocarbons) and high (for entrained hydrocarbons) threshold exposure. These impacts will be temporally limited due to the rapid weathering of the oil and the open, well-mixed waters of the JBG and Indian Ocean. The impacts are likely to be as per those described in 'sensitivity to oil.'</p> <p>The potential impacts to each species within the ecological spill EMBA are predicted below:</p> <ul style="list-style-type: none"> • Loggerhead turtle – this species feeds mainly on pelagic species, which in themselves are not overly sensitive to oil spills (see Table 8.31, 'Fish'). The foraging BIA to the immediate north of the JBG is overlapped, with probabilities of exposure to known feeding areas being:

	<ul style="list-style-type: none"> ○ Pinnacles of the Bonaparte Basin KEF – 8-37% probability for entrained hydrocarbons and 1-3% probability for dissolved hydrocarbons; and ○ Carbonate Bank and terrace system of the Sahul Shelf KEF – 87-100% probability for entrained hydrocarbons and 85-98% probability for dissolved hydrocarbons. <ul style="list-style-type: none"> • Green turtle – the foraging BIA occurs in the same area and is slightly larger than that for the loggerhead turtle, with the probabilities of exposure therefore being similar. • Hawksbill turtle – important foraging areas are located around Ashmore Reef and Cartier Island (also nesting areas), where they feed on a range of pelagic and benthic invertebrates and seagrass and algae that are not highly sensitive to crude oil. These are areas where the concentrations of dissolved and entrained hydrocarbons are low (due to distance from the well) and the probability of exposure to hydrocarbons in the water column is low: <ul style="list-style-type: none"> ○ Ashmore Reef – 14% probability for entrained hydrocarbons and 1% probability for dissolved hydrocarbons; and ○ Scott Reef – 1-6% probability for entrained hydrocarbons and 1% probability for dissolved hydrocarbons. • Olive ridley turtle – the foraging BIA occurs over much of the JBG, which has a 100% probability of exposure. As this species forages primarily at the seabed, they are less susceptible to entrained and dissolved hydrocarbons that generally occur in the top 10 m of the water column. • Flatback turtle - the foraging BIA occurs in the same area as that for the loggerhead turtle, with the probabilities of exposure therefore being the same. As this species forages primarily at the seabed, they are less susceptible to entrained and dissolved hydrocarbons that generally occur in the top 10 m of the water column. <p>Sea snakes can be common in the shallow waters of reef lagoons and in shoals throughout the region, where the probabilities of exposure to moderate-high exposure thresholds vary from 0-72% depending on location and metocean season. There has been extremely limited study of the impacts of oil spills on sea snakes, so the effects of exposure are unknown.</p> <p>Crocodiles are common in the coastal waters of northern WA and the NT, where the probability of exposure to moderate-high exposure thresholds vary from 0-96% depending on the location and metocean season. There has been extremely limited study of the impacts of oil spills on crocodiles, so the effects of exposure are unknown.</p>
Shoreline	<p>See also Table 8.27 (sandy beaches).</p> <p>The following species are known to have nesting sites within the shoreline ecological EMBA (which have been defined as ‘critical habitat’ (i.e., critical to the survival of the species):</p> <ul style="list-style-type: none"> • Flatback turtle – known to nest in the thousands at Cape Domett and Lacrosse Island (eastern side of the mouth of Cambridge Gulf). Breeding occurs year-round with a peak nesting period from July to September. This area has a 70-93% probability of contact at ecological thresholds. Elsewhere, nesting occurs primarily along the Arnhem Land coast, where the probabilities of shoreline

	<p>loading at the ecological threshold are low (0-17%) and the WA coastline Islands centred around Cape Bougainville and Cape Londonderry where the probabilities of shoreline loading at the ecological level are moderate (0-44%).</p> <ul style="list-style-type: none"> • Green turtle – known to nest at Browse Island year-round, with a peak between December and January (11-27% probability of shoreline loading). Important (but low density) nesting areas at Ashmore Reef and Scott Reef have low probabilities of exposure (3% and 2-7%, respectively). Critical habitat (nesting) is also present south of the Anjo Peninsula which has a low probability of exposure (2 -21%) above ecological thresholds). • Hawksbill turtle – known to nest as Ashmore Reef (low density) and Scott Reef, which have low probabilities of exposure (3% and 2-7%, respectively). • Olive ridley turtle – nesting occurs primarily along the Arnhem Land coast, where the probabilities of shoreline loading at the ecological threshold are low (0-17%). <p>In these areas, oil coating the sand can become entrained in the beach and nesting turtles are therefore at risk of dragging oil into nests (with potential toxicity impacts on developing embryos) or hatchlings may travel through oiled sediments after they have emerged from the nest (with any oil stuck to them after entering the water resulting in toxic effects). This may cause mortality of individuals and cause localised population decline.</p> <p>The impacts described here will not impact on the long-term recovery objective (to allow for the conservation status of marine turtles to improve so that they can be removed from the EPBC Act threatened species list) and interim recovery objectives listed in the Recovery Plan for Marine Turtles in Australia (DoEE, 2017).</p>
Consequence evaluation based on an assessment against EPBC Act <i>Significant Impact Guidelines 1.1</i> (DoE, 2013)	
This LoWC OSTM results indicate that this spill scenario will not have a ‘significant’ impact on threatened reptile species (see Appendix 11) when assessed against the EPBC Act <i>Significant Impact Guidelines 1.1</i> (DoE, 2013), as assessed below:	
<ul style="list-style-type: none"> • Lead to a long-term decrease in the size of the population 	A spill would not lead to a long-term decrease in the size of a population given the small area of impact from a single spill, the rapid weathering of the crude and the low likelihood of a large portion of a turtle population being present in the spill area at any one time.
<ul style="list-style-type: none"> • Reduce the area of occupancy of the species 	Given the small area of ‘swept ocean’ from a single spill, the rapid weathering of the crude, the area of occupancy may be temporarily reduced (noting that turtles may not necessarily avoid a spill at the surface or in the water column), but there will be no long-term reduction in the area of occupancy.
<ul style="list-style-type: none"> • Fragment an existing population into two or more populations 	In the event of a spill resulting from a LoWC, turtles have access to an expansive area of unpolluted waters. As marine turtles migrate on a solitary basis, a spill would not be expected to split up a single population into two or more populations.

<ul style="list-style-type: none"> Adversely affect habitat critical to the survival of the species 	<p>The water quality of the impacted area would be temporarily reduced in the event of a spill. The portion of the oil that entrains or dissolves in the water column, where turtles spend the majority of their time, is dependent on ocean conditions during the spill (rough seas result in more entrainment than calm seas). The area affected by the oil is unlikely to form a significant part of turtle inter-nesting areas or migration routes, so exposure times are expected to be short.</p> <p>Nesting beaches may be impacted by oil residues. Some turtle nesting areas that may be affected by a LoWC event are designated as critical (i.e., Cape Domett & Lacrosse Island). Prioritisation of these areas in the event of a spill with respect to response activities to prevent shoreline residues from reaching these areas (see Chapter 9) will ensure that any impacts to these critical habitats are temporary and do not significantly impact on this critical habitat.</p>
<ul style="list-style-type: none"> Disrupt the breeding cycle of a population 	<p>Refer to the row above.</p>
<ul style="list-style-type: none"> Modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline 	<p>The water quality of the ecological spill EMBA would be temporarily reduced in the event of a spill. Marine habitat will not be modified, destroyed, removed, isolated or decreased to the extent that one or more turtle species will decline in number.</p> <p>Similarly, sandy beaches where nesting habitat is present may be temporarily impacted by a LoWC spill, however with spill response initiated (together with controls to prevent impacts), habitats will not be modified, destroyed, removed, isolated or decreased to the extent that one or more turtle species will decline.</p>
<ul style="list-style-type: none"> Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species habitat 	<p>A large-scale hydrocarbon spill is highly unlikely to result in the introduction and spread of IMS that are harmful to endangered marine turtles. Vessels that may be involved in the spill response strategies will be subject to strict IMS controls to ensure that ballast water is of 'low risk' and that hulls are free of IMS.</p>
<ul style="list-style-type: none"> Introduce disease that could cause the species to decline 	<p>The risk of toxic impacts to individual species or populations of turtle is negligible due to the rapid weathering of the crude. The small extent of a single spill further reduces the risk to a small area such that it is unlikely large number of 'oiled' turtles become susceptible to disease.</p> <p>Oil spill response activities are not expected to introduce disease to marine turtles.</p>
<ul style="list-style-type: none"> Interfere with the recovery of the species 	<p>For all the reasons outlined above, a crude oil spill will not interfere with the recovery of a marine turtle species.</p>

Consequence evaluation based on an assessment against actions identified in the <i>Recovery Plan for Marine Turtles in Australia</i> (DoEE, 2017)	
A1. Maintain and improve efficacy of legal and management protection	EOG is utilising the information contained in legal and management protection systems (e.g., spatial management systems that map BIAs and critical habitats, recovery plan management arrangements) to manage the anthropogenic impacts of drilling activities to ensure turtles are not displaced from their habitat.
A2. Actively manage turtle stocks to reduce risk and build resilience to climate change and variability	Limited applicability to EOG. Responsible agencies for this action are government agencies, research institutions, relevant NGOs and industry partners.
A3. Reduce the impacts from marine debris	Limited applicability to EOG, however all activity described in this EP demonstrates support for the EPBC Act <i>Threat Abatement Plan for the impacts of marine debris on vertebrate marine life</i> (DoEE, 2018).
A4. Minimise chemical and terrestrial discharge – specifically: <i>Ensure that spill risk strategies and response programs adequately include management for turtles and their habitats, particularly in reference to “slow to recover habitats” e.g., nesting habitat, seagrass meadows or coral reefs</i>	Spill response strategies have been developed ensuring that turtle habitats are managed to reduce impacts in the event of an oil spill (see Section 9).
A5. Address international take within and outside Australia’s jurisdiction	Not relevant to EOG.
A6. Reduce impacts from terrestrial predation	Not relevant to EOG.
A7. Reduce international and domestic fisheries by-catch	Not relevant to EOG.
A8. Minimise light pollution – specifically: <i>Artificial light within or adjacent to habitat critical to the survival of</i>	EOG will undertake shoreline survey/protection/clean-up response only during daylight hours such that light does not interfere with critical turtle habitats. Accommodation of shoreline responders is expected to be in offshore vessels.

<i>marine turtles will be managed such that marine turtles are not displaced from these habitats.</i>	
A9. Address the impacts of coastal development/infrastructure and dredging and trawling	Not relevant to EOG.
A10: Maintain and improve sustainable indigenous management of marine turtles.	Not relevant to EOG.
B1, Determine trends at index beaches	Not relevant to EOG.
B2. Understand population demographics at key foraging grounds	Not relevant to EOG.
B3. Address information gaps to better facilitate the recovery of marine turtle stocks	Not relevant to EOG.
Inherent impact consequence:	Severe

Table 8.35. Sensitivity and consequence evaluation of hydrocarbon exposure to seabirds and shorebirds

General sensitivity to oiling – seabirds and shorebirds	
Sensitivity rating of seabirds:	High
Sensitivity rating of shorebirds:	High
A description of seabirds and shorebirds in the spill EMBA is provided in:	Appendix 11, Section 5.3.7
<p>Seabirds and shorebirds are sensitive to the impacts of oiling, with their vulnerability arising from the fact that they cross the air-water interface to feed, while their shoreline habitats may also be oiled (Hook <i>et al.</i>, 2016). Species that raft together in large flocks on the sea surface are particularly at risk (ITOPF, 2011a).</p> <p>Birds foraging at sea have the potential to directly interact with oil on the sea surface some considerable distance from breeding sites in the course of normal foraging activities. Species most at risk include those that readily rest on the sea surface (such as shearwaters) and surface plunging species such as terns and boobies. As seabirds are top order predators, any impact on other marine life (e.g., pelagic fish) may disrupt and limit food supply both for the maintenance of adults and the provisioning of young.</p> <p>In the case of seabirds, direct contact with hydrocarbons is likely to foul plumage, which may result in hypothermia due to a reduction in the ability of the bird to thermo-regulate and impair waterproofing (ITOPF, 2011a). A bird suffering from cold, exhaustion and a loss of buoyancy (resulting from fouling of plumage) may dehydrate, drown or starve (ITOPF, 2011a; DSEWPC, 2011; AMSA, 2013). It may also result in impaired navigation and flight performance (Hook <i>et al.</i>, 2016). Increased heat loss as a result of a loss of water-proofing results in an increased metabolism of food reserves in the body, which is not countered by a corresponding increase in food intake, and may lead to emaciation (DSEWPC, 2011). The greatest vulnerability in this case occurs when birds are feeding or resting at the sea surface (Peakall <i>et al.</i>, 1987). In a review of 45 marine hydrocarbon spills, there was no correlation between the numbers of bird deaths and the volume of the spill (Burger, 1993).</p> <p>Toxic effects of hydrocarbons on birds may result where the oil is ingested as the bird attempts to preen its feathers, and the preening process may spread the oil over otherwise clean areas of the body (ITOPF, 2011a). Whether this toxicity ultimately results in mortality will depend on the amount of hydrocarbons consumed and other factors relating to the health and sensitivity of the bird. Birds that are coated in oil also suffer from damage to external tissues including skin and eyes, as well as internal tissue irritation in their lungs and stomachs. Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos. Engelhardt (1983), Clark (1984), Geraci & St Aubin (1988) and Jenssen (1994) indicated that the threshold thickness of oil that could impart a lethal dose to some intersecting wildlife individual is 10 μm ($\sim 10 \text{ g/m}^2$). Scholten <i>et al</i> (1996) indicates that a layer 25 μm thick would be harmful for most birds that contact the slick.</p> <p>Shorebirds are likely to be exposed to oil when it directly impacts the intertidal zone due to their feeding habitats. Shorebird species foraging for invertebrates on exposed sand and mud flats at lower tides will be at potential risk of both direct impacts through contamination of individual birds (ingestion or soiling of feathers) and indirect impacts through the contamination of foraging areas that may result in a reduction in available prey items (Clarke, 2010). Breeding seabirds may be directly exposed to oil via a number of potential pathways. Any direct impact of oil on terrestrial habitats has the potential to contaminate birds present at the breeding sites</p>	

(Clarke, 2010). Bird eggs may also be damaged if an oiled adult sits on the nest. Fresh crude was shown to be more toxic than weathered crude, which had a medial lethal dose of 21.3 mg/egg (Clarke, 2010).

Consequence evaluation based on the Beehive-1 OSTM

Sea surface	<p>The area of moderate and high threshold exposure at the sea surface does not overlap the foraging BIAs of any seabirds or shorebirds.</p> <p>Seabirds rafting, resting, diving or feeding at sea have the potential to come into contact with oil. However, because of the extensive ocean foraging habitat available to the species known to occur in the ecological spill EMBA, the area impacted by surface oil is unlikely to limit their ability to forage for unaffected prey. As such, surface oil is unlikely to affect species at a population level.</p>
Water column	<p>The area of high threshold exposure for entrained and moderate to high threshold exposure for dissolved hydrocarbons is extensive and is overlapped by BIAs for many seabirds and shorebirds (as described and mapped in Section 5.3.7 of Appendix 11).</p> <p>Seabirds spend a limited amount of time in the water column (diving for prey) and are therefore not likely to be significantly affected by hydrocarbons in the water column. Indirect effects through the ingestion of contaminated prey may affect individual birds but there are not likely to be impacts at the population level.</p>
Shoreline	<p>The northern WA and NT shorelines provide abundant feeding, roosting and nesting habitats for seabirds and shorebirds. The shoreline locations that intersect shorebird BIAs of the greatest significance are:</p> <ul style="list-style-type: none"> • Finnis River floodplain (NIW and IBA, 1-14% probability of contact at the moderate threshold, peak volume of 5-51 m³) – major breeding area for magpie geese and a major migration stopover for shorebirds. • Daly-Reynolds floodplain (N IW and IBA, 1-41% probability of contact at the moderate threshold, peak volume of 5-200 m³) – at least 30 shorebird species, with a large number of magpie geese. • Moyle floodplain (NIW and IBA, 13-54% probability of contact at the moderate threshold, peak volume of 22-134 m³) – 47 shorebird species, a significant breeding area for magpie geese, rookeries for darter and cormorant species. • Peron Islands (NT) (part of the Daly River IBA) (2-17% probability of contact at moderate threshold, peak volume of up to 32.4 m³). • Legune wetlands (IBA, 24-47% probability of contact at the moderate threshold, peak volume of 20-29 m³) – 47 shorebird species. • Ord River floodplain (Ramsar site, Cambridge Gulf, 70-93% probability of contact at the moderate threshold) – over 200 species of waterfowl, migratory shorebirds, mangrove birds and terrestrial species, including the threatened Australian painted snipe. • Bigge Island (west of the Mitchell River mouth, 70-93% probability of contact at the moderate threshold) – breeding BIA for the lesser crested tern. • Sir Graham Moore Island (north of Kalumburu, 70-93% probability of contact at the moderate threshold) – roseate tern breeding.

- Cartier Island (5% probability of contact at the moderate threshold, winter only, peak volume of 11 m³) – breeding BIAs for the lesser frigatebird, red-footed bobby, wedge-tailed shearwater and white-tailed tropicbird, along with habitat for lesser sand plovers, eastern reef egrets, ruddy turnstones, crested terns, bridled terns and roseate terns.
- Ashmore Reef (Ramsar site, 3% probability of contact at the moderate threshold, winter only, peak volume of 14 m³) – breeding BIAs for the lesser frigatebird, red-footed bobby, wedge-tailed shearwater and white-tailed tropicbird, along with roseate tern and greater frigatebird breeding and habitat for common noddies (second largest colony in Australia), sooty terns (largest colony in WA) and crested terns.
- Browse Island (11-27% probability of contact at the moderate threshold, peak volume of 14-64 m³) – breeding BIA for crested tern and habitat for eastern reef egrets, ruddy turnstones and sooty terns.

In these areas, impacts to birds may include oiling of feathers, oiling of feeding, roosting and nesting habitats (e.g., mudflats, mangroves, sandy beaches) and contamination of their food sources. Depending on the degree of oiling and the timing of a spill, this could result in small or large bird populations being injured or dying. Migratory birds may be too injured to fly to other feeding or breeding areas, resulting in a reduction of the next generation's population size. The values of NIWs and Ramsar wetlands may be temporarily compromised.

Consequence evaluation based on an assessment against the EPBC Act guidelines

This hydrocarbon spill scenario will not have a 'significant' impact on threatened migratory shorebird species (see Section 5.3.7 of Appendix 11) when assessed against *Industry guidelines for avoiding, assessing and mitigating impacts on EPBC Act-listed migratory shorebird species Policy Statement 3.21* (DoEE, 2017d):

• Loss of habitat.	The habitats along the shorelines of the ecological spill EMBA will not be lost.
• Degradation of habitat leading to a substantial reduction in migratory shorebird numbers.	Habitat quality will temporarily decrease in parts, but given the predicted weathering profile of the crude, there will be no long-term degradation. The presence of large areas of rocky shoreline in the ecological spill EMBA reduces the risk of degradation in those areas.
• Increased disturbance leading to a substantial reduction in migratory shorebird numbers.	Crude will rapidly percolate through sandy and muddy beach sediments, resulting in short-term disturbance. The most likely shoreline response option will be to monitor and evaluate (rather than actively undertake a clean-up in sensitive coastal habitats), further reducing the potential for disturbance to shorebirds.
• Direct mortality of birds leading to a substantial reduction in migratory shorebird numbers.	Depending on the nature of the spill, how it weathers and the location of shoreline loading, there is a low risk of direct mortality of birds. No one area of the EMBA, particularly the shoreline closest to the activity area, has high concentrations or a high percentage of a population of any migratory shorebird species. As such, a substantial reduction in migratory shorebird numbers is highly unlikely to occur.

This hydrocarbon spill scenario will not have a 'significant' impact on threatened seabird species (see Section 5.3.7) when assessed against the EPBC Act <i>Significant Impact Guidelines 1.1</i> (DoE, 2013), which are:	
<ul style="list-style-type: none"> Lead to a long-term decrease in the size of a population. 	A spill would not lead to a long-term decrease in the size of a population given the small area of 'swept ocean' from a single spill, the predicted rapid weathering of the crude and the low likelihood of a large portion of a seabird or shorebird population being present in the affected areas at any one time.
<ul style="list-style-type: none"> Reduce the area of occupancy of the species. 	Given the small area of 'swept ocean' from a single spill, the predicted rapid weathering of the crude and the abundance of suitable nearby habitat, sea surface water quality and some shoreline habitat quality will temporarily decrease and therefore the area of occupancy will be temporarily reduced but there will be no long-term reduction in the area of occupancy.
<ul style="list-style-type: none"> Fragment an existing population into two or more populations. 	Seabirds have access to an expansive area of unpolluted waters and shorebirds similarly have access to expansive areas of unpolluted shorelines. A spill would not be likely to fragment an existing population.
<ul style="list-style-type: none"> Adversely affect habitat critical to the survival of a species. 	The quality of marine and coastal habitats will be affected for a short period of time, but given the broad areas of habitat use by the species present in the ecological spill EMBA, the survival of any one species is not likely to be adversely affected.
<ul style="list-style-type: none"> Disrupt the breeding cycle of a population. 	<p>Most of the seabird and shorebird species known to occur in the ecological spill EMBA (e.g., common noddy, streaked shearwater and frigatebirds) breed outside of Australia or beyond the spill EMBA. Important breeding areas in Australia (e.g., Ashmore Reef, Cartier Island, Browse Island) generally have a low risk of contact and small volumes of predicted stranded oil, which can be removed through various response strategies.</p> <p>It is highly unlikely that the breeding cycle of a seabird population will be disrupted.</p>
<ul style="list-style-type: none"> Modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline. 	<p>Given the small area of 'swept ocean' from a single spill and the predicted rapid weathering of the crude, the quality of marine waters and shorelines in the area of the spill will be temporarily reduced. However, marine and coastal habitat will not be modified, destroyed, removed, isolated or decreased to the extent that one or more seabird species will decline.</p> <p>Most of the seabird and shorebird species known to occur in the ecological spill EMBA breed outside of Australia or beyond the spill EMBA. This being the case, it is unlikely that adults would bring contaminated prey back to nests to feed chicks. For the species that do breed in Australian waters and shorelines, it is unlikely that spill-affected prey would be brought back to the nest in quantities significant enough to result in mortality of chicks and the loss of a generation.</p>
<ul style="list-style-type: none"> Result in invasive species that are harmful to a critically endangered or endangered species becoming 	Response strategies employed to response to a spill are highly unlikely to result in the introduction and spread of IMS that are harmful to birds. Vessels that may be involved in spill response will be subject to strict IMS controls to ensure that ballast water is of 'low risk' and that hulls are free of IMS.

established in the endangered or critically endangered species' habitat.	
<ul style="list-style-type: none"> Introduce disease that may cause the species to decline. 	As described in 'sensitivity to oil', disease of individual birds or small populations may occur in the event of a spill. With the appropriate spill response strategies, this is unlikely to result in long-term decline of populations.
<ul style="list-style-type: none"> Interfere with the recovery of the species. 	For all the reasons outlined above, a spill from a LoWC is not likely to interfere with the recovery of bird species.
The activity will not impact on the objectives of the Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020), which are:	
<ol style="list-style-type: none"> International cooperation and collaboration continue to support the survival of seabirds and their habitats outside Australian jurisdiction. Seabirds and their habitats are identified, protected, and managed in Australia. The long-term survival of seabirds and their habitats is achieved through supporting priority research programs, coordinated monitoring, on-ground management and conservation. Increase the Awareness of the importance of conserving seabirds and their habitats through community education and capacity building to support monitoring and on-ground management. 	
Inherent impact consequence:	Severe

Table 8.36. Sensitivity and consequence evaluation of hydrocarbon exposure to socio-economic - commercial fisheries

General sensitivity to oiling – commercial fishing	
Sensitivity rating of commercial fisheries (socio-economic rating):	Medium
A description of commercial fisheries operating in the spill EMBA is provided in:	Appendix 11, Section 5.6.1
<p>Commercial fishing has the potential to be impacted through contaminated of fish stock, exclusion zones associated with the spill, the spill response and subsequent reduction in fishing effort. Exclusion zones may impede access to commercial fishing areas, for a short period of time, and nets and lines may become oiled. The impacts to commercial fishing from a public perception perspective, and its impacts on fish markets and customer consumption patterns, may be much more significant and longer term than the spill itself.</p> <p>Fishing areas may be closed for fishing for short or long periods because of the risks of the catch being tainted by oil. Concentrations of petroleum contaminants in fish, crustacean and mollusc tissues could pose a significant potential for adverse human health effects, and until these products have been cleared by the health authorities, they could be restricted for sale and human consumption. Indirectly, the fisheries sector will suffer a heavy loss if consumers are either stopped from using or unwilling to buy fish from the region affected by the spill.</p> <p>Impacts to fish stocks have the potential for reduction in profits for commercial fisheries, and exclusion zones exclude fishing effort. Davis et al (2002) report detectable tainting of fish flesh after a 24-hour exposure at crude concentrations of 0.1 ppm.</p> <p>The Montara spill (as the most recent [2009] example of a large hydrocarbon spill in Australian waters) occurred over an area fished by the Northern Demersal Scalefish Managed Fishery (with 11 licences held by 7 operators), with goldband snapper, red emperor, saddletail snapper and yellow spotted rockcod being the key species fished (PTTEP, 2013). As a precautionary measure, the WA Department of Fisheries advised the commercial fishing fleet to avoid fishing in oil-affected waters. Testing of fish caught in areas of visible oil slick (November 2009) found that there were no detectable petroleum hydrocarbons in fish muscle samples, suggesting fish were safe for human consumption. In the short-term, fish had metabolised petroleum hydrocarbons. Limited ill effects were detected in a small number of individual fish only (PTTEP, 2013). No consistent effects of exposure on fish health could be detected within two weeks following the end of the well release. Follow up sampling in areas affected by the spill during 2010 and 2011 (PTTEP, 2013) found negligible ongoing environmental impacts from the spill.</p> <p>Since testing began in the month after the Macondo well blowout in the Gulf of Mexico (GoM) (2010), levels of oil contamination residue in seafood consistently tested 100 to 1,000 times lower than safety thresholds established by the USA FDA, and every sample tested was found to be far below the FDA's safety threshold for dispersant compounds (BP, 2015). FDA testing of oysters found oil contamination residues to be 10 to 100 times below safety thresholds (BP, 2014a). Sampling data shows that post-spill fish populations in the GoM since 2011 were generally consistent with pre-spill ranges and for many shellfish species, commercial landings in the GoM in 2011 were comparable to pre-spill levels. In 2012, two years after the initial spill, shrimp (prawn) and blue crab landings were within 2.0% of 2007-09 landings. Recreational fishing harvests in 2011, 2012 and 2013 exceeded landings from 2007-09 (BP, 2014).</p> <p>In the event of a spill resulting from a LoWC, temporary fisheries closure may be put in place by AFMA, the WA or NT fishery authorities (or voluntarily by the fishers themselves). Oil may foul the hulls of fishing vessels and associated equipment, such as gill nets. A temporary fisheries closure, combined with oil tainting of target species (actual or perceived), may lead to financial losses to fisheries and economic losses for individual licence holders. Fisheries closures and the flow on losses from</p>	

the lack of income derived from these fisheries are likely to have short-term but widespread socio-economic consequences, such as reduced employment (in fisheries service industries, such as tackle and bait supplies, fuel, marine mechanical services, accommodation and so forth).

Consequence evaluation based on the Beehive-1 OSTM

OSTM predicts extensive areas may be exposed to entrained and dissolved hydrocarbons at the moderate and high exposure (ecological) thresholds.

A short- or long-term fishing closure may be implemented by AFMA, the WA and/or NT fishery authorities, with the duration depending on the results of water quality testing and fish sample testing. Fishers may lose access to traditional fishing grounds with consequential income losses and possible supply shortages to their commercial customers. In all instances, the worst-case deterministic OSTM results indicate that hydrocarbons in the water column would occupy small areas of each fishery.

This section evaluates the consequences on a fishery-by-fishery basis.

Commonwealth-managed fisheries (those known to fish within the spill EMBA)

NPF	The area overlapped by the socio-economic spill EMBA represents 32% of the area available to the fishery. Given that drilling is expected to start late Q1/early Q2 with a duration of 55-100 days and that the fishery is closed from 1 st December to 1 st August, if a LoWC occurred, its effects would likely not result in lost fishing time.	Consequence: Moderate
North West Slope Trawl	The area overlapped by the socio-economic spill EMBA represents 64% of the area available to the fishery. Fishing is concentrated in water depths greater than 200 m, which represents waters that will have lower in-water hydrocarbon concentrations than those closer to the well. Target species are generally benthic or demersal, where hydrocarbon concentrations will be low (they are generally concentrated in the top 10 m of the water column).	Consequence: Moderate
Southern bluefin tuna	The area overlapped by the socio-economic spill EMBA represents 42% of the area available to the fishery. There has been no active fishing in the region for many years, but tuna spawn in the region between September and March. Given that drilling is expected to start in late Q1/early Q2 with a duration of 55-100 days, if a LoWC occurred, its effects would likely not result in toxicological effects to tuna spawning and larvae and therefore have a negligible to minor consequence on the fishery off the southern states where the tuna migrate to.	Consequence: Minor

WA-managed fisheries (those known to fish within the spill EMBA)

Mackeral Managed Fishery	The area overlapped by the socio-economic spill EMBA represents 38% of the area available to the fishery. As a pelagic migratory species, mackeral are not likely to spend long periods of time in one location (e.g., waters with high hydrocarbon concentrations), so the risk of contamination is low.	Consequence: Moderate
--------------------------	--	---------------------------------

	<p>The fishing season overlaps the drilling window. If a LoWC occurred, a temporary fishery closure would be likely. In the Kimberley region, less than five vessels operate and catch levels are generally less than 300 t. There would be some impact to several fishers and some lost catch as a result of a fishery closure.</p>	
Northern Demersal Scalefish Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 73% of the area available to the fishery in Area 1 and 98% of Area 2.</p> <p>Fishing is assumed to occur year-round, so it will overlap with the drilling window.</p> <p>Given that the target species are generally benthic or demersal, where hydrocarbon concentrations will be low (they are generally concentrated in the top 10 m of the water column), impacts to fish stock are likely to be low. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 1,000 and 1,500 t.</p>	Consequence: Moderate
Kimberley Crab Managed Fishery (North Coast Crab Fishery)	<p>The area overlapped by the socio-economic spill EMBA represents 86% of the area available to the fishery.</p> <p>Fishing occurs from March to November, so it will overlap with the drilling window. Coastal waters in which the fishery operates would be exposed to hydrocarbons in the water column.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where six people are employed and who annual catches vary between 3 and 15 t.</p>	Consequence: Severe
Kimberley Prawn Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 97% of the area available to the fishery.</p> <p>Fishing occurs from April to mid-June, so it will overlap with the drilling window. Coastal waters in which the fishery operates would be exposed to hydrocarbons in the water column.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 100 and 333 t.</p>	Consequence: Moderate
Kimberley Gillnet and Barramundi Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 71% of the area available to the fishery.</p> <p>Fishing occurs predominantly from April to September, so it will overlap with the drilling window. Coastal waters in which the fishery operates would be exposed to hydrocarbons in the water column.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 73 and 92 t.</p>	Consequence: Moderate

Pearl Oyster Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 70% of the area available to the fishery.</p> <p>The fishery operates predominantly between March and June, so it will overlap with the drilling window. As a filter feeding species, oysters are sensitive to hydrocarbons in the water column, so the consequence of filtering large volumes of contaminated water could be severe.</p> <p>If a LoWC occurred, there could be contamination or loss of stock (and associated financial losses), with annual production varying between 468,000 and 614,000 shells.</p>	Consequence: Severe
Abalone Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 48% of the area available to the fishery.</p> <p>The fishery operates predominantly between October and May, so it will overlap with the drilling window. Coastal waters in which the fishery operates would be exposed to hydrocarbons in the water column.</p> <p>As a filter feeding species, abalone are sensitive to hydrocarbons in the water column, so the consequence of filtering large volumes of contaminated water could be severe.</p> <p>If a LoWC occurred, there could be contamination or loss of stock (and associated financial losses), with annual production varying between 47 and 51 t.</p>	Consequence: Severe
Marine Aquarium Fish Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 27% of the area available to the fishery.</p> <p>Fishing is assumed to occur year-round, so it will overlap with the drilling window.</p> <p>Waters in which the fishery operates would be exposed to hydrocarbons in the water column of various concentrations given the extent of the fishery.</p> <p>The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 12,000 and 27,500 individuals.</p>	Consequence: Severe
Broome Prawn Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 78% of the area available to the fishery.</p> <p>There is a very low risk of entrained (1-2%) hydrocarbons reaching the fishing area, and very low instantaneous concentrations (30-65 ppb). The probability of dissolved hydrocarbons in the area is not reported in the OSTM. As such, impacts are expected to be minor and effects to target species will be minor and there would be limited to no effects to the fishery.</p>	Consequence: Minor
Nickol Bay Managed Prawn Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 39% of the area available to the fishery.</p> <p>There is a very low risk of entrained (<1-2%) hydrocarbons reaching the fishing area, and very low instantaneous concentrations (<30-65 ppm). The reporting thresholds for dissolved hydrocarbons were not met in the OSTM.</p> <p>As such, impacts to target species will be minor and there would be limited to no effects to the fishery.</p>	Consequence: Negligible

Onslow Managed Prawn Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 26% of the area available to the fishery.</p> <p>There is a very low risk of entrained (<1-2%) hydrocarbons reaching the fishing area, and very low instantaneous concentrations (<30-65 ppm). The reporting thresholds for dissolved hydrocarbons were not met in the OSTM.</p> <p>As such, impacts to target species will be minor and there would be limited to no effects to the fishery.</p>	Consequence: Negligible
Specimen Shell Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 48% of the area available to the fishery.</p> <p>Fishing (hand collection) is assumed to occur year-round, so it will overlap with the drilling window. This fishery is not expected to be affected by an oil spill because it does not depend on catching live specimens for sale.</p>	Consequence: Negligible
Pilbara Demersal Scalefish Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 33% of the area available to the fishery.</p> <p>Fishing (hand collection) is assumed to occur year-round, so it will overlap with the drilling window. The fishery covers a large area so target pelagic species would be exposed to in-water hydrocarbon at various concentrations.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 1,800 and 3,000 t.</p>	Consequence: Moderate
Pilbara Crab Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 30% of the area available to the fishery.</p> <p>There is a very low risk of entrained (<1-2%) hydrocarbons reaching the fishing area, and very low instantaneous concentrations (<30-65 ppb). The reporting thresholds for dissolved hydrocarbons were not met in the OSTM.</p> <p>As such, effects to target species will be minor and there would be limited to no effects to the fishery.</p>	Consequence: Negligible
West Coast Deep Sea Crustacean Managed Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 39% of the area available to the fishery.</p> <p>Fishing occurs from January to June, with the greatest intensity in January and February. This high intensity fishing period is outside the drilling window.</p> <p>Given that the target species are benthic and in deep waters (targeting the 150 m bathymetry contour), where hydrocarbon concentrations will be low (they are generally concentrated in the top 10 m of the water column), impacts to deep sea crustacean stock are likely to be low.</p> <p>The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 153 and 164 t.</p>	Consequence: Minor

NT-managed fisheries (those known to fish within the spill EMBA)		
Seafarms Project Seadragon – onshore prawn aquaculture (planned)	<p>Project Sea Dragon has a sub-lease on an area of the Legune Pastoral Lease, southwest of the mouth of the Victoria River. Seafarms is focused on land-based production of Australia prawns for the domestic and international markets. It is currently (late 2022) in the construction phase and not yet operational. The quality of seawater from the Victoria River area tidal creeks is important to underpinning potential prawn production in sub lease area.</p> <p>The probabilities of contact in the Victoria-Daly OSTM sector at the low threshold are as follows (ranges account for seasons):</p> <ul style="list-style-type: none"> • Shoreline – 48-78%; • Sea surface – 36-67%; • Dissolved – 46-59%; and • Entrained – 53-80%. <p>If a LoWC occurred, seawater intakes would need to be closed as a precautionary measure to protect water quality of the aquaculture operations (if it is operational at the time of drilling). This could result in the loss of stock and therefore loss of income associated with that stock.</p>	Consequence: Severe
Demersal Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 38% of the area available to the fishery.</p> <p>The fishing season is year-round, so it overlaps the drilling window.</p> <p>Given that the target species are demersal, where hydrocarbon concentrations will be low (they are generally concentrated in the top 10 m of the water column), the effects of a spill on target fish species are likely to be low.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. About seven vessels operate and annual catch levels are generally up to 3,000 t. There would be some impact to several fishers and some lost catch as a result of a fishery closure.</p>	Consequence: Minor
Spanish Mackerel Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 39% of the area available to the fishery.</p> <p>The fishing season is year-round, so it overlaps the drilling window.</p> <p>As a pelagic migratory species, mackerel are not likely to spend long periods of time in one location (e.g., waters with high hydrocarbon concentrations), so the risk of contamination is low.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 357 and 411 t.</p>	Consequence: Severe
Offshore Net and Line Fishery	<p>The area overlapped by the socio-economic spill EMBA represents 39% of the area available to the fishery.</p> <p>There is little information available for this fishery, so it is assumed that the fishing season overlaps the drilling window.</p>	Consequence: Moderate

	<p>The fishery targets shark and mackerel. As pelagic (and migratory in the case of mackerel) species, they are not likely to spend long periods of time in one location (e.g., waters with high hydrocarbon concentrations), so the risk of contamination is low. If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers.</p>	
Coastal Line Fishery	<p>There is little information available for this fishery, so it is assumed that the fishing season overlaps the drilling window. The fishery covers the entire NT coastline and is concentrated around Darwin.</p> <p>There probability of entrained hydrocarbons around Darwin is 0-28% with instantaneous concentrations of 583-1,354 ppb, and for dissolved hydrocarbons it is 0-12% with instantaneous concentrations of 45-497 ppb. At these concentrations, sub-lethal effects to marine fauna are possible, though black jewfish, like other fish, are able to metabolise and excrete hydrocarbons.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 124 and 173 t.</p>	<p>Consequence: Moderate</p>
Barramundi Fishery	<p>There is little information available for this fishery.</p> <p>The fishery operates from February to September, so it overlaps the drilling window. The fishery is focussed on tidal mud flats and inside a restricted number of rivers, presumed to be concentrated around Darwin.</p> <p>There probability of entrained hydrocarbons around Darwin is 0-28% with instantaneous concentrations of 583-1,354 ppb, and for dissolved hydrocarbons it is 0-12% with instantaneous concentrations of 45-497 ppb. At these concentrations, sub-lethal effects to marine fauna are possible, though barramundi, like other fish, are able to metabolise and excrete hydrocarbons.</p> <p>If a LoWC occurred, a temporary fishery closure would be likely. The greatest impact would come from a precautionary closure of the fishery and associated loss of income for fishers, where annual catches vary between 276 and 392 t.</p>	<p>Consequence: Moderate</p>

Table 8.37. Sensitivity and consequence evaluation of hydrocarbon exposure to socio-economic sensitivities – protected areas

General sensitivity to oiling – protected areas	
Sensitivity rating of protected areas (MNPs (sanctuary zones) and Ramsar wetlands):	Very High
Sensitivity rating of protected areas (MNPs (habitat protection zones) and NIWs):	High
Sensitivity rating of protected areas (MNPs (multiple use zones) and fish habitat protection areas):	Medium
Protected areas are declared for their various physical, ecological, biological and social values, and these are described in various sections of Appendix 11, as noted below. An assessment of the risk of a LoWC on the management actions of the protected areas in the spill EMBA is presented in Appendix 13.	
Consequence evaluation based on the Beehive-1 OSTM	
Marine parks	<p>AMPs and state marine parks in the spill EMBA are described in Sections 5.4.1 and 5.4.9 respectively, in Appendix 11. Appendix 13 lists the probabilities of contact and exposure values for Commonwealth AMPs, WA and NT marine parks in the spill EMBA, along with providing an assessment against the relevant management plans.</p> <p>While the values of each of the marine parks vary, they support all the habitats and faunal groups described in the previous tables. A decrease in water quality in the marine parks will impacts on their habitat and fauna receptors and therefore have an adverse impact on the values of these reserves. This may have flow-on effects to tourism and a loss of revenue for coastal communities that provide access to these marine reserves. Marine parks often provide protected nursery grounds for fisheries species and therefore have a role in maintaining healthy fish stocks for commercial and recreational fisheries.</p>
Ramsar wetlands	<p>Ramsar wetlands in the spill EMBA are described in Section 5.4.4 in Appendix 11, and the probabilities of contact and exposure values are listed in Section 10 of Appendix 13.</p> <p>The Ramsar wetland with the highest probability of shoreline contact is the Ord River Floodplain, with a 70-93% probability of contact, depending on season. Receptors are risk at this wetland include mangroves, mud flats, sawfish, crocodiles and migratory shorebirds. The wetland also contains various Aboriginal cultural heritage artefacts.</p> <p>Consequence: severe.</p>
TECs	<p>There is one TEC in the spill EMBA, which is described in Section 5.4.5 in Appendix 11. This is the monsoon vine thickets on the coastal sand dunes of Dampier Peninsula. It occurs on dunes just above the high tide mark. The risk of shoreline contact in this area is 1%.</p> <p>Consequence: negligible.</p>
KEFs	<p>KEFs in the spill EMBA are described in Section 5.4.7 in Appendix 11, and the probabilities of contact and exposure values are listed in Section 10 of Appendix 13.</p>

	<p>These KEFs are subsea features, generally reefs, shoals, canyons, banks and pinnacles. As subsea physical features, they are generally at low risk from a spill associated with a LoWC. Impacts to the biological values of these KEFs, including fish and corals, are addressed in earlier tables.</p> <p>Consequence: moderate.</p>
NIWs	<p>NIWs in the spill EMBA are described in Section 5.4.8 in Appendix 11, and the probabilities of contact and exposure values are listed in Section 10 of Appendix 13.</p> <p>The NIWs with the highest probabilities of shoreline contact at the moderate threshold are:</p> <ul style="list-style-type: none"> • Ord Estuary System (70-93% probability); • Legune Wetlands (24-47% probability); • Moyle Floodplain and Hyland Bay System (13-54% probability); and • Daly-Reynolds Floodplain-Estuary System (1-41% probability). <p>The key values of the NIWs are associated with fish (see Table 8.31) and birds (see Table 8.33).</p> <p>Consequence: severe.</p>
National Heritage	<p>The spill EMBA intersects the West Kimberley National Heritage Place, which is described in Section 5.4.3 in Appendix 11. The section of coastline it covers is vast, with probabilities of shoreline contact ranging from 0-99% depending on location and season.</p> <p>The values most relevant to the marine environment is Roebuck Bay as a migratory hub for shorebirds. Roebuck Bay is located south of Broome and does not fall within the ecological spill EMBA. As such, the key marine values associated with the West Kimberley National Heritage Place will not be affected by a spill.</p> <p>Consequence: negligible.</p>

Table 8.38. Sensitivity and consequence evaluation of hydrocarbon exposure to First Nations cultural heritage values and sensitivities

General sensitivity to oiling – First Nations cultural heritage values and sensitivities	
Sensitivity rating:	High
A description of First Nations cultural heritage values and sensitivities in the spill EMBA is provided in:	Appendix 11, Section 5.5
<p>Sea Country values of First Nations people may be impacted in a number of ways by a hydrocarbon spill – at the physical, biological and spiritual levels. To EOG’s knowledges, this is not an area that has been subject to documented research.</p> <p>Impacts at the physical and biological levels (e.g., shorelines, fauna) are described in the earlier tables in this section. Physical and biological impacts may temporarily prevent or restrict access to traditional lands or seas for hunting and social gatherings (e.g., ceremonies). It is unknown how these impacts may translate to the spiritual level (e.g., rituals, song lines, animal totems), though it is likely that the visual presence of floating oil or shoreline oil accumulations will cause impacts.</p>	
Consequence evaluation based on the Beehive-1 OSTM	
Sea surface	<p>Oil will be present on the sea surface and in the water column, the concentrations and locations of which are dependent on a number of factors at the time of a spill (e.g., volume released, weather, trajectory, etc).</p> <p>In discussions with EOG, the BAC has stated that they have important connections to Country, including coastal and marine areas. Connections to Sea Country may be affected in this case. An oil spill is likely to impact Sea Country values, but the exact nature of these impacts is not known. It is assumed that Sea Country activities such as hunting (e.g., fish, turtles, dugong) may be impacted if oil results in death or oil tainting of fauna, or if oil slicks make offshore travel unsafe, and that values such as water quality may be impacted.</p> <p>There is likely to be an accumulation of oil at various shorelines. Many of the shorelines in the EMBA occur adjacent to Native Title claim areas and therefore, these are likely to be shorelines that are important to various First Nations groups and individuals.</p> <p>The presence of oil at these sites (likely to be weathered and degraded by the time they reach the coast, with little toxicity) may result in restrictions to food collection (e.g., shellfish on coastal rocky reefs, fish in shallow waters) in order to avoid food contamination. To extent to which such avoidance results in limiting the food supplies of groups or individuals cannot be predicted as this depends on the volume of oil released, its trajectory, weathering and persistence, along with any seasonality patterns related to food collection along the coast.</p> <p>The BAC has made EOG aware that there are rock arts sites along the coast of the spill EMBA. Aboriginal heritage sites along the coast (such as coastal rock art, dunes, shell middens, etc) will not be impacted by a spill as these sites are located above the high-water mark. During the consultation process for this activity, EOG has not received information regarding particular Country/Sea Country sensitivities and values that can be assessed here. Nevertheless, EOG understands that an oil spill may impact such values.</p>
Water column	
Shoreline	
Inherent impact consequence:	Moderate

8.7.6 Risk Assessment

Table 8.39 presents the risk assessment for a LoWC.

Table 8.39. Risk assessment for a LoWC

Summary			
Summary of risks	Widespread and temporary reduction in water quality. Sub-lethal to lethal toxicity impacts to marine life. Temporary fisheries closures.		
Extent of risks	The spill EMBA is presented in Figure 5.1 in Appendix 11.		
Duration of risks	Days, weeks or months, depending on the location, level of contact and receptor.		
Level of certainty of risks	HIGH – the environmental impacts of spilled hydrocarbons are well understood.		
Risk decision framework context	Decision type	B – new to the organisation or geographical area.	
	Activity	Infrequent activity.	
	Risk & uncertainty	Risks amenable to assessment using well-established data and methods. Some uncertainty.	
	Stakeholder influence	Pressure groups likely to object, significant media interest.	
Defined acceptable level	No LoWC that results in a crude oil spill.		
Risk Assessment (inherent)			
Receptor	Consequence	Likelihood	Risk rating
Benthic fauna	Severe	Rare	High
Macroalgae & seagrass	Severe	Rare	High
Coral	Severe	Rare	High
Mangroves & saltmarshes	Severe	Rare	High
Sandy beaches	Severe	Rare	High
Rocky shores	Moderate	Rare	Low
Tidal flats	Moderate	Rare	Low
Plankton	Moderate	Rare	Low
Fish	Moderate	Rare	Low
Marine mammals	Severe	Rare	High
Marine reptiles	Severe	Rare	High
Seabirds & shorebirds	Severe	Rare	High
Commercial fisheries	Minor to Severe	Rare	Negligible to High
Protected areas	Negligible to Severe	Rare	Negligible to High

Aboriginal cultural heritage values and sensitivities	Moderate	Rare	Low
Assessment of Proposed Control Measures			
Control measure	Control type	Adopt	Justification
PDSA investigation results are used to inform MODU positioning to avoid shallow gas hazards (RSK-07:EPS-01).	Engineering	Yes	<p>EB: Avoiding gas pockets and ensuring the stability of the MODU while drilling minimises the risk of an unplanned hydrocarbon release.</p> <p>C: Significant cost (millions of dollars).</p> <p>Ev: The significant costs are outweighed by the benefits of not drilling through a gas pocket and avoiding a significant release of gas.</p>
BOP is fitted and tested (RSK-07:EPS-02, -03, -04).	Engineering	Yes	<p>EB: Fitting a BOP and ensures its correct functioning reduces the likelihood of a spill resulting from a LoWC.</p> <p>C: BOPs are available with every MODU, and the cost of their supply and maintenance is built into MODU day rates, which are significant (up to \$1 million per day).</p> <p>Ev: Having a BOP fitted is best practice and required as part of the Safety Case regime. The environmental benefits outweigh the significant costs.</p>
Pre-campaign MODU assurance inspection (RSK-07:EPS-05).	Engineering & Administrative	Yes	<p>EB: Ensures that the physical status of the MODU, along with the systems and processes that govern its day-to-day operations, are suitable for this drilling program, and therefore minimises the likelihood of a LoWC.</p> <p>C: Moderate costs.</p> <p>Ev: It is best practice to conduct an independent review of the physical status of the MODU and its operating systems. The cost of doing so is outweighed by the environmental benefits.</p>
AGR WDP (RSK-07: EPS-06, -07, -08).	Engineering & Administrative	Yes	<p>EB: Considering all engineering and safety risks when drilling a well through the development of, continuous updates and training in detailed plans available for each stage of well design ensures best practice engineering design is achieved and minimises the risk of a LoWC.</p> <p>C: High cost of developing and continuously refining this system.</p> <p>Ev: It is best practice to have in place a management system to consider and plan for</p>

			risks. The high costs are outweighed by environmental benefits.
Maintain a second MODU on standby for the purpose of drilling a relief well.	Engineering & Administrative	No	<p>EB: Would reduce the mobilisation time for drilling a relief well, thereby minimising the volume of crude spilled to the sea.</p> <p>C: Significant, likely up to \$1 million per day. Would also require an in-force Safety Case/SCR, which could cost several hundred thousand dollars more to prepare.</p> <p>Ev: With all other control measures in place, the significant cost of this measure is grossly disproportionate to the low risk of a LoWC.</p>
Maintain support vessels on standby for the purpose of responding to a LoWC.	Engineering & Administrative	No	<p>EB: Would reduce the mobilisation time for deploying spill response equipment, thereby potentially minimising the impacts of spilled crude oil.</p> <p>C: Significant, likely several hundred thousand dollars per day.</p> <p>Ev: With all other control measures in place, the significant cost of this measure is grossly disproportionate to the low risk of a LoWC.</p>
Time drilling to avoid the cyclone season (start November to end April).	Administrative	No	<p>EB: Avoiding the cyclone season minimises the risk of having to quickly de-man the MODU in the event of a cyclone and minimises the risk of unintentionally leaving the well in an unsafe safe (and potentially prone to a LoWC).</p> <p>C: Removes 6 months of the year from the drilling schedule, meaning that securing access to a MODU would be extremely difficult.</p> <p>Ev: Drilling throughout the cyclone season in northwest Australia has taken place for decades, with well established and tested de-manning practices in place. The high costs associated with not being able to drill the well to schedule are not commensurate with the low risks of de-manning in the event of a cyclone.</p>
Accepted Safety Case, SCR and WOMP are in place (RSK-07:EPS-07).	Administrative	Yes	<p>EB: Ensures titleholder has plans in place to safely operate the MODU and drill the well, thereby minimising the risk of a LoWC.</p> <p>C: Moderate costs involved in preparing documents through to acceptance.</p> <p>Ev: It is a regulatory requirement to have these documents in place. The moderate costs are outweighed by environmental</p>

			benefits in terms of minimising the risk of a LoWC.
International Alliance for Well Control (IAWC)/IADC WellCap training (RSK-07:EPS-09).	Administrative	Yes	<p>EB: Ensures that the Drilling Superintendent and Drilling Supervisor are equipped to properly respond to a well kick and LoWC, which may reduce the volume of oil lost to the sea through an efficient technical response.</p> <p>C: Moderate cost to undertake initial and refresher training.</p> <p>Ev: Moderate costs are outweighed by environmental benefits in the event of a spill.</p>
Accepted OPEP is in place (RSK-07:EPS-10).	Administrative	Yes	<p>EB: Ensures titleholder has considered risks and planned for a response, which may reduce impacts to marine fauna and sensitive shoreline habitats.</p> <p>C: Significant cost to prepare plan and put in place agreements and contracts with suppliers.</p> <p>Ev: It is a regulatory requirement to have this document in place. High costs are outweighed by environmental benefits in the event of a spill.</p>
The SCERP (including the RWP) is in place and reviewed regularly (RSK-07:EPS-11)	Administrative	Yes	<p>EB: The pre-drilling identification of MODUs in the region suitable as drilling a relief well, and mobilisation planning, will aid in a prompt response to drilling a relief well in the event of a LoWC. This is considered industry best practice.</p> <p>C: Low cost involved in preparing RWP.</p> <p>Ev: The low cost of preparing the RWP is outweighed by the environmental benefits.</p>
All DIMT positions have undertaken relevant spill response training (e.g., IMO II or III) (RSK-07:EPS-12).	Administrative	Yes	<p>EB: Spill response trained ensures a response is smoother than it otherwise would be, with potential benefits in reducing the volume of oil lost and/or the volume of oil recovered.</p> <p>C: Moderate, depending on the number of personnel requiring training.</p> <p>Ev: There is significant benefit in personnel being trained and practiced in their responsibilities in the event of a LoWC. The cost is outweighed by the environmental benefits.</p>
Mutual aid agreement (MAA) is in place for access to other MODUs (RSK-07:EPS-13).	Administrative	Yes	<p>EB: Access to other MODUs operating in the region reduces the response time with regards to drilling a relief well, in turn potentially reducing the volume of oil released to the ocean.</p>

			<p>C: High costs of AEP membership and cost of time in negotiating access to the MAA.</p> <p>Ev: The high costs are outweighed by the environmental benefits.</p>
Agreement(s) in place with well blowout engineering expertise (RSK-07:EPS-18).	Administrative	Yes	<p>EB: Access to well blowout expertise (e.g., WWC) reduces the response time with regards to killing the well, in turn potentially reducing the volume of oil released to the ocean. This is considered industry best practice</p> <p>C: Moderate costs of putting agreement in place and maintaining access.</p> <p>Ev: The high costs are outweighed by the environmental benefits.</p>
Agreement(s) are in place with spill response organisations (RSK-07:EPS-17, -18).	Administrative	Yes	<p>EB: Access to organisations such as AMOSC and OSRL ensure that there is access to expert spill response preparedness advice during the planning phase and advise and response in the event of a LoWC. This may reduce the volume of oil released to the ocean and maximise the volume of oil recovered. This is considered industry best practice</p> <p>C: Significant costs of initial membership and maintaining access (hundreds of thousands to millions of dollars).</p> <p>Ev: The significant costs are outweighed by the environmental benefits.</p>
Agreement(s) are in place with OSMP service provider(s) (RSK-07:EPS-20).	Administrative	Yes	<p>EB: Access to organisations that can implement OSMP studies quickly and to a high standard allows impacts to be quantified, in turn informing spill response activities.</p> <p>C: Significant costs of initial membership and maintaining access (hundreds of thousands to millions of dollars).</p> <p>Ev: The moderate costs are outweighed by the environmental benefits and is considered industry best practice in Australia.</p>
Accepted OSMP (RSK-07:EPS-20).	Administrative	Yes	<p>EB: Ensures titleholder has considered plans to monitor impacted areas, which will inform future response efforts.</p> <p>C: Significant cost to prepare plan and put in place agreements and contracts with suppliers.</p> <p>Ev: It is a regulatory requirement to have this document in place. High costs are outweighed by environmental benefits in the event of a spill.</p>

Environmental Controls and Performance Measurement		
EPO	EPS	Measurement criteria
Preparedness		
No LoWC will occur for the duration of the activity.	(RSK-07:EPS-01) The results of the PDSA investigations are used to avoid shallow gas hazards and to determine the location for a relief well.	MODU station records verify that it is pinned on location that avoid hazards identified in the PDSA reports.
	(RSK-07:EPS-02) A functional and reliable BOP is installed on top of the surface casing that meets the requirements of API Standard 53 (Blowout Prevention Equipment Systems for Drilling Wells).	DDRs confirm BOP is fitted. Survey report confirms that the BOP meets the standard.
	(RSK-07:EPS-03) The BOP is routinely function and pressure tested in accordance with the manufacturer's specification and in alignment with the MODU contractor's PMS.	BOP function and pressure tests are available.
	(RSK-07:EPS-04) The BOP is pressure tested (high and low) prior to deployment, upon initial latch-up with the wellhead and every 21 days in accordance with API Standard 53. The BOP is function tested every 7 days.	BOP testing records confirm testing is performed to schedule.
	(RSK-07:EPS-05) EOG will arrange for an independent pre-campaign assurance check of the MODU, including the BOP system.	Independent assurance report is available and confirms the BOP system is functional.
	(RSK-07:EPS-06) The Beehive-1 well is designed in accordance with the AGR WDP (as endorsed by EOG) to ensure that the well is designed in accordance with all required codes of practice and industry standards.	EOG's review of the well design verifies that the WDP has been adhered to.
	(RSK-07:EPS-08) The EOG Drilling Supervisor ensures that well kick drills are undertaken during the campaign in accordance with the MODU contractor's schedule.	DDRs confirm that well kick drills are undertaken.
	(RSK-07:EPS-09) The EOG Drilling Supervisor (DSV) and Drilling Superintendent are trained and qualified to International Well Control Forum (IWCF)/IADC WellCap well control standards and AGR Well Standards (as endorsed by EOG) so that well control	Training records and certificates confirm these personnel are qualified and trained in well control.

	emergencies are efficiently and properly managed.	
EOG maintains preparedness to respond to a LoWC.	(RSK-07:EPS-10) A Beehive-1 OPEP and ERP are in place and prior to the activity commencing, a desktop LoWC and spill response exercise is conducted to test the DIMT functions.	Oil spill response exercise report verifies that an LoWC desktop exercise was undertaken.
	(RSK-07:EPS-11) The RWP is developed consistent with the <i>Source Control Emergency Response Planning Guide for Subsea Wells</i> , Report 594 (IOGP/IPIECA, 2019) at least 3 months prior to the start of drilling.	RWP is place prior to the start of drilling.
	(RSK-07:EPS-12) All DIMT roles have undertaken the necessary external training to fulfil their roles.	Training records verify that all DIMT roles have undertaken the necessary training (e.g., IMO II or III).
	(RSK-07:EPS-13) MAA is in place to provide access to other MODUs operating in Australia to reduce mobilisation time.	AEP MAA MoU signed by EOG prior to the start of drilling.
	(RSK-07:EPS-14) Agreement(s) are in place with well blowout engineering expertise (e.g., WWC) prior to the start of drilling.	Agreement(s) with WWC are in place prior to the start of drilling.
	(RSK-07:EPS-15) Agreement(s) will be in place with oil spill response organisations (AMOSC & OSRL) prior to the start of drilling.	Agreements with AMOSC and OSRL are in place prior to the start of drilling.
	(RSK-07:EPS-16) Agreement(s) will be in place with OSM service provider(s) prior to the start of drilling.	Agreement with OSM provider is in place prior to the start of drilling.
Emergency response		
The DIMT responds in accordance with the OPEP, ERP and their training.	(RSK-05:EPS-17) The DIMT will be activated and support resources (such as AMOSC and OSRL) will be mobilised to implement the OPEP and ERP.	DDRs and incident investigation reports verify that the OPEP and ERP were implemented.
	(RSK-05:EPS-18) The RWP will be implemented to stop the LoWC.	DDRs and incident investigation reports verify that the RWP was implemented.
Recording & reporting		
Regulatory authorities are promptly made of aware of a spill.	(RSK-05:EPS-19) EOG will report a spill associated with a LoWC to regulatory authorities within 2 hours of becoming aware of the incident.	Incident report verifies that contact with regulatory agencies was made within 2 hours.

Monitoring		
Characterise environmental impacts of a LoWC spill.	(RSK-05:EPS-20) EOG will undertake operational and scientific monitoring in accordance with the OSMP.	Daily operations reports and overall study reports verify that the OSMP was implemented.
Risk Assessment (residual)		
Receptor	Consequence	Risk rating
Benthic fauna	Severe	Medium
Macroalgae & seagrass	Severe	Medium
Coral	Severe	Medium
Mangroves & saltmarshes	Severe	Medium
Sandy beaches	Severe	Medium
Rocky shores	Moderate	Low
Tidal flats	Moderate	Low
Plankton	Moderate	Low
Fish	Moderate	Low
Marine mammals	Severe	Medium
Marine reptiles	Severe	Medium
Seabirds & shorebirds	Severe	Medium
Commercial fisheries	Minor to Severe	Negligible to Medium
Protected areas	Negligible to Severe	Negligible to Medium
Aboriginal cultural heritage values and sensitivities	Moderate	Low
The reasons for the LoWC risk ratings are outlined in the previous tables corresponding to each faunal group or habitat type or socio-economic sensitivity.		
Demonstration of ALARP		
The 'medium' residual risk ratings are considered to be intolerable and higher order risks. However, the adopted control measures and associated EPS cannot lower the risk ratings any lower. Engineering risk assessments including BOP risk assessments, well integrity risk assessments and the precautionary principle have been factored into the control measures.		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 1 describes the EP implementation strategy to be employed for this activity.	
Risk matrix standard compliance	The residual risk for each receptor ranges from negligible to medium.	

External context	Chapter 4 summarises the concerns raised by relevant persons (WA DoT, WAFIC, Seadragon Project, BAC and CCWA) regarding a large-scale hydrocarbon spill resulting from drilling.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> OPGGS Act 2006 (Cth): <ul style="list-style-type: none"> Section 572A-F (Polluter pays for escape of petroleum). OPGGS(E): <ul style="list-style-type: none"> Part 3 (Incidents, reports and records). <i>Protection of the Sea (Prevention of Pollution by Ships) Act 1983 (Cth)</i>: <ul style="list-style-type: none"> Section 9 (Prohibition of discharge of oil or oily mixture to sea). Section 11A (SOPEP). AMSA Marine Orders Part 91 (Marine pollution prevention – oil). 	
Industry practice	The consideration and alignment of EPS with the mitigation measures in the below-listed codes of practice and guidelines demonstrates that BPME will be implemented in this activity	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS developed for this activity are in line with the management measures listed for major spills from exploration facilities in Section 4.7.4 of the guidelines:</p> <ul style="list-style-type: none"> Well design undertaken in accordance with industry best practice (RSK-07: EPS-06 to -013). OSTM undertaken to determine potential impacts to the surrounding environment (part of ERA). Blowout prevention measures to focus on maintaining wellbore hydrostatic pressure (RSK-07: EPS-02 to -05). Well integrity testing to be performed (RSK-07: EPS-07 to -011). RWP in place to regain control of the well if there is a loss of integrity (RSK-07: EPS-07, -015).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	<p>The EPS developed for this activity are in line with the management measures listed for well blowouts in Section 18.2 of the guidelines:</p> <ul style="list-style-type: none"> Have in place a spill contingency plan (RSK-07: EPS-014 to -020). Primary and secondary well control (RSK-07: EPS-02, -03, -04, -05, -11). Well monitoring (RSK-07: EPS-08, -09, -10, -11). Relief well planning (RSK-07: EPS-015).
	Health, Safety and Environmental Case Guidelines for Mobile Offshore Drilling Units (IADC, 2015)	<p>The EPS developed for this activity are in line with Section 2.3.12 of the guidelines (drilling and well control operations), which specify that:</p> <ul style="list-style-type: none"> Personnel involved in the operations are competent (RSK-07: EPS-013, -016).

		<ul style="list-style-type: none"> Drilling and well control procedures are in place to shut-in and abandon the well (RSK-07: EPS-07).
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>The EPS developed for this activity are in line with the following parts of the guidelines:</p> <ul style="list-style-type: none"> Section 75 (Spills): Conducting a spill risk assessment, implementing personnel training and field exercises, ensuring spill response equipment is available (RSK-07: EPS-015 to -019). Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-07: EPS-014, -015). Section 115 (Well blowout). Blowout prevention measures should focus on maintaining wellbore hydrostatic pressure by effectively estimating formation fluid pressures and the strength of subsurface formation (RSK-07: EPS-09). Section 116 (Well blowout). A BOP system should be installed that can be closed rapidly. It should be tested at regular intervals (at least every 14 days) (RSK-07: EPS-02, -03, -04). Section 117 (Well blowout). The BOP system design, maintenance and report should comply with international standards. BOP systems should consist of one annular preventer, two blind-shear ram preventers and two pipe ram preventers (RSK-07: EPS-02). Section 118 (Well blowout). Contingency plans should be prepared for well operations (RSK-07: EPS-014, -015, -024). Section 119 (Well blowout). A dedicated blowout risk analysis and emergency plan should be prepared, detailing the measures in place to prevent a blowout, the provisions for well control in a blowout scenario and the time necessary for intervention (RSK-07: EPS-015).
	AEP CoEP (APPEA 2008)	<p>The EPS for this activity meet the code's following objectives for offshore geophysical surveys:</p> <ul style="list-style-type: none"> To reduce the risk of damage and cross-flow between fluid strata to ALARP and an acceptable level.
Environmental context	MNES	
	AMPs	As per Table 8.36.
	Ramsar wetlands	As per Table 8.36.
	TECs	As per Table 8.36.

	Nationally threatened and migratory species	As per Tables 8.31 to Table 8.34.
	Other matters	
	KEFs	As per Table 8.36.
	NIWs	As per Table 8.36.
	State marine parks	As per Table 8.36.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	Marine pollution is a threat identified for many fish, marine mammal, turtle and bird species. In general, population monitoring is the suggested action to deal with marine pollution. The Beehive-1 OSMP addresses this. The WCP for seabirds (2020) identifies acute pollution (oil spills) as a moderate threat to seabirds. The EPS outlined within this table mitigate the chance of an oil spill, and therefore, reduce the probability of acute pollution impacts on seabirds.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	EOG considers the risk of a spill resulting from a LoWC to be acceptable as: <ul style="list-style-type: none">• It will adhere to the company’s Safety and Environmental Policy;• The residual risk ratings are as low as can be achieved;• An Implementation Strategy (described in Chapter 9) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons has been considered and incorporated into the risk assessment;• Relevant legislation and industry best practice will be complied with;• A spill is not predicted to have long-term or significant impacts on MNES;• The management of a spill is not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species;• The management of a spill is not inconsistent with the aims of relevant marine reserve management plans; and• The management of a spill is not inconsistent with ESD principles.	
Environmental Monitoring		
<ul style="list-style-type: none">• As per the OPEP and OSMP.		
Record Keeping		
<ul style="list-style-type: none">• PDSA data reports.• AEP MoU.• Agreements with service providers.• Emergency response exercise reports.• DDRs.• BOP installation and testing reports.• BOP IAT Part 2 report.• Crew training records and certificates.• WDP review.• DIMT training records.• Incident reports.		

9. Environmental Risk Assessment – Hydrocarbon Spill Response

The section presents a risk assessment for the oil spill response activities in accordance with the requirements of Regulation 13(6)(b) of the OPGGS(E), which states that the evaluation of all impacts and risks, including those relating to potential emergency conditions, must be included in the EP.

A strategic Net Environmental Benefits Analysis (NEBA) of oil spill response options was conducted to determine which options are suitable for Beehive-1 and considered to result in a net benefit for the ecological and socio-economic receptors within the spill EMBA (see Appendix B of the OPEP). The approach used to develop the NEBAs is based on IPIECA's guideline *Response strategy development using NEBA: Good practice guidelines for incident management and emergency response personnel* (IPIECA, 2015c).

Table 9.1 summarises the response strategies selected for the OPEP from the strategic NEBA, noting that the combination of response options adopted in an actual response will depend on the trajectory of the spill.

Table 9.1. Hydrocarbon spill response strategies

Response option	Description
Source control	Vessel – SMPEP
	Relief well installation to kill well
Monitor & evaluate	Direct observation – aerial or marine, OSTM, satellite tracking buoys, satellite tracking
Dispersant application	Aerial dispersant application
	Vessel dispersant application
Containment & recovery	Use of booms and skimmers to contain surface oil in open waters. Relies on calm conditions and thicknesses > 10 µm to collect.
Protection and deflection	Booms and skimmers deployed to protect environmental sensitivities such as estuaries. Strong currents, waves, tidal ranges and poor access can limit the application of this response option.
Shoreline clean-up	Where impact is predicted, shoreline clean-up assessment technique (SCAT) is initiated. If SCAT and NEBA assess that clean-up will have a net benefit, clean-up can be initiated. Shoreline clean-up may take different forms, including manual removal if access is available.
Oiled wildlife response (OWR)	Consists of capturing, cleaning and rehabilitating oiled wildlife. It may also include hazing or pre-spill captive management.
Waste Management	Collection and disposal of large volumes of oily water and solid wastes.

Each of the response options identified as suitable for this activity from the strategic NEBA (see Appendix B of the OPEP) is assessed in accordance with the NOPSEMA Oil Pollution Risk Management Guidance Note (GN14488, Rev 2, Feb 2018) to ensure that the risks associated with the responses have been reduced to ALARP and acceptable levels.

The OPEP describes the arrangements for responding to and monitoring pollution in the event of a hydrocarbon spill during drilling for the Beehive-1 well. The OPEP is supported by a series of field response guidance documents and site-specific Tactical Response Plans (TRPs) for the implementation of applicable response strategies as identified via the strategic NEBA process.

The OPEP is supported by the following appendices:

- Appendix A Drilling Incident Management Team (DIME) Requirements.
- Appendix B Basis of Design and Response Strategy Requirements.
- Appendix C Operational and Scientific Monitoring (OSM) Bridging Implementation Plan (BIP).
- Appendix D Cumulative Requirements and Demonstration of Capability.
- Appendix E Environmental Sensitivities.

9.1. Source Control – Relief Well Drilling

9.1.1. Background Information

In the event of a LoWC incident (Level 3), source control would be initiated. As indicated in the NEBA in Appendix B of the OPEP, relief well drilling requiring a second MODU would be the primary response strategy to stop hydrocarbon flow should BOPs and protective measures fail or become inoperable.

9.1.2. Scope of Activity

The scope of activities involved with drilling a relief well are the same as drilling a standard well. A second MODU, engaged and transported to site, would be offset from the original MODU by 1-2 km to commence relief well drilling. The drilling process for a relief well is described in Section 2.10.2, although it would be a deviated well (rather than vertical) due to the need to drill from outside the 500 m radius PSZ.

9.1.3. Hazards

The hazards associated with drilling a relief well are the same as drilling a standard well, as outlined in Chapters 7 and 8.

9.1.4. Known and Potential Environmental Impacts and Risks

The environmental impacts and risks associated with drilling a relief well are the same as drilling a standard well, as outlined in Chapters 7 and 8.

9.1.5. Evaluation of Environmental Impacts and Risks

The evaluation of environmental impacts and risks associated with drilling a relief well are the same as drilling a standard well, as outlined in Chapters 7 and 8.

9.1.6. Impact and Risk Assessment

Table 9.2 presents the impact and risk assessment for relief well drilling.

Table 9.2. Impact and risk assessment for relief well drilling

Summary	
Summary of risks	As per Chapters 7 and 8 of this EP.
Extent of risk	As per those described in Chapters 7 and 8 of this EP.
Duration of risk	For the duration of drilling – up to 77 days.
Level of certainty of risk	HIGH – the impacts associated with drilling are well understood.

Risk decision framework context	Decision type	A – good industry practice required with engineering risk-based tools applied.		
	Activity	Nothing new of unusual, represents business as usual, well understood activity, good practice is well defined		
	Risk & uncertainty	Risks are well understood, uncertainty is minimal.		
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.		
Defined acceptable level	The net environmental benefit of a spill response strategy must be greater than no response.			
Risk Assessment (inherent)				
Hazard		Likelihood	Consequence	Risk rating
Relief well drilling (as per this EP)		Remote	Minor	Negligible
Assessment of Proposed Control Measures				
The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic NEBA, which is presented in Appendix B of the OPEP.				
The controls for each response strategy was assessed to ALARP in Appendix B of the OPEP. EPOs, EPSs and measurement criteria for response strategy preparedness are also presented in Appendix B of the OPEP.				
Environmental Controls and Performance Measurement				
EPO	EPS		Measurement criteria	
Preparedness – all preparedness EPS are presented in Appendix B of the OPEP.				
Response				
The Source Control Emergency Response Plan (SCERP) is implemented to stop the release of hydrocarbons.	(RSK-09:EPS-01) The Incident Controller initiates the SCERP within 3 hours of LoWC notification.		Incident logs.	
	(RSK-09:EPS-02) EOG shall implement relief well operations in accordance with the SCERP.		Incident logs verify the SCERP was implemented.	
	(RSK-09:EPS-03) Best endeavours will be made to kill the well via relief well drilling by day 77 following a LoWC event.		Incident logs verify that all attempts were made to kill the well within 77 days.	
	(RSK-09:EPS-04) Response shall only terminate when well kill has been achieved and barriers reinstated.		Incident logs verify that the response concluded only once the well was killed.	
Risk Assessment (residual)				
Hazard		Likelihood	Consequence	Risk rating
Relief well drilling		Remote	Minor	Negligible
The risk of relief well drilling activities to the identified receptors is assessed as negligible because:				
<ul style="list-style-type: none">The control measures adopted are effective in reducing the risk to ALARP as per Chapters 7 and 8 of this EP.				

Demonstration of ALARP		
A detailed demonstration of ALARP is presented in Appendix B of the OPEP. This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.		
Demonstration of Acceptability		
Policy compliance	EOG's Safety and Environmental Policy objectives are met.	
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.	
External context	There have been no concerns raised from relevant persons regarding spill response activities.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> OPGGs Act 2006 (Cth) and OPGGS(E): <ul style="list-style-type: none"> Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts. Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP). EPBC Regulations 2000 (Cth): <ul style="list-style-type: none"> Part 8 (Interacting with cetaceans and whale watching). <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i> (WA). <i>Marine Pollution Act 1999</i> (NT). <i>Waste Management & Pollution Control Act 1998</i> (NT). 	
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IEICA, 2020)	<p>The EPS meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-09: all EPS).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-09: all EPS).
	AEP CoEP (APPEA 2008)	<p>The EPS meet the following offshore development and production objectives:</p> <ul style="list-style-type: none"> To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill response plans and guidelines	

	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are required and deployed. The EPS complement the NatPlan.
	AMOSPlan (2017)	AMOSOC (on behalf of EOG) will implement this plan in the event their resources are required. The EPS complement AMOSPlan.
	WA Oil Spill Contingency Plan (2015)	DoT will implement this plan in the event their resources are required and deployed. The EPS complement the WA Oil Spill Contingency Plan.
	NT Oil Spill Contingency Plan (2014)	The NT IC will implement this plan in the event their resources are required and deployed. The EPS complement the NT Oil Spill Contingency Plan.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
Environmental context	MNES	
	AMPs	Oil causing marine pollution is a threat identified in the North Marine Parks Network Management Plan 2018 (DNP, 2018). Relief well activities will not be undertaken in AMPs. No additional impacts to AMPs are predicted.
	Ramsar wetlands	Relief well activities will not be undertaken or impact upon Ramsar wetlands.
	TECs	Relief well activities will have no impacts on TECs.
	NIWs	Relief well activities will have no impacts on NIWs.
	Nationally threatened and migratory species	Relief well activity impacts to threatened and migratory species have been assessed in this EP and have demonstrated to be ALARP and acceptable. All impacts and risks assessed may affect individuals within a species, however no significant impacts on threatened and migratory species at a population level are predicted as a result of relief well drilling.
	Other matters	

	State marine parks	The North Kimberley Marine Park Management Plan has the strategic objective <i>to protect and conserve biodiversity and ecological health</i> . Relief well drilling will assist in maintaining this objective by eliminating oil which threatens Marine Parks. As such, relief well activities do not conflict with the park in terms of cultural, natural, recreational, tourism, community or cultural values detailed in the Management Plan.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	Marine pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (i.e., nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from identified habitat critical to their survival</i> . Relief well activities will eliminate the oil spill source and allow the environment to recover. Relief well activities support the identified priority actions within this management plan. The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this.
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	EOG considers the risk associated with the drilling of a relief well to be acceptable because: <ul style="list-style-type: none">• It will adhere to the company's Environment Policy.• The residual risk ratings are negligible/low and ALARP.• An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved.• Relevant persons and stakeholders have not expressed concerns about this response method.• The activity complies with all relevant legislation and industry best practice.• Spill response activities will not have long-term or significant impacts on MNES.• Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species.• Spill response activities are not inconsistent with the aims of relevant marine reserve management plans.• Spill response activities are not inconsistent with ESD principles.	
Environmental Monitoring		
<ul style="list-style-type: none">• As per Beehive-1 OPEP and OSMP requirements.		

Record Keeping	
<ul style="list-style-type: none"> • Contracts and agreements with third parties. • Equipment and service provider register. • Exercise drill reports. • Inspection/audit reports. • Incident and daily operations reports. • RWP. 	<ul style="list-style-type: none"> • Operational NEBA. • Briefing records. • Photos. • IAP. • DIMIT Training Records

9.2. Monitor and Evaluate

9.2.1. Background Information

Surveillance and tracking of a hydrocarbon spill, using trained and experienced personnel, is necessary to determine the extent, behaviour and trajectory of the spill to maintain situational awareness and inform the spill response strategy. Monitor and evaluate activities also support a natural dispersion and weathering response strategy.

The monitoring and evaluation response option will always be employed during a response for all oil spill levels to provide and maintain situational awareness.

Sole use of the monitor and evaluate strategy (i.e., allowing hydrocarbons to naturally weather) will only be considered when:

- The oil spill trajectory is moving away from sensitive shoreline and marine receptors;
- Shoreline areas contacted by hydrocarbons are inaccessible;
- There is no net environmental benefit of employing other response strategies; and/or
- Other response strategies are not feasible (e.g., type of hydrocarbon released such as MDO).

9.2.2. Scope of Activity

The scope of monitor and evaluate activities is briefly outlined below:

- OSTM – EOG can access OSTM services through its AMOSC membership. The OSTM assists in predicting the oil slick direction and time to impact on possible sensitive receptors thereby informing oil spill response activities.
- Deployment of tracking buoys – satellite tracking buoys will be available on the MODU and on each of the two support vessels. In the event of a level 2 or 3 oil spill, the tracking buoys will be deployed from the MODU/vessels to drift with the oil spill. Their signals will be satellite monitored and tracked to provide real-time information on oil slick movement.
- Vessel and aerial-based observation – vessels and aircraft containing trained oil spill observers will observe the oil slick (distribution, colour and consistency) and determine the slick's weathering characteristics to inform oil spill response options.
- Satellite imaging – EOG will access satellite imaging to monitor the oil slick to inform oil spill response activities.

9.2.3. Hazards

Hazards associated with aerial and vessel-based monitoring and evaluation activities are:

- Increased noise, air and light emissions from additional aircraft and vessels;
- Increased liquid and solid discharges from additional vessels; and
- Unplanned vessel incidents such as introduction of IMS, collision with other vessels and cetaceans, disruption to other marine users and possible spills from vessels.

9.2.4. Known and Potential Impacts and Risks

The impacts and risks associated with monitoring and evaluation activities are:

- Routine and non-routine impacts and risks associated with vessel operations (as outlined in Sections 7.2 – 7.5, 7.8 - 7.11 and Chapter 8).
- Noise disturbance to marine fauna and shoreline species by aerial flights (see Section 7.5 and evaluation below).

9.2.5. Evaluation of Impacts and Risks

The impacts and risks associated with routine and non-routine MARPOL-standard vessel operations are assessed in Chapters 7 and 8 of this EP and are not repeated here. Smaller vessels engaged in oil spill response activities will be required to adhere to MARPOL discharge requirements as legislated by Commonwealth Marine Orders with equipment for discharge treatment appropriate to the class of vessel.

Additional impacts and risks are associated with the presence of aerial resources operating at low altitudes. These are discussed below.

Helicopter operations produce strong underwater sounds for brief periods when the helicopter is directly overhead (Richardson *et al.*, 1995). Sound generated from helicopter operations is typically below 500 Hz and sound pressure in the water directly below a helicopter is greatest at the surface but diminishes quickly with depth. Reports for a Bell 214ST (stated to be one of the noisiest) identifies that noise is audible in the air for four minutes before the helicopter passed over underwater hydrophones. The helicopter was audible underwater for only 38 seconds at 3 m depth and 11 seconds at 8 m depth (Richardson *et al.*, 1995).

Sound levels from helicopters are not expected to cause physical damage to marine fauna, however temporary behavioural changes (avoidance) in species (cetaceans, turtles, fish) may be observed.

The behavioural reaction of cetaceans to circling aircraft (fixed wing or helicopter) is sometimes conspicuous if the aircraft is below an altitude of 300 m, uncommon at 460 m and generally undetectable at 600 m (NMFS, 2001; Richardson *et al.*, 1995). Baleen whales sometimes dive or turn away during over-flights, but sensitivity seems to vary depending on the activity of the animals. The effect on whales seems transient, and occasional over-flights probably have no long-term consequences (NMFS, 2001).

Aerial surveillance flights will operate at between 300 – 500 m altitudes when undertaking observation activities (AMSA, 2003). In accordance with the EPBC Regulations (Part 8), a fixed-wing aircraft will maintain a buffer of 300 m and a helicopter will maintain 500 m from a cetacean. Any noise produced by surveillance aircraft is localised and temporary as they are in constant

movement. On this basis impact to marine mammals is expected to be temporary, localised, and recoverable.

9.2.6. Impact and Risk Assessment

Table 9.3 provides the impact and risk assessment for the monitor and evaluate response option.

Table 9.3. Impact and risk assessment for monitoring and evaluation

Summary			
Summary of risks	Disturbance to marine and nearshore fauna from increased vessel and aerial activity.		
Extent of risk	Localised (immediately around vessel or aircraft).		
Duration of risk	Medium- to long-term (depending on spill volume, trajectory and shorelines affected).		
Level of certainty of risk	HIGH – The impacts associated with vessel operations and noise disturbance to fauna from vessels and helicopters are well understood, and controls are documented in legislation.		
Risk decision framework context	Decision type	A – good practice is required	
	Activity	Nothing new or unusual, well understood activity, good practice is well defined	
	Risk & uncertainty	Risk is well understood, uncertainty is minimal	
	Stakeholder influence	No conflict with company values, no partner interest, some persons may object, may attract local media attention.	
Defined acceptable level	The net environmental benefit of a spill response strategy must be greater than no response (i.e., ‘do-nothing’).		
Risk Assessment (inherent)			
Hazard	Likelihood	Consequence	Risk rating
Fauna disturbance	Occasional	Moderate	Medium
Assessment of Proposed Control Measures			
The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic NEBA, which is presented in Appendix B of the OPEP.			
The controls for each response strategy was assessed to ALARP in Appendix B of the OPEP. EPOs, EPSs and measurement criteria for response strategy preparedness are also presented in Appendix B of the OPEP.			
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
General Activity Controls (Common to other response strategies not repeated in subsequent response option assessments)			

There is no increase in environmental harm from oil spill response activities.	(RSK-10:EPS-01) This response strategy is only undertaken if an EOG operational NEBA determines it is likely to have a net environmental benefit and it is safe to do so.	Operational NEBA.
	(RSK-10:EPS-02) An EOG NEBA is undertaken during each operational period to determine if the response strategy is continuing to have a net environmental benefit.	Operational NEBAs.
	(RSK-10:EPS-03) Helicopters will maintain a buffer distances of 500 m around cetaceans in accordance with EPBC Regulations 2000 (Part 8).	Flight instructions document these constraints.
	(RSK-10:EPS-04) Fixed wing aircraft will maintain a buffer distances of 500 m around bird colonies to avoid bird strikes.	Flight instructions document these constraints.
	(RSK-10:EPS-05) Vessels will maintain buffer distances around whales and dolphins in accordance with The Australian National Guidelines for Whale and Dolphin Watching (DoEE, 2017b) for those individuals not visibly affected by hydrocarbons (closer approaches may be necessary to determine impacts).	Incident reports note when cetaceans were sighted and what actions were undertaken.
Discharges from small vessels meet MARPOL requirements	(RSK-10:EPS-06) All vessels utilised in oil spill response activities will maintain pollution control equipment and/or observe discharge restrictions in accordance with MARPOL requirements according to vessel "Class".	Vessel Class Certificates.
<i>Preparedness – all preparedness EPS are presented in Appendix B of the OPEP.</i>		
<i>Response (see also response timing in Appendix B of the OPEP.</i>		
Provide situational awareness to inform DIMT decision-making.	(RSK-10:EPS-07) EOG will initiate monitoring and evaluation, inclusive of the Operational Monitoring Plans detailed in Table 5-1 of the AEP Joint Industry Operational and Scientific Monitoring (OSM) Plan Framework, within 2 hours of forming DIMT and in a manner consistent with the initiation criteria detailed within Table 9-1 of the of the AEP Joint Industry OSM Plan Framework.	Incident logs verifies that monitoring and evaluation was initiated.
	(RSK-10:EPS-08) EOG will undertake all monitoring and evaluation tasks within the defined timeframes as per Table 5.6 of the OPEP.	Incident log / communication records verify that timeframes were met.
	(RSK-10:EPS-09) EOG will implement operational monitoring as per Part B of the Beehive-1 Operational and Scientific Monitoring Bridging Implementation Plan (OSMBIP) (Appendix C of the OPEP).	Incident logs verify that operational monitoring was implemented.
	(RSK-10:EPS-10) EOG will meet all minimum standards relating to operational monitoring as per Appendix A of the AEP Joint Industry OSM Plan Framework.	Incident logs verify that minimum standards were met.

	(RSK-10:EPS-11) EOG will terminate monitoring and evaluation, inclusive of the Operational Monitoring Plans detailed in Table 5-1 of the AEP Joint Industry OSM Plan Framework, in accordance with the task-specific termination criteria detailed within Table 5.6 of the OPEP and in a manner consistent with the termination criteria detailed within Table 9-1 of the AEP Joint Industry OSM Plan Framework.	Sign-off reports verify that termination criteria have been met.	
	(RSK-10:EPS-12) An incident management plan (IAP) is prepared by the DIMT planning officer within the first 24 hours of a spill using monitoring data, which is used to guide response activities.	The IAP is available and daily reports verify it is implemented.	
Risk Assessment (residual)			
Hazard	Likelihood	Consequence	Risk rating
Fauna disturbance	Remote	Minor	Negligible
The risk of monitoring and evaluation spill response activities to the identified receptors is assessed as negligible because: The control measures adopted are effective in reducing the risk to ALARP.			
Demonstration of ALARP			
A detailed demonstration of ALARP is presented in Appendix B of the OPEP. This also considers the availability, functionality, reliability, survivability, and independence/capability of each control measure.			
Demonstration of Acceptability			
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.		
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.		
External context	There have been no concerns raised from relevant persons regarding monitor and evaluate spill response activities.		
Legislative context	The EPS align with the requirements of: <ul style="list-style-type: none">• <i>OPGGS Act 2006</i> (Cth) and <i>OPGGS(E)</i>:<ul style="list-style-type: none">○ Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts.○ Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP).• <i>EPBC Regulations 2000</i> (Cth):<ul style="list-style-type: none">○ Part 8 (Interacting with cetaceans and whale watching).• <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i> (WA).• <i>Marine Pollution Act 1999</i> (NT)• <i>Waste Management & Pollution Control Act 1998</i> (NT).		
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.		

	Environmental management in the upstream oil and gas industry (IOGP- IPIECA, 2020)	The EPS meet the relevant mitigation measures listed for offshore activities with regard to: Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-10: all EPS) .
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	Guidelines met with regard to: Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-10: all EPS) .
	AEP CoEP (APPEA 2008)	The EPS meet the following offshore development and production objectives: To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill response plans/guidelines	
	NATPLAN (AMSA, 2020)	AMSA will implement this plan in the event their resources are required and deployed. The EPS listed in this table complement the NATPLAN.
	AMOSPlan (2017)	AMOSOC (on behalf of EOG) will implement this plan in the event that their resources are required. The EPS listed in this table complement AMOSPlan.
	WA Oil Spill Contingency Plan (2015)	DoT will implement this plan for spills in WA waters in the event their resources are required and deployed. The EPS listed in this table complement the WA Oil Spill Contingency Plan.
	NT Oil Spill Contingency Plan (2014)	The NT IC will implement this plan for spills in NT waters in the event their resources are required and deployed. The EPS listed in this table complement the NT Oil Spill Contingency Plan.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.

	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	Monitor and evaluate	In-water surveillance of oil spills at sea (IPIECA/IOGP, 2016a).
		Aerial observations of oil spills at sea (IPIECA/IOGP, 2015)
		At-sea monitoring of surface dispersant effectiveness (IPIECA/IOGP, 2014).
		An assessment of surface surveillance capabilities for oil spill response using airborne remote sensing (Polar Imaging, 2014).

Environmental context	MNES	
	AMPs	Oil causing marine pollution is a threat identified in the North Marine Parks Network Management Plan 2018. Monitor and evaluate spill response helps to inform the spill response to prevent/limit impacts to AMPs are not realised (net benefit). Monitor and evaluate activities will not have any significant impacts on the AMP.
	Ramsar wetlands	Vessel or aircraft-based monitoring activities will have no impacts on Ramsar wetlands.
	TECs	Spill response will not be undertaken in areas where TECs exist. Vessel or aircraft-based monitoring activities will have no impacts on TECs.
	NIWs	Vessel or aircraft-based monitoring activities will have no impacts on NIWs.
	Nationally threatened and migratory species	Some threatened and migratory species may be present in spill response areas, however with the controls adopted vessel or aircraft-based monitoring and surveillance activities will not significantly impact threatened and migratory species.
	Other matters	

	State marine parks	<p>Many of the WA/NT marine and coastal reserve management plans list the protection of marine and terrestrial ecological communities and indigenous flora and fauna, particularly threatened species, as a management aim.</p> <p>The North Kimberley Marine Park Management Plan has the strategic objective to <i>protect and conserve biodiversity and ecological health</i>. Monitor and evaluate activities do not conflict with the management objectives for the park in terms of cultural, natural, recreational, tourism, community or commercial values detailed in the Management Plan. With permission of State regulators, EOG may, at the direction of the state regulators, undertake spill response in coastal marine parks. Vessel or aircraft-based monitoring activities will not significantly impact on these marine parks or the management objectives of the parks' management plans.</p>
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Marine pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (i.e., nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from identified habitat critical to their survival</i>. Monitor and evaluate activities will not impact upon turtles but will allow the spill response to have situational awareness and employ response options which mitigate impacts to turtle populations (very high protection priority).</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	

Statement of acceptability	<p>EOG considers the impacts and risks around the monitoring and evaluation response strategy to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Environment Policy. • The residual risk ratings of the activity are negligible-low. • An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved. • Relevant persons and stakeholders have not expressed concerns about this response method. • Measures comply with relevant legislation and industry best practice. • Activities will not have long-term or significant impacts on MNES. • Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species. • Spill response activities are not inconsistent with the aims of relevant marine reserve management plans. • Spill response activities are not inconsistent with ESD principles.
Environmental Monitoring	
As per Beehive-1 OPEP and OSMP requirements.	
Record Keeping	
<ul style="list-style-type: none"> • Contracts and agreements with third parties. • Equipment and service provider register. • Inspection/audit reports. • Incident and daily operations reports. • Flight Instruction Records • Vessel Class Certificates 	<ul style="list-style-type: none"> • Operational NEBA. • Photos. • IAP. • OSMP Records • Incident Log

9.3. Dispersant Application

9.3.1. Background Information

Chemical dispersants are an important response option for consideration in an oil spill to reduce the amount of surface or shoreline oiling. This is particularly beneficial if a spill trajectory shows likely contact with coastal environmental sensitivities, such as critical habitat for turtle breeding, Ramsar wetlands or NIWs, seabird and shorebird habitats, mangroves, and inter-tidal coral reefs. Application of dispersants in offshore marine environments aims to prevent/reduce the area of sea surface oiling and oil residue arriving onshore reducing risk to sensitive protection priorities.

Chemical dispersants are solvents that move oil from the water surface to the water column by breaking oil into small droplets through reduced oil/water interfacial and increasing droplet surface area available to be degraded by microorganisms. Dispersants do not reduce the total volume of oil in the environment but changes its location and physical properties (Laleian & Azwell, 2011).

Dispersant application, particularly by aircraft, in offshore environments is a key response tool to large, offshore oil spills given it can be quickly activated and cover significant geographic areas (BP, 2013b).

PIECA-IOGP (2014e) reports that dispersant use on oils with viscosity up to 5,000 cP is likely to be effective. The predicted Beehive oil viscosity, utilising Jabiru crude as an analogue, is 3.0 cP and fits this criterion, making dispersant application a suitable response option to consider in a Level 2 or 3 LoWC oil spill.

9.3.2. Scope of Activity

Dispersant may be applied in the event of a LoWC event to:

- Remove oil from the sea surface to reduce environmental impacts to sea-surface fauna (e.g., impacts to mammals, seabirds, turtles);
- Rapidly reduce oil toxicity by dilution through a large water mass;
- Enhance natural microbial biodegradation rates by increasing the surface area between oil and water;
- Reduce the extent and volume of stranded oil, minimising impacts to shoreline habitats and biota, lessening the scale of shoreline clean-up and the adverse effects of shoreline response actions; and
- Disperse oil into the water column to reduce the level of VOCs in areas where source control activities are being undertaken, thereby reducing worker exposure to potentially harmful VOCs (IPIECA-IOGP, 2014e).

Various methodologies exist to apply dispersant, which include direct application of dispersant at the subsea wellhead leaking oil (not applicable to Beehive given wellhead is at the surface) or application at surface from vessels or aircraft (applicable at Beehive-1).

Dispersant application from aircraft offers the advantage of rapid response, high treatment rates and optimum dispersant use. In Australia, agricultural aircraft (crop dusters) adapted for the application of dispersant (known as fixed wing aerial dispersant capability [FWADC] aircraft) are available for deployment. In addition, cargo aircraft with modular tanks for dispersant storage are available from overseas.

In Australia, the AMSA Protocol for the Register of Oil Spill Control Agents (OSCA) (AMSA, 2012a) is the recognised standard for the acceptance of chemical dispersants for use in Commonwealth marine waters. The OSCA protocol requires a dispersant to meet pre-determined requirements for chemical constituents, efficacy, toxicity and biodegradation. Chemicals listed on the OSCA Register are considered to meet a standard that is acceptable under the NatPlan and meets the exemption requirements under the EPBC Act 1999. EOG will only use dispersants listed on the OSCA register or transitional arrangement dispersants for a Beehive LoWC incident.

Where possible, testing of a crude against the available chemical dispersants is preferred so that crude-specific efficacy and eco-toxicity data can be gathered. This process aids in selecting the dispersant most effective for a given crude oil. As Beehive-1 is an exploration project this data is not available. In the absence of possessing crude-specific dispersant effectiveness data prior to Beehive-1 drilling, testing will be undertaken as part of operational monitoring to validate dispersant efficacy (OSMP Operational Monitoring Plan: Surface Chemical Dispersant fate and Effectiveness Assessment).

Additionally, given the absence of crude-specific ecotoxicity data prior to drilling commencement, monitoring will be undertaken as part of the OSMP to determine the impacts of applied dispersants on the marine environment to inform the spill response.

Dispersant application will not take place in AMPs (or within 10 km of AMPs), within WA and/or NT marine parks or within WA and/or NT territorial waters without the permission of relevant authorities. This measure aims to protect high sensitivity marine park areas and nearshore, shallow water habitats at risk from dispersant application (such as seagrass meadows, mangroves, etc.).

The use of chemical dispersants is an environmental trade-off; it is recognised that dispersants have their own set of environmental impacts (though they are generally less toxic than the oils they break down), but they are used in an attempt to minimise contact with shorelines, where the oil can cause significantly more damage. After application in open water, elevated entrained oil concentrations are normally only observed in the upper layers of the water column (<10 metres) but are rapidly reduced by dilution through water movement. Studies on crude oils have shown that immediately after dispersant application, oil concentrations in the range of 30-50 ppm can be expected in the water just below the slick, diminishing to 1-10 ppm in the uppermost 10m of the water column after a few hours. The exposure for marine organisms is therefore acute rather than chronic and the limited exposure time reduces the likelihood of long-term adverse effects (ITOPF, 2011a).

The risks to marine life from dispersed oil are broadly similar to the oil spill impacts (water column) in Section 8.7 and the risks associated with the proportional increase of entrained and dissolved oil using dispersants are discussed further in Section 9.3.

9.3.3. Dispersant Modelling

EOG commissioned OSTM (RPS, 2022c) to determine the fate and trajectory of chemically dispersed oil from a Beehive-1 LoWC to assess the impact of applying dispersant and the resulting exposure of sensitive receptors to the greater concentrations of entrained oil. The modelling also examined the net benefits of the dispersant strategy in reducing impacts on coastal and shoreline receptors. This modelling is shown as the 'mitigation scenario in the Beehive-1 Crude Oil Spill Modelling with Surface Dispersant Application report (Appendix 12). Table 9.4 details the modelling assumptions and input and output parameters.

The OSTM undertaken for a LoWC scenario (see Section 8.1.1 and Appendix 12) included an assessment of the use of surface dispersants applied by aircraft and vessels. The dispersant was assumed to be applied on surface oil with an age between 12 and 72 hours from the time of release. This enabled the evaporation process to take place during the initial 12 hours following the release while also avoiding any waste of dispersant on highly weathered oil, which would be ineffective.

The dispersant effectiveness was set at 65%, based on a combination of surface spraying using vessels and airplanes. It was assumed that the dispersant will be effective on oil with a minimum thickness of 10 µm and a viscosity of up to 12,500 cP. The surface dispersant application was assumed continuous for 10 hours during daylight hours only, starting from 24 hours after the initial release until the end of the spill duration (77 days). Winds were capped at 35 knots to ensure safe operating conditions for planes, but also to allow for sufficient mixing of the chemical dispersants and oil at the water surface (API *et al.*, 2001; NOAA, 2010). A dispersant to oil ratio of 1:20 was applied. A total volume of 9,066 m³ of dispersant was modelled.

Table 9.4. Assumptions factored into the dispersant modelling

Parameter	Input								
Dispersant to oil ratio	1:20 (only applied on oil >10 g/m ²)								
Dispersant effectiveness	65%								
Operational hours	10 (during daylight only)								
Application window (age of oil)	12 to 72 hours								
Dispersant application start	24 hrs after initial release								
Dispersant application – operational wind speed range (knots)	2-35 knots								
Aerial application	<p>Day 2: 2 x FWADC delivering 24 m³ dispersant</p> <p>Day 3: 6 x FWADC delivering 60 m³ dispersant & 1 x C130 Hercules delivering 24 m³/day</p> <p>Aviation Base (initial): Darwin (allows 4 FWADC sorties/day) FWADC flight time from Darwin: 60 minutes.</p> <p>Aviation Base (Day 12): Wyndham (allows 5 FWADC sorties/day) FWADC flight time from Wyndham: 32 minutes.</p> <p>Aviation Base (77days): Darwin (C130 Hercules – 2 sorties/day) C130 Hercules Flight Time from Darwin: <60 minutes.</p> <p>Figure 9.1 illustrates airfields closest to Beehive-1, distances and flight times (based on the AT-802 used by AMOSC).</p>								
Vessel application	<p>From Day 4/5: Vessel application commences (6 m³ per 2 days; 3 vessels operating).</p> <p>Steaming Time from Marine Base (Darwin): 15 hrs.</p> <p>Marine Base: Darwin.</p>								
Maximum dispersant application rate (based on assumptions)	126 m ³ /day								
Dispersant application area	<p>The following no-go zones for dispersant application are illustrated in Figure 9.2:</p> <table border="1"> <tr> <td> <ul style="list-style-type: none"> JBG AMP (and a 10 km buffer around it). </td><td rowspan="2">To prevent impacts to listed values.</td></tr> <tr> <td> <ul style="list-style-type: none"> WA or NT marine parks (and a 10 km buffer around them). </td></tr> <tr> <td> <ul style="list-style-type: none"> WA or NT waters. </td><td rowspan="2">To minimise impacts to sensitive coastal habitats such as mangroves and to coastal users.</td></tr> <tr> <td> <ul style="list-style-type: none"> Waters less than 20 m deep. </td></tr> <tr> <td> <ul style="list-style-type: none"> 1 km around the drill site. </td><td>To allow maximum evaporation of fresh oil and prevent impacts to first responders on the MODU or support vessels.</td></tr> </table>	<ul style="list-style-type: none"> JBG AMP (and a 10 km buffer around it). OSTM Results for Surface (Floating) Oil

The stochastic modelling included 100 individual simulations for each season. The maximum distances recorded for floating oil at the lowest exposure threshold (1 g/m²) was 1,048 km, 1,136 km and 1,517 km for the summer (Oct-Feb), transitional (Mar & Sept) and winter (Apr-Aug) seasons, respectively, for the unmitigated simulations (i.e., no dispersant used). This reduced to 994 km, 1,030 km and 1,257 km for the summer, transitional and winter seasons, respectively, for the mitigated simulations (i.e., dispersant used) (Table 9.5).

When the single worst simulation is removed, the 99th percentile maximum distance was 731 km, 903 km and 730 km for the summer, transitional and winter seasons, respectively, for the unmitigated simulations. A slight reduction to 728 km, 861 km and 686 km was predicted for the summer, transitional and winter seasons, respectively, for the mitigated simulations (see Table 9.5).

Table 9.5. Floating oil exposure for unmitigated and mitigated scenarios

Season	Distance travelled from the release location (km)	Zones of potential floating oil exposure					
		Unmitigated			Mitigated		
		Low	Moderate	High	Low	Moderate	High
Summer	Maximum	1,048	153	49	984	134	125
	99 th percentile	731	95	45	728	121	46
Transitional	Maximum	1,136	79	49	1,030	115	50
	99 th percentile	903	62	46	861	56	46
Winter	Maximum	1,517	79	61	1,257	84	63
	99 th percentile	730	68	55	686	68	57

OSTM Results for Shoreline Oiling

Without applying dispersants, the maximum volume of oil predicted to wash ashore from a single simulation at, or above, the low threshold (10 g/m²) ranged between 406.9 m³ (winter) and 704.7 m³ (summer) and the maximum length of shoreline contacted at the low threshold was 201 km for winter and 224 km for summer and transitional seasons (Table 9.6). With dispersants applied, the maximum volume ashore for a single spill trajectory ranged between 204.8 m³ (winter) and 421.0 m³ (summer), which represented a reduction of 50% in the maximum volume ashore in comparison to the unmitigated case.

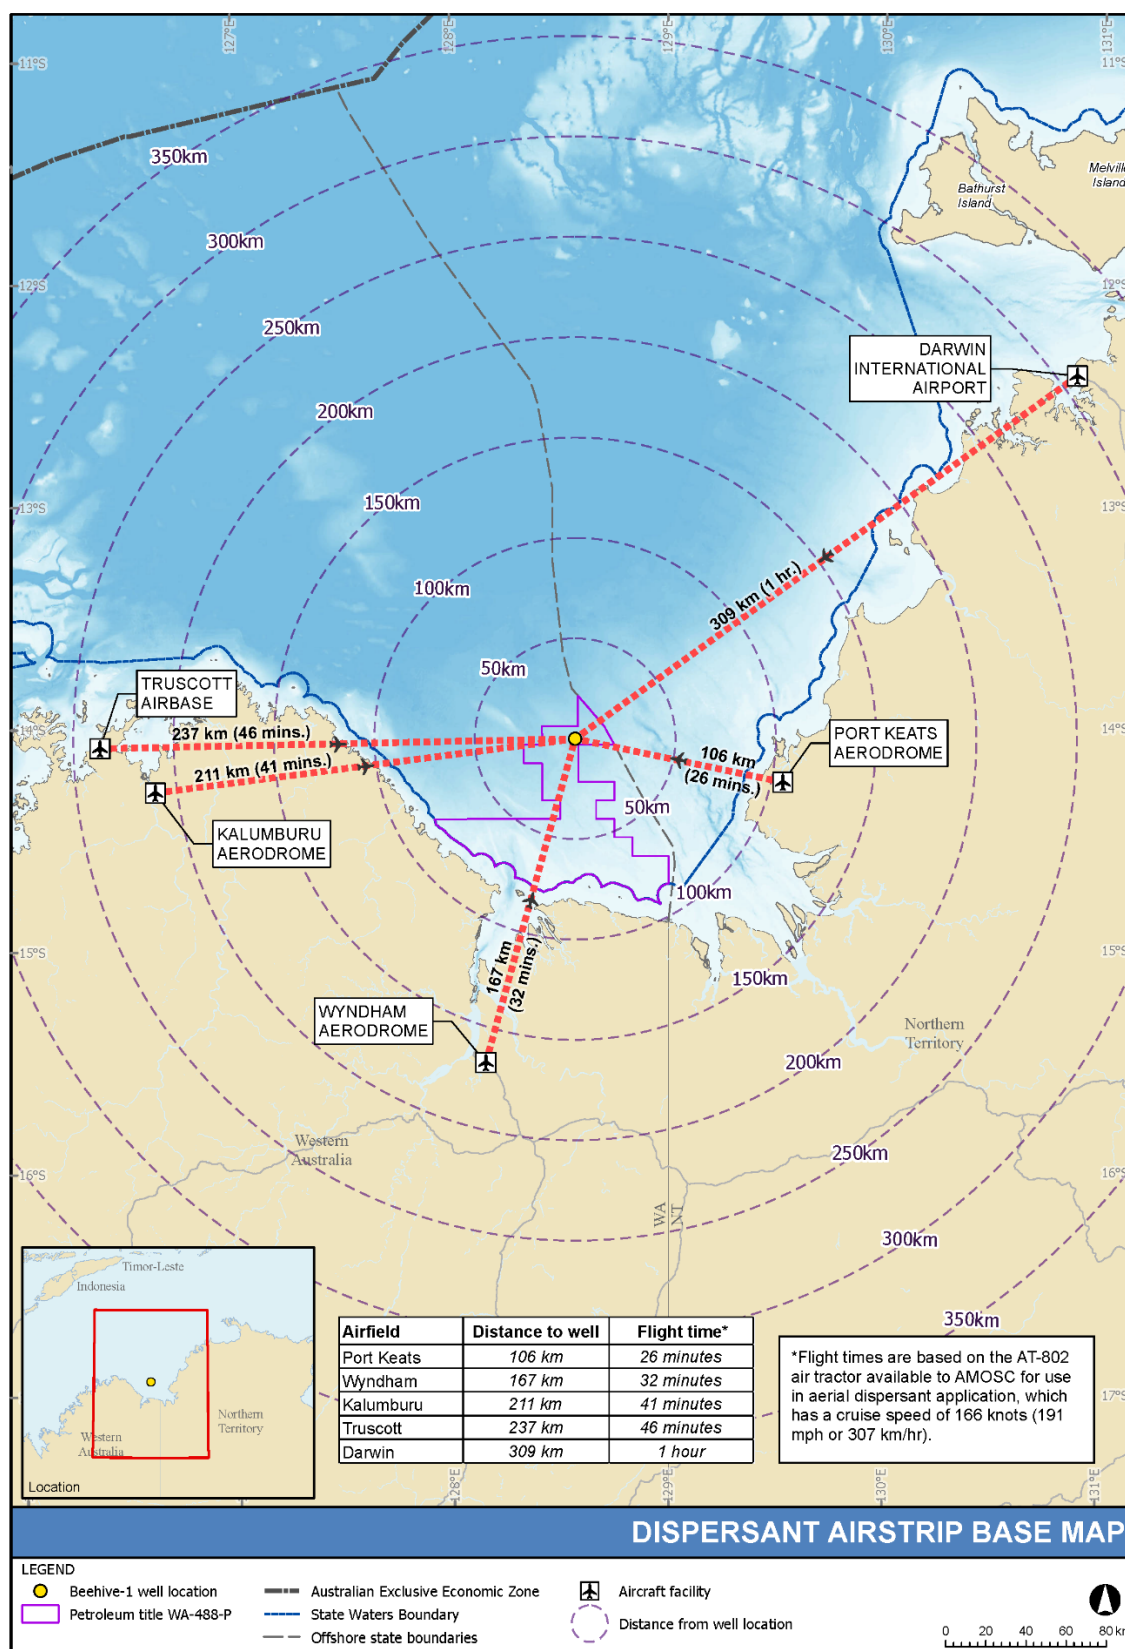

Figure 9.1. Air strips available for use for dispersant mobilisation

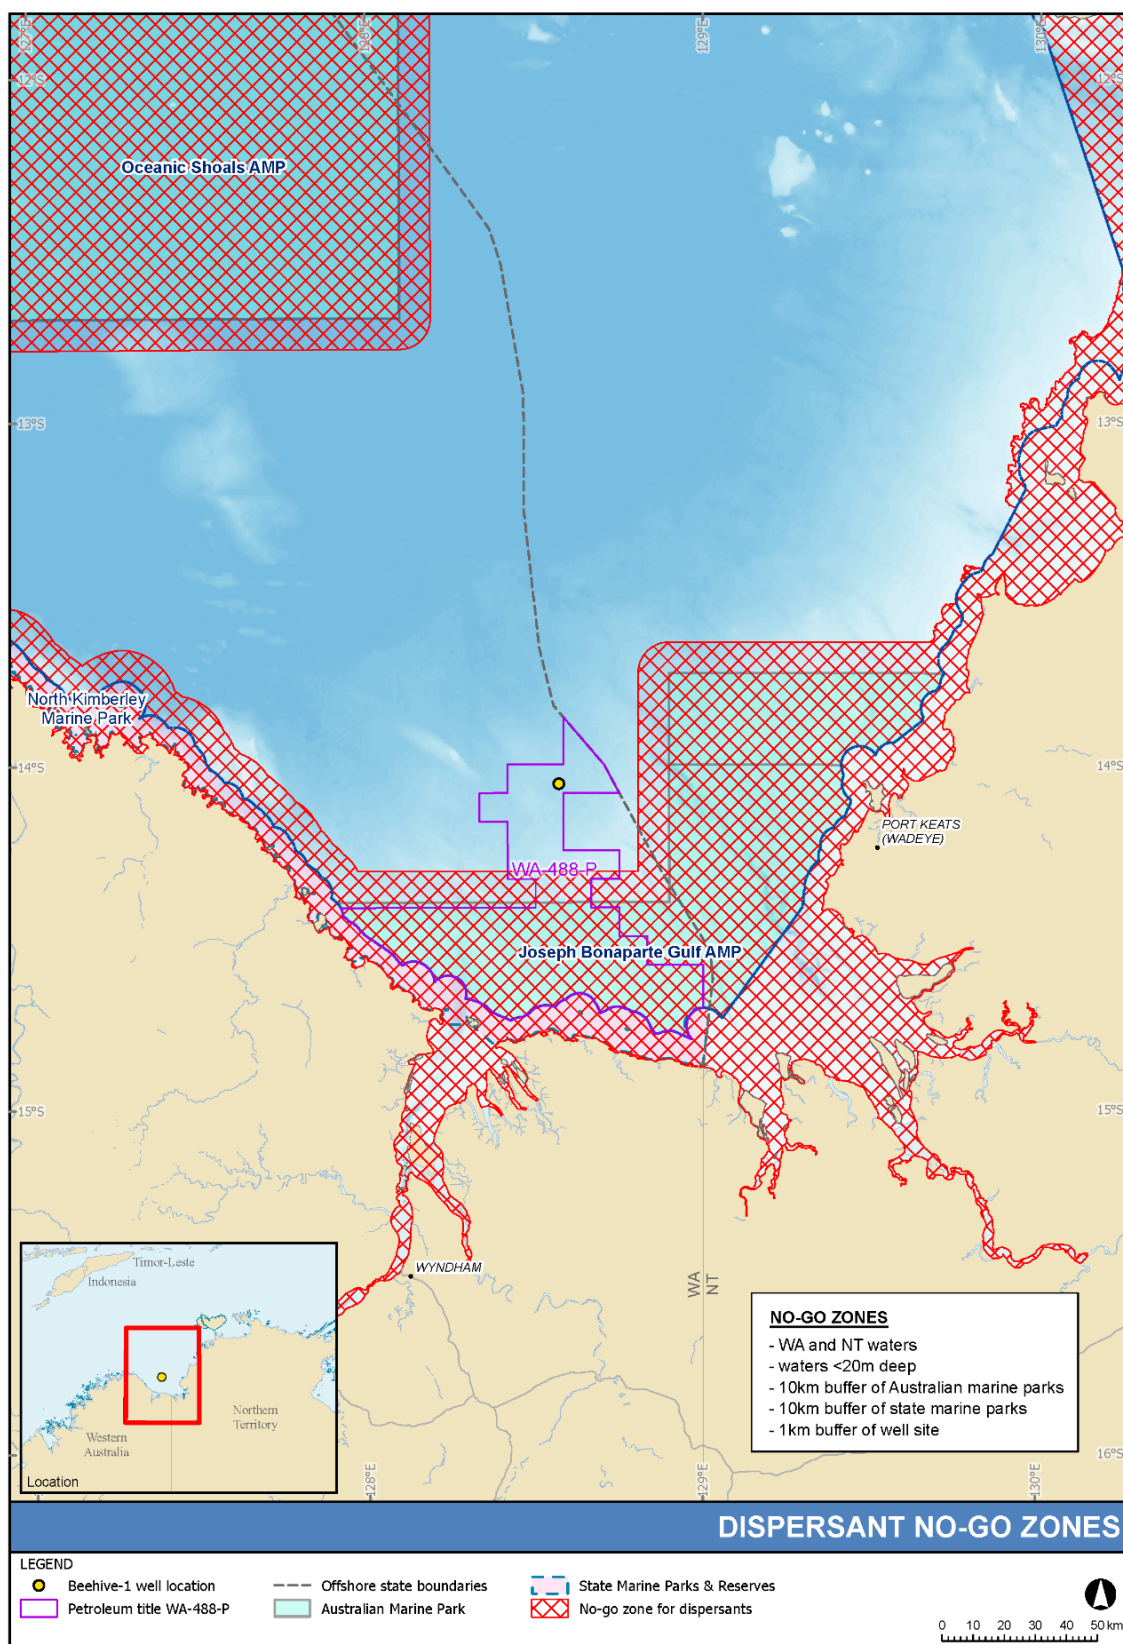

Figure 9.2. No-go zones for dispersant mobilisation

Table 9.6. Shoreline exposure for unmitigated and mitigated scenarios

Shoreline statistics	Unmitigated			Mitigated		
	Summer	Transitional	Winter	Summer	Transitional	Winter
Absolute minimum time for visible oil to shore (days)	11.58	10.29	11.25	13.17	10.79	10.71
Maximum volume of hydrocarbons ashore (m ³)	705.0	414.9	406.9	421.0	380.8	204.8
Average volume of hydrocarbons ashore (m ³)	259.5	176.9	145.8	178.6	96.8	64.2
Maximum length of the shoreline at 10 g/m ² (km)	225	224	201	151	143	132
Maximum length of the shoreline at 100 g/m ² (km)	129	116	99	98	84	53
Maximum length of the shoreline at 1,000 g/m ² (km)	16	9	8	13	6	2
Average shoreline length (km) at 10 g/m ² (km)	119.7	82.6	90.9	92.9	54.4	55.2
Average shoreline length (km) at 100 g/m ² (km)	61.6	45.5	40.9	43.6	26.2	19.1
Average shoreline length (km) at 1,000 g/m ² (km)	5.2	3.5	2.7	3.5	2.2	1.3

The maximum length of shoreline contacted at the low threshold was 201 km for winter and 225 km for summer and transitional (unmitigated). With dispersant application (mitigated case), the maximum length of shoreline contacted at the low threshold ranged from 132 km for winter to 151 km for summer. For all seasonal conditions assessed, the modelling demonstrated a maximum reduction in the length of shoreline contact above the low (39%), moderate (27%) and high (21%) thresholds, when the surface dispersant was applied.

For the unmitigated case, the minimum time before shoreline accumulation at, or above, the low threshold ranged between 10.3 days (transitional) to 11.6 days (summer). For the mitigated case, the minimum time before shoreline accumulation at, or above, the low threshold increased ranging from between 10.7 days (winter) to 13.2 days (summer).

Table 9.7 assesses the benefits to protection priority areas (PPAs) and to nearshore subsea reefs and shoals in the JBG as a result of dispersant use (unmitigated vs mitigated). Priority protection areas are those that are likely to be contacted early (within the first 20 days of the release), are particularly sensitive to oil and hard to restore in the event of a spill (e.g., mangroves) and have ecological (e.g., Ramsar wetlands, turtle and bird nesting areas) or socio-economic (e.g., tourism) values that have a higher priority for protection than less sensitive areas (e.g., rocky shorelines).

Table 9.7. Benefits and drawbacks of dispersant use at priority protection areas within the JBG across all seasons

Receptor sensitivity ratings as per Table 8.23.

9.3.4. Hazards

The process of dispersant application creates the following hazards:

- The use of additional vessels increases the risk of strikes to megafauna, vessel collisions and vessel routine discharges;
- The use of additional aircraft (noise and emissions);
- Dispersant application to the sea increases dispersed/entrained oil within the water column (possible increased toxicity impacts) placing marine habitats at risk; and
- Dispersant application directly on marine megafauna present in the dispersant application zone.

9.3.5. Known and Potential Impacts and Risks

The potential environmental risks of the application of chemical dispersant are:

- Planned light, air and noise emissions from aircraft as per Sections 7.3, 7.4 and 7.5;
- Planned liquid and solid discharges from vessels as per Sections 7.8, 7.9, 7.10 and 7.11;
- Unplanned events from vessels as per Sections 8.1 to 8.6; and
- Toxicity impacts to marine habitats and pelagic fauna and flora species (see below).

9.3.6. Evaluation of Impacts and Risks

Dispersant application increases the amount of entrained/dissolved oil in the water column, reducing exposure of coastal ecosystems to floating weathered oil and reducing the exposure risk of seabird, turtle and marine mammal populations to floating oil (Bock *et al.*, 2018; French-McCay *et al.*, 2018; NRC 2005, 2013). This, however, can increase the risk of toxic effects on plankton, pelagic, demersal and benthic organisms (Hook & Lee, 2015).

Exposure of marine organisms to dispersed and dissolved oil compounds in the water column will be dependent on their proximity to the release, their position within the water column, the drift direction of the plumes, and the ability of the marine organisms to detect oil and move away from the oil.

There are advantages and disadvantages with applying dispersants depending on the receptors targeted for protection, discussed here.

Advantages

The benefits of the use of dispersant were demonstrated during the Macondo (Gulf of Mexico) oil spill in 2010. Macondo oil that reached the shoreline was heavily weathered and degraded, and contained only a small fraction of compounds of concern (PAHs), according to the multi-agency Operational Science Advisory Team study (OSAT-2) released in February 2011. That study found that PAH concentrations in residual oil or 'tar balls' were below EPA-established levels of concern for human health. According to the OSAT-2 study, weathered oil samples showed 86-98% depletion of total PAHs. The study also found that the tar balls contain mostly sand (87-96%). Extensive government seafood testing results (tested by the FDA, the US NOAA and the Gulf states) and landing information indicated no seafood exceeded the FDA's human health threshold for dispersant constituents. In fact, 99% of the samples showed no detectible residue at all (BP, 2013).

The EPA Administrator at the time of the Macondo spill stated that the surface application of dispersants was effective in breaking up the oil and reduced risk to shorelines and to surface-dwelling organisms (BP, 2014b). However, the Federal On-Scene Coordinator (FOSC) limited BP's use of dispersant five weeks after the blowout started. In the After-Action Report, it was stated the decrease in dispersant use led to increased surface oil that could not be recovered, and that this oil most likely found its way to the shores of the Gulf of Mexico (BP, 2014b).

Disadvantages

The application of chemical dispersants to a crude oil spill has the following disadvantages:

- It results in more oil moving into the water column (dissolved & entrained);
- If chemical dispersant is applied but not effective, it may decrease the effectiveness of other response measures (such as oleophilic recovery);
- It is not effective on all types of oil under all conditions;
- It adds additional extraneous substances into the marine environment; and
- There is a limited time window for use.

The use of chemical dispersants is an environmental trade-off; it is recognized that dispersants have their own set of environmental impacts (though are generally less toxic than the oils they break down), but they are used in an attempt to minimize contact with shorelines, where the oil can cause significantly more damage.

Based on the most studied dispersant formulations, the increased risk for most taxa from dispersants comes from the increased solubility (and therefore bioavailability) of the toxic components of the oil, not the dispersant itself (Negri *et al.*, 2018). Many other recent studies (e.g., Brakstad *et al.*, 2018b; Fingas, 2002; 2011; Hansen *et al.*, 2014), found modern dispersants to be significantly less toxic than the oil alone or the dispersed oil.

Results from studies looking at potential synergetic effects of dispersants in oil exposure have suggested that the dispersants make it easier to move hydrocarbons across membranes – and thus may enhance exposure (NRDA, 2012).

Shortly after the Macondo oil spill, reports suggested that oil and dispersant constituents became entrained in the pelagic food web (Tjeerdema *et al.*, no date). Dispersed oil in the shallow water column became incorporated into at least two trophic levels beyond prokaryotic hydrocarbon consumers. Dispersed oil was also observed in blue crab larvae. Contaminants from dispersed oil may result in long-term adverse effects such as carcinogenesis, impaired reproduction, shortened life spans and decreased population numbers in planktonic organisms. Additionally, exposure to contaminants found in oil and dispersants during early phases of the life cycle can lead to infertility and a host of developmental problems (Tjeerdema *et al.*, no date).

Effective dispersion of oil may increase the acute (short-term, sometimes lethal) impacts on marine life living in the top few metres of the sea in the vicinity of the spill due to the dissolution of the smaller more volatile molecules into the water column rather than evaporating from the sea surface. However, these impacts are usually time-limited because of the rapid dilution of the dispersed oil (IPIECA-IOGP, 2014a). This is supported by earlier research that states where the dilution potential is greatest (i.e., the open ocean), concentrations of dispersed oil high enough to cause adverse effects are unlikely to persist for more than several hours (API, 2001).

The ultimate long-term effects will depend on the concentration, location and persistence of dispersed oil and the duration and timing of exposure to organisms (Tjeerdema *et al.*, no date).

Impacts to receptors

Table 9.8 assesses the risk of increased exposure to dissolved and entrained oil to the receptors in the spill EMBA as a result of chemical dispersion.

Table 9.8. Consequence evaluation for increased dissolved and entrained hydrocarbons

General impacts and risks	Beehive-1 specific impacts and risks
<p>Plankton (described in Section 5.4.3 and Appendix 11, Section 5.3.3)</p> <p>Plankton may be directly impacted by in-water and surface hydrocarbons. Plankton are an important food source for commercially targeted fish species (such as prawns) and planktonic larval stages of pelagic and benthic biota are broadly distributed in low densities across the region. Larval densities are expected to be lower further from shore and from source populations in the shallower waters of the shelf.</p> <p>Field observations from oil spills show minimal or transient effects on marine plankton (Volkman <i>et al.</i>, 2004). Oil can affect the rate of photosynthesis and inhibit growth in phytoplankton, depending on the concentration. For example, photosynthesis is stimulated by low concentrations of oil in the water column (10–30 ppb) but becomes progressively inhibited above 50 ppb. Conversely, photosynthesis can be stimulated below 100 ppb for exposure to weathered oil (Volkman <i>et al.</i>, 2004).</p> <p>Reproduction by survivors or migration from unaffected areas would be likely to rapidly replenish any losses from permanent zooplankton (Volkman <i>et al.</i>, 2004). Once background water quality conditions have re-established, the plankton community will take weeks to months to recover (ITOPF, 2011a), allowing for seasonal influences on the assemblage characteristics. Plankton found in open waters of the JBG are expected to be widely represented across the northern tropics. Migration from outside affected areas is expected to aid in the re-establishment of plankton communities if there was a population decline.</p>	<p>The modelling shows that in-water exposure at high dissolved and entrained thresholds may result in a large area around the source of the spill. At these levels, some sensitive mature individuals and early life stages (larvae, gametes and juveniles) may experience mortality upon exposure. Modelling indicates that exposure to in-water concentrations is unlikely to have an adverse effect on plankton in areas of biological significance, such as the Sahul Shelf bank and terrace (min. water depth- 30m); Pinnacles of the Bonaparte Basin (min. water depth of 30m); Van Diemen Rise carbonate banks and terrace system (min. water depth 10m); Ancient coastline (125m water depth); and the fringing reef systems of Ashmore Reef, Cartier Island, Mermaid Reef, Rowley Shoals, Scott and Seringapatam Reef systems and thus effects on higher trophic levels are not expected.</p> <p>Dispersant application is predicted to have the following effects on in-water hydrocarbon concentrations within these KEFs as follows:</p> <ul style="list-style-type: none"> - Sahul Shelf Carbonate Bank & Terrace System KEF (Untreated - Dissolved: High, probability up to 95%; Entrained – High, probability up to 100%. With Dispersant Use – Dissolved: High, probability up to 95%; Entrained – High, probability up to 100%)) - Van Diemen Rise carbonate bank and terrace system KEF (Untreated - Dissolved: Moderate, probability up to 6%; Entrained – High, probability up to 20%. With Dispersant Use – Dissolved: Moderate probability up to 5%; Entrained – High, probability up to 20%)) - Pinnacles of the Bonaparte Basin KEF (Untreated - Dissolved: High, probability up to 3%; Entrained – High, probability up to 37%. With Dispersant Use – Dissolved: High, probability up to 3%; Entrained – High, probability up to 38%)) - Seringapatam/Scott reef complex KEF (Untreated - Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 8%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – High, probability up to 8%)

General impacts and risks	Beehive-1 specific impacts and risks
	<ul style="list-style-type: none"> - Reef System of Ashmore Reef (Untreated - Dissolved: Low, probability up to 5%; Entrained – High, probability up to 3%. With Dispersant Use – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 3%) - Reef system of Cartier Island (Untreated - Dissolved: Low, probability up to 4%; Entrained – High, probability up to 15%. With Dispersant Use – Dissolved: Low, probability up to 3%; Entrained – High, probability up to 15%) - Reef system of Mermaid Reef/Rowley Shoals (Untreated - Dissolved: Moderate, probability up to 2%; Entrained – Low, probability up to 7%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – Low, probability up to 6%) <p>Exposure to greater concentrations of dissolved and entrained hydrocarbons due to the use of dispersants may result in marginally higher short-term impacts to local plankton populations. Taking into consideration the role of plankton at the base of the marine food web, dispersant application is expected to have a minor consequence.</p>
Benthic invertebrates, habitats and communities (described in Section 5.4.1 and Appendix 11, Section 53.1)	
<p>Sessile organisms on the seabed (especially in shallow waters) that cannot relocate may experience higher exposures compared with marine organisms that can relocate. Sessile organisms close to the release location can be exposed to high concentrations of dispersed oil for prolonged periods, though it is recognised that the risk to benthic habitats in deeper waters is less than that closer to the sea surface (IPIECA-IOGP, 2015a).</p> <p>Impacts from entrained (including chemically entrained) oil may include the effects of oxygen depletion in bottom waters resulting from the metabolic processes of bacteria degrading the oil (biological oxygen demand).</p> <p>Chemical oil dispersants, such as those used during the Macondo spill (e.g., Corexit 9500) may affect transport of oil from the water column by forming marine oil ‘snow’ with detritus, plankton/phytoplankton and microbes/bacteria that sinks to the seabed (Passow <i>et al.</i>, 2016). While some of the ‘snow’ biodegrades before reaching the seabed, some accumulates on the seabed, resulting in increased oil in sediments where it is biodegraded by sediment microbes.</p>	<p>Resident fauna such as worms, molluscs and crustaceans may suffer impacts from oil in marine snow that penetrates the sediments.</p> <p>Given the depth of benthic species within the KEFs (refer to ‘plankton’ above), benthic species and habitats in these areas are not likely to be exposed to levels of in-water hydrocarbons above thresholds of ecological significance.</p> <p>Deepwater hard corals, if present, occur at minimum water depths of 10-20m in the JBG and surrounding waters (e.g., Barracouta Shoals, Big Bank Shoals, Cootamundra Shoals, Eugene McDermott Shoal, Goree Shoal, Vulcan Shoal) and minimum water depths of 30m on the Sahul Shelf and van Diemen Rise carbonate bank and terrace systems. These systems would be adversely affected by increased sedimentation of oiled detritus and entrained hydrocarbons.</p> <p>It is possible that shoals and reefs in the region would be exposed to hydrocarbons in the water column at moderate to high levels given their proximity to the source.</p>

General impacts and risks	Beehive-1 specific impacts and risks
<p>Surface deposit or detritus feeders such as annelid worms, gastropods, or echinoderms are most likely to be affected by sedimented hydrocarbons rather than from entrained/dissolved oil.</p> <p>While exposure can lead to impacts including mortality, recovery of benthic habitats exposed to entrained hydrocarbons would be expected to be rapid, following return to background water quality conditions within weeks to months of contact (Burns <i>et al.</i>, 1993; Dean <i>et al.</i>, 1998).</p> <p>The ecological implications of potential reduction in diversity and abundance of benthic invertebrates will be dependent on the habitat affected. Areas of highly mobile sediment, where diversity and abundance are relatively low, will likely recover quickly. Complex assemblages (e.g., sponge habitat) or slow-growing sessile invertebrates are likely to recover more slowly. Persistent toxic components in some dispersants have been found in deep sea corals (White <i>et al.</i>, 2014).</p> <p>Filter feeding organisms that prey on plankton can ingest naturally- or chemically dispersed oil droplets when they are of a similar size to some plankton. Relatively simple organisms, such as bivalves, cannot biochemically process the higher molecular weight PAHs in the oil, and these PAHs can build up (bioaccumulate) in some organs (IPIECA-IOGP, 2015a). Predators that consume oil-contaminated bivalves can therefore be exposed to elevated concentrations of the higher molecular PAHs by this ingestion route.</p>	<p>Following the Macondo spill (White <i>et al.</i>, 2014), deep water corals were found to have been impacted by flocculant material (containing oil) up to approximately 20 km from the release location in the direction of prevailing current. The modelling indicates that deposition of drill muds and cuttings around the wellhead during drilling is omni-directional, so it is possible that benthic communities on shoals and reefs may also be affected to those distances.</p> <p>Overall, predicted impacts to benthic habitats vary widely according to species and location (nearshore versus offshore). Additional impacts associated with marine oil snow is expected to be localised and short to medium term and is assigned a consequence of moderate.</p>
Fish (described in Section 5.4.4 and Appendix 11, Section 5.3.4)	
<p>Pelagic fish may be exposed to greater concentrations of dissolved and entrained hydrocarbons as a result of dispersant application if they within the modelled plume of entrained oil. However, generally these species are highly mobile and only a small proportion would be expected to remain at the depth of the entrained plume for long enough to suffer extended exposure to moderate–high concentrations of oil. The richer assemblages of fish and cephalopods in the shallower waters of the JBG are unlikely to be exposed to moderate–high concentrations of entrained oil as a result of dispersant use being restricted to offshore waters.</p> <p>Organisms that possess livers, such as fish, can quickly metabolise PAH although some of these metabolites may be harmful.</p>	<p>Fish present in the deeper waters of the EMBA include the grey nurse shark (15–40m depths); great white shark, shortfin and longfin mako sharks and oceanic whitetip sharks.</p> <p>Areas of high productivity which attract aggregations of fish are predicted to be impacted by entrained or dissolved hydrocarbons as follows:</p> <ul style="list-style-type: none"> - Arafura AMP (Untreated - Dissolved: Low, probability up to 1%; Entrained – High, probability up to 3%. With Dispersant Use – Dissolved: Low, probability up to 2%; Entrained – High, probability up to 3%); - Argo-Rowley AMP (Untreated – Dissolved: Moderate, probability up to 5%; Entrained – High, probability up to 10%. With Dispersant Use – Dissolved: High, probability up to 22%; Entrained – High, probability up to 88%); - Oceanic Shoals AMP (Untreated – Dissolved: High, probability up to 2%; Entrained – High, probability up to 49%. With Dispersant Use – Dissolved: High, probability up to 2%; Entrained – High, probability up to 50%); - Ancient coastline KEF at 125m depth (Untreated – Dissolved: High, probability up to 2%; Entrained – High, probability up to 47%. With Dispersant Use – Dissolved: High, probability up to 2%; Entrained – High, probability up to 47%); - Sahul Shelf Carbonate Bank & Terrace System KEF (Untreated – Dissolved: High, probability up to 95%; Entrained – High, probability up to 100%. With Dispersant Use – Dissolved: High, probability up to 95%; Entrained – High, probability up to 100%); - Van Diemen Rise carbonate bank and terrace system KEF (Untreated – Dissolved: Moderate, probability up to 6%; Entrained – High, probability up to 20%. With Dispersant Use – Dissolved: Moderate probability up to 5%; Entrained – High, probability up to 20%); - Continental slope Demersal Fish Communities KEF (Untreated – Dissolved: High, probability up to 1%; Entrained – High, probability up to 32%. With

General impacts and risks	Beehive-1 specific impacts and risks
	<p>Dispersant Use – Dissolved: High, probability up to 1%; Entrained – High, probability up to 32%);</p> <ul style="list-style-type: none"> - Pinnacles of the Bonaparte Basin KEF (Untreated – Dissolved: High, probability up to 3%; Entrained – High, probability up to 37%. With Dispersant Use – Dissolved: High, probability up to 3%; Entrained – High, probability up to 38%); - Seringapatam/Scott reef complex KEF (Untreated – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 8%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – High, probability up to 8%). <p>While modelling predicts that some AMPs and KEFs may be affected by moderate to high levels of hydrocarbon exposure, increases in exposure levels and the associated probability of exposure do not vary significantly between the unmitigated and mitigated spills (i.e., dispersant used). On this basis, given the mobility of fish in open waters, that fish can metabolise PAHs and the limited exposures predicted, only a small increase in impact to pelagic fish could be expected due to dispersant use. The consequence is assigned as minor.</p> <p>Shallow inshore species include various syngnathids (seahorses, pipefish, pipe horses and sea dragons) and sawfish. Given that dispersants will be applied close to the well site and not within WA/NT waters, AMPs or marine parks, the consequences to shallow water fish species will be limited to affected water inflows. Modelling predicts the following in-water hydrocarbon water concentrations for inshore areas:</p> <ul style="list-style-type: none"> - Emu Reef (NT) (Untreated – Dissolved: High, probability up to 35%; Entrained – High, probability up to 81%. With Dispersant Use – Dissolved: High, probability up to 38%; Entrained – High, probability up to 82%); - King Shoals (WA) (Untreated – Dissolved: High, probability up to 92%; Entrained – High, probability up to 83%. With Dispersant Use – Dissolved: High, probability up to 91%; Entrained – High, probability up to 84%); - North Kimberley MP (Untreated – Dissolved: High, probability up to 88%; Entrained – High, probability up to 97%. With Dispersant Use – Dissolved: High, probability up to 90%; Entrained – High, probability up to 97%);

General impacts and risks	Beehive-1 specific impacts and risks
	<p>Shallow inshore species are less likely to be able to move away from in-water hydrocarbons and may be exposed for longer periods. As fish are most vulnerable to hydrocarbons during their embryonic, larval and juvenile life stages, nursery areas are more likely to suffer developmental effects, morbidity or mortality at lower concentrations.</p> <p>For shallow water areas, the use of dispersant does not significantly change exposure levels or probabilities of exposure between dispersed and non-dispersed scenarios. As per offshore areas, the consequence to inshore fish as a result of using dispersant is assessed as minor, given the predicted impacts associated with the unmitigated spill and the localised nature of the potential impact.</p>
Seagrass (described in Appendix 11, Section 5.3.2)	
<p>Dispersants can injure aquatic vegetation by breaking down the thin waxy cuticle of the plant, allowing greater penetration of oil fractions into leaves, thereby increasing phytotoxicity. In addition, this physical damage to the cuticle could cause a reduction in growth due to the increased physiological stress on the plant (NRDA, 2012).</p> <p>A study of the effects of oil and dispersed oil on temperate seagrasses by the Sydney University of Technology (Wilson, 2011) found that in most cases, the non-dispersed oils had less of an impact (photosynthetic stress) to the seagrasses <i>Zostera capricorni</i> and <i>Halophila ovalis</i> than the dispersed oil treatments. Wilson (2011) reports that seagrasses absorb more aliphatic and aromatic oil fractions when the oil is dispersed, thereby increasing its toxicity. The dispersants may affect the waxy cuticle of the seagrass blade, thereby increasing the penetrability of the dispersed oil to the photosynthetic organs, particularly the thylakoid membrane. As dispersed oil is more susceptible than non-dispersed oil to microbial breakdown, this leads to greater oxygen demand by microbes. A reduction in the oxygen in the seagrass community may impact on the seagrass system, as they have a high respiratory demand to support their large non-photosynthetic underground biomass (Wilson, 2011).</p> <p>Subtidal seagrasses can be exposed to oil by direct contact with the WAF and by rhizomal uptake from contaminated sediments. In addition, seeds may be affected by contact with oil contained within sediments (NRDA 2012) and the buoyant</p>	<p>While it is unlikely the effects of dispersant application will manifest themselves along the coast of the spill EMBA (because dispersant will be sprayed in offshore areas a significant distance from the coast), if such effects do occur, they are likely to be isolated given the patchy distribution of macroalgal communities along the coastline.</p> <p>Seagrass beds are present around Cape Londonderry, Ashmore Reef, Cobourg Peninsula, Vernon islands and Berkeley River.</p> <p>Given the distance from the potential source of the spill, and the natural distribution of seagrass communities, the OSTM predicts that these locations will be exposed to the following levels of in-water hydrocarbon (worst seasonal results quoted for all locations):</p> <ul style="list-style-type: none"> - Cape Londonderry (Untreated – Dissolved: High, probability up to 74%; Entrained – High, probability up to 94%. With Dispersant Use – Dissolved: High, probability up to 68%; Entrained – High, probability up to 95%); - Ashmore Reef AMP (Untreated – Dissolved: Low, probability up to 5%; Entrained – High, probability up to 3%. With Dispersant Use – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 3%); - Cobourg Peninsula (Untreated – Dissolved: Low, probability up to 1%; Entrained – High, probability up to 6%. With Dispersant Use – Dissolved: Low, probability up to 1%; Entrained – High, probability up to 6%);

General impacts and risks	Beehive-1 specific impacts and risks
<p>seedlings of seagrass species may also be exposed to floating oil; however, this effect would be reduced by dispersant application.</p> <p>When seagrass leaves are exposed to hydrocarbons, sub-lethal quantities of the soluble fraction can be incorporated into the tissue, causing a reduction in tolerance to other stress factors (Zieman <i>et al.</i>, 1984).</p> <p>Ballou et al (1987) conducted field experiments to assess the effects of dispersants, untreated crude and chemically dispersed oil on shallow water sub-tidal seagrasses. No significant effects on seagrass growth rates were measured at the untreated or chemically dispersed sites following treatment. Seagrass density declined at the chemically dispersed site following treatment but returned to greater than pre-spill levels after 7 months. The density of seagrasses at the untreated crude spill site also declined after treatment but did not return to pre-treatment levels. The abundance of sea urchins reduced dramatically at the chemically dispersed site such that no live sea urchins were present 4 months after treatment, however populations reappeared after 12 months. For the untreated spill site, there was a slight decrease in sea urchin abundance after site treatment followed by large increases in abundance recorded 7 months post spill. At both sites, the density and diversity of infauna were extremely variable and no discernible pattern over time between the sites were observed. Ballou et al (1987) notes that the field study simulated a severe, worst-case spill of unweathered Prudoe Bay crude oil with dispersant application in nearshore waters of a slowly flushed, semi-enclosed bay which is not reflective of conditions associated with a Beehive LoWC (i.e., open ocean spraying of semi-weathered crude oil along predominantly open coastlines).</p>	<ul style="list-style-type: none"> - Vernon Islands (Untreated – Dissolved: High probability up to 3%; Entrained – High, probability up to 24%. With Dispersant Use – Dissolved: High, probability up to 2%; Entrained – High, probability up to 24%); - Berkeley River (Untreated – Dissolved: High probability up to 92%; Entrained – High, probability up to 97%. With Dispersant Use – Dissolved: High, probability up to 91%; Entrained – High, probability up to 97%). <p>Based upon modelling outcomes, some areas containing seagrass are predicted to encounter high levels of in-water hydrocarbon.</p> <p>and dissolved fractions that tend to result in the greatest impacts. The use of dispersant, however, does not significantly alter the potential for in-water exposure at these locations (i.e., exposure levels and probabilities are similar between mitigated and unmitigated cases).</p> <p>AAs identified by Ballou et al (1987) sub-tidal seagrasses affected by chemically treated in-water hydrocarbons may take 12 months to recover but will be protected from surface oil due to the presence of the overlying water. On this basis, the consequence to sub-tidal seagrass associated with dispersant use, based on the studies of Ballou et al (1987) is moderate (localised and short-term).</p> <p>Intertidal seagrasses are more likely to be affected by shoreline accumulations of oil; however, these affects would be reduced by dispersant application offshore. On this basis, the use of dispersant is assessed as beneficial.</p>
Seabirds and shorebirds (described in Section 5.4.7 and Appendix 11, Section 5.3.7)	
<p>The change in the risk profile for seabirds and shorebirds resulting from dispersant application is related primarily to the benefit gained from the reduced sea surface oiling. The greater proportion of oil becoming entrained and dissolved would increase exposure for diving birds in offshore/nearshore areas where the concentrations are high enough to have an adverse effect, and indirectly thorough hydrocarbon biomagnification through the food web. Prey fish species, such as sardines and other baitfish, exposed to entrained or dissolved oil may retain some hydrocarbons in their tissues which would then be taken up by the birds.</p>	<p>Given the depth at which most in-water hydrocarbon will suspend until it is biodegraded, together with the reduction in the exposure of birds in offshore, coastal and nearshore areas to floating oil and shoreline accumulations, the overall consequences to birds are considered limited to local effects on individual birds associated with possible decrease in the abundance of prey or bioaccumulation of hydrocarbons in the individual birds.</p> <p>As per previous assessments, increases in in-water hydrocarbons as a result of dispersant use is not significant when compared with the unmitigated spill</p>

General impacts and risks	Beehive-1 specific impacts and risks
<p>Sea surface slicks and shoreline accumulation effects on shorebirds, roosting seabirds and foraging birds in general will be reduced by dispersant application offshore.</p> <p>Diving seabirds/shorebirds may be exposed to increased concentrations for both dissolved and entrained but reduced exposure to surface oils.</p>	<p>scenario. Therefore the consequence associated with dispersant use to marine birds is assessed as moderate.</p>
Marine reptiles (described in Appendix 11, Section 5.3.6)	
<p>Marine reptiles, specifically turtles and sea snakes, are potentially directly impacted by the toxicity of in-water hydrocarbons through ingestion of floating oil and breathing of volatile hydrocarbons at the sea surface. Impacts to reptiles through physical oiling or in-water hydrocarbon concentrations is provided in Table 8.34.</p> <p>Marine reptiles are also at risk of dispersant exposure where application is occurring. During the Macondo spill, the threats and damages from dispersant exposure are closely tied to the location and timing of the application of dispersant on slicks. Only 1 out of 68 heavily oiled turtles tested positive for the presence of chemicals found in dispersants; no other sampled turtles had detectable levels of dispersant based on available tests (Bailey <i>et al.</i>, 2021).</p> <p>The effect of dispersants on turtles is largely unknown, however dispersants have the potential to interfere with lung function, digestion and salt gland function (Shigenaka, 2003). In an exposure study investigating the effects of crude oil, dispersant and a crude/dispersant combination on loggerhead hatchlings, significant differences between treatment and non-exposed controls were detected in multiple blood chemistry parameters (Harms <i>et al.</i>, 2014). Electrolyte imbalances and hydration challenges were worst in the combined oil/dispersant group and the failure to gain weight was noted in the dispersant and combined exposed hatchlings (Harms <i>et al.</i>, 2014).</p> <p>Frasier <i>et al.</i> (2020) surmises that since oil itself is generally toxic and can be lethal, dispersants may improve short-term survival of marine megafauna by reducing oil slick formation, decreasing the probability of heavy oiling and accelerating the initial degradation of the released oil.</p>	<p>Dispersant application will not be undertaken in marine parks or within 10 km of park boundaries, in WA and/or NT territorial waters or in waters less than 20 m deep (see Figure 9.2). Outside of these areas, dispersant will be applied to released oil with weathering up to 72 hours which limits the area of dispersant application.</p> <p>Important critical habitats for marine turtles are present within the EMBA. This includes the following:</p> <ul style="list-style-type: none"> - Flatback turtle inter-nesting BIA within a 60 km radius of Cape Dommett/Lacrosse Island with movements confined to longshore movements in coastal waters; - Flatback inter-nesting area north of Daly River (NT) around the Cobourg Peninsula and Tiwi Islands; - Green turtle and olive ridley foraging BIA within the JBG; and - Flatback turtle and olive ridley foraging BIA which intersects the Oceanic Shoals AMP. <p>The OSTM identified that the use of dispersant in a Beehive LoWC incident would have the following exposures on at these locations:</p> <ul style="list-style-type: none"> - Cape Dommett/Lacrosse Island (Untreated – Dissolved: High, probability up to 24%; Entrained – High, probability up to 67%. With Dispersant Use – Dissolved: High, probability up to 25%; Entrained – High, probability up to 67%) - Daly River ((Untreated – Dissolved: High, probability up to 5%; Entrained – High, probability up to 64%. With Dispersant Use – Dissolved: High, probability up to 3%; Entrained – High, probability up to 64%)

General impacts and risks	Beehive-1 specific impacts and risks
	<ul style="list-style-type: none"> - Cobourg Peninsula (Untreated – Dissolved: Low, probability up to 1%; Entrained – High, probability up to 6%. With Dispersant Use – Dissolved: Low, probability up to 1%; Entrained – High, probability up to 6%) - Bathurst/Melville Island (Untreated – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 19%. With Dispersant Use – Dissolved: Moderate, probability up to 3%; Entrained – High, probability up to 19%) - JBG AMP (Untreated – Dissolved: High, probability up to 89%; Entrained – High, probability up to 100%. With Dispersant Use – Dissolved: High, probability up to 92%; Entrained – High, probability up to 99%) - Oceanic Shoals AMP (Untreated – Dissolved: High, probability up to 2%; Entrained – High, probability up to 49%. With Dispersant Use – Dissolved: High, probability up to 2%; Entrained – High, probability up to 50%)) <p>Individual marine reptiles may come into contact with moderate-high concentrations of in-water hydrocarbons in the offshore and near-shore areas of the JBG close to the areas of dispersant application, however the in-water concentrations and probability of exposure is not significant between the unmitigated and mitigated (dispersant) scenarios. Therefore dispersant use to mitigate shoreline oiling are not expected to have additional impacts over and above the level of impact assessed in Table 8.34. Impacts to Turtles associated with dispersant use are assessed as minor.</p>
Marine mammals (described in Appendix 11, Section 5.3.5)	
<p>Marine mammals can be exposed to chemically dispersed hydrocarbons through:</p> <ul style="list-style-type: none"> • Internal exposure by consuming oil or contaminated prey; • External exposure, by swimming in oil and having oil directly on the skin and body; and • External transfer of contaminants to embryos (NRDA 2012). <p>Physical impacts from ingested hydrocarbon with subsequent lethal or sub-lethal impacts are applicable to entrained and surface oil. However, the susceptibility of cetaceans varies with feeding habits. Baleen whales are likely to ingest surface oil as</p>	<p>Marine mammals with BIAs in the spill EMBA, and therefore at potential risk of encountering dispersant entrained hydrocarbons, are the pygmy blue whale, humpback whale, Australian humpback dolphin, Australian snubfin dolphin, Indo-Pacific spotted bottlenose dolphin and the dugong. Significant locations for these mammals include:</p> <ul style="list-style-type: none"> - Napier/Broome Bay (significant habitat for Australian humpback dolphin, foraging/ breeding/ calving habitat for Australian snubfin dolphin); - Vansittart Bay Anjo Peninsula (significant habitat for Australian humpback dolphin, foraging/breeding/calving habitat for Australian snubfin dolphin);

General impacts and risks	Beehive-1 specific impacts and risks
<p>they feed at the surface and in the water column. Toothed whales and dolphins may be susceptible to ingestion of dissolved and entrained oil as they gulp feed at depth.</p> <p>As highly mobile species, in general it is very unlikely that these animals will be constantly exposed to elevated concentrations of hydrocarbons in the water column for continuous durations (e.g., >96 hours) that could lead to chronic effects. Many marine mammals also have liver enzymes that metabolise hydrocarbons and excrete them as polar derivatives (Ball & Truskewycz, 2013).</p>	<ul style="list-style-type: none"> - Bougainville Peninsula (significant habitat for Australian humpback dolphin, foraging/breeding/ calving habitat for Australian snubfin dolphin); - Cape Londonderry (foraging habitat for Australian snubfin dolphin); - Ord River (foraging/breeding/calving habitat for Australian snubfin dolphin). <p>The OSTM identified that the use of dispersant in a Beehive LoWC incident would have the following exposures on at these locations:</p> <ul style="list-style-type: none"> - Napier/Broome Bay (Untreated - Dissolved: High, probability up to 19%; Entrained – High, probability up to 89%. With Dispersant Use – Dissolved: High, probability up to 19%; Entrained – High, probability up to 89%); - Vansittart Bay Anjo Peninsula (Untreated - Dissolved: High, probability up to 17%; Entrained – High, probability up to 88%. With Dispersant Use – Dissolved: High, probability up to 15%; Entrained – High, probability up to 89%); - Bougainville Peninsula (Untreated - Dissolved: High, probability up to 15%; Entrained – High, probability up to 86%. With Dispersant Use – Dissolved: High, probability up to 16%; Entrained – High, probability up to 86%); - Cape Londonderry (Untreated - Dissolved: High, probability up to 74%; Entrained – High, probability up to 94%. With Dispersant Use – Dissolved: High, probability up to 68%; Entrained – High, probability up to 95%); and - Ord River (Untreated – Dissolved: High, Probability up to 5%; Entrained – High, probability up to 64%. With Dispersant Use – Dissolved: High, probability up to 5%; Entrained – High, probability up to 65%). <p>Based upon modelling outcomes, some areas containing important habitat for marine mammals are predicted to encounter high levels of in-water hydrocarbon and dissolved fractions. The use of dispersant, however, does not significantly alter the potential for in-water exposure at these locations (i.e., exposure levels and probabilities are similar between mitigated and unmitigated cases). While impacts as described in Table 8.33 may occur, based upon modelling results there will not be significant additional impacts to these locations as a result of dispersant use. On this basis, impacts to mammals from in-water concentrations of hydrocarbons in shoreline locations resulting from dispersant use is assessed as minor.</p>

General impacts and risks	Beehive-1 specific impacts and risks
Corals (described in Appendix 11, Section 5.3.1)	
<p>Field experiments undertaken to assess the effect of untreated crude and chemically dispersed oil on shallow water sub-tidal coral reefs (containing <i>Porites porites</i>, <i>Agaricia tenuifolia</i>, <i>Montastrea annularis</i> and <i>Acropora cervicornis</i>) identified the following (Ballou et al, 1987):</p> <ul style="list-style-type: none"> - At the untreated crude site, there was a slight but statistically significant decrease in coral coverage over time. There was no change total organisms, total animals and total plants. - The percent coverage of coral reef substrate by epifauna and epiflora at the chemically treated site declines abruptly after treatment. The decline continued for 12 months post-spill after which the decline levelled off. The percent coverage by all assessment categories (total organisms, total animals, corals and total plants) declined during the study period. The effects of dispersed oil on <i>P. porites</i> was not great but a slight, significant reduction in 2 of 3 growth parameters was measured in the post-spill survey period. The coral species <i>Agaricia tenuifolia</i> showed clear signs of reduced growth rates. <p>There were no significant changes in growth rates of <i>Montastrea annularis</i> and <i>Acropora cervicornis</i> at either the treated or untreated sites.</p> <p>The author notes that the field study simulated a severe, worst-case spill of unweathered Prudoe Bay crude oil in nearshore, shallow waters of a slowly flushed, semi-enclosed bay. Total hydrocarbon exposures at the coral sites were between 475-755ppm-hours, significantly higher than those expected from predictive modelling.</p> <p>Direct inter-tidal coral physical oiling impacts are described in Table 8.26.</p>	<p>Predictive modelling identified that the use of dispersant in a Beehive LoWC incident would have the following exposures on sub-tidal coral reef system locations identified in the EMBA (see Table 8.26):</p> <ul style="list-style-type: none"> - JBG AMP (Untreated - Dissolved: High, probability up to 89%; Entrained – High, probability up to 100%. With Dispersant Use – Dissolved: High, probability up to 92%; Entrained – High, probability up to 99%); - Ashmore Reef AMP (Untreated - Dissolved: Low, probability up to 5%; Entrained – High, probability up to 3%. With Dispersant Use – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 3%); - Cartier Island AMP (Untreated - Dissolved: Low, probability up to 4%; Entrained – High, probability up to 15%. With Dispersant Use – Dissolved: Low, probability up to 3%; Entrained – High, probability up to 15%); - Mermaid Reef AMP (Untreated - Dissolved: Moderate, probability up to 2%; Entrained – Low, probability up to 7%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – Low, probability up to 6%); - Browse Island (Untreated - Dissolved: High, probability up to 1%; Entrained – High, probability up to 46%. With Dispersant Use – Dissolved: Moderate, probability up to 7%; Entrained – High, probability up to 46%); - Heywood Shoal (Untreated - Dissolved: Moderate, probability up to 4%; Entrained – High, probability up to 21%. With Dispersant Use – Dissolved: Moderate, probability up to 5%; Entrained – High, probability up to 19%); - Mermaid Reef (Untreated - Dissolved: Moderate, probability up to 2%; Entrained – Low, probability up to 6%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – Low, probability up to 5%); - Vulcan Shoal (Untreated - Dissolved: Moderate, probability up to 3%; Entrained – Low, probability up to 13%. With Dispersant Use – Dissolved: Moderate, probability up to 4%; Entrained – Low, probability up to 12%); - Scott Reef (North & South) (Untreated – Dissolved: Moderate, probability up to 1%; Entrained – High, probability up to 3%. With Dispersant Use –

General impacts and risks	Beehive-1 specific impacts and risks
	<p>Dissolved: Moderate, probability up to 1%; Entrained – High, probability up to 3%);</p> <ul style="list-style-type: none"> - Seringapatam Reef (Untreated - Dissolved: Moderate probability up to 2%; Entrained – High, probability up to 3%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – High, probability up to 3%); - Emu Reef (NT) (Untreated - Dissolved: High, probability up to 35%; Entrained – High, probability up to 81%. With Dispersant Use – Dissolved: High, probability up to 38%; Entrained – High, probability up to 82%); and - King Shoals (WA) (Untreated – Dissolved: High, probability up to 92%; Entrained – High, probability up to 83%. With Dispersant Use – Dissolved: High, probability up to 91%; Entrained – High, probability up to 84%). <p>Exposure comparisons between unmitigated and mitigated results indicates that exposure levels to both dissolved and entrained hydrocarbons at these location with only marginal changes to the likelihood of exposure. Using the impacts observed by Ballou et al (1987) for dispersed oil impacts to coral on a conservative basis (i.e., lower exposures), the consequence of dispersant use is over these subtidal coral systems is assessed as <i>moderate</i>. For emergent reef systems, dispersant use and the reduction of surface oiling is assessed as <i>beneficial</i>.</p>
Mangroves (described in Appendix 11, Section 5.2.4)	
<p>Field experiments undertaken to assess the effects of dispersants, untreated crude and chemically dispersed oil on mangroves identified that (Ballou <i>et al.</i>, 1987):</p> <ul style="list-style-type: none"> - Areas of mangroves exposed to untreated crude showed visual contamination of roots immediately post spill and seen and black globules of oil were released from sediments during the remainder of the study (20 months). The effects on adult and juvenile mangroves were severe with mortality and defoliation evident 4 months after site treatment. Partial defoliation of living trees was evident throughout the site averaging 45%. Trees located on the outer fringe next to the water showed no observable effects possibly because they were rooted in sediments that were always under water thereby reducing exposure to oil. Tree snails at the site reduced by 50% following site treatment and remained at these levels for one year after exposure. No mortality in mangrove 	<p>Significant areas of mangrove lie along the JBG coastline. The nearest mangrove forests with the highest probability of moderate to high shoreline exposures are at Quoin Island (138 km southeast), Clump Island (141 km southeast) and the southern coastline of Dorcherty Island (97 km east). Modelling predicts with dispersant application, volumes of oil stranded along JBG shorelines is reduced. Predicted impacts at these representative locations at ecological levels are:</p> <ul style="list-style-type: none"> - Quoin Island: Up to 49% probability of impact and 59.1 m³ of oil (peak) without dispersant. With dispersant application – up to 41% probability of impact and 40.5 m³ stranded oil (peak). In-water dissolved phase hydrocarbon remains at high exposure levels with a probability of up to 16% of impact without dispersant and 16% impact with dispersant. In-water entrained phase hydrocarbon remains at high exposure levels with a

General impacts and risks	Beehive-1 specific impacts and risks
<p>oysters was observed despite the uptake of high levels of hydrocarbons. Tissue levels decreased to low levels after one year.</p> <ul style="list-style-type: none"> - Areas exposed to dispersed oil exhibited a light coating of sheen on exposed sediments and prop roots but after 4 months it was difficult to detect the area had been oiled. There was no measurable impact on adult mangrove trees, however short-term survival and growth of juvenile mangroves were reduced compared with pre-spill levels. Tree snails at the site reduced by 50% following site treatment and recovery to pre-treatment levels occurred after one year. No mortality in mangrove oysters was observed. Tissue levels were high 3 days post-spill and declined over 12 months to very low levels. <p>Note in this field study dispersants were applied in nearshore waters and the author notes that the field study simulated a severe, worst-case spill of unweathered Prudoe Bay crude oil in nearshore waters of a slowly flushed, semi-enclosed bay.</p>	<p>probability of up to 70% of impact without dispersant and 71% impact with dispersant</p> <ul style="list-style-type: none"> - Clump Island: Up to 42% probability of impact and 20.6m³ of oil (peak) without dispersant. With dispersant application – up to 30% probability of impact and 20.9m³ stranded oil (peak). In-water dissolved phase hydrocarbon remains at high exposure levels with a probability of up to 18% of impact without dispersant and 18% impact with dispersant. In-water entrained phase hydrocarbon remains at high exposure levels with a probability of up to 70% of impact without dispersant and 70% impact with dispersant - Dorcherty Island: Up to 54% probability of impact and 134.8 m³ of oil (peak) without dispersant. With dispersant application – up to 39% probability of impact and 90.2 m³ stranded oil (peak). In-water dissolved phase hydrocarbon remains at high exposure levels with a probability of up to 30% of impact without dispersant and 33% impact with dispersant. In-water entrained phase hydrocarbon remains at high exposure levels with a probability of up to 79% of impact without dispersant and 80% impact with dispersant <p>Mangrove areas therefore benefit from dispersant application by reducing the amount of shoreline oiling above ecological levels and not significantly increasing the in-water hydrocarbon exposure levels or probability of exposure. As per Ballou et al (1987), chemically treated oil in-water concentrations may have short-term impacts to juvenile mangroves, with no measurable impact to adult mangroves.</p> <p>Overall, the consequence of dispersant application to mangroves is assessed as moderate.</p>

General impacts and risks	Beehive-1 specific impacts and risks
Aboriginal cultural heritage, sensitivities and values (described in Appendix 11, Section 5.5.1)	
<p>There are 280 registered Aboriginal sites that fall within the spill EMBA. The majority of registered sites are located along the coastline between Derby-West Kimberley, Mitchell River, Wyndham-East Kimberley shoreline sectors.</p>	<p>Modelling predicts that moderate-high levels of both dissolved and entrained hydrocarbons will intersect NT and/or WA coastlines during a Beehive LoWC incident. As per previous assessments into habitats and species with respect to impacts associated with dispersant use, the OSTM has identified that in-water concentrations of hydrocarbons with dispersant use are not significantly different to in-water concentrations for unmitigated spill response and at most localised impacts may be realised (e.g., corals, birds, etc.)</p> <p>Dispersant use does have beneficial attributes in that the volume of oil ashore is reduced, thereby providing benefit to the shoreline Aboriginal sites. Visual impacts to seascapes are also reduced.</p> <p>From a cultural and sea scape values perspective, dispersant application is considered beneficial.</p>
Native Title (described in Appendix 11, Section 5.5.3)	
<p>Most Native Title determination areas within the spill EMBA occurs along shorelines, with some determinations (Bindunbur, Bardi and Jarwi, Mayala People, Warrwa Mawadjala Gadjidgar, Dambimangari, Uunguu Part A, Balangarra, Larrakia and Croker Island) extending into coastal waters.</p>	<p>The use of dispersants will not affect the status of Native Title in nearshore waters, though it may temporarily affect the use and values of these waters (see row above).</p> <p>The likelihood of contact with the Native Title determinations along the coast of the spill EMBA is detailed in Table 5.17 of Appendix 11 of the EP, with associated mapping presented in Figure 5.59 of Appendix 11. The consequence of dispersant application to Native Title is assessed as minor.</p>
Commercial fisheries (described in Appendix 11, Section 5.6.1)	
<p>The NPF and North West Slope Trawl Fishery (in the Commonwealth sector) and the MMF, Northern Demersal Scale Managed Fishery, Kimberley Crab Managed Fishery, Kimberley Prawn Managed Fishery and the Kimberley Gillnet and Barramundi Fisheries (in the WA sector), are the key commercial fisheries in the spill EMBA.</p> <p>Effect pathways to benthic invertebrates (such as prawns and crabs) and finfish (such as snapper and barramundi) are predicted as described in earlier sections of this table.</p>	<p>The OSTM predicts no exposure to entrained or dissolved oil at concentrations that may cause harm at the seabed.</p> <p>Species such as prawns, targeted by the NPF, North West Slope Trawl Fishery and Kimberley Prawn Managed Fishery, are present through the spill EMBA at all times of the year. As such, dispersant application will result in localised areas of high to moderate dissolved and entrained hydrocarbons and dispersants if dispersant application takes place. Prawns move up and down the water column between day and night (diurnal movements), and as such, will spend at least half of each day in demersal waters, where concentrations of dispersed oil will be</p>

General impacts and risks	Beehive-1 specific impacts and risks
<p>No areas of commercial crabbing, scallop and rock lobster harvesting, or commercial invertebrate stocks are predicted to be affected by moderate–high concentrations of entrained or dissolved hydrocarbons or to increased oiled particle sedimentation.</p>	<p>lower than pelagic and near-surface waters. The application of dispersants offshore is predicted to reduce the exposure of breeding and juvenile prawns in inshore areas to floating oil.</p> <p>The overall consequences to commercially important fisheries species are predicted to be short-term effects on local populations and are assessed as moderate.</p>
Recreational fishing (described in Appendix 11, Section 5.6.2)	
<p>As per ‘fish’ earlier in this table.</p>	<p>Areas of high productivity that attract aggregations of fish that are predicted to be impacted by entrained or dissolved hydrocarbons as follows, and are known or likely to be recreational fishing areas, are listed below:</p> <ul style="list-style-type: none"> - Ashmore Reef AMP (Untreated – Dissolved: Low, probability up to 5%; Entrained – High, probability up to 3%. With Dispersant Use – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 3%); - Cartier Island AMP (Untreated – Dissolved: Low, probability up to 4%; Entrained – High, probability up to 15%. With Dispersant Use – Dissolved: Low, probability up to 3%; Entrained – High, probability up to 15%); - Mermaid Reef AMP (Untreated – Dissolved: Moderate, probability up to 2%; Entrained – Low, probability up to 7%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – Low, probability up to 6%); - JBG AMP (Untreated – Dissolved: High, probability up to 89%; Entrained – High, probability up to 100%. With Dispersant Use – Dissolved: High, probability up to 92%; Entrained – High, probability up to 99%); - Kimberley AMP (Untreated – Dissolved: High, probability up to 24%; Entrained – High, probability up to 88%. With Dispersant Use – Dissolved: High, probability up to 22%; Entrained – High, probability up to 88%); - Oceanic Shoals AMP (Untreated – Dissolved: High, probability up to 2%; Entrained – High, probability up to 49%. With Dispersant Use – Dissolved: High, probability up to 2%; Entrained – High, probability up to 50%); <p>While the OSTM predicts that some AMPs may be affected by moderate to high levels of hydrocarbon exposure, increases in exposure levels and the associated probability of exposure do not vary significantly between the unmitigated and</p>

General impacts and risks	Beehive-1 specific impacts and risks
	<p>mitigated spills (i.e., dispersant used). On this basis, given the mobility of fish in open waters, that fish can metabolise PAHs and the limited exposures predicted, only a small increase in impact to pelagic fish could be expected due to dispersant use. The consequence is assigned as minor.</p> <p>Shallow inshore species are likely to be a greater target of recreational fishing than the offshore locations listed above. Given that dispersants will be applied close to the well site and not within WA/NT waters, AMPs or marine parks, the consequences to shallow water fish species will be limited to affected water inflows. The OSTM predicts the following in-water hydrocarbon water concentrations for inshore areas:</p> <ul style="list-style-type: none"> - Emu Reef (NT) (Untreated – Dissolved: High, probability up to 35%; Entrained – High, probability up to 81%. With Dispersant Use – Dissolved: High, probability up to 38%; Entrained – High, probability up to 82%); - King Shoals (WA) (Untreated – Dissolved: High, probability up to 92%; Entrained – High, probability up to 83%. With Dispersant Use – Dissolved: High, probability up to 91%; Entrained – High, probability up to 84%); - North Kimberley MP (Untreated – Dissolved: High, probability up to 88%; Entrained – High, probability up to 97%. With Dispersant Use – Dissolved: High, probability up to 90%; Entrained – High, probability up to 97%); <p>Shallow inshore species are less likely to be able to move away from in-water hydrocarbons and may be exposed for longer periods. As fish are most vulnerable to hydrocarbons during their embryonic, larval and juvenile life stages, nursery areas are more likely to suffer developmental effects, morbidity or mortality at lower concentrations.</p> <p>For shallow water areas, the use of dispersant does not significantly change exposure levels or probabilities of exposure between dispersed and non-dispersed scenarios. As per offshore areas, the consequence to inshore fish (and therefore recreational fishing) as a result of using dispersant is assessed as minor, given the predicted impacts associated with the unmitigated spill and the localised nature of the potential impact.</p>

General impacts and risks	Beehive-1 specific impacts and risks
Traditional fishing (described in Appendix 11, Section 5.6.3)	
<p>As per 'benthic invertebrates', 'fish' and 'marine reptiles' earlier in this table. Section 5.6.2 of Appendix 11 of the EP provides information about recreational fishing in the spill EMBA, noting that very little information is available.</p>	<p>Given the sparse nature of settlements along the majority of the coastline of the spill EMBA, recreational fishing is concentrated in the Darwin region. The risk of nearshore floating oil and in-water concentrations in the Darwin region is 1% (at the low threshold only and summer only). At the low threshold, there are no ecological impacts, so risks of toxicity (or tainting) to any fish caught by recreational fishers in this region will be low.</p> <p>Elsewhere, traditional Indonesian fishing at Seringapatam Reef may be impacted, as outlined below:</p> <ul style="list-style-type: none"> - Seringapatam/Scott reef complex KEF (Untreated – Dissolved: Moderate, probability up to 2%; Entrained – High, probability up to 8%. With Dispersant Use – Dissolved: Moderate, probability up to 1%; Entrained – High, probability up to 8%). <p>The consequence to traditional fishing as a result of using dispersant is assessed as minor, given the predicted impacts associated with the unmitigated spill and the localised nature of the potential impact.</p>

9.3.7. Impact and Risk Assessment

Table 9.9 provides the impact and risk assessment for dispersant application.

Table 9.9. Impact and risk assessment for dispersant application

Summary			
Summary of risks	Disturbance to marine fauna from increased vessel and aerial activity. Potential toxicity effects to marine biota.		
Extent of risk	For potential toxicity impacts, the extent of consequence will be as widespread as the area of application (widespread).		
Duration of risk	May continue for a period (weeks to months) after the application of dispersant.		
Level of certainty of risk	HIGH – The impacts associated with vessel and aircraft disturbance are well understood, and controls are documented in legislation. MEDIUM – Some uncertainty associated with the use of dispersants.		
Risk decision framework context	Decision type	B – good industry practice required with engineering risk-based tools applied.	
	Activity	New to the geographical area, infrequent or non-standard activity, good practice not well defined or met by more than one option.	
	Risk & uncertainty	Amenable to assessment using well-established data and methods, some uncertainty.	
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.	
Defined acceptable level	The net environmental benefit of the dispersant application response strategy must be greater than no response (i.e., “do nothing”).		
Risk Assessment (inherent)			
Hazard	Likelihood	Consequence	Risk rating
Plankton (increased toxicity)	Occasional	Minor	Low
Benthic invertebrates (increased toxicity)	Occasional	Moderate	Medium
Fish (increased toxicity)	Occasional	Minor	Low
Sub-tidal seagrass (increased toxicity)	Occasional	Moderate	Medium
Inter-tidal seagrass (oiling)	Likely	Beneficial	Beneficial
Seabirds/shorebirds (increased toxicity)	Occasional	Moderate	Medium
Marine turtles (increased toxicity)	Occasional	Minor	Low
Marine mammals (increased toxicity)	Occasional	Minor	Low
Sub-tidal corals (increased toxicity)	Occasional	Moderate	Medium
Inter-tidal corals (oiling)	Likely	Beneficial	Beneficial
Mangroves (increased toxicity)	Occasional	Moderate	Medium
Aboriginal cultural heritage/values	Likely	Beneficial	Beneficial

Commercial fisheries (increased toxicity)	Occasional	Moderate	Low
Recreational fisheries (increased toxicity)	Occasional	Moderate	Low
Traditional fisheries (increased toxicity)	Occasional	Moderate	Low
Fauna injury (dispersant application)	Occasional	Moderate	Medium
Assessment of Proposed Control Measures			
The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic NEBA, which is presented in Appendix B of the OPEP.			
The controls for each response strategy was assessed to ALARP in Appendix B of the OPEP. EPOs, EPSs and measurement criteria for response strategy preparedness are also presented in Appendix B of the OPEP.			
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Preparedness – all preparedness EPS are presented in Appendix B of the OPEP.			
Response			
Dispersant application is undertaken to reduce the probability or severity of contact with shoreline protection priorities.	(RSK-11:EPS-01) Only dispersants listed on the OSCA register (including transitional dispersants) are applied to a Beehive-1 LoWC oil spill.	Daily reports listing dispersants used verify they are OSCA registered or transition dispersants.	
	(RSK-11:EPS-02) EOG shall initiate surface dispersant mobilisation following a LoWC within 2 hours of forming the DIMT.	Incident logs verify dispersant mobilisation was undertaken within 2 hours of the DIMT formation.	
	(RSK-11:EPS-03) An in-situ dispersant efficacy test is undertaken, and dispersant is only applied if the test is deemed successful.	Incident logs.	
	(RSK-11:EPS-04) Dispersant is applied only during daylight hours (in order to determine dispersion effectiveness).	Incident logs verify daytime only dispersant application was undertaken.	
	(RSK-11:EPS-05) Dispersant is only applied to dispersible oil (i.e., oil that has not emulsified), with the window of opportunity for dispersant application to be determined based on field testing.	Incident logs verify that dispersant application takes place only on dispersible oil.	
	(RSK-11:EPS-06) Dispersant is not applied within the: - JBG AMP or within 10 km of park boundaries (unless permission from the DNP has been sought and granted); or - North Kimberley Marine Park or within 10 km of park boundaries (unless permission from the NT DPWC has been sought and granted); - Within 1 km of the well site;	Incident logs verify no dispersant is applied within these areas.	

	<ul style="list-style-type: none"> - In waters less than 20 m deep; or - In WA or NT coastal waters (unless permission from WA/NT agencies has been sought and granted). 	
Dispersant application is monitored to ensure it is effective	<p>(RSK-11:EPS-07) Operational monitoring is undertaken for the duration of dispersant application to verify the effectiveness of dispersant use:</p> <ul style="list-style-type: none"> • Initial field effectiveness testing (Nat-DET) prior to dispersant application to determine hydrocarbon amenability to dispersant. • Test spray prior to broadscale application. • Visual assessment of dispersant operations by aerial observer in air attack aircraft. • Dispersant effectiveness via in-water testing (OSMP). • Volumes of dispersants applied will be visually assessed and recorded to determine that correct dosage rates have been applied. Dosage rates adjusted as needed. • OSTM daily reflecting dispersant application to identify potential impacts (OSMP). • OSTM on 3 day forecast model basis to assess and monitor for impacts and inform the IMT on the ongoing suitability of the response option (OSMP). 	Incident logs verify that monitoring is undertaken in accordance with operational monitoring requirements within the OSMP.
	(RSK-11:EPS-08) Dispersant application is applied where effectiveness has been demonstrated via field test, test spray and NEBA.	Record of dispersant testing prior to dispersant application
	(RSK-11:EPS-09) EOG shall terminate dispersant application where efficacy test results indicate dispersant is not effective, or at the direction of Control Agency.	Sign-off reports verify that dispersant is no longer effective.
The dispersant is sprayed over the thickest areas of slick and not over wildlife	(RSK-11:EPS-10) FWADC is guided by aircraft with an onboard Air Attack Supervisor (to advise aircraft when the aircraft is on target to release dispersant) and trained aerial observer (to identify suitable slick thickness).	Incident log verifies the location and effectiveness of dispersant application by air attack supervisor
	(RSK-11:EPS-11) Visual observation is undertaken in accordance with OSMP (Marine Megafauna and Birds) and	Observer logs record marine fauna sightings during dispersant application and verifies fauna

	operations are directed such that wildlife is not sprayed.	were not exposed to dispersant application.	
	(RSK-11:EPS-12) Sightings of EPBC-listed megafauna in the vicinity of dispersant application operations will trigger cessation of response until the animal has moved and not been sighted for 30 minutes.	Observer logs record marine fauna sightings and cessation of spraying.	
Dispersant operations are risk assessed and controls adopted to prevent personnel exposure to dispersants	(RSK-11:EPS-13) A risk assessment is undertaken to identify controls to prevent human exposure to dispersant. Measures to be adopted include: <ul style="list-style-type: none">All marine vessels are located upwind during dispersant application.Minimum buffer maintained between application sites and personnel areas (1 km vessel, 2 km aerial) (OSRL, 2011).Exclusion of commercial fishing via AMSA RCC warnings and AHO Notice to Mariners.Non-essential personnel inside accommodation with doors and windows secured during spraying operations.	Dispersant application records verify that location of dispersant application meets proximity distances to fixed and floating assets. AMSA RCC Auscoast warning. AHO Notice to Mariners issued.	
Relevant persons are advised of pending dispersant application to allay concerns.	(RSK-11:EPS-14) EOG prepares a communications strategy for potentially affected relevant persons to advise on the background to the decision to use dispersants, OHS factors that need to be considered and operational exclusion requirements.	Records of communication regarding dispersant use are consistent with the communications strategy.	
Aircraft maintain appropriate buffer distances from cetaceans and seabirds to prevent behavioural impacts	(RSK-11:EPS-15) Excepting for dispersant application activities, pilots to remain at a height of 300 m (fixed wing) above cetaceans in accordance with EPBC Regulations 2000 (Part 8).	Incident logs verify no breach of buffer distance during non-dispersant application activities.	
Risk Assessment (residual)			
Hazard	Likelihood	Consequence	Risk rating
Plankton (increased toxicity)	Rare	Minor	Negligible
Benthic invertebrates (increased toxicity)	Rare	Moderate	Low
Fish (increased toxicity)	Rare	Minor	Negligible
Sub-tidal seagrass (increased toxicity)	Rare	Moderate	Low
Inter-tidal seagrass (oiling)	Likely	Beneficial	Beneficial
Seabirds/shorebirds (increased toxicity)	Rare	Moderate	Low
Marine turtles (increased toxicity)	Rare	Minor	Negligible

Marine mammals (increased toxicity)	Rare	Minor	Negligible
Sub-tidal corals (increased toxicity)	Rare	Moderate	Low
Inter-tidal corals (oiling)	Likely	Beneficial	Beneficial
Mangroves (increased toxicity)	Rare	Moderate	Low
Aboriginal cultural heritage/values	Likely	Beneficial	Beneficial
Commercial fisheries (increased toxicity)	Remote	Moderate	Low
Recreational fisheries (increased toxicity)	Remote	Moderate	Low
Traditional fisheries (increased toxicity)	Remote	Moderate	Low
Fauna injury (dispersant application)	Rare	Moderate	Low
<p>The risk of spill response activities to the identified receptors is assessed as negligible to low because:</p> <ul style="list-style-type: none"> The control measures adopted are effective in reducing the risk to ALARP. 			
Demonstration of ALARP			
A detailed demonstration of ALARP is presented in Appendix B of the OPEP. This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.			
Demonstration of Acceptability			
Policy compliance	EOG's Safety and Environmental Policy objectives are met.		
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.		
External context	There have been no concerns raised from relevant persons regarding spill response activities.		
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> <i>OPGGs Act 2006 (Cth)</i> and <i>OPGGs(E)</i>: <ul style="list-style-type: none"> Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts. Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP). <i>EPBC Regulations 2000 (Cth)</i>: <ul style="list-style-type: none"> Part 8 (Interacting with cetaceans and whale watching). <i>Pollution of Waters by Oil and Noxious Substances Act 1987 (WA)</i>. <i>Marine Pollution Act 1999 (NT)</i>. <i>Waste Management & Pollution Control Act 1998 (NT)</i>. 		
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.		
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-11: all EPS). 	
	Best Available Techniques Guidance Document on Upstream Hydrocarbon	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.	

	Exploration and Production (European Commission, 2019)	
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-11: all EPS).
	AEP CoEP (APPEA 2008)	<p>The EPS meet the following offshore development and production objectives:</p> <ul style="list-style-type: none"> To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill-specific guidelines	
	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are deployed. The EPS complement the NatPlan.
	AMOSPlan (2017)	AMOSC (on behalf of EOG) will implement this plan in the event their resources are required. The EPS complement AMOSPlan.
	WA Oil Spill Contingency Plan (2015)	DoT will implement this plan in the event their resources are deployed. The EPS complement the WA Oil Spill Contingency Plan.
	NT Oil Spill Contingency Plan (2014)	The NT IC will implement this plan in the event their resources are deployed. The EPS complement the NT Oil Spill Contingency Plan.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	Dispersant application	Oil spill response: Should you spray dispersant (IPIECA/IOGP, 2022).

Environmental context		Dispersants: surface application. Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015a).
		Dispersant logistics and supply planning (IPIECA, OGP, 2013a).
	MNES	
	AMPs	Oil causing marine pollution are a threat identified in the North Marine Parks Network Management Plan 2018. Dispersant application will not be undertaken in AMPs and a buffer of 10km is in place to limit impacts to these sensitive areas. Associated vessel or aircraft-based monitoring activities (with controls) will have no significant impacts on the AMP.
	Ramsar wetlands	Dispersant application will not be undertaken near or in Ramsar wetlands.
	TECs	Dispersant application activities will not be undertaken in areas where TECs exist.
	NIWs	Dispersant application will not be undertaken in or near NIWs.
	Nationally threatened and migratory species	Some threatened and migratory species have the potential to be present in the dispersant application area, however only individuals may be at risk and with controls implemented, the risk is low and no impacts on threatened and migratory species at a population level is predicted.
	Other matters	
	State marine parks	The North Kimberley Marine Park Management Plan has the strategic <i>objective to protect and conserve biodiversity and ecological health</i> . Dispersant application supports this objective and does not conflict with the management objectives for the park in terms of cultural; natural; recreation, tourism and community; or commercial values detailed in the Management Plan. Dispersant application will assist in preserving the objectives detailed in the management plan. Dispersant application will not be undertaken in WA or NT waters by EOG unless under the direction of the WA or NT Control Agency after a NEBA assessment. Protection of the sensitive resources within these protected areas will be a key consideration in the NEBA such that there are no significant impacts on WA and/or NT marine parks or the management objectives of the parks' management plans.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	Marine (oil) pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to</i>

		<p><i>recover habitats (e.g., nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from habitat identified as critical to their survival.</i></p> <p>Dispersant application activities supplement other oil spill response strategies (which prevent impacts to critical habitats) and dispersant application (no-go) zones protect critical inter-nesting areas. Dispersant application operations support identified priority actions within this management plan.</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific actions to address this.</p> <p>The Wildlife Conservation Plan for Seabirds (CoA, 2020) identifies oil pollution as a threat to seabirds although no specific actions are defined to manage the threat.</p> <p>Dispersant application activities will assist in the removal of oil from the environment, thereby reducing the threat in support of the plan.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	<p>EOG considers the risk associated with dispersant application activities to be acceptable because:</p> <ul style="list-style-type: none">• It will adhere to the company’s Environment Policy.• The residual risk ratings are low-negligible.• An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons and stakeholders has been considered and incorporated into the design of the activity.• The activity complies with relevant legislation and industry best practice.• Dispersant application will not have long-term or significant impacts on MNES.• Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species.• Spill response activities are not inconsistent with the aims of relevant marine reserve management plans.• Spill response activities are not inconsistent with ESD principles.

9.4. Containment and Recovery

9.4.1 Background Information

Containment and recovery (CAR) typically involves the physical containment and mechanical removal of hydrocarbons via skimming operations from the marine environment. The objective of this response option is to remove free oil from the sea surface to minimise damage to fauna intersecting the sea surface and shoreline residue accumulation on adjacent shorelines.

CAR operations involve the deployment of booms and oil skimmers from vessels to collect oily water and transfer, store and dispose of oil and oily water recovered during operations. Typically, the oil/water mix is stored temporarily in support vessel tanks on the decks of vessels or in the internal storage tanks of vessels. To increase the endurance of CAR vessels, recovered seawater, collected with the oil, can be decanted back to sea, after sufficient separation time, to free up vessel storage and enable greater volumes of oil to be recovered without making the trip back to port (increasing the effectiveness of CAR). The decanting operation will occur in Commonwealth waters under approval by AMSA.

In offshore CAR operations, as opposed to nearshore protection booming (see Section 9.5), CAR typically recovers a low proportion of the original oil volume released (~10-15%) (ITOPF, 2022) largely due to limiting weather conditions (wind and wave height) for boom deployment.

Boom failures can occur when wind conditions > 20 knots and waves are > 1m (OSRL, 2017). Wind conditions in the JBG rarely exceed 20 knots (see Section 5.2.1) and wave heights are below 1 m for most of the year (see Section 5.2.2).

9.4.2 Scope of Activity

CAR operations typically involve the following:

- Strike teams each consisting of two vessels, booming and skimmers recovering oil/water to the vessel for storage/separation;
- Possible secondary vessel (spot hire tanker or barge) to collect oil residues and increase endurance of strike team vessels; and
- Aerial support to direct and coordinate strike teams to areas of suitable oil thickness away from any dispersant application. To maximise field presence and waste recovery of these vessels, an application to decant (discharge water collected through skimming operations to the marine environment) will be made to AMSA.

9.4.3 Hazards

CAR operations create the following hazards:

- The use of additional vessels increases the risk of interactions/strikes to megafauna, vessel collisions and routine discharges;
- Additional noise and air emissions from the use of aircraft;
- Waste handling hazards such as the accidental loss of oily wastes to the marine environment; and
- Contamination of surface waters due to the decanting of treated sea water.

9.4.4 Known and Potential Impacts and Risks

The potential environmental risks associated with CAR operations are:

- Planned noise, air and light emissions from aircraft;
- Planned liquid and solid discharges from vessels (as per Chapters 7 and 8).
- Unplanned events from vessels as per Chapter 8, noting that due to their slow speeds, the vessels used in CAR operations have a very low probability of collision;
- Interactions/strikes to marine fauna (as per Section 8.2);
- Interference with coral spawning slicks; and
- Loss of waste during generation, handling, transport or decanting treated seawater, noting that due to their slow speeds, the vessels used in CAR operations have a very low probability of collision (refer below).

9.4.5 Evaluation of Impacts and Risks

Waste Generation, Transport and Disposal

The following waste streams are expected during CAR activities and will require management and disposal else secondary contamination and effects on wildlife (ingestion, contact) may result:

- Recovered contaminated liquids (oil/water mixture);
- Semi-solids/solids (e.g., oily solids and contaminated boom); and
- Debris (e.g., seagrass/seaweed wrack, sand, wood, plastics).

All waste generated will be managed in accordance with AMSA approval requirements (treated seawater) and relevant WA and NT government agencies coordinating any nearshore response efforts (see Waste Management in Section 9.8 for risk assessment and controls).

Based upon vessel specifications for strike teams, the largest volume of oily water that could be spilled is 500 m³ (combination of seawater and crude oil). The biological consequences of spilling this volume of weathered oil on open water sensitive receptors in an area impacted by a Level 3 oil spill is likely to be similar in magnitude to those associated with the unplanned release of hydrocarbons as a result of an MDO release (refer Section 8.6). In such a scenario, there would be localised consequences to marine megafauna (if present), plankton and fish populations (surface and water column) within the spill affected area.

Increased risk of Interaction/Collision with Marine Fauna

Typical booms used in CAR operations are designed to sit on the water surface, which allows fauna capable of diving (turtles, cetaceans) to avoid contact. Impacts to species that inhabit the water column, such as sharks and fish, are not expected. Additionally, fauna such as cetaceans are likely to detect and avoid the activity area.

Vessels involved in CAR operations will be moving slowly and present little risk to marine megafauna in the area with possibly only several individuals at risk. In addition, the noise of vessel motors may have a positive effect of scaring marine fauna away from the immediate area with consequent reduced exposure to the thickest patches of oil. The presence of extra vessels and booms may lead to effects

at an individual, most likely limited to behavioural effects with a very limited, short-term impact on fauna in any particular area (minor consequence).

Interference with Coral Spawning Slicks

Coral spawning occurs primarily during March-April within the Kimberley region and to a lesser extent in September-October (Cook *et al.*, 2017). Coral spawning slicks can often be confused for oil spill slicks and CAR operations may target these slicks instead of oil. This may lead to minor impacts to coral reproductive success (if CAR occurs during spawning period), given the small area of CAR operations relative to the large spawning area for coral. Inappropriate targeting also results in inefficiency in CAR oil recovery operations.

9.4.6 Impact and Risk Assessment

Table 9.10 presents the impact and risk assessment for CAR operations.

Table 9.10. Impact and risk assessment for CAR operations

Summary			
Summary of risks	Disturbance to marine and nearshore fauna from increased vessel and aerial activity. Waste handling incidents during collection, storage, transfer, or decanting activities.		
Extent of risk	Localised (immediately around vessel or aircraft).		
Duration of risk	Medium- to long-term (depending on spill volume, trajectory and shorelines affected).		
Level of certainty of risk	HIGH – The impacts associated with vessel operations and noise disturbance to fauna from vessels and helicopters are well understood, and controls are documented in legislation.		
Risk decision framework context	Decision type	B – good industry practice required with engineering risk-based tools applied.	
	Activity	New to the organisation or geographical area, infrequent or non-standard activity, good practice is well defined.	
	Risk & uncertainty	Amenable to assessment using well-established data and methods, some uncertainty.	
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.	
Defined acceptable level	The net environmental benefit of a CAR response strategy must be greater than no response.		
Risk Assessment (inherent)			
Hazard	Likelihood	Consequence	Risk rating
Fauna disturbance	Rare	Minor	Negligible
Oily waste spills	Occasional	Moderate	Medium
Interference with coral spawn slicks	Occasional	Minor	Low

Assessment of Proposed Control Measures		
<p>The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic NEBA, which is presented in Appendix B of the OPEP.</p> <p>The controls for each response strategy was assessed to ALARP in Appendix B of the OPEP. EPOs, EPSs and measurement criteria for response strategy preparedness are also presented in Appendix B of the OPEP.</p>		
Environmental Controls and Performance Measurement		
EPO	EPS	Measurement criteria
<i>Preparedness – all preparedness EPS are presented in Appendix B of the OPEP.</i>		
<i>Response</i>		
CAR operations target oil slicks to maximise oil recovery.	(RSK-12:EPS-01) CAR operations are supported by trained aerial observers to position vessels in areas which contain oil in sufficient thicknesses for effective recovery.	Incident logs.
	(RSK-12:EPS-02) Oil volumes recovered are recorded.	Incident logs.
Waste decanting operations are undertaken in accordance with AMSA approval.	(RSK-12:EPS-03) Decanting in Commonwealth waters will only be undertaken following approval from AMSA.	Incident logs.
	(RSK-12:EPS-04) Treated water decanting operations adopt the following controls (per IPECA, 2013b): <ul style="list-style-type: none"> • Undertaken in daylight hours. • Skimmer vessels store water in pollutant free tanks. • Minimum settling time of 60 minutes adopted to allow for oil/water separation. • Treated water discharged into apex of containment boom to recover free oil. • Continuous visual monitoring to confirm no oil release. • Records of discharge are retained. 	Decanting records verify that all conditions were observed during decanting operations.
No spills overboard during oily waste transfer to dedicated waste storage vessel.	(RSK-12:EPS-05) A risk assessment of the transfer activity is undertaken prior to transfer and all identified controls implemented including, but not limited to: <ul style="list-style-type: none"> • Undertaken during daylight hours. • Continuous radio contact between vessels. • Continuous supervision by trained and competent crew. • Safe proximity distances established. • Weather boundaries of activity established. • Hoses and transfer equipment tested and fit-for purpose. • Available and tested vessel SMPEP. 	Risk assessment record verifies controls required for transfer.

Risk Assessment (residual)			
Hazard	Likelihood	Consequence	Risk rating
Fauna disturbance	Remote	Minor	Negligible
Oily waste spills	Rare	Moderate	Low
Interference with coral spawn slicks	Rare	Minor	Negligible
<p>The risk of spill response activities to the identified receptors is assessed as negligible to low because:</p> <ul style="list-style-type: none"> The control measures adopted are effective in reducing the risk to ALARP. 			
Demonstration of ALARP			
A detailed demonstration of ALARP is presented in Appendix B of the OPEP. This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.			
Demonstration of Acceptability			
Policy compliance	EOG's Safety and Environmental Policy objectives are met.		
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.		
External context	There have been no concerns raised from relevant persons regarding spill response activities.		
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> <i>OPGGs Act 2006</i> (Cth) and <i>OPGGs(E)</i>: <ul style="list-style-type: none"> Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts. Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP). <i>EPBC Regulations 2000</i> (Cth): <ul style="list-style-type: none"> Part 8 (Interacting with cetaceans and whale watching). <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i> (WA). <i>Marine Pollution Act 1999</i> (NT) <i>Waste Management & Pollution Control Act 1998</i> (NT). 		
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.		
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-12: all EPS). 	
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.	
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-12: all EPS). 	

	Development (World Bank Group, 2015)	
	AEP CoEP (APPEA 2008)	The EPS meet the following offshore development and production objectives: <ul style="list-style-type: none"> To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill-specific guidelines	
	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are deployed. The EPS complement the NatPlan.
	AMOSPlan (2017)	AMOS (on behalf of EOG) will implement this plan in the event their resources are required. The EPS complement AMOSPlan.
	WA Oil Spill Contingency Plan (2015)	DoT will implement this plan in the event their resources are deployed. The EPS compliment the WA Oil Spill Contingency Plan.
	NT Oil Spill Contingency Plan (2014)	The NT IC will implement this plan in the event their resources are deployed. The EPS compliment the NT Oil Spill Contingency Plan.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	Containment and recovery	The use of decanting during offshore oil spill recovery operations (IPIECA, OGP, 2013b).
		At-sea Containment & Recovery (IPIECA, 2016b).
		Characteristics of Response Strategies: A Guide for Spill Response Planning in Marine Environments (NOAA, 2001).
Environmental context	MNES	
	AMPs	Oil causing marine pollution are a threat identified in the North Marine Parks Network Management Plan 2018 (DNP, 2018).

		As this response removes oil from the environment, CAR operations minimise oil spill threats from AMP sensitivities. Vessel-based CAR activities, with all vessel-based controls implemented, will not have significant impacts on the AMP (and are designed to protect its values).
	Ramsar wetlands	CAR activities are not applicable to onshore Ramsar wetlands.
	TECs	CAR activities will not be undertaken in areas where TECs exist.
	NIWs	CAR activities will not be undertaken in NIWs.
	Nationally threatened and migratory species	Some threatened and migratory species have the potential to be present in areas of CAR operations, however impacts are predicted to affect individual animals only and not populations of threatened or migratory species.
	Other matters	
	State marine parks	<p>The North Kimberley Marine Park Management Plan has the strategic <i>objective to protect and conserve biodiversity and ecological health</i>. CAR activities support this objective and do not conflict with the management objectives for the park in terms of cultural; natural; recreation, tourism and community; or commercial values detailed in the Management Plan. CAR will assist in preserving the objectives detailed in the management plan.</p> <p>CAR operations may be undertaken in coastal marine parks at the direction of the relevant State/Territory Control Agencies, given that parks are predicted to have shoreline oil loading above ecological limits. Offshore CAR activities, with controls implemented, are not expected to have significant impacts on these marine parks or the management objectives of the parks' management plans.</p>
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Marine (oil) pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (e.g., nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from habitat identified as critical to their survival</i>. CAR activities supplement other oil spill response strategies (which prevent impacts to</p>

		<p>critical habitats). CAR supports identified priority actions within this management plan.</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific actions to address this.</p> <p>The Wildlife Conservation Plan for Seabirds (CoA, 2020) identifies oil pollution as a threat to seabirds although no specific actions are defined to manage the threat. CAR activities will assist in the removal of oil from the environment, thereby reducing the threat in support of the plan.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	<p>EOG considers the risk posed by CAR operations in the marine environment to be acceptable because:</p> <ul style="list-style-type: none">• It will adhere to the company’s Environment Policy.• The residual risk ratings of additional hazards identified in CAR operations are low-negligible and ALARP.• An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons and stakeholders has been considered.• Activity is compliant with relevant legislation and industry best practice.• Spill response activities will not have long-term or significant impacts on MNES.• Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species.• Spill response activities are not inconsistent with the aims of relevant marine reserve management plans.• Spill response activities are not inconsistent with ESD principles.

9.5. Shoreline Protection & Deflection

9.5.1 Background Information

Shoreline protection involves deploying boom to deflect and protect coastal environmental sensitivities from the impacts of oil. This response will be activated onshore and in nearshore waters

where surveillance and tracking activities identify that priority protection areas (e.g., turtle nesting beaches, bird rookeries) are at risk from oiling or at the direction of the relevant CA.

This response option includes techniques such as:

- Deflection booming (deployed to divert oil away from sensitive receptors to a suitable collection point on the shoreline or at sea for subsequent removal); and
- Protection/exclusion booming (deployed to contain oil away from environmental sensitivities such as turtle nesting beaches, estuary areas containing mangroves, shorebird nesting sites to completely seals off sensitive receptor from oil).

Various anchoring methods are required depending on the boom and its location. For example, when used on the shoreline itself, boom skirts are replaced with water-filled chambers designed to allow the boom to settle on an exposed shoreline at low tide.

It is unlikely that shoreline protection activities will be undertaken in Commonwealth waters. As such, the WA DoT as the Control Agency in WA and NT DEPWS as the Control Agency in the NT will direct response operations to protect shoreline sensitivities. For Commonwealth areas such as Ashmore Reef and Cartier Island, EOG will be the Control Agency in consultation with the DNP.

All aspects of shoreline protection operations will be conducted in accordance with the requirements of these Control Agencies after a shoreline assessment has been undertaken (see Section 9.6), NEBAs performed, IAPs developed and the permissions of relevant land managers obtained, with EOG supporting state/territory operations with resources as required.

Shoreline PPAs are those shorelines identified as being key coastal areas of importance in the spill EMBA (Table 9.11). Oil removal methods will be decided based on coastal access, nature of the weathered oil and sensitivity of the specific section of coastline. A summary of the minimum timeframes for a Level 3 LoWC where shoreline PPAs may be impacted by hydrocarbon residues (unmitigated) in excess of 10 g/m² (response time for surveys) and 100 g/m² (response time for equipment deployment) are provided in Table 9.11. This table also provides details on whether landside access to these locations is available.

EOG has prepared a series of maps illustrating the shoreline types (i.e., sandy beach, rocky shore, mangroves) within the parts of the spill EMBA predicted to have shoreline contact (Appendix 15). For the WA portion of the spill EMBA, the shoreline is mapped according to the fine-scale WAMOPRA DoT cells (which are also used in the OSTM report) so that in the event of a spill, EOG can communicate shoreline risks with the WA DoT by referencing their own data, which in turn can inform a better managed response. The locations noted in Table 9.11 are illustrated on the maps in Appendix 15. The exact geographic extent of each PPA is being determined by EOG in conjunction with OSRL. These are not yet finalised so are not marked as discreet areas within Appendix 15; this will be completed pre-drilling when the extents of the PPAs are finalised. These maps will assist in informing shoreline protection strategies in the event of a spill (e.g., deflecting spills from mangrove areas will be a higher priority than deflecting a spill from rocky shorelines).

Table 9.11. Minimum time to shore above 10 g/m² and 100 g/m² for priority protection areas (unmitigated)

Location	Habitat present	Sensitive fauna present	Landfall timeframe for 10 g/m ² (Days (d))	Landfall timeframe for 100 g/m ² (Days (d))	Landside access possible?

XXd – target days in which to deploy shoreline response

TRP pre-preparation

9.5.2 Scope of Activity

Shoreline protection may be applied to shoreline, shallow water habitats and estuarine environments in the path of the spill. Shoreline protection activities will be preceded by a Shoreline Clean-up and Assessment Technique (SCAT) survey to assess the local environmental sensitivities and the feasibility/location for boom installation and identify controls to prevent/limit impacts to identified sensitivities.

A summary of the expected types of booming to be employed in the event of a significant oil spill is provided in Table 9.12. The shoreline protection methods outlined are not suitable to the exposed rocky shorelines/cliffs within the spill EMBA as this shoreline type is self-cleaning due to wave action against the rocks. The methods provided in this table are limited to other shorelines such as sandy beaches, mangroves, wetlands and man-made structures (e.g., jetties and harbours).

Given the remoteness and inaccessibility of much of the coastline by land, shoreline protection and deflection is expected to be accessed either entirely or predominantly by marine-side resources (see Table 9.11).

Deployment of shoreline protection measures are limited to calm, low-energy environments (current, waves, winds) that allow booms to operate effectively. The techniques need to be adapted to local conditions and consider site constraints and metocean conditions at the time. Note that deployed booming requires ongoing supervision and maintenance (tidal changes require booming reconfiguration, oil recovery, etc).

Table 9.12. Potential shoreline protection measures

Technique	Description	Limitations	Possible environmental impacts
Nearshore			
Exclusion/containment	Boom is deployed across of around sensitive areas and anchored in place. Approaching oil is deflected or contained within boom	Cannot operate in: <ul style="list-style-type: none"> • Currents > 1 knot (varies according to boom angle) • Breaking waves >50 cm • Water depth >20 m 	Minor disturbance to seabed substrate or shoreline anchor points. Waste collection and disposal.
Redirection towards shoreline	Single or multiple booms are deployed from shoreline in path of approaching slick and anchored/held in place using a vessel suitable for the activity. Oil diverted to sacrificial shoreline for recovery.	Cannot operate in: <ul style="list-style-type: none"> • Currents >2 knots • Breaking waves >50 cm 	Minor disturbance to seabed/shoreline substrates due to anchoring. Sacrificial shoreline oiling & clean-up. Waste collection and disposal. Disturbance to beaches. Vessel environmental hazards.
Redirection away from shoreline	Single or multiple booms deployed from the shoreline at an angle away from the shore and anchored/held in place using a vessel suitable for the activity.	Cannot operate in: <ul style="list-style-type: none"> • Currents >2 knots • Breaking waves >50 cm 	Minor disturbance to seabed/shoreline substrates due to anchoring. Waste collection and disposal. Vessel environmental hazards.

	Oil deflected away from the shoreline for recovery.		
Onshore			
Inter-tidal/Shoreline Boom	Boom can be deployed across or along shore, on beach or in water to contain oil. Suitable where water levels fluctuate. Waterfilled chambers provide a seal as boom grounds. Can prevent remobilisation of stranded oil.	Cannot operate in: <ul style="list-style-type: none"> • Currents > 1 knot (varies on angle of boom) • Breaking waves >50 cm 	Minor disturbance to substrate at anchor points. Can cause heavy oiling if boom fails. Disturbance to beach and shoreline from vehicle and foot access. Waste collection and disposal.
Beach barriers, berms	Berm constructed along high water mark. Berm covered with plastic to minimise erosion, oil penetration or burial.	Cannot operate in: <ul style="list-style-type: none"> • Strong currents • Breaking waves >35 cm • Areas where turtle nesting or hatching is active 	Disturbs upper 50-60cm of foreshore zone. Disturbance to beaches from vehicle and foot access. Barrier to nesting turtles. Waste collection and disposal.

9.5.3 Hazards

Hazards associated with shoreline protection include:

- Additional vessel activity (including anchoring);
- Boom deployment and management (including human presence impacts); and
- Waste collection and disposal (see Section 9.8).

9.5.4 Known and Potential Impacts and Risks

The potential environmental impacts and risks from shoreline protection operations are:

- For nearshore vessel operations:
 - Planned discharges and emissions as per Sections 7.1 to 7.11.
 - Unplanned events as per Section 8.1 to 8.6.
- Damage to nearshore habitats/sea country from inshore shallow draught vessels (noise, turbulence and turbidity, outboard spills, anchoring) and boom anchoring (damage to seagrass, marine muds, sand, etc);
- Disturbance to native fauna breeding or entrapment (e.g., turtles);
- Damage to shoreline environments from vehicle and foot access and associated land use (e.g., waste storage, equipment cleaning); and
- Temporary restricted access to shoreline/waterway users.

9.5.5 Evaluation of Impacts and Risks

The known and potential impacts associated with routine and non-routine nearshore vessel operations are assessed through Sections 7.1 to 8.6.

Shoreline TRPs (including booming strategy) are being prepared for environmentally sensitive protection priorities (see Table 9.11). Other protection priority areas will be assessed at the time of the spill, given the time available to develop TRPs. In addition, EOG in consultation with relevant WA and NT authorities will undertake an operational NEBA at the time of the spill to confirm the net benefits of the implementation of a shoreline protection response strategy.

The following impacts may eventuate in the event of deploying a shoreline protection response strategy, noting that the nature of disturbance to shoreline environments will be dependent on the location and scale of activities in any given area.

Inshore Shallow Draught Vessel Operation

Small vessels required to anchor booms in inshore areas will operate intermittently and will contain small volumes of fuel (limiting spill potential). Given the size constraints of these vessels, noise impacts within inshore areas are expected to be similar to recreational fishing vessels that operate in nearshore waters (intermittent and localised).

Vessel & Boom Anchoring: Benthic Disturbance/Indigenous Sea Country

Damage to nearshore habitats (such as seagrass meadows, mangroves, estuaries, corals) from inshore shallow draught vessel activities and boom anchoring may disturb localised areas of seabed habitats and alter the dynamics of local ecosystems.

Sandy seabed habitats are generally able to quickly self-repair due to tidal sand movements. Localised physical damage to estuarine environments (i.e., subsurface marine muds) is also expected to recover quickly due to tidal water movements.

Seabed disturbance is a key contributor to the physical degradation in seagrass ecosystem function and can persist in sites for 5+ years after the disturbance (Bourque *et al.*, 2015). Physical damage to coral from disturbance activities can take a several decades to recover (Pearson, 1981).

Damage to Shoreline Environments

Damage to shoreline environments from vehicle and foot access and associated land-use (staging areas, etc) may disturb First Nation's cultural heritage areas (such as shell middens), and disturb nesting turtles and shoreline/wetland bird feeding, nesting, roosting, or breeding activities, in turn temporarily impacting on local population dynamics. Physical damage to vegetation as a result of gaining access to sites may result in localised mortality within estuarine environments (i.e., mangroves), however mangrove forests are generally able to recover with time (NOAA, 2014). Shoreline access may also result in localised soil compaction and erosion, which may result in poor vegetation growth and regeneration.

Secondary Contamination

Secondary contamination to shorelines not originally oiled may occur through access (vehicle, equipment and foot), equipment cleaning activities or waste management/storage activities. This may expose more habitat, flora and fauna to oiling than the area impacted by the spill itself, with oil smothering creating larger impact areas.

Secondary contamination risk from waste storage and handling activities will be managed by EOG's waste management contractor who will ensure that all waste storages are appropriately stored in

impervious bunds, removed from site promptly and transported/disposed in accordance with all State/Territory legislation (see Section 9.8).

Access Restrictions – Recreational and Indigenous

Shoreline protection booms may prevent indigenous people from accessing waterways for recreation and food collection (fishing). Alternate food gathering areas to those impacted from a Level 3 spill will need to be sought by indigenous people and recreational fishers.

Cultural Heritage Impacts

The movement of SCAT survey personnel, responders, vehicles and equipment through backshore areas may disturb or damage cultural heritage artefacts or sites. Adverse effects are expected to be localised to the area of disturbance, and for important sites – artefacts can be relocated or protected by exclusion zones. Disturbance to culturally significant artefacts may also affect spiritual associations and management and mitigation would be coordinated with local indigenous custodians (as appropriate).

Disturbance to Fauna (Turtle Nesting/Internesting, megafauna interaction with boom)

Use of barriers on shorelines during nesting periods or hatchling emergence can affect turtles by preventing females from reaching nesting beaches or blocking the movement of hatchlings or adults into the water. For hatchlings, barrier entrapment can increase predation risk and can also cause disorientation, dehydration or otherwise expend vital energy reserves causing mortality.

Booms, designed to protect sensitive resources on one side of deployment, can potentially increase turtle exposure to oil on the alternate side, whether the animals are trapped or not. Use of shoreline protection methods in turtle nesting areas require careful consideration and boom deployment is likely not recommended when females are nesting (NOAA, 2021), however this will be a key consideration during the operational NEBA. Boom use during hatchling emergence requires rigorous mitigation through regular monitoring of nests to ensure clear egress of hatchlings to sea (NOAA, 2021).

9.5.6 Impact and Risk Assessment

Table 9.13 presents the impact and risk assessment for shoreline protection and deflection.

Table 9.13. Impact and risk assessment for shoreline protection and deflection

Summary		
Summary of risks	Disturbance to nearshore benthic and shoreline fauna/habitat from increased vessel and human activity. Waste handling incidents during collection, storage, and transfer activities	
Extent of risk	Localised (immediately around vessel or shoreline protection area)	
Duration of risk	Short to medium-term (depending on length of spill response).	
Level of certainty of risk	HIGH – The impacts associated with boom deployment, vessel operations, habitat and fauna disturbance from vessels and human interference are well understood, however an operational NEBA undertaken at the time of a spill will determine the suitability of the response	
Risk decision framework context	Decision type	B – good industry practice required with engineering risk-based tools applied.
	Activity	New to the organisation or geographical area, infrequent or non-standard activity, good practice is well defined.

	Risk & uncertainty	Amenable to assessment using well-established data and methods, some uncertainty.	
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.	
Defined acceptable level	The net environmental benefit of a shoreline protection response strategy must be greater than no response.		
Risk Assessment (inherent)			
Hazard	Likelihood	Consequence	Risk rating
Fauna disturbance	Rare	Severe	High
Oily waste spills	Occasional	Moderate	Medium
Damage to benthic habitats	Occasional	Moderate	Medium
Interference with coral spawn slicks	Occasional	Minor	Low
Cultural Heritage Impacts	Occasional	Moderate	Medium
Interference to shoreline access for First Nations people	Occasional	Moderate	Medium
Assessment of Proposed Control Measures			
<p>The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic NEBA, which is presented in Appendix B of the OPEP.</p> <p>The controls for each response strategy was assessed to ALARP in Appendix B of the OPEP. EPOs, EPSs and measurement criteria for response strategy preparedness are also presented in Appendix B of the OPEP.</p>			
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
GENERAL SHORELINE OPERATIONS (applicable to all shoreline activities)			
Preparedness - all preparedness EPS are presented in Appendix B of the OPEP.			
Activity Controls			
There is no increase in environmental harm from oil spill response activities.	(RSK-13:EPS-01) The response strategy is only undertaken if a WA and/or NT Control Agency operational NEBA determines it is likely to have a net environmental benefit and it is safe to do so.	Operational NEBA is prepared.	
	(RSK-13:EPS-02) A Control Agency NEBA is undertaken during each operational period to determine if the response strategy is continuing to have a net environmental benefit.	Operational NEBAs are prepared.	
	(RSK-13:EPS-03) DIMT confirms protection priorities in consultation with WA DoT and/or NT IC (CA) as appropriate prior to deployment of SCAT.	IAP is in place. Incident logs verify DIMT has consulted with the Control Agencies.	

	(RSK-13:EPS-04) Environmental briefings are conducted for shoreline monitoring crews to identify site-specific risks and suitable controls.	Briefing records are available.
	(RSK-13:EPS-05) SCAT crews are inducted into the TRPs so that environmental, cultural heritage and socio-economic sensitivities are known and can be appropriately managed during survey.	Incident logs verify inductions took place.
Access and onshore activity is undertaken in accordance with Traditional Owner requirements.	(RSK-13:EPS-06) Traditional Owner permission (with conditions, if required) is sought and granted to access shorelines for this response (where required).	Incident logs verify permission was granted. Tradition Owner permits (if relevant) are available.
	(RSK-13:EPS-07) Traditional Owners are invited to participate in the activity to ensure that cultural heritage values are protected.	Incident logs verify invite to Traditional Owners was issued.
As recommended by Operational NEBA, undertake shoreline response in accordance with OPEP (appropriate to the nature and scale of the spill)	(RSK-13:EPS-08) Where monitoring and evaluation indicates that shoreline contact could occur within the next 3 days, SCAT teams will be deployed within 24 hours of that forecast.	Incident logs verify that SCAT resources have been mobilised in suitable timeframe
	(RSK-13:EPS-09) SCAT verify shoreline and nearshore sensitivities (environmental, cultural), determine 'no-go' zones (turtle nesting, shoreline bird habitats, etc), least impact zones and any limitations associated with shoreline response to inform the WA and/or NT operational NEBA and IAP for the predicted shoreline contact area.	IAP records.
	(RSK-13:EPS-10) TRPs are reviewed and updated based upon SCAT outcomes to become site-specific TRPs and to reflect outcomes of the operational NEBA.	Site-specific TRPs available.
	(RSK-13:EPS-11) During periods of important ecological sensitivity (e.g., coral spawning, turtle nesting/inter-nesting and hatching season), EOG will provide input into WA and/or NT operational NEBA regarding these sensitivities and will assist with providing input into operational constraints.	Operational NEBA verifies that sensitivities have been considered and operational controls developed.
No secondary contamination to the environment from	(RSK-13:EPS-12) Decontamination zones are setup and implemented to ensure that responders do not cause secondary contamination.	Incident logs verify decontamination zones and waste facilities have been set up and is supervised.

shoreline response activities	(RSK-13:EPS-13) Waste collection facilities are set out in accordance with TRPs, which provides for waste storage tanks and hoses to be located in a contained, impervious area.	Incident logs verify waste storage facility has been set-up and is supervised.	
	(RSK-13:EPS-14) Spill kits are available at oil recovery areas, which are under supervision and secured from public access.	Audit/Inspection records verify waste storage facility has spill kits	
	(RSK-13:EPS-15) Waste is collected, transported, and disposed in accordance with WA and/or NT waste management requirements	Waste Transport Certificates verify waste disposal location.	
Impacts from shoreline activities to shoreline fauna, native vegetation and habitats are prevented.	(RSK-13:EPS-16) Access to shoreline habitats is via established tracks. Access outside existing tracks is determined in consultation with the WA and/or NT Cas and local land managers.	Incident records verify that consultation has occurred and controls implemented.	
SHORELINE PROTECTION & DEFLECTION			
Response			
As recommended by Operational NEBA, undertake shoreline protection in accordance with OPEP appropriate to the nature and scale of the spill.	(RSK-13:EPS-17) Site-specific TRPs are reviewed and revised based upon SCAT and monitoring and evaluation outcomes.	Revised site-specific TRPs.	
	(RSK-13:EPS-18) Where the WA and/or NT Control Agencies request shoreline protection resources, EOG will provide them within the requested timeframes.	Incident log verifies resource deployment within requested timeframes.	
Activity Controls			
Shoreline protection equipment does not lead to wildlife entrapment.	(RSK-13:EPS-19) Monitoring teams are deployed to monitor and maintain the operability of shoreline booms (including oiled wildlife surveillance and management).	Incident logs verify maintenance and wildlife entrapment incidents.	
Shoreline protection operations do not harm sensitive benthic habitats (seagrass, emergent reefs).	(RSK-13; EPS-20) Vessel and boom anchoring will not occur in areas of fragile/sensitive habitat (reefs, seagrass, sponge).	Incident logs verify adoption of this control.	
Risk Assessment (residual)			
Hazard	Likelihood	Consequence	Risk rating
Fauna disturbance	Remote	Severe	Medium
Oily waste spills	Rare	Moderate	Low
Damage to benthic habitat	Remote	Moderate	Low
Coral spawn slicks	Remote	Minor	Negligible

Cultural heritage impacts	Rare	Moderate	Low
Interference to shoreline access for First Nations people	Rare	Moderate	Low
The risk of spill response activities to the identified receptors is assessed as negligible to low because:			
<ul style="list-style-type: none"> The control measures adopted are effective in reducing the risk to ALARP. 			
Demonstration of ALARP			
A detailed demonstration of ALARP for shoreline protection is presented in Appendix B of the OPEP. . This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.			
Demonstration of Acceptability			
Policy compliance	EOG's Safety and Environmental Policy objectives are met.		
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.		
External context	There have been no concerns raised from relevant persons regarding spill response activities.		
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> <i>OPGGs Act 2006 (Cth)</i> and <i>OPGGSE</i>: <ul style="list-style-type: none"> Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts. Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP). <i>EPBC Regulations 2000 (Cth)</i>: <ul style="list-style-type: none"> Part 8 (Interacting with cetaceans and whale watching). <i>Pollution of Waters by Oil and Noxious Substances Act 1987 (WA)</i>. <i>Protection of Marine Waters (prevention of Pollution from Ships) Act 1987 (WA)</i>. <i>Emergency Management Act 1986 (WA)</i>. <i>Contaminated Sites Act 2003 (WA)</i>. <i>Waste Management & Pollution Control Act 1998 (NT)</i>. <i>Environment Protection Act 2019 (NT)</i>. 		
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.		
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS meet the relevant mitigation measures listed with regard to:</p> <ul style="list-style-type: none"> Emergency preparedness and response – spill preparedness and emergency response measures are in place (OPEP). 	
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.	

	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	Guidelines met with regard to: <ul style="list-style-type: none"> Sections 76-79 (Spill response planning): A spill response plan should be prepared (OPEP).
	AEP CoEP (APPEA 2008)	The EPS meet the following offshore development and production objectives: <ul style="list-style-type: none"> To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill-specific guidelines	
	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are deployed. The EPS listed in this table complement the NatPlan.
	AMOSPlan (2017)	AMOSOC (on behalf of EOG) will implement this plan in the event their resources are required. The EPS listed in this table complement AMOSPlan.
	WA OSCP (2015)	DoT will implement this plan in the event their resources are deployed. The EPS listed in this table complement the WA Oil Spill Contingency Plan.
	NT OSCP (2014)	The NT IC will implement this plan in the event their resources are deployed. The EPS listed in this table complement the NT Oil Spill Contingency Plan.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS listed in this table are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	Shoreline protection and deflection	Use of booms in oil pollution response, Technical Information, Paper 3 (ITOPF, 2011c).
		Shoreline Response Programme Guidance (IPIECA, 2020).
		Characteristics of Response Strategies: A Guide for Spill Response Planning in Marine Environments (NOAA, 2001).

Environmental context	MNES	
	AMPs	<p>Oil causing marine pollution are a threat identified in the North Marine Parks Network Management Plan 2018.</p> <p>Removal of oil through spill response activities possibly in areas such as Ashmore Reef, Cartier Island will assist in the protection of values in AMPs. Shoreline protection, with all controls implemented, is not inconsistent with maintaining AMP values.</p>
	Ramsar wetlands	<p>Shoreline protection activities may be undertaken on the perimeter of onshore Ramsar wetlands (e.g., Cambridge Gulf). Protection controls developed for implementing shoreline protection aim to protect the wetlands from damage and improve environmental outcomes resulting from any spills. Impacts to Ramsar wetlands are not expected.</p>
	TECs	<p>Shoreline protection activities will not be undertaken in areas where TECs exist.</p>
	NIWs	<p>Shoreline protection activities may be undertaken on the perimeter of NIWs (Moyle River Estuary, Daly River Estuary, Darwin Estuary). Protection controls developed for implementing shoreline protection aim to protect the wetlands from damage and improve environmental outcomes resulting from any spills.</p>
	Nationally threatened and migratory species	<p>Some threatened and migratory species have the potential to be present in shoreline protection operations, however impacts are predicted to affect individual species only and not populations of threatened or migratory species. Protection controls developed for implementing shoreline protection aim to protect threatened and migratory species from damage and improve environmental outcomes resulting from any spills</p>
	Other matters	

	State marine parks	<p>The North Kimberley Marine Park Management Plan has the strategic <i>objective to protect and conserve biodiversity and ecological health</i>. CAR activities support this objective and do not conflict with the management objectives for the park in terms of cultural; natural; recreation, tourism and community; or commercial values detailed in the Management Plan. Shoreline protection and deflection will assist in preserving the objectives detailed in the management plan.</p> <p>Shoreline protection and deflection operations may be undertaken in coastal marine parks at the direction of the relevant WA and/or NT CAs, given that parks are predicted to have shoreline oil loading above ecological limits. With controls implemented, shoreline protection and deflection activities are not expected to have significant impacts on these marine parks or the management objectives of the parks' management plans.</p>
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Marine (oil) pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (e.g., nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from habitat identified as critical to their survival</i>. Shoreline protection activities, with controls implemented, will prevent impacts to critical habitats. Shoreline protection supports identified priority actions within this management plan.</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this.</p> <p>The Wildlife Conservation Plan for Seabirds (CoA, 2020) identifies oil pollution as a threat to seabirds although no specific actions are defined to manage the threat. Shoreline protection activities will assist in the removal of oil from the environment and isolation of species from oiled areas, thereby reducing the threat in support of the plan.</p>
	ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).

Statement of acceptability	<p>EOG considers the risk posed by shoreline protection operations in the marine environment to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Environment Policy. • The residual risk ratings of additional hazards identified in shoreline protection operations are negligible to medium and ALARP. • An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved. • Input from engagement with relevant persons and stakeholders has been considered. • Activity is compliant with relevant legislation and industry best practice. • Spill response activities will not have long-term or significant impacts on MNES. • Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species. • Spill response activities are not inconsistent with the aims of relevant marine reserve management plans. • Spill response activities are not inconsistent with ESD principles.
Environmental Monitoring	
<ul style="list-style-type: none"> • As per Beehive-1 OPEP and OSMP requirements. 	
Record Keeping	
<ul style="list-style-type: none"> • Contracts and agreements with third parties. • Equipment and service provider register. • Inspection/audit reports. • Incident and daily operations reports. • OSMP Records (SCAT) • Stakeholder Consultation Records • Operational NEBA. • Briefing records. • IAP. • Shoreline TRPs (including revised TRPs) • Induction Records 	

9.6. Shoreline Clean-up

9.6.1 Background Information

As per the Level 3 LoWC OSTM results, the first shoreline contact with coastlines associated with a LoWC is 11.6 days at 10 g/m² (Moyle River Estuary, Lacrosse Island, Cambridge Gulf and Berkeley River) in the absence of any on-water response efforts. Shoreline impacts at ecological harm levels (100 g/m²) is 12.5 to 12.8 days (Cambridge Gulf, Lacrosse island, Cape Domett, Berkeley River).

The objective of shoreline clean-up is to reduce the volume of oil on the shoreline, reduce the likelihood/consequence of impacts to shoreline sensitivities and promote increased speed to the natural recovery of the shoreline to its pre-oiled state.

Any shoreline response activities will be preceded by a SCAT survey. The objective of SCAT is to systematically collect data about the location, nature and degree of shoreline oiling and at risk/impacted wildlife to inform shoreline treatment and oiled wildlife response planning.

Shoreline response activities including SCAT come under the control of the relevant WA and NT Control Agencies. Control Agencies may choose to conduct the SCAT activity, including provision of SCAT specialists, wildlife specialists, local government rangers and Aboriginal heritage advisors/rangers. The Control Agency may also request EOG to provide specialist support personnel including SCAT and OWR experts and logistical support for remote and/or larger SCAT operations.

Two shoreline locations that fall under Commonwealth jurisdiction (rather than WA or the NT) are Ashmore Reef and Cartier Island. In the event of a spill reaching these two locations, EOG would be

the Control Agency. Under this scenario, the SCAT team would consist of SCAT specialists and wildlife response specialists provided by industry mutual aid, supported by a Parks Australia ranger (or equivalent). No Aboriginal heritage advisors are required at this location. Note that an unexploded ordnance risk is present on Cartier Island and in waters within a 10 km radius. Landing or anchoring anywhere within the Cartier Island AMP is strictly prohibited. Therefore, SCAT surveys will be conducted by fixed wing, helicopter or drone in this location. Due to the sensitivities of these shoreline receptors and the safety issues associated with UXO, the merits of shoreline clean-up at Cartier Island will be discussed in consultation with the DNP.

Shoreline types within the LoWC EMBA are described in Section 5.2 of Appendix 11 of this EP, and include :

- Rocky shorelines of the Bonaparte Archipelago;
- Fine sands, silts, clays, muds of sheltered and highly tidal mangrove/saltmarsh and salt flat systems of the Kimberley and NT maintain shorelines; and
- Coarse sandy/gravel beaches, on offshore islands, the Kimberley coastline and some areas of the NT coastline.

9.6.2 Scope of Activity

Any clean-up response will be preceded by a SCAT survey. NOAA (2013b) describes this process as the systematic approach to collecting data on shoreline oiling conditions using the following steps:

- Conduct reconnaissance survey;
- Segment the shore;
- Assign teams and conduct shoreline surveys;
- Develop clean-up guidelines and endpoints;
- Submit reports and sketches to Planning Section in DIMT;
- Monitor effectiveness of clean-up;
- Conduct post-clean-up inspections; and
- Undertake a final evaluation of clean-up activities.

A trained SCAT team will be deployed prior to shoreline stranding (informed by surveillance and tracking) to provide feedback on the best methods for clean-up (as appropriate).

Shoreline clean-up activities will be controlled by the relevant WA and/or NT Control Agencies. Feedback from SCAT teams into a WA and/or NT-controlled NEBA will determine whether shoreline intervention offers net benefits. Techniques that may be considered in the NEBA are provided in Table 9.14, which lists techniques generally in order of least impact to highest impact.

The deployment of all types of shoreline clean-up material and associated staging facilities such as waste reception and responder amenities (shelter, ablutions) requires a large, coordinated logistics effort and access to large numbers of on-ground responders.

Given the remoteness and lack of land access to many parts of the EMBA coastline, shoreline clean-up operations are expected to be undertaken mostly by marine-side resources.

Table 9.14. Description of key shoreline clean-up techniques (ITOPF 2011d, 2012)

Technique	Description	Suitable shorelines
1. Natural Cleaning	For most shorelines, oil will clean and degrade naturally over time, the rate determined by the oil type (low or high viscosity) and	Sub-tidal macroalgae & seagrass

Technique	Description	Suitable shorelines
	<p>coastline feature (low/high energy). Natural cleaning encompasses photo oxidation, biodegradation, abrasion, clay/oil flocculation and/or mineral-oil aggregation.</p> <p>In high energy environments (e.g., surf beaches, sheer cliffs) oil is likely to be removed within a seasonal cycle (except areas above the high tide mark which may take several years). In low energy environments (mangroves, salt marshes), degradation can take many years as oil is incorporated into fine anaerobic muds where the absence of oxygen precludes bacterial degradation.</p> <p>Jabiru crude, a persistent Type II crude oil, is expected to take a substantial period of time to weather naturally on coastal shorelines and may infiltrate the underlying substrate.</p> <p>MDO evaporates within hours to days and spreads to very thin layers rapidly. MDO is not sticky or viscous and when stranded on the shoreline the hydrocarbon will tend to penetrate the porous sediments quickly but be washed by waves and tidal action. While MDO is considered persistent (5% by mass), MDO is readily and completely degraded by naturally occurring microbes in timeframes of 1-2 months (NOAA, 2020). Natural cleaning is feasible for MDO spills on any shoreline type found in the EMBA.</p>	<p>Social infrastructure & cultural values (low level oiling only)</p> <p>All shorelines (dependent on oiling level)</p>
2. Flushing	<p>Flushing uses high volumes of low-pressure water to wash stranded or buried oil from shorelines. Floating booms can be used in conjunction with this process to contain any oil released with recovery of oil through skimming.</p> <p><u>Within sediments:</u> Oil can become mixed with substrate (sand, pebbles, rocks) through natural seepage, burial under clean sediment deposited by tidal movements or after storms, or as a result of clean-up activities. Flushing oil from sediment reduces the amount of waste compared with substrate removal. Seawater is drawn by portable pumps through screens/hose to lances or nozzles. Water is injected into sediment to provide agitation, dislodging oil. When dislodgement is above the waterline released oil can be channelled to pits, trenches or to Sea where it is contained for recovery.</p> <p><u>Sensitive/inaccessible areas:</u> Flooding shorelines with water may flush oil and oiled debris from sensitive areas such as mangroves. Low-pressure flushing reduces the potential for physical damage to the shoreline, habitat and fauna compared with other techniques. The oil flushed out can be contained and recovered from the sea surface (since these shorelines are usually in calm, sheltered waters).</p> <p><i>Technique suitable for both crude oil and MDO spills where material is still fluid. Not feasible for muddy or sandy substrates.</i></p>	<p>Social infrastructure & cultural values</p> <p>Fine to coarse grained sand/gravel beaches</p> <p>Exposed tidal flats (low pressure only)</p> <p>Sheltered, solid man-made structures, riprap</p> <p>Sheltered tidal flats (low pressure only)</p>
3. Ploughing/ Harrowing	<p>After bulk oil removal from sand beaches, light contamination usually remains where oil has been mixed into the sand by clean-up traffic. Agricultural ploughs/harrows can be used repeatedly to the lightly oiled sediments during low tide to remove the remaining contamination. Breaking up oiled sediments increases surface areas exposed to weathering processes and facilitates sediment aeration enhancing microorganism degradation. Small amounts of oil that may be released during high tide can be recovered using sorbents.</p>	<p>Fine to coarse grained sand/gravel beaches</p>

Technique	Description	Suitable shorelines
	<i>This technique is suitable for both crude oil and MDO hydrocarbon residues on accessible shorelines.</i>	
4. Adsorbents	<p>Adsorption refers to the process whereby oil is preferentially attracted to the surface of the material and incorporated into the body of the material. Once recovered, oiled material needs to be stored in enclosed storage facilities to prevent oil leaching (secondary contamination) until disposal.</p> <p>Adsorbents are best used in nearshore and onshore clean-up operations, but large-scale use is discouraged due to the excessive volumes of oiled waste. Adsorbent use should be restricted to situations where other techniques aren't likely to be feasible or effective and is best employed to capture run-off from high-pressure washing, capture oil mobilised on successive tides in mangrove areas or to clean rockpools.</p> <p><i>Technique is feasible for both crude oil and MDO spills on accessible shores where oil is free-floating close to shore or stranded onshore.</i></p>	<p>Sub-tidal macroalgae & seagrass, shoreline fauna (in conjunction with protect and deflect activities)</p> <p>Social infrastructure & cultural values (low level oiling only)</p> <p>Coarse grained beaches</p> <p>sheltered, solid man-made structures, riprap</p> <p>Sheltered tidal flats (where damage to vegetation and substrate is limited)</p>
5. Manual Collection	<p>Manual collection of oil is a suitable technique that can be employed for most shoreline types except those deemed too dangerous, such as sheer cliffs, rock walls and jetties.</p> <p>A workforce using shovels, rakes and buckets is more selective than mechanical methods of cleaning (e.g., bulldozers) as the amount of underlying clean material collected can be minimised. While manual clean-up is labour intensive, it generally leads to more rapid shoreline recovery as a result of less disturbance to substrate. Manual clean-up is particularly effective for high viscous or emulsified oils where it can be directly transferred using shovels and buckets/plastic bags into a centralised waste storage area.</p> <p><i>Suitable for crude oil. MDO rapidly percolates into substrates and surface collection is not feasible.</i></p>	<p>Social infrastructure & cultural values</p> <p>Shoreline Fauna</p> <p>Coarse grained beaches</p> <p>Exposed tidal flats</p> <p>sheltered, solid man-made structures, riprap</p> <p>Sheltered tidal flats (where damage to vegetation and substrate is limited)</p>
6. Sand blasting/steam cleaning	<p>High-pressure washing can be used on hard substrates (cliffs, rock platforms and man-made objects such as piers and rock walls) once bulk oil is removed. This method is generally applied when further natural cleaning is insufficient or too slow for recreational, amenity or aesthetic reasons and may occur with hot or cold water.</p> <p>This method damages fauna such as limpets, mussels or lichen and may damage the substrate surface itself. Oil released by pressure washing can be collected with adsorbent materials at the base of the surface to be cleaned or contained and recovered in booms.</p> <p><i>Technique suitable for both crude oil and MDO but not feasible on soft substrates, vegetation, or loose substrates such as sand.</i></p>	<p>Sheltered, solid man-made structures, riprap</p>
7. Mechanical collection	<p>Oil-in-water emulsions may be lifted directly from the sea surface in excavator buckets into trucks and skips. Skilled operators are required to minimise the volume of water collected with the oil.</p> <p>On sandy beaches, if there is adequate access, front-end loaders can be used to collect and remove stranded oil and contaminated material, though care must be exercised to ensure that oil is not mixed with clean sediment through the actions of the mechanical</p>	<p>Social infrastructure & cultural values</p> <p>Fine grained sand/gravel beaches</p>

Technique	Description	Suitable shorelines
	<p>equipment. Oiled material must be temporarily stored prior to removal from site.</p> <p><i>Technique is suitable for crude oils but not feasible on shorelines that cannot support heavy equipment and sensitive habitats (seagrass, corals, soft substrates – saltmarsh, mangrove, inter-tidal flats). Technique is not suitable for MDO residues which spread rapidly to sheens and percolate into sand sediments.</i></p> <p>Floating oil accumulated in calm waters against shorelines accessible by vehicles can be recovered by vacuum pumps and/or skimmers after being concentrated by recovery booms. Similarly, trenches can be dug in sandy beaches to collect through flushing with the oil collected by vacuum trucks or temporarily stored.</p>	
8. Chemical dispersants (shoreline application)	<p>Dispersants are sometimes used as cleaning agents to remove remaining oil from hard surfaces such as man-made structures, rocks and boulders. Dispersed oil cannot be recovered and in instances where its application is approved, it is generally applicable to areas of low environmental sensitivity but high amenity value.</p> <p>It is very unlikely that chemical dispersants will be used in shoreline clean-up operations.</p> <p><i>Technique is suitable for crude oil residues. MDO residues quickly evaporate and percolate into sediments.</i></p>	Sheltered, solid man-made structures, riprap (where residue does not pose risk)
9. Vegetation Removal	<p>In rare circumstances, vegetation may require removal to remove oil from the environment. This is likely where viscous oil has adhered to vegetation such as mangroves and saltmarsh and cannot be otherwise removed, or possibly where secondary contamination has occurred through sand dune vegetation as a result of clean-up activities.</p> <p><i>Technique is feasible for habitats composed of vegetation – wetlands, seagrass beds and kelp beds containing emergent vegetation.</i></p>	<p>Emergent macroalgae & seagrass</p> <p>Social infrastructure & cultural values</p> <p>Coarse grained beaches</p> <p>Exposed tidal flats</p> <p>Sheltered tidal flats & mangroves (where damage to vegetation and substrate is limited)</p>

Note the following:

- Cliffs/Rocky Coves (Bonaparte Archipelago): IPIECA-IOGP (2015d) identify that the base of cliff faces can be accessed only with great difficulty and can present an extremely hazardous working environment. Typically, cliffs and inaccessible rocky coves are highly exposed and best left to self-clean naturally unless there are over-riding reasons to intervene. Unless the oil has been thrown up to extreme heights by exceptional weather conditions and is not under the influence of normal sea conditions, residual staining would be expected to diminish over 2-3 seasonal cycles. Given the extreme tidal regime of the Kimberley coastline, together with the recommendations of IPIECA-IOGP (2015d), planning for cleaning of remote rocky cliffs/shorelines is not considered appropriate.
- Wetlands/mudflats: In general, oil deposited on mudflats does not penetrate into the substrate because the water table is sufficiently high to provide a barrier against the downwards migration of oil. It is most likely that the oil will re-float and migrate elsewhere, however this does not apply when there are open stemmed plants, animal burrows, wormholes, etc., or if oil is present in a storm which suspends sediment, oil can attach to the sediment and be deposited

in the mudflat (IPIECA-IOGP, 2015d). Erecting barriers across major inlets allowing water exchange but preventing oil ingress is the best strategy paying attention to the tidal currents that the barriers need to withstand (IPIECA-IOGP, 2015d).

- Sandy beaches: It is anticipated that the typical response strategy for sandy beaches will be small remote response teams conducting manual clean-up (i.e., rakes, shovels, lined bulk bags) with limited likelihood for use of any machinery-assisted cleaning except for small, tracked vehicles that may be used for collection and transport of small volumes of oily waste to collection points/landing barges. The high tidal regime will result in enhanced natural surf washing/flushing, a recognised rehabilitation technique within IPIECA-IOGP (2015d). If relatively close to the surface, oil may be mobilised through harrowing/ploughing or by using flushing lances to release the oil and flush it to the waters' edge where it can be recovered by skimmers or sorbents. This technique would need to be recommended by the relevant CA.

9.6.3 Hazards

The hazards associated with SCAT surveys and shoreline clean-up are:

- Additional human activity on shorelines;
- Mechanical access to, and activity on beaches;
- Loss of shoreline sediment; and
- Waste collection and transport (see Section 9.8).

9.6.4 Known and Potential Impacts and Risks

The known and potential environmental risks of shoreline clean-up include:

- Ground disturbance due to manual raking, turnover of sand beaches or tidal flats to remove oil could affect sediment infauna,
- Damage to First Nations cultural heritage sites (e.g., shell middens);
- Damage to habitat (i.e., loss of inter-tidal or supratidal flora/fauna species habitat);
- Disturbance to shoreline fauna from human presence – noise, air, light emissions from response activities (such as pumps, vehicles, staging areas) affecting behaviours (e.g., shorebird and seabird foraging and nesting, turtle nesting) with potential for secondary contamination of foreshore and backshore areas;
- Vegetation cutting and compression in preparing storage areas, vehicle access tracks and accommodation areas;
- Vertical infiltration/secondary contamination of oil into shoreline sediments;
- Increased demand for what may be limited resources in small, isolated coastal towns (such as accommodation, fuel, hire vehicles, PPE); and
- Temporary exclusion of residents and tourists from amenity beaches.

Note that the risks relating to waste handling and management are assessed in Section 9.5 and with waste transport and disposal are addressed in Section 9.8.

9.6.5 Evaluation of Impacts and Risks

Shoreline clean-up plans can only be finalised once the fate and trajectory of the spilled oil, the oil type and volume have been verified. Damage or loss of habitat from oil spill response techniques is

expected, in most cases, to be localised to the area in which the technique is employed but may have secondary impacts to features further along shorelines.

Oil spill modelling indicates that in the case of a LoWC, the probability of accumulation on any shoreline is 100% and the greatest volume of oil ashore is 705m³. The maximum length of shoreline exposed to accumulations of oil at actionable concentrations (> 100 g/m²), it is approximately 129 km (in summer). This is expected to be the maximum length of shoreline subjected to clean-up and to the extent of possible effects of response activities. It is important to note this is the maximum predicted length of shoreline affected, with the actual length of shoreline impacted lower with areas not amenable or suitable for clean-up activities. Modelling also assumes that once oil accumulates on a shoreline, it remains at the location until removed. In reality, the loading will be temporary removed by natural processes with diminishing concentrations.

The risks described in this section assume independence of response measures and are based on the unmitigated spill outcome without any nearshore containment or deflection booming which would reduce impacts under real conditions.

Damage to Shoreline Habitat

Damage to shoreline habitats can be caused by high pressure washing (detaching intertidal rock biota such as limpets, mussels and algae), compression/compaction of shoreline sediments from vehicles and human responders, removal of oiled biota and collection of oiled sediments and wrack from beaches leading to loss of sandy habitats and sediment infauna.

Damage to intertidal shoreline habitats and communities may have indirect effects on food chains affecting the macrofauna communities they support. In addition, removal of habitat (e.g., sand from beaches) may also make the beaches more vulnerable to ongoing erosion. Affected sites are predicted to recover through beach replenishment due to natural sediment transport processes and recolonisation by beach biota within the medium term (1-3 years).

Cultural Heritage

Cultural heritage assessment has been undertaken in Section 9.5 (Shoreline Protection & Deflection).

Disturbance to Shoreline Fauna

The noise, light and general disturbance created by shoreline clean-up activities is likely to disturb the feeding, breeding, nesting or resting activities of resident or migratory fauna species present in the affected area. This includes beach-nesting turtles and shoreline birds whereby eggs may be damaged; incubating adult birds may abandon nests; eggs may not be protected against adverse weather conditions or chicks may be disturbed leading to starvation. Compression due to machinery may also damage turtle nests. Any erosion caused by responder access to sandy beaches, or the removal of sand, may also bury nests. For critical turtle breeding areas such as Cape Domett and Lacrosse Island (flatback turtle nesting areas), this may have impacts at the population level. Note that shoreline response activities occur during daylight hours only.

Damage to Vegetation

Localised damage to vegetation may occur from shoreline clean-up activities, vehicle and foot traffic to access shorelines, and associated vegetation clearing for land-use (staging areas, etc). In addition, shoreline access may also cause soil compaction and erosion, which may result in poor vegetation growth and regeneration.

Impacts to sensitive vegetation areas, such as mangroves and saltmarsh may lead to long-term damage. The use of heavy equipment, poorly supervised manpower and removal of oiled sediment

have led to long-term damage due to trampling, damage to root systems and consequent erosion in saltmarshes (IPIECA-IOGP, 2015d).

Damage to Sediment/Infiltration of Oil

Vertical infiltration of oil into shoreline sediments is possible by machinery/ equipment movement thereby exposing fauna to oil that would not otherwise be exposed. This affects the base of the foodweb to contamination that may bioaccumulate up through the food chain. It can also result in the need to increase removal of the affected substrate, which in turn will exacerbate the risk of beach erosion. Untreated, secondary contamination of the environment from human/equipment movement from oil-exposed areas into clean areas can also have the same impact causing chronic toxicity impacts to flora/fauna directly contacted. Habitat degradation or loss may occur as a result of soil pollution. The degree of impact is a function of the volume of oil spilled and how long it remains in the environment before being cleaned (if at all).

Ground/Topography Disturbance

The collection of oil from sandy beaches may also result in significant volumes of clean sand removed from beaches, resulting in temporary loss of shoreline habitat and associated macrofauna and meiofauna. The reduced sand profile of sandy beaches may also make them more vulnerable to damage (such as additional sand loss, erosion of dunes, etc.) caused by spring tides and storm surges. This risk is temporary as tides replenish the lost sand over the following weeks/months.

Temporary Exclusion of Residents/Tourists

The presence of stranded oil and clean-up operations will necessitate temporary beach closures, with ground disturbance also requiring beach closures. During shoreline clean-up operations, it is expected that the entire beach would be closed.

As described in Appendix 11 (Section 5.6), there are indigenous, recreational and tourism activities linked to the coastal region. The exclusion of tourist is likely to result in impacts to local tourism businesses. Given that coastal exclusions may be in place for the majority of the release duration and for extended clean-up once the well is killed, there is potential for a prolonged impact to tourism and local residents (~1 year).

Influx of shoreline personnel to area

The influx of clean-up personnel to a given region, if landside access is available, will place increased demand on the resources of small and remote coastal towns in the EMBA such as accommodation, meals, vehicle hire, fuel groceries and other day-to-day consumables (where these are available, noting the remoteness of most of the shoreline in the EMBA). Sudden and temporary influxes of workers to small Australian towns can often be fraught with social unrest as the demand for goods and services can negatively impact on the provision of services to residents and tourists. This is likely to be temporary and localised. For a response to a Beehive LoWC, these impacts are not likely to materialise given that it is likely that most shoreline clean-up personnel will be accommodated in offshore accommodation vessels.

9.6.6 Impact and Risk Assessment

Table 9.15 presents the impact and risk assessment for shoreline clean-up operations.

Table 9.15. Impact and risk assessment for shoreline clean-up operations

Summary			
Summary of risks	Damage to shoreline habitats and cultural heritage. Damage to sediment/topography. Damage to sediment. Disturbance to shoreline fauna. Exclusion of residents/tourists to coastal areas. Influx of population to remote areas.		
Extent of risk	Immediate area of works along relevant shorelines.		
Duration of risk	Medium-term (depending on spill volume, trajectory and shorelines affected, potential for months of clean-up).		
Level of certainty of risk	MEDIUM – The impacts associated with SCAT and shoreline clean-up are well understood, however an operational NEBA undertaken at the time of spill will confirm the suitability of activity.		
Risk decision framework context	Decision type	B – good industry practice required with engineering risk-based tools applied.	
	Activity	New to the organisation or geographical area, infrequent or non-standard activity, good practice not well defined or met by more than one option.	
	Risk & uncertainty	Amenable to assessment using well-established data and methods, some uncertainty.	
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.	
Defined acceptable level	The net environmental benefit of a spill response strategy must be greater than no response.		
Risk Assessment (inherent)			
Hazard	Likelihood	Consequence	Risk rating
Damage to shoreline habitat	Likely	Moderate	Medium
Cultural heritage impacts	Occasional	Moderate	Medium
Sediment contamination (including secondary contamination)	Occasional	Moderate	Medium
Disturbance to shoreline fauna	Occasional	Moderate	Medium
	Occasional	Severe (based on presence of nesting/hatching turtles and/or birds)	High
Damage to vegetation	Likely	Moderate	Medium
Ground/topography disturbance	Occasional	Moderate	Medium
Exclusion of residents/tourists	Likely	Moderate	Medium

Influx of population to remote area	Likely	Minor	Low
Assessment of Proposed Control Measures			
The suitability of response techniques to a hydrocarbon spill from Beehive-1 drilling activities are based on a strategic (or <i>a-priori</i>) NEBA, which is presented in Appendix B (BOD) of the OPEP.			
A strategic NEBA is based on theory and experience from other global hydrocarbon spill incidents, but not on experience for this well, this oil type (which is speculative) and this location. An operational (<i>a-posteriori</i>) NEBA will be undertaken at the time of the spill once key facts about the spill are established (nature of the oil, flow rate, trajectory of movement, etc).			
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Preparedness - all preparedness EPS are presented in Appendix B of the OPEP.			
Response			
Implement shoreline clean-up response as recommended by an operational NEBA so there is no increase in environmental harm from oil spill response activities.	(RSK-14:EPS-01) For Ashmore Reef and Cartier Island, DIMT to confirm protection priorities in consultation with the DNP together with the deployment of SCAT teams to gather information.	Incident logs verify DIMT consulted with the DNP about protection priorities at these locations.	
	(RSK-14:EPS-02) For Ashmore Reef and Cartier Island, shoreline response strategies will be implemented in consultation with the DNP after an operational NEBA determines a net benefit.	Incident logs verify operational NEBA was undertaken.	
	(RSK-14:EPS-04) Unless directed otherwise by the Control Agency, a Heritage Advisor and/or Traditional Owner and/or Aboriginal Ranger is consulted if shoreline operations overlap with areas of cultural significance.	Incident logs verify these experts were consulted on shoreline operations.	
	(RSK-14:EPS-05) The establishment of forward staging areas and decontamination areas on shorelines is undertaken only under the direction of or in consultation with the WA DoT and/or NT DEPWS.	Outcomes of consultation with WA/NT agencies regarding forward staging areas is documented in IAP and incident logs.	
	(RSK-14: EPS-06) Clean-up teams are mobilised to undertake shoreline clean-up activities in accordance with the timeframes in the OPEP.	Incident logs verify clean-up crews were deployed in the assigned timeframes.	
	(RSK-14: EPS-07) Shoreline decontamination areas are set up at each shoreline response location to ensure secondary oiling impacts are prevented.	Incident logs verify that decontamination areas were established.	
	(RSK-14: EPS-08) No vehicle access or machinery to be used in sensitive vegetation (mangroves, saltmarsh and other sensitive habitat).	Incident logs verify no vehicle or machinery access into sensitive coastal vegetation.	

	(RSK-14:EPS-09) Deploy accommodation vessel/s to remote areas to provide accommodation for shoreline teams where onshore accommodation is not available or feasible to rapidly establish.	Incident logs verify accommodation vessel/s has been deployed.	
	(RSK-13:EPS-10) TRPs are reviewed and updated based upon SCAT outcomes to become site-specific TRPs and to reflect outcomes of the operational NEBA.	Site-specific TRPs available.	
	(RSK-14:EPS-11) SCAT response continues to provide feedback on the effectiveness of the shoreline response until termination criteria are met, as outlined within the OPEP.	Incident logs verify effectiveness of SCAT response.	
Risk Assessment (residual)			
Hazard	Likelihood	Consequence	Risk rating
Damage to shoreline habitat	Rare	Moderate	Low
Damage to cultural heritage	Rare	Moderate	Low
Sediment contamination	Rare	Moderate	Low
Disturbance to shoreline fauna	Remote	Moderate	Medium
	Remote	Severe (based on presence of nesting/hatching turtles and/or birds)	Medium
Damage to vegetation	Remote	Moderate	Low
Ground/topography disturbance	Rare	Moderate	Low
Exclusion of residents/tourists	Likely	Moderate	Medium
Influx of population to remote area	Likely	Negligible	Negligible
The residual risk of SCAT and shoreline clean-up response activities to the identified receptors is assessed as negligible to medium and is considered to be ALARP on the following basis:			
<ul style="list-style-type: none">• The control measures adopted are effective in reducing the risk. Further controls will be developed based upon the area impacted through the NEBA process.• The shoreline response will not proceed unless there is a net benefit. This will include the assessment of impacts against seasonal turtle critical habitats to determine whether clean-up activities should proceed.• The response option has been assessed on a conservative basis utilising the worst case shoreline oil loading and independent of other response options which, if implemented will reduce the likelihood and severity of impacts along the shoreline.			
Demonstration of ALARP			
A detailed demonstration of ALARP for shoreline clean-up is presented in Appendix B of the OPEP.. This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.			
Demonstration of Acceptability			
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.		

EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.	
External context	There have been no concerns raised from relevant persons regarding spill response activities.	
Legislative context	<p>The EPS align with the requirements of:</p> <ul style="list-style-type: none"> • OPGGS Act and OPGGS(E): <ul style="list-style-type: none"> ○ Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts. ○ Regulation 13(5) (risk assessment undertaken to demonstrate ALARP). • <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i> (WA). • <i>Protection of Marine Waters (prevention of Pollution from Ships) Act 1987</i> (WA). • <i>Emergency Management Act 1986</i> (WA). • <i>Contaminated Sites Act 2003</i> (WA). • <i>Waste Management & Pollution Control Act 1998</i> (NT). • <i>Environment Protection Act 2019</i> (NT). 	
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-14: all EPS).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> • Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-14: all EPS).
	AEP CoEP (APPEA 2008)	<p>The EPS meet the following offshore development and production objectives:</p> <ul style="list-style-type: none"> • To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill-specific guidelines	

	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are deployed. The EPS listed in this table complement the NatPlan.
	AMOSPlan (2017)	AMOSC (on behalf of EOG) will implement this plan in the event their resources are required. The EPS listed in this table complement AMOSPlan.
	WA OSCP (2015)	DoT will implement this plan in the event their resources are deployed. The EPS listed in this table complement the WA OSCP.
	NT OSCP (2014)	The NT IC will implement this plan in the event their resources are deployed. The EPS listed in this table complement the NT OSCP.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	SCAT/Shoreline Clean-up	A guide to oiled shoreline assessment (SCAT) surveys (IPIECA/IOGP, 2014f).
		A guide to oiled shoreline clean-up techniques (IPIECA/IOGP, 2015d).
		Shoreline Response Program Guidance – A technical support document to accompany the IPIECA-IOGP guidance on oiled shoreline assessment and shoreline clean-up techniques (IPIECA-IOGP, 2020b).
		Characteristic Coastal Habitats: Choosing Spill Response Alternatives (NOAA, 2013b).

Environmental context	MNES	
	AMPs	Oil causing marine pollution is a threat identified in the North & North-West Marine Parks Network Management Plans 2018. Any spill response activity considered for AMPs such as Ashmore Reef and Cartier Island will be undertaken in consultation with the Commonwealth DNP. Any intervention would proceed after a NEBA identifying a positive benefit and identifying controls to bring any risks to ALARP.
	Ramsar wetlands	As above.
	TECs	Shoreline clean-up will not be undertaken in areas where TECs exist.
	NIWs	Any spill response activity considered for NIWs will be under the control of WA and/or NT CAs and would proceed only after a NEBA identified a positive benefit and identifying controls to be implemented to bring any risks to ALARP.
	Nationally threatened and migratory species	Any spill response activity considered for areas where nationally threatened and migratory species are present will be under the control of WA/NT CAs and would proceed only after a NEBA identified a positive benefit and identifying controls to be implemented to bring any risks to ALARP.
	Other matters	
	State marine parks	The North Kimberley Marine Park Management Plan (coastline is part of park) has the strategic objective <i>to protect and conserve biodiversity and ecological health</i> . Shoreline clean-up activities do not conflict with the management objectives for the park in terms of cultural, natural, recreation, tourism and community, or commercial values detailed in the management plan. Shoreline clean-up, if undertaken, will assist in preserving the objectives detailed in the management plan.

	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Marine (oil) pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (e.g. nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from identified habitat critical to their survival.</i> Shoreline clean-up activities will consider turtles within the NEBA performed by the WA or/ or NT CAs and will only be undertaken if there are net benefits with controls implemented. Shoreline clean-up supports the identified priority actions within this management plan.</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this.</p> <p>The Wildlife Conservation Plan for Seabirds (CoA, 2020) identifies oil pollution as a threat to seabirds although no specific actions are defined to manage the threat. Shoreline protection activities will assist in the removal of oil from the environment and isolation of species from oiled areas, thereby reducing the threat in support of the plan.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	<p>EOG considers the risk of a hydrocarbon release to be acceptable because:</p> <ul style="list-style-type: none">• It will adhere to the company’s Environment Policy;• The residual risk ratings are ALARP;• An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved.• Input from engagement with relevant persons and stakeholders has been considered and incorporated into the design of the activity;• Relevant legislation and industry best practice will be complied with;• Spill response activities will not have long-term or significant impacts on MNES;• Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species;• Spill response activities are not inconsistent with the aims of relevant marine reserve management plans; and• Spill response activities are not inconsistent with ESD principles.	
Environmental Monitoring		
<ul style="list-style-type: none">• As per Beehive-1 OPEP and OSMP requirements.		

Record Keeping	
<ul style="list-style-type: none"> • Contracts and agreements with third parties. • Equipment and service provider register. • Exercise drill reports. • Inspection/audit reports. • Incident and daily operations reports. 	<ul style="list-style-type: none"> • Operational NEBA. • Briefing records. • Photos. • OSMP implementation records and reports. • IAP. • Stakeholder Consultation Records • Shoreline TRPs • Induction Records

9.7. Oiled Wildlife Response

9.7.1 Background Information

Oiled wildlife response (OWR) may be required in the event of a significant spill incident, at sea (especially nearshore), on island shorelines, and/or at the WA/NT mainland shores. A description of the coastlines with key fauna sensitivities within the EMBA is provided in Section 5.3 of Appendix 11 and summarised in the environmental sensitivity matrix for the spill EMBA (see Appendix B of the OPEP).

The objective of OWR is to minimise the impacts of an oil spill on wildlife by both prevention of oiling where possible or mitigate the impacts of individuals when oiling has taken place (IPIECA-IOGP, 2014c).

OWR will be implemented for a Level 2/3 crude oil spill or Level 2 MDO spill. The response will be activated and undertaken in accordance with the WA and/or NT oiled wildlife plans by trained personnel, prioritised according to net benefits based on a WA and/or NT operational NEBA, and informed via monitoring and SCAT activities. OWR response activities are typically under the control of the relevant WA and/or NT CA. Control agencies may choose to deploy their own OWR team leads and support personnel or the CA may request EOG to provide specialist support personnel including OWR team leads, additional OWR personnel and labour hire, OWR equipment, logistical and service support (water, waste) for remote and/or larger OWR operations.

As per shoreline clean-up, the only two locations in the region that do not have a WA or NT CA are Ashmore Reef and Cartier Island, both of which are under Commonwealth control. In the event of a spill reaching these locations, EOG will be the CA. In this scenario, SCAT teams would survey with team membership consisting of SCAT and wildlife response specialists provided by mutual aid, and as recommended by the DNP, possibly a Parks Australia person with local knowledge. No Aboriginal heritage advisers are required at these two locations.

In the event of a spill, modelling indicates that an extensive area of coastline may be exposed to shoreline accumulations of hydrocarbons. Based upon sensitivity of receptors and maximum shoreline loadings, there are a large number of locations – specifically birds and turtles, which have the potential to be oiled. Table 9.11 provides details of the environmentally sensitive shoreline fauna locations predicted to be heavily impacted by oil and the time for contact at 10 g/m² (survey implementation timeframes) and 100 g/m² (OWR resource response timeframe).

9.7.2 Scope of Activity

Broadly, OWR involves the following three-tiered approach:

1. Primary Response
 - a. Undertaking surveillance to determine location and extent of wildlife injuries or death (situational awareness possibly using drones).
 - b. Deflecting oil away from areas of high sensitivity where practicable.
2. Secondary Response
 - a. Hazing (scaring animals away for impacted or potentially impacted areas).
 - b. Pre-emptive capture and exclusion activities.
3. Tertiary Response:
 - a. Capture and stabilisation of oiled wildlife (on vessels or on the beach).
 - b. Transport to treatment facilities
 - c. Treatment of affected animals.
 - d. Rehabilitation and release of affected animals.

Site-specific wildlife reconnaissance is undertaken by SCAT teams where possible to optimise response resources.

Hazing, to deter wildlife from entering contaminated areas or move wildlife away from areas likely to be affected by the spill, includes the following techniques:

- Human disturbance (simple process of humans in the wildlife habitat);
- Vehicular disturbance (e.g., terrestrial vehicles, boats and aircraft);
- Visual disturbance (e.g., lights, reflectors, flags, effigies, etc.);
- Auditory disturbance (e.g., noise generators); and
- Physical structures (e.g., fences) to prevent wildlife from entering site.

Animals often quickly become habituated to the deterrent stimulus, at which point efficacy will decrease markedly and the deterrent should be changed.

Both the WA DoT and NT DEWPS have OWR plans for their respective states: the WA Oiled Wildlife Response Plan (WAOWRP) and the NT Oiled Wildlife Response Plan (NTOWRP).

Given the remoteness and poor land access to much of the affected coastline within the spill EMBA, EOG anticipates that a significant portion of the OWR will be supported by marine resources (transport, accommodation, and treatment of affected animals). Therefore, both landside and marine activities are anticipated.

9.7.3 Hazards

OWR involves reconnaissance from vessels, aircraft, drones and shoreline surveys as well as capture, transport, rehabilitation of oiled wildlife.

In addition to vessel, aircraft and shoreline survey/activity hazards previously identified in this EP, additional hazards associated with wildlife response include:

- Hazing activities;

- Pre-emptive capture and capturing of oiled wildlife;
- Relocation of unoiled wildlife;
- Transporting wildlife;
- Stabilising wildlife;
- Cleaning and rinsing oiled wildlife;
- Rehabilitation (e.g., diet, cage size, housing density) activities; and
- Release of wildlife.

9.7.4 Known and Potential Impacts and Risks

At sea, the known and potential environmental risks of OWR activity are:

- Planned noise, air and light emissions from vessels (accommodation and activity support) and aircraft (reconnaissance) as per Section 7.1 to Section 7.11 and Section 9.2;
- Planned liquid and solid discharges from vessels as per Sections 7.3, 7.4, 7.5, 7.8 to 7.11; and
- Unplanned events from vessels as per Sections 8.1 to 8.4.

Onshore, the potential environmental impacts and risks are generally limited to:

- Vegetation clearing required for the establishment of OWR facilities (directed by the relevant WA and/or NT CA);
- Use of drones in surveillance activities;
- Provision of water and other services (generators, hot water);
- The generation of waste materials (oil and detergents washed off animals, oiled carcasses, oiled PPE, transport boxes, used medical supplies); and
- Domestic wastes (e.g., food and kitchen waste, sewage, etc.,) generated by responders.

Additional wildlife-related specific risks associated with OWR include:

- Hazing activities
 - Disturbance to target and non-target biota with potential for behavioural impacts (i.e., to resting, feeding, breeding) and stress-related responses.
 - Exclusion facilities (e.g., drift fences around sensitive habitats such as turtle hatchling areas to prevent hatchlings from entering an oiled area) may deter non-target animals from their normal resting, feeding, breeding and other behaviours.
- Pre-emptive capture and capturing of oiled wildlife
 - Inefficient capture techniques (e.g., due to inadequate training) have the potential to cause stress, exhaustion, or injury to wildlife.
 - Pre-emptive capture/translocation could cause undue wildlife impacts when oiling is not certain.
- Transporting wildlife
 - Inefficient transport techniques have the potential to cause injury, stress and thermoregulation pressures to wildlife.

- Stabilising wildlife
 - Inefficient stabilisation of wildlife has the potential to cause injury to wildlife and thermoregulation stress, in addition to potential mortality during the triage process.
 - Euthanasia of affected animals that cannot be treated or have no chance of rehabilitation.
- Cleaning and rinsing oiled wildlife
 - Inefficient cleaning and rinsing techniques have the potential to cause injury, stress and exhaustion of wildlife (e.g., removing the natural water-proofing on feathers).
- Rehabilitation (e.g., diet, cage size, housing density) activities
 - Inefficient rehabilitation techniques have the potential to cause injury or thermoregulation stress.
- Release of treated wildlife
 - Potential to stress wildlife if released in an unfamiliar site.
 - Potential for rehabilitated wildlife to return to the oiled area of capture.
 - Potential for stress when adjusting to the release site.

9.7.5 Evaluation of Impacts and Risks

The evaluation of environmental impacts and risks associated with OWR are:

- Planned noise, air and light emissions from vessels and aircraft as per Sections 7.3, 7.4 and 7.5;
- Planned liquid and solid discharges from vessels as per Sections 7.8 through 7.11;
- Unplanned events from vessels as per Sections 8.1 to 8.6;
- Aircraft impacts as per Section 7.4 and 7.5 and Section 9.2;
- Shoreline vegetation clearing as per Section 9.6; and
- Waste generation, handling, treatment and disposal as per Section 9.8.

Other identified impacts and risks include:

Unnecessary Wildlife Impacts

It is preferable to have oil-affected animals that have no prospect of surviving or being successfully rehabilitated and released back to their environment, humanely euthanized rather than allow for prolonged suffering. The removal of these individuals from the environment has additional benefits in so far as they are not consumed by predators/scavengers, avoiding secondary contamination of the food chain.

Hazing is best undertaken by trained and experienced expert personnel as there are many factors to be considered, both before and during hazing. Considerations include having available geographic area to relocate species to and understanding specific species response to the specific deterrent.

Hazing and exclusion of wildlife from known congregation, resting, feeding, breeding or nesting areas may have a short or long-term impact on survival if access to result in the prevention of species accessing their preferred resources (affecting both target and non-target species). For example, drift-fences set up on beaches to capture emergent turtle hatchlings before they entered an inter-tidal

oiled zone may prevent them from reaching the sea and will require relocation/ release to an area well away from the slick (informed by modelling).

This approach may also result in additional localised disturbance/handling stress without any benefit as many species (e.g., birds) return to sites from which they have been moved. This can result in reduced healing capacity, reduced reproduction and species recruitment, as well as reduced energy stored for migratory animals.

Untrained personnel capturing and handling native fauna may cause distress, injury and death of fauna. To prevent these impacts only trained oiled wildlife responders will approach and handle fauna. This will reduce the potential for distress, injury or death of individual wildlife and prevent injury to the responders.

Fauna casualties from OWR activities have the potential to result in incremental impacts on fauna populations (though oiling is expected to pose a greater risk). However, there is still the potential for OWR to result in local degradation of the environment or effects on individuals as opposed to population level effects.

Wildlife behavioural impacts due to use of drones

While drones are being used increasingly in wildlife studies, there are few scientifically justified guidelines that provide minimum distances at which wildlife can be approached to minimise visual and auditory disturbance. Bevan et al (2018) identified that sea turtles in nearshore waters off nesting beaches or in foraging habitats exhibited no evasive behaviours (e.g. rapid diving) in response to a drone at or above 20-30m altitude, and at or above 10m altitude for juvenile green and hawksbill turtles foraging on shallow, algae covered reefs. Adult female flatback sea turtles were not deterred by drones flying forward or stationary at 10m altitude when crawling up the beach to nest or digging a body pit or egg chamber. In contrast, flyovers elicited a range of behaviours from crocodiles including minor lateral head movements, fleeing or complete submergence when a drone was present below 50m altitude. Similarly, a colony of crested terns resting on a sandbank displayed disturbance behaviours (e.g. flight response) when a drone was flown below 60m altitude.

Within the Bevan et al (2018) study, it was concluded that behavioural disturbance thresholds for diverse species should be considered when establishing operating conditions for drones. Current evidence shows that negative effects on bird species are reduced when drones are flown at altitudes ≥ 60 m depending on the characteristics of the target species. The Wildlife Conservation Plan for Seabirds (CoA, 2020) recommends that altitude thresholds for target species should be determined prior to initiating studies.

Hampton et al (2022) also identifies that the proximity of take-off and landing locations have behavioural effects on wildlife with Mulero-Pazmany et al (2017) suggesting that control stations are 100-300m away from the study area.

Drone surveys also present a risk of mid-air wildlife (bird) collision resulting in injuries or fatalities to individuals. Mulero-Pazmany et al (2017) recommends, to minimise disturbance and collision risk that drones are operated only by experienced pilots; drones with a low noise profile are utilised, survey missions should be as short as possible; manoeuvres above animals be avoided; minimise flights over sensitive species or during breeding periods; avoid drones with silhouettes that resemble predator shapes and favour indirect approaches.

Onshore OWR Facility Impacts

Given the remote locations where oil spill impacts may occur, most OWR activity (triage, etc.,) is likely to be marine-based on vessels with appropriate pollution treatment and control for vessel discharges. Marine-based operations (accommodation, triage, treatment and support) would utilise offshore

barges with all wastes contained on-board as per assessed vessel operations (see Section 7.8, 7.9, 7.10 and 7.11)

During oiled wildlife cleaning, it is expected that up to 1000 litres of fresh water may be required to wash and rinse one wildlife casualty. Additional water is required for rehabilitation pools, general cleaning, etc. Freshwater and oily water waste storage is therefore a key consideration. For those areas where onshore access is available, OWR centres will preferentially avoid locations which require vegetation clearing (leading to loss of habitat, reduction in local species biodiversity and abundance). Facilities such as portable toilets, kitchen facilities, oily residue management will be established to deal with the day-to-day requirements of responders so wastes are not discharged to the environment.

Waste Collection, Treatment and Disposal

OWR activities undertaken offshore will manage OWR waste residues on-board vessels in inboard tanks or on deck mounted liquid waste storage tanks and avoid discharge to the marine environment. These wastes will then be collected at the FOB (expected to be Port of Darwin) for treatment and disposal by EOG's waste management contractor (see Section 9.8).

Onshore, OWR facilities will be supplied with facilities for the collection and/or treatment of oily water and detergents associated with the treatment of oiled wildlife to prevent discharge to the environment. A licenced waste management contractor will coordinate the supply of waste facilities and regular removal of wastes (including carcasses) to licenced facilities for disposal and/or treatment. Further details are provided in Section 9.8.

9.7.6 Impact and Risk Assessment

Table 9.16 presents the impact and risk assessment for OWR operations.

Table 9.16. Impact and risk assessment for OWR operations

Summary		
Summary of risks	Disturbance, injury or death of wildlife through inappropriate handling and treatment Hazing of target fauna may result in disruption to feeding, resting, breeding activities of non-target species. Onshore response centres set-up and operation (possible vegetation clearing, disturbance to shorelines, cultural heritage impacts) Waste generation and disposal (refer Section 9.8 for assessment)	
Extent of risk	Localised. OWR limited to shoreline areas where hydrocarbon loadings may have ecological impacts.	
Duration of risk	Long-term – weeks to months at any one location.	
Level of certainty of risk	HIGH – The impacts associated with OWR are well understood, with trained personnel available through the WA and NT OWR Plans to manage the activity. However, and operational NEBA undertaken at the time of the spill will determine the suitability of the response.	
Risk decision framework context	Decision type	B – good industry practice required with engineering risk-based tools applied.
	Activity	New to the organisation or geographical area, infrequent or non-standard activity, good practice is well defined.

	Risk & uncertainty	Amenable to assessment using well-established data and methods, some uncertainty.		
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.		
Defined acceptable level	The net environmental benefit of a spill response strategy must be greater than no response.			
Risk Assessment (inherent)				
Hazard		Likelihood	Consequence	Risk rating
Wildlife injury or death through inappropriate handling and treatment		Occasional	Moderate	Medium
Wildlife injury or death through inappropriate handling and treatment to fauna of cultural significance to First Nations people (e.g., turtles, dugong)		Occasional	Moderate	Medium
Hazing disturbance to non-target species		Likely	Moderate	Medium
Fauna Disturbance due to drone activity		Likely	Moderate	Medium
Onshore response centre set-up and operation (vegetation clearing)		Likely	Moderate	Medium
Assessment of Proposed Control Measures				
<p>The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic (or <i>a-priori</i>) NEBA, which is presented in Appendix B (BOD) of the OPEP.</p> <p>A strategic NEBA is based on theory and experience from other global LoWC incidents, but not on experience for this well, this oil type (which is speculative) and this location. An operational (<i>a-posteriori</i>) NEBA will be undertaken at the time of the spill once key facts about the spill are established (nature of the oil, flow rate, trajectory of movement, etc).</p>				
Environmental Controls and Performance Measurement				
EPO	EPS		Measurement criteria	
<i>Preparedness - all preparedness EPS are presented in Appendix B of the OPEP.</i>				
<i>Response</i>				
Humanely treat, house, and release oiled fauna wherever possible. Euthanise fauna where treatment and release is not a humane option.	(RSK-15:EPS-02) Integration of WA and/or NT-based OWR liaison representatives in the DIMT is undertaken prior to the spill reaching coastal waters to facilitate planning and implementation of OWR response.		Incident logs verify integration of state-based agency OWR personnel into the DIMT prior to the spill reaching state waters.	
	(RSK-15:EPS-03) Mobilisation of OWR resources and trained resources will take place in accordance with the timeframes outlined in the OPEP.		Incident logs verify mobilisation within timeframes.	
	(RSK-15:EPS-04) Capture and treatment of oiled wildlife is undertaken only by trained personnel.		Incident logs noting names of wildlife capture and treatment personnel.	

	(RSK-15:EPS-05) Personnel provided by EOG are inducted into OWR handling restrictions.	Induction records.	
	(RSK-15:EPS-06) Wildlife surveys by drones are undertaken by experienced drone pilots flying at the highest altitude possible to avoid disturbance to the target species if known. Disturbance altitude should be established for each target species If altitude is not known, 60 m should be utilised for bird species and 10 m for nesting turtles.	Incident logs capture fly-over altitudes for target species.	
	(RSK-15:EPS-07) OWR response continues until termination criteria are met, as outlined within the OPEP.	Incident logs.	
Risk Assessment (residual)			
Hazard	Likelihood	Consequence	Risk rating
Wildlife injury or death through inappropriate handling and treatment	Remote	Moderate	Low
Wildlife injury or death through inappropriate handling and treatment to fauna of cultural significance to First Nations people (e.g., turtles, dugong)	Remote	Moderate	Low
Hazing disturbance to non-target species	Remote	Moderate	Low
Fauna Disturbance due to drone activity	Remote	Moderate	Low
Onshore response centre set-up and operation (vegetation clearing)	Remote	Moderate	Low
The risk of spill response activities to the identified receptors is assessed as low because:			
<ul style="list-style-type: none">• The control measures adopted are effective in reducing the risk to ALARP.			
Demonstration of ALARP			
A detailed demonstration of ALARP is presented in Appendix B of the OPEP. This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.			
Demonstration of Acceptability			
Policy compliance	EOG’s Safety and Environmental Policy objectives are met.		
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.		
External context	There have been no concerns raised from relevant persons regarding spill response activities.		
Legislative context	The EPS align with the requirements of: <ul style="list-style-type: none">• OPGGS Act 2006 and OPGGS(E):<ul style="list-style-type: none">○ Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts.○ Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP).		

	<ul style="list-style-type: none"> • EPBC Regulations 2000 (Cth): <ul style="list-style-type: none"> ○ Part 8 (Interacting with cetaceans and whale watching). • <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i> (WA). • <i>Protection of Marine Waters (prevention of Pollution from Ships) Act 1987</i> (WA). • <i>Emergency Management Act 1986</i> (WA). • <i>Contaminated Sites Act 2003</i> (WA). • <i>Waste Management & Pollution Control Act 1998</i> (NT). • <i>Environment Protection Act 2019</i> (NT) • <i>Parks and Wildlife Commission Act 2013</i> (NT) • <i>Territory Parks and Wildlife Conservation Act 2014</i> (NT) 	
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	<p>The EPS meet the relevant mitigation measures listed for offshore activities with regard to:</p> <ul style="list-style-type: none"> • Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-15: all EPS).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	<p>Guidelines met with regard to:</p> <ul style="list-style-type: none"> • Sections 76-79 (Spill response planning): A spill response plan should be prepared (RSK-15: all EPS).
	AEP CoEP (APPEA 2008)	<p>The EPS meet the following offshore development and production objectives:</p> <ul style="list-style-type: none"> • To reduce the risk associated with any oil spill response option from any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill-specific guidelines	
	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are deployed. The EPS complement the NatPlan.
	AMOSPlan (2017)	AMOSC (on behalf of EOG) will implement this plan in the event their resources are required. The EPS complement AMOSPlan.
	WA OSCP (2015)	DoT will implement this plan in the event their resources are deployed. The EPS complement the WA OSCP.
	WA OWRP (2021)	WA OWRP is a subplan to the WestPlan-MOP and is the responsibility of DBCA) who provides advice

		to the CA with respect to OWR. The EPS complement the WA OWRP.
	NT OSCP (2014)	The NT IC will implement this plan in the event their resources are deployed. The EPS complement the NT OSCP.
	NT OWRP (2019)	PWC is the lead agency for OWR in the NT and will liaise with the CA on oiled wildlife matters in the event of a hydrocarbon spill. This plan will be implemented according to the nature and scale of the spill. The EPS complement the WA OWRP.
	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	OWR	Key principles for the protection, care and rehabilitation of oiled wildlife (IPIECA, IOGP, 2017)
		Wildlife response preparedness (IPIECA/IOGP, 2014c).
		A guide to oiled wildlife response planning (IPIECA, 2014).
Environmental context	MNES	
	AMPs	Oil causing marine pollution are a threat identified in the North Marine Parks Network Management Plan 2018. Removal of oil impacts through spill response activities such as OWR will assist in the protection and rehabilitation of fauna species vulnerable to oil in AMPs. OWR activities, with controls adopted, will not have any impacts on AMPs.
	Ramsar wetlands	OWR activities will not be undertaken in Ramsar wetlands given the sensitivity of the habitat, hence no impacts predicted. OWR assists in protecting and rehabilitating Ramsar-associated wildlife.
	TECs	OWR activities will not be undertaken in areas where TECs exist. No impacts predicted.

	NIWs	OWR activities will not be undertaken in NIWs given the sensitivity of the habitat, hence no impacts predicted. OWR assists in protecting and rehabilitating NIW-associated wildlife.
	Nationally threatened and migratory species	OWR activities prevent oil spill impacts to, or rehabilitate (where possible), nationally threatened and migratory species from oiling impacts. As such, OWR activities do not conflict with nationally threatened/migratory species management plan requirements.
	Other matters	
	State marine parks	The North Kimberley Marine Park Management Plan has the strategic objective <i>to protect and conserve biodiversity and ecological health</i> . OWR activities do not conflict with the management objectives for the park in terms of cultural; natural; recreation, tourism and community; or commercial values detailed in the Management Plan. OWR will assist in preserving the objectives detailed in the management plan.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	Marine (oil) pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (e.g. nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from identified habitat critical to their survival</i> . OWR activities supplement other oil spill response strategies (which prevent impacts to critical habitats) and mitigate any impacts to the species assist with their recovery. OWR supports the identified priority actions within this management plan. The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this. OWR does not propose to target whales, dolphins or dugongs for rehabilitation due to their size. The Wildlife Conservation Plan for Seabirds (CoA, 2020) identifies oil pollution as a threat to seabirds although no specific actions are defined to manage the threat. OWR activities will mitigate impacts on bird species thereby reducing the threat in support of the plan.

ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).
Statement of acceptability	<p>EOG considers the risk associated with OWR activities resulting from a hydrocarbon release to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Environment Policy; • The residual risk ratings are low and ALARP; • An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved. • Input from engagement with relevant persons and stakeholders has been considered and incorporated into the design of the activity; • Relevant legislation and industry best practice will be complied with; • Spill response activities will not have long-term or significant impacts on MNES; • Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; • Spill response activities are not inconsistent with the aims of relevant marine reserve management plans; and • Spill response activities are not inconsistent with ESD principles.
Environmental Monitoring	
<ul style="list-style-type: none"> • As per Beehive-1 OPEP and OSMP requirements. 	
Record Keeping	
<ul style="list-style-type: none"> • Contracts and agreements with third parties. • Equipment and service provider register. • Exercise drill reports. • Inspection/audit reports. • Incident and daily operations reports. • OWR Strategy • Shoreline TRPs. • Operational NEBA. • Briefing records. • Photos. • OSMP implementation records and reports. • IAP. • Stakeholder Consultation Records • Induction Records 	

9.8. Waste Management (Support Activity)

9.8.1. Background Information

Waste removal and management is a support activity relevant to almost all the oil spill response strategies detailed throughout Chapter 9. The minimisation of waste generation and recovery of waste is a key consideration in assessing benefits of the oil spill response strategies, especially in the context of logistics in a remote environment and that oil spill response results in the rapid generation and accumulation of large quantities of oily waste (IPIECA-IOGP, 2014d). Table 9.17 summarises the types of waste typically generated by each response strategy.

Table 9.17. Waste typically generated by each response strategy

Response strategy	Waste generated	
Relief well drilling	Routine and unplanned emissions and discharges (see Chapters 7 and 8)	
Monitor and evaluate	Routine vessel discharges and emissions (refer Section 9.2)	
Dispersant application	Empty dispersant containers	PPE
Offshore CAR	Recovered weather oil Oily water	Oiled PPE Oiled sorbent materials

	Oiled equipment (booms skimmers) Oiled vessels	Oiled flotsam & jetsam Animal carcasses
Shoreline protection & deflection Shoreline clean-up	Recovered weather oil Oily water Oiled equipment (booms skimmers) Oiled vessels Oiled storage facilities (temporary tanks, pit liners, barrels, sacks, skips, bins)	Oiled PPE Oiled sorbent materials Oiled flotsam & jetsam Animal carcasses Oiled vegetation Oiled beach material (sand, wrack materials) General domestic wastes
OWR	Animal carcasses Animal capture materials (nets, slings, stretchers, transport boxes) Veterinary wastes Oil absorbent materials	Oiled equipment (booms, skimmers) Oiled vessels Oily water (from washing) Oiled PPE General domestic wastes

9.8.2. Scope of Activity

Once oil and associated waste are contained and recovered, residues must be carefully removed and managed (transferred, stored and disposed) to avoid further contamination of the environment. Waste management will be implemented for a Level 2 or 3 spill event when safe to do so and as directed by WA and/or NT Control Agencies in WA/NT waters.

Waste management is a key consideration for many of the response options outlined in this chapter. As part of the implementation of response options, a waste management plan will be developed in consultation with AMOSC and EOG's waste management contractor, prior to the commencement of the activity. This plan will take into account the unique logistics required for the spill EMBA coastline and put provisions in place to rapidly mobilise waste management personnel and equipment to various locations along the affected coastline. The waste management plan will deal with the following:

- Establishment of temporary waste depots;
- Waste storage;
- Waste transfer (offshore to onshore, nearshore to shore, shoreline to road/marine support);
- Waste transport (temporary facilities to permanent facilities); and
- Waste disposal or treatment.

EOG will adhere to, and implement strategies to support the waste minimisation hierarchy when dealing with waste (IPIECA-IOGP, 2014d):

1. Avoid/eliminate – consider actions which will eliminate or avoid the production of waste (e.g., removal of shoreline wrack prior to oiling);
2. Reduce – techniques to reduce waste generated (e.g., in-situ treatment of oiled material such as offshore decanting of water collected in CAR activities and careful control of consumables such as sorbent materials);
3. Reuse – implement programs to reuse resources where possible during clean-up (e.g., reusing oiled equipment and PPE where possible);

4. Recycle – implement programs to reuse wastes such as waste oil recovery into refinery streams or road building;
5. Recovery – utilise waste oil as a fuel for power or heat generation; and
6. Disposal – wastes that cannot be dealt with by the above techniques are disposed of through options such as incineration, landfill or composting in accordance with the relevant WA and/or NT legislative requirements.

EOG has assessed the waste management requirements for a Level 3 LoWC incident. Anticipated waste volumes to be collected, treated and disposed based on a LoWC (Level 3) incident are provided in Appendix B of the OPEP. All wastes generated from response options described in this section have been treated independently (i.e., it assumes that dispersant application cannot be implemented and therefore does not reduce the impact on shoreline loading volumes). Waste management arrangements are therefore seen as being conservative.

9.8.3. Hazards

The hazards associated with waste management activities include the following:

- Increased vessel and marine activity;
- Waste management handling, transfer, storage, transport and disposal;
- Establishment of shoreline waste transfer areas; and
- Offshore decanting and transfer activities.

9.8.4. Known and Potential Impacts and Risks

For both onshore and offshore waste management activities, response activities may be delayed/constrained by limited access to temporary waste storage, transport and disposal.

Offshore, the known and potential environmental risks of waste management activity are:

- Planned noise, air and light emissions from vessels (accommodation and activity support) as per Section 7.3 to 7.5;
- Planned liquid and solid discharges from vessels as per Sections 7.8 to 7.11;
- Unplanned events from vessels as per Sections 8.1 to 8.6;
- Contain and recover vessel decanting activities leading to a return of oil to the offshore environment (as per Section 9.4); and
- Oil transfer from CAR vessels to support marine storage vessels leading to oil spills offshore (as per Section 9.4).

Onshore, the potential environmental impacts and risks associated with waste management activities are generally limited to:

- Vegetation clearing required for the establishment of waste collection facilities (directed by the relevant WA and/or NT CA) as per Section 9.7 (OWR).
- Secondary contamination of the environment (i.e., spreading of oil to otherwise unpolluted areas via response activities associated with people, equipment and vehicles) such as:
 - Air pollution (incineration disposal techniques).
 - Groundwater contamination (failure of temporary coastal storage, transfer spills, transport spills, inappropriate landfill disposal).
 - Habitat damage and fauna injury/death (failure of temporary coastal storage, transfer spills, transport spills, inappropriate landfill disposal).

Health and safety risks to response personnel are not addressed here, these will be specifically dealt with in the spill-specific waste management plan.

9.8.5. Evaluation of Impacts and Risks

Impacts and risks associated with increased marine vessel activity offshore is contained in Sections 7.3 to 7.5, Sections 7.8 to 7.11 and Sections 8.1 to 8.6, along with Section 9.5 (shoreline vessels).

Impacts and risks associated with vegetation clearing associated with onshore waste holding and transfer facilities are described in Section 9.5 (Shoreline Protection).

Constrained Waste Management

EOG has assessed waste management requirements on a conservative basis to understand the level of support required to provide effective and non-constrained waste management support. EOG will engage a waste management contractor with a national footprint, experienced in emergency response and has access to waste storage equipment, transport and resources to support a Level 3 LoWC Beehive oil spill response to ensure waste collection and disposal (and therefore spill clean-up response) is not constrained by inadequate waste removal.

In the event of a Level 3 spill, a Waste Management Contractor Coordinator will operate within the EOG DIMIT and assist in the development of a spill-specific waste management plan.

Offshore, waste collection activities may be constrained by available oil/water storage capacity. To increase capacity, CAR vessels will utilise oil/water decanting techniques (see below) as approved by AMSA to maximise the vessels' oil storage capacity. In addition and as required, an additional support vessel (tanker or barge) may be engaged as an 'oil reception vessel' to receive waste oil from CAR vessels thereby increasing the endurance of the CAR strike vessels.

Secondary Contamination

Secondary contamination of the environment can occur through overfilling oil containment, transfer spills or utilising inappropriate treatment/disposal techniques/locations. EOG's waste management plan supported by EOG's waste contractor facilities will ensure that all wastes are appropriately segregated, stored in covered containers in storage areas with impervious bunds to collect spills, transported via appropriately permitted vehicles and disposed to licenced waste treatment/disposal facilities in accordance with all WA and/or NT waste legislation to prevent secondary contamination.

9.8.6. Impact and Risk Assessment

Table 9.18 presents the impact and risk assessment for waste management operations.

Table 9.18. Impact and risk assessment for waste management operations

Summary	
Summary of risks	Offshore oil spills due to decanting or oil transfer with associated toxicity effects to marine fauna. Increased vessel activity. Secondary oil contamination (leaking containers, transfer spills, incorrect disposal location).
Extent of risk	Shoreline (localised) – waste management activities contained to sandy beaches, near-shore activities shoreline, accessed by vessel vehicles and on foot (where possible and safe to do so). Offshore (localised) – surrounding contain and recover vessels, oil storage tanker.
Duration of risk	Mid to long-term (~100 days for LoWC incident)
Level of certainty of risk	HIGH – The impacts associated with spill response waste management are well understood, with trained personnel available through EOG Contractor(s).

	However, an operational NEBA undertaken at the time of the spill will determine the suitability of the response and the location of waste management to reduce impacts to ALARP.		
Risk decision framework context	Decision type	B – good industry practice required with engineering risk-based tools applied.	
	Activity	New to the organisation or geographical area, infrequent or non-standard activity, good practice not well defined or met by more than one option.	
	Risk & uncertainty	Amenable to assessment using well-established data and methods, some uncertainty.	
	Stakeholder influence	No conflict with company values, some partner interest, some persons may object, may attract local media attention.	
Defined acceptable level	The net environmental benefit of a spill response strategy must be greater than no response.		
Risk Assessment (inherent)			
Waste strategy	Likelihood	Consequence	Risk rating
Secondary contamination (spills on transfer, incorrect disposal)	Occasional	Moderate	Medium
Delays in waste removal constraining response activities	Likely	Moderate	Medium
Assessment of Proposed Control Measures			
The suitability of response techniques to a spill of crude oil from a Beehive-1 LoWC are based on a strategic NEBA, which is presented in Appendix B of the OPEP.			
The controls for each response strategy was assessed to ALARP in Appendix B of the OPEP. EPOs, EPSs and measurement criteria for response strategy preparedness are also presented in Appendix B of the OPEP.			
Environmental Controls and Performance Measurement			
EPO	EPS	Measurement criteria	
Preparedness - all preparedness EPS are presented in Appendix B of the OPEP.			
Waste from oil spill recovery activities will be managed to prevent additional environmental impacts and ensure clean-up operations are not constrained by waste handling issues.	(RSK-16:EPS-01) TRPs for PPAs are prepared ahead of drilling, factoring in shoreline type and safe access for waste management purposes.		Shoreline PPA TRPs are available prior to the well spud.
Response			
Waste management resources are sufficient to allow for uninterrupted response	(RSK-16:EPS-02) Waste contractor is called out and mobilised within 48 hrs after notification of a LoWC to assist with the development of a spill-specific waste management plan.		Incident logs verify contact is made with the waste contractor in the required time.

implementation as a result of waste collection and disposal	(RSK-16:EPS-03) Waste management personnel and equipment are deployed (if safe to do so, depending on shoreline type) to areas at least 48 hours prior to predicted shoreline stranding to minimise waste where possible (e.g., relocate shoreline wrack).	Incident logs verify personnel and equipment are deployed in the required time.
	(RSK-16:EPS-04) Waste collection facilities are set out in accordance with spill-specific TRPs/waste management plan, which provides for waste storage tanks and hoses to be located in a contained, impervious area.	Incident logs verify waste storage facility has been set-up and is supervised.
	(RSK-16:EPS-05) Waste storage areas are under supervision and secured from public access.	Audit records verify waste storage facility is secured and supervised
	(RSK-16:EPS-06) Wastes are treated and/or disposed of in accordance with the spill specific waste management plan, which documents all regulatory requirements.	Waste transport, disposal and/or destruction certificates verify regulatory compliance.
	(RSK-16:EPS-07) Waste management response continues until termination criteria are met, as outlined within the OPEP.	Incident logs.

Risk Assessment (residual)

Response strategy	Likelihood	Consequence	Risk rating
Secondary contamination (spills on transfer, incorrect disposal)	Rare	Moderate	Low
Delays in waste removal constraining response activities	Rare	Moderate	Low

The risk of spill response activities to the identified receptors is assessed as negligible to low because:

- The control measures adopted are effective in reducing the risk to ALARP.

Demonstration of ALARP

A detailed demonstration of ALARP is presented in Appendix B of the OPEP. This also considers the availability, functionality, reliability, survivability and independence/capability of each control measure.

Demonstration of Acceptability

Policy compliance	EOG's Safety and Environmental Policy objectives are met.
EMS compliance	Chapter 10 describes the EP implementation strategy to be employed for this activity.
External context	There have been no concerns raised from relevant persons regarding spill response activities.
Legislative context	The EPS align with the requirements of: <ul style="list-style-type: none"> • OPGGS Act 2006 and OPGGS(E): <ul style="list-style-type: none"> ○ Part 6.2 – directs the polluter to take actions in response to an incident and to clean up and monitor impacts.

	<ul style="list-style-type: none"> ○ Regulation 13(5) (Risk assessment undertaken to demonstrate ALARP). • EPBC Regulations 2000 (Cth): <ul style="list-style-type: none"> ○ Part 8 (Interacting with cetaceans and whale watching). • <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i> (WA). • <i>Protection of marine Waters (Prevention of Pollution from Ships) Act 1987</i> (WA). • <i>Emergency Management Act 1986</i> (WA). • <i>Contaminated Sites Act 2003</i> (WA). • <i>Waste Management & Pollution Control Act 1998</i> (NT). • <i>Environment Protection Act 2019</i> (NT). 	
Industry practice	The consideration and alignment of EPS, listed in this table and in the OPEP BoD, with the mitigation measures outlined in the below-listed codes of practice and guidelines demonstrates that BPEM will be implemented for this activity.	
	Environmental management in the upstream oil and gas industry (IOGP-IPIECA, 2020)	The EPS meet the relevant mitigation measures listed for waste management with regard to: <ul style="list-style-type: none"> • Emergency preparedness and response – spill preparedness and emergency response measures are in place (RSK-16: all EPS).
	Best Available Techniques Guidance Document on Upstream Hydrocarbon Exploration and Production (European Commission, 2019)	No guidance is provided regarding oil spill response activities, other than having a spill contingency plan in place. An OPEP is in place for the activity.
	Environmental, Health and Safety Guidelines for Offshore Oil and Gas Development (World Bank Group, 2015)	Guidelines met with regard to: <ul style="list-style-type: none"> • Sections 76-79 (Spill response planning): A spill response plan should be prepared (OPEP).
	AEP CoEP (APPEA 2008)	The EPS meet the following offshore development and production objectives: <ul style="list-style-type: none"> • To reduce the risk of any unplanned release of material into the marine environment to ALARP and to an acceptable level.
	Hydrocarbon spill-specific guidelines	
	NatPlan (AMSA, 2020)	AMSA will implement this plan in the event their resources are deployed. The EPS complement the NatPlan.
	AMOSPlan (2017)	AMOS (on behalf of EOG) will implement this plan in the event their resources are required. The EPS complement AMOSPlan.
	WA OSCP (2015)	DoT will implement this plan in the event their resources are deployed. The EPS complement the WA OSCP.
	NT OSCP (2014)	The NT IC will implement this plan in the event their resources are deployed. The EPS complement the NT OSCP.

	Contingency planning for oil spills on water – Good practice guidelines for incident management and emergency response personnel (IPIECA/IOGP, 2015b)	The EPS are prepared cognisant of these guidelines, which discuss oil spill scenarios, various response techniques and the requirements for contingency plan preparation.
	Oil spill training - Good practice guidelines on the development of training programmes for incident management and emergency response personnel (IPIECA/IOGP, 2014b)	The EPS are prepared cognisant of these guidelines, in so far as training of EOG and contractor personnel in oil spill preparedness and response takes place and is overseen by an emergency response specialist.
	Response-specific guidance	
	Waste management	Oil spill waste minimisation and management (IPIECA, IOGP, 2014).
Environmental context	MNES	
	AMPs	Oil causing marine pollution are a threat identified in the North Marine Parks Network Management Plan 2018 (DNP, 2018). Removal of oil through spill response activities supported by waste management will assist in the protection and rehabilitation of fauna species vulnerable to oil in AMPs. Waste management activities, with controls implemented, will not have any impacts on AMPs.
	Ramsar wetlands	Waste management activities will not be undertaken in Ramsar wetlands given the sensitivity of the habitat. No impacts are predicted.
	TECs	Waste management activities will not be undertaken in areas where TECs exist. No impacts are predicted.
	NIWs	Waste management activities will not be undertaken in areas classified as NIW given the sensitivity of the habitat. No impacts are predicted.
	Nationally threatened and migratory species	Waste management activities remove oil from the environment and will prevent or minimise impacts to nationally threatened or migratory species. As such, waste management activities do not conflict with nationally threatened/migratory species management plan requirements.
	Other matters	
	State marine parks	The North Kimberley Marine Park Management Plan has the strategic objective <i>to protect and conserve biodiversity and ecological health</i> . Waste management support activities do not conflict with

		the management objectives for the park in terms of cultural; natural; recreation, tourism, and community; or commercial values detailed in the Management Plan. Waste removal will assist in preserving the objectives detailed in the management plan.
	Species Conservation Advice/ Recovery Plans/ Threat Abatement Plans	<p>Marine (oil) pollution is a threat identified in the Recovery Plan for Marine Turtles in Australia 2017-2027 (DoEE, 2017c) with priority actions requiring that <i>spill risk strategies and response programs include management for turtles and their habitats particularly in reference to slow to recover habitats (e.g. nesting beaches, important foraging grounds, corals, seagrasses AND manage anthropogenic activities to ensure that marine turtles are not displaced from identified habitat critical to their survival.</i> Waste management activities support other oil spill response strategies (which prevent impacts to critical habitats) and mitigate any impacts to the species assist with their recovery. Waste management supports the identified priority actions within this management plan.</p> <p>The conservation advice and management plans for blue, humpback, sei and fin whales identify hydrocarbon spill as threats, though there are no specific aims to address this.</p> <p>The Wildlife Conservation Plan for Seabirds (CoA, 2020) identifies oil pollution as a threat to seabirds although no specific actions are defined to manage the threat. Waste removal activities will mitigate impacts on bird species thereby reducing the threat in support of the plan.</p>
ESD principles	The EIA presented throughout this EP demonstrates that ESD principles (a), (b), (c) and (d) are met (noting that principle (e) is not relevant).	
Statement of acceptability	<p>EOG considers the risk to be acceptable because:</p> <ul style="list-style-type: none"> • It will adhere to the company's Environment Policy; • The residual risk ratings are low and ALARP; • An Implementation Strategy (described in Chapter 10) is in place to ensure the EPS are achieved. • Input from engagement with relevant persons and stakeholders has been considered and incorporated into the design of the activity; • Relevant legislation and industry best practice will be complied with; • Spill response activities will not have long-term or significant impacts on MNES; • Spill response activities are not inconsistent with the aims of recovery plans/conservation plans/advice that are in force for EPBC Act-listed threatened and migratory species; • Spill response activities are not inconsistent with the aims of relevant marine reserve management plans; and • Spill response activities are not inconsistent with ESD principles. 	

Environmental Monitoring	
<ul style="list-style-type: none">• As per Beehive-1 OPEP and OSMP requirements.	
Record Keeping	
<ul style="list-style-type: none">• Contracts and agreements with waste contractor.• Equipment and service provider register.• Shoreline TRPs.• Inspection/audit reports.• Incident and daily operations reports.• Waste transport certificates	<ul style="list-style-type: none">• Operational NEBA.• Briefing records.• Photos.• OSMP implementation records and reports.• IAP.• Stakeholder consultation records• Induction records

10. Implementation Strategy

The OPGGS(E) Regulation 14 requires that an Implementation Strategy be included in an EP. EOG retains full and ultimate responsibility as the Titleholder of the activity and is responsible for ensuring that the EPO and EPS outlined throughout Chapters 7, 8 and 9 are adequately implemented.

10.1. Activity Organisational Structure

Figure 10.1 illustrates the organisational chart for the activity and the relationship between EOG, AGR (as the drilling project manager), the MODU contractor and consultants for the activity.

EOG has overall responsibility for the management of the activity to ensure that:

- Design and execution of the activity is undertaken in accordance with industry accepted practice and legislated standards;
- All regulatory approvals are obtained prior to activity commencement;
- Contractors have been pre-qualified as having appropriate resources and equipment to undertake the activity and have appropriate systems in place to ensure that these activities are undertaken in accordance with all legislative requirements;
- The environmental impacts and risks of the activity are minimised and reduced to ALARP and environmental performance is monitored; and
- The day-to-day direction and oversight of work by contractors is undertaken in accordance with the accepted EP.

The MODU contractor will have the day-to-day control and management of the MODU through the Offshore Installation Manager (OIM) and the support vessels through the respective Vessel Masters. The OIM and Vessel Masters have overriding authority and responsibility to make decisions with respect to environment protection and pollution prevention and to request assistance as may be necessary.

Specific environmental roles and responsibilities are outlined in Table 10.1. These will be communicated to all personnel involved in the activity. As the Titleholder, EOG has entered into an agreement with AGR to provide the following ongoing services through this phase:

- Integrated Management System (IMS) (i.e., health, safety and environment) and support (resource) services; and
- Incident management capabilities associated with this activity.

10.2. Roles and Responsibilities

The environmental roles and responsibilities of key project team members are summarised in Table 10.1.

Day-to-day implementation of the activity (and the EP) will occur on the MODU under the leadership of the OIM, and for the support vessels under the leadership of the Vessel Masters. The AGR Project Manager will have oversight of the performance of the activity against the project plans, including this EP, and will initiate reviews and audits as required.

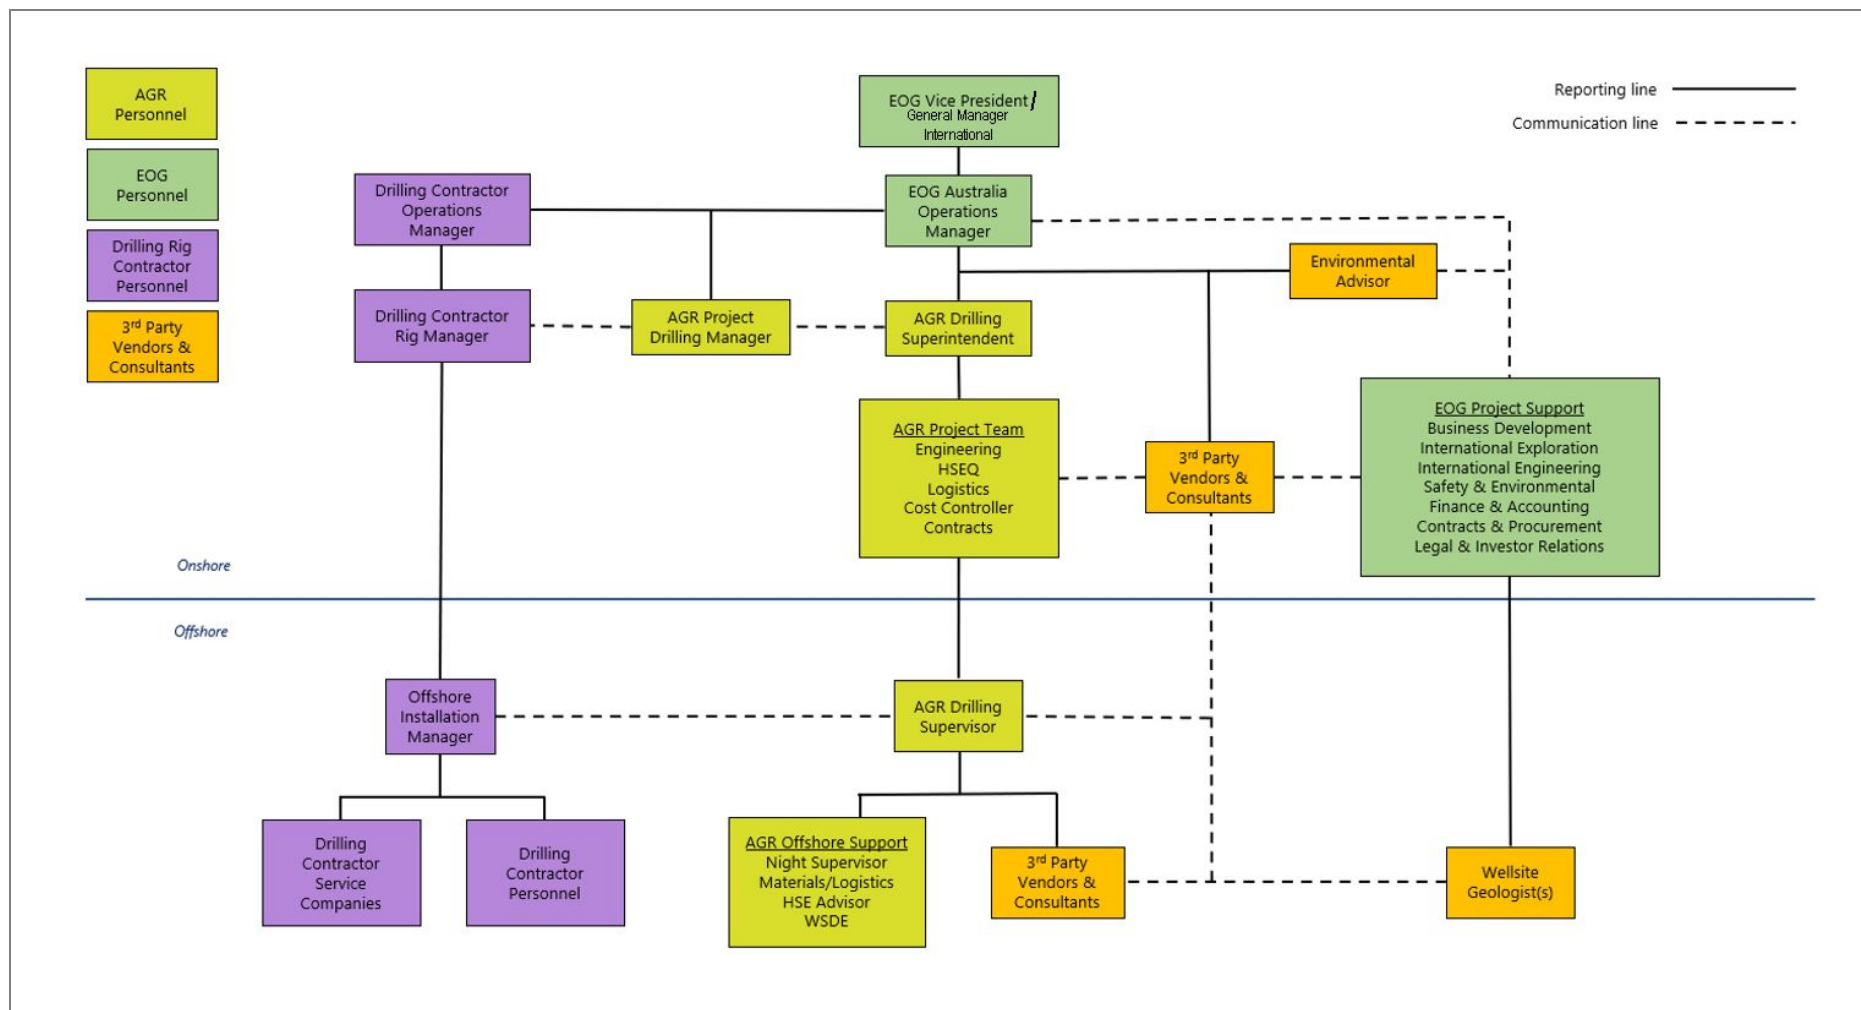

Figure 10.1. Activity organisation chart

Table 10.1. Environmental roles and responsibilities for the activity

Role	Environmental responsibilities
Onshore	
EOG	
EOG Vice President and General Manager – International	<ul style="list-style-type: none"> Ensures EOG's standards are met. Approves this EP for submission to NOPSEMA.
Vice President (Safety & Environment)	<ul style="list-style-type: none"> Ensures EOG's Safety and Environmental Policy is applied to the activity.
EOG Australia Operations Manager	<ul style="list-style-type: none"> Overall project manager for the activities. Works with the EOG team, as well as all contractors, to execute a safe and successful project. Ensures EOG is adequately resourced to undertake the activities. Ensures AGR and Aventus are adequately resourced to support the activities. Liaises with AGR and Aventus for guidance. Attends operations meetings during the activity. Reviews technical proposals to ensure compliance with industry best practice and EOG's Safety and Environmental Policy. Reviews the Drilling EP, OPEP and OSMIP. Confirms all required plans, audits and reviews are undertaken in accordance with the requirements of the EP and other regulatory documents. Reviews and approves incident reports and submits them to regulators. Ensures all notifications are prepared and submitted in a timely fashion. Reviews major changes to operations. Reviews and submits the end-of-activity notification for submission to NOPSEMA. Reviews and submits the Environmental Performance Report to NOPSEMA. Approves submissions to NOPSEMA.
Project support	<ul style="list-style-type: none"> Provides direction on stakeholder consultation. Attends stakeholder meetings as required.
Specialists	
AGR Project Manager	<ul style="list-style-type: none"> Facilitates clear communications between EOG and MODU contractor. Ensures the support vessels are appropriately inspected, certified and fit for purpose. Ensures compliance with the EP. Ensures effective emergency response arrangements are in place with the MODU. Ensures all AGR, MODU and third-party contractor personnel are inducted and are aware of their activity-specific environmental responsibilities. Ensures all required plans, audits and reviews are undertaken in accordance with the regulatory requirements and as required by the EP. Conducts incident investigations. Provides daily feedback on operations progress to the EOG Australia Operations Manager. Reports all incidents to the EOG Australia Operations Manager.
AGR Drilling Superintendent	<ul style="list-style-type: none"> Executes operations and is the key interface point between AGR and MODU management onshore during operations. Ensures AGR's drilling operations perform to the highest required standards of HSEQ as defined by the AGR organisation, government regulators and clients.

Role	Environmental responsibilities
	<ul style="list-style-type: none"> • Promotes a proactive HSEQ culture within AGR operations and attendance at project Health, Safety and Environment (HSE) meetings • Ensures full and complete HSEQ compliance with EOG requirements and government regulations. • Leads onboard HSEQ incident investigations. • In the event of an emergency, assumes the role of DIMT Leader and activates the EOG Drilling Program Bridging Emergency Response Plan (ERP) to ensure the necessary onshore support is managed appropriately.
AGR HSEQ Manager	<ul style="list-style-type: none"> • Provides frontline HSEQ support and direction to management and all personnel for the project. • Ensures AGR complies with all applicable legislative, industry and corporate governance requirements. • Encourages the implementation of industry best practice and implements AGR's management systems to achieve exemplary HSE performance. • Manages the preparation of the HSE regulatory approvals documents (e.g., SCR and WOMP). • Provides technical input to risk analysis and evaluation techniques. • Arranges for review of the MODU and vessel contractors' HSE management systems upon contract award. • Reports recordable and reportable incidents to EOG. • Assists with review, investigation and reporting of HSE incidents.
Aventus (Environmental Advisor)	<ul style="list-style-type: none"> • Prepares the EP. • Provides technical input to stakeholder consultation. • Maintains the stakeholder consultation register. • Plans for the implementation of the EP. • Prepares the environmental induction. • Conducts EP compliance inspections/audits. • Monitors environmental performance against the EPS in this EP. • Assists with review, investigation and reporting of environmental incidents. • Provides incident support. • Reviews major changes to operations. • Alerts EOG ahead of any required notifications. • Prepares monthly recordable incident reports for submission to NOPSEMA. • Prepares the end-of-activity notification for submission to NOPSEMA. • Prepares the end-of-activity environmental performance report for submission to NOPSEMA.
Offshore	
MODU	
MODU Offshore Installation Manager (OIM)	<ul style="list-style-type: none"> • Responsible for the daily control and management of the MODU, has over-riding authority and responsibility to make decisions regarding environment protection and pollution prevention. • Responsible for all vessel activities within the PSZ around the MODU. • Oversees all work activities and work programs ensuring work is undertaken in accordance with procedures, work instructions and in compliance with the MODU Safety Case and Safety Case Addendum. • Assumes role of MODU ERT Leader. • Ensures all offshore personnel understand their obligations with respect to the management of HSE risks. • Ensures the MODU training matrix is fully implemented by all MODU crew. • Ensures MODU HSE inductions are conducted. • Ensures waste disposal complies with MARPOL requirements.

Role	Environmental responsibilities
	<ul style="list-style-type: none"> Monitors closeout of non-conformances, corrective actions and audit recommendations. Reports all incidents, near-misses and dangerous occurrences to the AGR drilling supervisor (DSV) in accordance with the incident reporting system.
AGR DSV	<ul style="list-style-type: none"> Acts as AGR's and EOG's Onboard Representative during the activity and ensures that commitments made in the EP are met. Represents AGR and EOG onboard the MODU in all matters that affect EOG's commitment to HSE performance and ensures that the HSEQ and technical expectations are met. Ensures inductions, auditing and reporting requirements are met. Shares any design changes with the MODU OIM and rest of the onboard project team. Encourages the principle of stop-work authority for safety. All personnel are encouraged to call a Time Out For Safety (TOFS) and to stop operations if there is a risk or any reasonable doubt about safety. Ensures that the operation is halted in a safe manner to protect personnel, equipment and the environment prior to providing clarification and, if necessary, performing a risk assessment to identify mitigating plans in order to resume safe operations. Participates in HSE meetings and will be a member of the investigation team activated as the result of an accident or incident. Advises the AGR Drilling Superintendent of any incidents. Complies with all MODU rules, regulations, policies and procedures as defined within the Vessel Safety Case (and Addendum) and MODU ERP. Undertakes a technical review of the activity. Liaises with the AGR Drilling Superintendent to ensure compliance with drilling program requirements.
AGR HSE Coordinator	<ul style="list-style-type: none"> Supports the DSV to ensure the execution of all HSE commitments under the HSE Plan, Safety Case (and Addendum), WOMP and EP. Assists and advises on MODU risk assessments. Participates in the MODU behavioural-based safety programs. Conducts or participates in incident investigations as required. Conducts HSE inspections. Provides HSE technical support to the program and works with the MODU HSE Officer.
All MODU personnel	<ul style="list-style-type: none"> Undertake work activities with reasonable care and in accordance with EP commitments to ensure no adverse impacts to the environment. Report all new hazards, incidents, near-misses and dangerous occurrences to immediate supervisor as soon as possible. Participate in the development of work procedures through the JSA process. Attend all necessary toolbox talks, HSE inductions and HSE meetings. Participate in workplace inspections. Maintain high house-keeping standards.
Support vessels	
Vessel Master	<ul style="list-style-type: none"> Complies with all applicable navigational safety standards and regulations. Conducts emergency drills. Supervises vessel crew to ensure they are fit for duty and undertaking work only within their area of qualification and training. Monitors, reports and takes appropriate action to remedy any vessel or equipment defects that may impact on safety and environmental performance of the vessel.

Role	Environmental responsibilities
	<ul style="list-style-type: none"> • Maintains logs of emissions and discharges in accordance with MARPOL regulations. • Ensures that all crew are appropriately qualified, trained and equipped for their roles on the vessel. • Reports all incidents and near-misses to the DSV, recording the details and taking initial actions with the Vessel Master to render the situation safe. • Keeps watch for megafauna and avoids direct interactions.
Vessel crew	<ul style="list-style-type: none"> • Undertake work activities with reasonable care and in accordance with EP commitments to ensure no adverse impacts to the environment. • Report all new hazards, incidents, near-misses and dangerous occurrences to immediate supervisor as soon as possible. • Participate in the development of work procedures through the JSA process. • Attend all necessary toolbox talks, HSE inductions and HSE meetings. • Participate in workplace inspections. • Maintain high house-keeping standards.

10.3. HSE Management

EOG will have overall responsibility for the management, review and audit of HSE issues during implementation of the activity, ensuring the activity is conducted safely and in accordance with corporate policies and procedures, as well as relevant Australian legislation and international standards.

10.3.1. EOG

EOG has in place an Australian Projects HSE Management Plan (996161-2022-Beehive#1-HSEPlan) that is aligned with ISO 14001:2016 (*Environmental Management Systems – requirements with guidance for use*), ISO 31000:2009 (*Risk management*), ISO 45001:2018 (*Occupational health and safety management systems*) and ISO 9001:2016 (*Quality management systems–requirements*) to guide the management of the activity. The HSE Plan includes descriptions of the following:

- Leadership and commitment – HSE objectives and performance monitoring, stop work authority;
- Organisation – roles and responsibilities, reporting;
- HSE legislation and standards – occupational, health and safety legislation;
- Risk management – risk management procedures and matrix;
- HSE competence and training – training and induction requirements;
- Subcontractors – pre-qualification process, management;
- Communications – meetings, record keeping and reporting, HSE awareness programs;
- Work instructions – permit to work system;
- Management of change;
- Incident management – recording and reporting procedures, investigation procedure, communicating lessons learned;
- Safety critical equipment and activities – safety critical equipment, working at heights, confined space, PPE requirements, hot work;
- Emergency response;

- Occupation health – medical facilities, infectious disease management (e.g., COVID-19), hygiene, smoking, fatigue management, drugs and alcohol, heat stress, mental health;
- Security – International Ship and Port Facility Security (ISPS) compliance, security alert levels, port security, third-party interference;
- Environmental management – EP compliance, waste management, spill prevention, preparedness and response, biosecurity, monitoring; and
- Audit and review – inspection and audit program.

The MODU and vessel contractors will be required to have an HSE management system or plan that meets the requirements of the EOG Safety and Environmental Policy and the EOG Australian Projects HSE Management Plan.

10.3.2. AGR

AGR's management system is accredited with ISO 9001:2015 and ISO 14001:2015 and governs all of the group business as documented in the AGR Management System Manual (AGR-HSEQ-M-01). AGR uses a standardised management system process to ensure that project activities are planned and managed efficiently and with due consideration to good oilfield practice, local and international standards as they relate to well design, operations planning, construction and then subsequent suspension or abandonment operations. This process is known as the WDP (see also Section 2.3). The AGR WDP is a central component of the AGR Management System and is being used by EOG for this activity.

The AGR WDP is supported by the AGR Well Standard (UK-WDP-S01), which details the standards that apply to all operations planned and conducted by AGR. These are the minimum standards to be applied to all wells within AGR unless standards stipulated by local legislation are more onerous. All well operations are planned and performed in compliance with applicable legislation, regulations and industry guidelines.

All wells are designed, constructed and operated to maintain well life cycle integrity and to ensure prevention of major accidents in line with the AGR Corporate Major Accident Prevention Policy (CMAPP, UK-HSEQ-S01).

Safety and Environmentally Critical Elements (SECE) can be defined as installation and well equipment and systems (including software) whose purpose is to prevent, limit or control the effects of a major accident or environmental event, or whose failure could cause or increase the risk of a major accident or environmental event.

With respect to well construction, AGR has identified the following SECE within its control and measures to assure its fitness for purpose:

- Drilling Fluids;
- Casing;
- Cement Fluids;
- Wellheads;
- Blow Out Preventer and drill-string internal BOP;
- Rig Selection and Intake;
- Manage Shallow Gas Potential;

- Weather and sea state conditions; and
- Well Suspension or Abandonment.

Additional detail regarding the WDP is provided in the WOMP.

During the activity, AGR will identify any new or increased environmental impacts and risks (that are not addressed in this EP) and communicate these to the EOG Project as soon as they are identified as part of the MoC (see Section 10.8) and risk management processes.

There are daily meetings, DDRs, weekly meetings and weekly reports between the AGR and EOG management teams that keep all management personnel apprised of project issues (technical or HSE) as they arise.

10.4. Training and Awareness

10.4.1. Recruitment and Training

EOG contractor competency

Contractor management is detailed in the EOG Australian Projects HSE Management Plan. During its contractor selection process, EOG will conduct an HSE qualification to ensure that the MODU and support vessel contractors have procedures in place to ensure the correct selection, placement, training and ongoing assessment of employees (or this may be delegated to AGR using their contractor competency assessment process).

Procedures will also be in place to identify the training needs of an individual to competently perform their role, and evidence of corporate and/or vessel inductions will also be required.

AGR personnel competency

AGR's Wells Competency Management System (AP-WDP-M16) describes how it manages the competence of individuals and teams to carry on their work and associated risks. This includes staff, consultants, associates and third-party suppliers.

Importantly, this system specifies the roles and responsibilities and qualifications and training requirements for safety and environmentally critical positions (SECP) including the DSV, HSE Manager, Principal Engineer, Senior Completions Engineer and so forth. Position-specific competence matrices are available for these roles and are used to guide and record assessments of skills.

AGR's Operations Supervision Manual (AP-WDP-M13) provides detailed guidance for all AGR Well Management Supervisors (i.e., DSVs) to ensure that drilling is undertaken in accordance with AGR standards and policies. It specifies that people in the role of DSV have a Subsea Supervisor International Well Control Certificate, offshore survival training, industry safety training, oil spill training and offshore medical training at a minimum. This manual provides the minimum standards required to ensure well control is maintained, and provides specifications for optimising drilling parameters, adequate bulk and drilling fluids, coring operations, casing/wellhead operations, cementing, formation strength tests, wireline logging, well testing and completions, and well abandonment.

10.4.2. Environmental Induction

An activity-specific HSE induction for all personnel working on the activity will be undertaken. The environmental component of the induction will include information on the following environmental issues:

- Description of the environmental sensitivities, conservation and heritage values of the operational area and spill EMBA;
- Overview of the key control measures to be implemented;
- The importance of following procedures and using JSAs to identify environmental risks and mitigation measures;
- Procedures for responding to and reporting environmental hazards or incidents;
- Overview of emergency response and spill management procedures;
- Overview of the waste management requirements; and
- Roles and environmental responsibilities of key personnel aboard the vessel.

EOG will prepare the induction and the AGR DSV is responsible for ensuring personnel receive this induction prior to the commencement of the activity. All personnel will be required to sign an attendance sheet to confirm their participation in and understanding of the induction.

The MODU and support vessel contractors will conduct their own company and vessel-specific inductions independently of the activity-specific HSE induction.

10.4.3. Oil Spill Response Training

Quarterly training of MODU and support vessel crews in SMPEP procedures is a MARPOL requirement for vessels over 400 GRT (Annex 1, Regulation 37).

During its contractor audit process, EOG will assess the vessel contractor's implementation of their SMPEPs (or equivalent, relevant to class).

An office-based desktop spill response exercise of the Beehive-1 OPEP and bridging ERP will be conducted, involving key personnel from EOG, AGR, MODU and specialist third-party contractor personnel prior to or at the start of the activity.

10.4.4. Toolbox Talks and HSE Meetings

Environmental matters will be included in daily toolbox talks as required by the specific task being risk assessed (e.g., crane lifts).

Environmental issues will also be addressed in daily operations meetings and weekly HSE meetings, where department leads will participate with the AGR DSV in discussing HSE matters that have arisen during the week, and issues to consider for the following week.

Records associated with environmental training, inductions and attendance at toolbox meetings will be recorded and maintained in respective company data servers.

10.4.5. Communications

The OIM, AGR DSV and AGR HSE Coordinator are jointly responsible for keeping personnel informed about HSE issues, acting as a focal point for personnel to raise issues and concerns, and consulting and involving all personnel in the following:

- Issues associated with the implementation of the EP;
- Any proposed changes to equipment, systems, or methods of operation of equipment, where these may have HSE implications; and
- Any proposals for the continuous improvement of environmental protection, including the setting of environmental objectives and training schemes.

Table 10.2 outlines the key meetings proposed to take place onshore and offshore during the activity.

Table 10.2. Activity communication meetings

Meeting	Frequency	Attendees
Onshore		
EOG Project Management	Daily	EOG Australia Operations Manager, AGR Project Manager, AGR Drilling Superintendent, AGR DSV, AGR HSEQ Manager, AGR HSE Coordinator, vessel masters (if necessary)
Offshore		
Operations	Daily	OIM, Department heads, AGR DSV, AGR HSE Coordinator, vessel masters (if necessary)
Pre-start safety meeting	Daily, prior to each shift	All personnel on shift
Toolbox	Before each task	All personnel involved in the task
HSE	Weekly	All personnel
TOFS	As required, based on safety issues	All personnel

10.5. Environmental Emergencies and Preparedness

In the event of an emergency of any type, the MODU OIM (for the MODU) and Masters (for the support vessels) will assume overall onsite command and act as the ERT Leader. All personnel aboard the MODU and vessels will be required to act under the ERT Leader's directions.

The AGR DSV will maintain communications with the AGR Drilling Superintendent, who will become the overall DIMT Leader and activate the DIMT. The DIMT Leader will communicate with the EOG Australia Operations Manager who will implement the EOG Crisis Management Plan (CMP) if required, with support from the AGR DIMT as required.

10.5.1. Adverse Weather Protocols

It is the duty of the MODU OIM and the support vessel masters to act as the focal point for all actions and communications with regards to adverse weather or sea state, to safeguard the vessel, all personnel onboard and the environment. During adverse weather, the MODU OIM and support vessel masters are responsible for the following:

- Ensuring the safety of all personnel onboard;
- Monitoring all available weather forecasts and predictions;
- Initiating the safety management systems, HSE procedures and/or ERPs;

- Keeping the AGR DSV fully informed of the prevailing situation and intended actions to be taken;
- Assessing and maintaining security, watertight integrity and stability of the vessel; and
- Proceeding to identified shelter location(s) as appropriate.

Other appropriate responsibilities shall be taken into consideration as dictated by the situation.

In addition to using Very High Frequency (VHF) Marine Radio Weather Services, the MODU and support vessel contractor will obtain daily weather forecasting from the Bureau of Meteorology (BoM) and/or other suitable weather monitoring services to monitor weather within the operational area in the lead up to and for the duration of the activity.

10.5.2. Vessel Emergencies and Oil Spills

Activity-specific oil spill related emergency response procedures are included in the Beehive-1 OPEP, Bridging ERP, RWP and MODU and support vessel SMPEPs. The Beehive-1 Bridging ERP contains instructions for the MODU and support vessel emergency, medical emergency, search and rescue, reportable incidents, incident notification and emergency contact information that is specific to Beehive-1.

Vessel-specific SMPEPs and ERPs typically include vessel-specific procedures for the following:

- Vessel incidents – collision, grounding, hull damage, man overboard, equipment failure;
- Waste management;
- Hazardous materials and handling; and
- Hydrocarbon and chemical spills.

The SMPEP includes information about initial response, reporting requirements and arrangements for the involvement of third-parties having the appropriate skills and facilities necessary to respond effectively to oil spill issues. The SMPEP will be the principal working document for the MODU and support vessel crews in the event of a marine oil spill. This document will include specific emergency procedures including steps to control discharges for bunkering spills, hull damage, grounding and stranding, fire and explosion, collisions, vessel list, tank failure, sinking, and vapour releases. The SMPEP also includes requirements for regular drills of the plan and revision following drills or incidents.

The Beehive-1 OPEP will be implemented in the event of a Level 2 or 3 hydrocarbon spill that requires response resources beyond those immediately available to the MODU and support vessels. Oil spill emergency response for this activity is detailed in the Beehive-1 OPEP.

10.5.3. Emergency Response Training

The readiness and competency of EOG, AGR, the MODU and support vessel contractors to respond to incidents and emergencies will be tested by conducting a desktop emergency response exercise as close immediately prior to or soon after the activity commences.

A scenario will be chosen that combines an emergency with risk to human life (such as fire) and risk to the environment (large hydrocarbon spill). This way several plans (i.e., the ERP and OPEP) can be tested simultaneously. This exercise has the objectives of:

- Developing and testing the response arrangements as outlined in the emergency response procedures;
- Ensuring the skills and teamwork of the DIMT and ERT to respond to major emergency events are up-to-date. In particular, ensuring individual roles, responsibilities and reporting requirements are understood;
- Testing interfaces between all key parties involved in emergency response (EOG, AGR, MODU and support vessel contractors); and
- Ensuring the correct communications are known and used and that contact details (e.g., phone numbers) are correct.

This exercise will be facilitated by an experienced facilitator. At the completion of the exercise, the facilitator will hold a debrief session during which the exercise is reviewed, and lessons learned and areas for improvement are identified.

Any learnings, findings or recommendations identified as part of the testing exercise will be addressed and incorporated into the relevant emergency response plans and procedures to ensure they remain effective.

MODU-specific training

The MODU OIM is responsible for ensuring that personnel fulfilling emergency response roles are competent in crisis and emergency procedures related to the protection of HSE and integrity. The level of training and associated competency demonstration is dependent on individual roles in a crisis or emergency situation in accordance with the MODU's personnel training and qualifications matrix. This includes identification and development of approved competency and non-competency-based courses, and ensuring training is undertaken to schedule and records are maintained.

10.6. Simultaneous Operations

Simultaneous operations (SIMOPs) refer to two or more operations occurring simultaneously in the same area that have the potential to interfere with each other. The activity area is located 20 km from the Blacktip unmanned wellhead platform and 12 km from the Blacktip gas export pipeline at its closest point, operated by Eni Australia. At this distance, it is not expected that SIMOPs will be an issue. EOG will remain in contact with Eni Australia so that SIMOPs issues can be addressed if and as required.

10.7. Incident Management

10.7.1. Recordable Incident Management

Regulation 4 of the OPGGS(E) regulations defines a 'recordable' incident as:

A breach of an EPO or EPS in the EP that applies to the activity that is not a reportable incident.

Routine monthly recordable incident reports, including 'nil' incident reports, will be prepared by Aventus and submitted by EOG to NOPSEMA by the 15th of each month. These are reported using the NOPSEMA template *Monthly environmental incident reports* (N-03000-FM0928). Table 10.3 summarises the recordable incident reporting requirements.

Table 10.3. Recordable incident reporting details

Timing	Reporting requirements	Contact
By the 15 th of each month	<ul style="list-style-type: none"> All recordable incidents that occurred during the previous calendar month. The date of the incident. All material facts and circumstances concerning the incidents that the operator knows or is able to reasonably find out. The EPO and/or EPS breached. Actions taken to avoid or mitigate any adverse environmental impacts of the incident. Corrective actions taken, or proposed to be taken, to stop, control or remedy the incident. Actions taken, or proposed to be taken, to prevent a similar incident occurring in the future. Actions taken, or proposed, to prevent a similar incident occurring in the future. 	NOPSEMA – submissions@nopsema.gov.au

10.7.2. Reportable Incident Management

Regulation 4 of the OPGGS(E) defines a 'reportable' incident as:

An incident that has caused, or has the potential to cause, moderate to significant environmental damage.

In the context of the EOG Environmental Risk Matrix, EOG interprets 'moderate to significant' environmental damage to be those hazards identified through the EIA and ERA process (see Chapters 7, 8 and 9) as having an inherent or residual impact consequence of 'moderate' or greater. Impacts and risks with these ratings are:

- Introduction of IMS;
- Death or injury of threatened or migratory megafauna resulting from vessel collision;
- MDO spill; and
- LoWC.

Table 10.4 presents the reportable incident reporting requirements.

Table 10.4. Reportable incident reporting requirements

Timing	Requirements	Contact
Verbal notification		
Within 2 hours of becoming aware of incident	<ul style="list-style-type: none"> The verbal incident report must include: All material facts and circumstances concerning the incident that the titleholder knows, or is able, by reasonable search or enquiry, to find out; Any actions taken to avoid or mitigate any adverse environmental impacts of the reportable incident; and The corrective action that have been taken, or is proposed to be taken, to stop, control or remedy the reportable incident. 	<ul style="list-style-type: none"> NOPSEMA – 1300 674 472

Timing	Requirements	Contact
	Level 2 or 3 vessel spills that threaten WA or NT waters	<ul style="list-style-type: none"> • WA DoT – (08) 9480 9924 • NT – 1800 064 567 • WA DMIRS - 0419 960 621
	For Level 2 or 3 hydrocarbon spills in Commonwealth waters.	As above, plus: <ul style="list-style-type: none"> • AMSA – 1800 641 792

10.7.3. Incident Investigation

Any non-compliance with the EPS outlined in this EP will be investigated by EOG and follow-up action will be assigned as appropriate. The findings and recommendations of inspections, audits and investigations will be documented and distributed to relevant MODU, support vessel and onshore project personnel for review. Tracking the recommendations and close-out actions arising from incident investigations will be managed via either the MODU, support vessel, AGR or EOG management systems, depending on the location and nature of the incident.

Investigation outcomes will be communicated to the project team via daily operations meetings and to the MODU and support vessel crew during daily toolbox meetings and at weekly HSE meetings.

10.7.4. Routine Recording and Reporting

Routine reporting of HSE matters will be provided via the meetings listed in Table 10.2. The DDR will report on HSE matters, including environmental issues, incidents and near-misses.

10.8. Management of Change

A Management of Change (MoC) process is important to ensure that all changes to the project planning, design or operations are evaluated for their potential consequences on other elements of the activity.

This section describes the EOG and AGR MoC processes and their interactions.

10.8.1. EOG

EOG's Australian Projects HSE Management Plan outlines the MoC procedure for the activity. The MoC procedure will be used to determine whether any changes to the design of the activity (or other factors) trigger revisions to the EP that require re-submission to NOPSEMA (see Section 10.10.3).

Permanent or temporary changes to organisation, equipment, plant, standards or procedures that have potential HSE and/or integrity impacts are subject to formal review and approval by the relevant EOG role with responsibility for the change prior to initiating the change to ensure risks remain acceptable and are reduced to ALARP. The level of management approval for each change is commensurate with the risk.

An MoC form must be completed. This is then reviewed by relevant specialists that have technical and project-specific knowledge and understanding to determine the impact (if any) and significance of the change. The relevant role with responsibility for the change shall look at any additional safety requirements needed to ensure the safety of personnel, the effect on schedule and cost, the effect on equipment and third-party assets and then decide whether to approve or reject the change. The results of the review will then be documented in the MoC form and the relevant role will communicate the change to all those who may be affected by it, including AGR. The MoC form will then be stored by EOG in the MoC register.

For AGR documented programmes and procedures, the AGR MoC process will be used and signed off as required by EOG. For EOG documents (e.g., well data information), the EOG process will be used. For changes that affect the policies and standards of the MODU contractor, the MODU contractor's MoC will also be required.

The AGR MoC procedure is applied to all changes and deviations for the activity after the approval of the Beehive-1 Detailed Drilling Program, until the completion of activity.

10.8.2. AGR

AGR undertakes MoC under their WDP, known as 'Management of Risk and Control of Change'. This change management process applies to all changes and deviations for well-related activities after the approval of the Beehive-1 Detailed Drilling Program document, until the well is handed over to the EOG. This includes planning and operations including drilling, well interventions or workovers, or any other work designed and executed by AGR.

AGR, in conjunction with the EOG Operations Manager, will ensure any changes triggering an EP revision are captured as part of the MoC process. EOG has evaluated the AGR MoC procedure and verified that it meets its requirements as the Titleholder.

Permanent or temporary changes to organisation, equipment, plant, standards or procedures that have potential HSE and/or integrity impacts are subject to formal review and approval prior to initiating the change to ensure risks remain acceptable and are reduced to ALARP. The level of management approval for each change is commensurate with the risk.

Deviations from the original plan at BOD stage may become necessary due to uncertainties in the subsurface environment or problems encountered during the course of operations and are subject to the MoC process. It is the purpose of the MoC procedures to provide guidance for facilitating the agreement of change with the various stakeholders (e.g., the titleholder, the offshore management team, the MODU contractor). This is achieved by determining and agreeing the value and impact of a change and subsequently documenting the approval process accepting the change. Changes in functionality or well integrity are also documented in an auditable format.

Routine optimisation of rig operating parameters is carried out as part of managing drilling and completion operations and is not subject to formal change control as described in this process, unless there is a material change to the drilling program compared to the original plan, in which case this process is triggered.

The AGR DSV and Drilling Superintendent are responsible for identifying any increases to risks already identified or new hazard as operations proceed. If a change is required for operational reasons, the process needs to be reviewed and the change evaluated against the original process/procedure. All changes triggered by the AGR MoC process are detailed in the AGR MoC Request Form and recorded in the Beehive-1 MoC Register.

Changes are classified as minor, significant or major and are described here.

Minor Change

A minor change is a change to an approved plan, work program (or a procedure referenced in it) that has no safety, environmental or well integrity implication, adds less than \$100,000 to the cost of the operation and has no impact on the operation's objectives (e.g., an additional wiper trip).

Minor changes to the project will be discussed and agreed at the daily operations meeting. All activity changes will be confirmed by email from the AGR Drilling Superintendent, or designate, to the AGR DSV.

When operations are being conducted, the AGR Drilling Superintendent must provide approval. All minor changes must be confirmed via email and approved by the AGR Drilling Superintendent. Minor changes do not require approval from EOG.

Significant Change

A significant change is defined as a change to an approved plan or work program that does not impact the operation's objectives but could have a direct safety, environmental or well integrity implication (i.e., increase in risk profile above that of the originally planned program) and/or increase the cost of the operation by more than \$100,000 but less than \$250,000.

Significant changes to the plan or program, or significant operations not included in the programme, will be discussed, risk assessed and agreed by the onshore and offshore teams and confirmed in writing with an approved Program Supplement/Amendment. This will be issued prior to commencing the change in programme. The AGR Drilling Superintendent will discuss the proposed change with the EOG Australian Operations Manager and the MODU OIM. The Supplement/ Amendment is developed by the Project Well Engineer and approved by the AGR Drilling Superintendent, or his delegate and the EOG Australia Operations Manager (denoted by a signature) and issued to the team.

All changes are assessed to ensure any new impacts or risks, or significant change in risk level, are identified and whether or not the change influences environmental aspects of the project or an EP revision is triggered. Following this process, EOG will assess and undertake the necessary EP revision and/or re-submission.

Major Change

A major deviation from plan is one that results in a deviation from the well program, and has a direct safety, environmental or well integrity implication (i.e., an increase in risk profile above that of the originally planned program), an EP revision being triggered, the design of the well changing and/or will result in the well Authority for Expenditure (AFE) being exceeded.

Changes affecting the approved activity require an approved Program Supplement/Amendment to be issued. The AGR Project Manager will discuss the proposed change with the EOG Australia Operations Manager and the MODU Manager/OIM. The Supplement/Amendment is developed by the Project Well Engineer and approved by the EOG Australia Operations Manager (denoted by a signature) and the AGR Drilling Superintendent, or his delegate.

Exceptionally, if conditions demand an immediate response to safeguard the well or the MODU, then the AGR DSV is authorised to implement any necessary changes to the Program with the agreement of the MODU OIM. Contact with the AGR Project Manager or his delegate should be made as soon as reasonably practicable. A Programme Supplement/Amendment should be prepared the next working day.

10.9. Record Keeping

In accordance with Regulations 27 and 28 of the OPGGS(E), documents and records relevant to the implementation of this EP are stored and maintained by EOG for a minimum of five years. These records will be made available in electronic or printed form upon request.

10.10. Assurance, Reporting and Review

10.10.1. Field Environmental Monitoring

EOG will maintain a quantitative record of emissions and discharges, and other environmental matters generated on location during the activity, as required under Regulation 14(7) of the OPGGS(E).

The MODU and support vessel contractors are responsible for collecting this data and reporting it to the AGR DSV. This is facilitated by completing a daily environmental monitoring register that will be provided by EOG to the contractors, which captures the commitments made in Table 10.5 below.

Table 10.5. Summary of environmental monitoring requirements

Aspect	Monitoring parameter	Frequency	Record
Impacts			
Underwater sound	Megafauna observations	During VSP	Megafauna observation register
Atmospheric emissions	Fuel consumption	Tallied at end of activity from DDRs	DDRs
Drill cuttings and muds	Chemicals used in the mud system	Daily	DDR Daily mud report
	Volume of muds discharged overboard		
	Observations of the separation treatment system.	Continuous during activity	DDR Daily mud report
Cement	Real-time ROV observations	During conductor cementing operations	DDR
	Chemical additive use	As required	Daily cement report
Displacement of other marine users	Ongoing patrol for, and communications with, third-party vessels	Continuous during activity	Bridge communications book
Bilge water	Volume of bilge water discharged during the activity	Each discharge (infrequent)	Oil record book
Risks			
Waste disposal	Weight/volume of wastes sent ashore (including oil sludge, solid/hazardous wastes)	Tallied at end of activity	Waste manifest
Dropped objects	Type, location, quantity.	Each event	Incident report DDR
Displacement or interference with other marine users	Ongoing patrol for, and communications with, third-party vessels	Continuous during activity	Bridge communications book
Introduction of IMS to activity area	Volume and location of ballast water discharges noted	Each discharge	Ballast water log
Vessel strike or entanglement with megafauna	Megafauna observations	Continuous while in operational area	Incident report DDR
Hydrocarbon or chemical spill	Volume, type	Each event	Incident report DDR

Aspect	Monitoring parameter	Frequency	Record
MDO spill	Operational monitoring in line with the OPEP and scientific monitoring in line with the OSMP (depending on spill volume)	As required	Incident reports
LoWC	BOP function testing	Every 7 days	BOP testing reports
	BOP pressure testing	Every 21 days	
	Well casing pressure testing	After installation	Well casing pressure test reports

10.10.2. Routine Reporting and Notifications

Regulation 11A of the OPGGS(E) specifies that consultation with relevant authorities, persons and organisations must take place. This consultation includes an implicit obligation to report on the progress of the activity. Table 10.6 outlines the routine reporting obligations that EOG will undertake with external organisations.

Table 10.6. External routine reporting obligations

Requirement	Timing	Contact details	OPGGS(E) regulation
Pre-activity			
Notify the DoD of the activity commencement date.	5 weeks prior to activity starting.	Offshore.Petroleum@defence.gov.au.	11A
Notify the AHO of the activity commencement date and duration to enable Notices to Mariners to be issued.	3 weeks prior to activity starting.	datacentre@hydro.gov.au	11A
Notify all other stakeholders in the stakeholder register with the activity commencement date.	2 weeks prior to activity starting.	Via email addresses in the stakeholder consultation register	11A
Notify NOPSEMA with the activity commencement date.	At least 10 days prior to activity starting.		29
Notify AMSA in order to issue daily AusCoast warnings.	Within 24 hours of activity starting.	rccaus@amsa.gov.au	11A
Activity completion			
Notify AMSA in order to cease daily AusCoast warnings.	Within 24 hours of activity completion.	rccaus@amsa.gov.au	11A
Notify all stakeholders in the stakeholder register.	Within 2 days of activity completion.	Via email addresses managed by the Environment Advisor	11A
Notify the AHO in order to cease the issuing of Notices to Mariners.	Within 2 days of activity completion.	datacentre@hydro.gov.au	11A
Notify NOPSEMA of the activity end date.	Within 10 days of activity completion.	submissions@nopsema.gov.au	29
Notify NOPSEMA of the end of the operation of the EP.	After acceptance of the end-of-activity	submissions@nopsema.gov.au	25A

Requirement	Timing	Contact details	OPGGS(E) regulation
	EP performance report.		
Performance reporting			
Submit an end-of-activity EP Performance Report.	Within 3 months of activity completion.	submissions@nopsema.gov.au	26C
Provide marine fauna observation data to the DCCEEW.	Within 3 months of activity completion.	Upload via the online Cetacean Sightings Application at: https://data.marinemammals.gov.au/nmmdb	N/A – EPBC Act

10.10.3. Environment Plan Review

EOG may determine that an internal review of the EP is necessary based on any one or all of the following factors:

- Changes to hazards and/or controls identified in the review of the EP, which in itself is supported by:
 - Reviewing changes to AMP management arrangements (through subscription to the AMP email update service at <https://parksaustralia.gov.au/marine/about/>).
 - Environment and industry legislative updates (through subscriptions to NOPSEMA, AEP and legal firms).
 - Running a new EPBC Act PMST for the impacts and/or spill EMBA to determine whether there are newly-listed threatened species or ecological communities in the EMBA's.
 - Remaining up to date with new scientific research that may impact on the EIA/ERA in the EP (for example, through professional networking and AEP membership).
 - Remaining in regular contact with relevant persons.
- Implementation of corrective actions to address internal or external inspection or audit findings;
- An environmental incident and subsequent investigation identifies issues in the EP that require review and/or updating;
- A modification of the activity is proposed that is not significant but needs to be documented in the EP;
- Changes identified through the MoC process, such as hazards or controls, organisational changes affecting personnel in safety critical roles; and
- Changes to any of the relevant legislation.

The EOG Australia Operations Manager will seek advice on the material impact of the items listed above and whether or not a review of the EP should be undertaken. The scope of a review is determined by the factors that trigger the review and an appropriate team will be assembled by EOG to conduct the review.

If a review of the EP relates to a topic that had previously been raised by a relevant person or stakeholder, an updated response will be prepared and provided to affected stakeholders in a process managed by Aventus for EOG.

Revisions Triggering EP Re-submission

EOG will revise and re-submit the EP for assessment as required by the OPGGS(E) regulations listed in Table 10.7.

Table 10.7. EP revision submission requirements

Regulations	OPGGS(E) regulation
Submission of a revised EP before the commencement of a new activity	17(1)
Submission of a revised EP when any significant modification or new stage of the activity that is not provided for in the EP is proposed	17(5)
Submission of a revised EP before, or as soon as practicable after, the occurrence of any significant new or significant increase in environmental impact or risk not provided for in the EP	17(6)
Submission of a revised EP if a change in titleholder will result in a change in the manner in which the environmental impacts and risks of an activity are managed	17(7)

Revisions and re-submission of the EP generally centre around ‘new’ activities, impacts or risks and ‘increased’ or ‘significant’ impacts and risks. EOG defines these terms in the following manner:

- **New** impact or risk – one that has not been assessed in Chapters 7, 8 or 9.
- **Increased** impact or risk – one with greater extent, severity, duration or uncertainty than is detailed in Chapters 7, 8 or 9.
- **Significant** change –
 - The change to the activity design deviates from the EP to the degree that it results in new activities that are not intrinsic to the existing Activity Description in Chapter 2.
 - The change affects the ability to achieve ALARP or acceptability for the existing impacts and risks described in Chapters 7, 8 or 9.
 - The change affects the ability to achieve the EPO and EPS contained in Chapters 7, 8 and 9.

A change in the activities, knowledge, or requirements applicable to the activity are considered to result in a ‘significant new’ or ‘significant increased’ impact or risk if any of the following criteria apply:

- The change results in the identification of a new impact or risk and the assessed level of residual impact consequence is higher than ‘minor’ or the residual risk rating is higher than ‘low’;
- The change results in the identification of a new impact or risk and the assessed level that is not acceptable and ALARP;
- The change results in an increase to the assessed impact consequence or risk rating for an existing impact or risk described in Chapters 7, 8 and 9; and
- There is both scientific uncertainty and the potential for significant or irreversible environmental damage associated with the change.

While an EP revision is being assessed by NOPSEMA, any activities addressed under the existing accepted EP are authorised to continue. Additional guidance is provided in NOPSEMA Guideline *When to submit a proposed revision of an EP* (N04750-GL1705, NOPSEMA 2020h).

Minor EP Revisions

Minor revisions to this EP that do not require resubmission to NOPSEMA will be made where:

- Minor administrative changes are identified that do not impact on the environment (e.g., document references, contact details, etc.); and
- A review of the activity and the environmental risks and impacts of the activity do not trigger a requirement for a revision, as outlined in Table 10.7.

Minor revisions to the EP will not be submitted to NOPSEMA for assessment.

10.10.4. Inspections and Audits

Various inspections and audits will be undertaken for the activity using competent personnel, as outlined in Table 10.8. Any non-compliances or opportunities for improvement identified at the time of an inspection or audit will be communicated to the relevant EOG and contractor personnel at the time of the inspection or audit. These are tracked by EOG, which includes assigning responsibilities to personnel to manage the issue and verify that it is closed out.

A summary of the EP commitments for the activity will be distributed to the AGR DSV and support vessel management and implementation of the EPS will be continuously monitored by Aventus through review of the completed weekly checklists and attendance at relevant meetings.

Non-compliances and/or opportunities for improvement will be communicated to the EOG Australia Operations Manager in writing and at appropriate meetings.

Table 10.8. Summary of environmental inspections and audits

Type	When	Frequency	Method	Details
HSE due diligence inspection	Post-award, pre-activity	Once	Desktop or in port/during mobilisation	Focused on ensuring HSE Plan and EPS in this EP can be met through review of relevant records and databases.
EP compliance audit	During drilling	Once	In person on board the MODU	A suitably experienced auditor will assess compliance against the EPS for key drilling matters (e.g., cuttings and muds, cementing, LoWC) through interviews, observations and review of databases and records.
Ongoing inspections	During activity	Weekly	In person on board	Checklists to be completed by the AGR HSE Coordinator.

10.10.5. Regulatory Inspections

Under Part 5 of the OPGGS Act, NOPSEMA inspectors have the authority to enter EOG premises, including the MODU, to undertake monitoring or investigation against this EP. EOG will cooperate fully with the regulator during such investigations.

10.10.6. End of Activity Performance Report

In accordance with the OPGGS(E) Regulation 14(2), EOG will submit an end-of-activity EP performance report to NOPSEMA within three months of completion of the activity. Performance will be measured against the EPO and EPS outlined in Chapters 7 and 8 (and Chapter 9, if required).

The information in the report will be based on the information collected during routine communications, inspections and audits, as outlined in this chapter.

10.10.7. Monitoring and Review

The MODU and support vessel contractors will have specific contractual compliance obligations associated with implementing the EP and other project plans. AGR, on behalf of EOG, will monitor the contractors against these obligations both in terms of deliverables and quality.

EOG will establish, maintain and review an EP commitments register to assist in monitoring against these EP. Learnings from this monitoring will inform continued operations and the development of EPs for future phases (if any) of the Beehive project.

10.11. Summary of Implementation Strategy Commitments

Table 10.9 summarises the commitments provided throughout the Implementation Strategy by assigning EPO, EPS and measurement criteria to each commitment.

Table 10.9. Summary of EP implementation strategy commitments

Section	EPO	EPS	Measurement criteria
10.4.1	Project personnel are trained and competent to fulfil their duties.	The Australian Projects HSE Management Plan records and tracks core and critical HSE and technical compliance training.	Training records are readily accessible through.
		Due diligence is undertaken on contractors to ensure they are competent to work on the activity.	Contractor due diligence reports are readily available and verify their suitability to work on the activity.
10.4.2	Project personnel are familiar with their HSE responsibilities.	All personnel working on the MODU and support vessels are inducted into the activity-specific HSE requirements.	Vessel crews and visitor lists, along with induction familiarisation checklists are readily available, verifying that all personnel working on and visiting the MODU and support vessels are inducted.
10.4.2, 10.4.3 & 10.4.6	Project personnel are familiar with operations HSE issues.	Regular HSE communications take place between offshore and office-based personnel.	HSE meeting records are available and verify regularity of communications.
10.5.2	Emergency response responsibilities are clearly defined.	The Australian Projects HSE Management Plan, OPEP, RWP and Bridging ERP outline emergency responsibilities for project personnel.	The emergency responsibilities are communicated to project personnel prior to the activity commencing.
10.5.2	Offshore and onshore project personnel are familiar with their emergency response responsibilities.	All relevant MODU-, vessel- and office-based personnel participate in emergency response (e.g., ERP and OPEP) training, drills and exercises.	Training records verify that emergency response exercises were undertaken.
10.7.1 & 10.7.2	Incident reports are issued to the	Recordable incidents reports are issued monthly to NOPSEMA as per Table 9.4.	Recordable and reportable incident reports and associated email correspondence is

Section	EPO	EPS	Measurement criteria
	regulators as required.	Reportable incidents are reported to NOPSEMA in accordance with the timing requirements provided in Table 9.5.	available to verify their issue to NOPSEMA (and other agencies, as required).
10.7.3	Incidents are investigated.	Incident investigations are undertaken by suitably qualified and experienced personnel in a timely manner.	Incident investigation reports are available and align with incidents recorded in the incident management system.
10.8	Changes to approved plans (including this EP), equipment, plant, standards or procedures are assessed through the MoC process.	Changes are documented in accordance with the MoC processes.	MoC records are available in the MoC register.
10.9	All records relevant to implementation of the EP are available for five years.	All records relevant to implementation of the EP are retained by EOG, AGR and Aventus.	EP documents are readily accessible.
10.10.1	Emissions and discharges are recorded.	Emissions and discharges from the MODU and support vessels, in line with Table 9.5, are recorded.	Monitoring records are available and align with the requirements in Table 9.5.
10.10.2	Regulatory agencies and stakeholders are aware of activity start and end.	Pre- and post-activity notifications to regulatory agencies and stakeholders are issued as per Table 9.6.	Notification records verify issue.
10.10.3	The EP is reviewed for currency in light of any changes to the activity, controls, legislation or relevant scientific research.	EOG updates the EP as required.	The revision history of this EP is updated to record document changes.
10.10.3	This EP is reviewed and updated on an as-required basis.	This EP is reviewed and updated based on the triggers presented in Section 9.10.3 on an as-required basis.	A record of EP reviews and updates is available.
			The review and/or update details are recorded in the document control page of this EP.
		If the review identifies that significant changes to the EP are required, the EP is updated and re-issued to the regulators.	A record of EP revision is included in the document control page of this EP.
10.10.4	EP compliance inspections and audits are	EP compliance is assessed during the activity by competent personnel.	Environmental inspection reports, completed checklists and audit report are available

Section	EPO	EPS	Measurement criteria
	undertaken for the activity.		and verify compliance with this EP.
10.10.6	An end-of-activity EP performance report is submitted to NOPSEMA.	The end-of-activity EP performance report is issued to NOPSEMA within three months of completion of the activity.	The end-of-activity EP performance report and associated email correspondence is available to verify its issue to NOPSEMA.
10.10.7	An EP commitments register is established.	EP commitments register is in place and used throughout the campaign to track compliance with EPS.	EP commitments register verifies it is in use.

Appendices

1. Commonwealth, State and Northern Territory legislation.
2. Relevant Persons Consultation and Engagement Plan (RPCEP).
3. List of relevant persons.
4. List of relevant persons – named individual fishing licence holders (*provided to NOPSEMA separately as sensitive information under Regulation 9(8) of the OPGGS(E)*).
5. Newspaper advertisements.
6. Project information flyers.
7. Communication records (*provided to NOPSEMA separately as sensitive information under Regulation 9(8) of the OPGGS(E)*).
8. Stakeholder communications summary.
- 8a. Supplement to communications summary – named individuals (*provided to NOPSEMA separately as sensitive information under Regulation 9(8) of the OPGGS(E)*).
9. Fishing compensation protocol summary.
10. EPBC Act Protected Matters Search Tool (PMST) results.
11. Existing environment in the spill EMBA.
12. Oil spill trajectory modelling report.
13. Assessment of the risk of a LoWC on the management actions of protected areas.
14. NT Aboriginal heritage map (*provided to NOPSEMA separately as sensitive information under Regulation 9(8) of the OPGGS(E)*).
15. Shoreline LoWC exposure risk and shoreline types.

Appendix 1

Commonwealth, State and Territory Legislation

COMMONWEALTH LEGISLATION

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
<p><i>Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)</i> (& Regulations 2000)</p>	<p>Protects matters of national environmental significance (MNES), provides for Commonwealth environmental assessment and approval processes and provides an integrated system for biodiversity conservation and management of protected areas.</p> <p>MNES are:</p> <ol style="list-style-type: none"> 1. World heritage properties; 2. National heritage places; 3. Wetlands of international importance (Ramsar wetlands); 4. Nationally threatened species and ecological communities; 5. Migratory species; 6. Commonwealth marine environment; 7. The Great Barrier Reef Marine Park; 8. Nuclear actions (including uranium mining); and 9. A water resource, in relation to coal seam gas development and large coal mining development. <p>Relevance to this activity: This EP includes a description and assessment of MNES and migratory species (Item 4 and Item 5 in this list) including the Commonwealth marine environment (Item 6), that may be impacted by the activity.</p>	<ul style="list-style-type: none"> • Republic of Korea Migratory Birds Agreement 2006 (ROKAMBA). • Convention on Biological Diversity and Agenda 21 1992. • Agreement between the Government and Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment 1986 (CAMBA). • Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention) 1979. • Agreement between the Government and Australia and the Government of Japan for the Protection of Migratory Birds and Birds in Danger of Extinction and their Environment 1974 (JAMBA). • Convention on International Trade in Endangered Species of Wild Fauna and Flora 1973 (CITES). • Convention on Wetlands of International Importance especially as Waterfowl Habitat 1971 (RAMSAR). • International Convention for the Regulation of Whaling 1946. 	<p>DCCEEW (National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) in the case of this activity)</p>

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
<i>Offshore Petroleum Greenhouse Gas Storage Act (OPGGSA) 2006 and OPGGS (Environment) Regulations 2009</i>	<p>The Act addresses all licensing and HSE issues for offshore GHG activities extending beyond the 3 nm limit.</p> <p>The Regulations (Part 2) specify that an EP must be prepared for any petroleum activity and that activities are undertaken in an ecologically sustainable manner.</p> <p>Relevance to this activity: The submission and acceptance of this EP satisfies the key requirements of this legislation.</p>	Not applicable.	NOPSEMA
<i>Environment Protection (Sea Dumping) Act 1981 (& Regulations 1983)</i>	<p>Aims to prevent the deliberate disposal of wastes (loading, dumping, and incineration) at sea from vessels, aircraft, and platforms.</p> <p>Relevance to this activity: There will be no dumping at sea within the meaning of the legislation that would require a sea dumping permit to be obtained.</p>	<ul style="list-style-type: none"> • Protocol on the Prevention of Marine Pollution by Dumping of Waste and Other Matter 1996 [London Protocol] • Convention on the Prevention of Marine Pollution by Dumping of Waste and Other Matter 1972 [London Convention] 	DCCEEW
<i>Australian Maritime Safety Authority Act 1990</i>	<p>Facilitates international cooperation and mutual assistance in preparing and responding to a major oil spill incidents, and encourages countries to develop and maintain an adequate capability to deal with oil pollution emergencies.</p> <p>Requirements are effected through the Australian Maritime Safety Authority (AMSA). AMSA is the lead agency for responding to oil spills in the Commonwealth marine environment and is responsible for implementing the Australian National Plan for Maritime Environmental Emergencies (NatPlan).</p> <p>Relevance to this activity: In the event of a Level 2 or 3 hydrocarbon spill to sea from a vessel in Commonwealth waters, AMSA is the designated Combat Agency and implements the NatPlan. In the event of a spill from a well blowout, AMSA will assist the Drilling Incident Management Team (DIMIT)</p>	<ul style="list-style-type: none"> • Protocol on Preparedness, Response and Cooperation to Pollution Incidents by Hazardous and Noxious Substances 2000 • International Convention on Oil Pollution Preparedness, Response and Cooperation 1990 (OPRC). 	AMSA

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
<i>Underwater Cultural Heritage Act 2018</i>	<p>Protects the heritage values of shipwrecks, sunken aircraft and relics (older than 75 years) in Australian Territorial waters below the low water mark to the outer edge of the continental shelf (excluding the State's internal waterways. It is an offence to interfere with a shipwreck covered by this Act. This Act replaced the <i>Historic Shipwrecks Act 1976</i> and came into effect on 1 July 2019.</p> <p>Relevance to this activity: No historic shipwrecks have been identified within the operations area through desktop research. In the event of discovery of, and damage to, previously unrecorded wrecks, this legislation may be triggered.</p>	<ul style="list-style-type: none"> • Convention on Protection of the Underwater Cultural Heritage 2001. • Agreement between the Netherlands and Australia concerning old Dutch Shipwrecks 1972. 	DCCEEW
<i>Ozone Protection and Synthetic Greenhouse Gas Management Act 1989</i>	<p>Regulates the manufacture, importation and use of ozone depleting substances.</p> <p>Relevance to this activity: The MODU and support vessels will have a register of ozone-depleting substances (ODS).</p>	<ul style="list-style-type: none"> • United Nations Framework Convention on Climate Change 1992. • Montreal Protocol on Substances that Deplete the Ozone Layer 1987. 	DCCEEW
<i>Recycling and Waste Reduction Act 2020</i> <i>Recycling and Waste Reduction (Mandatory Product Stewardship—Mercury added Products) Rules 2021</i>	<p>The Rules are made under the <i>Recycling and Waste Reduction Act 2020</i> and reflect requirements outlined with paragraph 94(1)(c) regarding Australia's obligations to agreements made with one or more other countries, in this case the rules support the implementation of Australia's commitment to the Minamata Convention.</p> <p>The Rules aim to reduce the risks to human health and environment from mercury used in imported and manufactured products. Prohibiting Australia from importing, exporting, and manufacturing mercury-added products listed in Annex A, Part I of the Minamata Convention, incorporation of listed mercury-added products into other products is also prohibited.</p> <p>Relevance to this activity: the management of mercury in drill cuttings and muds is addressed in Section 7.6.</p>	<ul style="list-style-type: none"> • The Minamata Convention (2013). 	DCCEEW (lead) & relevant state and territory governments.

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
<i>Navigation Act 2012</i> (& Regulations 2013)	<p>This Act regulates ship-related activities in Commonwealth waters and invokes certain requirements of the International Convention for the Prevention of Pollution from Ships (MARPOL 73/78) relating to equipment and construction of ships. Several Marine Orders (MO) are enacted under this Act relating to offshore petroleum activities, including:</p> <ul style="list-style-type: none"> • MO Part 21: Safety of navigation and emergency procedures • MO Part 30: Prevention of collisions • MO Part 50: Special purpose ships • MO Part 59: Offshore industry vessel operations • MO Part 70: Seafarer certification. <p>Relevance to this activity: Support vessels will adhere to the relevant MOs while operating within Commonwealth waters.</p>	<ul style="list-style-type: none"> • International Convention on Standards of Training, Certification and Watchkeeping for Seafarers (STCW) as amended, 1995. • United Nations Convention on the Law of the Sea 1982 (UNCLOS). • International Convention for the Prevention of Pollution from Ships 1973, as modified by the Protocol of 1978 (MARPOL). • International Convention for the Safety of Life at Sea 1974 (SOLAS). • Convention on the International Regulations for Preventing Collisions at Sea 1972 (COLREG). World Trade Organization Agreement on the Application of Sanitary and Phytosanitary Measures (SPS agreement) 1995. World Organisation for Animal Health and the International Plant Protection Convention 1952. 	DCCEEW

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
	<p>The person in charge of an exposed conveyance carries the responsibility for pre-arrival reporting under the Act and must arrive at a first point of entry.</p> <p>This Act includes mandatory controls in the use of seawater as ballast in ships and the declaration of sea vessels voyaging into and out of Commonwealth waters. The regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers.</p> <p>The Biosecurity Amendment (Biofouling Management) Regulations 2021 entered into force on the 15th of June 2022 and requires that vessel operators provide information on biofouling management practices prior to arriving in Australia.</p> <p>Relevance to this activity: The MODU and support vessels sourced from foreign ports will adhere to the DCCEW guidelines regarding quarantine clearance to enter Australian waters.</p>		

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
<i>Marine Safety (Domestic Commercial Vessel) National Law Act 2012</i> (& Regulations 2013)	<p>This Act provides for a national system for Domestic Commercial Vessels (DCV) between states and territories to ensure their safe operation. This system provides for MO and National Standards to be adopted for DCVs of different classes. Current MO include:</p> <ul style="list-style-type: none"> • MO 501 (Administration – National Law) 2013 • MO 502 (Vessel Identifiers – National Law) 2013 • MO 503 (Certificates of Survey – National Law) 2013 • MO 504 (Certificates of Operation and Operational Requirements – National Law) 2013 • MO 505 (Certificates of Competency – National Law) 2013 • MO 507 (Load Line Certificates – National Law) 2013. <p>This law does not over-ride state legislation with respect to marine environmental management, dangerous goods management, speed limits, navigation aids, rules for prevention of collisions, monitoring of marine communications systems, workplace health and safety or emergency management and response.</p> <p>Relevance to this activity: The MODU and support vessels will adhere to the relevant MOs while operating within Commonwealth waters.</p>	Not applicable.	AMSA
<i>Native Title Act 1993</i>	<p>Allows for recognition of native title through a claims and mediation process and also sets up regimes for obtaining interests in lands or waters where native title may exist.</p> <p>Relevance to this activity: Native Title Determination area does not cover the operational area, and therefore there is no relevance to this activity.</p>	Not applicable.	National Native Title Tribunal (NNTT)

Commonwealth Legislation/ Regulation	Scope	Related International Conventions	Administering Authority
<i>Fisheries Management Act</i> 1991 (& Regulations 2009)	<p>This Act aims to implement efficient and cost-effective fisheries management on behalf of the Commonwealth, ensure that the exploitation of fisheries resources and the carrying on of any related activities are conducted in a manner consistent with the principles of Ecologically Sustainable Development (ESD), maximise the net economic returns to the Australian community from the management of Australian fisheries, ensure accountability to the fishing industry and to the Australian community in the Australian Fisheries Management Authority's (AFMA's) management of fisheries resources, and achieve government targets in relation to the recovery of the costs of AFMA.</p> <p>Relevance to this activity: Provides the regulatory and other mechanisms to support any necessary fisheries management decisions in the event of a hydrocarbon spill in Commonwealth waters.</p>	Not applicable.	AFMA
<i>Aboriginal and Torres Strait Islander Heritage Protection Act 1984</i>	<p>This Act provides for the preservation and protection from injury or desecration areas and objects that are of significance to Aboriginal people, under which the Minister may make a declaration to protect such areas and objects. Under the Act, discovery of Aboriginal remains must be reported to the Environment Minister.</p> <p>Relevance to this activity: No known sites of Aboriginal heritage significance occur within the operational area. May be relevant in the event of a hydrocarbon spill requiring shoreline access for clean-up purposes.</p>	Not applicable.	DCCEEW

WESTERN AUSTRALIAN LEGISLATION

WA Legislation/ Regulation	Scope	Relevance to activity	Administering Authority
<i>Conservation and Land Management Act 1984</i>	<p>This Act makes provision for the use, protection and management of certain public lands and waters and the flora and fauna. It establishes authorities responsible for such protection.</p> <p>This Act covers the management of Nationally Important Wetlands that are present along the coast of the EMBA.</p>	This Act would be triggered in the event of a hydrocarbon spill that threatens coastal marine parks, or that access to respond to a hydrocarbon spill is required through such parks.	Conservation and Parks Commission
<i>Contaminated Sites Act 2003</i> (& Regulations 2006)	<p>This Act provides for the identification, recording, management and remediation of contaminated sites.</p> <p>Under the Act, a 'site' is an area of land or water in WA, including surface water, groundwater and offshore areas out to 3 nm. A site is 'contaminated' if it has a substance in it at above background concentrations, which presents or has the potential to present a risk of harm to human health or the environment.</p>	This Act would be triggered in the event that a hydrocarbon spill contaminates shorelines and requires remediation.	Department of Water and Environmental Regulation (DWER)
<i>Environmental Protection Act 1986</i>	<p>This is the principal Act relating to environmental protection in WA. It establishes the EPA and gives the EPA overall responsibility for the prevention, control and abatement of environmental pollution and for the conservation, preservation, protection, enhancement and management of the environment.</p> <p>Part 5 of the Act states that a person who causes pollution or environmental harms or allows pollution or environmental harm to be caused commits an offence.</p>	Hydrocarbons are listed in Schedule 1 of the Act as a Listed Waste. The Act would be triggered in the event of a hydrocarbon spill that reaches the coast, particularly with regard to waste treatment, transport and disposal.	Office of the EPA
Environmental Protection (Controlled Waste) Regulations 2004	<p>These regulations detail the appropriate management and handling of controlled wastes in respect to the environment.</p> <p>Schedule 1 of the regulations lists waste oil and water, or hydrocarbons and water, mixtures or emulsions as a controlled waste.</p>	These regulations may be triggered in the event that a hydrocarbon spill enters state waters and reaches shorelines, requiring collection and onshore handling, transport and disposal.	DWER

WA Legislation/ Regulation	Scope	Relevance to activity	Administering Authority
Environmental Protection (Unauthorised Discharges) Regulations 2004	<p>These regulations make it an offence to cause pollution through unauthorised discharges, particularly with regard to dark smoke (anything darker than shade 1 on the Australian Miniature Smoke Chart, AS 3543, 1989). It may be a defence to cause dark smoke to prevent irreversible damage to a significant part of the environment.</p> <p>Schedule 1 of the regulations lists hydrocarbon as a material that must not be discharged to the environment.</p>	This Act would be triggered in the event that a hydrocarbon spill enters state waters and/or in-situ burning is a response consideration.	DWER
<i>Emergency Management Act 2005</i>	This Act provides for prompt and coordinated organisation of emergency management in the State. Hazards captured under the Act include events that result in destruction of or damage to the environment. It establishes the State Emergency Management Committee (SEMC), which is the key plan in responding to emergencies of state significance.	This Act would be triggered in the event that a hydrocarbon spill threatens state waters and shorelines. The SEMC would implement the State Emergency Management Plan on behalf of the state.	SEMC
<i>Aquatic Management Resources Act 2016 (ARMA)</i>	This Act provides for the ecologically sustainable development and management of the State's aquatic resources including management of aquatic biosecurity.	This Act would be triggered in the event that a hydrocarbon spill enters state waters and has the potential to impact commercial fishing activities (e.g., closures).	Department of Primary Industry and Regional Development (DPIRD)
<i>Harbours and Jetties Act 1928</i>	This Act relates to the liability of owners of ships for damage to harbours and jetties, and works connected therewith.	This Act may be triggered in the event that a support vessel used for the project causes loss or damage to a harbor or jetty.	Department of Transport (DoT)
<i>Pollution of Waters by Oil and Noxious Substances Act 1987 (& Regulations 1993)</i>	This Act provides for the protection of the sea and certain waters from pollution by oil and other noxious substances discharged from ships (as defined in the WA Marine Act, see below). This Act prohibits the discharge of oil or noxious substances into State waters and provides for the removal of oil or any mixture containing oil from affected waters.	This Act may be triggered in the event that a hydrocarbon spill enters state waters.	EPA & DoT
<i>Western Australian Marine Act 1982 (& (Infringements) Regulations 1985)</i>	This Act regulates navigation and shipping in WA waters.	Activity vessels traversing WA state waters (e.g., in the event of hydrocarbon spill) must abide by the requirements of the Act with regard to marine safety requirements.	DoT

WA Legislation/ Regulation	Scope	Relevance to activity	Administering Authority
<i>Biodiversity Conservation Act 2016 (& Regulations 2018)</i>	<p>This Act provides for the conservation and protection of wildlife. Licences to take (i.e., for fauna, to kill, capture, disturb, hunt and for flora to gather, pluck, dig up, destroy, etc) protected flora and fauna on Crown land (e.g., coastal parks) are required under this act.</p> <p>The regulations provide for the issuing of licences to take, keep, import and export flora and fauna, and for the caring of sick or injured fauna.</p>	This Act would be triggered in the event that native wildlife rescue and treatment is required in the event of a hydrocarbon spill, or that native habitat on the coast may be damaged in the process of responding to coastal stranding of hydrocarbons.	Department of Biodiversity, Conservation and Attractions (DBCA)
<i>Animal Welfare Act 2002 (& Animal Welfare (General) Regulations 2003)</i>	This Act is established to provide for the welfare, safety and health of animals, to regulate the use of animals for scientific purposes and for related purposes. The Act is focused on prohibiting cruelty to, and other inhumane or improper treatment of, animals.	This Act would be triggered in the event that wildlife rescue and treatment is required in the event of a hydrocarbon spill.	DPIRD

NORTHERN TERRITORY LEGISLATION

NT Legislation/ Regulation	Scope	Relevance to activity	Administering Authority
<i>Environment Protection Act 2019</i> (& Regulations 2020)	This Act provides the requirement for operators in the Northern Territory to hold an 'environmental approval' for proposed actions that will have a significant impact on the environment or require referral under a 'referral trigger'.	The Act would be triggered in the event of a hydrocarbon spill that reaches the shoreline, particularly with regard to pollution and waste containment, avoidance and abatement.	NT EPA
<i>Waste Management and Pollution Control Act 1998</i> (& (Administration) Regulations 1998)	Legislation protecting the environment through the encouragement of effective waste management, pollution prevention and control practices (relevant for waste disposal and transfer).	This Act and its regulations may be triggered in the event that a hydrocarbon spill enters state waters.	NT EPA
<i>Dangerous Goods Act 1998</i> (& Regulations 1985)	This Act provides for the safe storage, handling and transport of certain Dangerous Goods.	This Act and its regulations may be triggered in the event that a hydrocarbon spill enters state waters, with regard to incident reporting requirements.	NT Worksafe
<i>Marine Pollution Act 1999</i> (& Regulations 2003)	This Act provides protection of the marine and coastal environment by minimising intentional and negligent discharges of ship sourced pollutants to coastal waters. It also enacts Annexures 1, 2, 3 and 5 of MARPOL.	This Act and its regulations may be triggered in the event that a hydrocarbon spill enters state waters.	NT Department of Environment, Parks and Water Security (DEPWS)

1. Introduction

EOG holds a 100% interest in the WA-488-P Permit, an exploration permit located offshore Western Australia (Figure 1) and intends to explore for petroleum in the area targeting the Beehive Prospect. As part of operating in Australia, EOG recognises the importance of engaging with local community stakeholders to build relationships and lines of communication and to understand the social, economic, and cultural features of the environment as well as the heritage value of places near EOG's proposed Work Plan, defined as the group of petroleum activities that EOG proposes to undertake in the Block. EOG has specific consultation requirements in connection with obtaining approvals for each Environmental Plan (EP) required by the Work Plan. This Relevant Person Consultation and Engagement Plan (RPCEP) describes how EOG plans to undertake its consultation activities in Australia.

1.1. Scope

This RPCEP outlines EOG's planned consultation and engagement activities in connection with its Work Plan. This document is prepared in accordance with NOPSEMA Guideline N-04750-GL2086 and is also informed by the principles of the International Association for Public Participation IAP2 spectrum. This RPCEP also considers the consultation process requirements identified by EOG following the Federal Court of Australia appeal decision of *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 (the Decision).

1.2. Background

EOG has previously taken steps to introduce its Work Plan to relevant persons and the public. EOG commenced consultation activities in September 2021. Initially, 62 relevant persons were identified and consulted with prior to first submission of its Drilling EP and Geotech EP. EOG has met with all three Land Councils in the Environment that May be Affected (as defined by regulations, the EMBA) and a Prescribed Body Corporate (PBC), while it continues to seek in-person meetings with other PBCs that are identified as relevant persons.

In monitoring the regulatory requirements and developments in Australia leading up to and including the Decision, EOG began to update and enhance its consultation process. EOG's updated methods have identified over 400 relevant persons, and we continue our efforts to identify and consult with all relevant persons. Our recent efforts have included posting additional public notices at the boat ramps and ports and developing a dedicated Work Plan-specific EOG website through Social Pinpoint to use as part of our consultation and engagement.

Figure 1 - Location of Beehive-1 WA-488-P

1.3. Definitions and Abbreviations

Term	Definition
Activities	To be read broadly and is broader than the definition of “activity” in Section 4 of the OPGGS (E) Regulations and is likely directed to what the relevant person is already doing
Activity	Petroleum activity as per Regulation 4 of the OPGGS (E) Regulations
ALARP	As low as reasonably practicable
Drilling EP	The Beehive-1 Exploration Drilling Environment Plan
EOG	EOG Resources Australia Block WA-488 Pty Ltd., a subsidiary of EOG Resources, Inc.
EMBA	Environment that May Be Affected
EP	Environment Plan as defined in the OPGGS (E) Regulations.
EPBC Act	<i>Environment Protection and Biodiversity Conservation Act 1999</i>
Functions	Refers to “a power or duty to something.”
Geotech EP	The Beehive Pre-Drill Geotechnical Assessment Environment Plan.
Interests	To be construed as conforming with the accepted concept of “interest” in other areas of public administrative law. Includes “any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.”
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
OPGGS Act	<i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i>
OPGGS (E) Regulations	Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009
Relevant Person	A person specified under Division 2.2A of the OPGGS (E) Regulations
RPCEP	Relevant Person Consultation and Engagement Plan
Work Plan	The group of petroleum activities that EOG proposes to undertake to meet our obligations under the WA-488-P title

2. Overview

2.1. Aim and Objectives

Through its consultation efforts, EOG aims to demonstrate that its Work Plan will be planned and executed in a way that considers the rights, interests, and concerns of all relevant persons, and establish two-way, good faith, responsive engagement.

The objectives of EOG's consultation efforts are to:

- Establish lines of communication between EOG and relevant persons.
- Gather knowledge about the social, economic, and cultural features of the environment as well as the heritage value of places near EOG's proposed Work Plan.
- Collect feedback from the community and assess input from relevant persons to inform the quality of EOG's environmental impact assessments.
- Assess the magnitude and significance of potential interferences with other rights or potential impacts on the environment and evaluate opportunities to improve EOG's ability to minimise environmental impacts and risk from the Work Plan, including through mitigation and monitoring processes.
- Evaluate acceptable levels of environmental impacts consistent with the OPGGS Act and the OPGGS (E) Regulations and perform the consultations in accordance with Australian law.

2.2. Key Legislation Summary

Legislation	Summary	Requirement
OPGGS Act S 280	Interference with other rights	<p>A person carrying out activities in an offshore area under the permit, lease, license authority or consent should not interfere with:</p> <ul style="list-style-type: none"> a. Navigation; or b. Fishing; or c. The conservation of the resources of the sea and seabed; or d. Any activities of another person being lawfully carried on by way of: <ul style="list-style-type: none"> • Exploration for, recovery of or conveyance of a mineral (whether petroleum or not); or • Construction or operation of a pipeline; or • Offshore infrastructure activities (within the meaning of <i>Offshore Electricity Infrastructure Act 2021</i>); or e. The enjoyment of native title rights and interests (within the meaning of the <i>Native Title Act 1993</i>). <p>to a greater extent than is necessary for the reasonable exercise of the rights and performance of the duties of the first person.</p>
OPGGS (E)R 13	Environment Description	<p>Description of the environment</p> <p>(2) The environment plan must:</p> <ul style="list-style-type: none"> a. Describe the existing environment that may be affected by the activity; and b. Include details of the relevant values and sensitivities (if any) of that environment. <p><i>Note: The definition of environment in regulation 4 includes its social, economic and cultural features.</i></p> <p>(3) Without limiting paragraph (2)(b), particular relevant values and sensitivities may</p>

		<p>include any of the following:</p> <ol style="list-style-type: none"> The world heritage values of a declared World Heritage property within the meaning of the EPBC Act; The national heritage values of a National Heritage place within the meaning of that Act; The ecological character of a declared Ramsar wetland within the meaning of that Act; The presence of a listed threatened species or listed threatened ecological community within the meaning of that Act; The presence of a listed migratory species within the meaning of that Act; Any values and sensitivities that exist in, or in relation to, part or all of; <ul style="list-style-type: none"> A Commonwealth marine area within the meaning of that Act; or Commonwealth land within the meaning of that Act.
Division 2.2A OPGGS(E)R 11A	Relevant persons	<p>(1) In the course of preparing an environment plan, or a revision of an environment plan, a titleholder must consult each of the following (a relevant person):</p> <ol style="list-style-type: none"> Each Department or agency of the Commonwealth to which the activities to be carried out under the environment plan, or the revision of the environment plan, may be relevant; Each Department or agency of a State or the Northern Territory to which the activities to be carried out under the environment plan, or the revision of the environment plan, may be relevant; The Department of the responsible State Minister, or the responsible Northern Territory Minister; A person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the environment plan, or the revision of the environment plan; Any other person or organization that the title holder considers relevant.
Division 2.2A OPGGS(E)R 11A	Sufficient Information	<p>(2) For the purpose of consultation, the titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person.</p>
Division 2.2A OPGGS(E)R 11A	Reasonable period	<p>(3) The titleholder must allow a relevant person a reasonable period for the consultation.</p>
Division 2.2A OPGGS(E)R 11A	Sensitive information	<p>(4) the titleholder must tell each relevant person the titleholder consults that:</p> <ol style="list-style-type: none"> The relevant person may request that particular information the relevant person provides in consultation not be published; and Information subject to such a request is not to be published under this Part.
OPGGS(E)R 9(8)	Sensitive information	<p>All sensitive information (if any) in an environment plan, and the full text of any response by a relevant person to consultation under regulation 11A in the course of preparation of the environment plan, must be contained in the sensitive information part of the environment plan and not anywhere else in the environment plan.</p>
OPGGS(E)R 14(9)	Ongoing consultation	<p>The implementation strategy must provide for appropriate consultation with:</p> <ol style="list-style-type: none"> Relevant authorities of the Commonwealth, a State or Territory; and Other relevant interested persons or organisations
OPGGS(E)R 16(b)	Consultation report	<p>The environment plan must contain:</p> <ol style="list-style-type: none"> A report on all consultations under regulation 11A of any relevant person by the titleholder, that contains: <ul style="list-style-type: none"> A summary of each response made by a relevant person; and An assessment of the merits of any objection or claim about the adverse impact of each activity to which the environment plan relates; and A statement of the titleholder's response, or proposed response, if any, to each objection or claim; and A copy of the full text of any response by a relevant person.

OPGGS(E)R 10A	Criteria for acceptance of environment plan	For regulation 10, the criteria for acceptance of an environment plan are that the plan: (g) demonstrates that: a. The titleholder has carried out the consultations required by Division 2.2A; and b. The measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate.
------------------	--	---

2.3. Acceptable Levels of Environmental Impact and Risk

Section 280 of the OPGGS Act and the OPGGS (E) Regulations implement Australian government policy regarding mutual marine use. The OPGGS Act and OPGGS (E) Regulations also recognize that the offshore petroleum industry can mitigate potential impacts so that they are reduced to as low as reasonably possible (ALARP) and acceptable levels and are consistent with the principles of ecologically sustainable development.

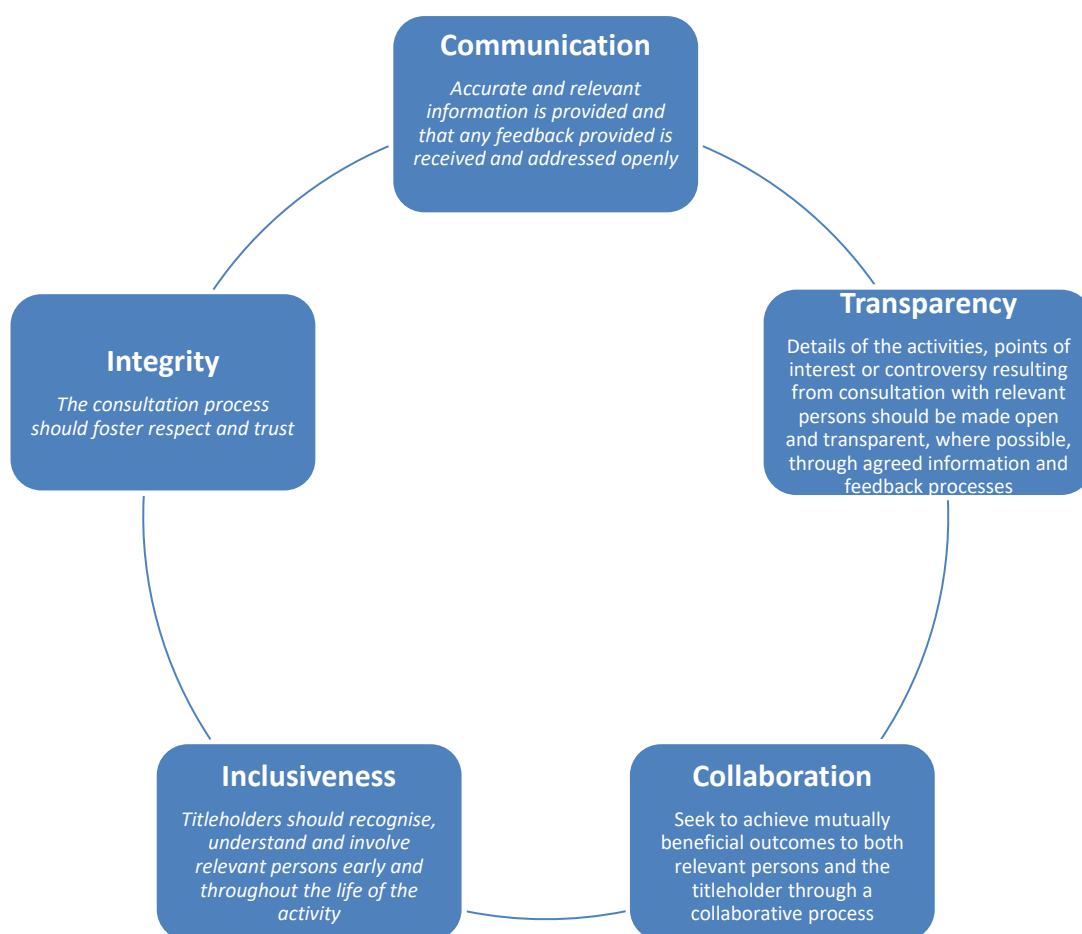

Acceptable levels of environmental impact and risk are context specific, so they are established in the preparation of each individual EP and are informed by the consultation process. Generally, the following levels of environmental impact and risk are considered acceptable:

- No person, organisation, or authority is worse off because of offshore petroleum activities;
- Environmental impacts are short-term, temporary, and recoverable; and
- Environmental risks have consequences that are preventable and effectively managed.

3. The Principles of Engagement and Consultation

3.1. Application

When conducting consultation, EOG focuses on fostering relationships, establishing a clear process of two-way, good faith, responsive engagement, and providing opportunity for identification of substantive issues. Our consultation with external authorities, organisations, or persons is guided by the following principles.

To conduct consultations in a reasonable manner, EOG will not respond to or consider information that includes:

- statements of general objection to offshore energy projects
- comments that contain threats or profanities
- comments made outside of the communication methods provided by EOG (e.g., through online social media channels)
- SPAM mail, form letters, or petitions

3.2. Engagement with the Public

This RPCEP makes a distinction between public comment and public engagement. Public comment is a regulatory process facilitated by NOPSEMA allowing anyone to make comment on the EP directly to the regulator. Public engagement is a task completed by the titleholder to transparently share information on its activities in preparation of an EP and to support self-identification of relevant persons. Public engagement also includes providing the public and relevant persons with an online resource where the latest information and progress on the Work Plan can be found.

3.2.1. Public Comment

The OPGGS(E) Regulations provide members of the public the ability to comment directly to the regulator on their views for a 30-day period on a seismic or exploratory drilling EP. At the time of writing, the Drilling EP has been through a public comment period. The Geotech EP was not published for public comment as it does not fit into the required category related to public comment. The public comment period does not replace the need for public engagement.

3.2.2. Public Engagement

The public is a broader group of people than those who can be identified as relevant persons. Without proactive action from EOG, the first time the public are made aware of the Work Plan in the EP may be via the publication on NOPSEMA's website. EOG aims to support persons who may self-identify as someone who may be affected by the activities in our Work Plan as early in the EP development process as possible. Therefore, EOG plans to publish or has published notices in print media, social media, and online to:

- Notify the public of the commencement of the preparation of an EP.
- Encourage relevant persons to self-identify for consultation.
- Notify the public of the commencement of the consultation process.

EOG has made available an online feedback function and survey on a dedicated Work Plan- specific EOG website through Social Pinpoint. Not only will this provide another venue for public engagement and feedback, to help determine if they are a relevant person. If the person's responses initially indicate they are not a relevant person, then they will still be given an option to self-identify as relevant and EOG will consider them as a relevant person. Persons may identify as a relevant person at any point during EP development or during the Work Plan.

A full copy of the latest submission of each EP will be available on the respective activity-specific websites.

3.3. Identification of Relevant Persons: Authorities, Organisations, and Persons

The OPGGS (E) Regulations create a distinction between the public and relevant persons (authorities, organizations, and persons), and require consultation with all relevant persons in the preparation of each EP. The OPGGS (E) Regulations further specify that relevant persons include people and organizations whose functions, interests, and activities may be affected by the petroleum activity. The Federal Court of Australia helped to define these terms in the *Tipakalippa v National Offshore Petroleum Safety and*

Environmental Management Authority (No 2) [2022] FCA 1121 and Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193.

Identification of potentially affected persons is the first step in being able to manage and address the concerns and issues of groups, organizations, or individuals who may impact or be impacted by the Work Plan. When EOG prepares to undertake an EP, EOG seeks to proactively identify relevant persons and provide them opportunity to be consulted consistent with the regulated process and will continue identification activities throughout the Work Plan.

EOG recognizes that a community can be disaggregated and a member of a community may identify differently from the community at large. These methodologies are open-ended approaches that cast a broad net. The result is that a large pool is created from both general and targeted searches from which relevant persons can be located so that it is reasonable to conclude that all relevant persons have been identified. The exact methods used and the outputs of those methods will be recorded in each EP as applicable.

Taking into consideration the considerations discussed above, EOG uses the following methods to find relevant persons (authorities, organisations and persons) who may be affected by our Work Plan:

- **Geographic searches:** Geospatial focused and location-based search of maps and public GIS data to help form an understanding of the persons and organisations within the environment planning area.
- **Healthy Country Plans:** Review of Aboriginal Corporation public Healthy Country plans to understand the values and sensitivities for those groups within the Work Plan area.
- **Government agencies and organizations:** Relevant government agencies may have information about individuals and organisations that may be affected by the Work Plan
- **Review of EP's both accepted and under assessment within the same Work Plan region:** Previous petroleum activities within a bioregion show who has previously engaged in consultation with petroleum titleholders. It is a broad search method with large coverage.
- **Online internet research:** A search for news articles and press releases about similar activities in the environment planning area and identify individuals and groups that were mentioned.
- **Notices in print media:** EOG will utilize the NT News, The Australian, The West Australian, Koori Mail and The Kimberly Echo to provide notice of the activity and seek input and feedback.
- **Social Media searches:** The use of social media to find relevant persons by following local groups and searching for pages, hashtags and key words related to the activity.
- **Dedicated Work Plan-specific EOG website:** Making activity information available to the public and allowing persons or organizations to self-identify.
- **Referrals from others:** Asking persons if they know of other relevant persons.
- **Self-Identification:** Through the outreach methods and actions listed above, EOG provides several avenues for relevant persons to self-identify and engage in the consultation process.

Once a relevant person has been identified, under the OPGGS (E) Regulations, EOG must tell any authority, person, or organisation that:

- They have been identified as a relevant person.
- The subsequent consultation effort is being undertaken as per the prescribed process.
- EOG is obligated to expressly advise them of titleholder obligations for consultation.

3.4. Tailored Consultation Approach – Subject-Centred Groups

Subject-centred grouping allows for tailoring communication and engagement strategies. People and organisations grouped into subject-centred categories can allow the search for one member of a group to lead to the discovery of additional members of that group. The identification of persons or organisations within subject-centred groups will evolve as engagement with these groups is carried out. In all cases each person contacted will be asked to identify other relevant persons and encouraged to share information about the petroleum activity and how to connect us with others in the subject-centred group.

The following subject-centred groups have been identified in the preparation of this RPCEP. A person could be associated with more than one of these groups while an organisation is more likely that to associate with just one.

Subject-centred groupings

- Marine users
- Tourism operators
- Traditional owners / First nations peoples and land trusts
- Port users
- Petroleum titleholders
- Commercial fishers
- Recreational fishers
- Native title prescribed bodies corporate and land councils
- Conservation groups
- Fishing associations
- Commercial shipping
- Local councils
- Educational bodies
- Commerce
- Ports and harbours
- Heritage groups

Information about each of these subject-centred groups that supports the identification of relevant persons can be found in materials published by the DCCEEW under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) including:

- **Plans of Management:** including for World and National Heritage places, Ramsar wetlands, Australian marine parks, Commonwealth reserves and Commonwealth Heritage places.
- **Recovery Plans:** for listed threatened species and ecological communities.
- **Policy Statements:** including significance impact guidelines and industry specific guidelines.
- **Other Material:** including management principles, online databases, factsheets and other publications.

3.4.1. Marine users

EOG will post notices at ports, boat launches, and ramps to connect with a wide variety of marine users.

3.4.2. Tourism Operators

To identify tourism operators EOG plans to perform the following searches:

- Online searches for cruise operators, marine tours and recreational experiences such as marine mammal observations, diving, recreational fishing and thrill-seeking experiences.
- Request Tourism Australia and Tourism WA to query any databases of local businesses along the coastline within the socio-economic risk EMBA.
- Enquire with local Chambers of Commerce to identify marine based tourism operators in the region.
- Search for upcoming marine-based community or sporting events.

3.4.3. First Nations Peoples

EOG appreciates that First Nations peoples have deep connections to, and concerns about the protection of Sea Country that may be viewed the same as their onshore country. Communications with the group will inform EOG about the cultural features of the environment that may be affected by the Work Plan.

The method of identifying potential First Nations Peoples that may be relevant persons will include:

- Assessing the total values and sensitivities of the environment that may be affected by the Work Plan and events that may lead to unplanned work in the EP, to include the spatial extent of the activities.
- Desktop research of any public Sea Country information within the EMBA of each specific activity.
 - Marine Park management programs
 - Aboriginal group Healthy Country Plans

- Engaging with the First Nations groups such as land councils and prescribed body corporates to seek who they represent, how First Nations groups or individuals should be consulted as relevant persons and if there are any groups or persons in which we have not identified.
- Providing Work Plan information via written correspondence, EOG activity flyers, and the Work Plan-specific EOG website and continually engaging with additional relevant persons or organisations as they are identified.
- Advertising in the Koori Mail and Kimberly Echo newspapers to invite consultation with any person who may have a function, interest or activity that may be affected by the Work Plan. Use of aboriginal owned publications allows for persons that have not yet been identified to self-identify their relevance.

Further, the following activities will be performed to identify First Nations Peoples:

- Visit the local government authority websites (the shire or municipal council) who often include an acknowledgement of the local traditional owners.
- Search state and territory government websites that include information about traditional owners in their jurisdictions, especially in the context of information about local offices.
- Search online for states' and territories' Aboriginal and Torres Strait Islander consultative bodies.
- Contact land councils representing the local Aboriginal or Torres Strait Islander communities.
- Online searches for Native Title groups and corporations on the [Prescribed Bodies Corporate website](#).
- Register searches on the [National Native Title Tribunal](#) website.
- Geospatial searches by completing the forms on the National Native Title Tribunal website.

Note that EOG plans to categorise any person with Native Title claims of any standing as a relevant person.

3.4.4. Port Users

To identify port users the following searches will be performed:

- Contact relevant harbourmaster to enquire about frequent users.
- Online searches for businesses located at wharves in regional ports.

3.4.5. Petroleum Titleholders

To identify petroleum titleholders the following searches will be performed:

- Use the [NEATS database](#) to find titles and titleholders within the EMBA.
- Use the [NOPSEMA EP database](#) to find other titleholders with activities within the EMBA.
- Subscribe to the NOPSEMA EP submissions pages for all activities within the EMBA.

3.4.6. Commercial Fishers

To identify commercial fishers the following searches will be performed:

- Request data from the fishing authorities to understand historical fishing activity within the EMBA.
- Visit local ports to find local fishers who operate in the area.
- Contact all state licensed fishers.
- Contact all Commonwealth fishing license holders.
- Queried and reviewed Fisheries Research and Development Corporation website including the annual State of the Fisheries Report (www.fish.wa.gov.au) and engagement with the Western Australia Fishing Industry Council Inc.

3.4.7. Recreational Fishers

To identify recreational fishers the following searches will be performed.

- Engagement with recreational fishing associations to use newsletters/circulars or websites.
- Request contact details for license holders.
- Request to engage with advisory bodies or reference groups to establish the best approach to identify relevant persons.

3.4.8. Native Title Prescribed Bodies Corporate and Land Councils

To identify native title land councils the following searches will be performed:

- Seek contact details of land councils from the [National Native Title Tribunal](#).

3.4.9. Conservation Groups

To identify conservation groups the following searches will be performed:

- Review of previously submitted EPs on the NOPSEMA website.
- Online searches for conservation groups with interests in similar activities.
- Online searches for new articles and current campaigns related to similar activities.

3.4.10. Fishing Associations

To identify fishing associations the following tasks and searches will be performed:

- Identify the target species within the EMBA through online research.
- Ask the peak fishing association to identify other species-specific associations.

- Request contact details for license holders.

3.4.11. Other Marine Users

To identify other marine users the following searches will be performed:

- Online searches for groups who use or have a connection to the marine environment. This search will focus on marine users proximate to the EMBA.

3.4.12. Commercial Shipping

To identify commercial shipping entities the following searches will be performed:

- Contact relevant harbourmasters and shipping agents to enquire about frequent users.
- Online searches for businesses located at wharves in regional ports.

3.4.13. Local Councils

To identify local councils, shires and cities, the following searches will be performed:

- Search the [Western Australian and Northern Territory Electoral Commission and Government databases](#) for councils, shires and cities proximate to the activity.

3.4.14. Educational Bodies

To identify educational and research bodies the following searches will be performed:

- Contact the Department of Education to identify relevant institutions and research programs.
- Contact the universities to identify any relevant research programs.

Note: for this category the exposure thresholds for monitoring of potential impacts of the activity will be used rather than the socio-economic thresholds because this is more relevant to the likely activities of research institutions.

3.4.15. Commerce

To identify commercial entities the following searches will be performed:

- Contact the local Chambers of Commerce to identify local marine-based businesses.
- Online searches for news articles or press releases about marine-based businesses in the area.

3.4.16. Ports and Harbours

To identify ports and harbours (including boat ramps) the following searches will be performed:

- Review of automatic information system (AIS) data of vessel activities along the coast to establish frequented ports.

- Review the States/NT [boat ramp database](#).
- Contact local councils, cities and shires for listing of local boat ramps and users.

3.4.17. Heritage Groups

To identify heritage groups the following searches will be performed:

- Contact State/NT heritage organisations to identify other relevant persons.
- Query the [Australian Heritage Database](#).
- Query the [Australasian Underwater Cultural Heritage Database](#).

Each of the relevant persons identification searches will be re-run at least quarterly while the EP is in-force and at least once a month before the Work Plan commences.

3.5. Authorities

Authorities are relevant to each of EOG's petroleum activities within its Work Plan. Each Department or Agency has been identified through online searches, expert advice, review of legislation, and review of previous EPs adjacent to the title area and are listed in Schedule B.

NOPSEMA guideline GL1887 identifies the government agencies as a relevant person as they have responsibilities within the Commonwealth marine area.

4. The Consultation Framework

A consultation framework will be implemented, within which there is flexibility to tailor the consultation so it is appropriate to the nature of the relevant person's specific functions, activities and interests. This includes providing initial information to the public sufficient to allow a person to self-identify as a relevant person. The early engagement of relevant persons will help provide clarity to the consultation process. Further, early engagements with relevant persons enable discussions about the expectations a relevant person may have about the type and level of detail of information required through the process.

Undertaking a petroleum activity is a complex task that requires extensive planning, integration of many component parts, and detailed risk management. To deliver the Work Plan, an integrated schedule governs the timing of all petroleum activities including the preparation of EPs, and relevant person consultation. This framework is designed to be flexible and is recognised in the first stage of the framework, which encourages relevant persons to influence the design of the subsequent processes and activities. This framework acknowledges that consultation activities cannot be 'one-size-fits-all' and should be adapted to feedback from the community and relevant persons.

4.1. Reasonable Period for the Consultation

EOG has established a framework for 'reasonable period' to consult with relevant persons once they have received 'sufficient information' to make an informed assessment of an effect on their functions, interests, and activities. The framework is adaptable to information gathered from relevant persons, for example fishers who may be away fishing for 3-4 weeks at a time will have 45 days to consider 'sufficient information'. The minimum definition of a 'reasonable period' will include:

Work Plan introduction

- Information made available in the public sphere prior to the first notice of commencement of the consultation process.

Initial provision of sufficient information

- **At least** 30 calendar days after providing sufficient information to the relevant person.

Ongoing consultation

- **At least** 10 calendar days following EOG's response to inquiry, claims or objections.

4.2. Sufficient Information

Information provided to a relevant person must be sufficient to allow an informed assessment of the possible consequences of the Work Plan on the functions, interests, or activities of the relevant person. What constitutes sufficient information as part of a consultation process will differ depending on the relevant person(s) and will consider:

- the functions, interests, or activities of the relevant person.
- the environmental impacts and risks that may affect them.
- the degree to which a relevant person is affected.

The overarching consultation framework will remain as the base case for consultation. The framework has been designed so that the EP (minus the sensitive information) will be made publicly available (and therefore to all relevant persons) for a minimum of 30 days prior to first submission of the EP. This design implies that sufficient information is, at least, the full EP contents that will be put before the regulator upon which they will decide whether to accept or refuse to accept the EP.

Notwithstanding the above measures to publish the full draft EP prior to submission, the specific processes applied to relevant persons will need be defined in collaboration with those persons for each EP. The type, format, and level of detail of information necessary is likely to vary for different relevant persons depending on the above factors. We will endeavour to tailor the information we provide in a convenient and digestible format that respects the needs and activities of each relevant person.

4.3. Adaptable Engagement and Consultation Activities

The regulatory expectation for co-design of consultation processes means that detailed planning in advance of talking to relevant persons is somewhat limited as the needs of the relevant person need to be taken into consideration. This does not remove the need for a preferred consultation and engagement plan to be developed. Rather, it means that the engagement and consultation activities need to be adapted in response to circumstances.

4.4. IAP2 Methodology

In designing our consultation process, we considered the International Association for Public Participation IAP2 spectrum (IAP2 Spectrum). Table 2 shows how our consultation activities and related objectives map to the IAP2 Spectrum elements.

The assessment included consideration of the following:

- Accessibility to the communication channel
- Accessibility of information
- Depth and quality of information able to be communicated
- Limited burden on the relevant person
- Opportunity to respond to the information
- Ability to show genuine consideration of the views prior to a decision

4.5. Consultation with Relevant Persons Process Flowchart

Relevant persons may reveal themselves at any time in the preparation of an EP. As a result, the flowchart in Figure 2 governs how each relevant persons will be treated irrespective of the stage within the framework.

Table 2 – Mapping of EOG Consultation Activities to IAP2 Spectrum

IAP2 Spectrum Element		EOG Consultation Activities	Objectives of EOG Consultation Activities
Inform	To provide balanced and objective information to assist persons to make an informed decision whether they wish to participate in the process and to understand the problems, alternatives and/or solutions.	EOG Australia website Dedicated Work Plan-specific EOG website (Social Pinpoint). Activity information flyers. Print media notices. Mandated public comment process.	These activities cover a wide range of persons and provide specific information about EOG's proposed Work Plan and the related potential environmental impacts and risks.
Consult	To obtain specific feedback on analysis, alternatives and/or decisions from potentially relevant persons.	Exchange of letters/emails. Informal discussions. Activity update flyers.	The methods adopted for consultation are fit-for-purpose as they are tailored to the relevant person and/or provide updates to specific information as the activity definition develops.
Involve	To work directly with relevant persons throughout the process to ensure that their functions, interests, and activities are consistently understood and considered.	Phone calls. Online meetings. Face-to-face meetings.	These methods were adopted to support the provision of detailed and tailored information to allow informed assessment of the possible consequences of EOG's proposed Work Plan on the relevant persons' specific functions, interests or activities and building of one-on-one relationships.
Collaborate	To partner with the public in each aspect of our decision making including the development of alternatives and the identification of the preferred solutions.	Dual consultation process for both the public and relevant persons. Participatory decision making.	The dual consultation process for the public and for relevant persons allow anyone to engage as they prefer to. Both processes may directly influence the design of the activity, its environmental management measures and the decision about whether the activity is environmentally acceptable.
Empowerment in respect of the process	To provide the opportunity to co-design the consultation process and directly influence the final design of the activity.	NOPSEMA, as the independent regulator undertakes its statutory duties, which includes the receipt of submissions that allow for public comment as well as ultimate review and oversight approval by NOPSEMA.	These activities are meant to satisfy the requirements of the OPGGS (E) Regulations so that NOPSEMA approves the Environmental Plans.

Consultation Process

Flowchart and Work Instruction

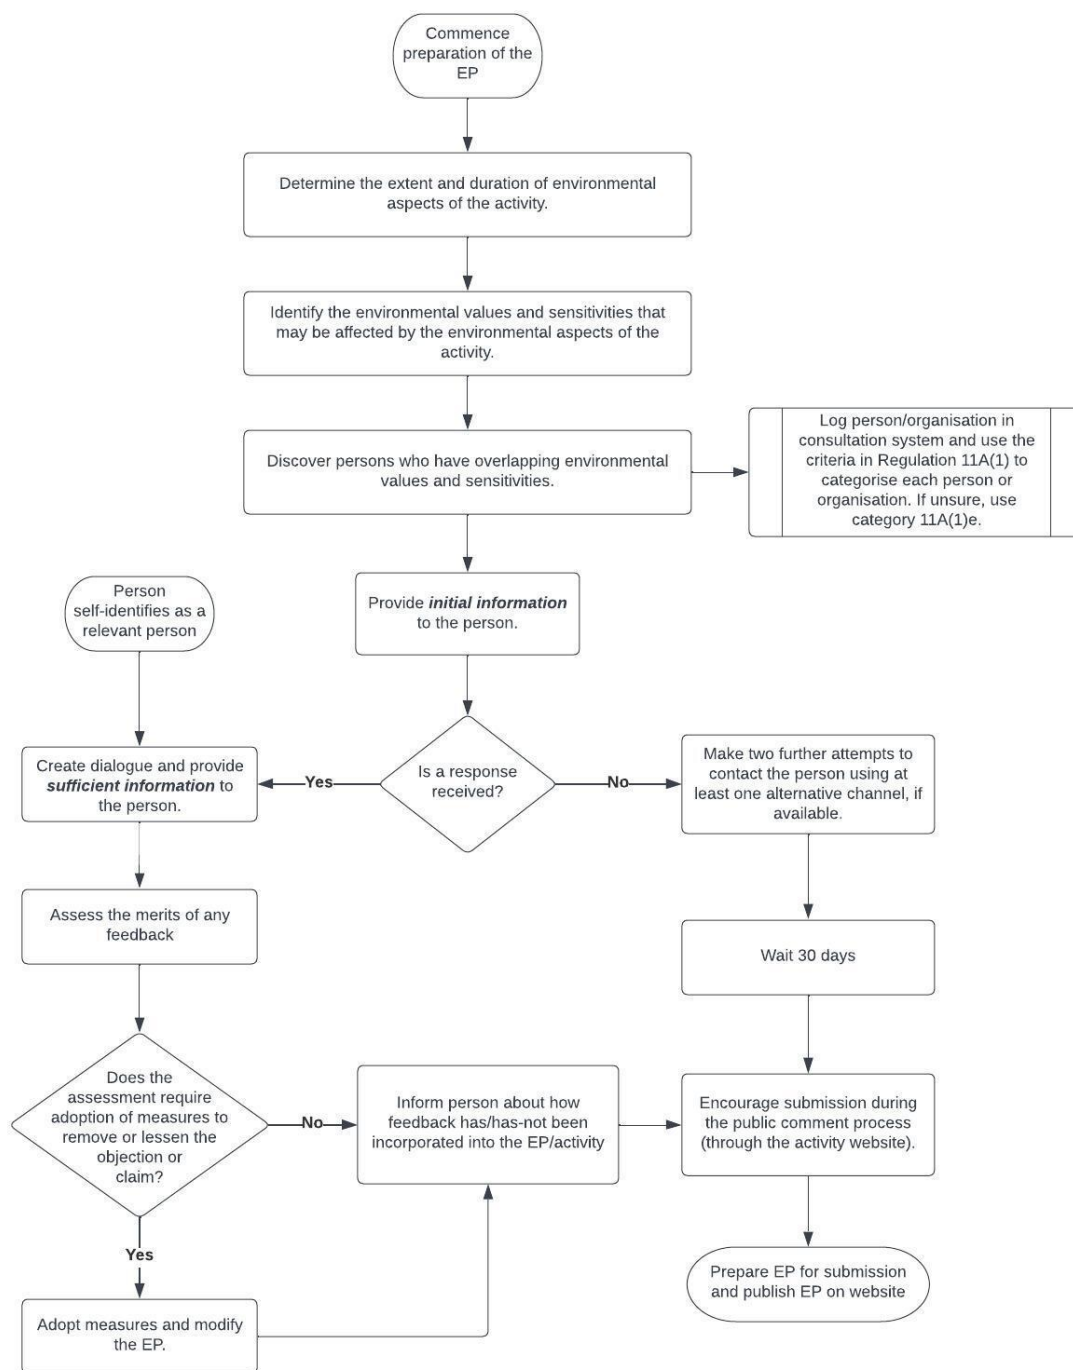

Figure 2 - Relevant persons consultation process

5. Consultation Activities and Tasks

EOG has identified consultation activities that it will carry out and consultation activities that are contingent. Contingent activities are typically less effective and/or are better implemented on request rather than proactively.

5.1. Consultation Activities to be Carried Out

The following tables identify all the activities and the tasks that EOG will carry out in preparation of an EP. The tables in this section provide guidance for how these activities are planned to be completed. The OPGGS (E) Regulations require that all consultation activities are specific to each EP. Consultation activities may relate to multiple petroleum activities, however each consultation activity needs to be clearly recorded against a specific petroleum activity and its EP.

Subject to feedback from stakeholders and the willingness of relevant persons to engage in a co-design methodology, the activities that EOG may undertake are listed below and are expanded on in the following tables.

1. Establish a dedicated work plan-specific website (Table 3)
2. Public notices in print media (Table 4)
3. Publication of information flyers (Table 5)
4. Written correspondence, including response to public comments (Table 6)
5. Phone calls (Table 7)
6. Beehive Project Information Sessions (Table 8)
7. Public notices at prominent locations (Table 9)
8. Face-to-face meetings (Table 10)
9. Further Requested Beehive project information sessions (Table 11)

Table 3 - Establish an activity-specific website

Consultation Activity	Dedicated Work Plan-specific EOG website
Purpose	The purpose of this activity is to establish a central place for all activity-specific information that is easily accessible to as many people as possible at any time during the consultation process and during the activity. The website will provide sufficient information in order for the community to understand the project, including whether they are a relevant person, and provide feedback or concerns.
Tasks	<ul style="list-style-type: none"> - Build an activity-specific webpage - Publish the details of the proposed activity and the consultation process going forward - Create a place for people to provide feedback on the proposed activities

Table 4 - Public notices in print media

Consultation Activity	Public notices in print media
Purpose	The purpose of these activities is to increase awareness of the petroleum activity and direct interested persons to the website. Notices are to be placed in local, regional, and other relevant print media. Subject-centered groups may have their own newsletters or print communication methods that could be used, if possible, to communicate within those groups.

Table 5 – Publication of information flyers

Consultation Activity	Information flyers
Purpose	Short summary flyers containing activity specific content about the petroleum activity and its potential environmental impacts and risks will be produced for distribution alongside other consultation activities. They will be accessible through the website and appended to correspondence as necessary. If a relevant person requests more information, or the information in a different form, subject-specific flyers may be created to further tailor the information to the relevant person that made the request. For example, if a fisher requests information about impacts on their target species a tailored flyer may be produced and provided.

Table 6 – Written correspondence, including response to public comments

Consultation Activity	Written correspondence
Purpose	To provide formal consultation between the titleholder and a relevant person. Written correspondence is useful to initiate (or continue) consultation with authorities and organizations.
Tasks	<ul style="list-style-type: none"> - Communicate with all identified authorities and organizations to commence the consultation process. - Focus of the letter/email is to notify the commencement of the preparation of the EP and invite co-design of the consultation process. - Communicate with all identified fishers to commence the consultation process. Focus of the letter/email is to notify the commencement of the preparation of the EP and invite co-design of the consultation process. - Respond to inquiries and to continue the consultation process as agreed - Notify of the available activity specific online presence and request input on the environmental values and sensitivities within the EMBA through the interactive map, via email, via phone call or written correspondence - Notify that the EP is available on the activity specific online presence and request any remaining feedback that has not been addressed by the consultation process to date.

Table 7 – Phone calls

Consultation Activity	Phone calls
Purpose	To supplement written correspondence to assist in delivering the message effectively and build relationships with the receiver. Cold calls are not part of this activity and are not supported as an effective method of commencing consultation.
Tasks	- Call relevant persons to confirm receipt of correspondence and offer opportunity to ask any questions.

Table 8 – Beehive Project Information Sessions

Consultation Activity	In person or online in relation to native title holders, Aboriginal land holders and traditional owners
Purpose	To seek and address feedback of communal interest holders through traditional decision-making processes or agreed and adopted processes
Tasks	<ul style="list-style-type: none"> - Engage with land councils, prescribed bodies corporate and land trusts to seek facilitation of native title holder group/traditional owner meetings. - Prepare information in a format and provide content that is culturally appropriate to communicate details of the Work Plan and its impacts, including possible effects on native title and traditional country, as well as resources integral to culture and customs. - Attend and participate in native title holder group/traditional owner meeting online or in person and obtain consultation feedback as provided in accordance with relevant decision-making processes. - Provide details of merits assessment of feedback and responses through channels agreed or committed to in the meeting.

Table 9 – Public Notices at prominent locations

Consultation Activity	Public Notices at prominent locations
Purpose	These notices can be targeted to relevant subject-centered groups and individual persons in public places of use with high traffic activity within the EMBA.
Tasks	- Public notices to be placed on notice boards, boat ramps, ports local councils and other prominent community gathering sites to inform of the activity and request to seek consultation with relevant persons. Primary message is to provide the activity website QR code so the public can (1) access information about the activity, (2) determine if they are a relevant person, and (3) contact EOG.

5.2. Contingent activities

EOG recognises that some consultation activities may be inappropriate to carry out if it is contrary to group norms, cultural traditions, or without support of representative bodies. As further detailed in the tables below, subject to feedback and the willingness of relevant persons to engage in a co-design

methodology, if requested by a relevant person who is a representative body, EOG may conduct Beehive project information sessions beyond those discussed in Section 5.1.

Table 10 – Face-to-face meetings

Consultation Activity	Face-to-face in person meetings
Purpose	In person meetings can be meaningful to communicate the same messages and content to multiple relevant persons at the same time on the same subject content.
Tasks	Face-to-face meetings to be held, if requested, with a clear agenda communicated and agreed beforehand.

Table 11 – Further Requested Beehive project information sessions

Consultation Activity	Requested Beehive project information sessions
Purpose	Open forums held at relevant locations proximate to the location of the activity to engage local communities within the Work Plan.
Triggers	Upon request of a relevant person who is a representative body
Tasks	Community briefings at strategic locations for anyone to come and meet with the EOG consultation team and discuss concerns

5.3. Coordination of Activities

All activities are coordinated by the EOG consultation team who are also responsible for updating this plan and communicating the change to external stakeholders, where relevant.

5.4. Assessment of Merit of Objections and Claims

Feedback is welcomed throughout the consultation process and will be recorded in our consultation management system, will form part of the EP, and may be incorporated into the Implementation Strategy of the EP. The process in Figure 3 will be applied to assess the merit of objections and claims received from relevant persons.

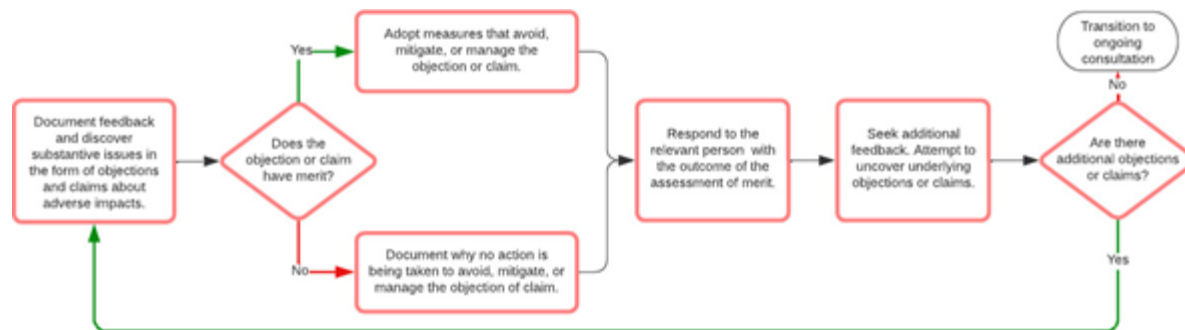

Figure 3 – Merit of objections and claims process

An assessment of merit of each objection or claim will be carried out by EOG. A relevant person's objection or claim will have higher merit when one or more of the following criteria is met:

- The objection or claim is relevant to environmental management of the activity.
- The objection or claim is relevant to the persons functions, interests, and activities.
- The objection or claim can be resolved through the adoption of additional control measures, an activity design variation/limitation, or through changes to the Implementation Strategy for the EP.

An objection or claim may be resolved by providing more information and/or adopting one of the three main types of 'measures' which can be adopted because of the consultations:

1. Control measures (with associated environmental performance outcomes and standards)
2. Activity design variations/limitations applied within the activity description.
3. Inclusions within the Implementation Strategy of the EP.

Despite our best efforts to resolve all objections and claims we understand that relevant persons may not agree with our treatment of their objection or claim. In such circumstances the process for seeking approval can continue provided that the relevant person has received a response about our assessment of their objections and claims and is aware how our respective views will be presented to NOPSEMA.

5.5. Ongoing Consultation

Section 14(9) of the OPGGS(E) Regulations requires ongoing consultation to be incorporated into the Implementation Strategy of the EP (see Chapter 9). This RPCEP is a part of the Implementation Strategy of each EP.

EOG will continue to engage with relevant persons before, during, and after the Work Plan up until all EP's have been finalized or expired. In addition, EOG will keep relevant persons up to date with the status of the title by sending periodic public notifications and correspondence to all relevant persons who have not explicitly requested that communications cease.

EOG acknowledges that relevant persons may have decided not to engage in the consultation process but may reconsider that decision at any time. As such, EOG will continue to provide notifications to relevant persons if they haven't specifically requested to be excluded from the consultation processes. EOG will

apply the same consultation processes that applied in preparation of each EP for the duration of the Work Plan. In addition, key milestones that will trigger further consultation with relevant persons include:

- Notification prior to commencing, and after completing, an activity under an EP as outlined with each EP.
- If there is a change to the EOG Work Plan scope that would affect the relevant person in a new or different manner to that which has been discussed.
- Any reportable incidents (e.g., large fuel spill).
 - EOG will notify all identified relevant persons within 72 hours of the event. EOG's public information officer, liaison officer or equivalent from the drilling incident management team or crisis response team will be the focal point for external engagement during the response operation.
 - During a spill event, a daily incident action plan and operational net environmental benefit analysis are undertaken using information gathered through the monitoring and evaluation strategies outlined in the Oil Pollution Emergency Plan. This information will be used to assess whether any relevant person's functions, activities or interests could be impacted within 7 days. If so, EOG will directly contact the relevant person(s) and provide them with relevant information in respect of the incident and activities that will occur. Final decisions on actions to be taken will be determined by the appropriate control agency.
 - Results of the response activities will be provided to relevant persons. Information will be shared with regulatory agencies/authorities as required and inputs received from relevant persons will be evaluated and where practicable, be used to refine the ongoing spill response and/or ongoing operational and/or scientific monitoring.

5.6. Communication and Communication of changes

In its consultation communication, EOG is aware of, and will communicate the legislative requirements around sensitive information. That is, parties may request any information provided throughout the consultation not be made publicly available. Whilst that information must still be included in the Environment Plan submitted to NOPSEMA, as ***sensitive information*** it will be excluded from the information published on NOPSEMA's website.

EOG acknowledges that changes to Work Plans based on knowledge underpinning the environmental impact and risk assessments occur from time to time. In the event of such a change that affects a relevant person's functions, interests, or activities, EOG will complete an assessment that includes provision of information to affected relevant persons in respect of the change and consideration of their feedback.

As required by OPGGS(E) Regulation 16(b), EOG shall assess the merits of any new claims or objections made because of the change that may have an adverse impact on their functions, interests, or activities. If the claim has merit, where appropriate, EOG will modify the management of the EOG Work Plan.

EOG will seek to finalise its determination of the merits of any claim or objection received before the Work Plan starts, and if after commencement, within 1 week of receipt, and undertake any resulting

management of change actions as soon as practicable, but preferably within that timeframe. The assessment of merit and any resulting management of change actions will be shared with the concerned relevant persons. For objections and claims that do not require a change in management of the Work Plan, EOG will respond to relevant persons providing reasoning and supporting information (as relevant) to support EOG's conclusions. This may include and outline of the options/controls explored to mitigate the degree to which the person may be affected and/or demonstration that the impact or risk in question has been reduced to ALARP and acceptable levels.

Any claims or objections raised by relevant persons after submission of the EP will be assessed for merit and a response provided. If a change to the EOG Work Plan or controls adopted during the EOG Work Plan occurs because of relevant persons consultation, the change will be managed in accordance with the processes outlined in the relevant EP.

5.7. Monitoring

5.7.1. Effectiveness of Consultation

The effectiveness of consultation undertaken will be evaluated in the following ways.

- **Responsiveness:** EOG has reached out to relevant persons, listened to their concerns, and taken appropriate actions to address those concerns.
- **Two-way communication:** EOG has provided sufficient information to relevant persons and allowed for reasonable time for relevant persons to review and provide feedback. Relevant persons feedback is crucial to two-way communication and successful consultation. In the event relevant persons do not respond to requests to consult, EOG will continue to seek consultation for the life of the EP and inform the relevant person of the activity's progress.
- **Inclusion:** We have reached out to a comprehensive range of people, including those who may be particularly affected by the Work Plan within reasonable and practicable manners.
- **Transparency:** We can show we have provided relevant persons with accurate and transparent information about the Work Plan and have been open and honest in our communication.
- **Feedback:** We have responded to feedback received from relevant persons and have taken appropriate actions to address their concerns.
- **Compliance:** We followed all relevant laws and regulations related to consultation, such as ensuring that rights of all persons are respected.

5.8. Records Management

Engagement and consultation activities with relevant persons will be logged by the person who carried out the activity in the consultation management system.

SCHEDULE A – References

The following requirements and guidance have been followed during the consultation process:

The OPGGS(E) Regulations

NOPSEMA policies, guidance, and information papers, including:

PL1347 - Environment plan assessment policy (19 May 2020).

GL1721 - Environment plan decision making (10 June 2021).

GL1887 - Consultation with Commonwealth agencies with responsibilities in the marine area (3 July 2020).

GN1344 - Environment plan content requirements (11 September 2020).

GN1488 - Oil pollution risk management (7 July 2021).

GN1785 - Petroleum activities and Australian marine parks (3 June 2020).

GN1847 - Responding to public comment on environment plans (11 September 2020).

N-04750-GL2086 A900179- Consultation in the course of preparing an environment plan

N-04750-GL1887 A705589- Consultation with Commonwealth agencies with responsibilities in the marine area

Other relevant guidance, including:

- Australian Fisheries Management Authority: Petroleum industry consultation with the commercial fishing industry (available at <https://www.afma.gov.au/sustainability-environment/petroleum-industry-consultation>).
- Western Australian Department of Primary Industries and Region Development: Guidance statement for oil and gas industry consultation with the Department of Fisheries (July 2013).
- Western Australian Department of Transport: Offshore Petroleum Industry Guidance Note – Marine Oil Pollution: Response and Consultation Arrangements (July 2020).
- AIATSIS Engaging with Traditional Owners Guidance

SCHEDULE B – Relevant Authorities

Relevant Authorities	Role and Relevancy
Australian Hydrographic Office (AHO)	Responsible for the publication and distribution of nautical charts and other information required for safe shipping and navigation in Australian waters. Relevant when the activity may impact operational requirements and where nautical products and other maritime safety information is required to be updated.
Australian Maritime Safety Authority (AMSA)	Responsible for maritime safety. Relevant when the activity may impact on the safe navigation of commercial shipping and to determine shipping traffic in the activity area.
Australian Communications and Media Authority (ACMA)	Administrator of submarine cable protection zones. Relevant when the activity may impact on subsea cables.
Department of Defence (DoD)	Responsible for Australian defence activities. Relevant when the activity encroaches on known training areas and/or restricted airspace.
Australian Fisheries Management Authority (AFMA)	Manager of fisheries in Commonwealth waters. Relevant when the activity has the potential to impact on fisheries resources in AFMA managed fisheries.
Department of Climate Change, Energy, the Environment and Water (DCCEEW)	Administers the <i>Environment Protection and Biodiversity Conservation Act 1999</i> (EPBC Act), the <i>Underwater Cultural Heritage Act 2018</i> (see further information for underwater cultural heritage below) and the <i>Environment Protection (Sea Dumping) Act 1981</i> .
Department of Agriculture, Fisheries and Forestry (DAFF)	Commonwealth department responsible for managing biosecurity for incoming goods and conveyances. Relevant due to the potential for the transfer of marine pests between MODU, vessels and the mainland.
Director of National Parks (DNP)	Manages the AMP network. Relevant when activities undertaken outside an AMP may impact on the values within an AMP.
National Native Title Tribunal (NNTT)	Responsible for administration of the <i>Native Title Act 1993</i> . Relevant when the activity may impact on Native Title. Maintains registers (and associated mapping) of native title determinations, prescribed bodies corporate, and registered native title claims.
Maritime Border Command (MBC)	Key agency for border protection. Relevant when the activity may impact on border protection activities (e.g., vessel patrols).
Dept of Foreign Affairs and Trade (DFAT)	Promotes and protects Australia's interests internationally. Manages relationships with countries neighbouring Australia's north, including Indonesia, Timor Leste and Papua New Guinea. Relevant when the activity may impact on waters outside Australia's maritime jurisdiction (such as an oil spill).
WA Department of Primary Industries and Regional Development (DPIRD)	Managed West Australian commercial fisheries. Relevant when the activity has the potential to impact on fisheries resources in DPIRD.
WA Department of Biodiversity, Conservation and Attractions (DBCA)	Manage State marine parks and reserves and protected marine fauna and flora. Relevant when activities undertaken outside a marine park may impact on the values within a marine park.
WA Department of Transport (DoT)	Manage oil pollution preparedness for response in WA state waters. Relevant if the activity results in impacts to a marine park.

Relevant Authorities	Role and Relevancy
WA Department of Fisheries (DoF)	Managed West Australian commercial fisheries. Relevant when the activity has the potential to impact on fisheries resources in DPIRD.
Department of Planning Lands and Heritage (DPLH)	Protect Aboriginal heritage, assist with compliance with the <i>Aboriginal Heritage Act 1972</i> and provide access to heritage information. Relevant if the activity results in impacts to Aboriginal heritage.
Pilbara Ports Authority	Manage the Dampier Port under the <i>Port Authorities Act 1999 (WA)</i> . Relevant if the activity results in impacts to port activities.
NT Department of Industry, Tourism and Trade (DITT)	Manage NT commercial fisheries. Relevant when the activity has the potential to impact on fisheries resources in DITT managed fisheries.
NT Department of Environment, Parks and Water Security (DEPWS)	Protect the environment and natural resources in the NT, including marine fauna management. Relevant when activities may impact on marine or coastal values.
NT Department of Industry, Tourism and Trade (DITT) - Fisheries	Responsible for managing NT fisheries and aquatic ecosystems. Relevant when the activity has the potential to impact on fisheries resources in DITT managed fisheries.
NT Department of Transport (DoT)	Manage oil pollution preparedness and response in NT waters. Relevant if the activity results in impacts to the NT waters or coastlines.
NT Environmental Protection Authority (EPA)	Independent authority established under the <i>Northern Territory Environment Protection Authority Act 2012</i> to prevent and respond to pollution. Relevant if the activity results in pollution to NT waters or coastline.
WA Department of Mines, Industry Regulation and Safety (DMIRS)	Manages offshore petroleum approvals in WA State waters. Relevant if the activity results in impacts to WA state waters.
NT Department of Industry, Tourism and Trade (DITT)	Manage NT commercial fisheries. Relevant when the activity has the potential to impact on fisheries resources in DITT managed fisheries.

SCHEDULE C – Guidance and Legal Decisions

NOPSEMA recently developed a Guideline “Consultation in the course of preparing an environment plan Document No N-04750-GL2086 A900179” dated 15/12/2022 to support clarity and transparency on the legal requirements, including recent case law, for consultation by titleholders in the course of preparing their environment plans prior to submission to NOPSEMA.

Some key elements from NOPSEMA’s GL2086 as well as guidance from Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 are outlined below.

1. The purpose of consultation under Regulation 11A

- Consultation processes must be designed in the context of the objects of the Regulations, which are set out in Regulation 3, which are to ensure that any offshore petroleum or greenhouse gas activity is carried out in a manner:
 - i. Consistent with the principles of ecologically sustainable development set out in section 3A of the EPBC Act
 - ii. By which the environment impacts and risks of the activity will be reduced as low as reasonably practicable; and
 - iii. By which the environmental impacts and risk of the activity will be of an acceptable level.
- The consultation process must assist to ensure that the titleholder has ascertained, understood, and addressed all the environmental impacts and risks that might arise from its proposed activity, including information that the titleholder would otherwise not be aware of, except through an appropriate consultation process in order to inform the most effective environmental management of the activities, impacts and risks.
- The consultation process should inform the titleholders understanding of the environment, including (amongst other things) people and communities, the heritage value of places and their social and cultural features which may be affected by a titleholder’s proposed activities.

2. Legislative and regulatory requirements

- Regulation 11A establishes a duty on titleholders to carry out consultation in the course of preparing an EP. NOPSEMA’s role is to assess whether or not the duty has been discharged, read particularly with reg 10A(g).
- Regulation 10A, the criteria for acceptance of an EP are that the plan.
 - (g) demonstrates that:
 - i. The titleholder has carried out the consultations required by Division 2.2A; and
 - ii. The measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate
- The EP must include sufficient information to enable NOPSEMA to form the requisite state of satisfaction on the basis of an evident and intelligible justification.

3. Identifying relevant persons

- Titleholders must clearly identify in their EP who is a relevant person and the rationale the titleholder has used to determine who they consider falls within that definition.
- Regulation 11A, like most statutory consultation provision, imposes an obligation that must be capable of practicable and reasonable discharge by the titleholder. It involves ‘some decisional choice’ that the titleholder must make in identifying relevant persons and in how the consultation is undertaken.
- Processes for the identification of relevant persons must provide for sufficiently broad capture of ascertainable persons and organisations who may have their functions, interests or activities affected or that may be affected by the activity.
- Persons and organisations under regulation 11A(1)(d)
- Regulation 11A creates an artificial definition of ‘relevant person’ which is broader than the usual legal meaning given to the term ‘person’. For the purposes of regulation 11A(1)(d), while an individual person may be a relevant person, so too may an organisation.

4. Functions, interest or activities under regulation 11A(1)(d) defined

- Functions: refers to “a power or duty to do something”
- Activities: to be read broadly and is broader than the definition of ‘activity’ in regulation 4 of the Environment Regulations and is likely directed to what the relevant person is already doing
- Interests: to be construed as conforming with the accepted concept of “interest” in other areas of public administrative law
 - Includes “any interest possessed by an individual whether or not the interest amounts to a legal right or is proprietary or financial interests or related to reputation”

5. General principles for effective consultation

- Consultation should be a genuine and meaningful two-way dialogue in which relevant persons are given sufficient information and time to allow them to make an informed assessment of the possible consequences of the activity on their functions, interests, or activities
- Principles adapted and amended from a report by the former Ministerial council on Mineral and Petroleum Resources:

6. Providing sufficient information under regulation 11A(2)

- Information provided must be sufficient to allow an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person.
- Titleholders should consider the functions, interest or activities of the relevant person and the impacts and risks that affect them when determining information requirements.

- Information should be in a form that is readily accessible and appropriate for the relevant person being consulted. Materials provided may include written forms, pictorial or other graphics, verbal briefings or presentations, and the use of other technologies.
- Information may well need to be provided in an interactive manner, as finer detail and precision is developed through the consultation process. Titleholders are encouraged to discuss expectations around the type and level of detail of information with relevant persons early when commencing consultation.

7. Providing reasonable period under regulation 11A(3)

- Titleholders must provide a “reasonable period” for the relevant person to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities and they are able to respond with any concerns.
- Nature, scale and complexity of an activity as well as the extent and severity of potential impacts and risks on a relevant persons functions, interests or activities may inform what makes a reasonable period for consultation.

8. Consulting with groups where interests are held communally

- Where interests are held communally, in accordance with tradition, the method of consultation will need to reasonably reflect the characteristics of the interests affected by the titleholder’s proposed activity.
- A title holder will need to demonstrate to NOPSEMA that what it did constituted consultation which is appropriate and adapted to the nature of the interests of the relevant persons.
- The Full Federal Court has held that there is good reason to adopt pragmatic and practical approaches to consultation conducted in accordance with regulation 11A.
- Consultation may be via properly notified and conducted meeting, or other arrangements that facilitate genuine two-way dialogue between the titleholder and relevant persons.

9. Reporting on consultation in the environment plan under regulation 16(b)

- The consultation process must be documented within the Environment Plan through the titleholder report on consultation and the sensitive information report.
- The report on consultation should include clear and precise identification of claims and objections presented, an assessment of the merit of each objection or claim with sufficient rationale provided to support that assessment, and a demonstration of the suitability of any measures adopted as a result of the consultation.
- Full text (source) records must be provided to verify the accuracy of the summary of the consultation. NOPSEMA interprets the term “full text” to mean an unedited version of the correspondence received without redacted or modified text.
- Titleholders will need to document in written form all communications undertaken between themselves and relevant persons. This may require documenting the minutes of meetings, undertaking written communications wherever practicable and requesting that responses from relevant persons be provided in writing where practical.

10. First Nations people / groups

- First Nations groups such as land councils and prescribed body corporates may be relevant persons with a function that may be affected by the activities in the EP, but they may also provide advice in relation to who and how other First Nations groups or individuals should be consulted as relevant persons whose interests may be affected by the activities.
- A connection of traditional owners with sea country may constitute an interest for the purposes of reg 11A(1)(d)
- The Federal Court has noted that there is no shortage of guidance on decisions on consultation processes under the *Native Title Act 1993* (NT Act) which is illustrative of how a seemingly rigid statutory obligation to consult persons holding communal interest may operate in a workable manner. The NT Act authorities require reasonable notice to group members, but not exhaustive communications with each and every person.

Appendix 3

Consultation: List of Relevant Persons

Category 1 - Commonwealth Department or Agencies	
Relevant Person	Functions, interests and activities & relevancy to activity
Australian Communications & Media Authority (ACMA)	Administrator of submarine cable protection zones. Relevant if the activity impacts on subsea cables.
Australian Fisheries Management Authority (AFMA)	Manager of fisheries in Commonwealth waters. Relevant if the activity impacts on fisheries resources in AFMA-managed fisheries.
Australian Hydrographic Office (AHO)	Responsible for the publication and distribution of nautical charts and other information required for safe shipping and navigation in Australian waters. Relevant if the activity impacts operational requirements and where nautical products and other maritime safety information is required to be updated.
Australian Maritime Safety Authority (AMSA)	Responsible for maritime safety. Relevant if the activity impacts on the safe navigation of commercial shipping.
Department of Agriculture, Fisheries and Forestry (DAFF)	Responsible for agricultural, fisheries and forestry industries by creating new and/or maintaining existing agricultural export opportunities for Australia as well as managing biosecurity risks to protect the Australian agricultural industries. Relevant due to the potential for the transfer of marine pests from the MODU and vessels to marine waters.
DAFF - Biosecurity Vessels, Aircraft & Personnel	Responsible for managing biosecurity for incoming goods and conveyances. Relevant due to the potential for the transfer of marine pests between MODU, vessels and the mainland.
Department of Climate Change, Energy, the Environment and Water (DCCEEW)	Responsible for protecting Australia's natural environment and heritage sites by helping Australia to respond to climate change and carefully manage water and energy resources. Relevant due to their role in marine conservation.
Department of Defence (DoD) - Property Management Branch	Responsible for Australian defence activities. Relevant if the activity encroaches on known training areas and/or restricted airspace.
DoD - Unexploded Ordnance	Responsible for managing unexploded ordnance. Relevant if the activity encroaches on known training areas and/or restricted airspace.
Department of Foreign Affairs & Trade (DFAT)	Promotes and protects Australia's interests internationally. Manages relationships with countries neighbouring Australia's north, including Indonesia, Timor Leste and Papua New Guinea. Relevant if the activity impacts on waters outside Australia's maritime jurisdiction (such as an oil spill).
Indigenous Land & Sea Corporation (ILSC)	Corporate Commonwealth entity established under the <i>Aboriginal and Torres Strait Islander Act 2005</i> (ATSI Act). The ILSC's long-term vision for meeting its ATSI Act mandate is

Category 1 - Commonwealth Department or Agencies	
Relevant Person	Functions, interests and activities & relevancy to activity
	<p>for Aboriginal and Torres Strait Islander people to enjoy the rightful entitlements, opportunities, and benefits that the return of country and its management brings. The ILSC's primary grant program – Our Country Our Future – provides assistance for acquiring and managing rights and interests in land, salt water and freshwater country in order to achieve this vision.</p> <p>Relevant if the activity results in an oil spill that impacts on coastal waters and shorelines used by Aboriginal and Torres Strait Islander people.</p>
Maritime Border Command	<p>Responsible for border protection.</p> <p>Relevant if the activity impacts on border protection activities (e.g., vessel patrols).</p>
National Native Title Tribunal (NNTT)	<p>Responsible for administration of the <i>Native Title Act 1993</i>.</p> <p>Relevant if the activity results in an oil spill that impacts on waters and shorelines subject to Native Title.</p>
Parks Australia	<p>Manages the Australian Marine Park (AMP) network.</p> <p>Relevant when activities undertaken outside an AMP may impact on the values within an AMP.</p>

Category 2 - State Department or Agencies	
Relevant Person	Functions, interests and activities & relevancy to activity
Northern Territory	
Government departments	
Department of Environment, Parks & Water Security (DEPWS)	Responsible for protecting the environment and natural resources in the NT, including marine fauna management. Relevant if the activity results in an oil spill that impacts on marine or coastal values in NT waters.
Department of Industry, Tourism & Trade (DITT) - Fisheries Branch	Responsible for managing NT fisheries and aquatic ecosystems. Relevant if the activity impacts the operations or target species of DITT-managed fisheries.
DITT - Petroleum Operations	Responsible for managing petroleum activities onshore and within NT waters. Relevant if the activity results in an oil spill that impacts on other petroleum operations.
Department of Infrastructure, Planning & Logistics (DIPL) - Marine Safety NT	Responsible for administering commercial fishing and aquaculture, marine pests, biosecurity, indigenous fishing, recreational fishing, boat ramps, tides, boat rules and safety in the NT. Relevant if the activity results in an oil spill that impacts on the use of coastal infrastructure.
DIPL - Regional Harbourmaster	Responsible for the moorings in the Darwin Port. Relevant for managing moorings that may be used by the support vessels.
Department of Territory Families, Housing & Communities - Heritage Branch	Works with the community to conserve the unique and diverse heritage of the NT. Supports the Heritage Council, provides advice about heritage management, promotes heritage, and encourages good conservation practice, oversees the NT Heritage Grants Program and the Rates Relief Program, and works with other government departments to conserve Government-owned heritage assets. Relevant if the activity results in an oil spill that impacts on heritage assets owned by the department.
Department of Transport - Marine Safety Branch	Manage oil pollution preparedness and response in NT waters. Relevant if the activity results in an oil spill that impacts on NT waters or coastlines.
NT Environmental Protection Authority	Independent authority established under the NT <i>Environment Protection Authority Act 2012</i> to prevent and respond to pollution. Relevant if the activity results in an oil spill that impacts on NT waters or coastlines.

Category 2 - State Department or Agencies	
Relevant Person	Functions, interests and activities & relevancy to activity
Local Government Areas (LGAs) <i>Relevant if the activity results in an oil spill that contacts the coastline in their council area.</i>	
West Daly Regional Council	The local government authority (LGA) for the Wadeye, Peppimenarti, Council Homelands & Palumpa Communities (covering a large section of the Joseph Bonaparte Gulf coastline).
Tiwi Islands Regional Council	The LGA for Bathurst & Melville Islands (Tiwi Island Group) that have access to Beagle Gulf & Van Diemen Gulf coastline.
West Arnhem Regional Council	The LGA for Kakadu, West Arnhem & Coburg Communities that have access to Van Diemen Gulf coastline.
Wagait Shire Council	The LGA for the Cox Peninsula (Beagle Gulf area).
Litchfield Council	The LGA for Channel Island, Wickham, Micket Creek, Shoal Bay, Murrumujuk, Gunn Point, Glyde Point & Koolpinyah Communities (Darwin Harbour, Beagle Gulf & Van Diemen Gulf coastline).
City of Palmerston Council	The LGA for Wishart & East Arm Communities (Darwin Harbour coastline).
City of Darwin Council	The LGA for Darwin City, Larrakeyah, The Gardens, Fannie Bay, East Point, Nighcliff, Rapid Creek, Brinkin, Tiwi, Lee Point & Buffalo Creek Communities (Darwin Harbour & Beagle Gulf coastline).
Western Australia	
Government departments Department of Biodiversity, Conservation & Attractions (DBCA)	Manage state marine parks and reserves and protected marine fauna and flora. Relevant if the activity impacts on the values within a WA marine park.
Department of Planning, Lands & Heritage (DPLH)	Protect Aboriginal heritage, assist with compliance with the <i>Aboriginal Heritage Act 1972</i> and provide access to heritage information. Relevant if the activity results in an oil spill that impacts on Aboriginal heritage in WA waters or coastlines.
Department of Primary Industries & Regional Development (DPIRD) - Fisheries	Manage WA commercial fisheries. Relevant if the activity has the potential to impact on the operations or target species of DPIRD-managed commercial fisheries.
Department of Transport (DoT) - Oil Spill Response Coordination	Manage oil pollution preparedness for response in WA state waters. Relevant in planning for oil spill preparedness and if the activity results in impacts to a marine park.

Category 2 - State Department or Agencies	
Relevant Person	Functions, interests and activities & relevancy to activity
LGAs <i>Relevant if the activity results in an oil spill that contacts the coastline in their council area.</i>	
Shire of Broome	The LGA with approximately 900 km of coastline.
Shire of Derby / West Kimberley	The LGA covering 118,560 km ² of land in the North West Kimberley Region with an expansive coastline.
Shire of Wyndham / East Kimberley	The LGA covering 121, 000 km ² of land in the Kimberley Region with an expansive coastline.
Ports 	
Kimberley Ports Authority	Responsible for the Ports of Broome, Wyndham, Derby & Yampi Sound under the <i>Port Authorities Act 1999</i> (WA) to operate, maintain, control, and preserve the ports and the assets. Relevant if the activity results in impacts to port activities.
Pilbara Ports Authority	Manage the Dampier Port under the <i>Port Authorities Act 1999</i> (WA). Relevant if the activity results in impacts to port activities.

Category 3 - Department of State Minister	
Relevant Person	Functions, interests and activities & relevancy to activity
Western Australia	
Department of Mines, Industry Regulation & Safety (DMIRS)	Manages petroleum approvals onshore and offshore in WA state waters. Relevant if the activity results in an oil spill that impacts WA state waters.

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
Traditional Owners	
<i>Relevant if the routine aspects of the activity impact the values associated with sea country or if unplanned events (i.e., oil spill) impact shorelines and sea country in their registered area.</i>	
Aboriginal Sea Company (ASC)	<p>Governed by a board comprising equal representation from the three land councils with traditional ownership of sea country (Northern Land Council, Tiwi Land Council & Anindilyakwa Land Council) as well as independent industry experts. The ASC empowers Aboriginal Traditional Owners to be actively engaged in the commercial fishing and aquaculture industries.</p> <p>Relevant if the activity results in oil spill impacts to commercial fishing and aquaculture industries.</p>
Ardyaloon Inc.	<p>Charitable organisation providing services and programs to Aboriginal residents of the One Arm Point/Ardyaloon Community. Objective of the association is to provide for the cultural, social and economic needs of the community, acting at all times as a benevolent body and not as a profit-making enterprise.</p> <p>Relevant if the activity results in oil spill impacts to the shorelines and sea country of the One Arm Point/Ardyaloon region.</p>
Arnhem Land Aboriginal Land Trust	NT Traditional owner group represented by the Northern Land Council (NLC).
Balanggarra Aboriginal Corporation (BAC)	WA Registered native title body corporate. Administers land on behalf of the Balanggarra People in the Kimberley region of WA.
Bardi & Jawi Niimidiman Aboriginal Corporation	WA Traditional owner group represented by Kimberley Land Council (KLC).
Bindunbur	WA Traditional owner group represented by KLC.
Cobourg Peninsula Sanctuary Land Trust	NT Traditional owner group represented by NLC.
Dak Djerat Guwe People	Native Title claimant over an area of land adjoining the coast to the west of Darwin.
Daly River / Port Keats Aboriginal Land Trust	NT Traditional owner group represented by NLC.
Dambimangari Aboriginal Corporation	WA Traditional owner group in the Kimberley with most of the Dambimangari people living in Derby or the nearby settlement of Mowanjum.
Durduga Tree Point Aboriginal Association Incorporated	NT Traditional owner group represented by NLC.
Gogolanyngor Aboriginal Corporation	WA Traditional owner group represented by KLC.

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
Kalumburu Aboriginal Corporation	Traditional custodians of Kalumburu. Northern most settlement in WA on the King Edward River and not far from the coast in the Kimberley region. Also lease Carson River Station which has access to coastal waters.
Kenbi Aboriginal Land Trust	NT Traditional owner group represented by NLA.
Kimberley Land Council (KLC)	Peak Indigenous body in the Kimberley region working with Aboriginal people to secure native title, conduct conservation and land management activities and develop cultural business enterprises.
Larrakia Nation Aboriginal Corporation	NT Traditional owner group represented by NLC.
Limilngan-Wulna Aboriginal Corporation	NT Traditional owner group represented by NLC.
Mayala Inninalang Aboriginal Corporation	WA Traditional owner group represented by KLC.
Miriuwong & Gajerrong Aboriginal Corporation	WA Native title holders of large areas in the north of the East Kimberley region.
Nimanburr Aboriginal Corporation	WA Traditional owner group represented by KLC.
North Australian Indigenous Land & Sea Management Alliance Ltd (NAILSMA)	North Australian Indigenous Land & Sea Management Alliance Ltd (NAILSMA) is an Indigenous led not-for-profit company operating across north Australia who work to assist Indigenous people manage their country sustainably for future generations.
Northern Land Council (NLC)	NT Independent statutory authority of the Commonwealth responsible for assisting Aboriginal peoples in the NT to acquire and manage their traditional lands and sea.
Nyul Nyul PBC Aboriginal Corporation	WA Traditional owner group represented by KLC.
Tiwi Islands Aboriginal Land Trust	Tiwi Islands Traditional owner group. The Trust is established under the <i>Aboriginal Land Rights (Northern Territory) Act 1976</i> and the only body with authority and capacity to direct and administer this Trust is the Tiwi Land Council (TLC).
Top End Aboriginal Corporation Croker Island	NT Traditional owner group represented by NLC.
Top End Aboriginal Corporation Legune Pastoral Lease	NT Traditional owner group represented by NLC.
Top End Aboriginal Corporation Spirit Hills Pastoral Lease	NT Traditional owner group represented by NLC.
Waardi Limited	Waardi Limited is the administrative arm of the Gogolanyngor Aboriginal Corporation (GAC) that was established to drive cultural, social and economic prosperity for Jabirr Jabirr /

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
	Ngumbarl people of the middle Dampier Peninsula (north of Broome).
Wanjina-Wunggurr Aboriginal Corporation	WA Traditional owner group represented by KLC.
Northern Territory Fishers & Traditional Owners	
<i>Relevant if the routine aspects of the activity impact the values associated with sea country or fishing operations or if unplanned events (i.e., oil spill) impact shorelines, sea country or fishing operations in their registered area.</i>	
Bawinanga Aboriginal Corporation	NT Aquarium Fish, Display & Mud Crab Fishing Licence Holder. Relevant if the activity results in oil spill impacts to their fishery.
Garngirr Fishing Aboriginal Corporation	NT Coastal Line Fishing Licence Holder. Relevant if the activity results in oil spill impacts to their fishery.
Commonwealth Fisheries Associations	
<i>Relevant if the routine aspects of the activity impact the operation of their members' fishing operations or if unplanned events (i.e., oil spill) impact their members' operations or target species.</i>	
Australian Southern Bluefin Tuna Industry Association Ltd (ASBTIA)	Peak body representing the Australian Southern Bluefin Tuna Industry.
Commonwealth Fisheries Association (CFA)	Peak industry body representing the collective rights, responsibilities and interests of a diverse group of commercial fishers in Commonwealth regulated fisheries. Relevant if the activity results in impacts to commercial fisheries.
Seafood Industry Australia	National peak-body representing the Australian seafood industry as a whole (wild catch, aquaculture and post-harvest sectors). Relevant if the activity results in impacts to commercial fisheries.
Southern Bluefin Tuna Fishery	Peak body representing the Southern Bluefin Tuna Fishery. Relevant if the activity results in impacts to their fishery.
Tuna Australia	Represents statutory fishing right owners, holders, fish processors and sellers, and associate members of the Eastern and Western tuna and billfish fisheries of Australia. Relevant if the activity results in impacts to their fishery.
Western Skipjack Tuna Fishery	Peak body representing the Western Skipjack Tuna Fishery. Relevant if the activity results in impacts to their fishery.
Western Tuna & Billfish Fishery	Peak body representing the Western Tuna & Billfish Fishery. Relevant if the activity results in impacts to their fishery.

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
Commonwealth & WA Fisheries Associations	
<i>Relevant if the routine aspects of the activity impact the operation of their members' fishing operations or if unplanned events (i.e., oil spill) impact their members' operations or target species.</i>	
Northern Prawn Fishery Industry Pty Ltd	Peak body representing the Northern Prawn Fishery.
Western Australian Fishing Industry Council (WAFIC)	Peak industry body representing the interests of the WA commercial fishing, pearling and aquaculture sectors.
WA Fishers Associations	
<i>Relevant if the routine aspects of the activity impact the operation of their members' fishing operations or if unplanned events (i.e., oil spill) impact their members' operations or target species.</i>	
Recfish West	Peak body representing recreational fishers in WA.
Specimen Shell Fishery	The activity area and EMBA overlap with the fisheries jurisdiction, but fishing effort is concentrated around populated areas, with the northern-most area being Broome.
WA Kimberley Crab Managed Fishery	Peak body representing the WA Kimberley Crab Managed Fishery.
WA Kimberley Gillnet & Barramundi Fishery	Peak body representing the WA Kimberley Gillnet and Barramundi Fishery.
WA Kimberley Prawn Managed Fishery	Peak body representing the WA Kimberley Prawn Managed Fishery.
WA Mackerel Managed Fishery (MMF) - Area 2	Peak body representing the MMF.
WA Northern Demersal Scalefish Managed Fishery (NDSMF)	Peak body representing the NDSMF.
NT Fisheries Associations	
<i>Relevant if the routine aspects of the activity impact the operation of their members' fishing operations or if unplanned events (i.e., oil spill) impact their members' operations or target species.</i>	
Amateur Fishermen's Association of the Northern Territory (AFANT)	Peak body representing the varied interests and pursuits of recreational fishers in the NT.
Coastal Line Fishery (via FRDC)	Industry body for fishing permitted between the high-water mark and 15 nautical miles out to sea. Consultation is via NT Seafood Council.
Demersal Fishery (via NT DITT Fisheries Branch)	Peak industry body representing demersal fishing (allowed from 15 nm from the low water mark to the outer boundary of the Australian Fishing Zone, excluding the area of the Timor Reef Fishery).
NT Guided Fishing Industry Association (NTGFIA)	Peak body responsible for promoting, developing, and maintaining the guided fishing industry in the NT. The NTGFA represents professional fishing guides and operators.

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
Northern Territory Seafood Council (NTSC)	NT peak body representing the seafood industry in NT.
NT Spanish Mackerel Fishery	Fishing is permitted between the high-water mark and 15 nm out to sea. Consultation via NT Demersal Fishery.
Offshore Net & Line Fishery	Fishing is permitted from the low water mark to the outer boundary of the Australian Fishing Zone. Consultation via NT Demersal Fishery.
Commonwealth Fishers	
<i>Relevant if the routine aspects of the activity impact their fishing operations or if unplanned events (i.e., oil spill) impact their operations or target species.</i>

Retention Leases WA-5-R, WA-7-R, WA-9-R, WA-10-R, WA-14-R, WA-15-R, WA-19-R, WA-20-R, WA-21-R, WA-22-R, WA-23-R, WA-24-R, WA-28-R, WA-29-R, WA-30-R, WA-31-R, WA-32-R, WA-39-R, WA-51-R, WA-52-L, WA-73-R, WA-76-R, WA-77-R, WA-82-R, WA-87-R, AC/RL16. Infrastructure Licence WA-2-IL. Greenhouse Gas Assessment Permit G-10-AP.
TGS - NOPEC Geophysical Company Pty Ltd	Titleholder and operator in Browse Basin. Access Authority WA-105-AA. Special Prospecting Authority WA-45-SPA.

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
Woodside Energy Limited	Titleholder of nearby petroleum permits WA-522-P & WA-279-P.
3D Oil Limited	Titleholder and operator in WA-527-P.
Tourism operators	
<i>Relevant if planned aspects of the activity interfere with fishing activities, or if an unplanned activity (e.g., oil spill) results in loss of business.</i>	
Adventure Wild Kimberley Tours	Fully guided Kimberley land-based adventure covering all areas between Broome & Kununurra including views of waterfalls and aboriginal rock art.
Anglers Choice Fishing Safaris	Charter operator operating out of Dundee Beach NT.
APT Touring	Cruise provider in the coastal waters and inlets of the Kimberley area between Broome & Darwin.
Arafura Bluewater Charters	Charter operator out of Cullen Bay Darwin.
Cannon Charters	Charter operator out of Cullen Bay Darwin.
Clearwater Island Lodge	Charter operator based out of Darwin.
Coral Expeditions	Operate three Australian expedition ships in the coastal waters of the Kimberley between Broome and Darwin from March to September each year offering different voyage options.
Cygnets Bay Pearl Farm	Operational pearl farm on the Dampier Peninsula that also offer tours and accommodation of the farm.
Darwin Harbour Fishing Charters	Charter operator based out of Stokes Hill Wharf Darwin.
Dundee Beach Fishing Charters	Charter operator based out of Dundee Beach.
Eco Abrolhos	Charter and cruise provider in the coastal waters and inlets of the Kimberley area between Broome & Wyndham.
Equinox Fishing Charters	Charter operator based out of Cullen Bay Darwin.
Fish Darwin	Charter operator out of Stokes Hill Wharf Darwin.
Kimberley Boat Cruises	Cruise provider in the coastal waters and inlets of the Kimberley area between Broome and Darwin.
Kimberley Expeditions	Cruise and adventure tour provider in the coastal waters & inlets of the Kimberley area between Broome & Darwin.
Kimberley Pearl Charters	Cruise provider in the Kimberley area.
Lady M Luxury Cruises	Cruise provider in the Kimberley area.
Marine Tourism WA (MTWA)	MTWA is an association made up of charter industry owners and operators who understand the many and varied pressures affecting the industry. MTWA represents the charter sector to all relevant government departments.
Ocean Dream Charters	Cruise provider in the Kimberley area.
Odyssey Expeditions	Cruise provider in the Kimberley area.
Offshore Boats Fishing Charters	Charter operator based out of Darwin.

Category 4 - Person, Organisation, Industry Group or Association	
Relevant Person	Functions, interests and activities & relevancy to activity
Oolin Sunday Island Cultural Tours	Cultural tour from the Dampier Peninsula retracing the ocean journey from Bardi Country on the mainland through the network of islands and tidal passages that make up Jawi Country. The tour passes through the whirlpools and eddies between Jooloom and Jayirru through some of the world's biggest tidal waters that are used by the Jawi people to hunt, fish and trade.
Red Devil Fishing Charters	Charter operator based out of Cullen Bay Darwin.
The Great Escape Charter Company	Cruise and fishing cruise provider in the Kimberley area.
Tipperary Group of Stations	Owners of Litchfield Station. The station's western boundary is the coastline of the Joseph Bonaparte Gulf.
Tiwi Island Adventures	Charter operator based out of the Tiwi Islands.
Yknot Fishing Charters	Charter operator based out of Cullen Bay Darwin & Dundee Beach.
Collins Roger	Private recreational marine user travelling in their yacht.
Other	
Australian Agricultural Company (AACo)	Owners of La Belle Downs Station. The station's western boundary is the coastline of the Joseph Bonaparte Gulf. Relevant if an oil spill from the activity reaches their land.
Darwin Ports Corporation	Privately owned, responsible for management of Darwin Port. Relevant if an oil spill from the activity impacts their operations through increased use of the port by vessels involved in oil spill response.
Seafarms Group Limited	Developer of the land-based prawn aquaculture project (Sea Dragon) in the NT reliant on ongoing sea water quality for infrastructure / facilities adjacent to coast in NT. Relevant if an oil spill from the activity reaches their sea water intake area and results in temporary closure of the aquaculture operations.
WA Cambridge Gulf Limited	International supply chain link for the resources and agricultural industry, headquarters in Kununurra. Relevant if an oil spill from the activity reaches their land.

Category 5 - Other Relevant Persons	
Relevant Person	Functions, interests and activities & relevancy to activity
Conservation groups	
<i>Relevant because they have interests in marine conservation.</i>	
Australian Institute of Marine Science (AIMS)	Applies science-based solutions to the key challenges facing those who live and work in the waters of northern Australia. AIMS' researchers understand large-scale, complex and emerging challenges in iconic marine habitats in Australia's vast and remote tropical waters.
Australian Wildlife Conservancy (AWC)	Private (not for profit) owner and/or manager of land for conservation in Australia whose mission is the effective conservation of all Australian native animal species and the habitats in which they live. Involved in a number of projects in the Kimberley Region.
Conservation Council WA (CCWA)	WA peak body not-for-profit, non-government conservation and environment organisation who are active in conservation and climate action and focused on fossil fuels, uranium, biodiversity, citizen science and green economic futures.
Territory Natural Resource Management	Independent not for profit, membership-based organisation who works with landholders, community groups, industry and government to ensure sustainable management of water, land, soils and biodiversity in the NT.
The Wilderness Society (TWS)	Public company that works to support the living world. They take on transnational corporations, rogue operators, and the armies of lobbyists and politicians who defend them in relation to projects that could affect the environment. They have been active in WA and the NT.
Environmental groups	
<i>Relevant because they have interests in marine conservation.</i>	
Environs Kimberley	Environmental non-government organisation for the Kimberley region, including protecting the Kimberley Coast and North Kimberley Marine Park jointly managed with groups such as Balanggara Aboriginal Corporation & MG Corp.
Environment Centre NT	Peak community sector environment organisation in the NT that work closely with communities across the NT to stop environmentally destructive projects, hold government and industry to account and improve environmental regulation and governance.
Other	
Aboriginal Areas Protection Authority (AAPA)	The AAPA is an independent statutory authority established under the <i>Northern Territory Aboriginal Sacred Sites Act</i> . The Authority is responsible for overseeing the protection of Aboriginal sacred sites on land and sea across the whole of the NT. Relevant if the activity results in oil spill impacts to sacred sites.

Category 5 - Other Relevant Persons	
Relevant Person	Functions, interests and activities & relevancy to activity
ASCO - Darwin Supply Base	<p>Specific purpose intermodal freight facility for storage and freight consolidation, loading and unloading of vessels servicing the offshore oil and gas industry.</p> <p>Relevant if an oil spill from the activity impacts their operations through increased use of the port by vessels involved in oil spill response.</p>
Commonwealth Scientific and Industrial Research Organisation (CSIRO)	<p>Australia's national science research organisation.</p> <p>Relevant if the activity results in oil spill impacts to sacred sites.</p>

ADVERTISING FOR ENVIRONMENT PLAN FEEDBACK – DECEMBER 2022

Presented in the same order as Table 4.2 of the EP.

THE WEST AUSTRALIAN

3 DECEMBER 2022

Drilling

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to drill an exploration well (Beehive-1) in Commonwealth marine water in permit area WA-488-P. Beehive-1 is located in the Joseph Bonaparte Gulf, 83 kilometers (km) off the Western Australian coastline and 300 km southwest of Darwin.

Drilling of the single exploration well, Beehive-1, is planned to take place over a 55 to 100 day period as early as March 1, 2023, but no later than December 31, 2024. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance, rig, and equipment availability.

EOG is searching for information about what environmental values people may have in the EOG project area and requests that you share your assessment of how your functions, activities, interests, or values in or around the project area that may be affected by our proposed activities and the predicted environmental impacts and risks. We will assess the merits of any objections or claims you make, provide a response to you which will outline our assessment of merit and any actions taken to mitigate the degree to which you may be affected.

To assist you in making your assessment the current EP can be found on the NOPSEMA website: https://info.nopsema.gov.au/environment_plans/587/show_public

For further information, please contact us at:
Local Consultant Representative Phone: 0427 737 607
Email: australia@eogresources.com

Geotechnical

EOG Resources Australia Block WA-488 Pty Ltd is planning to undertake geotechnical investigations in Commonwealth marine waters of the Joseph Bonaparte Gulf off the Western Australian coastline within permit area WA-488-P. The geotechnical investigations will take place within a ~50 km² area off the Western Australian coastline and are in relation to the Beehive-1 exploration drilling project (the subject of separate public notices).

The geotechnical activity is planned to take place over a 2-week period between January and December 2023. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance and equipment availability.

EOG is searching for information about what environmental values people may have in the EOG project area and requests that you share your assessment of how your functions, activities, interests, or values in or around the project area may be affected by our proposed activities and the predicted environmental impacts and risks. We will assess the merits of any objections or claims you make, provide a response to you which will outline our assessment of merit and any actions taken to mitigate the degree to which you may be affected.

To assist you in making your assessment the current EP can be found on the NOPSEMA website: https://info.nopsema.gov.au/environment_plans/605/show_public

Drilling

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to drill an exploration well (Beehive-1) in Commonwealth marine water in permit area WA-488-P. Beehive-1 is located in the Joseph Bonaparte Gulf, 83 kilometers (km) off the Western Australian coastline and 300 km southwest of Darwin.

Drilling of the single exploration well, Beehive-1, is planned to take place over a 55 to 100 day period as early as March 1, 2023, but no later than December 31, 2024. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance, rig, and equipment availability.

EOG is searching for information about what environmental values people may have in the EOG project area and requests that you share your assessment of how your functions, activities, interests, or values in or around the project area that may be affected by our proposed activities and the predicted environmental impacts and risks. We will assess the merits of any objections or claims you make, provide a response to you which will outline our assessment of merit and any actions taken to mitigate the degree to which you may be affected.

To assist you in making your assessment the current EP can be found on the NOPSEMA website:
https://info.nopsema.gov.au/environment_plans/587/show_public

Geotechnical

EOG Resources Australia Block WA-488 Pty Ltd is planning to undertake geotechnical investigations in Commonwealth marine waters of the Joseph Bonaparte Gulf off the Western Australian coastline within permit area WA-488-P. The geotechnical investigations will take place within a ~50 km² area off the Western Australian coastline and are in relation to the Beehive-1 exploration drilling project (the subject of separate public notices).

The geotechnical activity is planned to take place over a 2-week period between January and December 2023. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance and equipment availability.

EOG is searching for information about what environmental values people may have in the EOG project area and requests that you share your assessment of how your functions, activities, interests, or values in or around the project area may be affected by our proposed activities and the predicted environmental impacts and risks. We will assess the merits of any objections or claims you make, provide a response to you which will outline our assessment of merit and any actions taken to mitigate the degree to which you may be affected.

To assist you in making your assessment the current EP can be found on the NOPSEMA website:

THE KOORI MAIL

14 DECEMBER 2022

www.koorimail.com

THE KOORI MAIL, WEDNESDAY, DECEMBER 14, 2022 | 47

Notice of an application for revised determinations of native title in the state of Western Australia
Notification day: 28 December 2022

This is an application by the Walalakoo Aboriginal Corporation (NTBC) (ICN 8041), a registered native title body corporate, asking the Federal Court of Australia (Federal Court) to vary the determinations of native title in the area described below. The applicant seeks to include Nykina Mangala people with rights in the determination areas arising under traditional law and customs who were not included in the determined descriptions of the native title holders and to amend the name of an ancestor which is now known.

The applicant seeks to vary the determinations in the interests of justice so that:

- the apical ancestor identified as the "unnamed mother of Fulgentius Fraser" is changed to, and more properly described as, "Brumby Waddadai"; and
- the descendants of the following people are recognised as holding native title rights and interests in the determination areas and are eligible for membership of the prescribed body corporate that holds the native title on trust for Nykina Mangala people, Walalakoo Aboriginal Corporation (NTBC): (i) Bulu; (ii) Rimarrangudu aka Johnny Bilming; (iii) Kudij and Marrangkal; and (iv) Joe Nangan.

If you want to become a party to this application, you must file a Form 5 (Notice of intention to become a Party) with the Federal Court, on or before **27 March 2023**. Further information regarding how to file a Form 5 is available from www.fedcourt.gov.au. After **27 March 2023**, you will need to seek leave from the Federal Court to become a party.

National Native Title Tribunal

Application name: Walalakoo Aboriginal Corporation (NTBC) (ICN 8041) and the State of Western Australia
Federal Court File No: WAD214/2022
Date filed: 5 October 2022

Relevant Determinations: *Watson on behalf of the Nykina Mangala People v State of Western Australia* (No 6) [2014] FCA 545 (19 May 2014) and *Watson on behalf of the Nykina Mangala People (Nykina Mangala #2) v State of Western Australia* [2015] FCA 1132 (29 October 2015)

Description: The application area covers about 26,133 sq km and is located south of Derby and east of Broome

Relevant LGAs: Shires of Broome and Derby/West Kimberley

For assistance and further information about this application, call Hula McGrath on 08 6317 5442 or visit www.nttt.gov.au.

GEOTECHNICAL
EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to undertake geotechnical investigations in Commonwealth marine waters within permit area WA-488-P. The geotechnical investigations will take place in the Joseph Bonaparte Gulf, within a 50 km² area off the Western Australian coastline and are in relation to the Beehive-1 exploration drilling project (the subject of separate public notice).

The geotechnical activity is planned to take place over a 2-week period between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance and equipment availability.

DRILLING
EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to drill an exploration well known as Beehive-1 in Commonwealth marine waters within permit area WA-488-P. Beehive-1 is located in the Joseph Bonaparte Gulf, approximately 83 km's off the Western Australian coastline and approximately 294 km's southwest of Darwin.

Drilling of the single Beehive-1 exploration well, is planned to take place over a 55 to 100 day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance, rig and equipment availability.

To assist you in making your assessment the current EPs can be found via EOG website. EOG is committed to continued open engagement to keep our stakeholders informed. You can access the website with the link below for the most up to date project information at any time.

EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to undertake geotechnical investigations in Commonwealth marine waters within permit area WA-488-P. The geotechnical investigations will take place in the Joseph Bonaparte Gulf, within a 50 km² area off the Western Australian coastline and are in relation to the Beehive-1 exploration drilling project (the subject of separate public notice).

The geotechnical activity is planned to take place over a 2-week period between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance and equipment availability.

DRILLING
EOG Resources Australia Block WA-488 Pty Ltd (EOG) is planning to drill an exploration well known as Beehive-1 in Commonwealth marine waters within permit area WA-488-P. Beehive-1 is located in the Joseph Bonaparte Gulf, approximately 83 km's off the Western Australian coastline and approximately 294 km's southwest of Darwin.

Drilling of the single Beehive-1 exploration well, is planned to take place over a 55 to 100 day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. An Environment Plan (EP) for the activity is currently under assessment with NOPSEMA (National Offshore Petroleum Safety and Environmental Management Authority) with activity timing contingent on the receipt of EP acceptance, rig and equipment availability.

To assist you in making your assessment the current EPs can be found via EOG website. EOG is committed to continued open engagement to keep our stakeholders informed. You can access the website with the link below for the most up to date project information at any time.

<https://www.eogresources.com/australia> or QR Code

A version can also be found on the NOPSEMA website here:
Geotechnical Investigations: https://info.nopsema.gov.au/environment_plans/605/show_public
Drilling: https://info.nopsema.gov.au/environment_plans/587/show_public

For the Geotechnical and Drilling activities, EOG is looking to gather information about the social, economic and cultural features near the EOG project area and requests feedback on the functions, activities, and interests in or around the project area that may be affected by our proposed Geotechnical and Drilling activities. We will assess the merits of any objections or claims made and provide a response outlining our assessment of merit and any actions taken to mitigate the impact.

Project Information Flyers

Beehive-1 Exploration Well

Information Flyer #1

17 September 2021

EOG Resources Inc (EOG) is planning to drill the Beehive-1 exploration well ('the project') in Exploration Permit WA-488-P in the Joseph Bonaparte Gulf in Western Australia (WA) (Figure 1, over page).

Why We're Consulting You

EOG has identified you, your group, organisation or company as a 'relevant person', defined under the Offshore Petroleum and Greenhouse Gas (Environment) Regulations 2009 as someone whose *functions* (power, duty, authority or responsibility), *activities* (things you do or have done) or *interests* (your rights, advantages, duties and liabilities, or concerns) may be affected by the project. Relevant persons typically include Commonwealth, State and Territory government agencies, commercial and recreational fisheries, asset owners and environment groups.

This information flyer aims to introduce you to EOG and provide information about the project and invites you to submit questions or concerns about the project. This process will assist to inform the preparation of the project's Environment Plans (EPs), which are currently in preparation for regulatory submission.

Who is EOG?

EOG is one of the largest independent crude oil and natural gas exploration and production companies in the United States of America (USA).

EOG is in the process of acquiring the WA-488-P exploration permit from Finnis Offshore Exploration Pty Ltd, which is expected to complete in September or October 2021. EOG has operated offshore since 1992, with a history of nearly 30 years in Trinidad & Tobago, the UK North Sea and the USA Gulf of Mexico.

In the past 10 years, EOG has drilled nearly 40

offshore wells, with an excellent safety and environment record.

The Project

EOG aims to explore a known hydrocarbon prospect in WA-488-P located in the Bonaparte Basin. The project is divided into two phases; geophysical and geotechnical (G&G) investigations, followed by drilling.

This information flyer is focused on the first phase of work, the G&G investigations. Additional information flyers will be issued as the project progresses.

Geophysical and Geotechnical Investigations

The G&G investigations are planned to commence any time between the start of February and end of June 2022 (contingent on the receipt of EP acceptance, vessel and equipment availability). They will be undertaken within a 440 km² envelope, which is located 163 km from the nearest WA shoreline and 73 km from the nearest Northern Territory (NT) shoreline. Water depths in the project area range from 40 m to 50 m.

The G&G investigations (Figure 2) collect seabed and shallow geological information to inform the safe location of a jack-up drilling rig. The G&G investigations are divided into two phases, as outlined here.

Figure 2. Geophysical investigations

Figure 1. Beehive-1 project area

Geophysical investigations involve the following suite of tests:

- Assess water depths (bathymetry) – using a multi-beam echo sounder (MBES).
- Detect seabed hazards such as pipelines, shipwrecks, reefs and anchors – using a side scan sonar (SSS).
- Map the structure and thickness of uppermost seabed sediments (shallow geology) – using a sub-bottom profiler (SBP).
- Detect metallic objects on or below the seabed, such as cables, anchors, chains, buried pipelines – using a magnetometer.
- Map the near-surface geological hazards, such as shallow gas pockets – using a mini-airgun or sparker system.

The geophysical activities are likely to be conducted using a small, locally-based vessel (as depicted in Figure 2) and is likely to take up to two weeks to complete.

Geotechnical investigations acquire physical measurements and samples of the local shallow geology at and around the potential drill location, using the following techniques:

- Geological analysis of unconsolidated seabed sediments – using grab sampling.
- Geological analysis of formations below the seabed – using coring.
- Determine seabed strength – using piezo cone penetrometer testing (PCPT) and borehole sampling.

The geotechnical investigations are undertaken using a specialised medium-sized vessel, as depicted in Figure 3, and is likely to take up to two weeks to complete. This may be the same vessel as that used to undertake the geophysical investigations.

Figure 3. Geotechnical investigations

Drilling

Planning for the drilling campaign is underway. The Beehive-1 well is targeting the Sunbird Formation and anticipates the presence of a light oil or gas condensate.

A jack-up drill rig will drill the well vertically to a depth of about 5,000 m using a water-based mud system, which will take 40-50 days. In the event that hydrocarbons are discovered, well testing (that involves flaring) may take place.

It is anticipated that drilling may commence as early as Q3 2022 (contingent on the receipt of EP acceptance, vessel and equipment availability), but ideally no later than Q2 2023. Further details about the drilling campaign will be provided in future information flyers as planning progresses.

Environment Plans

Preparation of a G&G Investigations EP and a Drilling EP are underway. These will be submitted to the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for assessment.

The full EPs will be made available on NOPSEMA's website for public exhibition prior to formal assessment by NOPSEMA.

An EP is a comprehensive document that describes the project, outlines stakeholder feedback, details the existing marine and socio-economic environment, describes and assesses impacts and risks and outlines the

control measures to avoid, minimise and mitigate environmental impacts and risks to be acceptable and ALARP (As Low As Reasonably Practicable).

The project will be subject to industry best practice standards and undertaken in accordance with all relevant environmental and safety legislation and regulations.

Features of the Project Area

Features in the project area include:

- Dominated by the Indonesian Throughflow current and strong tides.
- A seabed dominated by flat featureless plains comprising sand and gravel, with localised reefs and outcrops supporting sponge gardens. The G&G investigations will provide more detail about the type of seabed in the project area. The plains contain diverse infaunal communities (e.g., crustaceans and polychaete worms).
- Seasonal presence or likely presence of threatened migratory species including turtles, sharks, sawfish, whales, dolphins and seabirds.
- Low-intensity commercial fishing by the Commonwealth-managed Northern Prawn Fishery (the project area has a 0.06% overlap with the fishery).
- Some commercial fishing by the WA-managed Northern Demersal Scalefish Managed Fishery (mostly goldband snapper and red emperor) and Mackeral Managed Fishery.
- An absence of NT-managed commercial fisheries.
- An absence of known shipwrecks.
- Low commercial shipping traffic.
- An overlap by the Department of Defence North Australian Exercise Area.

Distances from the project area to the following features are:

- The Carbonate bank and terrace system of the Sahul Shelf Key Ecological Feature (KEF) – 13 km.
- The Blacktip unmanned wellhead platform – 13 km.
- Joseph Bonaparte Australian Marine Park (AMP) – 16 km.
- WA North Kimberley Marine Park – 50 km.

A summary of key impacts and risks of the G&G investigations is presented in the following pages.

How to Provide Feedback

EOG encourages you to ask questions or provide feedback on the project using the following contact details:

Email: australia@eogresources.com

Phone: 0409 772 170

EOG will respond to feedback in a timely fashion.

Background project information (and this information flyer) is also available on the EOG website at:

<https://www.eogresources.com/australia>

Ongoing Consultation

Consultation with relevant persons will be ongoing throughout the project planning phase, with additional information flyers to be distributed at various milestones.

Preliminary environmental impact and risk assessment for the Beehive-1 geophysical and geotechnical investigations (WA-488-P)

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
<i>Planned events</i>		
Generation of underwater sound from G&G investigations and vessels	Temporary disruption to migration, feeding or breeding patterns for sound-sensitive fauna, such as cetaceans (whales and dolphins).	<ul style="list-style-type: none"> In accordance with the EPBC Act Policy Statement 3.1, a 500-m shutdown zone will be maintained during operation of the geophysical equipment to minimise impacts on cetaceans. Vessel engines and thrusters will be maintained in accordance with planned maintenance system to ensure they are operating efficiently.
	Damage to the Blacktip gas pipeline from sound pulses.	<ul style="list-style-type: none"> Shallow gas investigations, using a mini-airgun or sparker system, will not be undertaken over the pipeline.
Seabed disturbance from geotechnical activities	Temporary and localised seabed turbidity. Smothering of seabed habitat by disturbed sediments.	<ul style="list-style-type: none"> The vessel will not anchor during geotechnical investigations (it will remain on location using dynamic positioning). Very low volumes of cuttings and drilling fluids will be discharged during borehole sampling. Seabed grab sampling and coring activities are extremely localised. Cored holes are very narrow and will collapse in on themselves and small surface 'craters' will quickly fill in with sediments and recolonise with benthic fauna. Large bulky items will be securely fastened or stored on the vessel deck to prevent loss to sea. Any dropped objects will be recovered (where safe to do so).
<i>Routine vessel discharges and emissions</i>		
Atmospheric emissions	Temporary reduction in air quality in the local air shed.	<ul style="list-style-type: none"> Vessels >400 gross tonnes will have in place a current International Air Pollution Prevention (IAPP) certificate and Ship Energy Efficiency Management Plan (SEEMP). Only marine-grade low sulphur diesel (no greater than 0.5% m/m) will be used. Waste incineration will not take place. All fuel-burning equipment will be maintained in accordance with planned maintenance systems.
Light glow	Attractant to fauna, temporary increase in predation rates on fauna attracted to lights.	<ul style="list-style-type: none"> Vessel lighting will be kept to the minimum required but in accordance with navigational standards and personnel safety requirements for night-time work.

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
Discharge of treated sewage and grey water	Temporary and localised reduction in water quality.	<ul style="list-style-type: none"> Sewage and grey water will be treated in a MARPOL Annex IV-compliant sewage treatment plant prior to discharge (or taken back to port for disposal). Vessels >400 gross tonnes will have in place a current International Sewage Pollution Prevention (ISPP) certificate. In the event of a sewage treatment plant malfunction, untreated sewage will only be discharged when > 12 nm from shore or will be offloaded onshore for treatment.
Discharge of cooling water and reverse osmosis (brine)	Temporary and localised elevation in surface water temperature and salinity levels.	<ul style="list-style-type: none"> Low impact biocides (chlorine) are used in optimised concentrations in the cooling system. Engines and associated equipment that require cooling by water will be maintained in accordance with the planned maintenance system so that they are operating within accepted parameters. Only low-toxicity chemicals (ONCS 'Gold'/'Silver' (CHARM) or 'D'/'E' (non-CHARM)-rated) chemicals are used in the cooling and brine water systems.
Discharge of putrescible waste	Temporary and localised increase in nutrient content of surface and near-surface water quality. Temporary increase in scavenging behaviour of pelagic fish and seabirds.	<ul style="list-style-type: none"> Putrescible waste will be macerated to <25 mm prior to discharge (or taken back to shore for disposal). In the event of macerator malfunction, un-macerated putrescible waste will take place will be discharged when >12 nm of land or returned to shore. Non-putrescible galley waste will be returned to shore for disposal.
Discharge of bilge water and deck drainage	Temporary and localised reduction in water quality.	<ul style="list-style-type: none"> Vessels >400 gross tonnes will have in place a MARPOL Annex I-compliant oily water separator set to limit oil-in-water content to <15 ppm prior to discharge. Vessels >400 gross tonnes will have a current International Oil Pollution Prevention (IOPP) certificate. No whole residual bilge oil is discharged overboard (residual oil from the oily water separator is pumped to tanks and disposed of onshore). Chemical storage areas will be bunded and drain to the bilge tank. Portable bunds and/or drip trays are used to collect spills or leaks from equipment that is not contained within a permanently bunded area (non-process areas). Deck cleaning detergents will be biodegradable. Spills to decks will be cleaned immediately using Shipboard Marine Pollution Emergency Plan (SMPEP) kits.
Unplanned events		
Accidental overboard release of hazardous	Marine pollution (litter and a temporary and localised reduction in	<ul style="list-style-type: none"> Vessels >100 gross tonnes or certified to carry more than 15 people will have in place and implement a vessel-specific Garbage Management Plan. Vessel crew and visitors will be inducted into the waste

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
and/or non-hazardous waste from the vessels	water quality). Injury and entanglement of individual animals (such as seabirds and turtles) and smothering or pollution of benthic habitats.	management procedures. <ul style="list-style-type: none"> • A waste manifest will be maintained. • Only small volumes of chemicals will be kept on board and will be stored in secured drums in bunded areas away from open drains. • Bunded areas will drain through a closed system, processed through the oily water separator. • Safety Data Sheets (SDS) will be available in appropriate locations. • SMPEP kits will be available on board for rapid deck clean-up response.
Introduction of invasive marine species from the vessel hulls and/or ballast water	Reduction in native marine species diversity and abundance. Displacement of native marine species. Socio-economic impacts on commercial fisheries. Reduction of conservation values of protected areas.	<ul style="list-style-type: none"> • Vessels will carry a low risk of invasive marine species introduction (as determined through a vessel contractor pre-qualification report). • Vessels >400 gross tonnes will carry a current International Anti-fouling System (IAFS) Certificate and comply with Marine Order Part 98 (Anti-fouling Systems). • The vessel/s will comply with the: <ul style="list-style-type: none"> ○ Australian Ballast Water Management Requirements (DAWR, 2020); and ○ National Biofouling Guidance for the Petroleum Production & Exploration Industry (AQIS, 2009). • Towed/submersible equipment will be cleaned (e.g., fouling is removed) prior to initial use in the project area.
Damage to Blacktip subsea gas pipeline (e.g., dropped objects, anchoring)	Loss of pipeline integrity and lost field production.	<ul style="list-style-type: none"> • Vessel anchoring will not be permitted. • EOG will consult with ENI Australia (pipeline operator) to understand the implications of operating over the pipeline. • The geophysical investigations will be undertaken prior to geotechnical investigations in order to accurately locate the pipeline and put in place geotechnical exclusion buffer around it. • EOG will ensure that the geotechnical vessel contractor has the coordinates of the Blacktip pipeline marked in its navigation system (confirmed during the geophysical survey) to ensure that no geotechnical work is conducted within a nominated buffer around the pipeline.
Vessel strike or entanglement with megafauna (e.g., whales, dolphins, turtles)	Injury or death of individual animals.	<ul style="list-style-type: none"> • The Australian Guidelines for Whale and Dolphin Watching (DEWHA, 2005) for sea-faring activities will be implemented, which includes caution and no-approach zones around whales and dolphins. • Vessel strike causing injury to or death of a cetacean is reported via the online National Ship Strike Database within 72 hours of the incident. • Entanglement of megafauna in towed equipment is reported to the NT Marine Wildwatch on 1800 453 941 (or WA's Wildcare on 08-9474 9055) as soon as possible. No attempts to disentangle megafauna will be made by project personnel unless instructed

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
		by Wildwatch or Wildcare. <ul style="list-style-type: none"> Vessel crew will complete an environmental induction covering the above-listed requirements.
Displacement of or interference with third-party vessels	Temporary loss of fishing grounds around the vessel safety zone. Trawling gear snagging on towed or submerged equipment.	<ul style="list-style-type: none"> The project area is located in an area with low levels of shipping traffic and low fishing effort. A 'Notice to Mariners' will be issued. Standard maritime safety precautions will be in place, including: <ul style="list-style-type: none"> Radar and other anti-collision monitoring equipment to detect other vessels. Display of lights and day shapes. The ability to quickly move off location to avoid other vessels. Warnings issued (radio, flares, lights and horns) to avoid collisions. The Vessel Master will be qualified in accordance with AMSA Marine Orders Part 3 (Seagoing qualifications) (e.g., International Convention of Standards of Watchkeeping for Seafarers, STCW95, GMDSS Proficiency). The tail buoy on the shallow seismic streamer will have flashing lights and radar reflectors so it is visible to other marine users. The vessel master will sound the general alarm, manoeuvre the vessel to minimise the effects of the collision and implement all other measures as outlined in the vessel collision procedure. Vessel collisions will be reported to AMSA if that collision has or is likely to affect the safety, operation or seaworthiness of the vessel or involves serious injury to personnel.
Diesel release due to a vessel-to-vessel collision	Temporary and localised reduction in water quality. Tainting of commercial fisheries species. Injury and/or death of marine fauna and seabirds. Pathological effects on fish larvae and plankton.	<ul style="list-style-type: none"> <i>As per 'displacement of or interference with third-party vessels', plus:</i> No refuelling will take place on location. Vessel crew will be trained in spill response techniques in accordance with the SMPEP and vessel training matrix. Diesel spill trajectory modelling indicates a very small area of ecological impact in the event of the loss of a whole tank of fuel. An Oil Pollution Emergency Plan (OPEP) will be developed based on the spill modelling results. Vessel-specific SMPEP and project-specific OPEP will be implemented in the event of a large spill. EOG will report the spill to regulatory authorities within 2 hours of becoming aware of the spill.

Beehive-1 Exploration Well

Information Flyer #2

01 December 2021

Update on the Pre-Drill Seabed Assessment

EOG Resources, Inc. (EOG) advises that the Beehive Pre-Drill Seabed Assessment (PDSA) Environment Plan (EP) is now available on the National Offshore Petroleum Safety and Environmental Management Authority's (NOPSEMA) website for public exhibition and comment at https://info.nopsema.gov.au/home/open_for_comment

The following updates have occurred since Information Flyer #1 was issued:

- EOG Resources Australia Block WA-488 Pty Ltd, a subsidiary of EOG, is now the sole titleholder of the WA-488-P Exploration Permit;
- The activity window has been amended and is now April to August 2022 (exact timing dependent on the receipt of EP acceptance, weather, and vessel/equipment availability), rather than February to June 2022 as previously stated; and
- The PDSA activity area has been reduced by 100 km² from 440 km² to an area of 340 km².

Figure 1. Updated Beehive PDSA location

How to Provide Feedback

EOG encourages you to provide feedback on the activity using the following contact details:

Email: australia@eogresources.com

Phone: 0409 772 170

EOG will respond to feedback in a timely fashion.

Background project information (and this information flyer) is also available on the EOG website at:
<https://www.eogresources.com/australia>

Ongoing Consultation

Consultation with relevant persons will be ongoing throughout the project planning and during preparation of the Beehive-1 Drilling EP.

Beehive-1 Exploration Well

Information Flyer #3

28 February 2022

EOG Resources Australia Block WA-488 Pty Ltd, a subsidiary of EOG Resources, Inc. (together 'EOG') is the Titleholder of Exploration Permit WA-488-P in the Joseph Bonaparte Gulf in Western Australia (WA).

EOG is planning to drill the Beehive-1 exploration well ('the project') (Figure 1, over page). The Beehive-1 well is targeting the Sunbird Formation and anticipates the presence of a light crude oil.

Why We're Consulting You

EOG has identified you, your group, organisation or company as a 'relevant person', defined under the Offshore Petroleum and Greenhouse Gas (Environment) Regulations 2009 as someone whose *functions* (power, duty, authority or responsibility), *activities* (things you do or have done) or *interests* (your rights, advantages, duties and liabilities, or concerns) may be affected by the project. Relevant persons typically include Commonwealth, State and Territory government agencies, commercial and recreational fisheries, asset owners and environment groups.

This information flyer aims to introduce you to EOG and provide information about the project and invites you to submit questions or concerns about the project. This process will assist to inform the preparation of the project's drilling Environment Plan (EP), which is currently in preparation for regulatory submission and acceptance.

Who is EOG?

EOG is the one of the largest independent crude oil and natural gas exploration and production companies in the United States of America (USA). EOG acquired the WA-488-P exploration permit from Finniss Offshore Exploration Pty Ltd in November 2021 with the aim of exploring known hydrocarbon prospects in the Bonaparte Basin.

EOG has operated offshore since 1992, a history of 30 years with assets in Trinidad and Tobago, UK North Sea, and the US Gulf of Mexico. In the past 10 years, EOG has drilled nearly 40 offshore wells with an excellent safety and environmental record.

The Project

The Beehive-1 exploration well is situated within Commonwealth marine waters 83 kilometres (km) off the WA coastline and 300 km southwest of Darwin in a water depth of 40 m. Drilling of the Beehive-1 exploration well is the second phase of work following the geophysical and geotechnical (G&G) investigations that are planned to occur over 4-6 weeks between April and August 2022.

This information flyer is focused on the proposed drilling activities. Additional information flyers will be issued as the project progresses.

Drilling Activities

Drilling is planned to occur between Q4 2022 and Q3 2023 (contingent on the receipt of EP acceptance, including drill rig and equipment availability).

Drilling activities are estimated to take approximately 50 to 90 days. The duration of drilling may be subject to change based on geological conditions and potential for operational challenges (e.g., sea state). Operations will be conducted 24 hours per day, seven days per week.

Figure 1. Beehive-1 Location map

Approach and Equipment

EOG proposes to undertake the activity using a jack-up mobile offshore drilling unit (MODU) with a 500 m exclusion zone. There will also be auxiliary activities including the use of support vessels and helicopters.

EOG is currently evaluating the availability of drill rigs for this activity. Further information on the nominated drill rig will be made available as part of EOG's ongoing consultation.

The approach to and setup of the jack-up MODU on location is summarised in Figure 2, over page.

Drilling Program

The following phases describe the planned drilling activity:

- Move the MODU to location, position MODU, pre-load and jack-up to operational elevation.
- Drill conductor hole and run conductor pipe.
- Drill surface hole section.
- Run and cement surface casing.
- Install the surface wellhead and blowout preventor (BOP).
- Perform a pressure test.
- Drill intermediate hole section(s).
- Run and cement intermediate pipe (casing) strings.
- Drill remaining sections to well total depth (TD).
- Run well evaluation program (wireline logging, sidewall cores, vertical seismic profiling [VSP] and possibly a drill stem test).
- Plug and abandon (P&A) or temporarily suspend the well.
- Demobilise the MODU and tow it away.

Environment Plan

Preparation of a Drilling EP is underway. This will be submitted to the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for assessment.

The full EP will be made available on NOPSEMA's website for public exhibition prior to formal assessment by NOPSEMA.

The EP is a comprehensive document that describes the project, outlines stakeholder feedback, details the existing marine and socio-economic environment, describes and assesses impacts and risks (see Table 1) and outlines the control measures to avoid, minimise and mitigate environmental impacts and risks to be acceptable and ALARP (As Low as Reasonably Practicable).

The project will be subject to industry best practice standards and undertaken in accordance with all relevant environmental and safety legislation and regulations.

Figure 2. Overview of the jack-up MODU setup

Ongoing Consultation

Consultation with relevant persons will be ongoing throughout the project planning phase, with additional information flyers to be distributed at various milestones.

How to Provide Feedback

EOG encourages you to provide feedback on the project using the following contact details:

Email: australia@eogresources.com

Phone: 0409 772 170

EOG will respond to feedback in a timely fashion.

Additional background project information (and this information flyer) is available on the EOG website at:

<https://www.eogresources.com/australia>

Table 1. Preliminary environmental impact and risk assessment for Beehive-1 exploration well drilling

Hazard	Potential impacts & risks	Preliminary avoidance, mitigation & management strategies
<i>Planned Events</i>		
Physical presence		
Seabed disturbance	<ul style="list-style-type: none"> Physical removal or disturbance of seabed sediments. Increase in turbidity of the water column near the seabed. 	<ul style="list-style-type: none"> Seabed disturbance will be kept to the minimum area necessary for safe operations. Procedures will be in place to avoid objects being dropped overboard. If large objects are dropped overboard, they will be retrieved wherever possible.
Displacement of other marine users	<ul style="list-style-type: none"> Diversion from a planned travel route and additional time to re-join the planned route. Increased fuel use (and cost) as a result of this diversion. Temporary exclusion from fishing grounds. 	<ul style="list-style-type: none"> The exclusion zone will be reduced to the lowest area possible for safe operations. The required area of displacement for the duration of the activity will be communicated to commercial fisheries and authorities.
Routine emissions and discharges		
Light	<ul style="list-style-type: none"> Light glow may act as an attractant to light-sensitive species, in turn affecting predator-prey dynamics (due to attraction to or disorientation from light). Continuous lighting may result in localised alterations to normal marine fauna behaviours. 	<ul style="list-style-type: none"> MODU and support vessel external lighting will be kept to levels required for navigation and safety of deck operations. Blinds on portholes and windows will be lowered on support vessels at night. Lighting will be directed to working areas only (i.e., not overboard, unless in an emergency). The duration of flaring will be kept to the minimum time necessary.
Air	<ul style="list-style-type: none"> Localised and temporary decrease in air quality due to emissions from diesel combustion. Addition of greenhouse gas (GHG) to the atmosphere (influencing climate change). 	<ul style="list-style-type: none"> Only low sulphur (<0.5% m/m) marine diesel oil will be used. A planned maintenance system (PMS) will be implemented for combustion equipment. International Air Pollution Prevention (IAPP) certification will be maintained. A Ship Energy Efficiency Management Plan (SEEMP) will be in place and implemented. An Ozone Depleting Substances (ODS) procedure will be in place and implemented. Waste incineration will be managed in accordance with MARPOL and Marine Orders. The duration of flaring will be kept to the minimum time necessary. Fuel use will be monitored for abnormal consumption.

Hazard	Potential impacts & risks	Preliminary avoidance, mitigation & management strategies
Noise	<ul style="list-style-type: none"> Behavioural effects to sound-sensitive species (e.g., whales). Temporary or permanent threshold shift in sound-sensitive species (e.g., whales). 	<ul style="list-style-type: none"> EPBC Policy Statement 2.1 – Part A (Standard management procedures) will be implemented during VSP activities. Environmental awareness induction will be provided for all crew. Vessels and helicopters will comply with EPBC Regulations 2000. Vessel engines and thrusters will be well maintained.
Drill cuttings and muds	<ul style="list-style-type: none"> Localised and temporary increase in total suspended solids in the water column. Smothering of benthic habitat and fauna. Alteration of benthic substrate. Potential toxicity impacts to fauna. Reduction of visual amenity from turbidity plumes. 	<ul style="list-style-type: none"> Water-based mud (WBM) will be used for drilling (rather than synthetic- or oil-based muds). Only low-toxicity additives will be added to the WBM system. Mud operations will be managed to minimise discharge volumes. For example, shaker screens are used to maximise mud separation prior to overboard discharge.
Cement	<ul style="list-style-type: none"> Localised and temporary increased turbidity of the water column. Smothering of benthic habitat and fauna. Alteration of benthic substrate. Potential toxicity impacts to fauna. 	<ul style="list-style-type: none"> Cement operations will be managed to minimise discharge volumes. For example, once good returns are noted at the seabed, the mixing and pumping of cement will cease and displacement of the string with drilling fluid will begin. Only low-toxicity additives will be added to the cement system.
Putrescible waste	<ul style="list-style-type: none"> Temporary and localised increase in the nutrient content of waters surrounding the discharge point. An associated increase in scavenging behaviour of marine fauna and seabirds (at the sea surface or within the water column). 	<ul style="list-style-type: none"> A Garbage Management Plan will be in place and implemented. Putrescible waste will be treated as per MARPOL Annex V requirements prior to discharge. Environmental awareness induction will be provided for all crew.
Sewage and grey water	<ul style="list-style-type: none"> Increase in the nutrient content of surface waters around the MODU and support vessels. An associated increase in scavenging behaviour of marine fauna and seabirds (at the sea surface or within the water column). 	<ul style="list-style-type: none"> Treatment will be via a MARPOL-compliant sewage treatment plant prior to overboard discharge. The sewage treatment plant will be maintained in accordance with the PMS.
Cooling and brine water	<ul style="list-style-type: none"> Increase in sea water temperature, causing thermal stress to marine biota. 	<ul style="list-style-type: none"> Engines and associated equipment that require cooling by water will be maintained in accordance with the PMS so they are operating within accepted parameters.

Hazard	Potential impacts & risks	Preliminary avoidance, mitigation & management strategies
	<ul style="list-style-type: none"> • Increase in sea surface salinity, potentially causing harm to fauna unable to tolerate higher salinity. • Potential toxicity impacts to marine fauna from the ingestion of residual biocide and scale inhibitors. 	<ul style="list-style-type: none"> • Only low-toxicity biocide will be used.
Bilge water and deck drainage	<ul style="list-style-type: none"> • Temporary and localised reduction of surface water quality around the discharge point. • Acute toxicity to marine fauna through ingestion of contaminated water in a small mixing zone. 	<ul style="list-style-type: none"> • All bilge water passes through a MARPOL-compliant oily water system set to limit oily-in-water to <15 ppm prior to overboard discharge. • The oily water system is maintained in accordance with the PMS. • Bunding of hydrocarbons and chemical storage areas. • Shipboard Marine Pollution Emergency Plan (SMPEP) is in place. • Use of non-toxic, biodegradable deck cleaning products. • Spill kits are availability on deck and crew are trained in spill response.
Unplanned Events		
Accidental discharge of waste to the ocean	<ul style="list-style-type: none"> • Marine pollution. • Acute toxicity to marine fauna through ingestion or absorption. • Injury and entanglement of individual animals (such as seabirds and seals). • Smothering or pollution of benthic habitats. 	<ul style="list-style-type: none"> • Waste is managed in accordance with the Garbage Management Plan. • Recover accidentally discharged wastes or lost equipment. • Chemical lockers are in place and used. • Follow established handling and storage procedures. • All crew are inducted in waste management procedures.
Vessel collision with megafauna	<ul style="list-style-type: none"> • Injury or death of marine megafauna (e.g., whales, dolphins, turtles). 	<ul style="list-style-type: none"> • Australian National Guidelines for Whale and Dolphin Watching (2017) are implemented by the support vessels. • All vessel crew are inducted in the guidelines. • Incident reporting procedure will be in place.
Introduction and establishment of invasive marine species (IMS)	<ul style="list-style-type: none"> • Reduction in native marine species diversity and abundance. • Depletion of commercial fish stocks (and associated socio-economic effects). • Changes to conservation values of protected areas. 	<ul style="list-style-type: none"> • A MODU and support vessels already in Australia are likely to be used (reducing the risk of introducing IMS). • An IMS risk assessment will be undertaken. • The International Anti-fouling System (IAFS) Certification will be maintained. • Implement a Biofouling Management Plan and Biofouling Record Book. • Implement a Ballast Water Management Plan. • Incident reporting procedure will be in place.

Hazard	Potential impacts & risks	Preliminary avoidance, mitigation & management strategies
Interference with other marine users	<ul style="list-style-type: none"> • Damage to third-party vessels in the case of collision. • Damage to or loss of fishing equipment and/or loss of commercial fish catches. 	<ul style="list-style-type: none"> • An Exclusion (Safety) zone will be designated around the MODU. • Navigation equipment and associated procedures will be used, including constant bridge watch. • Crew will be appropriately qualified. • Stakeholder notification process will be in place.
Marine diesel oil spill	<ul style="list-style-type: none"> • Temporary and localised reduction in water quality. • Injury or death of exposed marine fauna and seabirds. • Habitat damage where the spill reaches shorelines. • Changes to the functions, interests or activities of other users (e.g., commercial fisheries). 	<ul style="list-style-type: none"> • As per <i>'Interference with other marine users.'</i> • A bunkering procedure for any at-sea refuelling will be used. • Crews will be trained in spill prevention and response. • The following plans will be implemented in the event of a spill: <ul style="list-style-type: none"> ○ SMPEP. ○ Project-specific Oil Pollution Emergency Plan (OPEP). ○ Project-specific Operational and Scientific Monitoring Program (OSMP).
Loss of well containment	<ul style="list-style-type: none"> • Temporary but potentially widespread reduction in water quality. • Tainting of commercial fisheries species. • Injury and death of species such as seabirds. • Pathological effects on fish larvae and plankton. • Pollution of shoreline habitats such as sandy beaches, mudflats and mangroves. 	<ul style="list-style-type: none"> • Well design (including casing) will be based on geotechnical data and previously drilled wells in the area (i.e., review of offset well data). • Continuous monitoring of mud weight and other mud flow parameters will occur to ensure primary well control barrier is operating as designed. • Blow out preventer (BOP) will be tested and installed before entering the hydrocarbon zone. • Well casing will be pressure tested after drilling prior to drilling ahead. • Well control exercises will be undertaken. • An approved Well Operations Management Plan (WOMP) and Safety Case Revision will be in place. • A blowout contingency plan will be in place. • EOG will be a member of the Australian Marine Oil Spill Centre (AMOSOC), who would be called upon to assist in spill response.
Hydrocarbon spill response activities	<ul style="list-style-type: none"> • Routine and non-routine impacts and risks associated with vessel operations. • Noise disturbance to marine fauna and shoreline species by aircraft and vessels. 	<ul style="list-style-type: none"> • Maintain access to spill response capabilities (including capable personnel and equipment) and implement as required. • An appropriate distance will be maintained from marine fauna during spill response activities.

Beehive-1 Exploration Well

Information Flyer #4

11 May 2022

EOG Resources Australia Block WA-488 Pty Ltd, a subsidiary of EOG Resources, Inc. (together 'EOG') is the Titleholder of Exploration Permit WA-488-P in the Joseph Bonaparte Gulf in Western Australia (WA).

EOG is planning to drill the Beehive-1 exploration well ('the project') (see attached map). The Beehive-1 well is targeting the Sunbird Formation and anticipates the presence of a light crude oil.

Why We're Consulting You

EOG has previously consulted with you, your group, organisation or company as a 'relevant person', defined under the Offshore Petroleum and Greenhouse Gas (Environment) Regulations 2009 as someone whose *functions* (power, duty, authority or responsibility), *activities* (things you do or have done) or *interests* (your rights, advantages, duties and liabilities, or concerns) may be affected by the project. Relevant persons typically include Commonwealth, State and Territory government agencies, commercial and recreational fisheries, asset owners and environment groups.

This information flyer provides an update on project planning.

Who is EOG?

EOG is the one of the largest independent crude oil and natural gas exploration and production companies in the United States of America (USA). EOG acquired the WA-488-P exploration permit from Finniss Offshore Exploration Pty Ltd in November 2021 with the aim of exploring known hydrocarbon prospects in the Bonaparte Basin.

EOG has operated offshore since 1992, a history of 30 years with assets in Trinidad and Tobago, UK North Sea, and the US Gulf of Mexico. In the past 10 years, EOG has drilled nearly 40 offshore wells with an excellent safety and environmental record.

The Project

The Beehive-1 exploration well is situated within Commonwealth marine waters 83 kilometres (km) off the WA coastline and 300 km southwest of Darwin in a water depth of approximately 40 metres (m).

Drilling of the Beehive-1 exploration well is the second phase of work following the pre-drilling seabed assessment (PDSA) (also known as geophysical and geotechnical investigations) that are planned to occur between June and August 2022.

Geophysical Investigations

The G&G Environment Plan (EP) was accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) in March 2022 (see this [link](#)).

The geophysical survey is scheduled to commence in early June 2022. EOG has contracted Fugro to undertake the survey, using the vessel *MV Outer Limit*. The survey is scheduled to take place from 1st June to 1st July 2022 in the area shown in Figure 1.

EOG has issued advice about the survey to the Australian Hydrographic Office to enable the Notice to Mariners to include the survey details. The vessel will be towing equipment approximately 100 m behind the vessel and EOG kindly requests other vessels to maintain a 500 m separation from the *MV Outer Limit* while it is undertaking survey operations.

The MV Outer Limit

The *MV Outer Limit* is a 35 m long vessel and its contact details are as follows:

- Call sign – VJN3640
- Communications – using VHF Channel 16, displaying flags India over Romeo during survey operations.

A simplified representation of the geophysical survey techniques is shown in the diagram below.

Geophysical survey techniques

Geotechnical Investigations Update

The geotechnical investigation work will soon be awarded and is scheduled to commence in August 2022. Further information on this phase of work will be provided once the choice of contractor and vessel is confirmed.

Drilling Update

Drilling is planned to occur between Q1 and Q3 2023 (contingent on the receipt of EP acceptance, including drill rig and equipment availability).

Drilling activities are estimated to take approximately 50 to 90 days.

The drilling EP is now available on NOPSEMA's website for public exhibition for 30 days, until 8th June 2022. The EP can be accessed at this [link](#). After this time, the EP will then be submitted to NOPSEMA for assessment.

The EP is a comprehensive document that describes the project, outlines feedback from relevant persons, details the existing marine and socio-economic environment, describes and assesses impacts and risks and outlines the control measures to avoid, minimise and mitigate environmental impacts and risks to be acceptable and ALARP (As Low as Reasonably Practicable).

Ongoing Consultation

Consultation with relevant persons will be ongoing throughout the project planning phase, with additional information flyers to be distributed at various milestones.

How to Provide Feedback

EOG encourages you to provide feedback on the project using the following contact details:

General Inquiries:

australia@eogresources.com

PDSA Specific Inquiries:

australia_pdsa@eogresources.com

Phone: 0409 772 170

EOG will respond to feedback in a timely fashion.

Additional background project information (and this information flyer) is available on the EOG website at:

<https://www.eogresources.com/australia>

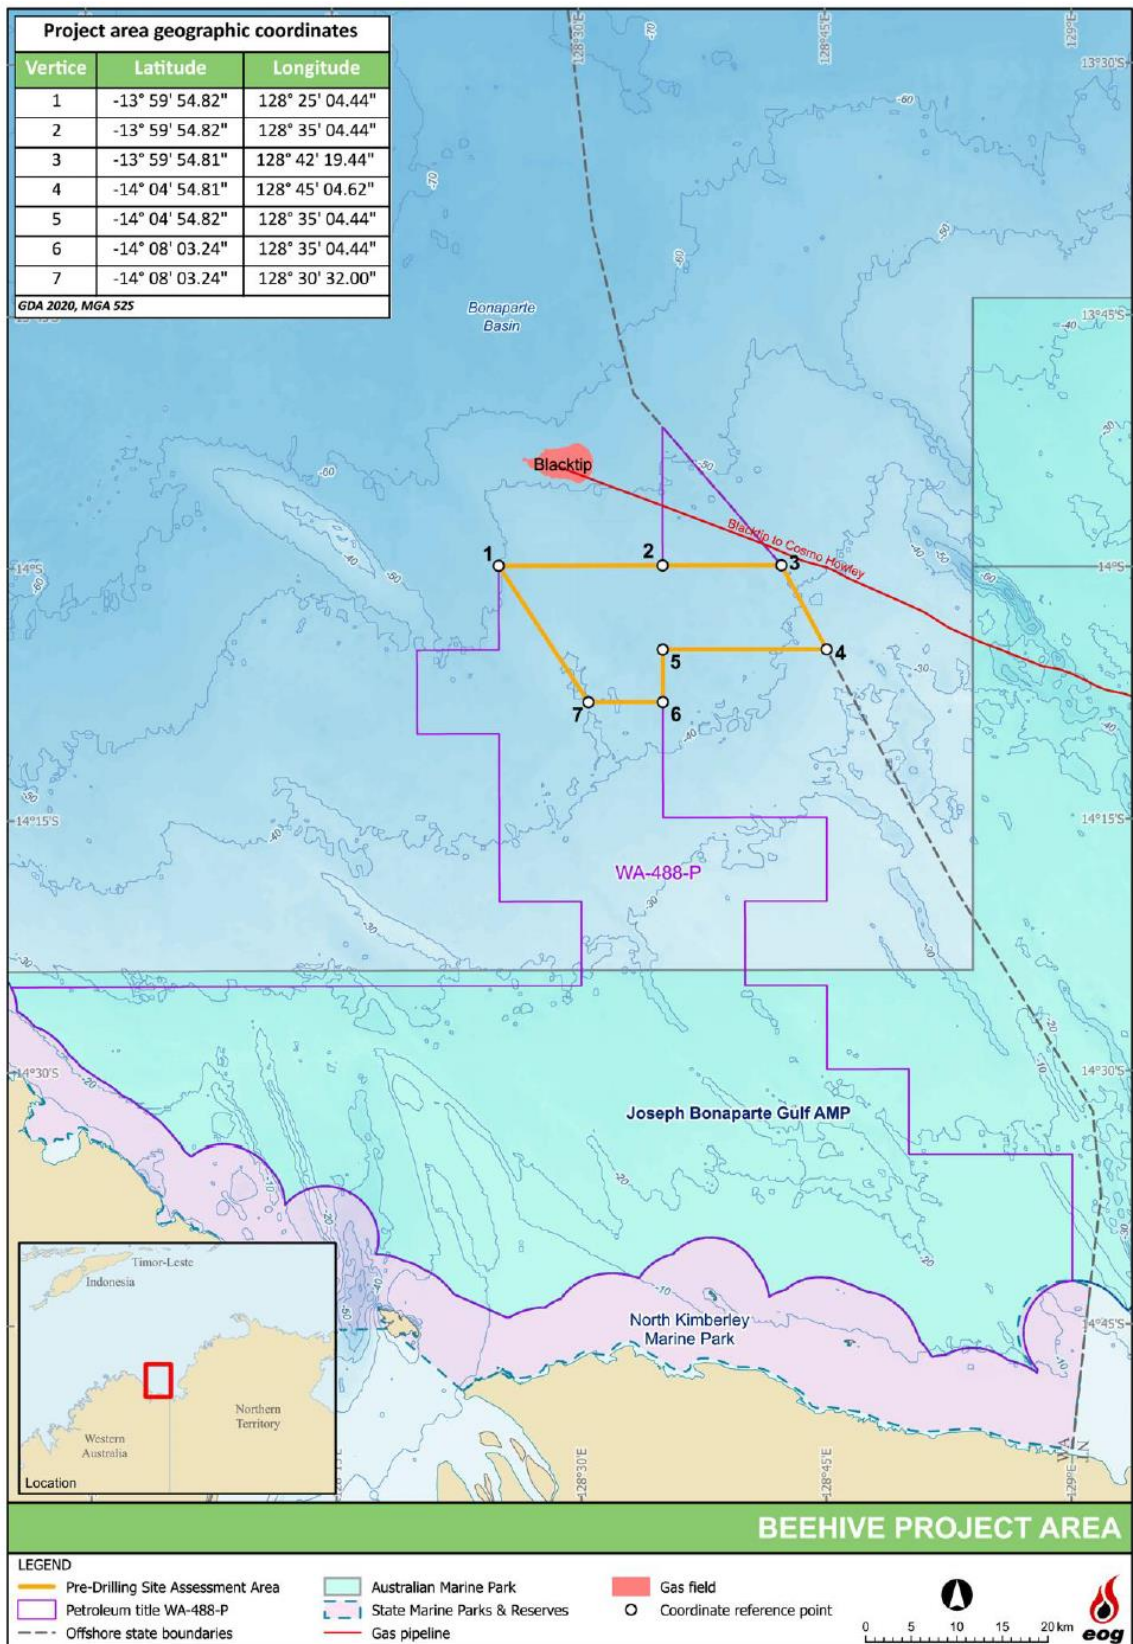

Figure 1. The Beehive-1 Project Area

Beehive-1 Exploration Well

Information Flyer #5

27 June 2022

EOG Resources Australia Block WA-488 Pty Ltd, a subsidiary of EOG Resources, Inc. (together 'EOG') as the Titleholder of Exploration Permit WA-488-P is planning to drill the Beehive-1 exploration well ('the project') in the Joseph Bonaparte Gulf in Western Australia (WA) (Figure 1, over page).

Why We're Consulting You

EOG has previously consulted with you, your group, organisation or company as a 'relevant person', defined under the Offshore Petroleum and Greenhouse Gas (Environment) Regulations 2009 as someone whose functions (power, duty, authority or responsibility), activities (things you do or have done) or interests (your rights, advantages, duties and liabilities, or concerns) may be affected by the project. Relevant persons typically include Commonwealth, State and Territory government agencies, commercial and recreational fisheries, and asset owners.

This information flyer provides an update on the project.

Who is EOG?

EOG is one of the largest independent crude oil and natural gas exploration and production companies in the United States of America (USA). EOG acquired the WA-488-P exploration permit from Finniss Offshore Exploration Pty Ltd in November 2021 with the aim of exploring known hydrocarbon prospects in the Bonaparte Basin.

EOG has operated offshore since 1992, with a history of nearly 30 years in Trinidad & Tobago, the UK North Sea and the USA Gulf of Mexico. In the past 10 years, EOG has drilled nearly 40 offshore wells, with an excellent safety and environment record.

The Project

EOG aims to explore a known hydrocarbon prospect in WA-488-P located in the Bonaparte Basin. The project includes geophysical and geotechnical investigations to characterise the seabed (collectively known as Pre-Drill Seabed Assessment or PDSA), prior to drilling an exploration well.

The *Beehive PDSA Environment Plan* (EP) for the geophysical and geotechnical investigations was accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) on 2 March 2022 ([link](#)) and is approved for activities up till August 2022. The geophysical investigations are currently underway and are expected to be completed soon.

The geotechnical investigations are now expected to commence by Q2 2023, therefore EOG will prepare and submit a new EP for submission to NOPSEMA.

This information flyer is focused on the new EP for the geotechnical investigations. Additional information flyers will be issued as the project progresses.

Figure 1. Beehive-1 project area

Geotechnical Investigation

The geotechnical investigations are planned to commence any time prior to Q2 2023 (contingent on the receipt of EP acceptance, vessel and equipment availability). They will be undertaken within a small area (approximately 50 km²) located 77 km from the nearest WA shoreline and 87 km from the nearest Northern Territory (NT) shoreline. Water depths in the project area range from 40 m to 50 m.

The geotechnical investigations acquire physical measurements and samples of the local shallow geology at and around the potential drill location, using the following techniques (Figure 2):

- Geological analysis of unconsolidated seabed sediments – using grab sampling.
- Geological analysis of formations below the seabed – using coring.
- Determine seabed strength – using piezo cone penetrometer testing (PCPT) and borehole sampling.

The geotechnical investigations are undertaken using a specialised medium-sized vessel and are likely to take up to two weeks to complete.

Figure 2. Geotechnical investigations

Drilling

Planning for the drilling campaign is underway. The Beehive-1 well is targeting the Sunbird Formation and anticipates the presence of a light oil or gas condensate.

A jack-up drill rig will drill the well vertically to a depth of about 5,000 m using a water-based mud system, which will take 40-50 days. In the event that hydrocarbons are discovered, well testing (that involves flaring) may take place.

It is anticipated that drilling will commence by Q3 2023 (contingent on the receipt of EP acceptance, vessel and equipment availability). Further details about the drilling campaign will be provided in future information flyers as planning progresses.

Environment Plans

As noted above, the *Beehive PDSA EP* was accepted by NOPSEMA on 2 March 2022. The EPs for the *Geotechnical Investigations* and for *Exploration Drilling* are currently being prepared. These will be submitted to the NOPSEMA for assessment. The *Exploration Drilling EP* has previously been made available on NOPSEMA's website for public exhibition prior to formal assessment by NOPSEMA.

An EP is a comprehensive document that describes the project, outlines stakeholder feedback, details the existing marine and socio-economic environment. It describes and assesses impacts and risks and outlines the control measures to avoid, minimise and mitigate environmental impacts and risks to be acceptable and ALARP (As Low As Reasonably Practicable).

The project will be subject to industry best practice standards and undertaken in accordance with all relevant environmental and safety legislation and regulations.

Features of the Project Area

Features in the project area include:

- Dominated by the Indonesian Throughflow current and strong tides.
- A seabed dominated by flat featureless plains comprising sand and gravel, with localised reefs and outcrops supporting sponge gardens. The plains contain diverse infaunal communities (e.g., crustaceans and polychaete worms).
- Seasonal presence or likely presence of threatened migratory species including turtles, sharks, sawfish, whales, dolphins and seabirds.
- Low-intensity commercial fishing by the Commonwealth managed Northern Prawn Fishery (the project area has a 0.006% overlap with the fishery).
- Some commercial fishing by the WA managed fisheries, including the Northern Demersal Scalefish Managed Fishery and the Mackerel Managed Fishery.
- An absence of NT managed commercial fisheries.
- An absence of known shipwrecks.
- Low commercial shipping traffic.
- An overlap by the Department of Defence North Australian Exercise Area.

Distances from the project area to the following features are:

- The Carbonate bank and terrace system of the Sahul Shelf Key Ecological Feature (KEF) – 13 km.
- The Blacktip unmanned wellhead platform – 13 km.
- Joseph Bonaparte Australian Marine Park (AMP) – 31 km.
- WA North Kimberley Marine Park – 64km.

The geotechnical investigations will provide more detail about the type of seabed in the project area. A summary of key impacts and

risks from the geotechnical investigations is presented in the following pages.

How to Provide Feedback

EOG encourages you to ask questions or provide feedback on the project using the following contact details:

General Inquiries:

australia@eogresources.com

PDSA Specific Inquires:

australia_pdsa@eogresources.com

Phone: 0409 772 170

EOG will respond to feedback in a timely fashion.

Additional background project information (and this information flyer) is also available on the EOG website at:

<https://www.eogresources.com/australia>

Ongoing Consultation

Consultation with relevant persons will be ongoing throughout the project, with additional information flyers to be distributed at various milestones, and in response to any potential changes in the project

Preliminary environmental impact and risk assessment for the Beehive-1 geotechnical investigations (WA-488-P)

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
<i>Planned events</i>		
Generation of underwater sound from the geotechnical investigations and vessels	Minor, temporary and localised disruption to migration, feeding or breeding patterns for sound-sensitive fauna, such as cetaceans (whales and dolphins).	<ul style="list-style-type: none"> Vessel engines and thrusters will be maintained in accordance with planned maintenance system to ensure they are operating efficiently. Geotechnical activities produce negligible underwater noise. The activity is expected to take no more than 2 weeks.
Seabed disturbance from geotechnical activities	Temporary and localised seabed turbidity. Smothering of seabed habitat by disturbed sediments.	<ul style="list-style-type: none"> The vessel will not anchor during geotechnical investigations (it will remain on location using dynamic positioning). Very low volumes of cuttings and drilling fluids will be discharged during borehole sampling. Seabed grab sampling and coring activities are extremely localised. Cored holes are very narrow and will collapse in on themselves and small surface 'craters' will quickly fill in with sediments and recolonise with benthic fauna. Large bulky items will be securely fastened or stored on the vessel deck to prevent loss to sea. Any dropped objects will be recovered (where safe to do so).
<i>Routine vessel discharges and emissions</i>		
Atmospheric emissions	Temporary reduction in air quality in the local air shed.	<ul style="list-style-type: none"> Vessels >400 gross tonnes will have in place a current International Air Pollution Prevention (IAPP) certificate and Ship Energy Efficiency Management Plan (SEEMP). Only marine-grade low sulphur diesel (no greater than 0.5% m/m) will be used. Waste incineration will not take place. All fuel-burning equipment will be maintained in accordance with planned maintenance systems.
Light glow	Attractant to fauna, temporary increase in predation rates on fauna attracted to lights.	<ul style="list-style-type: none"> Vessel lighting will be kept to the minimum required but in accordance with navigational standards and personnel safety requirements for night-time work.

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
Discharge of treated sewage and grey water	Temporary and localised reduction in water quality.	<ul style="list-style-type: none"> Sewage and grey water will be treated in a MARPOL Annex IV compliant sewage treatment plant prior to discharge (or taken back to port for disposal). Vessels >400 gross tonnes will have in place a current International Sewage Pollution Prevention (ISPP) certificate. In the event of a sewage treatment plant malfunction, untreated sewage will only be discharged when > 12 nm from shore or will be offloaded onshore for treatment.
Discharge of cooling water and reverse osmosis (brine)	Temporary and localised elevation in surface water temperature and salinity levels.	<ul style="list-style-type: none"> Low impact biocides (chlorine) are used in optimised concentrations in the cooling system. Engines and associated equipment that require cooling by water will be maintained in accordance with the planned maintenance system so that they are operating within accepted parameters. Only low-toxicity chemicals (ONCS 'Gold'/'Silver' (CHARM) or 'D'/'E' (non-CHARM)-rated) chemicals are used in the cooling and brine water systems.
Discharge of putrescible waste	Temporary and localised increase in nutrient content of surface and near surface water quality. Temporary increase in scavenging behaviour of pelagic fish and seabirds.	<ul style="list-style-type: none"> Putrescible waste will be macerated to <25 mm prior to discharge (or taken back to shore for disposal). In the event of macerator malfunction, un-macerated putrescible waste will take place will be discharged when >12 nm of land or returned to shore. Non-putrescible galley waste will be returned to shore for disposal.
Discharge of bilge water and deck drainage	Temporary and localised reduction in water quality.	<ul style="list-style-type: none"> Vessels >400 gross tonnes will have in place a MARPOL Annex I compliant oily water separator set to limit oil-in-water content to <15 ppm prior to discharge. Vessels >400 gross tonnes will have a current International Oil Pollution Prevention (IOPP) certificate. No whole residual bilge oil is discharged overboard (residual oil from the oily water separator is pumped to tanks and disposed of onshore). Chemical storage areas will be bunded and drain to the bilge tank. Portable bunds and/or drip trays are used to collect spills or leaks from equipment that is not contained within a permanently bunded area (non-process areas). Deck cleaning detergents will be biodegradable. Spills to decks will be cleaned immediately using Shipboard Marine Pollution Emergency Plan (SMPEP) kits.

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
<i>Unplanned events</i>		
Accidental overboard release of hazardous and/or nonhazardous waste from the vessels	Marine pollution (litter and a temporary and localised reduction in water quality). Injury and entanglement of individual animals (such as seabirds and turtles) and smothering or pollution of benthic habitats.	<ul style="list-style-type: none"> Vessels >100 gross tonnes or certified to carry more than 15 people will have in place and implement a vessel-specific Garbage Management Plan. Vessel crew and visitors will be inducted into the waste management procedures. A waste manifest will be maintained. Only small volumes of chemicals will be kept on board and will be stored in secured drums in bunded areas away from open drains. Bunded areas will drain through a closed system, processed through the oily water separator. Safety Data Sheets (SDS) will be available in appropriate locations. SMPEP kits will be available on board for rapid deck clean-up response.
Introduction of invasive marine species from the vessel hulls and/or ballast water	Reduction in native marine species diversity and abundance. Displacement of native marine species. Socio-economic impacts on commercial fisheries. Reduction of conservation values of protected areas.	<ul style="list-style-type: none"> Vessels will carry a low risk of invasive marine species introduction (as determined through a vessel contractor prequalification report). Vessels >400 gross tonnes will carry a current International Antifouling System (IAFS) Certificate and comply with Marine Order Part 98 (Anti-fouling Systems). The vessel/s will comply with the: <ul style="list-style-type: none"> Australian Ballast Water Management Requirements (DAWR, 2020); and National Biofouling Guidance for the Petroleum Production & Exploration Industry (AQIS, 2009). Towed/submersible equipment will be cleaned (e.g., fouling is removed) prior to initial use in the project area.
Vessel strike with megafauna (e.g., whales, dolphins, turtles)	Injury or death of individual animals.	<ul style="list-style-type: none"> The Australian Guidelines for Whale and Dolphin Watching (DEWHA, 2005) for sea-faring activities will be implemented, which includes caution and no-approach zones around whales and dolphins. Vessel strike causing injury to or death of a cetacean is reported via the online National Ship Strike Database within 72 hours of the incident. <p>Vessel strikes of megafauna in NT or WA waters is reported to the NT Marine Wildwatch on 1800 453 941 (or WA's Wildcare on 08-9474 9055) as soon as possible.</p> <ul style="list-style-type: none"> Vessel crew will complete an environmental induction covering the above-listed requirements.

Hazard	Potential impacts & risks	Avoidance, management and mitigation measures
Displacement of or interference with third party vessels	Temporary loss of fishing grounds around the vessel safety zone.	<ul style="list-style-type: none"> • The project area is located in an area with low levels of shipping traffic and low fishing effort. • A 'Notice to Mariners' will be issued. • Standard maritime safety precautions will be in place, including: <ul style="list-style-type: none"> ○ Radar and other anti-collision monitoring equipment to detect other vessels. ○ Display of lights and day shapes. ○ The ability to quickly move off location to avoid other vessels. ○ Warnings issued (radio, flares, lights and horns) to avoid collisions. ○ The Vessel Master will be qualified in accordance with AMSA Marine Orders Part 3 (Seagoing qualifications) (e.g., International Convention of Standards of Watchkeeping for Seafarers, STCW95, GMDSS Proficiency). • The vessel master will sound the general alarm, manoeuvre the vessel to minimise the effects of the collision and implement all other measures as outlined in the vessel collision procedure. • Vessel collisions will be reported to AMSA if that collision has or is likely to affect the safety, operation or seaworthiness of the vessel or involves serious injury to personnel.
Diesel release due to a vessel-to vessel collision	Temporary and localised reduction in water quality. Tainting of commercial fisheries species. Injury and/or death of marine fauna and seabirds. Pathological effects on fish larvae and plankton.	<ul style="list-style-type: none"> • <i>As per 'displacement of or interference with third-party vessels', plus:</i> • No refuelling will take place on location. • Vessel crew will be trained in spill response techniques in accordance with the SMPEP and vessel training matrix. • Diesel spill trajectory modelling indicates a very small area of ecological impact in the event of the loss of a whole tank of fuel. • An Oil Pollution Emergency Plan (OPEP) will be developed based on the spill modelling results. • Vessel-specific SMPEP and project-specific OPEP will be implemented in the event of a large spill. • EOG will report the spill to regulatory authorities within 2 hours of becoming aware of the spill.

Beehive Project

WA-488-P

May 2023 Flyer

Beehive Project *Updated Timelines*

Geophysical Survey

- Completed in June 2022
- Examined the seabed features and potential hazards
- Obtained shallow gas mapping for mobile offshore drilling unit placement

Environment Plan: ***approved and completed***

Geotechnical Assessment

- Plan to conduct a Geotechnical Assessment over a 14-day period between October 2023 and December 2025
- Undertaken using a medium-sized vessel
- Located approximately 77 km off the Western Australia coastline and 87 km from the Northern Territory coastline
- The activity area covers an area of approximately 50 km² in water depths ranging from 35 m to 50 m

Environment Plan: ***in-process and seeking input***

Exploration Drilling

- Plan to drill a single exploratory well over a 55- to 100-day period between January 2024 and December 2025
- Undertaken using a jack-up mobile offshore drilling unit
- Located approximately 80 km off the Western Australia coastline and 300 km southwest of Darwin in the Northern Territory
- Drilled vertically to a depth of about 5,090 m using water-based mud in a water depth of approximately 40 m

Environment Plan: ***in-process and seeking input***

Beehive-1 well location and Geotechnical Assessment area

Beehive Geotechnical Assessment Activity Overview

- Purpose: assess the physical properties of the seabed, such as soil types and rock formations, to support the safe placement of the mobile offshore drilling unit (MODU)
- Objective: acquire physical measurements and samples of local shallow geology within a relatively small area near potential MODU locations
- Equipment and Techniques:
 - *A specialised medium-sized vessel*
 - *Borehole sampling to acquire high quality soils for laboratory testing to inform the detailed engineering design in the field; and*
 - *Piezo cone penetrometer testing to determine seabed strength and general ground stratigraphy*
- Note: the Beehive Geotechnical Assessment activity must be completed prior to the Beehive-1 Exploration Drilling and is the subject of a separate Environment Plan and associated consultation process.

Simplified representation of Geotechnical Assessment techniques

Beehive-1 Exploration Drilling Activity Overview

- Description: Beehive-1 exploration well is a vertical well targeting the Sunbird formation with a planned total depth of 5,090 m
 - Water-based muds will be used to drill the well
- Location: situated in a water depth of approximately 40 m and located 80 km off the Western Australia coastline and 300 km southwest of Darwin in the Northern Territory
- Timing: drilling activity is expected to take 55 to 100 days to complete and will be conducted between January 2024 and December 2025
 - Exact timing is dependent on the receipt of environmental approvals and the availability of a mobile offshore drilling unit, or MODU
 - Operations will be conducted 24 hours per day, 7 days per week
- On Completion: if the well successfully finds hydrocarbon pay in the target formation, well evaluation will proceed, however, Beehive-1 will not be put on commercial production and will be plugged and abandoned with no equipment remaining on the seabed

Beehive-1 lithological cross section and jack-up type MODU

Note: you may request that information you provide during the consultation not be made publicly available. That information must still be included in the environment plan submitted to NOPSEMA as sensitive information but will be excluded from information published on NOPSEMA's website.

* The Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (including the definitions, sections 9(8), and 11A(4)) indicate that, if requested, information that you or your organization provides, along with personal information, will be considered "sensitive information". Environment plans published by NOPSEMA on its website do not include any information deemed as sensitive.

Cautionary Notice Regarding Forward-Looking Statements:

This presentation may include forward-looking statements within the meaning of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended. All statements, other than statements of historical facts, including, among others, statements and projections regarding EOG's future financial position, operations, performance, business strategy, goals, returns and rates of return, budgets, reserves, levels of production, capital expenditures, costs and asset sales, statements regarding future commodity prices and statements regarding the plans and objectives of EOG's management for future operations, are forward-looking statements. EOG typically uses words such as "expect," "anticipate," "estimate," "project," "strategy," "intend," "plan," "target," "aims," "ambition," "initiative," "goal," "may," "will," "focused on," "should" and "believe" or the negative of those terms or other variations or comparable terminology to identify its forward-looking statements. In particular, statements, express or implied, concerning EOG's future financial or operating results and returns or EOG's ability to replace or increase reserves, increase production, generate returns and rates of return, replace or increase drilling locations, reduce or otherwise control drilling, completion and operating costs and capital expenditures, generate cash flows, pay down or refinance indebtedness, achieve, reach or otherwise meet initiatives, plans, goals, ambitions or targets with respect to emissions, other environmental matters, safety matters or other ESG (environmental/social/governance) matters, or pay and/or increase dividends are forward-looking statements. Forward-looking statements are not guarantees of performance. Although EOG believes the expectations reflected in its forward-looking statements are reasonable and are based on reasonable assumptions, no assurance can be given that such assumptions are accurate or will prove to have been correct or that any of such expectations will be achieved (in full or at all) or will be achieved on the expected or anticipated timelines. Moreover, EOG's forward-looking statements may be affected by known, unknown or currently unforeseen risks, events or circumstances that may be outside EOG's control. Furthermore, this presentation may include or reference certain forward-looking, non-GAAP financial measures, such as free cash flow and cash flow from operations before changes in working capital, and certain related estimates regarding future performance, results and financial position. Because we provide these measures on a forward-looking basis, we cannot reliably or reasonably predict certain of the necessary components of the most directly comparable forward-looking GAAP measures, such as future changes in working capital. Accordingly, we are unable to present a quantitative reconciliation of such forward-looking, non-GAAP financial measures to the respective most directly comparable forward-looking GAAP financial measures. Management believes these forward-looking, non-GAAP measures may be a useful tool for the investment community in comparing EOG's forecasted financial performance to the forecasted financial performance of other companies in the industry. Any such forward-looking measures and estimates are intended to be illustrative only and are not intended to reflect the results that EOG will necessarily achieve for the period(s) presented; EOG's actual results may differ materially from such measures and estimates. Important factors that could cause EOG's actual results to differ materially from the expectations reflected in EOG's forward-looking statements include, among others:

- the timing, extent and duration of changes in prices for, supplies of, and demand for, crude oil and condensate, natural gas liquids (NGLs), natural gas and related commodities;
- the extent to which EOG is successful in its efforts to acquire or discover additional reserves;
- the extent to which EOG is successful in its efforts to (i) economically develop its acreage in, (ii) produce reserves and achieve anticipated production levels and rates of return from, (iii) decrease or otherwise control its drilling, completion and operating costs and capital expenditures related to, and (iv) maximize reserve recovery from, its existing and future crude oil and natural gas exploration and development projects and associated potential and existing drilling locations;
- the success of EOG's cost-mitigation initiatives and actions in offsetting the impact of inflationary pressures on EOG's operating costs and capital expenditures;
- the extent to which EOG is successful in its efforts to market its production of crude oil and condensate, NGLs and natural gas;
- security threats, including cybersecurity threats and disruptions to our business and operations from breaches of our information technology systems, physical breaches of our facilities and other infrastructure or breaches of the information technology systems, facilities and infrastructure of third parties with which we transact business;
- the availability, proximity and capacity of, and costs associated with, appropriate gathering, processing, compression, storage, transportation, refining, and export facilities;
- the availability, cost, terms and timing of issuance or execution of mineral licenses and leases and governmental and other permits and rights-of-way, and EOG's ability to retain mineral licenses and leases;
- the impact of, and changes in, government policies, laws and regulations, including climate change-related regulations, policies and initiatives (for example, with respect to air emissions); tax laws and regulations (including, but not limited to, carbon tax and emissions-related legislation); environmental, health and safety laws and regulations relating to disposal of produced water, drilling fluids and other wastes, hydraulic fracturing and access to and use of water; laws and regulations affecting the leasing of acreage and permitting for oil and gas drilling and the calculation of royalty payments in respect of oil and gas production; laws and regulations imposing additional permitting and disclosure requirements, additional operating restrictions and conditions or restrictions on drilling and completion operations and on the transportation of crude oil, NGLs and natural gas; laws and regulations with respect to financial derivatives and hedging activities; and laws and regulations with respect to the import and export of crude oil, natural gas and related commodities;
- the impact of climate change-related policies and initiatives at the corporate and/or investor community levels and other potential developments related to climate change, such as (but not limited to) changes in consumer and industrial/commercial behavior, preferences and attitudes with respect to the generation and consumption of energy; increased availability of, and increased consumer and industrial/commercial demand for, competing energy sources (including alternative energy sources); technological advances with respect to the generation, transmission, storage and consumption of energy; alternative fuel requirements; energy conservation measures and emissions-related legislation; decreased demand for, and availability of, services and facilities related to the exploration for, and production of, crude oil, NGLs and natural gas; and negative perceptions of the oil and gas industry and, in turn, reputational risks associated with the exploration for, and production of, crude oil, NGLs and natural gas;
- continuing political and social concerns relating to climate change and the greater potential for shareholder activism, governmental inquiries and enforcement actions and litigation and the resulting expenses and potential disruption to EOG's day-to-day operations;
- the extent to which EOG is able to successfully and economically develop, implement and carry out its emissions and other ESG-related initiatives and achieve its related targets and initiatives;
- EOG's ability to effectively integrate acquired crude oil and natural gas properties into its operations, identify and resolve existing and potential issues with respect to such properties and accurately estimate reserves, production, drilling, completion and operating costs and capital expenditures with respect to such properties;
- the extent to which EOG's third-party-operated crude oil and natural gas properties are operated successfully, economically and in compliance with applicable laws and regulations;
- competition in the oil and gas exploration and production industry for the acquisition of licenses, leases and properties;
- the availability and cost of, and competition in the oil and gas exploration and production industry for, employees, labor and other personnel, facilities, equipment, materials (such as water, sand, fuel and tubulars) and services;
- the accuracy of reserve estimates, which by their nature involve the exercise of professional judgment and may therefore be imprecise;
- weather, including its impact on crude oil and natural gas demand, and weather-related delays in drilling and in the installation and operation (by EOG or third parties) of production, gathering, processing, refining, compression, storage, transportation, and export facilities;
- the ability of EOG's customers and other contractual counterparties to satisfy their obligations to EOG and, related thereto, to access the credit and capital markets to obtain financing needed to satisfy their obligations to EOG;
- EOG's ability to access the commercial paper market and other credit and capital markets to obtain financing on terms it deems acceptable, if at all, and to otherwise satisfy its capital expenditure requirements;
- the extent to which EOG is successful in its completion of planned asset dispositions;
- the extent and effect of any hedging activities engaged in by EOG;
- the timing and extent of changes in foreign currency exchange rates, interest rates, inflation rates, global and domestic financial market conditions and global and domestic general economic conditions;
- the duration and economic and financial impact of epidemics, pandemics or other public health issues;
- geopolitical factors and political conditions and developments around the world (such as the imposition of tariffs or trade or other economic sanctions, political instability and armed conflict), including in the areas in which EOG operates;
- the extent to which EOG incurs uninsured losses and liabilities or losses and liabilities in excess of its insurance coverage;
- acts of war and terrorism and responses to these acts; and
- the other factors described under ITEM 1A, Risk Factors of EOG's Annual Report on Form 10-K for the fiscal year ended December 31, 2022 and any updates to those factors set forth in EOG's subsequent Quarterly Reports on Form 10-Q or Current Reports on Form 8-K.

In light of these risks, uncertainties and assumptions, the events anticipated by EOG's forward-looking statements may not occur, and, if any of such events do, we may not have anticipated the timing of their occurrence or the duration or extent of their impact on our actual results. Accordingly, you should not place any undue reliance on any of EOG's forward-looking statements. EOG's forward-looking statements speak only as of the date made, and EOG undertakes no obligation, other than as required by applicable law, to update or revise its forward-looking statements, whether as a result of new information, subsequent events, anticipated or unanticipated circumstances or otherwise.

Oil and Gas Reserves; Non-GAAP Financial Measures:

The United States Securities and Exchange Commission (SEC) permits oil and gas companies, in their filings with the SEC, to disclose not only “proved” reserves (i.e., quantities of oil and gas that are estimated to be recoverable with a high degree of confidence), but also “probable” reserves (i.e., quantities of oil and gas that are as likely as not to be recovered) as well as “possible” reserves (i.e., additional quantities of oil and gas that might be recovered, but with a lower probability than probable reserves). Statements of reserves are only estimates and may not correspond to the ultimate quantities of oil and gas recovered. Any reserve or resource estimates provided in this presentation that are not specifically designated as being estimates of proved reserves may include “potential” reserves, “resource potential” and/or other estimated reserves or estimated resources not necessarily calculated in accordance with, or contemplated by, the SEC's latest reserve reporting guidelines. Investors are urged to consider closely the disclosure in EOG's Annual Report on Form 10-K for the fiscal year ended December 31, 2022, available from EOG at P.O. Box 4362, Houston, Texas 77210-4362 (Attn: Investor Relations). You can also obtain this report from the SEC by calling 1-800-SEC-0330 or from the SEC's website at www.sec.gov. In addition, reconciliation schedules and definitions for non-GAAP financial measures can be found on the EOG website at www.eogresources.com.

Consultation: Communications Records

Provided to NOPSEMA separately as 'sensitive information' under Regulation 9(8) of the OPGGS(E)

Appendix 8

Consultation: Stakeholder Communications Summary

Cat 1 Commonwealth Department or Agencies									
Relevant Person	Functions, Interests and Activities	Engagement Start Date	Engagement End Date	Engagement Method	Consultation Days (Since Most Recent Update)	Reference	Summary	Stakeholder Comments	Team Assessment & Response
Australian Communications & Media Authority	Administrator of submarine cable protection zones. Relevant when the activity may impact on subsea cables.	18/09/2021 0:00	18/09/2021 0:00	Outbound	115	(ACMA-01)	EOG emailed Flyer 1.	No concerns raised.	N/A
		20/09/2021 0:00	20/09/2021 0:00	Inbound Email		(ACMA-02)	ACMA emailed EOG stating that there are 3 cable protection zones in Australia and that activities are not in the vicinity of any of these but encouraged EOG to contact the cable owners directly.	ACMA comments: * There are 3 cable protection zones in Australia and that activities are not in the vicinity of any of these but encouraged EOG to contact the cable owners directly.	Refer to email dated 2-Oct-21.
		2/10/2021 0:00	2/10/2021 0:00	Outbound Email		(ACMA-03)	EOG thanked ACMA for its response and noted that because the project area is not located within or near a submarine cable protection zone, there is no need to continue consultation with ACMA for this project.	No concerns raised.	EOG response: * Noted that because the project area is not located within or near a submarine cable protection zone, there is no need to continue consultation with ACMA for this project.
		23/05/2023 22:30	23/05/2023 22:30	Outbound Email		(ACMA-04 Xen)	Beehive Project update for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Follow up on updated information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More+A1 information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. More information will be provided prior to the start of drilling. * Guidance provided to EOG Australia Website and NOPSEMA website for further information and access to EP's. * Request made to provide feedback on any affects the Beehive Project may have to them to which we will assess and respond as required. * Information provided on how sensitive information is handled. * Options provided to respond via email, mail or phone.
		26/05/2023 1:14	26/05/2023 1:14	Inbound Email		(ACMA-05 Xen)	Response to email update on 23/5/23.	Thank you for the information regarding the Beehive project by EOG Resources Australia. I note the previous response my colleague provided EOG in September 2021. I have reviewed the information in the Beehive May 2023 flyer and wish to confirm that advice that the Beehive Activity Plans are not in the vicinity of any existing protection zones declared by ACMA. ACMA is also not aware of any submarine cables in the vicinity of the activity area. If EOG Resources do become aware of submarine cables in the vicinity of its activities, we recommend it engage with the relevant cable owners and operators. Our website provides further information regarding the ACMA's role as regulator of the submarine cable protection regime, established by Schedule 3A to the Telecommunications Act 1997. If you require further information, you are welcome to contact me by email. Otherwise, we do not require further engagement from EOG Resources regarding the Beehive Project at this time.	Refer to email 26/5/23.
		26/05/2023 22:31	26/05/2023 22:31	Outbound Email		(ACMA-06 Xen)	Reply to email 26/5/23.	N/A	Thank you very much I have made note of your response, I really appreciate your timely response.
Australian Fisheries Management Authority (AFMA)	AFMA is the Australian Government agency responsible for the efficient management and sustainable use of Commonwealth fish resources on behalf of the Australian community. AFMA manages and monitors commercial Commonwealth fishing to ensure Australian fish stocks and the Australian fishing industry is viable.	20/09/2021 0:00	20/09/2021 0:00	Outbound	115	(AFMA-01)	EOG emailed Flyer 1.	No concerns raised.	N/A
		26/09/2021 0:00	26/09/2021 0:00	Inbound Email		(AFMA-02)	AFMA emailed they were unable to comment on individual projects and suggested EOG should liaise with the relevant fisheries associations (weblink provided).	AFMA comments: * They were unable to comment on individual projects and suggested EOG should liaise with the relevant fisheries associations as per weblink provided.	Refer to email dated 1-Oct-21.
		1/10/2021 0:00	1/10/2021 0:00	Outbound Email		(AFMA-03)	EOG replied stating that they are undertaking consultation directly with Commonwealth fisheries associations relevant to the project area and that it would be in contact with AFMA again if consultation with these associations indicates the need to consult directly with Commonwealth concession holders.	No concerns raised.	EOG response: * Stated that they are undertaking consultation directly with Commonwealth fisheries associations relevant to the project area and that it would be in contact with AFMA again if consultation with these associations indicates the need to consult directly with Commonwealth concession holders.
		21/11/2022 0:00	21/11/2022 0:00	Outbound Email		(AFMA-04 Xen)	Email sent from EOG to AFMA providing Beehive Project update, providing details of where information can be found, information on how sensitive information would be handled, seeking feedback / objections / claims for the project and asking if there are other persons / organisations that may have interest in the project.	No concerns raised.	N/A

	fishing industry is viable now and in the future. Relevant when the activity has the potential to impact on fisheries resources in AFMA-managed fisheries.	23/05/2023 22:30	23/05/2023 22:30	Outbound Email	115	(AFMA-05 Xen)	Beehive Project update for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Follow up on updated information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. More information will be provided prior to the start of drilling. * Guidance provided to EOG Australia Website and NOPSEMA website for further information and access to EP's. * Request made to provide feedback on any affects the Beehive Project may have to them to which we will assess and respond as required. * Information provided on how sensitive information is handled. * Options provided to respond via email, mail or phone.
		23/05/2023 22:32	23/05/2023 22:32	Inbound Email		(AFMA-06 Xen)	Acknowledgement of email and advice.	Northern Prawn Fishery Industry Pty Ltd	Refer to email 26/5/23.
		26/05/2023 0:16	26/05/2023 0:16	Outbound Email		(AFMA-07 Xen)	Acknowledgement of email 23/5/23.	N/A	Thank you very much for the reply and notification of historic catch and effort in this area. Please know we are actively consulting with the Northern Prawn Fishery Industry Pty Ltd in this regard.
Australian Hydrographic Office	AHO is part of the Department of Defence, responsible for providing Australia's national charting service under the terms of SOLAS and the Navigation Act 2012 (Cth). Role includes provision of nautical charting (including charts in electronic form) and associated services in support of maritime safety. Responsible for the publication and distribution of nautical charts and other information required for the safe shipping and navigation in Australian waters. Relevant when the activity may impact operational requirements and where nautical products and other maritime safety and information is required to be updated, including Notice to Mariners.	18/09/2021 0:00	18/09/2021 0:00	Outbound	115	(AHO-01)	EOG emailed Flyer 1.	No concerns raised.	N/A
		20/09/2021 0:00	20/09/2021 0:00	Inbound Email		(AHO-02)	Automated acknowledgment of email.	No concerns raised.	N/A
		26/10/2021 0:00	26/10/2021 0:00	Outbound Phone Call		N/A	EOG called the AHO. AHO advised they had no initial concerns or issues and reiterated the notification requirements in relation to Notice to Mariners (NTM) prior to activity commencement. EOG confirmed the notification requirements are included in the EP.	No concerns raised.	N/A
		26/10/2021 0:00	26/10/2021 0:00	Inbound Email		(AHO-03)	AHO acknowledged phone call and advised that details of the project are required at least four weeks prior to activity commencement to allow AHO to issue a temporary NTM.	AHO acknowledged phone call and advised that details of the project are required at least four weeks prior to activity commencement to allow AHO to issue a temporary NTM.	N/A
		2/12/2021 0:00	2/12/2021 0:00	Outbound Email		(AHO-04)	EOG emailed Information Flyer 2 to notify that the PDSA EP was now available for public exhibition and comment on the NOPSEMA website and the latest updates to the EP.	No concerns raised.	N/A
		6/12/2021 0:00	6/12/2021 0:00	Inbound Email		(AHO-05)	AHO acknowledged receipt of Flyer 2 and confirmed they have registered, assessed, prioritised and validated the information in preparation for updating their Navigational Charting products which adhere to International and Australian Charting Specifications and standards.	No concerns raised.	N/A
		28/02/2022 0:00	28/02/2022 0:00	Outbound Email		(AHO-06)	EOG emailed Information Flyer 3 to notify of the Beehive-1 exploration well drilling program.	No concerns raised.	N/A
		28/02/2022 0:00	28/02/2022 0:00	Inbound Email		(AHO-07)	AHO acknowledged receipt of Flyer 3 and confirmed they have registered, assessed, prioritised and validated the information in preparation for updating their Navigational Charting products which adhere to International and Australian Charting Specifications and standards.	No concerns raised.	N/A
		28/04/2022 0:00	28/04/2022 0:00	Outbound Email		(AHO-08)	EOG emailed AHO a NTM in relation to the PDSA operations specifically location coordinates, vessel communications and confirmation of a 500 m avoidance zone around the vessel. AHO automated acknowledgement of email.	No concerns raised.	N/A
		28/04/2022 0:00	28/04/2022 0:00	Outbound Email		(AHO-09)	AHO acknowledged receipt of Flyer 3 and confirmed they have registered, assessed, prioritised and validated the information in preparation for updating their Navigational Charting products which adhere to International and Australian Charting Specifications and standards.	No concerns raised.	N/A
		12/05/2022 0:00	12/05/2022 0:00	Outbound Email		(AHO-10)	EOG emailed Information Flyer 4 with an update on the PDSA phase and invited return comment. The flyer also notified that the Drilling EP was available on NOPSEMA's website for public exhibition for 30 days, until 8th June 2022.	No concerns raised.	N/A
		17/05/2022 0:00	17/05/2022 0:00	Inbound Email		(AHO-11)	AHO requested EOG provide a status update on the PDSA activity for inclusion in the Notice to Mariners edition.	NTM Edition 11 (27 May 2022) included the details of the geophysical survey.	Refer to email dated 19-May-22.
		19/05/2022 0:00	19/05/2022 0:00	Outbound Email		(AHO-12)	EOG advised AHO they are on track to start on 1 June 2022.EOG advised AHO they are on track to start on 1 June 2022.	No concerns raised.	EOG advised AHO they are on track to start on 1 June 2022.
		27/06/2022 0:00	27/06/2022 0:00	Outbound Email		(AHO-13)	EOG emailed Flyer 5 with updates to the Geotechnical phase and invited to return comment.	No concerns raised.	N/A
		28/06/2022 0:00	28/06/2022 0:00	Inbound Email		(AHO-14)	AHO acknowledged receipt of Flyer 3 and confirmed they have registered, assessed, prioritised and validated the information in preparation for updating their Navigational Charting products which adhere to International and Australian Charting Specifications and standards.	No concerns raised.	N/A
		21/11/2022 0:00	21/11/2022 0:00	Outbound Email		(AHO-15 Xen)	Email providing Beehive Project update, providing details of where information can be found, information on how sensitive information would be handled, seeking feedback / objections / claims for the project and asking if there are other persons / organisations that may have interest in the project.	No concerns raised.	N/A

		23/05/2023 22:31	23/05/2023 22:31	Outbound Email	(AHO-16 Xen)	Beehive Project update for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Follow up on updated information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. More information will be provided prior to the start of drilling. * Guidance provided to EOG Australia Website and NOPSEMA website for further information and access to EP's. * Request made to provide feedback on any affects the Beehive Project may have to them to which we will assess and respond as required. * Information provided on how sensitive information is handled. * Options provided to respond via email, mail or phone.
		23/05/2023 22:39	23/05/2023 22:39	Inbound Email	(AHO-17 Xen)	Acknowledgement of email from 23/5/23.	Please accept this email as acknowledgement that your email has been received. The data you have supplied will now be registered, assessed, prioritised and validated in preparation for updating our Navigational Charting products. These adhere to International and Australian Charting Specifications and standards. These standards may result in some data generalisation or filtering due to the scale of existing charts, proximity to other features, and the level of risk a reported feature presents to mariners.	N/A
		30/06/2023 6:24	30/06/2023 13:05	Outbound Email	20230630 Email Follow Up June 2023	Follow up email seeking feedback by 21 July 2023 on update that was provided in May 2023 via email.	N/A	This message is in follow up to the email below providing an update to the Beehive project and requesting that you (or your organisation) share your assessment of how you may be affected by our proposed activities. We are kindly requesting feedback from you by 21 July 2023.
		30/06/2023 12:32	30/06/2023 12:32	Inbound Email	(AHO-18 Xen)	Feedback to email dated 30/6/23.	Please accept this email as acknowledgement that your email has been received by the AHO. The data you have supplied will now be registered, assessed, prioritised and validated in preparation for updating our Navigational Charting products. These adhere to International and Australian Charting Specifications and standards. These standards may result in some data generalisation or filtering due to the scale of existing charts, proximity to other features, and the level of risk a reported feature presents to mariners.	N/A
		30/06/2023 22:44	30/06/2023 22:44	Outbound Email	(AHO-19 Xen)	Acknowledgement of feedback from 30/6/23.	N/A	Thank you for confirmation that our email has been received.
		10/08/2023 4:58	10/08/2023 6:32	Outbound Email	20230810 Email Follow Up August 2023	<ul style="list-style-type: none">• We are following up on the previous communications sent by EOG Resources Australia Block WA-488 Pty. Ltd. ("EOG") regarding its activity plans and request to consult with you regarding the Beehive project located in the Joseph Bonaparte Gulf in Western Australia.• We are finalising the Environment Plans in preparation for submission to NOPSEMA (the offshore regulator) as soon as the end of August 2023 and are sending this as further reminder of the opportunity to provide feedback on EOG's proposed offshore activities.• A summary of the proposed activities is available via the following links: https://www.eogresources.com/australia https://klarite.mysocialpinpoint.com.au/beehive Geotechnical Investigations: https://info.nopsema.gov.au/environment_plans/605/show_public Drilling: https://info.nopsema.gov.au/environment_plans/587/show_public• Please reply to this correspondence with any feedback, objections, claims or if you know of any other persons or organisations that may have interest in this project.• Alternatively, should you have no further comments to make, you may wish to let us know by responding to this email, and we will close consultation for you or your organisation. 		30/06/2023 10:59	30/06/2023 10:59	Outbound Phone Call			Follow up phone call re May 2023 Beehive Project Update made to enquire if they had and comments or feedback to be considered in the Environmental Plan to be submitted to NOPSEMA.	N/A	Left message requesting call back.
		7/07/2023 6:59	7/07/2023 8:32	Outbound Email		20230707 Email Follow Up June 2023	Follow up email seeking feedback by 21 July 2023 on update that was provided in May 2023 via email.	N/A	This message is in follow up to the email below providing an update to the Beehive project and requesting that you (or your organisation) share your assessment of how you may be affected by our proposed activities. We are kindly requesting feedback from you by 21 July 2023.
		28/07/2023 3:54	28/07/2023 10:42	Outbound Email		20230728 Email Follow Up July 2023	Follow up email seeking feedback on Beehive Project update that was provided in May 2023 via email.	N/A	* Follow up email seeking feedback on Beehive Project update. * Advised we are finalising the Environment Plans in preparation for submission to NOPSEMA as soon as the end of August 2023 and are sending this as further reminder of the opportunity to provide feedback on EOG's proposed offshore activities. * Provided website links to the Project Information and EP's and also supplied email, mail and phone options to provide feedback, objections, claims or if you know of any other persons or organisations that may have interest in this project. * Requested if they have no further comments to make, to let us know by responding to this email, and we will close consultation for you or your organisation.
		14/08/2023 15:22	14/08/2023 15:22	Outbound Phone Call			Follow up phone call. Went to voicemail. Left voicemail stating I was following up on recent communications and whether there was any feedback and providing my phone number.	N/A	N/A
Australian Maritime Safety Authority (AMSA)	AMSA is the statutory authority established under the Australian Maritime Safety Act 1990. Principal functions are promoting maritime safety and protection of the maritime environment, preventing and combating ship-sourced pollution in the marine environment, providing infrastructure to support safety of navigation in Australian waters, and providing national search and rescue service to the maritime and aviation sectors.	18/09/2021 0:00	18/09/2021 0:00	Outbound	115	(AMSA-01)	EOG emailed Flyer 1.	No concerns raised.	N/A
		21/09/2021 0:00	21/09/2021 0:00	Inbound Email		(AMSA-02)	AMSA replied to EOG notification of activity and reminded them of the requirement to contact the AHO no less than four weeks prior to the activity starting and notify AMSA's Joint Rescue Coordination Centre (JRCC) for promulgation of radio-navigation warnings at least 24-48 hours before operations commence.	AMSA comments: * Reminded of the requirement to contact the AHO no less than four weeks prior to the activity starting and notify AMSA's Joint Rescue Coordination Centre (JRCC) for promulgation of radio-navigation warnings at least 24-48 hours before operations commence.	Refer to email dated 2-Oct-21.
		2/10/2021 0:00	2/10/2021 0:00	Outbound Email		(AMSA-03)	EOG acknowledged AMSA's response and noted that it is undertaking consultation directly with the AHO and will notify the JRCC closer to the time of the activity. The contact details and notification timings will be included in the EPs and EOG has obtained and mapped AIS traffic data for the project area for inclusion in the EPs.	No concerns raised.	EOG response: * Noted that it is undertaking consultation directly with the AHO and will notify the JRCC closer to the time of the activity. * The contact details and notification timings will be included in the EPs and EOG has obtained and mapped AIS traffic data for the project area for inclusion in the EPs.
		2/12/2021 0:00	2/12/2021 0:00	Outbound Email		(AMSA-04)	EOG emailed Information Flyer 2 to notify that the PDSA EP was now available for public exhibition and comment on the NOPSEMA website and the latest updates to the EP.	No concerns raised.	N/A
		28/02/2022 0:00	28/02/2022 0:00	Outbound Email		(AMSA-05)	EOG emailed Information Flyer 3 to notify of the Beehive-1 exploration well drilling program.	No concerns raised.	N/A
		1/03/2022 0:00	1/03/2022 0:00	Inbound Email		(AMSA-06)	AMSA thanked EOG for contacting them regarding the Beehive-1 drilling program and that their initial advice on the project will continue to apply and to continue to provide AMSA with updates as the project progresses.	No concerns raised.	N/A
		12/05/2022 0:00	12/05/2022 0:00	Outbound Email		(AMSA-07)	EOG emailed Information Flyer 4 with an update on the PDSA phase and invited return comment. The flyer also notified that the Drilling EP was available on NOPSEMA's website for public exhibition for 30 days, until 8th June 2022.	No concerns raised.	N/A
		16/05/2022 0:00	16/05/2022 0:00	Inbound Email		(AMSA-08)	AMSA thanked EOG for contacting them regarding Beehive-1 drilling program and that their initial advice on the project will continue to apply and to continue to provide AMSA with updates as the project progresses.	No concerns raised.	N/A

(DNP-04)	DNP emailed EOG with feedback confirming the activity area does not overlap with any AMP's and noted the carbonate bank and terrace system of the Sahul Shelf KEF and foraging areas within the activity area for the green turtle, olive ridley turtle. DNP also noted that Aboriginal Groups have responsibilities for sea country in the JBG AMP and should be consulted. In addition, DNP made EOG aware of the pollution incident reporting requirements and indicated they may request daily or weekly Situation Reports in the event of a pollution incident.	DNP comments: * Confirmed the activity area does not overlap with any AMP's and noted the carbonate bank and terrace system of the Sahul Shelf KEF and foraging areas within the activity area for the green turtle, olive ridley turtle. * DNP also noted that Aboriginal Groups have responsibilities for sea country in the JBG AMP and should be consulted. * DNP made EOG aware of the pollution incident reporting requirements and indicated they may request daily or weekly Situation Reports in the event of a pollution incident.	Refer to email dated 19-Oct-21.
(DNP-05)	EOG acknowledged DNP's comments and confirmed the EP will assess impacts and contain all required information. In addition, EOG confirmed they are consulting with the Aboriginal corporations relevant to the region.	No concerns raised.	EOG response: * Acknowledged DNP's comments and confirmed the EP will assess impacts and contain all required information. * Confirmed they are consulting with the Aboriginal corporations relevant to the region.
(DNP-06)	EOG emailed Information Flyer 2 to notify that the PDSA EP was now available for public exhibition and comment on the NOPSEMA website; and the latest updates to the EP.	No concerns raised.	N/A
(DNP-07)	EOG emailed Information Flyer 3 to notify of the Beehive-1 exploration well drilling program.	No concerns raised.	N/A
(DNP-08)	EOG emailed Information Flyer 4 with an update on the PDSA phase and invited return comment. The flyer also notified that the Drilling EP was available on NOPSEMA's website for public exhibition for 30 days, until 8th June 2022.	No concerns raised.	N/A
N/A	EOG called DNP to confirm if Flyer 3 & Flyer had been received. DNP could not locate and asked for them to be resent.	No concerns raised.	N/A
(DNP-09)	EOG reissued Information Flyer 3 and *4 to DNP as requested.	No concerns raised.	N/A
(DNP-10)	DNP confirmed receipt and said they would get back to EOG within 5 days.	No concerns raised.	N/A
(DNP-11)	EOG emailed Flyer 5 with updates to the Geotechnical phase and invited to return comment.	No concerns raised.	N/A
(DNP-12 Xen)	Email sent from EOG to DNP providing Beehive Project update, providing details of where information can be found, information on how sensitive information would be handled, seeking feedback / objections / claims for the project and asking if there are other persons / organisations that may have interest in the project.	No concerns raised.	N/A
(DNP-13 Xen)	Email received from DNP. Thank you for following up with the Director of National Parks in relation to the two Environment Plans for the Beehive Project. We have no objections or claims to raise at this time and note the draft EPs captured our previous input around the protection of marine park values and the need for consultation with relevant Sea Country managers.	DNP comments: * We have no objections or claims to raise at this time and note the draft EPs captured our previous input around the protection of marine park values and the need for consultation with relevant Sea Country managers.	N/A
(DNP-14 Xen)	Email received from DNP thanking for the consultation, confirming no planned overlapping activities, confirming no authorisation requirements and confirming they have no objections and claims at this time. Seeking further clarity on operational areas due to proximity of the title to Australian Marine Parks. Advising requirements for Emergency responses.	DNP comments: Thank you for consulting DNP on the upcoming work on WA-488-P. Based on the information provided, we note that the planned activities do not overlap any Australian Marine Parks and, as such there are no authorisation requirements from the DNP. Furthermore, DNP raises no objections and claims at this time. However, noting the proximity of the title to Australian Marine Parks, we wish to further clarify operational areas (OA). The DNP considers the OA to encompass operational activities such as line turns / repositioning, equipment maintenance, deployment and recovery, crew change and resupply. These are offshore petroleum activities and Commonwealth environment regulatory matters and, as such, should be included in the EP so relevant risks are assessed and effective mitigation applied. To assist in the preparation of an EP for petroleum activities that may affect Australian marine parks, NOPSEMA has worked closely with Parks Australia to develop and publish a guidance note that outlines what titleholders need to consider and evaluate. In preparing the EP, you should consider the Australian marine parks and their representativeness. In the context of the management plan objectives and values, you should ensure that the EP identifies and manages all impacts and risks on Australian marine park values (including ecosystem values) to an acceptable level and has considered all options to avoid or reduce them to as low as reasonably practicable; clearly demonstrates that the activity will not be inconsistent with the management plan. The North Marine Park Network Plan (management plan) provides further information on values for the Joseph Bonaparte Gulf and Oceanic Shoals marine parks, which the activity occurs near. Australian marine park values are broadly defined into four categories natural (including ecosystems), cultural, heritage and socio-economic. Information on the values for the marine parks is also located on the Australian Marine Parks Science Atlas.	Refer to email dated 8/1/23.
(DNP-15 Xen)	Response to email dated 3/10/23 (DNP-14 XEN)	No response received.	Thank you for the information, our team will ensure to incorporate into the preparation of the EP's and planning of the activities.

		23/05/2023 22:31	23/05/2023 22:31	Outbound Email		(DNP-16 Xen)	Beehive Project update for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Follow up on updated information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. More information will be provided prior to the start of drilling. * Guidance provided to EOG Australia Website and NOPSEMA website for further information and access to EP's. * Request made to provide feedback on any affects the Beehive Project may have to them to which we will assess and respond as required. * Information provided on how sensitive information is handled. * Options provided to respond via email, mail or phone.
		27/06/2023 15:10	27/06/2023 15:10	Outbound Phone Call			Follow up phone call re May 2023 Beehive Project Update made to enquire if they had and comments or feedback to be considered in the Environmental Plan to be submitted to NOPSEMA.	Spoke to current contact on file. Advised change of position and advised new contact.	Called new contacts but no answer so left message to call back.

		7/08/2023 2:57	7/08/2023 2:57	Inbound Email		(DCCEEW-02 Xen)	Email in response to follow up call.	Follow up call was internally submitted to their Heritage Branch. Heritage Branch states their role is to Branch considers applications made under the Aboriginal and Torres Strait Islander Heritage Protection Act 1984 (Cth) (ATSIHP Act). Question whether EOG was seeking another area within DCCEEW.	This branch of the DCCEEW deals solely with taking action to protect cultural heritage by making emergency declaration (injunctions). Unlikely to be most appropriate contact for EOG to have for DCCEEW to submit project information as EOG are not seeking an injunction to protect heritage. Suggest to email them back and ask for a direct email for the Energy branch within the DCCEEW.
		7/08/2023 11:50	7/08/2023 11:50	Outbound Phone Call			Follow up call. Call went to the message bank Asst. Director - Climate Change. Left a detailed voice message with the australia@eog.com.au email address for project feedback as well as name and contact phone number.	N/A	N/A
Indigenous Land & Sea Corporation (ILSC)	Corporate Commonwealth entity established under the Aboriginal and Torres Strait Islander Act 2005 (ATSI Act). The ILSC’s long-term vision for meeting its ATSI Act mandate is for Aboriginal and Torres Strait Islander people to enjoy the rightful entitlements, opportunities and benefits that the return of country and its management brings. The ILSC’s primary grant program – Our Country Our Future – provides assistance for acquiring and managing rights and interests in land, salt water and fresh water country in order to achieve this vision.	24/05/2023 21:43	24/05/2023 21:43	Outbound Email	114	(ILSC-01 Xen)	Beehive Project information for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance. (DEPWS-03)	DEPWS emailed EOG with the following comment "If there is a risk of a spill impacting WA State waters from the proposed activities, please ensure that the WA Department of Transport is consulted as outlined in the Department of Transport Offshore Petroleum Industry Guidance Note - Marine Oil Pollution: Response and Consultation Arrangements (July 2020) which can be accessed here https://www.transport.wa.gov.au/mediaFiles/marine/MAC_P_Westplan_MOP_OffshorePetroleumIndGuidance.pdf	DEPWS comment: * If there is a risk of a spill impacting WA State waters from the proposed activities, please ensure that the WA Department of Transport is consulted as outlined in the Department of Transport Offshore Petroleum Industry Guidance Note - Marine Oil Pollution: Response and Consultation Arrangements (July 2020) which can be accessed here https://www.transport.wa.gov.au/mediaFiles/marine/MAC_P_Westplan_MOP_OffshorePetroleumIndGuidance.pdf	Refer to email dated 17-Mar-22.
(DEPWS-03)	EOG emailed DEPWS following up on the email sent 28/2/22. Advised that EOG are currently preparing the EP and OPEP based on modelled worst-case scenario (WCS) of 786,858 m3 surface release of crude oil over 77 days (tracked for 98 days) to represent a loss of well control (LOWC). A WCS LOWC would obviously require a significant response on the part of EOG and also from WA agencies. EOG will engage with WA DoT. As stated, we are still preparing the EP and OPEP and have left all response options on the table. At this time we are waiting on feedback from AMOSC on the potential use of dispersants, and if applicable, we will update the modelling to include dispersant mitigation. We are happy to supply the oil spill modelling report and any other information which will support you in considering. Are you available for a meeting soon? If so, when? Due to location of staff (Brisbane and Melbourne) Microsoft Teams would be our preferred meeting format, but we are happy to use any other format which you prefer.	No concerns raised.	EOG response: * Currently preparing the EP and OPEP based on modelled worst-case scenario (WCS) of 786,858 m3 surface release of crude oil over 77 days (tracked for 98 days) to represent a loss of well control (LOWC). (DEPWS-03)	EOG sent DEPWS (post phone call) the Information Flyer 3 to notify of the Beehive-1 exploration well drilling program and requested some guidance from the NT government but would like to talk further with the relevant people or agencies to understand how best to integrate with any potential NT response.	No concerns raised.	EOG requested: * Some guidance from the NT government but would like to talk further with the relevant people or agencies to understand how best to integrate with any potential NT response.
(DEPWS-04)	DEPWS thanked EOG for the email and notified the relevant DEPWS person to contact.	No concerns raised.	N/A
(DEPWS-05)	EOG emailed Information Flyer 3 to notify of the Beehive-1 exploration well drilling program.	No concerns raised.	N/A
(DEPWS-06)	EOG emailed Information Flyer 4 with an update on the PDSA phase and invited return comment. The flyer also notified the stakeholder that the Drilling EP was available on NOPSEMA's website for public exhibition for 30 days, until 8th June 2022.	No concerns raised.	N/A
N/A	EOG called DEPWS but was unavailable. Call back Fri 13/5/22.	No concerns raised.	N/A
N/A	EOG called DEPWS but was unavailable so left message to call back.	No concerns raised.	N/A
(DEPWS-07)	EOG called DEPWS and the relevant person confirmed they looks after NT arrangements for spills that travel into territory waters. Relevant person sent a draft copy of the NT Oil spill Contingency Plan to EOG and is happy to assist with further questions / clarifications.	DEPWS confirmed: * They look after NT arrangements for spills that travel into territory waters. Relevant person sent a draft copy of the NT Oil spill Contingency Plan to EOG and is happy to assist with further questions / clarifications.	N/A
(DEPWS-08)	EOG emailed Flyer 5 with updates to the Geotechnical phase and invited to return comment.	No concerns raised.	N/A
(DEPWS-8 Xen)	Email sent from EOG to DEPWS providing Beehive Project update, providing details of where information can be found, information on how sensitive information would be handled, seeking feedback / objections / claims for the project and asking if there are other persons / organisations that may have interest in the project.	No concerns raised.	N/A
(DEPWS-9 Xen)	Email sent from EOG to DEPWS following phone call. Advised resubmittal of the EP and OPEP for the Beehive Exploration Drilling to NOPSEMA and provided copies. Advised that the OPEP had been significantly updated and includes new appendices demonstrating the capability of the DIMT and operational teams. Advised of commitment to developing TRPs for a number of locations (in development by OSRL). RPS has reviewed the capability requirements for the OSM BIP and we include additional updated information on monitoring priorities and capability. We welcome any comments / feedback on the revised OPEP.	No concerns raised.	EOG requests: * Do you have any TRPs for the region and if so, would you be able to share? * As part of our re-assessment of the response strategies, and to ensure better integration between the NT and EOG IMTs, we would like to invite you to participate in some of the OPEP Testing in the new year. If this is possible, could you please indicate when might be a good time? * The OPEP references information within the EP and the EP Appendices. This link provides access (Sharing with third parties). If it doesn't work, or if you have any other questions, please don't hesitate to contact me.
(DEPWS-10 Xen)	Feedback on OPEP	N/A	I was just wondering whether you had any feedback on the OPEP. I'm happy to have a chat if you want.
(DEPWS-11 Xen)	Beehive Project update for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Follow up on updated information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. More information will be provided prior to the start of drilling. * Guidance provided to EOG Australia Website and NOPSEMA website for further information and access to EP's. * Request made to provide feedback on any affects the Beehive Project may have to them to which we will assess and respond as required. * Information provided on how sensitive information is handled. * Options provided to respond via email, mail or phone.

N/A	DITT called EOG and confirmed receipt of Drilling Flyer 3. DITT did not feel they needed to respond as the operation occurs in WA waters. Normally NT DITT would respond if the activity is seismic related in terms of the impacts / concerns on fish larvae. DITT's only comment was that EOG contact the NTSC to ensure NT licence operators were aware of the drilling program. EOG confirmed they are in consultation with NTSC. DITT confirmed receipt of Flyer*4 but said it was a bit confusing as it spoke about the exploration activities and drilling. DITT said they would send an email with minor comments.	DITT comments: * DITT did not feel they needed to respond as the operation occurs in WA waters. Normally NT DITT would respond if the activity is seismic related in terms of the impacts / concerns on fish larvae. * DITT's only comment was that EOG contact the NTSC to ensure NT licence operators were aware of the drilling program. * DITT confirmed receipt of Flyer*4 but said it was a bit confusing as it spoke about the exploration activities and drilling. DITT said they would send an email with minor comments.	EOG comments: * Confirmed they are in consultation with NTSC.
N/A	DITT called EOG. DITT received Flyer 4. EOG talked through the 2D shallow seismic survey concerns and concerns about cumulative impacts to seabed critters from muds/cuttings from drilling and/or Geotech drilling. EOG explained the differences between Geotech drilling and exploration drilling and pointed them to the detailed muds/cuttings modelling in the drilling EP so as they could see that EOG addressed those concerns. DITT was satisfied with the outcomes of the discussion but would still send through the response.	DITT comments: * Was satisfied with the outcomes of the discussion but would still send through the response.	EOG response: * Talked through the 2D shallow seismic survey concerns and concerns about cumulative impacts to seabed critters from muds/cuttings from drilling and/or Geotech drilling. EOG explained the differences between Geotech drilling and exploration drilling and pointed them to the detailed muds/cuttings modelling in the drilling EP so as they could see that EOG addressed those concerns.
(DITT-11)	DITT provided comments on Flyer 3.	DITT comments: * Enquires about the damage to shared fish stocks that straddle on the WA/NT border. * Enquires about the amount of holes being drilled. * Raises concerns regarding benthic biotia being smothered. * Expresses gratitude for engaging efforts.	Refer to email dated 7/11/22.
(DITT-12) & (DITT-13)	EOG emailed Flyer 5 with updates to the Geotechnical phase and invited to return comment.	No concerns raised.	N/A
(NT DITT- Fisheries-03)	EOG emailed Flyer 5 with updates to the Geotechnical phase and invited to return comment.	No concerns raised.	N/A
(NT DITT - Fisheries-04)	Email notification undeliverable.	No concerns raised.	EOG believes it is not necessary to follow up with the Fisheries department given EOG is consulting directly with the NT DITT.
(DITT-14 Xen)	Email sent to DITT following up on conversation with EOG on 13/5/22 about concerns about the Beehive 1 drilling program proposed (prompted by the issue of Information Flyers 3 & 4). In that conversation 4 points were raised with answers provided. This email was a formal response to those questions and it was asked that confirm the responses where and accurate reflection of the conversation. In addition to this the email was also providing a Beehive Project update, providing details of where information can be found, information on how sensitive information would be handled, seeking feedback / objections / claims for the project and asking if there are other persons / organisations that may have interest in the project.	Q1. Request to note the potential impacts on aquatic life within the permit area resulting in negative impact on shared fish stocks that straddle the WA / NT border. Q2. NT fisheries need to understand the estimated number of holes to be drilled so that you can assess the magnitude of the activity and its potential impacts. Q3. Concerns of the cumulative effect of localised impacts from benthic smothering and possible follow on effects.A1. EOG have noted the predicted effects on aquatic life within the permit area in section 7.6 of the EP (link was provided). Q4. Importance of engagement with NTSC.A1. EOG have noted the predicted effects on aquatic life within the permit area in section 7.6 of the EP (link was provided).	A1. EOG have noted the predicted effects on aquatic life within the permit area in section 7.6 of the EP (link was provided). A2. One well will be drilled and the magnitude of impacts to fauna in the water column and at the seabed are assessed in section 7.6 of the EP (link was provided) which also outline why we think these impacts are of an acceptable level. A3. EOG have predicted the impacts to be minor in nature because of the non toxic nature of the drilling discharges, the small volume of discharge and limited spread, which limits the potential for cumulative effects. No other drilling is planned in or around Beehive 1 in the short term, which allows benthic fauna communities time to recover from the deposition of cuttings and muds. A4. EOG agreed and continued to engage with the NTSC in preparation of the EP.

		7/08/2023 14:44	7/08/2023 14:44	Outbound Phone Call			Follow up call. Call went to message bank. Left a detailed message concerning the Beehive project and advised contact details should the dept wish to provide feedback on the project.	N/A	N/A
NT Department of Infrastructure, Planning & Logistics - Marine Safety NT	NT Government Department responsible for administering commercial fishing and aquaculture, marine pests, biosecurity, indigenous fishing, recreational fishing, boat ramps, tides, boat rules and safety in the NT.	25/01/2023 16:00	25/01/2023 14:00	Outbound Phone Call	115		Phone call to Marine Safety NT enquiring on approvals required to place Public Notice's at boat ramps in NT.	Confirmed I was speaking to the right area and asked for an email to be sent through with the details. Email address provided.	Provided background on the Beehive Project and potential EMBA should a discharge occur. Explained that we are completing engagement on the project to identify relevant persons that may be affected by the activity and that one of the engagement activities is placing Public Notices at Boat Ramps. Asked what approvals would be required to place a Public Notice at the boat ramps in NT.
		25/01/2023 16:26	25/01/2023 18:26	Outbound Email		(MSNT-01 Xen)	Email sent re approvals required from Marine Safety NT to place Public Notice's at the boat ramps in NT.	Auto receipt acknowledgement received.	As discussed on the phone this afternoon, we are looking to place a Public Notice at each of the following 22 NT boat ramps (Wadeye, Crab Claw Island, East Arm, Saltwater Arm, Channel Point, Mandorah, Dinah Beach, Stuarts Tree, Dundee Beach, Channel Island, Doyles, South Alligator, Six Pack Creek 1, Southport, Nightcilff, East Alligator, Six Pack Creek 2, Middle Arm, Buffalo Creek, Milne Inlet, Palmerston, Leaders Creek). A copy of the notice is attached. We will print the notice on an A3 corflute board which will be attached to a single timber stake for display at the boat ramps. The signs will be placed as soon as we have approvals and weather allows and displayed for 3 – 4 months then we will remove them. The intent of the notice is to engage and search for information about what environmental values people may have in the EOG project area. Given the project is offshore, we have chosen boat ramps as one of the methods to engage with people who use the sea. I look forward to hearing from you soon.
		27/01/2023 15:23	27/01/2023 15:23	Inbound Email		(MSNT-02 Xen)	Response to email dated 25/1/23.	We are just checking with comms regarding your request. Should have an answer for you by Monday. Have a good weekend.	
		6/02/2023 11:54	6/02/2023 14:40	Outbound Email		(MSNT-03 Xen) & (MSNT-04 Xen)	Follow to email received 27/1/23.	Auto acknowledgement email received and also copied into internal email "Did you get any reply from communications regarding this request".	Just touching base to see if you have received feedback on our request? We are looking to do 20 of the ramps between next Monday 13/2/23 to Wednesday 15/2/23. We will not get to Wadeye or East Alligator due to flooding and road closure during this time but will look to get them put up at a later time so will still need access to those 2 as well.
		9/02/2023 10:26	9/02/2023 10:51	Outbound Email		(MSNT-05 Xen) & (MSNT-06 Xen)	Follow to email received 6/2/23.	Auto acknowledgement email received and also advised they are still following up with communications team.	Hope you are both well. Just chasing an update on my request below as we would like to place the Public Notices at the Public Boat Ramps next week.
		9/02/2023 16:14	9/02/2023 16:14	Inbound Email		(MSNT-07 Xen) & (MSNT-08 Xen)	Response to email 25/1/23.	Your request to have EOG signage at public boat ramps has been sent on to us. Unfortunately we are unable to support private signage requests at public boat ramps. If you'd like to discuss, please don't hesitate to get in touch with me.	Phone call made to clarify. Was made clear that no public signage is allowed at any NT boat ramps. Was suggested to contact Amateur Fisherman's Association NT (AFANT) to discuss ways to best reach people who use the waterways in project area. Additional email received with AFANT contact details.

NT Department of Territory Families, Housing & Communities - Heritage Branch	Works with the community to conserve the unique and diverse heritage of the NT. Supports the Heritage Council, provides advice about heritage management, promotes heritage and encourages good conservation practice, oversees the NT Heritage Grants Program and the Rates Relief Program, and works with other government departments to conserve Government owned heritage assets.	31/01/2023 15:21	31/01/2023 15:21	Outbound Email	115	(TFHC-01 Xen)	Assistance in identifying cultural heritage sites in EMBA.	N/A	EOG has an offshore exploration project in the Joseph Bonaparte Gulf (WA), and as part of the process for developing an Environmental Plan are required to describe the cultural features within the spill zone environment that may be affected (EMBA). This spill zone EMBA crosses state boundaries into Northern Territory. I am interested in obtaining cultural heritage site data (public and non-public, historical, Aboriginal, Macassan). Below is a quick snapshot of the EMBA area (within purple outline), which you can see is quite large and I assume would contain a number of registered entries. What is the best way forward for obtaining the information and the costs involved? All non-public information can be kept unpublished and non-public as part of the Environmental Plan assessment process.
		7/02/2023 14:59	7/02/2023 14:59	Outbound Email		(TFHC-02 Xen)	Follow up email to email sent 31/1/23 for assistance in identifying cultural heritage sites in EMBA.	N/A	Are you able to assist with the way forward for an area of this size?
		7/02/2023 16:26	7/02/2023 16:26	Inbound Email		(TFHC-03 Xen)	Assistance in identifying cultural heritage sites in EMBA.	Thanks for your enquiry and apologies for the delay. While we appreciate the NOPSEMA environment reporting obligations, I don't think we can provide you a detailed response about heritage impacts for a project footprint of this scale. Importantly a list of known sites in a project footprint this big would only ever be half the picture. For example only a fraction of the historic wrecks historically recorded have been located, meaning there are many significant but as yet unlocated sites in these waters. I recommend that best way to manage issues at this scale is to clearly frame the legislative framework and the potential cultural resource in this area. I recommend you list the Underwater Cultural Heritage Act 2018, noting its jurisdiction to the Continental Shelf, and the automatic protection of all shipwrecks over 75 years. You can note the various protected zones around the NT under this Act. I would also scope in the Heritage Act 2011 and the automatic protection of all prescribed archaeological sites along the coast and up to 3 nautical miles out to sea. I would also note the NT Heritage Register and that some heritage places are protected along the coast for their specific significance. Here are some links on these issues: Underwater cultural heritage - DCCEEW Underwater Cultural Heritage Act 2018 - DCCEEW Underwater heritage protected zones - DCCEEW Heritage Register: search for places or objects NT.GOV.AU	N/A

		10/08/2023 11:07	10/08/2023 11:07	Outbound Phone Call			Follow up call. Call respondent advised that the email has been received and had been forwarded to the appropriate person and that feedback would be provided if council had any concerns.	Recieved and forwarded	N/A
West Daly Regional Council	Northern Territory local government authority for the Wadeye, Peppimenarti, Council Homelands & Palumpa Communities and has a large section of the Joseph Bonaparte Gulf coastline.	6/02/2023 15:38	6/02/2023 15:38	Outbound Email	119	(WDRC-01 Xen)	Email sent re approvals required from West Daly Regional Council to place Public Notice at the boat ramp at Wadeye and Public Noticeboard at Wadeye.	N/A	EOG Resources are looking to place a Public Notice at the Wadeye Boat Ramp as soon as possible and are seeking any prior approvals that may be required. In addition, if there is a Public Noticeboard in Wadeye, we would also like to place a copy of the notice there as well. A copy of the Public Notice is attached. We will print the notice on a 600mm x 420mm corflute board which would be attached to a single timber stake for display at the boat ramp or on an A4 leaflet for the Public Noticeboard. Once placed the signs would be displayed for 3 – 4 months then we will remove them. The intent of the notice is to engage and search for information about what environmental values people may have in the EOG project area. Given the project is offshore, we have chosen the boat ramp as one of the methods to engage with people who use the sea. Given the location of Wadeye a community noticeboard in Wadeye would also be beneficial for our engagement. If we are able to place the Public Notices, given Wadeye is currently cut off by road, we would be appreciative of any suggestions of local contractors to help us place the notices in Wadeye. I look forward to hearing from you soon.

Kimberley Ports Authority	Responsible for the Ports of Broome, Wyndham, Derby & Yampi Sound under the Port Authorities Act 1999 (WA) to operate, maintain, control and preserve the ports and the assets. Relevant if activities impact the ports.	25/01/2023 12:20	25/01/2023 12:20	Outbound Email	78	(KPA-01 Xen)	Email sent re approvals required from Kimberley Ports Authority to place Public Notice's at the boat ramps in Broome (Entrance Point), Derby & Wyndham.	N/A	As discussed on the phone, we are looking to place a Public Notice at the boat ramps in Broome, Derby and Wyndham. A copy of the notice is attached. We will print the notice on an A3 corflute board which will be attached to a single timber stake for display at the boat ramps. The signs will be placed as soon as we have approvals and weather allows and displayed for 3 – 4 months then we will remove them. The intent of the notice is to engage and search for information about what environmental values people may have in the EOG project area. Given the project is offshore, we have chosen boat ramps as one of the methods to engage with people who use the sea. If you have any questions or require clarification, please let me know. I look forward to your response.
		25/01/2023 12:20	25/01/2023 12:20	Outbound Email		(KPA-01 Xen)	Email sent re approvals required from Kimberley Ports Authority to place Public Notice's at the boat ramps in Broome (Entrance Point), Derby & Wyndham. 		25/01/2023 16:00	25/01/2023 16:00	Outbound Phone Call			Phone call to Kimberley Ports Authority enquiring on approvals required to place Public Notice's at the boat ramps in Broome (Entrance Point), Derby & Wyndham.	Asked for the request to be emailed and provided email address.	Provided background on the Beehive Project and potential EMBA should a discharge occur. Explained that we are completing engagement on the project to identify relevant persons that may be affected by the activity and that one of the engagement activities is placing Public Notices at Boat Ramps. Asked what approvals would be required to place a Public Notice at the boat ramps in Broome (Entrance Point), Derby & Wyndham.
		1/02/2023 10:51	1/02/2023 10:51	Inbound Email		(KPA-02 Xen)	Response to email sent 25/1/23 re approvals required from Kimberley Ports Authority to place Public Notice's at the boat ramps in Broome (Entrance Point), Derby & Wyndham.	No issues placing this notice at the Entrance Point boat ramp in Broome. The Town Beach boat ramp is owned / managed by the Shire so if you were intending to place a notice here then best to check with them. For Derby the ramp is on KPA vested land and there is also no issues from our perspective however the Port is leased to the Shire so please raise with Shire of Derby / West Kimberley. For Wyndham ramps are owned and managed by the Shire Of Wyndham / East Kimberley.	Refer to email dated 3/2/23.
		3/02/2023 7:57	3/02/2023 7:57	Outbound Email		(KPA-03 Xen)	Response to email received 1/2/23 re approvals required from Kimberley Ports Authority to place Public Notice's at the boat ramps in Broome (Entrance Point), Derby & Wyndham.	N/A	Thank you for the response. I have also made contact with the 3 councils in Wyndham, Derby & Broome.
		29/06/2023 8:56	29/06/2023 8:56	Outbound Email		(KPA-04 Xen)	Beehive Project update for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Follow up on updated information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. More information will be provided prior to the start of drilling. * Guidance provided to EOG Australia Website and NOPSEMA website for further information and access to EP's. * Request made to provide feedback on any affects the Beehive Project may have to them to which we will assess and respond as required. * Information provided on how sensitive information is handled. * Options provided to respond via email, mail or phone.

Shire of Broome	Western Australian Local Government Authority with approx. 900km's of coastline within their authority area.	24/01/2023 15:00	24/01/2023 15:00	Outbound Phone Call	119		Phone call to Shire of Broome enquiring on approvals required to place Public Notice's at the boat ramps in Broome (Town Beach, Entrance Point, Gantheaum Point) and at One Arm Point which are all in the Broome Shire area.	Advised that Kimberley Ports would need to be contacted in relation to Entrance Point and was provided an email address for the Shire of Broome Rangers for the other Boat Ramps.	Provided background on the Beehive Project and potential EMBA should a discharge occur. Explained that we are completing engagement on the project to identify relevant persons that may be affected by the activity and that one of the engagement activities is placing Public Notices at Boat Ramps. Asked what approvals would be required to place a Public Notice at the boat ramps in Broome (Town Beach, Entrance Point, Gantheaum Point) and at One Arm Point which are all in the Broome Shire.
		25/01/2023 10:52	25/01/2023 10:52	Outbound Email		(SOB-01 Xen)	Email sent re approvals required from Shire of Broome to place Public Notice's at the boat ramps in Broome (Town Beach, Entrance Point, Gantheaum Point) and at One Arm Point which are all in the Broome Shire area.	N/A	Following call with Shire of Broome, an email was sent with our request to place a Public Notice at the boat ramps in Broome (Town Beach, Entrance Point, Gantheaum Point) and at One Arm Point which are all in the Broome Shire area with a copy of the notice. We will print the notice on an A3 corflute board which will be attached to a single timber stake for display at the boat ramps. The signs will be displayed for 3 – 4 months then we will remove them. The intent of the notice is to engage and search for information about what environmental values people may have in the EOG project area. Given the project is offshore, we have chosen boat ramps as one of the methods to engage with people who use the sea.
		6/02/2023 12:22	6/02/2023 12:22	Outbound Email		(SOB-02 Xen)	Email sent as follow up to email on 25/1/23.	N/A	Just following up on email from 25/1/23. We are looking to come to Broome on Friday 17/2/23 & Saturday 18/2/23 to place the signs but wanted to make sure it was ok from your end. We have received approval from Kimberley Ports Authority separately.

		6/02/2023 13:26	6/02/2023 13:26	Inbound Email		(SOB-03 Xen)	Email received from Shire of Broome regarding placement of Public Notices at Boat Ramps.	Apologies. I thought I provided a response, but it was sitting in my drafts. Given the proposal is public notice and not a promotional piece, we can support it without requiring any planning approval as 'temporary works'. We just need to confirm the date you intend to remove the signs. If you are aware of exact locations, it would be appreciated if you could send through a plan to indicate the number of signs and their positions. Aerials from Google Maps/Landgate's Map Viewer Plus would be sufficient. It is also worth noting that land surrounding the boat ramps towards the port is managed by the Kimberley Ports Authority and Lombadina is crown land where the Department of Planning, Lands and Heritage should be contacted. Out of interest, is the notification required by legislation?	Refer to email dated 9/2/23.
		9/02/2023 10:19	30/03/2023 10:19	Outbound Email		(SOB-04 Xen)	Email sent to Shire of Broome responding to comments in email received 6/2/23.	N/A	Thanks for the response. A colleague and I will be placing the Public Notices next week (17/2/23 & 18/2/23) at the Boat Ramps and will remove them by approx. 30/6/23. In Broome, the plan is to place 1 x Public Notice at the 3 locations as per below map. I would like to place them close to any other signage at these locations so as people read them but place them so as they do not interfere with the other signage. We will need to assess each location whilst we are there to determine exact locations. For Dampier Peninsula, we will need to assess if the public boat ramp is the right place for the public notice at One Arm Point or if we just use a smaller version of the public notice on community noticeboards at Ardyaloon and Lombadina. We have been in contact with Kimberley Ports and Department of Planning, Lands & Heritage as well with our plans. For offshore activities, under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 Regulation 11A, consultation with relevant authorities, persons and organisations must be undertaken in preparing an environmental plan. If you like I can provide you with actual locations once the public notices are placed at the boat ramps.
		19/05/2023 13:57	19/05/2023 13:57	Outbound Email		(SOB-05 Xen)	Beehive Project information for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.	N/A	* Information and flyer for Beehive Project Geotechnical and Exploration Drilling provided: * The Geotechnical environment plan is currently under assessment with NOPSEMA with the activity scheduled to occur over approximately 2 weeks between the 1st of October 2023 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2023. More information will be provided prior to the start of this geotechnical program. * Drilling of a single exploration well, Beehive-1, is planned to take place over a 55-to-100-day period between the 1st of January 2024 and no later than the 31st of December 2025, which was previously estimated to occur between March 2023 and December 2024. The drilling environment plan is currently under assessment with NOPSEMA with activity timing contingent on the receipt of environment plan acceptance, rig, and equipment availability. 		28/06/2023 16:31	28/06/2023 16:31	Outbound Phone Call			Follow up phone call re May 2023 Beehive Project Update made to enquire if they had and comments or feedback to be considered in the Environmental Plan to be submitted to NOPSEMA.	Unsure if they have received information from EOG. Requested information to be resent.	Email with information to be resent.
		30/06/2023 6:24	30/06/2023 13:05	Outbound Email		20230630 Email Follow Up June 2023	Follow up email seeking feedback by 21 July 2023 on update that was provided in May 2023 via email.	N/A	This message is in follow up to the email below providing an update to the Beehive project and requesting that you (or your organisation) share your assessment of how you may be affected by our proposed activities. We are kindly requesting feedback from you by 21 July 2023.
		28/07/2023 1:02	28/07/2023 1:02	Inbound Email		(SOB-06 Xen)	Feedback to May 2023 Beehive Project Update.	Based on the significant distance between the project site and the Shire of Broome boundary. Officers are satisfied that the impact from the proposed activities would be negligible.	N/A
		4/08/2023 22:23	4/08/2023 22:23	Outbound Email		(SOB-07 Xen)	Acknowledgement of feedback to May 2023 Beehive Project Update.	N/A	Thank you kindly for your response, we will notate our project file accordingly.
Shire of Derby / West Kimberley	Western Australian Local Government Authority covering 118560 square kilometres of land in the North West Kimberley Region with an expansive coastline within their authority area.	25/01/2023 12:35	25/03/2023 12:35	Outbound Email	119	(SDWK-01 Xen)	Email sent re approvals required from Shire of Derby / West Kimberley to place Public Notice at the boat ramp in Derby.	Auto acknowledgement received.	As discussed on the phone, we are looking to place a Public Notice at the boat ramp in Derby. A copy of the notice is attached. We will print the notice on an A3 corflute board which will be attached to a single timber stake for display at the boat ramps. The signs will be placed as soon as we have approvals and weather allows and displayed for 3 – 4 months then we will remove them. Given access to Derby is not currently available we would be interested in a suggestion of a service provider to install the Public Notice on our behalf. To do this we would get the notice printed and sent to Derby to be installed on our behalf. The intent of the notice is to engage and search for information about what environmental values people may have in the EOG project area. Given the project is offshore, we have chosen boat ramps as one of the methods to engage with people who use the sea. If you have any questions or require clarification, please let me know. I look forward to your response.
		25/01/2023 15:30	25/01/2023 15:30	Outbound Phone Call			Phone call to Shire of Derby / West Kimberley enquiring on approvals required to place Public Notice at the boat ramp in Derby.	Given recent flooding the person we need to speak to is really busy so email address was provided to send email with details.	Provided background on the Beehive Project and potential EMBA should a discharge occur. Explained that we are completing engagement on the project to identify relevant persons that may be affected by the activity and that one of the engagement activities is placing Public Notices at Boat Ramps. Asked what approvals would be required to place a Public Notice at the boat ramp in Derby.
		30/03/2023 16:23	30/03/2023 16:23	Outbound Email		(SDWK-02 Xen)	Follow up of email dated 25/1/23.	Auto acknowledgement received.	Appreciate you would be very busy with flood reconstruction work at present but just touching base to see if we can get some feedback on our request below? I look forward to your response.

		19/05/2023 13:55	19/05/2023 13:55	Outbound Email		(SDWK-03 Xen)	Beehive Project information for proposed Geotechnical & Drilling activities and seeking feedback for these 2 proposed activities to assist with Environment Plan acceptance.
