The Obigbo facility has a continuous flare that is of similar scale and has a flare rate (30 MMscfd) close to the rate expected for the Exploration Campaign (40 MMscfd). For these reasons, the Obigbo oil production facility was considered an appropriate analogue for the MODU flare. A detailed study describing lux levels at varying distances from the operational flare was also available for the Obigbo oil production facility (Isichei and Sanford, 1976). The detail provided in that study, as well as Nwaob (2005) and European Commission (2014) allow for the characteristics of the Obigbo flare to be scaled and for characterisation of other flares. This data provides the basis for the following flare light intensity modelling.

### 4.3.3 Model

The light intensity model was built in Microsoft Excel utilising the inverse law of illumination (Section 4.3.1). The following assumptions were made.

- Obigbo oil production facility flare characteristics as stated in Table 4-1,
- Combustion characteristics of the Exploration Campaign flare are similar to Obigbo,
- No allowance was made for atmospheric or topographic interactions including shadowing, absorption or scattering, as such the model is conservative and likely to overestimate illuminance at distance,
- Flare luminous intensity is calculated directly proportional to flare flow rate, and
- Facility luminous intensity is combined with the flare luminous intensity as a total luminous intensity input into the model.

Illuminance was calculated every 100 m from the flare source (in lux), and results overlaid in geographic information system (GIS) to identify geospatial contours.

A verification exercise of the Xodus Group light decay model (Xodus model) was conducted using the light decay model developed by Jacobs-SKM for the Browse FLNG Draft Environmental Impact Statement (Jacobs-SKM, 2014). The verification exercise for the Xodus model plotted the Xodus Group light decay model expected illuminance for the Browse Development against the Jacobs-SKM modelled illuminance. The Xodus model predicted illumination levels aligned with the Jacobs-SKM model, verifying the Xodus model outcomes.

## 4.4 Results and Recommendations

The results of the light intensity modelling are summarised in Table 4-2 and are also shown graphically for the Exploration Campaign in Figure 4-2 to Figure 4-5.

Table 4-2: Illuminance modelling results and Obigbo analogue.

SITE/SCENARIO	FLARE LUMINANCE INTENSITY (CD)	LIGHT ILLUMINANCE (LUX)						
		Distance from Facility (km)						
		0.5 km	1 km	5 km	10 km	20 km	30 km	60 km
Analogue Case								
Obigbo Facility – Nigeria	~1,805,000	7.2	1.8	0.072	0.018	0.004	0.002	< 0.002
Modelled Cases								
Exploration Campaign facility lighting from the MODU	~100,000	0.4	0.1	0.004	0.001	0.0002	<0.0001	<0.0001
Exploration Campaign combined facility lighting and flaring from the MODU (40 MMscfd)	~ 2,495,667	10.0	2.5	0.100	0.025	0.006	0.003	0.0007

For the Exploration Campaign, the model predicted the following for the combined facility lighting and flaring rate of 40 MMscfd during flaring (Figure 4-2 and Figure 4-3):

- Light intensity levels greater than 0.1 lux are predicted to occur up to 5 km from the MODU, comparable to ambient light levels during full moon to twilight.
- Between 5 km and 16 km from the MODU, the model predicted light intensity levels comparable to ambient light levels during a quarter moon to full moon night sky (0.01 lux to 0.1 lux).
- Between 16 km and 49 km, light intensity levels were predicted to be between 0.01 lux and 0.001 lux, which is comparable to ambient light intensity levels between a moonless clear night sky and a quarter moon.
- Beyond 49 km, there was no measurable change to the ambient light intensity levels.

For the Exploration Campaign, the model predicted the following for the facility lighting when not flaring (Figure 4-4 and Figure 4-5):

- Light intensity levels greater than 0.1 lux are predicted to occur up to 1 km from the MODU, comparable to ambient light levels during full moon to twilight.
- Between 1 km and 3 km from the MODU, the model predicted light intensity levels comparable to ambient light levels during a quarter moon to full moon night sky (0.01 lux to 0.1 lux).
- Between 3 km and 9 km, light intensity levels were predicted to be between 0.01 lux and 0.001 lux, which is comparable to ambient light intensity levels between a moonless clear night sky and a quarter moon.
- Beyond 9 km, there was no measurable change to the ambient light intensity levels.

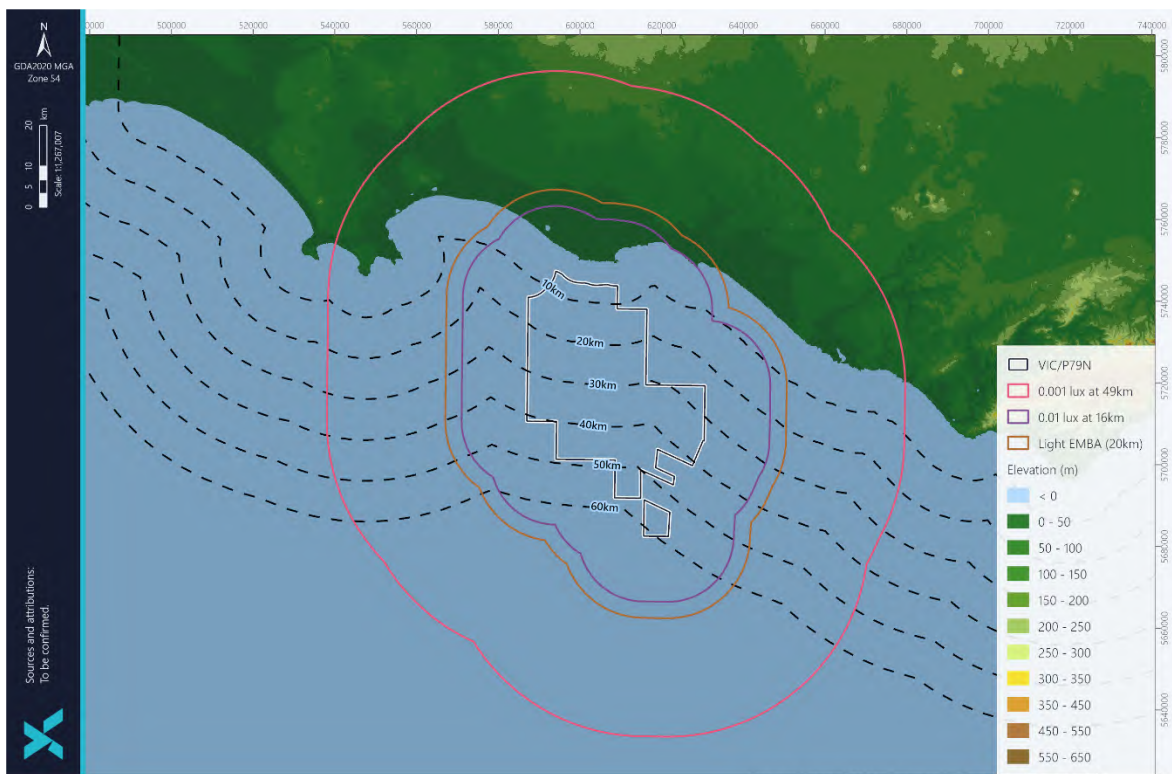

Figure 4-2: Map of expected light intensity (illuminance) levels from flare and facility lighting on the MODU during flaring (40 MMscfd).

Figure 4-3: Expected light intensity levels from flare and facility lighting on the MODU during flaring (40 MMscfd) at receptor locations.

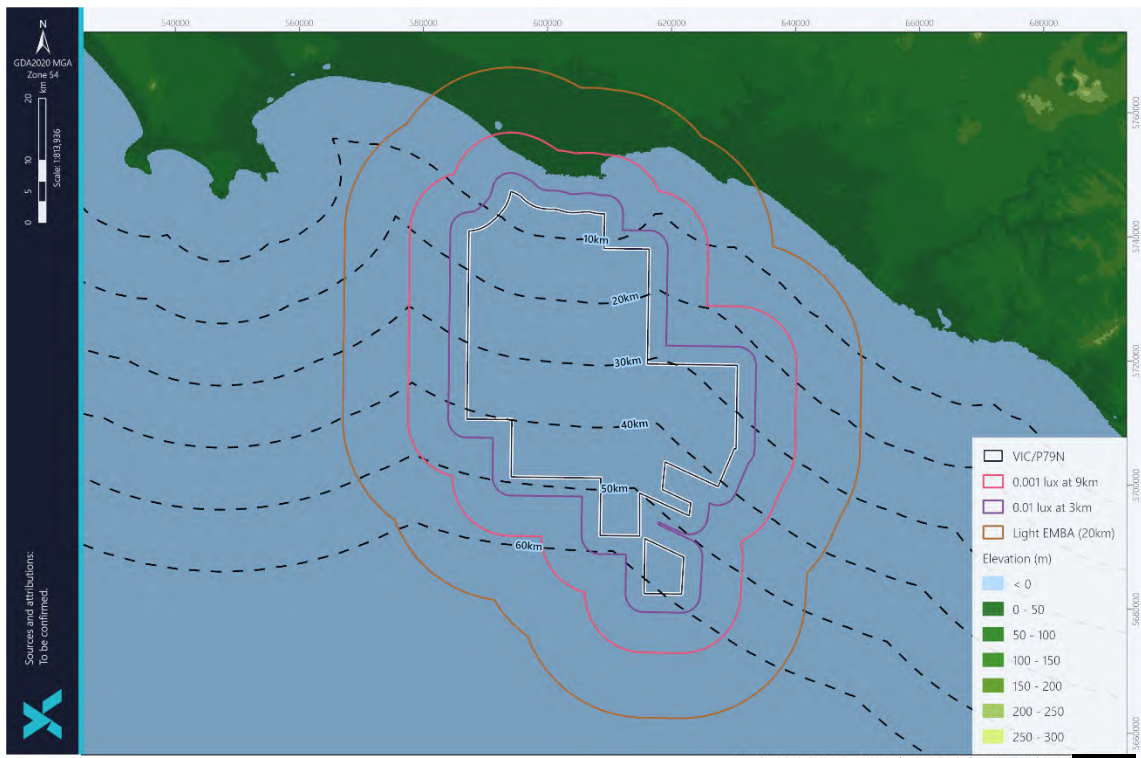

Figure 4-4: Map of expected light intensity (illuminance) levels from facility lighting on the MODU when not flaring.

Figure 4-5: Expected light intensity levels from facility lighting on the MODU at receptor locations when not flaring.

As noted in Section 2.2, in recognition that photometric measurements are biased towards the human eye response to light, the spatial extent potentially impacted by visible light from the MODU, as a visible dot on the horizon, is out to a distance of 9 km from the position of the MODU when not flaring (Figure 4-4 and figure 4-5). Note: This is distinct from the biological light EMBA which is relevant for the potential assessment of impacts to, for example, birds.

The spatial extent potentially impacted by visible light from flaring and MODU lighting, as a visible dot on the horizon, is out to a distance of 49 km from the position of the MODU (Figures 4-2 and 4-3).

As shown in the light intensity results, the light intensity levels from the MODU received at Yambuk Nature Conservation Reserve (6 km) and its nearby towns are about 0.07 lux when flaring, comparable to the ambient light levels during a full moon (0.1 lux) to a quarter moon (0.01 lux), equivalent to the 'Full' and 'First Quarter' moon phases in Figure 4-6; and the light intensity levels drop to less than a quarter moon (<0.01 lux) when not flaring.

At other selected receptor locations of Mepunga Coastal Reserve (24 km), Yambuk Coastal Reserve (24 km), Discovery Bay Marine National Park (40 km), Twelve Apostles Marine National Park (53 km), and the nearby towns, the light intensity levels are comparable to the ambient light levels less than a quarter moon (<0.01 lux) when flaring, and less than a moonless clear night sky (<0.001 lux) when not flaring, equivalent to the 'First Quarter' and 'New' moon phases in Figure 4-6, respectively.

Figure 4-6: The moon phases Credit: NASA/Bill Dunford (Johnston, 2020).

## EXECUTIVE SUMMARY

This technical report presents the results of the visible line of sight and light intensity (illuminance) assessments for ConocoPhillips Australia's (ConocoPhillips) Otway Exploration Drilling Campaign (Exploration Campaign). This light modelling study was conducted for the Exploration Campaign within the southern part of petroleum title VIC/P79 (VIC/P79S). The sources of light emissions considered were the lights and flare from the mobile offshore drilling unit (MODU). The lights on the MODU facility include the main deck light, process module lights, lighting on the drill rig and the navigation lights on the derrick. The light that come from the flaring during well testing was considered at a maximum flare rate of 40 MMscfd.

The threshold for the spatial extent of visible light that is predicted to occur from the Exploration Campaign was defined as whether any part of the facility is visible as a dot on the horizon (visible line of sight assessment). The threshold for the spatial extent of a measurable change in ambient light that is predicted to occur from the Exploration Campaign was defined as an illuminance equivalent to ambient light on a moonless clear night sky/new moon (<0.001 lux). The area within these thresholds is considered relevant to the impact assessment for planned light emissions from the Exploration Campaign.

The results of visible line of sight assessment conclude that the MODU lights and flare will be visible from a distance of 45 km from receptors at sea level while, due to elevations on the mainland, the MODU will be visible from the Victorian mainland adjacent to the project area.

Light intensity (illuminance) assessment indicates that during flaring, a measurable change will occur up to 49 km from the expected position of the MODU and reduces to 9 km from the MODU when not flaring. The light intensity results also show that the light intensity levels of the MODU at the selected receptor locations of the Twelve Apostles Marine National Park (34 km), Mepunga Coastal Reserve (34 km), Great Otway National Park (60 km), Coradjil Nature Conservation Reserve (60 km) and the nearby towns are comparable to the ambient light levels less than a quarter moon (0.01 lux) when flaring and less than moonless clear night sky (0.001 lux) when not flaring. A Zone of Theoretical Visibility analysis is thus recommended to quantify the visual impact and provide a communication tool to the relevant stakeholders.

# 1 INTRODUCTION

## 1.1 Project Overview

The Otway Exploration Drilling Campaign is located adjacent to the largest gas fields in the offshore Otway Basin, Thylacine and Geographe. ConocoPhillips Australia (ConocoPhillips) plan to execute an exploration well drilling campaign within the southern part of VIC/P79 (denoted as Vic/P79S), as shown in Figure 1-1. This report presents the light modelling study for the Exploration Campaign within VIC/P79S.

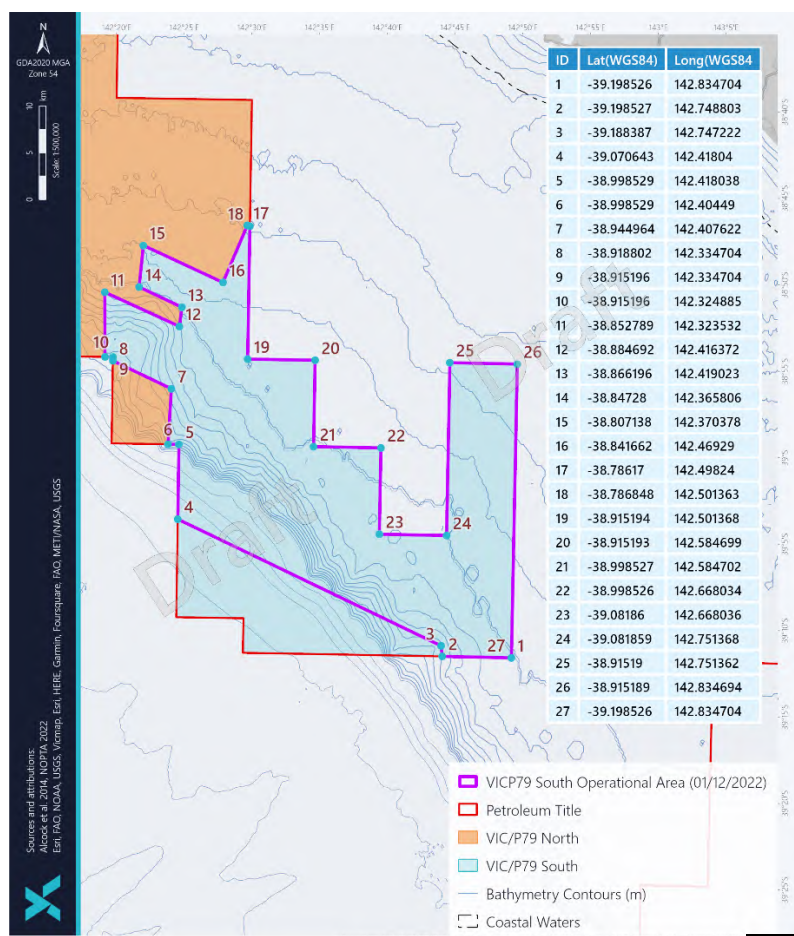

Figure 1-1: Otway drilling light modelling scope for VIC/P79S.

## 1.2 Aim and Objectives

The purpose of this technical report is to present the assessment undertaken to estimate the artificial light emissions from the Exploration Campaign within VIC/P79S to inform environmental impact assessment and management planning of the Exploration Campaign. This study considered and assessed:

- the distances of receptors from the mobile offshore drilling unit (MODU),
- light sources and flaring from the MODU, and
- the light levels received at various receptor locations from facility lighting and well test flaring.

## 1.3 Scope

The sources of light emissions include:

- external facility lighting on MODU and vessels for safe navigation and working conditions, and
- flaring of excess associated gas which will be from a horizontal boom flare and will occur up to approximately 42 hours per event.

Both sources of light emissions are quantified and discussed in this technical report. The exact well locations are yet to be determined or may be subject to change. Therefore, all potential locations in VIC/P79S were considered for modelling (Figure 1-1).

The assessment included two sets of modelling:

- visible line of sight estimates, and
- light intensity (illuminance) modelling.

Line of sight estimates have been used as an indication of the distance that the facility and its lights may be visible while light intensity (illuminance) modelling has been used as an indication of the measurable change in ambient light conditions. These quantifications have been used to develop two types of area used for subsequent environmental impact analysis (Table 1-1).

*Table 1-1: Predicted artificial light exposure and impact areas for the Exploration Campaign.*

ARTIFICIAL LIGHT ASSESSMENT AREAS	DESCRIPTION
<b>Visible Light Exposure Area</b>	The spatial extent of visible light that is predicted to occur from the Exploration Campaign. The threshold for this area is whether any part of the facility is visible as a dot on the horizon.
<b>Potential Impact Area</b>	The spatial extent of a measurable change in ambient light that is predicted to occur from the Exploration Campaign. The threshold for this area is an illuminance equivalent to ambient light on a moonless clear night sky/new moon (<0.001 lux). This is the area relevant to the impact assessment for planned light emissions from the Exploration Campaign.

The modelling utilises the MODU as the basis for modelling as it will be the largest and tallest piece of infrastructure that will be in field for the Exploration Campaign. The light intensity modelling utilises the two major sources of light emissions as the basis for the model – the MODU lighting, and flaring from the MODU for well testing. Artificial light emissions from vessels (e.g. support vessels) associated with the Exploration Campaign were not included in the assessment due to their much smaller scale and/or temporary and transient nature.

## 2 BASIS OF LIGHT ASSESSMENT

### 2.1 Light and its Measurement

Light is a form of energy that is emitted over a particular band of frequencies and wavelengths of the electromagnetic spectrum, and includes ultraviolet, visible (to humans) light and infrared light. As illustrated in Figure 2-1, the visible range for humans is approximately 400–700 nm. Fauna perceive light differently to humans, and their visible spectrum can vary between ~300 nm and >700 nm depending on the species (Commonwealth of Australia, 2020).

Figure 2-1: Ability to perceive different wavelengths of light in humans and wildlife is shown by horizontal lines. Black dots represent reported peak sensitivity. Note the common sensitivity to short wavelength light across all wildlife (Campos, 2017; Commonwealth of Australia, 2020).

Humans and fauna use photoreceptor cells (cones and rods) in the eye to detect light. Photopic vision, which occurs in bright conditions, activates the cones and allow the eye to see colour. Scotopic vision, which occurs in low light conditions, activates rods and allow the eye to see in shades of grey. Scotopic vision is more sensitive to shorter wavelength light than photopic visions (Commonwealth of Australia, 2020). Nocturnal species rely on scotopic vision and can therefore be sensitive to changes in light at high-energy, short-wavelength end of the spectrum (e.g. ultraviolet, violet and blue light).

Radiometry is the detection and measurement of electromagnetic radiation. With respect to optics, radiometry refers to the detection and measurement of radiant energy within the light (ultraviolet, violet, infrared) portion of the electromagnetic spectrum. Photometry is a subset of radiometry that applies to the visible light spectrum and measured values are also weighted to the typical response of a human eye. As humans and fauna perceive light differently, radiometric measurements are more biologically relevant, as they account for the energy emitted across all light wavelengths (Commonwealth of Australia, 2020). Common quantities used to describe light in radiometric and photometric terms are provided in Table 2-1.

Table 2-1: Typical radiometric and photometric quantities.

RADIOMETRIC			PHOTOMETRIC		
Quantity	Symbol	Units	Quantity	Symbol	Units
Radiant power	$\Phi_E$	W	Luminous flux	$\Phi_V$	lm
Radiant intensity	$I_E$	W/sr	Luminous intensity	$I_V$	lm/sr (or cd)
Irradiance	$E_E$	W/m <sup>2</sup>	Illuminance	$E_V$	lm/m <sup>2</sup> (or lux)
Radiance	$L_E$	W/m <sup>2</sup> sr	Luminance	$L_V$	lm/m <sup>2</sup> sr

$E$  = energetic;  $V$  = visual;  $W$  = watt;  $sr$  = steradian;  $lm$  = lumen;  $cd$  = candela

The conversion between radiometric and photometric units is dependent on the photopic spectral luminous efficiency function,  $V(\lambda)$ , as defined by the Commission International de l'Eclairage (CIE) in 1924, and the spectral radiant power curve,  $\Phi_E(\lambda)$ , of the light source. The conversion is provided by the following relationship:

$$\Phi_V = K_m \int_{\lambda=380}^{\lambda=830} \Phi_E(\lambda) V(\lambda) d\lambda$$

Where:

- $\Phi_V$  is the luminous flux (lumens),
- $K_m$  is a scaling factor equivalent to 683 lm/W,
- $\Phi_E(\lambda)$  is the spectral radiant power (W/nm), and
- $V(\lambda)$  is the photopic spectral luminous efficiency function.

The photopic spectral luminous efficiency function,  $V(\lambda)$ , is a function of wavelength and relates to how a human eye responds to that wavelength of light. In humans the photoreceptor cells are more responsive to green/yellow wavelength light compared to red or violet.  $V(\lambda)$  can be approximated by the following non-linear regression:

$$V(\lambda) = 1.019e^{-285.4(\lambda-0.559)^2}$$

Empirical data shows that the function has a maximum value at a wavelength of 555 nm (Figure 2-2), which is the wavelength at which the human eye is most responsive. Spectral luminous efficiency varies across different animal species this is discussed further in Section 2.2.

Figure 2-2: Spectral luminous efficiency function.

The spectral radiant power of a light source ( $\Phi_E$ ) is also related to wavelength, however, will also change depending on the type of light (Figure 2-3). The significance of a spectral power curve becomes apparent when using a photometric measurement to describe light for a source that is, for example, high in blue light emissions (such as cool LED or metal halide; Figure 2-3), or high in infrared emissions (such as a gas flare; Figure 2-4), as a photopic measurement may be underestimating the amount of light present as the photopic curve puts a higher weighting on light emitted in the green/yellow range compared to the blue or red (Figure 2-2).

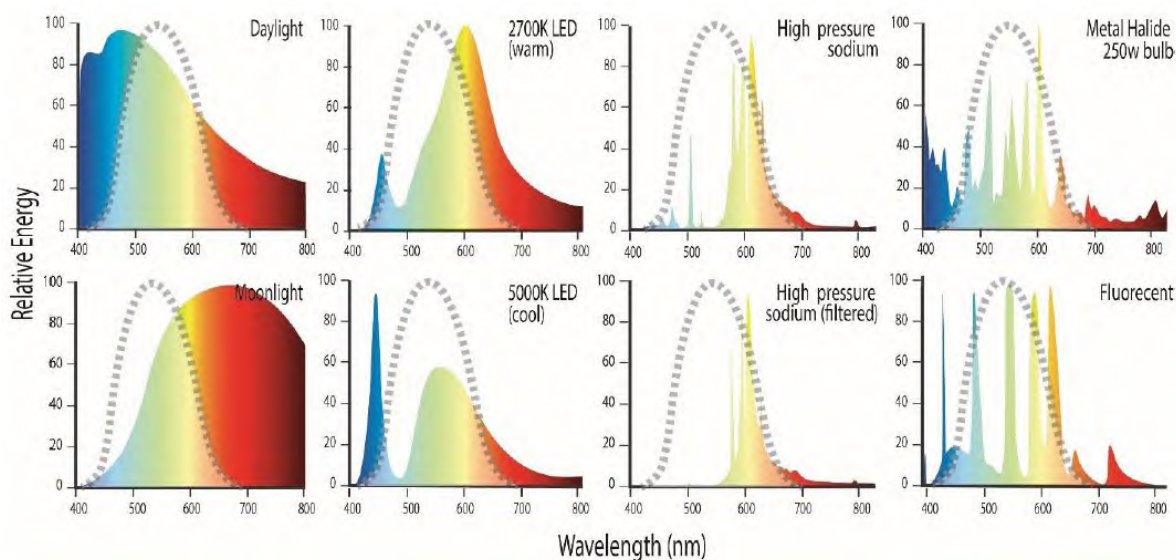

Figure 2-3: Relative spectral radiant power curves for common natural and artificial light sources (shown in colour) with photopic response curve (grey dashed line) (Commonwealth of Australia, 2020).

Figure 2-4: Predicted spectral radiance curve for a natural gas flare (based on 2,000 K blackbody emission).

## 2.2 Artificial Light Assessment

To date, light monitoring equipment has predominantly used photopic measurements. Few light measurement techniques that are appropriate for capturing biologically relevant light and are commercially available exist (Table 1 in Commonwealth of Australia (2020)). As described in Section 2.1, due to the photopic spectral luminous efficiency function being based on a human eye response, there is lower sensitivity in photometric measurements to shorter wavelength light (ultraviolet, violet, blue) that is important to nocturnally active marine fauna. For example, most wildlife is sensitive to short wavelength violet and blue light (Figure 2-1), but little or none of this light is measured by commercial instruments and thus not accounted for in current light models (Commonwealth of Australia, 2020). However, as noted within the National Light Pollution Guidelines (Commonwealth of Australia, 2020), photometric measures can be used in impact assessment on wildlife, but limitations should be acknowledged and considered.

For the light intensity (illuminance) modelling component of the artificial light emissions assessment for the Exploration Campaign (refer to Section 4), photometric measurements have been used. This decision was based on the type of published measured light data that was available to identify analogues and to use as input to the light modelling calculations.

As shown in Table 2-1, photometric light can be described in terms of luminous flux, luminous intensity and illuminance:

- Luminous flux ( $\Phi_v$ ) is a measure of the amount of light from a source emitted in total regardless of direction (unit of measurement: lumens),
- Luminous intensity ( $I_v$ ) is the amount of light emitted in a particular direction; the direction is typically stated in steradians (unit of measurement: candelas), and
- Illuminance ( $E_v$ ) is the amount of light reaching an area (unit of measurement: lux; where 1 lux is equivalent to 1 lumen/m<sup>2</sup>).

These terms are graphically depicted in Figure 2-5.

Illuminance (also referred to as light intensity) is the term of interest for environmental impact assessment for the Exploration Campaign. Typical light illuminance values from natural light sources are described in Table 2-2 and these are considered representative of ambient light levels in the vicinity of the Exploration Campaign in Victoria and King Island.

There are currently no published or accepted thresholds at which artificial light may impact fauna. Consequently, the minimum threshold used to describe a change in ambient light conditions within this artificial light assessment is an illuminance equivalent to a new moon / moonless clear night sky (0.001 lux). Beyond this threshold no impact to light sensitive fauna is assumed. This threshold (0.001 lux) was selected on the basis that fauna undertake nocturnal activities under the natural range of full moon (0.1 lux) to new moon (0.001 lux) without known adverse impacts.

In recognition that the photopic curve is biased towards a human eye response to light, and to remove some of the scientific uncertainty associated with the way light is measured, the 'Potential Impact Area' (i.e. the area relevant for impact assessment of planned light emissions; Table 1-1 conservatively uses an initial luminous intensity value 20% higher than the measured/modelled analogue value. This increase in luminous intensity increases the estimated distance of the Potential Impact Area and provides conservatism to the modelling and subsequent impact assessment.

Figure 2-5 Photopic light terminology.

Table 2-2: Summary of natural light illuminance (Environmental Resources Management, 2010).

NATURAL LIGHT SOURCE	LIGHT ILLUMINANCE (LUX)
Direct sunlight	100,00–130,000
Full daylight, indirect sunlight	10,000–20,000
Overcast day	1,000
Very dark day	100
Twilight	10
Deep twilight	1
Full moon	0.1
Quarter moon	0.01
Moonless clear night sky (new moon) <sup>1</sup>	0.001
Moonless overcast night sky	0.0001

<sup>1</sup> Impact threshold utilised in this report is 0.001 lux, beyond this threshold no impact to light sensitive fauna is assumed.

## 3 VISIBLE LINE OF SIGHT ASSESSMENT

### 3.1 Methodology

Visible line of sight assessment was conducted using the methodology described in Stallings (2005) for the MODU to determine the worst-case potential extent of visible light for ConocoPhillips. Line of sight and viewshed analysis is typically used in environmental impact assessment for the assessment of impact to visual amenity where an impact may alter a perceived sense of place or inherent value. The visibility of an artificial light does not imply a measurable change in ambient light (and therefore a potential environmental impact), this is estimated through change to illuminance as discussed in Section 4).

Line of sight assessment utilises the following equation to estimate the total line of sight ( $d$ ):

$$d = \left( 2 \cdot \frac{4}{3} R h_1 + h_1^2 \right)^{0.5} + \left( 2 \cdot \frac{4}{3} R h_2 + h_2^2 \right)^{0.5}$$

Where

$d$  = total line of sight ( $d_1 + d_2$ ),

$h_1$  = height of object,

$h_2$  = height of receptor, and

$R$  = radius of earth.

The analysis was completed using assumed heights of an analogue MODU for the Exploration Campaign as shown in Table 3-1, with final designs being confirmed during front end engineering (FEED). Receptor heights modelled included a receptor at sea level, and varying elevations (from 5 to 525 m) of the adjacent mainland.

Table 3-1: Assumed heights of the MODU facility infrastructure involved in the exploration campaign.

EXPLORATION CAMPAIGN FACILITY INFRASTRUCTURE	HEIGHT OF FACILITY / LIGHTING / FLARE (m) ABOVE SEA LEVEL
Main deck lights	40
Process module lights	50
Lighting on the drill rig	80
Derrick (navigation lights)	120
Boom flare flame height (horizontal boom)	53

## 3.2 Results and Recommendations

The line of sight assessment results for the different heights of the MODU facilities and receptors are outlined in Table 3-2. The assessment shows that at sea level, the maximum distance the tip of the MODU derrick (navigation lights) would be visible above the horizon is 45 km. The flare and equipment above main deck level would be visible from 30 km from the MODU location.

Figure 3-1 and Figure 3-2 show the corresponding areas (extent) of visibility for the MODU derrick (navigation lights) and the deck flare respectively, including the total line of sight distances and the Environment that May Be Affected (EMBA) which is within 20 km for light.

The line of sight assessment indicates that lights on the derrick and light associated with flaring may be visible as a dot on the horizon from the adjacent mainland, extending inland up to 140 km for elevated receptor locations. However, this line of sight distance was estimated without considering the atmospheric interactions/disturbances, and thus is a conservative estimation. Considering the luminance range of human vision, the extent of potential visibility is more likely up to only 49 km when the light intensity reaches 0.001 lux, equivalent to an ambient light intensity level of a moonless clear night sky (which will be shown further in the light intensity (illuminance) Section 4). It is recommended to conduct a Zone of Theoretical Visibility analysis to quantify the visual impact and provide a communication tool to the relevant stakeholders.

King Island is 107 km away from the operational area with a maximum receptor height of 165 m, as such, it is not affected by the light emissions from VIC/P79S (not shown in figures).

Table 3-2: Exploration campaign facility visual line of sight distances.

EXPLORATION CAMPAIGN INFRASTRUCTURE	HEIGHT OF FACILITY / LIGHTING / FLARE (m)	HEIGHT OF RECEPTOR (m)	TOTAL LINE OF SIGHT (km)
Visibility of MODU infrastructure at sea level			
Main deck light	32	0	23.3
Process module lights	50	0	29.1
Lighting on the drill rig	80	0	36.9
Derrick (navigation lights)	120	0	45.2
Flare flame height (horizontal boom)	53	0	30.0
Visibility of MODU derrick at various receptor heights			
Derrick (navigation lights)	120	5	54.4
	120	10	58.2
	120	50	74.3
	120	100	86.4
	120	300	116.5
	120	525	139.6

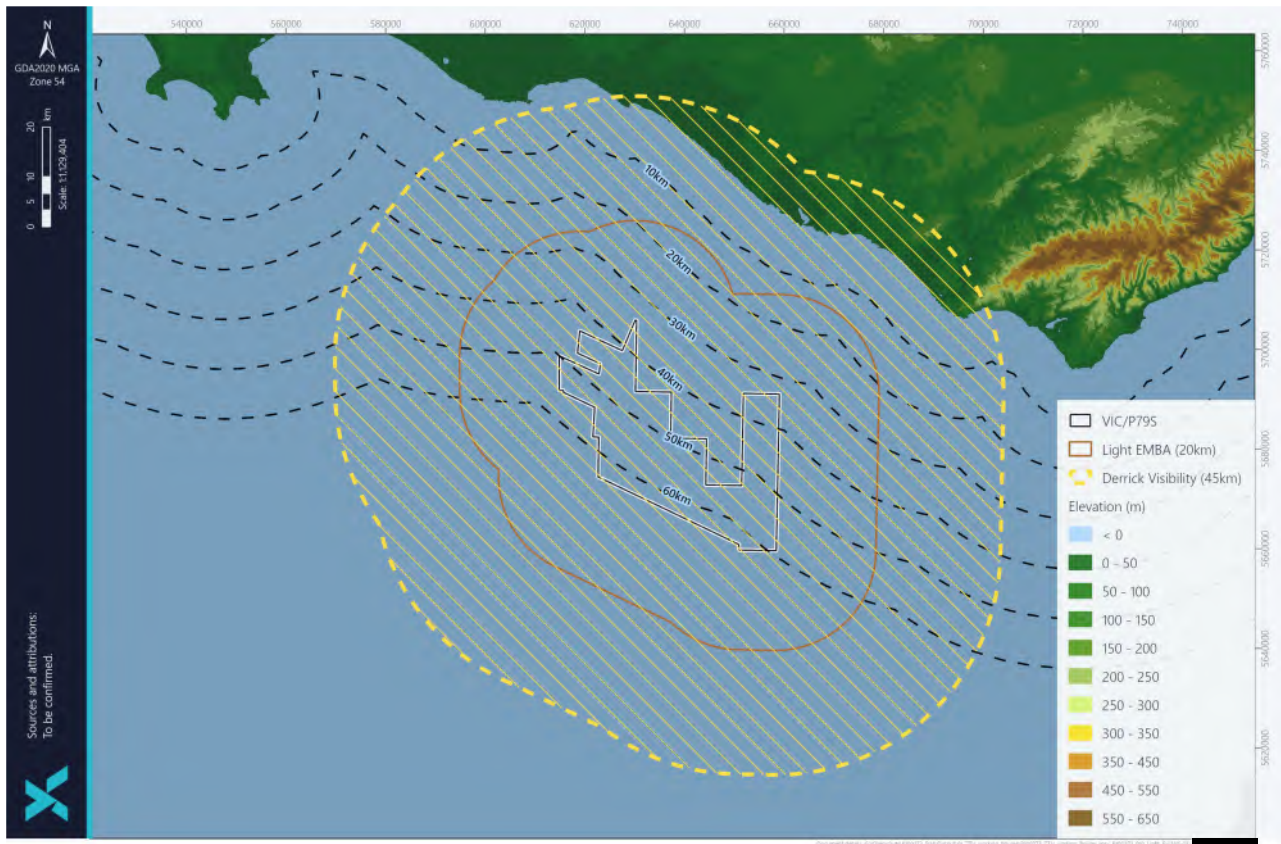

Figure 3-1: Light EMBA and area of visibility (derrick navigation lights).

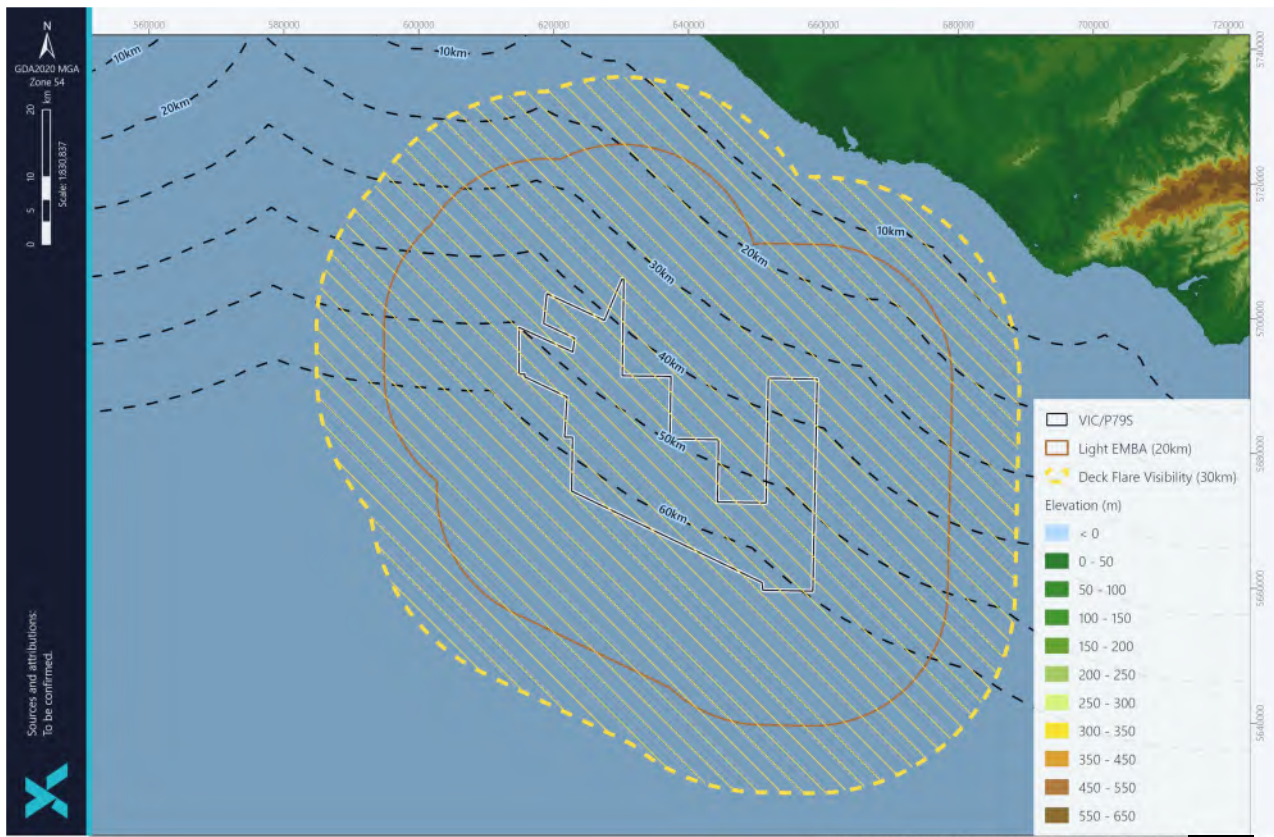

Figure 3-2: Light EMBA and area of visibility (light associated with flaring).

## 4 LIGHT INTENSITY (ILLUMINANCE) ASSESSMENT

The two sources of artificial lighting (facility and flaring) for the Exploration Campaign were assessed separately, using published modelled and measured data as analogues.

It is noted that most commercial light modelling software requires the input of a number of factors, such as the light fitting type, quantity, and location of light sources – information which is not available at this preliminary stage. As such, the use of analogues was adopted, as this provided a real-world analogue on which to base the artificial light emissions assessment. It is also considered a conservative approach as it does not include any best practice or additional mitigation measures that may be adopted by ConocoPhillips during the FEED of the project.

### 4.1 Facility Lighting

It is expected that the MODU for the Exploration Campaign will have a similar lit surface area as the drill rig utilised for the Woodside Torosa drilling campaign on Browse reef for which published data is available. The MODU utilised for the Exploration Campaign will be similar with similar lighting required for safe operations of the facility. Therefore the MODU facility light emissions would also be comparable to that of the Torosa wells used during a previous light intensity modelling and associated measured data completed by Environmental Resources Management (2010). Light characteristics and modelling of light sources for the Torosa assessment are based on measured lighting data (lux levels and wavelength) obtained whilst drilling the Torosa South-1 appraisal well on the edge of the South Reef lagoon and ambient data when no activities were occurring at Scott Reef (Environmental Resources Management, 2010). The drill rig used is a suitable analogue for the drill rig expected to be used for the VIC/P79S Exploration Campaign.

The light intensity values derived from the measured Torosa South 1 well campaign were utilised to represent the MODU facility lighting for the Exploration Campaign modelling.

### 4.2 Flare Light Emissions

The Exploration Campaign will require a MODU flare to dispose of the gas generated from well testing. The gas is produced and flared to allow for testing of the produced gas and oil as well as to calculate the size of the oil and gas reservoir and reservoir characteristics. The excess oil and gas is sent to the flare disposal system to be burnt. The flare for the MODU will be a horizontal boom flare extending out horizontally of the MODU deck. Flaring will occur for a duration of approximately 42 hours per well.

To inform the environmental impact assessment for the Exploration Campaign, light intensity from a flare flow rate of 40 MMscfd was modelled. This represents a peak flaring rate from the well test systems.

Based on Gas Processors Suppliers Association (2004), it has been calculated that this expected rate of flaring will result in a flare flame length of up to approximately 22 m. This flame will generate light. Analogues are utilised to determine the likely amount of light emitted from the flame. This is discussed in Section 4.3.2.

## 4.3 Methodology

### 4.3.1 Inverse Law

The light intensity modelling used the inverse square law of illuminance which states that *a doubling of distance results in a reduction in illuminance by four times*, i.e. as a surface that is illuminated by a light source moves away from the light source, the surface appears dimmer. Light emitted becomes dimmer in an inverse square relationship to distance as represented in Figure 4-1 and in the mathematical equation below:

$$E = \frac{I}{D^2}$$

Where

- E = illuminance (in lux),
- I = luminous intensity (in candela), and
- D = the distance from the light source in meters.

Figure 4-1: Inverse square law.

### 4.3.2 Analogues

As flares are not designed to be luminous, there is some uncertainty in calculating luminous intensity from a flare. To reduce the uncertainty, light measurements from an analogue, existing flares have been utilised to calculate likely light emissions from the flare. These analogues are documented within publicly available literature on light emissions from flares.

The analogues for gas flares were identified and are detailed in Table 4-1.

Table 4-1: Details of potential analogue natural gas flares.

ANALOGUE SITE	FACILITY TYPE	FLARE RATE	LUMINANCE INTENSITY	ILLUMINANCE METHOD	REFERENCE
<b>Galoc FPSO – Philippines</b>	Tamarind operated FPSO oil facility: Continuous gas flare	~15 MMscfd, 18–20 m high flame	Not specified	N/A (Flame height provided only)	Tamarind (2019)
<b>Wheatstone LNG Plant – Onslow, WA</b>	Chevron-operated onshore LNG facility: Safety flare	Not specified	Not specified	Modelled Illuminance (lux)	URS Australia (2010)
<b>Narrabri Gas Project – Bibblewindi, NSW</b>	Proposed Santos-operated onshore gas production facility: Safety flare	244 MMscfd, 30 m high flame	Not specified	Modelled Illuminance (lux) based on measured and calculated source data	Imbricata Environmental (2018)
<b>Obigbo Oil Production Facility – Nigeria</b>	Shell-operated oil production facility: Continuous flaring of associated gas	30 MMscfd	~1,805,000 cd	Measured Illuminance (lux)	Isichei and Sanford (1976) Nwaobi (2005) European Commission (2014)

The four analogues were compared to the expected flare characteristics (rates, flame heights) for the Exploration Campaign to determine if they were appropriate for use in this light emissions assessment.

The Galoc FPSO has a continuous flare which operates at a flare rate of ~15 MMscfd. However, it has not had light intensity levels or illuminance levels measured or modelled, and is therefore not considered further within this light intensity assessment.

The Wheatstone LNG flare has modelled illuminance information, but no details on flare rate are publicly available. As this information is unknown, the Wheatstone LNG flare was not carried through to the next stage of assessment as a potential analogue.

Despite the similar flame height (30 m for Narrabri compared to the 22 m from the exploration campaign MODU), the Narrabri gas flare rate is >200 MMscfd, which is an order of magnitude higher than that for the Exploration Campaign, and as such was not considered an appropriate analogue and is not discussed further in this assessment.

The Obigbo facility has a continuous flare that is of similar scale and has a flare rate (30 MMscfd) close to the rate expected for the Exploration Campaign (40 MMscfd). For these reasons, the Obigbo oil production facility was considered an appropriate analogue for the MODU flare. A detailed study describing lux levels at varying distances from the operational flare was also available for the Obigbo oil production facility (Isichei and Sanford, 1976). The detail provided in that study, as well as Nwaob (2005) and European Commission (2014) allow for the characteristics of the Obigbo flare to be scaled and for characterisation of other flares. This data provides the basis for the following flare light intensity modelling.

### 4.3.3 Model

The light intensity model was built in Microsoft Excel utilising the inverse law of illumination (Section 4.3.1). The following assumptions were made.

- Obigbo oil production facility flare characteristics as stated in Table 4-1,
- Combustion characteristics of the Exploration Campaign flare are similar to Obigbo,
- No allowance was made for atmospheric or topographic interactions including shadowing, absorption or scattering, as such the model is conservative and likely to overestimate illuminance at distance,
- Flare luminous intensity is calculated directly proportional to flare flow rate, and
- Facility luminous intensity is combined with the flare luminous intensity as a total luminous intensity input into the model.

Illuminance was calculated every 100 m from the flare source (in lux), and results overlaid in geographic information system (GIS) to identify geospatial contours.

A verification exercise of the Xodus Group light decay model (Xodus model) was conducted using the light decay model developed by Jacobs-SKM for the Browse FLNG Draft Environmental Impact Statement (Jacobs-SKM, 2014). The verification exercise for the Xodus model plotted the Xodus Group light decay model expected illuminance for the Browse Development against the Jacobs-SKM modelled illuminance. The Xodus model predicted illumination levels aligned with the Jacobs-SKM model, verifying the Xodus model outcomes.

## 4.4 Results and Recommendations

The results of the light intensity modelling are summarised in Table 4-2 and are also shown graphically for the Exploration Campaign in Figure 4-2 to Figure 4-5.

Table 4-2: Illuminance modelling results and Obigbo analogue.

SITE/SCENARIO	FLARE LUMINANCE INTENSITY (CD)	LIGHT ILLUMINANCE (LUX)						
		Distance from Facility (km)						
		0.5 km	1 km	5 km	10 km	20 km	30 km	60 km
Analogue Case								
Obigbo Facility – Nigeria	~1,805,000	7.2	1.8	0.072	0.018	0.004	0.002	< 0.002
Modelled Cases								
Exploration Campaign facility lighting from the MODU	~100,000	0.4	0.1	0.004	0.001	0.0002	<0.0001	<0.0001
Exploration Campaign combined facility lighting and flaring from the MODU (40 MMscfd)	~ 2,495,667	10.0	2.5	0.100	0.025	0.006	0.003	0.0007

For the Exploration Campaign, the model predicted the following for the facility lighting when flaring (Figure 4-2 and Figure 4-3):

- Light intensity levels greater than 0.1 lux are predicted to occur up to 5 km from the MODU, comparable to ambient light levels during full moon to twilight.
- Between 5 km and 16 km from the MODU, the model predicted light intensity levels comparable to ambient light levels during a quarter moon to full moon night sky (0.01 lux to 0.1 lux).
- Between 16 km and 49 km, light intensity levels were predicted to be between 0.01 lux and 0.001 lux, which is comparable to ambient light intensity levels between a moonless clear night sky and a quarter moon.
- Beyond 49 km, there was no measurable change to the ambient light intensity levels.

For the Exploration Campaign, the model predicted the following for the facility lighting when not flaring (Figure 4-4 and Figure 4-5):

- Light intensity levels greater than 0.1 lux are predicted to occur up to 1 km from the MODU, comparable to ambient light levels during full moon to twilight.
- Between 1 km and 3 km from the MODU, the model predicted light intensity levels comparable to ambient light levels during a quarter moon to full moon night sky (0.01 lux to 0.1 lux).
- Between 3 km and 9 km, light intensity levels were predicted to be between 0.01 lux and 0.001 lux, which is comparable to ambient light intensity levels between a moonless clear night sky and a quarter moon.
- Beyond 9 km, there was no measurable change to the ambient light intensity levels.

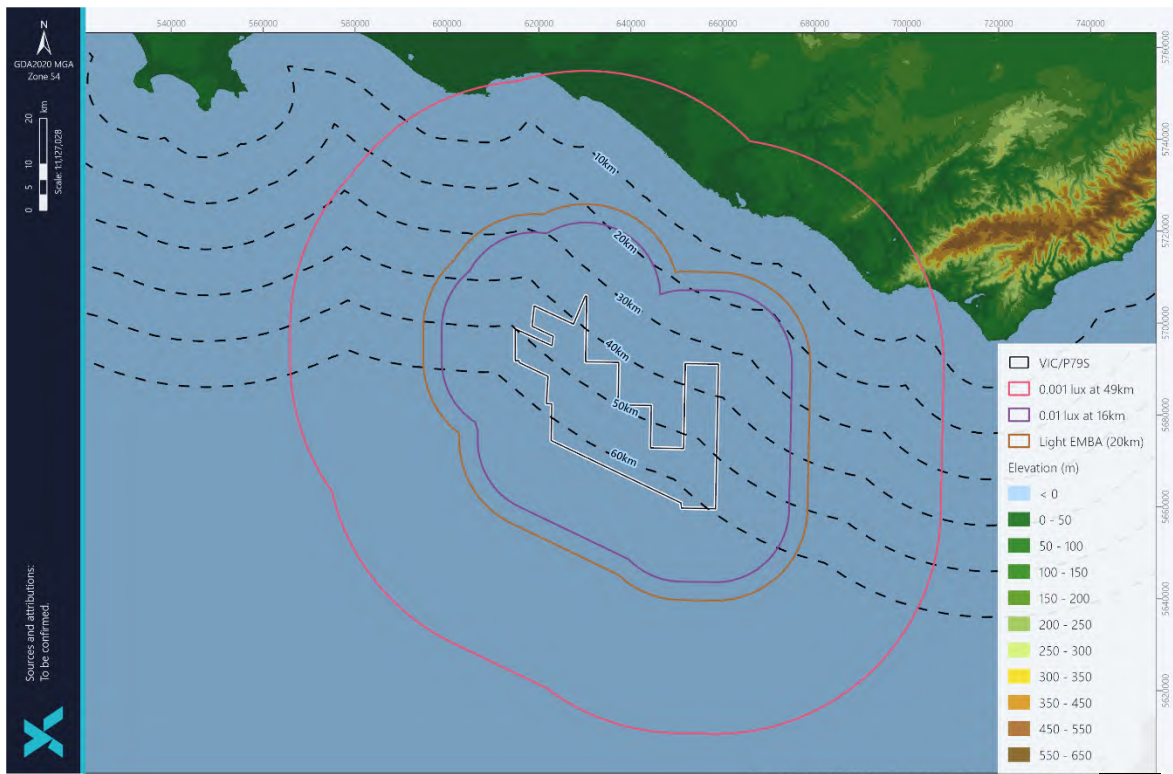

Figure 4-2: Map of expected light intensity (illuminance) levels from flare and facility lighting on the MODU during flaring (40 MMscfd).

Figure 4-3: Expected light intensity levels from flare and facility lighting on the MODU during flaring (40 MMscfd) at receptor locations.

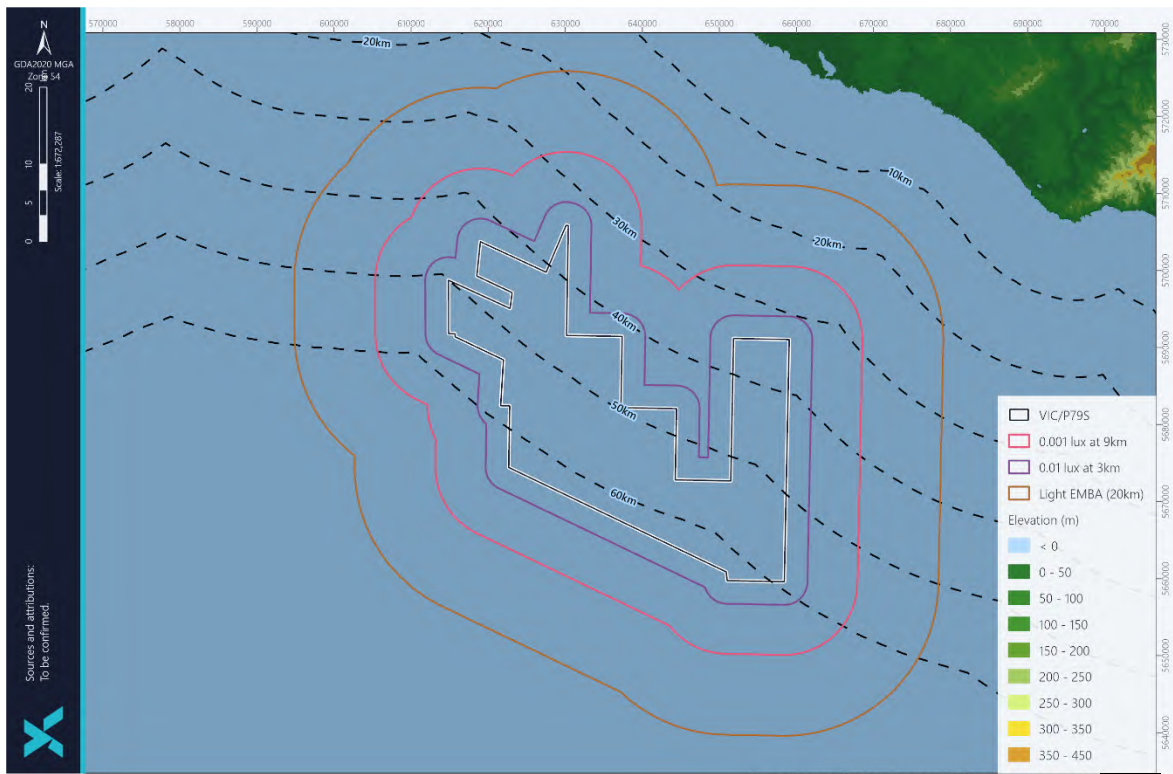

Figure 4-4: Map of expected light intensity (illuminance) levels from facility lighting on the MODU, when not flaring.

Figure 4-5: Expected light intensity levels from facility lighting on the MODU at receptor locations when not flaring.

As noted in Section 2.2, in recognition that photometric measurements are biased towards the human eye response to light, the spatial extent potentially impacted by visible light from the MODU, as a visible dot on the horizon, is out to a distance of 9 km from the position of the MODU when not flaring (Figure 4-4 and figure 4-5). Note: This is distinct from the biological light EMBA which is relevant for the potential assessment of impacts to, for example, birds.

The spatial extent potentially impacted by visible light from flaring and MODU lighting, as a visible dot on the horizon, is out to a distance of 49 km from the position of the MODU (Figures 4-2 and 4-3).

As shown in the light intensity results, the light intensity levels of the MODU structure received at the selected receptor locations of Twelve Apostles Marine National Park (34 km), Mepunga Coastal Reserve (34 km), Great Otway National Park (60 km), Coradjil Nature Conservation Reserve (60 km) and the nearby towns are comparable to the ambient light levels less than a quarter moon (0.01 lux) when flaring and less than a moonless clear night sky (0.001 lux) when not flaring, which are equivalent to the 'First Quarter' and 'New' moon phases shown in Figure 4-6, respectively.

# 1 INTRODUCTION

## 1.1 Project Overview

The Otway Exploration Drilling Campaign is located within Commonwealth waters in the Bass Strait in an area centred approximately 37.9 km offshore Victoria (VIC) and approximately 14.3 km west of King Island as pictured in Figure 1-1. The field lies in approximately 90-120 m of water within permit T/49P. ConocoPhillips Australia plan to execute an exploration well drilling campaign within T/49P. This will include drilling in up to six potential well locations and will occur for approximately 45 days per well. This campaign is referred to as the Exploration Campaign throughout the rest of this document.

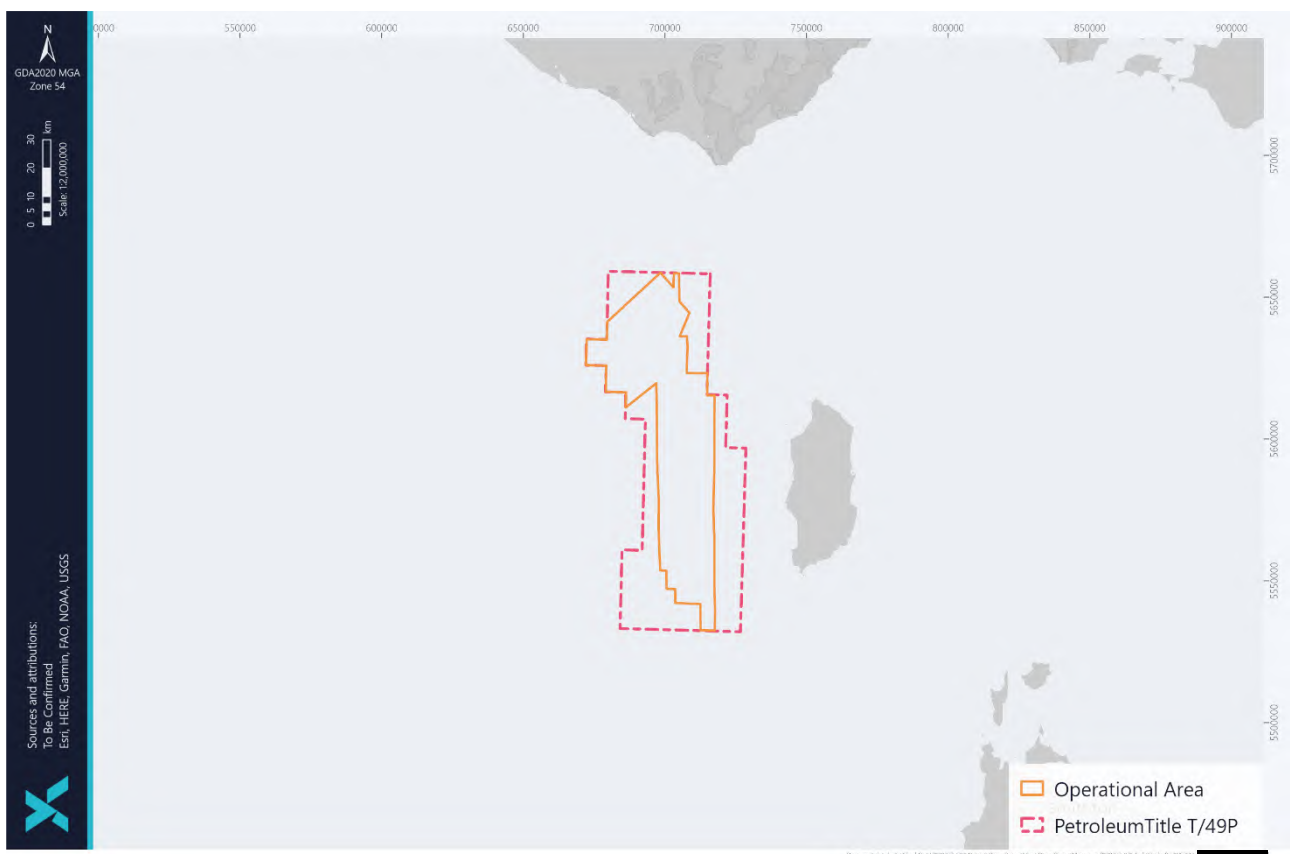

Figure 1-1 Operational area and potential well locations

## 1.2 Objective

The purpose of this technical note is to present the outcomes of the assessment undertaken to estimate the artificial light emissions from the Exploration Campaign. This study assessed distances from the considered operations to the physical equipment, lights and flaring from the mobile offshore drilling unit would be visible and where light levels from facility lighting and well test flaring reached thresholds corresponding to various natural light levels.

## 1.3 Scope

The operations of the mobile offshore drilling unit (MODU) and associated facilities and activities of the Exploration Campaign will require the physical presence of a MODU and generate artificial light emissions. The source of these emissions includes

- external facility lighting on vessels and Mobile Offshore Drilling Unit (MODU) for safe navigation and working conditions
- flaring of excess associated gas will be from a horizontal boom flare and will occur up to approximately 42 hours per event.

Both sources of light emissions are quantified and discussed in this technical note. The exact well locations are yet to be determined therefore all potential locations were considered for modelling (Figure 1-1).

The assessment included two sets of modelling:

- visible line of sight estimates
- light intensity (illuminance) modelling.

Light intensity modelling has been used as an indication of the measurable change in ambient light conditions, while line of sight estimates have been used as an indication of the distance that the facility and its lights may be visible. These quantifications have been used to develop two types of area used for subsequent environmental impact analysis (Table 1-1).

The modelling utilises the MODU as the basis for modelling as it will be the largest and tallest piece of infrastructure that will be infield for the Exploration Campaign. The modelling light intensity modelling utilises the two major sources of light emissions as the basis for the model, the MODU lighting and flaring from the MODU for well testing. Artificial light emissions from vessels (e.g. support vessels, export tankers) associated with the Exploration Campaign were not included in the assessment due to their much smaller scale and/or temporary and transient nature.

*Table 1-1 Predicted artificial light exposure and impact areas for the exploration campaign*

ARTIFICIAL LIGHT ASSESSMENT AREAS	DESCRIPTION
Visible Light Exposure Area	The spatial extent of visible light that is predicted to occur from the exploration campaign. The threshold for this area is whether any part of the facility is visible as a dot on the horizon.
Potential Impact Area	The spatial extent of a measurable change in ambient light that is predicted to occur from the exploration campaign. The threshold for this area is an illuminance equivalent to ambient light on a moonless clear night sky/new moon (<0.001 lux). This is the area relevant to the impact assessment for planned light emissions from the exploration campaign.

## 2 LIGHT

### 2.1 Definition

Light is a form of energy that is emitted over a particular band of frequencies and wavelengths of the electromagnetic spectrum, and includes ultraviolet, visible (to humans) light and infrared light. The visible range for humans is approximately 400–700 nm. Fauna perceive light differently to humans, and their visible spectrum can vary between ~300 nm and >700 nm depending on the species (CoA 2020).

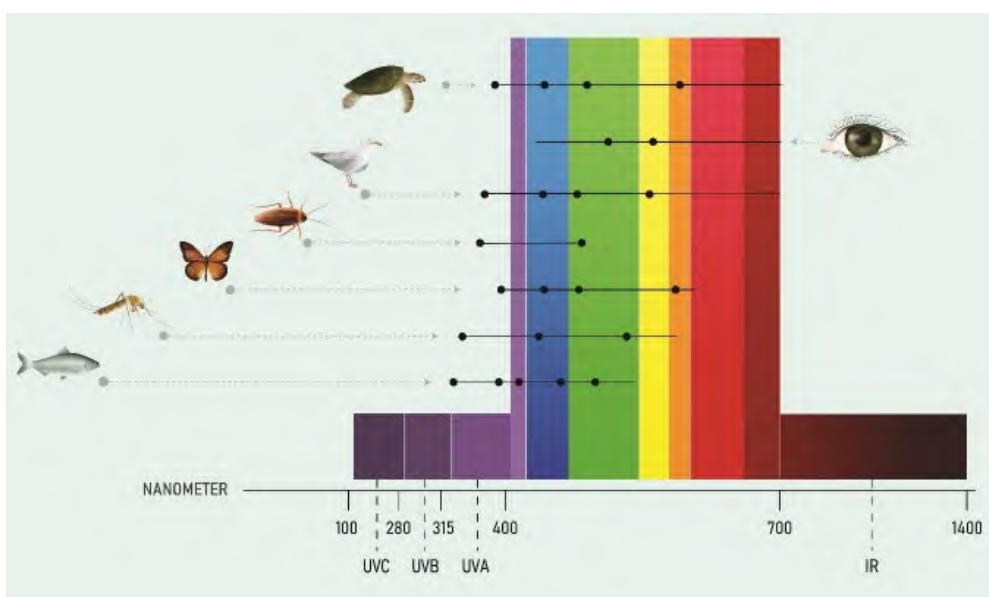

Figure 2-1: Ability to perceive different wavelengths of light in humans and wildlife is shown by horizontal lines. Black dots represent reported peak sensitivity. Note the common sensitivity to short wavelength light across all wildlife (Campos, 2017; Commonwealth of Australia, 2020).

Humans and fauna use photoreceptor cells (cones and rods) in the eye to detect light. Photopic vision, which occurs in bright conditions, activates the cones and allow the eye to see colour. Scotopic vision, which occurs in low light conditions, activates rods and allow the eye to see in shades of grey. Scotopic vision is more sensitive to shorter wavelength light than photopic visions (CoA 2020). Nocturnal species rely on scotopic vision and can therefore be sensitive to changes in light at this high energy short wavelength end of the spectrum (i.e. ultraviolet/violet/blue light).

### 2.2 Measurement

Radiometry is the detection and measurement of electromagnetic radiation. With respect to optics, radiometry refers to the detection and measurement of radiant energy within the light (ultraviolet, violet, infrared) portion of the electromagnetic spectrum. Photometry is a subset of radiometry that applies to the visible light spectrum and measured values are also weighted to the typical response of a human eye. As humans and fauna perceive light differently, radiometric measurements are more biologically relevant, as they account for the energy emitted across

all light wavelengths (CoA 2020). Common quantities used to describe light in radiometric and photometric terms are provided in Table 2-1.

Table 2-1 Typical radiometric and photometric quantities

RADIOMETRIC			PHOTOMETRIC		
Quantity	Symbol	Units	Quantity	Symbol	Units
Radiant power	$\Phi_E$	W	Luminous flux	$\Phi_V$	lm
Radiant intensity	$I_E$	W/sr	Luminous intensity	$I_V$	lm/sr (or cd)
Irradiance	$E_E$	W/m <sup>2</sup>	Illuminance	$E_V$	lm/m <sup>2</sup> (or lux)
Radiance	$L_E$	W/m <sup>2</sup> sr	Luminance	$L_V$	lm/m <sup>2</sup> sr

*E = energetic; V = visual; W = watt; sr = steradian; lm = lumen; cd = candela*

The conversion between radiometric and photometric units is dependent on the photopic spectral luminous efficiency function,  $V(\lambda)$ , as defined by the Commission International de l'Eclairage (CIE) in 1924, and the spectral radiant power curve,  $\Phi_E(\lambda)$ , of the light source. The conversion is provided by the following relationship:

$$\Phi_V = K_m \int_{\lambda=380}^{\lambda=830} \Phi_E(\lambda) V(\lambda) \delta\lambda$$

Where:

- $\Phi_V$  is the luminous flux (lumens)
- $K_m$  is a scaling factor equivalent to 683 lm/W
- $\Phi_E(\lambda)$  is the spectral radiant power (W/nm)
- $V(\lambda)$  is the photopic spectral luminous efficiency function.

The photopic spectral luminous efficiency function,  $V(\lambda)$ , is a function of wavelength and relates to how a human eye responds to that wavelength of light. In humans the photoreceptor cells are more responsive to green/yellow wavelength light compared to red or violet.  $V(\lambda)$  can be approximated by the following non-linear regression:

$$V(\lambda) = 1.019e^{-285.4(\lambda-0.559)^2}$$

Empirical data shows that the function has a maximum value at a wavelength of 555 nm Figure 2-2, which is the wavelength at which the human eye is most responsive. Spectral luminous efficiency varies across different animal species this is discussed further in section 2.3.

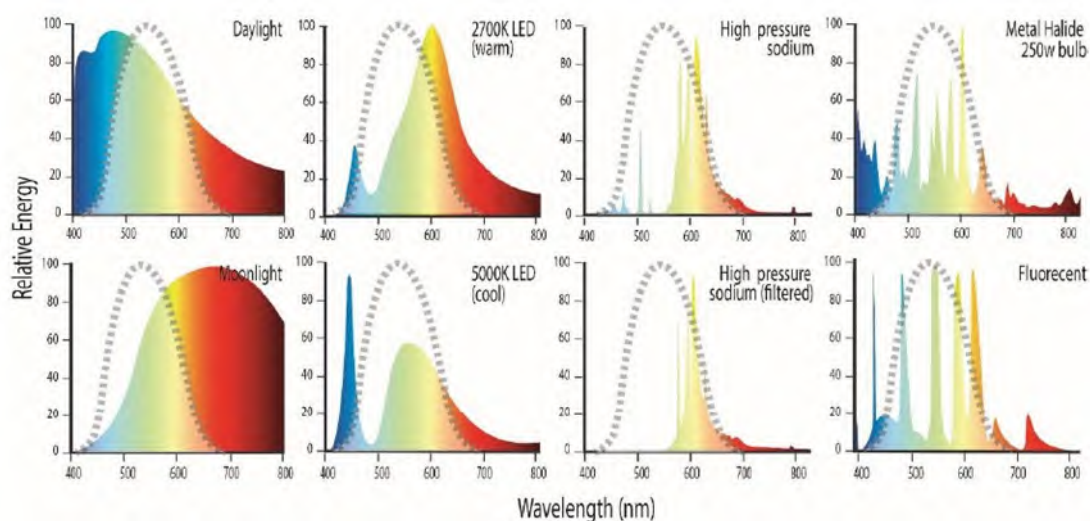

Figure 2-2 Spectral luminous efficiency function

The spectral radiant power of a light source is also related to wavelength, however, will also change depending on the type of light (Figure 2-3, Figure 2-4). The significance of a spectral power curve becomes apparent when using a photometric measurement to describe light for a source that is, for example, high in blue light emissions (such as cool LED or metal halide; Figure 2-3) or high in infrared emissions (such as a gas flare; Figure 2-3) as a photopic measurement may be underestimating the amount of light present as the photopic curve puts a higher weighting on light emitted in the green/yellow range compared to the blue or red (Figure 2-1).

(Source: (CoA 2020))

Figure 2-3 Relative spectral radiant power curves for common natural and artificial light sources (shown in colour) with photopic response curve (grey dashed line)

Figure 2-4 Predicted spectral radiance curve for a natural gas flare (based on 2,000 K blackbody emission)

## 2.3 Artificial Light Assessment

To date, light monitoring equipment has predominantly used photopic measurements. Few light measurement techniques that are appropriate for capturing biologically relevant light and are commercially available exist (Table 1 in CoA 2020). As described in Section 2.2, due to the photopic spectral luminous efficiency function being based on a human eye response, there is lower sensitivity in photometric measurements to shorter wavelength light (ultraviolet, violet, blue) that is important to nocturnally active marine fauna. However, as noted within the National Light Pollution Guidelines (CoA 2020), photometric measures can be used in impact assessment on wildlife, but limitations should be acknowledged and considered.

For the light intensity (illuminance) modelling component of the artificial light emissions assessment for the Exploration Campaign (refer to Section 4), photometric measurements have been used. This decision was based on the type of published measured light data that was available to identify analogues and to use as input to the light modelling calculations.

Photometric light can be described in terms of luminous flux, luminous intensity and illuminance:

- luminous flux is a measure of the amount of light from a source emitted in total regardless of direction (unit of measurement: lumens)
- luminous intensity is the amount of light emitted in a particular direction; the direction is typically stated in steradians (unit of measurement: candelas)
- illuminance is the amount of light reaching an area (unit of measurement: lux; where 1 lux is equivalent to 1 lumen/m<sup>2</sup>).

These terms are graphically depicted in Figure 2-4.

Illuminance (also referred to as light intensity) is the term of interest for environmental impact assessment for the ConocoPhillips Australia.

Typical light illuminance values from natural light sources are described in Table 2-2 and these are considered representative of ambient light levels in the vicinity of the Exploration Campaign in Victoria and King Island.

There are currently no published or accepted thresholds at which artificial light may impact fauna. Consequently, the minimum threshold used to describe a change in ambient light conditions within this artificial light assessment is an illuminance equivalent to a new moon / moonless clear night sky (0.001 lux), beyond this threshold no impact to light sensitive fauna is assumed. This threshold (0.001 lux) was selected on the basis that fauna undertake nocturnal activities under the natural range of full moon (0.1 lux) to new moon (0.001 lux) without known adverse impacts.

In recognition that the photopic curve is biased towards a human eye response to light, and to remove some of the scientific uncertainty associated with the way light is measured, a Potential Impact Area' (i.e. the area relevant for impact assessment of planned light emissions; Table 1-1) has been defined. This Potential Impact Area conservatively uses an initial luminous intensity value 20% higher than the measured/modelled analogue value. This additional distance provides a layer of conservatism to the modelling and subsequent impact assessment.

Figure 2-5 Photopic light terminology

Table 2-2 Summary of natural light illuminance

NATURAL LIGHT SOURCE	LIGHT ILLUMINANCE (LUX)
Direct sunlight	100,00–130,000
Full daylight, indirect sunlight	10,000–20,000
Overcast day	1,000
Very dark day	100

NATURAL LIGHT SOURCE	LIGHT ILLUMINANCE (LUX)
Twilight	10
Deep twilight	1
Full moon	0.1
Quarter moon	0.01
Moonless clear night sky (new moon) <sup>1</sup>	0.001
Moonless overcast night sky	0.0001

(Source: ERM 2010)

<sup>1</sup> Impact threshold utilised in this report is 0.001 lux, beyond this threshold no impact to light sensitive fauna is assumed.

## 3 VISIBLE LINE OF SIGHT ASSESSMENT

### 3.1 Methodology

A visible line of sight analysis was conducted using the methodology described in Stallings (2014) for the MODU to determine the worst-case potential extent of visible light for the ConocoPhillips Australia. Line of sight and viewshed analysis is typically used in environmental impact assessment for the assessment of impact to visual amenity where an impact may alter a perceived sense of place or inherent value. The visibility of an artificial light does not imply a measurable change in ambient light (and therefore a potential environmental impact), this is estimated through change to illuminance as discussed in Section 4).

Line of sight calculations utilised the following method:

$$d = \left( 2 \cdot \frac{4}{3} R h_1 + h_1^2 \right)^{0.5} + \left( 2 \cdot \frac{4}{3} R h_2 + h_2^2 \right)^{0.5}$$

Where

- $h_1$  = height of object
- $h_2$  = height of receptor
- $R$  = radius of earth
- $d$  = total line of sight ( $d_1 + d_2$ )

The analysis was completed using assumed heights of an analogue MODU for the Exploration Campaign, with final designs being confirmed during front end engineering (FEED) (Table 3-1). Receptor heights modelled included the highest point on King Island (165m above sea level) as well as a receptor at sea level.

Table 3-1 Exploration Campaign facility infrastructure and receptor heights

EXPLORATION CAMPAIGN FACILITY INFRASTRUCTURE	HEIGHT OF RECEPTOR (M) ABOVE SEA LEVEL	HEIGHT OF FACILITY / LIGHTING / FLARE (M) ABOVE SEA LEVEL
Receptor at King Island (highest point)		
Main deck light	165	40
Process module lights	165	50
Lighting on the flare tower/drill rig	165	80
Derrick (navigation lights)	165	120
Boom flare flame height (horizontal boom)	165	40
Receptor at Sea Level		
Main deck light	0	40
Process module lights	0	50
Lighting on the flare tower/drill rig	0	80
Derrick (navigation lights)	0	120
Boom flare flame height (horizontal boom)	0	40

## 3.2 Results and Recommendations

The line of sight assessment results for the different heights of the MODU facilities and receptors is outlined in Table 3-2.

The line of sight assessment shows that at sea level the maximum distance the tip of the MODU derrick (navigation lights) would be visible above the horizon was 45km. The flare and equipment above main deck level would be visible from 26km from the MODU location.

From the maximum height of King Island the tip of the MODU derrick (navigation lights) would be visible above the horizon when the MODU was up to 98km from King Island. The flare and equipment above deck level would be visible when the MODU was up to 79km from King Island.

The line of sight assessment indicates that the MODU will be visible as a small object or light on the horizon from King Island and to a lesser extent Great Otway National Park during the drilling campaign (Table 3-2 and Figure 3-2)<sup>2</sup>. It is likely that flaring will be visible at elevated locations on King Island and Great Otway National Park.

It is recommended that a view shed analysis of the MODU structure be completed to quantify the visual impact and provide a communication tool to stakeholders of King Island and Great Otway National Park.

*Table 3-2 Exploration campaign facility visual line of sight distances*

EXPLORATION CAMPAIGN INFRASTRUCTURE	HEIGHT OF RECEPTOR (m)	HEIGHT OF FACILITY / LIGHTING / FLARE (m)	VISIBLE RADIUS - LINE OF SIGHT ANALYSIS (km)
<b>Receptor King Island (highest point)</b>			
Main deck light	165	40	79.0
Process module lights	165	50	82.1
Lighting on the drill rig	165	80	89.8
Derrick (navigation lights)	165	120	98.1
Flare flame height (horizontal boom)	165	40	79.0
<b>Receptor Sea Level</b>			
Main deck light	0	40	26.1
Process module lights	0	50	29.1
Lighting on the drill rig	0	80	36.9
Derrick (navigation lights)	0	120	45.2
Flare flame height (horizontal boom)	0	40	26.1

<sup>2</sup> The expected position (including the 2 km buffer around the potential drill locations) of the MODU has been accounted for in the development of the Visible Light Exposure Area, with the respective distances being measured from the entire alignment along which the MODU may move instead of a single point.

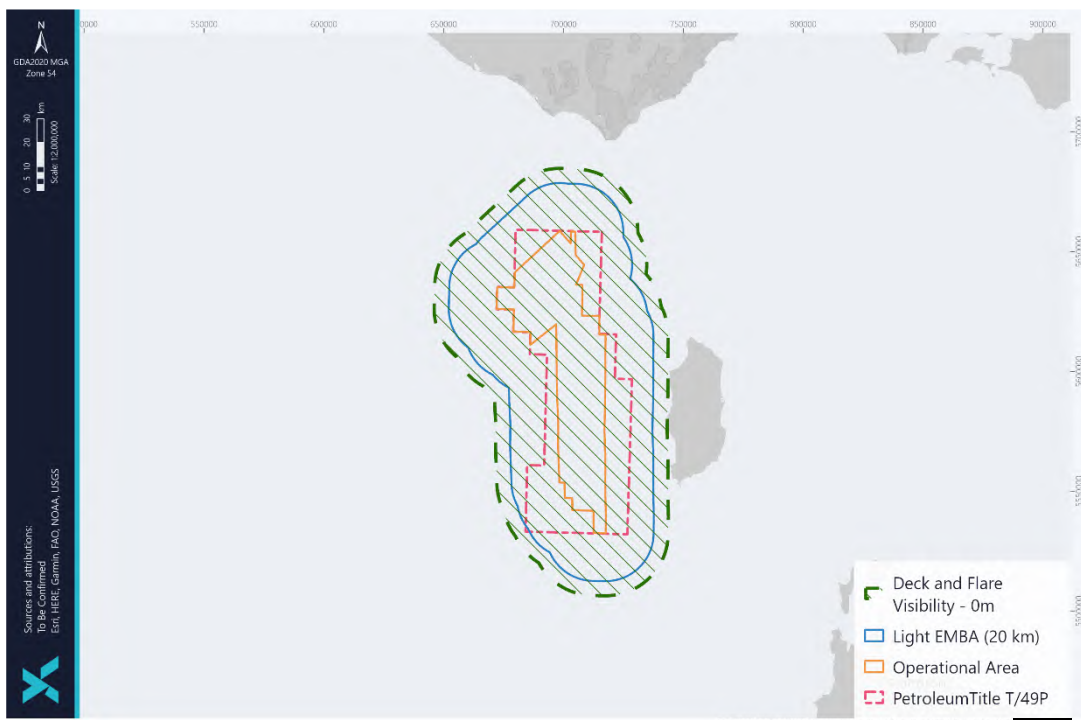

Figure 3-2 Area of Visibility (Deck flare and derrick)

## 4 LIGHT INTENSITY MODELLING

The two sources of artificial lighting (facility and flaring) for the Exploration Campaign were assessed separately, using published modelled and measured data as analogues.

It is noted that most commercial light modelling software requires the input of a number of factors, such as the light fitting type, quantity, and location of light sources – information which is not available at this preliminary stage. As such, the use of analogues was adopted, as this provided a real-world analogue on which to base the artificial light emissions assessment. It is also considered a conservative approach as does not include any best practice or additional mitigation measures that may be adopted by ConocoPhillips during the FEED of the project.

### 4.1 Facility Lighting

It is expected that the MODU for the Exploration Campaign will have a similar lit surface area as the drill rig utilised for the Woodside Torosa drilling campaign on Browse reef. The MODU utilised for the Exploration Campaign will be similar with similar lighting required for safe operations of the facilities. Therefore the MODU facility light emissions would also be comparable to that of the Torosa facilities used during a previous light intensity modelling completed by ERM (2010). Light characteristics and modelling of light sources for the Torosa assessment are based on measured lighting data (lux levels and wavelength) obtained whilst drilling the Torosa South-1 appraisal well on the edge of the South Reef lagoon and ambient data when no activities were occurring at Scott Reef (SKM and ERM 2008). The drill rig used is a suitable analogue for the drill rig planned to be used for the T/49P Exploration Campaign.

The light intensity values derived from the measured Torosa South 1 well campaign are utilised for MODU facility lighting for the Exploration Campaign modelling.

### 4.2 Flare Light Emissions

The Exploration Campaign will require a MODU flare to dispose of the gas generated from well testing. The gas is produced and flared to allow for testing of the produced gas and oil as well as to calculate the size of the oil and gas reservoir. The excess oil and gas is sent to the flare disposal system to be burnt. The well test and flare system includes production systems, separator, knock out drums, ignition system and a flare. The flare for the MODU will be a horizontal boom flare extending out horizontally of the MODU deck. Flaring will occur for a duration of approximately 42 hours per well.

To inform the environmental impact assessment for Exploration Campaign environmental approvals, light intensity from a flare flow rate of 25mmscfd was modelled. This represents a peak flaring rate from the well test systems.

Using the Gas Processors Suppliers Association Engineering Data Book (1998), it has been calculated that this expected rate of flaring will result in a flare flame length of approximately 14 m. This flame will generate light. Analogues are utilised to determine the likely amount of light emitted from the flame. This is discussed in section 4.3.2.

## 4.3 Methodology

### 4.3.1 Inverse Law

The light modelling used the inverse square law of illuminance which states that *a doubling of distance results in a reduction in illuminance by four times*, i.e. as a surface that is illuminated by a light source moves away from the light source, the surface appears dimmer. Light emitted becomes dimmer in an inverse square relationship to distance as represented in Figure 4-1 and in the mathematical equation below:

$$E = \frac{I}{D^2}$$

Where

- E = illuminance (in lux)
- I = luminous intensity (in candela)
- D = the distance from the light source in meters.

Figure 4-1 Inverse square law

Therefore, it is possible to calculate luminance intensity if the illuminance and the distance from the source is known (and vice versa).

### 4.3.2 Analogues

As flares are not designed to be luminaries (light emitting devices) there is some uncertainty in calculating luminance intensity from a flare. To reduce the uncertainty light measurements from an analogue existing flare have been utilised to calculate likely light emissions from the flare. These analogues are documented within publicly available literature on light emissions from flares.

The following analogues for gas flares were identified and are detailed in Table 4-1:

- Galoc Oil FPSO – Philippines
- Obigbo Oil Production facility – Nigeria
- Narrabri Gas Project safety flare – New South Wales
- Wheatstone LNG facility flare – Western Australia.

*Table 4-1 Details of potential analogue natural gas flares*

ANALOGUE SITE	FACILITY TYPE	FLARE RATE	LUMINANCE INTENSITY	ILLUMINANCE METHOD	REFERENCE
<b>Galoc FPSO – Philippines</b>	Tamarind operated FPSO oil facility continuous gas flare	~15 MMscfd 18–20 m high flame	Not specified	N/A (Flame height provided only)	Tamarind 2019
<b>Wheatstone LNG Plant – Onslow, WA</b>	Chevron-operated onshore LNG facility: Safety flare	Not specified	Not specified	Modelled Illuminance (lux)	URS 2010
<b>Narrabri Gas Project – Bibblewindi, NSW</b>	Proposed Santos-operated onshore gas production facility: Safety flare	244 MMscfd 30 m high flame	Not specified	Modelled Illuminance (lux) based on measured and calculated source data	Imbricata 2018
<b>Obigbo North – Nigeria</b>	Shell-operated oil production facility: Continuous flaring of associated gas	30 MMscfd	~1,805,000 candelas	Measured Illuminance (lux)	Isichei et al 1976 Nwaob 2005 European Commission 2014

The four analogues were compared to the expected flare characteristics (rates, flame heights) for the Exploration Campaign to determine if they were appropriate for use in this light emissions assessment.

The Galoc FPSO has a continuous flare which operates at a flare rate of ~15mmscfd, relatively close to the flare rate expected in the Exploration Campaign. However, the Galoc FPSO has not had light intensity levels or illuminance levels measured or modelled, and is therefore not considered further within this light intensity assessment.

The Wheatstone LNG flare has modelled illuminance information, but no details on flare rate are publicly available. As an unknown, the Wheatstone LNG flare was carried through to the next stage of assessment as a potential analogue.

Despite the similar flame height (30 m for Narrabri compared to the 14.5 m from the Exploration Campaign MODU), the Narrabri gas flare rate is >200 MMscfd, which is an order of magnitude higher than that for the Exploration Campaign and as such was not considered an appropriate analogue and is not discussed further in this assessment.

The Obigbo facility has a continuous flare that is of similar scale and has a flare rate in the same order of magnitude to the rate expected for the Exploration Campaign. For these reasons the Obigbo oil production facility was considered an appropriate analogue for the MODU flare. A detailed study describing lux levels at varying distances from the operational flare was also available for the Obigbo oil production facility (Isichei et al. 1976). The detail provided in that study, as well as Nwaob (2005) and European Commission (2014) allows for the characteristics of the Obigbo flare to be scaled and allow for characterisation of other flares. This data provides the basis for the following flare light intensity modelling.

### 4.3.3 Model

The light model was built in Microsoft Excel utilising the inverse law of illumination (Section 4.2.1.1). The following assumptions were made.

- Obigbo North flare characteristics as stated in Table 4-1.
- Combustion characteristics of the Exploration Campaign flare are similar to Obigbo.
- No allowance was made for atmospheric or topographic interactions including shadowing, absorption or scattering as such the model is conservative and likely to overestimate illuminance at distance.
- Flare luminance intensity is calculated directly proportional to flare flow rate.
- Facility luminance intensity is combined with the flare luminance intensity as a total luminance intensity input into the model

Illuminance was calculated every 100 m from the flare source (in lux), and results overlaid in GIS to identify geospatial contours.

A verification exercise of the Xodus Group light decay model (Xodus model) was conducted using the light decay model developed by Jacobs-SKM for the Browse FLNG Draft Environmental Impact Statement (Jacobs-SKM 2014). The verification exercise for the Xodus model plotted the Xodus Group light model expected illuminance for the Browse Development against the Jacobs-SKM modelled illuminance for the Browse Development. The Xodus model predicted illumination levels aligned with the Jacobs - SKM model verifying the Xodus model outcomes.

## 4.4 Results and Recommendations

The results of the light intensity modelling are summarised in Table 4-2 and are also shown graphically for the Exploration Campaign in Table 4-2 and Figure 4-4.

Table 4-2 Illuminance modelling results and Obigbo analogue

SITE/SCENARIO	FLARE LUMINANCE INTENSITY (CD)	LIGHT ILLUMINANCE (LUX)						
		Distance from Facility (km)						
		0.5 km	1 km	5 km	10 km	20 km	30 km	40 km
Analogue Case								
Obigbo Facility – Nigeria	~1,805,000	7.2	1.8	0.072	0.018	0.004	0.002	< 0.002
Modelled Cases								
Exploration Campaign facility lighting from the MODU	~100,000	0.4	0.1	0.004	0.001	0.0003	<0.0001	<0.0001
Exploration Campaign combined facility lighting and flaring from the MODU (25MMscfd)	~1,604,167	6.4	1.6	0.064	0.016	0.004	0.002	0.001

For the Exploration Campaign, the model predicted the following for the combined facility lighting and flaring rate of 25 MMscfd during flaring (Figure 4-2):

- Light intensity levels greater than 0.1 Lux up to 5 km from the MODU, comparable to ambient light levels during full moon to twilight.
- Between 5 km and 13 km from the MODU, the model predicted light intensity levels comparable to ambient light levels during a quarter moon to full moon night sky (0.01 Lux to 0.1 Lux).
- Between 13 km and 40 km, light intensity levels were predicted to be between 0.01 Lux and 0.001 Lux, which is comparable to ambient light intensity levels between a moonless clear night sky and a quarter moon.
- Beyond 40 km there was no measurable change to the ambient light intensity levels.

For the Exploration Campaign, the model predicted the following for the facility lighting when not flaring (Figure 4-3):

- Light intensity levels greater than 0.1 Lux up to 1 km from the MODU, comparable to ambient light levels during full moon to twilight
- Between 1 km and 4 km from the MODU, the model predicted light intensity levels comparable to ambient light levels during a quarter moon to full moon night sky (0.01 Lux to 0.1 Lux)
- Between 4 km and 10 km, light intensity levels were predicted to be between 0.01 Lux and 0.001 Lux, which is comparable to ambient light intensity levels between a moonless clear night sky and a quarter moon
- Beyond 10 km there was no measurable change to the ambient light intensity levels.

As noted in Section 2.3, in recognition that photometric measurements are biased towards the human eye response to light, the Potential Impact Area for flare lighting at 25 MMscfd has been defined as a distance of 10 km from the expected position of the MODU when not flaring.

Therefore, during the operational phase of the ConocoPhillips Australia, the Potential Impact Area for flare lighting is 40 km from the expected position of the MODU during flaring, which will reduce to 10 km from the expected position of the MODU when not flaring Figure 4-4 and Figure 4-5.

It is recommended that environmental impact assessment consider the potential impact of light emissions. Based on the outcome of the environmental impact assessment it is recommended that the project conducts a review of facility lighting design and management against the *Light Pollution Guidelines: National Light Pollution Guidelines for Wildlife* (DoEE, 2020) Principles of Best Practice Lighting Design and incorporate ALARP lighting controls.

## 5 ABBREVIATIONS

ACRONYM	DESCRIPTION
cd	candela (unit of measurement for luminous intensity)
CIE	Commission International de l'Eclairage
FEED	Front end engineering design
FID	Final investment decision
FPSO	Floating production storage and offtake facility
FSO	Floating storage and offloading
K	kelvin (unit of measurement for temperature)
CONOCOPHILLIPS AUSTRALIA	CONOCOPHILLIPS AUSTRALIA Energy Pty Ltd
km	kilometre (unit of measurement for distance)
LNG	Liquefied natural gas
lm	lumen (unit of measurement for luminous flux)
m	metre (unit of measurement for distance)
m <sup>2</sup>	metres squared (unit of measurement for area)
MMscfd	Million standard cubic feet per day (unit of measurement for gas)
MODU	Mobile offshore drilling unit
nm	nanometre (unit of measurement for distance)
sr	steradian (or square radian; unit of a solid angle)
W	watt (unit of measurement for radiant power)

## Executive Summary

JASCO Applied Sciences (JASCO) performed a modelling study of underwater sound levels associated with the ConocoPhillips Otway Exploration Drilling Program to inform the Environmental Impact Identification (ENVID) process. This study considered specific components of the program across two petroleum titles (T/49P and VIC/P79), at representative nominal well locations within two operational areas.

This modelling study considers a range of activities including:

- Continuous noise emissions from:
  - An anchored Mobile Offshore Drilling Unit (MODU) conducting drilling operations.
  - Associated Anchor Handler Tug Supply (AHTS) vessel resupplying the MODU under dynamic positioning (DP).
  - An AHTS on standby near the MODU (patrolling a prescribed area at slow speed).
  - AHTS involved in pre-lay and mooring activities for the MODU.
- Impulsive noise emissions from a boomer-type Sub Bottom Profiler (SBP) during seabed surveys and Vertical Seismic Profiling (VSP) during well evaluation operations. As the boomer source had not been decided at the time of the modelling study, a commonly used representative system was used for the modelling, with levels derived from a previous JASCO field measurement campaign. For the VSP seismic source, JASCO's specialised airgun array source model was used to predict the acoustic signature.

The study assessed distances from operations where underwater sound levels reached thresholds corresponding to various levels of potential impact to marine fauna. The animals considered here included marine mammals, turtles, fish (including fish eggs and larvae) and benthic invertebrates. Due to the variety of species considered, there are several thresholds for evaluating effects, including: mortality, injury, temporary reduction in hearing sensitivity, and behavioural disturbance. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

The modelling methodology considered scenario-specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels for non-impulsive (continuous) noise sources presented as sound pressure levels (SPL,  $L_p$ ), and as accumulated sound exposure levels (SEL,  $L_E$ ). Estimated underwater acoustic levels for impulsive noise sources (VSP) are presented as sound pressure levels, zero-to-peak pressure levels (PK,  $L_{pk}$ ), peak-to-peak pressure levels (PK-PK;  $L_{pk-pk}$ ), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels as appropriate for different noise effect criteria. In this report, the duration of the SEL accumulation is defined as integrated over a 24 h period.

The  $SEL_{24h}$  is a cumulative metric that reflects the dosimetric impact of noise levels within 24 h based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding  $SEL_{24h}$  radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for 24 h. Therefore, a reported radius for  $SEL_{24h}$  criteria does not mean that marine fauna travelling within this radius of a source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for 24 h.

## Vessel and Drilling Noise

For the results below, the distances to isopleths/thresholds were reported from the most dominant single source. Maps are provided in the report to assist with contextualising tabulated distances. The key results of this acoustic modelling study are summarised below. There are no thresholds for invertebrates for effects from non-impulsive noise, therefore no results are reported.

A key finding from the study is that despite the 17 m (18%) depth difference between Essington and Garfield, Garfield's placement approximately 10 km closer to the shelf edge and similar geology between the two sites, the variations observed in the ranges to thresholds for the vessel related activities at both sites are minimal. While the proximity to the shelf edge does not greatly affect the results of inshore sites, Garfield West, located effectively on the shelf edge, clearly demonstrates the extended ranges to threshold expected in the offshore direction. Additionally, Garfield West has a highly reflective seabed geology, contributing to the favourable propagation conditions observed. The reason this extended propagation is not observed in the near shelf sites is due to the combination of sources and the source depths used in the modelling, the almost linear sound speed profile in the top 200 m and the attenuating influence of the calcarenite seafloor.

### ***Marine mammals:***

The maximum distances to the (NOAA) (2019) marine mammal behavioural response criterion of 120 dB re 1  $\mu$ Pa (SPL) are presented in Table 1. The results for the criteria from Southall et al. (2019) for marine mammal PTS and TTS for MODU and vessel operations were assessed for all scenarios assessed for each nominal location. The maximum distances and total ensonified areas are presented in Table 2.

Table 1. Maximum ( $R_{\max}$ ) and 95% ( $R_{95\%}$ ) horizontal distances (in km) to the marine mammal behavioural response criterion of 120 dB re 1  $\mu$ Pa (SPL) from the most appropriate location for considered sources per scenario.

Scenario	Description	British Admiral		Flanagan		British Admiral West		Merope (66 m depth)		Julpha (45 m depth)		Essington (93 m depth)		Garfield (110 m depth)		Garfield West (168 m depth)

**Sea turtles:**

The maximum distance to the SEL<sub>24h</sub> metrics of 220 dB re 1  $\mu\text{Pa}^2\text{s}$  for PTS and 200 dB re 1  $\mu\text{Pa}^2\text{s}$  for TTS was 0.06 km for PTS onset and 0.14 km for TTS onset for the non-impulsive noise sources (Finneran et al. 2017). As is the case with marine mammals, a reported radius for SEL<sub>24h</sub> criteria does not mean that sea turtles travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.

**Fish:**

Sound produced by the MODU and/or vessel operations are predicted to reach the sound levels associated with physiological effects, recoverable injury, and TTS for some fish species in close proximity to the sound sources (within 20 m). For the thresholds to be exceeded, fish would have to remain at those distances for either 12 or 48 h.

**Vertical Seismic Profiling****Marine mammals:**

The results for marine mammal injury applied the criteria from Southall et al. (2019), which requires two metrics (PK and SEL<sub>24h</sub>) to be considered in when assessing marine mammal Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS), with the longest distance associated with either metric being required to be applied. Table 3 summarises the maximum distances for PTS, along with the relevant metric associated with the maximum PTS distance. The maximum distance where the NOAA (2019) marine mammal behavioural response criterion of 160 dB re 1  $\mu\text{Pa}$  (SPL) is also presented in Table 3. The maximum distance where the NOAA (2019) marine mammal behavioural response criterion of 160 dB re 1  $\mu\text{Pa}$  (SPL) is also presented in Table 3. The maximum range to the low-frequency cetacean weighted threshold of 140 dB re 1  $\mu\text{Pa}$  (SPL) from Wood et al. (2012), applied to migrating southern right whales, was 6.48 km.

Table 3. Summary of maximum ( $R_{\text{max}}$ ) horizontal distances (in km) from any modelled site to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. Maximum extents are in the broadside direction.

Hearing group	Modelled distance to effect threshold ( $R_{\text{max}}$ )		
	Behavioural response <sup>a</sup>	Impairment: TTS <sup>b</sup>	Impairment: PTS <sup>b</sup>
Low-frequency (LF) cetaceans	1.50	2.39 <sup>c</sup>	0.33 <sup>c</sup>
High-frequency (HF) cetaceans		–	–
Very high-frequency (VHF) cetaceans		0.25 <sup>d</sup>	0.11 <sup>d</sup>
Otariid Pinnipeds		–	–

Noise exposure criteria: <sup>a</sup> NOAA (2019) and <sup>b</sup> Southall et al. (2019)

<sup>c</sup> Longest distance to threshold from all SEL<sub>24h</sub> results

<sup>d</sup> Longest distance to threshold from all PK results

A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

**Sea turtles**

- The PK sea turtle injury criteria of 232 dB re 1  $\mu\text{Pa}$  for PTS and 226 dB re 1  $\mu\text{Pa}$  for TTS from Finneran et al. (2017) was not exceeded at a distance longer than 20 m from the acoustic centre of the source.
- The maximum distance to the SEL<sub>24h</sub> metrics of 204 dB re 1  $\mu\text{Pa}^2\text{s}$  for PTS and 189 dB re 1  $\mu\text{Pa}^2\text{s}$  for TTS was 0.03 km for PTS onset and 0.27 km for TTS onset for the 750 in<sup>3</sup> seismic source

(Finneran et al. 2017). As is the case with marine mammals, a reported radius for SEL<sub>24h</sub> criteria does not mean that sea turtles travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with either PTS or TTS if it remained in that location for 24 hours.

- Table 4 summarises the distances to where the criterion for behavioural response of turtles to 166 dB re 1 µPa (SPL) and the 175 dB re 1 µPa (SPL) threshold for behavioural disturbance (McCauley et al. 2000a), and the distances to where temporary threshold shift (TTS) and permanent threshold shift (PTS) (Finneran et al. 2017) could be exceeded.

Table 4. Summary of horizontal distances (in km) to turtle behavioural response criteria, temporary threshold shift (TTS), and permanent threshold shift (PTS).

Hearing group – Sea Turtles				
Location	Behavioural response <sup>1</sup>	Behavioural disturbance <sup>1</sup>	Impairment: TTS <sup>2</sup>	Impairment: PTS <sup>2</sup>
T/49P - British Admiral	0.92 (SPL)	0.36 (SPL)	0.27 (SEL <sub>24h</sub> )	0.03 (SEL <sub>24h</sub> )
T/49P - Flanagan	0.92 (SPL)	0.37 (SPL)	0.27 (SEL <sub>24h</sub> )	0.03 (SEL <sub>24h</sub> )
VIC/P79 (northern extent) Julpha	0.83 (SPL)	0.37 (SPL)	0.23 (SEL <sub>24h</sub> )	0.03 (SEL <sub>24h</sub> )
VIC/P79 (southern extent) Garfield	0.89 (SPL)	0.35 (SPL)	0.26 (SEL <sub>24h</sub> )	0.03 (SEL <sub>24h</sub> )

Noise exposure criteria: McCauley et al. (2000a), and <sup>2</sup> Finneran et al. (2017)

#### ***Fish, fish eggs, and fish larvae:***

This modelling study assessed the ranges for quantitative criteria based on Popper et al. (2014) and considered both PK and SEL<sub>24h</sub> metrics associated with mortality and potential mortal injury as well as impairment in the following groups:

- Fish without a swim bladder (also appropriate for sharks in the absence of other information),
- Fish with a swim bladder that do not use it for hearing,
- Fish that use their swim bladders for hearing, and
- Fish eggs and fish larvae.

Table 5 summarises the maximum distances to effect criteria for fish, fish eggs, and fish larvae along with the relevant metric for both modelled locations.

Table 5. Summary of maximum fish, fish eggs, and larvae injury and temporary threshold shift (TTS) onset distances for any modelled site, for single impulse and 24 h sound exposure level (SEL<sub>24h</sub>) modelled scenarios.

Relevant hearing group	Effect criteria	Water column	
		Metric associated with longest distance to criteria	R <sub>max</sub> (km)
Fish: No swim bladder	Recoverable injury	N/A	–
	TTS	SEL <sub>24h</sub>	0.45
Fish: Swim bladder not involved in hearing and Swim bladder involved in hearing	Recoverable injury	SEL <sub>24h</sub>	0.05
	TTS	SEL <sub>24h</sub>	0.45
Fish eggs, and larvae	Injury	PK	0.05

**Benthic invertebrates:**

To assist with assessing the potential effects on crustaceans, the following results were determined:

- The sound level of 202 dB re 1  $\mu$ Pa PK-PK from Payne et al. (2008), which is representative of no effects, was considered for seafloor sound levels; the sound level was reached at a maximum distance of 169.6 m from the acoustic centre of the VSP array, at Garfield in the southern extent of VIC/P79).
- The sound levels of 209–212dB re 1  $\mu$ Pa PK-PK from Day et al. (2016b) was reached at 74.2–39.0 m and 213 dB re 1  $\mu$ Pa from Day et al. (2016a) was reached at 27.5 m from the acoustic centre of the VSP array, only at Julpha in the northern extent of VIC/P79, and was not reached at any distance from the source at any other site.

**Boomer SBP**

As the boomer is also considered an impulsive source, the same metrics and thresholds as applied to the VSP analysis are applied to the SBP.

**Marine mammals:**

Table 6 summarises the maximum distances for PTS, along with the relevant metric associated with the maximum PTS distance for the SPB results. The maximum distance where the NOAA (2019) marine mammal behavioural response criterion of 160 dB re 1  $\mu$ Pa (SPL) is also presented in Table 6. The maximum range to the low-frequency cetacean weighted threshold of 140 dB re 1  $\mu$ Pa (SPL) from Wood et al. (2012), applied to migrating southern right whales, was 0.13 km.

Table 6. Summary of maximum ( $R_{max}$ ) horizontal distances (in km) from any modelled site to behavioural response thresholds and temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. Maximum extents are in the broadside direction.

Hearing group	Modelled distance to effect threshold ( $R_{max}$ )		
	Behavioural response <sup>a</sup>	Impairment: TTS <sup>b</sup>	Impairment: PTS <sup>b</sup>
Low-frequency (LF) cetaceans	–	–	–
High-frequency (HF) cetaceans		–	–
Very high-frequency (VHF) cetaceans		0.02	–
Otariid pinnipeds in water		–	–

Noise exposure criteria: <sup>a</sup> NOAA (2019) and <sup>b</sup> Southall et al. (2019)

<sup>c</sup> Longest distance to threshold from SEL<sub>24h</sub> results

<sup>d</sup> Longest distance to threshold from PK results

A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

**Sea turtles:**

No thresholds for effect on sea turtles were reached by the boomer SBP.

**Fish, fish eggs, and fish larvae:**

No fish, fish eggs, or fish larvae thresholds were reached within the modelled resolution.

**Benthic invertebrates:**

The PK and PK-PK sound levels produced by the SBP did not exceed any of the thresholds for effects on benthic invertebrates within the modelled resolution.

# 1. Introduction

JASCO Applied Sciences (Australia) performed a modelling study of underwater acoustic noise emissions associated with the ConocoPhillips Otway Exploration Drilling Program. This study specifically assessed distances from the considered operations to where underwater sound levels reached thresholds corresponding to various levels of impact to marine fauna. The key fauna considered in this study included marine mammals, sea turtles, fish (including fish eggs and larvae), and benthic invertebrates. Due to the variety of species considered, there are several different thresholds for evaluating effects, including: mortality, injury, temporary reduction in hearing sensitivity, and behavioural disturbance.

The modelling methodology considered source directivity and range-dependent environmental properties. Estimated underwater acoustic levels are presented as sound pressure levels (SPL,  $L_p$ ), zero-to-peak pressure levels (PK,  $L_{pk}$ ), peak-to-peak pressure levels (PK-PK,  $L_{pk-pk}$ ), and either single-impulse (i.e., per-pulse) or accumulated sound exposure levels (SEL,  $L_E$ ) as appropriate for different noise effect criteria for either non-impulsive (vessels and drilling) or impulsive (VSP) noise sources.

## 1.1. Acoustic Modelling Scenario Details

This study considered the following activities associated with the drilling campaign within the *British Admiral* and *Flanagan* drill targets:

- Pre-lay operations by an Anchor Handler Tug Supply (AHTS) vessel working on site.
- Mooring operations where an anchored Mobile Offshore Drilling Unit (MODU) is idle, one AHTS is keeping position on the bridle using dynamic positioning (DP), and two AHTS are working on site within 2 km of the MODU.
- Drilling operations from a MODU, only assessed for T/49P and discontinued due to unlikelihood of scenario during operations.
- Drilling operation from a MODU with an AHTS conducting resupply operations, using DP, only assessed for T/49P and discontinued due to unlikelihood of scenario during operations.
- Drilling operation from a MODU with a AHTS on standby, transiting at low speed within a prescribed area, 2 km from the MODU.
- Drilling operation from a MODU with an AHTS conducting resupply operations, using DP, and a AHTS transiting at low speed within the standby area, 2 km from the MODU.
- Vertical seismic profiling (VSP) during drilling operations at nominal wells within T/49P and VIC/P79.
- Boomer type Sub-Bottom Profiling (SBP) surrounding nominal wells in VIC/P79.

Details of the modelled sites are displayed graphically for nominal wells in:

- T/49P – shown in Figure 1 and listed in Table 7, with focused maps for the *British Admiral* and *Flanagan* nominal drill locations presented in Figures 2 and 3.
- VIC/P79 northern extent – shown in Figure 4 and listed in Table 8, with focused maps for the *Merope* and *Julpha* nominal drill locations presented in Figure 5 and Figure 6, and sub-bottom profiling shown around *Julpha* in Figure 7.
- VIC/P79 southern extent – shown in Figure 8 and listed in Table 9, with focused maps for the *Essington* and *Garfield* nominal drill locations presented in Figure 9 and Figure 10, the deeper Garfield West shown in Figure 11, and sub-bottom profiling shown around *Garfield* in Figure 12.

The modelled scenarios for non-impulsive sources are detailed in Table 10. A total of 14 scenarios to assess non-impulsive noise emission from vessel and drilling activities were initially modelled considering six combinations of activities for the drilling and vessel activities at each drill target within T/49P. The number of combinations of activities was then rationalised to 4 for modelling at VIC/P79 nominal locations as follows:

- For T/49P: Scenarios 1 to 6 were modelled at the nominal locations British Admiral and Flanagan; only Scenarios 3 and 4 were modelled at the British Admiral West location.
- For VIC/P79 – northern extent: Scenarios 1, 2, 5 and 6 were modelled at the nominal locations Merope and Julpha.
- For VIC/P79 – southern extent: Scenarios 1, 2, 5 and 6 were modelled at the nominal locations Essington and Garfield; only Scenarios 3 and 4 were modelled at the Garfield West location to provide a comparison between on-shelf and shelf-edge locations.

Table 10. Description of vessel modelling scenarios and the associated sound source sites

Scenario	Site(s)		Source(s)	Description
	For computing SPL fields	For computing SEL fields		
1*	MODU	Random locations (24 h) within 4 × 4 km box centred on MODU	Generic AHTS	<b>Prelay:</b> 1 × anchor handler working on site within 2 km of location
2	Vessel at Bridle, 2 km east and 2 km west of MODU	Vessel at Bridle (24 h) and 2 sets of random locations (24 h), within 4 × 4 km box centred on MODU	3 × Generic AHTS	<b>Mooring:</b> Moored Semi-sub idle (no noise) 1 × anchor handler on the bridle on DP 2 × anchor handlers working on site within 2 km of location
3	MODU	MODU (24 h)	<i>Ocean Onyx</i>	<b>Drilling:</b> Anchored MODU drilling
4	MODU and Supply vessel	MODU (24 h) and Supply vessel (8 h)	<i>Ocean Onyx</i> Generic AHTS	<b>Drilling and resupply:</b> Anchored MODU drilling 1 × anchor handler at rig doing resupply (8 h)
5	MODU and 2 km east of MODU	MODU (24 h) and random locations (24 h), within 2 × 4 km box east of MODU	<i>Ocean Onyx</i> Generic AHTS	<b>Drilling with standby vessel:</b> Anchored MODU drilling 1 × anchor handler on standby within 2 km
6	MODU, Supply vessel, and 2 km east of MODU	MODU (24 h) and Supply vessel (8 h) and random locations (24 h), within 2 × 4 km box east of MODU	<i>Ocean Onyx</i> 2 × Generic AHTS	<b>Drilling, resupply, with standby vessel:</b> Anchored MODU drilling 1 × anchor handler on standby within 2 km 1 × anchor handler at rig doing resupply (8 h)

DP: Dynamic Positioning, MODU: Mobile Offshore Drilling Unit

The scenarios for impulsive VSP operation considered in this report varied by the maximum number of pulses per 24 h, up to a defined total of 130. The total number of pulses considered were 10, 50, 100, and 130 per 24 h at each location as described in Table 11.

## 2. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is necessary to first establish exposure criteria (thresholds) for which sound levels may be expected to have a negative effect on animals. Whether acoustic exposure levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, SPL, and SEL, are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over a 24 h time period. Appropriate subscripts indicate any applied frequency weighting applied (Appendix 0). The acoustic metrics in this report reflect the updated ANSI and ISO standards for acoustic terminology, ANSI S1.1 (S1.1-2013) and ISO 18405:2017 (2017).

The following thresholds and guidelines for this study were chosen because they represent the best available science, and sound levels presented in literature for fauna with no defined thresholds:

1. Peak pressure levels (PK;  $L_{pk}$ ) and frequency-weighted accumulated sound exposure levels (SEL;  $L_{E,24h}$ ) from Southall et al. (2019) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals for non-impulsive and impulsive sources.
  - a. Weighted SPL for assessing more nuanced responses to impulsive noise for migrating Southern Right whales (SRW) from Wood et al. (2012).
2. Marine mammal behavioural threshold based on the current interim US National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals of 120 dB re 1  $\mu$ Pa (SPL;  $L_p$ ) and 160 dB re 1  $\mu$ Pa (SPL;  $L_p$ ) for non-impulsive and impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014).
4. Peak pressure levels (PK;  $L_{pk}$ ) and frequency-weighted accumulated sound exposure levels (SEL;  $L_{E,24h}$ ) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in turtles.
5. Peak-peak pressure levels (PK-PKS;  $L_{pk-pk}$ ) at the seafloor to help assess effects of noise on crustaceans through comparing to results in Day et al. (2016a), Day et al. (2019), Day et al. (2016b), Day et al. (2017) and Payne et al. (2008).

Sections 2.1 and 2.2, along with Appendices A.3 and A.4, expand on the thresholds, guidelines, and sound levels for marine mammals, fish, fish eggs, fish larvae, and sea turtles.

### 2.1. Marine Mammals

The criteria applied in this study to assess possible effects of non-impulsive and impulsive noise sources on marine mammals are summarised in Tables 12 and 13. Cetaceans and otariid seals were identified as the hearing groups requiring assessment. Details on thresholds related to auditory threshold shifts or hearing loss and behavioural response are provided in Appendix A.3, with frequency weighting explained in detail in Appendix A.4. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

To assist in assessing potential behavioural responses by migrating SRW, a graded probability of response for impulsive sounds using a frequency weighted SPL metric, as described in Wood et al. (2012), has been applied. Wood et al. (2012) defined behavioural response categories for sensitive species (including harbour porpoise and beaked whales) and for migrating mysticetes. The migrating

mysticete category has been applied to Southern Right Whales in this analysis, within the calving and calving buffer BIAs and also during migration, to assess behavioural response to impulsive sounds (Table 14). The Wood et al. (2012) approach has been updated to consider the frequency weighting from Southall et al. (2019) for low-frequency cetaceans as opposed to that from Southall et al. (2007).

Table 12. Criteria for effects of non-impulsive noise exposure, including vessel noise, for marine mammals: Unweighted sound pressure level (SPL) and 24 h sound exposure level (SEL<sub>24h</sub>) thresholds.

Hearing group	NOAA (2019)	Southall et al. (2019)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL ( $L_p$ ; dB re 1 $\mu$ Pa)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)
Low-Frequency (LF) cetaceans	120	199	179
High-frequency (HF) cetaceans		198	178
Very high-frequency (VHF) cetaceans		173	153
Otariid seals		219	199

$L_p$  denotes sound pressure level period and has a reference value of 1  $\mu$ Pa.

$L_E$  denotes cumulative sound exposure over a 24 h period and has a reference value of 1  $\mu$ Pa<sup>2</sup>·s.

Table 13. Acoustic effects of impulsive noise on marine mammals: Unweighted sound pressure level (SPL), 24 h sound exposure level (SEL<sub>24h</sub>), and peak (PK) thresholds.

Hearing group	NOAA (2019)	Southall et al. (2019)			
	Behaviour	PTS onset thresholds <sup>a</sup> (received level)		TTS onset thresholds <sup>a</sup> (received level)	
	SPL ( $L_p$ ; dB re 1 $\mu$ Pa)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)	PK ( $L_{pk}$ ; dB re 1 $\mu$ Pa)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)	PK ( $L_{pk}$ ; dB re 1 $\mu$ Pa)
Low-Frequency (LF) cetaceans	160	183	219	168	213
High-frequency (HF) cetaceans		185	230	170	224
Very high-frequency (VHF) cetaceans		155	202	140	196
Otariid seals		183	232	168	226

<sup>a</sup> Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

$L_p$  denotes sound pressure level period.

$L_{pk,flat}$  denotes peak sound pressure is flat weighted or unweighted.

$L_E$  denotes cumulative sound exposure over a 24 h period.

Table 14. Behavioural response criteria used in this analysis for calving and migrating Southern Right Whale (SRW) probability of behavioural response frequency-weighted sound pressure level (SPL, dB re 1  $\mu$ Pa). Probabilities are not additive. Adapted from Wood et al. (2012).

Frequency-weighted SPL ( $L_{p,LF}$ ; dB re 1 $\mu$ Pa) <sup>a</sup>	Probability of response (%)
120	10
140	50
160	90

<sup>a</sup> Low-frequency cetacean weighted, Southall et al. (2019).

## 2.2. Fish, Sea turtles, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Sea Turtles was formed to continue developing noise exposure criteria for fish and sea turtles, work begun by a NOAA panel two years earlier. The Working Group developed guidelines with specific thresholds for different levels of effects for several species groups (Popper et al. 2014). The guidelines define quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death,
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma, and
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges, these effects are not addressed in this report and are included in Tables 17 and 15 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure depends on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Sea turtles, fish eggs, and fish larvae are considered separately.

Table 15 lists the relevant effects thresholds from Popper et al. (2014) for vessel and drilling noise. Some evidence suggests that fish sensitive to acoustic pressure show a recoverable loss in hearing sensitivity, or injury when exposed to high levels of noise (Scholik and Yan 2002, Amoser and Ladich 2003, Smith et al. 2006); this is reflected in the SPL thresholds for fish with a swim bladder involved in hearing. There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles). Finneran et al. (2017) presented revised thresholds for turtle injury considering frequency weighted SEL, which have been applied in this study for vessels and drilling noise (Table 16). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

Table 15. Criteria for non-impulsive (vessel and drilling) noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Sea turtles	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Sound pressure level dB re 1  $\mu$ Pa.

Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

Table 16. Acoustic effects of non-impulsive noise on sea turtles, weighted 24 h sound exposure level ( $SEL_{24h}$ ), Finneran et al. (2017).

PTS onset thresholds <sup>a</sup> (received level)	TTS onset thresholds <sup>a</sup> (received level)
220	200

<sup>a</sup>  $L_E$ , cumulative sound exposure over a 24 h period, with a reference value of 1  $\mu Pa^2 \cdot s$ .

Impulsive noise from airguns (i.e., from VSP) and the SBP was assessed in this study based on the relevant effects thresholds from Popper et al. (2014) listed in Table 17. In general, whether an impulsive sound adversely effects fish behaviour depends on the species, the state of the individual exposed, and other factors.

The SEL metric integrates noise intensity over some period of exposure. Because the period of integration for regulatory assessments is not well defined for sounds that do not have a clear start or end time, or for very long-lasting exposures, an exposure evaluation time must be defined. Southall et al. (2007) defines the exposure evaluation time as the greater of 24 h or the duration of the activity. Popper et al. (2014) recommend a standard period of the duration of the activity; however, the publication also includes caveats about considering the actual exposure times if fish move. Integration times in this study for VSP and SBP operations have been applied over the total number of impulses per day.

Table 17. Criteria for seismic noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	> 219 dB SEL <sub>24h</sub> or > 213 dB PK	> 216 dB SEL <sub>24h</sub> or > 213 dB PK	>> 186 dB SEL <sub>24h</sub>	Seismic: (N, I, F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL <sub>24h</sub> or > 207 dB PK	203 dB SEL <sub>24h</sub> or > 207 dB PK	>> 186 dB SEL <sub>24h</sub>	Seismic: (N, I, F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL <sub>24h</sub> or > 207 dB PK	203 dB SEL <sub>24h</sub> or > 207 dB PK	186 dB SEL <sub>24h</sub>	Seismic: (N, I) Low (F) Moderate	(N, I) High (F) Moderate
Fish eggs and fish larvae	> 210 dB SEL <sub>24h</sub> or > 207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	Seismic: (N, I, F) Low	(N) Moderate (I, F) Low

Peak sound pressure level dB re 1  $\mu$ Pa; SEL<sub>24h</sub> dB re 1  $\mu$ Pa<sup>2</sup>·s.

All criteria are presented as sound pressure even for fish without swim bladders since no data for particle motion exist. Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

McCauley et al. (2000a) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1  $\mu$ Pa (SPL), the sea turtles increased their swimming activity, and above 175 dB re 1  $\mu$ Pa they began to behave erratically, which was interpreted as an agitated state. The Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy et al. 2017) acknowledges the 166 dB re 1  $\mu$ Pa SPL reported (McCauley et al. 2000a) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1  $\mu$ Pa level from McCauley et al. (2000a) is recommended as a criterion for behavioural disturbance. These thresholds are shown in Table 18.

Table 18. Acoustic effects of impulsive noise on sea turtles: Unweighted sound pressure level (SPL), 24 h sound exposure level (SEL<sub>24h</sub>), and peak pressure (PK) thresholds.

Effect type	Criterion	SPL ( $L_p$ ; dB re 1 $\mu$ Pa)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)	PK ( $L_{pk}$ ; dB re 1 $\mu$ Pa)
Behavioural response	McCauley et al. (2000a)	166	NA	
Behavioural disturbance		175		
PTS onset thresholds <sup>a</sup> (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds <sup>a</sup> (received level)			189	226

<sup>a</sup> Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS and TTS onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level thresholds associated with impulsive sounds, these thresholds should also be considered.

$L_p$  denotes sound pressure level period and has a reference value of 1  $\mu$ Pa.

$L_{pk,flat}$  denotes peak sound pressure is flat weighted or unweighted and has a reference value of 1  $\mu$ Pa.

$L_E$  denotes cumulative sound exposure over a 24 h period and has a reference value of 1  $\mu$ Pa<sup>2</sup>·s.

## 2.3. Invertebrates

Research is ongoing into the relationship between sound and its effects on crustaceans, including the relevant metrics for both effect and impact. Available literature suggests particle motion, rather than sound pressure, is a more important factor for crustacean and bivalve hearing. Water depth and seismic source size are related to the particle motion levels at the seafloor, with larger arrays and shallower water being related to higher particle motion levels, more likely relevant to effects on crustaceans and bivalves. Information is only available to define levels for assessment for impulsive sources.

At the seafloor interface, crustaceans and bivalves are subject to particle motion stimuli from several acoustic or acoustically induced waves. These include the particle motion associated with an impinging sound pressure wave in the water column (the incident, reflected, and transmitted portions), substrate acoustic waves, and interface waves of the Scholte type. However, it is unclear which aspect(s) of these waves is/are most relevant to the animals, either when they normally sense the environment or their physiological responses to loud sounds so there is not enough information to establish similar criteria and thresholds as done for marine mammals and fish. Including recent research, such as Day et al. (2016b), current literature does not clearly define an appropriate metric or identify relevant levels (pressure or particle motion) for an assessment. This includes the consideration of what particle motion levels lead to a behavioural response, or mortality. Therefore, at this stage, we cannot propose authoritative thresholds to inform the impact assessment. However, levels can be determined for pressure metrics presented in literature to assist the assessment.

The pressure and acceleration examples provided in Day et al. (2016a) as their Figures 11 and 12 indicate that the acceleration and pressure signals occurred simultaneously, which was interpreted as an indication that the waterborne sounds were responsible for the accelerations measured by the geophones. For clarity, it is important to distinguish that the acceleration from waterborne sound energy is not ground roll, which Day et al. (2016a) correctly define as the sound that propagates along the interface at a speed lower than the shear wave speed of the sediment. However, the report subsequently uses ground roll for all further discussions of particle acceleration. While Day et al. (2016a) discuss that they chose the simplest measure of ground roll, it should have been referred to as “the acceleration from waterborne sound energy”, or ‘waterborne acceleration’ for short.

For crustaceans, a PK-PK sound level of 202 dB re 1  $\mu$ Pa (Payne et al. 2008) is considered to be associated with no effect, and it was therefore applied in this assessment. Additionally for context related to different levels of potential impairment, the PK-PK sound levels determined for crustaceans in Day et al. (2016b), 209–212 dB re 1  $\mu$ Pa and 213 dB re 1  $\mu$ Pa from Day et al. (2019), are also included.

### 3. Methods and Parameters

The following sections provided a high-level description of the inputs used for this underwater noise modelling study. The sections are divided into subsections detailing the source inputs for the MODU and AHTS (Section 3.1), the VSP array (Section 3.2), and the SBP (Section 3.3), with Section 3.4 providing the details on the applied modelling technique and model configuration information.

#### 3.1. Vessel and Drilling Noise Sources

##### 3.1.1. Mobile Offshore Drilling Unit (MODU)

The MODU, or semi-submersible platform considered by ConocoPhillips will likely be similar to the *Ocean Onyx*, (Figure 13), therefore this is the MODU considered in the modelling. While in operation, the MODU will be held in position via anchors and chains, as opposed to using thrusters. Underwater sound from the platform while drilling is expected to originate primarily from onboard equipment vibrations, while a smaller portion of the sound is expected to be transmitted directly into the water via the vibrating drill (Austin et al. 2018). Since the dominant vibration sources (e.g., pumps, generators, and machinery) are located on or below the main deck of the platform, the modelled depth of the point source representing the MODU was set to 11.6 m, which is approximately half the draft of the *Ocean Onyx*.

The *Ocean Onyx* (Figure 13) was measured by JASCO while anchored and drilling (McPherson et al. 2021). It had a broadband (10 Hz to 31 kHz) source level of 175.4 dB re 1  $\mu\text{Pa}^2\text{m}^2\text{s}$ .

Figure 13. (Left) Photo of the *Ocean Onyx* semi-submersible platform and (right) the associated decidecade source level spectrum.

### 3.1.2. Anchor Handling Tug Supply (AHT) Vessel

Underwater sound that radiates from vessels is produced mainly by propeller and thruster cavitation, with a smaller fraction of noise produced by sound transmitted through the hull, such as by engines, gearing, and other mechanical systems. Sound levels tend to be the highest when thrusters are used to position the vessel and when the vessel is transiting at high speeds. A vessel's sound signature depends on the vessel's size, power output, propulsion system (e.g., conventional propellers versus Voith Schneider propulsion), and the design characteristics of the given system (e.g., blade shape and size). A vessel produces broadband acoustic energy with most energy emitted below a few kilohertz. Sound from onboard machinery, particularly sound below 200 Hz, dominates the sound spectrum before cavitation begins (Spence et al. 2007).

At this stage, the exact vessel specifications as well as the precise operational scenarios are not known. As such, estimates of the source levels for support vessel operations were based on a generic design of an Anchor Handling Tug Supply (AHTS) vessel. The generic AHTS vessel was based on the Siem AHTS VS491 CD design (Figure 14) and its specifications (Siem Offshore 2010) were used to form a basis for vessel source level estimation and source depth for acoustic modelling purposes. The general specification of these vessels is that they have a bollard pull of 285–310 t, and an overall length, beam, and draft of 91.0, 22.0, and 7.95 m, respectively.

The measured monopole source levels (MSLs) and spectra for the AHTS were from McPherson et al. (2021). For scenarios where the AHTS was under dynamic positioning (DP), the spectra from Section 5.5.2 in McPherson et al. (2021) were used.

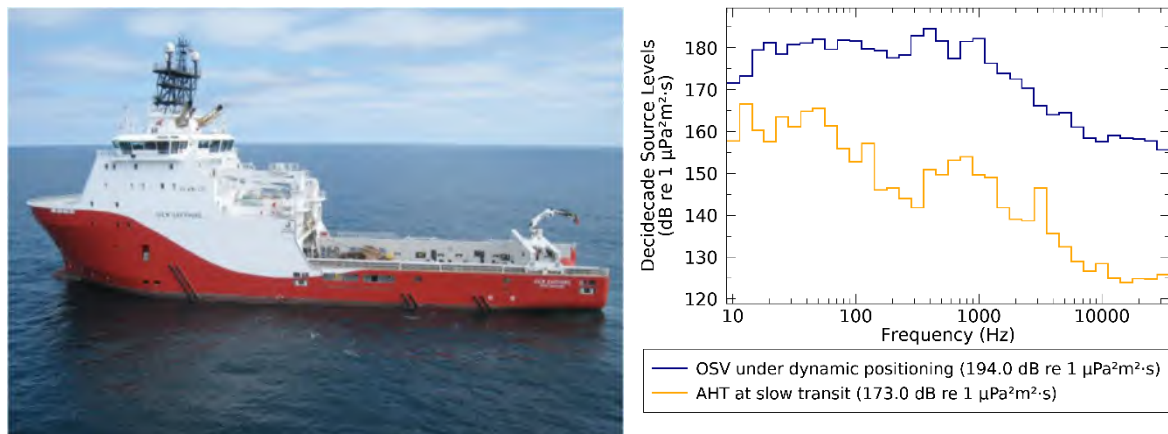

Figure 14. (Left) Photo of an Anchor Handling Tug Supply (AHTS) vessel and (right) the associated decidecade source level spectra (Photo source: Siem Offshore 2010).

## 3.2. Vertical Seismic Profiling Acoustic Source

The pressure signature of the individual airguns and the composite decade band point-source equivalent directional levels (i.e., source levels) of the 750 in<sup>3</sup> Vertical Seismic Profiling (VSP) source suspended at 5 m were modelled with JASCO's Airgun Array Source Model (AASM; see Appendix B).

### 3.2.1. Acoustic Source Model

AASM accounts for the notional pressure signatures of each source element with respect to the effects of surface-reflected signals on bubble oscillations and inter-bubble interactions, the surface-reflected signal (known as surface ghost) is not included in the far-field source signatures. The acoustic propagation models account for those surface reflections, which are a property of the propagating medium rather than the source. AASM considers:

- Array layout;
- Volume, depth, and firing pressure of each airgun; and
- Interactions between different airguns in the array.

## 3.3. Boomer Sub-bottom Profiling Acoustic Source

Sub-Bottom Profiling (SBP) systems are used to determine the physical properties of the seabed and to image and characterise geological information below the seabed and evaluate the near-seabed stratigraphy for hazards. SBP utilises an acoustic source typically towed just behind the vessel, with a hydrophone towed approximately 25 m behind the vessel to record the reflected sound waves.

Different SBP systems (pinger, compressed high intensity radar pulse (CHIRP) and boomer/sparker systems) are used depending on the objectives of the survey, water depths and prior knowledge of seabed geology with the main difference between each SBP system being the operating frequency.

The representative boomer system chosen for geophysical survey operations is the AP3000 triple-plate boomer (manufactured by Subsea Systems, Inc.). To estimate the sound field for the boomer source, the specifications of the Applied Acoustics AA202 boomer plate (Applied Acoustics Engineering 2013), a suitable approximation, were taken to represent a single plate, three of which comprise the full system. The boomer plate is 38 cm wide by 38 cm long with a circular baffle. Because the boomer source is a circular piston surrounded by a rigid baffle, it cannot be considered a point-like source (Verbeek and McGee 1995). The beam pattern of a boomer plate shows some directivity for frequencies above 1 kHz. Above this frequency, the acoustic wave's emitted length becomes comparable (of the same order of magnitude) with the baffle size (< 150 cm vs. 35 cm).

The input energy for the AP3000 system is up to 600 J per pulse per plate, or up to 1,800 J per pulse from all three plates. The width of the pulse calculated based on the 90% SPL ( $T_{90}$ ) is 8.1 ms.

JASCO performed a source verification study on an AP3000 system (Martin et al. 2012) with a double-plate configuration operating at maximum input energy of 1000 J. During the study, the acoustic data were collected as close as 8 m to the source and directly below it (Figure 15). The power spectrum of the boomer signal was determined directly from the measurement of the boomer signal having compensated the change in energy (Figure 16). The sound levels were back-propagated to obtain source levels using a geometrical approximation based on the method of images and plane-wave reflection coefficients. The reflection coefficients considered seabed attenuation and shear properties, as well as the seabed layering.

The increase in the source level of an AP3000 boomer when in triple-plate configuration, instead of double-plate configuration, was estimated at 2.6 dB because a triple-plate configuration could be used

with a higher energy input per pulse (up to 1800 J vs. up to 1000 J for double plate configuration). For modelling, the source level of the AP3000 triple-plated boomer operating at 1800 J per pulse energy was calculated to be 169.0 dB  $1 \mu\text{Pa}^2\text{m}^2\text{s}$  (Table 19). The 1/3-octave frequency boomer source spectra are shown in Figure 17. Boomer source spectra calculated from measurements (Martin et al. 2012).

Table 19. Specifications of the AP3000 triple-plate boomer system towed at a depth of 2 m used for the modelling

Specification	Specification	Source
Operating frequency (broad band):	200 Hz–16 kHz;	Estimated from field measurements; Martin et al. (2012)
Beam width	omnidirectional $-8^\circ$	System specification document
Beams	1	
Tilt angle (below horizontal plane)	$90^\circ$	
Maximum energy input (per pulse):	1800 J	
Per-pulse SEL source level	169.0 dB $1 \mu\text{Pa}^2\text{m}^2\text{s}$	Estimated from field measurements; Martin et al. (2012).

Figure 15. Spectrogram of dual-plate boomer (1000 J) pulses at the closest point of approach. Majority of energy is between 100 and 1000 Hz, with some energy at up to 10 kHz. (131,072 point FFT, 7000 data points, 3500 point overlap, Figure 15 in Martin et al. (2012)).

Figure 16. Boomer received timeseries (adjusted to 1800 J), where source depth is 2 m, receiver depth is 8 m, from the measurement Martin et al. (2012).

Figure 17. Boomer source spectra calculated from measurements (Martin et al. 2012).

### 3.4. Geometry and Modelled Regions

Several fit-for-purpose propagation models were used to model underwater noise emission from the scenarios considered for this study. Details on the model configuration is provided below.

The accuracy of the broadband calculated propagation loss for the Otway Basin continental shelf environment depends significantly upon the frequency content of the radiating sound source together with thickness of the sand layer on carbonate seabed (calcareenite) likely to occur within the region. In general, the thinner the sand layer, the greater the overall propagation loss. A measurement study in the Otway Basin of the *Ocean Onyx* and associated activities was previously undertaken (McPherson et al. 2021). This study found significant rates of propagation loss occurred in the region. As part of the model-measurement validation an adjustment factor was applied broadband received level predictions to account for the loss associated with a cemented limestone seabed (calcareenite). A similar adjustment, which only differed by accounting for sources in different water depths, was applied to broadband level predictions in this study as a very similar type of seabed environment is expected to be present.

#### 3.4.1. Sound Propagation Models

Three sound propagation models were used to predict the acoustic field around the seismic source:

- Combined range-dependent parabolic equation and Gaussian beam acoustic ray-trace model (MONM-BELLHOP, see Appendix D.1.2, 10 Hz to 25 kHz).
- Full Waveform Range-dependent Acoustic Model (FWRAM, see Appendix D.1.3, 10 to 1024 Hz).
- Wavenumber integration model (VSTACK, see Appendix D.1.4, 10 to 1024 Hz).

#### 3.4.2. Vessel and Drilling Noise

JASCO's Marine Operations Noise Model (MONM-BELLHOP; see Appendix D.1.2) was used to predict the acoustic field at frequencies of 10 Hz to 25 kHz for all vessel sources. To supplement the MONM results, high-frequency results for propagation loss were modelled using Bellhop for frequencies from 1.26 to 25 kHz. The sound field modelling calculated propagation losses up to 100 km from the source, with a horizontal separation of 20 m between receiver points along the modelled radials. A horizontal angular resolution of  $\Delta\theta = 2.5^\circ$  for a total of  $N = 144$  radial planes were

used. Receiver depths were chosen to span the entire water column over the modelled areas, from 2 m to a maximum of 5000 m, with step sizes that increased with depth.

For all stationary vessels, the SPL modelling results were converted to SEL by the duration of the measurement, which is appropriate for a non-impulsive noise source. As SEL was assessed over 8 or 24 h for a stationary vessel over a day (see Table 10), the conversion from SPL was obtained by increasing the levels by  $10 \cdot \log_{10}(T)$ , where T is either 28,800 or 86,400 (the number of seconds in 8 or 24 h, respectively).

For scenarios where a vessel was transiting along a track, a similar adjustment to the SPL was applied; however, the time factor was determined based on the step size along the track and the vessel's speed. See Appendix D.5 for details.

### 3.4.3. Vertical Seismic Profiling (VSP) and Sub-bottom Profiling

The above models were used in combination to characterise the acoustic fields at short and long ranges and in terms of SEL, SPL, PK, and PK-PK. Appendix D.1 details each model. MONM-BELLHOP was used to calculate SEL of a 360° area around each source location. FWRAM was used to model synthetic seismic and boomer pulses and to generate generalised range-dependent SEL to SPL conversion functions for the considered modelled sites. The range-dependent conversion functions were applied to predicted per-pulse SEL results from MONM-BELLHOP to estimate SPL values. FWRAM was also used to calculate water column PK and PK-PK levels.

VSTACK was used to calculate conversion functions applied to each modelled source, to better account for the increased bottom loss caused by the high shear wave speed in the calcareous seabed of this area, see Appendix D.1.5 for detail. Additionally, VSTACK was used to calculate the near field PK, PK-PK levels along 4 transects at the seafloor along the endfire and broadside directions for the VSP source. The boomer SBP PK sound level is too low to reach any relevant thresholds, and no near-field PK or PK-PK VSTACK calculations were performed for this scenario.

#### 3.4.3.1. Per-pulse Modelling

To assess sound levels with MONM-BELLHOP, the sound field modelling calculated propagation losses up to distances at least 100 km from the source, with a horizontal separation of 20 m between receiver points along the modelled radials. The sound fields were modelled with a horizontal angular resolution of  $\Delta\theta = 2.5^\circ$  for a total of  $N = 144$  radial planes. Receiver depths were chosen to span the entire water column over the modelled areas, from 2 m to a maximum of 4000 m, with step sizes that increased with depth. To supplement the MONM results, high-frequency results for propagation loss were modelled using Bellhop for frequencies from 1.26 to 25 kHz. The MONM and Bellhop results were combined to produce results for the full frequency range of interest.

FWRAM was run to 100 km along only two radials (one endfire, one broadside) for computational efficiency from 5 to 1024 Hz in 1 Hz steps. In the context of VSP source geometry (see Appendix B.2), the radials were modelled perpendicular to the sagittal plane of the array and parallel to the sagittal plane of the array. This was done to compute SEL-to-SPL conversions (see Appendix D.4) but also to quantify water column PK and PK-PK. The horizontal range step was dependent on frequency and ranged from 50 m at lower frequencies to 10 m above 800 Hz.

For the VSP modelling, the maximum modelled range for VSTACK was 1000 m and a variable receiver range increment that increased away from the source, from 10 to 25 m, was used. Received levels were computed for a receiver 0.5 m above the seafloor.

### 3.4.3.2. Multiple-pulse Modelling

The VSP operation was assessed in this report by considering several potential scenarios for a maximum number of pulses per 24 h. The SEL was assessed over 24 h by adjusting the per-pulse SEL by  $10 \cdot \log_{10}(N)$  (see Equation A-3), where the total number of pulses  $N$  was 10, 50, 100, or 130 per 24 h dependent on scenario at the two MODU locations (see Table 11).

The modelled accumulated SEL scenario for the SBP considered a set of nominal tracks where the acoustic source would be towed behind a vessel. The SBP acoustic source was modelled at multiple points along this track. When there are many pulses, it becomes computationally prohibitive to perform sound propagation modelling for every single event. If the distance between the consecutive pulses is small enough, the environmental parameters that influence sound propagation are virtually the same for many points. The acoustic fields can therefore, be modelled for a subset of pulses and estimated at several adjacent ones. The method to predict accumulated sound fields considered individual sound fields from representative modelled sites, which were then translated to account for the source position for nearby impulses. The sound field grids from all impulses were summed (Equation A-5) to produce the cumulative sound field grid with cell sizes of 20 m. The contours and threshold ranges were calculated from these flat Cartesian projections of the modelled acoustic fields.

The accumulated sound field computed with this approach is not as precise as modelling sound propagation at every impulse location, small-scale, site-specific sound propagation features tend to blur and become less relevant when sound fields from adjacent impulses are summed. Larger scale sound propagation features, primarily dependent on water depth, dominate the cumulative field.

## 4. Results

The maximum-over-depth sound fields for the modelled scenarios (described in Section 1.1) are presented below in two formats: as tables of distances to sound levels and, where the distances are long enough, as contour maps showing the directivity and range to various sound levels.

### 4.1. Vessel Operation Scenarios

#### 4.1.1. Tabulated Results

Table 20 presents the maximum and 95% distances (defined in Appendix D.3) to SPL isopleths and thresholds at all drilling locations in T/49P and Tables 21 and Table 22 present the maximum and 95% distances to SPL isopleths and thresholds at all drilling locations in VIC/P79 for typical on-shelf locations and the deeper Garfield West location, respectively.

For the results below, the distances to isopleths/thresholds were reported from the most dominant single source, except for the distance to marine mammal behavioural response in Scenario 5. For this scenario, where the contour of the threshold is characterised by two lobes, the centroid location between the MODU and the centre of the standby box was used. Maps are provided in Section 4.1.2 to assist with contextualising tabulated distances.

Table 20. T/49P: *Vessel and drilling scenarios: Maximum ( $R_{\max}$ ) and 95% ( $R_{95\%}$ ) horizontal distances (in km) to sound pressure level (SPL) isopleths and thresholds at all drilling locations. Scenario descriptions are given in Table 10.*

## 4.1.2. Sound Field Maps

Maps of the estimated sound fields, threshold contours and isopleths of interest for SPL and  $SEL_{24h}$  sound fields are presented in the following sections, sorted by each nominal location and then by scenario.

### 4.1.2.1. Instantaneous SPL Sound level Contour Maps

#### 4.1.2.1.1. T/49P British Admiral

Figure 18. Scenario 1— T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

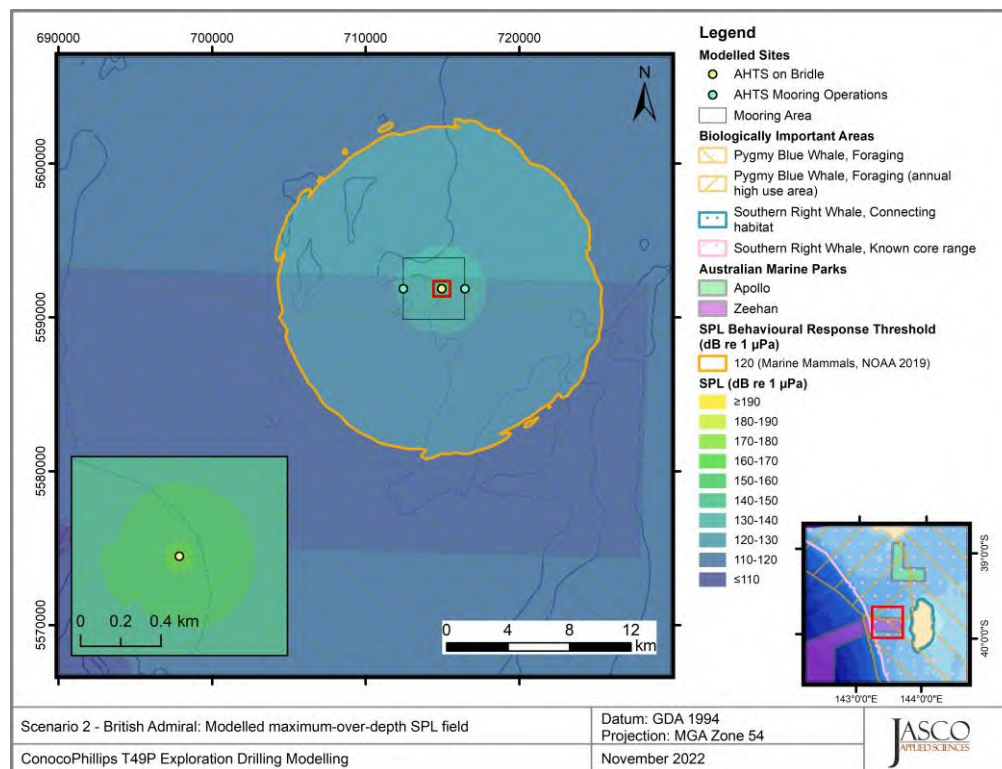

Figure 19. Scenario 2— T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

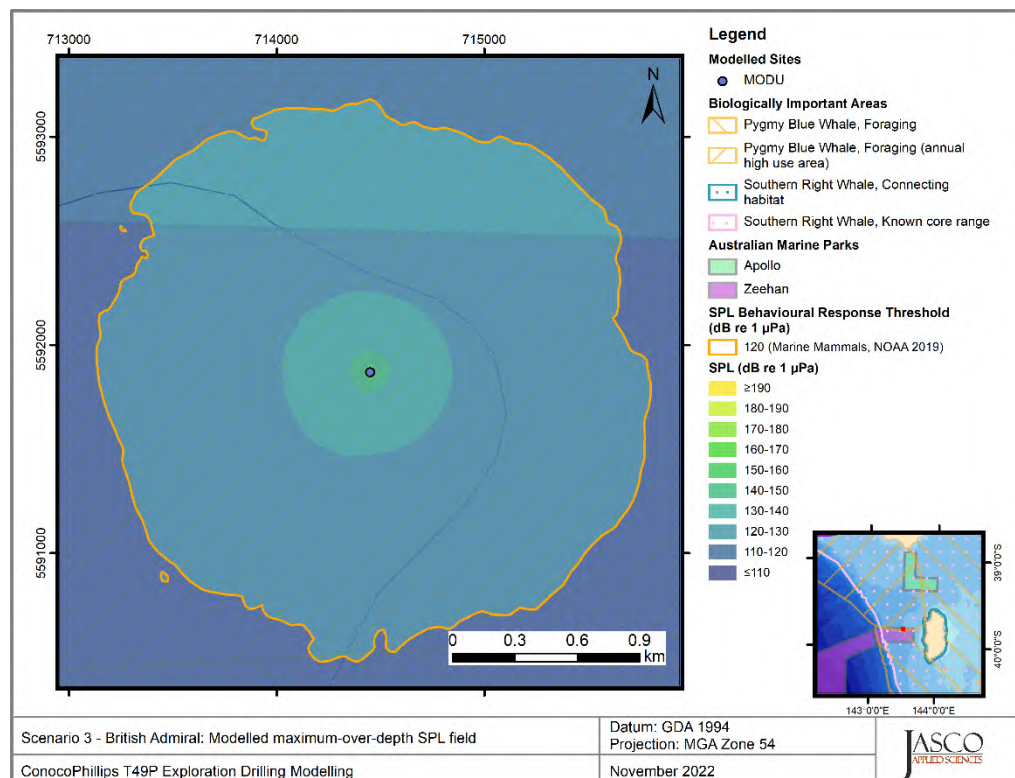

Figure 20. Scenario 3— T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

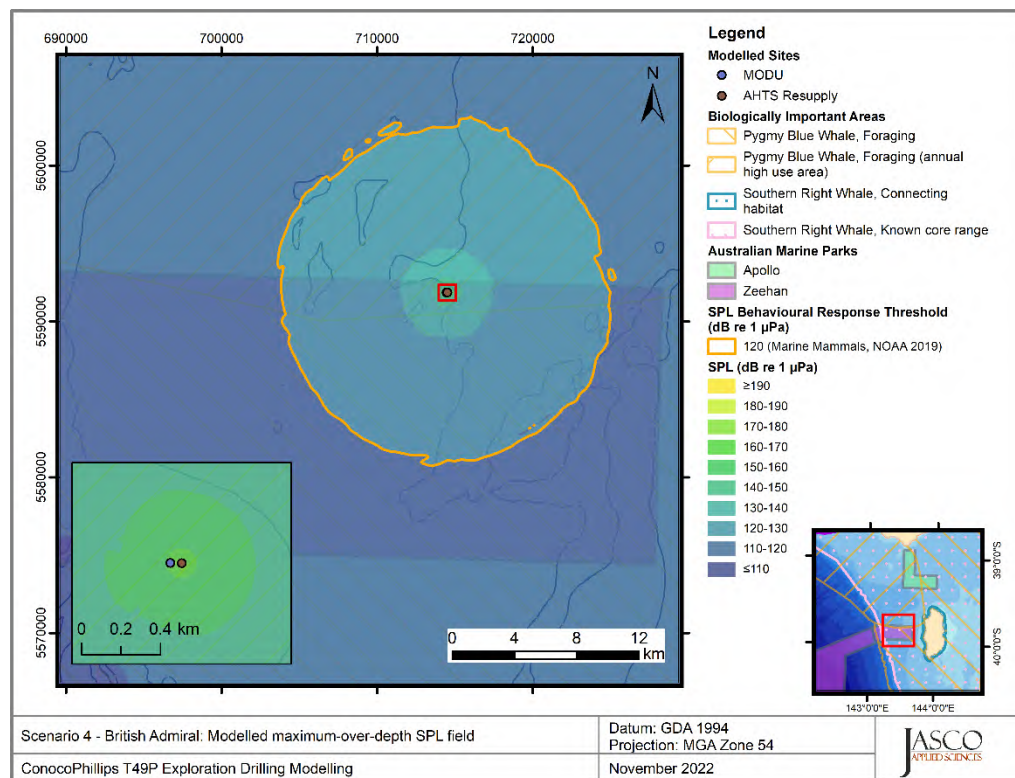

Figure 21. Scenario 4— T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

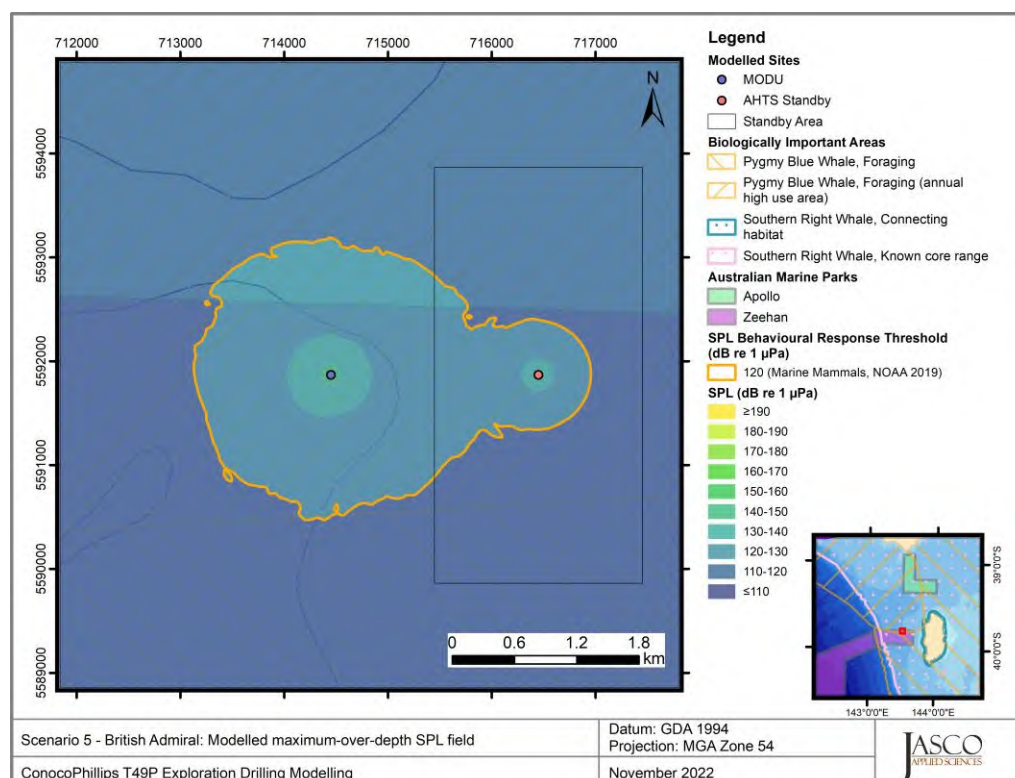

Figure 22. Scenario 5— T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

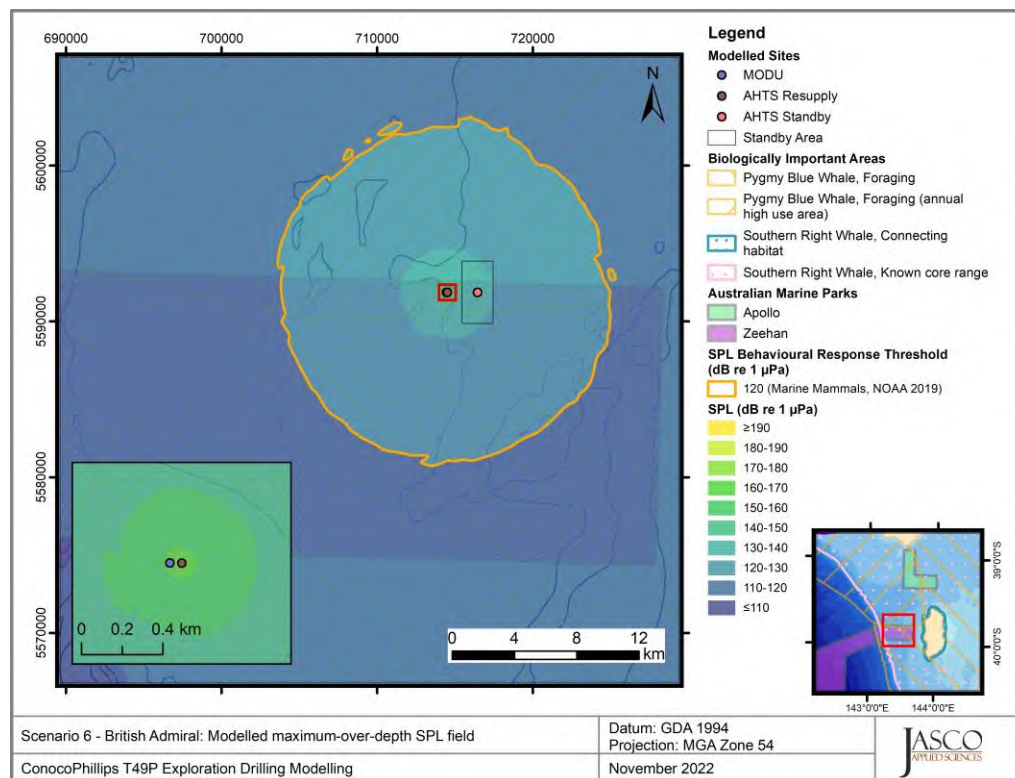

Figure 23. Scenario 6— T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.1.2. T/49P Flanagan

Figure 24. Scenario 1— T/49P Flanagan, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

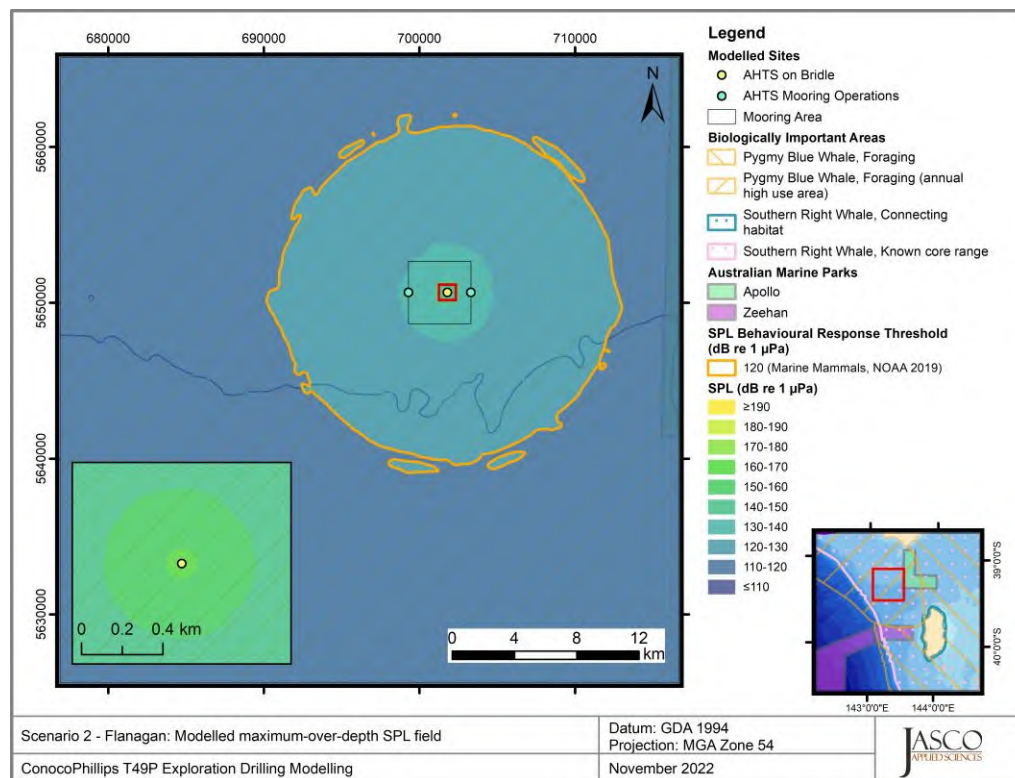

Figure 25. Scenario 2— T/49P Flanagan, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

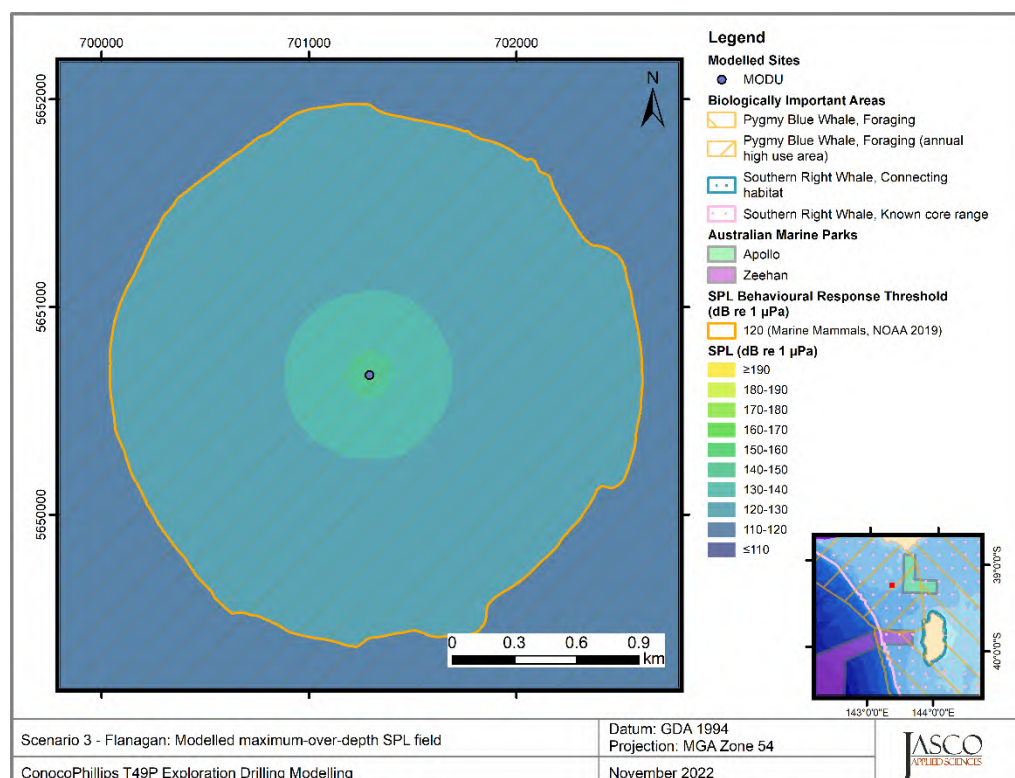

Figure 26. Scenario 3— T/49P Flanagan, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

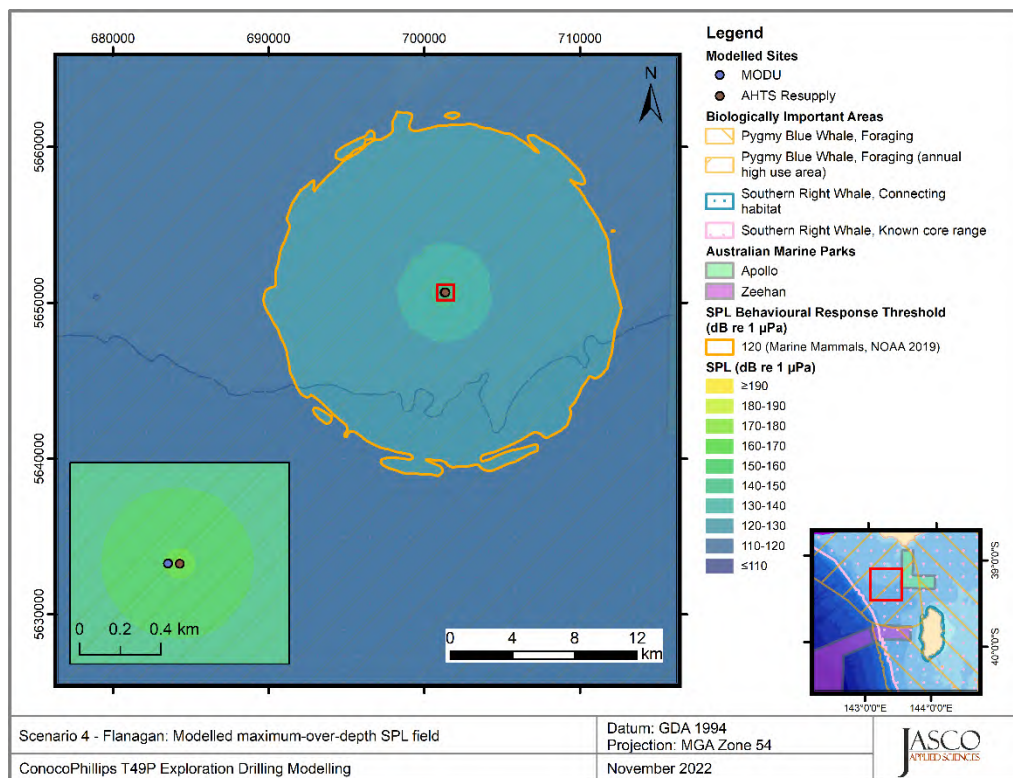

Figure 27. Scenario 4— T/49P Flanagan, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

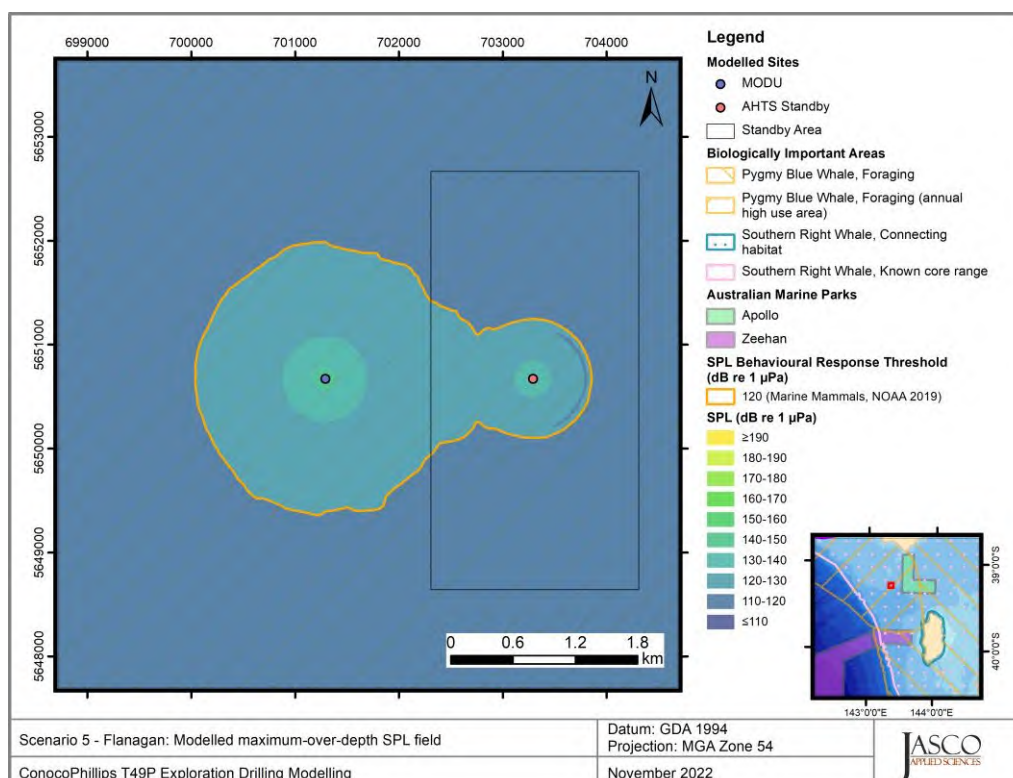

Figure 28. Scenario 5— T/49P Flanagan, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

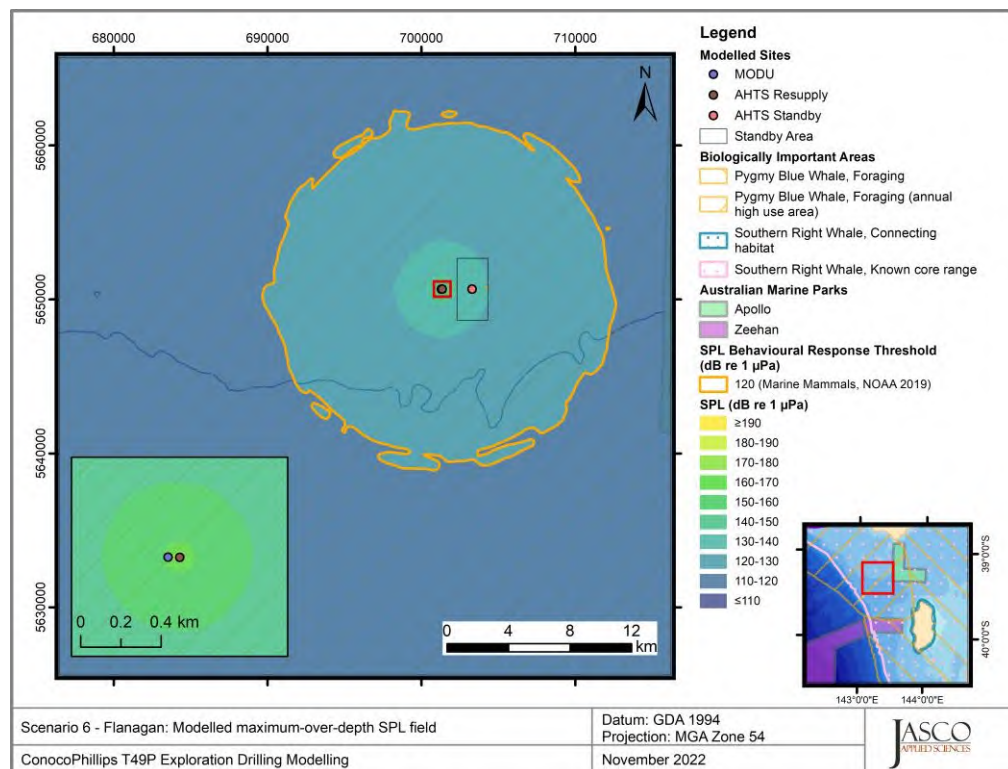

Figure 29. Scenario 6— T/49P Flanagan, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.1.3. T/49P British Admiral West

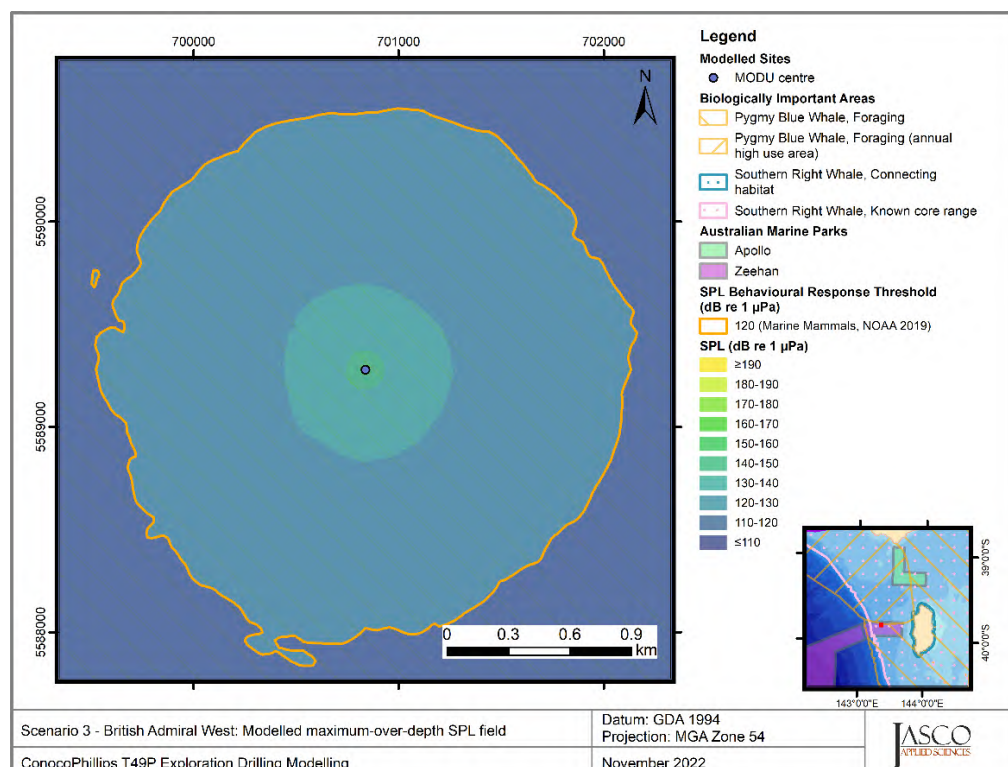

Figure 30. Scenario 3— T/49P British Admiral West, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

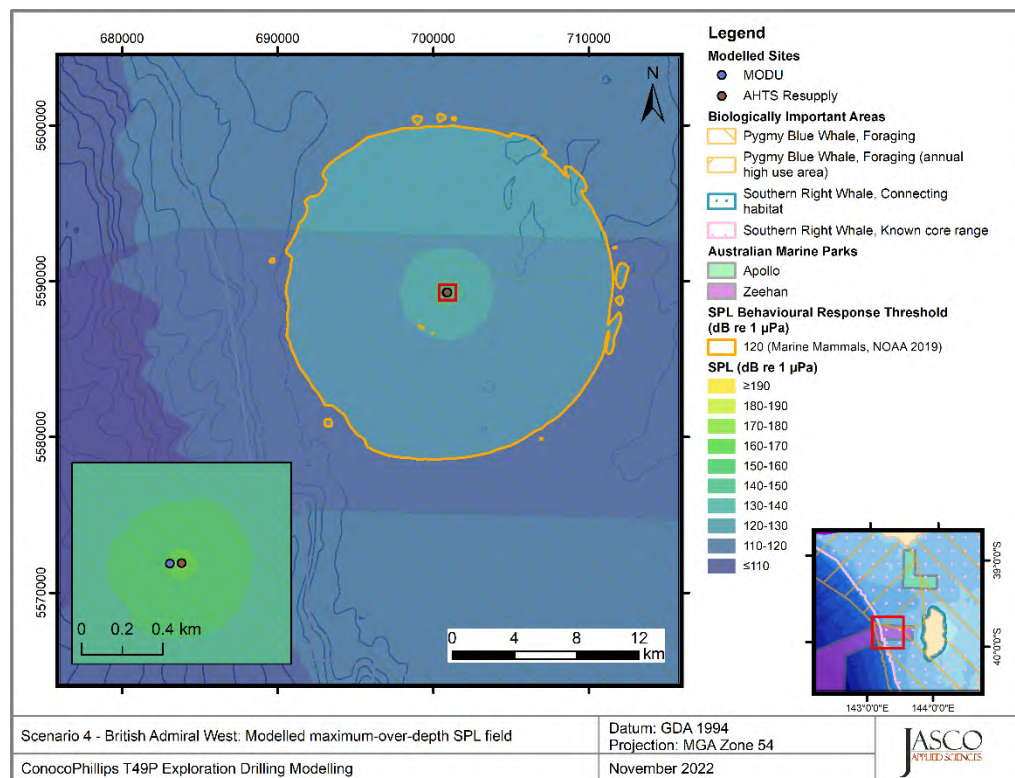

Figure 31. Scenario 4— T/49P British Admiral West, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.1.4. VIC/P79 Merope

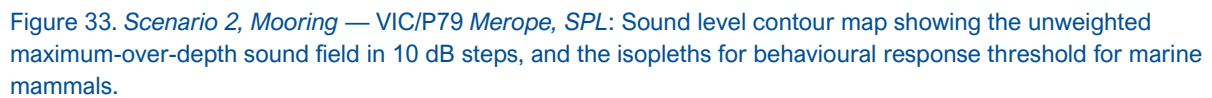

Figure 32. Scenario 1, Prelay — VIC/P79 Merope, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

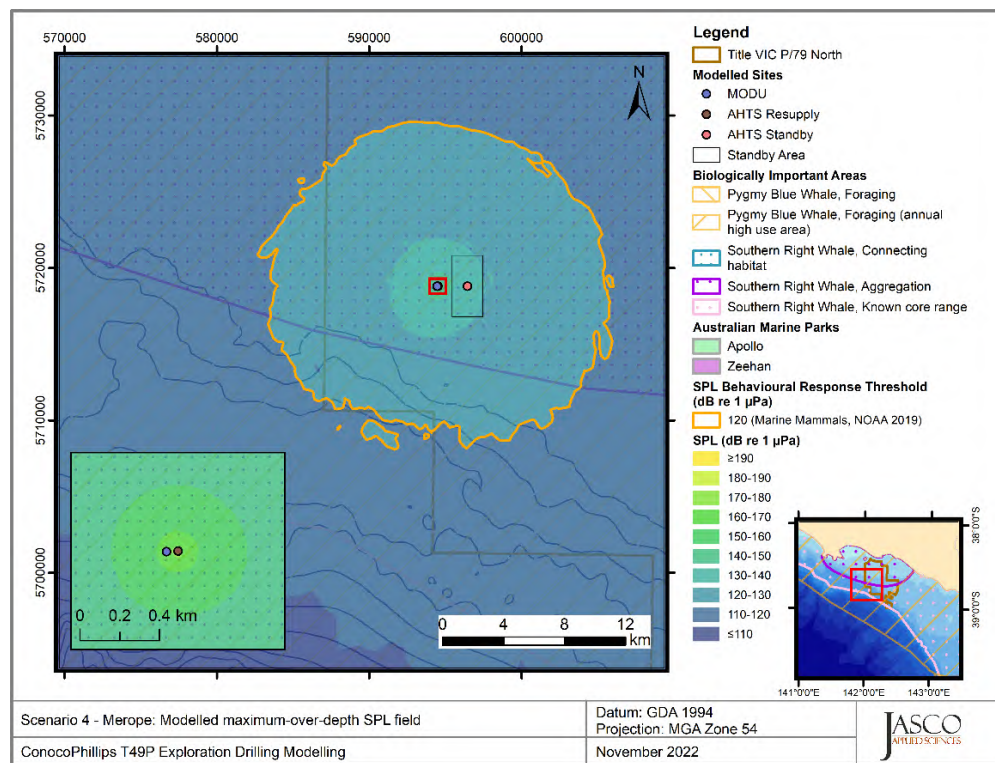

Figure 35. *Scenario 6, Drilling, resupply and standby vessel — VIC/P79 Merope, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.*

#### 4.1.2.1.5. VIC/P79 Julpha

Figure 36. *Scenario 1, Prelay — VIC/P79 Julpha, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.*

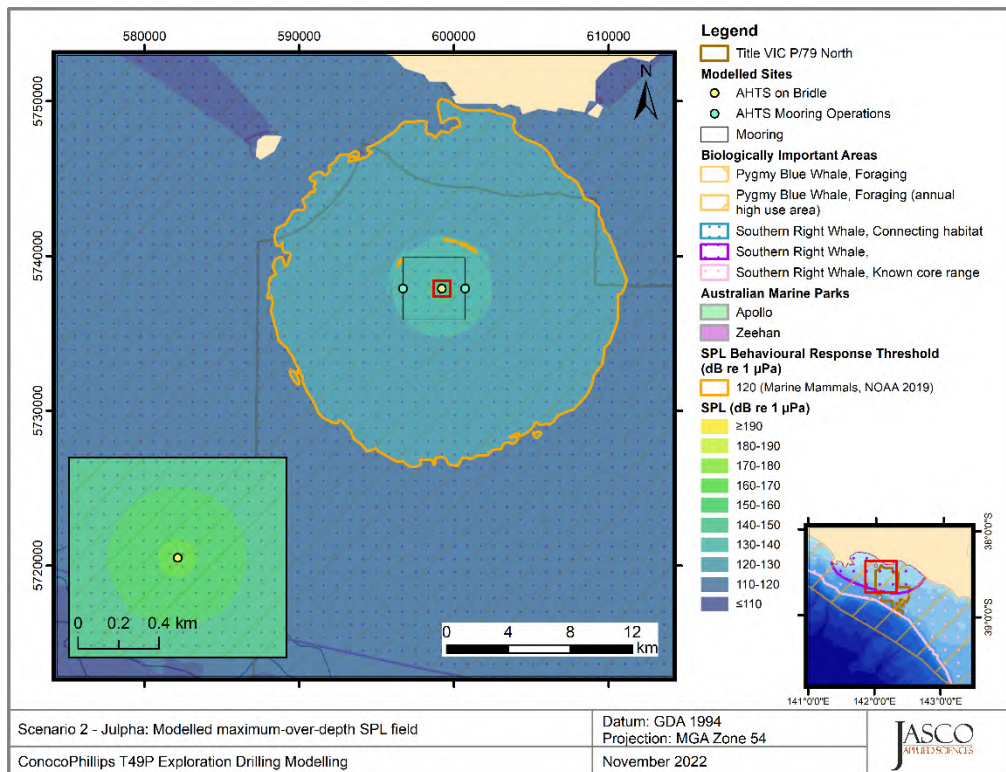

Figure 37. *Scenario 2, Mooring — VIC/P79 Julpha, SPL*: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

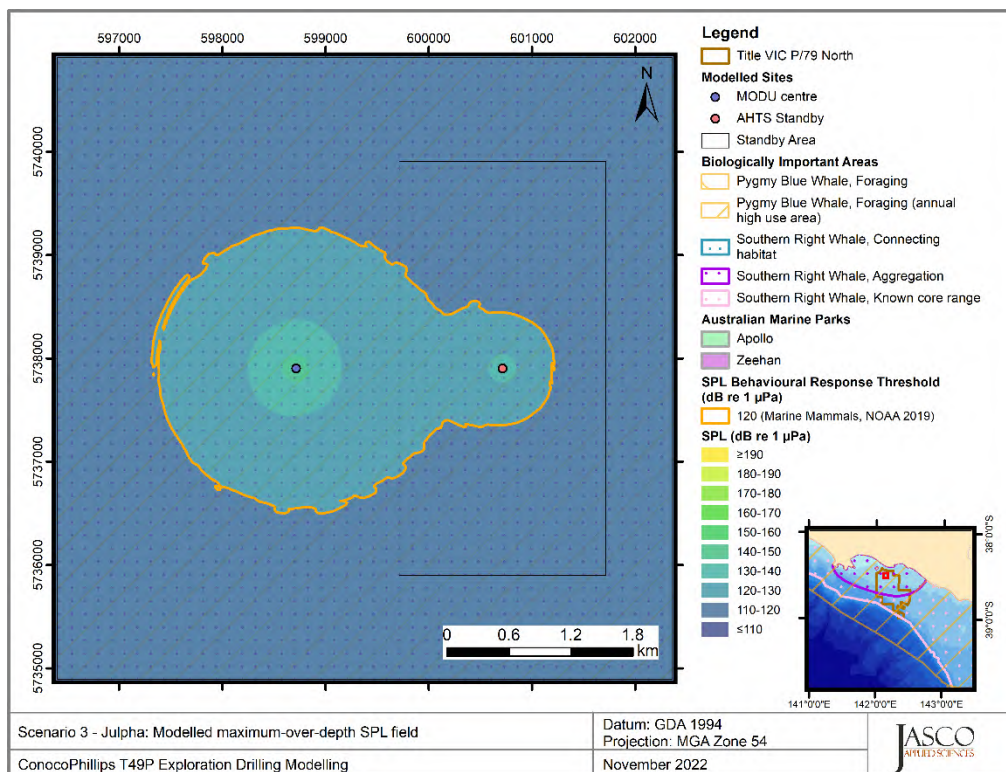

Figure 38. *Scenario 5, Drilling with standby vessel — VIC/P79 Julpha, SPL*: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

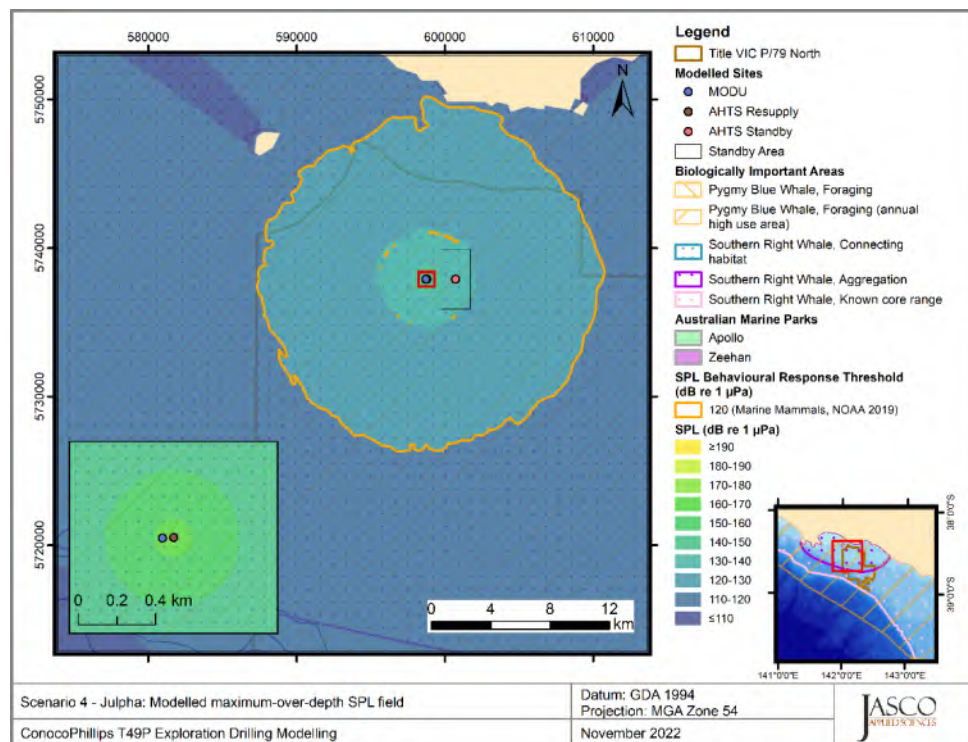

Figure 39. Scenario 6, Drilling, resupply and standby vessel — VIC/P79 Julpha, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.1.6. VIC/P79 Essington

Figure 40. Scenario 1, Prelay — VIC/P79 Essington, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

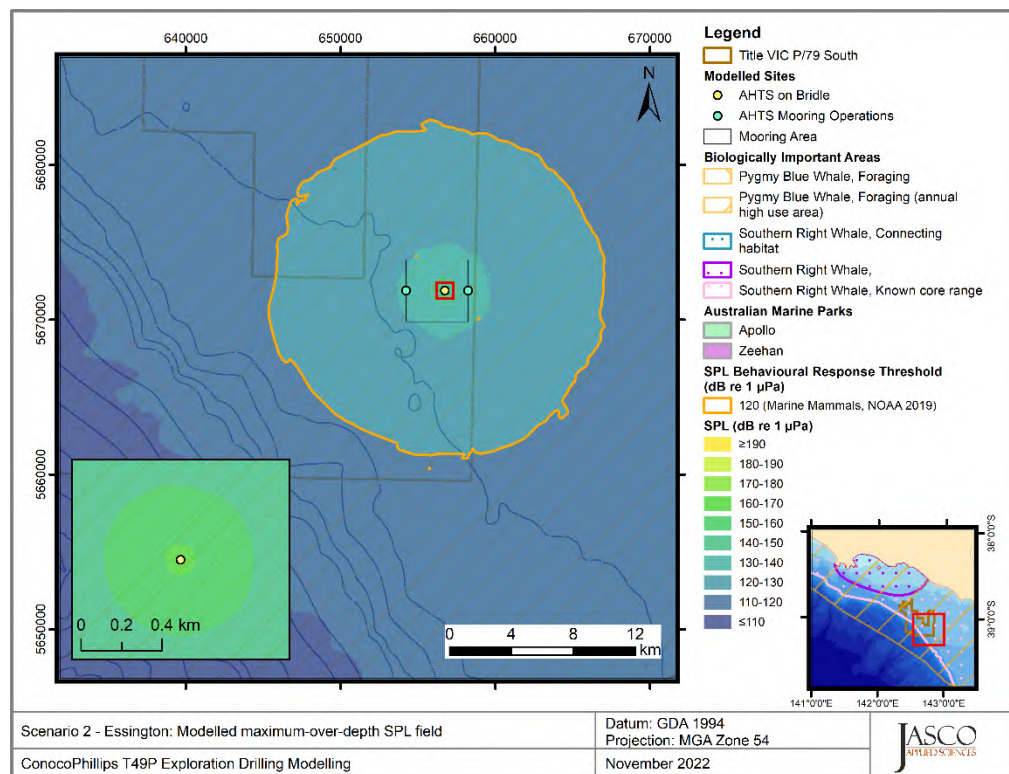

Figure 41. *Scenario 2, Mooring — VIC/P79 Essington, SPL*: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

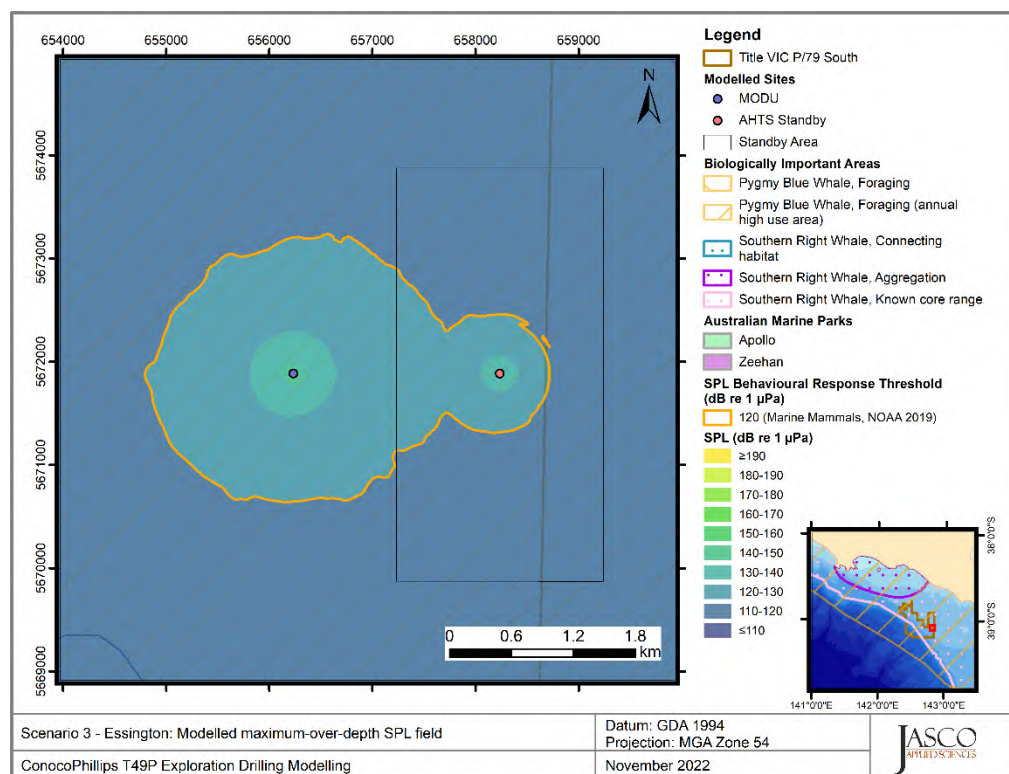

Figure 42. *Scenario 5, Drilling with standby vessel — VIC/P79 Essington, SPL*: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

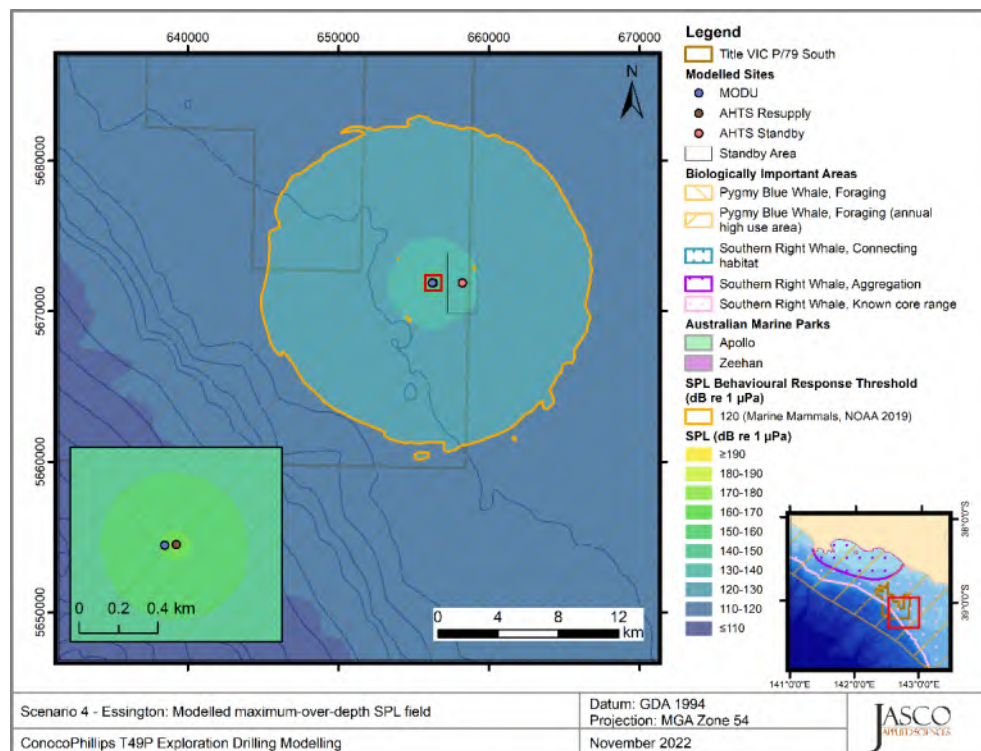

Figure 43. *Scenario 6, Drilling, resupply and standby vessel — VIC/P79 Essington, SPL*: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.1.7. VIC/P79 Garfield

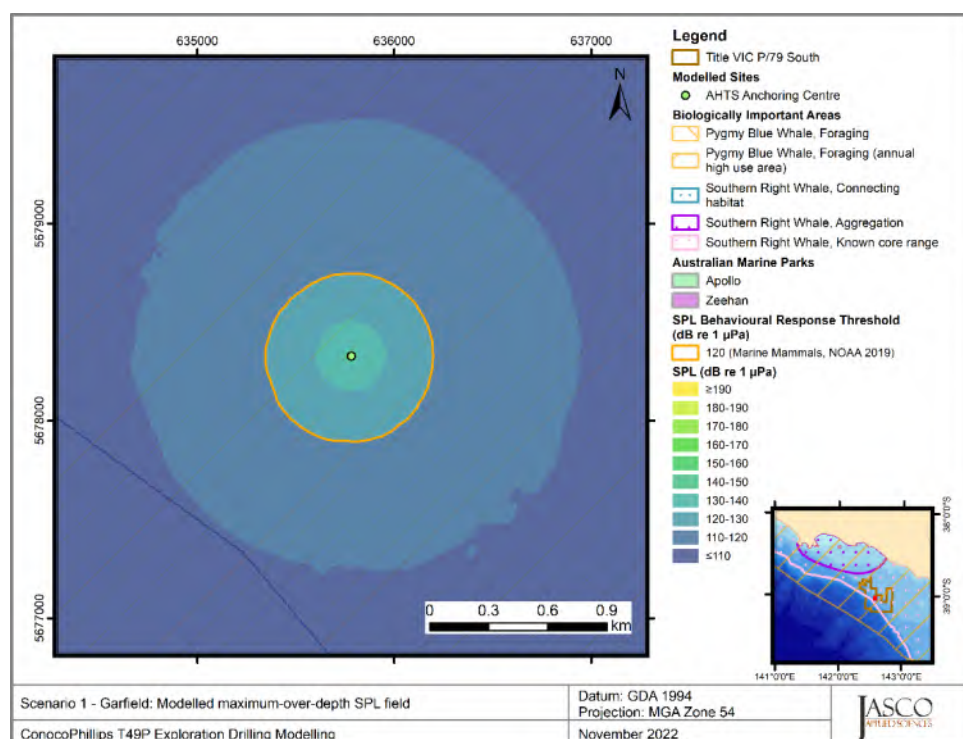

Figure 44. *Scenario 1, Prelay — VIC/P79 Garfield, SPL*: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

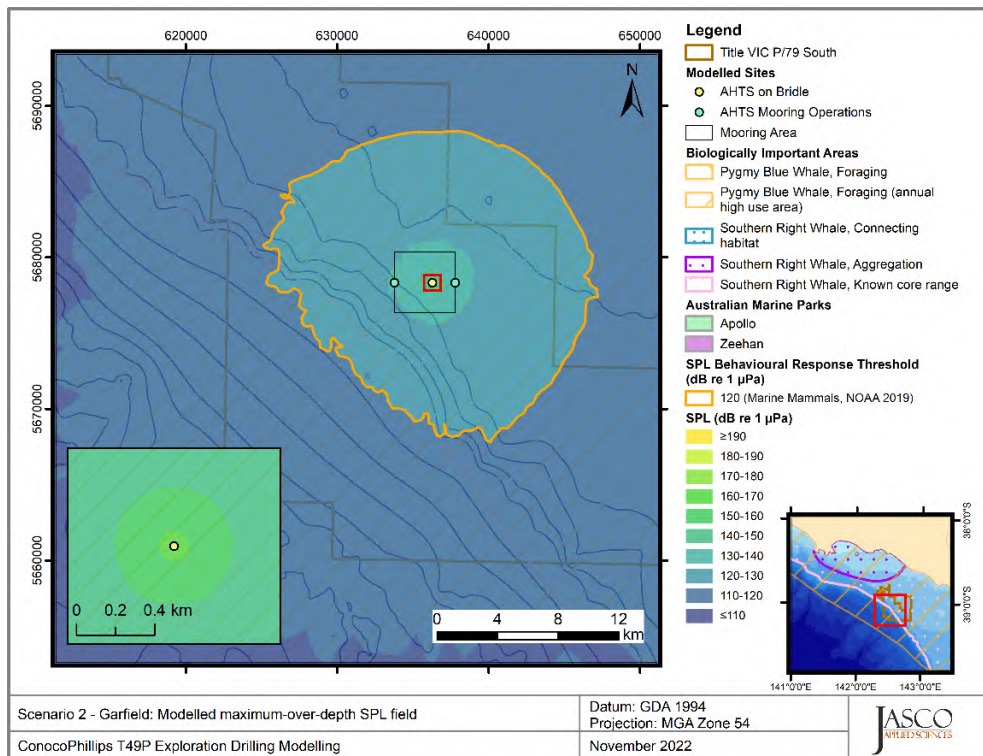

Figure 45. Scenario 2, Mooring — VIC/P79 Garfield, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

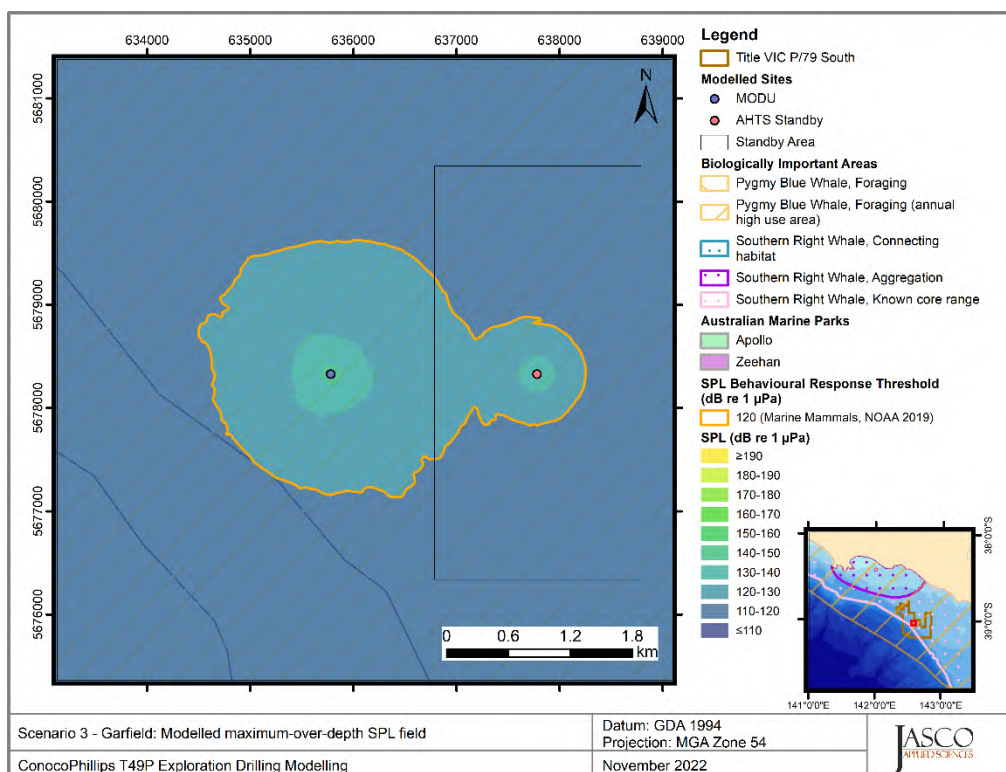

Figure 46. Scenario 5, Drilling with standby vessel — VIC/P79 Garfield, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

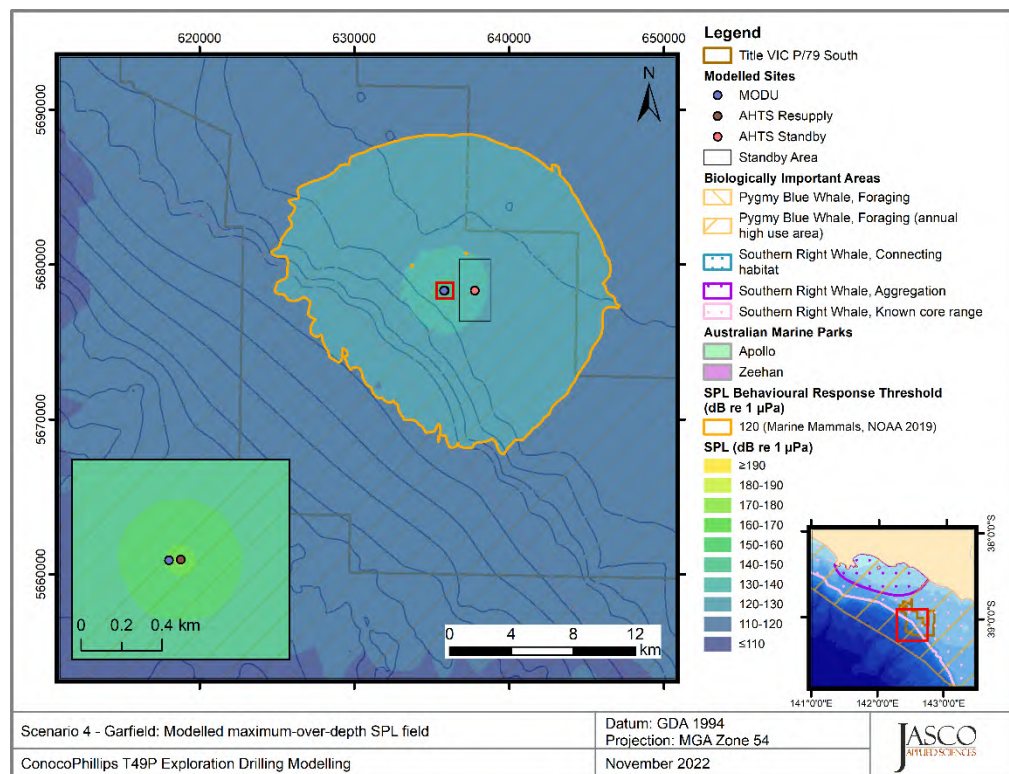

Figure 47. Scenario 6, Drilling, resupply and standby vessel — VIC/P79 Garfield, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.1.8. VIC/P79 Garfield West

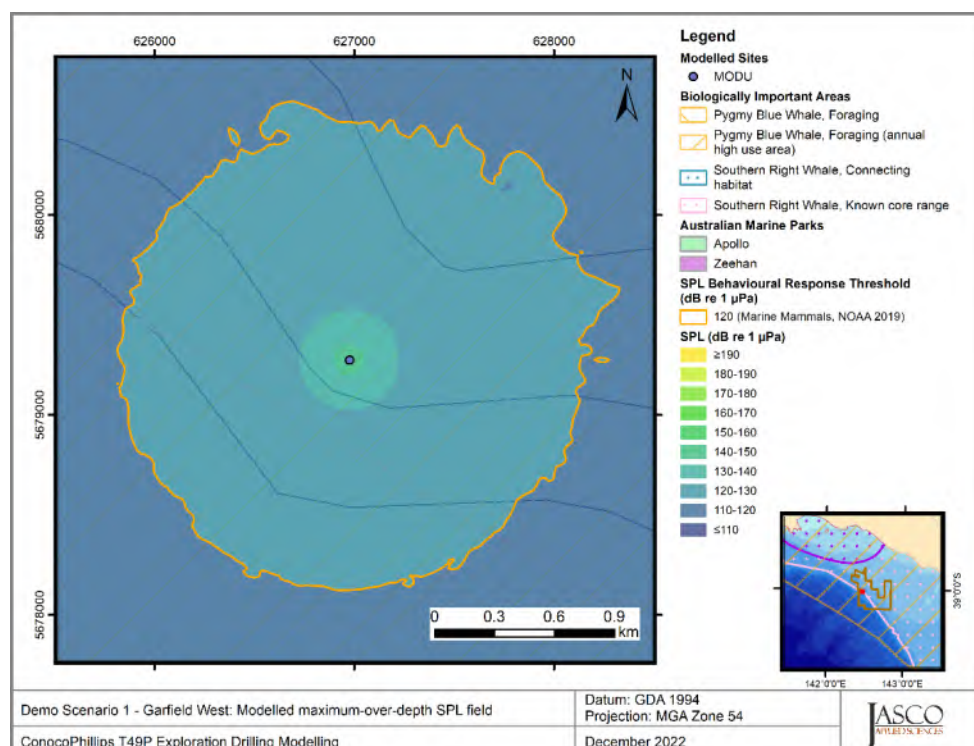

Figure 48. Scenario 3, Drilling — VIC/P79 Garfield West, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

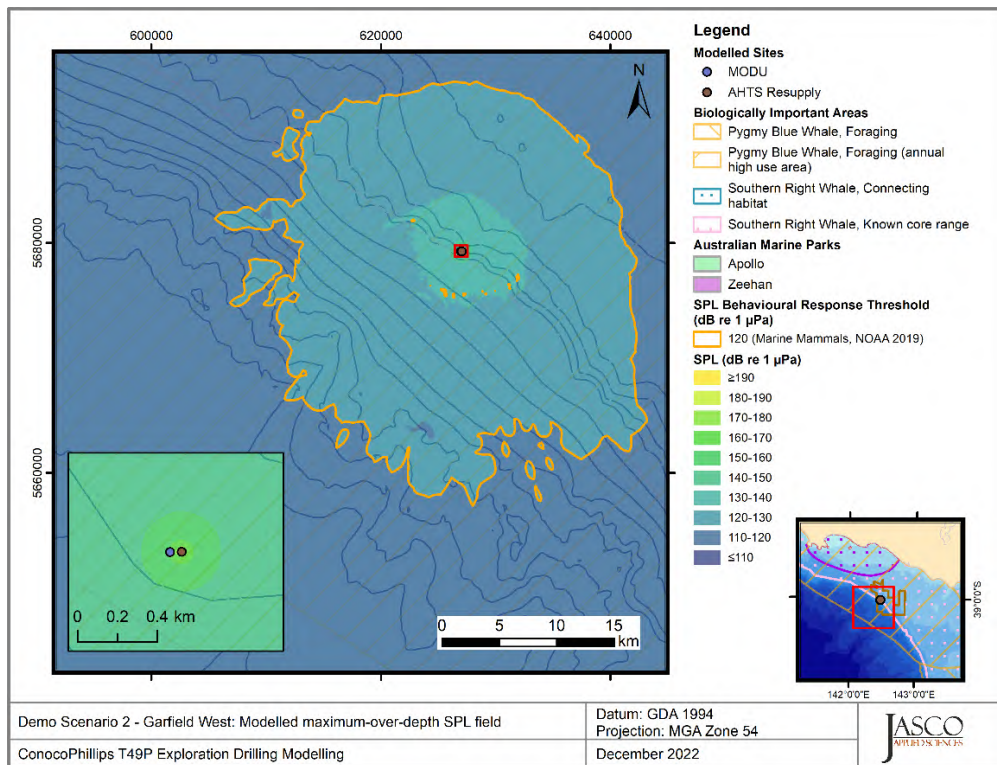

Figure 49. Scenario 4, Drilling and resupply — Garfield West, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

#### 4.1.2.2. Accumulated 24 h Sound Fields

The figures below present the 24 h accumulative Sound Exposure Level maps for the operation scenarios. Thresholds for permanent threshold shift (PTS) and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map. Refer to the radii tables in Section 4.1.1 for distances.

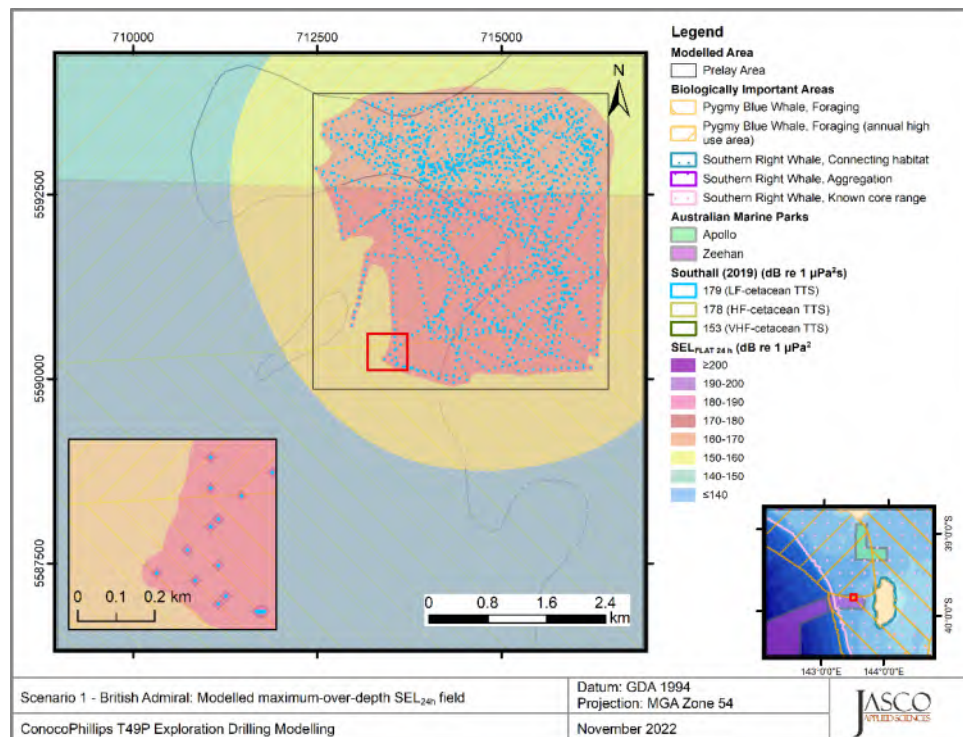

4.1.2.2.1. *T/49P British Admiral*

Figure 50. Scenario 1— *T/49P British Admiral*, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

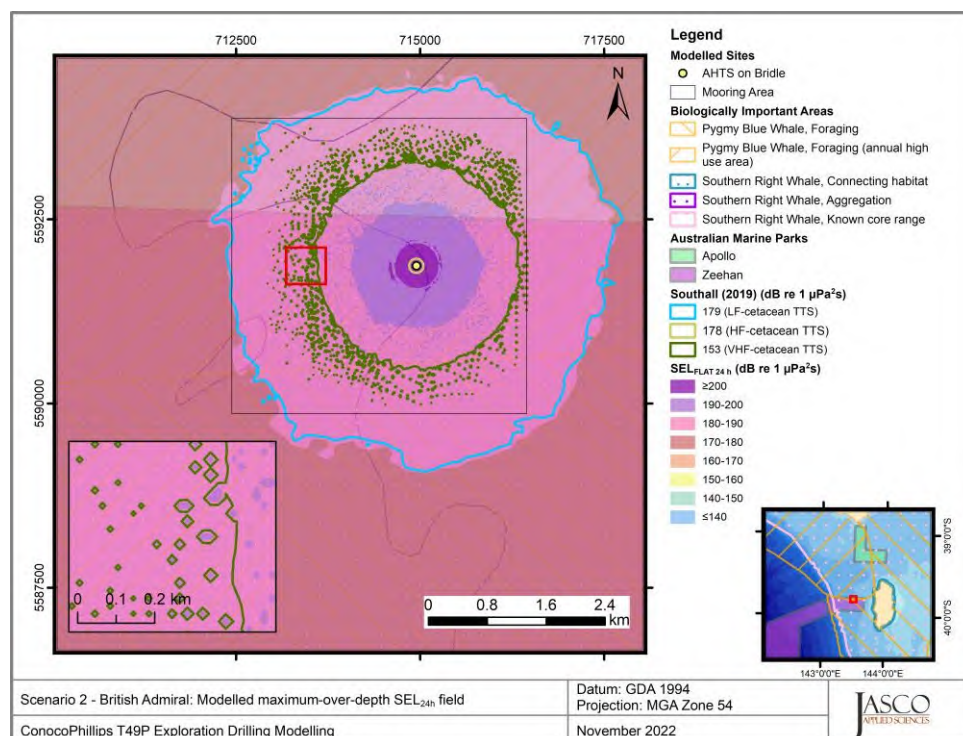

Figure 51. Scenario 2— *T/49P British Admiral*, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

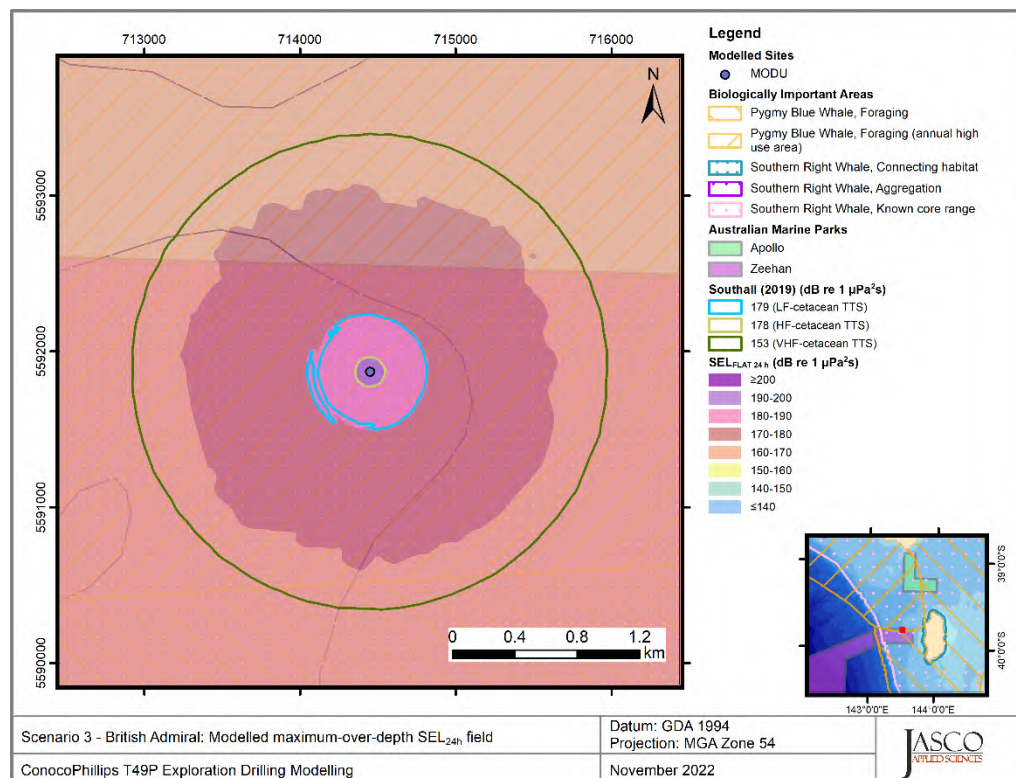

Figure 52. Scenario 3— T/49P British Admiral, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

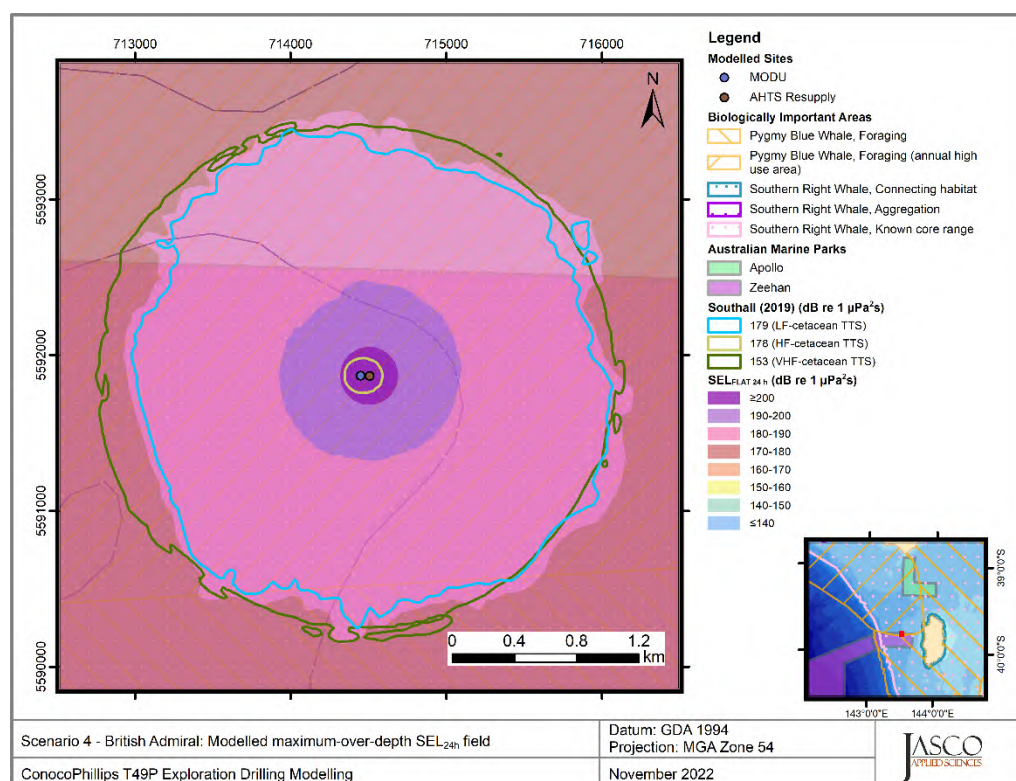

Figure 53. Scenario 4— T/49P British Admiral, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

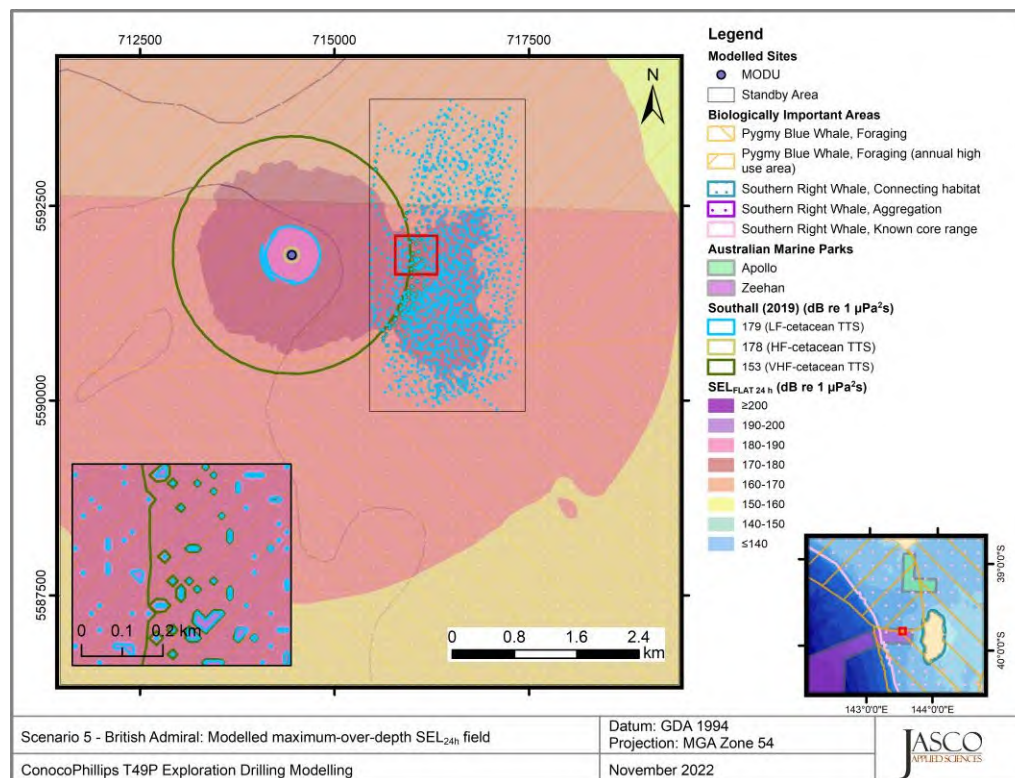

Figure 54. Scenario 5— T/49P British Admiral, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

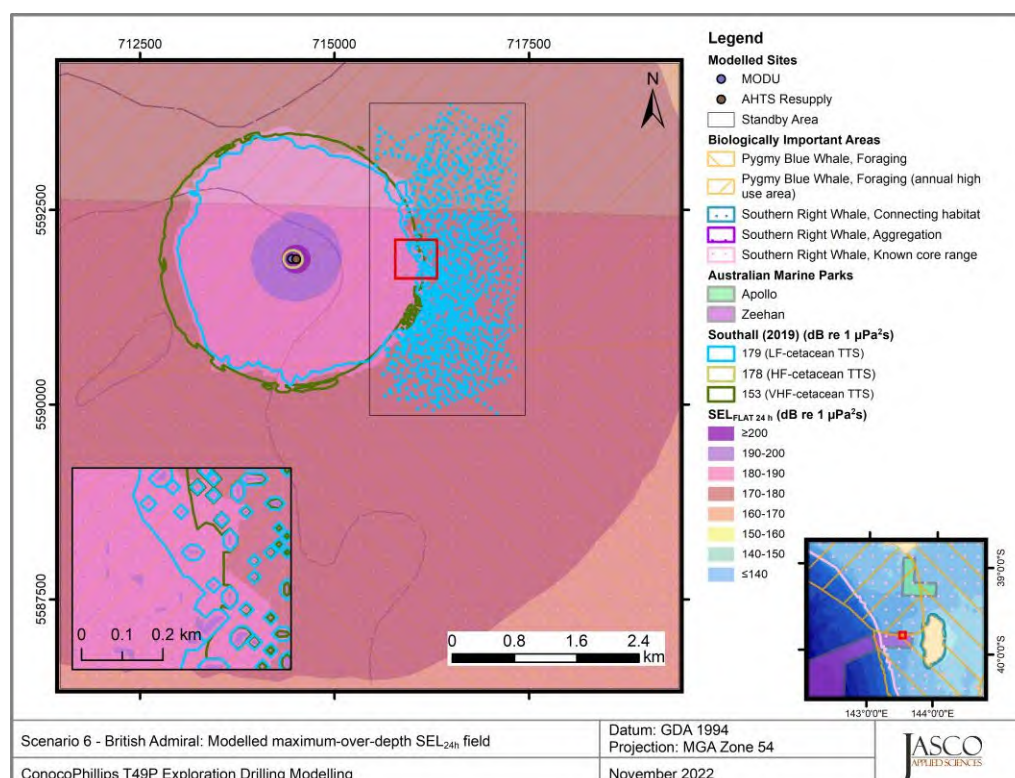

Figure 55. Scenario 6— T/49P British Admiral, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

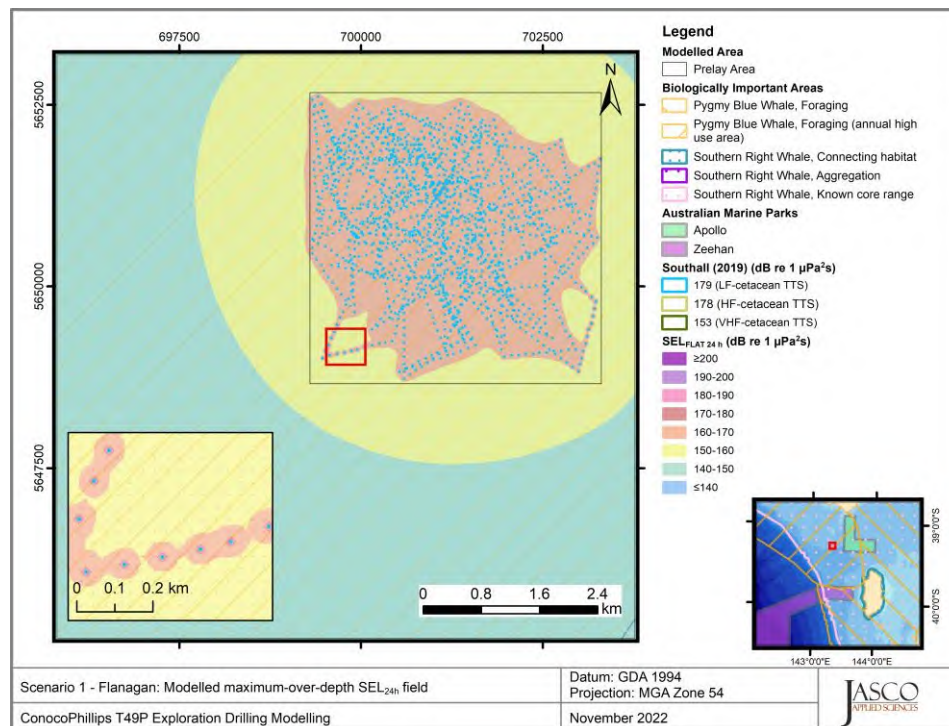

4.1.2.2.2. *T/49P Flanagan*

Figure 56. *Scenario 1— T/49P Flanagan, SEL<sub>24h</sub>*: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

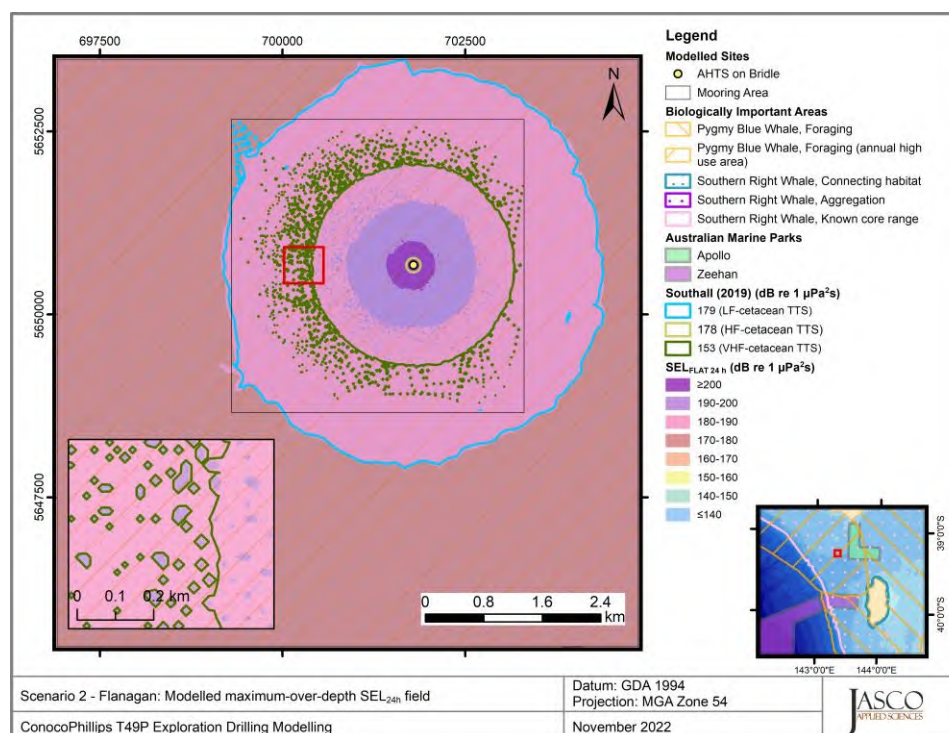

Figure 57. *Scenario 2— T/49P Flanagan, SEL<sub>24h</sub>*: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

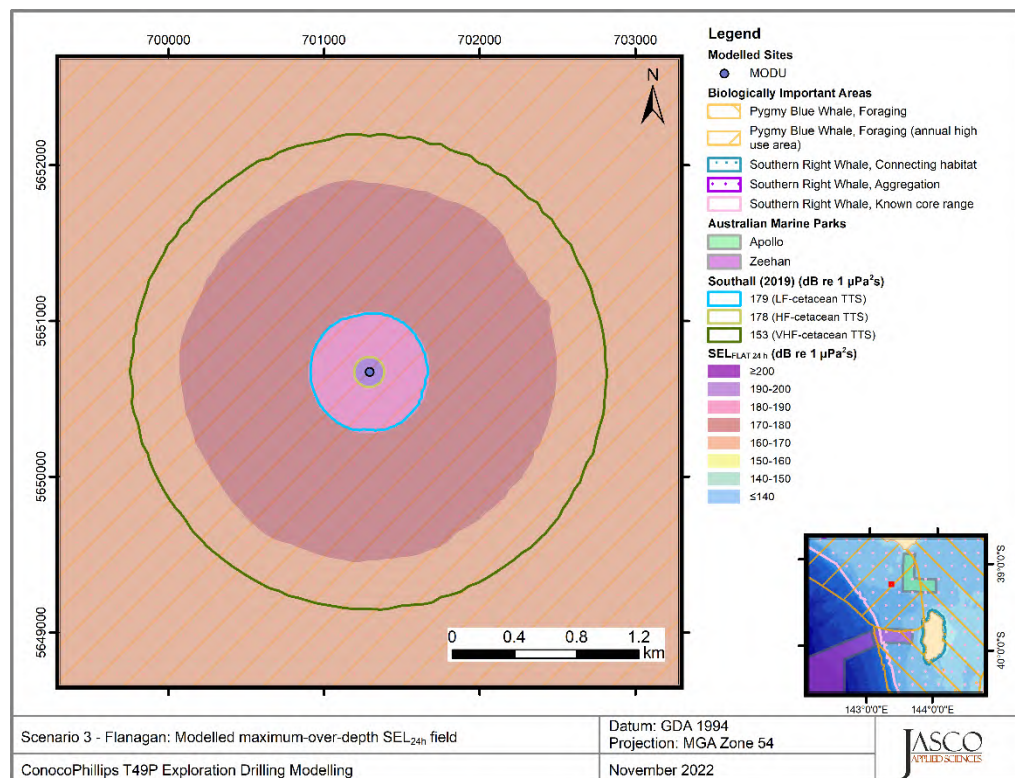

Figure 58. Scenario 3— T/49P Flanagan, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

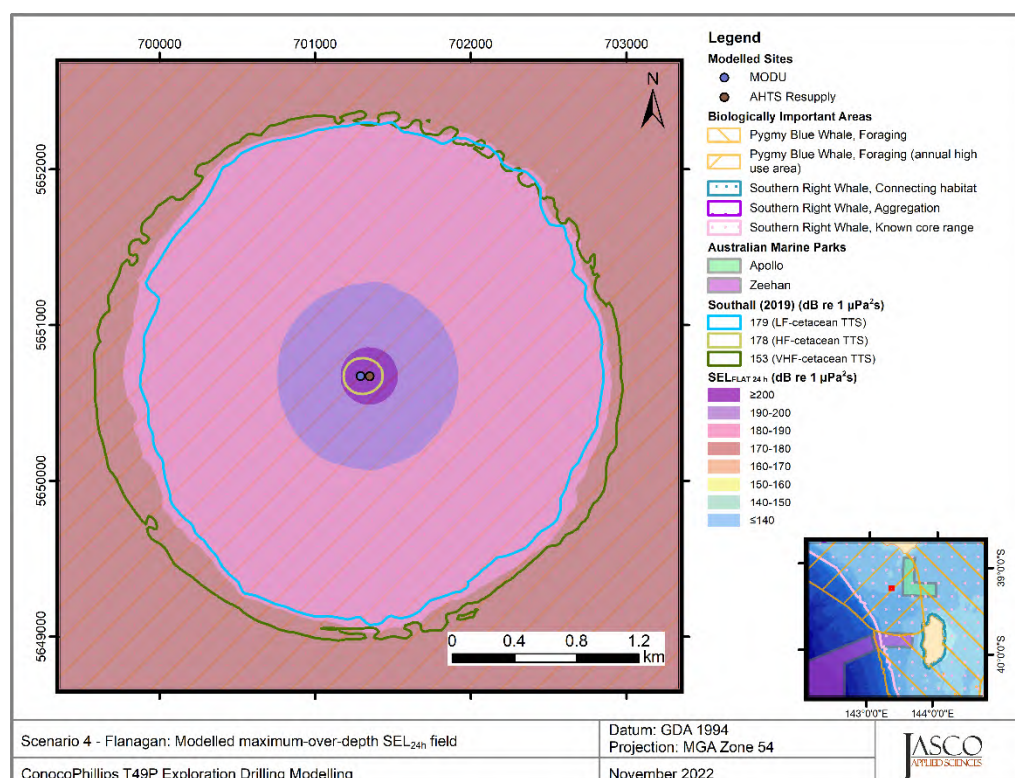

Figure 59. Scenario 4— T/49P Flanagan, SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

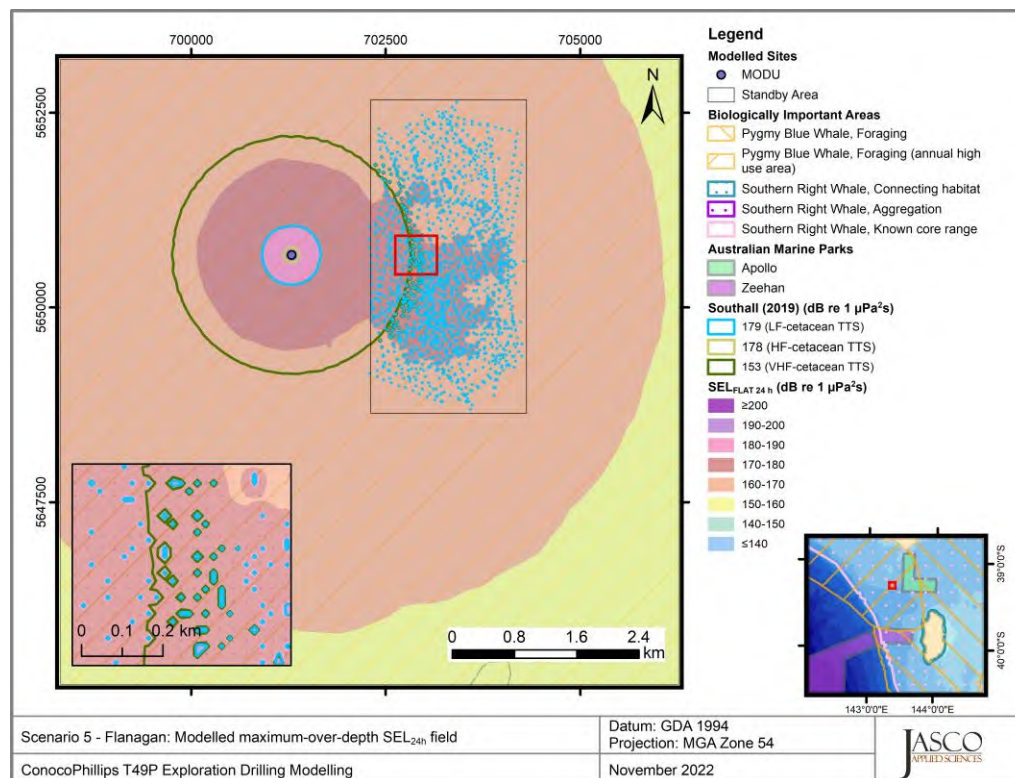

Figure 60. Scenario 5— T/49P Flanagan,  $SEL_{24h}$ : Sound level contour map showing unweighted maximum-over-depth  $SEL_{24h}$  field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

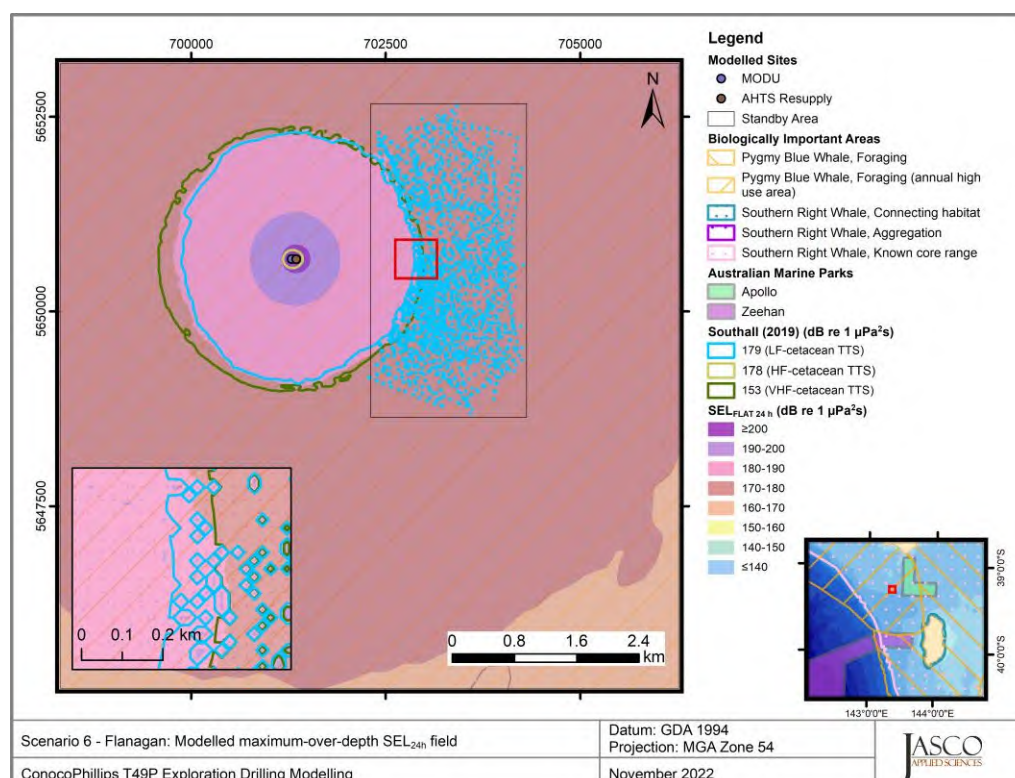

Figure 61. Scenario 6— T/49P Flanagan,  $SEL_{24h}$ : Sound level contour map showing unweighted maximum-over-depth  $SEL_{24h}$  field and isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some for TTS were either not reached or too short to be displayed on a map.

## 4.2. Vertical Seismic Profiling (VSP)

### 4.2.1. Acoustic Source Levels and Directivity

AASM (Section 3.2.1) was used to predict the horizontal and vertical overpressure signatures and corresponding power spectrum levels for the seismic source, with results provided in Appendix B along with the horizontal directivity plots.

Table 31 shows the PK and per-pulse SEL source levels in the horizontal-plane broadside (perpendicular to the sagittal plane of the array), endfire (parallel to the sagittal plane of the array), and vertical directions. The vertical source level that accounts for the 'surface ghost' (the out of phase reflected pulse from the water surface) is also presented to make it easier to compare the output of other seismic source models.

Appendix B.3 shows the broadside, endfire, and vertical overpressure signature and corresponding power spectrum levels for the source. The signature consists of a strong primary peak, related to the initial release of high-pressure air, followed by a series of pulses associated with bubble oscillations. Most energy was produced at frequencies below 300 Hz. Frequency-dependent peaks and nulls in the spectrum result from interference among airguns in the source and correspond with the volumes and relative locations of the airguns to each other.

Table 31. Far-field source level specifications for the 750 in<sup>3</sup> Vertical Seismic Profiling (VSP) array, for a 5 m source depth. Source levels are for a point-like acoustic source with equivalent far-field acoustic output in the specified direction. Sound level metrics are per-pulse and unweighted.

Direction	Peak source pressure level ( $L_{s,pk}$ ; dB re 1 $\mu$ Pa m)	Per-pulse source SEL ( $L_{s,E}$ ; dB 1 $\mu$ Pa <sup>2</sup> m <sup>2</sup> s)	
		10–2000 Hz	2000–25000 Hz
Broadside	239.3	214.5	168.8
Endfire	239.4	214.5	165.8
Vertical	239.2	214.5	173.6
Vertical (surface affected source level)	239.3	216.1	176.3

#### 4.2.2. Per-Pulse Sound Fields

This section presents the per-pulse sound fields in terms of maximum-over-depth SPL, SEL, PK, and seafloor PK and PK-PK. The different metrics are presented for the following reasons:

- Per-pulse SEL sound fields (Table 32) are used as inputs into the 24 h SEL scenario and to provide context for the range to 160 dB re 1  $\mu$ Pa<sup>2</sup>-s, relevant for the EPBC Act Policy Statement 2.1 (DEWHA 2008).
- SPL sound fields (Table 33) were used to determine the distances to marine mammal and turtle behavioural thresholds (see Sections 2.1 and 2.2). In addition, the maximum distance to the low-frequency weighted SPL 140 dB, and the SPL at the nominated receiver locations relevant to SRW are presented in Tables 34 and **Error! Reference source not found.**
- PK metrics within the water column (Table 35) are relevant to thresholds and guidelines for marine mammals, sea turtles, fish, fish eggs and larvae (as well as plankton; see Sections 2.1 and 2.2).
- PK metrics at the seafloor (Table 36) are relevant to guidelines for fish, fish eggs and larvae (Section 3.4).
- PK-PK metrics at the seafloor (Table 37) are relevant to sound levels used in assessing effect on benthic invertebrates (see Section 2.3).

The SPL sound fields, and distances to relevant isopleths can be visualised on the contour maps presented in Section 4.2.4.1.

Table 32. Maximum ( $R_{max}$ ) and 95% ( $R_{95\%}$ ) horizontal distances (in km) from the 750 in<sup>3</sup> Vertical Seismic Profiling (VSP) array to modelled maximum-over-depth unweighted per-pulse sound exposure level (SEL) isopleths for nominal drilling locations.

### 4.2.3. Multiple Pulse Sound Fields

This section presents the sound fields in terms of SEL accumulated over 24 h of activity, for the modelled scenarios (Table 11). Frequency-weighted  $SEL_{24h}$  sound fields were used to estimate the maximum and 95% distances ( $R_{max}$  and  $R_{95\%}$ ; calculated as detailed in Appendix D.3) to marine mammals and turtle PTS and TTS thresholds (listed in Table 38), and to estimate maximum distance and the area to injury and TTS guidelines for fish (Table 39).

Table 38. *VSP, multiple-pulse SEL*: Maximum-over-depth distances (in km) to frequency-weighted  $SEL_{24h}$  based PTS and TTS thresholds for marine mammals Southall et al. (2019) and sea turtles (Finneran et al. 2017) from Vertical Seismic Profiling (VSP) operations for nominal drilling locations, assuming different numbers of impulses during a 24 h period.

A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

#### 4.2.4. Sound Field Maps

Maps of the estimated sound fields, threshold contours, and isopleths of interest for the VSP operations are presented for all modelled nominal sites. The per-pulse SPL sound fields are presented as contour maps in Figures 82 to 85. The SEL<sub>24h</sub> sound fields are presented as contour maps in Figures 86 to 89 for 130 impulses per day. These figures present the unweighted SEL<sub>24h</sub> in 10 dB steps, as well as the isopleths corresponding to thresholds or guidelines for which  $R_{\max}$  is greater than 20 m, the modelling resolution.

##### 4.2.4.1. Maximum-over-depth Per-Pulse Sound Fields

Figure 82. VSP, T/49P British Admiral, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleth of behavioural response thresholds for marine mammals and turtles.

## 4.3. Boomer Sub-bottom Profiling

### 4.3.1. Per-Pulse Sound Fields

This section presents the per-pulse sound fields in terms of maximum-over-depth SPL, SEL, PK, and seafloor PK and PK-PK. The different metrics are presented for the following reasons:

Per-pulse SEL sound fields (

- Table 40) are used as inputs into the 24 h SEL scenario and to provide context for the range to 160 dB re 1  $\mu\text{Pa}^2\cdot\text{s}$ , relevant for the EPBC Act Policy Statement 2.1 (DEWHA 2008). The 160 dB re 1  $\mu\text{Pa}^2\cdot\text{s}$  level for impulsive sources from EPBC Act Policy Statement 2.1 (DEWHA 2008) is not reached.
- SPL sound fields (Table 41) were used to determine the distances to marine mammal and turtle behavioural thresholds (see Sections 2.1 and 2.2). They were also used to determine the maximum distance to the low-frequency weighted SPL 140 dB.
- PK metrics within the water column are relevant to thresholds and guidelines for marine mammals, sea turtles, fish, fish eggs and larvae (as well as plankton; see Sections 2.1 and 2.2). However, no thresholds were exceeded within the modelling resolution of 20 m.
- PK metrics at the seafloor are relevant to guidelines for fish, fish eggs and larvae (Section 3.4). However, no thresholds were exceeded and thus no tabulated results are included.
- PK-PK metrics at the seafloor are relevant to sound levels used in assessing effect on benthic invertebrates (see Section 2.3). However, no thresholds were exceeded and thus no tabulated results are included.

The SPL sound fields, and distances to relevant isopleths can be visualised on the contour maps presented in Section 4.2.4.1.

Table 40. Maximum ( $R_{\text{max}}$ ) and 95% ( $R_{95\%}$ ) horizontal distances (in km) from the Sub-bottom Profiling (SBP) boomer to modelled maximum-over-depth unweighted per-pulse sound exposure level (SEL) isopleths for the nominal locations.

<sup>a</sup> Marine mammal behavioural response threshold for a 50% probability of response for impulsive sound sources (adapted from Wood et al. (2012)).

### 4.3.2. Multiple Pulse Sound Fields

This section presents the sound fields in terms of SEL accumulated over 24 h of activity, for the modelled scenario (Table 11). Frequency-weighted  $SEL_{24h}$  sound fields were used to estimate the maximum and 95% distances ( $R_{\max}$  and  $R_{95\%}$ ; calculated as detailed in Appendix D.3) to marine mammal and marine turtle PTS and TTS thresholds (Table 43), and to estimate maximum distance and the area to injury and TTS guidelines for fish (Table 44).

Table 43. *SBP, multiple-pulse SEL*: Maximum-over-depth distances (in km) to frequency-weighted  $SEL_{24h}$  based PTS and TTS thresholds for marine mammals Southall et al. (2019) and sea turtles (Finneran et al. 2017) from Sub-bottom Profiling (SBP) operations for nominal drilling locations, assuming different numbers of impulses during a 24 h period.

Hearing group	Threshold for $SEL_{24h}$ ( $L_{E,24h}$ ; dB re 1 $\mu Pa^2 \cdot s$ )	Julpha		Garfield

### 4.3.3. Sound Field Maps

Maps of the estimated sound fields, threshold contours, and isopleths of interest for the SBP operations are presented for the Julpha site. The per-pulse SPL sound fields for the nominal drill locations are presented as contour maps in Figure 90 and Figure 91. The SEL<sub>24h</sub> sound fields are presented as contour maps in Figure 92 and Figure 93. These figures presents the unweighted SEL<sub>24h</sub> in 10 dB steps, as well as the isopleths corresponding to thresholds or guidelines for which  $R_{\max}$  is greater than 20 m, the modelling resolution.

#### 4.3.3.1. Maximum-over-depth Per-Pulse Sound Fields

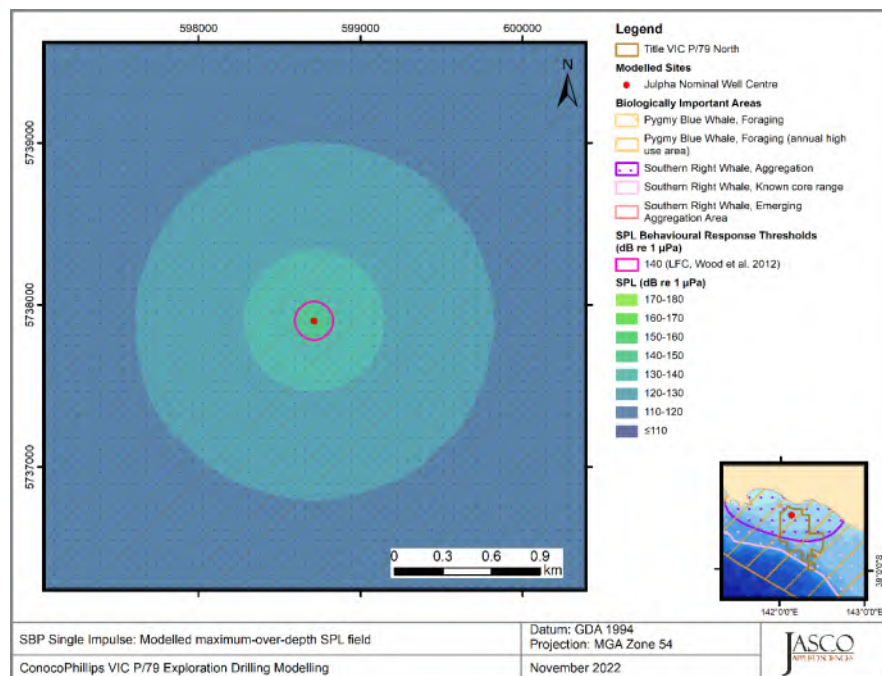

Figure 90. SBP, VIC/P79 Julpha, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleth of behavioural response thresholds for marine mammals and turtles.

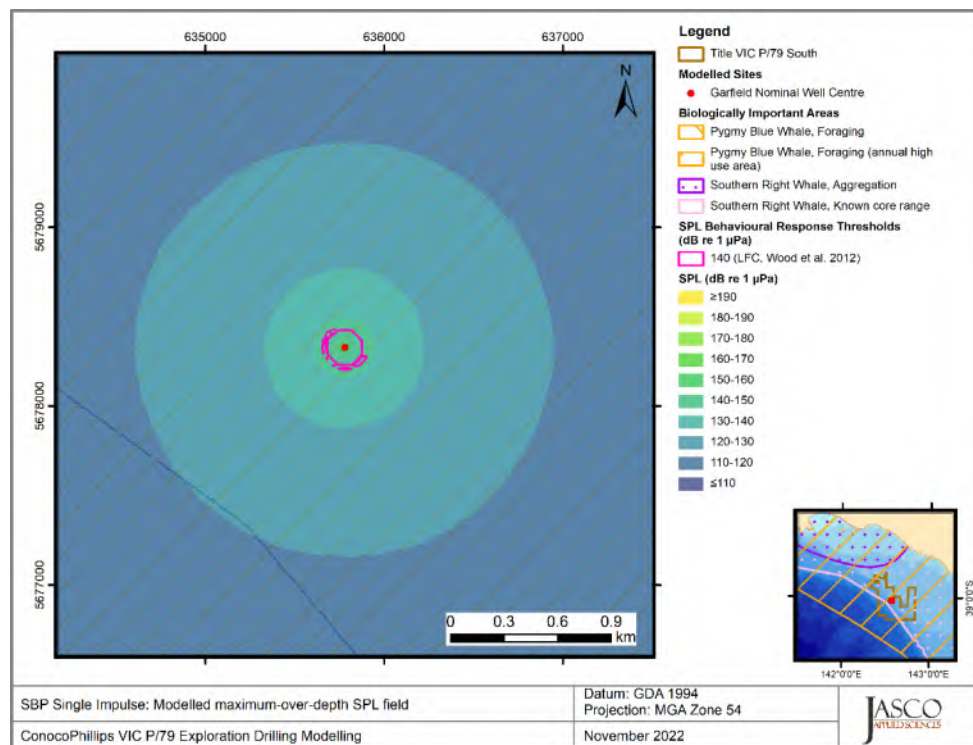

Figure 91. SBP, VIC/P79 Garfield, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleth of behavioural response thresholds for marine mammals and turtles.

#### 4.3.3.2. Accumulated Multi-Pulse Sound Fields

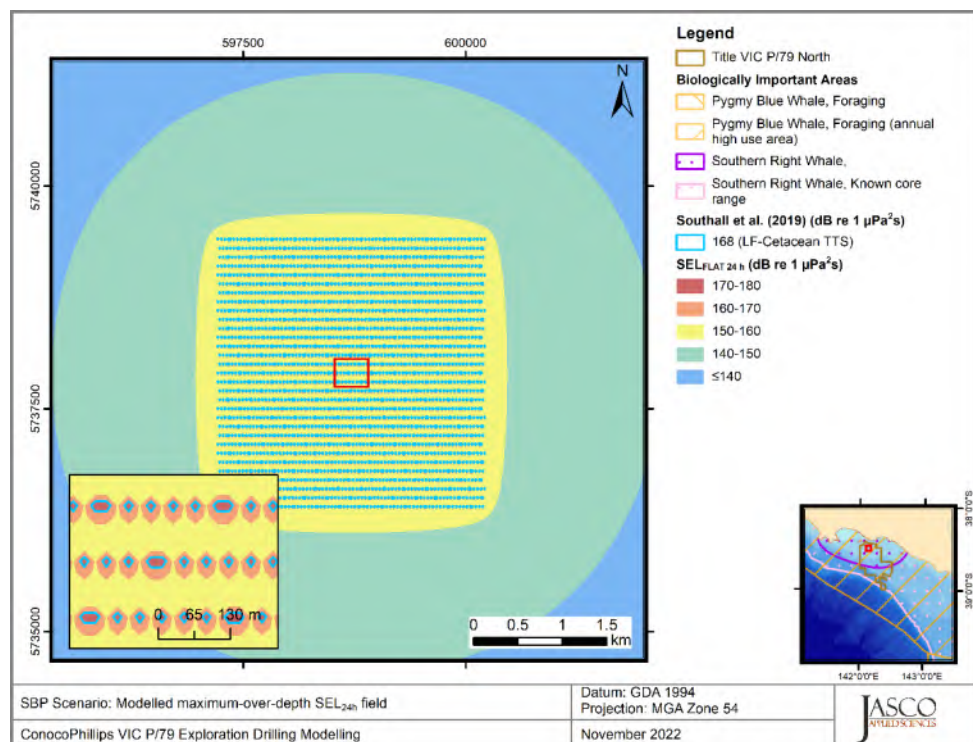

Figure 92. SBP, VIC/P79 Julpha, multiple-pulse SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map. Refer to the radii tables in Section 4.2.3 for distances.

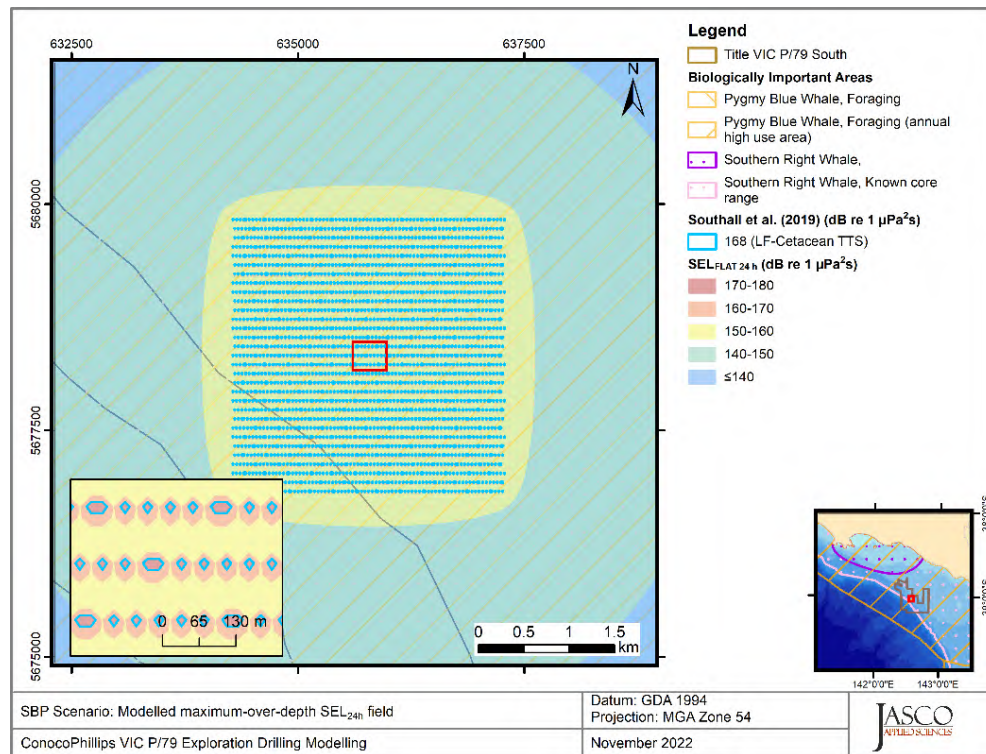

Figure 93. SBP, VIC/P79 Garfield, multiple-pulse SEL<sub>24h</sub>: Sound level contour map showing unweighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for temporary threshold shift (TTS) thresholds. Thresholds for permanent threshold shift (PTS) and some thresholds for TTS were either not reached or were small enough such that they could not be displayed on a map. Refer to the radii tables in Section 4.2.3 for distances.

## 5. Discussion and Conclusion

This modelling study presented underwater sound levels associated with the Otway Exploration Drilling Program. Sound fields were modelled for non-impulsive vessel and drilling noise sources, as well as an impulsive source (VSP and SBP). The model accounted for characteristics of each source (see Sections 3.1 and 3.2), as well as localised bathymetric variation, geoacoustic parameters, and sound speed variation throughout the water column (see Appendix D.2).

Both the MODU and AHTS were modelled as omnidirectional sources, and the VSP source showed little variation in directionality (see Appendix B.3), hence the shapes of the noise footprints for each modelled scenario are nearly entirely down to environmental features.

The studied modelling locations, with the exception of Garfield West, are on the continental shelf, and variations in bathymetry close to the source are gradual, resulting in broadly symmetric sound fields. The proximity of Garfield West to the continental slope, combined with its more reflective seabed resulted in increased ranges to SPL thresholds compared to similar scenarios modelled at sites further inshore.

The sound speed profile (see Appendix D.2.2) was derived from data from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). The month of July was chosen based on an analysis of the temperature, salinity and sound speed profiles extracted from this database. The final sound speed profile consisted of a composite profile representative of the environmental conditions likely to occur within the modelled area to capture propagation effects associated with shallow and deep-water regimes.

In T/49P, the sound speed profile was primarily downwards refracting, down to 1000 m depth, apart from a moderate surface duct. This surface duct traps high-frequency energy near the sea surface that would otherwise dissipate more rapidly in range due to seabed losses. However, at only approximately 40 m deep, this duct is not deep enough to trap energy below approximately 550 Hz. For all the modelled sources, most sound energy propagates at frequencies lower than this. However, there is enough sound energy at high frequency that, when trapped, can propagate with little loss and can produce higher levels near the sea-surface than scenarios where no surface duct is present.

In the northern extent of VIC/P79, the sound speed profile was primarily downwards refracting down to 1000 m depth, however this only influences the sound fields at ranges well beyond those associated with the effect thresholds being considered. The sound fields closer to the sources, and thus in depths less than 200 m, experience a generally linear sound speed profile.

In the southern extent of VIC/P79, the sound speed profile was primarily downwards refracting down to 1200 m depth, where it becomes upwards refracting. This downward refraction reduces propagation for any region with a depth less than 1200 m through sea-bed absorption, reducing distances to thresholds for the Essington and Garfield Sites. However, the sound emitted from the Garfield West Site in the offshore direction reaches this upward refracting layer, and experiences increased propagation as seen in the maps.

For the results tables presented in Section 4, where a dash is used in place of a horizontal distance, these thresholds may or may not be reached. Due to the discretely sampled 20 m calculation grids of the modelled sound fields, distances to these levels could not be estimated for practicable computational purposes. It is likely that SPL isopleths could be reached at distances between the source and the modelled horizontal resolution (20 m); however, distances to injurious accumulated SEL thresholds may not be reached at any range greater than the source due to the species-specific frequency weighing functions. Additionally, if close-to-source radii are comparable to the dimensions of the modelled vessel (MODU or AHTS) then they may only be reached within close proximity to a vessel, if at all.

Additionally,  $SEL_{24h}$  is a cumulative metric that reflects the dosimetric impact of noise levels within 24 h based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding  $SEL_{24h}$  radii therefore represent a worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for 24 h. Therefore, a reported radius for  $SEL_{24h}$  criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for 24 h.

Key findings from the study include:

- In T/49P: In general, the results are similar at all modelled locations, for the vessels and for the VSP operations. The differences between British Admiral and British Admiral West are relatively minor and considered for only two scenarios to provide a comparison point. The differences are shown in Table 45, and demonstrate the influence of the proximity of the shelf edge to British Admiral West. Additional analysis of the modelling work presented in this report for T/49P has been conducted (Appendix F) that indicates that it would be reasonable to represent the potential ranges to effect for drilling and associated operations within approximately the 110–125 m contour through using the presented results. Therefore, all potential drilling locations in T/49P within the operational area except for the very offshore boundary of Seal Rocks in two locations (near the canyon heads), can be represented through the presented results.
- In the northern extent of VIC/P79: Despite the 20 m depth difference, or approximately a 30% difference in these shallow water depths, and similar geology between sites, there is only minor variations in the ranges to thresholds for the vessel related activities at sites.
- In the southern extent of VIC/P79: Despite the 17 m (18%) depth difference between Essington and Garfield, and Garfield's placement approximately 10 km closer to the shelf edge and similar geology between the two sites, the variations observed in the ranges to thresholds for the vessel related activities at both sites are minimal. While the proximity to the shelf edge does not greatly affect the results of these inshore sites, Garfield West, located effectively on the shelf edge, clearly demonstrates the extended ranges to threshold expected in the offshore direction. Additionally, Garfield West has a highly reflective seabed geology, contributing to its favourable propagation conditions. The reason this extended propagation is not observed in the near shelf sites is due to the combination of sources and the source depths used in the modelling, the almost linear sound speed profile in the top 200 m and the attenuating influence of the calcarenite seafloor.

Table 45. Comparison I between the results in Table 20 for British Admiral compared to British Admiral West (positive values indicate the range is further at British Admiral, negative the range is further at British Admiral West).

## Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 80000-3 (2017).

### **1/3-octave**

One third of an octave. *Note:* A one-third octave is approximately equal to one decidecade ( $1/3 \text{ oct} \approx 1.003 \text{ ddec}$ ).

### **1/3-octave-band**

Frequency band whose bandwidth is one one-third octave. *Note:* The bandwidth of a one-third octave-band increases with increasing centre frequency.

### **90%-energy time window**

The time interval over which the cumulative energy rises from 5 to 95% of the total pulse energy. This interval contains 90% of the total pulse energy. Symbol:  $T_{90}$ .

### **90% sound pressure level (90% SPL)**

The sound pressure level calculated over the 90%-energy time window of a pulse.

### **acoustic impedance**

The ratio of the sound pressure in a medium to the volume flow rate of the medium through a specified surface due to the sound wave.

### **acoustic noise**

Sound that interferes with an acoustic process.

### **ambient sound**

Sound that would be present in the absence of a specified activity, usually a composite of sound from many sources near and far, e.g., shipping vessels, seismic activity, precipitation, sea ice movement, wave action, and biological activity.

### **attenuation**

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium.

### **audiogram**

A graph or table of hearing threshold as a function of frequency that describes the hearing sensitivity of an animal over its hearing range.

### **auditory frequency weighting**

The process of applying an auditory frequency weighting function. In human audiometry, C-weighting is the most commonly used function, an example for marine mammals are the auditory frequency weighting functions published by Southall et al. (2007).

### **auditory frequency weighting function**

Frequency weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity. Example hearing groups are low-, mid-, and high-frequency cetaceans, phocid and otariid pinnipeds.

**azimuth**

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also called bearing.

**background noise**

Combination of ambient sound, acoustic self-noise, and sonar reverberation. Ambient sound detected, measured, or recorded with a signal is part of the background noise.

**bandwidth**

The range of frequencies over which a sound occurs. Broadband refers to a source that produces sound over a broad range of frequencies (e.g., seismic airguns, vessels) whereas narrowband sources produce sounds over a narrow frequency range (e.g., sonar) (ANSI S1.13-2005 (R2010)).

**bar**

Unit of pressure equal to 100 kPa, which is approximately equal to the atmospheric pressure on Earth at sea level. 1 bar is equal to  $10^5$  Pa or  $10^{11}$   $\mu$ Pa.

**boxcar averaging**

A signal smoothing technique that returns the averages of consecutive segments of a specified width.

**broadband level**

The total level measured over a specified frequency range.

**cavitation**

A rapid formation and collapse of vapor cavities (i.e., bubbles or voids) in water, most often caused by a rapid change in pressure. Fast-spinning vessel propellers typically cause cavitation, which creates a lot of noise.

**cetacean**

Any animal in the order Cetacea. These are aquatic species and include whales, dolphins, and porpoises.

**compressional wave**

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called primary wave or P-wave.

**conductivity-temperature-depth (CTD)**

Measurement data of the ocean's conductivity, temperature, and depth; used to compute sound speed and salinity.

**continuous sound**

A sound whose sound pressure level remains above ambient sound during the observation period. A sound that gradually varies in intensity with time, for example, sound from a marine vessel.

**decade**

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006).

### decidecade

One tenth of a decade. *Note:* An alternative name for decidecade (symbol ddec) is “one-tenth decade”. A decidecade is approximately equal to one third of an octave ( $1 \text{ ddec} \approx 0.3322 \text{ oct}$ ) and for this reason is sometimes referred to as a “one-third octave”.

### decidecade band

Frequency band whose bandwidth is one decidecade. *Note:* The bandwidth of a decidecade band increases with increasing centre frequency.

### decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Unit: dB.

### energy source level

A property of a sound source obtained by adding to the sound exposure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value:  $1 \mu\text{Pa}^2\text{m}^2\text{s}$ .

### energy spectral density

Ratio of energy (time-integrated square of a specified field variable) to bandwidth in a specified frequency band  $f_1$  to  $f_2$ . In equation form, the energy spectral density  $E_f$  is given by:

$$E_f = \frac{2 \int_{f_1}^{f_2} |X(f)|^2 df}{f_2 - f_1},$$

where  $X(f)$  is the Fourier transform of the field variable  $x(t)$

$$X(f) = \int_{-\infty}^{+\infty} x(t) \exp(-2\pi i f t) dt.$$

The field variable  $x(t)$  is a scalar quantity, such as sound pressure. It can also be the magnitude or a specified component of a vector quantity such as sound particle displacement, sound particle velocity, or sound particle acceleration. The unit of energy spectral density depends on the nature of  $x$ , as follows:

- If  $x$  = sound pressure:  $\text{Pa}^2 \text{ s/Hz}$
- If  $x$  = sound particle displacement:  $\text{m}^2 \text{ s/Hz}$
- If  $x$  = sound particle velocity:  $(\text{m/s})^2 \text{ s/Hz}$
- If  $x$  = sound particle acceleration:  $(\text{m/s}^2)^2 \text{ s/Hz}$

The factor of two on the right-hand side of the equation for  $E_f$  is needed to express a spectrum that is symmetric about  $f = 0$ , in terms of positive frequencies only. See entry 3.1.3.9 of ISO 18405 (2017).

### energy spectral density level

The level ( $L_{E,f}$ ) of the **energy spectral density** ( $E_f$ ). Unit: decibel (dB).

$$L_{E,f} = 10 \log_{10}(E_f/E_{f,0}) \text{ dB}.$$

The frequency band and integration time should be specified.

As with **energy spectral density**, energy spectral density level can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement). The reference value ( $E_{f,0}$ ) for energy spectral density level depends on the nature of field variable.

**energy spectral density source level**

A property of a sound source obtained by adding to the energy spectral density level of the sound pressure measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value:  $1 \mu\text{Pa}^2\text{m}^2/\text{Hz}$ .

**ensonified**

Exposed to sound.

**far field**

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

**Fourier transform (or Fourier synthesis)**

A mathematical technique which, although it has varied applications, is referenced in the context of this report as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as fast Fourier transform (FFT).

**flat weighting**

Term indicating that no frequency weighting function is applied. Synonymous with unweighted.

**frequency**

The rate of oscillation of a periodic function measured in cycles-per-unit-time. The reciprocal of the period. Unit: hertz (Hz). Symbol:  $f$ . 1 Hz is equal to 1 cycle per second.

**frequency weighting**

The process of applying a frequency weighting function.

**frequency-weighting function**

The squared magnitude of the sound pressure transfer function. For sound of a given frequency, the frequency weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency weighting function*: compensatory frequency weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency weighting function*: frequency weighting function describing the sensitivity of an acoustic acquisition system, typically consisting of a hydrophone, one or more amplifiers, and an analogue to digital converter.

**geoacoustic**

Relating to the acoustic properties of the seabed.

**hearing group**

Category of animal species when classified according to their hearing sensitivity and to the susceptibility to sound. Examples for marine mammals include very low-frequency (VLF) cetaceans, low-frequency (LF) cetaceans, mid-frequency (MF) cetaceans, high-frequency (HF) cetaceans, very high-frequency (VHF) cetaceans, otariid pinnipeds in water (OPW), phocid pinnipeds in water (PPW), sirenians (SI), other marine carnivores in air (OCA), and other marine carnivores in water (OCW) (NMFS 2018, Southall et al. 2019). See **auditory frequency weighting functions**, which are often applied to these groups. Examples for fish include species for which the swim bladder is involved in

hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014).

### hearing threshold

The sound pressure level for any frequency of the hearing group that is barely audible for a given individual for specified background noise during a specific percentage of experimental trials.

### hertz (Hz)

A unit of frequency defined as one cycle per second.

### high-frequency (HF) cetacean

See **hearing group**.

### impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 second), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Examples of impulsive sound sources include explosives, seismic airguns, and impact pile drivers.

### isopleth

A line drawn on a map through all points having the same value of some quantity.

### knot

One nautical mile per hour. Symbol: kn.

### level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. Examples include sound pressure level, sound exposure level, and peak sound pressure level. For example, a value of sound exposure level with reference to  $1 \mu\text{Pa}^2 \text{ s}$  can be written in the form  $\times \text{ dB re } 1 \mu\text{Pa}^2 \text{ s}$ .

### low-frequency (LF) cetacean

See **hearing group**.

### median

The 50th percentile of a statistical distribution.

### mid-frequency (MF) cetacean

See **hearing group**.

### monopole source level (MSL)

A source level that has been calculated using an acoustic model that accounts for the effect of the sea-surface and seabed on sound propagation, assuming a point-like (monopole) sound source. Also see **radiated noise level**.

### Monte Carlo simulation

The method of investigating the distribution of a non-linear multi-variate function by random sampling of all of its input variable distributions.

### M-weighting

See **auditory frequency weighting function** (as proposed by Southall et al. 2007).

**mysticete**

A suborder of cetaceans that use baleen plates to filter food from water. Members of this group include rorquals (Balaenopteridae), right whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

**N percent exceedance level**

The sound level exceeded *N*% of the time during a specified time interval. Also see **percentile level**.

**non-impulsive sound**

Sound that is not an impulsive sound. A non-impulsive sound is not necessarily a continuous sound.

**octave**

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

**odontocete**

The presence of teeth, rather than baleen, characterizes these whales. Members of the Odontoceti are a suborder of cetaceans, a group comprised of whales, dolphins, and porpoises. The skulls of toothed whales are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

**otariid**

A common term used to describe members of the Otariidae, eared seals, commonly called sea lions and fur seals. Otariids are adapted to a semi-aquatic life; they use their large fore flippers for propulsion. Their ears distinguish them from phocids. Otariids are one of the three main groups in the superfamily Pinnipedia; the other two groups are phocids and walrus.

**otariid pinnipeds in water (OPW)**

See **hearing group**.

**other marine carnivores in water (OCW)**

See **hearing group**.

**parabolic equation method**

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of back-scattered sound, simplifying the computation of propagation loss. The effect of back-scattered sound is negligible for most ocean-acoustic propagation problems.

**peak sound pressure level (zero-to-peak sound pressure level)**

The level ( $L_{p,pk}$  or  $L_{pk}$ ) of the squared maximum magnitude of the sound pressure ( $p_{pk}^2$ ).

Unit: decibel (dB). Reference value ( $p_0^2$ ) for sound in water: 1  $\mu\text{Pa}^2$ .

$$L_{p,pk} = 10 \log_{10}(p_{pk}^2/p_0^2) \text{ dB} = 20 \log_{10}(p_{pk}/p_0) \text{ dB}$$

The frequency band and time window should be specified. Abbreviation: PK or Lpk.

**peak-to-peak sound pressure**

The difference between the maximum and minimum sound pressure over a specified frequency band and time window. Unit: pascal (Pa).

**percentile level**

The sound level not exceeded  $N\%$  of the time during a specified time interval. The  $N$ th percentile level is equal to the  $(100-N)\%$  exceedance level. Also see  **$N$  percent exceedance level**.

**permanent threshold shift (PTS)**

An irreversible loss of hearing sensitivity caused by excessive noise exposure. PTS is considered auditory injury.

**phocid**

A common term used to describe all members of the family Phocidae. These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves. Phocids are one of the three main groups in the superfamily Pinnipedia; the other two groups are otariids and walrus.

**phocid pinnipeds in water (PPW)**

See **hearing group**.

**pinniped**

A common term used to describe all three groups that form the superfamily Pinnipedia: phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

**point source**

A source that radiates sound as if from a single point.

**power spectral density**

Generic term, formally defined as power in a unit frequency band. Unit: watt per hertz (W/Hz). The term is sometimes loosely used to refer to the spectral density of other parameters such as squared sound pressure. ratio of **energy spectral density**,  $E_f$ , to time duration,  $\Delta t$ , in a specified temporal observation window. In equation form, the power spectral density  $P_f$  is given by:

$$P_f = \frac{E_f}{\Delta t}.$$

Power spectral density can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement).

**power spectral density level**

The level ( $L_{P,f}$ ) of the **power spectral density** ( $P_f$ ). Unit: decibel (dB).

$$L_{P,f} = 10 \log_{10}(P_f/P_{f,0}) \text{ dB}.$$

The frequency band and integration time should be specified.

As with **power spectral density**, power spectral density level can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement). The reference value ( $P_{f,0}$ ) for power spectral density level depends on the nature of field variable.

### power spectral density source level

A property of a sound source obtained by adding to the power spectral density level of the sound pressure measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value:  $1 \mu\text{Pa}^2\text{m}^2/\text{Hz}$ .

### pressure, acoustic

The deviation from the ambient pressure caused by a sound wave. Also called sound pressure. Unit: pascal (Pa).

### pressure, hydrostatic

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

### propagation loss (PL)

Difference between a source level (SL) and the level at a specified location,  $\text{PL}(x) = \text{SL} - \text{L}(x)$ . Also see **transmission loss**.

### radiated noise level (RNL)

A source level that has been calculated assuming sound pressure decays geometrically with distance from the source, with no influence of the sea-surface and seabed. Also see **monopole source level**.

### received level

The level measured (or that would be measured) at a defined location. The type of level should be specified.

### reference values

standard underwater references values used for calculating sound **levels**, e.g., the reference value for expressing sound pressure level in decibels is  $1 \mu\text{Pa}$ .

Quantity	Reference value
Sound pressure	$1 \mu\text{Pa}$
Sound exposure	$1 \mu\text{Pa}^2 \text{ s}$
Sound particle displacement	$1 \text{ pm}$
Sound particle velocity	$1 \text{ nm/s}$
Sound particle acceleration	$1 \mu\text{m/s}^2$

### rms

abbreviation for root-mean-square.

### shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

### sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium.

**sound exposure**

Time integral of squared sound pressure over a stated time interval. The time interval can be a specified time duration (e.g., 24 h) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: Pa<sup>2</sup> s.

**sound exposure level**

The level ( $L_E$ ) of the sound exposure ( $E$ ). Unit: decibel (dB). Reference value ( $E_0$ ) for sound in water: 1 μPa<sup>2</sup> s.

$$L_E = 10 \log_{10}(E/E_0) \text{ dB} = 20 \log_{10}(E^{1/2}/E_0^{1/2}) \text{ dB}$$

The frequency band and integration time should be specified. Abbreviation: SEL.

**sound exposure spectral density**

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum. Unit: Pa<sup>2</sup> s/Hz.

**sound field**

Region containing sound waves.

**sound intensity**

Product of the sound pressure and the sound particle velocity. The magnitude of the sound intensity is the sound energy flowing through a unit area perpendicular to the direction of propagation per unit time.

**sound pressure**

The contribution to total pressure caused by the action of sound.

**sound pressure level (rms sound pressure level)**

The level ( $L_{p,rms}$ ) of the time-mean-square sound pressure ( $p_{rms}^2$ ). Unit: decibel (dB). Reference value ( $p_0^2$ ) for sound in water: 1 μPa<sup>2</sup>.

$$L_{p,rms} = 10 \log_{10}(p_{rms}^2/p_0^2) \text{ dB} = 20 \log_{10}(p_{rms}/p_0) \text{ dB}$$

The frequency band and averaging time should be specified. Abbreviation: SPL or Lrms.

**sound speed profile**

The speed of sound in the water column as a function of depth below the water surface.

**soundscape**

The characterization of the ambient sound in terms of its spatial, temporal, and frequency attributes, and the types of sources contributing to the sound field.

**source level (SL)**

A property of a sound source obtained by adding to the sound pressure level measured in the far field the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa<sup>2</sup>m<sup>2</sup>.

**spectrogram**

A visual representation of acoustic amplitude compared with time and frequency.

**spectrum**

An acoustic signal represented in terms of its power, energy, mean-square sound pressure, or sound exposure distribution with frequency.

**surface duct**

The upper portion of a water column within which the sound speed profile gradient causes sound to refract upward and therefore reflect off the surface resulting in relatively long-range sound propagation with little loss.

**temporary threshold shift (TTS)**

Reversible loss of hearing sensitivity. TTS can be caused by noise exposure.

**thermocline**

The depth interval near the ocean surface that experiences temperature gradients due to warming or cooling by heat conduction from the atmosphere and by warming from solar heating.

**transmission loss (TL)**

The difference between a specified level at one location and that at a different location,  $TL(x_1, x_2) = L(x_1) - L(x_2)$ . Also see **propagation loss**.

**unweighted**

Term indicating that no frequency weighting function is applied. Synonymous with flat weighting.

**very high-frequency (VHF) cetacean**

See **hearing group**.

**very low-frequency (VLF) cetacean**

See **hearing group**.

**wavelength**

Distance over which a wave completes one cycle of oscillation. Unit: metre (m). Symbol:  $\lambda$ .

## Appendix A. Acoustic Metrics

This section describes in detail the acoustic metrics, impact criteria, and frequency weighting relevant to the modelling study.

### A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of  $p_0 = 1 \mu\text{Pa}$ . Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI S1.1-2013).

The sound pressure level (SPL or  $L_p$ ; dB re  $1 \mu\text{Pa}$ ) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window ( $T$ ; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10 \log_{10} \left( \frac{1}{T} \int_T g(t) p^2(t) dt / p_0^2 \right) \text{ dB} \quad (\text{A-1})$$

where  $g(t)$  is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function.

The sound exposure level (SEL or  $L_E$ ; dB re  $1 \mu\text{Pa}^2 \cdot \text{s}$ ) is the time-integral of the squared acoustic pressure over a duration ( $T$ ):

$$L_E = 10 \log_{10} \left( \int_T p^2(t) dt / T_0 p_0^2 \right) \text{ dB} \quad (\text{A-2})$$

where  $T_0$  is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the  $N$  individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the  $N$  individual events:

$$L_{E,N} = 10 \log_{10} \left( \sum_{i=1}^N 10^{\frac{L_{E,i}}{10}} \right) \text{ dB} . \quad (\text{A-3})$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g.,  $L_{E,LFC,24h}$ ; Appendix 0). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

## A.2. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a “decidecade” because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the  $i$ th band,  $f_c(i)$ , is defined as:

$$f_c(i) = 10^{\frac{i}{10}} \text{ kHz} \quad (\text{A-4})$$

and the low ( $f_{lo}$ ) and high ( $f_{hi}$ ) frequency limits of the  $i$ th decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i) \quad (\text{A-5})$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 10 ( $f_c(10) = 10 \text{ Hz}$ ) to band 44 ( $f_c(44) = 25 \text{ kHz}$ ).

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the  $i$ th band ( $L_{p,i}$ ) is computed from the spectrum  $S(f)$  between  $f_{lo,i}$  and  $f_{hi,i}$ :

$$L_{p,i} = 10 \log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f) df \text{ dB} \quad (\text{A-6})$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_i 10^{\frac{L_{p,i}}{10}} \text{ dB} \quad (\text{A-7})$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient noise signal. Because the decidecade bands are wider than 1 Hz, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale. Because the decidecade bands are wider with increasing frequency, the decidecade-octave-band SPL is higher than the power spectrum.

### A.3. Marine Mammal Noise Effect Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggest that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for auditory injury, impairment, and disturbance. The following sections summarise the recent development of thresholds; however, this field remains an active research topic.

#### A.3.1. Injury and Hearing Sensitivity Changes

In recognition of shortcomings of the SPL-only based auditory injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual auditory injury criteria for impulsive sounds that included peak pressure level thresholds and SEL<sub>24h</sub> thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas SEL<sub>24h</sub> is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for humans; see Appendix 0). The SEL<sub>24h</sub> thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower PTS and TTS values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1  $\mu\text{Pa}^2\cdot\text{s}$ . Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced the Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1  $\mu\text{Pa}^2\cdot\text{s}$ .

As of 2017, a definitive approach is still not apparent. There is consensus in the research community that an SEL-based method is preferable, either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes auditory injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018 (NMFS 2018). Southall et al. (2019) revisited the interim criteria published in 2007. All noise exposure criteria in NMFS (2018) and Southall et al. (2019) are identical (for impulsive and non-impulsive sounds); however, the mid-frequency cetaceans from NMFS (2018) are classified as high-frequency cetaceans in Southall et al. (2019), and high-frequency cetaceans from NMFS (2018) are classified as very-high-frequency cetaceans in Southall et al. (2019).

Southall et al. (2019) are identical (for impulsive and non-impulsive sounds); however, the mid-frequency cetaceans from NMFS (2018) are classified as high-frequency cetaceans in Southall et al. (2019), and high-frequency cetaceans from NMFS (2018) are classified as very-high-frequency cetaceans in Southall et al. (2019).

## A.3.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016, Southall et al. 2021).

### A.3.2.1. Non-Impulsive Noise

NMFS currently uses step function (all-or-none) threshold of 120 dB re 1  $\mu$ Pa SPL (unweighted) for non-impulsive sounds to assess and regulate noise-induced behavioural impacts on marine mammals (NOAA 2019). The 120 dB re 1  $\mu$ Pa threshold is associated with continuous sources and was derived based on studies examining behavioural responses to drilling and dredging, referring to Malme et al. (1983), Malme et al. (1984), and Malme et al. (1986), which were considered in Southall et al. (2007). Malme et al. (1986) found that playback of drillship noise did not produce clear evidence of disturbance or avoidance for levels below 110 dB re 1  $\mu$ Pa (SPL), possible avoidance occurred for exposure levels approaching 119 dB re 1  $\mu$ Pa. Malme et al. (1984) determined that measurable reactions usually consisted of rather subtle short-term changes in speed and/or heading of the whale(s) under observation. It has been shown that both received level and proximity of the sound source is a contributing factor in eliciting behavioural reactions in humpback whales (Dunlop et al. 2017, Dunlop et al. 2018).

### A.3.2.2. Impulsive Noise

For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1  $\mu$ Pa SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). For impulsive noise, NMFS currently uses step function thresholds of 160 dB re 1  $\mu$ Pa SPL (unweighted) to assess and regulate noise-induced behavioural impacts for marine mammals (NOAA 2018, NOAA 2019). The threshold for impulsive sound is derived from the High-Energy Seismic Survey (HESS) panel (HESS 1999) report that, in turn, is based on the responses of migrating mysticete whales to airgun sounds (Malme et al. 1984). The HESS team recognised that behavioural responses to sound may occur at lower levels, but significant responses were only likely to occur above a SPL of 140 dB re 1  $\mu$ Pa. Southall et al. (2007) found varying responses for most marine mammals between a SPL of 140 and 180 dB re 1  $\mu$ Pa, consistent with the HESS (1999) report, but lack of convergence in the data prevented them from suggesting explicit step functions.

## A.4. Marine Mammal Frequency Weighting

The potential for noise to affect animals of a certain species depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

### A.4.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The auditory weighting functions for marine mammals are applied in a similar way as A-weighting for noise level assessments for humans. The new frequency-weighting functions are expressed as:

$$G(f) = K + 10 \log_{10} \left\{ \frac{(f/f_1)^{2a}}{\left[1 + (f/f_1)^2\right]^a \left[1 + (f/f_2)^2\right]^b} \right\} \quad (\text{A-8})$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid-, and high-frequency cetaceans, phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018). The updates did not affect the content related to either the definitions of M-weighting functions or the threshold values. Table A-1 lists the frequency-weighting parameters for each hearing group; Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions as recommended by Southall et al. (2019).

Hearing group	<i>a</i>	<i>b</i>	<i>f<sub>lo</sub></i> (Hz)	<i>f<sub>hi</sub></i> (kHz)	<i>K</i> (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (dolphins, plus toothed, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very high-frequency cetaceans (true porpoises, <i>Kogia</i> , river dolphins, cephalorhynchid, <i>Lagenorhynchus cruciger</i> and <i>L. australis</i> )	1.8	2	12,000	140,000	1.36
Phocid seals in water	1.0	2	1,900	30,000	0.75
Otariid seals in water	2.0	2	940	25,000	0.64

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups as recommended by Southall et al. (2019).

## Appendix B. VSP Source

### B.1. Airgun Array Source Model

The source levels and directivity of the seismic source were predicted with JASCO's Airgun Array Source Model (AASM). AASM includes low- and high-frequency modules for predicting different components of the seismic source spectrum. The low-frequency module is based on the physics of oscillation and radiation of airgun bubbles, as originally described by Ziolkowski (1970), that solves the set of parallel differential equations that govern bubble oscillations. Physical effects accounted for in the simulation include pressure interactions between airguns, port throttling, bubble damping, and generator-injector (GI) gun behaviour discussed by Dragoset (1984), Laws et al. (1990), and Landrø (1992). A global optimisation algorithm tunes free parameters in the model to a large library of airgun source signatures.

While airgun signatures are highly repeatable at the low frequencies, which are used for seismic imaging, their sound emissions have a large random component at higher frequencies that cannot be predicted using a deterministic model. Therefore, AASM uses a stochastic simulation to predict the high-frequency (800–25,000 Hz) sound emissions of individual airguns, using a data-driven multiple-regression model. The multiple-regression model is based on a statistical analysis of a large collection of high quality seismic source signature data recently obtained from the Joint Industry Program (JIP) on Sound and Marine Life (Mattsson and Jenkerson 2008). The stochastic model uses a Monte-Carlo simulation to simulate the random component of the high-frequency spectrum of each airgun in an array. The mean high-frequency spectra from the stochastic model augment the low-frequency signatures from the physical model, allowing AASM to predict airgun source levels at frequencies up to 25,000 Hz.

AASM produces a set of “notional” signatures for each array element based on:

- Array layout
- Volume, operating depth, and firing pressure of each airgun
- Interactions between different airguns in the array

These notional signatures are the pressure waveforms of the individual airguns at a standard reference distance of 1 m; they account for the interactions with the other airguns in the array. The signatures are summed with the appropriate phase delays to obtain the far-field source signature of the entire array in all directions. This far-field array signature is filtered into decade bands to compute the source levels of the array as a function of frequency band and azimuthal angle in the horizontal plane (at the source depth), after which it is considered a directional point source in the far field.

A seismic array consists of many sources and the point source assumption is invalid in the near field where the array elements add incoherently. The maximum extent of the near field of an array ( $R_{nf}$ ) is:

$$R_{nf} < \frac{l^2}{4\lambda} \quad \text{(B-1)}$$

where  $\lambda$  is the sound wavelength and  $l$

is the longest dimension of the array (Lurton 2002, §5.2.4). For example, a seismic source length of  $l = 21$  m yields a near-field range of 147 m at 2 kHz and 7 m at 100 Hz. Beyond this  $R_{nf}$  range, the array is assumed to radiate like a directional point source and is treated as such for propagation modelling.

The interactions between individual elements of the array create directionality in the overall acoustic emission. Generally, this directionality is prominent mainly at frequencies in the mid-range between tens of hertz to several hundred hertz. At lower frequencies, with acoustic wavelengths much larger

than the inter-airgun separation distances, the directionality is small. At higher frequencies, the pattern of lobes is too finely spaced to be resolved and the effective directivity is less.

## B.2. VSP Source Parameters

The layout of the seismic source is provided in Figure B-1. Details of the airgun parameters are provided in Table B-1. In the context of this source geometry the broadside direction is perpendicular to the sagittal plane of the array and the endfire direction is parallel to the sagittal plane of the array.

Figure B-1. (Left) Plan and (right) side layouts of the modelled 750 in<sup>3</sup> seismic source array. Operational depth is 5 m. The labels indicate the firing volume (in cubic inches) for each airgun. Also see Table B-1.

Table B-1. Layout of the modelled 750 in<sup>3</sup> seismic source array. Operational depth is 5 m. Firing pressure for all guns is 2000 psi. Also see Figure B-1.

Gun	x (m)	y (m)	z (m)	Volume (in <sup>3</sup> )
1	0.0	0.0	4.48	250
2	0.0	0.45	5.26	250
3	0.0	-0.45	5.26	250

### B.3. Array Source Levels and Directivity

Figure B-2 shows the broadside (perpendicular to the sagittal plane), endfire (parallel to the sagittal plane), and vertical overpressure signature and corresponding power spectrum levels for the 750 in<sup>3</sup> array (see Appendix B.2). Horizontal decade band source levels shown as a function of band centre frequency and azimuth (Figure B-3) indicate that this array is mainly isotropic.

Figure B-2. Predicted source level details for the 750 in<sup>3</sup> array at a 5 m operational depth. (Left) the overpressure signature and (right) the power spectrum for horizontal (broadside and endfire) and vertical directions.

Figure B-3. Directionality of the predicted horizontal source levels for the 750 in<sup>3</sup> seismic source array, 10 Hz to 2 kHz. Source levels (in dB re 1  $\mu\text{Pa}^2\cdot\text{s m}^2$ ) are shown as a function of azimuth for the centre frequencies of the decade bands modelled, shown above the plots. The endfire axis (i.e., axis parallel to the sagittal plane) is to the right. Operational depth is 5 m.

## Appendix C. Survey and Positioning Equipment.

### C.1. Equipment Descriptions

#### C.1.1. Underwater Acoustic Positioning

USBL (Ultra-short Base Line) acoustic positioning system will be utilised onboard the Campaign vessels. This tool is used to locate the position of a single subsea transponder that will be placed temporarily on the seabed and subsequently recovered. The USBL system uses a vessel mounted transceiver to detect the range and bearing to a target using acoustic signals.

#### C.1.2. Single-beam Echo Sounders and Multi-beam Echo Sounders

Single-beam echo sounders (SBES) use a hydrographic technique that provides the water depths and an image of the seabed and pipeline by measuring the two-way travel time of a high frequency sound pulse emitted by a transducer. The transducer, generally mounted on a vessel or to an Autonomous Underwater Vehicle (AUV), also tracks the motion of the unit it is mounted on in order to allow for correction for the motion. Multi-beam echo sounders (MBES) work in the same way but produce a swath or acoustic fan shaped pulse of sound made up of many single beams. A MBES acquires a wide swath (strip) of bathymetry data perpendicular to the vessel track and provides total seabed coverage with no gaps between vessel tracks. Different MBES systems are available for all water depths between 1 m and 12,000 m. The transducer(s) 'listen' for the reflected energy from the seabed. The fans of seabed coverage form a series of strips along each track, which are lined up side-by-side to generate two dimensional georeferenced bathymetric maps of the seabed. MBES surveys will enable the collection of bathymetry data and the correlation of depth information. This type of survey uses a sonar system to transmit short pulses of sound energy, analysing the return signal from the seafloor or other objects.

#### C.1.3. Side Scan Sonar Surveys (SSS)

SSS is a marine geophysical technique that is used to produce an image of the seafloor and identify obstructions or features. This type of survey is a hydro-acoustic technique, comprising a set of transducers mounted on either side of a towed vehicle, towed approximately 10-20 m above the seabed. SSS transducers may be mounted on AUV systems, vessel hulls or, more commonly, using an ROV.

### C.2. Noise Emissions

#### C.2.1. Underwater Acoustic Positioning

An acoustic pulse is transmitted by the transceiver and detected by the subsea transponder, which replies with its own acoustic pulse. This return pulse is detected by the shipboard transceiver. The time from the transmission of the initial acoustic pulse until the reply is detected is measured by the USBL system and is converted into a range. To calculate a subsea position, the USBL calculates both a range and an angle from the transceiver to the subsea beacon. Angles are measured by the transceiver, which contains an array of transducers. The transducer will then send sound signals, typically at 19 to 33 kHz to a USBL transponder.

A typical and widely used USBL system is the Sonardyne Ranger USBL. The source level and frequency range of this system from previous field measurements (Warner and McCrodan 2011) were found to be 18-36 kHz and 204 dB re 1  $\mu$ Pa @1m (SPL). The per-pulse SEL source level was 173 dB re 1  $\mu$ Pa<sup>2</sup>s @ 1 m, and the measured maximum Peak (PK) was approximately 170 dB re 1  $\mu$ Pa at 30 m. This source can be considered an impulsive sound source for impact assessment purposes for this study. Austin et al. (2012) calculated the distances to SPL isopleths for the Ranger USBL in open water and found the distance to 160 dB re 1  $\mu$ Pa (SPL) to be 36 m. Considering 1000 impulses at 40 m range through summing the received SEL from each impulse results in an unweighted SEL of 144 dB re 1  $\mu$ Pa<sup>2</sup>s, which can be used in a conservative comparison against relevant SEL impact assessment thresholds.

### C.2.2. Single-beam Echo Sounders and Multi-beam Echo Sounders

Typical MBESs used in survey work include the Reson Seabat and the R2Sonic products. These systems operate at 200-400kHz, with a variable total beam width, although 60° is common. For example, the transmit power from a R2Sonic 2024 echo sounder is up to 221 dB re 1  $\mu$ Pa at 1m (SPL), with a short (15  $\mu$ s to 1 ms) pulse width, however the operational power level and pulse width influence the potential sound fields. This source can be considered an impulsive sound source for impact assessment purposes for this study. Measurements for the R2Sonic 2024 were reported in Martin et al. (2012), who measured a maximum SPL of 162 dB re 1  $\mu$ Pa at 4 m, with the system operating at an average pulse length of 0.11 ms. The accumulated SEL over 363 measured pulses was 121.5 dB re 1  $\mu$ Pa<sup>2</sup>s. Measurements of another similar system, the Reson SeaBat 8101 MBES operating at 240 kHz were reported in Chorney et al. (2011). These measurements show that at 40 m, the PK levels are approximately 170 dB re 1  $\mu$ Pa, and the per-pulse SEL 130 dB re 1  $\mu$ Pa<sup>2</sup>s. Zykov (2013) modelled an R2Sonic 2022, another similar MBES, and found that the sound levels would not exceed an unweighted 171 dB re 1  $\mu$ Pa<sup>2</sup>s more than 2 m from the source while conducting a 2.5 h geophysical survey. The models of MBES considered in this study are those which generate only high frequency signals (therefore excluding the lower frequency units), and as such will only be relevant for fauna with sensitivity to signals of approximately 200 kHz or higher, which excludes low-frequency cetaceans, fish, and turtles.

SBESs are less powerful than MBESs, therefore the information supplied for MBES is considered representative of the potential outputs from SBES.

### C.2.3. Side Scan Sonar Surveys (SSS)

The sonar is highly directional, with distances to sound levels outside the beam significantly less than those in the beam. SSS towfish are typically towed approximately 10 to 20 metres above the seabed, thus the beam will be restricted to a swath close to the seabed. These towfish can use a range of operating frequencies, but typically they are between 70 and 400 kHz. Representative systems could include those from Edgetech, such as the 4200 range. They output signals at 120 and 410 kHz. Measurements of an EdgeTech 4200 were reported in Crocker and Fratantonio (2016) for 100 and 400 kHz modes, with a maximum per-pulse source level of 176 dB re 1  $\mu$ Pa<sup>2</sup>s @ 1m (SEL), 205 dB re 1  $\mu$ Pa @ 1m (SPL) and 210 dB re 1  $\mu$ Pa @1m (PK). Austin et al. (2013a) also measured the system during an operational program, focusing on the 120 kHz impulses. The authors reported a PK of less than 175 dB re 1  $\mu$ Pa and an SPL of less than 170 dB re 1  $\mu$ Pa at 39 m, with the distance from in-beam pulses to an SPL of 160 dB re 1  $\mu$ Pa calculated to be 130 m.

The SSS models considered here are those which generate only high frequency signals, and as such will only be relevant for fauna with sensitivity to signals of approximately 110 kHz or higher, as shown in Austin et al. (2013a), which excludes low-frequency cetaceans, fish, and turtles.

## C.3. Impact

### C.3.1. Marine Mammals

The sound levels from positioning equipment are described Section C.2.1. As discussed above, the proposed equipment has sound levels which could reach the marine mammal behavioural threshold within 36 m. A nominal accumulation scenario for 1000 impulses results in an unweighted accumulated SEL well below thresholds for PTS and TTS in marine mammals. The measured PK at 30 m was 170 dB re 1  $\mu$ Pa is well below thresholds for PTS and TTS in marine mammals. Therefore, PTS and TTS thresholds (Table 13) are not predicted to be exceeded from the positioning equipment.

The sound levels from MBES are described in Section C.2.2. The measurement study from Martin et al. (2012) indicates that the behavioural response threshold (Table 13) could be exceeded within less than 10 m. PTS and TTS thresholds due to SEL are not predicted to be exceeded, considering that a measurement of along a track line with a closest point of approach of 4 m did not result in accumulated unweighted levels higher than 121.5 dB re 1  $\mu$ Pa<sup>2</sup>s. PTS and TTS thresholds due to PK are not predicted to be exceeded, considering measurement of 170 dB re 1  $\mu$ Pa PK at 40 m. Therefore, considering both SEL and PK metrics, PTS and TTS thresholds (Table 13) are not predicted to be exceeded from MBES and subsequently SBES.

The sound levels from SSS are described in Section C.2.3. The measurement study Austin et al. (2013) indicates that the behavioural threshold (Table 13) could be exceeded within less than 130 m for marine mammals within the highly directional source output beam pattern. The reported per-pulse sound levels at 40 m are like those from the MBES, and as it isn't predicted to exceed either the PTS or TTS thresholds considering both SEL and PK metrics (Table 13), neither is the SSS. Additionally, the per-pulse peak pressure source level of the SSS is below the PK criteria threshold, therefore the criteria cannot be exceeded.

Survey and positioning equipment could cause masking of vocalisations of cetaceans due to the overlap in frequency range between signals and vocalisations. However, due to the limited propagation range of the relevant frequencies (higher frequencies attenuate rapidly), the range at which the impact could occur will be small, within hundreds of meters. The masking will apply to MF cetaceans for the positioning equipment, MBES, and SSS, with all signals above 2 kHz.

Given the transient and mobile nature of the survey, the operating frequencies and noise maxima of the survey equipment considered here, effects of survey equipment noise on marine mammals are expected to be limited to behavioural responses proximal to the vessel, ranges less than those from the vessel by itself.

## Appendix D. Methods and Parameters

### D.1. Sound Propagation Models

#### D.1.1. Propagation Loss

The propagation of sound through the environment was modelled by predicting the acoustic propagation loss—a measure, in decibels, of the decrease in sound level between a source and a receiver some distance away. Geometric spreading of acoustic waves is the predominant way by which propagation loss occurs. Propagation loss also happens when the sound is absorbed and scattered by the seawater, and absorbed scattered, and reflected at the water surface and within the seabed. Propagation loss depends on the acoustic properties of the ocean and seabed; its value changes with frequency.

If the acoustic energy source level (ESL), expressed in dB re 1  $\mu\text{Pa}^2\cdot\text{s m}^2$ , and propagation loss (PL), in units of dB, at a given frequency are known, then the received level (RL) at a receiver location can be calculated in dB re 1  $\mu\text{Pa}^2\cdot\text{s}$  by:

$$\text{RL} = \text{SL} - \text{PL} . \quad (\text{D-1})$$

#### D.1.2. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). While other models may be more accurate for steep-angle propagation in high-shear environment, MONM is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 10 Hz to 1.6 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies >1.6 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

MONM computes acoustic fields in three dimensions by modelling propagation loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of  $\Delta\theta$ , yielding  $N = 360^\circ/\Delta\theta$  number of planes (Figure D-1).

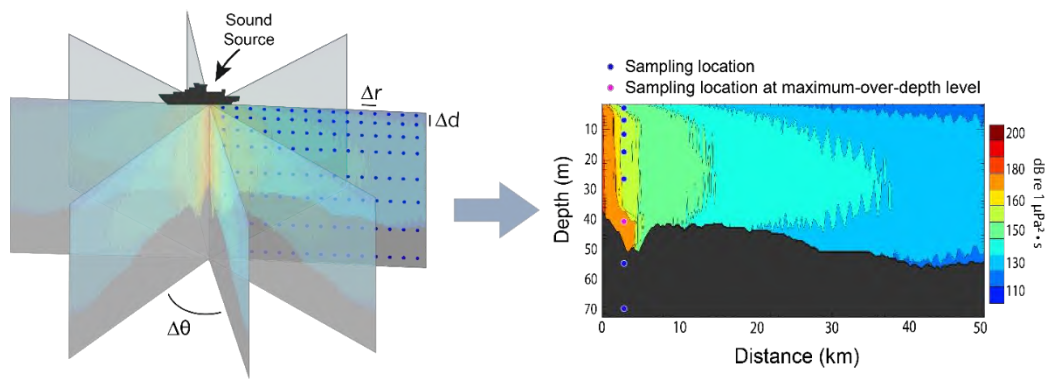

Figure D-1. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic propagation loss at the centre frequencies of decade bands. Sufficiently many decade frequency-bands, starting at 10 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the propagation loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decade received per-second SEL are computed by subtracting the band propagation loss values from the directional source level in that frequency band. Composite broadband received per-second SEL are then computed by summing the received decade levels.

The received 1-s SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. For areas with deep water, sampling is not performed at depths beyond those reachable by marine mammals. The received per-pulse or per-second SEL at a surface sampling location is taken as the maximum value that occurs over all samples within the water column, i.e., the maximum-over-depth received per-second SEL. These maximum-over-depth per-second SEL are presented as colour contours around the source.

### D.1.3. Noise Propagation with FWRAM

For impulsive sounds from impact pile driving, time-domain representations of the pressure waves generated in the water are required to calculate SPL and peak pressure level. Furthermore, the pile must be represented as a distributed source to accurately characterise vertical directivity effects in the near-field zone. For this study, synthetic pressure waveforms were computed using JASCO's Full Waveform Range-dependent Acoustic Model (FWRAM). FWRAM computes acoustic propagation via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the US Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for an elastic seabed (Zhang and Tindle 1995). The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). FWRAM accounts for the additional reflection loss at the seabed due to partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. FWRAM incorporates the following site-specific environmental properties: a modelled area bathymetric grid, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

FWRAM computes pressure waveforms via Fourier synthesis of the modelled acoustic transfer function in closely spaced frequency bands. FWRAM employs the VSP array starter method to accurately model sound propagation from a spatially distributed source (MacGillivray and Chapman 2012).

Synthetic pressure waveforms from the VSP array were modelled and post-processed, after applying a travel time correction, to calculate SPL, SEL and PK metrics versus range and depth from the source.

#### D.1.4. Wavenumber Integration Model

Sound pressure levels near the seismic source were modelled using JASCO's VSTACK wavenumber integration model. VSTACK computes synthetic pressure waveforms versus depth and range for arbitrarily layered, range-independent acoustic environments using the wavenumber integration approach to solve the exact (range-independent) acoustic wave equation. This model is valid over the full angular range of the wave equation and can fully account for the elasto-acoustic properties of the sub-bottom. Wavenumber integration methods are extensively used in the field of underwater acoustics and seismology where they are often referred to as reflectivity methods or discrete wavenumber methods. VSTACK computes sound propagation in arbitrarily stratified water and seabed layers by decomposing the outgoing field into a continuum of outward-propagating plane cylindrical waves. Seabed reflectivity in the model is dependent on the seabed layer properties: compressional and shear wave speeds, attenuation coefficients, and layer densities. The output of the model can be post-processed to yield estimates of the SEL, SPL, and PK.

VSTACK accurately predicts steep-angle propagation in the proximity of the source, but it is computationally slow at predicting sound pressures at large distances due to the need for smaller wavenumber steps with increasing distance. Additionally, VSTACK assumes range-invariant bathymetry with a horizontally stratified medium (i.e., a range-independent environment) which is azimuthally symmetric about the source. VSTACK is thus best suited to modelling the sound field near the source.

#### D.1.5. Limestone Seabed Propagation Loss

For sites where the seabed geoacoustic model consisted of bare calcarenite, an additional broadband correction was applied to the propagation loss results from MONM to better account for the additional propagation loss associated with a limestone (calcarenite) seabed (Duncan et al. 2009). The accuracy of the broadband calculated propagation loss for the South-eastern continental shelf of Australia depends significantly upon the frequency content of the radiating sound source together with thickness of any overlying layers of unconsolidated sediment (e.g., sand) on top of calcarenite likely to occur within the region.

In general, the thinner the sand layer, the greater the overall propagation loss. When comparing SPL data McPherson et al. (2021), higher rates of propagation loss were observed and were attributed to, an absorptive carbonate (calcarenite) seabed. In this study, comparisons were conducted using JASCO's Marine Operations Noise Model (MONM), a wide-angle parabolic equation model which applies the BELLHOP Gaussian beam acoustic ray-trace model at higher frequencies, and JASCO's wavenumber integration model (VSTACK, Appendix D.1.4) which can fully account for the elasto-acoustic properties of the sub-bottom.

To account for the additional propagation loss associated with a cemented calcarenite seabed, an additional broadband correction was applied to the propagation loss results from MONM to account for the higher rates of loss when the full for the elasto-acoustic properties of the sub-bottom are consider. The differences between the broadband SPL from MONM and VSTACK were extracted at the same modelled ranges and depths that corresponded range independent predictions. The 90th percentile of the resultant dB differences in 250 m range bins were selected to generate a correction function for each individual site/source to be modelled. The conversion functions were applied after the propagation loss calculation from MONM but before summing decidecade band levels, gridding, and radii calculations for each modelled site in each modelled scenario considered.

## D.2. Environmental Parameters

### D.2.1. Bathymetry

Water depths throughout the modelled areas were extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded onto a Map Grid of Australia (MGA) coordinate projection (Zone 54) with a regular grid spacing of 250 × 250 m (Figure D-2, D-3 and D-4).

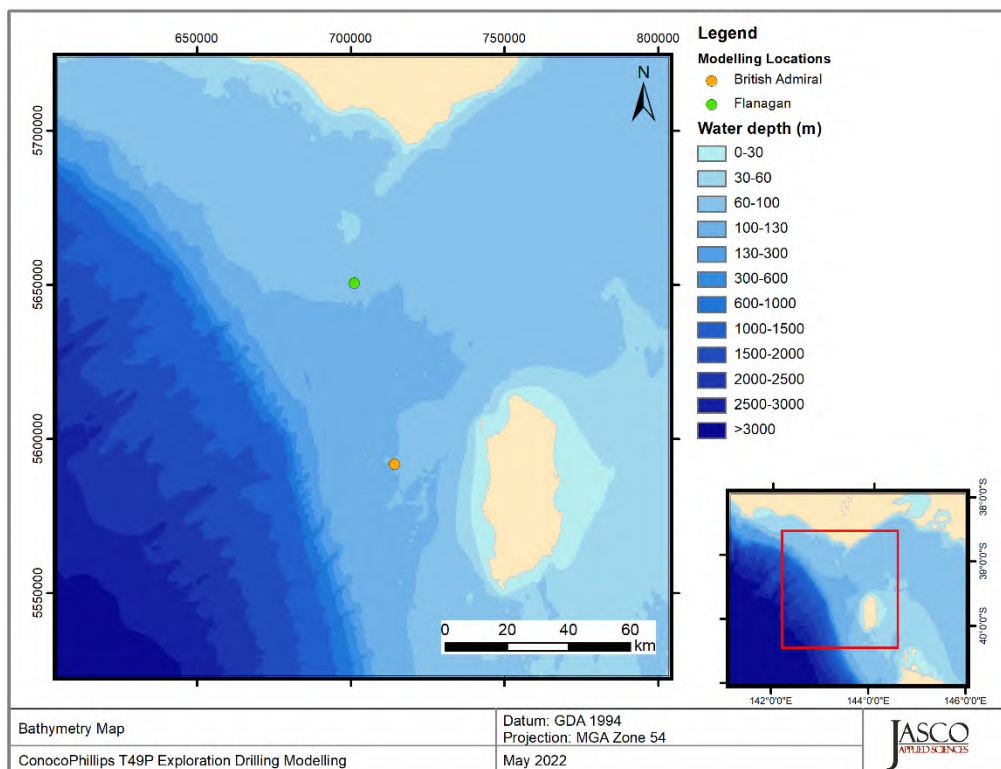

Figure D-2. Bathymetry in the T/49P modelled area.

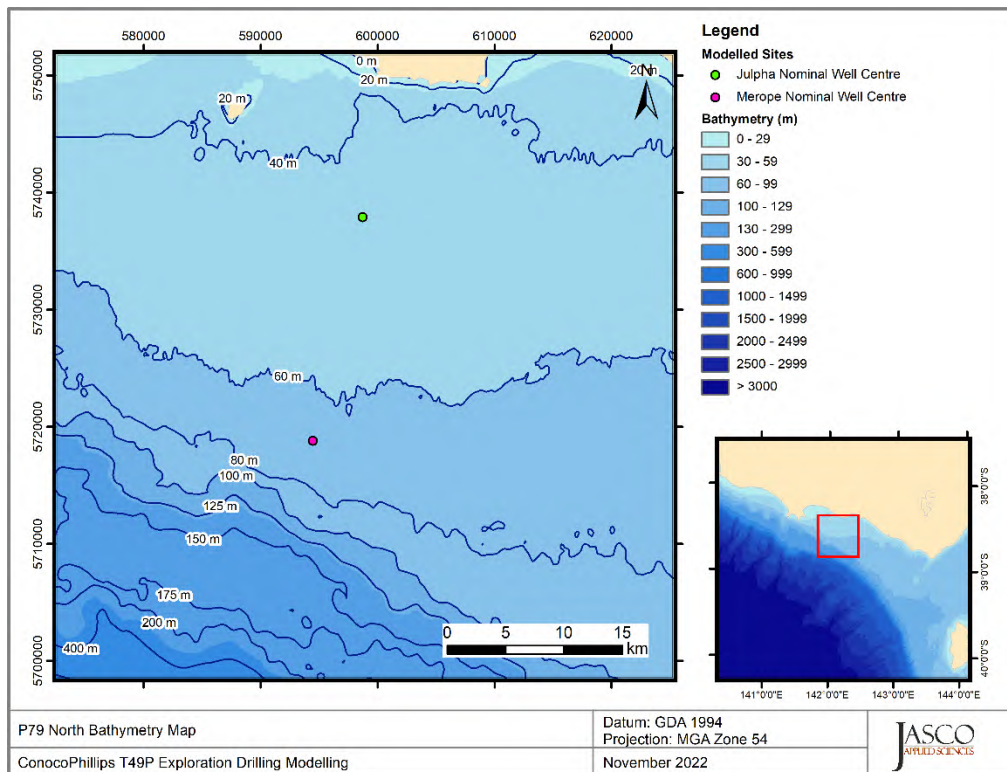

Figure D-3. Bathymetry in the northern extent of the VIC/P79 modelled area.

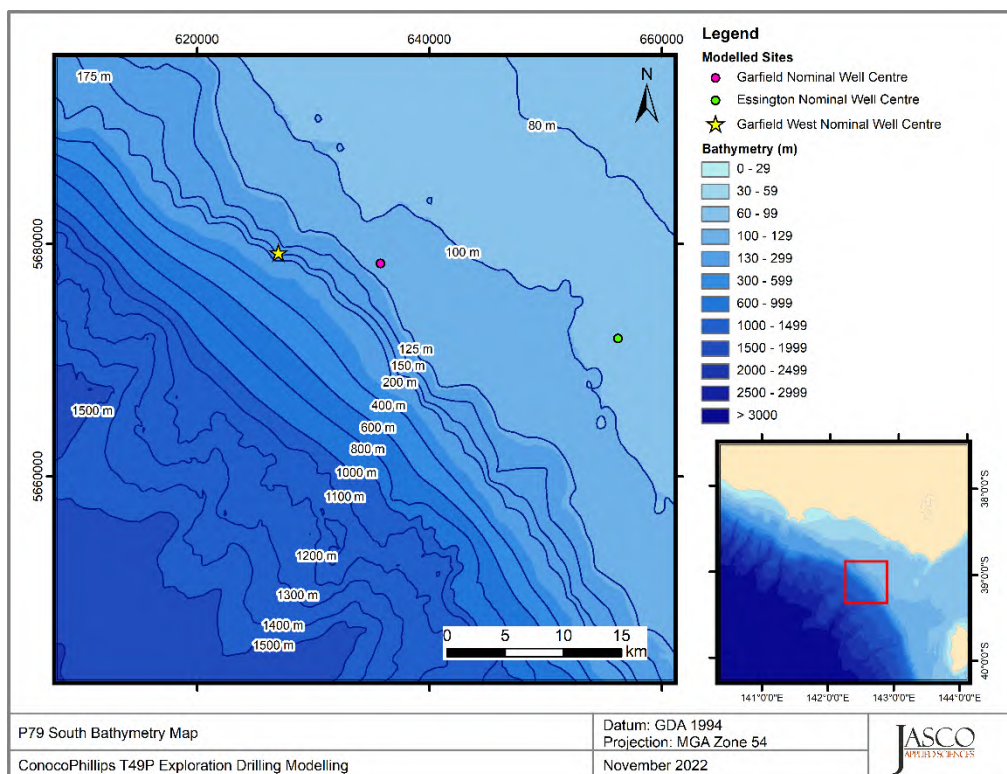

Figure D-4. Bathymetry in the southern extent of the VIC/P79 modelled area.

## D.2.2. Sound Speed Profile

The sound speed profile in the area was derived from temperature and salinity profiles from the US Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the US Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles at distances less than 40 km around the modelled site. The July sound speed profile is expected to be most favourable to longer-range sound propagation across the entire year, and as such was selected for sound propagation modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure D-5 shows the resulting profile, which was used as input to the sound propagation modelling as well as the other monthly profiles.

Figure D-5. The modelling sound speed profile corresponding to July (dashed curve) and (left) all full monthly profiles and (right) top 150 m. Profiles are calculated from temperature and salinity profiles from *Generalized Digital Environmental Model V 3.0* (GDEM; Teague et al. 1990, Carnes 2009).

## D.2.3. Geoacoustics

Aside from *Garfield West*, a single representative geoacoustic profile was used for all other modelled sites based on borehole analysis near the modelling sites at the western edge of the Bass Strait

(Duncan et al. 2013). The sediment is typified by a thin layer of well-cemented calcarenite overlying a softer sand/calcarenite layer that extends for a further 100 m below the sea floor. The sound propagation models use a single value shear speed, which has been set at a value representative of the layers beneath the cemented calcarenite layer. The geoacoustic profile is presented in Table D-1.

Geoacoustic parameters used for modelling at *Garfield West* were derived from sedimentary grain size measurements from the Australian Government's Marine Sediments (MARS) database (Heap 2009). Most of these samples were taken on or near the seafloor, although some are from sediment at greater depths. On average, the surficial grain size indicates silty sand is present throughout the modelled area. Geotechnical data along the southern Australian shelf typically show sand overlaying calcarenite layers (Bradshaw 2002, Duncan et al. 2013). Representative grain sizes and porosity were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models. Table D-2 lists the geoacoustic parameters used for modelling.

Table D-1. Geoacoustic profile for all modelled sites. Each parameter remains constant within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm <sup>3</sup> )	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–1	Well-cemented calcarenite	2.2	2600	0.2	500	0.4
1–101	Slightly to semi-cemented sand/calcarenite	1.9	2100	0.12		
101–1000	Semi-cemented sand/calcarenite	1.9	2200	0.12		
>1000	Basement (rock)	3.0	3800	0.1		

Table D-2. Geoacoustic profile for *Garfield West*. Each parameter changes linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm <sup>3</sup> )	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0–10	Silty carbonate sand to semi-cemented limestone	1.88	1605–1700	0.35–0.70	255	3.65
10–20		1.88–1.89	1700–1755	0.70–0.85		
20–50		1.89–1.90	1755–1850	0.85–1.15		
50–100		1.90–1.92	1850–1950	1.15–1.35		
100–200		1.92–1.96	1950–2100	1.35–1.60		
200–500		1.96–2.05	2100–2355	1.60–1.95		
>500		1.88	1605–1700	0.35–0.70		

### D.3. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1)  $R_{\max}$ , the maximum range to the given sound level over all azimuths, and 2)  $R_{95\%}$ , the range to the given sound level after the 5% farthest points were excluded (see examples in Figure D-6).

The  $R_{95\%}$  is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure D-6(a). In cases such as this, where relatively few points are excluded in any given direction,  $R_{\max}$  can misrepresent the area of the region exposed to such effects, and  $R_{95\%}$  is considered more representative. In strongly asymmetric cases such as shown in Figure D-6(b), on the other hand,  $R_{95\%}$  neglects to account for significant protrusions in the footprint. In such cases  $R_{\max}$  might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between  $R_{\max}$  and  $R_{95\%}$  depends on the source directivity and the non-uniformity of the acoustic environment.

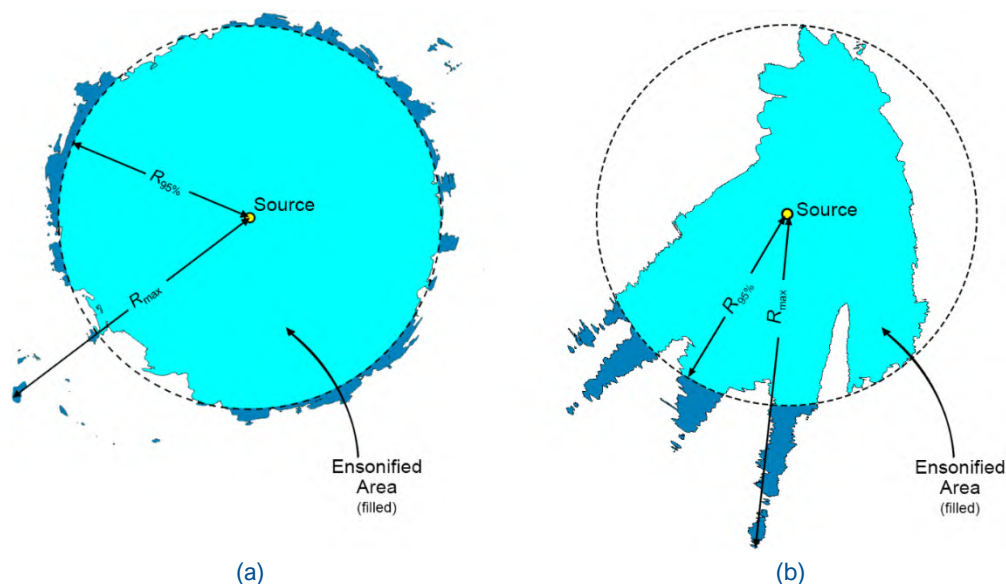

Figure D-6. Sample areas ensonified to an arbitrary sound level with  $R_{\max}$  and  $R_{95\%}$  ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by  $R_{95\%}$ ; darker blue indicates the areas outside this boundary which determine  $R_{\max}$ .

## D.4. Estimating SPL from Modelled SEL Results

The per-pulse SEL of sound pulses is an energy-like metric related to the dose of sound received over a pulse's entire duration. The pulse SPL on the other hand, is related to its intensity over a specified time interval. Seismic pulses, and VSP pulses typically lengthen in duration as they propagate away from their source, due to seafloor and surface reflections, and other waveguide dispersion effects. The changes in pulse length, and therefore the time window considered, affect the numeric relationship between SPL and SEL. This study has applied a fixed window duration to calculate SPL ( $T_{\text{fix}} = 125$  ms; see Appendix A.1), as implemented in Martin et al. (2017b). Full-waveform modelling was used to estimate SPL, but this type of modelling is computationally intensive, and can be prohibitively time consuming when run at high spatial resolution over large areas.

For the current study, FWRAM (see Appendix D.1.3) was used to model synthetic seismic pulses over the frequency range 5–1024 Hz. This was performed along select broadside and endfire radials at both drill site locations. FWRAM uses Fourier synthesis to recreate the signal in the time domain so that both the SEL and SPL from the source can be calculated. A 125 ms fixed time window positioned to maximise the SPL over the pulse duration was applied. The resulting SEL-to-SPL offsets were averaged in 0.01 km range bins along each modelled radial and depth, and the 90th percentile was selected at each range to generate a generalised range-dependent conversion function for the site. The range-dependent conversion function was then applied to predicted per-pulse SEL results from MONM to model and map SPL values.

The conversion offsets for the *British Admiral* and *Flanagan* sites are presented in; the spatial variation is caused by changes in the received airgun pulse as it propagates from the source.

Figure D-7. Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for Vertical Seismic Profiling (VSP) pulses at *British Admiral*. Black dots are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

Figure D-8. Range-and-depth-dependent conversion offsets for converting sound exposure level (SEL) to sound pressure level (SPL) for Vertical Seismic Profiling (VSP) pulses at *Flanagan*. Black dots are the modelled differences between SEL and SPL across different radials and receiver depths; the solid red line is the 90th percentile of the modelled differences at each range.

## D.5. Estimating Sound Field from Moving Vessels

During vessel transit, new sound energy is constantly introduced into the environment. The noise footprint for the transiting vessels considered in this report were estimated by modelling the 1 s SEL for the vessel at one location, and by translating and summing these footprints along the vessel transit routes. The vessel locations along the tracks were spaced uniformly, with an approximate step of  $\Delta s \approx 100$  m.

The SEL sound field at any given point along the path is dependent on the exposure duration, which with a fixed footprint spacing depends on the speed of the vessel during each segment of the transit. The 1 s SEL footprint at each vessel location ( $i$ ) were therefore scales based on the speed of the vessel following:

$$SEL_i = SEL_{1s} + 10 \log_{10} \left( \frac{\Delta s}{v} \right), \quad (D-2)$$

where  $v$  represents the vessel speed in m/s.

The present method acceptably reflects large-scale sound propagation features, primarily dependent on water depth, which dominate the cumulative field and is thus considered to provide a meaningful estimate of the  $SEL_{24h}$  field.

## Appendix E. Model Validation Information

Predictions from JASCO's propagation models (MONM, FWRAM, and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Arctic, Canadian and southern United States waters, Greenland, Russia, and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities that have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013b, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016).

## **Appendix F. Tech Memo: Otway Exploration Drilling Program - Representative nature of Modelling Sites and Scenarios**

### **F.1. Introduction**

Underwater acoustic modelling scenarios were considered for the ConocoPhillips Australia Otway Exploration Drilling Program in both VIC/P79 (North and South) and T/49P and presented in a consolidated report:

- Otway Exploration Drilling Program: Acoustic Modelling for Assessing Marine Fauna Sound Exposures, Document 02760.

The locations of the modelling scenarios are shown in Figures 94, 95, 96, with increased detail on the drilling targets in T/49P shown in Figure 97. The modelling scenarios considered a range of scenarios encompassing all activities which might pose higher risks to marine fauna from underwater noise. The modelling results from all three reports relating to marine mammals, behavioural response and Temporary Threshold Shift (TTS) are summarised in Tables 46 and 47 respectively.

### **F.2. Modelling Results Analysis**

To examine applicability of the modelling results across the drilling areas of interest, basic statistics were examined, and considered along with an understanding of how the geology and bathymetry influence the sound fields from the different operations. The statistical summary of the modelling results for behavioural response and TTS is presented in Table 48 and 49.

The general trend identified in the modelling results, and discussed in the modelling reports, is that for sites not immediately at the shelf edge (sites other than Garfield West), ranges to thresholds are generally consistent. This is due to both the bathymetry and the seabed geology, in particular the attenuating influence of the calcarenite seafloor. Close to the shelf break across the region the geology begins to change, resulting in a more reflective seabed, which when coupled with the down sloping bathymetry in the offshore direction, results in extended ranges to threshold(s) in the offshore direction.

The modelling results and associated trends indicate that it would be reasonable to represent the potential ranges to effect for drilling and associated operations within approximately the 110–125 m contour through using the presented results. Therefore, all potential drilling locations in T/49P within the operational area except for the very offshore boundary of Seal Rocks in two locations (near the canyon heads), as shown in Figure 97, can be represented through the presented results. For these two locations in the proximity to the shelf break increases; the proximity of the slope has an increased influence on the offshore propagation path, and the seabed increases in reflectivity, resulting in an increase in ranges to effect thresholds. However, this influence will gradually increase, and a conservative estimate of increases the maximum predicted ranges to effect by 125% is likely to be a valid representation of possible changes for these particular locations within Seal Rocks. For drilling locations within VIC/P79, the same reasoning is expected to apply, however no estimate is provided for potential ranges to thresholds deeper than the 150 m contour in VIC/P79.

# INTRODUCTION

The Otway Exploration Drilling Campaign is located within Commonwealth waters in the Bass Strait in an area centred approximately 37.9 km offshore Victoria (VIC) and approximately 14.3 km west of King Island as pictured in Figure 1.

The field lies in approximately 90-120 m of water within permit T/49P. ConocoPhillips Australia plan to execute an exploration well drilling campaign within T/49P.

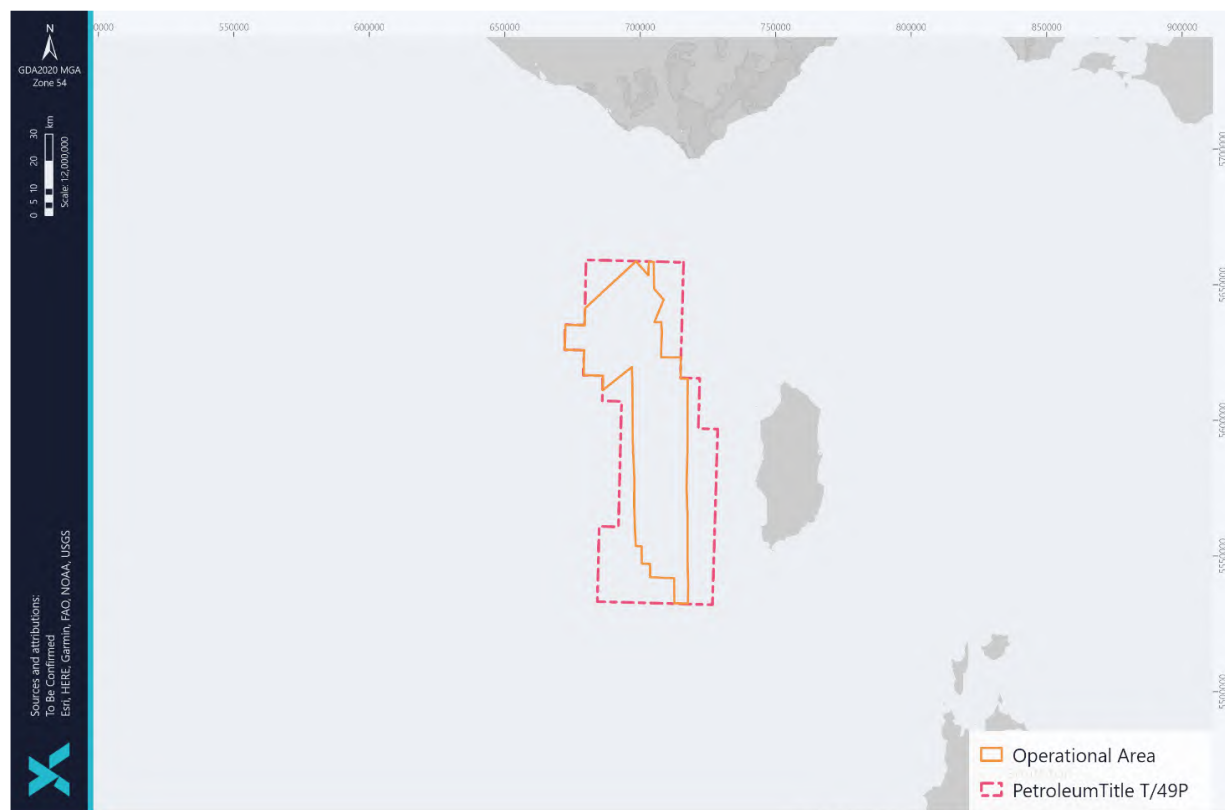

Figure 1: Operational area and potential well locations

# SCOPE

## Related work:

'P-100273-S00-A-REPT-003 Light Modelling Report' has been produced on 28/2/2023, presenting the light emissions modelling results for T/49P with a maximum flare rate of 25 MMscfd.

- Visible light exposure area (at horizon): 45 km
- Potential Impact Area (at 25 MMscfd flaring): 40 km

## This technical note:

Following the previous work, the aim and objective of this technical note is to present the sensitivity analysis on the flare rate, to investigate how the flaring affects the potential impact area.

- Flare rate will be varied from 0 (no flare), to 50 MMscfd
- An interactive plot (link to an HTML) will be provided to show the potential impact area\*

\*The Potential Impact Area is defined as "The spatial extent of a measurable change in ambient light that is predicted to occur from the exploration campaign. The threshold for this area is an illuminance equivalent to ambient light on a moonless clear night sky/new moon (<0.001 lux). This is the area relevant to the impact assessment for planned light emissions from the exploration campaign."

# METHODOLOGY

The methodology of light emissions modelling follows that in 'P-100273-S00-A-REPT-003 Light Modelling Report'.

To evaluate the sensitivity analysis on flaring, the light emissions modelling was conducted with the use of Python with the following procedure:

1. The flare rate was varied as such: 'No flaring', '5 MMscfd', '15 MMscfd', '25 MMscfd', '40 MMscfd', '50 MMscfd'.
2. The line of sight distance was estimated.
3. The illuminance (light intensity) distance was estimated.
4. The line of sight and illuminance distances at various flare rates were plotted on a map in HTML format.

# RESULTS INTERPRETATION

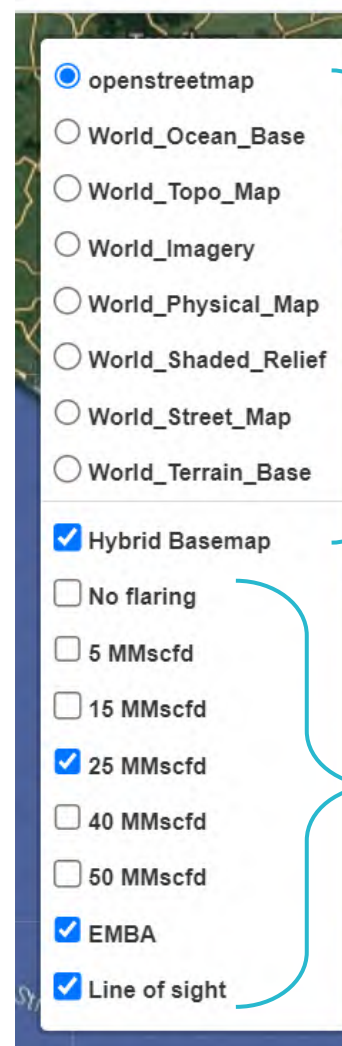

For interactivity, please

- (1) Click on [this link](#) to **download** the html file titled 'flare\_sensitivity\_analysis.html', then

Various flare rates, EMBA and line of sight for selection for display

## RESULTS

### Visible Light Exposure Area (Line of Sight) and Potential Impact Area at 25 MMscfd

The visible line of sight distance – Visible Light Exposure Area is not affected by the flare rates, but instead, the height of the highest infrastructure - seen as a dot on the horizon.

The highest infrastructure for T/49P was taken as 120 m (derrick, navigational lights).

Visible line of sight distance = **45 km** (the green line in Figure 2)

[Click here to download](#) the html file to your computer and open with a browser

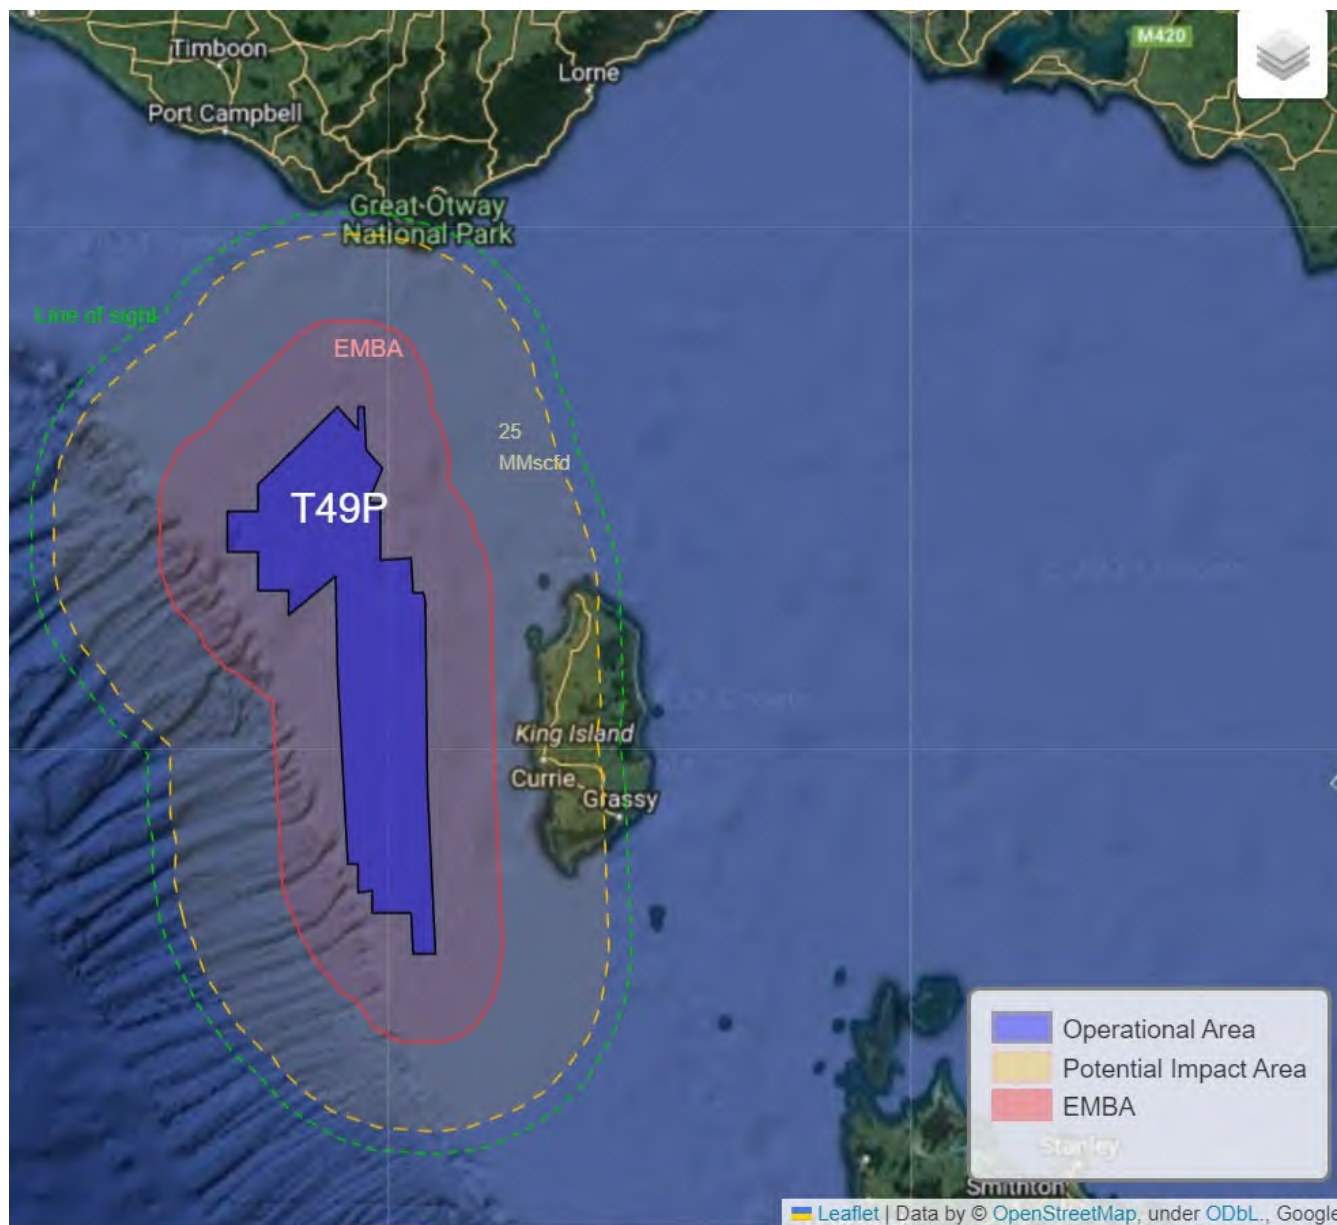

Figure 2: Visible Light Exposure Area and Potential Impact Area at 25 MMscfd

[Click here to download the html file to your computer and open with a browser](#)

# RESULTS

## Potential Impact Area at various flare rates

The illuminance (light intensity) distances which indicate the Potential Impact Area for ambient light level of less than 0.001 lux are given in Figure 3.

With no flaring, the potential impact area is 10 km, and increases to **40 km at 25 MMscfd**, and 50 km at 40 MMscfd.

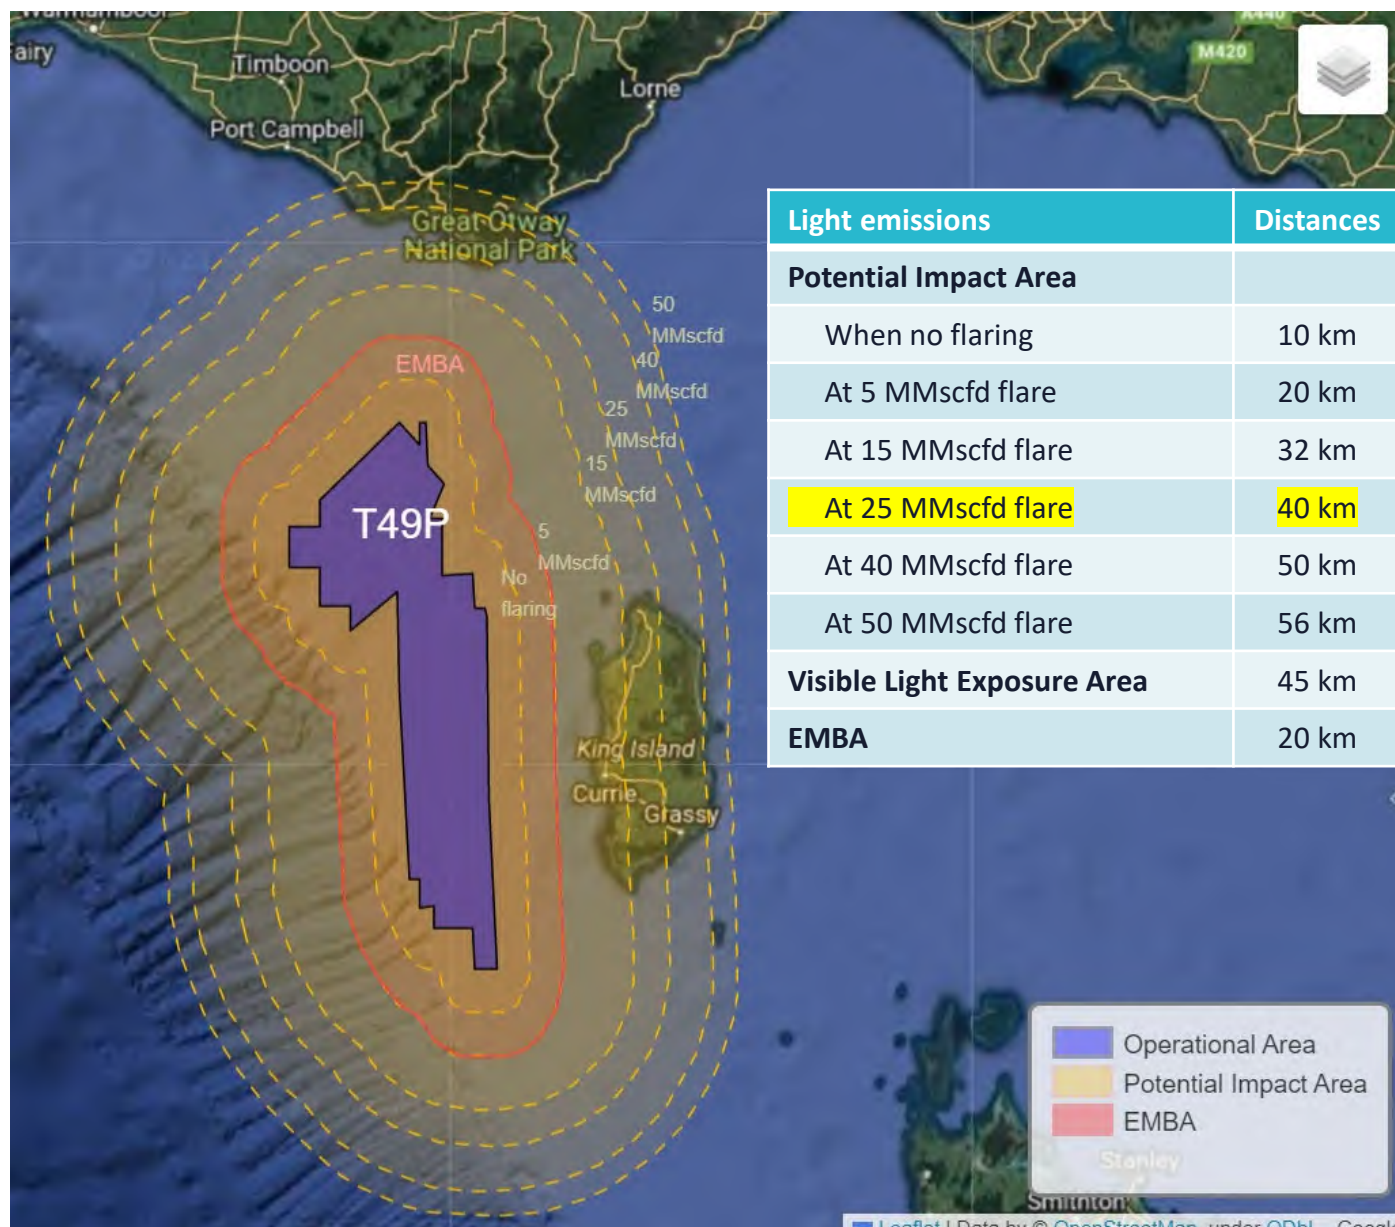

Figure 3: Potential Impact Area at various flare rates

## CONCLUSIONS

The spatial extent potentially impacted by visible light from flaring and MODU lighting, as a visible dot on the horizon, is out to a distance of 45 km from the position of the MODU ([Figure 2](#)).

During the operational phase of the Otway Drilling, the Potential Impact Area for flare lighting is 40 km from the expected position of the MODU during flaring, which will reduce to 10 km from the expected position of the MODU when not flaring ([Figure 3](#)).

It is noted that for the nearby towns at the adjacent mainland at various flare rates, the light intensity levels are comparable to the ambient light levels less than a quarter moon ( $<0.01$  lux), and less than a moonless clear night sky ( $<0.001$  lux), equivalent to the 'First Quarter' and 'New' moon phases in Figure 4.

# Zone of Theoretical Visibility (NORTH)

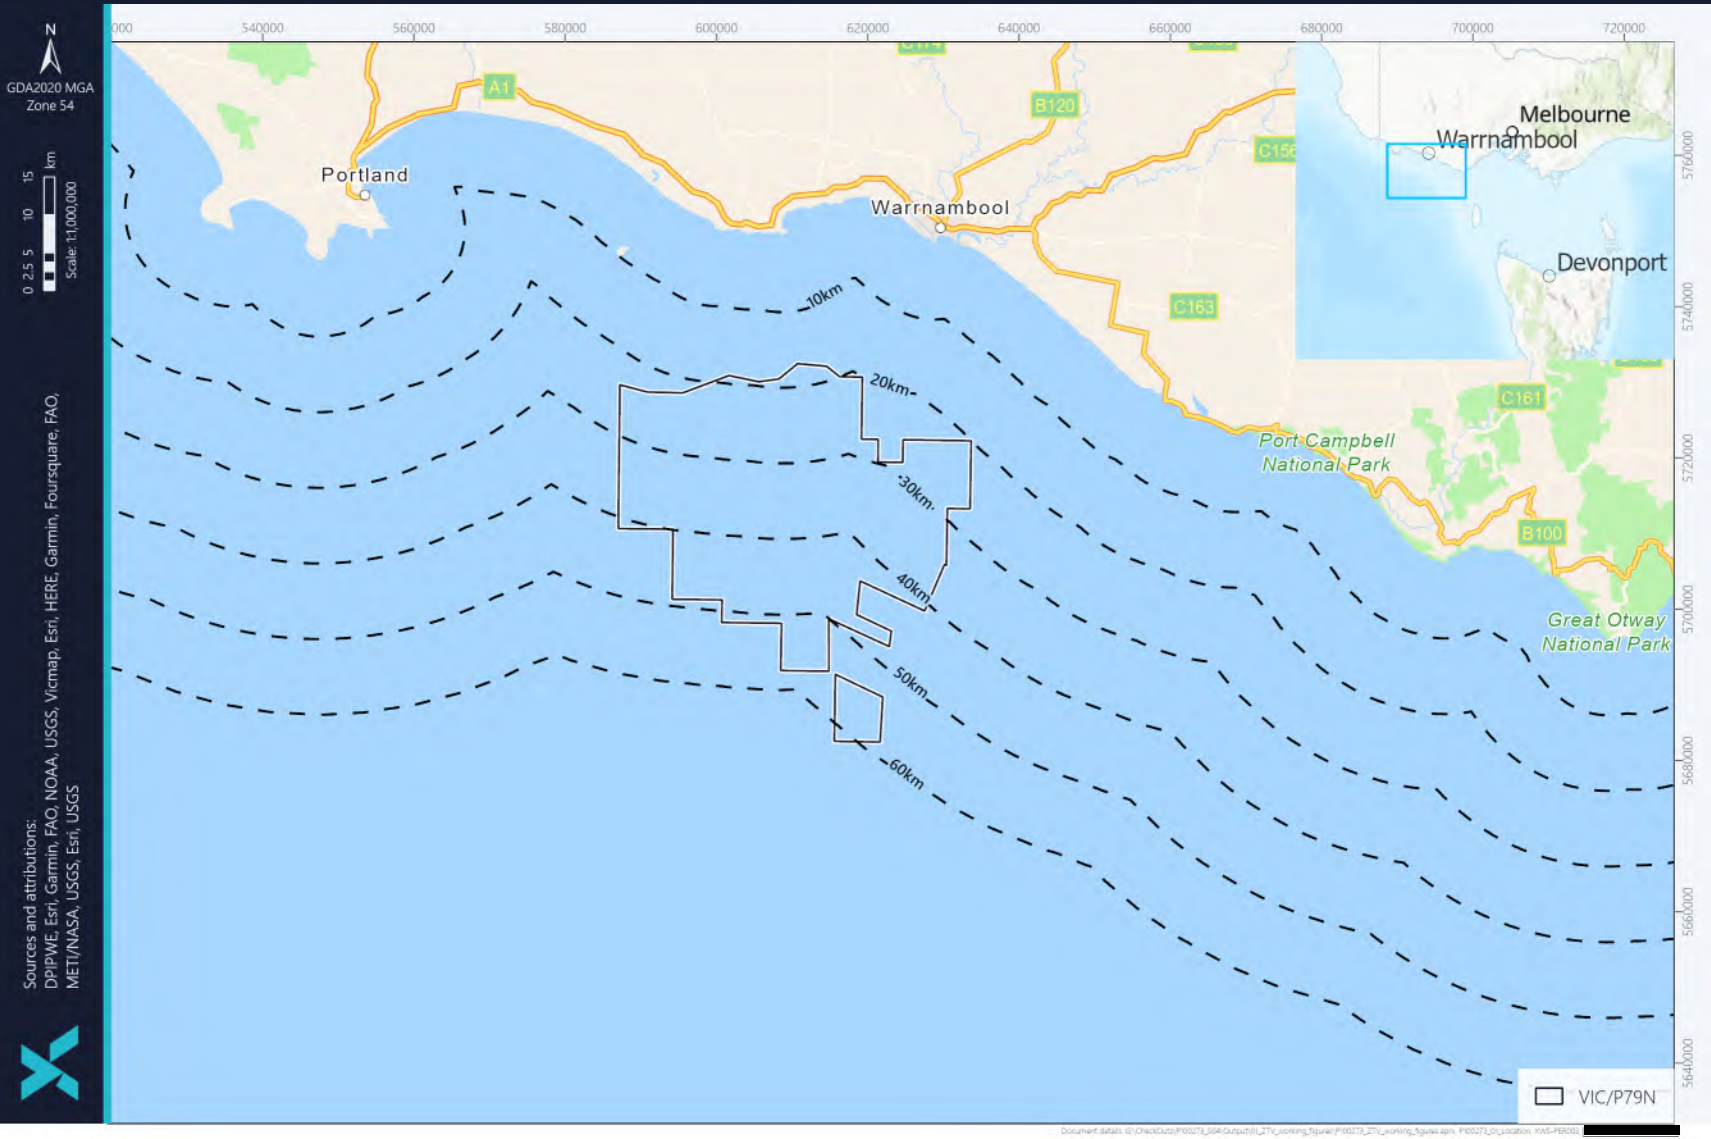

Geospatial visibility analysis of exploration activities within the northern extent of VIC/P79

[WWW.XODUSGROUP.COM](http://WWW.XODUSGROUP.COM)

# Target area VIC/79 (North)

The Otway Basin is located along the southern coast of Victoria, west of Melbourne.

The objective of this technical note is to present the outcomes of the assessment undertaken to estimate the Visual Impact from the project.

The study assess visibility of a platform from selected viewing locations.

# Otway Coast Elevation and Infrastructure

The elevation of the region is diverse.

Great Otway National Park to the east has a mountain range pushing elevations up into the 600-650m range.

Travelling north west from the national park, the terrain drops down into rolling hills and eventually flattens out into vast lower elevation agricultural plains.

There are several towns and one larger regional hub, Warrnambool.

The coastline's unique geography/geology attracts tourists and therefore, has a series of viewing locations.

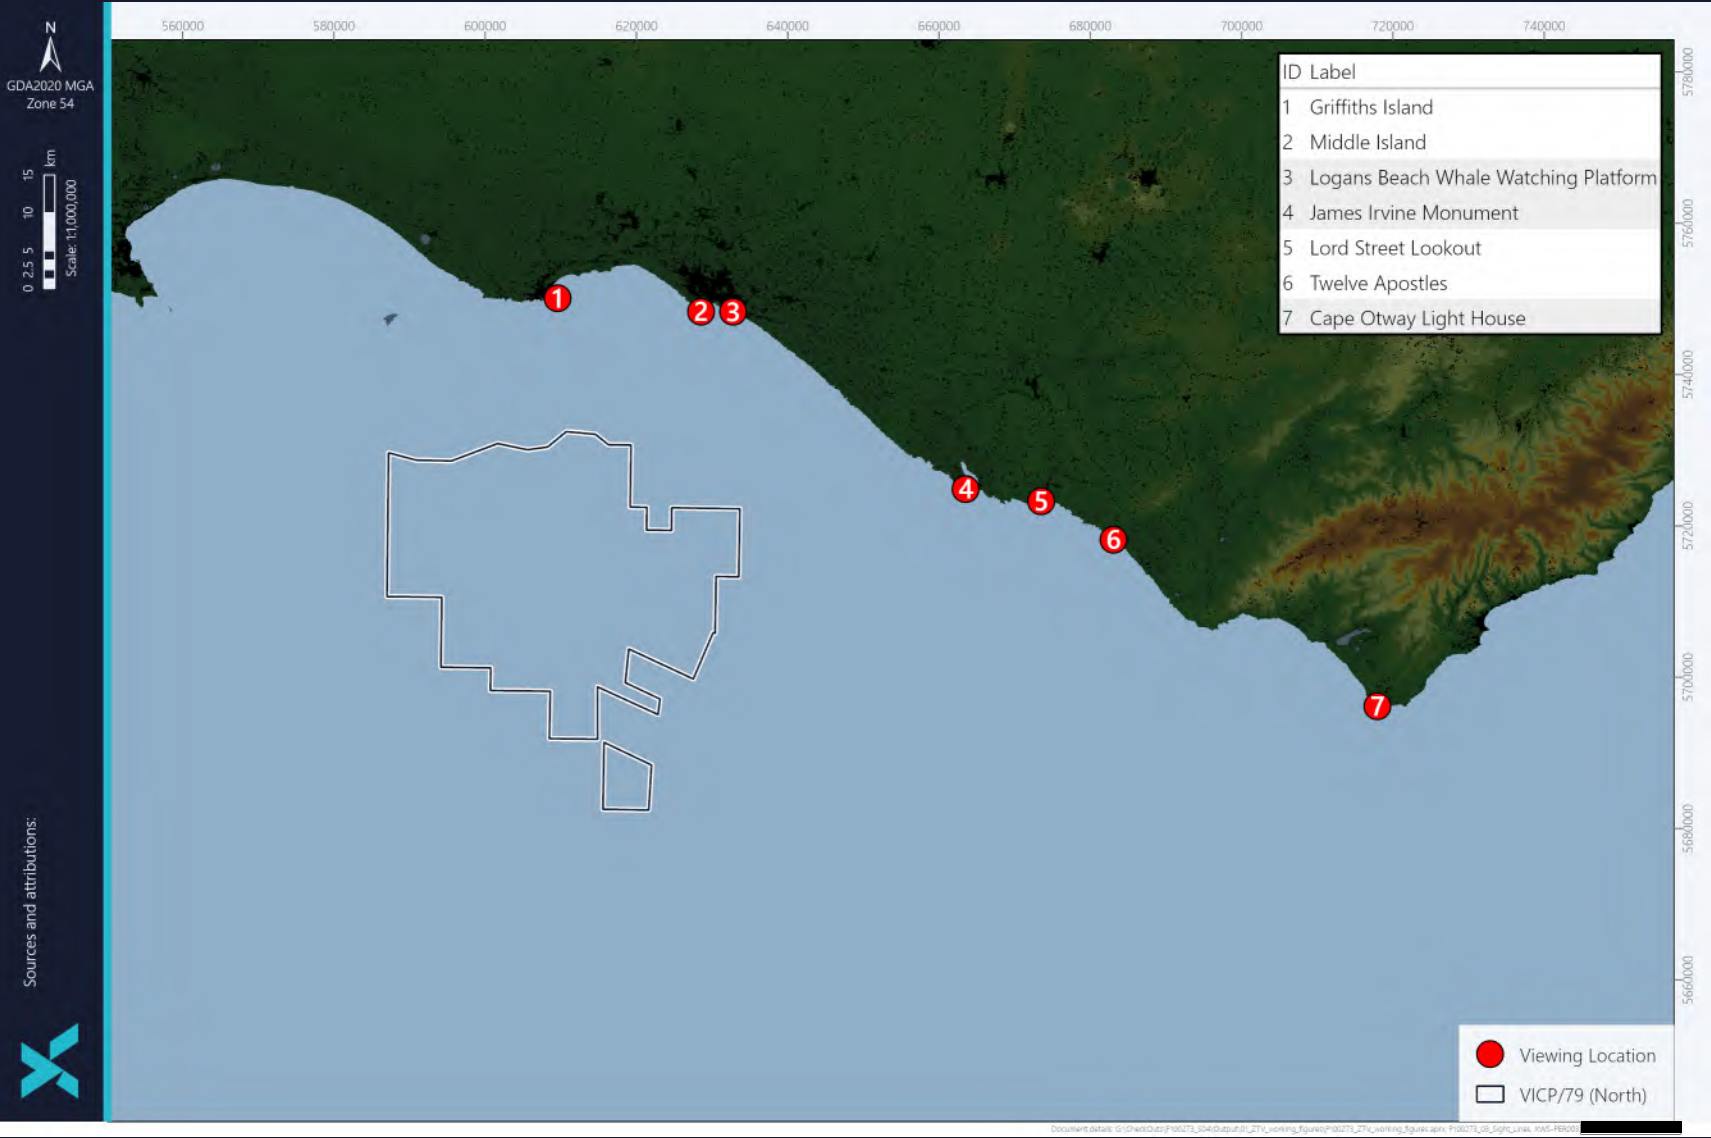

The Great Ocean Road tourism district (which includes this study area) attracted 7,038,000 people pre Covid-19 (2019).

# Otway Coast Viewing Locations

For this study, seven locations were chosen based on the following factors:

1. Elevation
2. Visual access
3. Tourism amenity
4. Proximity to a point of interest

## Griffiths Island

A tourism site at Port Fairy.

## Middle Island

A prominent tourist attraction at Warrnambool with an elevated position for site seeing.

## Logans Beach Whale Watching Platform

A prominent tourist attraction at Warrnambool with an elevated position for site seeing.

## James Irvine Monument

A tourism site at Peterborough, has high visual amenity.

## Lord Street Lookout

A tourism site at Port Campbell, has high visual amenity.

## Twelve Apostles

A prominent tourist attraction with an elevated position for site seeing.

## Cape Otway Light House

A tourism site with high visual amenity and elevated position.

## Line of Sight Calculation

$$d = \left( 2 \cdot \frac{4}{3} R h_1 + h_1^2 \right)^{0.5} + \left( 2 \cdot \frac{4}{3} R h_2 + h_2^2 \right)^{0.5}$$

Where

- $h_1$  = height of object
- $h_2$  = height of receptor
- $R$  = radius of earth
- $d$  = total line of sight ( $d_1 + d_2$ )

Line of sight and Viewshed analyses are conducted using the standard calculation above.

The calculation determines a viewer's ( $h$ ) visible horizon limit ( $d_1$ ). And if applicable, the observable distance of an object ( $h_{\text{receptor}}$ ) beyond the horizon ( $d_1 + d_2$ ).

As elevation/height of an observer increases, so does the distance to the horizon. Likewise, the viewable distance of an object beyond the horizon increases with its elevation/height.

This assumes no adverse atmospheric conditions or obstructed field of view.

## Calculated Viewshed

Label	Name	Elevation (m)	Horizon (km)	40 m Deck (km)	120 m Derrick (km)
1	Griffiths Island	3	8	30.6	47.1
2	Middle Island	14	14.3	36.9	53.4
3	Logans Beach Whale Watching Platform	20	16.7	39.3	55.8
4	James Irvine Monument	8	11.3	33.9	50.4
5	Lord Street Lookout	25	18.5	41.1	57.7
6	Twelve Apostles	43	23.9	46.5	63
7	Cape Otway Light House	91	34.4	57	73.5

These values represent the inputs (Elevation) and outputs (Horizon or Deck/Platform) of the calculated visibilities.

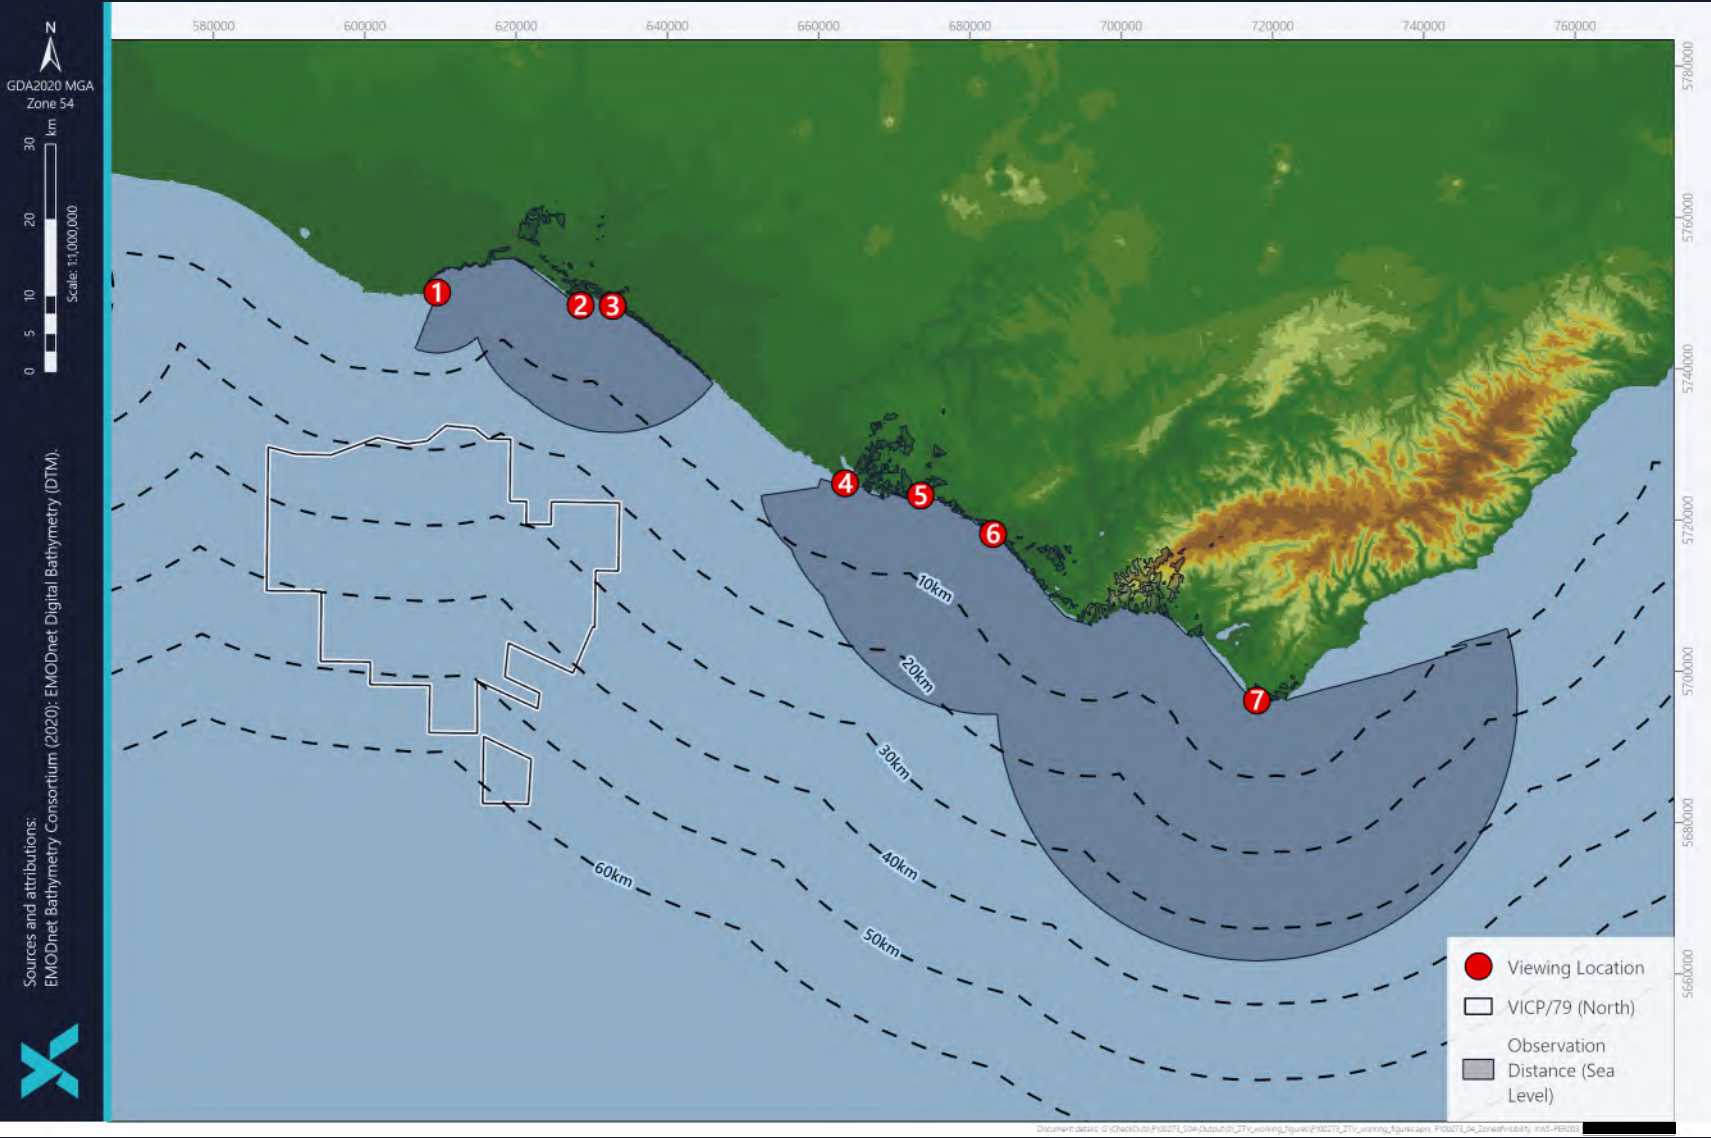

A 2 m tall observer at Griffiths Island (approximately 5 m above sea level) will see 34.4 km to the horizon. A 40 m high object will appear above the horizon to the observer up to 57 km away, and a 120 m high object will appear above the horizon up to 73.5 km away.

A main deck height of 40m and worst case scenario derrick height of 120 m has been used in this study. These represent the likely heights

Each location's elevation has had 2 m added as the elevation, to create the observers height.

# Otway Basin Viewshed for Sea Level Horizon

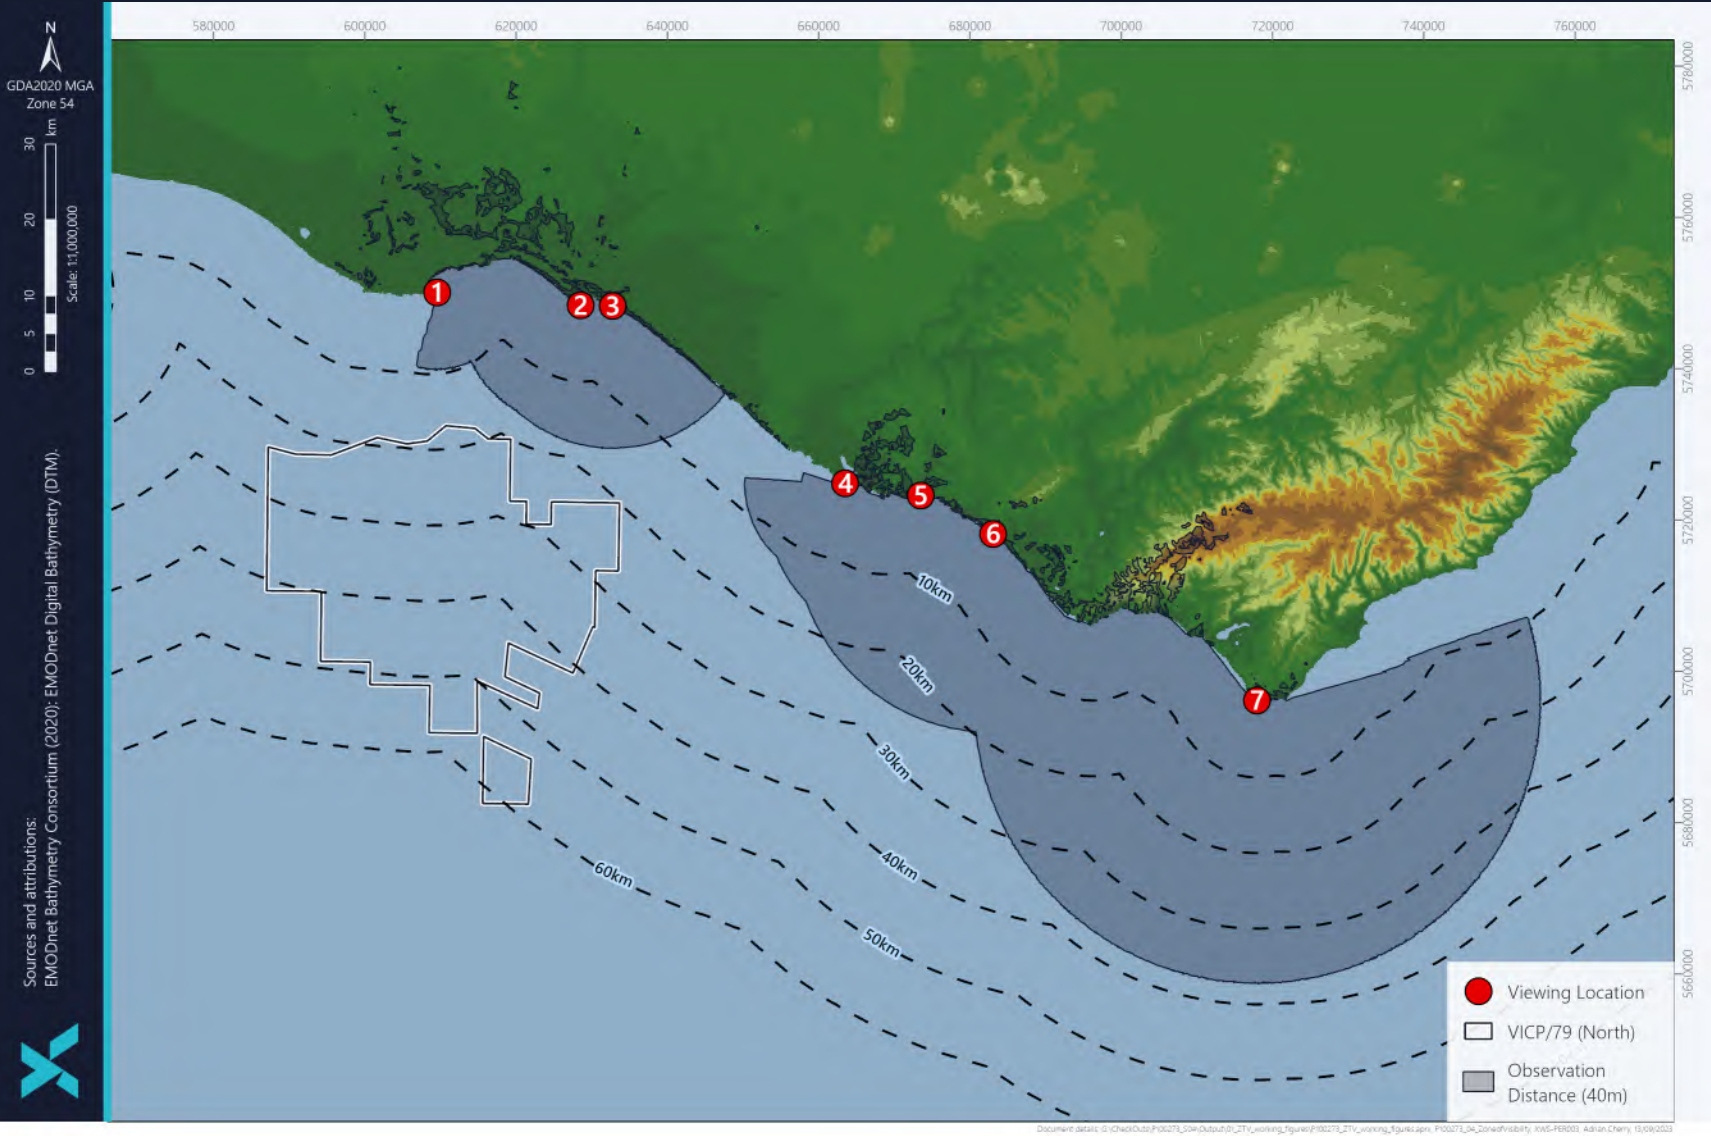

The fans of visibility (viewshed) represent the maximum viewable area from each location. As is demonstrated, the areas are dissected by local obstructions (islands and other landforms).

The permit area (at sea level) is partially visible from only a single location.

# Otway Basin Viewshed for 40 metre high object

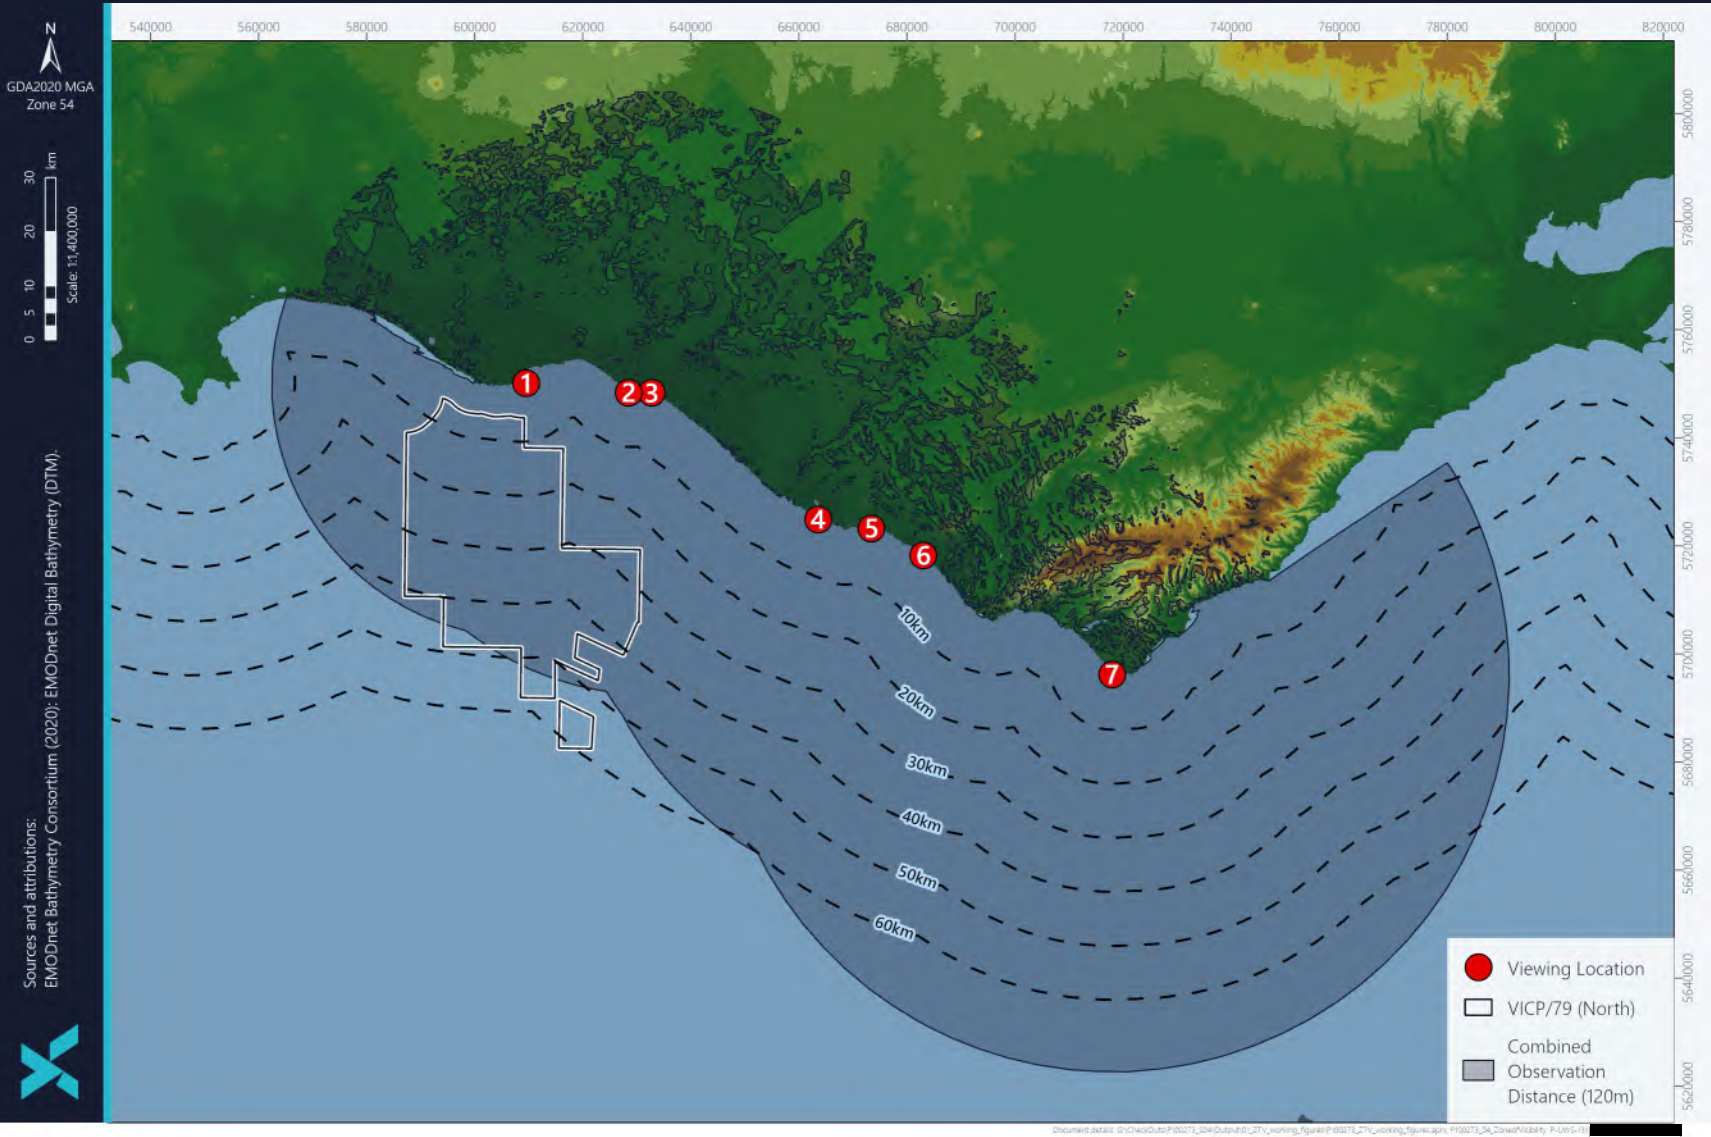

The fans of visibility represent the maximum viewable area of a 40 m high deck from each location.

The vast majority of the permit area can host a 40 m high deck without visual impact.

# Otway Basin Viewshed for 120 m high object

The fans of visibility represent the maximum viewable area of a 120 m high platform from each location.

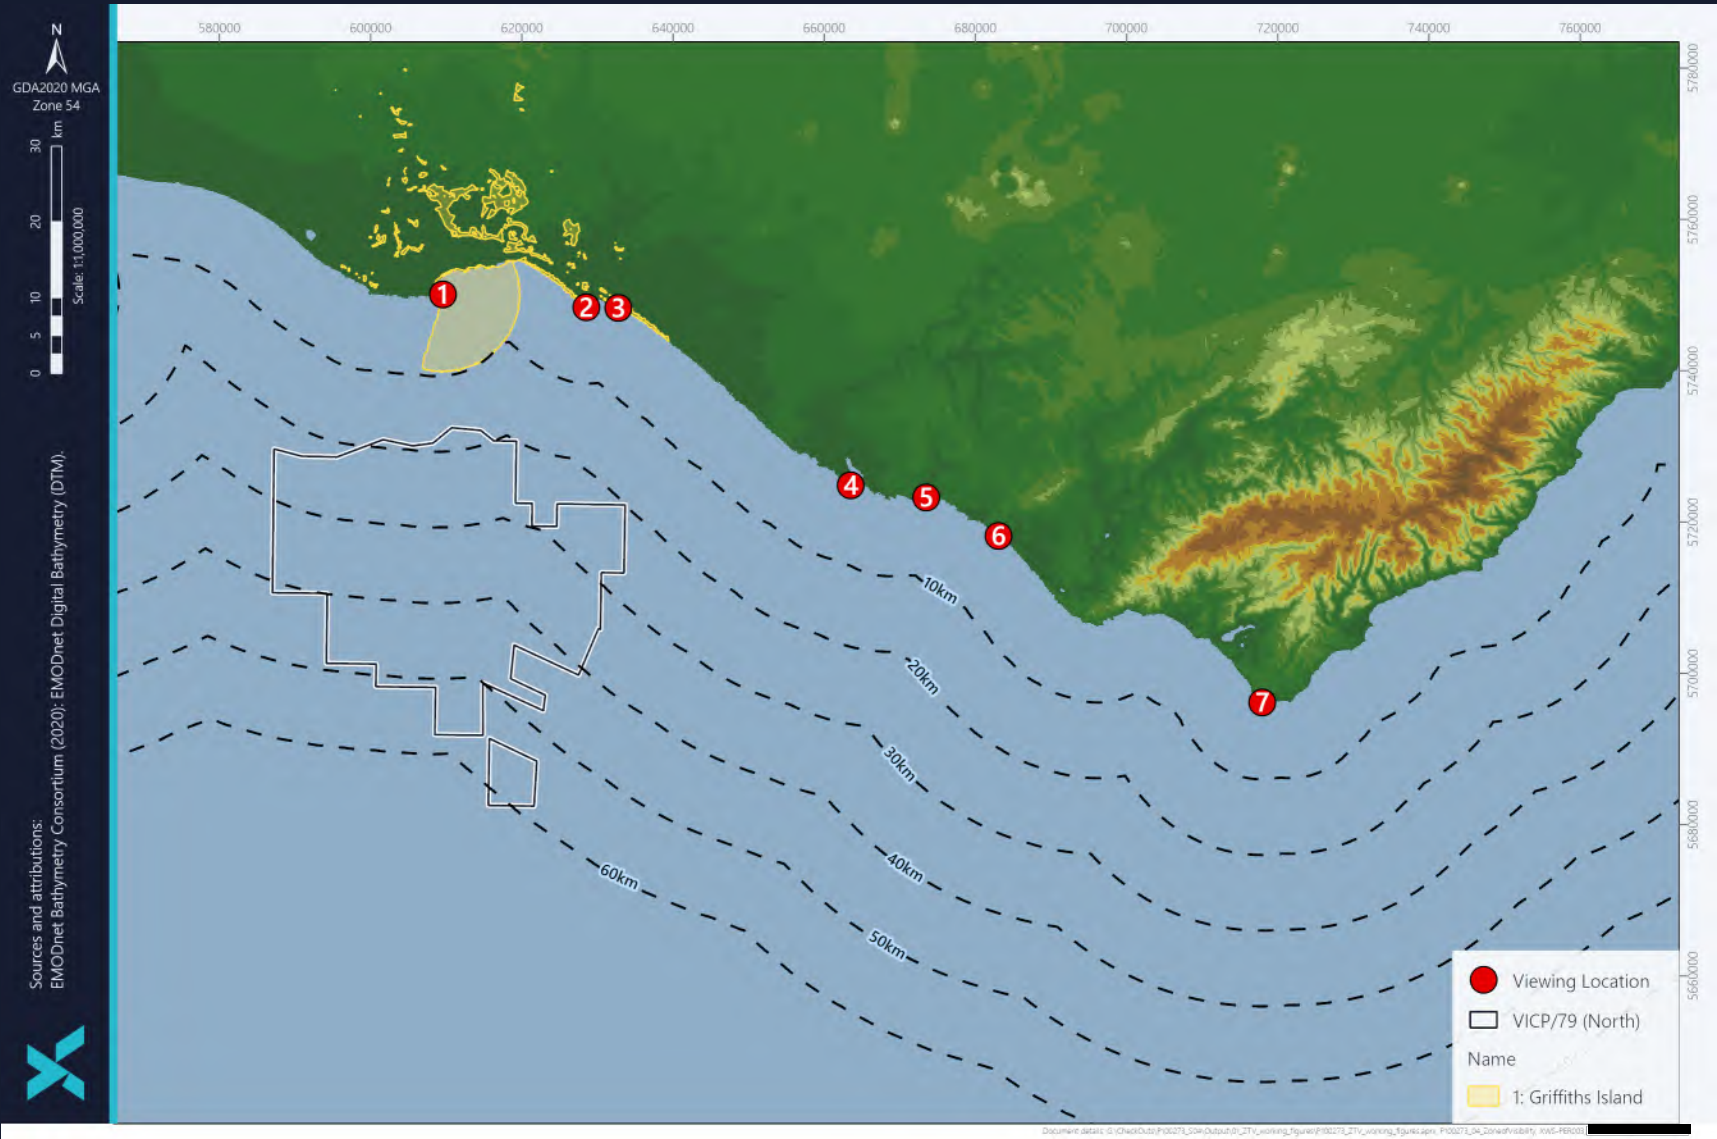

A 120 m high derrick will be visible from the western most viewing sites, and likely not visible from the eastern most (see individual viewshed images).

Very little of the permit area can host a 120 m high derrick that is not visible from at least one of the viewing sites.

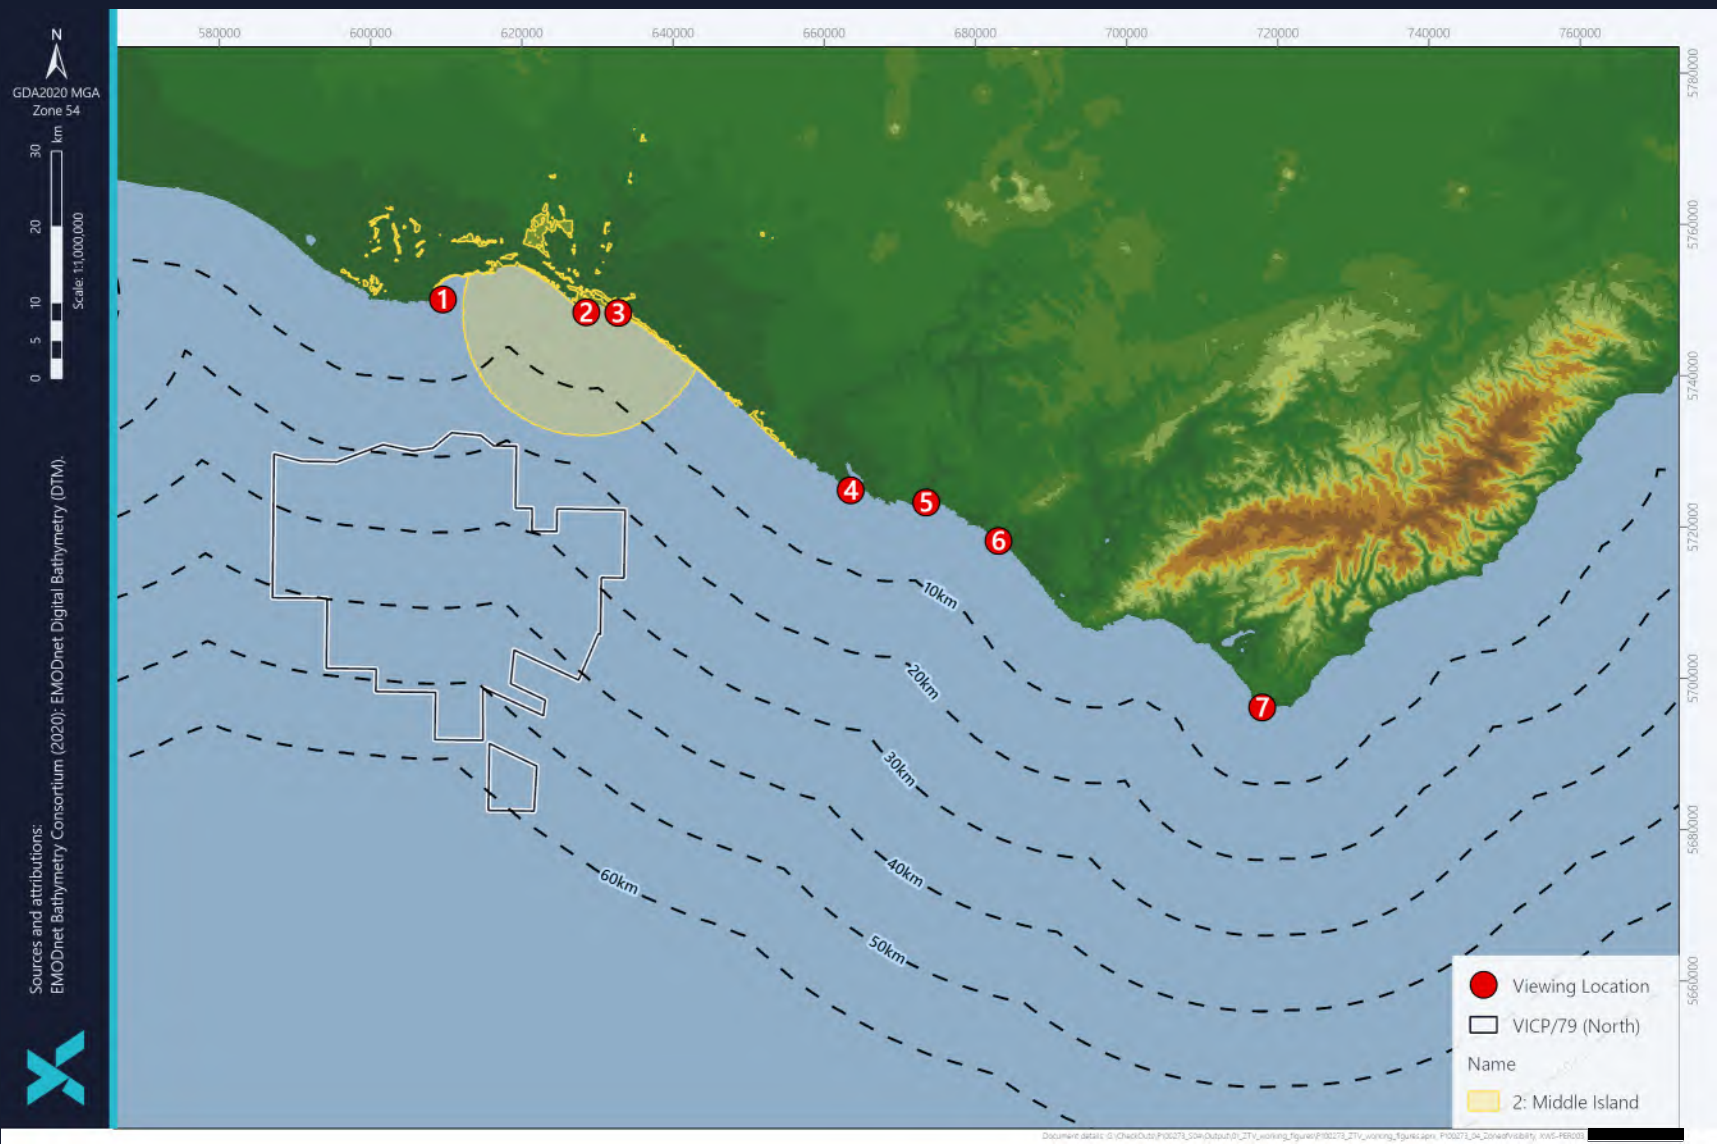

# Site 1 viewshed for 40 m high object

# Zone of Theoretical Visibility (SOUTH)

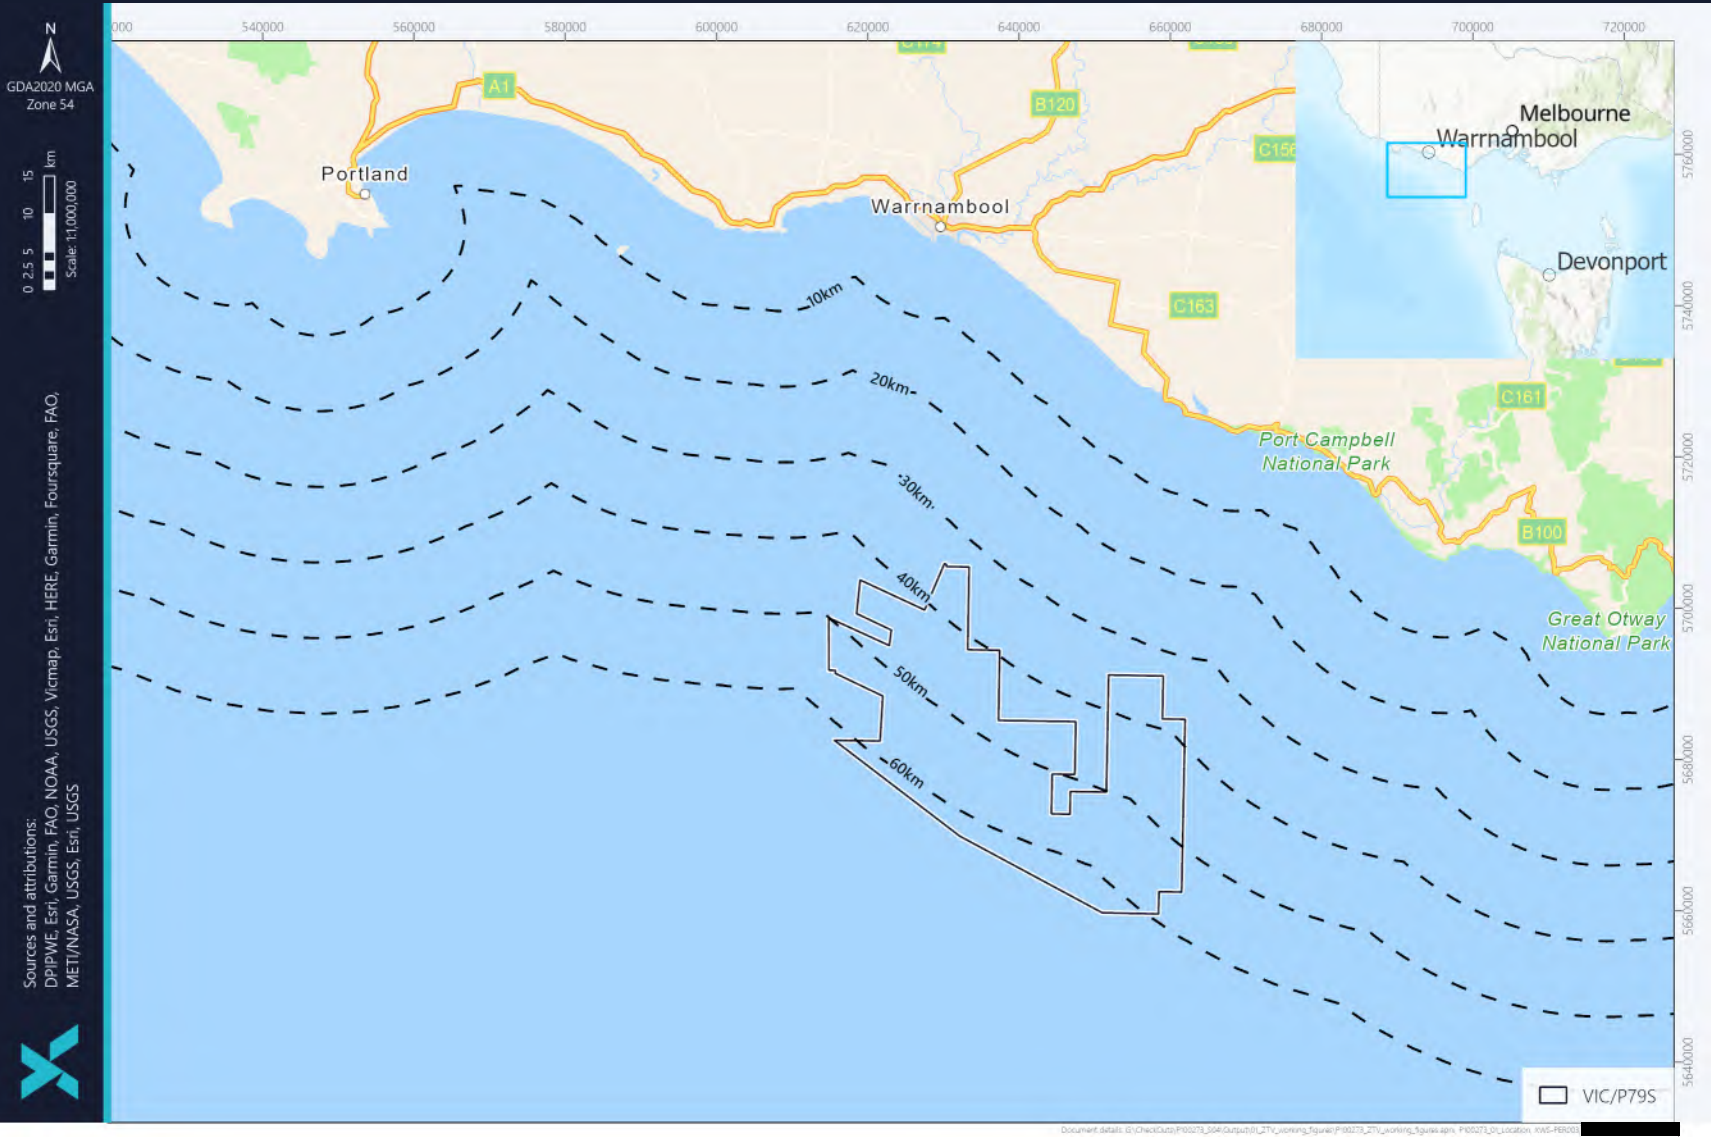

Geospatial visibility analysis of exploration activities within the southern extent of VIC/P79

[WWW.XODUSGROUP.COM](http://WWW.XODUSGROUP.COM)

# Target area VIC/79 (South)

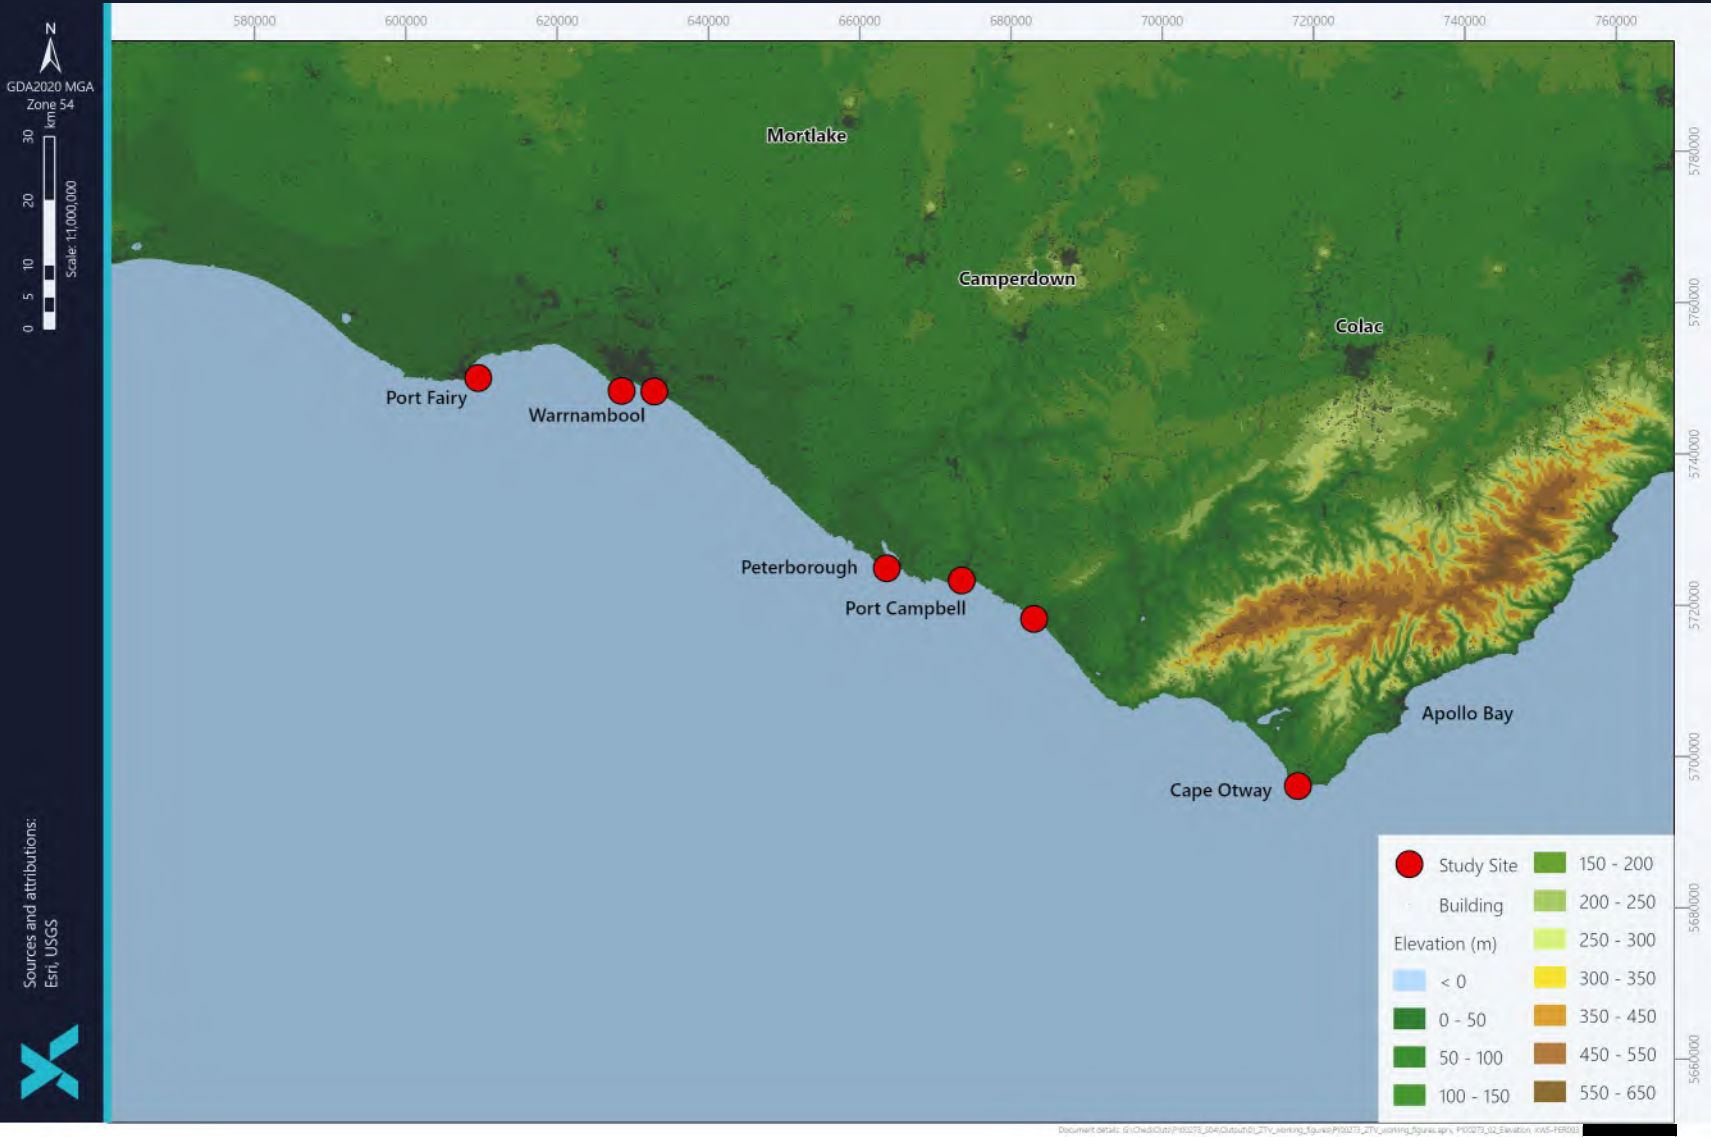

The Otway Basin is located along the Northern coast of Victoria, west of Melbourne.

The objective of this technical note is to present the outcomes of the assessment undertaken to estimate the Visual Impact from the project.

The study assess visibility of a platform from selected viewing locations.

# Otway Coast Elevation and Infrastructure

The elevation of the region is diverse.

Great Otway National Park to the east has a mountain range pushing elevations up into the 600-650m range.

Travelling west from the national park, the terrain drops down from the range to become rolling hills.

Continuing west, the terrain flattens out into lower elevation agricultural plains.

There are several towns and one larger regional hub (Warrnambool).

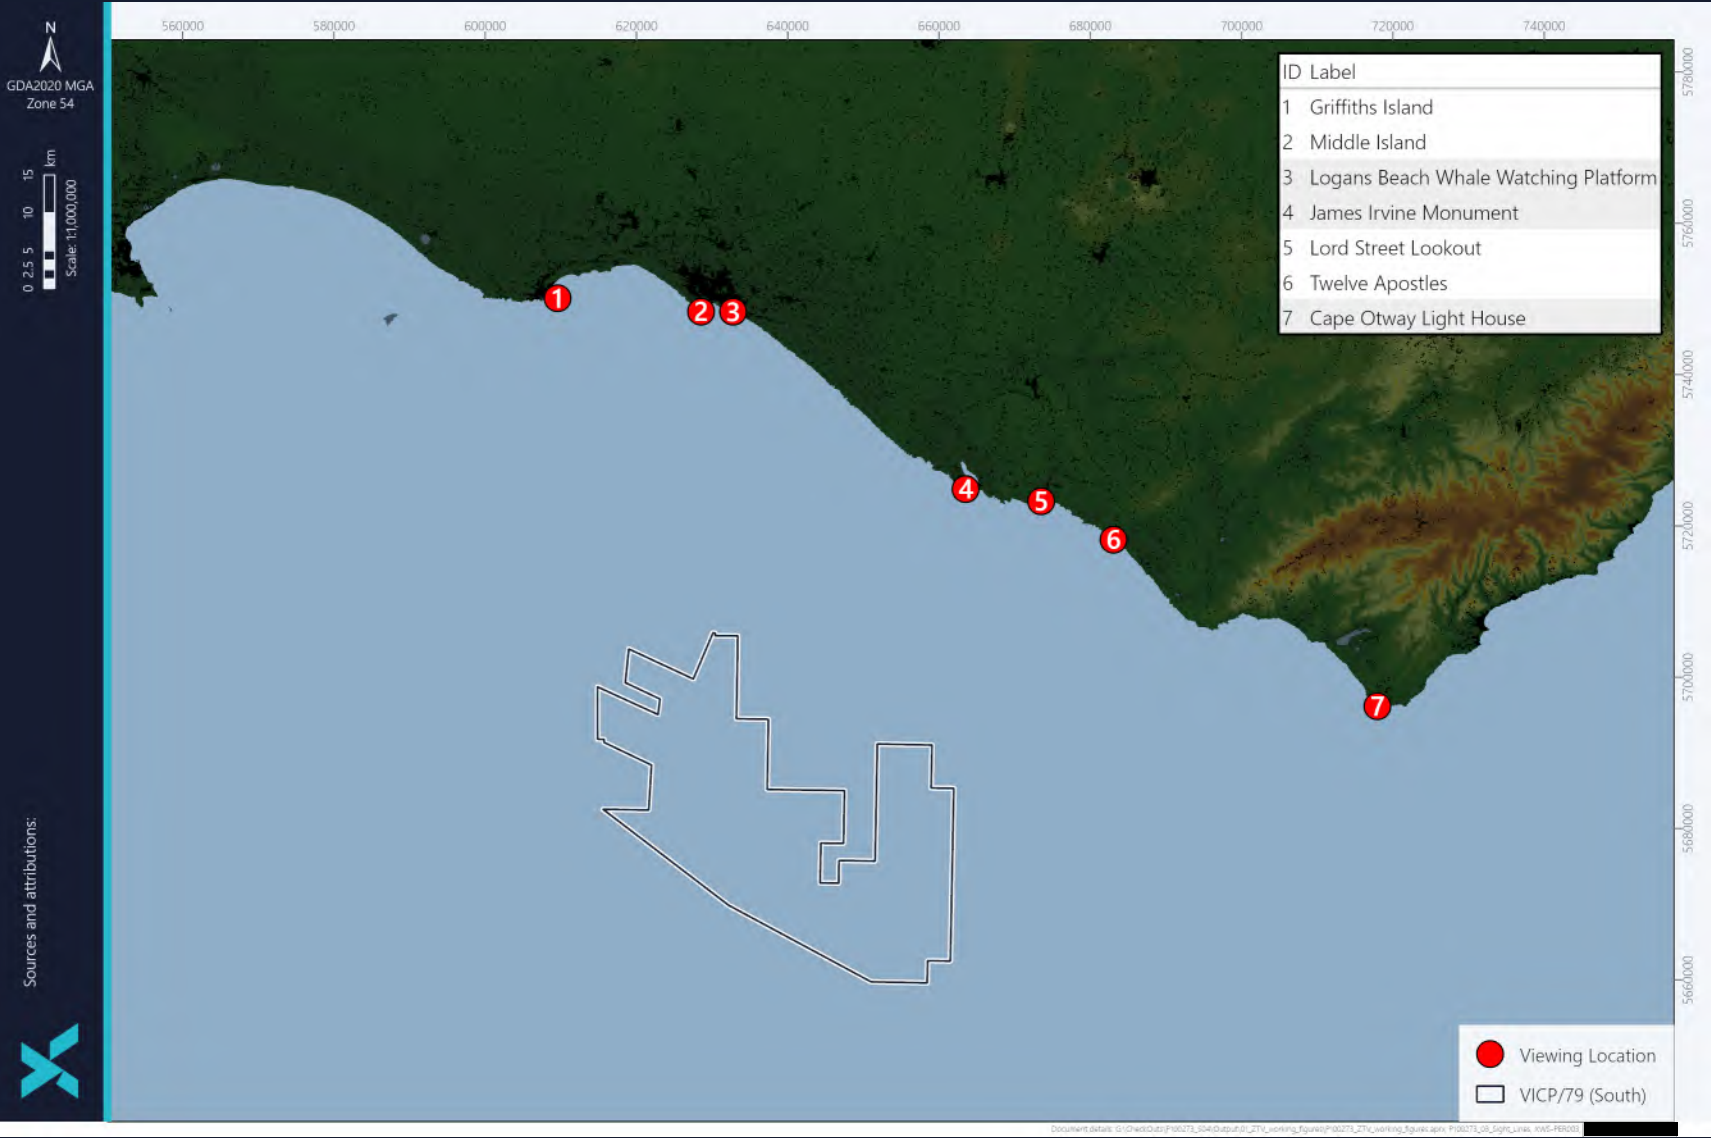

The coastline's unique geography/geology attracts tourists and therefore, has a series of viewing locations.

# Otway Coast Viewing Locations

For this study, seven locations were chosen based on the following factors:

1. Elevation
2. Visual access
3. Tourism amenity
4. Proximity to a point of interest

## Griffiths Island

A tourism site at Port Fairy.

## Middle Island

A prominent tourist attraction at Warrnambool with an elevated position for site seeing.

## Logans Beach Whale Watching Platform

A prominent tourist attraction at Warrnambool with an elevated position for site seeing.

## James Irvine Monument

A tourism site at Peterborough, has high visual amenity.

## Lord Street Lookout

A tourism site at Port Campbell, has high visual amenity.

## Twelve Apostles

A prominent tourist attraction with an elevated position for site seeing.

## Cape Otway Light House

A tourism site with high visual amenity and elevated position.

## Line of Sight Calculation

$$d = \left( 2 \cdot \frac{4}{3} R h_1 + h_1^2 \right)^{0.5} + \left( 2 \cdot \frac{4}{3} R h_2 + h_2^2 \right)^{0.5}$$

Where

- $h_1$  = height of object
- $h_2$  = height of receptor
- $R$  = radius of earth
- $d$  = total line of sight ( $d_1 + d_2$ )

Line of sight and Viewshed analyses are conducted using the standard calculation above.

The calculation determines a viewer's ( $h$ ) visible horizon limit ( $d_1$ ). And if applicable, the observable distance of an object ( $h_{\text{receptor}}$ ) beyond the horizon ( $d_1 + d_2$ ).

As elevation/height of an observer increases, so does the distance to the horizon. Likewise, the viewable distance of an object beyond the horizon increases with its elevation/height.

This assumes no adverse atmospheric conditions or obstructed field of view.

## Calculated Viewshed

Label	Name	Elevation (m)	Horizon (km)	40 m Deck (km)	120 m Derrick (km)
1	Griffiths Island	3	8	30.6	47.1
2	Middle Island	14	14.3	36.9	53.4
3	Logans Beach Whale Watching Platform	20	16.7	39.3	55.8
4	James Irvine Monument	8	11.3	33.9	50.4
5	Lord Street Lookout	25	18.5	41.1	57.7
6	Twelve Apostles	43	23.9	46.5	63
7	Cape Otway Light House	91	34.4	57	73.5

These values represent the inputs (Elevation) and outputs (Horizon or Platform) of the calculated visibilities.

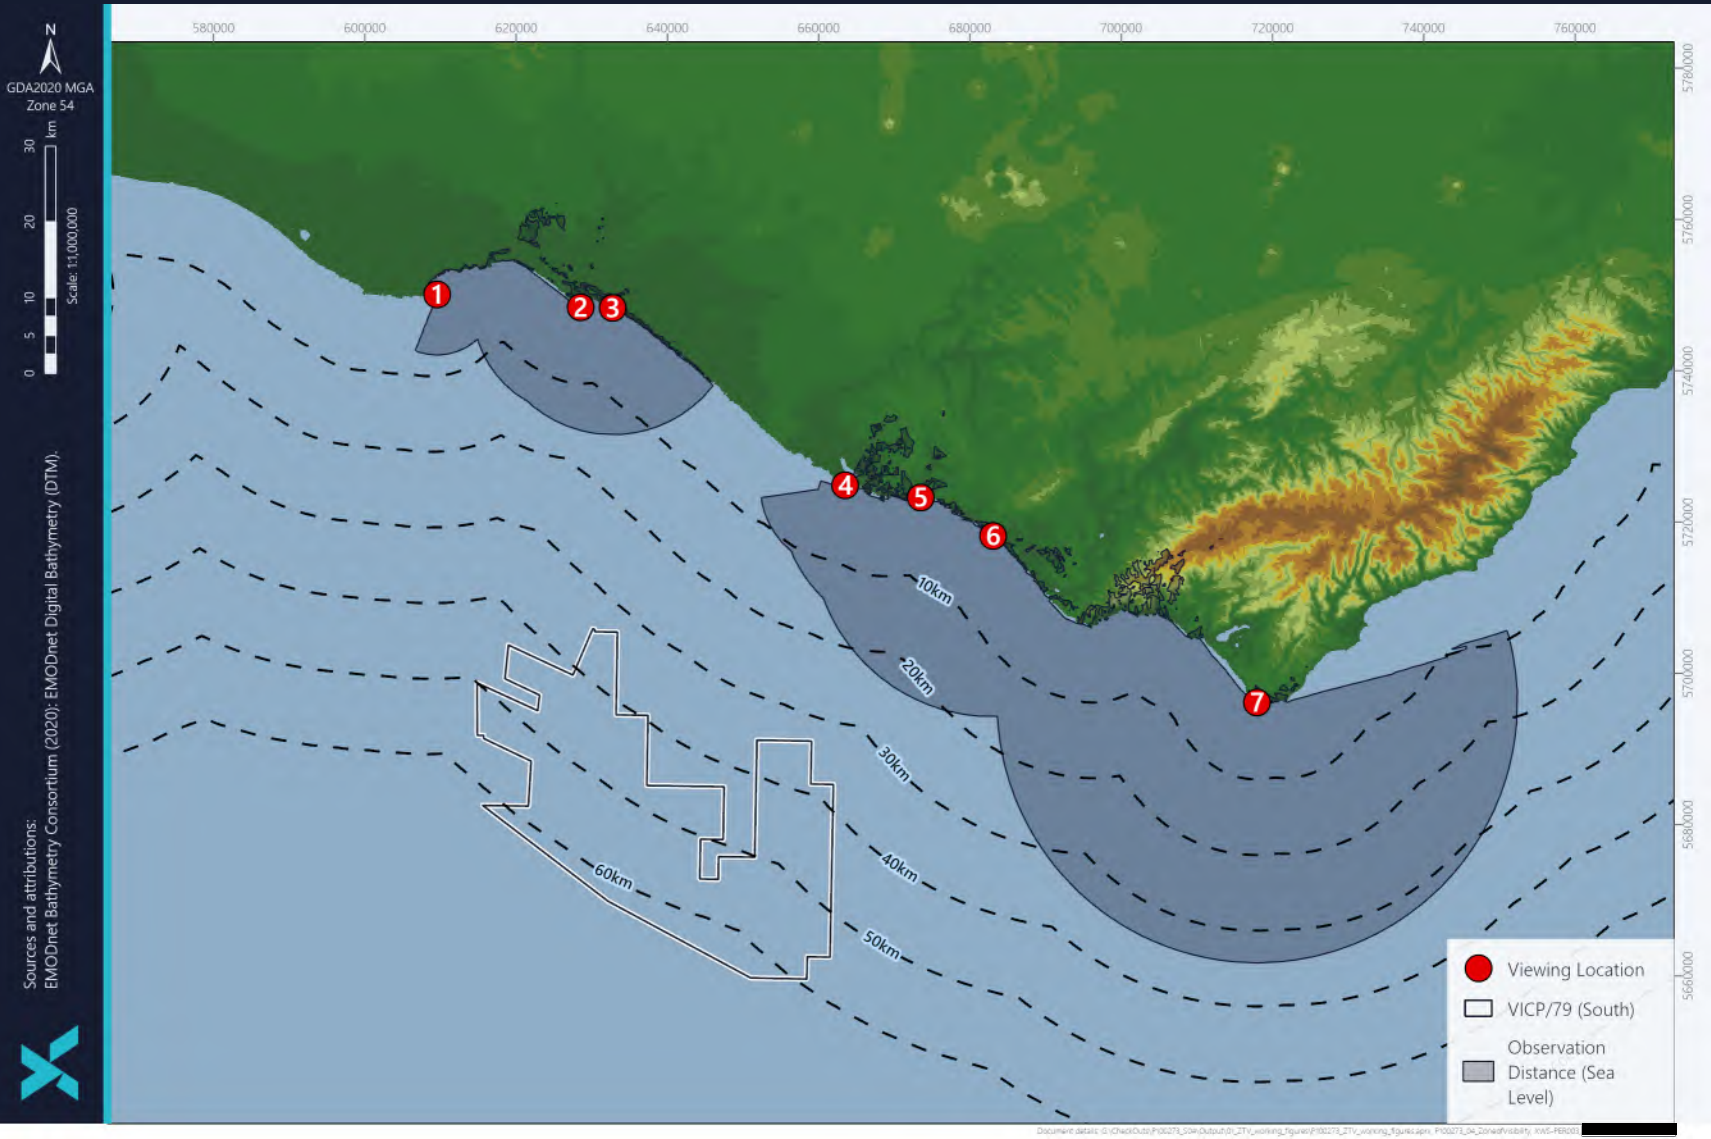

A 2 m tall observer at Griffiths Island (approximately 5 m above sea level) will see 34.4 km to the horizon. A 120 m high object will appear above the horizon to the observer up to 73.5 km away.

A platform height was not available, hence a generic worst case scenario height of 120 m has been used in this study.

Each location's elevation has had 2 m added as the elevation, to create the observers height.

# Otway Basin Viewshed for Sea Level Horizon

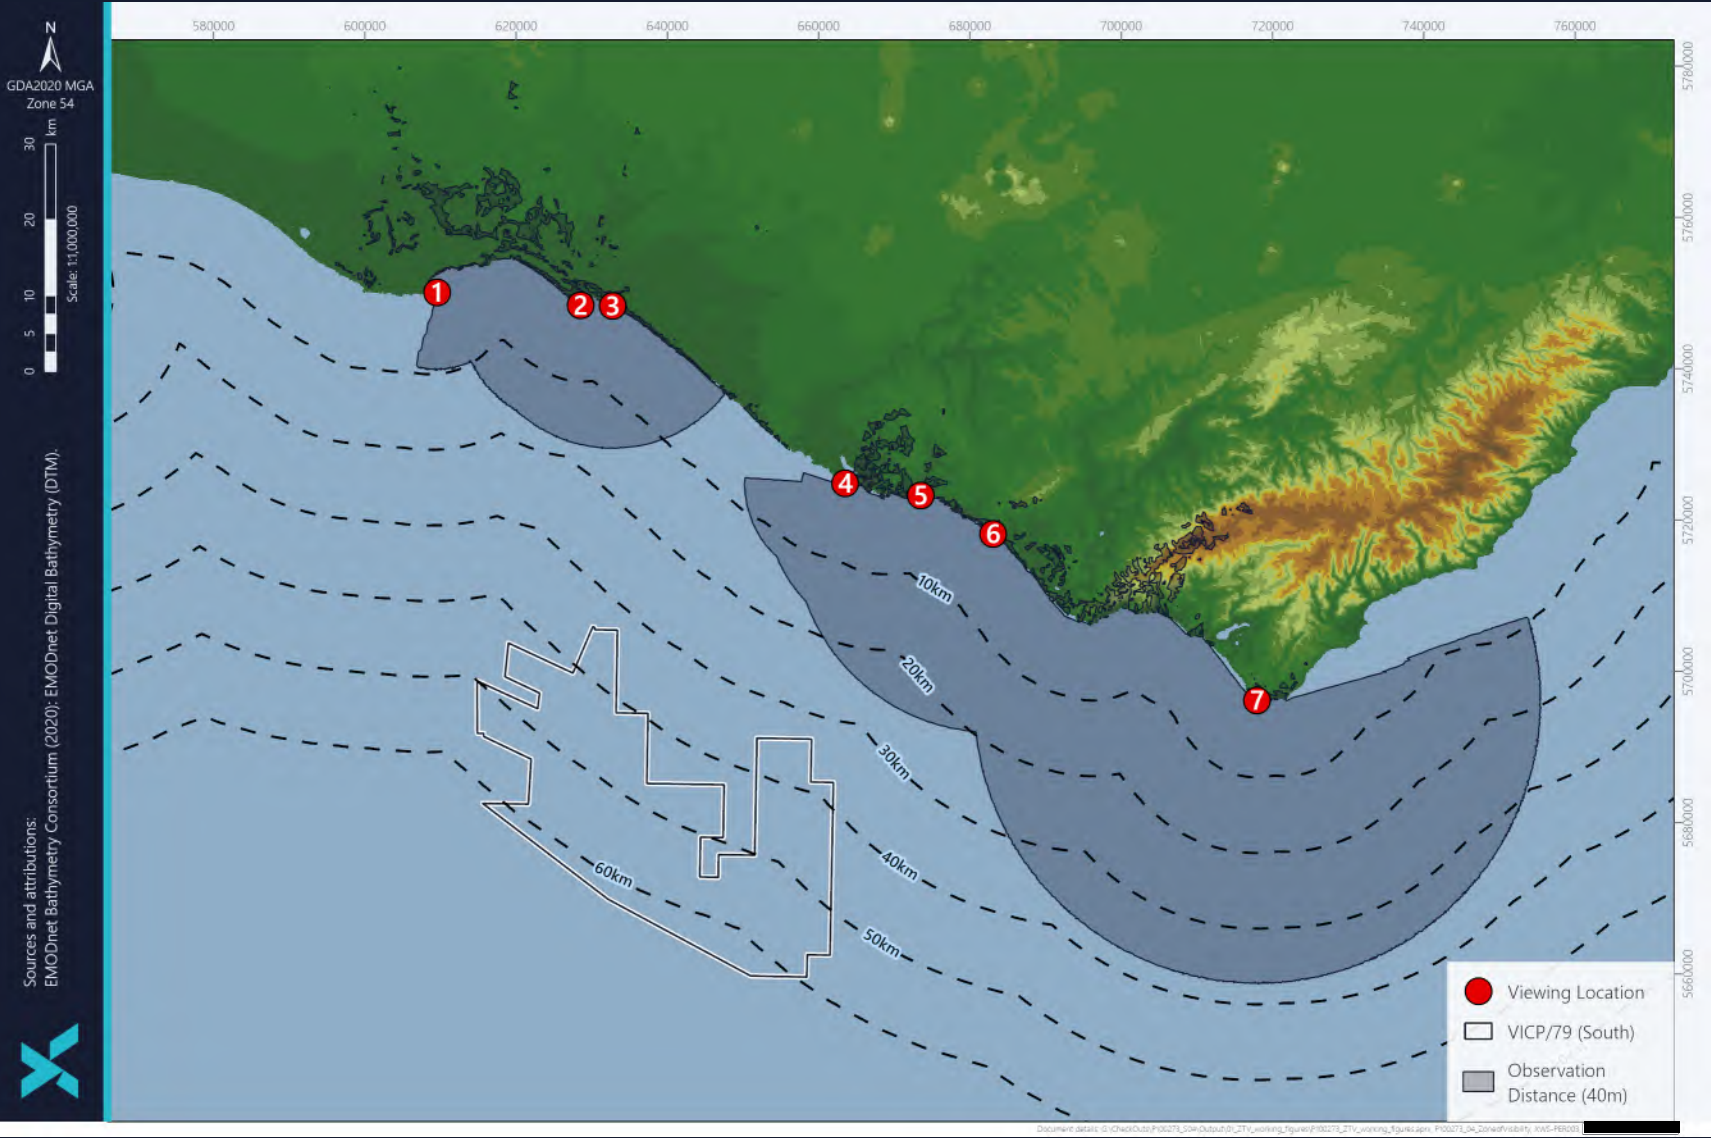

The fans of visibility (viewshed) represent the maximum viewable area from each location. As is demonstrated, the areas are dissected by local obstructions (islands and other landforms).

The entire permit area (at sea level) is not visible from any study location.

# Otway Basin Viewshed for 40 metre high object

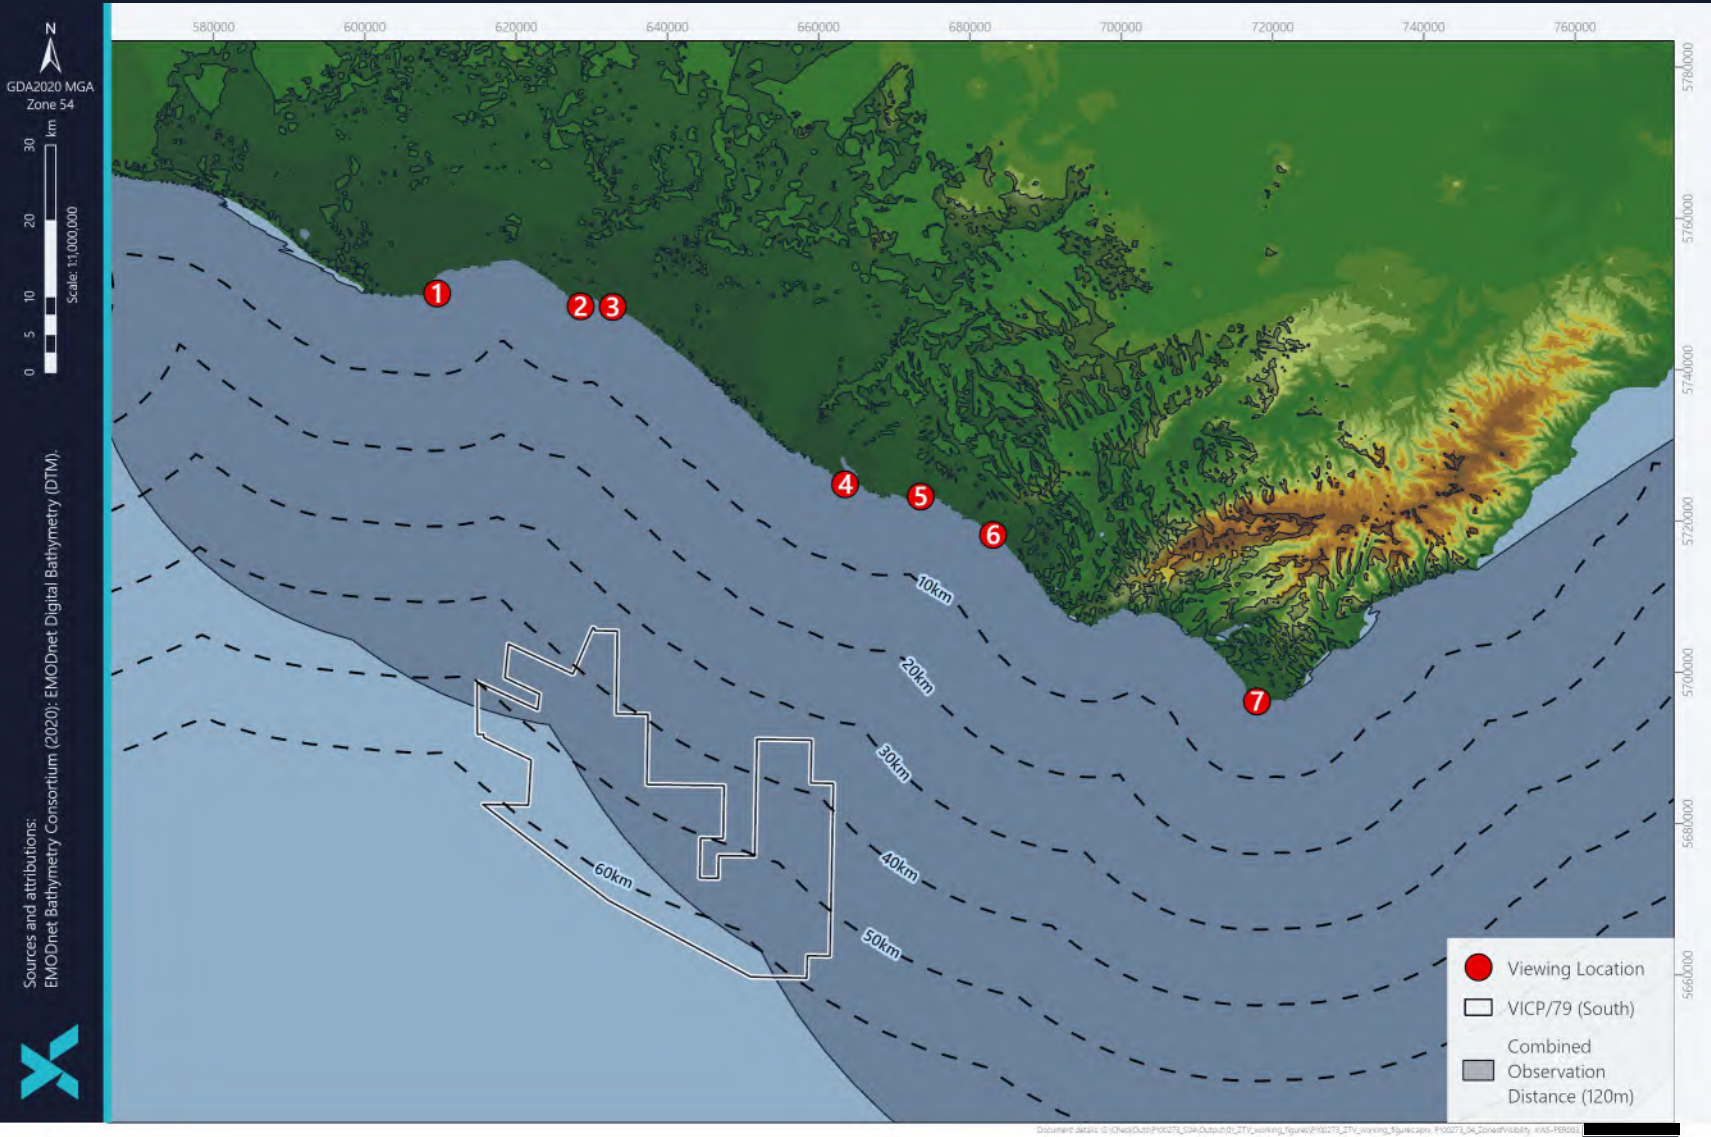

The fans of visibility represent the maximum viewable area of a 40 m high deck from each location.

The entire permit area can host a 40 m high deck without visual impact.

# Otway Basin Viewshed for 120 m high object

The fans of visibility represent the maximum viewable area of a 120 m high platform from each location.

A 120 m high derrick will be visible from the some viewing sites (see individual viewshed images).

Approximately half of the permit area can host a 120 m high derrick that is not visible from at least one of the viewing sites.

# Zone of Theoretical Visibility (King Island)

Geospatial visibility analysis  
of exploration activities  
within T/49P

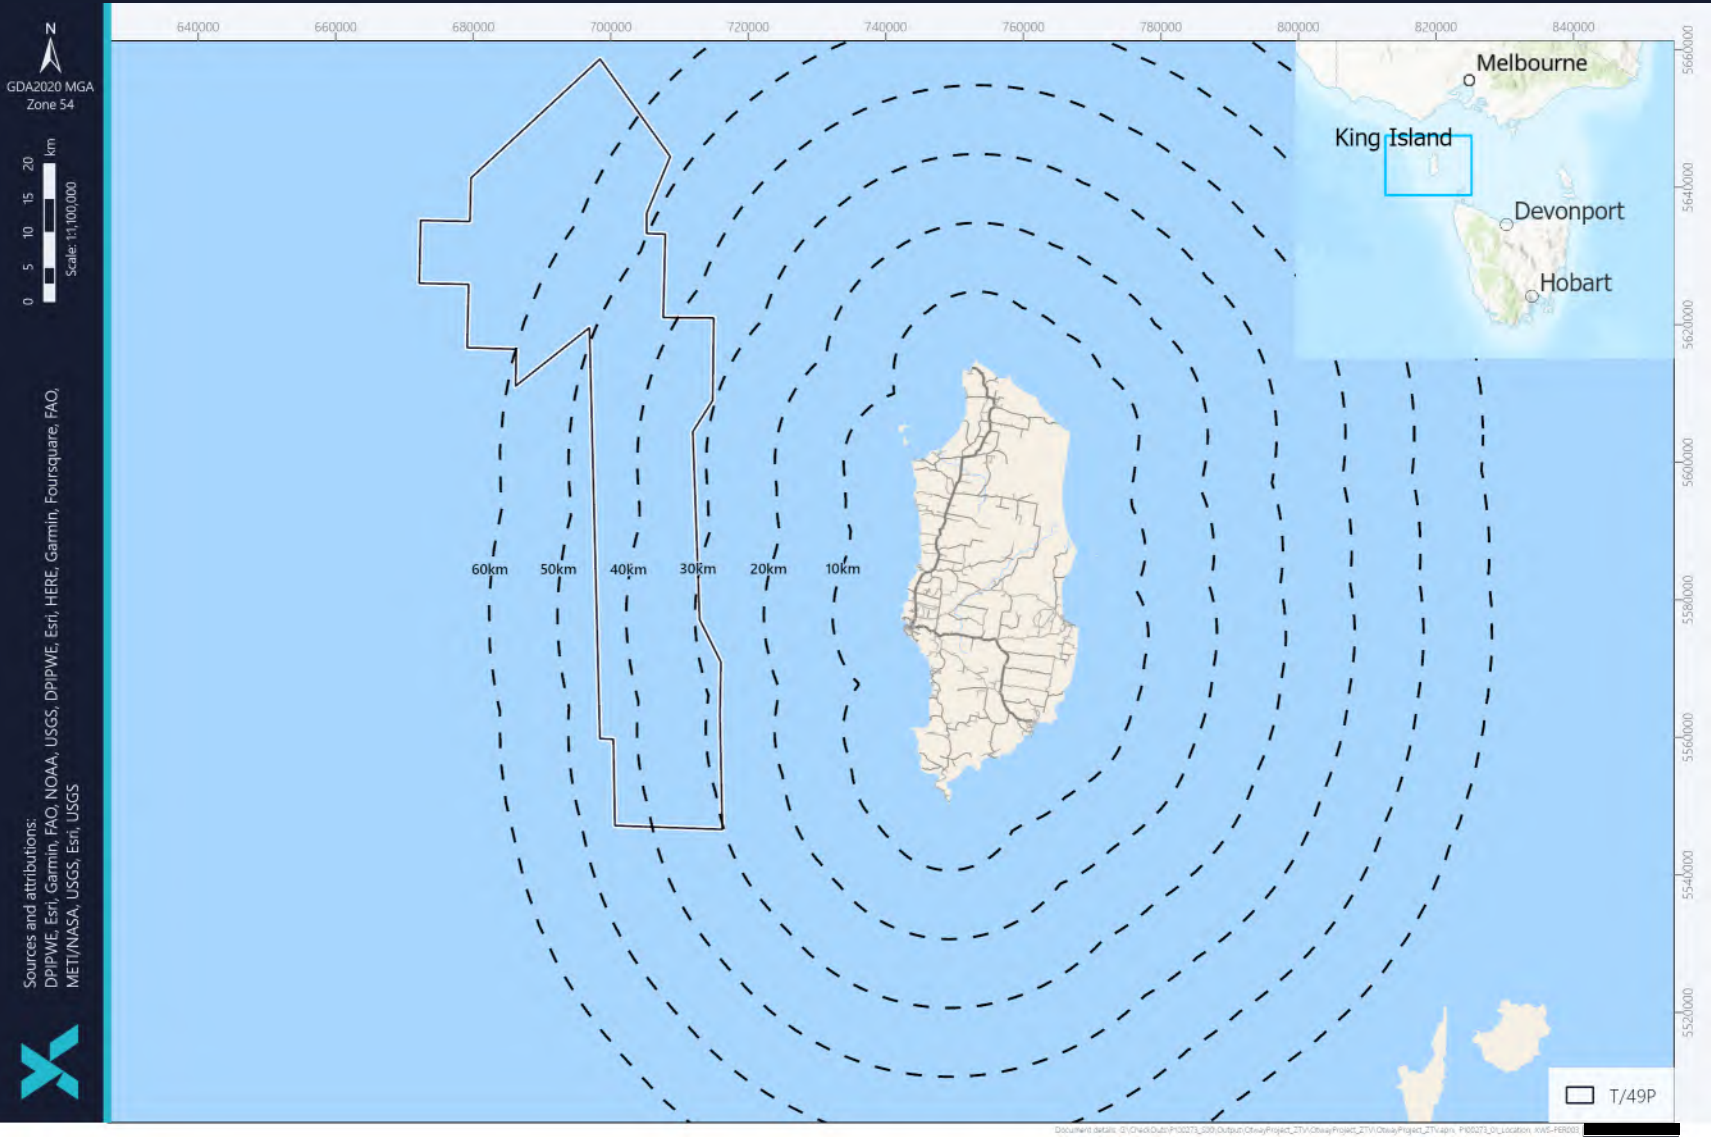

[WWW.XODUSGROUP.COM](http://WWW.XODUSGROUP.COM)

# King Island and Otway Targets

King Island is situated in the Bass Strait, north west of Tasmania and south of Victoria.

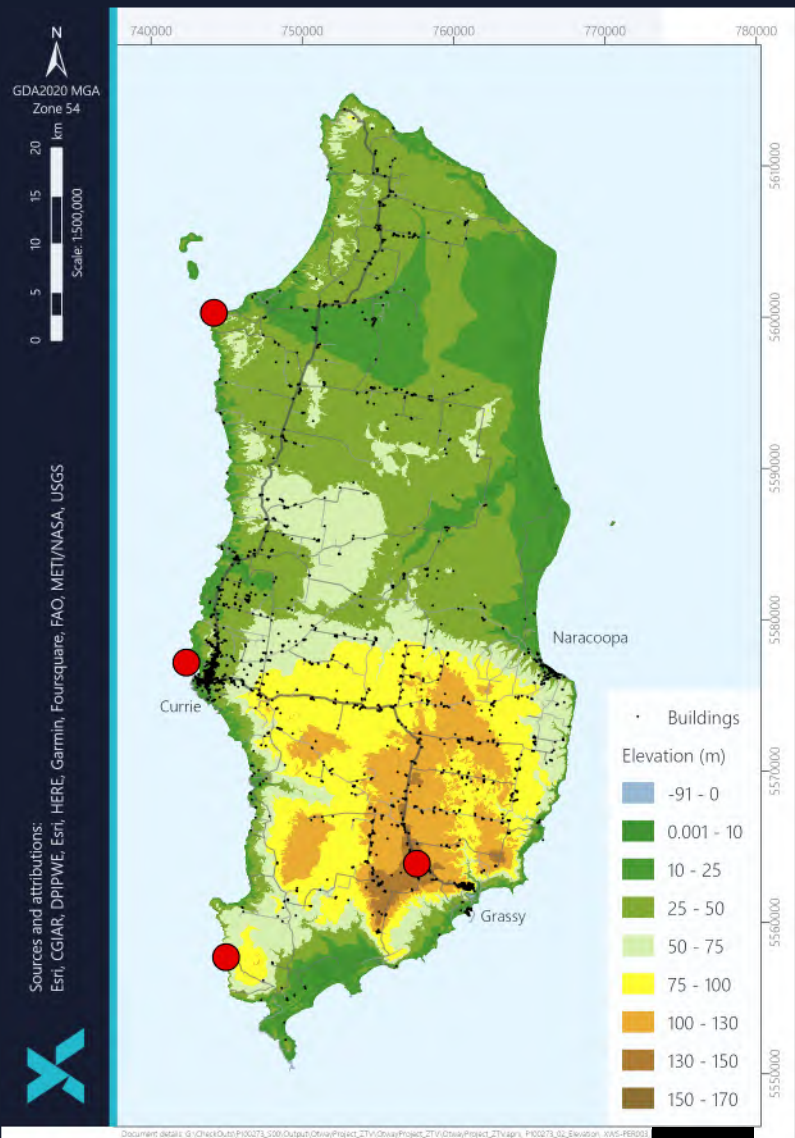

The Otway Exploration Drilling Campaign is located within Commonwealth waters in the Bass Strait, west of King Island.

The objective of this technical note is to present the outcomes of the assessment undertaken to estimate the Visual Impact from the campaign.

The study assess visibility of a platform from selected island locations.

# King Island Elevation and Infrastructure

King Island has a relatively flat and low elevation northern half.

The southern region has a single main peak of approximately 162 m surrounded by rolling hills.

The main town is Currie, with two smaller villages of Grassy and Naracoopa.

# King Island Viewing Locations

For this study, four locations were chosen based on the following factors:

1. Elevation
2. Visual access
3. Tourism amenity
4. Proximity to a point of interest

## Whistler Point

Site 1 is nearby to a coastal golf course and lighthouse. This site is conducive to tourism and visual amenity.

## Currie Lookout

Site 2 is located above Devils Rock. This site was chosen due to elevation, visual access and proximity to the main town.

## Highest Point

Site 3 is the highest point on King Island at approximately 160 m above sea level. The location itself is on private land approximately 200 m from the public road. This site is selected purely on elevation.

## Seal Rocks Lookout

Site 4 is the main cliff top lookout on King Island. It is selected due to elevation, visual amenity and being a major tourist attraction.

## Line of Sight Calculation

$$d = \left( 2 \cdot \frac{4}{3} R h_1 + h_1^2 \right)^{0.5} + \left( 2 \cdot \frac{4}{3} R h_2 + h_2^2 \right)^{0.5}$$

Where

- $h_1$  = height of object
- $h_2$  = height of receptor
- $R$  = radius of earth
- $d$  = total line of sight ( $d_1 + d_2$ )

Line of sight and Viewshed analyses are conducted using the standard calculation above.

The calculation determines a viewer's ( $h$ ) visible horizon limit ( $d_1$ ). And if applicable, the observable distance of an object ( $h_{\text{receptor}}$ ) beyond the horizon ( $d_1 + d_2$ ).

As elevation/height of an observer increases, so does the distance to the horizon. Likewise, the viewable distance of an object beyond the horizon increases with its elevation/height.

This assumes no adverse atmospheric conditions or obstructed field of view.

## Calculated Viewshed

Lab el	Name	Elevation (m)	Horizon (km)	40 m Deck (km)	120 m Derrick (km)
1	Whistler Point	15	14.7	37.3	53.8
2	Currie Lookout	10	12.4	34.9	51.5
3	Highest Point	160	45.4	68.0	84.6
4	Seal Rocks Lookout	35	21.8	44.3	60.8

These values represent the inputs (Elevation) and outputs (Horizon or Platform) of the calculated visibilities.

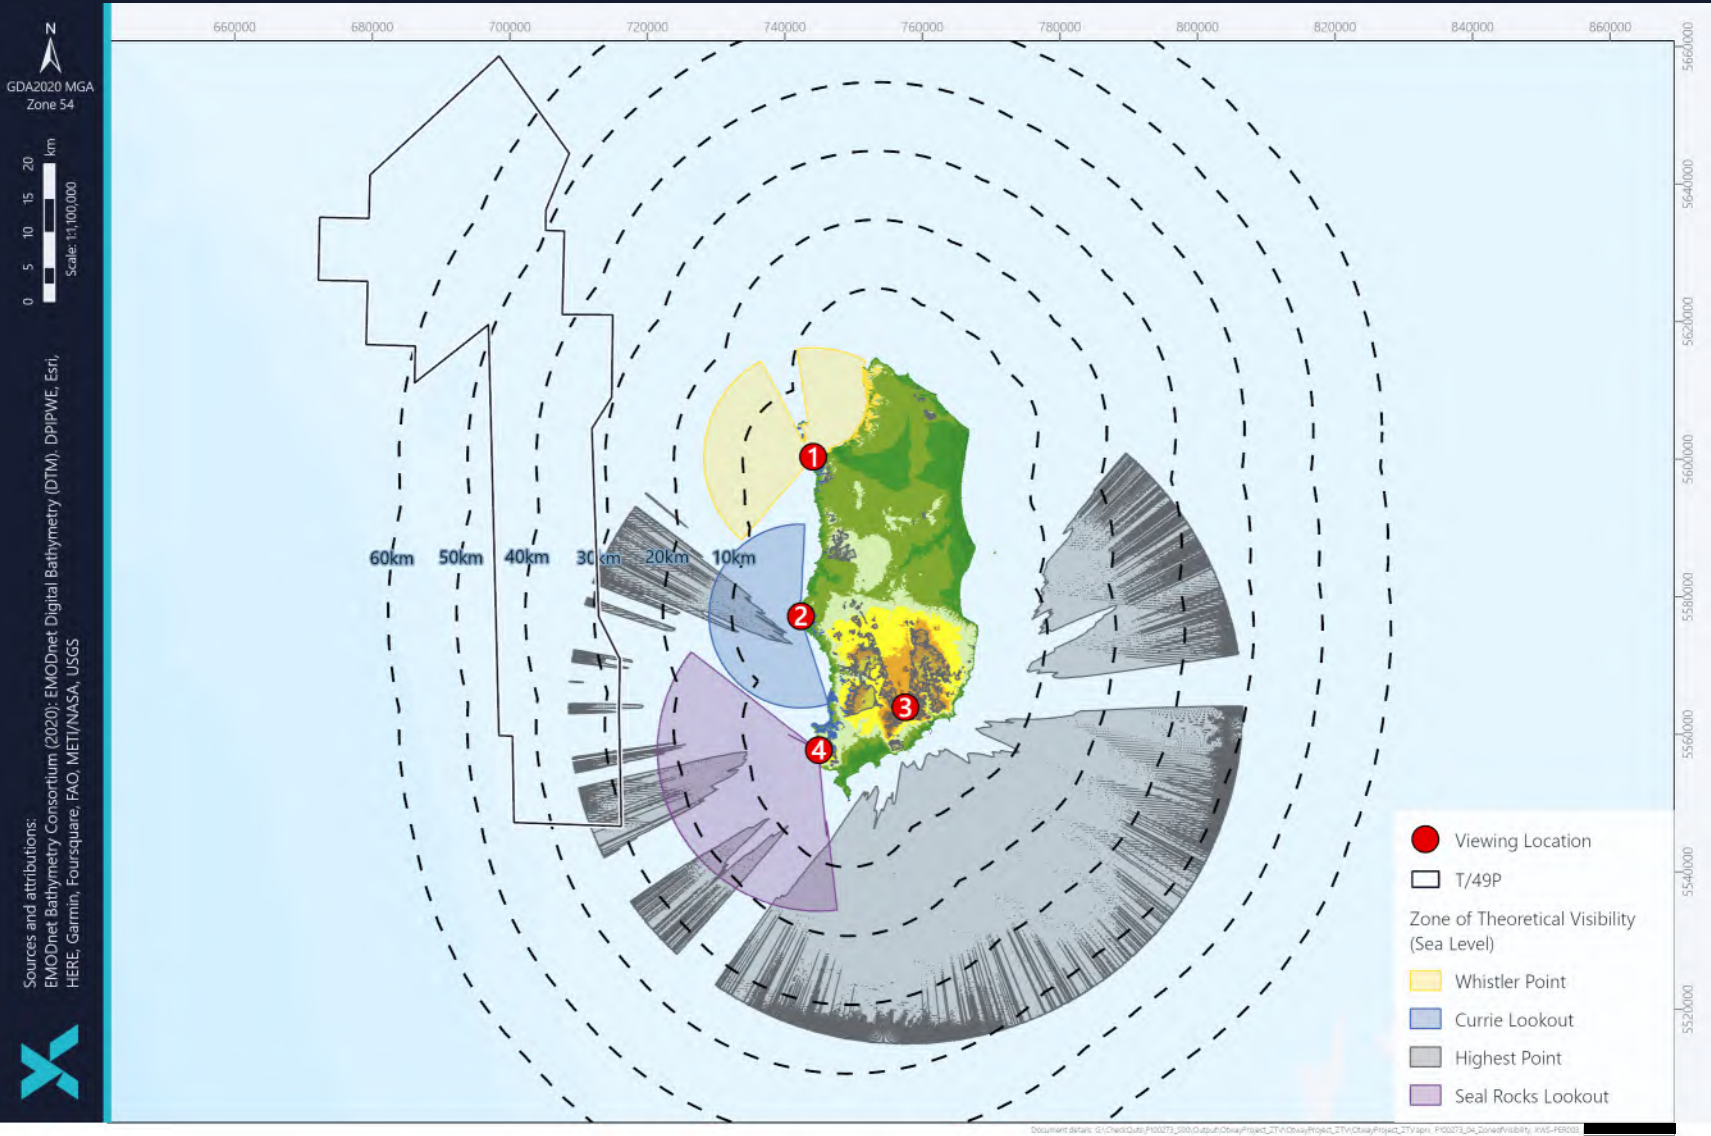

A 2 m tall observer at Seal Rocks Lookout (approximately 35 m above sea level) will see 21.8 km to the horizon. A 120 m high object will appear above the horizon to the observer up to 60.8 km away.

As of writing, ConocoPhillips have not chosen a platform, therefore a generic worst case scenario height of 120 m has been used in this study.

Each location's elevation has had 2 m added as the observers height.

# King Island Viewshed to Horizon

The fans of visibility represent the maximum viewable area from each location. As is demonstrated, the areas are dissected by local obstructions (islands and other landforms).

The Otway Target areas are not visible from Whistler Point, Currie or Seal Rocks Lookout. Some eastern areas of the VI Seal Rocks target area are visible from the Highest Point.

## King Island Viewshed for an Object 120 m high

The fans of visibility represent the maximum viewable area of a 120 m high platform from each location.

**An object 120 m high within the Otway Target areas will be visible from at least one of the locations.**

## 1. Introduction

ConocoPhillips Australia SH1 Pty Limited and ConocoPhillips Australia SH2 Pty Limited hold an 80% interest in and operatorship of Exploration Permits VIC/P79 and T/49P, respectively. Collectively these entities are called 'ConocoPhillips Australia or COP (in checklists)' for the purposes of this Oil Pollution Emergency Plan (OPEP).

This OPEP has been prepared in accordance with Regulations 14(8), 14(8AA) and 14(8A) of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (the Environment Regulations) to support the ConocoPhillips Australia's Otway Exploration Drilling Program in Permits VIC/P79 and T/49P (see Figure 2-1), located in Commonwealth waters of the offshore Otway Basin.

### 1.1. Purpose

The purpose of this OPEP is to describe the arrangements that ConocoPhillips Australia has in place to prepare for, respond to and monitor an oil pollution event, including:

- Control measures for a timely and effective response to an emergency that results, or may result, in oil pollution
- Arrangements and capability that will be in place for the duration of the activity to ensure timely implementation of pre-determined control measures, including arrangements for ongoing maintenance of response capability
- Arrangements and capability that will be in place for monitoring the effectiveness of the control measures and ensuring that the environmental performance standards are met, and
- Arrangements and capability in place for operational monitoring of oil pollution to inform response activities.

The processes and response structures used by ConocoPhillips Australia demonstrate effective integration and use of industry/government response efforts and resources.

The objective of this OPEP is to detail the actions that ConocoPhillips Australia will undertake during the event of an oil spill resulting from exploration activities.

### 1.2. Scope

This OPEP covers potential oil pollution emergencies that may result from activities associated with the Otway Exploration Drilling Program undertaken in permit areas VIC/P79 and T/49P. The OPEP recognises and incorporates the divisions of responsibility as defined under the terms of the National Plan for Maritime Environmental Emergencies (NATPLAN, 2020).

### 1.3. Otway Exploration Drilling Program Activities

This OPEP has been developed to address the oil spill risk associated with petroleum activities described in the Otway Exploration Drilling Program Environment Plan (EP). The EP provides further details on the description of activities, existing environment, assessment and management of environmental impacts and risks, and mitigations.

Otway exploration activities will occur within defined operational areas located entirely within offshore permits VIC/P79 and T/49P (Figure 1-1). The petroleum activities assessed in the EP which present a risk of oil spill and are covered by this OPEP, include:

- Seabed clearance surveys (seabed surveys), and
- Exploration drilling of up to 6 exploration wells, including support activities.

# Oil Pollution Emergency Plan

---

Seabed surveys may commence from 1 January 2024 and drilling may commence from 1 October 2024, subject to complying with other requirements in the EP. The term of the EP is from 1 January 2024 to 31 December 2028.

Seabed surveys involve the use of 1-2 survey vessels and drilling involves the use of a semi-submersible mobile offshore drilling unit (MODU) and up to three support vessels. The MODU and survey / support vessels carry marine diesel oil (MDO), or similar e.g. marine gas oil, which may be released in the event of a vessel to vessel or vessel to MODU collision during bunkering or as a result of equipment failure.

During drilling operations a failure of one or more well barriers may result in a situation where pressure control has been lost and reservoir fluids are free to flow to surface through the unsecured wellbore. Although extremely unlikely, these situations have the potential to result in a Loss of Well Control (LOWC) event whereby gas condensate is released into the marine environment.

## 1.4. Interface with Other Documentation and Plans

This OPEP integrates with the following emergency planning documentation:

- The National Plan for Maritime Environmental Emergencies (NATPLAN) (AMSA, 2020) – AMSA is the jurisdictional authority for spills from vessels in or affecting Commonwealth Waters, and the coordinator of the NATPLAN
- The Victorian State Maritime Emergencies (Non-search and Rescue) Plan (VicPlan) (Emergency Management Victoria, 2021) – Victorian Department of Transport and Planning (DTP-Vic) is the Control Agency for spills that impact Victorian State Waters
- The Tasmanian Marine Oil and Chemical Spill Contingency Plan (TasPlan) (TasEPA, 2022) – The Environment Protection Authority Tasmania (TasEPA) is the Control Agency for spills that impact Tasmanian State Waters.

The OPEP interfaces with a number of ConocoPhillips Australia emergency response documents, including:

- Crisis and Incident Management Plan (CIMP) (ABUE-450-HS-N05-C-00119)
- Emergency Contact Directory (ABUE-450-HS-L01-C-00001)
- Incident Reporting and Investigation Procedure (ABUE-450-HS-N05-C-00009)
- Business Continuity Plan (ABUE-450-HS-N05-C-00054)
- Otway Exploration Drilling Program Environment Plan (EP)
- Otway Exploration Drilling Program Source Control Emergency Response Plan (SCERP)
- Otway Exploration Drilling Program Relief Well Plan (RWP)
- Otway Exploration Drilling Program Operational and Scientific Monitoring Program (OSMP)
- Australia Business Unit – Operational Monitoring Plans (ABUE-450-EN-V01-C-00016)
- Australia Business Unit – Scientific Monitoring Plans (ABUE-450-EN-V01-C-00015)

The interface between key response documents and processes is pictorially represented in Figure 1-1 below.

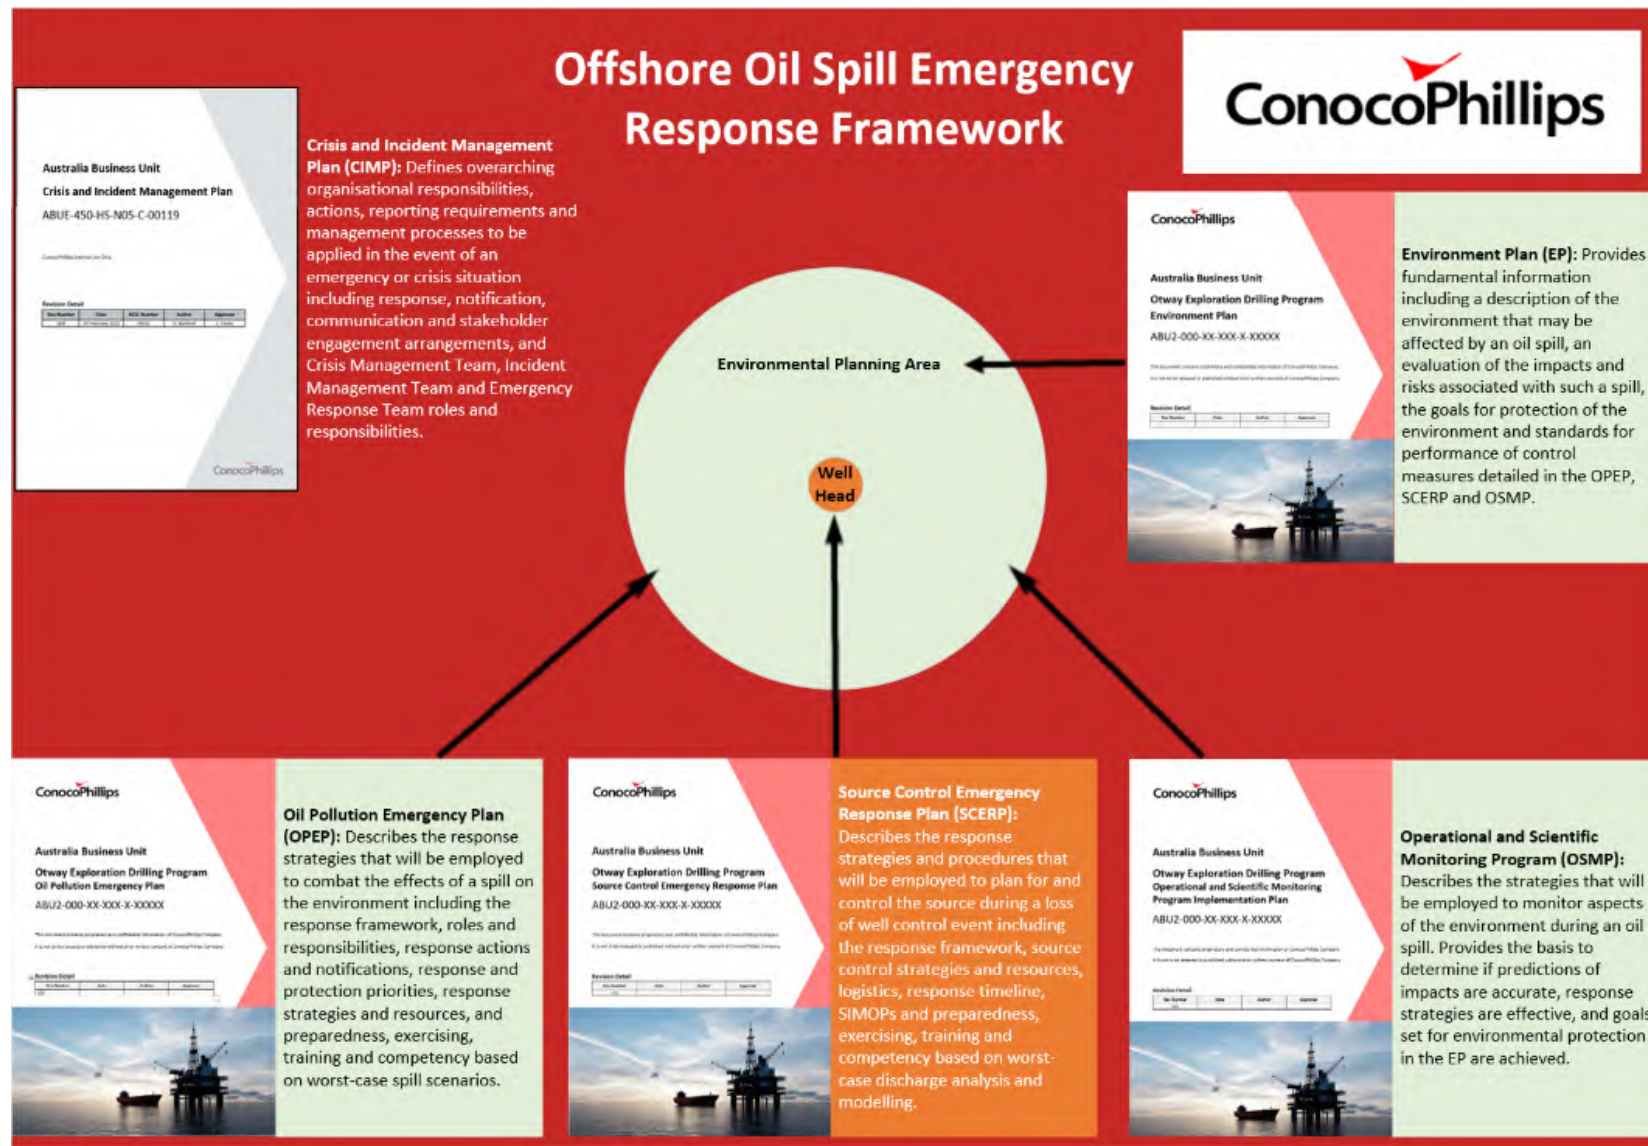

Figure 1-1: ConocoPhillips Australia offshore oil spill emergency response framework

## 1.5. Review of OPEP

The OPEP will be reviewed and updated as required and no less than annually during the activity, to ensure that material information remains accurate. Updates should reflect outcomes of testing, assurance and continuous improvement activities, amended contractual arrangements and feedback from ongoing consultation. Timing for review will be consistent with the arrangements outlined in the EP, as per requirements of Regulation 14(8).

## 1.6. Training and Testing Arrangements

ConocoPhillips Australia is committed to ensuring staff with functional roles within the IMT and field operations teams are properly trained and skilled to complete the tasks required of them.

All oil spill response trained personnel will gain and maintain their competency through the following competency/skills maintenance program:

### **Competency Based Training (CBT):**

- Incident Commanders to maintain current certification in the International Maritime Organisation (IMO) equivalent Course in Oil Spill Response Command & Control (IMO Illeq).
- Incident Management Team function roles to maintain certification in the International Maritime Organisation (IMO) equivalent Course in Oil Spill Response Management (IMO Illeq).

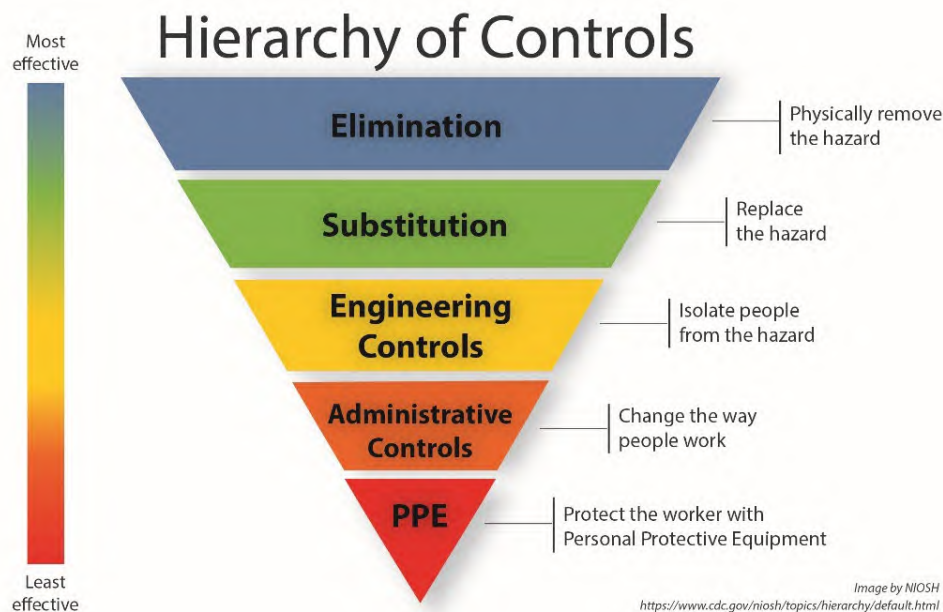

### **Exercises:**

- Annual participation in an oil spill functional position, within a ConocoPhillips desktop or activation exercise, using a ConocoPhillips Australia OPEP worst case credible scenario.

## 1.7. Health, Safety and Environment Policy

Oil spill response activities under the control of ConocoPhillips Australia shall be implemented in accordance with ConocoPhillips's Health, Safety and Environmental Policy, Standards, Practices and Guidelines, and consistent with the outcomes sought from the National Plan guidance paper *NP-GUI-026: Marine oil spill response health and safety*.

Prior to implementing spill response operations, for activities that are outside ConocoPhillips Australia's business as usual operations, activities will be risk assessed. Should new or heightened consequences be introduced, these shall be mitigated to As Low As Reasonably Practicable (ALARP). ConocoPhillips Australia will develop and implement a Spill Safety Plan which documents this process. Safety risk mitigation measures, including both process and personnel safety, will be established in accordance with the hierarchy of controls, as shown in Figure 1-2 below.

**Figure 1-2: Hierarchy of controls**

## 1.8. Spill Response Implementation and Environmental Performance

Environmental performance outcomes (EPOs) are measurable levels of performance required for the management of the Otway Exploration Drilling Program. EPOs ensure that the impacts and risks associated with the activities, including the risk of an oil pollution incident and consequential response activities, will be managed to an acceptable level.

Control Measures (CMs), being a system, an item of equipment, a person or procedure that are used as the basis for managing environmental impacts and risks associated with an oil spill response, have been identified to support achievement of the EPOs for this OPEP. Environmental performance standards (EPS) have been defined to provide a statement of the performance required of each of the identified CMs, and Measurement Criteria (MCs) have been developed to demonstrate how performance will be measured in an objective way.

Detailed EPOs, CMs, EPS' and MCs have been developed for response strategies identified in this OPEP and are collated in Section 6 to support implementation and ongoing monitoring and audit efforts.

## **2. Quick Reference OPEP Information**

### **2.1. Location**

This OPEP applies to spills from activities associated with the ConocoPhillips Australia Otway Exploration Drilling Program within the defined operational areas for petroleum titles (permit areas) VIC/P79 and T/49P, as shown in Figure 2-1.

#### **2.1.1. Operational Areas**

Operational areas represent the broadest area within which all petroleum activities, namely seabed surveys and exploration drilling, can occur. Operational areas are located within and adjacent to the relevant permit areas (VIC/P79 and T/49P) as shown in Figure 1-1. Water depths in the operational areas ranges from 35 m to 670 m. Exact drilling locations will be confirmed prior to the commencement of drilling activities.

Survey and drilling support vessels will traverse from coastal departure locations to the operational areas and may reside outside of operational areas from time to time. Vessels moving to or residing outside of operational areas are not considered part of the activity until such time that they enter an operational area.

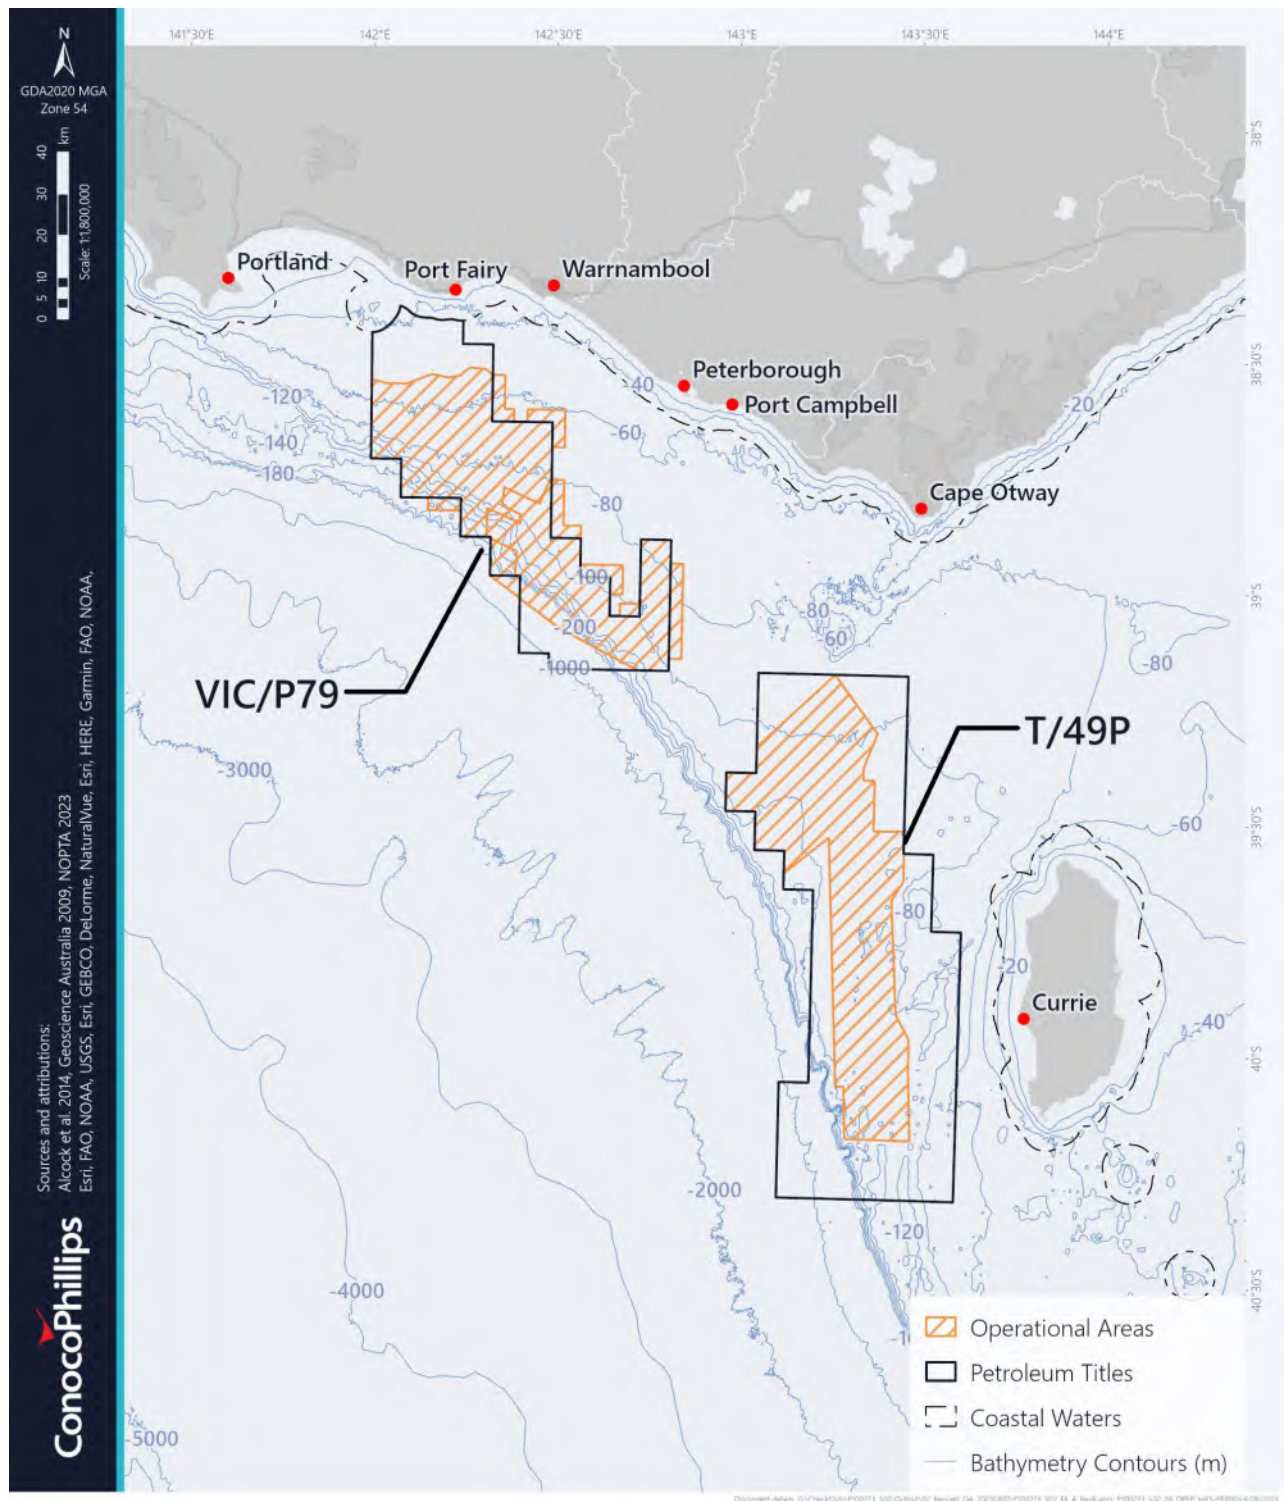

#### **2.1.2. Safe Navigation Area (SNA)**

A 500 m radius Safe Navigation Area (SNA) will be established around seabed survey vessels and any towed equipment when conducting seabed clearance activities. SNAs will be located entirely within the broader operational areas. Seabed surveys are expected to be conducted within 6 months prior to drilling.

#### **2.1.3. Drilling Area**

Exploration drilling will be undertaken at up to six locations within the operational areas. Drilling areas will be established around each exploration well, and will be located entirely within the broader operational areas. Each drilling area will be represented by a 2 km radius cautionary zone around the well site, also encompassing the 500 m Petroleum Safety Zone (PSZ), while the drilling rig is in location.

# Oil Pollution Emergency Plan

**Figure 2-1: Operational areas within permits VIC/P79 and T/49P**

## 2.2. Potential Hydrocarbon Types

There are two types of hydrocarbons covered in this plan that are associated with the Otway exploration program:

- Marine Diesel Oil (MDO), and
- Gas Condensate.

### 2.2.1. Marine Diesel Oil

MDO is generally considered to be a low viscosity and non-persistent oil that readily degrades by naturally occurring microbes. MDO will spread quickly when released and forms a thin film on the sea surface, increasing the rate of evaporation. However, some heavy components will have a strong tendency to physically entrain into the upper water column in the presence of moderate winds (i.e. >12 knots) and breaking waves but can re-float to the surface if these energies abate. Generally, about 6.0% of the MDO mass is predicted to evaporate within the first 12 hours (Boiling point (BP) < 180°C); with a further 34.6% evaporating within the first 24 hours (180°C < BP < 265°C); and an additional 54.4% evaporating over several days (265°C < BP < 380°C). Approximately 5% (by mass) of MDO will not evaporate, though will decay slowly over time. Characteristics of MDO are detailed in Table 2-1 and Table 2-2.

**Table 2-1: Physical characteristics of MDO**

Parameter	Characteristics
Density (kg/m <sup>3</sup> )	829 at 15°C
API	37.6
Dynamic viscosity (cP)	4.0 at 25°C
Oil category	Group II
Oil persistence classification	Light-persistent oil

**Table 2-2: Boiling point ranges for MDO**

Characteristic	Non-Persistent			Persistent
	Volatiles (%)	Semi-volatiles (%)	Low volatiles (%)	Residual (%)
Boiling point (°C)	<180	180 – 265	265 – 380	>380
Marine Diesel Oil	6.0	34.6	54.4	5

### 2.2.2. Gas Condensate

Reservoirs within the Otway Basin are expected to be gas condensate. As a result, no Group III-IV oils will be present during drilling activities. The characteristics for Thylacine condensate have been used as a proxy for LOWC, given that ConocoPhillips Australia do not have operational wells within the Otway Basin.

Thylacine condensate has an API of 44.3, a density of 805 kg/m<sup>3</sup> (at 15°C) and a low viscosity value of 0.875 cP. The volatile to semi-volatile components (boiling point (BP) < 265 °C), which represent approximately 83 % of the condensate is predicted to evaporate over the first day if exposed to the atmosphere at local temperatures, leaving the less volatile portion (16%) to progressively evaporate more slowly. Only 1% of the condensate is considered persistent. The heavier components (i.e. low volatile portion) of the condensate will tend to entrain in the upper water column during the presence of moderate winds (> 10 knots) and can potentially remain entrained for as long as the winds persist. It can subsequently resurface when the winds ease, and waves abate. Characteristics of Thylacine condensate are detailed in Table 2-3 and Table 2-4.

# Oil Pollution Emergency Plan

**Table 2-3: Physical characteristics of Thylacine condensate**

Parameter	Characteristics
Density (kg/m <sup>3</sup> )	805 at 15°C
API	44.3
Dynamic viscosity (cP)	9.95 at 50°C
Oil category	Group I
Oil persistence classification	Non-persistent oil

**Table 2-4: Boiling point ranges for Thylacine condensate**

Characteristic	Non-Persistent			Persistent
	Volatiles (%)	Semi-volatiles (%)	Low volatiles (%)	Residual (%)
Boiling point (°C)	<180	180 – 265	265 – 380	>380
Thylacine condensate	64.0	19.0	16.0	1.0

## 2.3. Risk/Credible Scenarios

The potential worst-case hydrocarbon spill scenarios relating to offshore petroleum activities are summarised in Table 2-5 and outlined below:

**For seabed surveys, drilling rig and support vessel operations: a release of MDO from a vessel within the operational area.**

- A vessel collision within the operational area resulting in a 350 m<sup>3</sup> surface release of MDO over 6 hours was identified as the worst-case credible spill scenario based on the AMSA Technical guidelines for preparing contingency plans for marine and coastal facilities (AMSA 2015). Calculation of discharge volume and timing align with the methodology recommended therein.

**For drilling operations: an open-hole and unrestricted well release based on Worst Case Discharge (WCD) calculations.**

- WCD calculations were completed in line with the ConocoPhillips Corporate Practice (Calculation and Documentation of Worst-Case Discharge, 2018) for a hypothetical Loss of Well Control (LOWC) scenario during exploration drilling. The WCD highest daily flow rate of hydrocarbons resulted in a predicted total spill volume of 139,400 m<sup>3</sup> over a 90-day duration.

**Table 2-5: Summary of risk/credible scenarios for this OPEP**

Spill Risk	Hydrocarbon Type	Worst-Case Volume	Spill Level	Location of spill	VIC/P79	T/49P
Vessel Collision	MDO	350 m <sup>3</sup> surface release over 6 hours	Level 1 or 2	Commonwealth	✓	✓
LOWC	Gas Condensate	139,400 m <sup>3</sup> over a 90-day duration.	Level 2 or 3	Commonwealth	✓	✓

Note. Further details regarding volumes, locations, potential release durations and environmental impacts are detailed within the Otway Exploration Drilling Program EP.

## 2.4. Response Planning Areas

Predictive modelling was used to identify areas that may be exposed to hydrocarbons from hypothetical worst-case spill scenarios. As per NOPSEMA's Oil Spill Modelling Guidance (NOSEMA 2019) the following 'Moderate' oil exposure thresholds listed in Table 2-6 were used to identify the primary response planning areas.

**Table 2-6: Exposure value thresholds**

Floating Surface Oil		
Moderate	10 g/m <sup>2</sup> (~10,000 litres/km <sup>2</sup> )	Approximate lower limit for harmful exposures to birds and marine mammals.
Note. 50 g/m <sup>2</sup> (~50,000 litres/km <sup>2</sup> ) represents the lower limit for consideration of response planning for surface oil.		
Shoreline Oil		
Moderate	100 g/m <sup>2</sup>	Represents the minimum thickness that does not inhibit the potential for recovery and is best remediated by natural coastal processes.

Given that specific drilling locations have not yet been identified, modelling was conducted for a range of locations to represent the full extent of possible drilling locations across both operational areas. The details of the modelled locations are provided in Table 2-7.

**Table 2-7: VIC/P79 MDO and LOWC modelling release locations**

VIC/P79	Latitude	Longitude	Water depth (m)
Location 1	39° 5' 17.4" S	142° 48' 23.1" E	93
Location 2	38° 43' 20.6" S	142° 26' 35.3" E	74
Location 3	38° 5' 8.9" S	142° 5' 8.9" E	66
Location 4	38° 30' 6.4" S	142° 7' 55.5" E	45
T/49P	Latitude	Longitude	Water depth (m)
Location 1	39° 15' 46.6" S	143° 20' 26.4" E	93
Location 2	39° 47' 49.7" S	143° 30' 46.3" E	100
Location 3	40° 13' 5.3" S	143° 29' 10.9" E	114

### 2.4.1. Onshore Priority Planning Areas

Based on the modelling outputs, priority shoreline planning areas have been identified for each permit area. For planning purposes, the scenarios presented in Tables 2-8 and 2-9, and shown in Figures 2-2 and 2-3, represent the worst-case modelling outputs for shoreline loading for each permit area.

# Oil Pollution Emergency Plan

**Table 2-8: T/49P (LOWC) – Location 2**

<b>Location 2 (Stochastic - 100 runs/season)</b>	139,400 m <sup>3</sup> released over 90 days

<b>Location 4, (Deterministic) Worst Shoreline Accumulation (Winter)</b>		
<b>Total volume ashore</b>	250 m <sup>3</sup>	

**Figure 2-3: VIC/P79 Potential shoreline loading from a LOWC at Location 4, winter conditions.**

A timely and appropriate response for the identified areas for priority protection have been planned for in Section 5.3 – Shoreline Protection and Deflection and Section 5.4 – Shoreline Clean-up, of this OPEP. A series of Tactical Response Plans (TRPs) have been developed to assist in implementing a rapid response, details for implementation are outlined in the Shoreline Plan (Appendix 1).

## 2.5. Bass Strait – Environmental Conditions

The Otway Basin lies within the western portion of the Bass Strait, a sea strait separating Tasmania from the southern Australian mainland. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. This region is characterised by high winds and strong tidal currents. The following information has been drawn from the prediction modelling report (MAQ115J) generated by RPS for ConocoPhillips Australia’s proposed exploration activities.

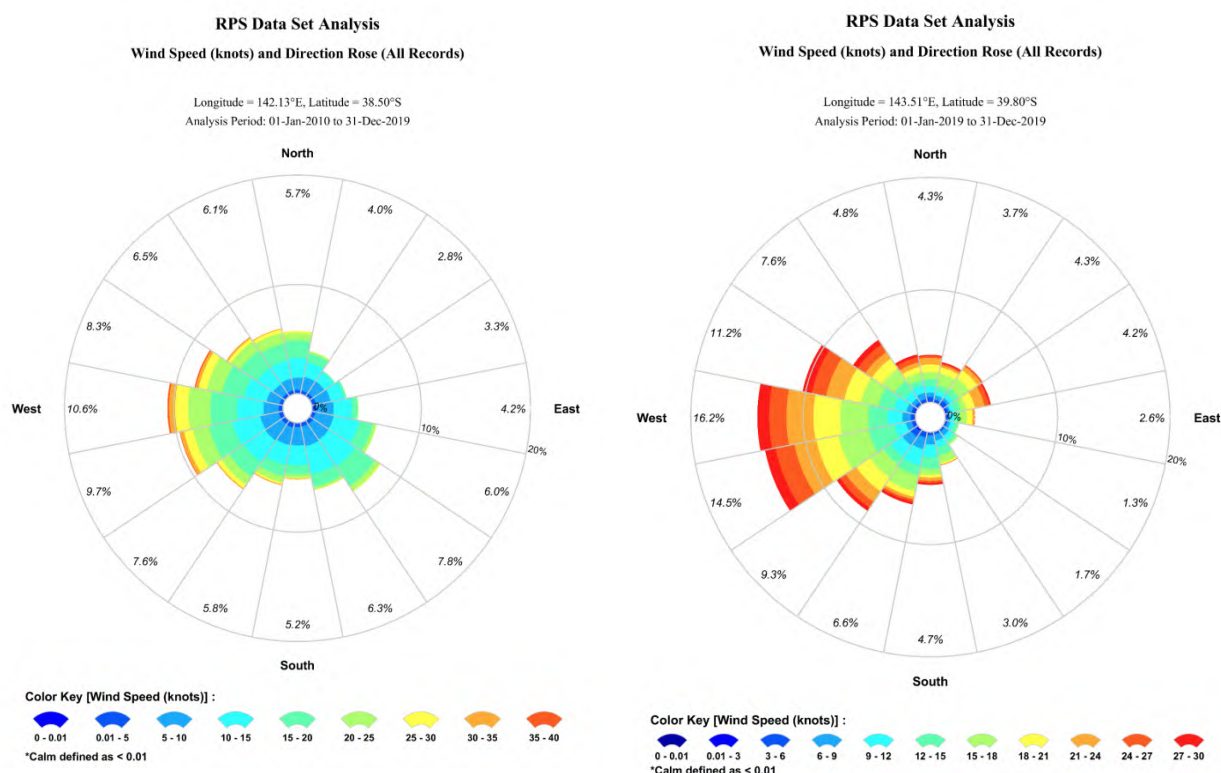

### 2.5.1. Temperature and Salinity

Monthly average sea surface temperatures range between 12.8°C (September, release location 3) and 18.4°C (March, release location 2). The monthly average salinity values remain relatively consistent ranging between 35.1 psu and 35.6 psu.

### 2.5.2. Wind

Wind speeds are predominantly 5-10 m/s year-round with stronger winds through the winter months. As per Section 2.4.1, the modelling outputs for VIC/P79 (LOWC) – Location 4 and T/49P (LOWC) – Location 2 indicated the greatest shoreline leading potential. Figure 2-4 provides the wind speed and direction roses for these locations.

# Oil Pollution Emergency Plan

VIC/P79 Potential shoreline loading from a LOWC at  
Location 4.

T/49P Potential shoreline loading from a LOWC at  
Location 2.

Figure 2-4: Wind speed and direction roses for representative locations

## 2.5.3. Current

Currents are primarily driven by tides, winds and density driven flows as follows:

- **Winter** - the South Australian current moves dense, salty water eastward from the Great Australian Bight into the western margin of the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving through the Bass Strait, and another forming the Zeehan Current off western Tasmania.
- **Summer** - water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

## 2.6. Selection of Response Strategies – Net Environmental Benefit Analysis

An analysis of the feasibility and effectiveness of available response strategies has been completed. Section 7.8 of the EP provides detailed justification statements, particularly where strategies have been considered not feasible and/or not effective.

Table 2-10 summarises the response strategies that are considered to be feasible in response to an MDO spill and gas condensate release associated with the proposed exploration activities.

# Oil Pollution Emergency Plan

**Table 2-10: Response strategy feasibility and implementation by hydrocarbon type**

Response Strategy	Hydrocarbon Type		Feasible	Implementation
	Gas Condensate	Marine Diesel Oil		
Source Control	✓	✓	Yes	Yes
Surveillance, Modelling & Visualisation (SMV)	✓	✓	Yes	Yes
Natural Dispersion	✓	✓	Yes	Yes
In-situ Burning (ISB)	x	x	No	No
Surface Dispersant	x	x	No	No
Containment & Recovery (At-sea C&R)	x	x	No	No
Shoreline Protection & Deflection (P&D)	✓	✓	Yes	Yes
Shoreline Clean-up	✓	✓	Yes	Yes
Oiled Wildlife Response (OWR)	✓	✓	Yes	Yes
Waste Management	✓	✓	Yes	Yes
Operational & Scientific Monitoring (OSM)	✓	✓	Yes	Yes

## 2.6.1. Strategic (Pre-spill) NEBA

The following information reflects good practice as outlined in the IPIECA-IOGP Guideline: Response strategy development using net environmental benefit analysis (NEBA), 2016.

NEBA is a response tool used to select spill response strategies that are feasible to use safely in particular conditions, and will minimise the impact of the spill on the environment. The aim of its use is to support the selection of an agreed strategy for oil spill response, which has been informed by a systematic assessment and evaluation of multiple factors, with input from a number of stakeholders.

The NEBA process has been undertaken at a strategic level (pre-spill) to identify pre-determined recommended response strategies. An Operational NEBA will be undertaken routinely during a response to ensure that evolving conditions are understood, and response strategies are adjusted/optimised as necessary to meet the conditions at the time and specific end points.

The NEBA process comprises four stages:

- 1) *Compile and evaluate data* to identify an exposure scenario and potential response options, and to understand the potential impacts of that spill scenario.
- 2) *Predict the outcomes* for the given scenario, to determine which techniques are effective and feasible.
- 3) *Balance trade-offs* by weighing a range of ecological, social and economic benefits and drawbacks resulting from each feasible response option.
- 4) *Select the best response options* for the given scenario, based on which combination of tools and techniques will minimise impacts.

Multiple stakeholders are involved in the NEBA process, which relies on cooperation among governments, industry and communities to ensure that informed response decisions can be made which take all perspectives and viewpoints into account. During a spill, an Operational NEBA or Spill Impact Mitigation Assessment (SIMA) is to be completed to allow for strategy validation and adjustment as conditions evolve.

Pre-spill Strategic NEBA's are presented in Table 2-11 (MDO) and Table 2-12 (Gas Condensate), with the criteria used to determine receptor sensitivity ranking included in Table 2-13. These NEBA's are to be used to identify and agree on response strategies for each identified hydrocarbon type/scenario.

# Oil Pollution Emergency Plan

**Table 2-11: Strategic NEBA – Marine Diesel**

**Table 2-13: Criteria used to determine receptor sensitivity ranking (H/M/L) in the NEBA**

Sensitivity*	Protected areas	Species status	BIA	Coastal habitat sensitivity	Receptors in the EMBA
--------------	-----------------	----------------	-----	-----------------------------	-----------------------

## Oil Pollution Emergency Plan

<b>Low</b>	No State marine protected areas. Commonwealth multiple use zones are the dominant component of protected areas.	Species is EPBC Listed, and impact expected to be limited to individuals with no population level impact. Present in the EMBA only occasionally or as vagrants, with no biologically important behaviours occurring. Populations known to recover rapidly from disturbance.	No BIA (or limited to only a few species of a particular faunal grouping).	Low sensitivity habitat, such as sandy beaches and exposed rocky shores, with rapid recovery from oiling (approximately 1 year or less). Public recreation beaches are not present or not widely used. No harbours or marinas.	<ul style="list-style-type: none"> <li>• Benthic assemblages</li> <li>• Plankton</li> <li>• Invertebrates</li> <li>• Fish</li> <li>• Sandy beaches</li> <li>• Rocky shores</li> <li>• Non-indigenous heritage</li> </ul>
<b>Medium</b>	No State marine protected areas. Little to no Commonwealth special purpose zonation.	Species may be EPBC Listed threatened or vulnerable and impact expected to be limited to individuals with no population level impact. Species may or may not be present at time of activity, however not undertaking biologically important behaviours. Some susceptibility to oiling. Populations may take a moderate time to recover from oiling.	Intersection with one or more BIAs, generally for distribution or foraging rather than breeding.	Moderately sensitive habitat present, such as sheltered rocky rubble coasts, exposed tidal flats, gravel beaches, mixed sand and gravel beaches, with a medium recovery period from oiling (approximately 2–5 years). Public recreation beaches present but not often used. No harbours or marinas.	<ul style="list-style-type: none"> <li>• Marine reptiles</li> <li>• Seabirds</li> <li>• Coastal habitats and communities</li> <li>• Some cetaceans</li> <li>• Commercial fisheries</li> <li>• Other marine and coastal users</li> <li>• Energy exploration and production</li> <li>• First Nations heritage</li> </ul>
<b>High</b>	State marine protected areas present. Commonwealth special purposes zones are the dominant component of the protected area.	Species are EPBC Listed Endangered or Critically Endangered Species known to be present at time of activity, undertaking biologically important behaviours. Known to be susceptible to oiling. Populations may take a long time to recover from oiling.	Significant intersection with one or more BIAs Notable overlap with spatially restricted BIA (e.g. breeding, nesting, migration)	Sensitive habitat present, such as mangrove, salt marshes, and sheltered tidal flats, with long recovery periods from oiling (> 5 years). Public recreation beaches present that are widely used. Busy harbours or marinas.	<ul style="list-style-type: none"> <li>• Some cetaceans</li> <li>• Pinnipeds</li> <li>• Shorebirds</li> <li>• Aquatic birds</li> <li>• State Marine Protected Areas</li> </ul>

\* Not to be confused with 'risk rating' which is based on the ConocoPhillips Risk Matrix

## 2.7. Statutory and Control Agencies

In any instance of a spill from ConocoPhillips Australia's petroleum activities, response activities should be considered to be regulated by NOPSEMA and directed by this OPEP, until such time as another control agency verifies its intention to stand up and assert control. As a response grows in size and complexity, a range of other parties and agencies may become involved, either to acquit a legislative obligation, or to provide support to a control agency as defined in Table 2-14.

**Table 2-14: Oil spill response arrangements**

Location	Spill Source	Jurisdictional Authority	Control Agency	
			Level 1	Level 2/3
Commonwealth waters (>3 NM from shorelines)	Petroleum Activity	NOPSEMA	ConocoPhillips	ConocoPhillips
	Vessel	AMSA	Vessel Owner/ Operator	AMSA
State waters (<3 NM of coastline)	Petroleum Activity	VIC DTP TasEPA	ConocoPhillips	VIC DTP/ TasEPA
	Vessel	VIC DTP TasEPA	Vessel Owner/ Operator	VIC DTP/ TasEPA or Relevant Port Authority

NOPSEMA – National Offshore Petroleum Safety and Environmental Management Authority; AMSA – Australian Maritime Safety Authority; VIC DTP – Victorian Department of Transport and Planning; TasEPA – Tasmanian Environment Protection Authority.

In all cases, for spills originating from ConocoPhillips Australia's assets and activities, ConocoPhillips Australia will facilitate the provision of resources to the control agency for their use in mitigating the consequences of the spill.

### 2.7.1. Control Agency Arrangements

The control agencies for the spill scenarios within the scope of this OPEP are detailed in Table 2-15.

**Table 2-15: Control agency and jurisdiction**

Activity	Control Agency and Jurisdiction
Vessels beyond 3 nm of the coast	<b>AMSA</b> Under the National Plan arrangements, AMSA may request that the state take control if: <ul style="list-style-type: none"><li>• The spill is likely to impact on the Victorian or Tasmanian shoreline</li><li>• AMSA personnel are in-transit to the location of the incident and/or</li><li>• It is more practical to have the state respond on behalf of AMSA.</li></ul>
Offshore petroleum activity beyond 3 nm of the coast	<b>ConocoPhillips Australia</b> Note: The state agency may provide a liaison officer within the IMT. The state agency will assume incident control for any portion of the spill that enters state waters, with ongoing support from ConocoPhillips Australia as Titleholder.

### 2.7.2. Commonwealth Arrangements

The Australian Maritime Safety Authority (AMSA) is the control agency for oil spills from vessels within Commonwealth waters. Upon notification of an incident involving a ship, AMSA will assume control of the incident and response in accordance with the National Plan for Maritime Environmental Emergencies. ConocoPhillips Australia will provide all available resources to AMSA to assist with the spill response, via the ConocoPhillips Australia Liaison Officer.

A Maritime Emergency Strategic Coordination Committee (MESCC) may be formed in the event of a significant maritime environmental emergency involving a ship within Commonwealth waters, or where the

# Oil Pollution Emergency Plan

---

Australian Government is supporting a state under the National Plan arrangements. The MESCC is led by AMSA.

An Offshore Petroleum Incident Coordination Committee (OPICC) may be formed in the event of a significant offshore petroleum incident in Commonwealth waters. The OPICC is led by the Commonwealth Department of Industry, Science, and Resources (DISR).

## **2.7.3. Victorian State Arrangements**

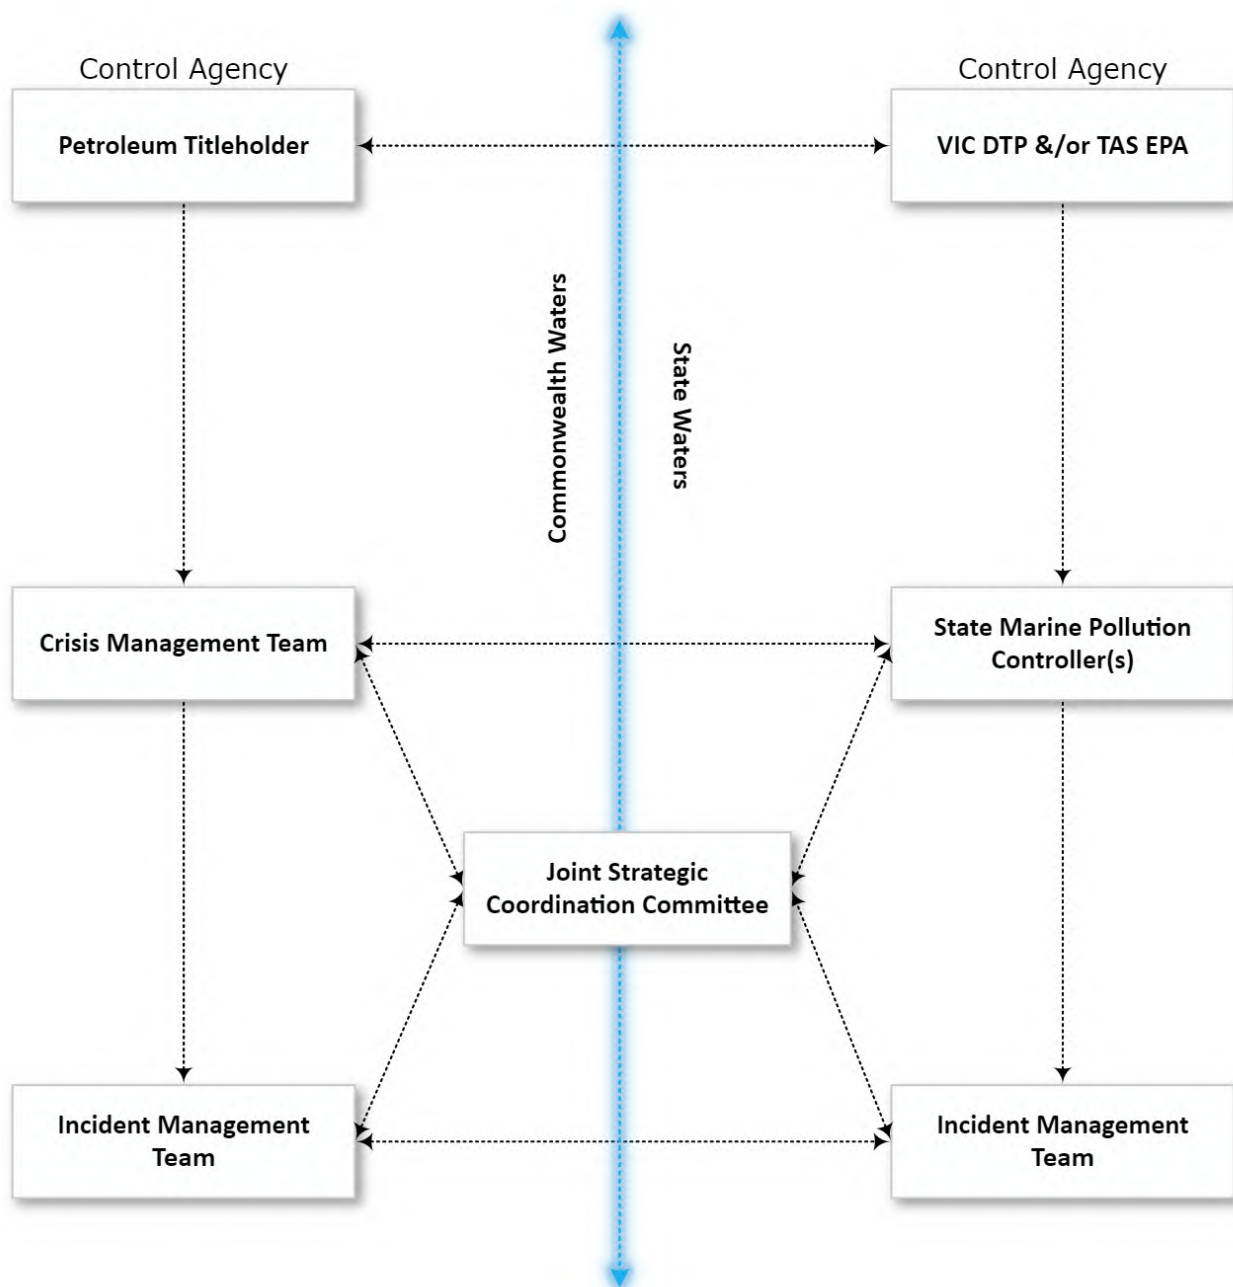

In Victoria, the Department of Transport and Planning (DTP) will assume control of response activities within 3 NM of the shoreline. ConocoPhillips Australia will maintain control of response operations for petroleum activity-related spills in Commonwealth waters and will provide available resources to the DTP to assist with the spill response, via the ConocoPhillips Australia Liaison Officer. This includes trained oil spill responders, shoreline equipment, shoreline tactical response and waste management plans and strategies. ConocoPhillips Australia will also mobilise resources as needed through the Australian Marine Oil Spill Centre (AMOSC) and the National Plan.

## **2.7.4. Tasmanian State Arrangements**

In Tasmania, the Environment Protection Authority (EPA) is the control agency (and Hazard Management Agency) for spills within 3 NM of the shoreline. ConocoPhillips Australia will maintain control of response operations for petroleum activity-related spills in Commonwealth waters and will provide available resources to TasEPA to assist with the spill response, via the ConocoPhillips Australia Liaison Officer. This includes trained oil spill responders, shoreline equipment, shoreline tactical response and waste management plans and strategies. ConocoPhillips Australia will also mobilise resources as needed through the Australian Marine Oil Spill Centre (AMOSC) and the National Plan.

## **2.7.5. Cross Jurisdictional Arrangements**

To facilitate the overarching coordination between two or more controlling agencies and their respective IMT's, a Joint Strategic Coordination Committee (JSCC) will be established similar to Figure 2-5. The JSCC will be chaired by the State Marine Pollution Controller (SMPC) and ConocoPhillips Australia's Crisis Management Team (CMT) leader. Attendees will be as deemed necessary by the chairs to ensure an effective coordinated response across jurisdictions. The role of the JSCC is to facilitate effective coordination between ConocoPhillips Australia and the State Control Agency IMTs.

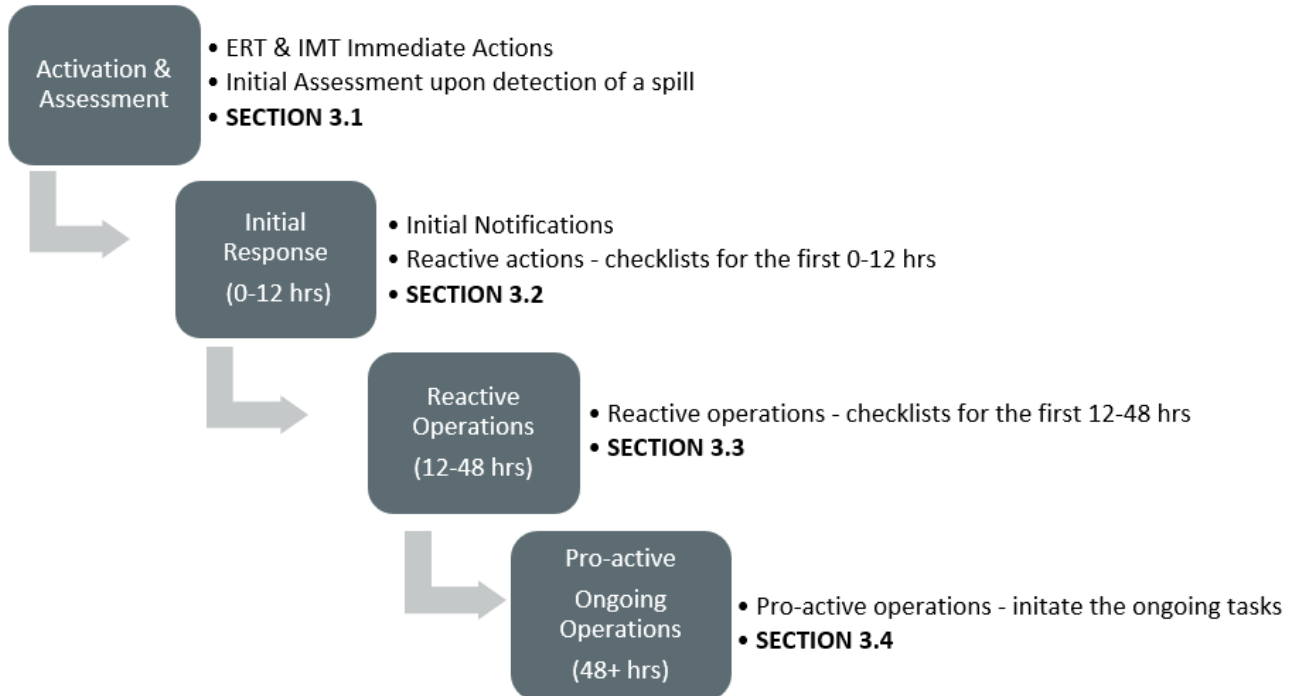

**Figure 2-5: Proposed cross jurisdictional control and coordination structure.**

Figure 2-5 is adapted from the Offshore Petroleum Industry Guidance Note – Marine Oil Pollution: Response and Consultation Arrangements, 2020.

## 3. Response Activation

The following section details the actions that ConocoPhillips Australia will undertake in the event of hydrocarbon spill resulting from the Otway Exploration Drilling Program. Figure 3-1 provides a spill response incident flowchart to guide response personnel.

**Figure 3-1: Spill response incident flowchart**

Once initiated, spill response operations should continue until termination end points and environmental performance objectives are reached for each response strategy.

### 3.1. Activation and Assessment

#### 3.1.1. Activation – Emergency Response and Incident Management Teams

Upon detection of a spill, the Offshore Installation Manager (OIM) or the Vessel Master (VM) will undertake the following actions:

- Begin a risk assessment in order to determine (and then execute) safety mitigations
- Determine the size, bearing/trajectory and fate (weathering) of the spill
- Judge the potential environmental impacts and the appropriate actions necessary to reduce those impacts
- Execute any available source control options/first-strike response actions, and
- Notify the ConocoPhillips Australia (Brisbane-based) duty Incident Commander (IC) of the incident await further instructions as to the appropriate actions to take.

The following checklist (Table 3-1) outlines the immediate actions to be completed.

# Oil Pollution Emergency Plan

**Table 3-1: OIM/VM immediate actions**

Who	What	Minimum time to implement	✓/x
Observer of Spill	Report the spill to the Offshore Installation Manager (OIM) or Vessel Master (VM).	ASAP	<input type="checkbox"/>
OIM/VM	Secure operations, assess and report damage. Isolate spill source if it is safe to do so.	ASAP	<input type="checkbox"/>
OIM/VM	Ensure that all personnel are accounted for.	ASAP	<input type="checkbox"/>
OIM/VM	Conduct a hazard assessment to determine the potential for fire, explosion, and hazardous/toxic vapours as well as to define the personal protective equipment (PPE) needed by responders.	ASAP	<input type="checkbox"/>
OIM/VM	Implement spill mitigation measures to prevent further oil from entering the water, providing it is safe to do so. Activate the Emergency Response Team (ERT) as required.	ASAP	<input type="checkbox"/>
OIM/VM	OIM/VM to initiate upward internal communications to the Duty Incident Commander. Observe and include the following information in the brief: <ul style="list-style-type: none"> <li>• Number of injuries.</li> <li>• Note ongoing immediate hazards to life (such as risk of fire or explosion).</li> <li>• Description of incident.</li> <li>• Location of the incident.</li> <li>• Status of source.</li> <li>• Time of incident.</li> <li>• People and assets involved in the incident.</li> <li>• Current field objectives/actions.</li> <li>• Details of support required from COP IMT.</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Observe and report on weather and sea states, including: <ul style="list-style-type: none"> <li>• Current/tide-stream speed, direction and period</li> <li>• Wind speed, direction and period</li> <li>• Wave height and direction</li> <li>• Swell height and direction.</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Observe and determine the spill trajectory (manual plotting), noting the speed and direction of the spill.	ASAP	<input type="checkbox"/>
OIM/VM	Observe and determine the likely spill type and volume: Is the source contained, ongoing, isolated or stopped? Provide a visual description of the slick (e.g. is it breaking up, floating, sinking, etc.) What type of spill is it (MDO, Gas Condensate)? Calculate/estimate the spill volume (refer to OSMP O1 – Oil Spill Surveillance).	ASAP	<input type="checkbox"/>
OIM/VM	Observe and note any immediate sensitivities in the area at risk from the spill. Note the presence of people, environmental sensitives (e.g. fauna, reef, etc.).	ASAP	<input type="checkbox"/>
OIM/VM	Request helicopter overflight and commence regular surveillance of the spill. Evaluate spill weathering.	ASAP	<input type="checkbox"/>
OIM/VM	Remain available to update the Offshore Incident Management Team.	Ongoing	<input type="checkbox"/>
OIM/VM	Evaluate the incident and determine the incident classification/level based on the below national plan levels (Section 3.2.1). Confirm this level with the on-call/duty Incident Commander.	ASAP	<input type="checkbox"/>
OIM/VM	Report the incident to NOPSEMA (as per Section 3.2.1).	ASAP and within 2hrs	<input type="checkbox"/>

# Oil Pollution Emergency Plan

Once the Duty IC has been notified of the spill, go to Table 3-2: IMT Immediate Actions

**Table 3-2: Incident Management Team (IMT) immediate actions**

Who	What	Minimum time to implement	✓/x
IC	Establish communications with the Offshore Installation Manager (OIM) or Vessel Master (VM) to obtain situational awareness briefing and determine the next steps. Confirm the following details with the field-based team: <ul style="list-style-type: none"><li>Incident details – what happened?</li><li>What are the current field operations?</li><li>What are the immediate incident objectives and priorities?</li><li>What support is required from the COP IMT in order to execute the immediate objectives?</li></ul>	ASAP	<input type="checkbox"/>
IC	Activate the COP IMT and then: <ul style="list-style-type: none"><li>Provide an initial incident briefing to the IMT.</li><li>Commence the incident action-planning process.</li><li>Commence the size-up of the incident.</li><li>Establish incident response aim and objectives and offer support to the affected facility.</li><li>Begin working to meet incident and oil spill response objectives.</li></ul>	< 60 mins	<input type="checkbox"/>
IC	Notify the Crisis Manager of the incident and request Crisis Management Team (CMT) support as required.	ASAP	<input type="checkbox"/>
IC	Notify Health, Safety and Environment (HSE), Governance and External Affairs (GEA) and Security of the incident.	ASAP	<input type="checkbox"/>
IC	In conjunction with the Planning Section Chief (PSC), Environmental Unit Lead (EUL) and the HSE and Security team, determine and confirm the appropriate response level. Use the <i>Response Level Assessment Table 3-3</i> below to drive this process.	4 hours	<input type="checkbox"/>
IC, PSC and OSC	In conjunction with the PCS and Operations Section Chief (OSC) determine the response required of COP: <ul style="list-style-type: none"><li>Stand down – no spill/no oil left.</li><li>Level One – monitoring of site-based response until completion.</li><li>Level Two or Three – significant field and IMT escalation with significant additional resources required.</li></ul>	5 hours	<input type="checkbox"/>
Once Activation and Initial Actions are completed, move on to Section 3.2.1.			

## 3.1.2. Spill Classification - Response Level Assessment

Under the NatPlan (AMSA, 2020), marine hydrocarbon spills and their response requirements are categorised into three levels, based on a combination of factors:

- The known or inferred spill size, scale and complexity
- The likely fate of the spill
- Environmental, socio-economic and cultural values likely to be impacted, and
- The available resourcing levels as needed to mitigate consequences, and level of support/escalation required.

The NatPlan identifies three levels of incidents as follows:

- Level 1** – Incidents are generally able to be resolved through the application of local or initial resources only (e.g. first-strike capacity)
- Level 2** – Incidents are more complex in size, duration, resource management and risk and may require deployment of jurisdiction resources beyond the initial response, and

# Oil Pollution Emergency Plan

---

- **Level 3** – Incidents are generally characterised by a degree of complexity that requires the Incident Controller to delegate all incident management functions to focus on strategic leadership and response coordination and may be supported by national and international resources.

In the event of a spill occurring where effective response is considered beyond the immediate response capabilities (i.e. a spill above Level 1), the response will be escalated immediately to the next level.

Table 3-3 summarises the hydrocarbon spill level response models adopted for this OPEP, as per NatPlan Guidance. On the basis of the information gathered by the ERT/IMT, a spill level is to be determined using the following indicators defined in Table 3-3.

**Table 3-3: Response level assessment**

Criteria	Level One Indicator	Level Two Indicator	Level Three Indicator
<b>Location</b>	Incident area only	One or two incident areas	Multiple incident areas
<b>Complexity</b>	Response is managed by control agency IMT	Medium	High
<b>Duration</b>	Less than or a single shift	Multiple shifts	Protracted response
<b>Spill status</b>	Little or no potential for escalation	Escalation required	Declared state of emergency/disaster
<b>Impact</b>	Little or no impact	Medium impact	Major impact
<b>Resources</b>	Single or limited multi-agency response Locally sourced resources	Multi-agency response Local and State sourced resources	Multi-agency response Local, State and Nationally sourced resources

# Oil Pollution Emergency Plan

## 3.2. Initial Response (0-12hrs)

### 3.2.1. Notifications

Once a spill has occurred, internal and regulatory notifications are to be made in accordance with the following requirements outlined in Table 3-4 for vessel spills (MDO) and Table 3-5 for a LOWC event.

**Table 3-4: Notification requirements for a vessel spill (MDO)**

MDO Spill – Vessel Operations				
From	To	Timing	Complete	Notes
Vessel Master/ Client Rep	COP Duty Manager Ph: As per IMT Duty Roster	ASAP	<input type="checkbox"/>	
Vessel Master	AMSA <ul style="list-style-type: none"> <li>Verbally via phone Ph: +61 02 6230 6811 or 1800 641 792</li> <li>Written Web: <a href="https://amsa-forms.nogginoca.com/public/">https://amsa-forms.nogginoca.com/public/</a></li> </ul>	<ul style="list-style-type: none"> <li>Verbally: Immediately</li> <li>Written POLREP: ASAP (Appendix 7)</li> <li>SITREPs (Appendix 6): As Requested</li> </ul>	<input type="checkbox"/>	
Vessel Master	State and Port Authorities (if in or threatening state waters) <b>VICTORIA</b> <ul style="list-style-type: none"> <li>Port of Portland (SA Border to Cape Otway) Ph: +61 3 5525 2450</li> <li>Ports Victoria (Cape Otway to Southeast Point of Wilsons Promontory) Ph: +61 3 9644 9745</li> <li>Gippsland Ports (Southeast Point of Wilsons Promontory to NSW Border) Ph: +61 408 185 591</li> <li>Port of Hastings Duty Officer Ph: +61 437 645 026</li> <li>Level 2/3 Incidents to Vic DoT State Duty Officer Ph: +61 409 858 715</li> </ul> <b>TASMANIA</b> <ul style="list-style-type: none"> <li>Tasmania EPA (TasEPA) Ph: 1800 005 171</li> </ul>	ASAP	<input type="checkbox"/>

# Oil Pollution Emergency Plan

## 3.2.2. Reactive Actions – Level 1 Checklists for 0-12 hrs

The reactive actions relevant to the first 12 hours of a Level 1 incident are provided in Table 3-6. The responsible IMT function is listed – see description below for functional role clarification.

**Table 3-6: Reactive Actions: Level 1 - 0-12-hour actions**

Who	What	Minimum time to implement	✓/x
IC	Ensure all necessary regulatory notifications have been made.	12 hours	<input type="checkbox"/>
IC	Commence the planning cycle (the 'stem' of the planning 'P'): Establish incident aim and objectives Determine appropriate initial strategies and tactics to achieve objectives.	ASAP – <2 hours	<input type="checkbox"/>
OPS	If the source is not controlled, establish a Source Control Branch to develop and implement the Source Control Plan.	ASAP	<input type="checkbox"/>
OPS	Undertake aerial surveillance: <ul style="list-style-type: none"> <li>Deploy surveillance by contracted aircraft.</li> <li>Initiate mobilisation of a trained aerial observer – COP or AMOSC.</li> <li>Obtain photographs or video footage.</li> <li>Obtain completed aerial observer's report and pass to the PSC/SITL.</li> </ul>	ASAP, then 2x daily	<input type="checkbox"/>
OPS	Deploy a regular watch of the affected asset(s)/vessel – confirm heading/changes to the situation.	ASAP then by reporting exception.	<input type="checkbox"/>
LOG	Confirm the location of aerial and marine assets currently contracted to COP.	4 hours	<input type="checkbox"/>
PLA	Initiate specific elements of OM01 of OSMP, including tasks below (Table 4-13)	ASAP	<input type="checkbox"/>
PLA	Monitor and predict weather and sea states: Consult meteorology services to determine water current and wind speed data, either from <a href="http://www.bom.gov.au">http://www.bom.gov.au</a> or <a href="http://www.marineweather.net.au">http://www.marineweather.net.au</a>	4 hours	<input type="checkbox"/>
PLA	Conduct a manual forecast of the spill trajectory: Determine the direction of the spill. Determine if the spill is likely to cross into state waters, impact shorelines and/or impact other sensitivities.	4 hours	<input type="checkbox"/>
PLA	Activate third-party trajectory modelling of the spill trajectory: Organise oil-spill trajectory modelling via AMOSC/RPS (if not already done – see Table 3-5)	4 hours	<input type="checkbox"/>
SIT	Establish a common operating picture – Display overflight, OSTM/manual vectoring data, spill location, assets deployed to spill site	4 hours	<input type="checkbox"/>
PLA	Prepare and disseminate SITREPs (Appendix 6) as more information becomes available. (Frequency to be dictated by IC)	Ongoing	<input type="checkbox"/>
PLA	Identify potential exposed environmental sensitivities based on spill trajectory, consult the NEBA (Section 2.6.1), and develop an Incident Action Plan of spill response strategies, including a spill-specific NEBA.	12 hours	<input type="checkbox"/>
<b>Once these actions are complete, move to Section 3.3 of this plan.</b>			

IC – Incident Commander; OPS- Operations Section; LOG – Logistics Section; PLA - Planning Section; SIT – Situation Unit

# Oil Pollution Emergency Plan

## 3.2.3. Reactive Actions – Level 2/3 Checklists for 0-12 hrs

The reactive actions relevant to the first 12 hours of a Level 2/3 incident are provided in Table 3-7. The responsible IMT function is listed – see description below for functional role clarification.

**Table 3-7: Reactive Actions: Level 2/3 – 0-12 hours actions**

Who	What	Minimum time to implement	✓/x
IC	Seek alignment on incident priorities from the CMT.	ASAP	<input type="checkbox"/>
IC	Confirm all necessary regulatory notifications have been made.	<2 hours	<input type="checkbox"/>
IC	Commence the planning cycle (the 'stem' of the planning 'P'): Establish the incident response aim and objectives. Determine appropriate strategies and tactics to achieve objectives.	ASAP – <6 hours	<input type="checkbox"/>
IC	Establish full, Brisbane-based COP IMT.	<2 hours	<input type="checkbox"/>
IC	Establish a line of communications with the State IMT and exchange Liaison Officers.	<2 hours	<input type="checkbox"/>
IC	Establish a line of communication with AMSA, NOPSEMA and OPICC. Facilitate integration of relevant liaison officers.	<2 hours	<input type="checkbox"/>
IC	Initiate the activation of the ConocoPhillips GIMAT.	<24 hours	<input type="checkbox"/>
OPS	If the source is not controlled, establish a Source Control Branch to develop and implement the Source Control Emergency Response Plan (SCERP).	ASAP	<input type="checkbox"/>
OPS	Undertake aerial surveillance: <ul style="list-style-type: none"> <li>Initiate aerial surveillance using contracted aircraft.</li> <li>Initiate the mobilisation of a trained aerial observer – COP or AMOSC.</li> <li>Obtain photographs and video footage of the incident.</li> <li>Obtain a completed aerial observer's report and pass to the PSC/SITL.</li> </ul>	ASAP, then twice daily	<input type="checkbox"/>
OPS	Deploy a twice-daily vessel observation - confirm heading/changes to the situation.	ASAP then by reporting exceptions.	<input type="checkbox"/>
OPS	On the advice of the Drilling Engineer/Source Control Branch, mobilise the Subsea First Response Toolkit (SFRT) via AMOSC.	4 hours	<input type="checkbox"/>
LOG	Confirm the location of aerial and marine assets currently contracted to COP. Confirm the location and availability of vessels of opportunity in VIC/TAS.	<3 hours	<input type="checkbox"/>
LOG	Request that 3 x AMOSC Technical Advisors come to the site (IMT) and that 3 x AMOSC Operations Officers are deployed to support field operations (Aviation/Shoreline). Request that AMOSC undertake the call-out of CG resources. Request the mobilisation of additional satellite tracking buoys (if required). Discuss potential equipment and service needs (spill-type specific) with AMOSC to support shoreline response operations.	<3 hours	<input type="checkbox"/>
LOG	Notify the Aviation FOB of the need to conduct spill response operations and prepare area.	<6 hours	<input type="checkbox"/>
LOG	Notify waste contractors to prepare for potential liquid, and solid wastes – specific amounts and types to be determined.	<12 hours	<input type="checkbox"/>
PLA	Initiate specific elements of OM01 of OSMP, including the tasks below.		
PLA	Monitor and predict weather and sea states: Consult meteorology services to determine water current and wind speed data, either from <a href="http://www.bom.gov.au">http://www.bom.gov.au</a> or <a href="http://www.marineweather.net.au">http://www.marineweather.net.au</a>	4 hours	<input type="checkbox"/>
PLA	Conduct ADIOS2 forecasting of oil weathering and conduct manual vectoring of the spill trajectory, as follows: <ul style="list-style-type: none"> <li>Determine the direction of the spill.</li> <li>Determine if the spill is likely to cross into state waters or shorelines or if it might impact other sensitivities.</li> </ul>	4 hours	<input type="checkbox"/>
PLA	Activate third-party trajectory modelling of the spill trajectory:	4 hours	<input type="checkbox"/>

# Oil Pollution Emergency Plan

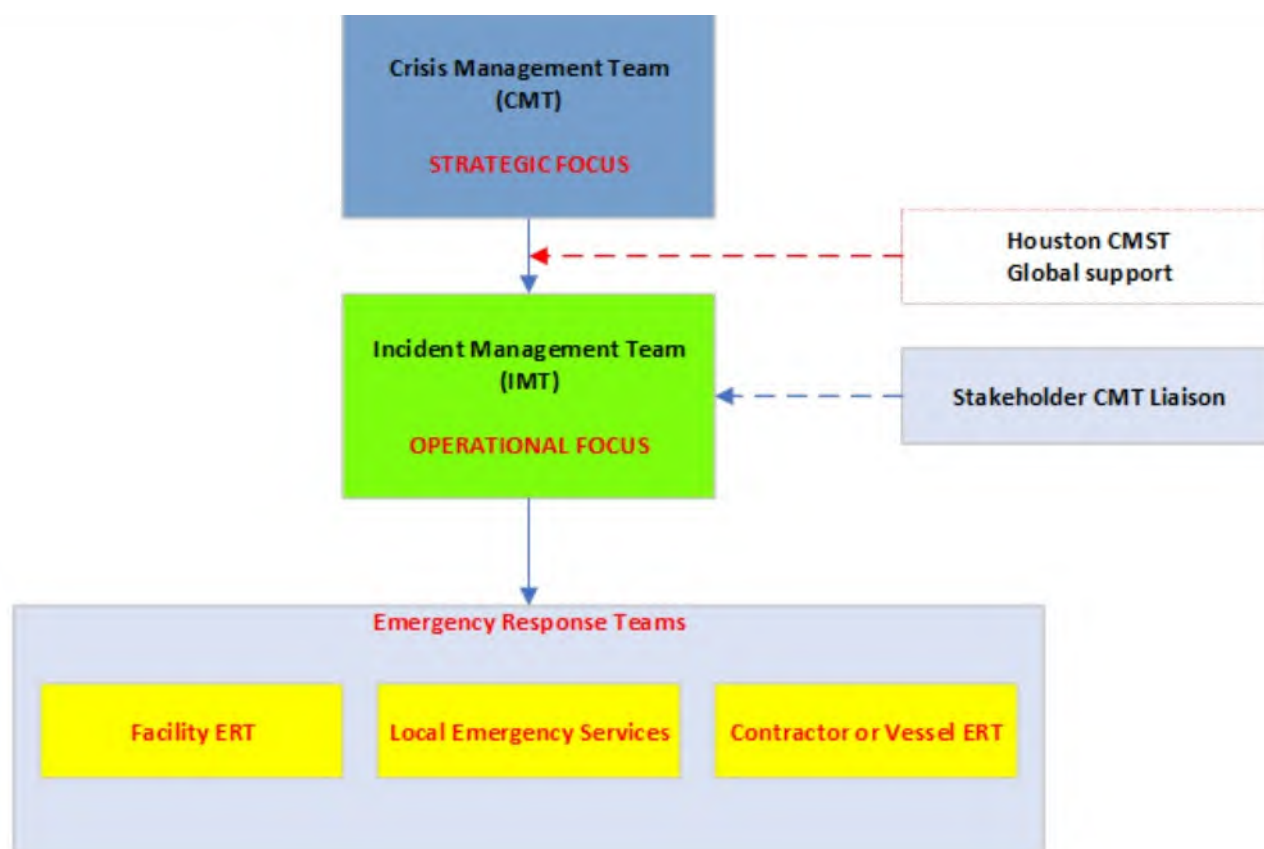

Who	What	Minimum time to implement	✓/x
	Organise oil-spill trajectory modelling via AMOSC/RPS (if not already done – see Table 3-5)		
PLA	Establish a common operating picture – Display overflight, OSTM/manual vectoring data, spill location, assets deployed to spill site	4 hours	<input type="checkbox"/>
PLA	Prepare and disseminate SITREPs (Appendix 6) as more information becomes available. (Frequency to be dictated by IC)	Ongoing	<input type="checkbox"/>
PLA	Identify potential exposed environmental sensitivities based on spill trajectory, consult the NEBA (Section 2.6.1), and develop an Incident Action Plan of spill response strategies, including a spill-specific NEBA (ref OPEP 7.5).	ASAP	<input type="checkbox"/>
EU	Activate OSMP modules OM01, OM02, OM03, OM04, OM05 and OM06, as relevant to the incident (Table 4-13).	ASAP	<input type="checkbox"/>
EU	Liaise with the relevant state government Environment & Scientific Support Coordinator if it is anticipated that state waters or shorelines will be impacted.	6 hours	
EU	Assess the need for and coordinate the development of specific plans, including the following: <ul style="list-style-type: none"> <li>Wildlife Management Plan</li> <li>SCAT Plan</li> </ul> Monitor the environmental consequences of any actions. Participate in the development of plans for the next operational period.	12 hours	<input type="checkbox"/>
<b>Once these actions are complete, move to Section 3.3 of this plan.</b>			

IC – Incident Commander; OPS- Operations Section; LOG – Logistics Section; PLA - Planning Section; EU – Environment Unit

## 3.3. Reactive Operations (12-48 hrs)

### 3.3.1. Emergency Management Structure

Following the immediate action and assessment process, ConocoPhillips Australia will establish an Emergency Management structure proportionate to the scale of the incident, in line with Figure 3-2 as per the ConocoPhillips Australia Business Unit (ABU) Crisis and Incident Management Plan (CIMP).

**Figure 3-2: Crisis, incident and emergency management interface arrangements**

The emergency management structure includes the Crisis Management Team (CMT), Incident Management Team (IMT) and Emergency Response Teams (ERT). Further details are provided below.

### 3.3.2. Crisis Management Team (CMT)

The CMT (Figure 3-6), under the leadership of the Crisis Manager, is responsible for managing the consequences of an incident for ConocoPhillips Australia at an enterprise level and involves the strategic, business interruption impacts, legal, reputation and the highest-level organisational liaison aspects of a crisis event.

This involves developing an integrated strategic management approach to manage the consequences of the incident for:

- Public Information and stakeholder relationships directly related to our operating Facilities
- Business continuity impacts, and
- Legal considerations.

# Oil Pollution Emergency Plan

ABU CMT primary objectives are to:

- Consider the business continuity, strategic, legal and public image consequences of the incident for the ABU
- Attend to public media issues relating to the operating facilities
- Develop a Crisis Management plan to coordinate all actions
- Communicate with internal and external stakeholders that relate directly to ABU operations
- Comply with applicable regulatory requirements, and
- Notify ConocoPhillips Australia Crisis Management and Emergency Response – Houston as appropriate.

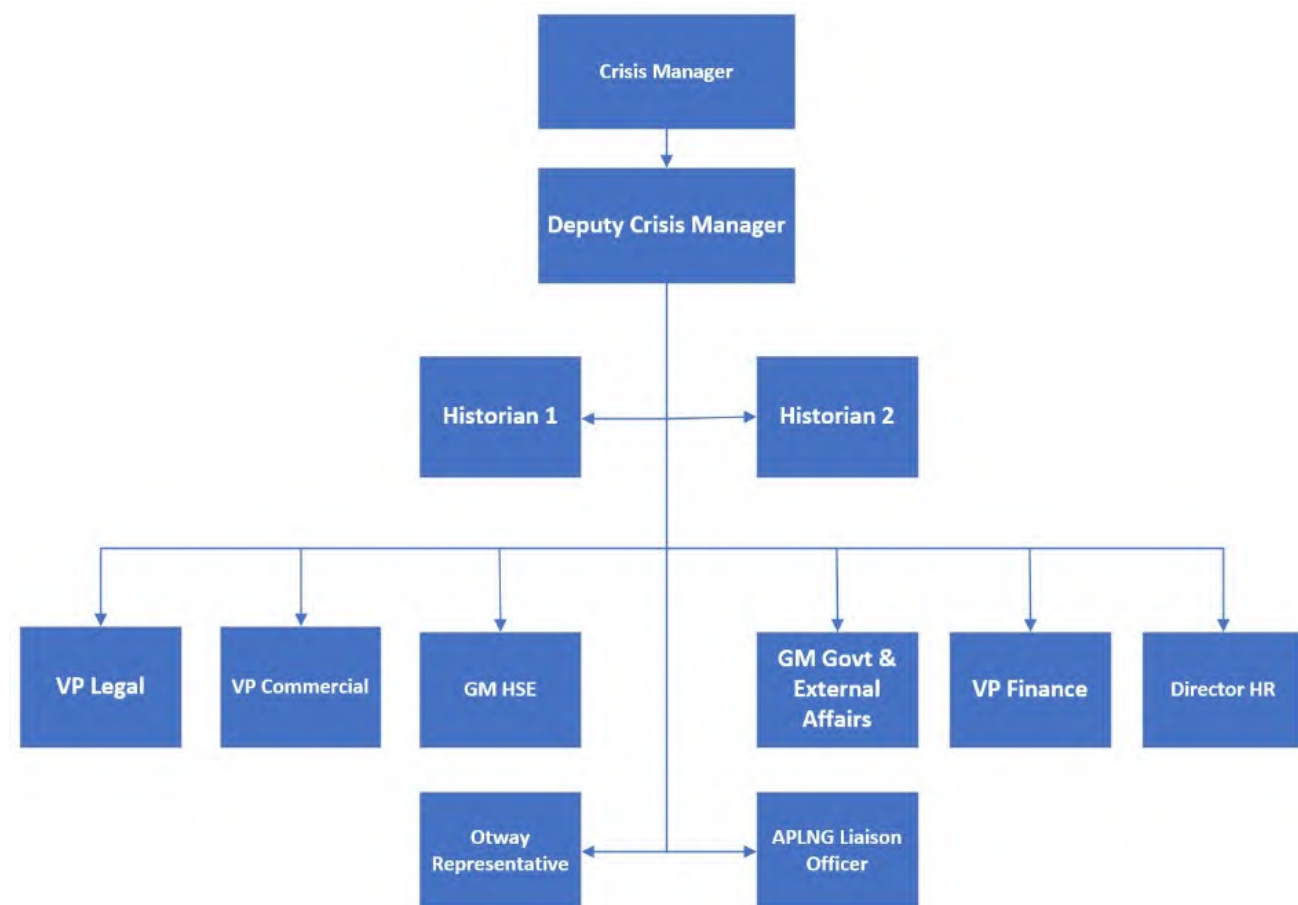

Figure 3-3: CMT structure

### 3.3.3. Incident Management Team (IMT)

ConocoPhillips Australia will mobilise an appropriate IMT guided by Figure 3-4 and Figure 3-5. The IMT, under the leadership of the Incident Commander (IC) provides support via technical expertise, the development of operational strategies and plans, and provision of resourcing for these operations.

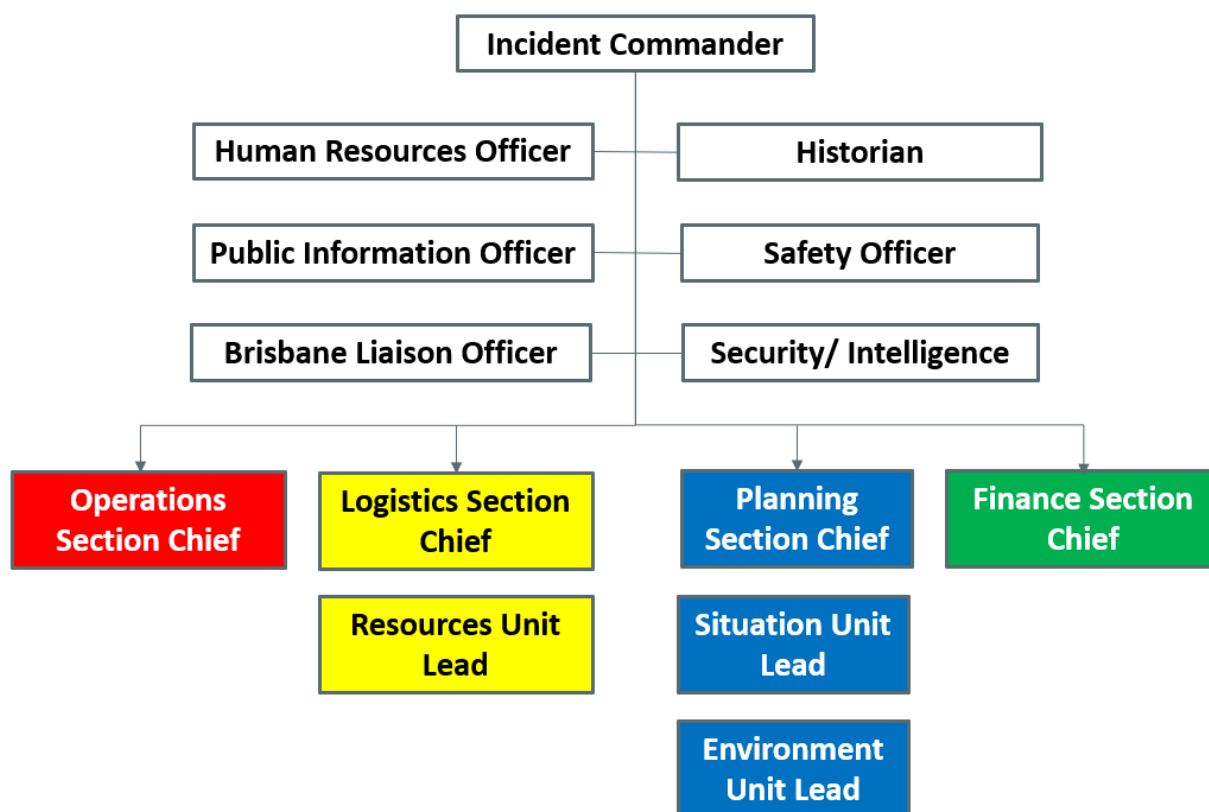

Figure 3-4: IMT structure – localised response activities.

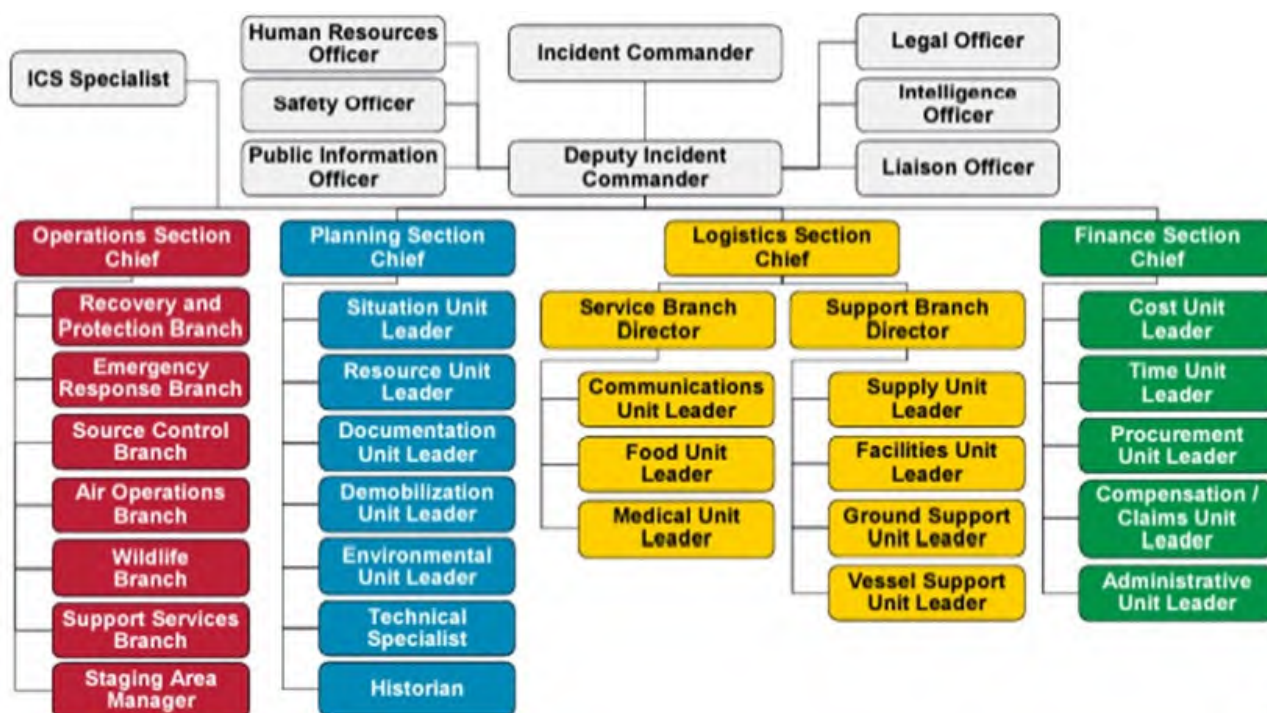

Figure 3-5: Expanded IMT structure

# Oil Pollution Emergency Plan

## 3.3.4. Additional Organisational Support

Further support for managing emergency events, the Crisis Manager can request assistance via:

- Crisis Management Support Team (CMST), and
- Global Incident Management Assist Team (GIMAT) - a specialist incident management team. Members are located globally and can be readily mobilised to support a business unit IMT that has exceeded its capacity to manage effectively.

## 3.4. Roles and Responsibilities

ConocoPhillips Australia's IMT Functional Roles and overall outputs/outcomes are outlined in Table 3-8.

IMT personnel should use their relevant role checklists throughout a response. These are available in the ABU Crisis and Incident Management Plan (ABUE-450-HS-N05-C-00119) and ConocoPhillips Incident Management Handbook.

**Table 3-8: IMT roles and responsibilities**

Function	Sub/Function	Outputs	Outcomes
Incident Commander (IC)	Control	Safe and efficient response structure and organisation.	A response is put in place that meets the requirements of the OPEP. People and processes in place that meets the above.
	Safety	Draft the development of a plan that assesses and manages the safety risk of the response.	Safety risks assessed and mitigation plans/processes in place
	Liaison Officers	External/pubic/stakeholder affairs are managed.	Key stakeholders (government, regulatory and community) are informed of the incident and have their concerns acknowledged and addressed by the response organisation.
Planning (PLA)	Planning	Drive the planning process that develops the IAP. Tracking resources. Provide Intelligence/Enviro function.	Response planning and 'thinking' that fits best the scenario (oil type, weather, fates, locations, sensitivities), to most effectively cleans up oil.
	Environmental Unit	Oil Spill Preparedness and Response (OSPR) strategies are tactically implemented consistent with good global practice, accounting for the net benefit of each strategy. Assessment of environmental risk.	Daily NEBA analysis. Analysis of the resources at risk. Deployment of OSPR SME and technical advice into the EMT.
	Situation Unit	Development and maintenance of the Common Operating Picture for the IMT (including trajectory/forecasting).	Maintaining the Common Operating Picture to maintain situational awareness. Maintenance and operation of GIS capability
Operations (OPS)		Run the operations in the field. Provide technical input to the production of the next operational period IAP. Draft the daily operational orders for each field team. Provide tech input to the safety plans.	Run the current operations in the field – the execution of the IAP for that operational period.
Logistics (LOG)		Acquire resources and materials that match the operations. Ensure resources are serviced and maintained to required specifications.	Fit for purpose resources are where they need to be at the right time.
Finance (FIN)		Tracks all costs and provides financial oversight consistent with the control agency requirements.	Financial and administrative management process in place for the response.

## 3.5. Reactive Operations

Once the IMT is established, Section 4 – Response Strategies should be used to assist each IMT functional area to execute tasks in support of the identified spill response strategies.

OPEP section references for each response strategy are outlined in Table 3-9.

**Table 3-9: Response strategy – OPEP section reference**

Response Strategy	Relevant Section
Source Control	Section 4.1
Surveillance, Modelling & Visualisation (SMV)	Section 4.2
Shoreline Protection & Deflection (P&D)	Section 4.3
Shoreline Clean-up	Section 4.4
Oiled Wildlife Response	Section 4.5
Waste Management	Section 4.6
Operational & Scientific Monitoring (OSM)	Section 4.7

The goal of the IMT is to implement reasonable and proportionate oil spill response strategies until such a time as the oil spill response may be terminated (Section 4.8).

This can be achieved by implementing the following response planning process (Figure 3-7):

### 1. Reactive Phase: Activate OPEP:

Assessing the situation, making informed decisions based on the situation and the oil spill priorities (and strategies) outlined in this OPEP.

### 2. Reactive → Pro-active Phase:

Developing an Incident Action Plan (IAP) that outlines the objectives, strategies, tactics, tasks and supporting resources that will have the greatest chance of success to meet the overarching aim of the response.

### 3. Pro-active Phase:

Implementing the IAP. Reviewing the chosen strategies for success, modification and/or continuance. The IAP should be considered the 'project plan' for the oil spill, which should be regularly reviewed and updated, consistent with the situation at the time.

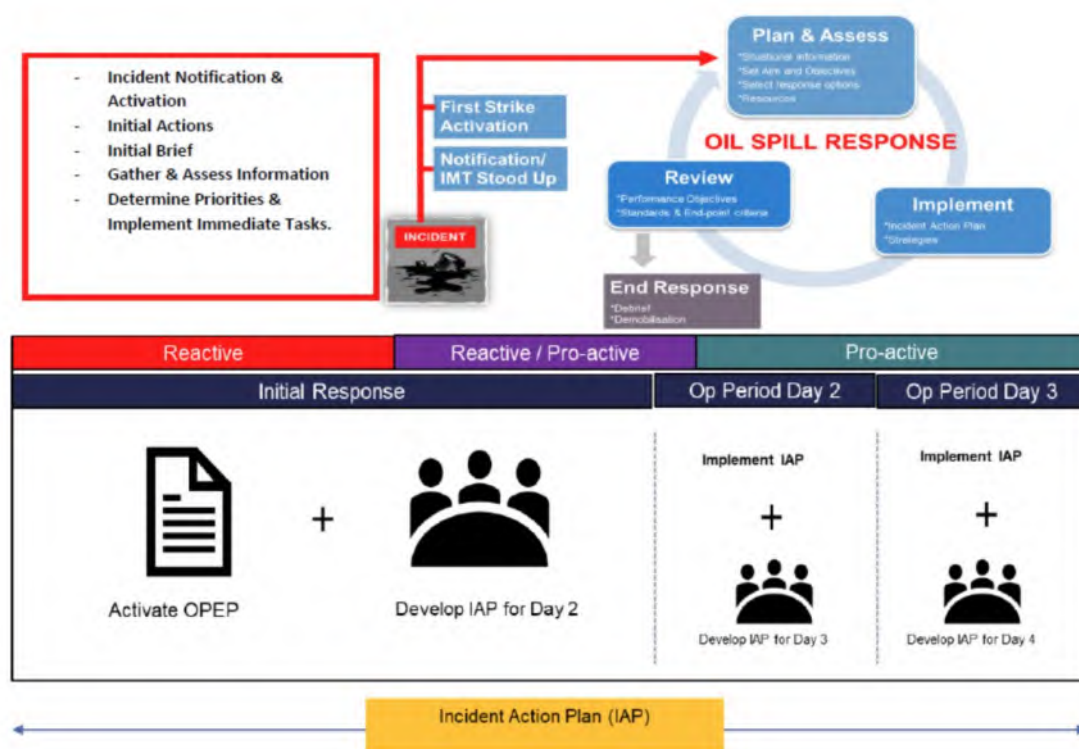

Figure 3-6: AMOSC guide: Action planning process

## 3.6. Pro-active Ongoing Actions (48+hrs)

### 3.6.1. Incident Management System (IMS)

ConocoPhillips Australia uses the Incident Control System (ICS) as its internal Incident Management System. ICS is compatible with the Australian Inter-agency Incident Management System (AIIMS) adopted by Australian Government agencies under the National Plan.

The ABU Crisis and Incident Management Plan (ABUE-450-HS-N05-C-00119) and ConocoPhillips Incident Management Handbook should be used in conjunction with this OPEP to implement the Incident Action Plan process.

### 3.6.2. ICS Operational Planning Cycle

The ICS Operational Planning Cycle should be used to develop and present a safe and effective Incident Action Plan (IAP) for each operational period of an incident.

The response phases of this OPEP are aligned with the phases mapped in Figure 3-8 below.

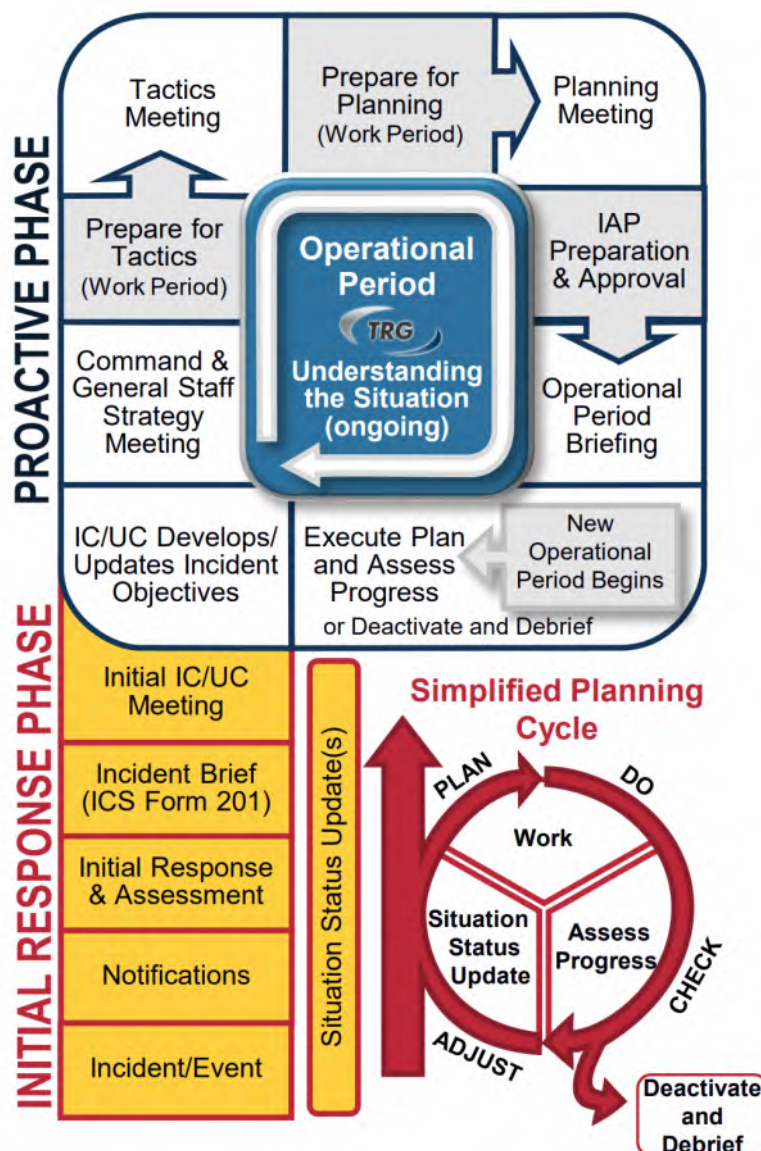

Figure 3-7: COP Incident Management Handbook – Response phases.

For each operational period, the IMT should progress through the pro-active phase of the planning cycle using the daily briefing and meeting schedule outlined in Figure 3-8.

MEETING / BRIEFING	APPROX TIME-FRAME	FACILITATOR	ATTENDEES
<b>IC/UC Develops/ Updates Incident Objectives</b>	30 Minutes	IC/UC or PSC (If available)	IC/UC, SOFR, OSC, PSC, DOCL, SITL and ICS Specialist (optional)
<b>Command and General Staff/Strategy Meeting</b>	45 Minutes	PSC	IC/UC, SOFR, LOFR, PIO, OSC, FSC, LSC, ISC, SITL, DOCL and ICS Specialist (as needed)
<b>Tactics Meeting</b>	1 Hour	PSC	OSC, LSC, FSC, RESL, SITL, ENVL, SOFR, COML, DOCL, ICS Specialist, and Technical Specialists (as needed)
<b>Planning Meeting</b>	45 Minutes	PSC	IC/UC, SOFR, LOFR, PIO, OSC, FSC, LSC, ISC, SITL, DOCL, RESL, ENVL, COML, THSP and ICS Specialist
<b>Operations Period Briefing</b>	30 Minutes	PSC or OPBD, DIVS, Task Force/Strike Team Leader	IC/UC, SOFR, LOFR, PIO, OSC, FSC, LSC, ISC, OPBD, SITL, DOCL, RESL, ENVL, COML, DIVS, STAM, THSP, Task Force/Strike Team Leaders, field personnel, ICS Specialist and others as appropriate
<b>Execute Plan and Assess Progress</b>	8+ Hours	Unified Command and Section Chiefs	IC/Unified Command, Command Staff, General Staff

**Figure 3-8: COP Incident Management Handbook – Pro-active phase daily meeting schedule**

### 3.6.3. Incident Action Plan (IAP)

An IAP will be developed for each operational period. It is derived by an assessment of the situation and outlines the preferred course of action.

The IAP provides;

- A summary of incident details and critical situational information
- Clear direction via the incident priorities, aim and objectives
- Includes a comprehensive listing of the strategies, tactics, tasks and resources, and
- Supporting documentation including safety, communication, waste, operational sub-plans.

The ICS planning process requires a suite of ICS forms to be completed as part of the IAP development. These are available via ConocoPhillips' Incident Action Plan software. Passwords for IAP access are provided to each IMT member.

**PLA**

The Planning Section Chief is responsible for coordinating the development of the IAP and the Incident Controller is required to approve the IAP prior to dissemination for implementation.

## 4. Spill Response Strategies

The following sections describe each of the spill response strategies that ConocoPhillips Australia will put in place where applicable to the incident.

### 4.1. Source Control

Well intervention, subsea infrastructure repairs and vessel salvage will be used as appropriate to the source of the spill to control and cease the uncontrolled flow of hydrocarbons into the environment.

#### 4.1.1. Response Activities

Depending on the circumstances, the following options will be followed:

**Vessel salvage:** Vessel source control actions are those in accordance with the vessel's Shipboard Oil Pollution Emergency Plan (SOPEP) or Shipboard Marine Pollution Emergency Plan (SMPEP) relevant to vessel class, and dependent on the scenario type. It may include transfer of the fuel from the damaged tank to another vessel and repairing the tank. ConocoPhillips Australia will provide support to ensure appropriate salvage operations.

**Wells/drilling:** The proposed strategy for dealing with a source control event is (in order of activation and assuming failure of the previous action):

- Activate the emergency Blow Out Preventer (BOP)
- Activate an Independent Well Control Device (IWCD) if engineering proves feasible (ram that has an independent control system that can be installed within the BOP or between the wellhead and BOP)
- Undertake ROV intervention of the existing BOP if safe to do so
- Drill a relief well

All wells/drilling source control operations will be done in accordance with the Otway Exploration Drilling Program Source Control Emergency Response Plan (SCERP).

Emergency BOP activation involves delivering hydraulic fluid to the BOP stack using an ROV to mitigate any problems that may have arisen with the BOP control system in a loss of well control event.

Independent Well Control Device activation involves the remote activation of specialist pre-installed (prior to activity commencement) well control equipment which sits within or below the BOP ram and uses hydraulic pressure to seal off the well and stop the flow of hydrocarbons.

The drilling of a relief well provides an opportunity to permanently kill and secure the well. A relief well is drilled to intersect the compromised well bore above the blowout location. Weighted drill fluid is pumped down the relief well at high rates to kill the existing well. This requires the mobilisation of another suitable MODU, or safe relocation of the existing MODU, to the relief well location.

#### 4.1.2. Response Resources

A detailed list of the resources required to support the source control strategy outlined above are provided in the SCERP.

#### 4.1.3. Environmental Risk Assessment (Source Control)

An assessment of potential environmental impacts and risks associated with source control techniques is undertaken as part of the Otway Exploration Drilling Program EP Section 7.8.

## 4.2. Surveillance, Modelling and Visualisation (SMV)

Surveillance, Modelling and Visualisation (SMV) is a critical tool in the spill response hierarchy. It informs the understanding of the behaviour and trajectory of a hydrocarbon spill, improving the understanding of the potential for environmental harm, and therefore the response strategies that should be put in place. SMV involves:

### Surveillance:

- Aerial Surveillance (Spill size estimation, quantification, See Appendices 11 and 12),
- Vessel/marine Surveillance,
- Satellite Tracking Drift Buoys (Spill movement and behaviour).
- Satellite photography

### Modelling:

- Manual Vector Calculations (100% current, 3% wind)
- Oil Spill Trajectory Modelling (OSTM) (request form in Appendix 4)
- Oil Fate Prediction (ADIOS or GNOME).

### Visualisation:

Refers to presenting the collated information on an electronic platform such as a GIS system (developing a Common Operating Picture), in such a way as to help the IMT and IC make informed decisions surrounding response strategies, daily taskings and resource requirements. Typical status boards are listed in Appendix 5.

### 4.2.1. Response Activities

Table 4-1 provides key information required to implement the SMV strategy during a response.

An Aviation Plan has been developed (refer Appendix 1) which provides guidance on response tasking, resources and logistics. The Aviation Plan includes a draft Aviation Sub-Plan (Section 6) to support Aviation operations identified in the IAP. The Aviation Sub-Plan will require validation based on situational information relevant to the incident.

**Table 4-1: SMV implementation**

Surveillance, Modelling and Visualisation (SMV)				
Response Objective	To gather information and validate planning assumptions to adjust response plans as appropriate to the scenario. To quantitatively assess the extent, severity, persistence, and recovery of environmental values and sensitivities affected by the spill.			
Response Tactics	1. Satellite tracking buoys will be deployed to monitor the leading edge of the slick; and deployed in 24-hour intervals to indicate swept pathways. 2. Twice daily aerial surveillance flights (with trained Aerial Observers) will be undertaken to monitor the spreading, location and weathering of the slick. 3. Daily oil spill trajectory modelling will be used to predict the weathering and direction that the oil will spread. 4. Twice daily vessel observation to confirm the extent and spreading of the spill. 5. Activate the OSMP.			
Initiation Criteria	Notification of a spill (MDO, Gas Condensate) to the environment.			
Implementation Plan/ Guidance Document	COP Aviation Plan – See pg. 4 Aerial Surveillance Response Flowchart. COP Aviation Plan – Section 8 IAP Aviation Sub-Plan Operational and Scientific Monitoring Program (OSMP)			
Critical Outputs	Tactic	Level 1	Level 2	Level 3
	Aerial Surveillance	✓	✓	✓
	Oil Spill Trajectory Monitoring (Vectoring + ADIOS)	✓	✓	✓
	Twice daily Oil Spill Trajectory Modelling		✓	✓

# Oil Pollution Emergency Plan

	Continuous monitoring from Oil Spill Tracking Buoys		✓	✓
	Surveillance from: <ul style="list-style-type: none"> <li>Aircraft – 2 x daily overflights</li> <li>Vessels – Opportunistic to sense check aerial observations</li> </ul>		✓	✓
	Shoreline surveys (pre-emptive and post impact).		✓	✓
	Operational and Scientific Monitoring programmes		✓	✓
	Satellite imagery runs as requested by the SITU			✓
<b>Resources</b>	As per section 4.2.2 Response Resources (SMV)			
<b>Termination Criteria</b>	Termination occurs when the following criteria is fulfilled: <ul style="list-style-type: none"> <li>The spill has ceased,</li> <li>The spill is no longer visible to human observers. Specifically, a silver/grey sheen as defined by the BAOAC is not observable and 24 hrs has elapsed since the last confirmed observation of surface hydrocarbons,</li> <li>Modelling results (OM1) do not predict surface exposures at visible levels.</li> </ul> Termination criteria to be agreed with relevant Control Agency in State Waters.			

## 4.2.2. Response Resources

Table 4-2 details the capability required to support an SMV response, including resources required and availability.

**Table 4-2: Summary of SMV resources**

Resource	Requirement		Availability	Description
Aerial/ Vessel Surveillance	1x Pilot/Aircraft		Aviation contract /Pre-qualification	Suitable aircraft suppliers listed in the Aviation Plan – Section 6.
	1x Trained Aerial Observer		Trained aerial observers via AMOSC	
	1x Vessel		Vessel contract /Pre-qualification	Vessel(s) of Opportunity
Manual Trajectory Calculation (Vectoring + ADIOS)	1x IMT Member	IMT Planning Officer (or equivalent)	Resource available within COP and/or via AMOSC.	
	Current & Wind Data		Bureau of Meteorology Tracking buoy data	Available online
	Fate & behaviour assessment	ADIOS or GNOME	Resource available within COP and/or via AMOSC.	
Oil Spill Trajectory Modelling (OSTM)	Access to RPS via contract to initiate callout on a 24/7 basis.		AMOSC contract with RPS	Access via AMOSC to activate RPS for OSTM within 60 mins. 1 <sup>st</sup> report to be provided within 4 hrs.
Satellite Tracking Buoy	1x Satellite tracking buoy per operational vessel.		Available via AMOSC.	Satellite tracking buoys will be located offshore for the duration of the campaign.
Satellite Imagery	Access to KSAT Satellite Imagery via contract to initiate callout on a 24/7 basis.		AMOSC contract with Kongsberg Satellite Services.	Access via AMOSC to activate KSAT Imagery within 60 mins. Timeframes for imagery will be subject to satellite availability (Appendix 12).

## 4.2.3. Environmental Risk Assessment (SMV)

An assessment of possible environmental impact and risk associated with SMV techniques is undertaken as part of the Otway Exploration Drilling Program EP Section 7.8.

## 4.3. Shoreline Response: Protection and Deflection

Shoreline Protection and Deflection (P&D) involves using specialist equipment (e.g. nearshore booms and skimmers) to divert floating oil away from pre-identified sensitive receptors. Techniques vary depending on the location and type of sensitivity being protected.

### 4.3.1. Response Activities

Table 4-3 provides key information required to implement the Shoreline P&D strategy during a response.

A Shoreline Plan has been developed (refer Appendix 1) which provides guidance on response tasking, resources and logistics. This document should be used to assist in the development of a Shoreline Response Sub-Plan and used in conjunction with state response plans, e.g., the *Tasmania EPA (February 2023) First Strike Plan King Island*.

**Table 4-3: Shoreline protection and deflection implementation**

Shoreline Response: Protection and Deflection	
Response Objective	Protection of priority shorelines from contact from surface (floating) hydrocarbons and reduced hydrocarbon loading on shorelines.
Response Tactics	Identify sensitive areas that may benefit from protection and deflection. Deploy protection and deflection booms as per recommendations in the Primary or Secondary TRP's, prior to oil stranding. Daily surveillance of boom sets to ensure optimal protection.
Initiation Criteria	Notification of a spill (MDO, Gas Condensate) to the environment.
Implementation Plan/ Guidance Document	COP Shoreline Plan – See pg. 5 Shoreline Response Flowchart. ConocoPhillips Primary and Secondary Tactical Response Plans for Victoria and King Island. Tasmania EPA (February 2023) First Strike Plan King Island VIC State Maritime Emergencies Subplan Edition 2
Critical Outputs	Modelling predicts the shoreline loading over time. Where shoreline impact is predicted, a Tactical Response Plan (TRP) or Shoreline Treatment Recommendation (STR) will be implemented. TRPs consist of detailed response information and resources required including the equipment and personnel to carry out identified taskings related to the protection of specific sensitivities. Taskings within the TRPs include: <ul style="list-style-type: none"><li>• SCAT surveys</li><li>• Pre-cleaning of shorelines</li><li>• Protection &amp; deflection booming</li><li>• Containment and recovery</li></ul> Primary TRP Sites identify sensitivities permanently exposed which will require a definitive response. The TRP identifies specific tasks aimed at minimising environmental impact. Secondary TRP sites identify sites at which exposure is seasonal or irregular and require confirmation of a requirement prior to a response. The TRP identifies sensitivities, site information, likely response strategies and resources that would require validation based on the conditions at the time of the event. Secondary TRP sites that do not require a response would allow additional resources to be directed towards other response activities.
Resources	As per section 4.3.2 Response Resources (P&D)
Termination Criteria	Termination occurs when the following criteria is fulfilled: <ul style="list-style-type: none"><li>• The spill has ceased.</li><li>• The spill is no longer observable to human observers and all oil has impacted shorelines and is unlikely to remobilise.</li><li>• Slick thickness and characteristics mean that protection/deflection booms will not be effective as determined by the NEBA.</li><li>• NEBA concludes that that continued activity will not produce any net environmental benefit.</li></ul> Termination criteria is to be agreed with relevant Control Agency in State Waters.

# Oil Pollution Emergency Plan

## 4.3.2. Response Resources

Table 4-4 provides a summary of shoreline protection and deflection resources that will be required to support a response.

**Table 4-4: Summary of shoreline protection and deflection resources**

Resource	Requirement	Availability	Description
Trained oil spill response personnel	<ul style="list-style-type: none"><li>Boom deployment personnel.</li><li>Skimmer and recovery operations personnel.</li></ul>	Available from AMOSC equipment stockpile, AMSA national plan equipment	Qualified operators are required to effectively setup and maintain boom deployments to effectively protect or deflect hydrocarbons away from sensitive shorelines.
Boom and ancillary equipment	<ul style="list-style-type: none"><li>Shore sealing boom (Beach guardian boom)</li><li>Fence boom (Solid floatation boom)</li><li>Near shore boom (Zoom boom, GP boom)</li><li>Sorbent Boom</li></ul>	Available from AMOSC equipment stockpile, AMSA national plan equipment	Different types of boom will be required to effectively protect different shoreline types. By having access to all styles of boom, an effective protection and deflection strategy can be achieved.
Temporary dyke	<ul style="list-style-type: none"><li>Sandbags</li><li>Shovels</li></ul>	Hardware stores, safety stores, SES	In certain areas, it is just as effective as booming, to close off the sensitive area to the incoming surface hydrocarbon. This can be achieved by building a temporary dyke out of sandbags.
Boom deployment vessel	<ul style="list-style-type: none"><li>Shallow draft work vessel</li><li>Coxswain</li></ul>	CoP Vessel contractor, Vessels of opportunity, AMOSC Geelong equipment stockpile.	In order to effectively deploy protection and deflection booming systems, a shallow draft work vessel and competent coxswain are required to position and anchor booming sets in place.

## 4.3.3. Environmental Risk Assessment (Protection and Deflection)

An assessment of possible environmental impact and risk associated with Shoreline Protection & Deflection techniques is undertaken as part of the Otway Exploration Drilling Program EP Section 7.8.

## 4.4. Shoreline Response: Shoreline Clean-up

Appropriate efforts, as indicated by the NEBA, should be made to prevent an oil spill from reaching a shoreline to help reduce the environmental impact, the duration of the clean-up and the amount of waste generated. In the event that a shoreline is impacted with hydrocarbons, appropriate shoreline clean-up techniques will need to be employed to remove the pollutant.

Many factors influence what clean-up technique should be employed including:

- Shoreline type
- Weather conditions
- Shoreline Accessibility
- Shoreline Sensitivity, and
- The amount spilled.

The predictive modelling generated by RPS covered a wide range of representative of spill locations, two different hydrocarbon types (MDO and Gas Condensate) over two different petroleum titles. Extensive analysis of this modelling data has concluded that King Island and some Local Government Areas (LGAs) along the southern coast of Victoria are most at risk of being impacted.

# Oil Pollution Emergency Plan

Figure 4-1 shows a diagram of the LGAs that could be impacted based on all spill locations, scenarios, and oil types.

**Figure 4-1: Potentially affected LGAs for all spills and oil types**

In order to mount an effective and timely response to a potential shoreline impact, extensive work has been done to clearly define what clean-up strategies should be employed based on the location of the shoreline impact. The location of the shoreline impact triggers either a Tactical Response Plan (TRP) activation, or a Shoreline Treatment Recommendation (STR) implementation.

TRPs have been developed for areas of high sensitivity (see Shoreline Plan Section 5.2, Table 3 for assessment criteria) on King Island and the Victorian coastlines within the LGAs summarised Table 4-5.

Badger Box Creek Secondary TRP	39°57'55.40"S	143°52'25.32"E
Potential Secondary TRP	40° 3'44.60"S	143°52'54.48"E
Eel Creek Secondary TRP	39°45'2.42"S	143°51'14.86"E
Big Lake Inlet Secondary TRP	40° 6'54.97"S	143°56'44.53"E
Camp Creek Secondary TRP	39°55'24.19"S	143°50'38.99"E
Three Rivers Creek Inlet Secondary TRP	39°53'33.29"S	143°50'46.41"E
Porky Creek Inlet Secondary TRP	39°51'22.61"S	143°51'38.57"E
Pass River Secondary TRP	39°48'4.43"S	143°51'53.51"E
Bungaree Creek Primary TRP	39°46'9.34"S	143°51'5.83"E
Yellow Rock River Secondary TRP	39°41'52.58"S	143°53'27.66"E

Where a shoreline is impacted that is not part of a TRP, an STR should be implemented based on its shoreline type and accessibility as per the ConocoPhillips Australia Shoreline Plan (Appendix 1).

## 4.4.1. Response Activities

The information presented in Table 4-7 should be used to assist in the development of a Shoreline Response Sub-Plan and used in conjunction with the *Tasmania EPA (February 2023) First Strike Plan King Island* and/or the VIC State Maritime Emergencies Subplan Edition 2, where relevant.

**Table 4-7: Shoreline clean-up implementation**

Shoreline Response: Shoreline Clean-up	
<b>Response Objective</b>	To remove bulk stranded oil from accessible shorelines and speed up natural recovery of habitats.
<b>Response Tactics</b>	Identify potentially affected shorelines using modelling data. Assess potentially affected shorelines using SCAT. Activate relevant TRPs for affected shorelines. Shoreline treatment recommendations will be put in place for all other affected shorelines.
<b>Initiation Criteria</b>	Notification of a spill (MDO, Gas Condensate) to the environment.
<b>Implementation Plan/ Guidance Document</b>	ConocoPhillips Shoreline Sub Plan. Tasmania EPA (February 2023) First Strike Plan King Island VIC State Maritime Emergencies Subplan Edition 2.
<b>Critical Outputs</b>	Coordinate with contractors and jurisdictional authorities to mobilise SCAT teams to conduct shoreline assessments (Appendix 11). SCAT feedback will determine whether a shoreline response is required for any segment/sector. Operational teams to be put together based on recommendations from Primary and Secondary TRPs resource lists. For affected areas where a TRP has not been developed, apply the appropriate STR. Conduct ongoing SCAT operations to monitor shoreline loading throughout the shoreline clean-up operation. Source appropriately skilled personnel and equipment to support the ongoing shoreline clean-up operations of all affected shorelines.
<b>Resources</b>	As per section 4.4.2 Response Resources (Shoreline Clean-up)
<b>Termination Criteria</b>	Termination occurs when the following criteria is fulfilled: <ul style="list-style-type: none"> <li>The source of the hydrocarbon spill is controlled.</li> <li>No additional response or clean-up of habitat is predicted.</li> <li>Locations predicted to be contacted by hydrocarbons have been contacted.</li> </ul>

# Oil Pollution Emergency Plan

	<ul style="list-style-type: none"> <li>Independent scientific advice indicates that hydrocarbon levels are below 100g/m<sup>2</sup>, or further clean-up activities are unlikely to materially decrease hydrocarbon impacts on environmental sensitivities.</li> </ul> <p>Termination criteria is to be agreed with the relevant Control Agency.</p>
--	--

## 4.4.2. Response Resources

Table 4-9 provides a summary of the resources that are expected to be required to support a shoreline clean-up response.

**Table 4-8: Summary of Shoreline Clean-up Resources**

Resource	Requirement	Availability	Description
<b>Trained SCAT Crew</b>	Typical SCAT crew includes: 1x Wildlife specialist 1x Oil spill response specialist	Available via AMOSC, VIC DTP, TasEPA, AMSA	In order to effectively inform the IMT of an appropriate shoreline clean-up recommendation, a qualified SCAT team should include specialists listed. Consistent, informed data from SCAT can then be fed back into the IMT to allow them to activate the appropriate TRP or STR and source required equipment.
<b>Shoreline Clean-up Team Leaders</b>	Appropriately trained shoreline response team leaders.	Trained shoreline team leaders via AMOSC	Shoreline response team leaders are required to coordinate shoreline clean-up operations. Each team of 10 clean-up responders should be assigned a team leader.
<b>Shoreline Clean-up Responders</b>	Appropriately trained shoreline clean-up responders.	Trained shoreline responders via AMOSC, VIC DTP, TasEPA, AMSA	A shoreline response team should consist of 10 responders to perform the clean-up of the assigned shoreline. This team will be responsible for setting up booming, operating skimming systems, manually cleaning the shoreline and storing waste in appropriate storage containers.
<b>Support Personnel</b>	Labour hire, unskilled workers not required to be trained in oil spill response.	Labour hire contractor, AMOSC Core Group, AMSA NRT, Internal COP personnel	Support personnel are used to help assist in manual shoreline clean-up operations. Where large areas of shoreline are affected, groups of support personnel can be useful under the instruction of trained shoreline responders to perform shoreline clean-up operations.
<b>Beach Clean-up Kit</b>	Beach clean-up kit consists of hand tools used to assist the collection of waste from the shoreline and transport it to the temporary waste storage containers. For example: Shovels, rakes, brooms, wheelbarrows, trowels	Available from AMOSC equipment stockpile, AMSA national plan equipment, bulk purchase from hardware store	Pre-cleaning and post removal of waste from a shoreline is a manual and laborious task and suited to support personnel.
<b>Decontamination Kit</b>	Decontamination kits consist of all equipment necessary to ensure that oil spill responders and equipment are suitably catered for when travelling from the hot zone (contaminated) to the cold zone (uncontaminated). These kits typically consist of, but are not limited to, the following: <ul style="list-style-type: none"> <li>Marquees</li> <li>Bunds</li> <li>Scrubbing brush's</li> <li>Waste receptacles</li> <li>Detergents</li> <li>Hand wash stations</li> <li>Jet washers</li> </ul>	Available from AMOSC equipment stockpile, AMSA national plan equipment	In order to minimise the movement of oil from the affected shorelines to beyond the operational area, decontamination stations are setup in a warm zone to allow responders, vehicles and equipment to be cleaned prior to entering an uncontaminated zone. These stations are critical in minimising the transmission of secondary contamination beyond the operational area.

# Oil Pollution Emergency Plan

Resource	Requirement	Availability	Description
<b>Mechanical Equipment</b>	Mini Excavator Bobcat Bulldozers	Available through equipment hire contractors	In areas where bulk oil has accumulated on the shoreline, it may be possible to assist in the removal with the use of mechanical equipment as opposed to manual labour alone. Mechanical equipment can help increase the amount of waste removed from the shoreline.
<b>Skimming and ancillary equipment</b>	Drum Skimmer Brush Skimmer Disc Skimmer Passive Weir Skimmer Rope Mop Ro Vac Rock Cleaning Brush System	Available from AMOSC equipment stockpile, AMSA national plan equipment	Floating oil caught in containment and recovery booms can be removed from the water surface prior to it stranding on the shoreline. Skimmers can be used to transport the liquid hydrocarbon from the water surface to temporary storage containers.
<b>Waste Management Support Services</b>	Waste management contractor	CoP waste management contractor, other waste management contractors	Once waste has been collected on the shoreline, whether it be liquid oily waste, solid oily waste, or contaminated PPE, a suitable waste contractor should be employed to assist with the removal of waste from the operational area.
<b>Temporary Waste Storage</b>	Fastank temporary storage. Intermediate Bulk Containers (IBC). Vikoma storage tanks. Specialised bins (plastic lined) used for storage and transport of waste.	Available from AMOSC equipment stockpile, AMSA national plan equipment	A shoreline clean-up generates vast amounts of varying waste streams. Suitable storage containers need to be available to store this waste until the waste management support can remove it from site.

## 4.4.3. Environmental Risk Assessment (Shoreline Clean-up)

An assessment of potential environmental impacts and risks associated with Shoreline Clean-up techniques is undertaken as part of the Otway Exploration Drilling Program EP Section 7.8.

## 4.5. Oiled Wildlife Response

Oiled wildlife response (OWR) is a support function that is implemented alongside other response options if applicable and commensurate to the scale and nature of the spill. OWR tactics and techniques are intended to mitigate adverse wildlife impacts by reducing the number of animals that come into contact with spilled oil, capturing and rehabilitating oiled fauna, and removing oiled carcasses to reduce secondary impacts.

OWR will be conducted under the supervision of state authorities, in accordance with state specific marine oil spill contingency plans and relevant wildlife response plans.

Typical OWR can be separated into three stages, these include:

- 1) **Wildlife Reconnaissance** - situational awareness / visual observations of species present and identification of species that may potentially be impacted by vessel, aircraft, vehicle, AUV, or foot.
- 2) **Preventative Actions:**
  - a) Deterrence strategies (e.g. hazing by auditory or visual scarers)
  - b) Displacement strategies (e.g. fencing or barricading techniques)
  - c) Pre-emptive capture - removal of wildlife from an area and transportation to a staging facility or to an adequate area not expected to be impacted.
- 3) **Wildlife Rescue:**
  - a) Capture of oiled wildlife – action only to be completed by trained wildlife handlers.
  - b) Transportation to field processing facility and / or primary care facility staging.
  - c) Triage – undertaken by trained veterinarians (euthanasia may be required).
  - d) Stabilisation – of wildlife prior to cleaning.
  - e) Cleaning – rinsing, washing, drying to remove contamination.

# Oil Pollution Emergency Plan

---

- f) Rehabilitation – feeding, swimming, waterproofing, conditioning, pre-releases assessment.
- g) Release – once approved.

## 4.5.1. Response Activities

Observations for oiled wildlife would occur during aerial/vessel surveillance and monitoring (OM02 and OM03 of the OSMP). A decision would be made to activate OWR based on observations as well as advice from relevant organisations, agencies and stakeholders. The responsibility for OWR depends on the location and origin of the spill.

### Victoria

The Department of Energy, Environment and Climate Action (DEECA), formerly DELWP is the agency responsible for responding to wildlife affected by a marine pollution emergency in Victorian State waters. DEECAs response to oiled wildlife is undertaken in accordance with the Wildlife Response Plan for Marine Pollution Emergencies, with support of agencies including Parks Victoria and Philip Island Nature Park.

To activate oiled wildlife response, contact DEECA on **136 186** for Wildlife Emergencies and **1300 136 017** specifically for Whale and Dolphin Emergencies.

### Tasmania

The Tasmanian Oiled Wildlife Response Plan (“WildPlan”) sets out the minimum standard required for an Oiled Wildlife Response in Tasmania within State waters. All oil spill response strategies involving the management of wildlife needs to be planned and undertaken by experienced personnel. This role within Tasmania is the responsibility of the Environment Business Unit of the Department of Natural Resources and Environment (NRE Tas) under the leadership of the Marine Conservation Program (MCP; Wildlife, Health and Marine (WHAM) section).

The MCP Wildlife Co-ordinator should be contacted in the event of an oil spill of any size via the 24-hour “Whale” Hotline on **0427 942 597** (0427 WHALES).

### Commonwealth

AMOSC and AMSA have on call personnel and equipment that can be activated to support an oiled wildlife response in commonwealth waters.

The IMT should consult with AMSA, DECCA, NRE Tas, AMOSC and the Phillip Island Nature Park wildlife clinic to provide support for any wildlife response activities, including obtaining permits to conduct an OWR in State waters and/or Commonwealth waters, as stated above.

ConocoPhillips Australia will provide support for the response through provision of resources as requested by the relevant agency utilising existing contracts such as AMOSC.

To activate, contact:

- **AMSA:** Ph 1800 641 792
- **AMOSC:** 0483 379 328

# Oil Pollution Emergency Plan

## 4.5.2. Response Resources

Table 4-9 provides a summary of the resources available to ConocoPhillips Australia to support a request for resource assistance from the relevant state agency.

**Table 4-9: Summary of oiled wildlife response resources**

Resource	Requirement	Availability	Description
<b>OWR Personnel</b>	AMOSC Oiled Wildlife Advisor AMOSC Core Group AMOSC Industry Strike Team Third party support agencies/organisations	Trained OWR personnel via AMOSC	Available via trained AMOSC staff, Industry personnel (via Mutual Aid) and supporting National and Global OWR organisations.
<b>OWR Facility Establishment /Management</b>	OWR Facilities establishment group (DWYERtech Response Ltd)	Available via AMOSC SLS	Call-off contract with service available on-site within 24hrs of call-out.
<b>OWR Containers</b>	1x OWR Container (Geelong) 1x OWR Container (Fremantle)	Available via AMOSC SLS	AMOSC OWR containers available onsite within 24hrs of call-out.
<b>OWR Kits</b>	<i>Geelong:</i> 1x OWR Fauna Hazing & Exclusion Kits 2x OWR Fauna Kits <i>Fremantle:</i> 4x OWR Fauna Hazing & Exclusion Kits <i>Exmouth:</i> 1x OWR Fauna Kit <i>Broome:</i> 1x OWR Fauna Kit	Available via AMOSC SLS	AMOSC OWR kits available onsite within 24hrs of call-out.

## 4.5.3. Environmental Risk Assessment

An assessment of possible environmental impact and risk associated with oiled wildlife response techniques is undertaken as part of the Otway Exploration Drilling Program EP Section 7.8.

## 4.6. Waste Management

Oil spill response operations generate a variety of waste streams that need to be planned for including:

- Liquid Wastes (oil and water)
- Bulk Hard Wastes including oil mixed with organic material, sand, rocks, debris, etc, and
- Sundry wastes including PPE, catering, etc.

All waste generated from oil spill response activities will require effective management, storage, transportation and disposal. The type and amount of waste generated will heavily rely on the response strategy employed, the volume of oil encountered and the affected shoreline substrate type.

### 4.6.1. Waste Types and Volumes

For planning purposes, stochastic modelling data has been used to calculate estimated total waste volumes for each scenario and oil type.

Stochastic modelling data was used over deterministic data as the deterministic modelling data only covers the worst-case scenario for each location. The chances of the conditions being the same as the deterministic run are slim, therefore, a stochastic approach was used which better represents the likelihood of shoreline contact. Stochastic oil spill modelling is created by overlaying hundreds of individual, computer-simulated hypothetical spills and presenting the results as a probability of shoreline contact.

# Oil Pollution Emergency Plan

In Section **4.4 – Shoreline Response: Shoreline Clean up, Figure 4-1**, potentially affected LGA's are identified for all spill scenarios. The waste generated from the shoreline clean up response strategy is primarily sand with oily residue. **Table 4-10** summarises the affected LGA's and the total potential volume based on stochastic modelling data for actionable shoreline contact. Shoreline loading of oil above 100g/m<sup>2</sup> is considered actionable.

The predictive modelling undertaken for all locations and both oil types along with the recommended response strategies, indicate that the volumes of waste generated can be vastly different, depending on when, where, how much, and of what oil type is spilled.

**Table 4-10: Potential Waste Volumes Generated**

Permit Area	Scenario	Season	Location	Waste type	Total Volume Ashore (m <sup>3</sup> )	Total Actionable Ashore (m <sup>3</sup> ) (>100g/m <sup>2</sup> )	Waste Volume (M <sup>3</sup> )
T49P	Vessel Collision - 350m <sup>3</sup> of MDO over 6 hours, surface release	Summer	1	-	3.8	0	0
		Winter	1	-	8	0	0

		Winter	4	Sand with oil residue	318.9	548.1	5481

Where Red, >10% probability of waste coming ashore, Orange, <10% probability of waste coming ashore and Green, 0% chance of any waste coming ashore above the actionable limit of 100g/m<sup>2</sup>.

## 4.6.2. Waste Management Planning

It is envisaged that the Waste Management Plan will come into full effect from Day 2 of a response. The passage of two days allows for the reactive phase of the response to commence with operational response strategies employed.

A Waste Management Plan will need to be developed by the Incident Management Team in support of the Incident Action Plan. For shoreline response waste, this will need to be completed in support to/ in consultation with the relevant Jurisdictional Control Agency. It is recommended that a representative from the selected waste provider(s) is consulted during the development phase to ensure accuracy and to provide logistical support.

# Oil Pollution Emergency Plan

The final decisions on how waste can be lawfully stored, transported, and disposed of, will be subject to advice and approvals from the EPA at the time of the incident. Waste management contractors will need to abide by the relevant EPA acts when involved with the collection, transportation, storage, and processing of waste.

Victoria: <https://www.epa.vic.gov.au/for-business/find-a-topic/manage-industrial-waste/hazardous-waste>

King Island: <https://epa.tas.gov.au/business-industry/regulation/waste-management>

## 4.6.3. Waste Management: Contractors, Transport, Storage, Processing

There are several waste management contractors available in Victoria with two of the largest being Cleanaway and Veolia. Both contractors are setup and capable of collecting, storing, and processing large volumes of waste that could be potentially generated during a high-level oil spill event. Sections 4.6.3.1 and 4.6.3.2 go through the contact information and capabilities of each of these contractors in Victoria. King Island only has one waste contractor, being the King Island Council, who are responsible for all of King Islands waste management via the King Island Council waste infrastructure plan. Section 4.6.3.3 highlights the capabilities of this waste management contractor.

This information should be used to assist the development and execution of an effective waste management plan/operation.

### 4.6.3.1. Contact Information

#### Cleanaway Melbourne Corporate Head Office

Level 4, 441 St Kilda Road, Melbourne, VIC, 3004

Ph: 13 13 39 – Option 3 (Oily water and hazardous waste)

Emergency Spills Response: 1800 SPILLS / 1800 774 557

#### Veolia Liquid and Hazardous – Environmental Services

15 McDonald Road, Brooklyn, VIC, 3028

Ph: 132 955

24/7 Customer Portal: <https://vanz.force.com/customerportal>

### 4.6.3.2. Contractor Capability

An overview of the currently identified contractors' capabilities is provided in Table 4-11.

**Table 4-11: Contractor capability overview**

Capability	Cleanaway	Veolia
Operational Depot Locations	Hazardous waste operational depots located in Sunshine, Mulgrave and Morwell in Victoria.	Operational locations across Victoria
Adherence to regulatory requirements relating to the transport, storage, and disposal of oil/hazardous waste (List them). <ul style="list-style-type: none"><li>State/Federal</li><li>ISO Certifications</li></ul>	Comply with AS/NZS 4801:2001 ISO 14001 ISO 9001 OHS 609391 And all state/federal regulations	Comply with AS/NZS 4801:2001 ISO 14001 ISO 9001 And all state/federal regulations
Experience in handling Hazardous/Oily Waste	Yes, Cleanaway are one of the largest waste management providers in Australia and provide waste management across all sectors of industry.	Yes, Veolia are contracted to many companies to provide hazardous waste management
Permitted to handle and transport Hazardous Waste Victoria wide.	Yes, licenced by the EPA and WorkSafe to transport and handle hazardous and dangerous waste.	Yes, by the EPA and WorkSafe to transport and handle

# Oil Pollution Emergency Plan

Capability	Cleanaway	Veolia
<ul style="list-style-type: none"> <li>Permitted fleet.</li> </ul>	<p>Cleanaway has established relationships with the EPA and hold permits for the operational areas outlined.</p> <p>Cleanaway can also obtain permits with experienced staff on call to assist with permit applications.</p>	hazardous and licenced dangerous waste
24hr On Call access?	Yes, to contracted customers via 1800 774 557	24hrs via Customer Portal
In field technical support/liaison capability. How many personnel can be used to assist in a large-scale incident?	Yes, available to contracted customers.	[HOLD]
<b>Temporary Storage/In field management</b>		
<p>In field storage capability for liquid waste</p> <ul style="list-style-type: none"> <li>Type of storage</li> <li>Quantity available</li> </ul>	<p>Hazardous waste storage drums</p> <p>Intermediate Bulk Containers</p> <p>Temporary Storage Facilities – equipped with containment measures and operated in compliance with regulatory requirements</p>	Yes, numbers to be confirmed
<p>In field storage capability for solid waste</p> <ul style="list-style-type: none"> <li>Type of storage</li> <li>Quantity available</li> </ul>	<p>Bin sizes from 120L to 6.0m</p> <p>Skip sizes from 3m<sup>3</sup> to 31m<sup>3</sup></p>	Yes, numbers to be confirmed
Ability to transfer from temporary storage to transport vehicle (Liquid and solid)	Yes, ability to transfer waste as required using pumps and vacuum trucks	[HOLD]
Site decontamination capability	Yes, can provide decontamination capability including road cleaning with specially designed vacuum trucks to clean the road surface if required.	[HOLD]
<b>Transport</b>		
<p>Fleet available for Hazardous liquid waste transport including surge capacity:</p> <ul style="list-style-type: none"> <li>Immediate</li> <li>In 24hrs</li> <li>In 48hrs</li> <li>Total available</li> </ul>	<p>1500 assets available nationally. Availability is dependent on contract in place.</p> <p>Cleanaway has a fleet from Medium Rigid to Semi Trailers with a tank size from 6,000L to 30,000L located across their sites nationally.</p>	Assets available in Victoria and nationally.
<p>Fleet available for solid transport including surge capacity:</p> <ul style="list-style-type: none"> <li>Immediate</li> <li>In 24hrs</li> <li>In 48hrs</li> <li>Total available</li> </ul>	<p>1500 assets available nationally with capability to transport solid waste.</p> <p>Availability is dependent on contract in place</p>	Assets available in Victoria and nationally
Vehicle decontamination capability (yes/no, if yes, describe)	No	[HOLD]
Road decontamination capability (Yes/no, if yes describe)	Drain cleaning, rotary mower, Industrial vacuum trucks and high-pressure blasting and access to a specially designed vacuum trucks to clean the road surface if required.	[HOLD]
<b>Disposal</b>		
<p>Ability to dispose hazardous solid waste.</p> <ul style="list-style-type: none"> <li>Disposal Location/s</li> <li>Volume per day per location</li> </ul>	Yes, locations Australia wide	Yes, sites in Brooklyn, Echuca Dandenong, and Hallam

# Oil Pollution Emergency Plan

Capability	Cleanaway	Veolia
Ability to dispose hazardous liquid waste. <ul style="list-style-type: none"><li>Disposal Location/s</li><li>Volume per day per location</li></ul>	Yes, locations in Dandenong and Campbellfield. Cleanaway also can leverage on 3 <sup>rd</sup> party facilities if operationally efficient. Cleanaway sites Can process >200,000L per day	Yes, Veolia operates the Brooklyn Industrial Services Hub

## 4.6.3.3. King Island Council

King Island Council  
PO Box 147 Currie  
King Island TAS 7256  
Ph: 03 6462 9000

The King Island Council will transfer waste to Charles Street transfer station/depot for relocation to either the Parena landfill or the old Charles Street landfill.

**Table 4-12: Solid waste capability – KIC King Island**

Type	Capacity	First 24 Hours	24 – 48 Hours	Beyond 48 Hours
Rear Loader (240l and 660l Bins)	12 - 14 Tonne	1 Truck	1 Trucks	Based on Island availability

## 4.6.4. Environmental Risk Assessment

An assessment of possible environmental impacts and risks associated with Waste Management techniques has been undertaken as part of the Otway Exploration Drilling Program EP Section 7.8.

## 4.7. Operational and Scientific Monitoring Program

ConocoPhillips Australia have developed an Operational and Scientific Monitoring Program (OSMP) to meet the requirements of the Environment Regulations. The OSMP is the principle tool for determining the extent, severity and persistence of environmental impacts from an oil spill, and allows titleholders to determine whether their environmental protection goals are met. Operational monitoring can be used to assess how effective the oil spill response is in protecting the environment. Whereas scientific monitoring can be used to direct remediation efforts, typically after the spill response activities are completed.

The OSMP is designed to support the implementation of a range of operational and scientific monitoring plans, depending on the type of spill, location, and status of the response. The use of vessels, aircraft, and shoreline responders (on foot, vehicles) may be required to undertake the techniques identified within the OSMP.

The activation process, specific plans, capability and resourcing requirements are detailed in the OSMP, and the individual supporting plans are summarised in the Table 4-13 below.

**Table 4-13: Operational and scientific monitoring plans**

Plan	Title
<b>Operational Monitoring</b>	
OM01	Hydrocarbon and other chemical spill trajectory prediction
OM02	Hydrocarbon and other chemical spill surveillance and reconnaissance
OM03	Operational monitoring of hydrocarbon and other chemical properties, behaviour and weathering
OM04	Pre-emptive assessment of sensitive receptors at risk

# Oil Pollution Emergency Plan

---

Plan	Title
OM05	Operational monitoring of sensitive receptors & SCAT
OM06	Air Quality Modelling (Responder Health and Safety)
<b>Scientific Monitoring</b>	
SM01	Monitoring of hydrocarbons and other chemicals in marine waters
SM02	Monitoring of hydrocarbons in benthic sediments
SM03	Survey of shoreline/intertidal sediments and biological communities to determine impacts of hydrocarbon spill and other chemicals and recovery
SM04	Monitoring of subtidal benthos to determine impacts of hydrocarbon spill/other chemicals and recovery
SM05	Wildlife surveys to determine impact of hydrocarbon / chemical spill on shorebirds and seabirds
SM06	Wildlife surveys to determine impact of hydrocarbon / chemical spill on marine megafauna
SM07	Determination of impact of hydrocarbon / chemical spill on commercial, traditional and recreational fisheries and aquaculture
SM08	Determination of impact of hydrocarbon / chemical spill on recreational, commercial and/or industrial users
SM09	Determination of impact of hydrocarbon / chemical spill on conservation, heritage and native title importance

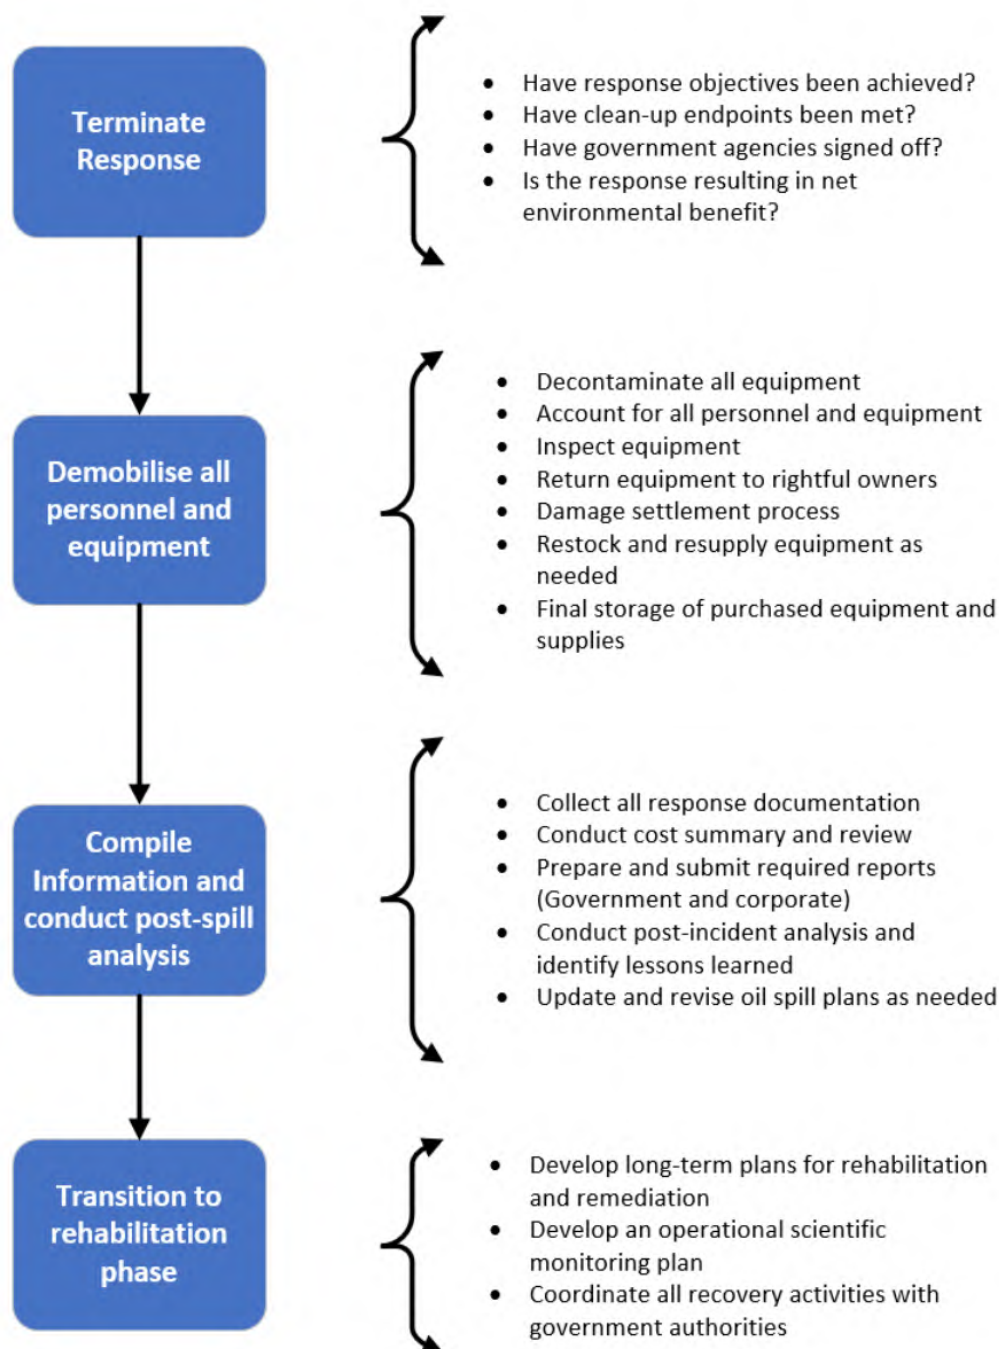

## 4.8. Demobilisation

The termination of an oil spill response includes:

- Demobilisation of equipment
- Post-incident reporting
- Review and updating of current plans
- Rehabilitating damaged environments
- Resupplying equipment, and
- Post spill scientific monitoring.

The decision to demobilise needs to be made in conjunction with the relevant government authorities that may include Vic DTP, TasEPA, AMSA and NOPSEMA. This decision can be made once all termination criteria have been met for any response operation, at any time. Resources can then be moved into other operational areas or rehabilitated and stood down. Key considerations are safety and prioritisation of resources with lower utilisation, higher costs and greater decontamination needs.

The response termination process may take days or weeks to complete depending on the scope and scale of the response. Figure 4-2 below summarises the process for terminating an oil spill response and the associated activities.

**Figure 4-2: Oil spill response termination procedure**

## 5. Response Resources

Logistical and support arrangements for the supply of people, equipment and resources will operate in a local, regional and global approach.

### 5.1. Local Resources

Local resources are those available in the state of Victoria or on King Island, Tasmania, and can be used on short notice. This equipment may come from the Port Authorities, State Jurisdictions (VIC DPT or TasEPA), local governments (e.g. access to earthmoving equipment and trained operators), or from access to locally available AMSA and AMOSC equipment.

### 5.2. Regional Resources

Regional response resources are those that are available within Australia. These may take time to mobilise and can come from AMOSC, AMSA, ConocoPhillips Australia operations or via the AMOSPlan Mutual Aid arrangements with industry.

#### 5.2.1. AMOSC Resources

ConocoPhillips Australia have access to AMOSC equipment and resources Australia wide. Geelong based equipment can be mobilised to King Island in approximately 18hrs. Additional equipment in Fremantle, Exmouth and Broome can be mobilised to the Port of Geelong in approximately 40, 51 and 55hrs respectively. This includes an allowance of 4hrs for truck availability/sourcing and loading.

An overview of what equipment AMOSC has available is on the AMOSC website

<http://www.amosc.com.au/equipment.php>

An inventory is in Appendix 2 with live readiness status and locations available via the members section of the AMOSC website <https://amosc.com.au/member-login/>. Access to this information is available via the AMOSC Duty Officer.

AMOSC also has access via the AMOSPlan to Mutual Aid equipment via its members. This equipment can be made available to ConocoPhillips Australia in the event of a response (Appendix 13).

#### 5.2.2. AMSA Resources

ConocoPhillips Australia have access to AMSA equipment Australia wide through AMOSC and the National Plan. AMSA maintain significant stockpiles of equipment in Adelaide, Brisbane, Dampier, Darwin, Devonport, Fremantle, Melbourne, Sydney, and Townsville.

A full inventory of AMSA equipment is available from the AMSA website: <https://amsa-forms.nogginoca.com/public/equipment.html>

AMSA also administers the National Response Team (NRT). The purpose of the NRT is to provide a national incident management and field operations surge capacity to support Australian pollution response control agencies responding to major marine environmental incidents. NRT is a core capability of the National Plan for Maritime Environmental Emergencies (NATPLAN) and comprises of 40 incident management team personnel and 42 field team leaders.

#### 5.2.3. Labour Hire

ConocoPhillips Australia has access to labour hire arrangements to support shoreline protection and clean-up operations via commercially available providers.

## 5.3. Global Resources

The ConocoPhillips Global Incident Management Assist Team (GIMAT) is a specialist incident management team. Members are located globally and can be readily mobilised to support a business unit IMT that has exceeded its capacity or is required to maintain sustained IMT operations over an extended duration incident.

The GIMAT can fill most roles within the ConocoPhillips IMT structure.

ConocoPhillips Australia also has access to the global Crisis Management Support Team (CMST). The CMT can request assistance, advice and support on a range of issues from the CMST including:

- Providing guidance on major corporate strategic objectives
- Being available to:
  - Assist in communications with senior personnel of business partners
  - Provide general assistance to the ABU CMT
  - Contact senior community leaders including government Ministers and others at the request of the CMT, and
  - Brief other ConocoPhillips staff and operations.

## 6. Environmental Performance

Table 6-1 provides a summary of the Environmental Performance Outcomes (EPO), Control Measures (CM), Performance Standards (EPS), Measurement Criteria (MC) and responsibilities for the implementation of this OPEP.

# Oil Pollution Emergency Plan

**Table 6-1: Environmental performance requirements and responsibilities for the OPEP**

Environmental Performance Outcome	Control Measure	Environmental Performance Standard	Measurement Criteria	Responsible Person
<b>General – Response Preparedness</b>				
Trained and competent IMT and CMT personnel, including Source Control Branch, are prepared to effectively respond to a worst-case spill scenario for the duration of the activity	Response Training, Exercising and Testing	ConocoPhillips response personnel are trained and deemed competent according to the Training and Exercising Plan.	Training Records Training and Exercising Plan	COP GM-HSE
		Exercising and testing is completed according to the Training and Exercising Plan.	Training and Exercising Plan	COP GM-HSE
		Lessons from exercises and testing are captured, actioned and integrated into the OPEP.	Exercise and testing report(s) including observations and opportunities for improvement  Actions are managed to completion  Management of Change Register	COP GM-HSE
		Assurance that the initial ConocoPhillips Australia Source Control Branch can be activated and mobilised within 24 hours.	IMT Roster Exercise and Testing Records	COP GM-HSE
Timely and ongoing consultation, notification and reporting to government agencies and other relevant persons	Communication Plan	Maintain Notifications Checklist (Section 3.2 of the OPEP).	Management of Change Register	COP GM-HSE
		Undertake consultation with relevant government departments and other relevant persons in development of OPEP to align response strategies and minimise potential impacts and risks to environmental values and sensitivities.	Consultation Records EP Sensitive Information Report	COP GM-HSE
		Prior to commencement of drilling, undertake testing of Communication Plan, including communication protocols between:	Consultation Records	COP GM-HSE

## 1. Purpose

The purpose of this Aviation Plan is to describe the arrangements that ConocoPhillips Australia, in association with AMOSC, has in place to prepare for and respond to aerial surveillance of a hydrocarbon release during the Otway Exploration Drilling Project.

This plan will provide the ConocoPhillips Incident Management Team (IMT) with the information and procedures required to operate and manage all aspects of an aerial surveillance operation. It has primarily been designed to assist in the setup and operation of a remote forward operating base (FOB) utilising AMOSC as the manager of these operations.

## 2. How to Use this Plan

This plan supports Section 4.2 (Surveillance, Modelling and Visualisation) of the ConocoPhillips Australia OPEP.

Each section of this Plan and its supporting appendices has been drafted to expedite the implementation of aerial surveillance operations.

By following the flowchart in Section 3 – Figure 3-2: Aerial Surveillance Response Flowchart, clear tasking and responsibilities have been outlined to ensure that when aerial surveillance is required, it can be implemented with minimal delays.

Once activated, AMOSC will follow the Airfield Setup Procedures flowchart in Section 4 – Figure 4-1: Airfield Setup Procedures Flowchart to nominate an airfield and Forward Operating Base (FOB), acquire suitable surveillance aircraft and appropriately trained personnel, complete all appropriate documentation, and begin surveillance operations.

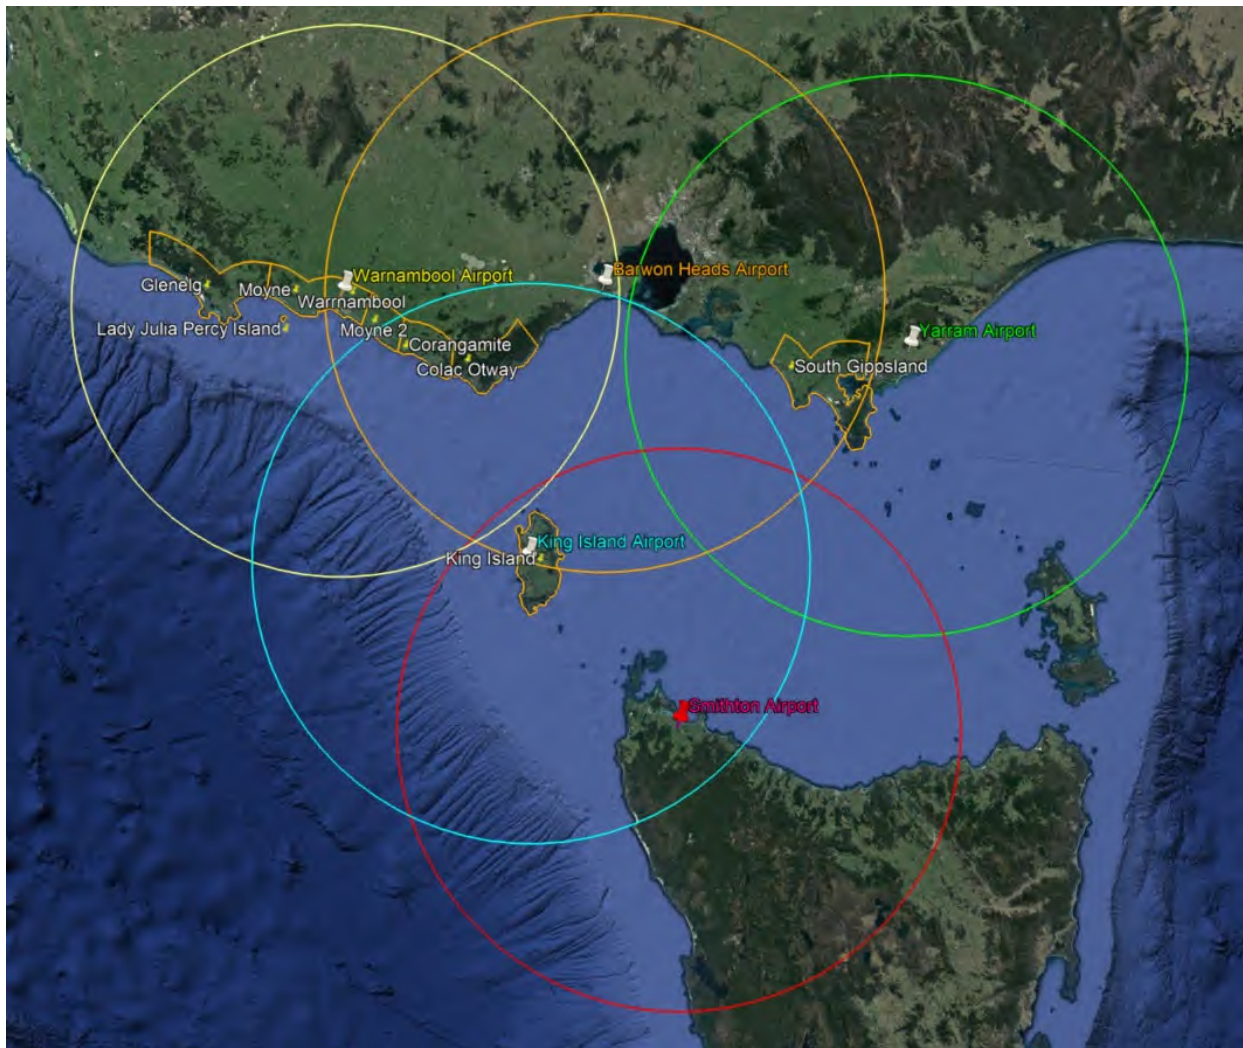

## 3. Aerial Surveillance

Four primary airfields have been selected to cater for the potentially affected shorelines. Typically, a surveillance aircraft will need to be capable of flying up to 100nm from the FOB to conduct surveillance operations. This has been highlighted in Figure 3-1 below.

Primary airfields include:

- 1) Barwon Heads Airport – YBRS (Section 7.1)
- 2) King Island Airport – YKII (Section 7.2)
- 3) Yarram Airport – YYRM (Section 7.3)
- 4) Warrnambool – YWBL (Section 7.4)

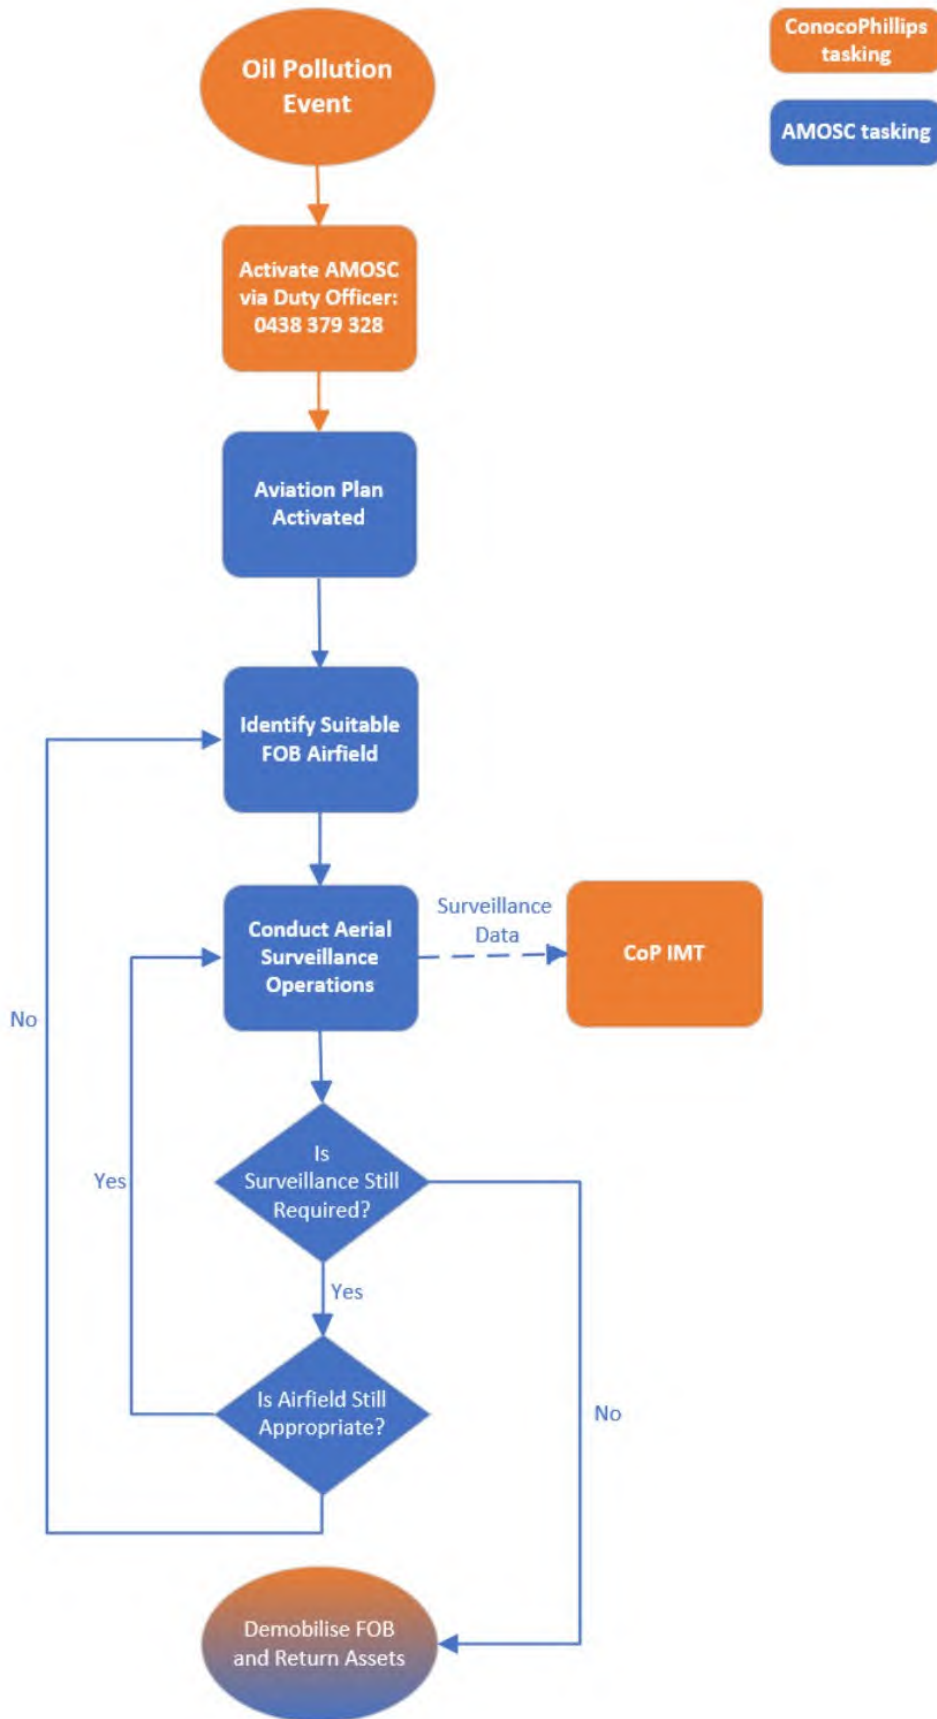

Initially, operations will be run from the Barwon Heads Airport due to its proximity to both drilling permit areas and the AMOSC stockpile of equipment. If the surveillance operation is required to move to a more suitable location (closer to the drifting spill for example), AMOSC will relocate the FOB to a more suitable airfield. If the operation plans to move to the King Island Airport, supporting logistics needs to be setup five days prior to commencing operations, as the airport does not hold any fuel stores.

**Figure 3-1: Airfield locations with 100nm boundaries highlighted, covering all potential shoreline breaches.**

The Aerial Surveillance response strategy is outlined in Figure 3-2 below.

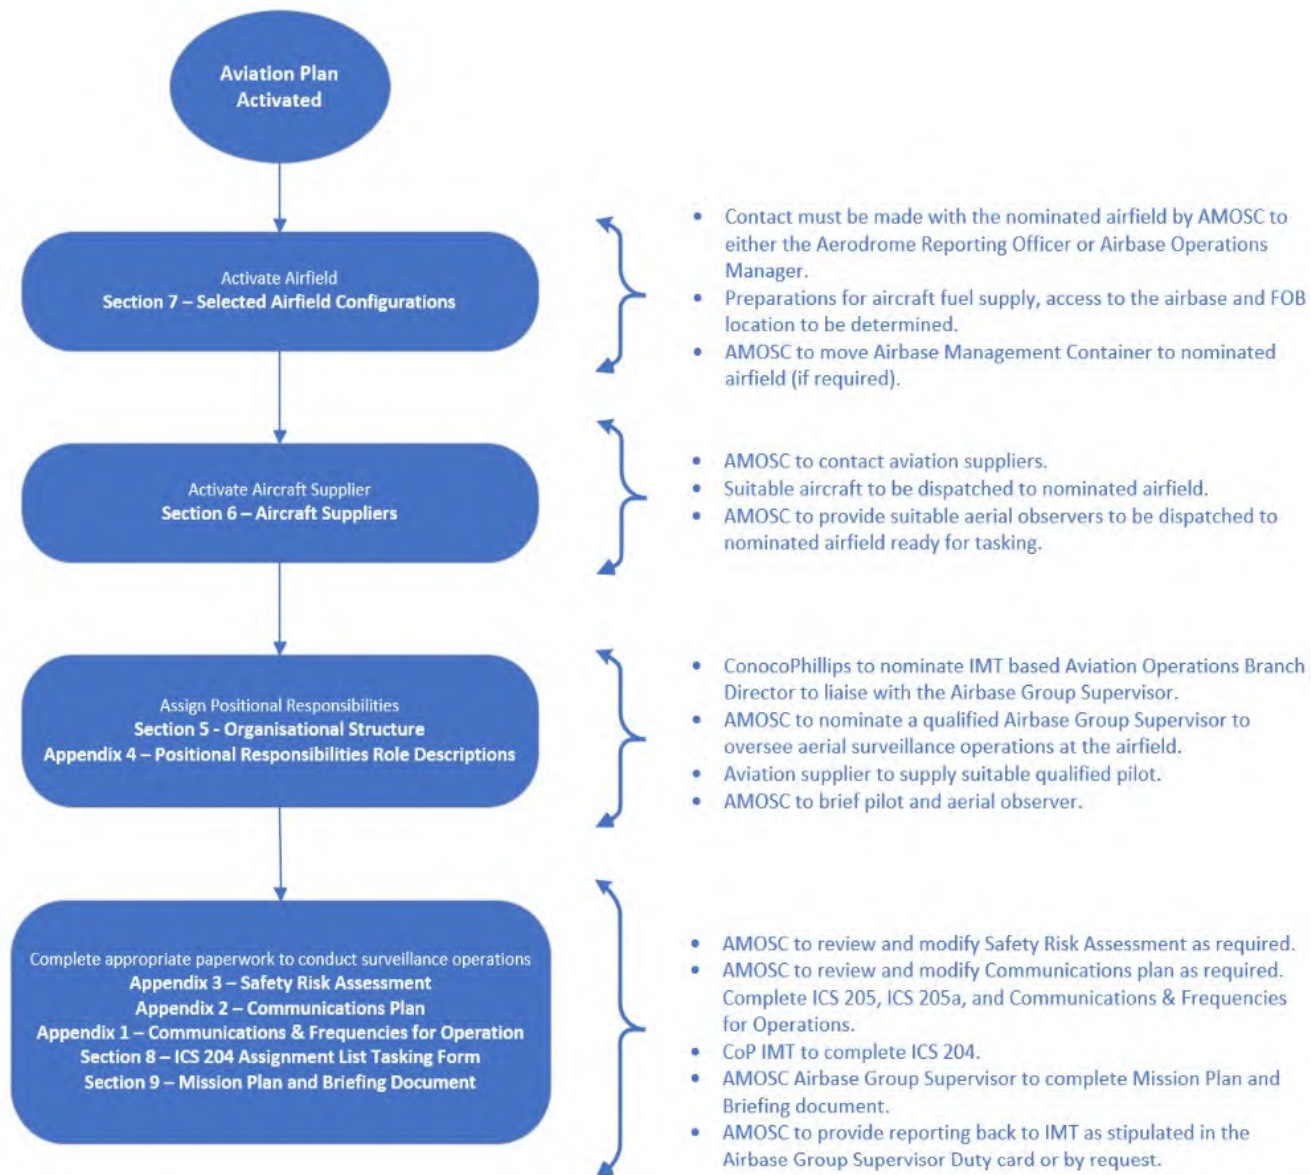

**Figure 3-2: Aerial Surveillance Response Flowchart**

## 4. Airfield Setup Procedure

Once the surveillance contract has been activated by ConocoPhillips Australia, AMOSC will activate and conduct the aerial surveillance operations using the procedure outlined in Figure 4-1 below.

This flowchart ensures that all people, equipment, and documentation are in place.

**Figure 4-1: Airfield Setup Procedure Flowchart**

## 5. Organisational Structure

The positions required to undertake an effective aerial surveillance operation have been highlighted in Figure 5-1 below.

Detailed descriptions and responsibilities for these positions can be found in Appendix 4 – Positional Responsibilities Role Descriptions.

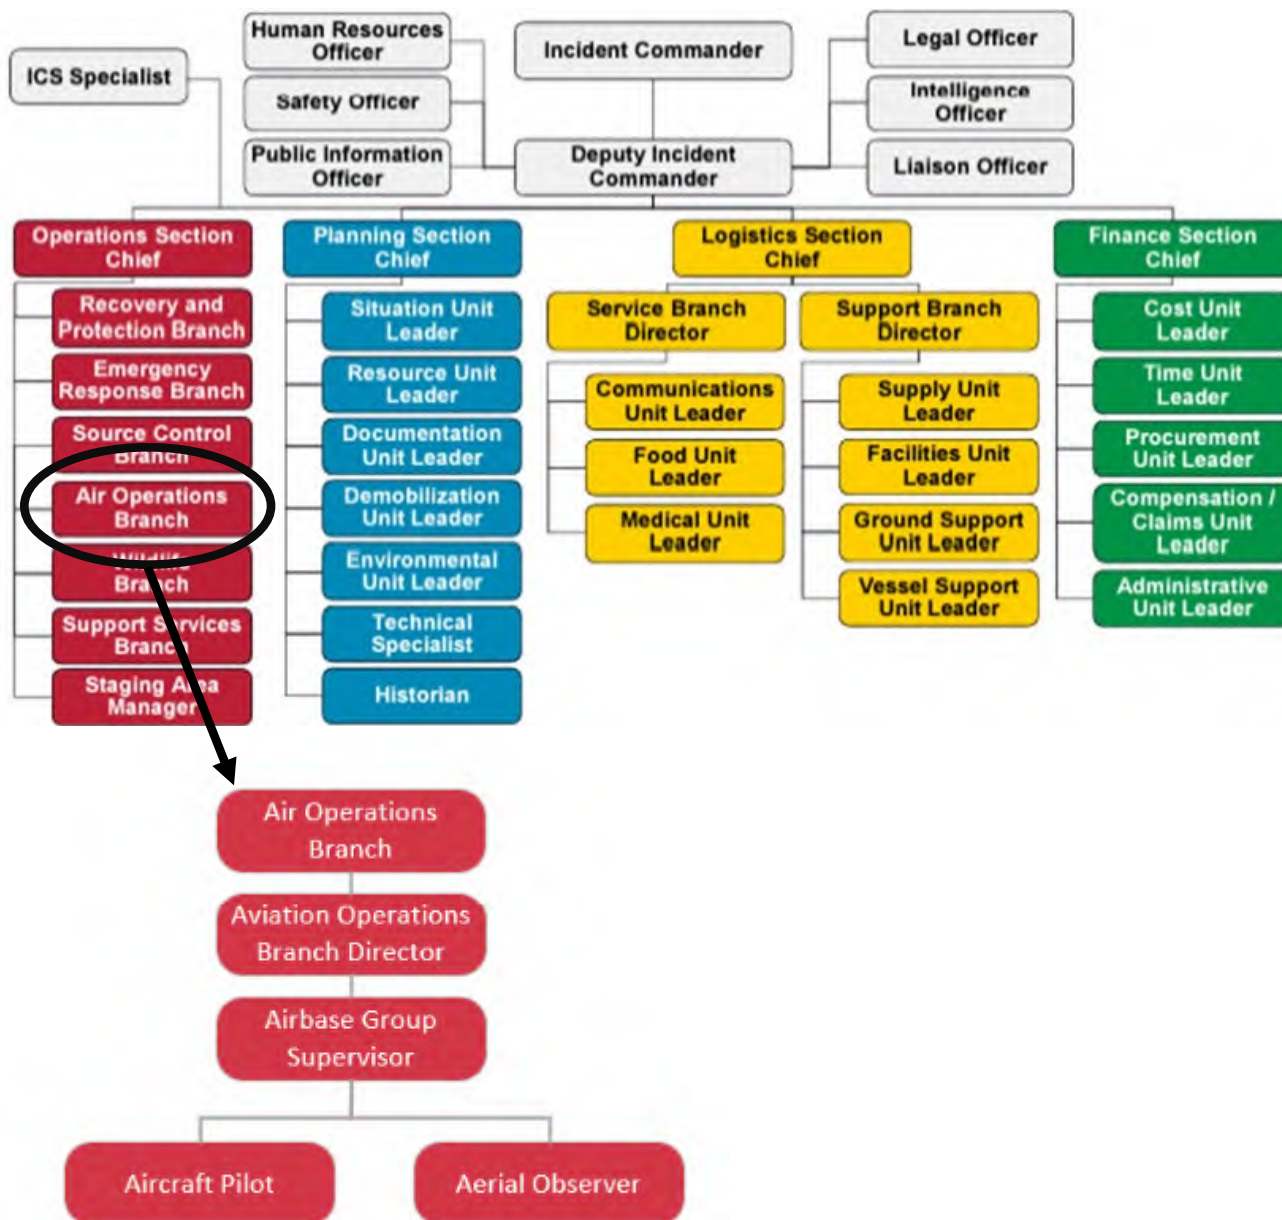

Figure 5-1: CoP organisational structure showing expanded “Air Operations Branch” Roles.

## 6. Aircraft Suppliers

Two aircraft suppliers have been identified as suitable for ConocoPhillips Australia's aerial surveillance operations (see Table 6-1).

When choosing an aerial observation platform, the preference is to use twin engine aircraft, however, with a risk assessment and buoyancy bags fitted to the ground runners while flying over water, single engine aircraft may also be suitable. This decision will be made by the operational staff at the time of the incident, taking into account weather conditions and distance from shoreline.

## 7. Selected Airbase Configurations

### 7.1. Barwon Heads Airport – YBRS

Barwon Heads Airport is a small airfield specifically for light aircraft on the Bellarine Peninsula near the township of Barwon Heads, Victoria, Australia. It is primarily used for scenic flights, private aircraft and flight training.

The airport has a flight training school with two classrooms and fuel facilities. A shower and toilets are located in the terminal building, there is a kitchen, snack and drink machines and a lounge area.

The airport has two runways, the main one is an unrated sealed north/south runway, and there is a smaller east/west grass runway, primarily for ultralight aircraft, and light aircraft in stronger wind conditions.

This airfield can be used for all initial surveillance flights given its close proximity to both drilling permit areas.

#### 7.1.1. YBRS Contact Details

Barwon Heads Airport: 1405 Barwon Heads Road, Connewarre VIC, 3227, Australia and/or PO Box 1123, Barwon Heads VIC, 3227, Australia.

Phone Contacts:

- Jeff Brooks 0418 643 401
- Don Adamson 0418 138 840
- Anton Westerink 0410 552 373

## **7.1.2. YBRS Local Information**

PJE and HEL OPS.

Highway to the South of RWY 18/36, 50M displaced threshold.

Windsock located RWY INT.

Barwon Heads Airport is not a security-controlled airport.

Landing and overnight fees apply.

Prior permission is required before using the airport.

Surface of runway 09/27 is not all weather and should be checked by the pilot in command before use to assess serviceability for your aircraft, it is important you remain on taxiways at all times and refrain from turning on the sealed runway, a turning area is provided at north end to allow turn and back track.

Avgas is available but prior arrangements may be required. A \$20 call out fee is payable AH. All avgas is to be paid at time of refuelling. For avgas they have a number of commercial operators with keys or can arrange with one of the contacts a time for access. Although YBRS is not a self-service Avgas dispenser it is treated as one. All pilots must be aware that as a consequence no after refuelling sample is taken at YBRS and as such CASA Regulations {Section 20.2 Issue 5 part 5.1 (ii)} requires an after fuelling sample to be taken from each aircraft tank before flight.

All pilots of aircraft wanting to land or take-off at YBRS must agree to YBRS terms of conditions before operating on the airfield.

YBRS has a number of commercial operators operating from the airport, these include:

- Flight training
- Warbird adventure flights
- Helicopter flights, and
- Skydiving.

After hours toilet is available with the pin code/door lock 1357 (Melbourne Centre Area Frequency).

All aircraft which are not on the CASA Aircraft database must register their aircraft and provide a billing address with us before landing at YBRS.

All landing & overnight fees and any other chargers are to be deposited into the cash box in the side of the office wall or directly into our bank account.

It is the responsibility of all aircraft owners and pilots to secure their aircraft while on the airfield

YBRS accepts no responsibility for damage sustained to any aircraft left on the airport arising from any cause whatsoever, including negligence on the part of YBRS.

Airport Information	
Approved loading area	Yes
Access to loading area	Yes
Water supply	Yes
Jet A1 fuel	Yes (see ERSA details above)
Access to office facilities	Yes
3G & 4G Reception	Yes
Wifi Available?	Yes
Access to welfare buildings	Yes

## 7.1.4. YBRS Runway Information

- Elevation 50ft.
- CTAF 119.00.
- Area Frequency is Melbourne Centre 120.00.
- On the northern side of the airport just outside the circuit area is Class E Airspace. Avalon Approach 133.55.
- Surface of runway 09/27 is not all weather and should be checked by the pilot in command before use to assess serviceability for your aircraft.
- Runway 36 slopes up to North.
- Runway 18 slopes down to the South.
- Runway 09 slopes down to the East.
- Runway 27 slopes up to the West.
- Runway 36 has a displaced threshold due to Barwon Heads Road (Do not fly low over the road).
- Runway 09 has a displaced threshold due to Stacey's Road.
- Runways 36/18 are sealed but unrated, edges can be soft, do not attempt to exit other than by the taxiways. A turning area is provided at the north end to turn for backtracking.
- All circuits are left hand (unless advised).
- In zero wind they prefer aircraft take off to the south using 18 and landing using 36 (assuming no other conflicting traffic). This uses the slope for best advantage.
- Caution, helicopter landing areas are normally located grass right of runway 36 (they are well outside the gable markers and not marked by the H as depicted by the photo).
- Beware of birds around the airport and in the circuit area (due to the wetlands and Lake Connemara).
- Caution parachute operations, they operate all year round & normally land in the parachute landing area as depicted in the photo with the red box.
- In wet weather stay on runways and taxi ways at all times.
- Visitor and overnight parking are available on the concrete pads south of the fuel bowser. Overflow parking is available to the West of the windsock and on the North side of the East and West runways as depicted in the photo with the blue box.
- PAL lighting on runway 18/36 can be activated by 5 clicks on the CTAF 119.00 within 10 seconds.

## 7.2. King Island Airport - YKII

King Island Airport is a small regional airport located near the town of Currie on King Island off the north-west coast of Tasmania, Australia. The airport is owned and operated by the King Island Council.

Facilities include the King Island Airport Cafe, public toilets, visitor information brochures, free parking and disability access. There are a number of areas available to setup a FOB including parts of the airport facility and a house which may be available for use through the King Island Council.

Refuelling facilities at the airport do not exist, with the airport only holding 5 drums of Jet A1 for emergencies at any one time. Logistics will need to be setup to barge in fuel trucks to assist with the refuelling of aircraft. Currently TasPorts is the primary supplier of bulk fuel products to the Island, however an alternative would be to utilise the vessel "John Duigan" and load a fuel truck from AAT Appleton Dock for transport to King Island. Tas Cargo Services handle all transport arrangements.

Microflite Helicopter services can supply the following:

- 2000 litre fuel trailer
- 5700 litre fuel trailer
- 18,000 litre fuel truck

Fuel vehicles only available outside of the fire season. Alternative sources of fuel can be acquired by Microflite if the fuel vehicles are not available. The fuel vehicle needs to be no heavier than 28 tonnes as the Melbourne loading side is via crane only. The King Island side is roll off, so weight is not a factor unloading.

The now defunct runway 06/24 has been identified as the primary staging location of aircraft and refuelling, as it is only used for overflow aircraft parking and is far enough away from regular airport activities so as not to interfere with regular daily operations.

### 7.2.1. YKII Contact Details

- Address: King Island Airport, 102 Morrison Ave, Loorana, TAS 7256
- Phone: Airport Reporting Officer (ARO) (03) 6462 1499
- Address: King Island Council, PO BOX 147 Currie, King Island, Tasmania 7256
- Phone: (03) 6462 9000
- Address: TasPorts, 90-110 Willis Street, Launceston, PO Box 1060, Launceston, Tasmania 7250

## 7.2.4. YKII Runway information

- Runway 10/28 - 1,585m × 30m – Surface paved, lighted
- Runway 17/35 - 1,105m × 30m – Surface other (COM), lighted
- Runway 06/24 - 800m × 30m – Surface gravel, lighted, no longer active.

## 7.3. Yarram Airport – YYRM

The Yarram airport (also known as the Yarram Aerodrome) is located 3nm East of Yarram, Victoria, Australia and is a small regional airport. The Yarram aerodrome is now operated by the Wellington Shire Council and boasts an all-weather gravel runway, runway lighting, GPS approaches and a number of hangars and a terminal building.

## Aviation Plan

### 7.3.1. YYRM Contact Details

- President: Brian Lucas - 0428 527 237
- Aerodrome Reporting Officer (ARO): Jim Christison - 0429 825 266
- Coordinator Aerodromes: Theo Christopher - 1300 366 244
- Secretary/Treasurer: Trevor Bruns - 0438 384 744
- Chief Flying Instructor: Allan Jarvis - 0439 613 868

### 7.3.2. YYRM Local Information

Ultralight ACFT movements at AD.

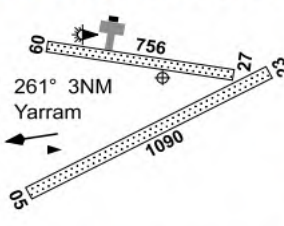

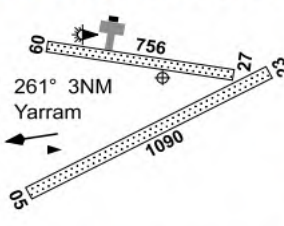

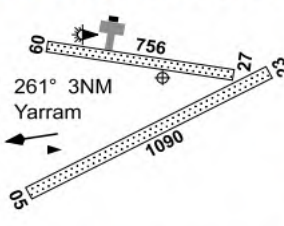

Turbulence and windshear hazard exist:

- RWY 09 – when NE wind ABV 10KT;
- RWY 27 – when NW wind ABV 10KT

Right hand circuits required for night OPS RWY 09.

ACFT at opposite ends of RWY05/23 may not be visible to each other.

### 7.4. Warrnambool Airport – YWBL

The Warrnambool Airport is located 6 nautical miles northwest of Warrnambool, Victoria in Australia.

Warrnambool Regional Airport is owned and operated by the Warrnambool City Council and is registered under Civil Aviation Safety Regulation (CASR) subpart 13.6.C Registered Airports.

The airport has 16 hangars on site accommodating both business and recreational aircraft. The airport is home to Ambulance Victoria, Helicopter Emergency Medical Services (HEMS 4). The airport averages about 40 aircraft movements daily with General Aviation Maintenance (Courier Service) and Ambulance Victoria fixed wing aircraft daily users.

Warrnambool Regional Airport is categorised as a “Security Controlled Airport” under the Aviation Transport Security Act 2004 and Regulations 2005 and operates on an Airport Security Identification Card (ASIC) switch on, switch off program. Only persons with a lawful reason are to access the “Airside Area” of the Warrnambool Regional Airport and must display a valid “Airport Security Identification Card” ASIC, at all times.

## 10. Secondary Airbase Considerations

### 10.1. Smithton Airport – YSMI

Smithton Airport is a small Australian regional Airport. Located on Tasmania's North-West tip. Smithton is just a 30-minute flight from King Island and a 1-hour flight from Moorabbin in Victoria.

The airport is operated by the Tasmanian Department of Infrastructure, Energy and Resources.

The airport has a number of tenants including:

- J.M.M. Pty Ltd trading as King Aviation.
- Tasmanian Seafoods Pty Ltd.
- Lloyd Kay trading as Bell Ultralight Aviation.
- Paul Murphy.

#### 10.1.1. YSMI Contact Details

- Address: 347 Montagu Rd, Smithton, Tasmania
- Phone: 0412 203 439
- Email: [info@smithtonairport.com.au](mailto:info@smithtonairport.com.au)

#### 10.1.2. YSMI Local Information

Bird hazards exist.

## Appendix 1. Communication and Frequencies for Operations

Below is a template for a summary of all communication & frequencies which should be used by the Airbase Manager and the IMT to ensure efficient communications can be made with all personnel involved in the surveillance operation. This communications list should be posted in clear view at the airfield so that everyone can access it when required.

LOCATION/RESOURCE	OFFICER	CONTACT NUMBERS

Emergency services	<i>(Nearest Location)</i>	<i>(Phone No.)</i>
Helicopter company	<i>(Contact Name)</i>	<i>(Phone No.)</i>

# Aviation Plan

## Appendix 2. Communications Plan

This section is to be used to develop a communications plan which will clearly highlight what technology, frequency, or number is needed to allow for effective communication across all areas relating to an offshore surveillance operation.

Whenever an incident occurs in a remote offshore location, communications can be challenging. By developing this plan, communication between the IMT, the FOB and the operating aircraft can be identified and documented.

There are three distinct communication zones:

- The IMT
- The Airbase
- The Offshore Operations (Operational Aircraft)

By using the below matrix, primary and secondary communication methods can be established.

	The IMT	The Airbase	Offshore Operations
The IMT	Primary: Voice Secondary: Mobile Phone/UHF Radio	Primary: Mobile Phone Secondary: Satellite Phone	N/A
The Airbase	Primary: Mobile Phone Secondary: Satellite Phone	Primary: Voice Secondary: Mobile Phone/UHF Radio	Primary: Airband VHF Radio Secondary: Satellite Phone
Offshore Operations	N/A	Primary: Airband VHF Radio Secondary: Satellite Phone	Primary: VHF Headset Secondary: Voice

Once communication lines have been established between the IMT, the Airbase and the Operational Aircraft, the airbase manager will complete an ICS Form 205 and 205a to record all communication paths.

### INCIDENT RADIO COMMUNICATIONS PLAN (ICS 205)

### COMMUNICATIONS LIST (ICS 205A)

[illegible]

## Appendix 3. Safety Risk Assessment (AMOSOC)

### Column Descriptions

<b>Column A</b>	Hazard ID#. Unique identifier for each identified hazard.
<b>Column B</b>	Location of hazard.
<b>Column C</b>	The activity to be carried out. Do not fill in names of machines/equipment to be used (i.e. a computer is not an activity, but working on a computer is)
<b>Column D</b>	Select from the drop down list the type of hazard associated with the activity to be carried out. i.e., Physical, Chemical, Ergonomic, Environmental, Electrical.
<b>Column E</b>	More specific detail of hazard e.g. Environment - over exposure to extreme temperatures
<b>Column F</b>	Identify possible consequences/effects accidents/ill health associated with each identified hazard (e.g. fires, explosions, cuts, burns, frost bites, fractures etc).
<b>Column G</b>	Inherent Risk Rating. The risk that an activity would pose if no controls or other mitigating factors were in place (the gross risk or risk before controls) Likelihood - see matrix section below.
<b>Column H</b>	Inherent Risk Rating. The risk that an activity would pose if no controls or other mitigating factors were in place (the gross risk or risk before controls) Consequence - see matrix section below.
<b>Column I</b>	Inherent Risk Rating. The risk that an activity would pose if no controls or other mitigating factors were in place (the gross risk or risk before controls) Risk = Likelihood x Consequence. Calculated automatically and cell will change colour based on risk rating
<b>Column J</b>	Risk control measures that are in place to eliminate or minimise risks. Methods to control risks may be analysed according to the Hierarchy of Controls: Elimination, Substitution, Engineering Controls, Administrative Controls and Personal Protective Equipment (PPE). Elimination of the hazard should take first priority while PPE should be the last line of defence. Elimination (e.g. Use water-based solvents instead of organic based solvents); Substitution (e.g. Use a less toxic solvent); Engineering Controls (e.g. Use of fume cupboard or gloves boxes); Administrative Controls (e.g. Work instructions, good practices, training); PPE (e.g. Use of safety eyewear plus respirator, use of gloves).
<b>Column K</b>	Residual Risk. The risk that remains after controls are considered (the net risk or risk after controls). Likelihood - see matrix section below.
<b>Column L</b>	Residual Risk. The risk that remains after controls are considered (the net risk or risk after controls). Consequence - see matrix section below.
<b>Column M</b>	Residual Risk. The risk that remains after controls are considered (the net risk or risk after controls). Consequence - see matrix section below Risk = Likelihood x Consequence. Calculated automatically and cell will change colour based on risk rating
<b>Column N</b>	Enter the name of the person appointed to oversee the implementation of the additional control measures.

## Risk Matrix Tool

<b>Risk Matrix Based on AS/NZ ISO 31000</b>				Consequence/Impact/Severity				
				Insignificant (1)	Minor (2)	Moderate (3)	Major (4)	Catastrophic (5)
				No injuries	First aid treatment	Medical treatment required	Extensive injuries	Death
				1	2	3	4	5
Likelihood/Probability	Frequent (5)	Almost Certain	A	5	10	15	20	25
	Likely (4)	Will probably occur in most circumstances	B	4	8	12	16	20
	Possible (3)	Might occur at some time	C	3	6	9	12	15
	Unlikely (2)	Could occur at some time	D	2	4	6	8	10
	Rare (1)	May occur only in exceptional circumstances	E	1	2	3	4	5

1 to 2	Risk Acceptable	There are no imminent dangers. Frequent review shall be in place especially changes in procedures, materials or environment.
3 to 6	Review Task before proceeding	Proceed with care. Additional control is advised.
7 to 14	High Risk Task	Proceed with extreme caution. Implement additional (secondary) controls if possible.
15 to 25	Operation not permissible	Stop operation and review controls. If necessary abort task.

# Aviation Plan

## Risk Assessment

Hazard ID #	Hazard Identification					Inherent Risk Rating (pre-controls)			Risk Control	Residual Risk (post controls)			
#	Location	Work Activity / Task / Hazard Source	Hazard Type	Hazard	Effects / Consequences	Likelihood (L)	Consequence ( C )	Risk = LxC	Risk Control	Likelihood (L)	Consequence ( C )	Risk = LxC	Person Responsible
SURV-1-1	On water / over water activities	Normal Flight Operations	Physical	Aircraft Ditching, Engine failure, Fuel exhaustion, Structural Failure	Personal Injury or death	2	5	10	Daily pre-flight inspections of all aircraft, Thorough flight planning.	1	5	5	Pilot
SURV-1-2	Airfield / Airbase	Normal Flight Operations	Physical	Aircraft accident within airbase/airfield boundary	Personal Injury or death	3	5	15	Communication with control tower. Communication with emergency services on field. Secure Site. Appropriate reporting procedures to authorities.	1	5	5	Pilot, Airfield Operator, AGS
SURV-1-3	Airbase / Airfield / Operational Flying / Over water	Normal Flight Operations	Physical	Pilot disorientation, Incapacitation	Personal; Injury or death	2	3	6	Accurate weather reports before departure. Ground crew monitoring pilot. Pilot has current medical. Self-monitoring by Pilot. Fatigue management.	1	3	3	AGS, Pilot
SURV-1-4	Airbase / Airfield / Operational Flying / Over water	Normal Flight Operations	Physical	Communications Failure	Personal injury, Failure of equipment	2	2	4	Pre-flight testing of the system. Use of aircraft secondary navigation systems, second GPS, second VHF channel, TracPlus units, Returning to NOB	1	2	2	AGS, Pilot
SURV-1-5	Airbase / Airfield / Operational Flying / Over water	Normal Flight Operations	Physical	Emergency Equipment non-operational	Personal injury or death, Failure of equipment	2	5	10	Pre-flight inspection of sea survival equipment. Top cover for SAR purposes and surface vessel SAR. Pilot to wear lifejacket and personal EPIRB whilst operational. Quarterly equipment checks. Equipment serviced as per manufacturer's instructions.	1	5	5	AGS, Pilot
SURV-1-6	Airbase / Airfield / Operational Flying / Over water	Normal Flight Operations	Physical	Extreme weather events	Personal Injury or death	3	5	15	Up to date and accurate weather reports and regular monitoring. Identify a secondary airfield as an alternate landing strip.	1	5	5	AGS, Pilot

# Aviation Plan

Hazard ID #	Hazard Identification					Inherent Risk Rating (pre-controls)			Risk Control	Residual Risk (post controls)			
SURV-1-7	Airbase / Airfield	Normal Refuelling Operations	Chemical / Physical	Aircraft fire on the ground	Personal Injury or death, environmental damage, infrastructure damage, equipment damage	2	5	10	Shutdown aircraft before refuelling. Refuel by qualified airfield personnel. Pilot to supervise refuelling. Pilot to exit aircraft whiles refuelling in progress. Fire extinguisher on hand at all times. Emergency contact phone number for airfield emergency services.	1	5	5	AGS, Pilot

## Appendix 4. Positional Responsibilities Role Descriptions

### Aviation Operations Branch Director (AOBD)

- Interpret the incident controller's intent for surveillance.
- Liaise with operations unit – air operations branch.
- Liaise with logistics unit for aviation support requirements.
- Assess the available response assets and any limitations (maintenance, Crew, logistics, weather) that may impact tasking.
- Generate the surveillance flying program to meet IMT planning section intelligence requirements.
- Generate the Air Data Computer (ADC) flying program for maximum coverage in conjunction with the aircraft pilot.
- Assess SAR requirements and in liaison with the air operations branch, generate SAR aircraft standby and flying program to provide coverage for surveillance operations.
- Generate any logistical support missions as required.
- Help generate the Air Task Order (ATO) and flying program.
- Issue ATO and flying program to the AGS.
- Assemble aviation surveillance operations activity brief for the IC.

### Air Base Group Supervisor (AGS)

- Receive taskings / flying program details from the AOBD.
- Brief airfield ARO and airfield fuel suppliers of 72-hour requirements.
- Ensure aviation fuel stocks are suitable for 72-hour forecast activities.
- If required, liaise with airfield ARO and the AOBD to ensure that the aviation fuel requirements are met.
- Notify IMT of all SARTIME overruns and initiate the emergency response plan if required.
- Monitor airfield suitability and report any issues to the IMT as required (i.e. security, airfield congestion, etc).
- Report any airfield stakeholder issues to the IMT.
- Compile and report daily and weekly reports as required to the IMT.

### Surveillance Pilot

- Receive tasking information from the AGS.
- Plan flight to arrive at the operational area as per tasking order.
- Submit a flight plan for the flight.
- Nominate SARTIME with the AGS.
- Maintain safety of the flight.
- Conduct operations as required by the aerial observer.
- Participate in debriefing activities post flight with the AGS and IMT
- Compile and report post flight activities to the AGS including:
  - Total hours flown,
  - The status of the crew,
  - Any safety breaches,
  - Any administration or logistical issues.

### Aerial Observer

- Receive tasking information from the AGS.
- Attain the most recent information from the IMT planning section.
- Plan the flight with the pilot to arrive onsite as tasked.
- Conduct observation operations as tasked.
- Participate in debriefing activities post flight with the AGS and IMT.
- Compile and report post flight activities including:

## Aviation Plan

---

- Total hours flown,
- Results of the operation,
- Any safety breaches,
- Any administration or logistical issues.

# Shoreline Protection and Clean-up Plan

---

## 1. Purpose

The purpose of this Shoreline Protection and Clean-up Plan is to describe the arrangements that ConocoPhillips Australia has in place to prepare for and respond to shoreline impact of a hydrocarbon release during the Otway Exploration Drilling Program (the activity or exploration program).

## 2. How to use this Plan

This plan supports Section 4.3 (Shoreline Response: Protection and Deflection) and Section 4.4 (Shoreline Response: Shoreline Clean-up) of the ConocoPhillips Australia Oil Pollution Emergency Plan (OPEP) for the exploration program.

Each section of this document and the supporting appendices have been drafted to expedite the implementation of appropriate shoreline response operations.

In the event of a spill and upon awareness of the potential for shoreline contact, the incident management team can use the function-specific sections of this document (Section 3) to guide shoreline response – including tactics/tasks, resources and logistics.

This plan should be used in conjunction with the Environment Protection Authority (EPA) Tasmania – First Strike Plan for King Island, and the Victorian State Maritime Emergencies (non-search and rescue) Plan.

## 3. Shoreline Protection and Clean-up Strategy

Shoreline protection and deflection and shoreline clean-up have been identified through a feasibility and effectiveness assessment as proposed response strategies for both an marine diesel oil (MDO) and a gas condensate release. These strategies should be deployed where safe to do so and where the Net Environmental Benefit Analysis (NEBA) indicates the strategy will result in net environmental benefit. Should the response or the spill impact state waters (within 3 nm of the coastline), the shoreline response will be under the control of the relevant state control agency with ConocoPhillips Australia providing equipment and personnel support as required.

Oil spill modelling shows the probability of shoreline contact by hydrocarbon released during a worst-case credible discharge varies depending upon the season and the relative wind and sea conditions. The geographic boundaries of potential oil stranding sites extend from the SA/Victorian Border to Wilsons Promontory and King Island. Further modelling detail is available within the OPEP Section 2.3

In order to mount an effective and timely response to a potential shoreline impact, extensive work has been done to clearly define what clean-up strategies should be employed based on the location of the shoreline impact. The location of the shoreline impact triggers either a Tactical Response Plan (TRP) activation, or a Shoreline Treatment Recommendation (STR) implementation. The shoreline response process is outlined in Figure 1.

# Shoreline Protection and Clean-up Plan

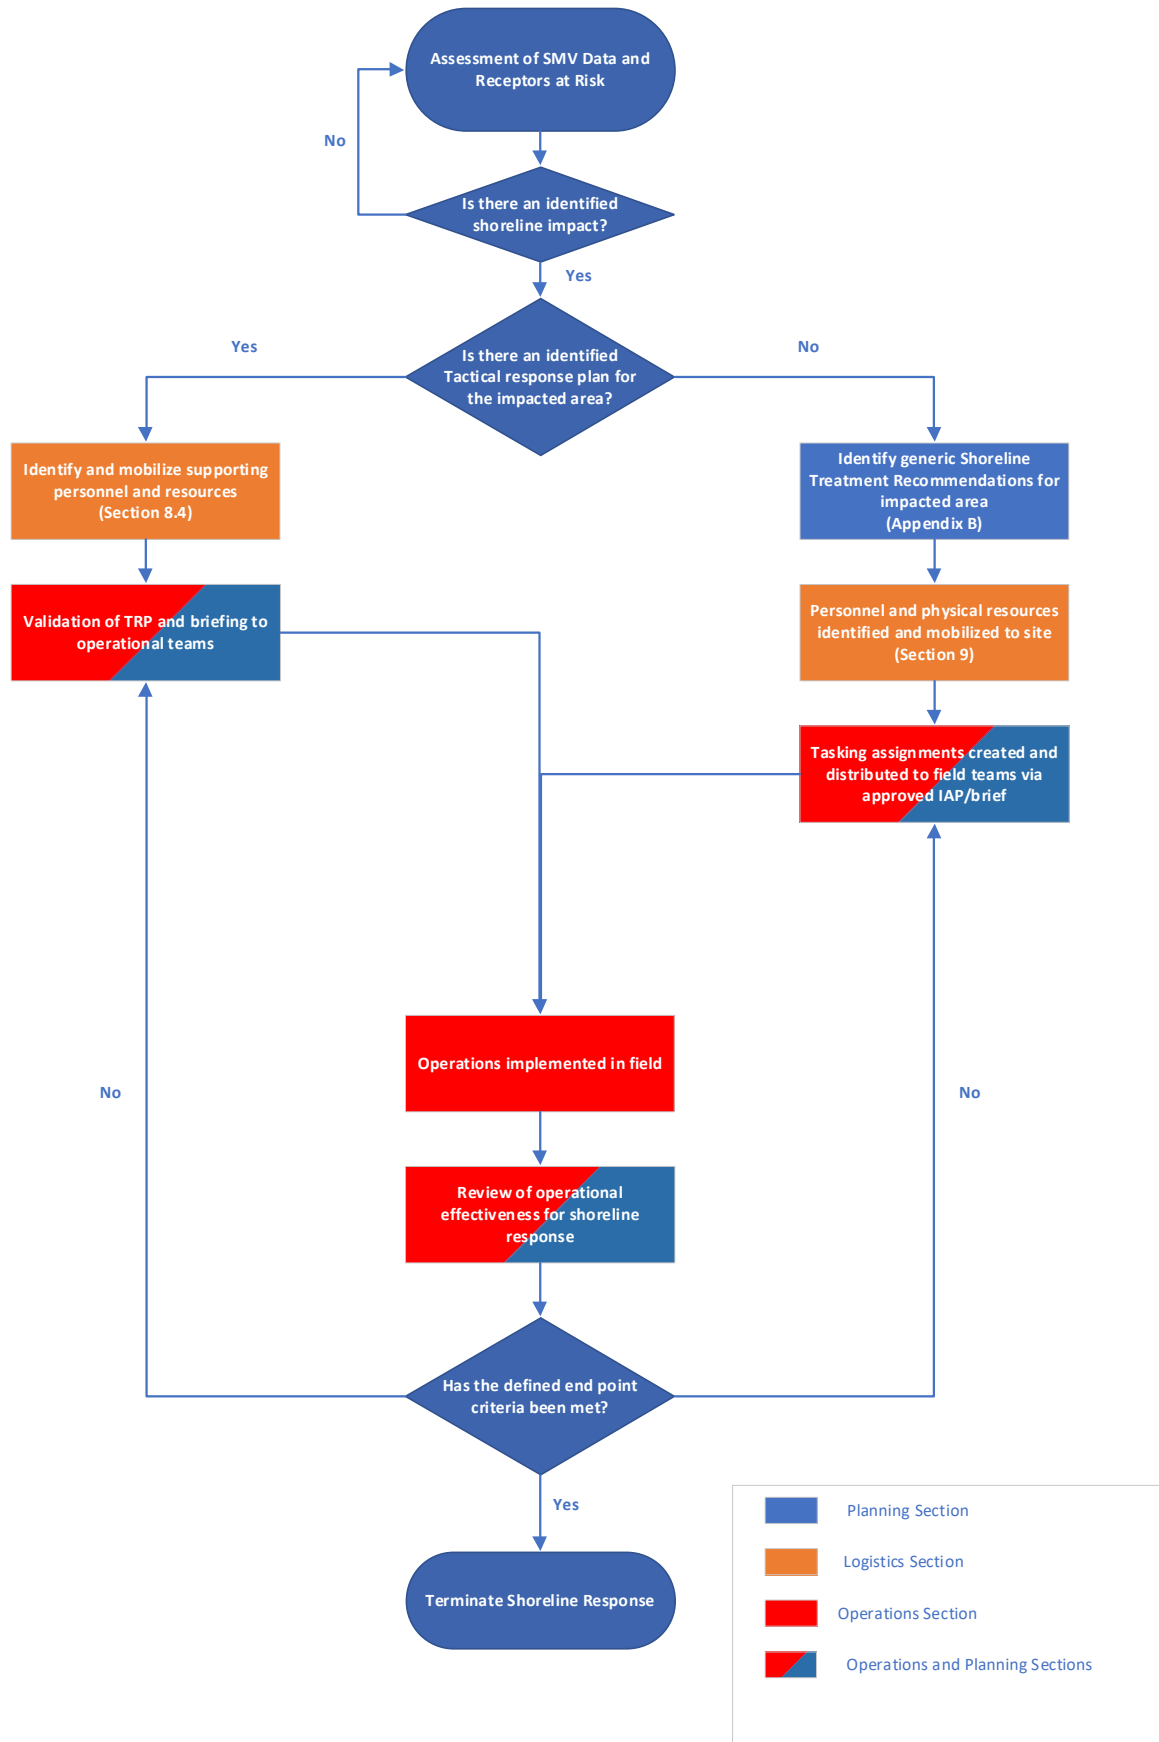

Figure 3-1: Shoreline response flowchart

## 4. Shoreline Command Structure

Shoreline response field operations can scale up quickly to involve large numbers of responders and supporting equipment and logistics. This requires effective planning, operational support and communication across the Incident Management Team, Forward Operating Base(s) and Field Teams.

For ConocoPhillips Australia's exploration activity, oil spill modelling indicates the potential for shorelines to be impacted at moderate thresholds at King Island, Tasmania and along the Victorian coastline, requiring the need for cross-jurisdictional response arrangements. Further details around these arrangements are outlined in Sections 2.7.2 – 2.7.5 of the OPEP for the exploration program.

## 5. Tactical Implementation

This section provides Tactical Response Plans (TRPs) for the identified 'high priority' shoreline sites along the Victorian and King Island coastlines. A Shoreline Treatment Recommendation Guide (STRG) is also included as a supporting resource (Appendix 1) along with pre-determined sectorisation and segmentation mapping.

### 5.1. Sectorisation and Segmentation

The shoreline from Nelson to Cumberland River (including Deen Maar (Lady Julia Percy Island), Inverloch to South Point (including surrounding islands off the Wilsons Promontory National Park) and the Western Side of King Island has been identified in the modelling as having a potential to be impacted by a hydrocarbon spill. This stretch of coastline has been divided in to eight sectors for the purpose of this Shoreline Protection and Clean-up Plan. The geographic scope and sectors are illustrated in Figure 5-1.

**Figure 5-1: Geographic scope and sectors of this plan**

Sector A – Glenelg	Sector B – Moyne
Sector C – Warrnambool	Sector D – Moyne 2
Sector E – Corangamite	Sector F – Colac-Otway
Sector G – South Gippsland	Sector H – King Island

# Shoreline Protection and Clean-up Plan

The eight sectors are further divided into operational segments to assist with site identification and tactical response planning found in Table 5-1.

Several parameters were taken into consideration during the segmentation process, these include substrate type, sensitive receptors (ecological, sociological, and economic), population, access and egress, proximity to key sites, distance between segments and bodies of water (embayment's, estuaries, rivers).

The sectorisation and segmentation of the coastline was completed in Google Earth Pro. Sector layers have been prepared and are available in KMZ/KML format via Australian Marine Oil Spill Centre (AMOSC).

**Table 5-1: Shoreline segmentation – primary details**

Sector Reference	Total Segments	West Segment	West Coordinate	East Segment	East Coordinate
A: Glenelg	91	NEL-10	38°3'22.43"S 140°57'57.30"E	CDT-06	38°15'53.27"S 141°52'18.77"E
B: Moyne	37	CDT-06	38°15'53.27"S 141°52'18.77"E	WNB-09	38°22'12.59"S 142°25'7.70"E
C: Warrnambool	13	WNB-08	38°22'12.59"S 142°25'7.70"E	MPG-05	38°27'1.14"S 142°36'32.08"E
D: Moyne 2	28	MPG-05	38°27'1.14"S 142°36'32.08"E	PTB-05	38°36'36.95"S 142°53'16.10"E
E: Corangamite	36	PTB-05	38°36'36.95"S 142°53'16.10"E	CVN-02	38°45'20.57"S 143°17'35.81"E
F: Colac-Otway	62	CVN-02	38°45'20.57"S 143°17'35.81"E	TSI-03	38°34'49.59"S 143°56'43.95"E
G: East Gippsland	124	INV-05	38°38'9.69"S 145°43'53.08"E	WEL-09	38°42'13.60"S 146°25'45.56"E
H: King Island inc Christmas and New Year Island.	646	KI01	39°56'7.27"S 143°50'26.27"E	KI526	39°56'7.24"S 143°50'26.09"E

## 5.2. Areas of Sensitivity

As outlined in the Environment Plan (EP) for the Otway Exploration Drilling Program, ConocoPhillips Australia have identified the following key coastal areas listed in Table 5-2 as areas of high sensitivity in the event of a large accidental release of hydrocarbons.

**Table 5-2: High sensitivity coastal locations**

ID	Location
VIC080	Shallow Inlet Marine & Coastal Park
VIC062	Anderson Inlet
VIC158	Aire River
VIC075	Lower Merri River Wetlands
VIC028	Glenelg Estuary
VIC030	Long Swamp
VIC066	Corner Inlet
VIC093	Princetown Wetlands
VIC091	Lower Aire River Wetlands
VIC084	Yambuk Wetlands
VIC159	Glenelg River
Victorian Cultural Heritage Sites	
Tasmanian Cultural Heritage Sites (inc. King Island)	
King Island Important Bird Area (IBA)	

# Shoreline Protection and Clean-up Plan

The scale of the coastline in which the above areas are located is extensive. The shoreline type, key sensitive receptors and access/egress all vary significantly and subsequently so do the suitability of shoreline response options.

On review of the affected Local Government Areas (LGAs) and high sensitive coastal locations, the criteria within Table 5-3 was used to identify the requirement to develop a Primary or Secondary TRP.

**Table 5-3: Selection criteria for primary and secondary tactical response plan development**

Identified sensitivities to protect.	Response is logistically feasible.	Response is achievable with good chance of success.
Area of high sensitivity and/or long recovery time; or	Accessible by existing roads, tracks or vessels (Min. 4wd drive and pedestrian access)	No more than 5 boom sets of 250m each required (<1.25 km booming); and
Area of high cultural, local or national significance; and		Potential for calm water; and
Where the use of this area will be significantly affected by the presence of oil.		Probability of current flows being slow enough.

## 6. Tactical Response Plans

TRPs have been prepared for sites along the coastline in all the affected LGA's outlined in Section 3.1. Figure 6-1 shows the TRP decision guide used to determine the type of TRP is developed, being either a:

**Primary TRP** – for sites which meet the criteria outlined in Section 5.2, and therefore have a tactical response plan prepared which includes site specific details, response tasks, site setup plans, concept of operations and a full resource inventory; or

**Secondary TRP** – for sites which only partially meet the criteria outlined in Section 5.2. Their status indicates they are not significantly at risk to the impact of a hydrocarbon release; however, conditions could change which would require immediate attention for shoreline response planning. A tactical response plan for secondary sites focuses on site details and response initiation.

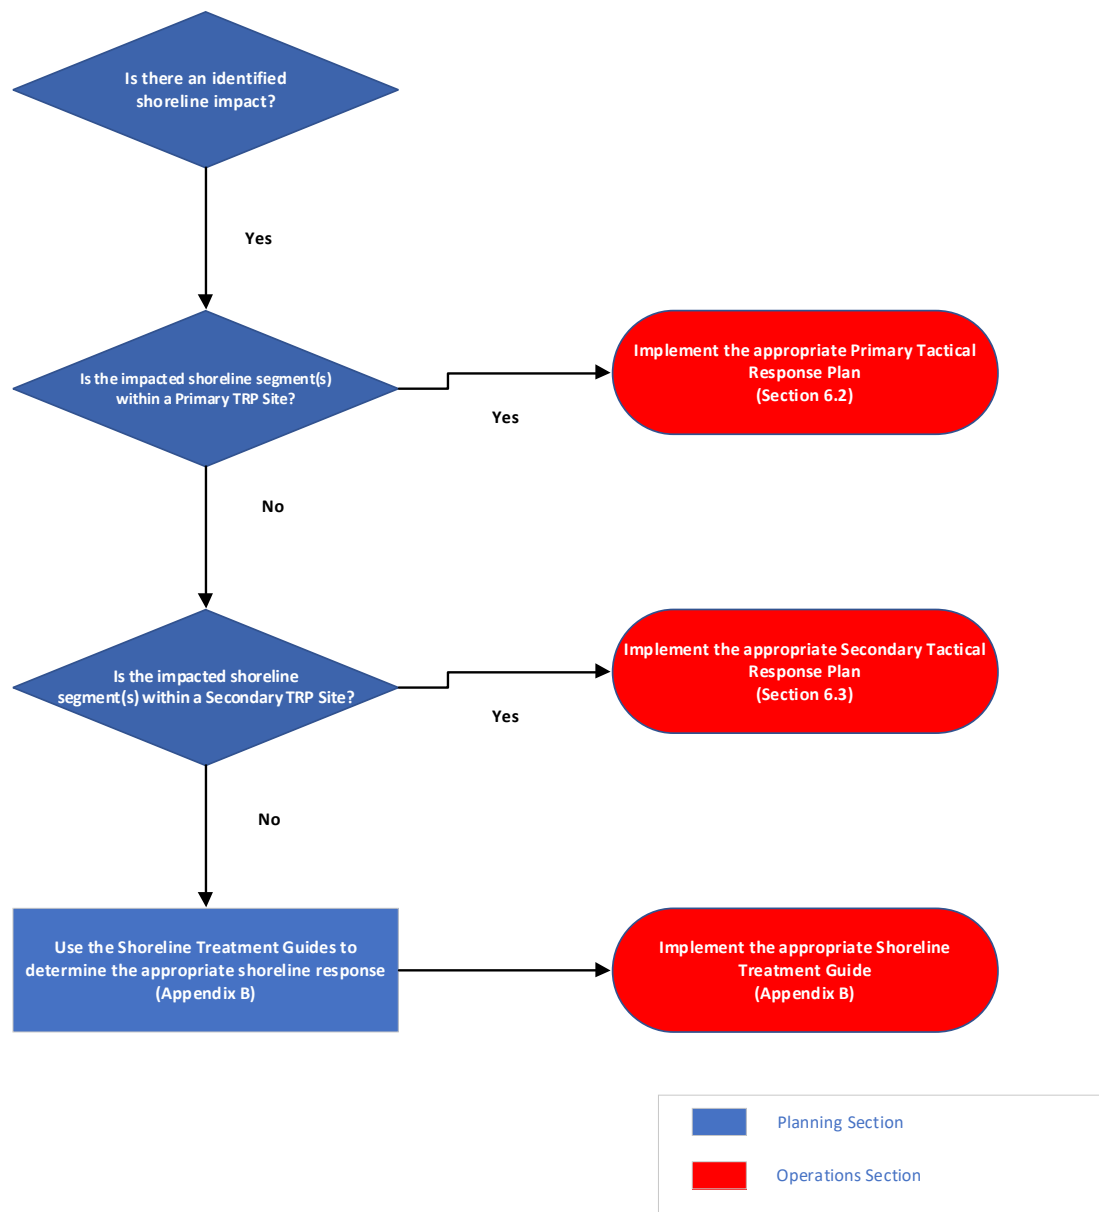

Figure 6-1: TRP development decision guide

## 6.1. Sites of First Nations Peoples Cultural Significance

Tasmania and Victoria have a rich and varied Indigenous Heritage. It is understood that there are likely to be sites along the affected areas that are important for social, spiritual, historical, and commemorative purposes.

Access to data identifying the location and reasoning behind these areas is limited due to cultural sensitivity of the sites and traditional landholders' preference to keep sacred sites within their own people.

Prior to the implementation of any shoreline deflection, protection, or clean-up, it is recommended that a cultural heritage advisor with specific knowledge of a given region is identified and incorporated into the planning section of the Incident Management Team (IMT).

Further situational information and mapping of cultural heritage sites of significance will need to be developed in the event of an incident, beyond what has been presented in this plan.

# Shoreline Protection and Clean-up Plan

## 6.2. Primary TRP Sites

The 23 sites in Table 6-1 have been identified as 'High Priority' for shoreline response. Primary TRPs have been developed for each site, with the following information included in the Primary TRPs:

- **TRP Reference** – sector, segment(s), coordinates,
- **Site Details** – site location image, site description, site access, site constraints, main sensitivities, and facilities/services,
- **Response Information** – response tasks, rationale, site reference and response checklist,
- **Site Setup** – schematic illustrating site zoning, control, waste, and decontamination,
- **Concept of Operations** - guide to response deployment including boom placement, anchoring and oil recovery (where appropriate),
- **Tactical Assignments** – response tasking and considerations, response personnel and communications,
- **Resources** – inventory of personnel, oil spill equipment, vehicles/vessels, and site support resources required, and
- **Personnel and Emergency Information** – to be populated prior to implementation.

For each TRP there is an electronic tactical response layer available for Google Earth Pro which identifies the TRP site and response operations.

All references to booming operations in the TRPs and electronic layers are for illustrative purposes only. Situational Awareness and response specific conditions will determine the appropriate angle and anchoring system required on the day.

**Table 6-1: Primary TRP locations**

	LGA Reference	TRP Name	Latitude	Longitude
Victoria	Glenelg LGA	Glenelg River Primary TRP	38° 3'34.76"S	140°59'22.54"E
		Portland Primary TRP Site	38°20'42.53"S	141°37'17.54"E
		Surrey River Primary TRP	38°15'34.68"S	141°42'4.86"E
		Fitzroy River Primary TRP	38°15'42.64"S	141°51'12.37"E
	Moyne LGA	Moyne River Primary TRP Site	38°23'21.55"S	142°14'55.94"E
	Warrnambool LGA	Merri River Primary TRP Site	38°24'2.60"S	142°28'18.98"E
		Hopkins River Primary TRP Site	38°24'7.93"S	142°30'32.38"E
	Moyne 2 LGA	Curdies Inlet Primary TRP Site	38°36'24.74"S	142°52'52.33"E

		Ettrick River Primary TRP	39°59'36.76"S	143°53'29.45"E
TAS	King Island LGA	Ettrick River Primary TRP	39°59'36.76"S	143°53'29.45"E

# Shoreline Protection and Clean-up Plan

## 6.3. Secondary TRP Sites

The 33 sites in Table 6-2 have been identified as secondary sites for shoreline response. Secondary TRPs have been developed for each site, with the following information included in the Secondary TRPs:

- **TRP Reference** – sector, segment(s), coordinates,
- **Site Details** - site location image, site description, site access, main sensitivities, and facilities/services,
- **Site Reference** – site reference image,
- **Response** – site response justification, response initiation tasks, actions required, site assessment checklist and local information.

For each TRP there is a tactical response layer available for Google Earth Pro which identifies the TRP site.

**Table 6-2: Secondary TRP sites**

	LGA Reference	TRP Name	Latitude	Longitude
Victoria	Glenelg	Lake Mombeong	38° 6'46.27"S	141° 7'13.64"E
	Moyne	Yambuk Lakes	38°20'17.43"S	142° 2'45.38"E
		Yambuk Coastal Reserve	38°16'14.69"S	141°54'15.61"E
		Belfast Coastal Reserve	38°20'55.39"S	142°22'4.91"E
	Warrnambool	<i>Nil Secondary Identified</i>		
	Moyne 2	Buckley Creek	38°29'42.35"S	142°41'7.26"E
	Corangamite	Sherbrook Creek	38°38'35.02"S	143° 3'26.26"E
	Colac Otway	Milinesia Creek	38°45'5.30"S	143°18'49.43"E
		Blanket Bay Creek	38°49'35.59"S	143°34'58.68"E

		Yellow Rock River	39°41'52.58"S	143°53'27.66"E

## 7. Shoreline Clean-up and Assessment Technique

Shoreline Clean-up and Assessment Technique (SCAT) provides a systematic approach that uses standard terminology to collect data on shoreline oiling conditions. SCAT teams will evaluate oiling conditions factoring in shoreline types and environmental sensitivities and provide Shoreline Treatment Recommendations (STRs) and associated constraints. SCAT teams will collect the data needed to develop a Shoreline Clean-up Assessment Plan that will:

- Maximise recovery and enhance natural clean-up processes to the maximum extent practicable,
- Obtain the net environmental benefit, and
- Minimise the risk of further damage to habitats and resources from clean-up efforts.

During a response, SCAT would usually be undertaken by the Shoreline Assessment Group within the Environment Unit of the IMT.

This would occur concurrently with shoreline response activities, including pre-cleaning and protection of pre-determined locations. In the context of this plan this operating model is a guide and ConocoPhillips Australia would be responding under the guidance of the Victorian and/or Tasmanian control agencies, should it be requested.

## 8. Logistics and Resourcing Arrangements

The logistics section describes the equipment and resources required to support the TRPs outlined above.

Logistical and support arrangements for the supply of equipment and resources will operate in a tiered approach as described in the following sections.

### 8.1. Local Response Resources

Local resources are those available in the state of Victoria or on King Island, Tasmania and can be used on short notice. This equipment may come from the Port Authorities, state agencies (Department of Transport and Planning Victoria, or EPA Tasmania) or access to locally available equipment from the Australian Maritime Safety Authority (AMSA) and AMOSC.

### 8.2. Regional Response Resources

Regional response resources are those that are available within Australia, these may require mobilisation time and can come from AMSA, AMOSC or via the AMOSPlan Mutual Aid arrangements with industry. Table 8-1 provides a general indication of road transport time for this equipment to be available in townships that may be close to response locations.

Table 8-1: Indicative equipment movements times – via road

Time (hrs)	Portland	Apollo Bay	Sandy Point	Tidal River	Currie*
Geelong	4	2	4	5	16
Melbourne	5	3	3	4	17
Devonport#	16	14	16	17	12
Adelaide	6	9	11	11	24
Sydney	13	12	11	12	26
Brisbane	22	21	20	21	28
Townsville	29	29	29	30	43
Fremantle	35	37	39	40	52
Exmouth	46	48	50	51	64
Broome	49	51	53	54	67

\*Travel time to Currie includes vessel transit from the Port of Geelong.

# Travel time from Devonport includes transit to Port of Geelong (direct to Currie)

#### 8.2.1. AMSA Resources

ConocoPhillips Australia have access to Australian Maritime Safety Authority (AMSA) equipment Australia wide through AMOSC and the National Plan. AMSA maintain significant stockpiles of equipment in Adelaide, Brisbane, Dampier, Darwin, Devonport, Fremantle, Melbourne, Sydney, and Townsville.

A live full inventory of AMSA equipment is available from the AMSA website:

<https://amsa-forms.nogginoca.com/public/equipment.html>

AMSA also administers the National Response Team (NRT). The purpose of the NRT is to provide a national incident management and field operations surge capacity to support Australian pollution response control agencies responding to major marine environmental incidents. The NRT is a core capability of the National Plan and comprises of 40 incident management team personnel and 42 field team leaders.

#### 8.2.2. AMOSC Resources

ConocoPhillips Australia have access to Australian Marine Oil Spill Centre (AMOSC) equipment and resources Australia wide. Geelong based equipment can be mobilised to King Island in approximately 18 hours.

# Shoreline Protection and Clean-up Plan

---

Additional equipment in Fremantle, Exmouth and Broome can be mobilised to the Port of Geelong in approximately 40, 51 and 55 hours respectively. This includes an allowance of 4 hours for truck availability/sourcing and loading.

An overview of what equipment AMOSC has available is on the AMOSC website:

<http://www.amosc.com.au/equipment.php>

An inventory of AMOSC equipment is available in Appendix 2 of the OPEP with live readiness status and locations available via the members section of the AMOSC website with the login details provided to ConocoPhillips Australia of access to this information can be given by contacting the AMOSC Duty Officer directly:

<https://amosc.com.au/member-login/>

AMOSC also has access via the AMOSPlan to mutual aid equipment via its members. This equipment can be made available to ConocoPhillips Australia in the event of a response (available in Appendix 13 of the OPEP).

## 8.3. Global Resources

The ConocoPhillips Global Incident Management Assist Team (GIMAT) is a specialist incident management team. Members are located globally and can be readily mobilised to support a business unit IMT that has exceeded its capacity to manage effectively or is required to maintain sustained IMT operations over an extended duration incident. The GIMAT can fill most roles within the ConocoPhillips Australia IMT structure.

## 8.4. TRP Resource Guidance

This section supports the personnel and equipment recommendations made in the TRPs in Section 3. Individual items of oil spill response equipment, as well as the combination of commercially available materials could be used in any shoreline response scenario. These are deemed suitable for a shoreline response to a accidental hydrocarbon release during the ConocoPhillips Australia Otway Exploration Drilling Program.

### 8.4.1. Response Personnel

Personnel provided for operational work on the shoreline or in vessels must be fit to work in the shoreline environment. Minimum trained operational personnel requirements for individual operational activities are listed within each TRP document. Incident Command System (ICS) span of control ratios have been applied to establish the numbers of personnel required and the contents of the response kits to support their activities. Span of control will not exceed seven personnel under the command of a single supervisor.

#### 8.4.1.1. Trained Responders

Trained responders can be sourced from the following locations:

- ConocoPhillips Staff
- AMOSC Technical Staff
- AMOSC Core Group
- AMSA National Response Team

Additional responders can be sourced from labour hire agencies as required under supervision of trained personnel.

#### 8.4.2. Site Set-up

Provision for activities supporting the operational taskings associated with each TRP will require non-oil spill response specific equipment and supplies as per the TRP listings for the Site Set-up Kit and Decontamination

# Shoreline Protection and Clean-up Plan

Kit. Both the Site Set Up Kit and the Decontamination Kit listed in Tables 8 and 9 respectively are designed to support up to 30 personnel at the beginning of the response with further equipment required for extended response durations.

**Table 8-2: Site set-up kit**

Contents	Quantity (Minimum)	
Tarps, 3m x 3m	2	Unit
Gazebo, 3m x 3m	2	Unit
Sorbent Roll, 30" x 150m	1	Unit
Sorbent Pads	1	Pack 100
1.8m steel core garden stakes	20	Unit
Barrier Tape, 75mm x 100m	8	Rolls
Flagged Safety Bunting, 30m	1	Roll
Rope, 12mm x 20m	2	Lengths
T Top Safety Bollards w/ 6kg weights	6	Unit
Folding chair	2	Unit
Clip Board and pens	2	Sets
20 ltr Water Drum	1	Unit
Trestle Table	2	Units
Portable Toilet	2	Unit
Fresh Water, 1000 litre IBC	2	Units
Waste Water Storage, 1000 litre IBC	2	Units
120 litre Wheely Bin	4	Units

## 8.5. Site Decontamination

Decontamination of oiled personnel and equipment is essential in the prevention of secondary contamination and must be taken into consideration prior to any contact with oil. Decontamination procedures and equipment listed in Table 8-3 will be required at any location at which oil spill response is carried out.

**Table 8-3: Decontamination kit**

Contents	Quantity (Minimum)	
Tarps, 3m x 3m	2	Unit
Gazebo, 3m x 3m	2	Unit
Portable Bund	2	Unit
Sorbent Roll, 30" x 150m	1	Unit
Sorbent Pads	1	Pack 100
1.8m steel core garden stakes	20	Unit
Barrier Tape	2	Rolls
Flagged Safety Bunting, 30m	1	Roll
Rope, 12mm x 20m	2	Lengths
T Top Safety Bollards w/ 6kg weights	6	Unit
Folding chair	2	Unit
Scrubbing Brush	4	Unit
Plastic Tub, 50 ltr	2	Unit
Plastic Tub, 35 ltr	2	Unit
Cable ties	1	Pack 100
Duct Tape	2	Roll
Tyvek Coveralls	8	Pairs
Oil Resistant Gloves	8	Pairs
Nitrile Gloves	1	Box 100
Safety Goggles	4	Pairs
P2 Respirator Mask	1	Box 10
Plastic bucket, 10 ltr	2	Unit
'Exit' Sign	1	Unit
'Entry' Sign	1	Unit
Slide/Stake Hammer	1	Unit

## Shoreline Protection and Clean-up Plan

Contents	Quantity (Minimum)	
Stake Puller	1	Unit
Detergent, 5 ltr	2	Unit
Heavy Duty Hand Cleaner, 5 ltr	2	Unit

### 8.6. Shoreline Pre-cleaning

Most pre-clean activities will not require extensive equipment and resources and generally require that natural materials in potential impact zones are physically relocated to above the high tide line. The equipment and personnel identified within a TRP to undertake shoreline clean-up can be utilised for shoreline pre-clean to above high-tide mark.

### 8.7. Shoreline Clean-up

Shoreline clean-up activities are generally labour intensive. The equipment listed in Table 8-4 should be generally considered as a minimum. Shoreline assessment of specific locations in the event of an incident should be used to recommend the most suitable equipment for shoreline clean-up.

**Table 8-4: Shoreline clean-up kit**

Contents	Quantity (Minimum)	
Long handled metal rake	8	Units
Plastic Rake	4	Units
Concrete placers	4	Units
Square mouth shovel	8	Units
Heavy duty plastic bags, 300mm x 600mm	1,000	Units

### 8.8. Protection and Deflection

#### 8.8.1. Near-shore Boom

Near-shore boom is used for protection and deflection activities. Various types of nearshore boom can be used and are held by various agencies and suppliers. Table 8-5 identifies the most common types available along with basic performance.

**Table 8-5: Near-shore boom**

Boom Type	Considerations	Operational Limitations
Self Inflating	<ul style="list-style-type: none"><li>• Generally in 25m lengths.</li><li>• Good wave following characteristics.</li><li>• Rapid, easy to deploy.</li><li>• For deflection and containment in low current nearshore waters.</li><li>• Susceptible to punctures.</li><li>• Not suitable for abrasive environments (Sharp rocks, abrasive jetty structures).</li></ul>	<ul style="list-style-type: none"><li>&gt; 1.2m waves</li><li>&gt; 0.25m/s current</li></ul>
Inflatable – general purpose boom	<ul style="list-style-type: none"><li>• Produced in 10m, 20m and 25m lengths.</li><li>• Requires air inflation to deploy.</li><li>• Have good wave following characteristics.</li><li>• For deflection and containment in low current nearshore waters.</li><li>• Susceptible to punctures.</li><li>• Not suitable for abrasive environments (Sharp rocks, abrasive jetty structures).</li></ul>	<ul style="list-style-type: none"><li>&gt; 2m waves</li><li>&gt; 0.25m/s current</li></ul>
Solid inflation – general purpose	<ul style="list-style-type: none"><li>• Generally in 25m lengths.</li><li>• Have poor wave following characteristics.</li><li>• Considered easy to deploy.</li><li>• For deflection and containment in low current nearshore waters.</li><li>• Highly durable, abrasive resistant, punctures do not result in loss of buoyancy.</li></ul>	<ul style="list-style-type: none"><li>&gt; 1m waves</li><li>&gt; 0.25m/s current</li></ul>

# Shoreline Protection and Clean-up Plan

## 8.8.2. Near-shore Boom Ancillaries Kit

The near-shore boom ancillary kit contents in Table 8-6 have been selected as a recommended list of equipment required to deploy 100m of Near Shore Boom.

**Table 8-6: Near-shore boom ancillaries kit**

Contents	Quantity (Minimum)	
ASTM Tow Bridle	2	Units
15kg Anchor	4	Units
10m rope	8	Lengths
20m rope	4	Lengths
Float	4	Units

## 8.8.3. Shore Seal Boom

Shore seal boom is used for protection and deflection activities, Table 8-7 identifies the considerations and limitations of shore seal boom during a response.

**Table 8-7: Shore seal boom**

Boom Type	Considerations	Operational Limitations
Shore sealing	<ul style="list-style-type: none"><li>Produced in 10m, 20m and 25m lengths.</li><li>Good wave following characteristics.</li><li>Complex to deploy, requires comprehensive ancillaries.</li><li>Designed to seal at the waterline on mud or sand flats.</li><li>For deflection and containment in low current nearshore waters.</li><li>Susceptible to punctures.</li><li>Not suitable for abrasive environments (Sharp rocks, abrasive jetty structures).</li></ul>	Will not seal on rough or rocky shorelines.

## 8.8.4. Shore Sealing Boom Ancillaries Kit

The shore seal boom ancillary kit contents outlined in Table 8-8 are based on minimum requirements to deploy and maintain 100m of shore seal boom.

**Table 8-8: Shore seal boom ancillaries kit**

Contents	Quantity (Minimum)	
Solid Stake	3	Units
Slide Hammer	1	Unit
Stake Puller	1	Unit
15kg Anchor	4	Units
10m rope	8	Lengths

# Shoreline Protection and Clean-up Plan

## 8.9. Spill Recovery

Any task within the TRPs that relates to Spill Recovery will require the following:

- Trained Responder
- Unskilled Labour
- Recovery System (i.e. Vacuum Truck)

The provision of specifically trained staff for the use vacuum trucks will require negotiation with the supplier.

### 8.9.1. Vacuum Truck

Vacuum trucks have been identified in the TRPs as an oil recovery method where access allows. Vacuum trucks can be used as a primary method to collect oil from booming sites or more traditionally to recover oil from temporary storage where an oil recovery skimmer is being used.

Vacuum trucks can service multiple sites, transporting waste directly to onwards disposal location, and are commonly available in most towns, often utilised as part of a council's waste contract.

### 8.9.2. Portable Vacuum Unit

Portable vacuum systems are designed to operate in remote areas and can recover oil over a wide range of viscosities and weathered conditions. Temporary storage or oil drums for direct removal of collected waste will be required in addition to the vacuum unit. Table 15 is a guide to the contents of a portable vacuum unit.

Table 8-9: Portable vacuum unit

Contents	Quantity (Minimum)	
Vac Unit/Power Pack	1	Unit
Suction Hose	1	Set
Suction Fittings	1	Set

## 8.10. Site and Response Support Personnel

### 8.10.1. Communication

Effective communication arrangements are critical to the success of any response operation and should consider the following:

- Satellite phone communications are specified in remote area TRPs to allow operational field teams to provide information to the IMT
- VHF radio communications will be required on all vessels supplied
- VHF handheld radio units will be required to support shore to vessel communications during deployments, and
- UHF radio units are recommended for communications between individual operational task groups in the field.

### 8.10.2. Support Vessels

Support vessels are required for some of the pre-identified TRP sites to assist in the deployment of boom and transport personnel and equipment. Small fishing or work vessels may be considered suitable, pending ConocoPhillips Australia marine vetting requirements and consideration of the below minimum requirements:

- Commercially registered with the relevant regulatory authority
- Capable of carrying 4 people
- Open, aluminium hull
- Safety equipment as per state regulations, and

# Shoreline Protection and Clean-up Plan

---

- Ability to safely tow boom if required.

## 8.11. Shoreline Flushing Kit

The use of high-volume, low-pressure water flow to remobilise stranded oil for skimming may be recommended at TRP sites. Oil is flushed from a high point into sorbent materials or boom where it can be contained and recovered. Table 8-10 outlines the contents of a shoreline flushing kit.

**Table 8-10: Shoreline flushing kit**

Contents	Quantity (Minimum)	
Water Pump	1	Unit
Suction Hose	1	Unit
Discharge Hose	1	Unit
Suction Strainer	1	Unit
Float	2	Units
5kg anchor	1	Unit
Rope, 12mm x 20m	2	Units
1.8m steel core garden stakes	20	Units
Barrier Tape	2	Rolls

## 8.12. Utility Terrain Vehicle (UTV)

UTVs have been included in the TRPs for the movement of personnel, equipment and waste. UTVs have been selected over other types of vehicles, such as ATVs (All-Terrain Vehicles) i.e. Quads, because of the ability to carry greater loads, personnel and the improved safety features including:

- Side by side seating
- Seatbelts
- ROP (Roll Over Protection), and
- Minimum 360 kg payload.

## 8.13. Temporary Waste Storage

Within the context of CoP's Otway Drilling operations and the response options available waste will mainly be solid waste from PPE sorbent and shoreline clean-up activities. There will likely be limited liquid waste generated by vacuuming larger concentrations of hydrocarbon collected by protection and deflection operations.

Recommended considerations for temporary storage includes Intermediate Bulk Containers, plastic lined skip bins or plastic lined pits as detailed below:

- 1) Standard Schutz IBCs
  - a) Volume restricted by available laydown area and number of IBCs
  - b) Preferred method of lifting requires a forklift
  - c) Camlock fitting and valve for hose attachment
  - d) Transfer waste using hose and pump, or vacuum
- 2) Plastic Lined Skip Bins
  - a) Volume restricted by available laydown area and capacity of bins
  - b) Overfilling bins may make them unable to be lifted
  - c) Easy removal from site using hook trucks from commercial providers
- 3) Plastic Lined Pits
  - a) Volume restricted by available area and capacity
  - b) Protection of recovered waste in inclement weather to be considered

## Shoreline Protection and Clean-up Plan

- c) Transfer waste using mechanical means into a skip bin for disposal
- d) Environmental assessment/approvals may be required due to the requirement to dig a hole for this option.

### 8.14. Personnel Protective Equipment (PPE)

Responders to an accidental hydrocarbon release may be exposed to various risks while working, with some examples being:

- Exposure to dangerous gasses or fumes
- Environmental – weather, sea state, animals
- Vessel Operations
- Slips, Trips and Falls
- Vehicle Operations
- Plant Operations
- Manual Handling, and
- Noise.

All operators involved in oil spill operations are required to maintain a basic standard of PPE when on task. The standard and group issue PPE requirements listed in Tables 8-11 and 8-12 are based on the API Recommended Practice 98, First Edition, August 2013, 'Personal Protective Equipment Selection for Oil Spill Responders'.

**Table 8-11: Standard issue individual PPE kit**

Contents	Quantity (Minimum)	
Hard hat	1	Unit
Safety glasses with side shields (clear)	1	Unit
Safety glasses with side shields (smoked)	1	Unit
Goggles	1	Unit
Steel capped boots with gaiters	1	Units
Disposable nitrile gloves	100 pack	Unit
Lacerations resistant riggers gloves	2	Units
Chemical resistant gloves	2	Units

**Table 8-12: Group issue resupply PPE kit – 50 PAX for 5 day operations**

Contents	Quantity (Minimum)	
Safety glasses with side shields (clear)	17	Unit
Safety glasses with side shields (smoked)	17	Unit
Goggles	10	Unit
Face shield	10	Unit
Steel capped boots with gaiters	5	Units
Chemical resistant boots (wellies)	10	Unit
Disposable nitrile gloves	10x 100p	Units
Lacerations resistant rigger gloves	250	Units
Chemical resistant gloves	250	Unit
Chemical protective garments - TYVEK (impervious chem suit)	250	Unit
Ear protection - ear plugs	50x 25p	Unit
Ear protection - muffs	10	Unit
Respiratory - disposable particulate respirator	50x 20p	Units
PFD (Type 1)	20	Unit

## 9. Resource Estimation

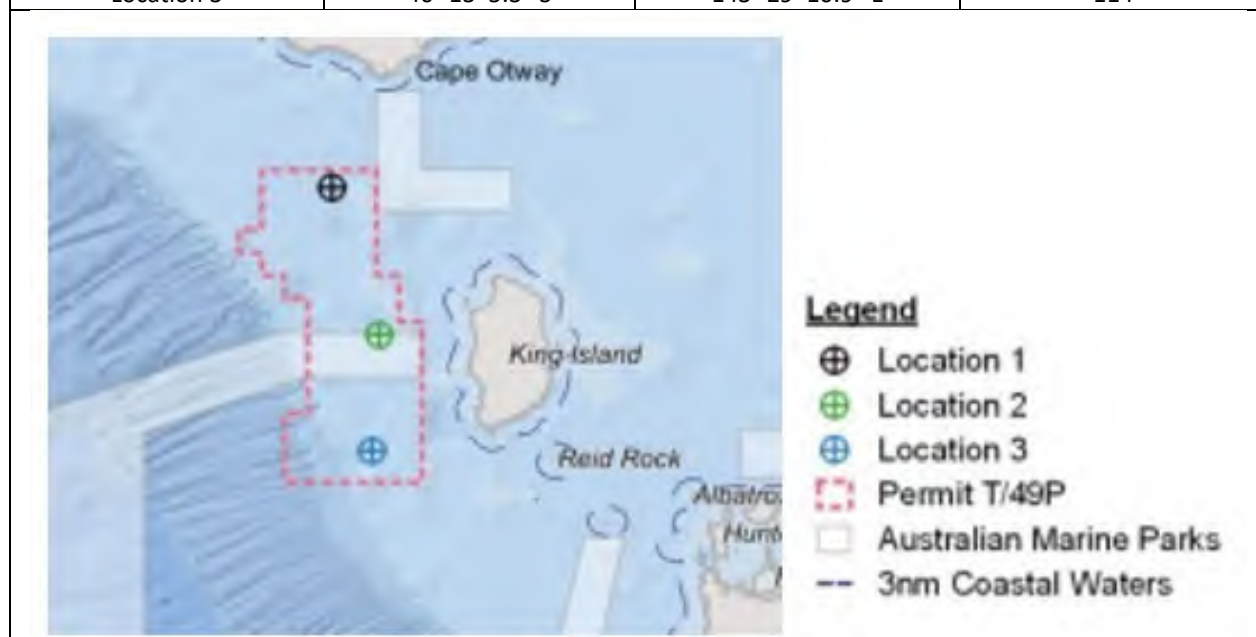

The following information supports the personnel and equipment recommendations derived from an analysis of the modelling for each scenario/location. When activating TRPs, clear response resource totals are highlighted for each location. However, when activating a generic STR, resource summaries are not clear due to the varying nature of shoreline loading and shoreline length.

The following resource estimations have been calculated based on the modelling done for each permit area, hydrocarbon type and location. By analysing the shoreline types for each affected LGA, calculations have been made based on industry guidelines for best practice for each response strategy to come up with an estimation of resource requirements. These estimations may help the IMT properly resource an effective spill response operation. A list of the assumptions and criteria for each estimation is in located in Appendix 2 Shoreline Personnel and Equipment Assumptions.

For each of the estimations below, the permit areas and location descriptions identified in Tables 9-1 and 9-2 are used (and are shown in the associated images).

**Table 9-1: T/49P hydrocarbon release locations**

Release Location	Latitude	Longitude	Water Depth (m)
Location 1	39° 15' 46.6" S	143° 20' 26.4" E	93
Location 2	39° 47' 49.7" S	143° 30' 46.3" E	100
Location 3	40° 13' 5.3" S	143° 29' 10.9" E	114

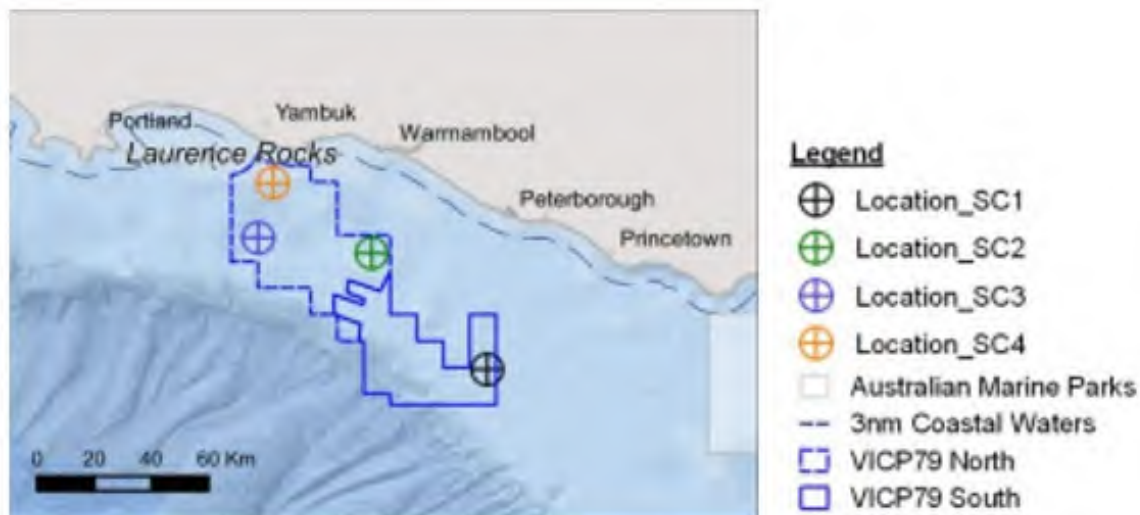

## Shoreline Protection and Clean-up Plan

**Table 9-2: VIC/P79 hydrocarbon release locations**

Release Location	Name	Latitude	Longitude	Water Depth (m)
Location 1	Essington	39° 5' 17.4" S	142° 48' 23.1" E	93
Location 2	Regia	38° 43' 20.6" S	142° 26' 35.3" E	74
Location 3	Merope	38° 5' 8.9" S	142° 5' 8.9" E	66
Location 4	Julpha	38° 30' 6.4" S	142° 7' 55.5" E	45

Each permit area (T/49P and VIC/P79) and location combination have 2 scenarios which have been modelled for both summer and winter conditions, being:

- Scenario 1: Vessel Collision - 350m<sup>3</sup> of MDO over 6 hours, surface release, and
- Scenario 2: Thylacine Condensate LOWC 139,000 m<sup>3</sup> released over 90 days.

Figure 9-1 highlights how to navigate to the appropriate section in Appendix 2. By using this flowchart, resource summary estimations can be used to calculate response strategies and logistical requirements based on the type of hydrocarbon, permit area, and location.

## Shoreline Protection and Clean-up Plan

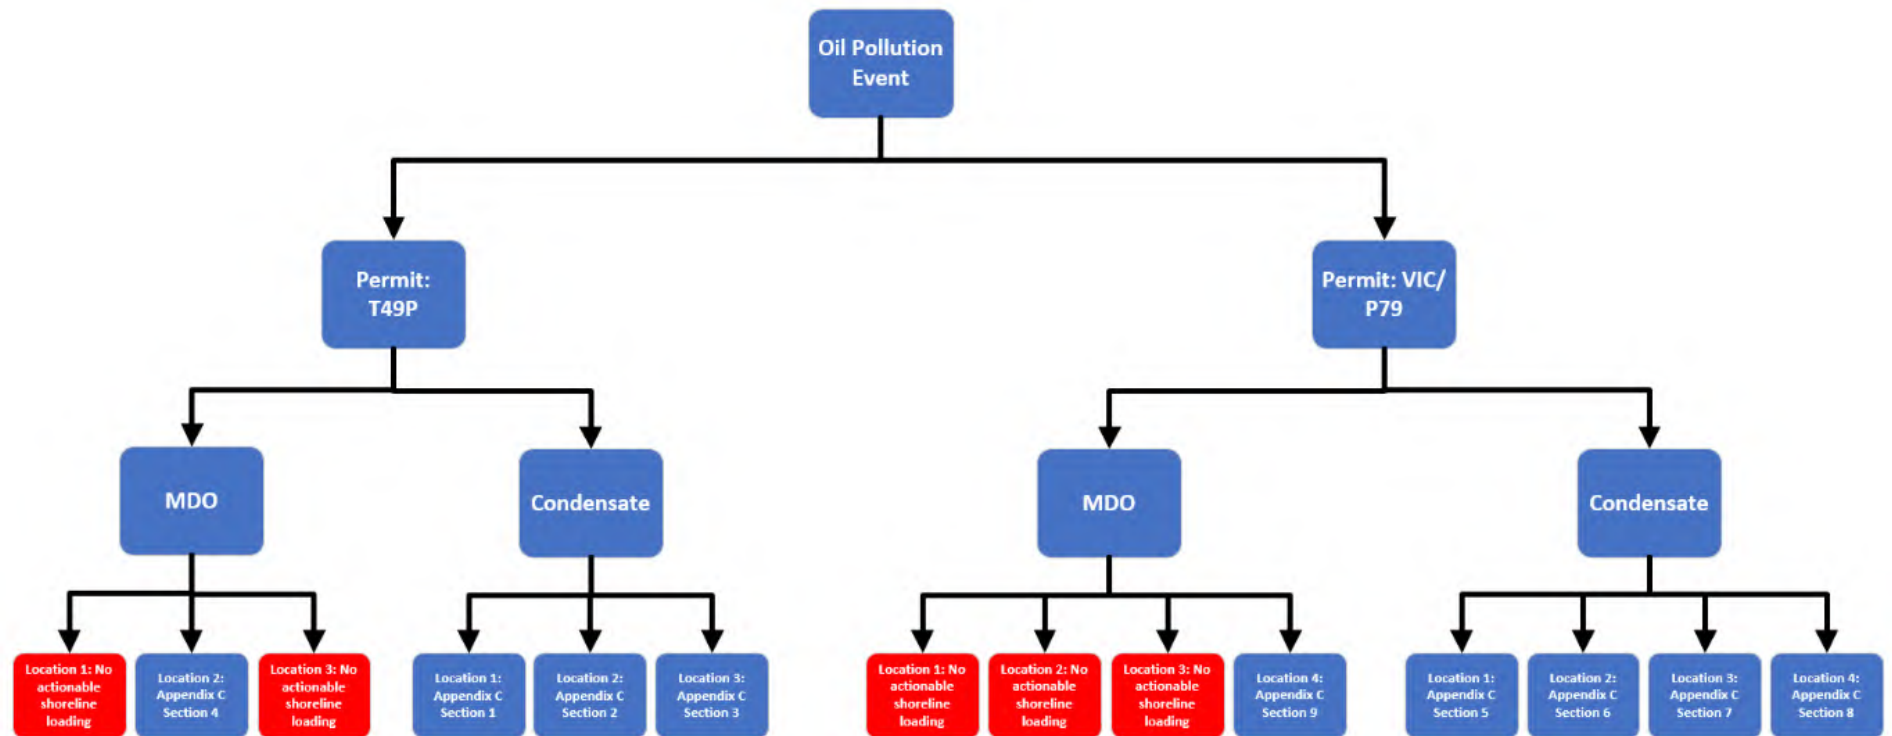

Figure 9-1: Resource summary location flowchart

# Shoreline Protection and Clean-up Plan

## Appendix 1: Shoreline Treatment Recommendation Guides

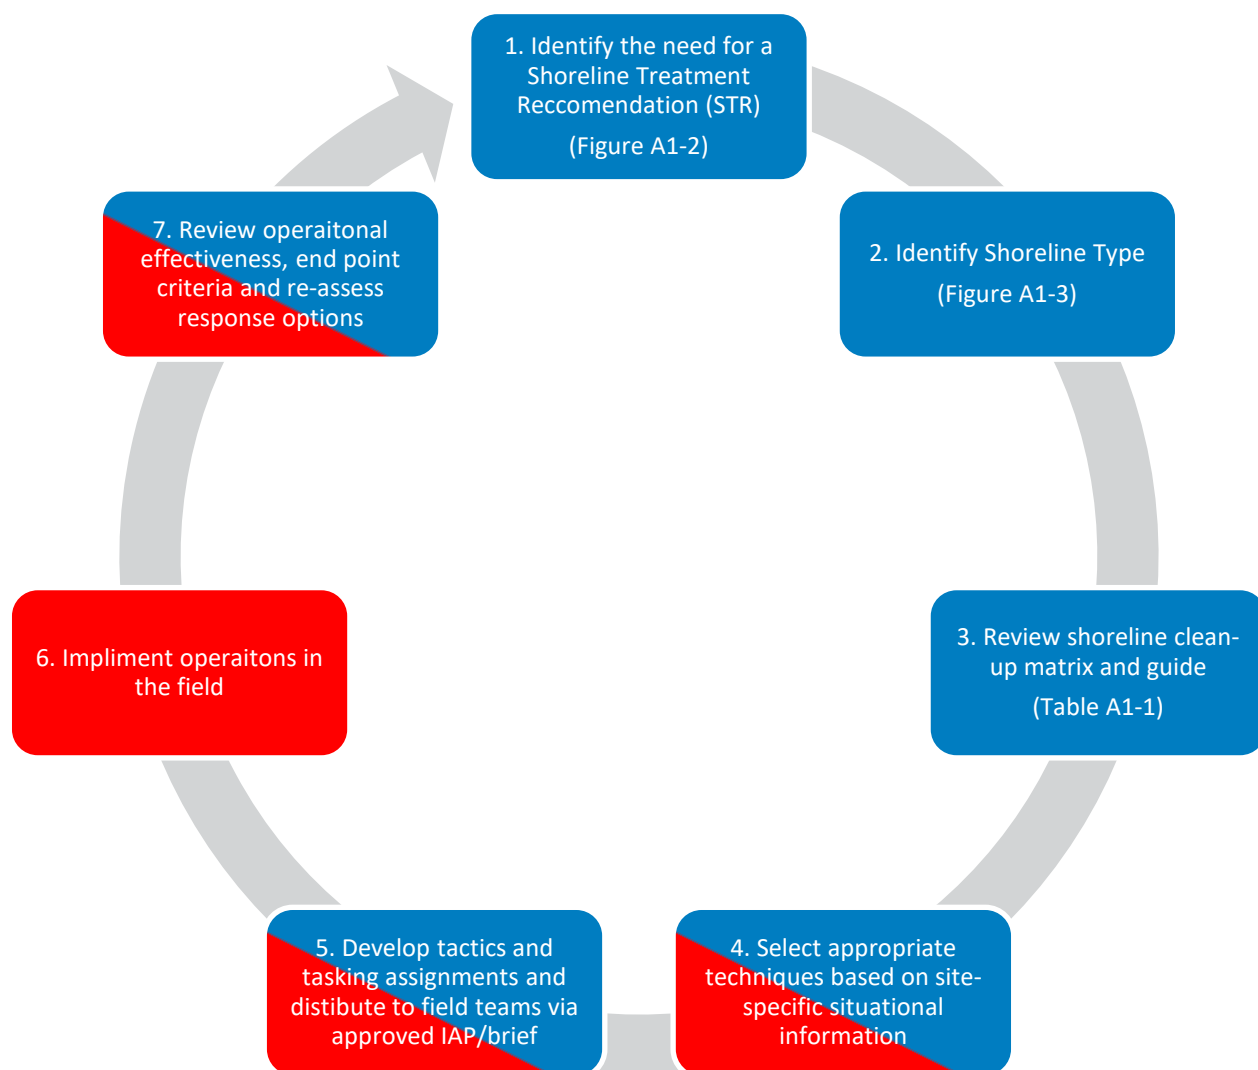

This section provides Shoreline Treatment Recommendations (STRs) for generic shoreline types. It offers operational guidance on preferred techniques and outlines the constraints associated with their implementation. This section is relevant for shoreline that has or is soon to be impacted by oil, and where the site is not covered by a Primary or Secondary Shoreline Tactical Response Plan.

The primary objective of shoreline clean-up is to restore normal usage of the area by removing oil where possible and enhancing natural recovery of shoreline resources. Shoreline clean-up is usually carried out in three stages:

- **Stage 1:** Collection of floating oil and heavily contaminated beach material.
- **Stage 2:** Removal of stranded oil and moderately oiled beach materials.
- **Stage 3:** Final clean-up of lightly contaminated shorelines and removal of oily stains.

Shoreline clean-up needs to be carried out in accordance with a clear strategy that takes account of the characteristics of the oil, the level of contamination, the difficulty of access, the safety of clean-up crews and the relative environmental, economic and amenity sensitivities of different locations.

Figure A1-1 outlines the process to follow when using the Shoreline Treatment Recommendation Guide.

**Figure A1-1: Shoreline treatment process**

# Shoreline Protection and Clean-up Plan

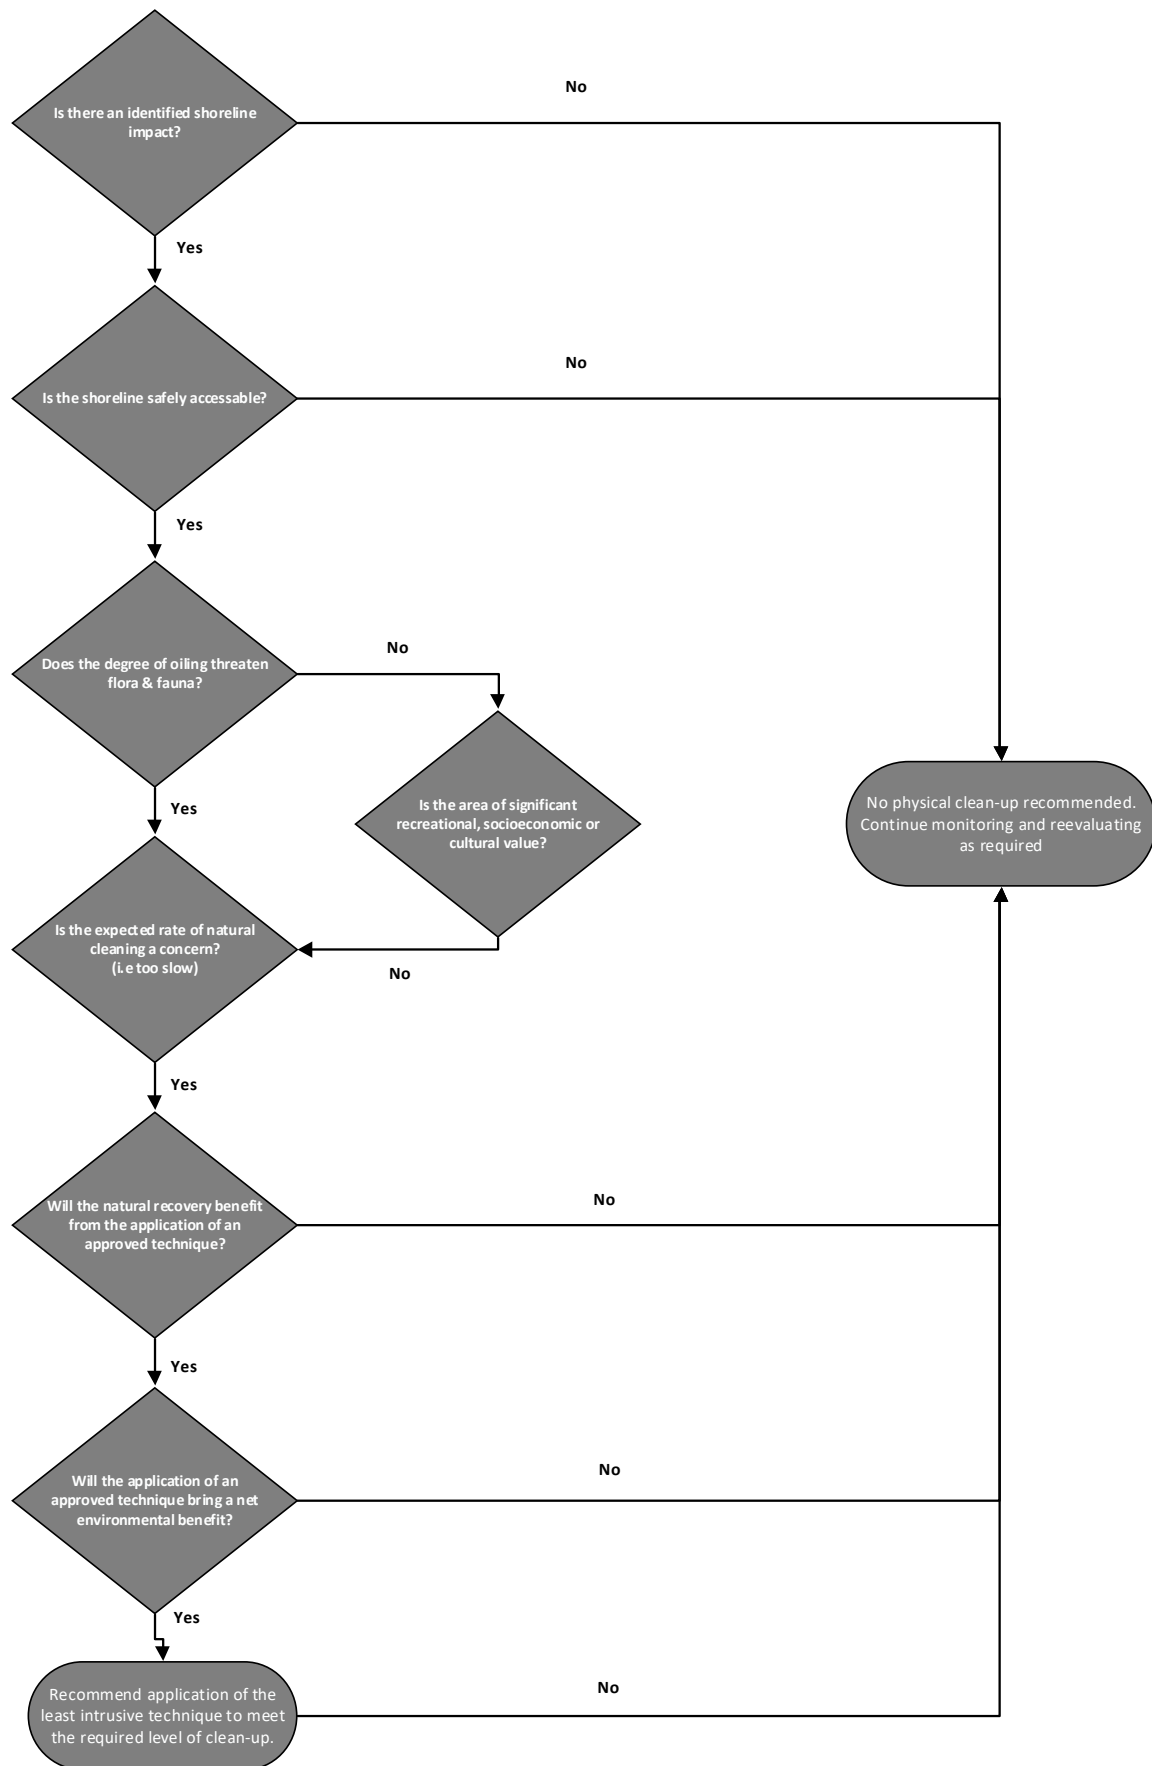

Figure A1-2: Shoreline treatment plan recommendation flowchart

# Shoreline Protection and Clean-up Plan

---

## Step 2: Choose shoreline type

Eight (8) shoreline types have been identified along the coastlines of the LGAs, as outline in Figure A1-3.

**1. Manmade structures**  
(Jetties, piers, sea walls etc.)

**Rocky shore (sheltered)**

**Rocky platform/ Cliff face (exposed)**

**Sandy beach (mixed sand/shell)**

**Tidal flats (mud/sand) and Vegetative**  
**salt/brackish marsh**

**Shallow seagrass**

**Reef (Rocky/Coral)**

**Mangroves**

**Figure A1-3: Shoreline types**

## Step 3: . Review shoreline clean-up technique matrix (Table A1-1) and guide

# Shoreline Protection and Clean-up Plan

The following matrix outlines the shoreline types present and the shoreline clean-up techniques available for shoreline response.

A three-tiered criteria has been used to identify preferred and possible techniques and those to avoid to minimise secondary damage to the shoreline.

**Table A1-1: Shoreline clean-up technique matrix**

	Manmade structures (Jetties, piers, sea walls etc.)	Rocky shore (sheltered)	Rocky platform/ Cliff face (exposed)	Sandy beach (mixed sand/shell)	Tidal flats (mud/sand) and Vegetative salt/brackish marsh	Shallow seagrass	Reef (rocky/coral)	Mangroves

# Shoreline Protection and Clean-up Plan

Recommended shoreline treatments are described below.

**Table A1-1a: Shoreline treatment recommendation – Manmade structures**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"> <li>• Solid, man-made structures such as seawalls, groynes, piers, jetties, port facilities and residential marinas.</li> <li>• Constructed of concrete, wood, or metal.</li> <li>• Built to protect the shore from erosion by waves, boat wakes, and currents.</li> </ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"> <li>• Both MDO and Condensate are Class I/II hydrocarbons</li> <li>• Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li> <li>• Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li> </ul> <p>For detailed oil behaviour see OPEP page 17.</p>	
---	--

## Clean up Recommendations:

<b>Tactical:</b> Where appropriate, the following response strategies are recommended.	
Natural Recovery	 <p>Allow tidal action to flush stranded hydrocarbon off the structure. The spilt hydrocarbon will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean up techniques would cause more harm than benefit, or where access is restricted.</p>
Sorbents	 <p>Sorbent material (boom, pads, snares) may be placed on the floating Hydrocarbon or water surface, allowing it to absorb or can be used to wipe or dab stranded Hydrocarbon. Recovery of all sorbent material is mandatory. Sorbent materials must be placed and removed carefully to minimise disturbance to the surrounding area. Likewise, they must be carefully monitored to prevent entanglement.</p>
Vacuum	 <p>Vacuuming can be used to remove pooled and/or surface oil from impacted structures. Vacuum equipment ranges from small portable units to large vacuum trucks.</p>
High-Pressure, Ambient-Water Flushing	 <p>High -pressure, ambient-temperature flushing can be used to flush trapped oil out to open water for collection using booms and sorbents. Considerations should be given to tidal currents (flush on a falling tide) and wind (an onshore wind will push any released hydrocarbon back onto the structure).</p>
<p><b>People and Resources:</b></p> <p>Personnel and resource requirements should be assessed on a case-by-case basis.</p>	

## Staging and/or Logistics Constraints/Waste Issues:

<ul style="list-style-type: none"> <li>• Access to these sites should be easily available due to being manmade.</li> <li>• Mobile Phone coverage may be limited in remote areas, a contingency with a Satellite Phone should be scoped prior to deployment to site.</li> <li>• Sorbents will create larger volumes of waste and a higher contamination risk; this should be considered within the Waste Plan for any response.</li> </ul>
---

# Shoreline Protection and Clean-up Plan

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

**Table A1-1b: Shoreline treatment recommendation – Rocky shore (sheltered)**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"><li>Rocky substrate that varies widely in permeability.</li><li>Some sediment accumulation may occur on the bedrock surface in particularly sheltered areas.</li><li>Species density and diversity vary greatly, tidal zonation may be present.</li></ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"><li>Both MDO and Condensate are Class I/II hydrocarbons</li><li>Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li><li>Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li></ul> <p>For detailed oil behaviour see OPEP page 17.</p>	
---	---

## Clean up Recommendations:

**Tactical:** Where appropriate, the following response strategies are recommended.

Natural Recovery	Allow tidal action to flush stranded hydrocarbon off the rocky shore. The spilt hydrocarbon will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean up techniques would cause more harm than benefit, or where access is restricted.
------------------	---

## People and Resources:

Personnel and resource requirements should be assessed on a case-by-case basis.

## Staging and/or Logistics Constraints/Waste Issues:

- Access will be dependent on location, with natural recovery being the preferred response strategy the use of vessel or aviation observations is recommended.
- Mobile Phone coverage may be limited in remote areas, a contingency with a Satellite Phone should be scoped prior to deployment to site.

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

# Shoreline Protection and Clean-up Plan

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

**Table A1-1c: Shoreline treatment recommendation – Rocky platform/cliff face**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"><li>• The intertidal zone is steep and narrow.</li><li>• Sediment accumulation is uncommon.</li><li>• Access to these areas is highly restricted and dangerous.</li><li>• Often strong vertical zonation of biological communities, which vary in density and diversity.</li></ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"><li>• Both MDO and Condensate are Class I/II hydrocarbons</li><li>• Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li><li>• Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li></ul> <p>For detailed oil behaviour see OPEP page 17.</p>	
--	---

## Clean up Recommendations:

**Tactical:** The following response strategy is recommended.

Natural Recovery	Allow tidal action to flush stranded hydrocarbon off the platform or cliff face. The spilt hydrocarbon will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean up techniques would cause more harm than benefit, or where access is restricted.
------------------	--

## People and Resources:

Personnel requirements should be assessed on a case-by-case basis.

## Staging and/or Logistics Constraints/Waste Issues:

Access for observation of these sites via aircraft is recommended due to the danger of vessel operations and lack of physical access.

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Access to these areas is difficult and can be dangerous – no physical clean-up recommended.

# Shoreline Protection and Clean-up Plan

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Access to these areas is difficult and can be dangerous – no physical clean-up recommended.

**Table A1-1d: Shoreline treatment recommendation – Sandy beach (mixed sand/shell)**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"> <li>These beaches are flat to moderately sloping and relatively hard packed. Some beaches may have softer sediments – reducing access by people and vehicles.</li> <li>There can be heavy accumulations of wrack (seagrass/debris) present.</li> <li>Beaches support a diversity of animal and plant species.</li> </ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"> <li>Both MDO and Condensate are Class I/II hydrocarbons</li> <li>Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li> <li>Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li> </ul> <p>For detailed oil behaviour see the Otway Exploration Drilling OPEP page 17.</p>	
--	--

## Clean up Recommendations:

<b>Tactical:</b> Where appropriate, the following response strategies are recommended.		
Natural Recovery		Allow tidal action to flush stranded hydrocarbon off the beach. The spilt hydrocarbon will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean up techniques would cause more harm than benefit, or where access is restricted.
Manual Oil Removal (incl. debris removal)		The removal of bulk hydrocarbon and contaminated sediment by manual methods including shovels, heavy duty plastic bags and buckets. Often used where substrate is insufficient for mechanical operations and/or where the beach is too far for pumps or suction hoses to reach the water's edge. Only suitable where there is safe access/egress for personnel and support facilities to manually recover oil.
Barrier (Onshore/ Nearshore boom)		Onshore/Nearshore booms may be deployed to contain and recover oil released from the contaminated area either naturally or concurrently with flooding/flushing operations. Booms must be placed and removed carefully to minimise disturbance to the surrounding area. Likewise, they must be carefully monitored to prevent stranding, entanglement or failure.
Low-Pressure, Ambient-Water Flushing		Low -pressure, ambient-temperature flushing can be used to flush trapped oil out to open water for collection using booms and sorbents. Considerations should be given to tidal currents (flush on a falling tide) and wind (an onshore wind will push any released hydrocarbon back onto the beach).
<p><b>People and Resources:</b></p> <p>Personnel requirements should be assessed on a case-by-case basis, for guidance refer to Appendix 2.</p>		

# Shoreline Protection and Clean-up Plan

## Staging and/or Logistics Constraints/Waste Issues:

- Access to some beaches will require permission from the relevant LGA or Land Manager
- Mobile Phone coverage may be limited in remote areas, a contingency with a Satellite Phone should be scoped prior to deployment to site.
- Manual and debris removal will generate waste and have decontamination requirements.
- Manual removal will require personal and support facilities.

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

**Table A1-1e: Shoreline treatment recommendation – Tidal flats (mud/sand) and vegetative salt/brackish marsh**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"> <li>• Wetlands consisting of emergent herbaceous vegetation that are regularly, frequently, or continually flooded.</li> <li>• Highly productive ecosystems that support a diversity of animal and plant species.</li> <li>• Vary widely in type of vegetation, substrate (mud/sand), salt tolerance and seasonality.</li> </ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"> <li>• Both MDO and Condensate are Class I/II hydrocarbons</li> <li>• Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li> <li>• Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li> </ul> <p>For detailed oil behaviour see the Otway Exploration Drilling OPEP page 17.</p>	
--	---

## Clean up Recommendations:

<b>Tactical:</b> Where appropriate, the following response strategies are recommended.		
Natural Recovery		Allow tidal action to flush stranded hydrocarbon off the tidal flats or marsh. The spilt hydrocarbon will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean up techniques would cause more harm than benefit, or where access is restricted.
Barrier (Onshore/ Nearshore Boom)		Onshore/Nearshore booms may be deployed to contain and recover oil released from the contaminated area either naturally or concurrently with flooding/flushing operations. Booms must be placed and removed carefully to minimise disturbance to the

# Shoreline Protection and Clean-up Plan

		surrounding area. Likewise, they must be carefully monitored to prevent stranding, entanglement or failure.
Low-Pressure, Ambient-Water Flushing		Low -pressure, ambient-temperature flushing can be used to flush trapped oil out to open water for collection using booms and sorbents. Considerations should be given to tidal currents (flush on a falling tide) and wind (an onshore wind will push any released hydrocarbon back onto the beach).
<b>People and Resources:</b> Personnel requirements should be assessed on a case-by-case basis, for guidance refer to Appendix 2.		

## Staging and/or Logistics Constraints/Waste Issues:

- Mobile Phone coverage may be limited in remote areas, a contingency with a Satellite Phone should be scoped prior to deployment to site.
- Contaminated boom will require cleaning and removal with decontamination options to be considered

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

**Table A1-1f: Shoreline treatment recommendation – Shallow seagrass**

<b>Oiled Areas for Treatment:</b> <b>Description:</b> <ul style="list-style-type: none"> <li>• Flowering plants that grow in shallow or sheltered coastal waters, anchored in sand or mud bottoms.</li> <li>• Provide habitat for a variety of marine, estuarine and beach-dwelling animals.</li> </ul> <b>Predicted Oil Behaviour</b> <ul style="list-style-type: none"> <li>• Both MDO and Condensate are Class I/II hydrocarbons</li> <li>• Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li> <li>• Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li> </ul> For detailed oil behaviour see the Otway Exploration Drilling OPEP page 17.	
---	--

## Clean up Recommendations:

<b>Tactical:</b> Where appropriate, the following response strategies are recommended.		
Natural Recovery		Allow tidal action to flush stranded hydrocarbon out of contaminated seagrass beds. The hydrocarbon will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative cleanup techniques would cause more harm than benefit to the seagrass beds.

# Shoreline Protection and Clean-up Plan

Barrier (Onshore/ Nearshore boom)		Onshore/Nearshore booms may be deployed to contain and recover oil released from the contaminated area naturally or concurrently with flooding/flushing operations.
--	--	---

## People and Resources:

Personnel requirements should be assessed on a case-by-case basis, for guidance refer to Appendix 2.

## Staging and/or Logistics Constraints/Waste Issues:

- Mobile Phone coverage may be limited in remote areas, a contingency with a Satellite Phone should be scoped prior to deployment to site.
- Boom used may require decontamination.

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

**Table A1-1g: Shoreline treatment recommendation – Reef (rocky/coral)**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"> <li>• Subtidal rocky/coral reefs provide habitat for a variety of plant and animal species.</li> <li>• Coral reefs are important economic and natural resources. They protect shorelines and support fisheries, recreation, and tourism.</li> </ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"> <li>• Both MDO and Condensate are Class I/II hydrocarbons</li> <li>• Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li> <li>• Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li> <li>• For detailed oil behaviour see the Otway Exploration Drilling OPEP page 17.</li> </ul>	
---	--

## Clean-up Recommendations:

**Tactical:** The following response strategy is recommended.

Natural Recovery		Allow natural tidal action to flush stranded/deposited oil. Oil will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean up techniques would cause more harm than benefit, or where access is restricted.
---------------------	--	---

## People and Resources:

# Shoreline Protection and Clean-up Plan

Personnel requirements should be assessed on a case-by-case basis, for guidance refer to Appendix 2.

## Staging and/or Logistics Constraints/Waste Issues:

- SMV will be the primary response option for this area with the use of vessel or aviation observations

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

**Table A1-1h: Shoreline treatment recommendation – Mangroves**

<p><b>Oiled Areas for Treatment:</b></p> <p><b>Description:</b></p> <ul style="list-style-type: none"><li>• Roots and trunks are mostly intertidal; the lower leaves are flooded at high tide.</li><li>• Substrate type can vary between mud, sand and leaf debris.</li><li>• They are highly productive, serve as nursery habitat, and support a diversity of animal and plant species.</li></ul> <p><b>Predicted Oil Behaviour</b></p> <ul style="list-style-type: none"><li>• Both MDO and Condensate are Class I/II hydrocarbons</li><li>• Class I/II hydrocarbons spread rapidly, disperse, and evaporate quickly.</li><li>• Gas Condensate is predicted once weathered to leave a waxy substance that will require manual removal.</li></ul> <p>For detailed oil behaviour see the Otway Exploration Drilling OPEP page 17.</p>	
---	---

## Clean-up Recommendations:

<b>Tactical:</b> Where appropriate, the following response strategies are recommended.		
Natural Recovery		Allow tidal action to flush stranded oil out of contaminated mangrove areas. Oil will continue to weather, degrading and gradually reducing in volume and toxicity. Natural recovery is appropriate in situations where alternative clean-up techniques would cause more harm than benefit to the mangroves and associated habitat.
Barrier (Onshore/ Nearshore boom)		Onshore/Nearshore booms may be deployed to contain and recover oil released from the contaminated area either naturally or concurrently with flooding/flushing operations.
Sorbents		Sorbent material (boom, pads, snares) may be placed on the floating hydrocarbon or water surface, allowing it to absorb or used to wipe or dab stranded hydrocarbon.

# Shoreline Protection and Clean-up Plan

		Recovery of all sorbent material is mandatory. Sorbent materials must be placed and removed carefully to minimise disturbance to the surrounding area. Likewise, they must be carefully monitored to prevent stranding, entanglement and failure
Low-Pressure, Ambient-Water Flushing		Low-pressure flushing with ambient seawater can be used to wash hydrocarbon from the sediment surface and mangrove vegetation in to areas where it can be collected. Flushing operations are most feasible from the outer fringe of the mangrove habitat and considerations should be given to tidal currents (flush on a falling tide) and wind (an onshore wind will push any released hydrocarbon back onto the shoreline).
<b>People and Resources:</b> Personnel requirements should be assessed on a case-by-case basis, for guidance refer to Appendix 2.		

## Staging and/or Logistics Constraints/Waste Issues:

- Access to some beaches will require permission from the relevant LGA or Land Manager
- Mobile Phone coverage may be limited in remote areas, a contingency with a Satellite Phone should be scoped prior to deployment to site.
- Manual and debris removal will generate waste and have decontamination requirements.
- Manual removal will require personal and support facilities.

## Ecological Concerns:

A NEBA or SIMA should be undertaken to ensure the most appropriate response options and any sensitivities are identified.

## Cultural/Historical Concerns:

Consultation with Traditional Owner Groups and relevant government departments should be sought prior to mounting a response to cover any cultural or historical concerns.

## Safety Concerns:

Risk assessments should be conducted for each individual site with site safety plans and a Job Safety Analysis undertaken prior to commencement of response activity.

# Shoreline Protection and Clean-up Plan

## Shoreline Treatment Recommendation Guide – Additional Information

The following table provides additional information to assist with planning decisions around the use of individual shoreline clean-up techniques. Key elements including objective, description, applicable habitat types, when to use, biological constraints, environmental effects and waste generation have been provided for each of the twelve shoreline clean-up techniques.

**Table A1-2: Additional information to support shoreline treatment recommendation guide. Note. This table is based on the information provided in the NOAA Shoreline Assessment Manual.**

	Objective	Description	Applicable Habitat Types	When to Use	Biological Constraints	Environmental Effects	Waste Generation
<b>Natural Recovery</b>	No stranded oil is removed in order to minimise impact to the environment, or because no there is no effective/safe method for cleanup.	Oil is left in place to degrade naturally. Monitoring of the contaminated area may be required.	Manmade Structures Rocky Shore Sandy Beach Tidal Flats Shallow Seagrass Reef Mangroves	When natural removal rates are fast (high evaporation, high energy coastline), when the degree of oiling is light or when cleanup actions will do more harm than natural recovery.	Natural recovery may be inappropriate for area used by high numbers of mobile animals (birds, marine mammals) or endangered species.	Same as from the oil alone.	None.
<b>Manual Oil Removal</b>	Removal of oil with hand tools and manual labour.	Removal of surface oil using hands, rakes, shovels, buckets, scrapers, sorbents, etc., and placing in containers. Includes underwater recovery of submerged oil by divers.	Preferred: Rocky Shore Sandy Beach  Possible: Tidal Flats Mangroves	Light to moderate oiling conditions for stranded oil. Submerged heavy oils that have formed semi-solid/solid masses on the bottom.	Foot traffic over sensitive areas (wetlands, tidal pools, etc.) should be restricted or prevented. Shoreline access may need to be restricted/closed at times (i.e. during bird nesting/ turtle hatching). Permission to work in culturally significant sites.	Minimal, if surface disturbance by responders and waste generation is controlled.	Collection of oil mixed with sand. Oily wastewater following decontamination. Oiled personal protective gear. All must be properly treated and/or disposed.

## Shoreline Protection and Clean-up Plan

	Objective	Description	Applicable Habitat Types	When to Use	Biological Constraints	Environmental Effects	Waste Generation
<b>Mechanical Oil Removal</b>	Removal of oil from shorelines using mechanical equipment.	Oil is collected using equipment such as graders, bulldozers, dredges, beach cleaners, etc. Requires systems for temporary storage, transport and treatment/disposal of collected material.	Possible: Sandy Beach	When large amounts of oiled materials must be removed. Care should be taken to remove sediments only to the depth of oil penetration. Excessive sediment removal will cause erosion and significantly increase waste volume.	Use of heavy equipment in sensitive habitats (i.e. wetlands, soft substrates) should be restricted. Permission requested for use in culturally significant areas. Site area must be controlled to prevent physical disturbance to adjacent, unoiled areas. The noise generated by the mechanical equipment may present a constraint as well.	May be detrimental if excessive sediments are removed without replacement. Organisms in the sediment will be affected, although the need to remove oil may make this response method the best overall alternative. Resuspension of exposed oil and fine-grained, oil sediments can affect adjacent bodies of water.	Can generate large quantities of contaminated sediment debris that requires treatment and/or disposal.
<b>Sorbents</b>	Removal of surface oil by absorption by oleophilic material placed at the waterline.	Sorbent material (boom, pads, snares) is placed on the floating oil or water surface, allowing it to absorb oil or is used to wipe or dab stranded oil. Recovery of all sorbent material is mandatory - they need to be firmly anchored in areas exposed to wave action/currents, to prevent stranding on the shoreline.	Preferred: Rocky shore  Possible: Tidal Flats Shallow Seagrass Mangroves	When oil is free-floating in small rocky pools, or stranded on shore. As a secondary treatment method after gross oil removal, and in sensitive areas where access is restricted (i.e mangroves). Note. Heavy oil will only coat the surface – therefore requires a large surface area to be effective.	Access for deploying and retrieving sorbents should not adversely affect wildlife. Application is soft or sensitive habitats will require deployment by boat or use of walking boards. Sorbent material left in place too long can break apart and present an ingestion hazard to wildlife.	Physical disturbance of habitat during deployment and retrieval.	All sorbent material must be collected and disposed appropriately. Caution should be taken to prevent overuse and the generation of large amounts of lightly oiled sorbents.

## Shoreline Protection and Clean-up Plan

	Objective	Description	Applicable Habitat Types	When to Use	Biological Constraints	Environmental Effects	Waste Generation
<b>Vacuum</b>	Removal of oil pooled on a shoreline substrate or subtidal sediments.	Vacuum unit is attached via a flexible hose to a suction head that recovers free oil. May be mounted on vessels for water-based operations, on trucks driven to recovery areas, or hand-carried to remote sites.	Preferred: Rocky shore  Possible: Manmade Structures Sandy Beach Tidal Flats Shallow Seagrass Mangroves	When oil is stranded on the substrate, pooled against a shoreline, concentrated in rocky trenches or trapped in vegetation. May be used in combination with low-pressure flushing to lift the oil off the substrate and vegetation.	Restrictions should be established for areas where foot traffic and equipment operation may be damaging, such as soft substrates.	Minimal, if foot and vehicle traffic are controlled and minimal substrate/vegetation is damaged or removed. Site restrictions and procedures should be developed and implemented.	Collected oil and or oil/water mix will need to be stored temporarily prior to treatment/disposal. Large amounts of water are often recovered, requiring separation and treatment.
<b>Debris Removal</b>	Removal of debris in path of spill prior to oiling and to remove contaminated debris from the shoreline and water surface.	Manual or mechanical removal of debris (seaweed, driftwood, wreckage, trash) from the shore or water surface.	Possible: Sandy Beach Tidal Flats Mangroves	When debris is heavily contaminated and provides a potential source of secondary oil release and/or contamination for other resources that use the area such as birds and small mammals. Removal of non-oiled debris (beach wrack) may be considered to reduce potential oiled waste; or likely clogging of recovery skimmers; or if it is likely to cause safety problems for responders.	Foot traffic over sensitive areas (wetlands, spawning grounds) must be restricted/controlled. Debris may be a habitat and an important source of prey (i.e. shorebirds feeding in wrack on beaches).	Physical disruption of substrate.	Potential to generate large volumes of contaminated debris. Waste disposal options should be less restrictive for debris collected pre-spill.

## Shoreline Protection and Clean-up Plan

	Objective	Description	Applicable Habitat Types	When to Use	Biological Constraints	Environmental Effects	Waste Generation
<b>Vegetation Removal</b>	To remove portions of oiled vegetation or oil trapped in vegetation to prevent oiling of wildlife or secondary oil releases.	Oiled vegetation is cut (weed trimmers, blades), picked or raked up and bagged for disposal.	Possible: Tidal Flats Mangroves	When the risk of oiled vegetation contaminating wildlife is greater than the value of the vegetation that is to be cut, and there is no less-destructive method that removes or reduces the risk to acceptable levels. Also, to remove thick oil residues under the oiled vegetation.	Cutting only the oiled portions of the plants and leaving roots and stems (as much as possible) will reduce impact to plants. Operations must be strictly monitored to minimise the degree of root destruction and mixing oil deeper into the sediments.	Vegetation removal/unnecessary trampling will destroy habitat for many animals. Cut areas will have reduced plant growth and, in some instances, plants may be killed. Along exposed sections of shoreline, the vegetation may not recover, resulting in erosion and habitat loss.	Cut portions of oiled plants must be collected and disposed of properly.
<b>Sediment Tiling</b>	To break up oily sediments and surface oil deposits, increasing their surface area, and bringing deeper subsurface oil layers to the surface, enhancing the rate of degradation by aeration. Also, to increase the rate sediment re-working by wave action.	Oil sediments are mixed (i.e. rototilled) using mechanical equipment or manual tools. Along beaches, oiled sediments may be pushed to the lower intertidal zone to enhance natural cleanup by wave activity (surf washing). On gravel beaches, the process may be aided with high-volume flushing.	Possible: Sandy Beach Sedimentary substrate that can support mechanical equipment or foot traffic and hand tiling.	On sand to gravel beaches with subsurface oil where sediment removal is not feasible (due to erosion, transportation or disposal problems). On sand beaches where the sediment is stained or lightly oiled. May be appropriate for sites where the oil is stranded above the normal high waterline, so that the sediments can be reworked by wave action.	Avoid use on shores near sensitive wildlife habitats, such as fish-spawning areas or bird-nesting and adjacent to subtidal habitats such as shellfish beds, seagrass, or coral reefs.	Mixing of oil into sediments could further expose organisms that live below the original layer of oil. Repeated reworking could delay re-establishing of these organisms. Refloated oil and oily suspended sediments from treated sites could contaminate adjacent waterbodies and shorelines.	None.
<b>Flooding</b>	To lift and wash oil stranded on land to the water's edge for collection.	A perforated hose is placed above the oiled shore. Sea water is pumped through the hose at low pressure and flows downwards	Preferred: Sandy Beach  Possible:	In heavily oiled areas when the oil is still fluid and adheres loosely to the substrate, and where oil has penetrated into gravel sediments. Can be	Care should be taken to recover oil where nearshore habitats contain rich biological communities. Not	Habitat may be physically disturbed by foot traffic during operations and smothered by sediments washing. If containment methods are not	Depends on the effectiveness of the collection method.

## Shoreline Protection and Clean-up Plan

	Objective	Description	Applicable Habitat Types	When to Use	Biological Constraints	Environmental Effects	Waste Generation
		to the water where any released oil is collected by booms and recovered by skimmers or vacuum. On porous sediments, water flows through the substrate, pushing loose oil ahead of it. On saturated, fine-grained sediments, the technique will lift and flush the oil.	Manmade Structures Rocky shore Tidal Flats Shallow Seagrass	used with other washing techniques (i.e. low or high-pressure flushing).	appropriate for soft, muddy substrates.	sufficient, oil and oiled sediments may be flushed into adjacent areas. Flooding may cause sediment loss and erosion of the shoreline and shallow rooted vegetation. Oiled sediment may be transported to nearshore areas, contaminating them and burying benthic organisms.	
<b>Low-Pressure, Ambient-Water Flushing</b>	Removal of fluid oil that has adhered to the substrate or man-made structures, pooled on the surface, or become trapped in vegetation.	Ambient-temperature water (sea water) is sprayed at low pressure (<72 kilopascals (kpa)) from a hand-held hose, to lift oil from the substrate and float it to the water's edge for recovery by skimmers, vacuum or sorbents. Can be conducted from barges or flat-bottom vessels with long-reach spray systems. Usually used with a flooding systems to prevent released oil from re-adhering to the substrate downstream of the treatment area.	Preferred: Sandy Beach  Possible: Manmade Structures Rocky shore Tidal Flats Shallow Seagrass	Where fluid oil is stranded onshore or floating on shallow intertidal areas.	May need to restrict use so that the oil/water effluent does not drain across sensitive intertidal habitats, and the mobilised sediments do not affect rich subtidal communities. Use from boats will reduce the need for foot traffic in soft substrates and vegetation. Flushed oil must be recovered to prevent further oiling of adjacent areas.	If containment methods are not sufficient, oil and oiled sediments may be flushed into adjacent areas. Flooding may cause sediment loss and erosion of the shoreline and shallow rooted vegetation. Some trampling of substrate and attached biota may occur.	Depends on the effectiveness of the collection method.

## Shoreline Protection and Clean-up Plan

	Objective	Description	Applicable Habitat Types	When to Use	Biological Constraints	Environmental Effects	Waste Generation
<b>High-Pressure, Ambient-Water Flushing</b>	To remove oil that has adhered to hard substrates or man-made structures.	Similar to low-pressure flushing, except that water pressure is 720-7,200 kpa. High-pressure spray will more effectively remove sticky or viscous oils.	Preferred: Manmade Structures	When low-pressure flushing is not effective at removing adhered oil, which must be removed to prevent continued oil release or for aesthetic reasons. When a directed water jet can remove oil from hard to reach sites.	May need to restrict flushing so that the oil does not drain across sensitive habitat. Flushed oil must be recovered to prevent further oiling of adjacent areas. Should not be used directly on attached algae nor rich, intertidal areas.	All attached animals and plants in the direct spray zone will be removed, even when used properly. If containment methods are not sufficient, oil and oiled sediments may be flushed into adjacent areas. Some trampling of substrate and attached biota may occur. Inappropriate use may drive oil deeper into the substrate or erode fine sediments from shorelines.	Depends on the effectiveness of the collection method
<b>Hot-Water Flushing</b>	To mobilise weathered and viscous oil strongly adhered to surfaces.	Hot water (32°C up to 77 °C) is sprayed with hand-held wands at low (<72 kpa) pressure/high (>720kpa) pressure – where appropriate. Requires immediate use of a vacuum/sorbents or used with a flooding system, using booms and a skimmer/vacuum for collection.	Possible: Manmade Structures	Low-pressure flushing where heavy, relatively fresh oil is stranded onshore. High-pressure flushing on heavily weathered oil that is not effected by low-pressure flushing.	Use should be restricted so that the oil/water effluent does not drain across habitats sensitive to exposure by oil, oily sediments and hot water. Should not be used directly on attached algae nor rich, intertidal areas. Released oil must be recovered to prevent further oiling of adjacent habitats.	All attached animals and plants in the direct spray zone will be removed, even when used properly. Oiled sediment may be transported to shallow nearshore areas, contaminating them and burying benthic organisms.	Depends on the effectiveness of the collection method

# Shoreline Protection and Clean-up Plan

---

## Appendix 2: Shoreline Personnel and Equipment Assumptions

### Personnel calculations are based on the following:

- Based on 14 day shifts of workers.
- Based on oil stranding daily/Continuously.
- Based on 1 primary crew and a replacement crew in rotation.
- Based on Exxon Mobil Handbook for heavily oiled shorelines and resources required per km.
- Based on average of shoreline strategies for each shoreline type (See below for strategy %).

### Manual Equipment based on the following

- Shovels – 1 per worker per week.
- Rakes – 1 per worker per week.
- Picks – 1 per worker per week.
- Plastic Bags – 50 per worker per day.
- Wheelbarrows – 1 per team (5 workers) per week.

### Resource calculation Assumptions/limitations

- Remoteness, travel time to/from work locations.
- Vessels, Lodging, Food.
- Collection/transport of waste.
- Logistical resources needed not currently factored.
- Rates for mechanical clean up are extremely variable.
- There are multiple variations for all techniques - these are generalized needs for planning purposes only.
- Assumed 8-hour workdays.
- Not all oil comes ashore at once.
- Not all shoreline is cleaned at once.
- Some shorelines may be cleaned multiple times.

### Strategy % employed per shoreline substrate type

#### Manmade Structures

- Flooding – 10%
- HP, ambient water flushing – 60%
- Hot water flushing – 10%
- Natural recovery – 10%

#### Rocky Shores (Sheltered)

- Natural recovery – 100%

#### Rocky Platform / Cliff face (exposed)

- Natural recovery – 100%

#### Sand Beach (mixed sand/shell)

- Manual removal – light oil – 20%
- Manual removal – Heavy oil – 30%
- Flooding – 20%
- Mechanical removal – 10%
- Natural Recovery – 10%

#### Tidal Flat (mud/sands) and vegetative salt/brackish marsh

- LP, ambient water flushing – 30%
- Natural recovery – 70%

#### Shallow Seagrass

- Natural Recovery – 100%

# Shoreline Protection and Clean-up Plan

---

## Reefs

- Natural Recovery – 100%

## Mangroves

- LP, Ambient water flushing – 20%
- Natural recovery – 80%

## Other Assumptions

- Stochastic modelling used as opposed to Deterministic as the chances of deterministic occurring are slim. Stochastic gives a greater probability of where the oil could potentially go.
- Anything shoreline with less than 10% probability of shoreline contact of  $>100\text{gm/m}^2$  not considered for shoreline clean up.
- Anything with only  $10\text{gm/m}^2$  is not actionable. The minimum actionable amount is  $100\text{gm/m}^2$ .

## **Appendix 4: Oil Spill Trajectory Modelling Request Form**

### **Oil Spill Trajectory Modelling (OSTM)**

Computer based OSTM is used to help estimate the track of an oil slick in real time using live wind, weather, and current data. This service is provided by RPS Group and is accessible directly via the Conoco Phillips or AMOSC membership contracts. RPS has been used extensively to help run the predictive modelling used in this OPEP.

To predict the early movement of a level 2 or level 3 oil spill, real time OSTM will be generated by RPS. This information is typically available within 4 hours of request and can be constantly improved by feeding in real time observational data from aerial surveillance and satellite tracking buoys.

Incident ☐ Exercise ☐

## PROCEDURE FOR INITIATING SPILL MODELLING – FOR OIL SPILLS

1. Complete the form with all details – provide estimates and detail uncertainties. Clear form
2. Call the RPS Response duty officer on (0408 477186) to alert them of the requirement for spill modelling explaining the general details and seeking clarification as required.
3. Send the form to **RPSresponse@rpsgroup.com** (click on the email address).

If new information becomes available, inform the duty officer by telephone and then email updates.

**Date and time of this notification:**

### Contact details

Name of the company	
Name of contact person	
Contact number (include country/area codes)	
Email address for return communications	

### Details of spilled material (include oil assay if available)

Oil name			
Type or description			
Latitude of source	Degrees: <input type="text"/>	Minutes: <input type="text"/>	Seconds: <input type="text"/>
Longitude of source	Degrees: <input type="text"/>	Minutes: <input type="text"/>	Seconds: <input type="text"/>
Date and time spill started			
Time zone (+ or - from UTC)			
If slicks have been observed from an unknown source, provide map information to define the bounds			
Do you want forecasting forward in time from this location or back-track to an unknown source?	<input type="checkbox"/> Forward from slick area	Geographic bounds of slick area(s) and <u>time of observation</u> must be supplied	
	<input type="checkbox"/> Back-track from slick area		
	<input type="checkbox"/> Forward and back-track		

### Depth, type of discharge

Depth of release	<input type="checkbox"/> Surface	<input type="checkbox"/> Subsurface – specify the depth (m) <input type="text"/>
If from subsurface, describe the discharge energy	<input type="checkbox"/> Low turbulence e.g. low-pressure leak	
	<input type="checkbox"/> Medium turbulence e.g. intermediate-pressure leak	
	<input type="checkbox"/> High turbulence e.g. well blow out, ruptured pipeline	

### Volume or rate of release

Short spills that have ended	Volume: <input type="text"/>	Units: <input type="text"/>	Duration (hours): <input type="text"/>
Ongoing spills	Rate: <input type="text"/>	Units: <input type="text"/>	per hour

**Notes** (describe special details of the incident, special concerns, landmarks, doubts about information, etc.)

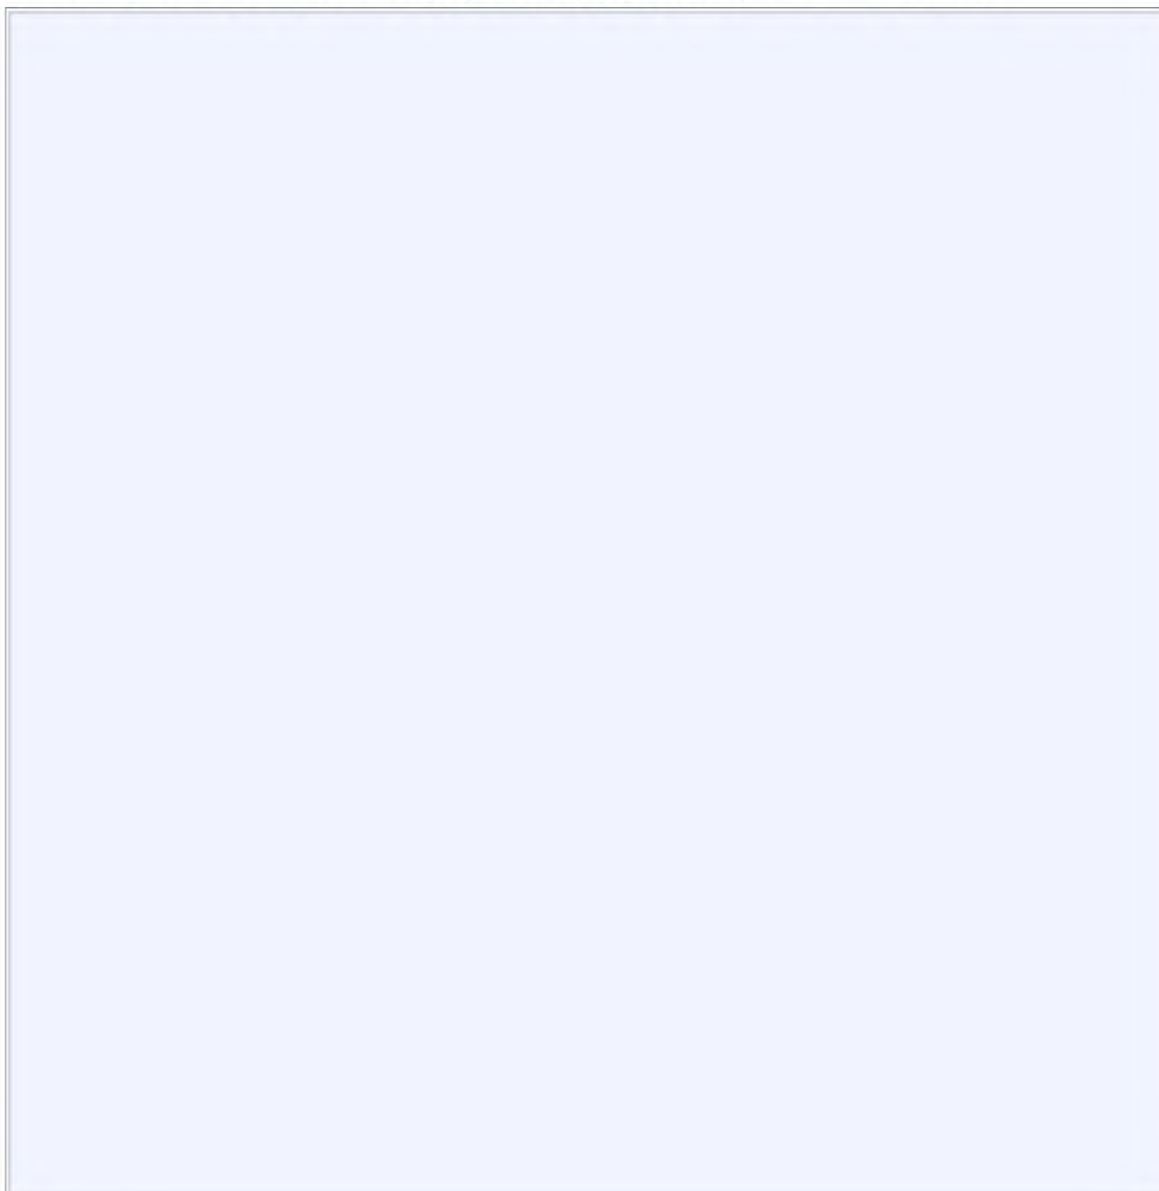

--

### Documents attached

- |  |   |   |
|--|---|---|
| <input type="checkbox"/> Oil Assay sheet   | <input type="checkbox"/> Safety data sheet        | <input type="checkbox"/> Local wind measurements                |
| <input type="checkbox"/> Spill site photos | <input type="checkbox"/> Aerial surveillance maps | <input type="checkbox"/> Line drawings showing oil distribution |
| <input type="checkbox"/> Others (specify): |   |   |

## PROCEDURE FOR REQUESTING UPDATED OIL SPILL MODELLING

1. Revise the input form for any changes.
2. If surveillance is available to define the observed location of slicks, this information should be provided to the duty officer in a form that can be translated to define the spatial distribution and relative thickness of the oil. Formats that would be useful include:
  - a. A GIS (shp) file defining the oil distribution (including the datum format)
  - b. Satellite imagery that includes spatial references
  - c. Photographs with location references
  - d. A line drawing marked with estimated centre and edge locations, length and width dimensions, and relative thickness contours (use the space below making sure to provide spatial references)
  - e. Location of tracking buoys (confirm first that these are marking the slick location).
3. Call the RPS Response duty officer on **(0408 477186)** to request an update to the spill modelling for changed details, explaining what has changed and seeking clarification as required.
4. Send the form and any files to **RPSresponse@rpsgroup.com** (click on email address).

## Appendix 7: POLREP Form

Australian Government  
Australian Maritime Safety Authority

## HARMFUL SUBSTANCES REPORT (POLREP)

Marine Order 91 (*Marine pollution prevention – Oil*)

To: General Manager, Response  
through Joint Rescue Coordination Centre (JRCC) Australia

Telephone: +61 (0)2 6230 6811

Freecall: 1800 641 792 (within Australia)

AFTN: YSARYCYX

E-mail: [rccaus@amsa.gov.au](mailto:rccaus@amsa.gov.au)

*Note: If any of the following items of the vessel reporting format are inappropriate they should be omitted from the report. These items of the standard reporting format are referred to in IMO Resolution A.851(20).*

A.	Name of vessel	Call sign	Flag
	<input type="text"/>	<input type="text"/>	<input type="text"/>
B.	Date and time of event ( <i>Note: Time must be expressed as Coordinated Universal Time (UTC)</i> )		
	<input type="text"/>		
C.	Position: latitude and longitude		
	or <input type="text"/>		
D.	Position: true bearing and distance		
	<input type="text"/>		
E.	True course (as a three digit group)		
	<input type="text"/>		
F.	Speed (in knots and tenths of a knot as a 3-digit group)		
	<input type="text"/>		
L.	Route information – details of intended track		
	<input type="text"/>		
M.	Full details of radio stations and frequencies being guarded		
	<input type="text"/>		
N.	Time of next report ( <i>Note: Time must be expressed as Coordinated Universal Time (UTC)</i> )		
	<input type="text"/>		
P.	Type and quantities of cargo and bunkers on board		
	<input type="text"/>		
Q.	Brief details of defects, damage, deficiencies or other limitations. These must include the condition of the vessel and the ability to transfer cargo, ballast or fuel		
	<input type="text"/>		

# Oil Pollution Emergency Plan

R. Brief details of actual pollution. These should include the type of oil, an estimate of the quantity discharged, whether the discharge is continuing, the cause of the discharge and, if possible, an estimate of the movement of the slick

[illegible]

S. Weather and sea conditions, including wind force and direction and relevant tidal or current details

T. Name, address, telephone and facsimile numbers of the vessel's owner and representative (*manager or operator of the vessel, or their agents*)

Owner		Representative	
Telephone	Facsimile	Telephone	Facsimile

U. Type of vessel	Length	Breadth	Tonnage

X. 1. Action being taken with regard to the discharge and to the movement of the vessel

\_\_\_\_\_

2.Assistance or salvage efforts which have been requested or which have been provided by others

[illegible]

3. The master of an assisting or salvaging vessel should report the particulars of the action undertaken or planned

--

# Oil Pollution Emergency Plan

## Appendix 8: Initial Assessment Checklist

### STATUS BOARD 2

### INITIAL ASSESSMENT

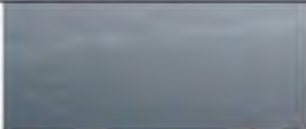

#### 10 Questions of Spill Assessment

What is it?	Oil Type Oil Name Oil Properties Specific Gravity/Viscosity/Pour Point Asphaltenes/Wax Content/Boiling Point @ 200C
Where is it?	Lat/Long Distance and Bearing
How big is it?	Area Volume Colour Appearance
Where is it going?	Weather Conditions Currents and Tides
Is the source contained?	Instantaneous or Continuous Release
What is in the way?	Resources/Sensitivities at risk
When will it get there?	How much time do you have to respond? Basic spill trajectory modelling
What is happening to it?	Weathering process
What is the worst credible scenario?	What if? So what?
What can we do?	

# Oil Pollution Emergency Plan

## Appendix 9: Bonn Agreement Reference Diagrams

Code	Description / Appearance	Layer Thickness Interval (Microns)	Litres per km <sup>2</sup>	Typical Appearance
1	Sheen (silver / grey)	0.04-0.30	40-300	
2	Rainbow	0.30-5.0	300-5,000	
3	Metallic	5.0-50	5,000-50,000	
4	Discontinuous True Oil Colour	50-200	50,000-200,000	
5	Continuous True Oil Colour	>200	>200,000	

# Oil Pollution Emergency Plan

---

## Appendix 10: Aerial Surveillance Form

### Aerial Surveillance

Aerial Surveillance is one of the quickest most effective ways of providing the IMT with real time information surrounding an oil spill. Aircraft provide a much better platform than vessels to observe, quantify and position the spill. Aerial Surveillance gives the IMT the ability to plan for and decide on response strategies early. It is the quickest way of providing the IMT with situational awareness surrounding an oil spill.

Fixed wing or rotary wing aircraft can be utilised to perform aerial surveillance; however some aircraft are better suited to further offshore than others. Considerations will need to be made prior to selecting an observation platform based on distance from shore, weather conditions and flight duration.

In order to properly quantify the oil on water, trained aerial observers are required to implement the Bonn Agreement Oil Appearance Code (BAOAC) (See Appendix 9).

This technique allows a trained aerial observer to accurately estimate the quantity of oil on water based on how it looks. The different appearance corresponds with different thicknesses, combined with area calculations and coverage estimates, equates to a volume estimation.

Trained aerial observers are available via the AMOSC membership and can be stood up within 4 hours of activation. Aerial Observation is typically performed twice a day to get current, accurate positional data of the oil spill, along with up-to-date quantification data. This data can be used to help improve Oil Spill Trajectory Modelling predictions and help guide operational and planning decisions in the IMT.

# Oil Pollution Emergency Plan

<b>Incident</b>		<b>Date</b>		<b>Observers</b>

E															

Slick	OIL APPEARANCE COVERAGE - %						MINIMUM VOLUME - m <sup>3</sup>	MAXIMUM VOLUME - m <sup>3</sup>	TYPE OF DETECTION (etc. visual, IR)	THE BONN AGREEMENT OIL APPEARANCE CODE (BAOAC)			
	1	2	3	4	5	OTH				No	OIL APPEARANCE	MIM. VOLUME m <sup>3</sup> / km <sup>2</sup>	MAX. VOLUME m <sup>3</sup> / km <sup>2</sup>
A													
B										1	SHEEN	0.04	0.30
C										2	RAINBOW	0.30	5.00
D										3	METALLIC	5.00	50.0
E										4	DISCONTINUOUS TRUE COLOUR	50.0	200
										5	TRUE COLOUR	200	>200

**NOTE:** Ground Speed (SOG) is the speed of the aircraft relative to the ground (sea) measured in knots (kt). One knot is one nautical mile (nm) per hour.

1 kt = 1 nm per hour = 1.85 Kilometres (km) per hour = 0.03 km (31m) per minute = 0.0005 km per second

**EXAMPLE:** A helicopter, flying at 80 knots, takes 120 seconds to fly along the length of an oil slick.

(Speed x Time = Distance) 80 knots x 120 seconds =/ 80 x 1.85 x 120 / 60 / 60 = 148 kph x 0.03 hr = 4.9 km

## Appendix 13: AMOSC Mutual Aid Request Form

**Attachment 3**  
**Available Services Request for Mutual Aid (clause 9)**

Defined terms in this Available Services Request for Mutual Aid (Services Request) have the meaning given to them in the Master Service Contract (MSC) between AMOSC and you.

AMOSC has received a request for services from another AMOSC Member. AMOSC requests, in accordance with clause 9 of the MSC that you provide (or procure that an Affiliate provide) the following equipment, personnel or services as indicated below:

**EQUIPMENT**

☐ AMOSC requests Equipment

Type	Quantity	

**CONSUMABLES**

☐ AMOSC requests Consumables

Type	Quantity	

**PERSONNEL**

☐ AMOSC requests Personnel

Category or name of Personnel	Number	

AMOSC MASTER SERVICE CONTRACT - ATTACHMENT 3  
PRO FORMA - AVAILABLE SERVICES REQUEST FOR MUTUAL AID page 1

Please state below:

- what equipment, consumables and/or personnel (as requested) (if any) can be provided by you or your Affiliate:  
[Insert]  
(being 'Available Resources'); and
- the timeframe for the provision of those Available Resources:  
[Insert]

Following completion please sign date and return this Request to AMOSC by email.

In returning this Request you acknowledge that the Available Resources will be provided to AMOSC on the terms of clause 9 of the MSC.

SIGNED by [name of authorised representative] as authorised representative for [Member] in the presence of:

Signature of witness

Name of witness (block letters)

Date [insert]

By executing this Request the signatory warrants that the signatory is duly authorised to execute this Request on behalf of [Member]

GREENHOUSE GAS EMISSIONS TECHNICAL SUMMARY	4
REFERENCES	7
APPENDIX	8

## GREENHOUSE GAS EMISSIONS TECHNICAL SUMMARY

ConocoPhillips Australia is preparing to conduct an Otway Exploration Drilling Program, hereinafter referred to as the Activity, within permits T/49P and VIC/P79. An Environment Plan is currently being prepared based on the 'design envelope' which is a five-year timeframe from January 2024 to end 2028. In relation to the EP, this technical summary presents the worst-case and expected direct (scope 1) greenhouse gas (GHG) emissions estimate for the Activity.

The GHG emissions inventory for the Activity was calculated based on the methodology in the National Greenhouse and Energy Reporting (Measurement) Determination 2008 (Clean Energy Regulator, 2022). The boundary of assessment is shown in Figure 1. The emission sources from mobile offshore drilling unit (MODU), vessels, flaring and helicopters were considered in the assessment. The input information and assumptions used are provided in the Appendix.

Figure 1: Boundary of GHG assessment.

As shown in Table 1 and Figure 2, the total worst-case direct GHG emissions are estimated to be approximately 195 kT CO<sub>2</sub>-e over the project life, assuming worst-case conditions, for example the longest possible drilling duration for each well and maximum flaring duration and rates on each well. Emissions from vessels, flaring, MODU, and helicopters represent 38%, 35%, 27%, and 0.6% of the total emissions, respectively. This emissions estimate is equivalent to 132 kT CO<sub>2</sub>-e/year (or 11 kT CO<sub>2</sub>-e/month, based on a worst-case project period of 540 days), which is approximately 0.027% of the annual Australian GHG emissions of 488 Mt CO<sub>2</sub>-e in 2021 (Department of Climate Change, Energy, the Environment and Water, 2022).

Table 1: Summary of worst-case estimated GHG emissions.

Emission source	GHG emissions (T CO <sub>2</sub> -e)			Total GHG Emissions (T CO <sub>2</sub> -e)	Percentage
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O		
Vessels	73,156	335	6	73,497	37.6%
Flaring	68,484	133	40	68,657	35.1%
MODU	51,850	237	4	52,092	26.7%
Helicopters	1,111	0	10	1,120	0.6%
TOTAL	194,600	706	60	195,366	

Figure 2: GHG emissions by source under worst-case conditions.

As shown in Table 2 and Figure 3, the total expected direct GHG emissions are estimated to be approximately 83 kT CO<sub>2</sub>-e over the project life, assuming more realistic operational conditions, for example typical drilling duration and well testing on only two wells at maximum duration and rates. Emissions from vessels, flaring, MODU, and helicopters represent 44%, 28%, 28%, and 0.6% of the total emissions, respectively. This emissions estimate is equivalent to 10.5 kT CO<sub>2</sub>-e/month (based on a more realistic project period of 240 days) and is approximately 0.017% of the annual Australian GHG emissions of 488 Mt CO<sub>2</sub>-e in 2021 (Department of Climate Change, Energy, the Environment and Water, 2022).

Table 2: Summary of expected estimated GHG emissions.

Emission source	GHG emissions (T CO <sub>2</sub> -e)			Total GHG Emissions (T CO <sub>2</sub> -e)	Percentage
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O		
Vessels	36,380	167	3	36,550	44.0%
Flaring	22,828	44	13	22,886	27.5%
MODU	23,045	106	2	23,152	27.9%
Helicopters	495	0	4	499	0.6%
<b>TOTAL</b>	<b>82,747</b>	<b>317</b>	<b>23</b>	<b>83,087</b>	

Figure 3: GHG emissions by source under realistic operational conditions.

## APPENDIX

Input information used:

1. The well drilling and testing phase, including the plug and abandonment, will take 540 days in total, equivalent to maximum drilling days of 90 per well for 6 wells under worst-case operational conditions; and 240 days in total, equivalent to drilling days of 40 per well for 6 wells under realistic operational conditions.
2. Vessels moving to or residing outside the operational area are not considered part of the Activity. Vessel activities within the operational area is considered in this inventory (Xodus, 2022).
3. Amount of vented gas is negligible and therefore excluded.
4. Helicopters will be the only aircraft used. There are on average two helicopters, with a flight frequency of three times a week, flying from the Port of Warrnambool during well drilling and testing (including plug and abandonment phase). A one-way distance of 125 nm was used in calculation of helicopter emissions.
5. Maximum flare rate is 40 MMscfd for 120 hours/well during well drilling and testing. Under worst-case operational conditions, well testing applied on all 6 wells; and under realistic operational conditions, well testing applied on only 2 wells.
6. No flaring during plug and abandonment activities.

Assumptions used:

1. No fuel gas or purchased electricity is to be used.
2. Vessels and MODU details used in calculation are shown in Table A1.

Table A1: Vessels and MODU input used in calculation.

VESSELS	QUANTITY	NO. OF TRANSIT DAYS	NO. OF WORKING DAYS UNDER WORST-CASE CONDITIONS	NO. OF WORKING DAYS UNDER REALISTIC CONDITIONS

SAA	Small Arms Ammunition
WWI	World War One
UXO	Unexploded Ordnance
WWII	World War Two

## EXECUTIVE SUMMARY

### Background

RPS Explosives Engineering Services (RPS), part of RPS Energy Ltd, has been commissioned by **ConocoPhillips** to conduct a desktop study and risk assessment for potential Unexploded Ordnance (UXO) contamination at the **Otway Exploration Drilling** site. This document will provide an overview and easy access to future operations in respect of UXO risk handling for all potential upcoming drilling works.

The principal aim of RPS, for this report, is to provide **ConocoPhillips** with an appropriate and pragmatic assessment of the risks posed by UXO to the **Otway Exploration Drilling**, in order to identify a suitable methodology for the mitigation of any identified risks to an acceptable level in accordance with the 'ALARP' Principle.

The Area of Interest (AOI) is the **Otway Exploration Drilling** Permit Areas VIC/P79 and T/49P. These permit areas are located in the Otway Basin, between Warrnambool, Victoria and King Island. Permit Area VIC/P79 covers an area of approximately 2576 km<sup>2</sup>, whilst Permit Area T/49P covers an area of approximately 4690 km<sup>2</sup>.

### UXO Risk Level

**The Risk Levels identified in this study are based upon Probabilities of Encounter which have been determined for the provided Scope of Works (i.e. a limited number of wellsite drilling and seabed survey locations) which, due to the limited nature of interaction with the seabed are lower overall than those for the entirety of the Permit Areas. If the client were to conduct extensive further works, RPS must be consulted so that the risk posed by the additional interaction with the seabed can be assessed.**

Based on the conclusions of the research and the risk assessment undertaken, RPS has found there to be a **Low** risk from encountering UXO on site.

RPS also take in to account the category of UXO both when assessing the probability of the item functioning and the consequence of such an event. This leads to the varying risk levels between munitions with the same installation methodology. The full risk matrices are presented in **Appendix 6**, providing an assessment of the risk associated with each activity.

The Permit Areas have been split into 4 zones (A-D), dependent on the risk presented and the planned installation activities.

**Table 0.1 - Overall Risk Levels**

Overall Risk Levels					
UXO		Risk Zones			
		A	B	C	D
Small Arms Ammunition		Neg	Neg	Neg	Neg
Land Service Ammunition		Neg	Neg	Neg	Neg
≤155 mm Projectiles		Neg	Neg	Neg	Neg
>155 mm Projectiles		Neg	Low	Low	Neg
HE Bombs	Allied Origin	Low	Low	Low	Low
	Axis Origin	Neg	Neg	Neg	Neg
Sea Mines	Allied Origin (Contact Mine)	Low	Low	Low	Low
	Allied Origin (Ground Mine)	Low	Low	Low	Low
	Axis Origin (Contact Mine)	Low	Low	Low	Low
	Axis Origin (Ground Mine)	Low	Low	Low	Low
Torpedoes		Low	Low	Low	Low
Depth Charges		Low	Low	Low	Low
Conventional Dumped Munitions		Low	Low	Low	Low
Dumped Chemical Munitions		Low	Low	Low	Low
Missiles/Rockets		Low	Low	Low	Low

## Burial

In the softer sediments, it is possible for munitions to be covered by shifting sediments on the seabed and subsequently become buried. This is dependent on the mass, dimensions/shape of the item and the sediments upon which it came to rest as well as the currents affecting the area, however the maximum burial depth due to scour is approximately equal to the diameter of the munition. Burial is not possible in areas where bedrock is exposed.

Given the water depths throughout the site, it is considered likely that burial via natural processes (i.e. mobile seabed) will be the main form of burial rather than burial as a direct result of penetration upon impact.

RPS have determined that any UXO present on site is likely to be buried to scour depth (approximately equal to the diameter of the munition) plus the wave height of any mobile sediment bedforms present.

## Recommendations

Based on the identified risk levels, it is recommended that appropriate mitigation is implemented to reduce the risk, prior to and/or during any works.

Due to the Low-Risk present at the wellsite locations, it would be recommended that Reactive Mitigation is used to manage the residual risk on site. It would be recommended that for all risk areas and activities that at a minimum all personnel are provided an **Explosives Safety and Awareness Briefing**.

The Moderate Risk associated with Snag on Vessel is also mitigated using Reactive Mitigation.

**Table 0.2 - Risk Mitigation Strategy Overview**

Risk Zone	Activity / Risk Level*	Mitigation Requirement					
		UXO Survey	Avoidance and / or ID&C	Explosives Safety Briefing	Explosives Engineer on Vessel**	Explosives Engineer On-Call	Detection Requirement
A	Low Risk Activities			✓		✓	N/A
B	Low Risk Activities			✓		✓	N/A
C	Low Risk Activities			✓		✓	N/A
D	Low Risk Activities			✓		✓	N/A

\* See Table 6.2 for risk level of each activity in each risk zone

\*\* Dependent on Survey Results

For further information about Reactive Mitigation requirements see Section 11

# 1 INTRODUCTION

## 1.1 Instruction

RPS Explosives Engineering Services (RPS), part of RPS Energy Ltd, has been commissioned by **ConocoPhillips** to conduct a desktop study and risk assessment for potential Unexploded Ordnance (UXO) contamination at the **Otway Exploration Drilling** site. This document will provide an overview and easy access to future operations in respect of UXO risk handling for all potential upcoming drilling works.

A site location map has been presented in **Appendix 1**.

## 1.2 Scope of Work

The following facets will be covered within this report:

- **UXO Risk Analysis:** Assessment of the specific military, former military and UXO related activities that have taken place within the vicinity of the project area. Additionally, to review any previous UXO clearance/mitigation operations that have already taken place. Then, to assess the risks which the identified UXO types present to the installation/survey activities.
- **Recommendations:** Based on the outcome of the assessment, appropriate mitigation measures that have been recommended to allow works to proceed safely and with minimal disruption. The recommendations will be designed to reduce the risk on site to As Low As Reasonably Practicable ('ALARP').

This report focuses on historical activities that occurred within the proposed Area of Interest and its immediate surroundings, with respect to the likelihood of encountering potential UXO and any associated risk with the proposed scheme of work.

## 1.3 Definitions

The term 'Site' refers to the area within the extent of the works associated with the **Otway Exploration Drilling**, illustrated in **Appendix 1**.

The term '**Area of Interest (AOI)**' refers to the area within the extent of the works associated with the site. This is defined by the client-provided ArcGIS shapefile "COP\_Permits\_Otway.shp".

The term "**Area of Interest Buffer**" is a 5 km buffer surrounding the AOI. Due to the degree of inaccuracy when plotting historical munitions this buffer is used to aid in determining the probability of encountering UXO within the site.

The term "**Wider Area of Interest**" is an undefined area outside of the AOI in which some of the information detailed in this report may relate to, to outline the overall military history of the area

Selected terminology referred to throughout this report is documented in **Appendix 2**.

## 1.4 Aims

The principal aim of RPS, for this report, is to provide **ConocoPhillips** with an appropriate and pragmatic assessment of the risks posed by UXO to the **Otway Exploration Drilling**, in order to identify a suitable methodology for the mitigation of any identified risks to an acceptable level in accordance with the 'ALARP' Principle.

The 'ALARP' Principle is clearly defined in **Appendix 3**.

## 1.5 Reporting Conditions

This study consists of a desk-based collation and review of available documentation and records relating to the possibility of UXO being present within the site. Certain information obtained for the purposes of this study

is either classified, restricted material or considered to be confidential to RPS. Therefore, summaries of such information have been provided.

It must be emphasised that this desk study is only able to identify the potential for UXO to be present. Further geophysical surveys and target investigation may be necessary to provide confirmation of the presence of UXO and the actual risks involved.

**Note:** Our appraisal relies on the accuracy of the information contained within the documents consulted which have been deemed suitable following review. RPS will however in no circumstances be held responsible for the accuracy of such information or data supplied.

## 1.6 Sources of Information

The main sources of information consulted by RPS for this report were obtained from within the public domain. Additional sources reviewed are below:

- RPS Archives;
- Military Archives;
- National Archives;
- Historic Maps, Aerial Photographs and Records; and
- Internet Research.

RPS has also consulted a series of research documents to compile this report. These are listed in **Section 1.6.1** below.

### 1.6.1 Specific Documents

RPS has consulted a number of research documents and existing reports in researching this report. These are listed below:

- [1] Menzel, P., Wranik, H. & Paschen, M. (2017). Laboratory experiments and numerical simulations on the wave and flow-induced migration of munition from WW1 and WW2 as a risk assessment for offshore construction. Lehrstuhl für Meerestechnik.
- [2] ConocoPhillips. (2022). Otway Exploration Drilling Program Environment Plan. Section 2: Description of Activity. Rev 00b

## 1.7 Additional Deliverables

In addition to this report, RPS will supply the client with GIS deliverables representing UXO Features and Risk Zones. These will be supplied in Layer Package format.

**Note:** Due to licencing agreements with the data provider, RPS are not able to supply wreck data in spatial format. As such, relevant wreck data is tabulated in Section 3.4 and shown visually in Appendix 5.

## 2 SITE DETAILS AND DESCRIPTION

### 2.1 Area of Interest

The Area of Interest (AOI) is the **Otway Exploration Drilling** Permit Areas VIC/P79 and T/49P. These permit areas are located in the Otway Basin, between Warrnambool, Victoria and King Island. Permit Area VIC/P79 covers an area of approximately 2576 km<sup>2</sup>, whilst Permit Area T/49P covers an area of approximately 4690 km<sup>2</sup>.

A site location map has been presented at **Appendix 1**.

### 2.2 Proposed Scheme of Work

The client has indicated that the following activities are to take place within the AOI:

- Well Drilling (up to 6 locations);
- MODU Anchoring;
- Peel Grab Operations;
- Borehole/Vibrocore;
- CPT; and
- Grab Sampling.

The client has indicated that up to 12 geotechnical investigation locations will be utilised per potential drilling location, with sampling equipment deployed over the side the vessel and placed on the seabed. The indicative total footprint is 0.072 m<sup>2</sup> per potential drilling location.

### 2.3 Background Geology

The site is located within the Otway Basin, a large approximately 500 km long NW-SE basin located to the south of Warrnambool and north-west of Tasmania. The Otway Basin is Jurassic – Late Cretaceous in age and is part of a series of basins that follow the southern coast of Australia. The basin was formed through multi-stage rift-sag and inversion phases. The latest sediments deposited in the Jurassic - Early Cretaceous can reach up to 8 km thick in parts of the basin.

## 3 UNEXPLODED ORDNANCE RISK ANALYSIS

### 3.1 Naval Warfare

Due to its distance from the major theatres of war in the 20<sup>th</sup> century, the waters off the southern coast of Australia have been spared much of the UXO contamination from fighting evident in other parts of the world. Nevertheless, low level naval activity did take place in the wider Area of Interest (AOI), and the following sections summarise the known activities that may have resulted in UXO presence within and close to the AOI.

#### 3.1.1 World War One (WWI) (1914-1918)

There is no evidence to suggest any significant military activity took place within or around the AOIs during this conflict that may have resulted in the presence of UXO. Away from the European and Mediterranean theatres, the Australian Navy operated largely to the north of Australia, in the Indian Ocean and around the Netherlands East Indies (Indonesia) with a minimal presence in the wider area of the AOI.

#### 3.1.2 World War Two (WWII) (1939-1945)

Disguised German raiding vessels operated briefly in waters off the south Australian coast in 1940, laying a number of mines (see **Section 3.3.2**). Following Japan's entry into the war in December 1941, Japanese submarines operated off the southeast coast of Australia, with some attacks recorded on Sydney and on shipping at the eastern edge of the Bass Strait. For example, Japanese submarine *I-27* sank the merchantman *Iron Crown* approximately 40 miles south/southwest of Gabo Island, Victoria on 03 June 1942<sup>1</sup>. No information has been found, however, to suggest that Japanese submarines operated within the AOI.

Japanese submarine *I-25* circumnavigated Tasmania in February 1942 and loitered off the northern tip of King Island for several days before launching a reconnaissance aircraft on a flight over the Melbourne area. No combat occurred and although the submarine likely transited a portion of both AOI's no UXO risk is known to exist as a result<sup>2</sup>.

German surface raiders operated intermittently off Australia in 1942 and 1943 but none are reported to have operated in the vicinity of the AOI.

### 3.2 Mine Laying Campaigns

#### 3.2.1 World War One (WWI) (1914-1918)

The German raiding vessel *Wolf* laid mines off New Zealand in June 1917, before moving into Australian waters and laying a small minefield of 25 mines approximately 10 km off Gabo lighthouse, Victoria, on 3<sup>rd</sup> July 1917<sup>3</sup>, claiming several vessels as victims. There is no information available, however, to indicate that mines were laid in other areas and given that Gabo is almost 600 km east of the AOIs, the UXO risk from mines of this period is considered to be extremely limited.

#### 3.2.2 World War II (WWII) (1939-1945)

Two German surface raiders are known to have laid mines in the wider AOI in 1940. The vessel *Pinguin* entered the Indian Ocean from the South Atlantic in August 1940 and arrived off Western Australia in October. On 7 October *Pinguin* captured the Norwegian tanker *Storstad* which was sailing from Borneo to Melbourne. A German prize crew took over *Storstad* (re-named as *Passat*) and mines were transferred to her from *Pinguin*. The two ships then sailed to the east. *Pinguin* laid EMC (*Elektrische Minen* Type C moored contact mines) mines off the New South Wales coast between Sydney and Newcastle on the night of 28<sup>th</sup>

<sup>3</sup> Journal of the Australian Naval Institute, May 1987, *The Seamine as a 'First Strike' weapon against Australia – Then and Now*. Vol. 13, No.2, p25

## DESK STUDY FOR POTENTIAL UXO CONTAMINATION

October, with both vessels then departing for Tasmanian waters. *Pinguin* laid two minefields off Hobart on 31<sup>st</sup> October and 1<sup>st</sup> November, and over the period 29–31 October *Storstad* laid mines in Banks Strait off the north-east corner of Tasmania and off Wilson's Promontory and Cape Otway on the Victorian coast. *Pinguin* also laid further mines in Spencer Gulf off Adelaide in South Australia in the first week of November. The two ships then sailed west for the Indian Ocean, having avoided all detection. Mines laid by *Passat* sank the cargo ship *Cambridge* off Wilsons Promontory and the American *City of Rayville* off Cape Otway on 8 and 9 November, and the mines laid off Sydney by *Pinguin* sank the coastal steamer *Nimbin*. The British steamer *Hertford* was also damaged after striking a mine at the entrance to Spencer Gulf.

Information relating to the mines laid by *Pinguin* and *Passat* are held by German archives that have been reviewed by RPS. The closest mine lines to the AOI are recorded as being 24 km east of the VIC/P79 AOI and 22.8 km north of T/49P AOI. This distance, combined with the limited number of mines laid, indicates that the potential for the presence of German EMC mines within both AOI is very low but cannot be completely excluded.

There is no information that suggests Japanese or allied mines were deployed operationally in either of the AOIs.

Minesweeping operations began in early January 1941, after the sinking of the *Cambridge*. The Australian 20<sup>th</sup> Minesweeping Flotilla searched the waters around Tasmania and the Bass Strait regularly for 14 months after the initial minelaying operation. The number of mines swept is inconsistent, with one source stating that 19 German mines<sup>4</sup>, were recovered, and another that 20 were found<sup>5</sup>; either way, even when taking successful detonations and reports of mines swept ashore into account, a very low number of mines are likely to have been dealt with compared to the 230 EMC mines reportedly laid<sup>6</sup>. Statistics for north European waters, which experienced a much higher density of mining and much more intense minesweeping, indicate that 25% of moored contact mines laid remain un-swept and potentially present today<sup>7</sup>.

The majority of the mines laid by the Germans in the Bass Strait area were reported to have become 'floaters' within four months of deployment<sup>8</sup> *i.e.* they broke away from their mooring mechanisms and floated with the currents, which greatly complicated sweeping operations. The Australian Navy believed they unknowingly cut and swept the last mine off Cape Otway on 22 July 1942<sup>9</sup> but there is no proof that all mines were accounted for, and there is a possibility, albeit remote, that unexploded German EMC mines may have drifted into the AOIs.

### 3.3 Aerial Conflict and Bombing Campaigns

#### 3.3.1 World War One (WWI) (1914-1918)

No information is available to suggest that aircraft operated within the AOI or would have created a UXO risk.

#### 3.3.2 World War Two (WWII) (1939-1945)

There is no evidence to suggest that aerial conflict occurred within the AOI during this period. However, Australian aircraft (Hudson and Anson types being the main maritime patrol aircraft) routinely flew off the south coast of Australia and over the Bass Strait as part of anti-submarine patrolling and convoy escort. No enemy vessels are certainly known to have been attacked, and none are known to have been destroyed, aircraft did occasionally jettison ordnance when in difficulty or even disappeared over the ocean as a result of poor flying conditions or mechanical failure; aircraft lost in this way are considered to be the most likely source of UXO as a result of air operations from WWII (see Section 3.4.2).

### 3.4 Shipwrecks and Downed Aircraft

No information has been found to indicate the presence of a shipwreck or downed aircraft within either AOI. A single wreck, the *W Gordon*, a sailing vessel that disappeared off Cape Otway in 1876 (i.d. 6784), is charted within the buffer of the T/49P AOI but has no known UXO association. Even the site of the wreck is speculative as only fragments of the vessel washed ashore at Cape Otway.

It is possible that vessels and aircraft that disappeared without trace might be located within the AOIs; whilst any UXO potential is likely to be limited, all previously unknown wrecks should be treated with caution until proved safe.

### 3.5 Anti-Aircraft Artillery / Coastal Batteries

#### 3.5.1 World War One (WWI) (1914-1918)

There is no information that suggests a UXO risk exists from any land-based artillery system of the period.

#### 3.5.2 World War Two (WWII) (1939-1945)

There is no information that suggests a UXO risk exists from any land-based artillery system of the period.

Naval vessels were routinely equipped with dedicated anti-aircraft guns from the late 1920s onward but the probability of projectiles that might represent a UXO risk being present in the AOI is considered negligible.

### 3.6 Military Practice Areas

A rectangular area west of King Island, Tasmania, was used in 1954 as an Air-to-Air firing range. The UXO risk from primary Air-to-Air Weapons systems in use at the time (20 mm and 30 mm cannon) is unlikely to impact sub-surface operations but individual projectiles might represent a hazard if brought aboard a vessel. The area does not appear to have been used since 1954.

No other military Practice and Exercise Areas (PEXA) are located in the vicinity of the AOI.

### 3.7 Offshore UXO Dumpsites

Three official maritime munitions dumping areas are recorded between 21 km and 50 km west of the T/49P AOI, these same areas being located between 37 km and 62 km south of the VIC/P79 AOI. One of these dumping areas was used for the disposal of 1,634 tons of chemical munitions but all three sites are located beyond the edge of the continental shelf, in deeper water and have no direct impact on either AOI.

Despite the designation of official dumping areas, there is good evidence to indicate that munitions dumping took place away from these sites (a very common occurrence by all nations in the post WWII period); the War Diary of HMAS *Tarakan* (also known as *LST 3017*) indicates it dumped 650 tons of obsolete ammunition for the RAAF (speculatively aircraft bombs) on 09 July 1949 and 11 July 1949. Two separate dumping areas appear to have been used, firstly one located at an unspecified location west of King Island. Poor weather

interrupted operations and after dumping all the ammunition stored on the upper deck, the vessel went to a sheltered anchorage in Elephant Bay (now called Elephant Seal Bay) on the east of King Island. Whilst there, the remaining 250 tons of ammunition stored in the tank hold was brought to the deck, and then the ship travelled to an apparently separate dumping area south west of King Island for dumping to be completed on 11 July 1949<sup>11</sup>. As no co-ordinates were given for the dumping area, the actual location is unclear.

Dumping was often very poorly recorded. For example, HMAS *Tarakan* dumped 350 tons of ammunition loaded at Bell Bay Tasmania whilst enroute to Hobart on 30 April 1948; there is no record of the ammunition (obsolete 18-lbr and 4.5-inch howitzer projectiles) being dumped in a specifically designated area and a trail of projectiles is likely to litter the seabed along part of the course the vessel took. A further 445 tons of ammunition was dumped enroute from Bell Bay to Hobart on 21/22 May 1948; the original plan for dumping obsolete Tasmanian ammunition called for it to be dumped in 300 fathoms (548 m) approximately 80 km from the coast<sup>12</sup>.

Whilst not near either AOI, the HMAS *Tarakan* dumping episodes are illustrative of the unofficial dumping that frequently took place and may well have been carried out by vessels traversing the AOIs. It is therefore possible that unrecorded dumping took place following the end of WWII and that UXO might be found within the AOIs.

A possible civilian dumpsite (the materials may be related to mining rather than military use) has been identified approximately 3.79 km southwest of the VIC/P79 AOI. The following table summarises the materials known to have been dumped at that site and is included for completeness.

**Table 3.1 - Summary of known materials dumped within 3.79 km of VIC/P79<sup>13</sup>**

Date	Item	Quantity	Notes
23/07/1970	Cyanide	90 gallons	18 x 5 gallon drums
23/07/1970	Cyanide	96 gallons	4 x 24 gallon drums
23/07/1970	Explosives	144 boxes	No further information – type unspecified
23/07/1970	Detonators	2331 cases	No further information – type unspecified
23/07/1970	Cordtex	168 cases	55lb in each case, explosive detonating cord containing PETN explosive (9,240 lb total). PETN is insoluble in water and may be encased in plastic coating so may still represent a risk.

### 3.8 OSPAR Munition Encounters

The AOI is outside the Oslo and Paris Agreement reporting area and no data is therefore available.

### 3.9 Post-War Clearance Operations

The Australian 20<sup>th</sup> Minesweeping Flotilla may have conducted post-WWII sweeping operations in Newcastle, Bass Strait, Banks Strait, Cape Otway, Hobart and South Australia minefields after the end of the war<sup>14</sup>. No information has been found to indicate they were any more successful than during WWII and no information has been found on the number

### 3.10 Current and Emerging Threats

The Bass Strait is located well away from current centres of global tension and as a result is likely to be less impacted by the development and use of new maritime technology such as drones and submarines and covert efforts to interfere with sub-surface marine infrastructure. Although not considered a significant risk, it should be borne in mind.

## 4 BASELINE THREAT ASSESSMENT

The results of the historical review have been used to conduct a threat assessment to determine the baseline pre-exploration and pre-mitigation risk posed by UXO contamination on site. The assessment outlines the types of UXO that have been identified during the research and assesses the probability of encountering them on site (without considering that any construction activities have already taken place).

### 4.1 Probability Assessment

Each of the types of UXO that have been identified through the research have been assessed and given a probability of encounter Grade based on the following Level and Rationale.

**Table 4.1 - Probability Levels**

Probability Assessment Levels		
Grade	Probability Level	Rationale
<b>A</b>	Highly Probable	Clear evidence that this type of munition would be encountered.
<b>B</b>	Probable	Significant evidence to indicate that this type of munition would be encountered.
<b>C</b>	Possible	Evidence suggests that this type of munition could be encountered.
<b>D</b>	Remote	Evidence suggest that these munitions have been found in the Wider Area of Interest area but not specifically within the AOI.
<b>E</b>	Improbable	Not considered likely to encounter this type of munition within the AOI, but not possible to discount completely.
<b>F</b>	Highly Improbable	No evidence that this type of munition would be encountered within the AOI or the immediate vicinity.

#### 4.1.1 Risk Zoning

The probability assessment results will vary across the site due to the geographical extent of the potential UXO sources identified in the research presented above. This results in a different risk profile across the site based upon these affected areas. RPS divide the site into Risk Zones based upon the probability assessment results (in addition to planned activities and water depths) in order to ensure that a pragmatic approach is taken to the risk of each ordnance type across the site. The results of the probability assessment are shown in **Table 4.2**. RPS Risk Zoning is shown graphically at **Appendix 8**. The sources of UXO which influence the risk zoning and probability assessment are shown graphically in **Appendix 4** and detailed in **Section 6.1.2**.

#### 4.1.2 Probability Assessment Results

The research from the above sections has been used to determine the Probability of Encounter for each ordnance variety. The results are shown in the table below:

**Table 4.2 - Shows the probability of encounter for each assessed ordnance variety, based on the research provided in the prior sections**

Probability of Encounter					
UXO		Risk Zones			
		A	B	C	D
Small Arms Ammunition		E	E	E	E
Land Service Ammunition		E	E	E	E
≤155 mm Projectiles		E	D	D	E
>155 mm Projectiles		E	E	E	E
HE Bombs	Allied Origin	E	D	D	E
	Axis Origin	F	F	F	F
	Allied Origin (Contact Mine)	E	E	E	E

## DESK STUDY FOR POTENTIAL UXO CONTAMINATION

Probability of Encounter					
UXO		Risk Zones			
		A	B	C	D
Sea Mines	Allied Origin (Ground Mine)	E	E	E	E
	Axis Origin (Contact Mine)	D	D	D	D
	Axis Origin (Ground Mine)	E	E	E	E
Torpedoes		E	E	E	E
Depth Charges		D	D	D	D
Conventional Dumped Munitions		C	C	C	C
Dumped Chemical Munitions		D	D	D	D
Missiles/Rockets		E	E	E	E

Due to the extremely limited interaction with the seabed the proposed scheme of works will have (with a limited number of wellsite areas across both permit areas) and indicative total footprint of geotechnical activities at each location is 0.072 m<sup>2</sup>, RPS have revised the probability of encountering each munition at each individual wellsite.

**Note:** The following Probabilities of Encounter are applicable only at the limited number of wellsite and seabed survey locations. Works further to those being conducted at the limited number of wellsite and seabed survey locations will be subject to the Probabilities of Encounter in Table 4.2 and RPS would have to be informed prior to additional works being undertaken.

**Table 4.3 - Probability of Encountering each munition type whilst undertaking the described works.**  
Due to the limited interaction with the seabed the proposed activities will have, the Probability of Encounter is reduced in comparison to the Permit Area as a whole

Probability of Encounter					
UXO		Risk Zones			
		A	B	C	D
Small Arms Ammunition		F	F	F	F
Land Service Ammunition		F	F	F	F
≤155 mm Projectiles		F	E	E	F
>155 mm Projectiles		F	F	F	F
HE Bombs	Allied Origin	F	E	E	F
	Axis Origin	F	F	F	F
Sea Mines	Allied Origin (Contact Mine)	F	F	F	F
	Allied Origin (Ground Mine)	F	F	F	F
	Axis Origin (Contact Mine)	E	E	E	E
	Axis Origin (Ground Mine)	F	F	F	F
Torpedoes		F	F	F	F
Depth Charges		E	E	E	E
Conventional Dumped Munitions		D	D	D	D
Dumped Chemical Munitions		E	E	E	E
Missiles/Rockets		F	F	F	F

## 5 RPS UXO ANALYSIS & ASSESSMENT

### 5.1 General

A Risk Assessment is a formalised process for assessing the level of risk associated with a particular situation or action. It involves identifying the hazards and the potential receptor that could be affected by the hazard. The degree of risk is associated with the potential for a pathway to be present, linking the hazard to the receptor. This relationship is usually summarised as the Source – Pathway – Receptor.

The assessment has utilised information provided in **Section 3** and included the proposed intrusive activities to propose a more specific and detailed mitigation methodology.

### 5.2 Sources / Hazards

Based on the information collated, RPS considers that the following types of ordnance have the potential to have been utilised on/within the vicinity of the proposed site:

- Projectiles
- Allied HE Bombs
- Depth Charges
- Conventional Dropped Munitions
- Dropped Chemical Munitions

Importantly, whilst the technology in some of these munitions has altered significantly over the years, the composition of the explosives within them generally has not changed. It is the explosives within the devices that pose the risk; therefore, historic munitions can pose as significant of a risk today as more modern devices, especially as bulk explosives may not have degraded since the time the device was assembled.

It should be considered that WWI and WWII munitions will be found on or below the sea floor that are still hermetically sealed; with no water ingress. Other devices may however be cracked, with the outer casings of some mines for example, worn away over time. Therefore, it is not possible to state with any certainty that historic munitions pose less of a risk based on their degradation over time.

### 5.3 Pathway

The pathway is described as the route by which the hazard reaches the site personnel. Given the nature of the proposed works the only pathways would be during:

- Well Drilling;
- Snag on Vessel;
- Anchoring;
- Peel Grab Operations;
- Borehole/Vibrocore;
- CPT; and
- Grab Sampling.

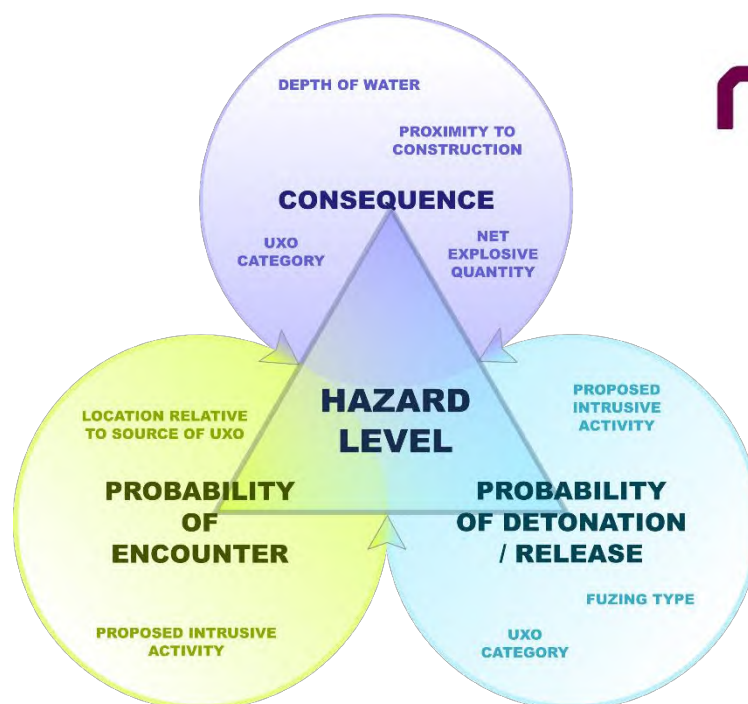

## 5.4 Receptors

Sensitive receptors applicable to this proposed route would be:

- People (Workers / Engineers and General Public);
- High Value Equipment;
- Infrastructure;
- Vessels (including public); and
- Environment.

## 5.5 Risk Evaluation

The following sections contain the Risk Evaluation for the proposed route, prior to the implementation of any risk mitigation measures. For the risk to be properly defined, several factors must be taken into account, including the consequences of initiation, the probability of encountering UXO on the proposed route and the probability of detonating munitions during intrusive activities. The technique used to evaluate level of risk is outlined in the following diagram:

$$\text{Risk level} = \text{Probability of Encounter} \times \text{Probability of Detonation or Release} \times \text{Consequence}$$

**Figure 5.1 - Hazard Level Considerations**

If a significant risk is identified, an appropriate risk mitigation strategy is necessary for the intended geotechnical investigation and installation works. A semi quantitative assessment is completed below to identify the risk.

## 5.6 Probability and Consequence Assessment

For the purpose, of this assessment RPS has examined the probability of encounter and detonation and the potential subsequent consequence for the specific proposed works to be undertaken during the project. Only the main categories of munitions have been included to provide a range of assessment data and it should be noted that other munition types may remain in the area.

The assessment is presented at **Appendix 6** and the process detailed below.

### 5.6.1 Probability of Encounter Assessment

An estimate of the likelihood of a UXO risk being present within each route segment is made to assess the probability of encounter, which are ranked A – F, as below.

- A – Highly Probable
- B – Probable
- C – Possible
- D – Remote
- E – Improbable
- F – Highly Improbable

### 5.6.2 Probability of Detonation Assessment

The probability of encounter is combined with the probability of a certain munition type detonating. The probability of each engineering activity causing each munition type to detonate is assessed and ranked A – F:

- A – Highly Probable
- B – Probable
- C – Possible
- D – Remote
- E – Improbable
- F – Highly Improbable

This is based on the estimated disturbance caused by the installation activity and the likelihood for this to cause a detonation of specific munitions (*which is based on the items initiation systems*).

### 5.6.3 Consequence Assessment

Finally, the consequence level for each activity and munition type is obtained from the table presented in **Appendix 7**, which provides a consequence rating from 1 to 5, depending upon the severity. The detonation consequence assessment assigns a site-specific consequence level to any potential UXO that may be encountered at the proposed route. This is achieved by combining the UXO impact ranking and the depth of water across the proposed route. A rating system for assigning consequence levels has been derived based on the expected effects of a detonation event during each of the engineering activities, both on the seabed and on the vessel.

### 5.6.4 Risk level

The result for each activity, munition type and segment are then presented as:

$P_E \times P_D \times C$ ; where:

- $P_E$  is the Probability of Encounter level, (A – F)
- $P_D$  is the Probability of a Detonation level (A – F)
- $C$  is the Consequence of a Detonation level (1 – 5)

## DESK STUDY FOR POTENTIAL UXO CONTAMINATION

The probability of encounter, probability of detonation/release and consequence of a detonation/release levels are then multiplied to give a risk level for each munition type, segment and engineering activity.

This was determined by assigning the values in the following table to the above results, which were then multiplied to provide a final risk level ranging between Negligible and High.

**Table 5.1 - Probability & Consequence Levels**

Prob. of Encounter (1)		Prob. of Detonation (2)		Consequence (3)	
<b>A</b>	Highly Probable (1 in 1)	<b>A</b>	Highly Probable (1 in 1)	<b>1</b>	Catastrophic (1.00)
<b>B</b>	Probable (1 in 10)	<b>B</b>	Probable (1 in 10)	<b>2</b>	Major (0.1)
<b>C</b>	Possible (1 in 100)	<b>C</b>	Possible (1 in 100)	<b>3</b>	Moderate (0.01)
<b>D</b>	Remote (1 in 1,000)	<b>D</b>	Remote (1 in 1,000)	<b>4</b>	Minor (0.001)
<b>E</b>	Improbable (1 in 10,000)	<b>E</b>	Improbable (1 in 10,000)	<b>5</b>	Insignificant (0.0001)
<b>F</b>	Highly Improbable (1 in 100,000)	<b>F</b>	Highly Improbable (1 in 100,000)		

**Table 5.2 - Example Risk Score and Associated Risk Rating (Full details in Appendix 7)**

		Probability of Encounter, P <sub>E</sub>					
<b>C = 1</b>		<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>	<b>E</b>	<b>F</b>
Probability of Detonation, P <sub>D</sub>	<b>A</b>	AA1	BA1	CA1	DA1	EA1	FA1
	<b>B</b>	AB1	BB1	CB1	DB1	EB1	FB1
	<b>C</b>	AC1	BC1	CC1	DC1	EC1	FC1
	<b>D</b>	AD1	BD1	CD1	DD1	ED1	FD1
	<b>E</b>	AE1	BE1	CE1	DE1	EE1	FE1
	<b>F</b>	AF1	BF1	CF1	DF1	EF1	FF1

**Table 5.3 - Definition of Risk Levels**

Risk Level	Definition
High	Indisputable evidence that there is a risk from this type of UXO in the area. Proactive UXO Mitigation is required.
Moderate	Evidence suggests that there is a risk from this type of UXO in the area. Proactive UXO Mitigation is required.
Low	Some evidence suggests that there is a risk from this type of UXO in the area or wider region. Reactive mitigation may be required.
Negligible	No evidence suggesting that there is a risk from this type of UXO in the area or wider region. No further mitigation is required.

The full consequence level matrix can be found in **Appendix 7**.

## 6 UXO RISK LEVELS

### 6.1 UXO Risk

**Note:** The Risk Levels identified in this study are based upon Probabilities of Encounter which have been determined for the provided Scope of Works (i.e. a limited number of wellsite drilling and seabed survey locations) which, due to the limited nature of interaction with the seabed are lower overall than those for the entirety of the Permit Areas. If the client were to conduct extensive further works, RPS must be consulted so that the risk posed by the additional interaction with the seabed can be assessed.

Based on the conclusions of the research and the risk assessment undertaken, RPS has found there to be a **Low** risk from encountering UXO on site.

As per **Figure 5.1** RPS also take in to account the category of UXO both when assessing the probability of the item functioning and the consequence of such an event. This leads to the varying risk levels between munitions with the same installation methodology. The full risk matrices are presented in **Appendix 6**, providing an assessment of the risk associated with each activity.

The Permit Areas have been split into 4 zones (A-D), dependent on the risk presented and the planned installation activities. **Table 6.1** shows the maximum risk for each zone. Descriptions of the zones are given in **Section 6.1.2**. RPS Risk Zoning is shown graphically in **Appendix 8**.

#### 6.1.1 Risk Levels

**Table 6.1 - Overall Risk Level**

Overall Risk Levels					
UXO		Risk Zones			
		A	B	C	D
Small Arms Ammunition		Neg	Neg	Neg	Neg
Land Service Ammunition		Neg	Neg	Neg	Neg
≤155 mm Projectiles		Neg	Neg	Neg	Neg
>155 mm Projectiles		Neg	Low	Low	Neg
HE Bombs	Allied Origin	Low	Low	Low	Low
	Axis Origin	Neg	Neg	Neg	Neg
Sea Mines	Allied Origin (Contact Mine)	Low	Low	Low	Low
	Allied Origin (Ground Mine)	Low	Low	Low	Low
	Axis Origin (Contact Mine)	Low	Low	Low	Low
	Axis Origin (Ground Mine)	Low	Low	Low	Low
Torpedoes		Low	Low	Low	Low
Depth Charges		Low	Low	Low	Low
Conventional Dumped Munitions		Low	Low	Low	Low
Dumped Chemical Munitions		Low	Low	Low	Low
Missiles/Rockets		Low	Low	Low	Low

#### 6.1.2 Risk Zones

##### 6.1.2.1 Zone A – Low Risk

##### Permit Area VIC/P79 outside King Island air-to-air firing area

This zone represents the area of the VIC/P79 Permit Area which lies outside the King Island air-to-air firing area. In this zone there is the potential to encounter dumped conventional and chemical munitions. There are a number of dumpsites in the vicinity of this zone, including conventional munitions dumpsites, chemical munitions dumpsites and an assumed mining waste dumpsite (which includes explosives, in the form of detonators, PETN Detonating Cord and bulk explosives and chemicals including cyanide). Although this zone

lies outside of the known dumpsites, it is expected that munitions may have been disposed of *en route* from ports to official dumpsites, and so it is anticipated that they could be encountered in this area.

#### 6.1.2.2 Zone B – Low Risk

##### Permit Area VIC/P79 inside King Island air-to-air firing area

This zone represents the area of the VIC/P79 Permit Area which lies inside the King Island air-to-air firing area. In this zone there is the potential to encounter small calibre (20 mm and 30 mm) projectiles associated with air-to-air gunnery practice. Further to this, there is the potential to encounter dumped conventional and chemical munitions. There are a number of dumpsites in the vicinity of this zone, including conventional munitions dumpsites, chemical munitions dumpsites and an assumed mining waste dumpsite (which includes explosives, in the form of detonators, PETN Detonating Cord and bulk explosives and chemicals including cyanide). Although this zone lies outside of the known dumpsites, it is expected that munitions may have been disposed of *en route* from ports to official dumpsites, and so it is anticipated that they could be encountered in this area.

#### 6.1.2.3 Zone C – Low Risk

##### Permit Area T/49P inside King Island air-to-air firing area

This zone represents the area of the T/49P Permit Area which lies inside the King Island air-to-air firing area. In this zone there is the potential to encounter small calibre (20 mm and 30 mm) projectiles associated with air-to-air gunnery practice. Further to this, there is the potential to encounter dumped conventional and chemical munitions. There are a number of dumpsites in the vicinity of this zone, including conventional munitions dumpsites and chemical munitions dumpsites. Although this zone lies outside of the known dumpsites, it is expected that munitions may have been disposed of *en route* from ports to official dumpsites, and so it is anticipated that they could be encountered in this area.

#### 6.1.2.4 Zone D – Low Risk

##### Permit Area T/49P outside King Island air-to-air firing area

This zone represents the area of the T/49P Permit Area which lies outside the King Island air-to-air firing area. In this zone there is the potential to encounter dumped conventional and chemical munitions. There are a number of dumpsites in the vicinity of this zone, including conventional munitions dumpsites and chemical munitions dumpsites. Although this zone lies outside of the known dumpsites, it is expected that munitions may have been disposed of *en route* from ports to official dumpsites, and so it is anticipated that they could be encountered in this area.

### 6.1.3 Risk Level by Activity

The risk level in each zone varies depending on the exploration activities being undertaken as well as the types of ordnance expected in each zone. As outlined in **Section 5.6**, the risk level for each ordnance type and each activity is determined using the Probability of Encounter, Probability of Detonation and Consequence of Detonation.

The Probability of Detonation varies between exploration activities as each activity interacts with the seabed in a different way, either increasing/reducing the chance of the equipment/asset interacting with potential UXO or increasing/decreasing the amount of energy transferred from the equipment/asset to potential UXO, which may result in a detonation. For example, a plough (as it is intrusive and higher energy) has an increased Probability of Detonation compared to a non-intrusive activity, such as Surface Cable Lay. The second factor which changes between activities is the Consequence of Detonation. This is because the potential consequences of striking UXO with a plough on the seabed towed behind the boat is significantly lower than if UXO were snagged on equipment and brought to deck (Snag on Vessel).

The Risk Level of each activity within each Risk Zone are shown in **Table 6.2**.

**Table 6.2 - Risk Level by Activity and Risk Zone**

<b>Risk Level by Activity</b>				
<b>Activity / Pathway</b>	<b>Risk Zone</b>			
	<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>
<b>Well Drilling</b>	Low	Low	Low	Low
<b>Snag on Vessel</b>	Mod	Mod	Mod	Mod
<b>Anchoring</b>	Low	Low	Low	Low
<b>Peel Grab Operations</b>	Low	Low	Low	Low
<b>Borehole / Vibrocore</b>	Low	Low	Low	Low
<b>CPT</b>	Low	Low	Low	Low
<b>Grab Sampling</b>	Low	Low	Low	Low

## 7 DATA REVIEW

RPS has not been supplied with site-specific bathymetric or seabed sediment data; open-source bathymetric and seabed sediment data has been reviewed to provide an overview of the expected water depths, seabed features and seabed sediments on site.

### 7.1 Bathymetry

Open-source bathymetric data has been used to provide an overview of the expected water depths across the two permit areas.

The water depths across the VIC/P79 Permit Area range from 35 m in the northwest of the permit area to over 1100 m in the south of the permit area. For the most part, the area sits on the continental shelf, lying in water depths <120 m. As the site extends southwest from the 120 m w.d. contour, the seabed descends more rapidly to >1100 m w.d.

The water depths across the T/49P Permit Area range from 70 m in the east of the permit area to 1465 m in the southwest of the permit area. For the most part, the area sits on the continental shelf, lying in water depths <120 m. As the site extends west from the 120 m w.d. contour, the seabed descends more rapidly to >1400 m.

### 7.2 Seabed Sediments

It is anticipated that the seabed sediments in the Permit Areas will be composed of lithoclastic sands and gravels in areas lying on the continental shelf, with fine sands, carbonate rich muds and muddy sands in areas lying on the continental slope.

#### 7.2.1 Mobile Sediment Bedforms

It is known that mobile sediment bedforms (ripples, megaripples and sand waves) form in the Bass Strait, with wave heights up to 12 m. It is assumed that in areas of the site where sands are present, there is the potential for sand waves to form.

## 8 MARINE UXO MIGRATION / DRIFT AND BURIAL

### 8.1 Migration / Drift

Numerous studies have documented that munitions can migrate across the seafloor; the main force behind this movement is tidal currents. Research by Wilson et al. (2008) highlights that the migration of munitions decreased with burial depth, with munitions in a minimal burial state being particularly susceptible to movement when influenced by a large wave or strong current. Importantly, Wilson's report states that once a munition is completely buried, no further migration occurs unless bottom profile variation allows for re-exposure or there is scour.

The greater the tidal current or current velocity, the greater the likelihood and rate at which UXO items can migrate. However, larger items of UXO such as mines, torpedoes and larger categories of bombs, are unlikely to migrate as far and frequently as smaller items, as they require significant tidal / current velocities to exceed the minimum energy for them to move. Smaller items of UXO, such as AAA projectiles and Small Arms Ammunition (SAA), are more likely to migrate when subjected to lower levels of energy generated by more benign tides and currents.

Additionally, munitions tend to gather in seabed hollows (they roll in, but tidal action is sometimes insufficient to roll them out again). Shoals of fish tend to congregate in seabed hollows too (as they avoid strong currents in slack water) and fishing trawlers trying to catch them are occasionally prone to snagging UXO in their nets bringing them to the surface. Interaction with the seabed from fishing activities are therefore a possible vector for UXO migration.

RPS has considered a report compiled by Menzel, Wranik and Paschen entitled "*Laboratory experiments and numerical simulations on the wave- and flow-induced migration of munition from WW1 and WW2 as a risk assessment for offshore construction*". This report considers the critical velocities needed to move certain objects at various points of burial. The items considered were:

- British Depth Bomb Mark 1;
- British 250 lb General Purpose Bomb;
- German Mine Type GU; and
- German Mine Type GY.

The critical velocities in m/s are presented below for the various statuses of burial:

**Table 8.1 - Critical Velocities**

Item	Critical Velocity @ 5% Burial (m/s)	Critical Velocity @ 15% Burial (m/s)	Critical Velocity @ 30% Burial (m/s)	Critical Velocity @ 50% Burial (m/s)
<b>Mark 1</b>	1.2	1.5	1.9	2.2
<b>250 lb GP</b>	1.6	2	2.4	2.7
<b>GU Mine</b>	1.8	2.1	2.5	3.3
<b>GY Mine</b>	2.2	2.7	2.9	3.9

The results show scenarios with conservative assumptions and it should be noted that the following assumptions have been made:

- A sandy, non-cohesive seabed is required;
- The objects must be at least partially buried;
- An accumulation area is formed in the wake of the objects;
- Flow through the sediment is neglected;

- The influence of surface waves is neglected;
- Ripples, dunes and the overall shape of the seabed are constant;
- The influence of the water column above the object is neglected; and
- The value of the incident velocity is defined 20 cm above the seafloor in realistic scale.

The results show that the larger an item is and the greater its mass, the larger the tidal current or current velocity must be to move it.

The most appropriate surrogate for the ordnance expected within the site would be the British Depth Bomb Mark 1, which mobilises at 1.2 m/s when 5% buried. Although no current data has been provided, RPS has reviewed open-source current data which indicates that the current velocity is expected to be a maximum of 1 knot (0.51 m/s), with the current velocities on the seafloor expected to be significantly lower than this. The maximum current velocity on site is lower than the critical velocity noted in **Table 8.1**. Therefore, it is concluded that seabed currents are not sufficient to cause the migration of UXO.

## 8.2 Depth of Burial

### 8.2.1 Burial Via Initial Penetration

When a munition is fired/dropped from height, its velocity upon initial impact provides the potential for the item to penetrate the seabed. In situations where a device impacted into >10 m depth of water, it is likely that penetration would have been retarded significantly by the water and the ordnance would come to rest on or very near the seabed (*within the top 2 m*). Given the water depths located throughout the site, it is considered highly unlikely munitions would have become buried when coming to rest on the seabed.

Certain munitions, including those that have either been dumped, placed (*e.g. sea mines*) or have migrated from elsewhere, are likely to have landed on the surface of the seabed rather than penetrating.

### 8.2.2 Burial Via Natural Processes

In the softer sediments, it is possible for munitions to be covered by shifting sediments on the seabed and subsequently become buried. This is dependent on the mass, dimensions/shape of the item and the sediments upon which it came to rest as well as the currents affecting the area, however the maximum burial depth due to scour is approximately equal to the diameter of the munition. Burial is not possible in areas where bedrock is exposed.

Given the water depths throughout the site, it is considered likely that burial via natural processes (i.e. mobile seabed) will be the main form of burial rather than burial as a direct result of penetration upon impact.

### 8.2.3 Depth of Burial Analysis

RPS have determined that any UXO present on site is likely to be buried to scour depth (approximately equal to the diameter of the munition) plus the wave height of any mobile sediment bedforms present.

## 9 RISK MITIGATION STRATEGY

### 9.1 Mitigation Strategy Rationale

RPS' Risk Assessment for Potential UXO contamination has identified a risk from UXO on site. The research completed established that there is a Moderate UXO Risk within the AOI as the following three components are present:

- **Source:** A UXO risk that exists;
- **Detonation Pathway:** A mechanism that may cause UXO to detonate; and
- **Receptors:** These would be at risk of experiencing an adverse response following the detonation of a munition.

The purpose of risk mitigation is to take action to address one or more of these components to reduce the probability of an incident occurring or to limit the impact of the problem if it does occur; thereby, eliminating the risk or reducing the risk to an acceptable level, or 'ALARP'.

Obviously, the most effective method of mitigation is to remove the source of the contaminant. However, where this is not feasible it may be necessary to look at alternative methodologies; such as, avoiding a suspect item, removing the detonation pathway or minimising the risks to the receptors.

### 9.2 Recommendations

Based on the identified risk levels, it is recommended that appropriate mitigation is implemented to reduce the risk, prior to and/or during any works.

Due to the Low-Risk present at the wellsite locations, it would be recommended that Reactive Mitigation is used to manage the residual risk on site. It would be recommended that for all risk areas and activities that at a minimum all personnel are provided an **Explosives Safety and Awareness Briefing**.

The Moderate Risk associated with Snag on Vessel is also mitigated using Reactive Mitigation.

**Table 9.1 - Risk Mitigation Strategy Overview**

Risk Zone	Activity / Risk Level*	Mitigation Requirement					
		UXO Survey	Avoidance and / or ID&C	Explosives Safety Briefing	Explosives Engineer on Vessel**	Explosives Engineer On-Call	Detection Requirement
A	Low Risk Activities			✓		✓	N/A
B	Low Risk Activities			✓		✓	N/A
C	Low Risk Activities			✓		✓	N/A
D	Low Risk Activities			✓		✓	N/A

\* See Table 6.2 for risk level of each activity in each risk zone

\*\* Dependent on Survey Results

For further information about Reactive Mitigation requirements see Section 11

## 10 ALARP SIGN-OFF

Based on the results of this Desktop Study, ALARP sign-off would be provided for the site, which would demonstrate that appropriate mitigation has been implemented in order to reduce the risks from UXO to exploration activities to an acceptable level i.e. As Low As Reasonably Practicable

Based on the UXO Risk Profile identified for the proposed activities, which has been assessed to be **Low** (barring unknown factors), RPS would give an **ALARP validity of 5 years from issue of the ALARP certification**. RPS would advise that existing data (if available) and the UXO Risk Profile is reviewed during the ALARP period to ensure this validity and to potentially carry it past the 5-year period.

This sign-off would advise residual risk mitigation required. The likely possible requirements are detailed in the following sections.

**Table 10.1 - Requirements for ALARP sign-off for the proposed activities**

Risk Zone	Activity	Risk Level	Mitigation Requirement	
			ALARP Requirement	Validity
A	Low Risk Activities	Low	Desk Study and Reactive Mitigation	5 Years
B	Low Risk Activities	Low	Desk Study and Reactive Mitigation	5 Years
C	Low Risk Activities	Low	Desk Study and Reactive Mitigation	5 Years
D	Low Risk Activities	Low	Desk Study and Reactive Mitigation	5 Years

**N.B. This table does not detail the provisos the ALARP will be under the condition of.**

**This table provides requirements for ALARP sign-off for the proposed activities. If further/additional activities are to be undertaken, RPS must be consulted**

### 10.1 Data Review

To determine whether it is possible to continue / extend the validity of the ALARP, it would be recommended that a review of the UXO Risk Profile be conducted. This would include review of any additional information which may have come to light since the compilation of this Desktop Study that may have an effect on the UXO Risk Profile. If no additional information was identified that alters the risk, it is likely that RPS would be able to extend the ALARP validity due to the Low Risk nature of the proposed activities.

In addition to the above any changes in industry practices would be reviewed to align the ALARP process in the future. This review can be undertaken at any stage prior to the expiry of the certification (for example at 4.5 years) taking into account notably contingency for additional seasonal restricted surveys in order to allow uninterrupted continuation of projects beyond the expiry date.

## 11 REACTIVE MITIGATION

The following section outlines in more detail the recommended methods of reactive mitigation that can be implemented on site to further reduce the risks associated with UXO encounters. **Table 9.1** details the zones/activities where reactive mitigation is recommended in place of proactive mitigation.

However, even where a Low Risk has been assessed or after proactive mitigation measures are implemented there will always remain a residual possibility that UXO could be encountered or potentially brought on board the vessels working in the area. Due to the residual risk it is therefore recommended that as a minimum Explosives Safety Awareness be implemented to manage any inadvertent UXO encounters during operations and maintenance.

### 11.1 Explosives Safety Awareness

**Explosives Safety and Awareness Briefings** should be provided to personnel carrying out seabed survey and exploration drilling activities. The Briefing would allow the project team to plan the proposed works and potentially deal with the event of a suspicious item / UXO discovery incident. It would address the risk to all of the specific proposed works and will inform personnel how to undertake the works safely and will refer to the specific risk items/hazards that have been identified for the site and where applicable the mitigation that has been completed to reduce the risk.

If deemed beneficial a set of **Explosives Site Safety Guidelines (ESSGs)** could be produced, which would be provided to the Client along with training. The guidelines would allow the project team to manage the safety and awareness briefings and provide them in-house and also allow the project team to manage an inadvertent UXO encounter. The guidelines would typically be provided to the Client in the form of a '*Guidelines Document*' along with a supporting PowerPoint Slideshow. Safety and Awareness Training would be provided to key personnel, offshore teams, survey and trenching teams.

RPS would specifically recommend that these be delivered to personnel involved in intrusive works on the seabed. Training on how to recognise UXO for these personnel would be considered most prudent given the risks in the area.

The Explosive Safety and Awareness Briefing and ESSGs could be built into the induction package for the exploration program.

### 11.2 Explosives Engineer On-Call for Offshore Activities

RPS would recommend an on-call service is set up which can be used by the contractors in the event of a potential UXO encounter. This would provide 24/7 on-call availability to a UXO Expert who could assist the drilling rig and/or vessel in dealing with a potential UXO encounter. A procedure would be implemented in the event that potential UXO is encountered during exploration activities so that the item can be identified and dealt with as quickly as possible.

### 11.3 Explosives Engineer on Vessel

If the client requires further assurances, an **Explosives Safety Engineer** (*Explosives Ordnance Disposal trained*) can be based on board the drilling rig and/or vessel(s) during operations, in order to reduce the risks to personnel and equipment and avoid unnecessary delays and associated costs.

Not all apparent UXO items contain energetic material. A qualified Explosives Safety Engineer can often determine which items are considered UXO and deal with them accordingly. In some cases, it may not be possible to visually determine what the item is due to corrosion or encrustation and therefore whether it is UXO or something benign, such as an oil drum. The EOD Engineer would therefore be able to carry out ordnance recognition and minimise delays due to items that do not turn out to be UXO.

The EOD support would include but not be limited to:

- Attendance at risk assessment meetings, such as HIRA's,
- Carrying out Explosive Ordnance Safety and Awareness Briefings for all personnel. The Briefings would be given to all operational personnel working for the Client on site during cable lay operations,

## DESK STUDY FOR POTENTIAL UXO CONTAMINATION

- Development of Emergency Response Plans,
- Monitoring works in order to identify potential UXO items if they are uncovered as works progress,
- Inspecting the equipment (grapnel and trenching equipment) when it is brought back on board the vessel to ensure no ordnance are brought back on board.
- Assist in liaison with relevant authorities / personnel should ordnance be identified and present an explosive hazard,
- Where it is not practical or safe to observe the intrusive works, the Explosives Engineer will be on-call and immediately available to respond to a request for assistance,
- Provide on-call services to immediately respond to suspected ordnance that has been discovered by other site staff,
- Identify an area to which safe-to-move ordnance may be stored prior to recovery by the appropriate authorities.

The main aim would be to avoid interaction with UXO and consider the mitigation that will have already been undertaken in Moderate risk areas and therefore the resulting reduced risk, the risk of encounter should be Low. However, should an item of ordnance be discovered then the following action will be taken:

- a. If an item is identified as ordnance, the Explosives Safety Engineer will carry out an ordnance risk assessment. They will assess the nature of the item, its initiation system as well as determining the explosive content. They will assess the requirement and size of any exclusion zone around the item,
- b. The Explosives Safety Engineer will inform the Client as to the nature of the item and the conclusions of the risk assessment,
- c. If the item does not contain any hazardous components, the Explosives Safety Engineer may remove it from the area of works, or if on the seafloor inform the client that works can continue,
- d. If the item is deemed to pose a risk and cannot be moved, the Explosives Safety Engineer will contact the relevant authorities to dispose of the item.

### 11.4 Anchor Management

RPS have been advised that seabed survey vessels will not be anchoring. The MODU Drilling Rig will be anchored using 8-12 chain tensioned anchors (~20 tonnes) specific to the rig within a radius of approximately 1 – 1.5 km of the MODU Drilling Rig. It is anticipated that some anchor chain will lie on the seafloor.

It should be noted that the chain attached to any anchor is not considered a significant risk. The highest risk involved with anchoring and encountering UXO is associated with the anchor directly striking a UXO with sufficient force to cause a detonation. Any tensioning once the anchor is placed is expected to have insufficient energy to cause a detonation.

As such, in order to mitigate the risk from UXO during anchoring activities it is recommended that a controlled anchor lowering takes place to reduce the potential force exerted on any items of UXO.

RPS have been advised that, prior to anchor deployment, an ROV run would typically be conducted. This will assist in managing any residual risk present. If anything suspicious is seen during visual inspection it should be avoided when anchoring.

## Appendix 1 – Site Map

## Appendix 2 – Terminology

# Terminology

**Explosive Ordnance Disposal (EOD)** - The detection, identification, evaluation, rendering safe, recovery and disposal of UXO.

**Fuze-** A designed and manufactured mechanism to activate munitions. It can be designed for use by electrical, chemical or mechanical systems, by push, pull, pressure, release and time activation, singly or in combination. Usually consists of an igniter and detonator.

**High Explosive (HE)** - An explosive that normally detonates rather than burns; that is, the rate of detonation exceeds the velocity of sound.

**Initiation** - A physical process that sets in motion a cascade of chemical reactions of ever increasing energy (the explosive chain) that will eventually generate sufficient energy (the velocity of detonation) to allow the main charge to detonate in a violent, explosive chemical reaction, releasing energy in the form of heat and blast.

**Snag on Vessel** - UXO is snagged on submarine equipment and subsequently brought onto the vessel.

**Unexploded Bomb (UXB)** -The term UXB refers to any WWII aerial-delivered unexploded bomb, torpedo, projectile or mine consisting of a complete ferrous casing (without tailfins) weighing 50kg or greater.

**Unexploded Ordnance (UXO)** - Explosive Ordnance that has been primed, fuzed, armed or otherwise prepared for action, and which has been fired, dropped, launched, projected or placed in such a manner as to constitute a threat to the safety and/or security of people, animals, property or material and remains unexploded either by malfunction or design or for any other reason.

**UXO Contamination** - UXO that is present, within any given physical context that is considered to be an impediment to the safe on-going or intended use of a facility, including geological features. Safety in this instance is measured against an acceptable level of exposure to the potential risks that UXO present.

## Appendix 3 – ALARP Principle

## 'ALARP PRINCIPLE'

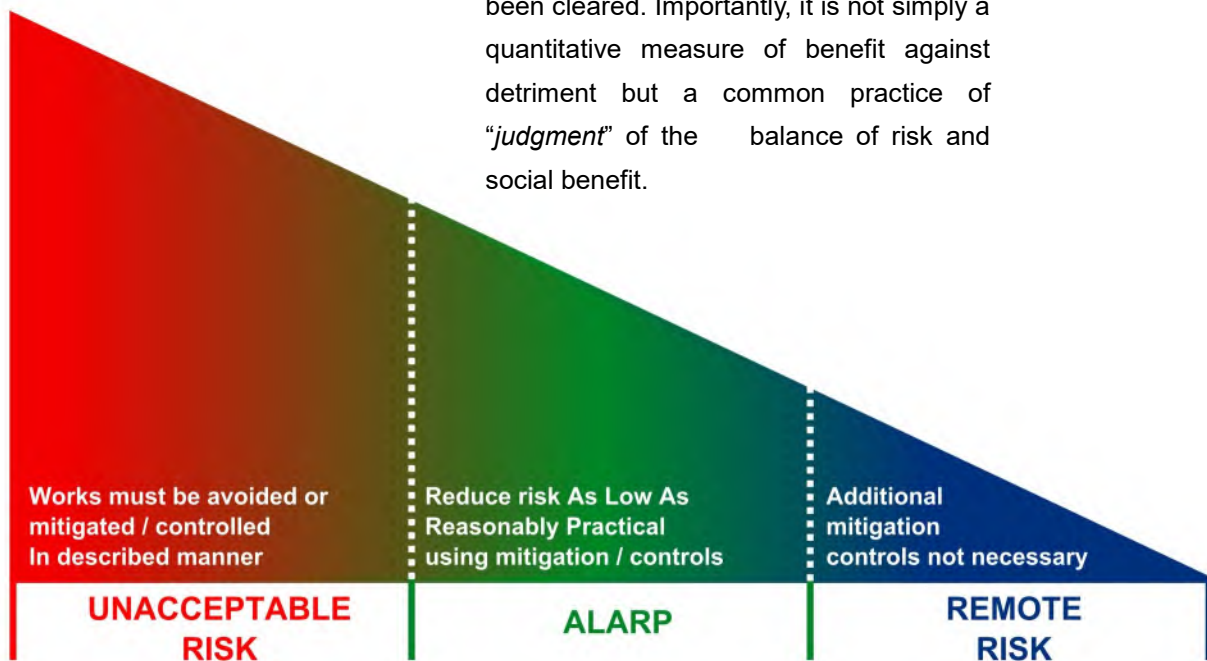

ALARP has particular connotations in UK Health and Safety law and the core concept of what is "*reasonably practicable*". This involves weighing a risk against the effort, time and costs needed to control it, which will vary greatly dependent upon the level of UXO Hazard and the environment within which it is associated.

For a risk to be reduced in line with ALARP it must be possible to demonstrate that the cost involved in reducing the risk further would be "*grossly disproportionate*" to the benefit gained. The ALARP principle arises from the fact that it would be possible to spend infinite time, effort and money attempting to reduce a risk to zero, which may never be achievable. This is particularly true of UXO risk, where there will always remain a residual (albeit low) risk, for example from smaller UXO that is not easily detectable, or due to the limitations of survey equipment,

**ALARP Resource Graph**

and particularly in the marine environment where UXO can migrate after the area has been cleared. Importantly, it is not simply a quantitative measure of benefit against detriment but a common practice of "*judgment*" of the balance of risk and social benefit.

**ALARP Diagram Approach**

## Executive summary

---

Biosis Pty Ltd was commissioned by Conoco Phillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait.

The purpose of this report is to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area in order to provide the project a grounding in Aboriginal cultural heritage. This short report will describe the known cultural environment, include a brief ethnohistory and history, and analysis of previous studies.

The study area includes the proposed permit areas (the location of the exploration zone(s)), where seabed surveys and drilling exploration may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island.

The study area consists of a large geographical area noted as the 'Investigation Area for the Identification of Values and Sensitivities' which is based on stochastic modelling of oil spills, generating a statistical area where impacts may occur under many eventualities. This modelling predicts potential oil spill outcomes over many different variables to generate an investigation area for potential impacts.

Due to the significant size of the study area, it is broken into three areas for discussion in parts of this report and for the Communication Plan (CP), this includes:

1. Primary Traditional Owner area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines
2. Secondary Traditional Owner area – the wider area affected by the modelling of oil spills
3. Primary Traditional Owner area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and LDADs. Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

In light of a review of Aboriginal places within the study area, there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

On the Tasmanian coast, Aboriginal heritage should be expected in any area of low-lying coastal areas, shelter sites, and sources of food, water and raw materials. These coastal margins contain all Tasmanian Aboriginal site types. It is also known on the West Coast of Tasmania, that a number of rock art sites are located on the coast, many either close or in tidal margins (Dix pers. obs.). Large midden sites are also located very close to the waters edge, as well as some stone quarry sites within tidal margins (Dix pers .obs.).

# 1 Introduction

---

## 1.1 Acknowledgement

Biosis acknowledges that the authors of this assessment identify as non-Aboriginal Australians living on Bunurong and Wurundjeri Countries. We acknowledge that they interpret, present and understand the past through their own cultural lens. In writing this report about Aboriginal living culture including their cultural heritage and the events following the commencement of colonisation, we pay our respects to Elders past, present and emerging and recognise that Country is unceded.

The authors acknowledge the inherent racism, cultural ignorance and political agendas imbedded within ethnographic sources at the time of, and following, colonisation.

Traditional Owners are the owners of all Traditional knowledge. Traditional knowledge and cultural values remain the intellectual property of the Traditional Owners and the interpretation and understanding of cultural values must be undertaken in genuine consultation with Aboriginal people.

## 1.2 Scope of works

Biosis Pty Ltd was commissioned by Conoco Phillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait.

It must be emphasised, that this report is not intended to meet the requirements of a formal assessment under First Peoples – State Relations, Heritage Victoria, Aboriginal Heritage Tasmania or Heritage Tasmania guidelines.

The purpose of this report is to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area in order to provide the project a grounding in Aboriginal cultural heritage. This short report will describe the known cultural environment, include a brief ethnohistory and history, and analysis of previous studies.

In regard to Tasmanian Aboriginal site data, no Aboriginal Heritage Register Search (AHR Search) was conducted due to time constraints and the need for greater consultation with the Tasmanian Aboriginal Community. The large search area would have encompassed the vast majority of coastal sites within the state of Tasmania, which includes highly significant and sacred sites. As such, it is highly recommended that in-person consultation occurs with the Aboriginal Heritage Council (AHC) and Aboriginal Heritage Tasmania (AHT) so that proper and respectful management of their data can occur. Therefore, the details of this report referring to Tasmania are based on freely accessible published materials.

## 1.3 Study area

The extent of the study area is shown in Figure 1.

The study area includes the proposed permit areas (the location of the exploration zone(s)), where seabed surveys and drilling exploration may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island.

The study area consists of a large geographical area noted as the 'Investigation Area for the Identification of Values and Sensitivities' which is based on stochastic modelling of oil spills, generating a statistical area where

impacts may occur under many eventualities. This modelling predicts potential oil spill outcomes over many different variables to generate an investigation area for potential impacts.

Due to the significant size of the study area, it is broken into three areas for discussion in parts of this report and for the Communication Plan (CP), this includes:

4. Primary Stakeholder area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines
5. Secondary Stakeholder area – the wider area affected by the modelling of oil spills
6. Primary Stakeholder area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands

## 1.4 Heritage Advisor/Authorship

### Emily Ward BArch

Emily has recently started her career in the Heritage Industry by initially interning at Biosis from August 2022 to September 2022, to her current role as a Graduate Heritage Consultant. Within her internship, Emily learnt and completed many techniques and processes such as aiding in background research to Cultural Heritage Management Plans, illustrating stratigraphic contexts and subsurface field testing. Emily also gained experience in field photography, rock art and heritage building surveys. Emily has been a part of several projects since she was an intern, gaining knowledge of several systems, such as HERMES and ACHRIS.

Emily completed her Bachelor of Archaeology at LaTrobe University at the end of 2022 and will start further study in 2024.

### Erica Walther BArch(Hons)

Erica (B Arch Hons (2007)) is an Archaeologist and Heritage Advisor, with over 15 years' experience as a heritage consultant. Erica is the Technical Director for heritage in Victoria and specialises in project management, community liaison and the resolution of complex cultural heritage issues in varying situations. Erica provides specialist cultural heritage legislative advice and completes technical reports to meet the requirements of heritage legislation. Erica has broad experience completing various heritage assessments, including over 60 Cultural Heritage Management Plans (CHMPs). Erica carries out cultural heritage inductions, salvages, and other compliance requirements for completed CHMPs. Erica has also completed Due Diligence Assessments, Heritage Impact Assessments, "Consents to Disturb" and other permit applications, conservation management plans, and heritage reports. Erica has also assisted on a wide variety of other heritage projects, including as an expert witness and with planning and overlay applications, strategic advice, and continues to work towards completing projects to best practice standards.

Erica is a full member of the Australian Association of Consulting Archaeologists and is a listed heritage advisor under the *Aboriginal Heritage Act 2006*.

### Dr Samuel Dix BA(Hons), PhD, MCIfA

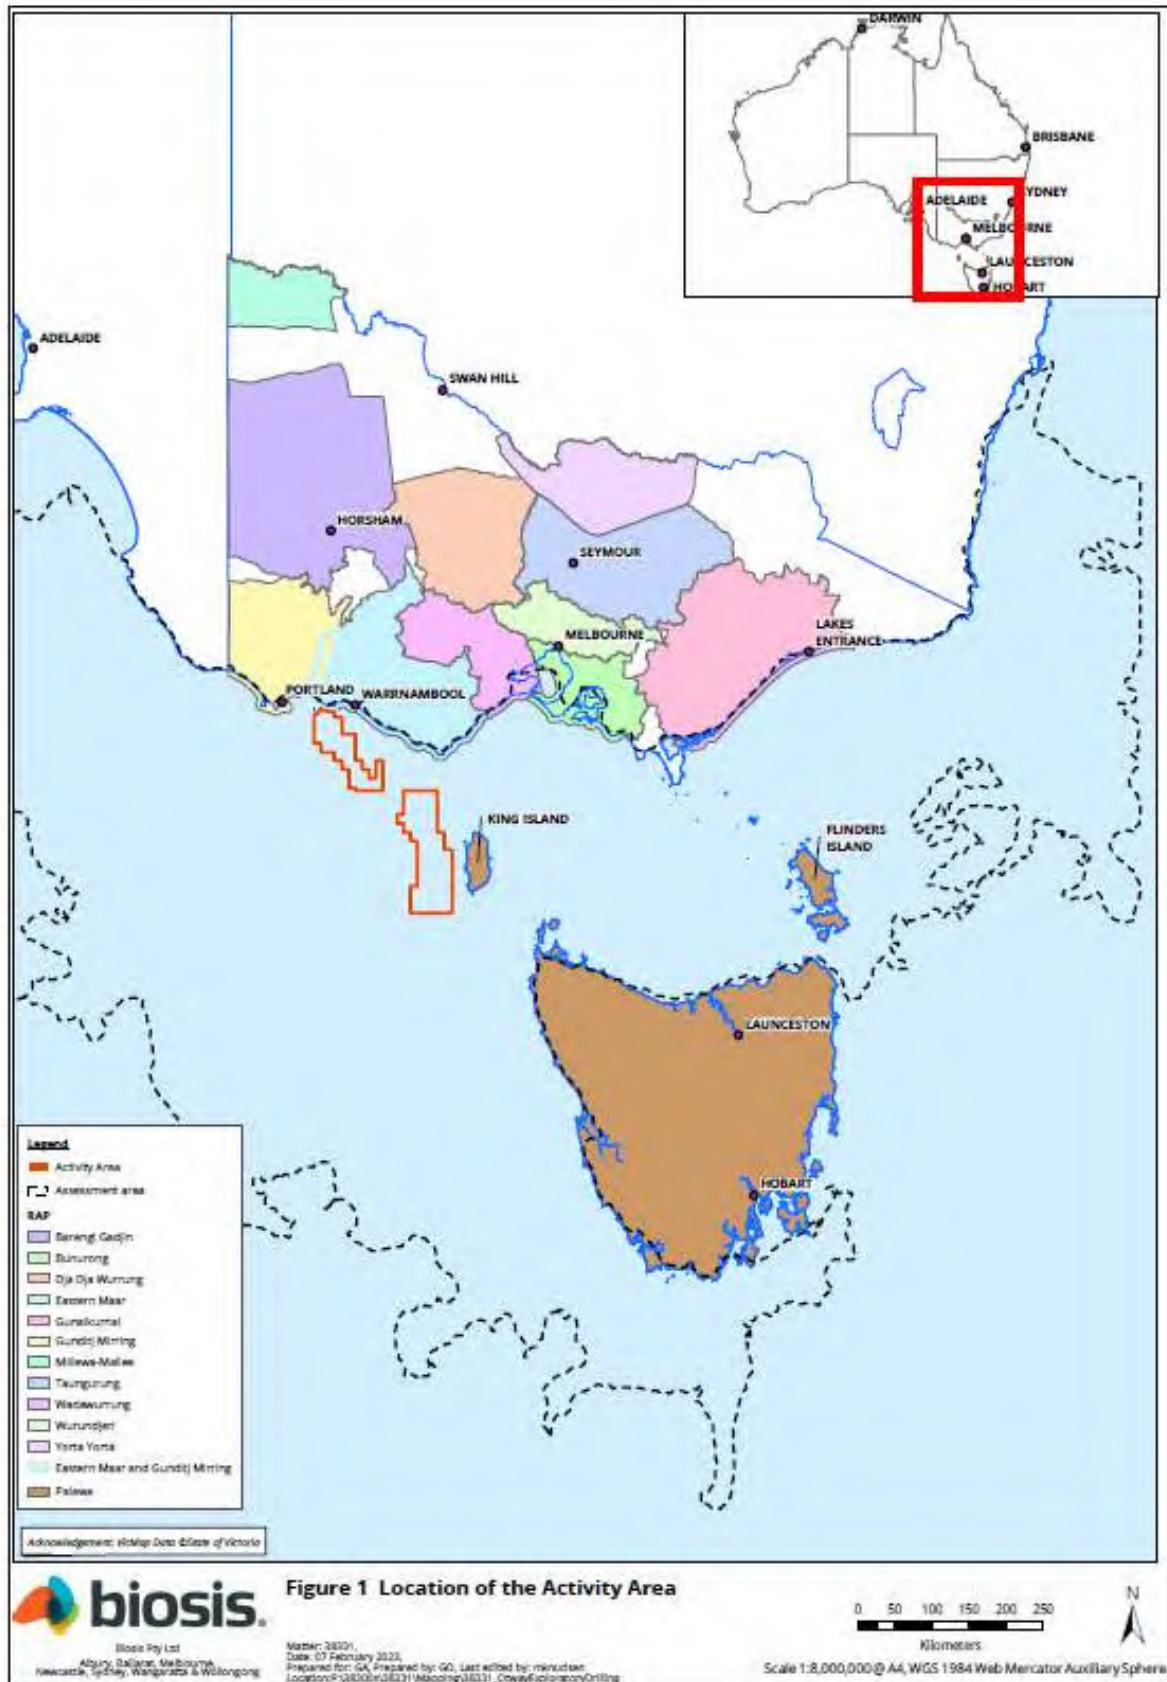

Samuel has worked in archaeology and heritage management since 2007. Samuel has undertaken numerous archaeological projects around Australia and has worked in consulting, government, teaching and museums in Victoria, Tasmania, Northern Territory, Western Australia, the United Kingdom, Middle East, and South Africa. Samuel completed his Bachelor of Arts with First Class Honours where his thesis focussed on hand stencil rock art. After a break from university to undertake consulting, government and teaching based archaeological work, Samuel returned to complete his PhD at Griffith University where he was the recipient of the Australian Research Council Laureate Scholarship in 2016. His thesis explored contact archaeology in

Arnhem Land, and how people reacted to change through what was depicted in rock art. Samuel is a registered heritage advisor under the Victorian *Aboriginal Heritage Act 2006*.

## 1.5 Traditional Owner Groups

It is not within the remit of this report to undertake consultation with Traditional Owner groups, industry bodies or other stakeholders. No consultation was undertaken. Stakeholder and Traditional Owner engagement is considered in the Communication Plan (CP). In Victoria, Traditional Owner groups are represented by the relevant Registered Aboriginal Party (RAP). There are five RAPs registered in the study area, including the Gunditjmara, Eastern Maar, Wadawurrung, Bunurong, and Gunaikurnai.

In Tasmania, the Traditional Owner group is referred to collectively as the Palawa, and are not represented by a representative or governing body.

## 2 Background review

---

### 2.1 Geology and geomorphology

The Bass Strait is the stretch between the south of the Australian mainland and north of the Tasmanian state. The Bass Strait formed during the last glacial period, also known as the Last Ice Age, which occurred between 110,000 and 12,000 years ago (Williams et al. 2018, p. 149). During this time, the Earth's climate was much cooler and global sea levels were much lower due to the large amount of water that was locked up in glaciers and ice sheets.

As the climate began to warm and the glaciers began to melt, sea levels began to rise. This process caused the land bridge that connected Tasmania to mainland Australia to be gradually flooded eventually forming the Bass Strait as we know it today.

This gradual flooding is therefore known to have occurred within the period of human occupation in southeastern Australia – the diaspora of people from Victoria to Tasmania occurred prior to the total flooding of the strait, across a land bridge for which archaeological evidence may be buried deep below the ocean (Lourandos 1997, p. 244). Evidence for this indicates people crossed the land bridge from Victoria to Tasmania at 35,000 years ago (Lourandos 1997, p. 254). In addition, dreaming stories of both Victorian and Tasmanian Aboriginal communities further reinforce the memories and songlines relating to the flooding and connection to Sea Country of coastal communities (Nunn & Reid 2016).

#### 2.1.1 Bass Strait, Islands and the land bridge

The Bass Strait is bordered on the west by King Island and the King Island Rise and on the east by Flinders Island and the Bassian Rise, with an approximated depth of between 60 and 80 metres (Harris & Heap 2009, Robinson 1974). The predominant deposits within the Bass Strait consist of Tertiary sediments overlaid on early Cretaceous deposits. The sediments in the early Cretaceous period contained combinations of shale, siltstone, sandstone, while a variety of marl, mudstone, limestone and shale can be seen in the later deposits (Robinson 1974).

Phillip Island's geomorphology is centred around Quaternary limestone dunes with higher-level shore platforms that were formed by Quaternary sea levels (Birch 2003). French Island is bordered by sandy sheets, similar to Western Port Sunkland. Port Phillip Bay is the lowest part of the Sunklands and is currently flooded due to Quaternary sea-level fluctuations in the Last Glacial Maximum (Birch 2003, p. 556). Also during this period the Yarra River water levels had risen and spilled over the coastal plain, forming what is now known as the Bass Strait (Birch 2003, p. 556).

#### 2.1.2 The Victorian Coast

The coastal plains of southwest Victoria are made up of both Tertiary and Quaternary marine and nonmarine sediments, formed on calcareous sands and sandy limestones, overlaid with dune ridges and beaches that were formed during the last 800 000 years. The dune ridges closer to the coast are younger than those further inland and are comprised of calcareous sands. Caves are common in ridges of the limestone sands (Birch 2003, p. 545).

The coastline of western Victoria is seen to have several layers of sedimentary deposits, as evident in the cliffs often found, containing stratigraphic sections of basalt, limestone and clay (Birch 2003, p. 555).

The geomorphic evolution of southeast coastal plains of Victoria is varied, with Tertiary overlaying early Cretaceous sediments on the Otway coast as well as Quaternary sand and limestone dunes in Mornington

Peninsula and Phillip Island (Birch 2003, pp. 547,556). The coast of East Gippsland is covered extensively in coastal dunes, with intermittent pockets of Pleistocene deposits. Parabolic dunes formed from Pleistocene and Holocene age deposits are also located in this area (Birch 2003, p. 557).

### **2.1.3 The Tasmanian Coast**

The Tasmanian coast consists of varying deposits making up its rugged nature. Geological formations include Dolerite, Sandstone, Mudstone, Granite, Limestone, and other Volcanic rocks. These varying geologies are reflected in high cliffs and outcrops, dune-backed beaches, sea stacks and arches. The Tasmanian geological makeup is complex and varies. Along the coastal regions detailed in the study area, these consist of Devonian granites, Tertiary Basalt, Neoproterozoic dolomite, Cambrian boninite, Cambrian Sediment, and Mesoproterozoic quartzite (MRT: 2022).

Tasmania is known to have been one of the few areas in the southern hemisphere that was glaciated during the Pleistocene (MRT 2002). This generally occurred in higher regions of the state and influenced many of the earlier Pleistocene sites recorded in Tasmania (MRT 2022).

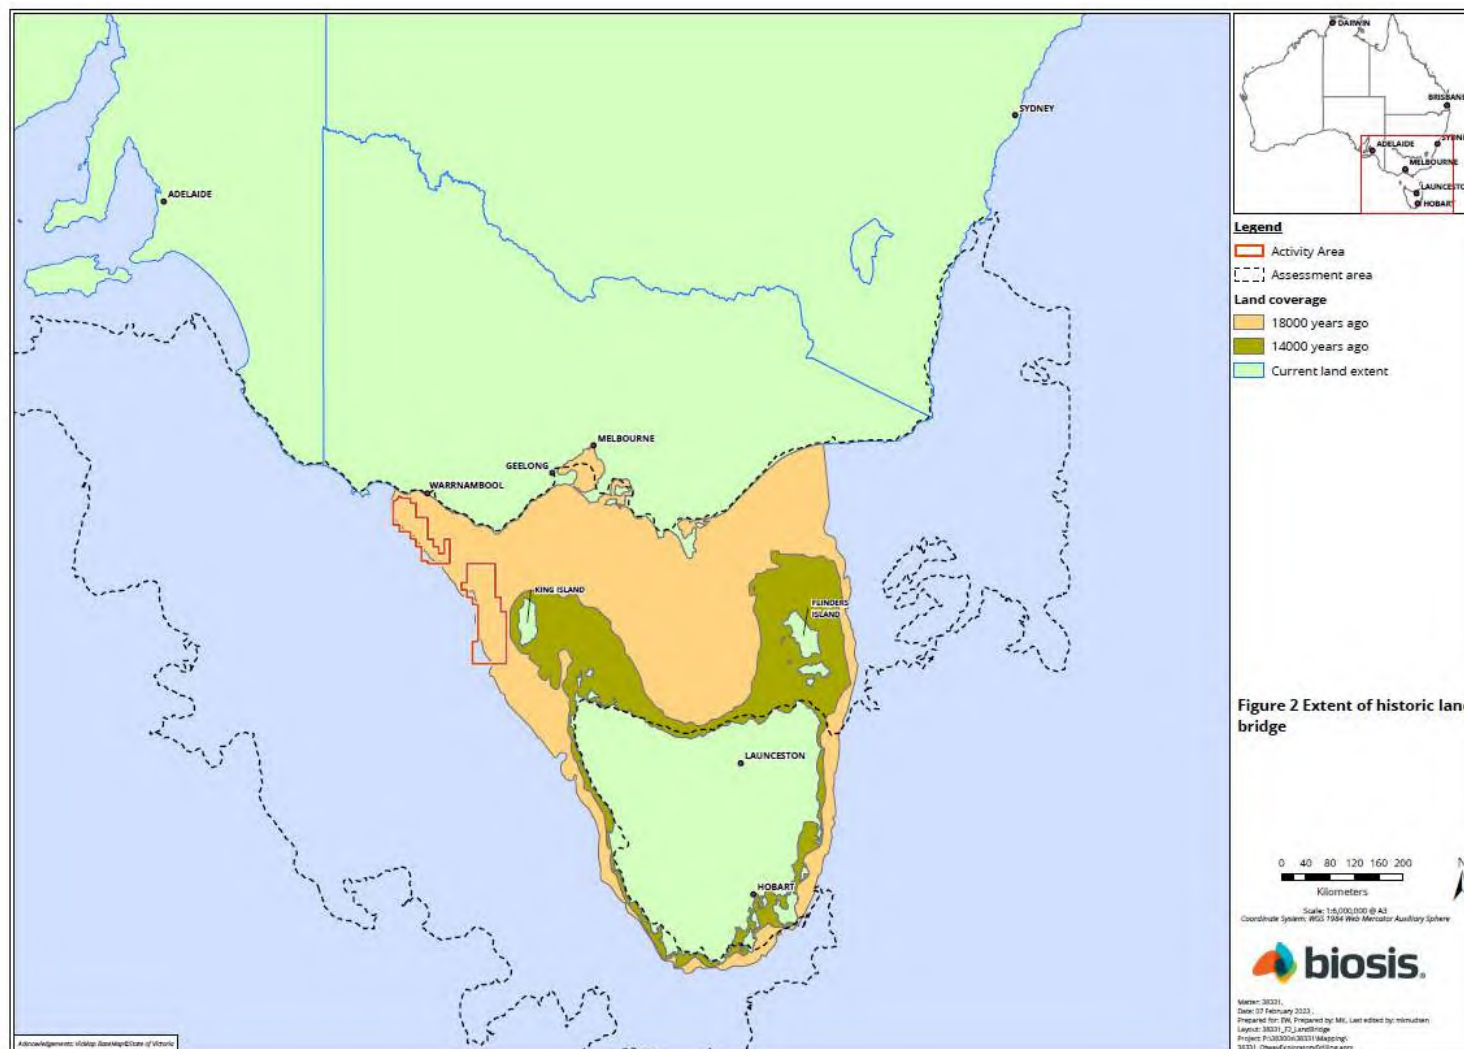

### **2.1.4 Archaeology of the Sea Floor**

Archaeology of the sea floor is an emerging aspect of archaeological science. Throughout the world, archaeological investigations have shown that there is evidence for human occupation to be recovered below current sea levels. Investigations in the Sunda Shelf, Southeast Asia demonstrates the impact of sea level rise at approximately 12,000 years ago, with the investigation of settlements, fish traps, and other structures. Other investigations have occurred in India (Kumar 2021), and the Black Sea (Ryan 2003), investigating more recent sea level change, around 7,500 years ago. In the UK and US, the offshore wind industry is required to complete offshore archaeological investigations including desk-based studies and field survey.

In comparison, Bass Strait is comparable to the vanished landscape of Doggerland that was submerged similarly in rising sea levels during the Mesolithic Period. Like the Blassian Plain, Doggerland formed a land bridge between the United Kingdom and Europe. Works by marine archaeologists have found that many artefacts and environmental sediments still remain from this now vanished ancient landscape (Gaffney et al. 2007). It is even suggested by Weninger et al (2008) that this was caused by a catastrophic flood. However, such ideas are not believed in the example of Bass Strait, and that this was a more gradual separation (see Davidson and Roberts 2008:20)

In Victoria, limited investigations have been completed, however the use of LiDAR and shoreline mapping has occurred. In particular, Gunditjmara have worked with Extent Heritage in partnership with Wessex Archaeology in determining the location of prior shorelines with the use of remote sensing. Should archaeological evidence survive, it is likely that the previous shorelines would provide the most likely locations for this. Physical investigations are likely to be difficult, complex, and costly.

Following deposition, archaeological evidence of human occupation along the Bass Strait has flooded. Since flooding, sedimentation has also occurred, capping any archaeological evidence deep below the current sea floor. The depth of sedimentation varies throughout the strait, however combined with deep waters (400 to 5,500 metres) and harsh conditions, exploration of sea floor archaeology utilising physical methods in this area is currently unlikely.

**Figure 2 Land Bridge and activity area**

## 2.2 Land use history

Permanent European colonisation of Victoria and Tasmania occurred first in Tasmania, in 1803, and Victoria in 1835. Earlier exploration and transitory, temporary or failed settlements occurred in the two states. Early settlements in Tasmania were penal, with free settlement commencing following. The Gold Rush in Victoria in the 1850s resulted in the rapid expansion of population and the establishment of towns throughout the state. Agriculture and Industry heavily influenced the growth of the population of Tasmania.

Settlement, population growth and utilisation of land for agricultural purposes has resulted in the spread of disease, displacement, and violence to Indigenous communities, leading to a significant decline in population and disruption to traditional cultural practice. Aboriginal people were subject to forced displacement and assimilation, including the forced removal of Aboriginal children, from the 1800s up until the 1970s. Overall the impact of colonisation on Aboriginal people has been devastating.

In regard to the remains of physical cultural heritage (such as sites and places), the practice of archaeology has increased the knowledge of Aboriginal occupation of the land in the past. The potential for archaeology to shed light on Aboriginal connections to Country has been realised with increasing frequency due to relatively recent legislative requirements. Archaeology is, however, a finite resource which has also been impacted by the effects of population growth, construction, land clearance, resource extraction, and climate change. Self-determination for Aboriginal people in regard to ownership of cultural heritage and knowledge has resulted in increased investigations led by Aboriginal people supported by technical experts, following research pathways set by the communities themselves.

Archaeological sites are located throughout the land and adjacent seascape and consist of the physical remains of the way people used the land in the past. Places may reflect resource extraction (such as scarred trees, stone quarries); be evidence of settlement (such as stone huts), manufacture (stone artefact scatters) and cultural practices (such as painting, etchings, and stone arrangements); food consumption (shell middens, earth mounds and hearths); and ritual practice (such as burials). Other cultural values can take the form of intangible places or be recorded in historic (ethnographic) references.

Whilst long-lasting, archaeological sites are heavily affected, and frequently destroyed, by the effects of modern, and past, impacts. Land clearance and increasingly intense bushfires result in the removal of old growth trees, including those showing cultural scarring, and also increases the effects of erosion. Ploughing for agricultural practices displace artefact scatters and deflate earth mounds. Coastal erosion, coastal change and increased storm surges destroys shell middens and artefact scatters located in coastal and offshore landforms. The practice of archaeology itself is destructive and results in the loss of archaeological places. Alteration of the natural environment also affects intangible values, affecting connections between the Dreamtime and the landscape, for example, by interrupting songlines. As Aboriginal people have strong connections to Country, effects on the natural environment, the land, sea, and animals, also have strong effects on Aboriginal people.

## 2.3 Aboriginal heritage – registered archaeological places in the study area

A search of the Victorian Aboriginal Heritage Register (VAHR) was undertaken by Emily Ward, Biosis Pty Ltd on the 21 of December 2022 utilising access number 11456. The search area was set by the study area and consists of the entire Victorian coastline.

The search identified 5636 recorded Aboriginal places within the study area (Table 1).

The dominant Aboriginal place types in the study area are shell middens (n=2639, 46.82%), artefact scatters (n=2210, 39.21%) and low density artefact distribution also known as LDADs (n=321, 5.70%). Other place types include earth features (n=181, 3.21%), object collections (n=160, 2.84%), Aboriginal Ancestral Remains (Burial) (n=51, 0.90%), scarred trees (n=42, 0.75%), stone features (n=12, 0.21%), quarries (n=9, 0.16%), Aboriginal historical places (n=8, 0.14%), Aboriginal Ancestral Remains Reinterments (n=2, 0.04%) and rock art (n=1, 0.012%).

Object Collections represent places that have been removed from the context in which they were originally recorded. More specifically, they represent the location of stored artefacts (i.e. heritage consultancies, museums, private collections) or places where artefacts have been repatriated; therefore, Object Collections are not necessarily representative of the archaeological character of the region

Due to most of the search area being coastal, the dominance of shell middens in the study area is not surprising. Middens represent the repeated consumption of coastal resources (predominantly shells of rocky or sandy shore types, such as mussel, pipi, oyster, turban) and consist of the discarded shell. Other objects may be discarded within the midden, such as bones (seal and bird are common), and artefacts. The shells and other items were discarded in discrete areas over time, some middens are small consisting of a smaller number of meals or individuals, others are larger, indicating multiple meals, some revisited over many hundreds, or thousands, of years (Frankel 2017, p.38).

*'Archaeological evidence from Victoria indicates that occupation of coastal areas is as old as the present coastline – about 6000 years. Most coastal occupation sites in Victoria, however, are 4000 years old or younger' (National Oceans Office, 2002:80)*

Within the study area the Traditional Owner group with the most registered Aboriginal places is Bunurong with 1486 place registrations, with 26.37% of the total registered sites in the study area. This is then followed by Gunditjmara with 853 registered sites (15.77%), then Eastern Maar with 853 registered sites (15.13%), Wadawurrung with 798 registered sites (14.16%), Gunaikurnai with 700 registered sites (12.42%) and the area of overlap of Gunditjmara and Eastern Maar has 88 registered sites (1.56). The area within the study area that has no registered RAP group has a total of 822 registered sites (14.16%). The specifics of each group are discussed below.

The areas of Bellarine Peninsula, Mornington Peninsula and French Island and Wilson's Promontory have been searched specifically on the Victorian Aboriginal Heritage Register (VAHR) as they are distinctive landforms on the coastline of Victoria and hold distinct cultural patterning, regarding both tangible and intangible cultural heritage values. These three areas contribute 1775 of the registered sites (31.5%), out of the 5636 total registered sites in the study area; The Bellarine Peninsula has 578 registered sites, Mornington Peninsula and French Island have 813 registered sites and Wilson's Promontory has 384 registered sites.

**Table 1 – Aboriginal places within the study area (Victoria)**

Aboriginal Place Type	Total number of sites	Percentage of sites
<b>Aboriginal Ancestral Remains (Burial)</b>	51	0.90%
<b>Aboriginal Ancestral Remains (Reinternment)</b>	2	0.04%
<b>Aboriginal Historical Place</b>	8	0.14%
<b>Artefact Scatter</b>	2210	39.21%
<b>Earth Feature</b>	181	3.21%
<b>LDAD</b>	321	5.70%
<b>Object Collection</b>	160	2.84%
<b>Quarry</b>	9	0.16%
<b>Rock Art</b>	1	0.012%
<b>Scarred Tree</b>	42	0.75%
<b>Shell Midden</b>	2639	46.82%
<b>Stone Feature</b>	12	0.21%
<b>Total</b>	5636	100%

### 2.3.1 Primary Traditional Owner Area - Gunditjmara Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 889 recorded Aboriginal places within the Gunditjmara RAP area. The dominant Aboriginal place types in the study area are artefact scatters (47.36%), shell middens (38.81%) and LDADs (6.3%).

Artefact scatters have been registered throughout the search area, with notable clusters of artefact scatters south of Portland, around Point Danger. Low Density Artefact Distributions (LDADs) consisting of fewer artefacts less densely present than artefact scatters, are most often found further inland, compared to artefact scatters and shell middens which are located close to the shoreline. This suggests concentration of activity close to the coast, and increased transitory movement to and from the coast, as material is being discarded when people are moving across the landscape.

Other registered place types include earth features (6.3%), object collection (0.56%), Aboriginal historic places (0.34%), Aboriginal Ancestral Remains Burial (0.11%), quarry (0.11%) and scarred trees (0.11%) There are no registered sites in the western most area of the Gunditjmara RAP group, within the study area. This area is along the southern most point of the Fitzroy River and west of Narrawong.

### 2.3.2 Primary Traditional Owner Area - Eastern Maar Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 853 recorded Aboriginal places within the Eastern Maar RAP area. The dominant Aboriginal place types in the study area are shell middens (53.81%), artefact scatters (34.11%) and earth features (5.39%)

Shell midden sites on in coastal landforms have been frequently registered. The artefact scatters with the study area tend to follow natural paths inland. This suggests movement to and from the coast, with people utilising land resources. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016).

Other registered place types include LDADs (3.99%), object collection (1.52%), Aboriginal Ancestral Remains Burial (0.94%), quarry (0.12%) and stone features (0.12%)

### **2.3.3 Primary Traditional Owner Area – Shared Gunditjmara and Eastern Maar Aboriginal places**

In this area, the two RAP groups overlap. The search of the Victorian Aboriginal Heritage Register (VAHR) identified 88 recorded Aboriginal places within the shared Gunditjmara and Eastern Maar RAP area. The dominant Aboriginal place types in the study area are shell middens (52.27%) artefact scatters (34.09%) and stone features (7.95%).

Majority of the artefact scatters and shell midden sites with the study area are located between the coast and Eumerella River. This suggests the use of both fresh and sea water sources for material and resources. Shell midden sites can be found along the coastline while the artefact scatters tend to be closer to fresh water sources. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016).

Other registered place types include earth features (4.55%) and Aboriginal historic places (1.14%).

### **2.3.4 Secondary Traditional Owner Area - Wadawurrung Aboriginal places**

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 798 recorded Aboriginal places within the Wadawurrung RAP area. The predominate Aboriginal place types in the study area are artefact scatters (46.12%), shell middens (33.83%) and LDADs (9.27%).

Within the study area, artefact scatters tend to follow freshwater sources inland and cluster around headlands (such as the Queenscliff and the Indented Heads area). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea. LDADs are most often found further inland, compared to shell middens which are located closer to the shoreline. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape

Other registered place types include object collection (5.64%), earth features (2.88%), scarred trees (0.88%), Aboriginal Ancestral Remains Burial (0.75%) Aboriginal historic places (0.25%), stone features (0.25%) and quarry (0.13%)

## **Bellarine Aboriginal Places**

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 578 recorded Aboriginal places within the Bellarine Peninsula. The predominate Aboriginal place types found on the Bellarine Peninsula are artefacts scatters (48.44%), shell middens (29.41%) and LDADs (10.03%).

Within the study area, artefact scatters tend to follow freshwater sources inland and cluster around headlands (such as Queenscliff and Barwon Heads). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea. LDADs are most often found further inland, compared to shell middens which are located closer to the shoreline. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape

Other site types include object collection (6.75%), earth features (3.29%), Aboriginal Ancestral Remains Burial (0.87%), scarred trees (0.69%), Aboriginal historical places (0.35%) and stone features (0.17%).

### 2.3.5 Secondary Traditional Owner Area - Bunurong Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 1486 recorded Aboriginal places within the Bunurong RAP area. The predominate Aboriginal place types in the study area are shell middens (45.56%), artefact scatters (38.36%) and LDADs (8.28%).

Within the study area, artefact scatters on French Island and Phillip Island are found further inland, compared to shell middens. Some of the shell middens within the study area can be found in clusters around headlands (such as the Portsea and Sorrento area). This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea.

Other registered place types include object collection (5.79%), earth features (1.28%), scarred trees (0.20%), Aboriginal Ancestral Remains Burial (0.20%), quarry (0.13%), Aboriginal historic place (0.07%), rock art (0.07%) and stone features (0.07%).

### Mornington Peninsula and French Island Aboriginal Places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 813 recorded Aboriginal places within the Mornington Peninsula and French Island area. The dominant Aboriginal place types in the study area are shell middens (50.43%), artefact scatters (31.12%) and LDADs (11.69%).

Along the coast of the Mornington Peninsula there is a significant increase in shell midden sites from Sorrento to Cape Schanck. This could indicate targeted gathering of resources specific to this area and purposeful occupation of the coastline. From Cape Schanck, moving east, there is a noticeable decrease in the number of registered sites along the coast. Shell middens can be found along the coast, either along the shore or along creeks close to the coast (such as Merricks Creek). Artefact scatters can be found intermittently along the coast but can also be seen following water sources inland. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources and coastal sites as occupation sites and opportunities for variety in resource gathering. LDADs are an inland site type within the locality. This suggests movement to and from the coast, as material is being discarded when people are moving across the landscape.

There are 50 registered sites on French Island. Only nine of these sites are located along its coast, the other 41 are inland sites, with the majority of the sites being artefact scatters. The inland artefact scatters are located along paths of water, suggesting targeted use of the landscape (land use patterning).

Other registered place types include object collection (4.31%), earth features (1.72%), scarred trees (0.37%), Aboriginal historic places (0.12%), quarry (0.12%) and rock art (0.12%).

### 2.3.6 Secondary Traditional Owner Area - Gunaikurnai Aboriginal places

The search of the Victorian Aboriginal Heritage Register (VAHR) identified 700 recorded Aboriginal places within the Gunaikurnai RAP area. The predominate Aboriginal place types in the study area are shell middens (46.29%), artefact scatters (43.14%) and scarred trees (4.29%).

Clusters of artefact scatter sites can be found on the eastern coast of the Corner Inlet Marine and Coastal Park. These artefact scatters tend to follow sources of freshwater inland. This may indicate some form of land use patterning (Lawler, Oataway, & Berelov 2016), with groups using freshwater sources as occupation sites and opportunities for resource gathering, as well as using the headlands as vantage points across the bay or out to sea.

Other registered place types include LDADs (2.14%), Aboriginal Ancestral Remains Burial (2.14%), earth features (1%), object collection (0.57%), Aboriginal Ancestral Remains Reinternment (0.14%), Aboriginal historic places (0.14%) and stone features (0.14%).

## **Wilson's Promontory Aboriginal Places**

The Traditional Owners of Wilson's Promontory come from two recognised RAP groups: Bunurong and Gunaikurnai.

The search of the Victorian Aboriginal Heritage Register (VAHR) identified recorded 384 Aboriginal places within the Wilson's Promontory area. The predominate Aboriginal place types in the study area are shell middens (72.40%), artefact scatters (21.61%) and earth features (2.08%)

Clusters of shell midden sites can be found both inland and around the coast of Wilson's Promontory. A large shell midden cluster can be found along the western coast of the Promontory with a total of 163 shell midden registered sites. Another two clusters have been recorded around the opening of Wilson's Promontory, with a total of 18 registered sites between them. All 18 shell midden sites are in close proximity to either the coast or moving water. Majority of the artefact scatter register sites recorded at Wilson's Promontory follow water sources inland. The strategic locations of both shell midden and artefact scatter sites demonstrate land use patterning.

Other registered place types include LDADs (1.56%), Aboriginal Ancestral Remains Burial (1.3%), object collection (0.52%), Aboriginal Ancestral Remains Reinternment (0.26%) and scarred trees (0.26%)

## **2.4 Aboriginal heritage – archaeological places in Tasmania**

### **2.4.1 Primary Traditional Owner Area – Bass Strait Island Aboriginal places**

Today, the Tasmanian Aboriginal people refer to sea country as tayaritja/Bass Strait Sea Country Protected Area (IPA) (TAC 2022). In recent works, the Marine Parks Project has been initiated to establish and recognise Aboriginal connection to the sea, as well as those areas of land now inundated after the rising sea levels after the last Ice Age. The South-east Marine Parks Network is located from Tasmania, Victoria and South Australia and includes:

- Underwater canyons and mountains;
- Diversity and abundance of marine creatures (unique globally to the study area);
- Rich diversity of marine mammals and birds (Aboriginal Education Tasmania 2022)

Tayaritja Sea Country IPA is managed by the Tasmanian Aboriginal Centre (DCCEEW 2022). These include Ramsar wetland as well as ecologically significant coastal habitats. The program will assist the Tasmanian Aboriginal Centre, and the broader Tasmanian Aboriginal Community with the rehabilitation, restoration and monitoring of the significant marine ecosystem (DCCEEW 2022). This will also aim to protect threatened marine animals and seabird life, including over 120 plant species (DCCEEW 2022).

Mackay (1946) was the first to identify archaeological evidence of past Aboriginal use of the Bass Strait Islands in the 1930s (see also (Sim 1990). Earlier thoughts were that these were stone artefacts left behind when the Tasmanians were moved to Flinders Island by George Augustus Robinson in the 1830s. It was not until Rhys Jones' work in the 1960s that attention to the Bass Strait islands was made. Sandra Bowdler (1979) excavated at Cave Bay Cave on Hunter Island that provided the first evidence of Pleistocene occupation, dating from 23,000 years. At this time, this was the oldest recorded date of Aboriginal occupation in Tasmania. This was also archaeological proof of the Bassian Land Bridge that once connected Tasmania to Mainland Australia (Sim 1990).

Further work was carried out on Flinders Island and several other smaller islands in Bass Strait showed signs of earlier occupation, including stone artefacts, middens and burials. It was believed at the time that the absence of middens on some islands, but the presence of stone artefacts meant that the midden sites were once closer to the original pre-Ice Age coast, which is now under water (Orchiston & Glenie 1978). The first middens excavated in Bass Strait was by Orchistone (Orchiston & Glenie 1978, Orchiston 1979, Orchiston

1984), however, the full details of the report have not been published. (Sim 1990) recorded a number of middens on Flinders Island in 1989 and noted that many of the remaining midden sites were found where the sea floor drops away abruptly, further suggesting that many of the midden sites were possibly found on ground level now under water due to rising waters after the Ice Age. (Sim 1990) argued that the Bass Strait islands were abandoned before the last remnants of the Bassian Plain land bridge between Mainland Australia and Tasmania disappeared. Davidson and Roberts Davidson & Roberts (2008:20) state:

*For a while, perhaps, it was possible to use watercraft to maintain contact with families and friends on the other side but eventually this became more difficult. Boats sank sometimes, or storms and rough seas would have made the crossing perilous. When the sea barrier became too wide, those left on the Tasmanian side turned their backs and never saw their friends and families again. It proved to be a monumental turning point, leading to an independent evolution in their technology, economy, society and culture. They were alone for five hundred generations, knowing no other people in the world, living with the knowledge and beliefs derived from those they had known before the sea surrounded them. They remained isolated from the rest of humanity until that same sea brought the first Europeans in the late seventeenth and early eighteenth centuries*

Brown (1990) conducted excavations on Flinders Island that again proved the antiquity of the Bass Strait Islands, where sporadic occupation from 20,000 years to 8,500 years was found at Mannalargenna Cave on Prime Seal Island. Again, it was hypothesised that the islands were abandoned after 8,500 years due to the rising sea levels (see Sim 1990). Early thoughts at the time state that water craft between the islands would have been possible, and the sea level rise was gradual and would have been shallower. However, with the rise of waters, also meant that the distance between land masses increased, therefore making travel much harder and dangerous. It is thus why many believe that the islands were abandoned around 6,000 years ago when the seas reached their current levels (Sim 1990).

The flooding of the Bassian Plain meant that the people who chose to remain in Tasmania would soon be isolated for generations. Jones (1971) states ‘... no other human society, which survived until modern times, had been isolated so completely and for so long’.

#### **2.4.2 Secondary Area – Tasmanian coastal Aboriginal places**

Archaeological evidence of occupation in Tasmania range between 34,000 – 40,000 BP. The most accurate date for occupation is from the Parmerspar Rockshelter close to Cradle Mountain that was excavated by archaeologist Richard Cosgrove (Mulvaney & Kamminga 1999, p. 189). This was a time when Tasmania was still a part of the landmass of Australia before it was disconnected with the flooding of the Bassian Plain after the last Ice Age. Further excavations of Kutukina Cave (formally Frasier Cave) in southwest Tasmania established Pleistocene settlement of Tasmania with radio carbon dates ranging from 15,000 to 20,000 years BP (Kiernan, Jones, & Ranson 1983, Mulvaney & Kamminga 1999, p. 182).

By the end of the last Ice Age (12,000 BP) the rising temperatures and subsequent rising sea levels flooded the Bassian Plain and separated Tasmania from the mainland of Australia (Kee 1987, p. 12; Taylor 2003). The formation of what is now known at the Bass Strait ultimately led to the isolation of the Tasmanians from their groups on the mainland of Australia. The resulting 10,000 years of isolation crafted a unique culture and economy that was independent from any mainland Australia influence (Mulvaney & Kamminga 1999, p. 339). A series of environmental and climatic changes started to occur in Tasmania as a result of this separation with a reduction in rainfall, lower than normal temperatures, some reduction in the seeding of vegetation, as well as the formation of sand dune systems that were to become a prime area for the discovery of Aboriginal remains. Kee (1987, p. 14) stated that these dunes formulated a new abundance of resources available to the Tasmanian's, which is reflected in much of the early archaeology of this period. These climatic changes started to stabilise around 6,000 years ago. This has been noted by radiocarbon dating at Carlton Bluff, where dates ranged from 8,000 to 6,000 BP (Dix 2015, pp. 147–8); Kee 1987, p. 12;

Neil 1981; Reber 1965), and therefore the range of sites found on the coast are more than likely representative of this 6,000 year figure.

Regionally, sites vary in Tasmania. As such, the state has been divided into three geographic regions. Various studies were conducted in the 1980s and 1990s to understand these regional differences in sites, and to understand more broadly Tasmanian Aboriginal archaeology (Brown 1991; Cane 1980; Cosgrove 1985; 1990; Gaughwin 1985: 52; Jones 1965; 1966; 1967; Key 1991; Lourandos 1968; 1970; 1977; MacFarlane 1993; Stockton 1977a, 1977b; 1982).

- East/South East Tasmania
  - Middens formulate 90% of all site types on the east coast with a range of shell from turbo, oyster, limpet, abalone and mussel. Brown (1991:46) determined that turbo middens dominated areas behind rock platforms where oysters were mostly predominant behind sandy beaches, where shell fish consumption generally took place within the immediate proximity of where it was procured from;
  - 50m within the coastline appears to be the limit of the majority of the larger sites in the area;
  - Sites are generally situated on well drained more inland areas;
  - That 81% of sites recorded contained some level of stone artefacts, and generally consist of hornfels, cert, quartzite and chalcedony flakes.
  - Stone artefact scatters were generally located on flat or gently inclined landscapes where they were close to a water source;
  - The underlying geology of the inland area suggests that areas where the underlying rock was sandstone was more favourable over those areas that contain dolerite;
  - Sandstone rock shelters located close to water often contain signs of occupation.
  - Rock art can occasionally be found on sandstone rock shelters, and is generally executed in ochre.
- Archaeological Sites – North/ North East Tasmania
  - Sites generally occur on high energy coastlines;
  - Approximately 78% of sites occur within 50m from a water source;
  - Sand dune areas most commonly have sites located on them;
  - The main stone typology noted in these assemblages include hornfels, chert, and quartz.
  - Rock art can be found pecked in stone on coastal margins
- Archaeological sites North West/ West/ South West
  - Majority of sites can be found on sand dunes close to rock platforms;
  - Middens are generally smaller and lower on sandy shores.
  - Middens are generally absent along rocky granite shorelines.
  - Site types include artefact scatters, isolated artefacts, stone and ochre quarry sites and rock shelters.

- The main stone types used in the area include spongolite, quartzite, quartz, silcrete and hornfels.
- Artefact scatters and isolated artefacts are generally located on the forest plain.
- Stone artefacts will be varies in material type, which reflects the opportunistic nature of collecting material.
- Areas within 500m of major water courses and creeks will generally contain Aboriginal sites.
- Sites that contain stone artefacts made from spongolite artefacts will no predate 2,500BP.
- Generally, sites are 70 to 100 artefacts per km<sup>2</sup>. Densities are approximately 1.7 artefacts per site in places away from major rivers and quarry sites, whereas there will be approximately 6.5 artefacts per site in areas close to these resources.
- Sites will generally be located near the transition of inland heath plains and forest margins.
- Large artefact scatters will be located close to major creeks or rivers especially where flat grounds are associated with the area;
- Hut depression occur on coastal margins, generally close to food sources
- Rock art is found on coastal margins, and is generally pecked or engraved on large sandstone faces, or where creeks exit to the sea.

## 2.5 Archaeological summary

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and LDADs. Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

In light of a review of Aboriginal places within the study area, there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

Within Tasmania, Aboriginal heritage should be expected in any area of low-lying coastal areas, shelter sites, and sources of food, water and raw materials. These coastal margins contain all Tasmanian Aboriginal site types. It is also known on the West Coast of Tasmania, that a number of rock art sites are located on the coast, many either close or in tidal margins (Dix pers. obs.). Large midden sites are also located very close to the waters edge, as well as some stone quarry sites within tidal margins (Dix pers .obs.). It has also been observed that there is evidence some submerged sites within areas of Tasmania, and these will need to be considered (Dix pers.obs.)

## 2.6 Traditional Owner groups and ethnohistory

For the purposes of this assessment, information about Aboriginal Victorian and Tasmanian pre and post contact history has been sourced from nineteenth and twentieth century primary and secondary ethnographic/historical records.

### 2.6.1 Primary Traditional Owner Area - Gunditjmara

The Gunditjmara RAP group covers the area boarding the South Australia border with Victoria and the Southern Grampians. This area includes Harrow and Horsham, south to Dunkeld and MacArthur, and southwest to Portland and Cape Nelson. The Gunditjmara RAP area also includes many state and national parks such as Discovery Coastal Park, Mount Richmond National Park, Cape Nelson State Park and the Grampians National Park.

The area between the Shaw and Eumerella Rivers in the south-west to Lake Linlithgow in the north and Yambuk in the south, are shared by both the Gunditjmara RAP and the Eastern Maar RAP groups.

There are many landscapes within Gunditjmara Country – Nyamat Mirring (Sea Country), Tungatt Mirring (Stone Country), Bocara Mirring (River Country) and Woorrowarook Mirring (Forest Country) (Glenelg-Hopkins Catchment Management Authority 2023).

It can be noted that the Gunditjmara view water as part of their traditional lands and should be recognised and protected as such (Clark 1990, RNTBC 2023)

Evidence of Gunditj Mara knowledge of water is found in the eel trapping and the redirecting of waterways at Lake Condah and in the larger Budj Bim National Heritage Landscape. The Budj Bim National Heritage Landscape had been managed by Traditional Owners to form waterways and channels to bring eels down from Darlots Creek into Lake Condah for fishing and resource gathering (Department of Climate Change, Energy, the Environment and Water 2021). This practice can be dated to approximately 6600 years old, with one of five of the eel trap systems around the lake's edge being carbon dated. The relocating and breeding of eels became a sustainable husbandry practice that sustained the Gunditjmara through every season, providing food stuffs and sources of trade. There are plans currently being made with VicWater and Wannon Water to reestablish traditional eel farming in the Budj Bim area (VicWater 2022). Another plan devised to aid in the management of Indigenous water landscapes is the Sea Country IPA Program. The Sea Country IPA (Indigenous Protected Areas) Program was developed at the beginning of 2021 to aid in the conservation and protection of Indigenous marine and coastal environments. The IPA program covers the Gunditjmara area from the Convincing Ground to the Yambuk Lakes and provides further protection of the Budj Bim landscape as well as opportunities for Indigenous employment, documentation of traditional knowledge and sea management (DCCEEW 2022)

The Lake Condah mission was opened in 1867 in response to the displaced Gunditj Mara after the Eumerella wars (Budj Bim Cultural Landscape 2023). The Eumerella wars lasted over 20 years, beginning in the mid 1830s to the 1860s, starting over disagreements in ownership of land in southwest Victoria. The Dhauwurd wurrung people (apart of Eastern Maar country) refused to settle at the mission in Framlingham, so the Lake Condah mission was established, where they farmed and learnt to read and write English. The mission was strategically positioned to both house eel trapping facilities and have a view of the Budj Bim Reserve. In 1918, the mission was formally closed, and some of the Gunditj Mara were moved to other missions, such as the Lake Tyers Mission, while others refused to leave country. In 1987, the land on which the mission was situated on was given back to the Gunditj Mara (Budj Bim Cultural Landscape 2023).

Gunditj Mara hold strong cultural connections to sea country (Nyamat Mirring), and Nyamat Mirring features heavily in the Dreaming and creation stories of the Gunditj Mara. The Gunditj Mara believe that after the initial eruption of the creator spirit, Budj Bim, out of a volcano, the spirits movement throughout the landscape created the surrounding landscapes and their features. The lava flow from this

eruption caused the creation of the wetlands found within the Gunditj Mara landscape. In the traditional funeral rites of the Gunditj Mara people, bodies are bundled in grass and laid into the ground with their heads pointing towards Deen Maar (Lady Julia Percy Island). This is due to Deen Maar having a cave called Tarn Wirrung, which is thought to be the beginning of the passage towards the afterlife. Once the bodies were buried, if grass grew at the mouth of the cave, it was thought that the spirit had made it to the island, and into the realm of the clouds

Deen Maar (Lady Julia Percy Island) is the point where two creator deities, Punjil and Pallian left this earth. Pallian was the creator deity of the sea and fish and the governor of the oceans (after William Thomas, Letters from Victorian Pioneers, in National Oceans Office 2003:12). This island holds and creation story holds significance for both the Gunditjmarra and Eastern Maar.

Significant locations of conflict are also located on the coast, including the massacre of Gunditj Mara at Convincing Ground, east of Portland. The Convincing Ground Massacre occurred at Allestree, approximately 10km from Portland, where Kilcarer Gunditj, Gunditj Mara people were killed by whalers over a disagreement about the ownership of a beached whale(VHR n.d.). The suggested dates for this massacre are between 1833 and 1834, with an unknown number of Indigenous peoples being killed(VHR n.d.).

### **2.6.2 Primary Traditional Owner Area - Eastern Maar**

The Eastern Maar RAP group covers the area including Port Fairy and Warrnambool, down to Apollo Bay, east to Lorne and northwest towards Ararat. The RAP area of Eastern Maar also extends 100 meters off the coast and therefore encompasses the Twelve Apostles.

Eastern Maar is an umbrella term, used to describe a large area of land containing many, smaller traditional owner groups, such as Maar, Eastern Gunditjmarra, Tjap Wurrung, Peek Whurrung, Kirraw Whurrung, Kuurn Kopan Noot. Yarro waetch and many others.(Eastern Maar Aboriginal Corporation 2020)

In 1865 the first Aboriginal mission was formed in the Western District at Framlingham in Girai wurrung country, north-east of Warrnambool. Aside from the Dhauwurd wurrung clans who moved to the Lake Condah mission in the 1860s, other Indigenous people were removed to the Framlingham Aboriginal Mission, which was gazetted as a 'temporary reservation for the use of Aborigines' (Barwick 1979: 4).In this mission the Eastern Maar people continued both cultural and spiritual traditional practices. In 1867 and 1899 the mission was meant to close down, and the Eastern Maar people were expected to move into the Lake Condah mission. Again, in 1916, the Eastern Maar people were expected to move into missions within Gippsland Victoria. All three times, the people refused to move and were successful in staying on country. During the 1970's, Eastern Maar were granted ownership of the land, including 586 acres of the original mission (Lawler, Oatway, & Berelov 2016).

Eastern Maar's connection to water relies heavily in the marine resources, abundant around the area. Fishing practices are still used today with the fishing and collection of eels, perch, blackfish, yabbies, abalone, cockles and crayfish (Eastern Maar Aboriginal Corporation 2015, p. 9). The techniques used in eeling have been passed down for generations, meaning the practices used today are techniques and skills traditional owners were using to eat and to trade (Eastern Maar Aboriginal Corporation 2015, p. 9). Shell middens are an important archaeological site to the Eastern Maar, where they take time to teach others about the importance of culture and preservation and management of sea resources (Eastern Maar Aboriginal Corporation 2015, p. 9).

*When Maar citizens visit places with archaeological sites, we take time to teach our young ones about what they mean in terms of our history and culture. For example, our ancestors left many ancient middens along the coast which continue to tell a story about our Country - how the coastline and estuaries fluctuated, how and when our ancestors used the resources along the coast, what was harvested from out in the open ocean, how climatic conditions changed over time, where the meeting places were and ceremonies took place. This type of cultural*

*learning helps develop empathy for Country; a deeper understanding on a societal scale of what Country means to us as a nation. We always pay our respects...(Eastern Maar Aboriginal Corporation 2015, p. 9)*

Through Country, Eastern Maar People connect with their ancestors who are associated with different water systems within the landscape (Eastern Maar Aboriginal Corporation 2015, p. 9):

*We believe that the spirits of our dead reside in our waterways and water bodies, and that they use animate and inanimate objects to move through Country. The signs they reveal to us are an important part of the interaction with our Ancestors – engaging, guiding, informing and warning us. When our citizens die, they are often buried with their bodies facing towards Deen Maar (Island). A story associated with Deen Maar Island is that the spirits go first to Deen Maar and then up to the stars, as Bunjil had done. A star falling or lights flying through the sky is a sign that the spirit is going over.*

*Sea Country Maar citizens have always had a close connection with the sea and its resources, which were central to our culture, economy and survival. The ocean nourished our Ancestors and we still rely on it for our survival. Abundant middens along the coastline tell a rich story of our past. The coastline is home to sites that are important for our Dreaming - Three Sisters Rocks and Deen Maar (Lady Julia Percy Island) where our Ancestors leave the earth. Our connection with our Sea Country extends well beyond the current shoreline to the edge of the continental shelf. While this area is under the sea today, we occupied it for thousands of years and rising sea levels have not washed away the history, physical evidence or our connection.(Eastern Maar Aboriginal Corporation 2015, p. 13)*

### **2.6.3 Secondary Traditional Owner Area - Wadawurrung**

Aboriginal groups mapped natural features as boundaries for their ranges, estates and economic territories. The Wadawurrung held land along the coast from Painkalac Creek at Aireys Inlet, east into Port Phillip Bay and to the Werribee River and to the north as far as Mt Emu and Fiery Creeks (Clark 1990).

Little is known about the Wadawurrung and their social organisation as they were one of the first Aboriginal groups within the region to be affected by European settlement in the area (Clark 1990). However, the Wadawurrung RAP organisation has traced its people's lineage to that of the seven families of John Robinson who was born in 1846 and passed in 1919 (WTOAC 2019).

During the summertime months, Wadawurrung along with Djab wurrung, Dhauwurd wurrung and girai wurrung language groups gathered at Mirraewuae swamp for ceremony and hunting. In early autumn the Wada wurrung would meet with Girai wurrung at Lake Bolac with local Djab wurrung named groups to take advantage of the migratory eels. The Wadawurrung participated in trade meetings at Terang, trading axe's and adhesive gum.

The coastal Wadawurrung first came into contact with settlers around the early 1800s when John Murray and William Flinders surveyed part of Indented Head. By the end of 1836 sheep runs were endemic around Geelong for an approximate 40.2 kilometre radius. The following year, settlers began to spread westward towards the Colac district.

An important figure in the history of Wadawurrung country was an escaped convict named William Buckley. The Wadawurrung balug first encountered Europeans in 1832 when William Buckley, escaped from the failed Sorrento settlement in 1803. Buckley was adopted by the Wadawurrung balug and spent the next 32 years with them; taking part in their customs, learning the language as well as hunting gathering techniques (Clark 1990). Buckley's story was recorded by John Morgan in 1852. From Buckley's accounts it was recorded that the Wadawurrung balug would catch eels at Lake Modewarre and would spend time on the hunting ground of the neighbouring Bengalat bulluck. According to Buckley the clan was at odds with the Bun wurrung, Woi wurrung and Daung wurrung clans (Clark 1990).

#### 2.6.4 Secondary Traditional Owner Nations Area - Bunurong

The land encompassing the eastern side of the study area, as mapped by Clark (Clark 1990), is held by the Boon Wurrung language group, commonly associated with the Bunurong people. Boon Wurrung land occupied the coastal area from the Werribee River to Anderson Inlet, Phillip Island and probably beyond to Wilsons Promontory (Horton & Morris 1983, p. 44). The Bunurong RAP group covers the Mornington Peninsula (such as Rosebud and Frankston), Western Port (French Island, Phillip Island and San Remo) and the eastern most part of South Gippsland (Warragul down to Leongatha)(BLCAC 2023).

The Bunurong group is loosely divided into smaller clan or family groups, named for the area they associated with (Gaughran & Sullivan 1984, p. 85). Barwick (1984, pp. 117–118) identified six clans: the *Burinyung-balluk* from Point Nepean and Cape Schanck, the *Mayone-bulluk* associated with the Carrum swamp, Cranbourne and the northern part of the Mornington Peninsula, the *Ngaruk-willam* associated with the Brighton area and Mordialloc, the *Yallock-bulluk* (most relevant to the study area) associated with the eastern side of Bass River and Tooradin, the *Yallukit-willam* associated with the area now called St Kilda and a broader region from the Werribee River to Mordialloc, the *Yowenghera* occupying the Tarwin River area. Thomas distinguished between the Bunurong people from Port Phillip and those of Western Port, though he rarely had contact with the Bunurong people on the eastern side of Western Port Bay (Sullivan 1981, pp. 16–9, Clark 1990). The Yallock-Bulluk Bunurong group are the most likely to have lived and associated with San Remo and Phillip Island area. The moiety of the Yallock-Bulluk named group is Bunjil, commonly associated with the Phillip Island area.

People were likely to have moved between the interior in winter and the coast in the summer. Movement was made up of many small distances (c. 10 km per day) punctuated by camps of one to three nights and occasionally longer stays of eight to ten days (Sullivan 1981). Social activity involving neighbouring named or socio-dialectical groups was usually held in warmer periods, held at the intersection of group boundary's and arranged by a person assigned of the responsibility of travelling between groups to organise the time, place, and events of the meeting.

An important figure in the history of Bunurong country was an Indigenous man named Derrimut. Derrimut was the *arweet* the *Yalukit Willam* group at the time of European settlement of the region (Clark 1990, pp. 368–9). His name, Derrimut (derrimart/derremot), is believed to mean 'to hunt' or 'to pursue' in the language of the *Yalukit Willam* (Clark 2005, p. 1), Derrimut was a prominent figure in both the Indigenous and European histories of early Melbourne, and historical and contemporary views of his status vary. William Buckley, an escaped convict who lived with the Wadawurrung people of the Geelong region, considered him a 'traitor' who should be speared for divulging impending attacks to European colonists (Clark 2005, pp. 109). Clark (2005) considers Derrimut a 'culture-broker' who sought to navigate the newly imposed political context of colonial Victoria by forging relationships with prominent early European Melbournians including John Pascoe Fawcner and William Thomas, who held Derrimut in high regard (Clark 2005, pp. 111). In 1849, Derrimut and other members of the *Yalukit-Willam* agitated for the establishment of the Mordialloc Reserve, and when it was later divided for sale in 1863, Derrimut used his European connections to angrily protest its sale (Clark 2005, pp. 116).

Bunurongs use of water-based resources is evident in the quantity of shell midden sites found along the coastline. Within the study area and the bounds of the Bunurong RAP group, there are a total of 677 registered shell midden sites, within two hundred meters of the shoreline. This suggests knowledgeable exploitation of marine resources as practiced techniques and an understanding of the ocean would be needed to accumulate the amount of shell middens listed on Bunurong country.

### 2.6.5 Secondary Traditional Owner Area - Gunaikurnai

The Gunaikurnai RAP group covers most of the Gippsland Area, spanning from Warragul and Noojee, down to Port Albert and Port Welshpool, eastward towards Bairnsdale, Lakes Entrance and Marlo, and north towards Omeo and Hotham Heights

The Gunaikurnai believe in strong connections between land (Wurruk), water (Yarnda) and air (Watpootjan) and how these connections support living things. The Gunaikurnai see no separation of land and water, combining the two to represent whole country and therefore, demonstrate the same levels of importance to both land and sea. Due to this definition of country, both land and ocean receive the same amount of protection and management (GLWAC 2023a).

Throughout Gunaikurnai country, there are multiple sites that detail Indigenous relation to country and resource exploitation. One site that displays local resource exploitation is the recently excavated cave near Mitchell River, Raymond Creek 2 Rock Shelter, that provides evidence of using mussel shell tools and localised resource gathered through fishing (Monash University & GLWAC 2019).

The Buchan Caves Reserve is an example of the spiritual and physical relation to country that the Gunaikurnai people share. At this site in Eastern Victoria there are registered indigenous burials located in and around the cave system, creating a spiritual space within the landscape. In conjunction to the sacred burials, the site was already known to be a great place of connection as it played an integral role in the migrating patterns of the Gunaikurnai travelling through the mountains (GLWAC 2023b).

The area surrounding Buchan Caves Reserve is also considered special to country, with several other caves being recognized as having cultural meaning. One such cave is Cloggs Cave, located southeast of Buchan Caves Reserve, having an undisturbed cultural sequence, that could prove indigenous settlement in the Late Holocene and holds evidence of megafauna that challenge the idea of megafaunal extinction being caused by the LGM (GLWAC 2023a, David et al. 2021, GLWAC 2023b)

### 2.6.6 Primary Traditional Owner Area – Palawa (Tasmania)

Prior to European colonisation, the Tasmanian landscape was delineated by socio-dialectical groups based around clan or family groups identified as owning areas of land, which formed larger amalgamations based on shared common language, economic and social interests. These larger amalgamations are referred to as Nations by early ethnographer George Robinson (see below).

During the winter months, groups would usually be located on their coastal home ranges targeting shellfish and waterfowl resources such as swans and swan eggs. During spring and summer the groups move further west inland, hunting game with targeted burns (Ryan, 2012, pp. 17-19). While some clans in resource rich areas would not always seasonally migrate, but take advantage of local resources all year round, they would however travel as required for ceremonial events in neighbouring clan and nation territory as required (Ryan, 2012).

According to Jones (1974), Tasmanian Aboriginal society pre colonisation consisted of three social units. These generally consisted of the hearth group, the band and the Tribe (Jones 1974; Ryan 2012). The hearth group was described as being the family unit, and consisted of a man, woman, any children, grandparents and aged family or relatives (Plomley 1983). It is believed that this group ranged from between two to eight people (Jones 1974; Plomley 1983).

*There were nine individuals in this family, and clearly they represented a hearth group, because Peron visited their campsite with its single hut. The group comprised an older man and wife, a younger man and wife, and five children, one a daughter (Oure-Oure) of the older man and wife, and the other four the children of the younger man and wife. (Plomley 1983:168).*

The band was considered to be more similar to a 'social unit'. This ranged from a number of hearth groups, that was defined by geographic boundaries (Jones 1974:324-325). Brown (1986:21) further notes that according from ethnographic reference from the period, the band was generally led by an older man who was know for their success as a hunter and fighter. Brown (1986:21) also believes that the band was exogamous, with the wife generally moving to her husband's band and hearth group. Each of these bands were then associated with what could be called a 'political' unit (Jones 1974:328-329):

*...that agglomeration of bands which lived in contiguous regions, spoke the same language or dialect, shared the same cultural traits, usually intermarried, had a similar pattern of seasonal movement, habitually met together for economic and other reasons, the pattern of whose peaceful relations were within the agglomeration and of whose enmities and military adventures were directed outside it. Such a tribe had a territory, consisting of the sum of the land owned by its constituent bands ... The borders of a territory ranged from a sharp well defined line associated with a prominent geographic feature to a broad transition zone.*

Ryan (2012:14) hypothesises that the population of Tasmania was associated with a broad network of nine Tribes, each consisting of six to 15 bands. Ryan (2012:14) estimates that at by the time of European colonisation, the population of each group was around 350 and 800 people, where the overall population of Tasmania is estimated at being 3000-8000 people.

The first European interactions within Tasmania occurred in 1642 when Abel Tasman stayed a short time at anchor near modern day Dunalley, and noted that people inhabited Tasmania, but never saw any of the Tasmanians (Plomley 1983:160). Marion du Fresne was to anchor for four days in Marion Bay on 1-10 March 1772, some one hundred and thirty years later (Plomley 1983:160). He is known to have visited the mainland shore close to the anchorage here, as well as Maria Island. Tobias Furneaux anchored in Adventure Bay from 10-15 March 1773, and later James Cook was there from 26-30 January 1777 and William Bligh on 20 August 1788 (Plomley 1983:160). John Henry Cox anchored in now Cox Bight and Oyster Bay between 3-11 July 1793. William Bligh made a second visit from 9-22 February 1792, and John Hayes was anchored in the Derwent from 26 April to 9 June 1793, however, records of this long visit no longer exist (Plomley 1983:160). George Bass and Matthew Flinders circumnavigated Tasmania between October 1798 and January 1799, where the last European visitation to Tasmania before colonisation at Risdon Cove in 1803 was that of the Baudin Expedition of 1802 (Plomley 1983:160).

Lieutenant John Bowen's occupation at Risdon Cove in 1803, which would have occurred in Moomairremener territory, represents the first permanent European settlement of Tasmania. This location lies in a key route between the Big River Nation's kangaroo hunting grounds to the northwest and rich shellfish grounds of the Oyster Bay Nation such as the study area and Coal River estuary to the west. The Risdon settlement soon encountered travelling bands of Big River and Oyster Bay Nation, with both Europeans and Tasmanian Aboriginal People being initially shocked at the arrival of each other. The initial European reaction was very hostile and soldiers fired upon Big River and Oyster Bay Nation people several times within the first five months of occupation, with the Risdon massacre of a group of Big River Nation people occurring on the 3 May 1804.

From 1807 to 1813, incoming settlers from Norfolk Island began to settle the southeast coast which led to direct confrontation with the Oyster Bay Nation (Ryan, 2012, p. 62). Early European settlement in Tasmania struggled with reliable food supplies and Europeans were often in direct competition with Aboriginal hunters for kangaroo and emu meat. By 1818 the Moomairremener clan had suffered heavily from conflict with Europeans and survivors either moved to other Oyster Bay or Big River clans to continue resistance, or tried to remain on their familiar territories with some reliance on charitable assistance from European settlers. Conflict continued to escalate between 1823 and 1828 before Aboriginal resistance in the 'settled areas' was quashed around 1830 with the surrender of Mannalargenna, a key Oyster Bay chief and resistance fighter (Ryan, 2012). Twenty three Oyster Bay and Big River survivors of the conflict would eventually follow Robinson to Flinders Island.

With the removal of the Tasmanians to Flinders Island by George Augustus Robinson after the ill-fated Black Line military operations in the state, population of the Tasmanian Aboriginal people decreases, and associations with different geographical areas of Tasmania were lost. When the Tasmanian Aboriginal people returned to the mainland to Oyster Cove, many of these survivors were not allowed back into their traditional areas where they were born, or where their family had resided for generations.

Today, coastal sites generally consist of midden sites, however, significant stone quarries, rock art, and former hut depressions and camp site can still be located. These sites show a seasonal exploitation of the coastal areas (Brown 1991; Jones 1977). The recording of bark canoes by early explorers shows that the Tasmanians did have a rich maritime tradition, however, many of these were used to access smaller off shore islands, not the larger islands of Bass Strait, or to the main land of Australia (Jones 1977).

## 2.7 Conclusion

Aboriginal communities in Victoria and Tasmania continue to be present and vibrant, and maintain strong connections to their traditional lands, waters, and their cultures. Each group is distinct and hold different systems of belief, connection, ceremony, language and lore and cultural practice. Each group hold traditional ecological knowledge of plants, animals and land management passed down through generations.

Aboriginal communities continue to practice traditional hunting, fishing, and gathering, and have a deep understanding of the environment around them. They also have a spiritual connection to the land and sea. Aboriginal people and representative bodies in Victoria and Tasmania have become more active in conservation, land and heritage management, working to protect and restore their traditional lands and waters, and to ensure that their cultural heritage is respected and protected.

*Coastal environments in south-eastern Australia are rich in cultural sites. These include archaeological sites, such as shell middens and stone quarries, as well as "natural" sites, such as headlands, river mouths, reefs and islands. These sites have continuing cultural meaning because of their connection with Creation Stories, Dreaming Tracks, ceremonial places, camping places and massacre sites. Many of these places are listed on the Register of the National Estate, others are recorded in State-based heritage registers, while many others are known only to Indigenous people themselves and are not formally recorded...*

*Protecting this cultural heritage is a major concern for Indigenous people. (National Oceans Office 2002:4).*

This Cultural Heritage Desktop Assessment explores the cultural heritage background for the region, provides a summary of available information in order to provide the project with a grounding in the cultural heritage of Aboriginal people in the study area.

## 4 Glossary of Terms

---

The glossary provides definitions of various archaeological and heritage related terms.

**Heritage place:** A place that has aesthetic, historic, scientific or social values for past, present or future generations – ‘...this definition encompasses all cultural places with any potential present or future value as defined above’ (Pearson & Sullivan, 1995, p. 7).

**Aboriginal place:** Aboriginal place is defined under Section 5 of the *Aboriginal Heritage Act* 2006 as follows:

5 What is an Aboriginal place?

- (1) For the purposes of this Act, an Aboriginal place is an area in Victoria or the coastal waters of Victoria that is of cultural heritage significance to the Aboriginal people of Victoria.
- (2) For the purposes of subsection (1), *area* includes any one or more of the following—
  - (a) an area of land;
  - (b) an expanse of water;
  - (c) a natural feature, formation or landscape;
  - (d) an archaeological place, feature or deposit;
  - (e) the area immediately surrounding anything referred to in paragraphs (c) and (d), to the extent that it cannot be separated from the thing without diminishing or destroying the cultural heritage significance attached to the thing by Aboriginal people;
  - (f) land set aside for the purpose of enabling Aboriginal human remains to be re-interred or otherwise deposited on a permanent basis;
  - (g) a building or structure.

**Alluvial terrace:** a platform created from deposits of alluvial material along river banks.

**Angular fragment:** a piece of stone that is blocky or angular, not flake-like.

**Archaeology:** the study of the remains of past human activity.

**Artefact scatter:** a surface scatter of cultural material. Aboriginal artefact scatters are defined as being the occurrence of five or more items of cultural material within an area of about 100 square metres. Artefact scatters are often the only physical remains of places where people have lived camped, prepared and eaten meals and worked.

**Backed piece:** a flake or blade that has been abruptly retouched along one or more margins opposite an acute (sharp) edge. Backed pieces include backed blades and geometric microliths. They are thought to have been hafted onto wooden handles to produce composite cutting tools. Backed pieces are a feature of the ‘Australian small tool tradition’, dating from between 5,000 and 1,000 BP in southern Australia (Holdaway & Stern, 2004).

**Blade:** a flake at least twice as long as it is wide.

**Burial place:** usually a sub-surface pit containing human remains and sometimes associated artefacts.

**Contact place:** see ‘Aboriginal historical archaeological place’.

**Core:** an artefact from which flakes have been detached using a hammerstone. Core types include single platform, multi-platform and bipolar forms.

**Cortex:** original or natural (unflaked) surface of a stone.

**Cortical:** refers to the cortex.

**Flake:** a stone piece removed from a core by percussion (striking it) or pressure. It is identified by the presence of a striking platform and bulb of percussion, not usually found on a naturally shattered stone.

**Flaked piece:** a piece of stone with definite flake surfaces, which cannot be classified as a flake or core.

**Formal tool:** an artefact that has been shaped by flaking, including retouch, or grinding to a predetermined form for use as a tool. Formal tools include scrapers, backed pieces and axes.

**Geocentric Datum of Australia 1994 (GDA94):** a system of latitudes and longitudes, or east and north coordinates, centred at the centre of the earth's mass. GDA94 is compatible with modern positioning techniques such as the Global Positioning System (GPS). It supersedes older coordinate systems (AGD66, AGD84). GDA94 is based on a global framework, the IERS Terrestrial Reference Frame (ITRF), but is fixed to a number of reference points in Australia. GDA94 is the Victorian Government Standard and spatial coordinates for excavations, transects and places in CHMP documents.

**Geometric microlith:** a small tool that has been fashioned from breaking apart a microblade. The piece is then retouched or backed and a small tool formed.

**Grindstones:** upper (handstone) and lower (basal) stones used to grind plants for food and medicine and/or ochre for painting. A handstone sometimes doubles as a hammerstone and/or anvil.

**Hearth:** usually a sub-surface feature found eroding from a river or creek bank or a sand dune - it indicates a place where Aboriginal people cooked food. The remains of a hearth are usually identifiable by the presence of charcoal and sometimes clay balls (like brick fragments) and hearth stones. Remains of burnt bone or shell are sometimes preserved within a hearth.

**Isolated artefact:** the occurrence of less than five items of cultural material within an area of about 100 square metres. It/they can be evidence of a short-lived (or one-off) activity location, the result of an artefact being lost or discarded during travel, or evidence of an artefact scatter that is otherwise obscured by poor ground visibility.

**Manuport:** foreign fragment, chunk or lump of stone that shows no clear signs of flaking but is out of geological context and must have been transported to the place by people.

**Map Grid of Australia (MGA):** The official coordinate projection for use with the Geocentric Datum of Australia 1994 (GDA94).

**Mound:** these places, often appearing as raised areas of darker soil, are found most commonly in the volcanic plains of western Victoria or on higher ground near bodies of water. The majority were probably formed by a slow build-up of debris resulting from earth-oven cooking; although some may have been formed by the collapse of sod or turf structures.

**Percussion:** the act of hitting a core with a hammerstone to strike off flakes.

**Platform preparation:** removal of small flake scars on the dorsal edge of a flake, opposite the bulb of percussion. These overhang removal scars are produced to prevent a platform from shattering.

**Pre-contact:** before contact with non-Aboriginal people.

**Post-contact:** after contact with non-Aboriginal people.

**Quarry (stone/ochre source):** a place where stone or ochre is exposed and has been extracted by Aboriginal people. The rock types most commonly quarried for artefact manufacture in Victoria include silcrete, quartz, quartzite, chert and fine-grained volcanics such as greenstone.

**Rejuvenation flake:** a flake that has been knapped from a core solely for the purpose of preparing a new platform and making it easier to get flakes off a core, as it reduces the angle between platform and core surface.

**Retouch:** a flake, flaked piece or core with intentional secondary flaking along one or more edges.

**Rock art:** 'paintings, engravings and shallow relief work on natural rock surfaces' (Rosenfeld, 1988, p. 1). Paintings were often produced by mineral pigments, such as ochre, combined with clay and usually mixed with water to form a paste or liquid that was applied to an unprepared rock surface. Rock engravings were made by incising, pounding, pecking or chiselling a design into a rock surface. Rare examples of carved trees occasionally survive.

**Rock shelter:** may contain the physical remains of camping places where people prepared meals, flaked stone, etc. They are often classed as a different type of place due to their fixed boundaries and greater likelihood of containing sub-surface deposits. Rock shelters may also contain rock art.

**Scarred tree:** scars on trees may be the result of removal of strips of bark by Aboriginal people e.g. for the manufacture of utensils, canoes or for shelter; or resulting from small notches chopped into the bark to provide hand and toe holds for hunting possums and koalas. Some scars may be the result of non-Aboriginal activity, such as surveyors' marks.

**Scraper:** a flake, flaked piece or core with systematic retouch on one or more margins.

**Shell midden:** a surface scatter and/or deposit comprised mainly of shell, sometimes containing stone artefacts, charcoal, bone and manuports. These place types are normally found in association with coastlines, rivers, creeks and swamps – wherever coastal, riverine or estuarine shellfish resources were accessed and exploited.

**Significance:** the importance of a heritage place or place for aesthetic, historic, scientific or social values for past, present or future generations.

**Striking platform:** the surface of a core, which is struck by a hammerstone to remove flakes.

**Structures (Aboriginal):** can refer to a number of different place types, grouped here only because of their relative rarity and their status as built structures. Most structures tend to be made of locally available rock, such as rock arrangements (ceremonial and domestic), fishtraps, dams and cairns, or of earth, such as mounds or some fishtraps.

**Stratified deposit:** material that has been laid down, over time, in distinguishable layers.

**Transect:** A fixed path along which one records archaeological remains.

**Utilised artefact:** a flake, flaked piece or core that has irregular small flake scarring along one or more margins that does not represent platform preparation.

---

## APPENDIX M CONOCOPHILLIPS' HSE POLICY

---

## HEALTH, SAFETY AND ENVIRONMENT POLICY

### Our Commitment

ConocoPhillips is committed to protecting the health and safety of everybody who plays a part in our operations, lives in the communities in which we operate or uses our products. Wherever we operate, we will conduct our business with respect and care for both the local and global environment and systematically manage risks to drive sustainable business growth. We will not be satisfied until we succeed in eliminating all injuries, occupational illnesses, unsafe practices and incidents of environmental harm from our activities.

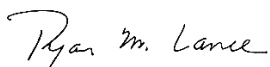

### Our Plan

To meet our commitment, ConocoPhillips will:

- Demonstrate visible and active leadership that engages employees and services providers, and manage health, safety and environmental (HSE) performance as a line responsibility with clear authorities and accountabilities.
- Ensure that all employees and contractors understand that working safely is a condition of employment, and that they are each responsible for their own safety and the safety of those around them.
- Maintain “stop work” policies that establish the responsibility and authority for all employees and contractors to stop work they believe to be unsafe.
- Manage all projects, products and processes through their life cycles in a way that protects safety and health and minimizes impacts on the environment.
- Provide employees with the capabilities, knowledge and resources necessary to instill personal ownership and motivation to achieve HSE excellence.
- Maintain process, procedures and training to prepare for and respond to emergencies.
- Provide relevant safety and health information to contractors and require them to provide proper training for the safe, environmentally sound performance of their work.
- Measure, audit and publicly report HSE performance and maintain open dialogue with stakeholder groups and with communities where we operate.
- Comply with applicable regulations and laws.
- Work with both governments and stakeholders where we operate to develop regulations and standards that improve the safety and health of people and the environment.
- Maintain a secure work environment to protect ourselves, our contractors and the Company’s assets from risks of injury, property loss or damage resulting from hostile acts.
- Communicate our commitment to this policy to our subsidiaries, affiliates, contractors and governments worldwide and seek their support.

### Our Expectations

Through implementation of this policy, ConocoPhillips seeks to earn the public’s trust and to be recognized as the leader in HSE performance.

A handwritten signature in black ink that reads "Ryan M. Lance".

Ryan Lance  
Chairman and Chief Executive Officer  
ConocoPhillips

## 1. Introduction

### 1.1. Purpose

The purpose of this Whale Management Plan (WMP) is to provide the details of the control measure (the WMP) required for Regulation 13(5)(c) of the Offshore Petroleum Greenhouse Gas Storage (Environment) Regulations (Environment Regulations). The WMP details how ConocoPhillips Australia (COPA) will carry out the Otway Exploration Drilling Program (the exploration program) in a manner by which the environmental impacts from underwater sound and the risk of a vessel collision to whales will be reduced to as low as reasonably practicable and be of an acceptable level.

This WMP will ensure that the Environmental Performance Outcomes (EPOs) from the Otway Exploration Drilling Program Environment Plan (EP) relevant to whales will be achieved such that:

- EPO3: No death or injury to listed threatened or migratory species from the activity.
- EPO4: Biologically important behaviours can continue while the activity is being undertaken.
- EPO9: Anthropogenic noise in biologically important areas will be managed such that:
  - Any blue whale continues to utilise the area without injury, and is not displaced from a foraging area.
  - It does not prevent any southern right whale from utilising the area or cause injury (TTS and PTS) and/or disturbance.

### 1.2. Scope

#### 1.2.1. Aspects

This WMP is a control measure to manage impacts from the following aspects as detailed in the Otway Exploration Drilling Program EP:

- Interaction with marine fauna – risk of a vessel collision with a whale.
- Underwater sound emissions – impulsive sound associated with geophysical surveys and vertical seismic profiling.
- Underwater sound emissions – non-impulsive sound associated with vessels, MODU transiting, MODU resupply and drilling.

#### 1.2.2. Timing

This WMP applies at all times when the activities detailed in Section 1.2.3 are being undertaken in Commonwealth waters offshore of Victoria and Tasmania in the Otway Basin.

#### 1.2.3. Activities

The activities covered by this WMP are collectively called the Otway Exploration Drilling Program and include:

- Seabed surveys: geophysical acquisition.
- Exploration drilling: MODU and vessels.
- Vertical seismic profiling (VSP).

### 1.3. Assumptions

Assumptions have been made in creating this Plan. Important assumptions have been listed below to make them explicit to users to assist in interpretation and implementation of the Plan. If an aspect of this Plan is unclear, users should consider these assumptions in determining what action, if any, to take.

- 1) Vessel Captains and the COPA Drilling Supervisor will follow Marine Mammal Observer (MMO) advice to minimise impacts to whales as long as it is safe to do so.

## Otway Exploration Drilling Program Whale Management Plan

---

- 2) Conservatism has been built into how the Activity Action Zone distances have been determined which accounts for detection accuracy, weather conditions, uncertainty in the impact assessment, and whale behaviour.
- 3) The Activity Action Zone distances are based to the furthest distance to the noise criteria from the acoustic modelling for the activity.

If there is a lack of clarity, or residual uncertainty, about the instructions in this WMP users are required to take actions in a manner that manages noise threats to whales, are precautionary, and will ensure impacts and risks are within the defined acceptable levels specified in the Environment Plan.

## 2. Implementation

This section details the accountabilities and responsibilities for the implementation of the WMP and the reporting requirements.

### 2.1. Roles and Responsibilities

Role	Accountability
COPA HSE General Manager	Document Owner – accountable to define the requirements of the business process described by this procedure, ensure appropriate performance metrics are defined and reviewed, track lessons learned, and drive continuous improvement.
COPA Drilling Manager	Accountable for implementation of this procedure.
Role	Responsibilities
COPA Offshore Representative	Maintain open communication with MMOs.
	Communicate the status of the activities (i.e. commencing, underway, or at Safe Point) to MMOs.
	Decide whether actions within the WMP can safely be implemented and take action accordingly.
	Document reasons for not following the WMP Plan, if required.
	Provide input into the review of effectiveness and compliance with the WMP.
MODU/Vessel Masters	Maintain open communication with MMOs.
	Communicate the status of the activities (i.e. commencing, underway, or at Safe Point) to MMOs.
	Decide whether actions within the WMP can safely be implemented and take action accordingly.
	Document reasons for not following the WMP, if required.
	Provide input into the review of effectiveness and compliance with the WMP.
Marine Mammal Observers (MMOs)	Coordinate the training and implementation of the WMP offshore.
	Undertake observations and reporting in accordance with the WMP.
	Provide advice to the COPA Drilling Supervisor and Vessel Master (or delegate) on the requirements of the WMP.
	Provide input into the review of effectiveness and compliance with the WMP.
COPA Environmental Compliance Officer	Ensure the requirements for the implementation of the WMP are in place prior to the commencement of the activities the WMP is applicable to.
	Document the review undertaken to determine that the requirements for the implementation of the WMP are in place prior to the commencement of the activities the WMP is applicable to.
	Ensure the activity-specific environmental induction provides an overview of the WMP.
	Review the MMO daily report to ensure detection and actions meet the requirements of the WMP.
	Coordinate and document the review of effectiveness and compliance with the WMP. The review will be undertaken within one week of activity commencement and thereafter every four weeks while the activity is being undertaken.
All vessel and MODU crew	Undertake activity-specific environmental induction that provides an overview of the WMP.
	Communicate whale sighting to MMOs immediately.

# Otway Exploration Drilling Program Whale Management Plan

## 2.2. Records and Reporting

Records and Reporting Requirement	Responsible	Reported to	Description
Pre-activity WMP implementation review	COPA Environmental Compliance Officer	COPA Drilling Manager	Documentation and records of evidence to show that the WMP implementation requirements are in place prior to the commencement of the activities.
Vessel and MODU crew environmental induction records	Vessel Master COPA Drilling Supervisor	COPA Environmental Compliance Officer	Environmental Induction Training records.
MMO qualifications	COPA Drilling Manager	COPA Environmental Compliance Officer	MMO resume Training certificates
Communication of this Plan to MMOs, Drilling Superintendent, Drilling Supervisor and Vessel Captains.	COPA Drilling Manager	COPA Environmental Compliance Officer	Signed record that roles responsible for implementation and actions in this plan have read and understand.
Daily MMO Reports included in Activity Daily Report.	MMO	COPA Drilling Manager COPA Offshore Representative MMO/Vessel Captain COPA Environmental Compliance Officer	Report detailing marine mammal sightings, actions taken as per the WMP, and reasons actions not taken.
Review of effectiveness and compliance with the WMP	COPA Environmental Compliance Officer	COPA Drilling Manager COPA Offshore Representative Vessel Captain MMOs	Documentation and any actions from the review of effectiveness and compliance with the WMP.
End of Well / End of Program MMO Report	MMO	COPA Drilling Manager COPA Environmental Compliance Officer	Report detailing marine mammal sightings, actions taken as per the WMP, and reasons actions not taken.  COPA Environmental Compliance Officer to forward report on to relevant persons who requested access to this information (Implementation Strategy).
Record of marine mammal sightings	MMO	COPA Environmental Compliance	Spreadsheet including all applicable attributes requested by the DCCEEW Australian Marine Mammal Centre Division.  COPA Environmental Compliance Officer to forward to DCCEEW Australian Marine Mammal Centre Division.

## 3. Detection of Whales

### 3.1. Detection Methods

In the context of the Otway Exploration Drilling Program, it is acknowledged that there are inherent challenges in detecting whales. Whales, with their vast range of species, behaviours, and habitats, require a multifaceted approach to detection. No single method can guarantee the detection of all whales, but by combining several complementary techniques across various platforms, it maximises the likelihood of accurate and early detection.

#### 3.1.1. Vessel Marine Mammal Observers

The primary method for whale detection involves applying the expertise of MMOs stationed on support vessels. MMOs conduct their observations using binoculars and the unaided eye, primarily from the bridge of the survey vessel or, ideally, from an elevated vantage point. These observations constitute the cornerstone of the detection efforts, providing real-time data crucial for decision-making.

MMOs play a pivotal role in both the observations themselves and applying the decision-making process to adaptively manage interactions with whales. The vessel MMO is a dedicated position with experience in whale observation, distance estimation, and reporting. MMOs are the primary source of real-time data, providing critical insights into the presence and behaviour of whales. The MMO serve as educators, imparting their knowledge and skills to facility crew members who serve as Officers of the Watch to provide additional support to ensure a continuous and thorough watch on the marine environment.

Where activities span more than five consecutive days at sea with over twelve hours of daylight, an additional dedicated MMO, experienced in whale observation and distance estimation, to ensure the ongoing integrity of observations during periods of longer days.

#### 3.1.2. Aerial Surveys

Complementing vessel-based observations, aerial surveys are another component of COPA's multifaceted approach for detecting whales and may be used where observation of the Activity Action Zone cannot be undertaken.

Experienced operators, with a proven track record of conducting aerial surveys for pygmy blue whales and southern right whales in the waters offshore of Victoria and Tasmania, oversee these aerial surveys. Their expertise and knowledge of local whale populations is instrumental in supporting detection efforts. Aerial surveys extend over the Activity Action Zones, as detailed in Sections 4 to 7, and encompass a boundary extending beyond these zones. This proactive approach ensures that any whales approaching the Activity Action Zones during ongoing activities are promptly identified. Aerial surveys offer a unique vantage point and the capacity to cover larger areas, making them an invaluable tool in our whale detection strategy.

#### 3.1.3. Acoustic Detection

ConocoPhillips Australia's whale detection strategy includes the integration of acoustic detection systems, recognising the dynamic nature of whale behaviour and the crucial factor that whales must vocalise to be detected. Prior to deploying acoustic detection systems, they are subjected to rigorous testing to validate their reliability. These tests are specifically designed to confirm the systems' capability to detect whales, including those emitting low-frequency calls. However, it's imperative to acknowledge that the detection of marine mammals through acoustic means is contingent upon their vocalisation.

The underwater area is not a constant symphony of whale songs, and the likelihood of vocalisation can vary. Whales are known to communicate using a diverse range of vocalisations, from intricate songs to simpler clicks and whistles, depending on their species and circumstances. Therefore, the effectiveness of our acoustic detection methods can be influenced by factors such as species presence, behaviour, and environmental conditions that may affect vocalization patterns.

This variability underscores the importance of our multifaceted approach to whale detection. While acoustic detection adds a valuable dimension to detection capabilities, it is inherently dependent on whales vocalising. Consequently, the use of multiple detection methods, including visual and aerial observations, enhances overall confidence in detecting whales, both above and below the water surface, regardless of their vocalisation patterns.

## **3.2. Detection Area**

The effectiveness of detection efforts relies on the extent of the detection area. The designated detection area aims to be as extensive as practically feasible, encompassing, at a minimum, the Activity Action Zone delineated in each activity section. However, this area will be broadened whenever possible to ensure comprehensive coverage.

## **3.3. A Balanced Approach**

The detection of whales for the Otway Exploration Drilling Program requires a comprehensive and balanced approach. ConocoPhillips Australia recognise the complexities and uncertainties inherent in this task and acknowledge that no single detection method is perfect. Therefore, we strategically leverage the strengths of multiple alternative methods to enhance our confidence in our detection capabilities.

This multifaceted strategy not only underscores our unwavering commitment to marine mammal conservation but also serves as an assurance of the thoroughness and responsibility of our survey operations. Through these collective efforts, we aim to harmonise the objectives of scientific research and environmental stewardship in our exploration endeavours, while being mindful of the challenges posed by whales that may not always be visible at the surface.

## 4. Whale Management Actions – Vessel Whale Interaction

This section details the procedure and actions that will be implemented by vessels to ensure interaction between vessels and whales, which may result in injury to the whale, does not occur.

Figure 4-1 provides the actions to be implemented.

### 4.1. Activity Action Zone

The Activity Action Zone is the area where action is required to be taken to meet the EPOs in Section 1.1. For interactions between vessels and whales, the Activity Action Zone is detailed in Table 4-1.

**Table 4-1: Vessel Activity Action Zone**

Activity/ Source	Action Zone Distance
Vessel movements	500 m
Justification for Action Zone Distance	
All vessels at all times must comply with the Environment Protection and Biodiversity Conservation Regulations 2000 Part 8: Vessel and Operating Procedures, which stipulates a 300 m caution zone for whales. ConocoPhillips Australia, as detailed in CM02: Vessel and Operating Procedures, has increased the whale caution zone to 500 m for activities under this WMP.	

### 4.2. Relevant Whale Species

This procedure applies to all whale species.

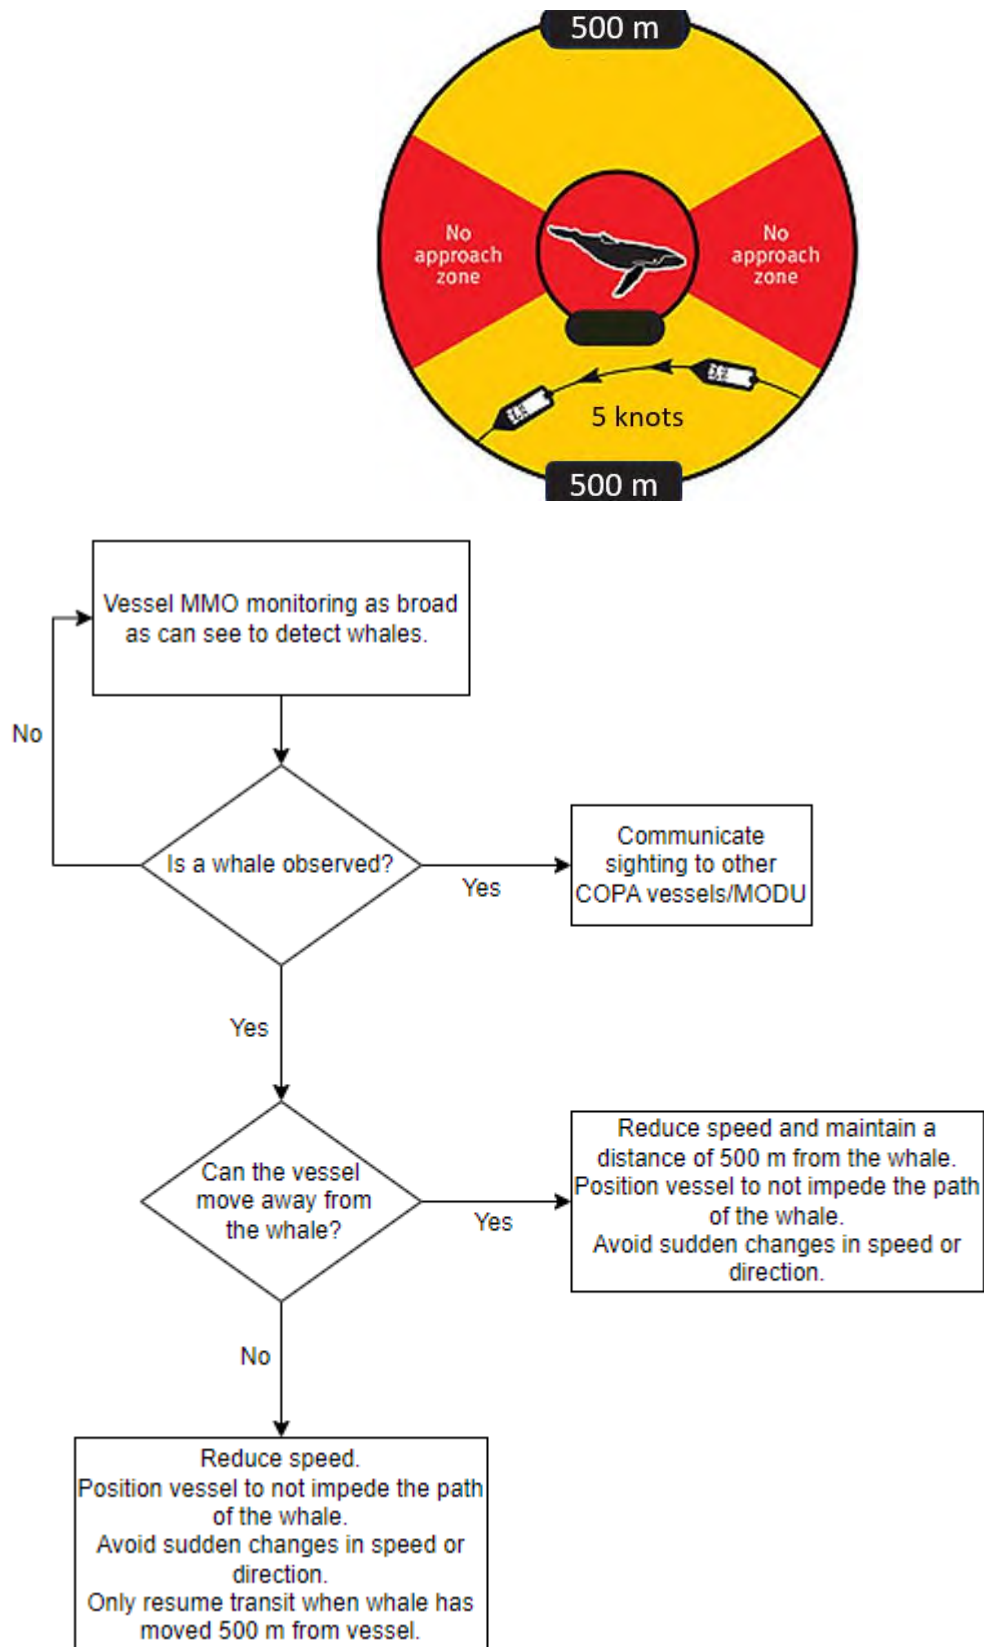

Figure 4-1: Whale Management Actions – Vessel Whale Interaction

## 5. Whale Management Actions – Geophysical Survey

This section details the procedure and actions that will be implemented by vessels when undertaking a geophysical survey. Figure 5-1 provides the actions to be implemented.

Explanatory notes are detailed in the following sections.

### 5.1. Activity Action Zone

The Activity Action Zone is the area where action is required to be taken to meet the EPOs in Section 1.1. For geophysical surveys the Activity Action Zone is detailed in Table 5-1

**Table 5-1: Geophysical Activity Action Zone**

Activity/ Source	Action Zone Distance	PTS 24 hr	TTS 24 hr	Behavioural Response
Geophysical survey	500 m	Not reached	20 m	130 m
<b>Justification for Action Zone Distance</b>				
Based on the acoustic modelling for the sub-bottom profiler the furthest distance to each noise effect criteria for whales are used. The furthest distance is 130 m. However, CM02: Vessel and Operating Procedures detail that vessel will implement a caution zone of 500 m between whale and vessels. As the geophysical vessel is manoeuvrable, even when the geophysical equipment is in the water, the 500 m caution zone will be applied to geophysical surveys.				

### 5.2. Relevant Whale Species

This procedure applies to all whale species.

### 5.3. Pre-Activity Whale Detection Survey

The geophysical survey can commence if no whales are detected within or are likely to enter the Activity Action Zone, based MMO direct observation of the Activity Action Zone within 30 min preceding the activity commencement.

30 minutes is sufficient time for the vessel and/or whale to have moved 500 m away and to account for whales such as blue whales that are capable of diving for periods up to 30 mins (see Appendix 1 for data).

### 5.4. During Acquisition

As the geophysical vessel is manoeuvrable, even when the geophysical equipment is in the water, the vessel will implement a caution zone of 500 m from all whales.

### 5.5. Night-time Start Arrangements

Geophysical surveys cannot commence at night if:

- $\geq 3$  whales have been observed within the Activity Action Zone within the preceding daylight hours with one of the observations within the hour before darkness.

Three whales within the preceding daylight hours is seen as an indicator that whales may be migrating or foraging in the area and therefore could be present in the Activity Action Zone at night.

# Otway Exploration Drilling Program Whale Management Plan

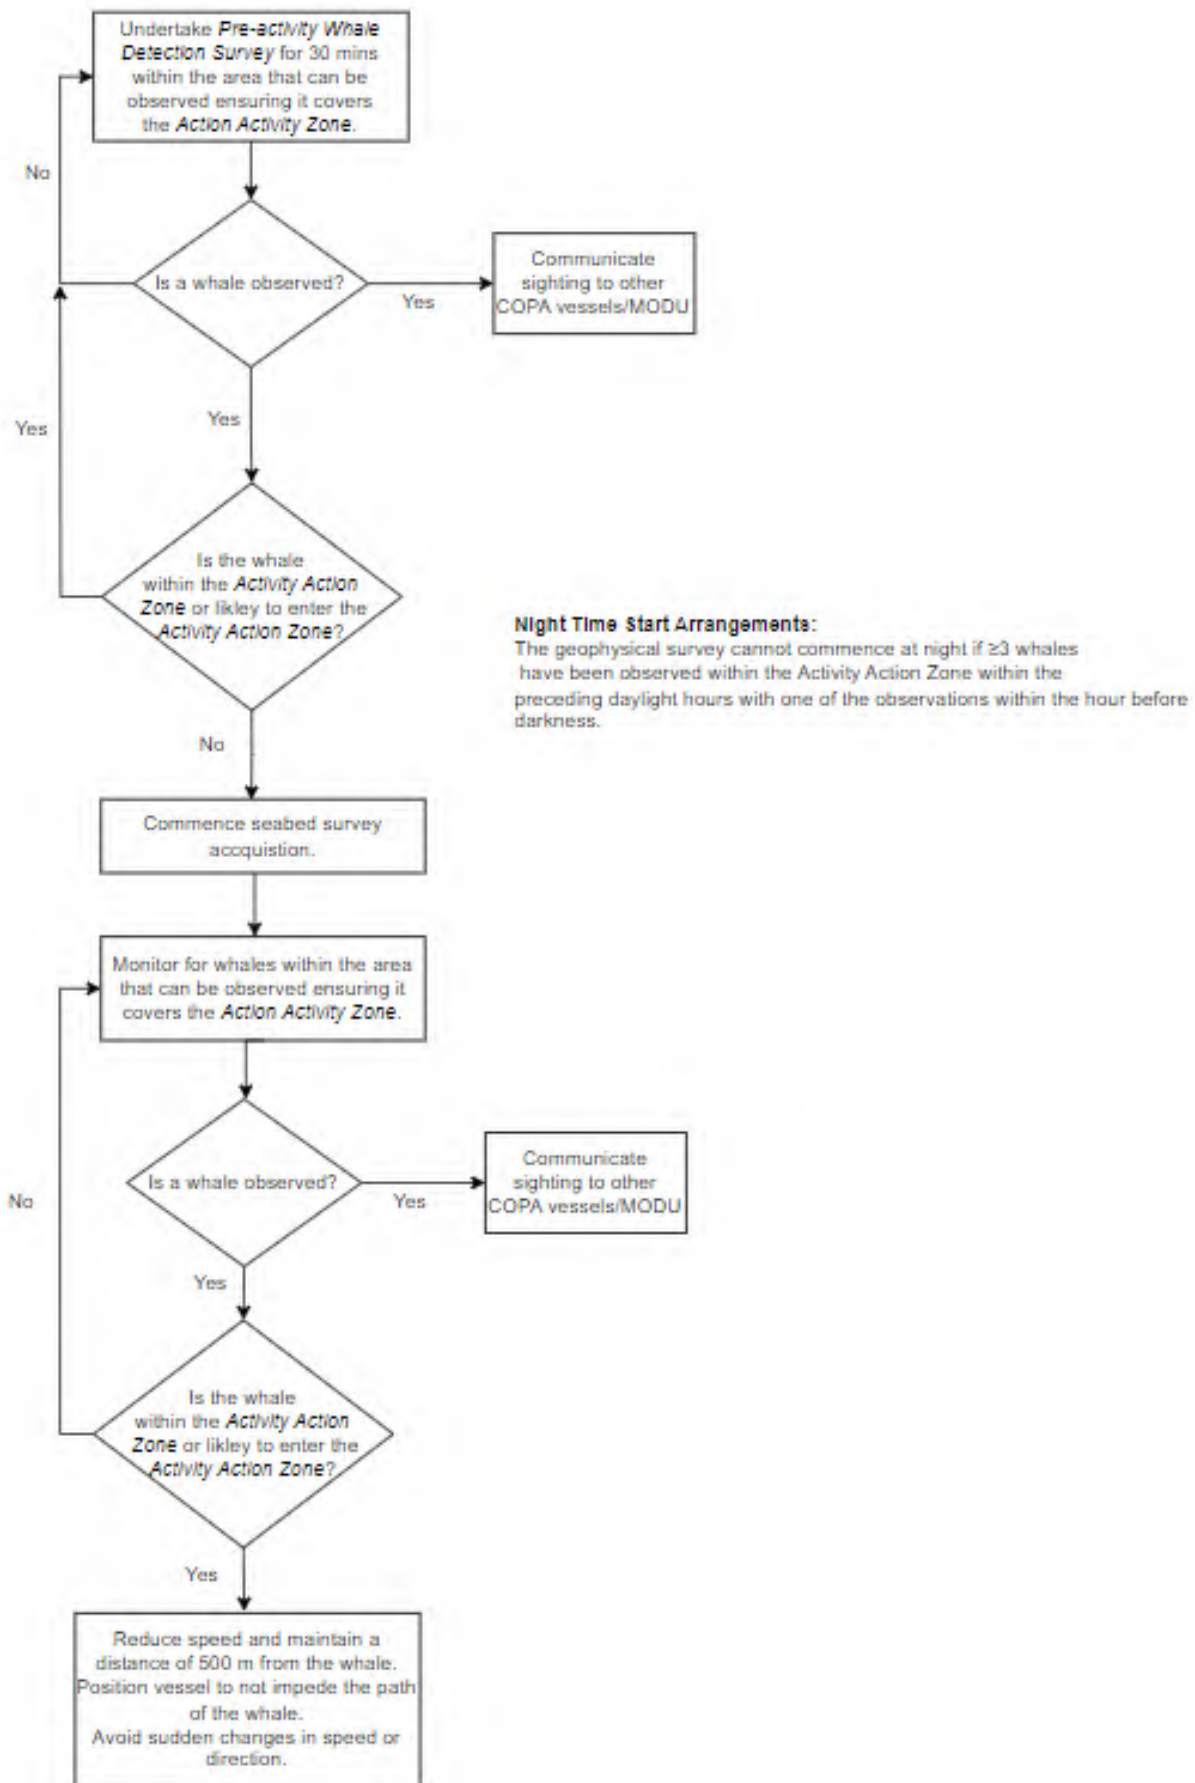

Figure 5-1: Whale Management Actions – Geophysical Survey

## 6. Whale Management Actions – VSP

This section details the procedure and actions that will be implemented on the MODU for VSP activities. Figure 4-1 provides the actions to be implemented.

Explanatory notes are detailed in the following sections.

### 6.1. Activity Action Zone

The Activity Action Zone is the area where action is required to be taken to meet the EPOs in Section 1.1. For VSP the Activity Action Zone is detailed in Table 6-1.

**Table 6-1: VSP Activity Action Zone**

Activity/ Source	Action Zone Distance	PTS 24 hr	TTS 24 hr	Behavioural Response
Vertical Seismic Profiling (VSP)	1.5 km all other whales April to end of October: 6.5 km SRW cow-calf pair	330 m	1.5 km	1.5 km all other whales 6.48 km SRW cow-calf pair
Justification for Action Zone Distance				
Based on acoustic modelling for VSP, the furthest distance to each noise effect criteria for whales are used. ConocoPhillips Australia has applied a precautionary approach for SRW cow calf pairs applying a lower noise effect criteria hence the greater distance.				

### 6.2. Relevant Whale Species

During April to the end of October it is likely that pregnant SRWs are moving through the migration BIA to the coastal reproduction BIA and SRW cow-calf pairs are moving from the reproduction BIA. Thus, during this period detections for whales will be undertaken in the larger 6.5 km Activity Action Zone but actions will only be implemented for SRWs, or whales that cannot be confirm not to be SRWs, within the 6.5 km Activity Action Zone. For all other whales actions will be applied within the 1.5 km Activity Action Zone.

It is possible that SRWs may occur within the Otway area early than April or later than October, and how this will be managed is detailed in Section 6.7 Adaptive Management.

### 6.3. Pre-Activity Whale Detection Survey

VSP can commence if no whales are detected within or likely to enter the applicable Activity Action Zone within 30 min preceding the activity commencement.

30 min is sufficient time for the MMO to undertake observations from a vessel of the applicable Activity Action Zone and to account for whales such as blue whales that are capable of diving for periods up to 30 mins (see Appendix 1 for data).

### 6.4. Soft Start

For VSP, a soft start will be implemented after the Pre-Activity Detection Survey has confirmed that no whales are present within the VSP Activity Action Zone. The VSP soft start will be undertaken by gradually bringing on each acoustic source over a 30 min period. If a whale enters the VSP Activity Action Zone, that will constantly be monitored by a MMO on a vessel, the acoustic source will be shut down and the soft start will only resume after the whale has been detected to move outside the VSP Activity Action Zone, or when 30 min has lapsed since the last whale sighting.

## 6.5. Shutdown

If a whale is sighted within or is likely to enter the VSP Activity Action Zone, the VSP source will be shut down.

Power-up of the VSP source with soft-start procedures will only occur after the whale has been observed to move outside the VSP Activity Action Zone Low power zone, or when 30 minutes have lapsed since the last whale sighting.

## 6.6. Night-time / Low Visibility Arrangements

VSP can continue at night or low visibility conditions:

- providing there have not been 3 or more whales detected within the VSP Activity Action Zone during the preceding 24-hour period.

Three whales within the preceding daylight hours is seen as an indicator that whales may be migrating or foraging in the area and therefore could be present in the Activity Action Zone at night.

## 6.7. Adaptive Management

It is possible that SRWs may occur within the Otway area early than April or later than October. As drilling will be undertaken prior to VSP occurring, if SRWs have been observed 1 week prior to VSP operations outside of the April to end of October period, the actions within this section will be implemented within the 6.5 km Activity Action Zone.

# Otway Exploration Drilling Program Whale Management Plan

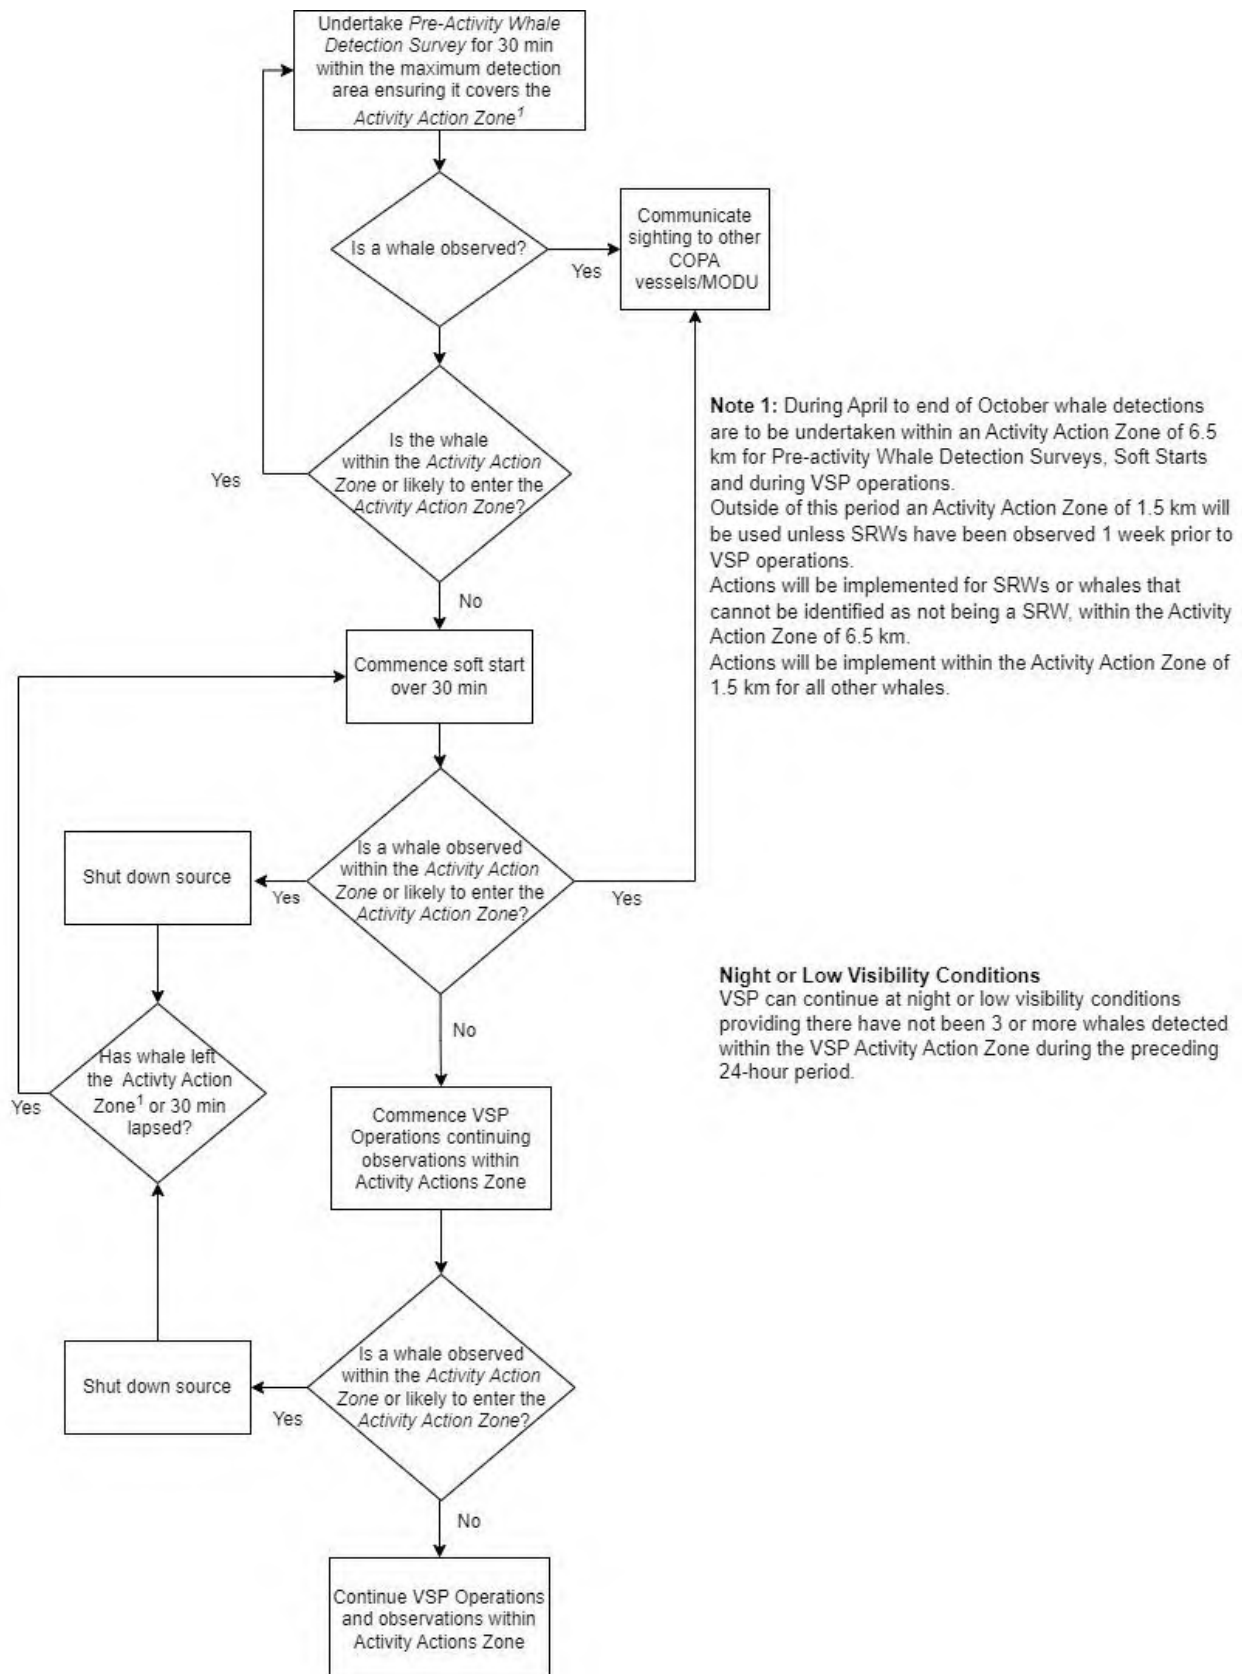

Figure 6-1: Whale Management Actions – VSP

## 7. Whale Management Actions – Drilling

This section details the procedure and actions that will be implemented when drilling. Figure 7-2 provides the actions to be implemented.

Explanatory notes are detailed in the following sections with actions to be undertaken for each activity detailed in Table 7-2 to Table 7-5.

### 7.1. Activity Action Zone

The Activity Action Zone is the area where action is required to be taken to meet the EPOs in Section 1.1. These zones are different for different drilling activities and different drilling locations and are based on the furthest distance to the cetacean behaviour, TTS or PTS noise criteria from acoustic modelling, as presented in Table 7-1.

The acoustic modelling showed a dramatic distance in distances to the cetacean noise criteria for the shelf edge location as noise travels down the shelf to the deepwater. Figure 7-1 shows the location of the shelf edge for the implementation of the Drilling Activity Action Zone in Table 7-1.

Due to the nature of the drilling activities, the activities cannot be immediately stopped as this would create a safety risk, thus this procedure identifies 'safe points' where an activity can be stopped, and action taken to reduced noise levels. Table 7-1 details the safe points for each activity. Table 7-2 to Table 7-5 detail the actions to be taken for each activity.

**Table 7-1: Drilling Activity Action Zone**

Activity/ Source	Action Zone Distance	PTS 24 hr	TTS 24 hr	Behavioural Response	Safe Point
Anchor prelay	1.5 km	150 m	690 m	1.39 km	Anchor deployed
MODU mooring	13 km	320 m	3.6 km	12.2 km	MODU securely anchored.
Drilling with vessel on standby	2.5 km	30 m	460 m	2.44 km	Next positive test of well integrity (e.g., after cementing each casing)
MODU resupply: <ul style="list-style-type: none"> <li>On shelf all directions</li> <li>On shelf edge onshore direction</li> </ul>	13 km	200 m	1.93 km	12.6 km	Resupply complete
MODU resupply: <ul style="list-style-type: none"> <li>On shelf edge offshore direction</li> </ul>	23 km	200 m	1.93 km	22.8 km	Resupply complete
<b>Justification for Action Zone Distance</b>					
Based on the acoustic modelling for the drilling activities the furthest distance to each noise effect criteria for whales are used.

## 7.2. Relevant Whale Species

This procedure applies to PBW and SRWs only. The impact assessment for underwater sound from continuous noise associated with drilling activities determined that the activity could be carried out in a manner by which the impacts to whales, with the exception of PBWs and SRWs, will be of an acceptable level.

As the drilling activities will be undertaken within the PBW and SRW biologically important areas this WMP procedure for drilling was identified as a control measure to ensure that the activity could be carried out in a manner by which the impacts to PBWs and SRWs will be of an acceptable level.

As PBWs and SRWs can be hard to distinguish from other baleen whales the following will apply.

A PBW or SRW is a whale that:

- Is confirmed to be a PBW or SRW; or
- Is not confirmed to be another species.

## 7.3. Pre-Activity Detection Survey

Drilling activities can commence if no whales are detected within or likely to enter the applicable Activity Action Zone within 30 min preceding the activity commencement.

30 min is sufficient time for the MMO to undertake observations from a vessel of the applicable Activity Action Zone and to account for whales such as blue whales that are capable of diving for periods up to 30 mins (see Appendix 1 for data).

## 7.4. Night-time Start Arrangements

Drilling activities cannot commence at night if:

- $\geq 3$  whales have been observed within the Activity Action Zone within the preceding daylight hours with one of the observations within the hour before darkness.

Three whales within the preceding daylight hours is seen as an indicator that whales may be migrating or foraging in the area and therefore could be present in the Drilling Activity Action Zone at night.

## 7.5. Adaptive Management

A risk review will be undertaken if there are 3 consecutive days of BWs or SRWs sited within the Drilling Activity Action Zone.

The risk review will be documented and will consider at a minimum:

- Increased duration of Pre-Activity Detection Surveys.
- Increased no night-time activity trigger.
- If the MODU can relocate to a well location where less or no whales have been detected. This may need to be informed by vessel or aerial surveys.
- If vessel or aerial surveys are required to detect whales.

The Drilling Activity Action Zone is an appropriate trigger as it is the only drilling activity that will be undertaken over a 3-day period and hence where MMOs will be continuously observing.

Activity/ Source	Pre-Activity Actions and Start Criteria	Safe Point
MODU resupply	<p>Prior to commencing MODU resupply a Pre-Activity Detection Survey<sup>1</sup> will be undertaken as per Section 7.3.</p> <p>MODU resupply can commence and proceed to the Safe Point when absence of BW and SRW in Activity Action Zone is confirmed<sup>2</sup>.</p> <p>MODU resupply can commence if whale detection cannot be undertaken of the Activity Action Zone, such as at night or low visibility conditions, if:</p> <ul style="list-style-type: none"> <li>- ≥3 BW/SRW have been observed within the Activity Action Zone within the preceding daylight hours with one of the observations within the hour before darkness.</li> </ul>	Resupply complete.
<b>Actions During Activity</b>		
<p>Monitoring of the Activity Action Zone will continue while the activity is being undertaken.</p> <p>If BW/SRW are detected within the Activity Action Zone during MODU resupply the vessel will do the following if safe to do so:</p> <ul style="list-style-type: none"> <li>- Reduce thrusters.</li> <li>- Cease resupply and move away from the whale maintaining a distance of 500 m from the whales as detailed in Section 4 (Vessel Whale Interaction).</li> </ul>		
<b>Notes</b>		
<p><sup>1</sup>: Detection may be via aircraft, vessel or acoustics, or a combination of these.</p> <p><sup>2</sup>: Absence of BW and SRW means:</p> <ul style="list-style-type: none"> <li>- No BW/SRW observed for 30 min within the Activity Action Zone.</li> <li>- BW/SRW observed leaving the Activity Action Zone.</li> </ul>		

## Appendix A: Blue Whale Diving Summary

Diving behaviour of blue whales associated with feeding at depth was observed by Gill and Morrice (2003) in the Otway region, who note that blue whales dived steeply, submerging for 1 – 4 minutes, then returned to the surface. Tagging of a pygmy blue whale at the Perth Canyon identified 1677 dives over the tag duration (7.6 days) (Owen et al. 2016). The duration of dives was:

- Feeding - mean of 7.6 minutes, maximum of 17.5 minutes.
- Migratory – mean of 5.2 minutes, maximum of 26.7 minutes.
- Exploratory – mean of 8.6 minutes, maximum of 22.05 minutes.

Tagging of 13 pygmy blue whales (five of which had tags that monitored dive depth and duration) in the Bonney upwelling identified (Möller et al. 2020):

- Whales predominantly carried out area-restricted search (presumably foraging) with generally shallow and short dives. However, dives were generally deeper at night compared to during the day.
- Whales performed mostly square shaped dives that were shallow in depth and short in duration.
- Dives recorded to a maximum of 492 m (mean = 59.5 m  $\pm$  94.3), and for a maximum duration of 112 minutes (mean = 6.1 minutes  $\pm$  5.2).

Although the maximum recorded dive time was 112 minutes, the mean dive time of 6.1 minutes  $\pm$  5.2 provides confidence that the typical dive time is less than 30 minutes (Möller et al. 2020). Tagging of eight blue whales off California (Irvine et al. 2019) identified that dive durations were as long as 30.7 minutes, and no feeding lunges were recorded during dives > 20 minutes in duration.
