## **4 Description of the Environment 66**

|       |   |     |
|-------|---|-----|
| 4.1   | Overview  | 66  |
| 4.2   | Determination of the Environment that May Be Affected                           | 66  |
| 4.3   | Relevant Environmental Values and Sensitivities                                 | 69  |
| 4.3.1 | Bioregions  | 69  |
| 4.3.2 | Matters of National Environmental Significance                                  | 69  |
| 4.4   | Stybarrow Field Environmental Surveys   | 70  |
| 4.5   | Biological Environment  | 70  |
| 4.5.1 | Sediments   | 71  |
| 4.5.2 | Benthic Habitats and Infauna  | 71  |
| 4.5.3 | Water Quality   | 72  |
| 4.6   | Protected or Significant Areas  | 74  |
| 4.6.1 | Key Ecological Features   | 74  |
| 4.6.2 | World Heritage Properties   | 76  |
| 4.6.3 | National Heritage Properties  | 76  |
| 4.6.4 | Wetlands of International Importance  | 76  |
| 4.6.5 | Marine Protected Areas  | 76  |
| 4.7   | Marine Fauna  | 80  |
| 4.7.1 | Threatened and Migratory Species  | 80  |
| 4.7.2 | Biologically Important Areas and Habitat Critical for the Survival of a Species | 88  |
| 4.7.3 | Species Recovery Plans, Conservation Advice and Threat Abatement Plans          | 99  |
| 4.8   | Socio-economic Environment  | 106 |
| 4.8.1 | Cultural Values and Heritage  | 106 |
| 4.8.2 | Commercial Fisheries  | 119 |
| 4.8.3 | Traditional Fisheries   | 127 |
| 4.8.4 | Tourism and Recreation  | 127 |
| 4.8.5 | Oil and Gas Activities  | 127 |
| 4.8.6 | Commercial Shipping   | 127 |
| 4.8.7 | Defence   | 127 |

## **5 Consultation 131**

|     |                                |     |
|-----|--------------------------------|-----|
| 5.1 | Summary                        | 131 |
| 5.2 | Consultation – General Context | 132 |

|          |   |            |
|----------|---|------------|
| 5.3      | Identification of Relevant Persons for Consultation   | 136        |
| 5.3.1    | Regulations 11A(1)(a), (b) and (c)  | 136        |
| 5.3.2    | Regulation 11A(1)(d)  | 136        |
| 5.3.3    | Regulation 11A(1)(e)  | 137        |
| 5.3.4    | Persons or organisations Woodside chooses to contact  | 137        |
| 5.4      | Consultation Material and Timing  | 137        |
| 5.4.1    | Sufficient information  | 138        |
| 5.4.2    | Reasonable Period for Consultation  | 140        |
| 5.4.3    | Discharge of Regulation 11A   | 141        |
| 5.5      | Context of Consultation Approach with First Nations   | 142        |
| 5.5.1    | Approach to Methodology – Woodside's Interpretation of Tipakalippa  | 142        |
| 5.5.2    | Consultation Method   | 143        |
| 5.6      | Providing Feedback and Assessment of Merit of Objections or Claims  | 146        |
| 5.7      | Ongoing Consultation  | 146        |
| 5.8      | Woodside's Methodology to Identify Relevant Persons   | 147        |
| 5.8.1    | Identification of relevant persons under Regulation 11A(1)(a), (b) and (c)                                | 147        |
| 5.8.2    | Identification of Relevant Persons under Regulation 11A(1)(d)   | 147        |
| 5.8.3    | Identification of relevant persons under subregulation 11A(1)(e)  | 153        |
| 5.8.4    | Assessment of Relevant Persons for the Proposed Activity  | 153        |
| 5.9      | Consultation Activities and Additional Engagement for the Stybarrow Plug and Abandonment Environment Plan | 193        |
| 5.9.1    | Community Information Sessions  | 193        |
| 5.9.2    | Traditional Custodian Specific Consultation   | 196        |
| <hr/>    |   |            |
| <b>6</b> | <b>Environmental Risk Management Framework</b>  | <b>197</b> |
| 6.1      | Evaluation of Impacts and Risks   | 197        |
| 6.1.1    | Decision Context  | 199        |
| 6.1.2    | Environmental Impact Analysis   | 200        |
| 6.1.3    | Planned Activity Assessment   | 200        |
| 6.1.4    | Unplanned Event Risk Assessment   | 200        |
| 6.2      | Demonstration of ALARP  | 201        |
| 6.2.1    | Planned Activity and Unplanned Event ALARP Evaluation   | 201        |
| 6.2.2    | Spill Response Strategy Effectiveness and ALARP   | 202        |
| 6.3      | Demonstration of Acceptability  | 204        |
| 6.4      | Environmental Performance Outcomes, Performance Standards and Measurement Criteria                        | 205        |
| 6.4.1    | Environmental Performance Outcomes  | 205        |
| 6.4.2    | Environmental Performance Standards   | 205        |
| 6.4.3    | Environmental Measurement Criteria  | 205        |
| <hr/>    |   |            |
| <b>7</b> | <b>Environmental Impact Assessment and Evaluation - Planned Activities</b>                                | <b>207</b> |
| 7.1      | Physical Presence – Interaction with Other Marine Users   | 210        |
| 7.1.1    | Summary of Risk Assessment and Evaluation   | 210        |
| 7.1.2    | Source of Hazard  | 210        |
| 7.1.3    | Environmental Impact Assessment   | 211        |
| 7.1.4    | Demonstration of ALARP  | 212        |

## Woodside | Stybarrow Plug and Abandonment Environment Plan

|       |   |     |
|-------|---|-----|
| 7.1.5 | Demonstration of Acceptability  | 215 |
| 7.1.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 217 |
| 7.2   | Light Emissions   | 219 |
| 7.2.1 | Summary of Risk Assessment and Evaluation   | 219 |
| 7.2.2 | Source of Hazard  | 219 |
| 7.2.3 | Environmental Impact Assessment   | 220 |
| 7.2.4 | Demonstration of ALARP  | 225 |
| 7.2.5 | ALARP Summary   | 227 |
| 7.2.6 | Demonstration of Acceptability  | 227 |
| 7.2.7 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 229 |
| 7.3   | Noise Emissions   | 230 |
| 7.3.1 | Summary of Risk Assessment and Evaluation   | 230 |
| 7.3.2 | Source of Hazard  | 230 |
| 7.3.3 | Environmental Impact Assessment   | 233 |
| 7.3.4 | Demonstration of ALARP  | 241 |
| 7.3.5 | Demonstration of Acceptability  | 246 |
| 7.3.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 248 |
| 7.4   | Atmospheric Emissions   | 251 |
| 7.4.1 | Summary of Risk Assessment and Evaluation   | 251 |
| 7.4.2 | Source of Hazard  | 251 |
| 7.4.3 | Environmental Impact Assessment   | 253 |
| 7.4.4 | Demonstration of ALARP  | 253 |
| 7.4.5 | Demonstration of Acceptability  | 255 |
| 7.4.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 257 |
| 7.5   | MODU and Vessel Discharges  | 259 |
| 7.5.1 | Summary of Risk Assessment and Evaluation   | 259 |
| 7.5.2 | Source of Hazard  | 259 |
| 7.5.3 | Environmental Impact Assessment   | 260 |
| 7.5.4 | Demonstration of ALARP  | 262 |
| 7.5.5 | Demonstration of Acceptability  | 264 |
| 7.5.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 266 |
| 7.6   | Plug and Abandonment Discharges   | 268 |
| 7.6.1 | Summary of Risk Assessment and Evaluation   | 268 |
| 7.6.2 | Source of Hazard  | 268 |
| 7.6.3 | Environmental Impact Assessment   | 274 |
| 7.6.4 | Demonstration of ALARP  | 277 |
| 7.6.5 | Demonstration of Acceptability  | 280 |
| 7.6.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 282 |
| 7.7   | Solid Waste Generation  | 284 |
| 7.7.1 | Summary of Risk Assessment and Evaluation   | 284 |
| 7.7.2 | Source of Hazard  | 284 |
| 7.7.3 | Environmental Impact Assessment   | 285 |
| 7.7.4 | Demonstration of ALARP  | 286 |
| 7.7.5 | Demonstration of Acceptability  | 287 |

|          |   |            |
|----------|---|------------|
| 7.7.6    | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 288        |
| 7.8      | Seabed Disturbance  | 290        |
| 7.8.1    | Summary of Risk Assessment and Evaluation   | 290        |
| 7.8.2    | Source of Hazard  | 290        |
| 7.8.3    | Environmental Impact Assessment   | 292        |
| 7.8.4    | Demonstration of ALARP  | 293        |
| 7.8.5    | Demonstration of Acceptability  | 295        |
| 7.8.6    | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 296        |
| <hr/>    |   |            |
| <b>8</b> | <b>Environmental Risk Assessment and Evaluation: Unplanned Events</b>             | <b>297</b> |
| 8.1      | Quantitative Spill Risk Assessment Methodology                                    | 299        |
| 8.1.1    | Worst-case Hydrocarbon Spill Scenarios  | 299        |
| 8.1.2    | Hydrocarbon Properties  | 300        |
| 8.1.3    | Hydrocarbon Exposure Values   | 301        |
| 8.1.4    | Scientific Monitoring   | 303        |
| 8.2      | Hydrocarbon Release from a Loss of Well Control                                   | 304        |
| 8.2.1    | Summary of Risk Assessment and Evaluation   | 304        |
| 8.2.2    | Source of Hazard  | 304        |
| 8.2.3    | Stochastic Oil Spill Modelling Results  | 305        |
| 8.2.4    | Environmental Impact Assessment   | 315        |
| 8.2.5    | Demonstration of ALARP  | 320        |
| 8.2.6    | Demonstration of Acceptability  | 322        |
| 8.2.7    | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 325        |
| 8.3      | Hydrocarbon Release from Vessel Collision or Bunkering Incident                   | 327        |
| 8.3.1    | Summary of Risk Assessment and Evaluation   | 327        |
| 8.3.2    | Source of Hazard  | 327        |
| 8.3.3    | Stochastic Oil Spill Modelling Results  | 330        |
| 8.3.4    | Environmental Impact Assessment   | 334        |
| 8.3.5    | Demonstration of ALARP  | 335        |
| 8.3.6    | Demonstration of Acceptability  | 339        |
| 8.3.7    | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 341        |
| 8.4      | Marine Fauna Interaction  | 344        |
| 8.4.1    | Summary of Risk Assessment and Evaluation   | 344        |
| 8.4.2    | Source of Hazard  | 344        |
| 8.4.3    | Environmental Impact Assessment   | 344        |
| 8.4.4    | Demonstration of ALARP  | 346        |
| 8.4.5    | Demonstration of Acceptability  | 348        |
| 8.4.6    | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 350        |
| 8.5      | Introduction of Invasive Marine Species   | 351        |
| 8.5.1    | Summary of Risk Assessment and Evaluation   | 351        |
| 8.5.2    | Source of Hazard  | 351        |
| 8.5.3    | Environmental Impact Assessment   | 352        |
| 8.5.4    | Demonstration of ALARP  | 354        |
| 8.5.5    | Demonstration of Acceptability  | 356        |

|       |   |     |
|-------|---|-----|
| 8.5.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 357 |
| 8.6   | Unplanned Spills of Chemicals and Hydrocarbons                                    | 358 |
| 8.6.1 | Summary of Risk Assessment and Evaluation   | 358 |
| 8.6.2 | Source of Hazard  | 358 |
| 8.6.3 | Environmental Impact Assessment   | 360 |
| 8.6.4 | Demonstration of ALARP  | 360 |
| 8.6.5 | Demonstration of Acceptability  | 363 |
| 8.6.6 | Environmental Performance Outcome, Performance Standards and Measurement Criteria | 365 |
| 8.7   | Loss of Solid Hazardous and Non-hazardous Wastes, including Dropped Objects       | 367 |
| 8.7.1 | Summary of Risk Assessment and Evaluation   | 367 |

# 1 Introduction

## 1.1 Overview of Proposed Activity

Woodside Energy (Australia) Pty Ltd (Woodside), as Titleholder under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Commonwealth) (referred to as the Environment Regulations), proposes to undertake permanent plug and abandonment (P&A) activities of the Stybarrow development wells within offshore Permit Area WA-32-L. The petroleum activities include the P&A of ten subsea wells including production, gas injection and water injection wells and removal of all well infrastructure above the mudline.

These activities will hereafter be referred to as the Petroleum Activity and forms the scope of this Environment Plan (EP). A detailed description of the Petroleum Activity is provided in **Section 3**. Infrastructure associated with the Stybarrow wells is defined in **Section 3.5**. Other subsea infrastructure within WA-32-L will continue to be managed under the Stybarrow Cessation of Production EP. This is described further in **Section 3.6**.

This EP has been prepared to meet the Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGGS Act) as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

## 1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- The potential environmental impacts and risks from planned (routine and non-routine) activities and unplanned events (including emergency situations) of the Petroleum Activity are identified and described.
- Appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable.
- The petroleum activities are performed in a manner consistent with the principles of ecologically sustainable development (ESD) (as defined in Section 3A of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act)).

The EP describes the process used by Woodside to identify and evaluate potential environmental impacts and risks arising from the petroleum activities and defines activity specific Environmental Performance Outcomes (EPOs), Performance Standards (PSs) and Measurement Criteria (MCs) to be applied to manage the impacts and risks to ALARP and acceptable levels.

These form the basis of the implementation strategy, defined in **Section 11** for monitoring, auditing, and managing the petroleum activities to be performed by Woodside and its contractors. This EP documents and considers consultation with relevant authorities, persons, and organisations.

## 1.3 Scope of this Environment Plan

A detailed description of the Petroleum Activity is provided in **Section 3**. The spatial boundary of the Petroleum Activity has been described and assessed using the Operational Area, which is described in **Section 3.3**.

The petroleum activity described in this EP forms part of the decommissioning of all property within the Stybarrow field in WA-32-L. Other activities relevant to the decommissioning of the Stybarrow field are covered under the following EPs and include:

- Ongoing field management and removal of the majority of subsea infrastructure associated with the Stybarrow field in WA-32-L, addressed in the Stybarrow Decommissioning and Field Management EP.
- Abandonment *in situ* of the disconnectable turret mooring anchors, suction piles and a historic exploration wellhead (Eskdale-1) within WA-32-L, addressed in the Stybarrow Field Decommissioning EP.

A summary of the holistic decommissioning planning and execution for the Stybarrow field, including an indicative schedule, is provided in **Section 3.6**. The Stybarrow Decommissioning and Field Management EP is intended to be the final decommissioning EP for the Stybarrow field and will therefore address the

requirement of Section 270 and final title relinquishment.

The scope of this EP does not include the movement of the mobile offshore drilling unit (MODU) and support vessels outside of the Operational Area. These activities will be performed in accordance with other relevant maritime and aviation legislation, most notably the Commonwealth *Navigation Act 2012* and Commonwealth *Civil Aviation Act 1988*.

## 1.4 Woodside/BHP Merger

BHP Petroleum (Australia) Pty Ltd (BHP Petroleum) and Woodside announced their intention to merge in 2021, which became effective on 1 June 2022. Prior to the 1 June 2022, BHP Petroleum and Woodside acted as independent companies, thus planning activities for this decommissioning Environment Plan were conducted originally by BHP Petroleum. The merger consisted of a change of control of BHP Petroleum International Pty Ltd (holding company for BHP global petroleum business) via a share sale to Woodside Petroleum Ltd. All BHP Petroleum entities holding Australian Petroleum titles transferred to Woodside parent company control with this change in ownership.

All BHP Petroleum policies, standards, processes and procedures were included in the merger agreement and remain valid. Harmonisation of processes between BHP Petroleum and Woodside commenced planning upon the completion of the merger and will be conducted in a staged manner. The BHP Petroleum HSE Management system (herein referred to as the Woodside (PetDW) HSE Management System) will continue to be used by 'heritage' BHP operations until potential changes have been assessed.

The Titleholder name change from BHP Petroleum (Australia) Pty Ltd to Woodside Energy (Australia) Pty Ltd was made on 11 July 2022.

## 1.5 Overview of HSE Management System

All Woodside controlled activities associated with the Petroleum Activity will be conducted in line with:

- Woodside "Our Values" (Appendix A),
- Woodside Environment and Biodiversity Policy,
- Woodside Wells and Seismic Delivery Management System,
- Woodside (PetDW) Management System,
- Woodside (PetDW) Health, Safety and Environment (HSE) Standard,
- any specific commitments laid out in this EP.

All Woodside sites must maintain up-to-date practices that adhere to the requirements contained in the Woodside (PetDW) HSE Management System and Standard. Activity-specific environmental management measures specific to the petroleum activity are implemented through this EP.

Whilst HSE Management Systems apply to the manner in which Woodside execute their responsibilities under this EP, operational control of the MODU remains the responsibility of the MODU Contractor and shall be managed in accordance with Contractor Management Systems as detailed within the NOPSEMA accepted Safety Case for the facility.

## 1.6 Environment Plan Summary

An EP summary has been prepared based on material provided in this EP. **Table 1-2** summarises the items as required by Regulation 11(4) of the Environment Regulations.

Table 1-1: EP Summary

| EP Summary Material Requirement  | Relevant Section of the EP                         |
|--|--|
| The location of the activity   | Section 3.2  |
| A description of the receiving environment   | Section 4<br>Appendix C                            |
| A description of the activity  | Section 3  |
| Details of the environmental impacts and risks   | Section 7<br>Section 8                             |
| The control measures for the activity  | Section 7<br>Section 8                             |
| The arrangements for ongoing monitoring of the titleholder's environmental performance | Section 7<br>Section 8<br>Section 10<br>Section 11 |
| Response arrangements in the Oil Pollution Emergency Plan                              | Section 10<br>Section 11<br>Appendix D             |
| Consultation already undertaken and plans for ongoing consultation                     | Section 5<br>Section 11                            |
| Details of the titleholder's nominated liaison person for the activity                 | Section 1.8  |

## 1.7 Structure of the Environment Plan

The EP has been structured to reflect the requirements of the Environment Regulations, as outlined in Table 1-2.

Table 1-2: EP content requirements from the Environment Regulations and relevant sections of the EP demonstrating the requirements are met

| Criteria for Acceptance  | Content Requirements / Relevant Regulations   | Elements  | Section of EP  |
|--|---|---|--|
| Regulation 10A(a):<br><i>is appropriate for the nature and scale of the activity</i> | Regulation 13<br><i>Environmental Assessment</i>  | The principle of 'nature and scale' applies throughout the EP   | Section 1  |
|  | Regulation 14<br><i>Implementation strategy for the environment plan</i>                                  |   | Section 3  |
|  | Regulation 16<br><i>Other information in the environment plan</i>   |   | Section 5<br>Section 6<br>Section 7<br>Section 8<br>Section 11 |
| Regulation 10A(b):<br><i>demonstrates that the environmental impacts</i>             | Regulation 13(1)–13(7):<br>13(1) <i>Description of the activity</i><br>13(2)(3) <i>Description of the</i> | <ul style="list-style-type: none"> <li>Set the context (activity and existing environment)</li> <li>Define 'acceptable' (the</li> </ul> | Section 1<br>Section 2   |

| Criteria for Acceptance   | Content Requirements / Relevant Regulations   | Elements  | Section of EP  |
|---|---|---|--|
| <p><i>and risks of the activity will be reduced to as low as reasonably practicable</i></p> <p>Regulation 10A(c):<br/><i>demonstrates that the environmental impacts and risks of the activity will be of an acceptable level</i></p>   | <p><i>environment</i></p> <p>13(4) Requirements</p> <p>13(5)(6) Evaluation of environmental impacts and risks</p> <p>13(7) Environmental performance outcomes and standards</p> <p>Regulation 16(a)–16(c):<br/><i>A statement of the titleholder's corporate environmental policy</i></p> <p><i>A report on all consultations between the titleholder and any relevant person</i></p>   | <p>requirements, the corporate policy, relevant persons)</p> <ul style="list-style-type: none"> <li>Detail the impacts and risks</li> <li>Evaluate the nature and scale</li> <li>Detail the control measures – ALARP and acceptable</li> </ul>                              | <p><b>Section 3</b></p> <p><b>Section 5</b></p> <p><b>Section 6</b></p> <p><b>Section 7</b></p> <p><b>Section 8</b></p> <p><b>Appendix A</b></p> |
| <p>Regulation 10A(d):<br/><i>provides for appropriate environmental performance outcomes, environmental performance standards and measurement criteria</i></p>  | <p>Regulation 13(7):<br/><i>Environmental performance outcomes and standards</i></p>  | <ul style="list-style-type: none"> <li>Environmental Performance Outcomes</li> <li>Environmental Performance Standards</li> <li>Measurement Criteria</li> </ul>   | <p><b>Section 7</b></p> <p><b>Section 8</b></p> <p><b>Section 10</b></p>   |
| <p>Regulation 10A(e):<br/><i>includes an appropriate implementation strategy and monitoring, recording and reporting arrangements</i></p>   | <p>Regulation 14:<br/><i>Implementation strategy for the environment plan</i></p>   | <p>Implementation strategy, including:</p> <ul style="list-style-type: none"> <li>systems, practices, and procedures,</li> <li>performance monitoring,</li> <li>Oil Pollution Emergency Plan (OPEP) and scientific monitoring, and</li> <li>ongoing consultation</li> </ul> | <p><b>Section 6</b></p> <p><b>Section 10</b></p> <p><b>Section 11</b></p> <p><b>Appendix D(OPEP)</b></p>   |
| <p>Regulation 10A(f):<br/><i>does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the EPBC Act</i></p> | <p>Regulation 13 (1)–13(3):</p> <p>13(1) Description of the activity</p> <p>13(2) Description of the environment</p> <p>13(3) Without limiting [Regulation 13(2)(b)], particular relevant values and sensitivities may include any of the following:</p> <p>(a) the world heritage values of a declared World Heritage property within the meaning of the EPBC Act</p> <p>(b) the national heritage values of a National Heritage place within the meaning of that Act</p> <p>(c) the ecological character of a declared Ramsar wetland</p> | <p>No activity, or part of the activity, undertaken in any part of a declared World Heritage property.</p>  | <p><b>Section 3</b></p> <p><b>Section 4</b></p> <p><b>Section 7</b></p> <p><b>Section 8</b></p> <p><b>Section 9</b></p>                          |

| Criteria for Acceptance   | Content Requirements / Relevant Regulations   | Elements  | Section of EP      |
|---|---|---|--------------------|
|   | <p><i>within the meaning of that Act</i></p> <p><i>(d) the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act</i></p> <p><i>(e) the presence of a listed migratory species within the meaning of that Act</i></p> <p><i>(f) any values and sensitivities that exist in, or in relation to, part or all of:</i></p> <p><i>(i) a Commonwealth marine area within the meaning of that Act; or</i></p> <p><i>(ii) Commonwealth land within the meaning of that Act.</i></p> |   |                    |

## 1.8 Titleholder Details

Woodside Energy (Australia) Pty Ltd is the operator and nominated titleholder of WA-32-L along with Woodside Energy Ltd.

Woodside's mission is to deliver affordable energy solutions and superior outcomes for stakeholders. Wherever Woodside works, it is committed to living its values of integrity, respect, working sustainably, ownership, courage and working together. Woodside's operations are characterised by strong safety and environmental performance in remote and challenging locations.

Woodside has an excellent record of efficient and safe production. Woodside strives for excellence in safety and environmental performance and continues to strengthen relationships with customers, partners co-venturers, governments and communities with the aim of being a partner of choice. Further information about Woodside can be found at <http://www.woodside.com>.

In accordance with Regulation 15(1) of the Environment Regulations, details of the titleholder are provided in **Table 1-3**. In accordance with Regulation 15(2) of the Environment Regulations, details of the titleholder's

nominated liaison person are provided in **Table 1-4**.

In the event of any change in the titleholder, titleholder parent company, a change in the titleholder's nominated liaison person or a change in the contact details for either the titleholder or the liaison person, Woodside will notify NOPSEMA in writing in accordance with Regulation 15(3) of the Environment Regulations

## 2 Legislative Framework

### 2.1 Commonwealth Legislation

Environmental aspects of the Petroleum Activity in Commonwealth waters are subject to the Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGGS Act) and the EPBC Act. Each of these, as applicable to the Petroleum Activity, is described in the next sections. There are also additional applicable Commonwealth legislation, international agreements and conventions, and other applicable standards, guidelines, and codes that may apply to the Petroleum Activity. These are summarised in **Appendix B** of this EP.

#### 2.1.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006

The *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGGS Act) provides the regulatory framework for all offshore exploration and production activities in Commonwealth waters (those areas beyond three nautical miles from the territorial sea baseline and in the Commonwealth Petroleum Jurisdiction Boundary). The Environment Regulations have been made under the OPGGS Act to ensure “...any *Petroleum Activity or greenhouse gas activity carried out in an offshore area is:*

- carried out in a manner consistent with the principles of ecologically sustainable development set out in section 3A of the *Environment Protection and Biodiversity Act 1999* (EPBC Act)
- carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable
- carried out in a manner by which the environmental impacts and risks of the activity will be of an acceptable level”.

This EP meets the requirements of the Environment Regulations by providing a plan that:

- is appropriate for the nature and scale of the activity
- demonstrates the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable
- demonstrates the environmental impacts and risks of the activity will be of an acceptable level
- provides for appropriate Environmental Performance Outcomes (EPOs), Environmental Performance Standards (EPSs) and Measurement Criteria (MC)
- includes an appropriate implementation strategy and monitoring, recording and reporting arrangements
- does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being performed in any part of a declared World Heritage property within the meaning of the EPBC Act
- demonstrates that:
  - an appropriate level of consultation, as required by Division 2.2A of the Environment Regulations, has been performed
  - the measures (if any) adopted, or proposed to adopt, because of consultations are appropriate
  - complies with the OPGGS Act and the Environment Regulations.

The OPGGS Act and supporting regulations address licensing, health, safety and environmental matters for offshore petroleum and gas exploration and production operations in Commonwealth waters. Obligations in relation to the maintenance and removal of equipment and property brought onto title are provided under subsection 572(3) of the OPGGS Act.

Under subsection 572(3) of the OPGGS Act, a titleholder must remove from the title area all structures that are, and all equipment and other property that is neither used nor to be used in connection with the operations. Under subsection 572(7), property removal requirements are subject to any other provision of the OPGGS Act, the regulations, directions given by NOPSEMA or the responsible Commonwealth Minister, and any other law. Section 572(3) requires the removal of property when it is no longer used, unless NOPSEMA has accepted alternative arrangements where justification is appropriate and with regard to the Guideline: Offshore Petroleum Decommissioning (Department of Industry, Science and Resources, 2022).

Under subsection 270(3) of the OPGGS Act, before title surrender, all property brought into the surrender area must be removed to the satisfaction of NOPSEMA, or arrangements that are satisfactory to NOPSEMA must be made relating to the property.

Field management covered under the Stybarrow Decommissioning and Field Management EP evaluates the infrastructure integrity and applies applicable measures, based on risk, to ensure well and subsea infrastructure may be removed in accordance with Section 572(3) of the OPGGS Act. All Stybarrow subsea and well infrastructure within WA-32-L will be removed before 31 March 2025, in accordance with General Direction 833 (**Section 2.1.2**) and Section 572(3) of the OPGGS Act, unless NOPSEMA approves and is satisfied that an alternative decommissioning approach delivers equal or better environmental outcomes compared with complete removal.

**2.1.2 General Direction 833**

On 30 August 2021, NOPSEMA issued Woodside with a General Direction (General Direction 833) under Section 574 of the OPGGS Act in relation to decommissioning of infrastructure relating to the Stybarrow field within WA-32-L. **Table 2-1** outlines the directions in General Direction 833, and Woodside’s intention for addressing each of these directions, either under this EP or under other separate Stybarrow decommissioning EPs.

This EP will address requirements under this General Direction related to the P&A of the Stybarrow wells and removal of well infrastructure above the mudline. Requirements relating to the decommissioning of other subsea infrastructure within WA-32-L is covered under the following separate EPs:

- Stybarrow Decommissioning and Field Management EP (BHPB-00SC-N000-003), currently under assessment by NOPSEMA (submitted 14 April 2022)
- Stybarrow End State Decommissioning EP (BHPB-00SC-N000-0007), currently under assessment by NOPSEMA (submitted 31 July 2022)

Currently inspection and maintenance activities on subsea infrastructure (including well infrastructure) within WA-32-L is managed under the accepted Stybarrow Operation Cessation EP (in force). Once accepted, the Stybarrow Decommissioning and Field Management EP, will cover ongoing inspection and maintenance of this infrastructure until final decommissioning. The Stybarrow Decommissioning and Field Management EP is also intended to be the final decommissioning EP for the Stybarrow field and will therefore address the requirement of Section 270 and title relinquishment. Further detail on the decommissioning EPs for the Stybarrow field is provided in **Section 3.6**.

**Table 2-1: General Direction 833**

| Direction   | Woodside’s Intentions relating to Direction  |
|---|--|
| <p><b>Direction 1</b></p> <p>Plug or close off, to the satisfaction of NOPSEMA, all wells made in the title area by any person engaged or concerned in operations authorised by the title as soon as practicable and no later than 30 September 2024.</p>                                     | <p>Woodside has a total of 17 wells within WA-32-L, all of which are subject to Direction 1. Ten of the wells are associated with the production of the Stybarrow field and require permanent plug and abandonment as described in this EP (refer to <b>Section 3</b>). It is intended that this activity will be completed no later than the 30 September 2024.</p> <p>Seven of the wells are historical exploration/appraisal wells drilled between 2002 to 2014 and were permanently plugged upon completion of the drilling activities at that time (details provided in <b>Table 3-2</b>. No further work is required on these seven wells to comply with Direction 1.</p>                        |
| <p><b>Direction 2</b></p> <p>Remove, or cause to be removed, to the satisfaction of NOPSEMA, from the title area all property brought into that area by any person engaged or concerned in the operations authorised by the title as soon as practicable and no later than 31 March 2025.</p> | <p>Well infrastructure above the mudline (wellheads, subsea trees) will be recovered under this EP following permanent plugging of the Stybarrow development wells. Activities relating to well infrastructure removal are defined in <b>Section 3.8.8</b>.</p> <p>The Stybarrow Decommissioning and Field Management EP covers the removal of the Stybarrow infrastructure within WA-32-L by no later than 31 March 2025. The Stybarrow Field Decommissioning EP covers infrastructure proposed for <i>in situ</i> abandonment. <b>Section 3.6</b> provides further details on the holistic decommissioning approach for the Stybarrow Field including timeframes for decommissioning activities.</p> |

| Direction  | Woodside’s Intentions relating to Direction   |
|--|---|
| <p><b>Direction 3</b><br/>Until such time as Direction 1 and 2 are complete, maintain all property on the title to NOPSEMA’s satisfaction, to ensure removal of the property is not precluded.</p>   | <p>Currently, inspection and maintenance activities for all subsea wells and infrastructure within petroleum title WA-32-L are managed under the accepted Stybarrow Operation Cessation EP (in force).<br/>Once accepted, the Stybarrow Decommissioning and Field Management EP will cover ongoing inspection and maintenance activities on all subsea infrastructure (including wells) until wells have been permanently plugged for abandonment and decommissioning of subsea infrastructure commences.</p>   |
| <p><b>Direction 4</b><br/>Provide, to the satisfaction of NOPSEMA, for the conservation and protection of the natural resources in the title area within 12 months after property referred to in direction 2 is removed.</p>   | <p>Woodside applies the same definition for the term “natural resources”<sup>1</sup> as is used in policy <i>Section 270 Consent to surrender title - NOPSEMA advice</i> (NOPSEMA, 2022).<br/>Details on how Woodside will ensure the conservation and protection of natural resources in petroleum title WA-32-L will be addressed in the Stybarrow Decommissioning and Field Maintenance EP and Stybarrow Field Decommissioning EP, which covers final decommissioning activities for infrastructure within the Stybarrow field.<br/>Furthermore, <b>Section 7</b> of this EP assesses risks and impacts to natural resources in the title area specifically relating to plugging and abandonment activities.</p> |
| <p><b>Direction 5</b><br/>Make good, to the satisfaction of NOPSEMA, any damage to the seabed or subsoil in the title area caused by any person engaged or concerned in the operations authorised by the title within 12 months after the property referred to in direction 2 is removed.</p>  | <p>Details on how Woodside will address requirement to make good any damage to the seabed or subsoil within petroleum title WA-32-L will be addressed in the Stybarrow Decommissioning and Field Maintenance EP which covers final removal activities as required under Direction 2<br/><b>Section 7</b> of this EP assesses the potential impacts of the petroleum activity on the seabed and lists controls that will be implemented to ensure impacts are ALARP and acceptable.</p>  |
| <p><b>Direction 6</b><br/>Submit to NOPSEMA on an annual basis, until all direction have been met, a progress report detailing planning towards and process with undertaking the actions required by directions 1, 2, 3, 4 and 5.<br/>The report submitted under Direction 6(a) must be to the satisfaction of NOPSEMA and submitted to NOPSEMA no later than 31 December each year.<br/>Publish the report on the registered titleholders’ website within 14 days of obtaining NOPSEMA satisfaction under Direction 6(b).</p> | <p>The Stybarrow Decommissioning and Field Management EP is intended to be the final decommissioning EP for the Stybarrow Field and therefore provides Woodside’s external reporting obligations required under Direction 5. Further detail is provided in <b>Section 11.9.2</b></p>  |

**2.1.3 Environment Protection and Biodiversity Conservation Act 1999**

The EPBC Act aims to protect and manage nationally and internationally important flora, fauna, ecological communities, and heritage places in Australia. These are defined in the EPBC Act as Matters of National Environmental Significance (MNES). NOPSEMA, through the Streamlining Offshore Petroleum Environmental Approvals Program, implements these requirements with respect to offshore Petroleum Activities in Commonwealth waters. The Streamlining Offshore Petroleum Environmental Approvals Program is applicable to all offshore petroleum activities authorised under the OPGGS Act and requires the petroleum activities to be conducted in accordance with an accepted EP, consistent with the principles of Ecologically Sustainable

<sup>1</sup> The Section 270 NOPSEMA advice - Consent to surrender title (NOPSEMA 2022) applies the same meaning to “natural resources” as in Article 77 of the United Nations Convention on the Law of the Sea 1982, which states “The natural resources referred to in this Part consist of the mineral and other non-living resources of the seabed and subsoil together with living organisms belonging to sedentary species, that is to say, organisms which, at the harvestable stage, either are immobile on or under the seabed or are unable to move except in constant physical contact with the seabed of the subsoil”.

Development (ESD). The definition of ‘environment’ in the Streamlining Offshore Petroleum Environmental Approvals Program is consistent with that used in the EPBC Act and encompass all matters protected under Part 3 of the EPBC Act.

The development of the Stybarrow field was referred for assessment as an action under the EPBC Act (Referral 2004/1469) and the assessment was subsequently set at the level of an Environmental Impact Statement (EIS). The action was approved by the Commonwealth Minister for the Environment following an assessment of the EIS, with a number of conditions set for the action, which were consolidated in 2015. The consolidated conditions are provided in **Appendix B**, with conditions that apply to the Petroleum Activity described in this EP summarised in **Table 2-2**.

**Table 2-2: EPBC 2004/1469 conditions relevant to the Petroleum Activity considered in this EP**

| EPBC 2004/1469 Conditions  | Relevance to activities described in this EP   |
|--|--|
| <p>1 The person taking the action must submit, for the Minister’s approval, a plan (or plans) for managing the offshore impacts of the action. The plan (or plans) must include measures for:</p> <p>a) Drilling operations:</p> <ol style="list-style-type: none"> <li>i. Drilling fluid type and disposal method</li> <li>ii. Drill cuttings disposal method</li> <li>iii. Fuel and chemical handling and transfer procedures</li> <li>iv. Cetacean interaction procedures for supply vessels and aircraft that are consistent with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000</li> <li>v. Cetacean and whale shark sightings reporting</li> </ol>  | <p>The petroleum activity described in this EP is plug and abandonment of wells, which is a drilling activity. Hence EPBC 2004/1469 Condition 1(a) applies to the Petroleum Activity.</p> <ul style="list-style-type: none"> <li>• Drilling fluids (e.g. cement) are described in <b>Section 3.8</b> and measures to manage the environmental impacts of these fluids are described in <b>Section 7.6</b>.</li> <li>• Disposal of drill cuttings, including produced sand, are described in <b>Section 7.6</b>.</li> <li>• Fuel and chemical handling procedures are described in <b>Section 7.5</b>, <b>Section 7.6</b>, <b>Section 8.3</b> and <b>Section 8.6</b>.</li> <li>• Cetacean interaction procedures and cetacean and whale shark sighting reporting procedures are described in <b>Section 8.4</b>.</li> </ul> |
| <p>2 The person taking the action must submit for the Minister’s approval an oil spill contingency plan to mitigate the environmental effects of any hydrocarbon spills. The oil spill contingency plan must include:</p> <ul style="list-style-type: none"> <li>• The types of dispersants, protective booms, clean up gear, and related equipment to be used in the event of an oil spill and their storage arrangements</li> <li>• A demonstrated capacity to deploy oil spill response equipment within 12 hours</li> <li>• Training of staff in oil spill response measures</li> <li>• Identification of sensitive areas, in particular, Ningaloo Marine Park, and the specific response measures for these areas</li> <li>• The reporting of oil spill incidents.</li> </ul> | <p>The Stybarrow Plug and Abandonment Oil Pollution Emergency Plan (OPEP) (<b>Appendix D</b>) and this EP constitute the Oil Spill Contingency Plan required by EPBC 2004/1469 Condition 2.</p>  |
| <p>3 At least twelve months before the expiry of the period for which this approval has effect, the person taking the action must submit a decommissioning plan for approval by the Minister that considers the removal of all structures and components above the sea floor, including floating production, storage and offtake vessels, subsea wells, flowlines, and any other associated infrastructure.</p> <p>Decommissioning may not commence until the plan is approved. The approved plan must be implemented.</p>   | <p>The Decommissioning Plan required by EPBC 2004/1469 is met by:</p> <ul style="list-style-type: none"> <li>• Stybarrow Decommissioning and Field Management EP</li> <li>• Stybarrow Plug and Abandonment EP (this EP)</li> <li>• Stybarrow Field Decommissioning EP</li> </ul> <p>In combination, these plans consider the maintenance and decommissioning of property relating to the Stybarrow Field in WA-32-L (<b>Section 3.6</b>).</p>  |

| EPBC 2004/1469 Conditions  | Relevance to activities described in this EP   |
|--|--|
| <p>7 The person taking the action may choose to revise a management plan approved by the Minister under Conditions 1, 2, 3 or 6 without submitting it for approval under Section 143A of the EPBC Act, if the taking of the action in accordance with the revised plan would not be likely to have a new or increased impact. If the person taking the action makes this choice they must:</p> <ul style="list-style-type: none"> <li>• Notify the Department in writing that the approved plan has been revised and provide the Department with an electronic copy of the revised plan</li> <li>• Implement the revised plan from the date that the plan is submitted to the Department</li> <li>• For the life of this approval, maintain a record of the reason the person taking the action considers that taking the action in accordance with the revised plan would not be likely to have a new or increased impact.</li> </ul> | <p>The management of change process that will be applied to this EP is described <b>Section 11.7</b>. This process considers triggers for submission of a revision of this EP to NOPSEMA in accordance with Regulation 17 of the Environment Regulations, including:</p> <ul style="list-style-type: none"> <li>• Significant modification or new stage of activity</li> <li>• New or increased environmental impact or risk</li> <li>• Change in titleholder</li> </ul> |

Under Section 139(1)(b) of the EPBC Act, the Minister must not act inconsistently with a recovery plan or threat abatement plan. Similarly, under Section 268 of the EPBC Act:

*“A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.”*

In respect to offshore petroleum activities in Commonwealth waters, these requirements are implemented by NOPSEMA via the commitments included in the *Streamlining Offshore Petroleum Environmental Approvals Program*. These commitments relating to listed threatened species and ecological communities are included in the Program Report:

- NOPSEMA will not accept an Environment Plan that proposes activities that will result in unacceptable impacts to a listed threatened species or ecological community.
- NOPSEMA will not accept an Environment Plan that is inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community.
- NOPSEMA will have regard to any approved conservation advice in relation to a threatened species or ecological community before accepting an Environment Plan.

Species recovery and threat abatement management plans relevant to this EP are outlined in **Section 9**.

## 2.2 State Legislation

In the event of a hydrocarbon release from a loss of well containment (**Section 8.2**), or tank rupture from a vessel collision (**Section 8.3**), there is the potential for the release to impact State waters and shorelines. Relevant state legislation is listed in **Appendix B**.

## 2.3 Environmental Guidelines, Standards and Codes of Practice

Several industry standards, codes of practice, guidelines and international conventions are relevant to environmental management of the Petroleum Activity. These are listed in **Appendix B**.

## 2.4 Location

The Stybarrow field is located within Production Licence WA-32-L, located in Commonwealth waters, around 55 km north-west of Exmouth, Western Australia and in water depths of about 790 m – 850 m (**Figure 3-1**). The coordinates and water depth of the Stybarrow production wells subject to P&A activities are presented in **Table 3-1**.

The nearest point of the Stybarrow Operational Area (defined in **Section 3.3**) to the mainland (North West Cape) is approximately 41 km. The relative distances between key onshore features (islands/mainland) and the Operational Area are provided in **Table 3-3**.

**Table 2-3: Distance from Operational Area to Key Onshore Features**

| Key Onshore Features         | Distance and Direction from Operational Area |
|------------------------------|--|
| Ningaloo World Heritage Area | 23 km south                                  |
| Muiron Islands               | 51 km east-south-east                        |
| Exmouth                      | 55 km south-south-east                       |
| Serrurier Island             | 83 km east                                   |
| Thevenard Island             | 113 km east                                  |
| Onslow                       | 129 km east                                  |
| Barrow Island                | 162 km east-north-east                       |

## 3 Description of the Activity

### 3.1 Overview

This section has been prepared in accordance with Regulation 13(1) of the Environment Regulations, and describes the Petroleum Activity to be performed under this EP.

Woodside proposes to undertake the permanent plug and abandonment (P&A) of ten Stybarrow subsea wells within offshore petroleum licence WA-32-L. The P&A activity will be conducted within Commonwealth waters approximately 55 km north-west (NW) of Exmouth, Western Australia, in water depths between 790 m – 850 m.

The Stybarrow Development produced crude oil from the Stybarrow and Eskdale fields via a network of subsea wells tied back to the Stybarrow Venture MV16 Floating Production, Storage and Offloading (FPSO). The subsea production system consisted of six production wells, one gas injection well and three water injection wells located within four drill centres (DC-A, DC-B, DC-C, DC-D) (**Table 3-1**). The Stybarrow field ceased production in June 2015 and subsequently the subsea wells were shut in and are currently in a state of preservation with a wellhead and horizontal xmas tree in place.

Woodside proposes to undertake the following petroleum activities under this EP, including:

- Vessel based activities to prepare wells for P&A prior to MODU mobilisation. Activities include cleaning and inspection of well infrastructure, pressure and function testing subsea trees, verification of subsea tree barriers, disconnection of ancillary equipment to subsea trees as required to enable clear access and installation of temporary equipment for P&A (including mooring pre-lay, tethering system, mud mats, clump weights as required).
- Permanent plug and abandonment of the ten Stybarrow wells using a MODU.
- Removal and recovery of the well infrastructure above the mudline, including subsea trees and wellheads using the MODU or a project support vessel. Subsea tree and wellhead removal and recovery is an optional activity in this EP. The base case is removal and recovery of subsea trees and wellheads as part of the field equipment removal campaign described and managed under the Stybarrow Decommissioning and Field Management EP.

As outlined in **Section 3.6**, the petroleum activities described in this EP are part of the overall decommissioning of the Stybarrow field. Decommissioning activities such as removal of subsea structures, umbilicals, risers and flowlines are beyond this scope of this EP.

**Table 3-1: Location of the Stybarrow Subsea Development Wells**

| Well Name                | Well Type       | Latitude          | Longitude          | Water Depth (m LAT) |
|--------------------------|-----------------|-------------------|--------------------|---------------------|
| <b>DC-A Drill Centre</b> |                 |                   |                    |                     |
| Stybarrow-5 (I-3)        | Water Injection | 21° 28' 07.305" S | 113° 50' 45.529" E | 801                 |
| Stybarrow-6 (I-2)        | Water Injection | 21° 28' 08.871" S | 113° 50' 46.358" E | 799                 |
| Stybarrow-12H (H-5)      | Production      | 21° 28' 11.340" S | 113° 50' 47.310" E | 800                 |
| <b>DC-B Drill Centre</b> |                 |                   |                    |                     |
| Stybarrow-9 (I-1)        | Water Injection | 21° 28' 28.613" S | 113° 49' 32.639" E | 835                 |
| Stybarrow-10H (H-3)      | Production      | 21° 28' 29.263" S | 113° 49' 30.047" E | 835                 |
| Stybarrow-11H (H-4)      | Production      | 21° 28' 26.281" S | 113° 49' 30.891" E | 835                 |

In addition to the Stybarrow production wells listed in **Table 3-1**, General Direction 833 describes seven exploration wells within WA-32-L, as listed in **Table 3-2**. These exploration wells have previously been permanently plugged and abandoned and six of the wellheads have been removed, as outlined in **Table 3-2**. The wellhead on Eskdale-1 exploration well remains *in situ*, following repeated unsuccessful recovery attempts in April 2004 after the well was permanently plugged for abandonment. *In situ* abandonment of the Eskdale-1 wellhead will be covered under the Stybarrow End State Decommissioning EP currently under assessment with NOPSEMA.

**Table 3-2: Permanently Abandoned Exploration and Appraisal Wells Listed in General Direction 833**

| Well Name       | Well Location                           | Water Depth (m LAT) | Well Status  |
|-----------------|---|---------------------|--|
| Stybarrow 1/1CH | 21° 28' 40.127" S<br>113° 50' 3.551" E  | 825                 | Stybarrow-1/1CH exploration well drilled in February 2003. Upon completion, the well was permanently plugged and abandoned. The wellhead was recovered on 6 March 2003.  |
| Stybarrow 2     | 21° 29' 32.993" S<br>113° 49' 19.991" E | 862                 | Stybarrow-2 appraisal well was drilled in June 2003. Upon completion, the well was permanently plugged and abandoned. The wellhead was recovered on 20 June 2003.  |
| Stybarrow 3/4   | 21° 27' 53.647" S<br>113° 51' 00.426" E | 792                 | Stybarrow-3/4 appraisal well was drilled in May 2004. Upon completion, the well was permanently plugged and abandoned. The wellhead recovered on 25 June 2004.   |
| Knott 1         | 21° 28' 48.103" S<br>113° 54' 41.488" E | 681                 | Knott-1 exploration well was drilled in June 2004. Upon completion, the well was permanently plugged and abandoned as a dry hole. The wellhead was recovered on 9 July 2004.   |
| Eskdale 1       | 21° 21' 49.009" S<br>113° 49' 36.571" E | 798                 | Eskdale-1 exploration well was drilled in March 2003. Upon completion, the well was permanently plugged and abandoned. The Eskdale-1 wellhead remains <i>in situ</i> after repeated unsuccessful recovery attempts were made over the 10 – 11 April 2003, following completion of the drilling program.<br>BHP Petroleum (Operator at the time) subsequently informed the Western Australian Department of Industry and Resources (the administrator of the petroleum title at the time) that recovery of the wellhead was not feasible, and BHP Petroleum intended to abandon the wellhead <i>in situ</i> . |
| Eskdale 2/2CH   | 21° 22' 31.802" S<br>113° 48' 31.414" E | 824                 | Eskdale-2/2CH exploration well was drilled in April 2004. Upon completion, the well was permanently plugged and abandoned. The wellhead was recovered on 15 May 2004.  |
| Skiddaw 1/2     | 21° 29' 06.856" S<br>113° 51' 55.363" E | 803                 | Skiddaw-1/2 exploration well was drilled May 2003. Upon completion, the well was permanently plugged and abandoned. The wellhead was recovered on 1  |

| Well Name | Well Location | Water Depth (m LAT) | Well Status |
|-----------|---------------|---------------------|-------------|
|           |               |                     | June 2003.  |

### 3.2 Location

The Stybarrow field is located within Production Licence WA-32-L, located in Commonwealth waters, around 55 km north-west of Exmouth, Western Australia and in water depths of about 790 m – 850 m (**Figure 3-1**). The coordinates and water depth of the Stybarrow production wells subject to P&A activities are presented in **Table 3-2**.

The nearest point of the Stybarrow Operational Area (defined in **Section 3.3**) to the mainland (North West Cape) is approximately 41 km. The relative distances between key onshore features (islands/mainland) and the Operational Area are provided in **Table 3-3**.

**Table 3-3: Distance from Operational Area to Key Onshore Features**

| Key Onshore Features         | Distance and Direction from Operational Area |
|------------------------------|--|
| Ningaloo World Heritage Area | 23 km south                                  |
| Muiron Islands               | 51 km east-south-east                        |
| Exmouth                      | 55 km south-south-east                       |
| Serrurier Island             | 83 km east                                   |
| Thevenard Island             | 113 km east                                  |
| Onslow                       | 129 km east                                  |
| Barrow Island                | 162 km east-north-east                       |

### 3.3 Operational Area

The Operational Area shown in **Figure 3-2** defines the spatial boundary of the Petroleum Activity as described, risk assessed and managed by this EP, including MODU and vessel related petroleum activities. The Operational Area is defined by a 3,000 m radius around each of the drill centres for the Stybarrow development wells within the scope of this EP. This radius allows for the installation of a temporary mooring system for a moored semi-submersible MODU and cannot reasonably be reduced.

The Operational Area includes a temporary 500 m radius exclusion zone around the MODU during the petroleum activity to manage vessel movements.

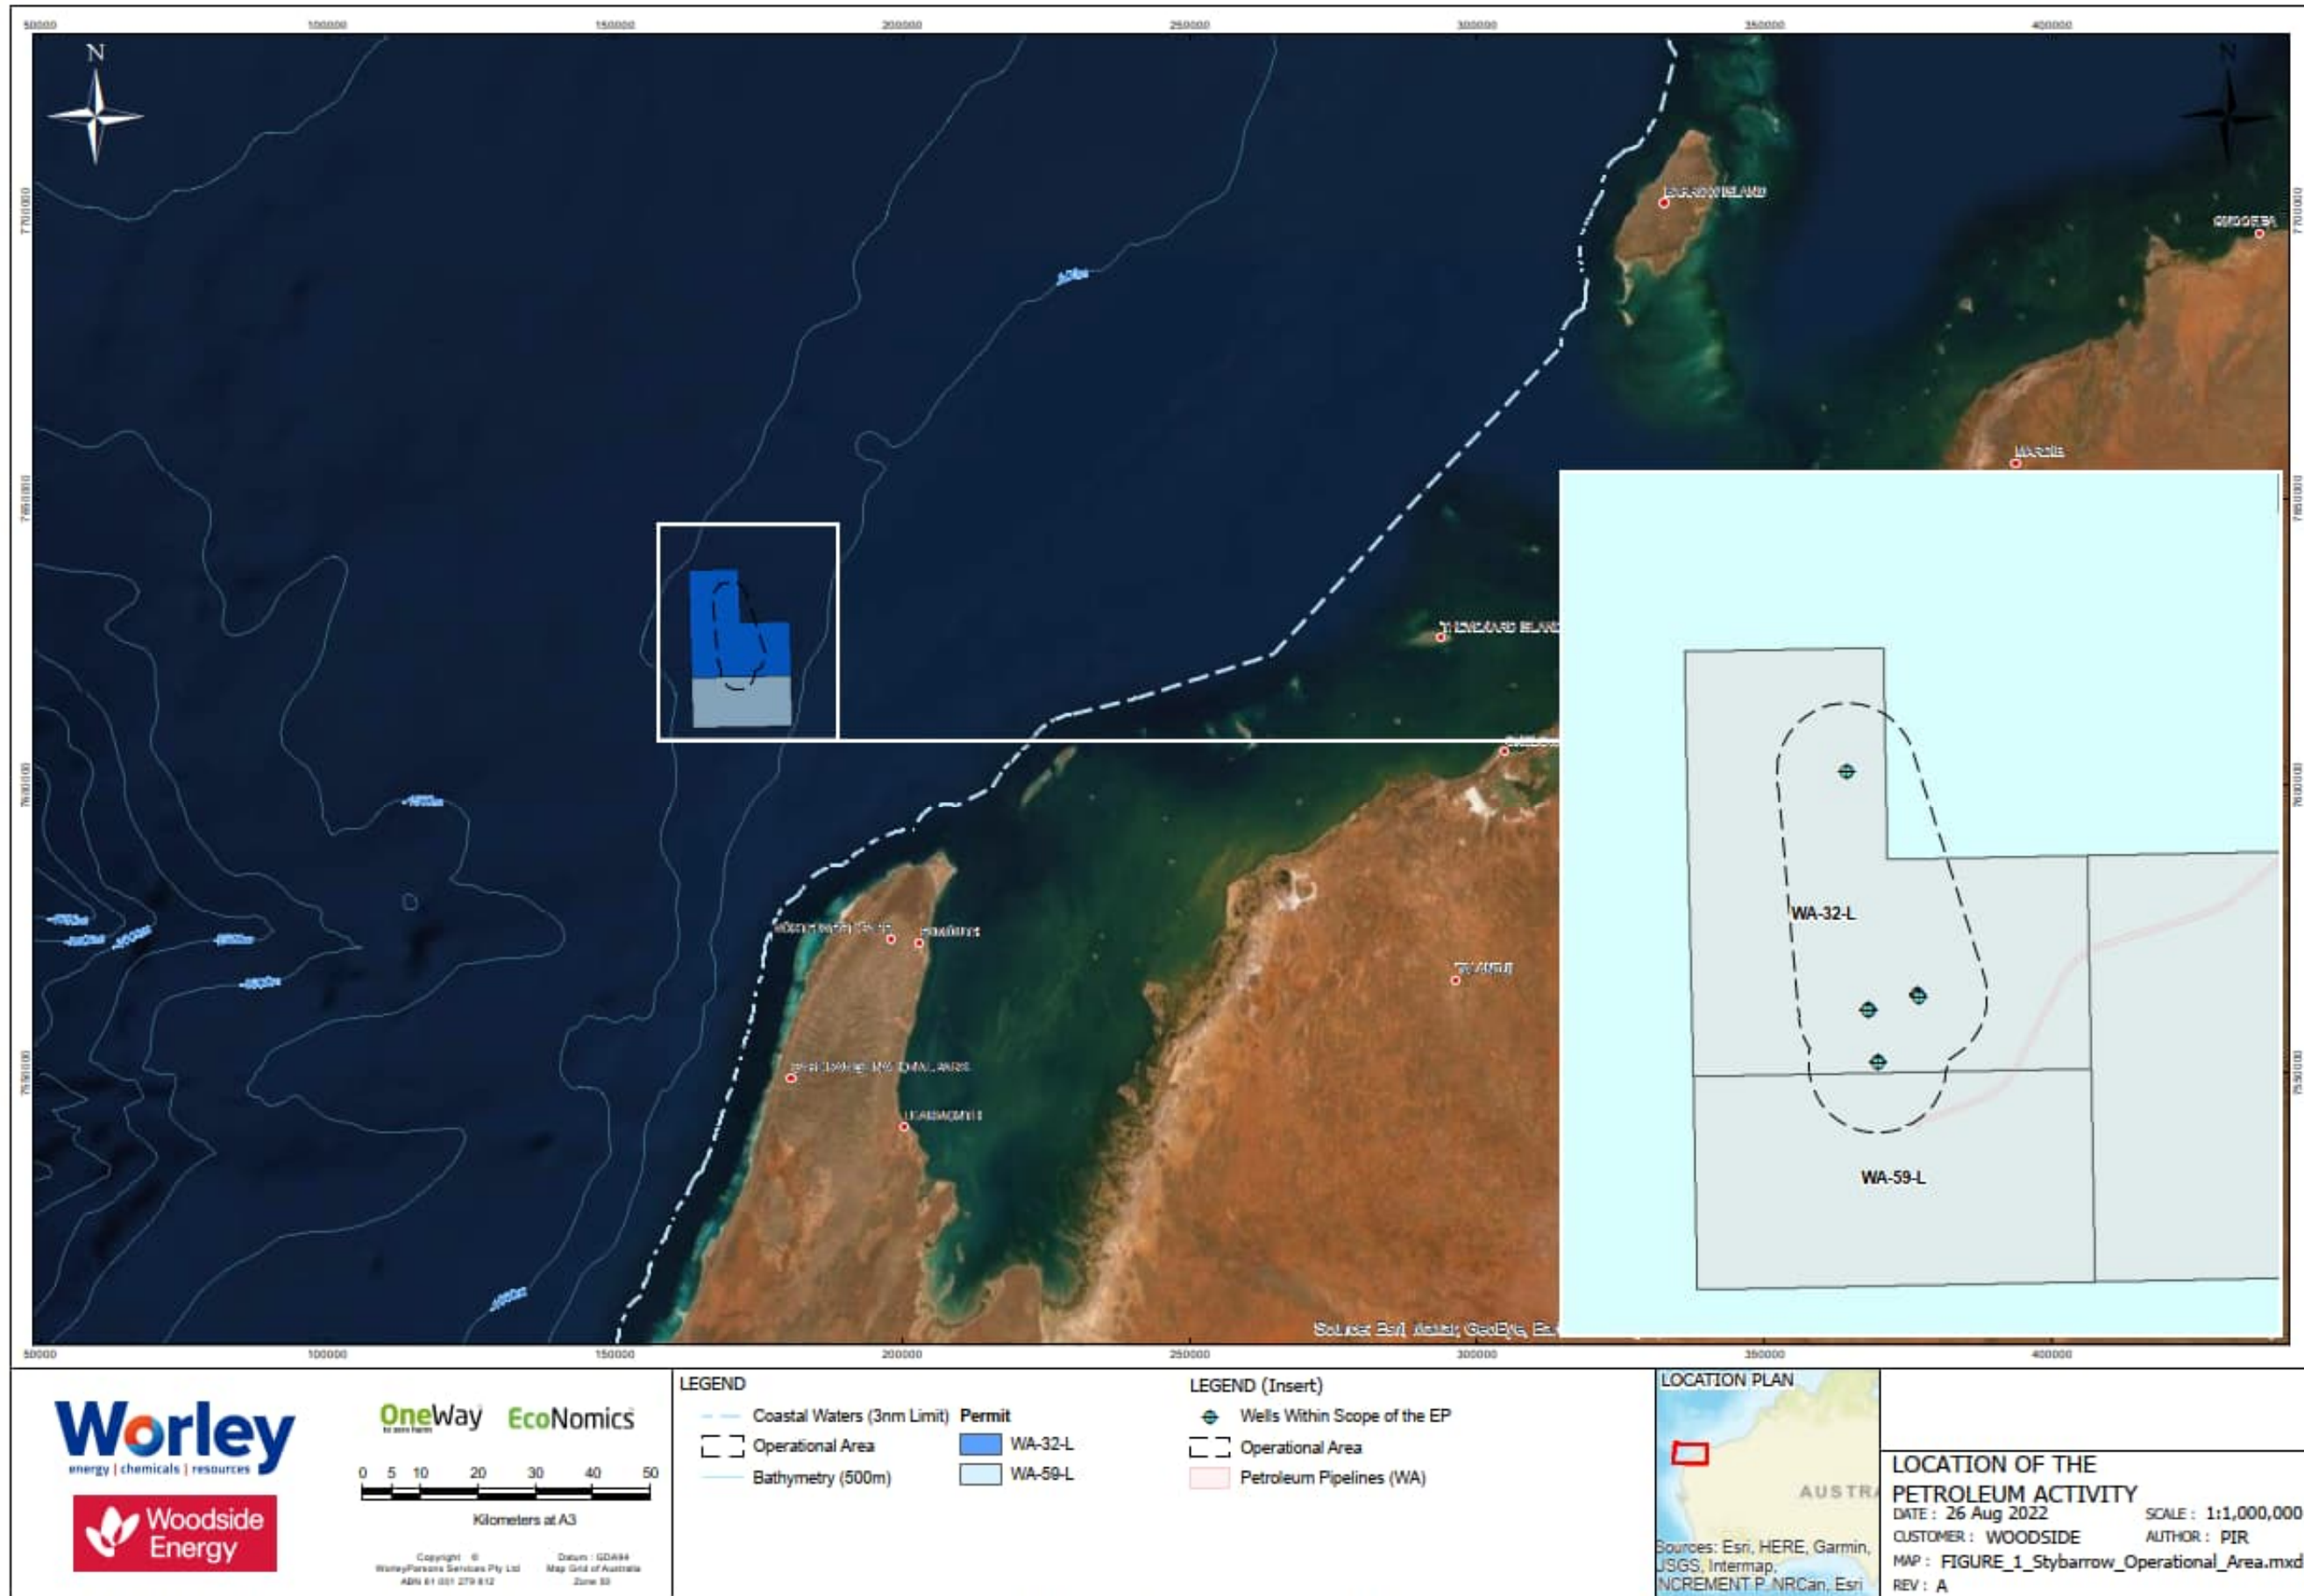

Figure 3-1 Location of the Petroleum Activity and Operational Area

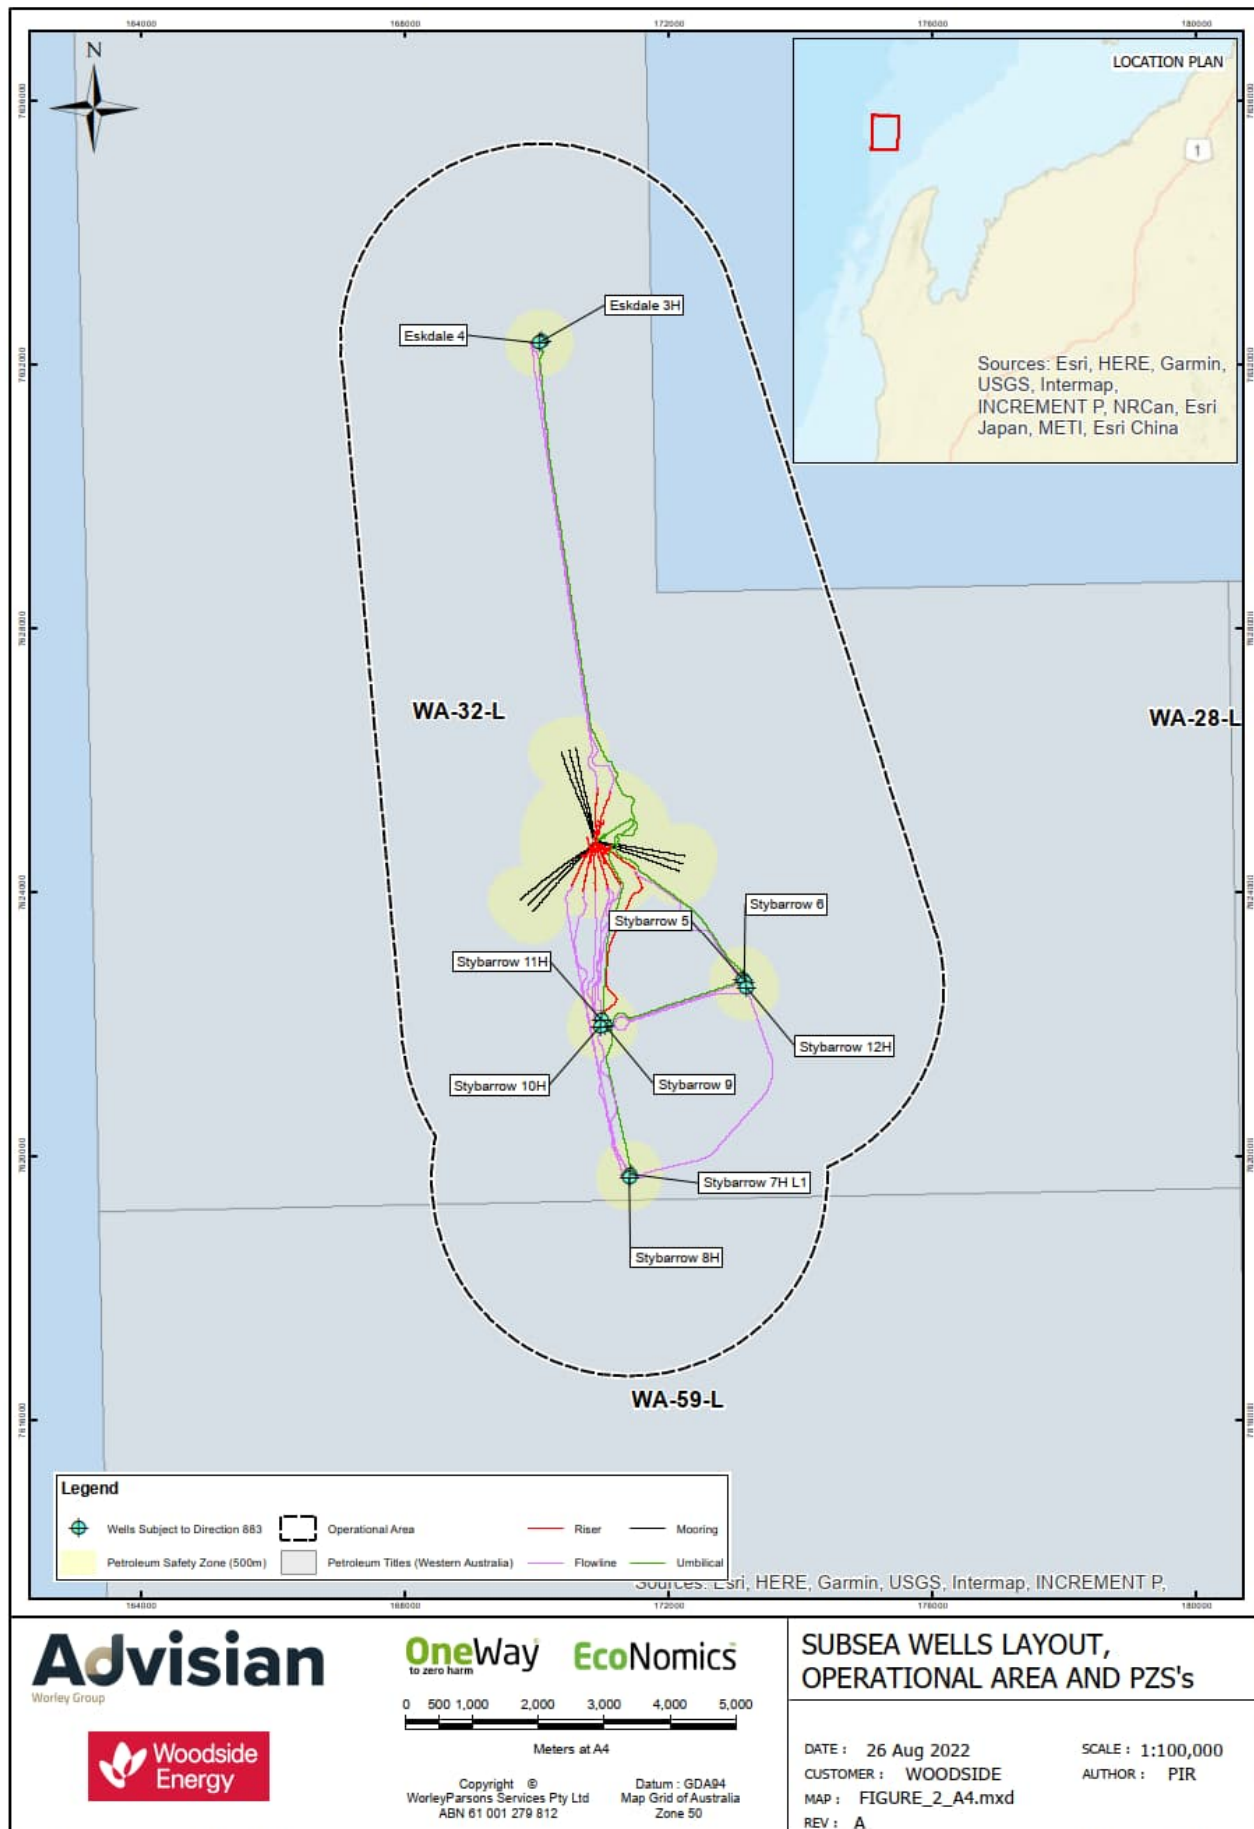

Figure 3-2: Petroleum Activity Location and Operational Area

### 3.4 Timing and Duration

The proposed timing for the petroleum activity is outlined in **Table 3-4**. P&A activities are dependent on the availability of a suitable MODU. The earliest the Petroleum Activity may commence is Q4 2023 (subject to acceptance of this EP by NOPSEMA). However, this is subject to the EP acceptance timeline, vessel availability, operational constraints and prevailing weather conditions.

The permanent plugging of the Stybarrow wells within WA-32-L is required to be completed no later than the 30 September 2024, pursuant to Direction 1 of General Direction 833. Subsea tree and wellhead removal and recovery is an optional activity in this EP. The base case is removal and recovery of subsea trees and wellheads as part of the field equipment removal campaign described and managed under the Stybarrow Decommissioning and Field Management EP. Well infrastructure above the mudline is required to be recovered no later than 31 March 2025, under Direction 2 of General Direction 833.

Decommissioning planning and timing for other decommissioning activities, including ongoing inspection and maintenance activities of infrastructure until decommissioning related to WA-32-L are outlined in (**Section 3.6**).

**Table 3-4: Indicative timing of the proposed Petroleum Activity**

| Activity  | Cumulative Duration  | Approximate Timing   | Indicative Vessel(s)   |
|---|--|--|--|
| Preparatory activities, including cleaning, inspection and testing of subsea trees, hydrate remediation, verification of barriers, disconnection of ancillary equipment (as required) and installation of temporary equipment for P&A (mooring pre-lay, tether installation) as required. | ~ 7 to 10 days per well  | Conducted approximately one to six months prior to plug and abandonment activities.<br>Some preparatory activities may be ongoing once the MODU arrives on location.<br>Estimated to be between Q4 2023 – Q3 2024.   | One project vessel, either a Light Construction Vessel (LCV) or Multi-Purpose Support Vessel (MPSV)  |
| Permanent plug and abandonment  | ~ 18 to 24 days per well   | Estimated to be between Q4 2023 – Q3 2024.<br>Permanent plug and abandonment activities will be completed no later than 30 September 2024 as required by Direction 1 under General Direction 833.  | MODU supported by 2 – 3 support vessels  |
| Removal of well infrastructure (subsea trees and wellheads)   | ~ 1 to 5 days per well (included in above duration if performed as part of the plug and abandonment scope on the MODU) | Estimated to be between Q1 2024 – Q1 2025.<br>This is an optional activity under this EP to take advantage of available vessels and/or opportunities for efficiencies with other Stybarrow removal activities.<br>Removal of well infrastructure will be completed no later than 31 March 2025 as required by Direction 2 under General Direction 833. | Base case is to remove well infrastructure with support vessel (LCV or MPSV) as part of the field equipment removal campaign described and managed under the Stybarrow Decommissioning and Field Management EP.<br><br>Optional activity to remove well infrastructure with MODU under this Stybarrow Plug and Abandonment EP. |
| Recovery of ancillary equipment including pre-laid moorings and BOP tether system (if used)   | ~ 1 to 2 days per well   | Within about one month following MODU demobilisation<br>Estimated to be between Q4 2023 – Q4 2024.<br>This activity will be completed  | Support vessel   |

| Activity | Cumulative Duration | Approximate Timing  | Indicative Vessel(s) |
|----------|---------------------|---|----------------------|
|          |                     | by the end of Q1 2025 as required by General Direction 833. |                      |

The MODU and support vessels are expected to remain within the Operational Area for approximately eight months if activities are undertaken in a single campaign (including contingency time). When ongoing, activities will be undertaken 24 hours per day, seven days per week.

The indicative timings provided in **Table 3-4** are subject to change due to project schedule requirements, MODU/vessel availability, unforeseen circumstances and weather. This EP has risk assessed P&A activities throughout the year (all seasons) to provide operational flexibility. All the above timeframes are subject to change and, as no particular time periods have been nominated, changes to the above will not be interpreted as 'new stages' against Regulation 17(5) if within the lifetime of this EP.

### 3.4.1 SIMOPS

No simultaneous P&A operations (i.e., more than one MODU in the Operational Area simultaneously) are planned. There is potential some preparatory activities conducted on a project vessel may still be ongoing once the MODU mobilises and commences plugging activities within the Operational Area. There is also potential for simultaneous operations (SIMOPS) to occur between the Petroleum Activity and other decommissioning activities, such as subsea removal activities defined in the Stybarrow Decommissioning Equipment Removal and Field Management EP within WA-32-L. Potential cumulative environmental impacts from SIMOPS are assessed in this EP and the Stybarrow Decommissioning Equipment Removal and Field Management EP. Woodside has developed the Stybarrow Facilities Decommissioning SIMOPS Management Plan to manage SIMOPS.

If SIMOPS were to occur, a maximum of four vessels and the MODU may be in the field at the same time based on:

- The MODU and one support vessel
- Two equipment removal vessels
- One supply vessel.

## 3.5 Stybarrow Infrastructure Overview

The Stybarrow and Eskdale fields within petroleum permit WA-32-L were jointly developed as the Stybarrow Development. The development produced hydrocarbons via a cluster arrangement of ten wells connected to subsea flexible flowlines and risers tied back to the Stybarrow Venture MV16 FPSO, moored to a disconnectable mooring riser system (DTM). The Stybarrow wells included:

- Five production wells in the Stybarrow field - Sty-8H (H-1), Sty-7H L1 (H-2), Sty-10H (H-3), Sty-11H (H-4) and Sty-12H (H-5);
- One production well in the Eskdale field – Esk-3H (EH-1);
- Three water injection wells to provide reservoir pressure maintenance and reinjection of produced water in the Stybarrow field - Sty-5 (I-3), Sty-6 (I-2) and Sty-9 (I-1); and
- One gas injection well in Eskdale for storage for excess produced gas from the Stybarrow Development as well as pressure maintenance in the Eskdale field - Esk-4 (EG-1).

The Stybarrow development ceased production in 2015, having produced more than 60 MMstb of crude oil since coming on stream in 2007. Following cessation of production (CoP), an initial cessation program was conducted via the FPSO facility and included:

- The depressurisation of the subsea production system, including flushing and cleaning of flowlines and risers to displace residual hydrocarbons back into the formation using treated seawater;
- Nine of the wells (all except Sty-11) were back flushed with treated seawater (bull-headed via gas lift annuli and tubulars) to the surface controlled subsurface safety valves (SCSSV), then closed and pressure above the subsurface safety valves (SCSSV) was bled off;
- The subsea tree valves were closed and pressure tested to verify integrity of barriers; and
- The DTM was ballasted and then lowered to normal ballast level (approximately 30 m water depth).

Following these activities, the FPSO was able to permanently disconnect and depart the field. In early 2016, a subsequent vessel-based program was conducted to disconnect the production and annulus flowlines from the subsea tree flow bases that run to the production platform or between drill centres (some interconnectors within the drill centres remain installed), providing additional assurance of infrastructure integrity during CoP and prior to final decommissioning.

### 3.5.1 Stybarrow Subsea Wells

A summary of the ten Stybarrow development wells is provided in **Table 3-5**. Each well is completed with a subsea horizontal xmas tree (HXT) incorporating wellhead controls for opening and closing hydraulically operated 'fail safe' control valves to isolate and regulate flow. The primary down-hole safety system is SCSSV on each well, which are installed in the production tubing approximately 400 - 500 m below the mudline.

Since CoP, all wells were permanently shut in via SCSSV and subsea tree valve closure. Final valve inflow and pressure tests were performed to a defined acceptance criteria specified in the Well Integrity Management System as part of cessation requirements. Prior to wells being shut in and where feasible, wells were flushed and bull headed with treated seawater containing 800 ppm of Hydrosure chemical.

Table 3-5: Description of the Stybarrow development wells

| Well Name            | Well History  |  | Current Status and Residual Fluids  |  |   | Well Infrastructure  |
|----------------------|---|--|---|--|---|--|
|                      | Well Description  | Drilling Fluids  | Current Status  | Production Tubing Contents   | Production Annulus <sup>2</sup> Contents  |  |
| Stybarrow-7HL1 (H-2) | Stybarrow 7H L1 is a horizontal gas-lifted oil production well.<br>The well was spudded on the 14 November 2006 and produced from 2007 to 2015. | The well was drilled with predominately water-based mud systems, with the 12.25" section drilled with a synthetic based mud. | The well was shut in via SCSSV and subsea tree valve closure, with testing completed to verify barriers.<br>Subsea control hydraulics are de-energised and disabled and well is disconnected from flowline at flowbase connector. | Predominately reservoir fluids with potential for residual treated seawater (800 ppm Hydrosure). | Predominately treated seawater (800 ppm Hydrosure) with residual hydrocarbons and completion brine. | 5" x 2" horizontal production xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing |
| Stybarrow-8H (H-1)   | Stybarrow-8H is a horizontal gas-lifted oil production well.<br>The well was spudded on the 13 November 2006 and produced from 2007 to 2015.    | The well was drilled with predominately water-based mud systems, with the 12.25" section drilled with a synthetic based mud. | The well was shut in via SCSSV and subsea tree valve closure, with testing completed to verify barriers.<br>Subsea control hydraulics are de-energised and disabled and well is disconnected from flowline at flowbase connector. | Predominately reservoir fluids with potential for residual treated seawater (800 ppm Hydrosure). | Predominately treated seawater (800 ppm Hydrosure) with residual hydrocarbons and completion brine. | 5" x 2" horizontal production xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing |
| Stybarrow 10H (H-3)  | Stybarrow-10H is a horizontal gas-lifted oil production well.<br>The well was spudded on 17 March 2007 and produced from 2007 to 2015.          | The well was drilled with predominately water-based mud systems, with the 12.25" section drilled with a synthetic based mud. | The well was shut in via SCSSV and subsea tree valve closure, with testing completed to verify barriers.<br>Subsea control hydraulics are de-energised and disabled   | Predominately reservoir fluids with potential for residual treated seawater (800 ppm Hydrosure)  | Predominately treated seawater (800 ppm Hydrosure) with residual hydrocarbons and completion brine. | 5" x 2" horizontal production xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing |

<sup>2</sup> The production annulus refers to the a-annulus space behind the production tubing.

| Well Name           | Well History   |   | Current Status and Residual Fluids  |   |   | Well Infrastructure   |
|---------------------|--|---|---|---|---|---|
|                     | Well Description   | Drilling Fluids   | Current Status  | Production Tubing Contents  | Production Annulus <sup>2</sup> Contents  |   |
|                     |  |   | and well is disconnected from flowline at flowbase connector  |   |   |   |
| Stybarrow-11H (H-4) | Stybarrow-11H is a gas-lifted oil producer.<br>The well was spudded on the 18 March 2007 and produced through to August 2010, when a significant failure of the lower completion led to a sand production event. The well was shut in from production and remained offline thereafter. | The well was drilled with predominately water-based mud systems, with the 12.25" section drilled with a synthetic based mud.  | Shut in via tree valve closure. Valves inflow tested to acceptance in August 2010 and in situ leak tested in June 2015.   | Predominately reservoir fluids. Possible sand plug at unknown depth.                            | Completion brine with residual hydrocarbon.   | 5" x 2" horizontal production xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing  |
| Stybarrow-12H (H-5) | Stybarrow-12H is a gas-lifted oil producer<br>The well was spudded on the 27 July 2010 and produced from 2010 to February 2014, when it was shut in due to restricted flowrates.   | The well was drilled with predominately water-based mud systems, with the 12.25" section drilled with a synthetic based mud.<br>The 16" section was also drilled with SBM which was displaced to WBM prior to cementing the 13-3/8" casing. | Shut in via valve closure. Valves inflow tested to acceptance.<br>The gas lift and production choke of the well were known to be seized in an open position, and consequently were unable to be closed as part of cessation activities. | Predominately reservoir fluids with potential for residual treated seawater (800 ppm Hydrosure) | Predominately treated seawater (800 ppm Hydrosure) with residual hydrocarbons and completion brine. | 5" x 2" horizontal production xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing.<br>Subsea tree is non drill through tree. |
| Eskdale-3H (EH-1)   | Eskdale-3H is a gas lifted oil producer.<br>The well was spudded on the 5 April 2007 and   | The well was drilled with predominately water-based mud systems, with the 12.25" section drilled  | The well was shut in via SCSSV and subsea tree valve closure, with testing completed to verify barriers.  | Predominately reservoir fluids with potential for residual treated seawater (800 ppm Hydrosure) | Predominately treated seawater (800 ppm Hydrosure) with residual hydrocarbons and completion brine  | 5" x 2" horizontal production xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing.   |

| Well Name         | Well History   |  | Current Status and Residual Fluids   |   |  | Well Infrastructure   |
|-------------------|--|--|--|---|--|---|
|                   | Well Description   | Drilling Fluids  | Current Status   | Production Tubing Contents  | Production Annulus <sup>2</sup> Contents                   |   |
|                   | produced from 2007 to 2015.<br>Throughout the production life, the well produced under natural flow, and gas lift was not required.  | with a synthetic based mud.<br>The 17.5" section was also drilled with SBM which was partially displaced to WBM prior to cementing the 13-3/8" casing. | Subsea control hydraulics are de-energised and disabled and well is disconnected from flowline at flowbase connector   |   |  | Subsea tree is non drill through tree.  |
| Stybarrow-5 (I-3) | Stybarrow-5 is a water injection well.<br>The well was spudded on the 13 September 2006. Water injection commenced in 2007 initially using treated seawater and later using produced water. Well injected significant water volumes from 2007 to 2015. | The well was drilled with water-based mud systems.   | In August 2015, the well was closed in as part of production cessation, with a column of treated inhibited seawater in the tubing.<br>Shut in via valve closure. Valves inflow tested to acceptance. | Predominately treated seawater (with 800 ppm Hydrosure) and completion brine. | Annulus is closed and contains a water-based packer fluid. | 5" x 2" horizontal water injection xmas tree / flowbase / 18-3/4" high pressure wellhead and 30" wellhead housing |
| Stybarrow-6 (I-2) | Stybarrow-6 is a water injection well.<br>The well was spudded on the 15 September 2006. Water injection commenced in 2007 initially using treated seawater and later using produced water. Well injected significant water volumes from 2007 to 2015. | The well was drilled with water-based mud systems.   | In August 2015, the well was closed in as part of production cessation, with a column of treated inhibited seawater in the tubing.<br>Shut in via valve closure. ## 3.6 Holistic Stybarrow Decommissioning and Timing

### 3.6.1 Decommissioning Planning

Decommissioning planning for the Stybarrow field is underway, with scope of work and tender/contract documents in a mature state.

Stybarrow infrastructure within petroleum title WA-32-L is required to be removed before 31 March 2025, in accordance with General Direction 833, unless NOPSEMA accepts and is satisfied that an alternative decommissioning approach delivers equal or better environmental outcomes.

The activities being undertaken to meet the requirements of Section 572, Section 270 and General Direction 833 are covered by three separate Environment Plans. Prior to acceptance of the Stybarrow Equipment Removal and Field Management EP, the accepted Stybarrow Operation Cessation EP remains in force. The scope of each is detailed in **Table 3-6** and their expected scheduling is shown in **Figure 3-3**.

The Stybarrow Decommissioning and Field Management EP is the overarching permissioning document under which the decommissioning requirements of General Direction 833 are captured. It is planned to be the final EP for the Stybarrow field and anticipated to remain in force until such time all decommissioning activities are completed, and the petroleum title can be relinquished.

**Table 3-6: Summary of EPs related to the decommissioning of the Stybarrow Field**

| EP  | Scope   | EP Initiation   | EP Termination  | EP Status <sup>1</sup>                 |
|---|---|---|---|--|
| Stybarrow Operation Cessation EP                  | Preservation <i>in situ</i> of subsea equipment.<br>Vessel-based activities (e.g., subsea inspections and interventions).   | Currently in force, accepted by NOPSEMA 28 April 2017.  | On acceptance by NOPSEMA of the Stybarrow Equipment Removal and Field Management EP.<br>The EP will end when Woodside notify NOPSEMA that the petroleum activity has ended, all obligations under the EP have been completed, and NOPSEMA accept the notification in accordance with Regulation 25A of the Environment Regulations.                         | In force                               |
| Stybarrow Decommissioning and Field Management EP | Removal of subsea equipment in the Stybarrow field (WA-32-L), excluding infrastructure proposed for abandonment <i>in situ</i> (assessed under the Stybarrow Field Decommissioning EP).<br>Field management activities (e.g., inspections) for all infrastructure within WA-32-L as required until final decommissioning. | From acceptance of the EP, covering all infrastructure removal and field management activities.                   | The EP will end when Woodside notify NOPSEMA that the petroleum activity has ended, all obligations under the EP have been completed, and NOPSEMA has accepted the notification in accordance with Regulation 25A of the Environment Regulations.<br>This EP will be the final EP in force for Stybarrow Field.<br>( to be completed by the end of Q2 2025) | Under assessment                       |
| Stybarrow P&A EP<br>( <i>this EP</i> )            | P&A of wells subject to Direction 1 of General Direction 833 that have not been accepted by NOPSEMA as plugged and abandoned.<br>Removal of well infrastructure above the mudline (wellheads and  | On notification to NOPSEMA for commencement of activities relating to the P&A of the Stybarrow development wells. | The EP will end when Woodside notify NOPSEMA that the petroleum activity has ended, all obligations under the EP have been completed, and NOPSEMA has accepted the notification in accordance with Regulation 25A of the Environment Regulations.<br>( to be completed by the end   | Under assessment<br>( <i>this EP</i> ) |

| EP                     | Scope   | EP Initiation   | EP Termination  | EP Status <sup>1</sup> |
|------------------------|---|---|---|------------------------|
|                        | subsea trees).  |   | of Q1 2025)   |                        |
| Stybarrow Deviation EP | The proposed abandonment <i>in situ</i> for Stybarrow infrastructure including the DTM anchors, suction piles and Eskdale-1 wellhead. | From acceptance of EP, covering abandonment <i>in situ</i> of infrastructure (no activities required) | The EP will end when Woodside notify NOPSEMA that the petroleum activity has ended, all obligations under the EP have been completed, and NOPSEMA has accepted the notification in accordance with Regulation 25A of the Environment Regulations.<br><br>(estimated to be completed within four months following acceptance of the EP). | Under assessment       |

Note 1. Status as of 1 November 2023

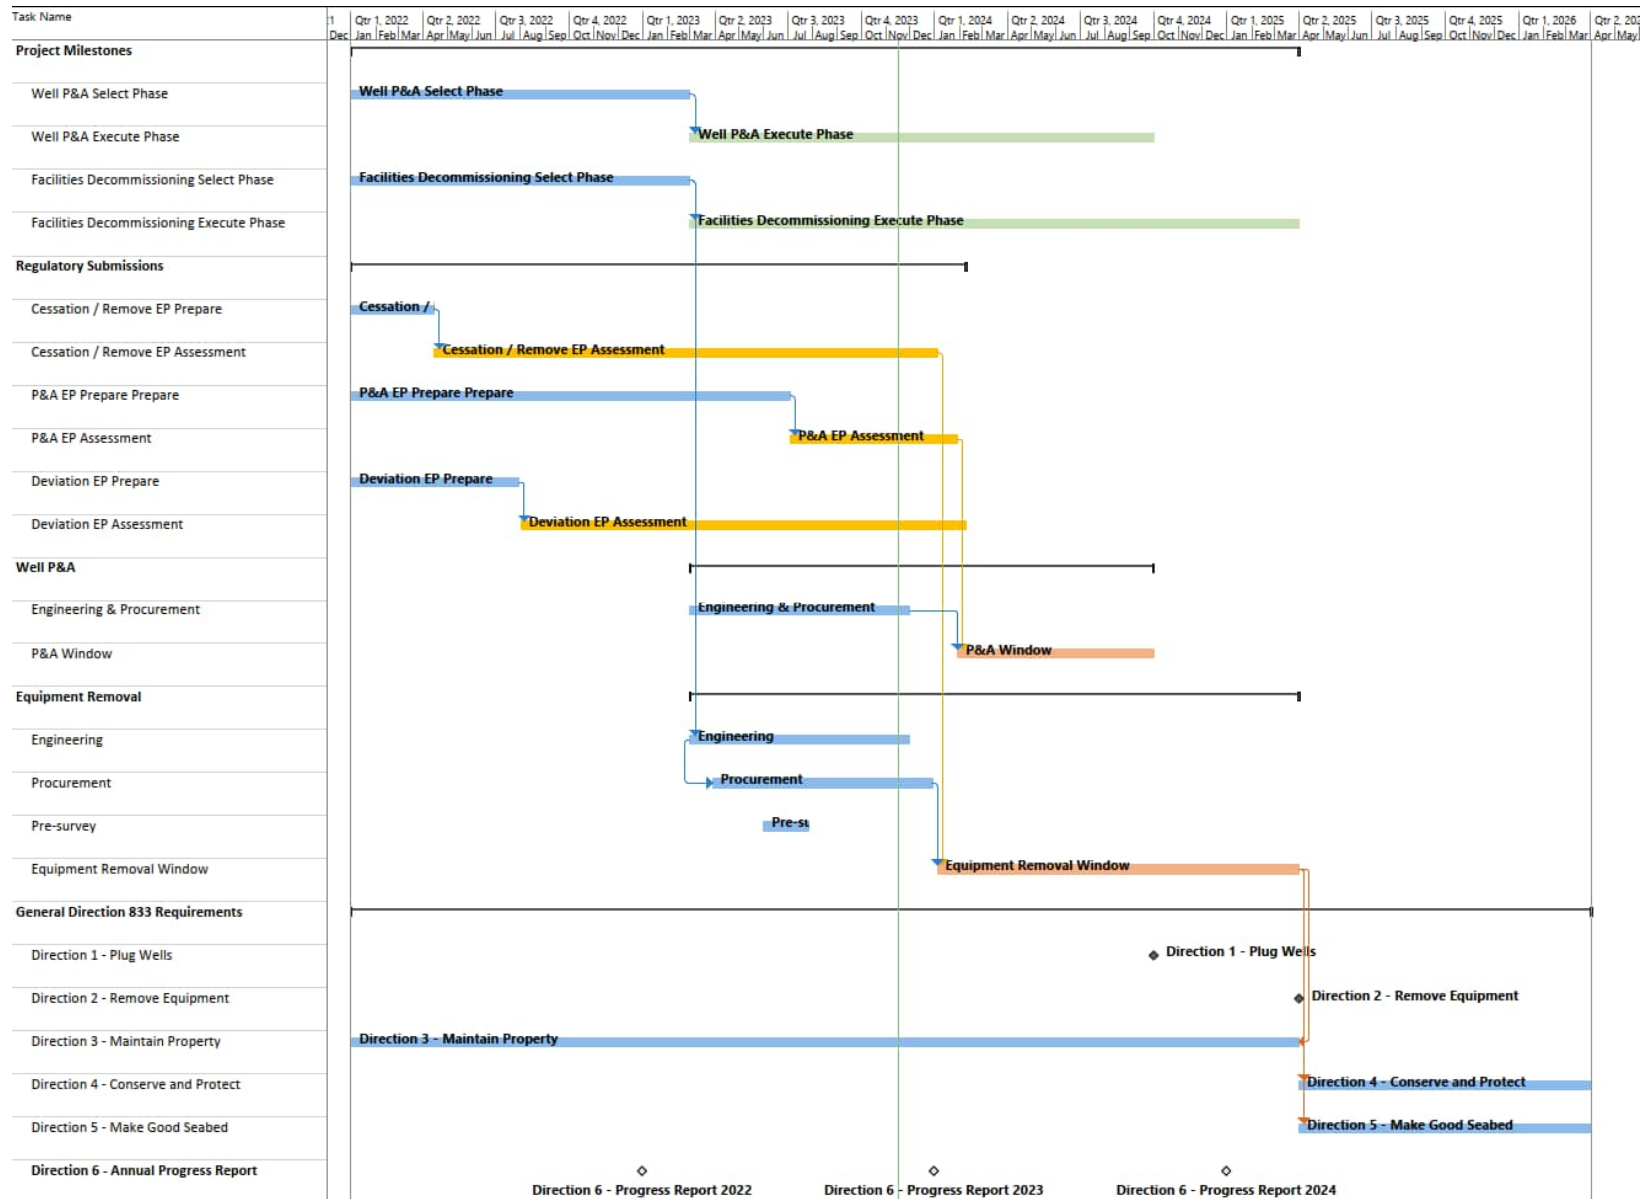

Figure 3-3: Indicative schedule for submission of permissioning documents and planning for Stybarrow Field decommissioning

### 3.6.2 Plug and Abandonment Contracting Process

Woodside has in-house expertise in well design, including P&A. Woodside relies on contractors to implement the P&A designs that will be developed by Woodside. Woodside will engage the market to select an appropriate suite of service providers to undertake P&A activity under Woodside's supervision. Woodside's process to engage the market comprises:

- Expression of interest (EOI) – service providers likely to have, or can develop, the capability to execute elements of the P&A activity are invited by Woodside to express their interest in implement the P&A of wells. Through the EOI process, contractors are asked to submit details of relevant experience, basic methodology for execution, and resource availability (e.g., MODU and support vessel availability). EOI submissions are assessed against the requested details to create a short-list of service providers who should be invited to respond to tender.
- Invitation to tender and evaluation – documents defining the required services are released to short-listed service providers, who are invited to submit a tender for evaluation. The tender will detail particulars, such as schedule, methodology, equipment and cost.
- Contract Award – Woodside will then evaluate tenders and select a preferred tender to undertake the work. Woodside supervises tender work and undertakes compliance activities to ensure work by tenders meets Woodside's specifications.

### 3.6.3 Surveys or Studies Undertaken to Support the Decommissioning Program

A baseline environmental survey was conducted in 2018 to inform background levels of contaminants in the sediment and water column (Cardno, 2019). These survey results will be utilised as a comparison basis for the post decommissioning environmental survey described in the Stybarrow Decommissioning and Field Management EP.

Remotely Operated Vehicle (ROV) surveys have also been completed to inform the infrastructure condition and removal methods. These surveys will support P&A planning, infrastructure removal planning and a Sea Dumping Permit application for infrastructure proposed to be abandoned *in situ* (not part of this EP scope).

Woodside undertook surveys of potential naturally occurring radioactive material (NORM) and mercury within the Stybarrow subsea production system (SA Radiation, 2018a, 2018b). Radiation measurements at the trees found NORM activity was below the limits of detection. Mercury in a thin layer of scale was below the laboratory limit of detection.

Woodside will undertake final environmental surveys described in the Stybarrow Decommissioning and Field Management EP. Results from these decommissioning surveys will be collated with relevant historical survey data, ROV images and other sediment sampling conducted over the operational life of the field to demonstrate Woodside has provided for the conservation and protection on natural resources and made good any damage to the seabed as per s. 270 of the OPGGS Act and Directions 4 and 5 in General Direction 833. Refer to the Stybarrow Decommissioning and Field Management EP for further detail, including Woodside's reporting obligations under both the OPGGS Act and General Direction 833.

## 3.7 Project Vessels

Several vessel types will be required to complete the petroleum activities as summarised in **Table 3-7**.

All project vessels (including MODU and support vessels) will be subject to Woodside's Marine Management procedure and review of the Offshore Vessel Inspection Database (OVID). All required audits and inspections will assess compliance with the laws of the international shipping industry, which include safety and environmental management requirements, and maritime legislation including International Convention for the Prevention of Pollution from Ships 1973 as modified by the Protocol of 1978 (MARPOL) and other International Maritime Organization (IMO) standards.

For power generation, vessels may use diesel-powered generators and/or LNG. All vessels will display navigational lighting and external lighting on a 24-hour basis, as required for safe operations. Lighting levels will be determined primarily by operational safety and navigational requirements under relevant legislation, specifically the *Navigation Act 2012*.

Table 3-7: Project Vessels Overview

| Vessel Type              | Activities   |
|--------------------------|--|
| MODU                     | <p>A moored or dynamically positioned (DP) MODU will be used to permanently plug the wells.</p> <p>Typical specifications for a MODU are provided in <b>Table 3-8</b> and <b>Table 3-9</b></p>   |
| Offshore Support Vessels | <p>Offshore Support Vessels may include:</p> <ul style="list-style-type: none"> <li>Anchor handling vessel (AHV) to set anchors, prepare the wells for P&amp;A and support the MODU during operations</li> <li>AHVs or Light Construction Vessel (LCV) with ROV capability to remove and recover well infrastructure above the mudline</li> <li>General support vessels including cargo vessels and barges for transporting equipment and materials from port/staging area to the Operational Area (e.g. equipment, fluids and cement) and for general resupply and support for the MODU.</li> </ul> <p>Offshore support vessels will not anchor within the Operational Area due to water depth and therefore, the vessels will use DP.</p> <p>Typical specifications for support vessels are provided in <b>Table 3-10</b>.</p> |

### 3.7.1 Mobile Offshore Drilling Unit

A MODU will be required to undertake the petroleum activities. The MODU that will undertake the plug and abandonment activities has not yet been determined. The MODU will be either moored or dynamically positioned (either a semi-submersible or a drillship) – both types have been considered in this EP. Use of the term MODU in this EP may refer to any of the types described above. Indicative specifications for a moored MODU and a dynamically positioned MODU are provided in **Table 3-8** and **Table 3-9**. At least one support vessel will be in the Stybarrow field on standby duties near the MODU at all times.

If a moored MODU is used, a detailed mooring analysis will be undertaken for each drill centre and may use pre-laid moorings. The standard mooring system aboard an indicative moored MODU consists of eight (3 ¼") x 4,200 ft. RQ5 chains, eight (3 ¼") x 8,800 ft. wires, and eight 15T Stevpris MK6 anchors with an individual footprint of approximately 30 m<sup>2</sup>.

The capacity of the standard mooring system may be expanded to a 12-point mooring system, depending on the outcomes of the mooring analysis. Each of the mooring lines will be tethered to drum winches aboard the MODU enabling the tensioning of individual moorings to compensate for MODU movement during the activity. Multiple mooring spreads may be installed concurrently to facilitate efficient use of the MODU (i.e., "leap-frogging" to pre-laid moorings when moving between drill centres).

The MODU will have a well fluid handling package, enabling the recovery, treatment and storage of fluids containing residual hydrocarbons. Residual liquid hydrocarbons will either be retained onboard for onshore disposal or flared. Residual gas will be either flared or cold vented. All hydrocarbons recovered from wells will be managed in accordance with the MODU Safety Case.

Combustion engines onboard the MODU (e.g., generators, cranes, etc.) will use diesel fuel.

The petroleum activity will result in discharges to the marine environment, in accordance with relevant requirements, which include:

- Utility discharges, such as sewage, grey water, cooling water, reverse osmosis brine and putrescible wastes
- Drainage water that conforms to discharge standards
- Ballast water
- Fluids recovered from wells, such as water, brine, production tubing and annulus fluids
- Excess drilling fluids and related materials that meet discharge standards, such as:
  - Excess cement slurry (including cement unit test slurry)
  - Excess brine and water-based drilling fluids
  - Excess dry bulk cement, bentonite and barite

- Sands recovered from wells

Materials that do not meet the discharge standards described in this EP will be disposed of onshore.

**Table 3-8: Typical moored MODU specifications (based on *Ocean Apex*)**

| Parameter                            | Indicative Values                       |
|--------------------------------------|---|
| <b>Rig Type</b>                      | <b>Deep-water semi-submersible MODU</b> |
| Accommodation                        | 140 persons (maximum persons on board)  |
| Station Keeping                      | Moored                                  |
| Bulk Mud and Cement Storage Capacity | 765 m <sup>3</sup>                      |
| Liquid Mud Storage Capacity          | 1,706 m <sup>3</sup>                    |
| Fuel Oil Storage Capacity            | Approximately 4,000 m <sup>3</sup>      |
| Drill Water Storage Capacity         | 2,457 m <sup>3</sup>                    |

**Table 3-9: Typical DP MODU specifications (based on *Valaris DPS-1*)**

| Parameter                            | Indicative Values                             |
|--------------------------------------|---|
| <b>Rig Type</b>                      | <b>Ultra-deep-water semi-submersible MODU</b> |
| Accommodation                        | 189 persons (maximum persons on board)        |
| Station Keeping                      | Dynamically positioned                        |
| Bulk Mud and Cement Storage Capacity | 1,000 m <sup>3</sup>                          |
| Liquid Mud Storage Capacity          | 2,663 m <sup>3</sup>                          |
| Fuel Oil Storage Capacity            | 3,640 m <sup>3</sup>                          |
| Drill Water Storage Capacity         | 3,482 m <sup>3</sup>                          |

### 3.7.2 Offshore Support Vessels

The MODU will be accompanied by at least one, but up to three, Offshore Support Vessels. Support vessels will primarily be used to deploy and recover anchors (if a moored MODU is used), towing, and supply (e.g., fuel, provisions, consumables etc.), but may perform other duties as required (e.g., well infrastructure removal and recovery, emergency response).

Support vessels are expected to transit to and from the Operational Area to ports in the region (most likely to be Dampier or Exmouth), however at least one support vessel will remain with the MODU at all times on standby duties. Support vessel activities outside the Operational Area are beyond the scope of this EP. Support vessels will use dynamic positioning when working in proximity to the MODU.

Support vessels will make routine discharges to the sea in accordance with relevant requirements, such as:

- Utility discharges, such as sewage, grey water, cooling water, reverse osmosis brine and putrescible wastes
- Deck drainage
- Bilge water
- Cooling water
- Ballast water

Table 3-10: Typical vessel specifications for Offshore Support Vessels

| Parameter                                     | Indicative Offshore Support Vessel |
|---|------------------------------------|
| Draft (max) (m)                               | 8 to 9                             |
| Length (m)                                    | 110 to 130                         |
| Berths (persons)                              | 130                                |
| Gross tonnage (t)                             | 3,000                              |
| Fuel type                                     | MDO                                |
| Total fuel volume (m <sup>3</sup> )           | 3,000                              |
| Volume of largest fuel tank (m <sup>3</sup> ) | 800                                |

### 3.7.3 Refuelling and Bulk Transfer

All vessels and MODU will utilise diesel-powered generators for power generation and will be refuelled via support vessels, approximately weekly during activities within the Operational Area. Other fuel transfers may occur within the Operational Area including refuelling of cranes, helicopters or other equipment as required. All project vessels will run on Marine Diesel Oil (MDO); no intermediate or heavy fuel oils will be used.

Bulk transfers of chemicals (e.g., barite, bentonite, cement and other drill fluid chemicals) may also be undertaken between vessels and between a vessel and the MODU within the Operational Area. Support vessels may undertake transfers of equipment, material and consumables to and from the MODU, or between support vessels.

### 3.7.4 Dynamic Positioning

DP uses satellite navigation and radio transponders in conjunction with thrusters to maintain position at the required location. Information about the position of the vessel/MODU is provided via a number of seabed transponders, which emit signals detected by receivers on the vessel and used to calculate position. The transponders are typically deployed in an array on the seabed, using clump weights comprising concrete, for the duration of permanent plugging activities at each well, and are recovered at the end, generally by ROV.

### 3.7.5 Remotely Operated Vehicles

Work-class ROVs will be used throughout the Petroleum Activity and may be deployed from the MODU and support vessels. ROVs will be deployed, operated and recovered using a tether management system. ROVs may be used for:

- visual inspections and observations
- seabed and hazard survey
- anchor hold testing
- Blow Out Preventer (BOP) installation, testing, operation and recovery (including tether deployment and recovery, if required).
- Installation of subsea equipment (e.g. HXT controls system, lightweight H4 corrosion cap, flowline hub caps)
- xmas tree valve operation and pressure testing
- testing of electrical and hydraulic controls on subsea trees
- subsea tree barrier testing (bleeding off residual hydrocarbon from SCSSV control line and tree cavity)
- Hydrate remediation of HXT and flowline cavities
- marine growth removal and cleaning
- sediment relocation
- subsea rigging, handling and cutting

- manual valve functioning
- wellhead tooling and cutting
- De-coupling of existing flowline and flying leads (hydraulic and electrical)
- recovery of dropped objects
- as-left seabed surveys

An ROV can be fitted with various tools and camera systems that can be used to capture permanent records (both still images and video) of the operations and immediate surrounding environment.

### 3.7.6 Helicopters

Crew changes for the MODU and support vessels may be performed using helicopters, with transfers occurring as required, depending on crew requirements. Helicopter operations within the Operational Area will be limited to landing on, and take-off from, the helidecks.

## 3.8 Well Plug and Abandonment Activities

### 3.8.1 Well Abandonment Design Standards

The goal of a permanent abandonment is to reduce the possibility fluid will escape from the wellbore, or develop harmful flow below the surface, to as low as reasonably practicable. The design of the wells and P&A activities, including applicable standards, are described in detail in the Stybarrow / Eskdale Well Operations Management Plan (WOMP). P&A activities will be undertaken in accordance with the accepted WOMP.

### 3.8.2 Plug and Abandonment Preparatory Activities

Prior to the MODU arrival to conduct rig-based P&A, an offshore support vessel will be mobilised to the field to conduct preparatory activities. The purpose of this campaign is to prepare the wells to facilitate an efficient and informed approach to rig based P&A activities.

The following preparatory activities that may be conducted include:

- Inspections and as found visual surveys to validate condition of well infrastructure prior to P&A
- Marine growth removal, cleaning of mineral deposits and sediment relocation as required around the well infrastructure in preparation for the MODU to secure access to the well
- Disconnection of hydraulic flying leads and electrical flying leads from subsea trees to enable clear access for P&A.
- Disconnection of existing flexible jumpers from the subsea tree flow bases and installation of pressure retaining plugs (where required).
- Installation of subsea tree control hardware.
- Subsea tree function and pressure testing.
- Validate well barriers by bleeding off residual hydrocarbons from tree cavities and SCSSV control lines to the marine environment.
- Interrogating Subsea Control Modules to confirm functionality and gauge communications.
- Optional deployment of mud mats for temporary placement of subsea trees during P&A as required.
- Optional deployment of pre-laid moorings for the MODU (moored MODU only) and BOP tether system (if required).

These activities may occur between about one to six months prior to the MODU mobilising to the Operational Area and may be ongoing once the MODU commenced plugging activities.

All project vessels and MODUs used to undertake the Petroleum Activity will be subject to pre-mobilisation checks as part of Woodside's Marine Management Procedure.

#### 3.8.2.1 Visual Inspection

An as-found survey using an ROV may be conducted on the well infrastructure prior to P&A. This survey aims to

identify any issues with the infrastructure (e.g., burial, integrity) which have the potential to affect the approach to P&A and final removal. The as-found survey may also identify miscellaneous debris for recovery. ROVs may also be used to conduct an as-left survey as discussed in **Section 3.8.7**.

### 3.8.2.2 Marine Growth Removal and Cleaning

Excess marine growth and mineral deposits may need to be removed from well infrastructure using an ROV before performing permanent plugging activities. Marine growth removal may also be required for the MODU throughout the campaign. **Table 3-11** lists the different cleaning techniques that may be used. Sulfamic (or equivalent) acid may be used to clean any calcium deposits that may have built up over time on the subsea tree interfaces.

**Table 3-11: Marine growth removal methods**

| Activity/Equipment             | Description  |
|--------------------------------|--|
| Water jetting                  | Uses high-pressure water to remove marine growth                   |
| Brush systems                  | Uses brushes attached to an ROV to physically remove marine growth |
| Acid (typically sulfamic acid) | Chemically dissolves calcium deposits                              |

### 3.8.2.3 Sediment Relocation

If sediment build up around well infrastructure has the potential to impede permanent plugging activities, a water jet or ROV-mounted suction pump may be used to move small amounts of sediment in the immediate vicinity of the infrastructure (i.e., within the existing footprint), to allow inspection/intervention works to be performed.

### 3.8.2.4 Disconnection of Jumpers and Flying Leads

Disconnection of any remaining equipment attached to the subsea trees may be required in order to facilitate safe and effective P&A and removal of well infrastructure. The majority of flowlines and jumpers have been flushed and disconnected from the subsea trees as part of the cessation of production flushing campaign. There are however several lines that are still connected to the trees including:

- three (3) 4" gas lift jumpers,
- one (1) 7" production jumper; and
- one (1) 9" water injector.

These flowlines have previously been flushed with raw seawater. Once disconnected from the subsea tree, the fluid retained within the lines will drain to the marine environment. The gas lift and water injection jumpers contain raw seawater, whilst the production jumper contains raw seawater with negligible volumes of residual hydrocarbon (< 30 ppm).

In addition, there is a hydraulic flying lead and an electrical flying lead attached to each of the subsea trees that require disconnection. During disconnection of the hydraulic flying leads, negligible volumes of water based hydraulic fluid may be discharged to the surrounding environment, with the majority of the fluid contents remaining within the leads as they contain self-sealing plugs. There is no fluid retained within the electrical flying leads, therefore no discharge associated with their disconnection.

### 3.8.2.5 Subsea Tree Preparation

The well infrastructure has been left in a state of preservation and certain inspections and testing activities will need to be conducted to verify well barriers and ensure infrastructure is prepared for efficient and successful P&A. Preparatory activities are defined in **Table 3-12** below including any relevant discharges. Further details on the associated discharges of these activities are assessed in **Section 7.6**.

Table 3-12: Summary of the subsea preparatory activities required for well P&amp;A

| Activity  | Description  |
|---|--|
| Removal or replacement of subsea tree cap               | When the tree cap is removed, there may be some gas, residual well fluids and residual chemicals from the well vented to the environment due to the internal tree cap passing minor quantities of fluids.  |
| Installation of Remote Work Over Control System (RWOCs) | Installation RWOCs onto HXT workover production plate and testing of functionality – Hydraulic testing to be conducted by ROV HPU  |
| Valve testing and barrier validation                    | Pressure testing the subsea trees via the RWOCs system   |
| Function testing of SCSSV                               | Function testing the SCSSV via the subsea tree hot stab receptacles  |
| Function testing SCM                                    | Function testing the subsea control module on the subsea trees (hydraulic and electrical testing). The SCMs may require recovery and replacement. A typical release of control fluid is estimated to be 10 L   |
| Flow base testing and preservation                      | Testing the subsea tree flowline hubs and installing protective caps where require for preservation.   |
| Hydrate remediation                                     | Hydrate remediation of the subsea trees where required. Small quantities of gas may be vented from the returns bladder during recovery to surface via the pressure relief valve.   |
| Mud mat installation                                    | Three of the subsea trees are no drill through trees and therefore require removal prior to rig based P&A activities. Three mud mats may be temporarily installed on the seabed adjacent to the subsea trees, to store the subsea trees on once they have been disconnected by the MODU. The mud mats are used to provide stability to wet parked structures due to the nature of seafloor sediments. The carbon steel mud mats are approximately 3.5 m x 3.5 m.<br><br>The mud mats, if deployed to support a subsea tree, will be recovered at the same time the other well infrastructure is being recovered. |

### 3.8.2.6 Blow Out Preventer Tether System Installation

To manage wellhead fatigue during P&A activities, a BOP tether system may be required to limit BOP movement. A typical BOP tether system uses about four to eight clump weights or similar anchoring system, weighing about 25–47 tonnes each, although final number and weight of the clump weights may differ depending on seabed and current conditions. These clump weights are deployed to the seabed about 20 to 40 m away from the wellhead, usually from an anchor handler tug. A ROV will then connect tethers between the clump weights and the BOP, which are subsequently tensioned to limit BOP movement. Suction piles may be used instead of clump weights, with typically four 160” diameter piles used per tether system. Both types of BOP tether will be removed at the end of the activity along with any pre-laid moorings.

### 3.8.2.7 MODU Mooring Installation and Anchor Hold Testing

In the event a moored MODU is used for the Petroleum Activity, the MODU mooring system, which includes chains/ropes and anchors, may be pre-laid before the MODU arrives at the location. Prior to the MODU arriving in the permit area a ‘Rig Move and Positioning Plan’ will be developed outlining the appropriate mooring configuration necessary to keep the MODU securely on location for the duration of the P&A activity. The final mooring configuration and design will be dependent on the outcome of this assessment.

Mooring may require an 8 to 12 point pre-laid mooring system at each well location, depending on the time of year. Moorings are typically placed in a radius around the well of up to approximately 4000 m. Transponders may be required to inform anchor positioning. The expected frequency (Hz) and source level (dB re 1 µPa @ 1 m) of the signal from transponders is 18–36 kHz, 196 dB (ref. 1 µPa @ 1 m).

Installation and proof tensioning of anchors involves some disturbance to the seabed. Anchor Handling Vessels (AHVs) are used in the deployment and recovery of the mooring system. As part of mooring preparations, anchor holding testing may be conducted at the well locations. An ROV may also be utilised to judge how deeply the anchor has embedded and independently verify the seabed condition. Anchor holding testing activities would occur prior to

the MODU arriving on location.

Soil analysis may also be necessary to provide data about composition and rock/substrate strength, as an input into the mooring or conductor design, and to verify seabed conditions for anchor hold. Soil analysis could include taking a physical sample of the seabed using ROV or other tools or using measuring devices such as a cone penetrometer.

All mooring equipment will be removed from the seabed upon completion of the P&A activity.

### 3.8.3 MODU Mobilisation and Positioning

The MODU will be mobilised to the Operational Area for P&A activities and commence positioning. If a moored MODU is used, it will either deploy anchors or connect to the pre-laid moorings, as described in **Section 3.6.2**. If a dynamically positioned (DP) MODU is used, the MODU will undertake DP testing to confirm the MODU is holding station at the correct location.

#### 3.8.3.1 Cement Unit Test

Upon arrival at the Operational Area, the MODU is typically required to perform a cement unit test to test the functionality of the cement unit and the MODU bulk cement delivery system before performing an actual cement job. Proper functioning of the cement system is important for ensuring well integrity. A cement unit test involves mixing a cement slurry at surface, and once functionality of the cement unit and delivery system has been confirmed, the slurry is discharged through the usual cement unit discharge line (which may be either below sea level or up to 10 m above the sea level) or through drill pipe below sea level.

The slurry is usually a mix of cement and water; however, may contain stabilisers or chemical additives in low concentrations. Cementing fluids will generally consist of Portland cement with additives (such as inorganic salts, lignins, bentonite, barite, silicates, defoamers and surfactants).

Cementing fluids are not routinely discharged to the marine environment, however, volumes of about 5 m<sup>3</sup> per well will be released when surplus fluids require disposal after cementing operations at the surface.

### 3.8.4 MODU Based Plug and Abandonment Activities

The permanent plugging for abandonment activities, including designing a permanent well barrier and installation of the barriers, will be completed in accordance with the NOPSEMA accepted Well Operational Management Plan (WOMP) as required under the OPPGS (Resource Management and Administration) Regulation 2011.

Once in position, the MODU will prepare to carry out P&A of wells. The nominal P&A program comprises of the following steps:

- Deploy ROV and perform calcium washes – this involves the discharge of calcium wash;
- Validate well barriers (which involves bleeding off residual hydrocarbons in tree cavities as SCSSV control line to sea).
- Remove debris cap, clean seal faces on the subsea tree and confirm well condition.
- Install, latch and pressure and function test BOP to subsea tree – this involves the discharge of water-soluble biodegradable ROV / BOP control fluids.
- Recover internal tree cap and a landing string / subsea test tree will be run inside the riser and a surface flow tree installed.
- Conduct wireline operations to recover production tubing hanger plug.
- Perform well kill by injecting well kill fluids (weighted brine) into well to bullhead residual hydrocarbons back into the reservoir.
- Where bullheading is not possible or additional circulation is required, lubricate and bleed operations or circulation options will be performed to remove any remaining residual hydrocarbon fluids from the well. A dedicated bleed off package will be installed on the MODU to manage fluid recovery, as described in **Section 3.8.4.2**.
- Stybarrow-11 (H-4), which experienced sand control failure during production, maybe require a coiled tubing intervention in order to circulate out formation sand above the planned suspension plug setting depth and allow plug and abandonment activities. Sand clean-out is described in **Section 3.8.5.1**.
- Install a mechanical deep-set suspension plug in the production tubing to isolate the reservoir and form the base for the cement plug.

- Cut production tubing/packer and recover production tubing from well.
- Conduct wireline logging if necessary to confirm annular isolation and determine the placement of the cement barrier.
- Install cement plugs to form permanent barrier isolating the production reservoir. The characteristics of the cement barrier (e.g., cement specification, barrier length etc.) will be verified and made in accordance with the accepted WOMP.
- Recover casing hanger seal assembly of well to release any potential gas and hydrocarbons that may have migrated into the annulus between the wellbore and production casing. Any hydrocarbons released will be recovered to the MODU and flared, vented or stored for disposal onshore via the bleed off package.
- Where synthetic based mud (SBM) was used to drill the 12-1/4" hole section and remains within the B-annulus, the casing will be perforated below the base oil / brine interface to allow the base oil component to be circulated out. Recovered base oil will be stored for disposal onshore. SBM remediation is described in **Section 3.8.4.6**.
- Where required, recover the 9-5/8" casing to allow for placement of shallow cement plugs to meet permanent barrier requirements to isolate the production reservoir and/or any shallower water bearing formations, where required. This may require the recovery of the subsea tree to allow for the recovery of the casing in the wells without drill through trees installed.
- The BOP is unlatched from the subsea tree and recovered to the MODU, along with the riser.
- Option to cut and recover the well infrastructure (subsea tree and wellhead) above the mudline from the MODU directly following permanent plugging of the well. Recovery of the subsea trees and wellheads is described in **Section 3.8.8**.

The P&A activities described above (along with contingent activities as required described in **Section 3.8.5**) will be repeated for each well, where relevant, within the scope of this EP.

The MODU will demobilise from the Operational Area on completion of the permanent plugging for abandonment of all ten wells. All moorings will be recovered upon completion of P&A activities. Excess brine and cement (including dry bulk cement, barite and bentonite) may be discharged to sea from the MODU following completion of the P&A activities (**Section 3.8.4.9**).

### 3.8.4.1 BOP and Subsea Control Systems

Permanent plugging of the Stybarrow wells commences with the installation of a BOP run on a marine riser. The BOP and marine riser provide a physical connection between the well and MODU. This enables a closed circulation system to be maintained, where fluids can be circulated from the wellbore back to the MODU, resulting in no unplanned discharges directly to sea. A subsea test tree and landing string is run inside the marine riser and BOP which connects to the internal tree cap or tubing hanger to facilitate primary well control during the well kill and abandonment. In addition, the subsea test tree inside the BOP provides a way to seal, control and monitor the well during permanent plugging activities.

The operation of the BOP components uses open hydraulic systems, using water-based BOP control fluids. The BOP will be tested on the surface prior to installation and will also routinely be tested once installed in accordance with the accepted WOMP.

The following tests are performed after the subsea BOP stack is initially installed on each well:

- A BOP function-test (including ROV test for closure of rams), and wellhead connector pressure-test; and
- A full pressure-test no later than 21 days from previous BOP pressure test.
- After the initial test, and for the duration of the activity, all BOP components (excluding hydraulic connectors and shear rams) shall be function tested every seven (7) days and pressure tested at intervals not exceeding 21 days.
- Function testing is undertaken by activating the hydraulic control system aboard the MODU to confirm functionality of the BOP systems, whilst a pressure test is undertaken to verify seals on the BOP stack.

The estimated volume of water-based BOP control fluid released to the marine environment per test is approximately 90 L. The functioning of subsea test tree valves and controls will discharge control fluid into the marine riser contained and returned to the MODU tanks.

Standard operations through the landing string and subsea test tree also include running logging and/or evaluation tools and removal of crown plugs and drifting tubing. During these operations the control system for the subsea tree operates in open loop, meaning control fluid is discharged to sea. Approximately 10 m<sup>3</sup> of control fluid is expected to be discharged per well.

Greater detail on the performance standards for the BOP and Subsea Control Systems, inclusive of design, functionality, and preventative maintenance, is provided in the WOMP.

#### 3.8.4.2 Well Kill

The wells will be killed by perforating the production tubing and pumping weighted well kill fluid into the wellbore. This is to control the pressure from the formation and to bullhead residual well fluids in the production tubing and A-annulus into the reservoir. The well kill fluid will be a weighted water-based brine. Loss control material (LCM) may also be used to reduce losses post well kill. MEG may also be added to the brine if required to inhibit hydrate formation.

If unable to kill the well by bullheading into the formation or where additional circulation may be required, the well pressure will be bled off at the MODU via a dedicated fluid and gas handling bleed off package. Subsequent operations such as “lubricate and bleed” will be used to kill the well. A dedicated bleed off package on the MODU will be used to direct residual wellbore fluids (including hydrocarbons) for separation and disposal/discharge, as described in **Section 7.6**. During well kill operations, the volumes returned to the MODU will depend on how much can be bullheaded into the formation successfully. Once the formation pressure is controlled, a mechanical deep-set suspension plug may be installed and verified to isolate the reservoir.

Fluids returned to the MODU during well kill operations will pass through a fluid handling bleed off package. The bleed off package is designed to take fluids through a choke and into a liquid knock out vessel or a surge tank (pressure rated). The knock-out vessel includes a separator which allows for gas and liquids to be separated. The gas, dependant on pressures and volumes, will be flared via the burner boom or cold vented from a safe location overboard. Liquids from the knock-out vessel or surge tank can be pumped to the burner head and burned via air atomisation or be diverted to a water treatment package. Fluids able to be treated via the water filtration package to less than 30 ppm oil in water content will be discharged overboard. Where 30 ppm is not achievable, fluids will be toted into tanks for onshore disposal.

During well kill operations, the volumes returned to the MODU will depend on how much can be bullheaded into the formation successfully. The maximum volume of residual well fluid returned to the MODU are up to about 1.55 MMscf of gas per well which may be flared/vented from the MODU, and up to about 155 m<sup>3</sup> of produced liquid per well may be returned for processing through the fluid handling and bleed off package. All flaring would occur at limited volumes given the activity is to permanently plug the well (e.g., in comparison to well unloading operations).

#### 3.8.4.3 Tubular Recovery

Once the formation pressure is controlled, production tubing and/or packer will be cut and recovered to the MODU. Tubulars recovered to the surface will be assessed for contamination (e.g., NORM and mercury). In the case contamination is identified, the tubing will be managed as per Woodside procedures appropriate for the contamination type.

Recovered tubing will be disposed of onshore. The tubing may require special management and treatment during the surface handling, transport, and disposal process, depending on the level of contamination. All waste will be handled and disposed of in accordance with federal, state, and international requirements.

#### 3.8.4.4 Well Clean Out

As required throughout activities with the marine riser connected, wells may be displaced from one fluid system to another (e.g., well kill brine to milling fluid) or cleaned. Wells will be cleaned out by displacing the tubing and casing annulus spaces to clean out brine. Well clean out brine may contain fluid pills/spacers (high viscosity pills or surfactants) to improve displacement efficiency, depending on the residual fluids remaining the tubing and annular spaces. Fluid returns will include displacement fluid and residual wellbore fluids contained in the tubing and annular spaces. Recovered fluids will be captured in mud pits and discharged if content is less than 1% by volume oil. If discharge specification cannot be met (i.e., is greater than 1% by volume oil content), the fluid will be returned to shore.

### 3.8.4.5 Installation of Permanent Barriers

Installation of the permanent barriers involves downhole casing and annulus cement integrity being verified via wireline logging if required. If required to remediate poor or insufficient annulus cement, casing may be perforated, and cement circulated behind the casing, or the casing may be cut or milled (refer to **Section 3.8.5.2**). Following this, permanent abandonment cement plugs will be installed and verified.

Cement will be pumped into the wellbore at specified depths to act as permanent barriers. These cement plugs are intended to isolate potential flow zones within the formation and will eliminate the possibility of potential hydrocarbon exposure to the marine environment. The characteristics of the cement barrier (e.g., cement specification, barrier length etc.) will be verified in accordance with the accepted WOMP.

Cementing fluids will generally consist of Portland cement with additives (such as inorganic salts, lignins, bentonite, barite, silicates, defoamers and surfactants). Cementing fluids are not routinely discharged to the marine environment, however, volumes may be discharged to the environment for the following reasons:

- After performing a cement job, the cement unit, surface lines and work string will be flushed to prevent cement curing.
- Any excess cement slurry may require disposal if not used after cementing operations.
- Small amounts of dry cement may be vented and blown overboard during the pneumatic transfer process (onboard transfer operations).
- Excess dry bulk cement or cement additives (bentonite, barite) following completion of the P&A campaign (refer to **Section 3.8.4.9**)

### 3.8.4.6 Residual Synthetic Based Mud Clean Out

Mobile fluids positioned above the uppermost plug in the wellbore or trapped within the uppermost section of the 9-5/8" casing annulus (B-annulus) or 13-3/8" casing annulus (C-annulus), will become open and free to exchange with the marine environment once the wellhead has been cut and recovered. Seven of the Stybarrow wells are anticipated to contain residual SBM remaining in the B-annulus, while both of the Eskdale wells may potentially have a relatively small amount of SBM remaining in the C-annulus. Woodside will conduct remediation of the mobile (free base oil) component of the residual SBM within the annuli to prevent it releasing to the marine environment following wellhead removal. Once access to the annuli is achieved, a series of fluid pills (high viscosity, surfactants) are pumped ahead of displacement brine to improve displacement efficiency, minimise the contamination interface and minimise residual SBM on the downhole casing. Recovered base oil will be circulated back to the MODU's mud system and returned to shore for treatment and disposal. Further description is provided in **Section 7.6**.

In the event the base oil is unable to be circulated from the casing annulus, an environment cement plug will be installed to create a barrier to the annulus preventing release of the fluid within the annulus once the wellhead is cut.

### 3.8.4.7 Wireline and Slickline Operations

Wireline or slickline activities may occur for permanent plugging activities including gamma ray and casing collar locator logging for depth correlation, ultrasonic imaging, and cement bond logging to verify presence of cement and running of other tools in hole such as SCSSV hold-open sleeves, drifts, plugs, punch perforators/cutters etc., plug removal and installation. Wireline and slickline work will be performed within the riser through the subsea test tree or BOP with appropriate isolation barriers in place. If wireline work is required to occur where there is a risk of barrier failure, the operation will be performed with full pressure control equipment at the surface.

### 3.8.4.8 Mud Pits

There are typically mud pits (tanks) on the MODU that provide a capacity to mix, maintain and store fluids required for drilling and permanent well plugging activities. The mud pits form part of the fluid circulation system. The mud pits and associated equipment/infrastructure are cleaned out at the completion of operations. Mud pit wash residue is operationally discharged with less than 1% by volume of oil. Mud pit residue over 1% by volume of oil is sent to shore for disposal.

### 3.8.4.9 Cement, Barite and Bentonite Discharge

Excess cement, barite and bentonite (dry bulk) after well operations are completed, will either be held onboard and used for subsequent wells, provided to the next operator at the end of the program, or if these options are not feasible, discharged to the marine environment. Towards the end of the campaign, if re-use, transfer or on-sale of the dry bulk

stocks becomes not feasible, Woodside will implement stock reduction measures to reduce the volume dry bulk stock requirement, to that necessary for well control, as defined in relevant well control procedures.

Excess cement, barite and bentonite that does not meet technical requirements during the Petroleum Activities Program may also be bulk discharged to the environment. Bulk discharges of cement may occur as a slurry through the usual cement discharge line or blown as dry bulk and discharged. Woodside requires that mercury and cadmium concentration in stock barite be below 1 mg/kg and 3 mg/kg, respectively. Documentation of heavy metal analysis is planned to be undertaken for all individual batches of barite and used to verify compliance with these concentrations.

### 3.8.5 Contingent Planned Activities

#### 3.8.5.1 Sand Removal and Discharge

Stybarrow-11 (H-4), which experienced sand control failure during production, maybe require a Coiled Tubing intervention in order to circulate out formation sand above the planned suspension plug setting depth and allow plug and abandonment activities.

High rate well bullhead operation, using a fluid train of brine, surfactants/solvents and viscous pill will be used to bullhead hydrocarbon, breaks up and disperses oil residue, leaving tubular surfaces and its content clean and water-wet whilst flushing formation sand away from the target suspension plug setting depth.

The Coiled Tubing spread will be utilised if required (i.e., sand is above the intended plug setting depth), to remove the residual sand using gel and/or brine sweeps which will be processed on surface using the temporary production system (TPS) equipment, also referred to as the MODU bleed off package.

The bleed off package will be required to be operational to process any residual hydrocarbon. A Dual Pot Sand Filter or a Cyclonic Desander will be installed within the bleed off package upstream of the well test choke manifold to separate the sand from the hydrocarbons and the clean out fluid.

Sand recovered at the Dual Pot Sand Filter / Cyclonic Desander shall be tested to measure hydrocarbon contamination entrained in the sand, should the level of contamination be above the required limit for discharge the sand can be cleaned by re-circulating the solids through process equipment on a closed loop cycle until they meet the required discharge specification. If residual oil on sand is reduced to below the oil on dry sand concentration outlined in **Section 7.6.2.7**, the sand will be discharged to sea from the MODU. Sand that does not meet discharge requirements will be retained and disposed of onshore.

#### 3.8.5.2 Casing Cutting / Milling

If the cement on the outside of the casing does not meet well barrier requirements, casing may need to be removed either by cutting and pulling or milling. These operations are done through the marine riser with milling debris (i.e., steel swarf, cement, formation) returned to the MODU and will only be performed if needed.

Milling operations involve removing steel casing, potentially annulus cement and formation to provide access to intervals whereby cement plugs can be installed. The methods used include milling tools that create chips or ribbons of steel (swarf), chips of cement and chips of formation. Milling is typically performed at a controlled rate (1 to 1.5 m/hr), to enable steel swarf to be removed effectively from the milling site to minimise the risk of 'birds nesting' of steel swarf, which may block fluid returns and jam equipment. Milling tools may become worn during milling operations and could require tripping for new/redressing about every 30 to 50 m. As a result, the rate of milling is slower than normal drilling operations.

As the steel swarf within the milling fluids is hard and sharp, the fluids from the well will be passed through specific swarf handling equipment, which generally include magnets, that liberate steel from the fluid before being processed through the conventional solids control equipment on the MODU such as shale shakers. The milling fluids, including up to an additional 2 m<sup>3</sup> of swarf, 3 m<sup>3</sup> of drilled cement and 3.5 m<sup>3</sup> of formation rock, will be discharged overboard per 100 m interval if milling is required. As a result of restricted milling speeds, the rate of swarf and cement will be generated over several days (the rate is expected to be about 50 m per 18 hours).

#### 3.8.5.3 Drilling of Cement Plugs

Woodside's design of the cement plugs for well P&A provides a very high confidence in the integrity and effectiveness of the plug. In the very unlikely event that a cement plug does not meet the design requirements, the plug may be drilled out to set a subsequent plug.

If required, drilling of cement plugs would be done with a riser in place using a viscosified brine or water-based drill

mud (WBM). Drilling fluids will be selected in accordance with the chemical assessment process described in **Section 3.9**. The WBM and cement cuttings will be processed through the drilling muds processing equipment on board the MODU and discharged overboard. This will generate about 25 m<sup>3</sup> of cement cuttings per plug and use approximately 250 m<sup>3</sup> of WBM.

#### 3.8.5.4 Marine Riser Clean-out

Woodside and industry experience has shown that horizontal xmas tree systems can be susceptible to rust and other build up in the marine risers and BOP. This can lead to multiple deployments of subsea test trees or other large diameter pulling tools, as this type of debris, albeit small volumes, can prevent successful land out of tools. To mitigate potential debris issues, the following activities may be performed as required:

- Ensuring riser is clean prior to initial deployment for the P&A of the first well.
- Running of riser brushes while the riser and BOP are suspended (open water).
- Implementing a BOP flushing sequence prior to landing the BOP on the subsea tree.
- Once the BOP and riser are landed out, cleaning tools are available to clean the interface surfaces where debris build-up might take place.
- In the event of significant debris issues, the marine riser may be recovered to the deck and inspected. Equipment will be available on the MODU to enable cleaning of the riser joints before being redeployed. Cleaning will be done over a bunded area, with fluids returned to tanks on the MODU.

Should debris continue to be a problem after brushing and circulation to the mud pits, then the riser may be disconnected from the subsea tree and an ROV used to flush the remaining debris from around the top of the tree cap.

### 3.8.6 Unplanned Contingent Activities

#### 3.8.6.1 Emergency Disconnect Sequence

An Emergency Disconnect Sequence (EDS) may be implemented if the intervention vessel/MODU is required to rapidly disengage from the well. The EDS closes the BOP (i.e., shutting in the well) and disconnects the riser to break the conduit between the BOP and MODU. Common examples of when this system may be initiated include when the MODU moves outside of its operating circle (e.g., failure of one or more of the moorings) or moves to avoid a vessel collision (e.g., third-party vessel on collision course with the MODU). The EDS aims to leave the well in a secure condition but will result in the loss of the fluids in the riser after disconnection.

#### 3.8.6.2 Temporary Well Suspension

During permanent plugging activities, a well may need to be temporarily suspended (e.g., in the case of adverse weather or unexpected well outcomes requiring additional time to plan the next operation). Suspension involves establishing suitable barriers, removing the riser, and disconnecting the MODU from the well. The BOP may be left in place to act as a barrier or removed if sufficient barriers are present in the well itself. On return to a well after suspension, the MODU reconnects to the well via the riser and well plugging activities resume.

### 3.8.7 Post MODU Activities

After the departure of the MODU, a support vessel with ROV capability will complete demobilisation activities, which may include:

- recovery of pre laid anchors and mooring chain
- recovery of BOP tether system and associated weights
- recovery of any marine debris or equipment as required if not recovered by the MODU
- as left visual inspections of the seabed.

### 3.8.8 Removal of Well Infrastructure

Well infrastructure above the mudline and ancillary equipment is planned to be removed as part of the Stybarrow decommissioning activities. Subsea tree and wellhead removal and recovery is an optional activity in this EP. The base case is removal and recovery of subsea trees and wellheads as part of the field equipment removal campaign described and managed under the Stybarrow Decommissioning and Field Management EP. The cutting and recovery

of well infrastructure and ancillary equipment may occur directly after P&A activities using the MODU, but the activity is planned to be completed by a vessel as part of the Stybarrow subsea removal campaign as defined under the Stybarrow Decommissioning and Field Management EP, currently under assessment with NOPSEMA.

While use of the MODU is a feasible option for removal of well infrastructure, there are technical, safety, cost and schedule benefits from utilising a subsea support vessel. In the event well infrastructure is not recovered directly following P&A activities, the infrastructure will be temporarily wet stored (either in a connected state attached to the wellhead or temporarily stored on a mud mat on the seabed) until removal.

Options for removing and recovering the wellheads are described in **Table 3-13**. The wellheads are planned to be cut below the seabed using mechanical cutting method. Once the wellheads are cut, the well infrastructure will be recovered to the vessel or MODU and transported to shore for reuse or disposal in an acceptable manner.

**Table 3-13: Wellhead Cutting Methods**

| Method                                  | Description  | MODU / Vessel Type                                | Preference   |
|---|--|---|--|
| Mechanical internal cutting             | Method: Method uses mechanical cutting knives that are inserted into the inner well casing and rotated.<br>Uses: Suitable for wells with multiple casing strings and within all water depths.  | Subsea support vessel with ROV capability or MODU | Preferred method given water depths within Operational Area.   |
| Abrasive water jet cutting              | Method: Method uses a system of high pressure water entrained with grit and flocculant pumped via an umbilical from a vessel to a subsea cutting tool that is inserted into the inner well casing.<br>Uses: Suitable where an internal cut can be achieved, generally within water depths shallower than approximately 300 - 350 m due to requirement for high pressure jetting. Not restricted by number of casing strings. | Subsea support vessel with ROV capability         | Not feasible option given wells are deeper than the normal requirements for this method to work effectively. |
| External cutting using diamond wire saw | Method: Method uses a hydraulically driven motor and pulley system to operate an industrial diamond cutting wire via a vessel or ROV.<br>Uses: Suitable for wells within all water depths. Not restricted by number of casing strings. May require up to 1m of well infrastructure to be left in situ above the mud line due to external cut.  | Subsea support vessel with ROV capability         | Contingency option if preferred option is unsuccessful.  |

The confirmed method and timing for removal and recovery of well infrastructure will be dependent on technical considerations, vessel availability, opportunities for efficiencies with other decommissioning activities, suitable weather windows and health safety and environmental considerations. Although infrastructure may be left *in situ* temporarily following P&A activities, this is considered to be acceptable given:

- Woodside is committed to recovery of Stybarrow well infrastructure above the mudline by no later 31 March 2025. Well infrastructure would therefore only be temporarily wet stored following P&A activities less than a year (based on completion of the P&A activity in around Q3 2024)
- Temporarily wet storing infrastructure will not affect future removal (e.g., cathodic protection systems will be in place if required)
- There are no new or increased impacts / risks to the environment from infrastructure remaining *in situ* for this temporary period (see **Section 7**).

This flexibility in the method and timing for removal and recovery of infrastructure provides cost efficiencies as well as reduced impacts and risks to the environment (e.g., reduced time and emissions/discharges across projects and reduced risk for dropped objects through additional feasibility assessment).

### 3.9 Chemical Assessment Process

The chemicals that may be used operationally for the petroleum activities described in this EP include:

- Chemicals for P&A activities including weighted brines, water-based fluids, lost circulation material, high viscosity pills, H<sub>2</sub>S scavenger, MEG, cement, cement spacers and other chemical and cement additives as required.
- Chemicals for preparatory activities for P&A including marine growth removal and cleaning, such as acids (note there is very little marine growth on Stybarrow well infrastructure due to water depth not being conducive for substantial fouling)
- Chemicals used for cutting of subsea infrastructure such as flocculants and lubricants

Chemicals will be stored on-board the MODU and support vessels as required within dedicated holding tanks for liquid chemicals / chemical mixtures and the sack room for dry chemicals. Hazardous chemicals are stored within bunds or in secure areas to prevent accidental overboard discharges. All chemicals that may be operationally released or discharged to the marine environment from either planned activities or unplanned events are accompanied with relevant Safety Data Sheets (SDS).

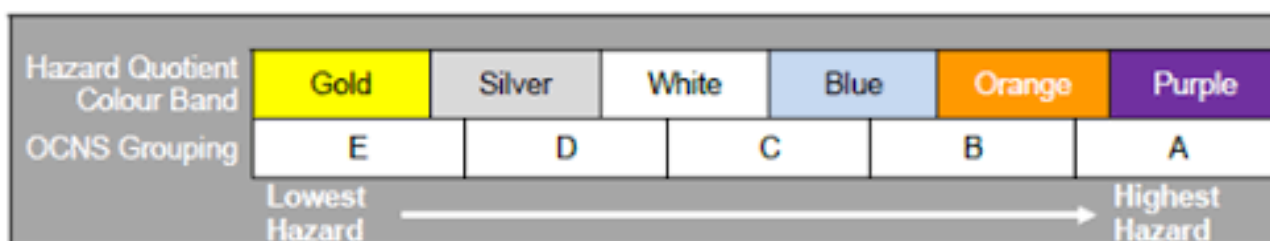

#### 3.9.1 Chemical Assessment

All chemicals that may be operationally released or discharged to the marine environment for the petroleum activities described in this EP will be evaluated using a defined framework and set of tools, to ensure the potential impacts are acceptable, ALARP and meet Woodside's expectation for environmental performance. This excludes legacy chemicals including residual water-based drilling fluids and brines that are currently present in the wellbore, which have been assessed for discharge in **Section 7.6**. All previously approved P&A and drilling chemicals are included on the Woodside Drilling and Completions Chemical Assessment Register, which is reviewed as per the Chemical Selection and Assessment Environment Guideline.

The chemical assessment process follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS), which manages chemical use and discharge in the United Kingdom and the Netherlands. It applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances listed on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters, such as biodegradation and bioaccumulation, in accordance with one of the two schemes (as shown in **Figure 3-4**).

- Hazard Quotient (HQ) Colour Band: Gold, Silver, White, Blue, Orange and Purple (listed in order of increasing environmental hazard), or
- OCNS Grouping: E, D, C, B or A (listed in order of increasing environmental hazard). Used for inorganic substances, hydraulic fluids and pipeline chemicals only.

**Figure 3-4: OCNS Ranking Scheme**

Chemicals fall into the following assessment types:

- No further assessment: Chemicals with a HQ band of Gold or Silver or an OCNS ranking of E or D with no substitution or product warnings do not require further assessment. Such chemicals do not represent a significant impact on the environment under standard use scenarios and are, therefore, considered ALARP and acceptable.
- Further assessment/ALARP justification required: The following types of chemicals require further assessment to understand the environmental impacts of discharge into the marine environment:
  - Chemicals with no OCNS ranking

- Chemicals with a HQ band of White, Blue, Orange, Purple or OCNS ranking of A, B, or C
- Chemicals with an OCNS product or substitution warning

### 3.9.2 Further Assessment/ALARP Justification

This includes assessing the ecotoxicity, biodegradation and bioaccumulation of the chemicals in the marine environment in accordance with the Centre for Environment, Fisheries and Aquaculture Science (CEFAS) Hazard assessment and the Department of Mine and Petroleum (DMP) Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

#### 3.9.2.1 Ecotoxicity

Chemical ecotoxicity is assessed using the criteria used by CEFAS to group chemicals based on ecotoxicity results (Table 3-14). If a chemical has an aquatic or sediment toxicity within the criteria for the OCNS grouping of D or E, this is considered acceptable in terms of ecotoxicity.

**Table 3-14: CEFAS OCNS grouping based on ecotoxicity results**

| Initial Grouping                         | A   | B       | C          | D             | E       |
|--|-----|---------|------------|---------------|---------|
| Results for aquatic-toxicity data (ppm)  | <1  | >1-10   | >10-100    | >100-1,000    | >1,000  |
| Results for sediment toxicity data (ppm) | <10 | >10-100 | >100-1,000 | >1,000-10,000 | >10,000 |

Note: Aquatic toxicity refers to the *Skeletonema costatum* EC50, *Acartia tonsa* LC50 and *Scophthalmus maximus* (juvenile turbot) LC50 toxicity tests; sediment toxicity refers to *Corophium volutator* LC50 test.

#### 3.9.2.2 Biodegradation

The biodegradation of chemicals is assessed using the CEFAS biodegradation criteria, which align with the categorisation outlined in the DMP Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

CEFAS categorises biodegradation into the following groups:

- **Readily biodegradable:** results of more than 60% biodegradation in 28 days to an OSPAR harmonised offshore chemical notification format (HOCNF) accepted ready biodegradation protocol.
- **Inherently biodegradable:** results more than 20% and less than 60% to an OSPAR HOCNF accepted ready biodegradation protocol or result of more than 20% by OSPAR accepted inherent biodegradation study.
- **Not biodegradable:** results from OSPAR HOCNF accepted biodegradation protocol or inherent biodegradation protocol are less than 20%, or half-life values derived from aquatic simulation test indicate persistence.

Chemicals with more than 60% biodegradation in 28 days to an OSPAR HOCNF accepted ready biodegradation protocol are considered acceptable in terms of biodegradation.

#### 3.9.2.3 Bioaccumulation

The bioaccumulation of chemicals is assessed using the CEFAS bioaccumulation criteria, which align with the categorisation outlined in the DMP Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

The following guidance is used by CEFAS:

- **Non-bioaccumulative:** LogPow < 3, or BCF ≤ 100 and molecular weight is ≥ 700.
- **Bioaccumulative:** LogPow ≥ 3 or BC > 100 and molecular weight is < 700.

Chemicals that meet the non-bioaccumulative criteria are considered acceptable.

If a product has no specific ecotoxicity, biodegradation or bioaccumulation data available, options to be considered are as follows:

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical.

- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

#### **3.9.2.4 Alternatives**

If no environmental data is available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical will be investigated, with preference for options with a HQ band of Gold or Silver, or OCNS ranking of Group E or D with no substitution or product warnings.

If no more environmentally suitable alternatives are available, further risk reduction measures (e.g., controls related to use and discharge) will be considered for the specific context and implemented where relevant to ensure the risk is ALARP and acceptable.

#### **3.9.2.5 Decision**

Once the further assessment/ALARP justification has been completed, concurrence is required from the relevant environment advisor that the environmental risk as a result of chemical use is ALARP and acceptable.

## 4 Description of the Environment

### 4.1 Overview

In accordance with Regulations 13(2) and 13(3) of the Environment Regulations, this section describes the existing environment that may be affected (EMBA) by the activity (planned and unplanned, as described in **Sections 7 and 8**), including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The description of the environment applies to two spatial areas:

- the Operational Area – the area where planned activities will occur and includes the area encompassing a 3,000 m radius around the Stybarrow wells.
- the wider EMBA. This is the Environment That May Be Affected by the worst-case hydrocarbon spill scenario identified as relevant to the activity (**Figure 4-1**).

The information contained in this section has been used to inform the evaluation and assessment of the environmental impacts and risks presented in **Sections 7 and 8** of this EP. The level of detail is appropriate to the nature and scale of the impacts and risks to the particular values and sensitivities. A detailed and comprehensive description of the environment in the Operational Area and EMBA is provided in **Appendix C**.

### 4.2 Determination of the Environment that May Be Affected

Stochastic hydrocarbon dispersion and fate modelling (described in **Section 8.1**) has been performed on the worst-case hydrocarbon releases, which were determined to be a loss of well control at the seabed and a 1,000 m<sup>3</sup> marine diesel oil (MDO) release from a vessel collision (described in **Section 8.1.1**). The results of modelling studies from both of these scenarios have been used to inform the spatial extent of the EMBA and the socio-cultural EMBA. The direct environmental impacts and risks from all other aspects of the Petroleum Activity will occur within the EMBA and/or socio-cultural EMBA. The EMBA (**Figure 4-1**) encompasses the outer most boundary of the worst-case spatial extent of four hydrocarbon phases where ecological impact could occur and the socio-cultural EMBA encompasses the outer most boundary of the worst-case spatial extent where social, cultural or economic impacts could occur (refer **Table 4-1**). The exposure threshold values used to define the EMBA are presented in **Table 4-1** and have been justified in **Section 8.1.3**.

**Table 4-1: Hydrocarbon components and EMBA exposure thresholds**

| Hydrocarbon Component           | EMBA Exposure Value  |
|---------------------------------|----------------------|
| <b>Socio-cultural EMBA</b>      |                      |
| Surface hydrocarbons            | 1 g/m <sup>2</sup>   |
| Shoreline hydrocarbons          | 10 g/m <sup>2</sup>  |
| Entrained hydrocarbons          | 100 ppb              |
| Dissolved aromatic hydrocarbons | 50 ppb               |
| <b>EMBA</b>                     |                      |
| Surface hydrocarbons            | 10 g/m <sup>2</sup>  |
| Shoreline hydrocarbons          | 100 g/m <sup>2</sup> |
| Entrained hydrocarbons          | 100 ppb              |
| Dissolved aromatic hydrocarbons | 50 ppb               |

Hydrocarbon contact below the defined thresholds may occur outside the EMBA and socio-cultural EMBA; however, the effects of these low exposure values are unlikely to result in ecological impacts.

The EMBA and socio-cultural EMBA presented does not represent the predicted coverage of any one hydrocarbon spill or a depiction of a slick or plume at any point in time. Rather, the areas are a composite of many theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

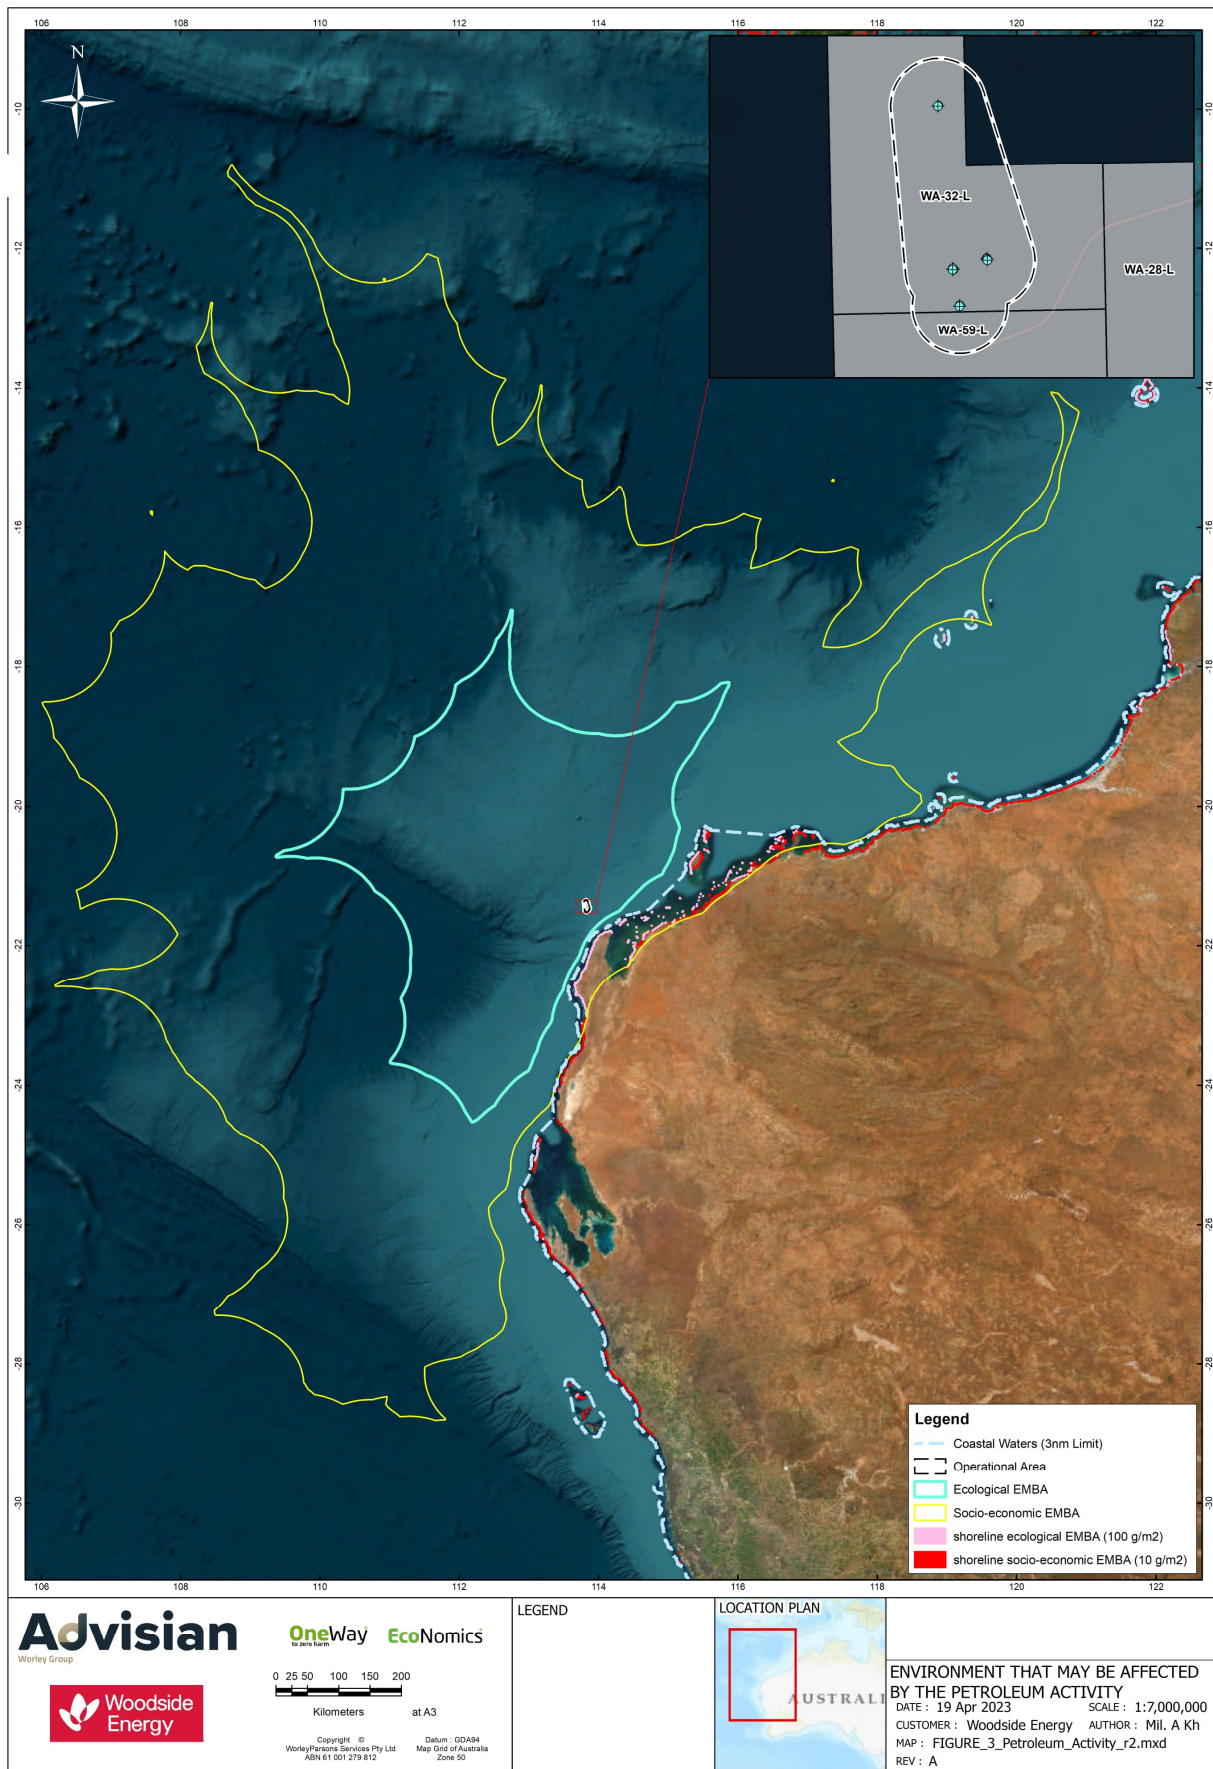

Figure 4-1: Environment that May Be Affected by the Petroleum Activity

### 4.3 Relevant Environmental Values and Sensitivities

Regulation 13(2) of OPGGS ((E) Regulations states that “*the environment plan must:*

- 13(2)(a) Describe the existing EMBA by the activity; and
- 13(2)(b) Include details of the particular relevant values and sensitivities (if any) of that environment”.

Regulation 13(3) of the OPGGS (E) Regulations states that “Without limiting paragraph 13(2)(b), particular relevant values and sensitivities may include any of the following:

- 13(3)(f) Any values and sensitivities that exist in, or in relation to, part or all of:
  - (i) A Commonwealth marine area within the meaning of that Act; or
  - (ii) Commonwealth land within the meaning of that Act”.

This section summarises environmental values and sensitivities, including physical, biological, socio-economic and cultural features in the marine and coastal environment that are relevant to the Operational Area and the EMBA. Searches for Matters of National Environmental Significance (MNES) and other matters protected by the EPBC Act were undertaken for the Operational Area and the EMBA using the Protected Matters Search Tool (PMST).

A full description of the values and sensitivities relevant to the Operational Area and EMBA is provided in **Appendix C**, along with the PMST Search Reports.

#### 4.3.1 Bioregions

The Operational Area is located approximately 55 km north-west of Exmouth, Western Australia and within Commonwealth waters. The EMBA overlaps the following Integrated Marine and Coastal Regionalisation of Australia (IMCRA) Provincial Bioregions:

- Northwest Province (overlaps Operational Area)
- Central Western Shelf Transition (23 km from Operational Area)
- Northwest Shelf Province (30 km from Operational Area)
- Central Western Transition (57 km from Operational Area)
- Northwest Transition (270 km from Operational Area)
- Central Western Shelf Province (301 km from Operational Area)

**Appendix C** summarises the characteristics of these marine bioregions.

#### 4.3.2 Matters of National Environmental Significance

**Table 4-2** and **Table 4-3** summarise the MNES identified as potentially occurring within the Operational Area and EMBA, respectively, as determined by the PMST results (**Appendix C**). Additional information on identified MNES are provided throughout this Section and in **Appendix C**.

Table 4-2: Summary of MNES within the Operational Area

| MNES  | Number | Relevant Section     |
|---|--------|----------------------|
| World Heritage Properties                     | None   | Not applicable       |
| National Heritage Places                      | None   | Not applicable       |
| Wetlands of International Importance (Ramsar) | None   | Not applicable       |
| Marine Parks <sup>1</sup>                     | None   | Not applicable       |
| Listed Threatened Ecological Communities      | None   | Not applicable       |
| Listed Threatened Species                     | 20     | <b>Section 4.7.1</b> |
| Listed Migratory Species <sup>2</sup>         | 31     | <b>Section 4.7.1</b> |

<sup>1</sup> The PMST search identifies that the Operational Area overlaps the Gascoyne Marine Park, however when the spatial data was interrogated it found that the Gascoyne Marine Park is located 4 km from the Operational Area.

<sup>2</sup> The EPBC Act categorises migratory and threatened species independently, therefore migratory species can also be threatened.

Table 4-3: Summary of MNES within EMBA

| MNES  | Number | Relevant Section     |
|---|--------|----------------------|
| World Heritage Properties                       | 2      | <b>Section 4.6.2</b> |
| National Heritage Places                        | 5      | <b>Section 4.6.3</b> |
| Wetlands of International Importance (Ramsar)   | 2      | Not applicable       |
| Marine Protected Areas (Commonwealth and State) | 11     | <b>Section 4.6.5</b> |
| Listed Threatened Ecological Communities        | 0      | Not applicable       |
| Listed Threatened Species <sup>1</sup>          | 34     | <b>Section 4.7.1</b> |
| Listed Migratory Species <sup>1, 2</sup>        | 51     | <b>Section 4.7.1</b> |

<sup>1</sup> Terrestrial species (such as terrestrial mammals, reptiles and bird species) that appear in the PMST results and do not have habitats along shorelines are not relevant to the Petroleum Activity impacts and risks and are not included in these numbers.

<sup>2</sup> The EPBC Act categorises migratory and threatened species independently, therefore migratory species can also be threatened.

## 4.4 Stybarrow Field Environmental Surveys

Woodside commissioned an environmental survey of the Stybarrow field (Cardno, 2019), the results of which are summarised in **Section 4.5.1** below. Woodside commissioned a study of the canyon systems in the region (BMT Oceanica, 2016), which includes the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula Key Ecological Feature (KEF) (refer **Sections 4.5.1 4.5.2**). One of the canyons constituting this KEF overlaps the Operational Area.

## 4.5 Biological Environment

This sub-section focuses on the biological environment in the Operational Area. Refer to **Appendix C** for description of the biological environment in the EMBA.

### 4.5.1 Sediments

Sampling by Cardno (2019) indicated sediments within the Stybarrow field are characterised by silt-sized (3.9 mm to 62.5 µm) particles, which is typical of sediments in similar water depths in the region (Baker et al., 2008).

Analysis of potential contaminants in sediments indicated concentrations of metals, radionuclides, and hydrocarbons within the Stybarrow field were generally not significantly higher than concentrations observed at reference sites. Elevated concentrations of some metals were observed at sites within the Stybarrow field – concentrations of lead, barium, boron, arsenic and mercury were higher at some impacted sites within the field, although barium was the only metal in which concentrations between sample sites and reference sites was statistically significant (Cardno, 2019). Increased barium concentrations may be due to historical discharges of drilling fluids, which commonly contain barium sulphate (barite) as a weighting agent. Concentrations of lead, mercury and arsenic were above the default guideline values (DGVs) for sediment quality stated in the *Australian and New Zealand guidelines for Fresh and Marine Water Quality* (Commonwealth of Australia and New Zealand Government, 2018), although none exceeded the upper guideline values (GV-high) at which toxicity-related effects may be expected to be observed.

An environmental survey and literature review of canyons in the region by BMT Oceanica (2016) concluded the following:

- The seabed in most of the region is featureless with sediments dominated by silty clays. Outcropping rock and consolidated or coarser sediment habitats were otherwise minor components of the seabed.
- Large areas of soft ooze and fine mud sediments were observed between water depths of 600 to 900 m.
- The small particle size of the sediments may influence the diversity of infauna (Etter and Grassle, 1992), and the retention of contaminants (Burdige, 2006; Fukue et al., 2006), with finer particles potentially having a greater retention capacity.
- Metals were below Interim Sediment Quality Guidelines outlined in the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality: Volume 1* (ANZECC and ARMCANZ, 2000).

### 4.5.2 Benthic Habitats and Infauna

Cardno (2019) observed only unconsolidated sediment within WA-32-L, with no areas of hard substrate (with the exception of the Stybarrow infrastructure). Few epifauna and demersal or benthic fish were observed by Cardno (2019), which is consistent with similar deep water habitats in the region, with heart urchins, grenadier fish and decapods the most commonly observed taxa.

Infauna sampling by ROV cores yielded very few infauna at sample sites and control sites in WA-32-L, indicating low density but widely distributed infauna assemblages (Cardno, 2019). This is consistent with other surveys in the region (e.g., RPS, 2013).

An environmental survey and literature review of canyons in the region by BMT Oceanica (2016) concluded the following:

- The North and South Enfield Canyons are regarded as bathyal which is defined as 200-2,000 m, ~1% gravel, ~70% mud, ~ 5 °C temperature at the seabed, and a 1° slope.
- Typical benthic habitats within the region are bare, unconsolidated, muddy, soft substrate and typically support sparse assemblages of filter and deposit-feeding epibenthic fauna.
- Outcropping rock and consolidated or coarser sediment habitats appeared to be minor components of the seabed.
- Distribution of biota was patchy, with crustaceans, molluscs, echinoderms, cnidarians and poriferans recorded. Motile scavengers were regarded as the dominant group including crabs and shrimps. Echinoderms were less abundant and consisted of ophiuroids, holothurians, echinoids and asteroids.

Two Key Ecological Features (KEFs) occur within the Operational Area and are of regional importance for either a region's biodiversity or its ecosystem function and integrity. The two KEFs are:

- Continental Slope Demersal Fish Communities
- Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula

Further description of these KEFs is provided in **Section 4.6.1**.

### 4.5.3 Water Quality

Cardo (2019) sampled surface waters in WA-32-L and found no evidence of contaminants. Given the depth of the infrastructure in the Stybarrow field, it is very unlikely that water from near the seabed would mix to the surface. The deeper parts of the water column below the thermocline are typically poorly mixed compared to surface waters and hence form an extensive barrier between water at the seabed and water at the surface (**Figure 4-2**).

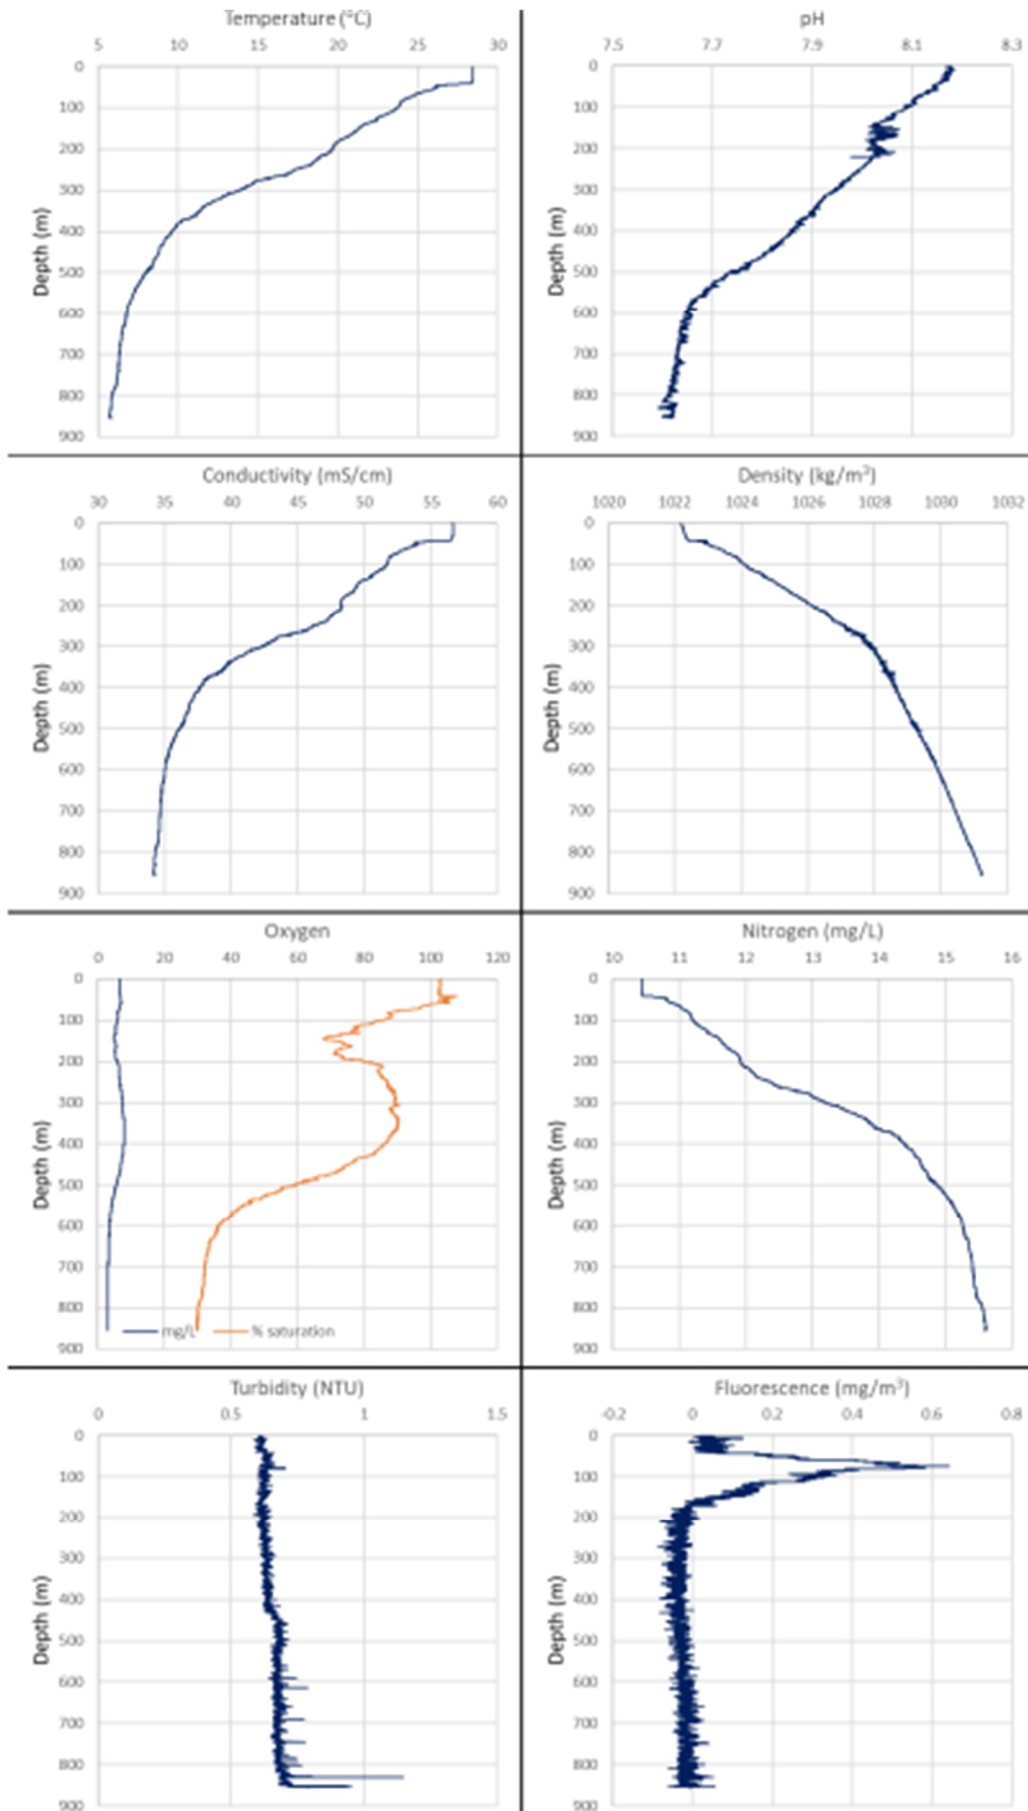

Figure 4-2: Selected physical and chemical profiles of the water column in the Stybarrow field (Cardno 2019)

## 4.6 Protected or Significant Areas

### 4.6.1 Key Ecological Features

Key Ecological Features (KEFs) are areas of regional importance for either biodiversity or ecosystem function and integrity within the Commonwealth marine environment and have been identified through the marine bioregional planning process.

The presence of KEFs within the Operational Area and EMBA is summarised in **Table 4-4** and a detailed description of these KEFs is provided in **Appendix C**. KEFs within the Operational Area and EMBA are presented in **Figure 4-3**.

**Table 4-4: Key Ecological Features in the Operational Area and EMBA**

| KEF   | Operational Area | EMBA | Distance from Operational Area (km) |
|---|------------------|------|-------------------------------------|
| Continental Slope Demersal Fish Communities                           | ✓                | ✓    | Overlaps                            |
| Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula | ✓                | ✓    | Overlaps                            |
| Commonwealth waters adjacent to Ningaloo Reef                         | -                | ✓    | 23 km                               |
| Exmouth Plateau   | -                | ✓    | 52 km                               |
| Ancient coastline at 125 m depth contour                              | -                | ✓    | 95 km                               |

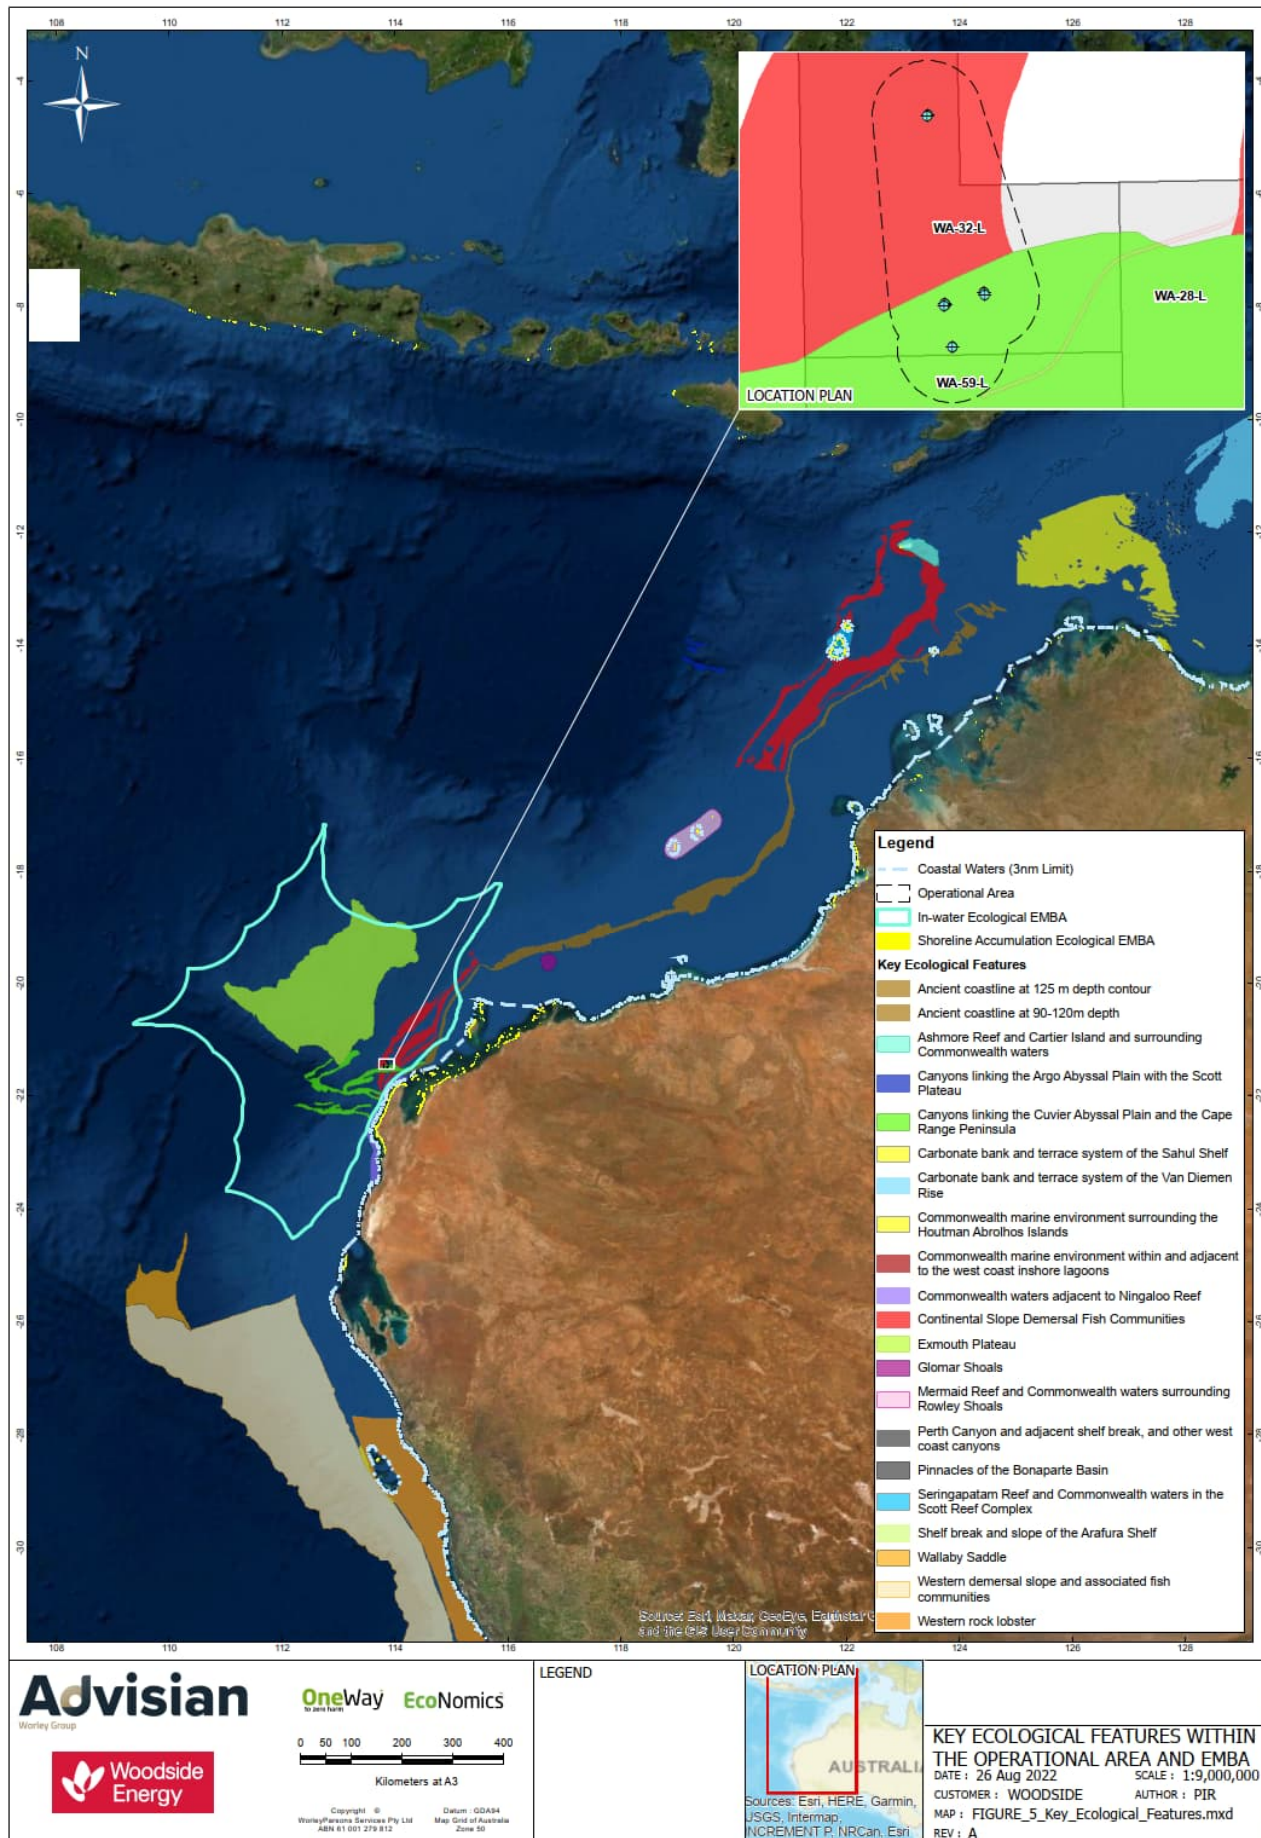

Figure 4-3: Key Ecological Features within the Operational Area and EMBA

#### 4.6.2 World Heritage Properties

World Heritage Properties represent the best examples of the world's cultural and natural heritage. There are no World Heritage Properties within the Operational Area. The EMBA overlaps two World Heritage Properties:

- the Ningaloo Coast, approximately 23 km from the Operational Area at the closest point; and
- Shark Bay, Western Australia, approximately 285 km from the Operational Area at the closest point.

#### 4.6.3 National Heritage Properties

Australia's national heritage comprises exceptional natural and cultural places that contribute to Australia's national identity. There are no National Heritage Places within the Operational Area. Five National Heritage Properties lie within the EMBA:

- The Ningaloo Coast (approximately 23 km from the Operational Area)
- Dampier Archipelago (including Burrup Peninsula) (approximately 285 km from the Operational Area)
- Shark Bay, Western Australia (approximately 372 km from the Operational Area)
- Batavia Shipwreck Site and Survivor Camps Area 1629 – Houtman Abrolhos (approximately 767 km from the Operational Area)
- The West Kimberley (approximately 883 km from the Operational Area).

#### 4.6.4 Wetlands of International Importance

Two Wetlands of International Importance (RAMSAR) were identified within the EMBA:

- Roebuck Bay
- Ashmore Reef National Nature Reserve.

These sites were identified as potentially having shoreline accumulation of hydrocarbons from a worst-case loss of well control. Both sites are important resting and foraging areas for migratory shorebirds using the East Asian-Australasian Flyway (Bamford et al., 2008).

#### 4.6.5 Marine Protected Areas

No Australian marine parks or State Marine Protected Areas (e.g., Marine Parks, Marine Management Areas etc.) overlap the Operational Area.

Four Australian Marine Parks and ten State marine parks, marine management areas and national parks fall within the EMBA (**Table 4-5** and **Table 4-6** respectively). A detailed description of these Australian Marine Parks and State marine protected areas is provided in **Appendix C**.

Australian Marine Parks and State marine protected areas within the EMBA are presented in **Figure 4-4**.

**Table 4-5 Australian marine parks within the Operational Area and EMBA**

| Australian Marine Park | IUCN Category or Relevant Park Zone | Operational Area | Distance from Operational Area (km) | EMBA |

In addition to the marine protected areas within the EMBA, the following WA State protected areas fall within the socio-cultural EMBA, these areas are described in **Appendix C**:

- Bardi Jawi Gaarra Marine Park
- Barrow Island Nature Reserve
- Bernier and Dorre Island Nature Reserve
- Coulomb Point Nature Reserve
- Dirk Hartog Island National Park
- Eighty Mile Beach Marine Park
- Jarrkumpungu Nature Reserve
- Jurabi Coastal Park
- Jurien Bay Marine Park
- Maiyalam Marine Park
- Mayala Marine Park
- North Laalang-garram Marine Park
- Nyinggulu Coastal Reserve
- Shark Bay Marine Park
- Tent Island Nature Reserve

- Yawuru Nagulagun/Roebuck Bay Marine Park

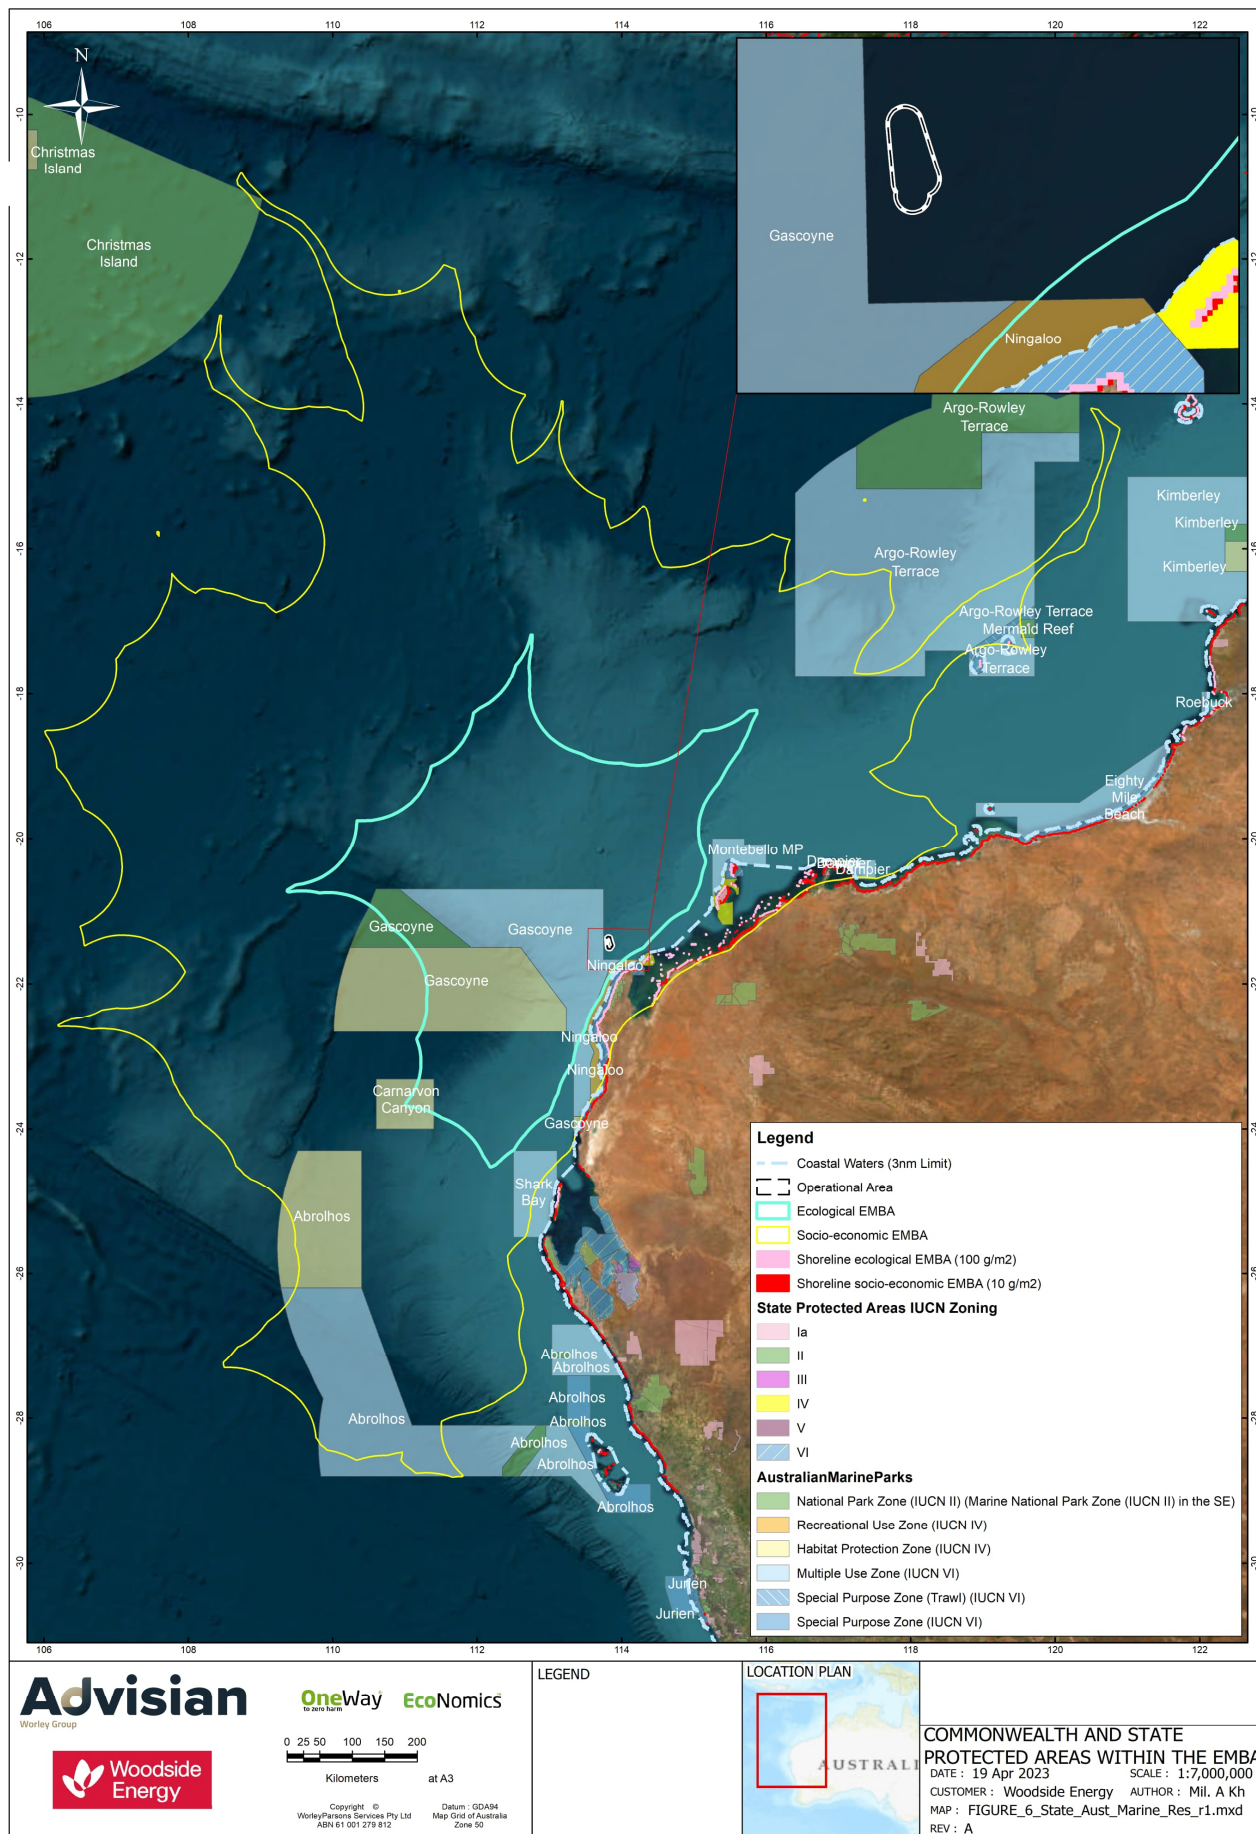

Figure 4-4 Commonwealth and State Marine Protected Areas within the EMBA and Socio-cultural EMBA

## 4.7 Marine Fauna

### 4.7.1 Threatened and Migratory Species

**Table 4-7** presents the threatened and migratory species within the Operational Area and the EMBA. These include all relevant MNES protected under the EPBC Act, as identified in the PMST search for the Operational Area and EMBA (PMST search results are provided in **Appendix C**). For each species identified, the extent of likely presence is noted.

The PMST results identified 20 marine fauna species listed as threatened species and 31 marine fauna species listed as migratory within the Operational Area. Within the EMBA, the PMST results identified 33 species listed as threatened species and 50 species listed as migratory.

Terrestrial species (such as terrestrial mammals, reptiles and bird species) that appear in the PMST results of the EMBA and do not have habitats along shorelines are not relevant to the Petroleum Activity impacts and risks and have therefore been excluded from **Table 4-7**.

A description of the identified threatened and migratory species is included in **Appendix C**.

Species with designated biologically important areas (BIAs) and identified habitat critical to the survival of a species overlapping the Operational Area and EMBA have been identified in **Section 4.7.2**.

Table 4-7: Threatened and migratory species predicted to occur within the Operational Area and EMBA

#### 4.7.2 Biologically Important Areas and Habitat Critical for the Survival of a Species

Biologically important areas (BIAs) are those locations where aggregations of members of a species are known to undertake biologically important behaviours, such as breeding, resting, foraging or migration. BIAs have been identified using expert scientific knowledge about species abundance, distribution and behaviours. BIAs are not recognised by the EPBC Act but are identified by the Department of Climate Change, Energy, the Environment and Water (DCCEEW) to aid in the management and protection of threatened fauna.

Habitats critical for the survival of a species may be identified in species recovery plans made under the EPBC Act. For example, the *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017) has identified habitats critical to the survival of a species for marine turtle stocks. Actions that may adversely affect habitat critical for the survival of a critically endangered or endangered species may be a significant impact as per the *Matters of National Environmental Significance Significant Impact Guidelines 1.1* (Department of the Environment, 2013).

Relevant BIAs and identified habitat critical to the survival of a species identified within the Operational Area and EMBA are presented in **Table 4-8** and **Table 4-9** respectively.

**Figure 4-5** to **Figure 4-12** show the spatial overlap with relevant BIAs and Critical Habitat areas and the Operational Area and EMBA.

**Table 4-8: Biologically Important Areas within the Operational Area and EMBA**

| Value / Sensitivity                 | BIA Type                    | Operational Area | EMBA | Closest Distance to Operational Area (km) |

### 4.7.3 Species Recovery Plans, Conservation Advice and Threat Abatement Plans

Woodside considered recovery plans, conservation management plans, threat abatement plans or approved conservation advice in place for EPBC Act-listed threatened species that may potentially occur or use habitat within the EMBA (**Table 4-10**).

Recovery plans set out the research and management actions necessary to stop the decline of and support the recovery of listed threatened species. In addition, threat abatement plans provide for the research, management and any other actions necessary to reduce the impact of a listed key threatening process on native species and ecological communities. The Minister decides whether a threat abatement plan is required for key threatening processes listed under Section 183 of the EPBC Act. **Table 4-10** provides information about the specific requirements of the relevant conservation advice, species recovery plans and threat abatement plans that applies to the petroleum activities, and demonstrates how current management requirements have been taken into account while preparing the EP. Through implementing relevant control measures, performance outcomes and performance standards, potential risks and impacts of the petroleum activities are managed to ALARP and acceptable levels.

**Table 4-10** summarises the actions relevant to the Petroleum Activity, with more information about the specific requirements of the relevant plans of management (including Conservation Advice and Conservation Management Plans) applicable to the Petroleum Activity and demonstrates where management requirements have been addressed.

Table 4-10: Recovery plans, Conservation Advice and Threat Abatement Plans relevant to the Petroleum Activity

| Common Name   | Recovery Plan / Conservation Advice / Management Plan  | Threats identified that may arise from the Petroleum Activity | Relevant EP Section                      |
|---|--|---|--|
| <b>All Vertebrate Fauna</b>   |  |   |  |
| All vertebrate fauna  | Threat abatement plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia, 2018)     | Marine debris   | <b>Section 8.7</b>                       |
| <b>Fishes, Sharks and Rays</b>  |  |   |  |
| Dwarf Sawfish, Queensland Sawfish   | Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015a)   | Habitat degradation and modification                          | <b>Section 8.2</b><br><b>Section 8.3</b> |
|   | Approved conservation advice for <i>Pristis clavata</i> (dwarf sawfish) (Threatened Species Scientific Committee, 2009)                                  |   |  |
| White Shark, Great White Shark  | Recovery Plan for the White Shark ( <i>Carcharodon carcharias</i> ) (Department of Sustainability, Environment, Water, Population and Communities, 2013) | Ecosystem effects from habitat modification                   | <b>Section 8.2</b><br><b>Section 8.3</b> |
| Whale Shark   | Conservation Advice <i>Rhincodon typus</i> whale shark (Threatened Species Scientific Committee, 2015a)  | Marine debris   | <b>Section 8.7</b>                       |
| Grey Nurse Shark (west coast population)  | Recovery Plan for the Grey Nurse Shark ( <i>Carcharias taurus</i> ) (Department of the Environment, 2014)  | Ecosystem effects from habitat modification                   | <b>Section 8.2</b><br><b>Section 8.3</b> |
| Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish | Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015a)   | Habitat degradation and modification                          | <b>Section 8.2</b><br><b>Section 8.3</b> |
|   | Approved conservation advice for <i>Pristis pristis</i> (largetooth sawfish) (Threatened Species Scientific Committee, 2014a)                            |   |  |
| Green Sawfish, Dindagubba, Narrowsnout Sawfish  | Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015a)   | Habitat degradation and modification                          | <b>Section 8.2</b><br><b>Section 8.3</b> |
|   | Approved conservation advice for green sawfish (Threatened Species Scientific Committee, 2008a)  |   |  |
| <b>Marine Mammals</b>   |  |   |  |
| Blue Whale  | Conservation management plan for the blue whale: A recovery plan under the <i>Environment Protection</i>   | Noise interference  | <b>Section 7.3</b>                       |

| Common Name            | Recovery Plan / Conservation Advice / Management Plan  | Threats identified that may arise from the Petroleum Activity | Relevant EP Section                      |
|------------------------|--|---|--|
|                        | <i>and Biodiversity Conservation Act 1999 2015-2025</i> (Commonwealth of Australia, 2015b)   | Vessel disturbance  | <b>Section 8.4</b>                       |
| Sei Whale              | Conservation Advice <i>Balaenoptera borealis</i> sei whale (Threatened Species Scientific Committee, 2015b)  | Noise interference  | <b>Section 7.3</b>                       |
|                        |  | Vessel disturbance  | <b>Section 8.4</b>                       |
| Fin Whale              | Conservation Advice <i>Balaenoptera physalus</i> fin whale (Threatened Species Scientific Committee, 2015c)  | Noise interference  | <b>Section 7.3</b>                       |
|                        |  | Vessel disturbance  | <b>Section 8.4</b>                       |
| Southern Right Whale   | Conservation management plan for the southern right whale: a recovery plan under the <i>Environment Protection and Biodiversity Conservation Act 1999 2011-2021</i> (Department of Sustainability, Environment, Water, Population and Communities, 2012) | Noise interference  | <b>Section 7.3</b>                       |
|                        |  | Vessel disturbance  | <b>Section 8.4</b>                       |

## 4.8 Socio-economic Environment

Socio-economic values and activities that may occur within the Operational Area, ecological EMBA and socio-economic EMBA include cultural values and heritage, commercial fishing, oil and gas exploration and production, and to a lesser extent, recreational fishing and tourism as summarised below. As the socio-economic EMBA covers a greater extent than the ecological EMBA it has been used to inform the socio-economic values and sensitivities relevant to this EP.

More detailed descriptions of socio-economic considerations are provided in **Appendix C**.

### 4.8.1 Cultural Values and Heritage

#### 4.8.1.1 Background

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places; and
- the social, economic, and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of the Operational Area and EMBA are described.

In line with The Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance (Australia ICOMOS 2013) (Burra Charter) and associated practice notes, Woodside understands heritage value to refer to the cultural significance of a place to an individual or group. A cultural feature, by contrast, is understood to be comparable to the Burra Charter term "fabric" and refer to a place's elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible or intangible dimensions (Australia ICOMOS 2013)

Through consultation with relevant persons, Woodside recognizes the deep spiritual and cultural connection to the environment that First Nations peoples hold.

#### 4.8.1.2 First Nations Peoples

As a starting point for understanding social and cultural features of the environment for First Nations groups, Woodside uses the existing systems, such as native title, to identify First Nations groups that may have functions, interests or activities that may be affected. To that end, Woodside identifies native title representative bodies and nominated representative entities (defined in **Section 5.5.2.1**), as well as native title claimant applications (claims), native title determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA overlaps. Native title claims, determinations and ILUAs are defined under the Native Title Act 1993 (Cth). While acknowledging that cultural features and heritage values may exist outside of the native title framework, Woodside considers this to be the broadest extent over which First Nations groups have claimed native title rights and interests. Native title claims are applications made to the Federal Court under the Native Title Act for a determination or decision about native title in a particular area. A claim is made by a native title claim group which asserts it holds native title rights and interests in an area of land and/or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so that its native title rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area (National [Native Title Tribunal](#)).

A requirement to establishing a positive determination of native title in court is proving that there is an organised society that occupied the land and/or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of *Mabo v Queensland (No 2)* [1992] HCA 23; (1992) 175 CLR 1 ('Mabo'). Justice Toohey had the following to say (at 187):

*it is inconceivable that indigenous inhabitants in occupation of land did not have a system by which land was utilized in a way determined by that society. There must, of course, be a society sufficiently organized to create and sustain rights and duties...*

Therefore, Woodside understands that native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which First Nations groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found

to either exist or not exist. Where native title rights or interests are determined to exist they will be held by a Registered Native Title Body Corporate (section 57, *Native Title Act 1993*) in trust or as agent for native title holders. The National Native Title Register holds information about the determination of claimant applications.

ILUAs are voluntary agreements between native title parties and other people or bodies about the use and management of land and/or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area; or
- a native title claim has been made; or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders (National [Native Title Tribunal](#)).

The *Native Title Act 1993* provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the Native Title Act within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details on the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

For the activity in this EP, there are 4 native title claims or determinations and 11 coastal ILUAs overlapping the in-water EMBA, and an additional 20 native title claims or determinations and 26 coastal ILUAs overlapping areas with potential for shoreline accumulation (see **Figure 4-13** and **Table 4-11**). There are a further 4 coastal ILUAs adjacent to the EMBA.

#### 4.8.1.3 Coastally Adjacent First Nations Groups

Woodside understands that First Nations groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth 2007). To identify cultural features and heritage values which may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to be consulted (See **Table 5-2**).

That said, Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas which those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for First Nations groups and individuals. This may also, over time, build expectations in the broader First Nations community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge. Woodside also acknowledges that a First Nations group's relative proximity to any Operational Areas or EMBA is not necessarily a meaningful indicator of the connection of First Nations groups to the area, and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

A summary of native title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA is set out in **Table 4-11**. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

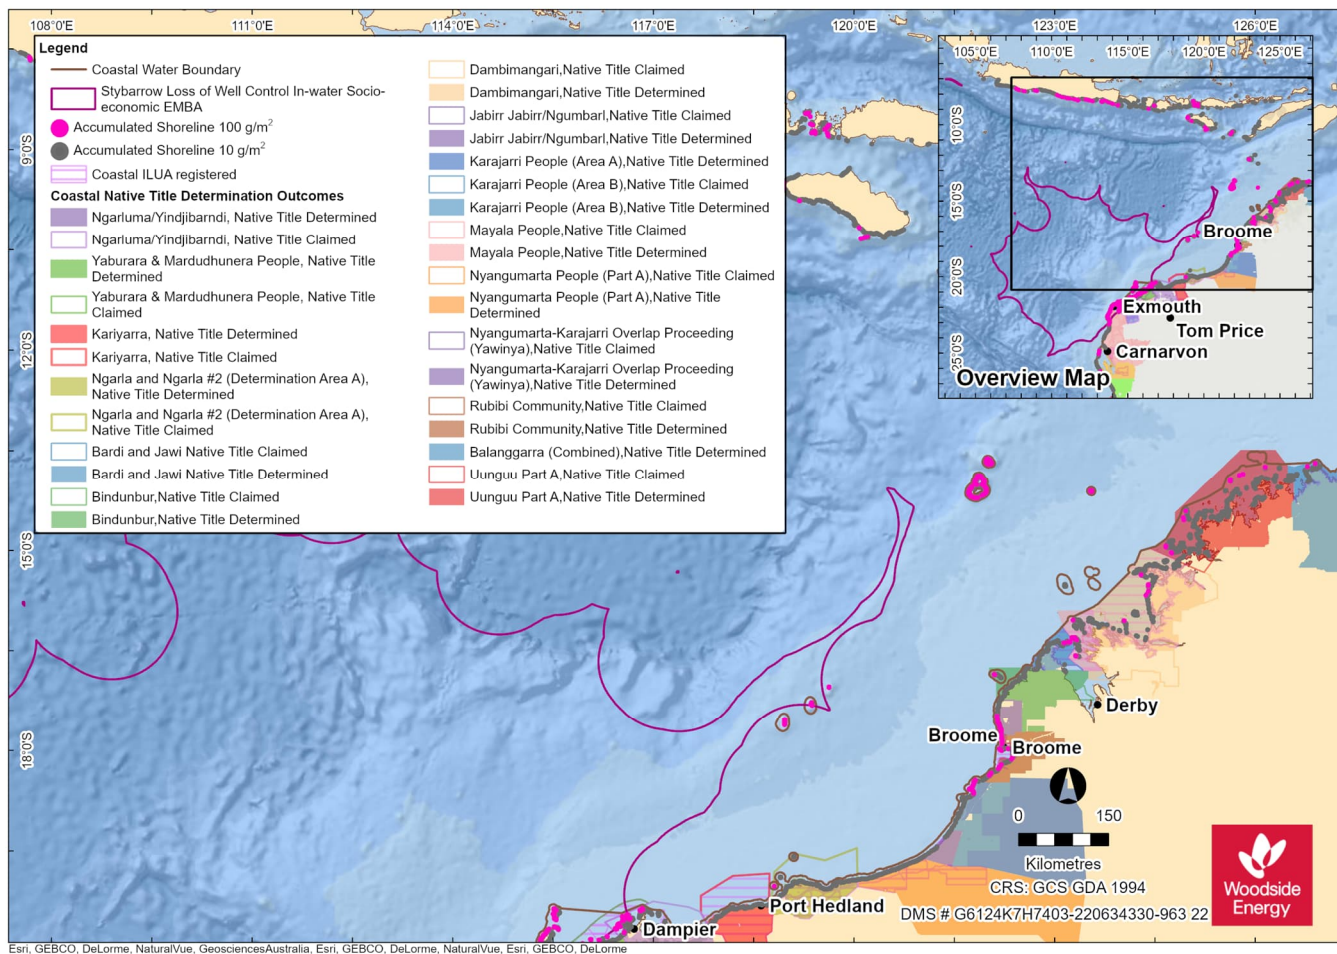

Figure 4-13: Operational Area and Socio-economic EMBA in relation to native title claims, determinations and ILUAs (1 of 2).

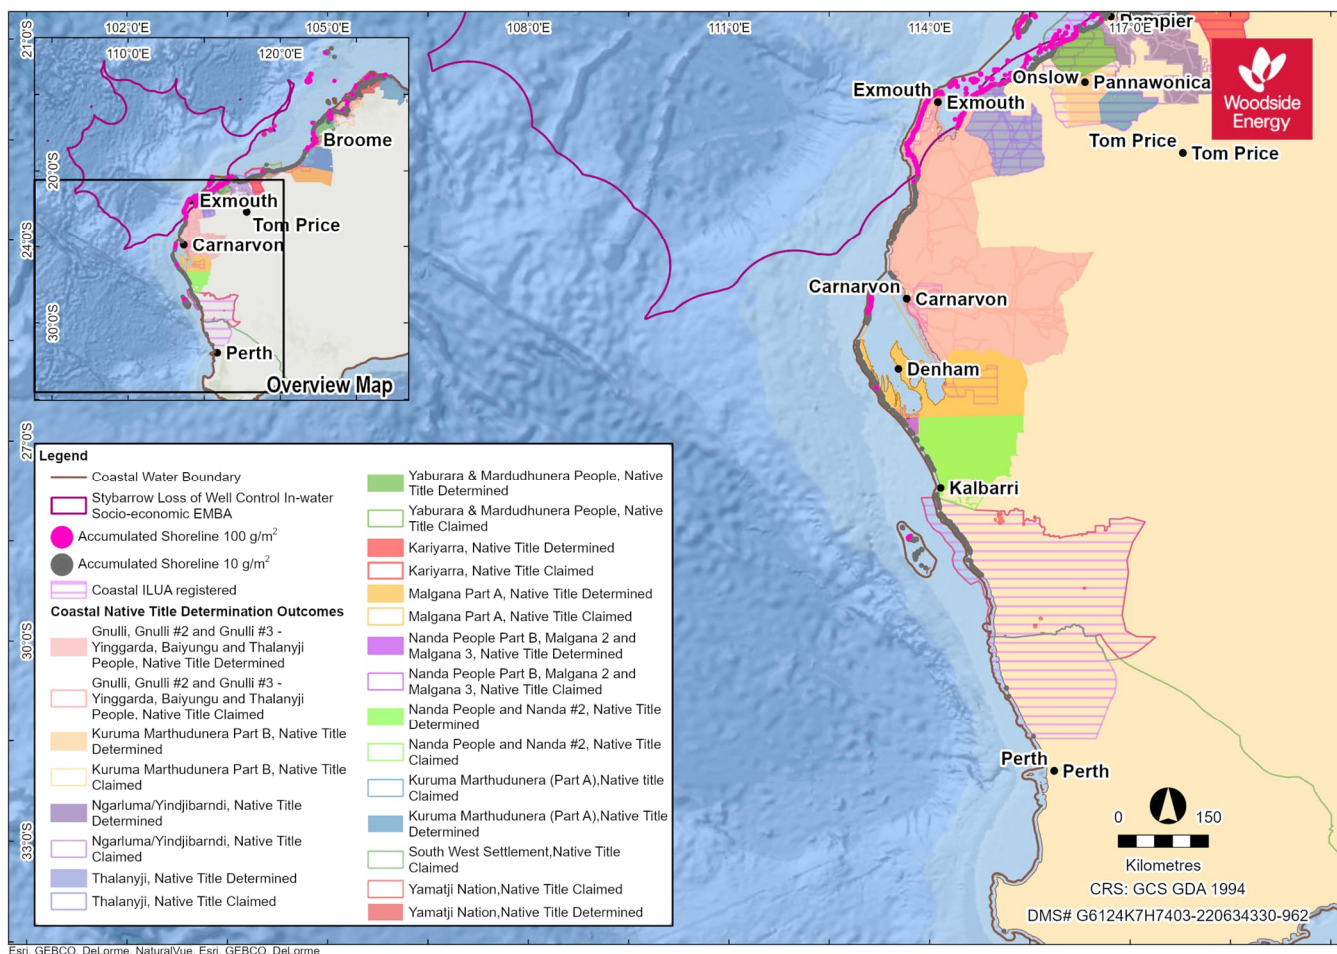

Figure 4-14: Operational Area and EMBA in relation to native title claims, determinations and ILUAs (2 of 2).

Table 4-11: Summary of Native Title Claims, Determinations and ILUAs which overlap or are coastally adjacent

| Claim / Determination / ILUA   | Registered Native Title Body Corporate  | Overlap with EMBA           | Coastally Adjacent to the EMBA |
|--|---|-----------------------------|--------------------------------|
| <b>Claim / Determination</b>   |   |                             |                                |
| Balanggarr (Combined)  | Balanggarr Aboriginal Corporation   | Shoreline accumulation only | No                             |
| Bardi and Jawi Native Title Determination                                  | Bardi and Jawi Niimidiman Aboriginal Corporation  | Shoreline accumulation only | No                             |
| Bindunbur  | Gogolanyngor Aboriginal Corporation, Nimanburr Aboriginal Corporation, Nyul Nyul PBC Aboriginal Corporation | Shoreline accumulation only | No                             |
| Dambimangari   | Wanjina-Wunggurr (Native Title) Aboriginal Corporation  | Shoreline accumulation only | No                             |
| Gnulli, Gnulli #2 and Gnulli #3 - Yinggarda, Baiyungu and Thalanyji People | Nganhurra Thanardi Garrbu Aboriginal Corporation (NTGAC), Yinggarda Aboriginal Corporation (YAC)            | Yes – in water EMBA         | Yes                            |

| Claim / Determination / ILUA                       | Registered Native Title Body Corporate                           | Overlap with EMBA           | Coastally Adjacent to the EMBA |
|--|--|-----------------------------|--------------------------------|
| Jabirr Jabirr/Ngumbarl                             | Gogolanyngor Aboriginal Corporation                              | Shoreline accumulation only | No                             |
| Karajarri People (Area A)                          | Karajarri Traditional Lands Association (Aboriginal Corporation) | Shoreline accumulation only | No                             |
| Karajarri People (Area B)                          | Karajarri Traditional Lands Association (Aboriginal Corporation) | Shoreline accumulation only | No                             |

#### 4.8.1.4 Marine Parks

Woodside acknowledges that Commonwealth and State Marine Park Management Plans have sought to recognise cultural values of First Nations groups. Australian Marine Parks (AMP) describe this framework in the following way: 'when making decisions about what can occur in marine parks and what action we will take to protect marine parks, we take values into account'. AMP summarises these values as natural values, cultural values, heritage values and socio-economic values. Woodside is triggered to undertake an assessment of cultural values within Marine Park Management Plans where the operational area or EMBA overlaps an AMP. Woodside considers the management plans of marine parks that overlap the Operational Area and the EMBA to determine whether cultural features and heritage values have been identified and whether there are specified Traditional Custodians or specified representative bodies referenced to contact regarding potential cultural features and heritage values.

The Operational Area does not overlap any AMPs or State Marine Parks. The EMBA overlaps features of 11 AMPs under the South-West Marine Parks Network Management Plan 2018 and North-West Marine Parks Network Management Plan 2018 and 21 State Marine Parks. Where these plans specify identifiable representative bodies who may hold knowledge of heritage values or cultural features—including but not limited to Registered Native Title Bodies Corporate—these bodies are consulted (**Appendix J**). Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. Twelve identifiable representative bodies were specified for the marine parks overlapped by the EMBA (see **Table 4-12**).

The marine park management plans did note for the Abrolhos, Dampier, Gascoyne, Montebello, Ningaloo and Shark Bay AMPs that the Yamatji Marlpa Aboriginal Corporation (YMAC) is the relevant Native Title Representative Body. Consultation with YMAC included discussion of the Traditional Custodians who may hold knowledge of heritage values or cultural features (**Appendix J**).

**Table 4-12: Summary of Commonwealth and State Marine Park Management Plan EMBA overlap**

| Marine Park Management Plan     | Operational Area Overlap | EMBA Overlap | Specified Bodies                         |

| Shark Bay Marine Park           | No                       | Yes          | No identifiable body specified.  |

The South-West Marine Parks Network Management Plan 2018 also notes that cultural features of the Abrolhos AMP include strong stories that connect ocean and land. No impact pathway that may disrupt the preservation of stories or other intangible heritage from this Petroleum Activities Program has been identified. The plan also references artefacts located outside of the AMP and the EMBA on islands in State waters.

Both management plans for the AMPs note shipwrecks within the AMPs and overlap with World, National and Commonwealth heritage lists. These are addressed in **Sections 4.8.1.7** and **4.8.1.8** below.

The Eighty Mile Beach Marine Park management plan 2014-2024 (relating to the state Eighty Mile Beach Marine Park) notes that:

- Reefs, coastal creeks, mangroves and intertidal flats in and adjacent to the marine park are particularly important for resource usage. Fish traps and shell middens along the coast show the historical importance of saltwater resources
- Customary use of the area includes camping, nature appreciation, fishing and other harvesting activities. Limited hunting of turtle (predominantly collection of turtle eggs) also occurs.
- Under traditional law, traditional owners are responsible for and obliged to protect, preserve and manage areas, sites and objects of significance associated with their country, and the traditional knowledge pertaining to them.

The Lalang-gaddam Marine Park Joint Management Plan 2022 (relating to Lalang-garram / Camden Sound Marine Park, Lalang-garram / Horizontal Falls Marine Park and North Lalang-garram Marine Park) notes that customary activities to preserve country and culture “include hunting for food, visiting important cultural places, making medicines, keeping rock art fresh, passing on La Lai narratives, managing country through fire at the right time of year and engaging in artistic and ceremonial events.” The plan also notes “There are many stone arrangements of high cultural significance to Dambeemangarddee people in and around the islands and mainland.”

The Management Plan for the Ningaloo Marine Park and Muiron Islands Marine Management Area 2005 – 2015: Management Plan Number 52 (relating to the Muiron Islands Marine Management Area and Ningaloo Marine Park) notes the aesthetic values of the seascape as a cultural value and that “Panoramic vistas of turquoise lagoon waters, reefs, beaches, breaking surf and the blue open ocean beyond the reef line are major attractions of the reserves.” In particular, the plan notes that “Inappropriate structures along the coastline, on the islands and in the surrounding waters have the potential to degrade the aesthetic values of the reserves. Coastal developments and maritime infrastructure projects must therefore be planned with careful consideration of this issue.” As the activity described in this EP does not include the addition of any structures and removes existing infrastructure, no impacts on the aesthetic values of these parks are anticipated.

The Parks and reserves of the south-west Kimberley and north-west Pilbara joint management plan 2019 (relating to Jinmarnkur Kulja Nature Reserve) notes that “The emu (*Dromaius novaehollandiae*) and the Australian bustard or bush turkey (*Ardeotis australis*) are two species that are culturally important to the area’s traditional owners” and “More generally, permanent and seasonal/temporary water sources, especially the wetlands of the planning area, hold great cultural and spiritual significance.”

A number of management plans for the state marine parks also note First Nations and maritime heritage within the marine parks. These are addressed in **Sections 4.8.1.6** and **4.8.1.7** below.

#### 4.8.1.5 Sea Country Values

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. This is one aspect of the broader concept of “sea country”, which can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. It has been noted that “the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as ‘saltwater country’ or ‘sea country’. ‘Country’ refers to more than just a geographical area: it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area.” (Smyth 2007). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within sea country—the seascape which Traditional Custodians view, interact with or hold knowledge of. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government’s Indigenous Protected Areas Program. The Indigenous Protected Areas program provides for “areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation...IPAs deliver environmental benefits...Managing IPAs also helps Indigenous communities protect the cultural values of their country for future generations...” (DCCEEW, 2023).

McNiven (2004) suggests that “For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20–30km out to sea, out to the horizon and the limit of human visibility. ... However, in some coastal places, clouds that can be seen well over 100km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon.” While there is some evidence of traditional watercraft in Australia’s North West, the recorded evidence is limited to travel across inland rivers (e.g. Barber and Jackson 2011) or travel between coastal islands (Paterson et al 2019). The process for identifying First Nations groups who may have interests and connection in Sea Country are set out in **Section 5**. The scope of advice Traditional Custodians were encouraged to provide through project consultation was not limited by reference to any particular boundaries or limits of sea country.

Cultural features of coastal areas may include marine species (e.g., humpback whales, turtles and dugongs) that may travel many thousands of kilometres through areas with similar cultural values to multiple First Nations language groups. For example, a humpback whale may travel 5,000 km from Antarctica to the Kimberley region of Western Australia (Double et al., 2010, 2012), passing First Nations language groups along the entire west coast of Australia. For a further description of turtles and whale distribution and whale migration patterns, see **Section 4.7**.

As set out above, an impact to marine ecosystems has the potential to impact cultural values where the impact is detectable within Sea Country. Woodside considers that impact to cultural values of marine species will be adequately managed in areas of traditional Sea Country, and therefore management of the environmental values will preserve the cultural values of environmental receptors, as assessed in **Section 6**.

Woodside consults on cultural values of Sea Country where Traditional Custodians or representative institutions are identified, or self-identify, as relevant persons.

#### ***First Nations Archaeological Heritage Assessment***

Woodside understands that communal cultural connection may exist between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that First Nations people have occupied the Australian continent for at least 65,000 years (Clarkson et al 2017) and in many places maintain a strong continuing connection that is said to extend back in First Nations cosmology to the beginning of time.

It is understood that the sea level has risen significantly during the 65,000 years of First Nations occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth et al 2019; UWA 2021). Woodside also understands that, at its lowest level during First Nations occupation, sea level was between 125 m (O’Leary et al 2020, Veth et al 2019, Williams et al 2018) and 130 m below current levels (Benjamin et al 2020, Benjamin et al 2023, UWA 2021). Archaeological material preserved on the Ancient Landscape has the potential to provide further information about the earliest periods of human occupation (Veth et al 2019; UWA 2021).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited and can retain archaeological material from this time (Benjamin et al, 2020; Benjamin et al 2023; see Ward et al 2021 for an opposing view).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline KEF (**Figure 4-3**) as an area where potential First Nations archaeological material may exist on the seabed, as this covers the full extent of this possible First Nations occupation. The Operational Area and EMBA do not overlap the Ancient Landscape.

Known First Nations heritage places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or *EPBC Act 1999*. However, these Acts only extend protection to First Nations heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is no First Nations archaeology known to exist anywhere within Commonwealth waters and no areas subject to declarations or prescriptions under these Acts are located within the EMBA.

For this EP, a search of DPLH's Aboriginal Heritage Inquiry System was undertaken, which showed no Registered Aboriginal Sites or Other Heritage Places in the Operational Area but did identify 404 sites in the EMBA (see **Appendix I**). The Operational Area is located outside Ancient Landscape.

No archaeological sites within the Operational Area or EMBA were identified by Traditional Custodians during the course of preparing the EP.

#### **4.8.1.5.1 Feedback Received via Consultation to Inform Existing Environment Description**

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that "Aboriginal and Torres Strait Islander heritage is managed... according to community ownership" (Heritage Chairs of Australia and New Zealand 2021). Dhawura Ngilan also specifically notes that "Aboriginal and Torres Strait Islander... intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community..." Through consultation with relevant persons, Registered Native Title Bodies Corporate have identified or raised topics relating to environmental values of cultural interest. These include a broad interest in the marine fauna, including whales and turtles (See **Appendix F**, Table 1).

During consultation, BTAC advised it has a cultural obligation to care for the environmental values of sea country (See Section 5). In the course of consultation specific to another Woodside EP, BTAC raised the importance of archaeological sites on nearshore islands. Given the EMBA for this activity extends to nearshore areas coastally adjacent to BTAC native title lands, these values may be relevant in the event of an unplanned hydrocarbon spill. BTAC has not provided further detail regarding heritage value of places or cultural features of the Operational Area or the EMBA.

BJNAC expressed an interest in protecting Sea Country and advised that it wants to make Woodside aware of Bardi and Jawi Sea Country where relevant (See Appendix F, Table 1). As the Bardi Jawi Gaarra Marine Park is outside of both the socio-cultural and ecological EMBA, it is not expected that there would be any impact to the marine park from an unplanned spill event.

Malgana Aboriginal Corporation noted the ecological importance of Shark Bay, including stromatolites and seagrass beds (See Table 5-4), which Woodside understands may therefore include cultural values. Shark Bay stromatolites and seagrass beds are inshore of the predicted EMBA and therefore it is not expected that there would be any impact to Shark Bay stromatolites or seagrass beds in the event of an unplanned hydrocarbon spill.

Nanda Aboriginal Corporation indicated that the shoreline holds particular cultural significance and expressed an interest in migratory whales. However, shorelines within or adjacent to Nanda Native Title claims or determinations are outside the in-water EMBA. During consultation on another Woodside activity, NTGAC raised an interest in whale sharks and marine parks.

During consultation Yued Aboriginal Corporation raised that there are cultural values within Yued Country and cultural rights ascribed under the South West Native Title Settlement, and that they were interested in how Woodside manages areas in the extended area of the oil spill modelling (i.e. the EMBA).

For completeness in describing the Existing Environment this feedback on potential cultural features and heritage values is identified below:

- whales (including migration patterns)
- whale sharks
- turtles
- dugongs
- plankton
- seagrass
- energy lines (unspecified)
- songlines and dreaming (unspecified)

- where saltwater and freshwater meet
- ecological importance of Shark Bay, including Stromatolites.

#### 4.8.1.6 Intangible Cultural Features

Intangible cultural heritage have been identified through consultation with First Nations people as culturally important (refer to Section 4.10.1). Cultural knowledge, as expressed through songlines, dreaming, dance and other cultural practices, can be associated with tangible objects and physical sites that are culturally important to First Nations people (Ardler 2021; Bursill et al. 2007). Intangible cultural heritage can also be embodied in the practices, representations, expressions, knowledge, uses and skills associated with physical sites (UNESCO 2003). As a result, physical features may have intangible dimensions (ICOMOS 2013).

Oral Songlines are often described by First Nations people as the law of the land and make up part of the Dreaming (Neale and Kelly, 2020:30). Songlines are viewed in Western academia as a framework for relating people to land and consist of a series of invisible, interconnected routes along the landscape that mark significant sites for First Nations people (Higgins 2021:723). Songlines demonstrate First Nations peoples' strong connections to land by revealing sacred knowledge that is place-specific (Roberts 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through, and interacted with, the physical landscape leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include inter alia: rocks, mountains, rivers, caves and hills (Higgins 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect in order to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. While no specific details of songlines have been provided by relevant persons during consultation for this Activity, it can be confirmed that no landforms typical of songlines have been identified or are anticipated to be impacted by the Activity.

In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of First Nations communities across the land (Neale and Kelly 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country make mention of mythical events occurring around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country—for example connections to nearby islands that they once inhabited in their songlines (Smyth and Isherwood 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines in order to communicate sacred knowledge that assists in safe navigation of the ocean (Neale and Kelly 2020:83-84).

#### 4.8.1.7 Historic Sites of Significance

There are no known sites of historic heritage of significance within the Operational Area. **Appendix C** describes cultural heritage sites within the EMBA.

#### 4.8.1.8 Underwater Heritage

A search of the Australasian Underwater Cultural Heritage Database, which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters does not contain records of sites within the Operational Area but does include 11 sites within the in-water EMBA. The closest Underwater Cultural Heritage site is the wreck of the Lady Ann a sailing vessel wrecked in 1982 approximately 40km east of the Operational Area.

#### 4.8.1.9 World, National and Commonwealth Heritage Listed Places

No listed world, national or commonwealth heritage places overlap the Operational Area. Three world, national or commonwealth heritages places overlap the EMBA as shown in **Table 4-13**.

**Table 4-13: World, National and Commonwealth Heritage Listed Places within the EMBA**

| Listed Place                               | Distance from Operational Area to Listed Place |
|--|--|
| <i>World Heritage Places (WHP)</i>         |  |
| Ningaloo Coast World Heritage Property     | 25 km  |
| <i>National Heritage Places (NHP)</i>      |  |
| Ningaloo Coast National Heritage Place     | 25 km  |
| <i>Commonwealth Heritage Places (CHP)</i>  |  |
| Ningaloo Coast Commonwealth Heritage Place | 25 km  |

#### 4.8.2 Commercial Fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area EMBA and socio-cultural EMBA. **Table 4-14** identifies the Commonwealth and State commercial fisheries overlapping the Operational Area and socio-cultural EMBA and provides an assessment of the potential interaction based on the nature of the fishery and historic DPIRD catch data.

Table 4-14: Commonwealth and State Managed Fisheries within the Operational Area and Socio-cultural EMBA

| Fishery Name                      | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>  |
|-----------------------------------|------------------|---------------------|-----------------------|---|
| <b>Commonwealth Fisheries</b>     |                  |                     |                       |   |
| Western Deepwater Trawl Fishery   | ✓                | ✓                   | Yes                   | The Western Deepwater Trawl Fishery operates in Commonwealth waters off the coast of Western Australia. Effort in recent years has been localised in the area offshore and slightly south of Shark Bay. Catch in the 2019–20 season was 31 t in total. Whilst the EMBA overlaps with the fishery management area, there is very little potential for interaction given the current distribution of target species and fishing effort. |
| Western Tuna and Billfish Fishery | ✓                | ✓                   | No                    | Fishing effort has concentrated off south-west Western Australia, with occasional activity off South Australia. Whilst there is an overlap with the fishery management area, there is no potential for interaction given the current distribution of fishing effort.  |
| Southern Bluefin Tuna Fishery     | ✓                | ✓                   | No                    | Fishing effort has concentrated off southern and eastern Australia. Whilst there is an overlap with the fishery management area, there is no potential for interaction given the current distribution of fishing effort.  |
| Skipjack Tuna Fishery             | ✓                | ✓                   | No                    | There has been no fishing in the since 2008–09. Whilst the Operational Area and EMBA overlaps with the fishery management area, there is no potential for interaction given the current distribution of fishing effort.   |
| North West Slope Trawl Fishery    | ✓                | ✓                   | No                    | The North West Slope Trawl Fishery operates off north-western Australia, roughly between the 200 m isobath and the outer boundary of the Australian Fishing Zone. The fishery extends beyond the Operational Area. The North West Slope Trawl Fishery has predominantly been a scampi fishery using demersal trawl gear. In 2020 there were six active fishing vessels.   |
| <b>State Fisheries</b>            |                  |                     |                       |   |
| Pilbara Crab Managed Fishery      | ✓                | ✓                   | No                    | Blue swimmer crabs are targeted by the Pilbara Crab Managed Fishery using hourglass traps, primarily within inshore waters around Nickol Bay and Dampier. Water depths in the Operational Area too deep to support the target species and the fishery is not active in the Operational Area.  |
| Pilbara Line Fishery              | ✓                | ✓                   | No                    | The Pilbara Line Fishery encompasses all of the 'Pilbara waters', extending from a  |

| Fishery Name                            | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>  |
|---|------------------|---------------------|-----------------------|---|
|   |                  |                     |                       | line commencing at the intersection of 21°56'S latitude and the boundary of the Australian Fishing Zone and north to longitude 120°E. There are no stated depth limits of the fishery. The fishing vessels primarily target demersal Lutjanid species such as goldband snapper, which typically occur in < 200 m water depth. Given the depth preferences of target species, no fishing in this fishery will occur in the Operational Area, although it is expected to occur within the EMBA.   |
| West Coast Deep Sea Crustacean Fishery  | ✓                | ✓                   | Yes                   | The West Coast Deep Sea Crustacean Fishery is a 'pot' fishery using baited pots operated in a long-line formation in the shelf edge waters (>150 m) of the West Coast and Gascoyne Bioregions. The fishery primarily targets crystal crabs. There are no landings in the last 10 years within the Operational Area, but it may operate within the EMBA.   |
| Mackerel Managed Fishery                | ✓                | ✓                   | Yes                   | The Mackerel Managed Fishery targets Spanish mackerel ( <i>Scomberomorus commerson</i> ) using near-surface trawling gear from small vessels in coastal areas around reefs, shoals and headlands. The commercial fishery extends from Geraldton to the Northern Territory border. No interaction is expected given the known fishing effort. There have been no landings from within the Operational Area for this fishery in the last 10 years, but the fishery may operate within the EMBA.   |
| Marine Aquarium Managed Fishery         | ✓                | ✓                   | No                    | The Marine Aquarium Managed Fishery operates within Western Australian waters. The fishery is primarily a dive-based fishery that uses hand-held nets to capture the desired target species and is restricted to safe diving depths (typically < 30 m). The fishery is typically active from Esperance to Broome, with popular areas including the coastal waters of the Cape Leeuwin/Cape Naturaliste region, Dampier and Exmouth. Water depths in the Operational Area are not conducive for this fishery. There have been no landings from within the Operational Area for this fishery in the last 10 years, but the fishery may operate within the EMBA. |
| South West Coast Salmon Managed Fishery | ✓                | ✓                   | No                    | The commercial salmon fishery use beach seine net to catch fish. There are two commercial salmon fisheries operating in Western Australia - the South Coast Salmon Managed Fishery (18 licences) and South West Coast Salmon Managed Fishery (six licences). The target species is restricted to temperate waters and will not occur in the Gascoyne or Pilbara. There have been no landings from within the Operational Area for this fishery in the last 10 years and it very unlikely to operate within the EMBA.  |
| Abalone Managed Fishery                 | -                | ✓                   | No                    | The Western Australian Abalone Managed Fishery includes all coastal waters from the Western Australian and South Australian border to the Western Australian and  |

| Fishery Name                            | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>   |
|---|------------------|---------------------|-----------------------|--|
|   |                  |                     |                       | Northern Territory border. The fishery is concentrated on the south coast (greenlip and brownlip abalone) and the west coast (Roe's abalone). Abalone are harvested by divers, limiting the fishery to shallow waters (typically < 30 m). The target species are restricted to temperate waters and are unlikely to occur in the Gascoyne or Pilbara. There have been no landings from within the Operational Area for this fishery in the last 10 years and it very unlikely to operate within the EMBA.                        |
| Specimen Shell Managed Fishery          | -                | ✓                   | No                    | The Specimen Shell Managed Fishery can be conducted anywhere within Western Australia waters and targets the collection of specimen shells for display, collection, cataloguing and sale. The Specimen Shell Managed Fishery encompasses the entire WA coastline but effort is concentrated in areas adjacent to the largest population centres such as: Broome, Karratha, Shark Bay, Mandurah, Exmouth, Capes area, Albany and Perth. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA. |
| Pilbara Fish Trawl Managed Fishery      | -                | ✓                   | No                    | The Pilbara Trawl Managed Fishery is divided into two zones and waters inside of the 50 m isobath are permanently closed to fish trawling. Trawling generally occurs in waters between 50-100 m deep. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Pilbara Trap Managed Fishery            | -                | ✓                   | No                    | The Pilbara Trap Managed Fishery covers the area from Exmouth northwards and eastwards to the 120° line of longitude, and offshore as far as the 200 m isobath. The fishery targets high value species such as red emperor ( <i>Lutjanus sebae</i> ) and goldband snapper ( <i>Pristipomoides multidens</i> ). The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.   |
| West Coast Rock Lobster Managed Fishery | -                | ✓                   | No                    | The West Coast Rock Lobster Managed Fishery targets the western rock lobster ( <i>Panulirus cygnus</i> ), on the west coast of Western Australia between Shark Bay and Cape Leeuwin. The majority of the West Coast Rock Lobster populations use algal covered limestone reefs as their habitat to a depth of 150 m. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.   |
| Pearl Oyster Fishery                    | -                | ✓                   | No                    | The Western Australian Pearl Oyster Fishery is the only remaining significant wild-stock fishery for pearl oysters in the world. Pearl oysters ( <i>Pinctada maxima</i> ) are collected by divers in shallow coastal waters (< 30 m) along the North West Shelf and Kimberley, which are mainly for use in the culture of pearls. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |

| Fishery Name  | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>   |
|---|------------------|---------------------|-----------------------|--|
| Onslow Prawn Managed Fishery                        | -                | ✓                   | No                    | The Onslow Prawn Managed Fishery encompasses a portion of the continental shelf off the Pilbara. The fishery targets a range of penaeids (primarily king prawns) which typically inhabit soft sediments < 45 m water depth. Fishing is carried out using trawl gear over unconsolidated sediments (sand and mud). The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.                          |
| Gascoyne Demersal Scalefish Fishery                 | -                | ✓                   | No                    | The Gascoyne Demersal Scalefish resource includes 60+ demersal species inhabiting marine waters deeper than 20 m in the Gascoyne Coast Bioregion. Commercial vessels in the fishery fish with mechanised handlines and target pink snapper ( <i>Chrysophrys auratus</i> ) and goldband snapper ( <i>Pristipomoides multidens</i> ). The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.        |
| Shark Bay Scallop Managed Fishery                   | -                | ✓                   | No                    | The Shark Bay Scallop Managed Fishery is currently in a recovery phase resulting from the marine heat wave in 2010/11. The stock has fully recovered in Denham Sound but is recovering more slowly in northern Shark Bay. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Shark Bay Prawn Managed Fishery                     | -                | ✓                   | No                    | The Shark Bay Prawn Managed Fishery uses low opening, otter prawn trawl systems within inner Shark Bay to target western king prawns ( <i>Penaeus latisulcatus</i> ), brown tiger prawns ( <i>Penaeus esculentus</i> ) and lesser quantities of endeavour ( <i>Metapenaeus endeavouri</i> ) and coral prawns ( <i>Metapenaeopsis</i> sp.). The fishery does not overlap the Operational Area, but fishing may occur within the EMBA. |
| Abrolhos Islands and Mid-West Trawl Managed Fishery | -                | ✓                   | No                    | The Abrolhos Islands and Mid-West Trawl Managed Fishery exclusively targets a single species of scallop ( <i>Ylistrum balloti</i> ) using demersal otter trawl methods. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Broome Prawn Managed Fishery                        | -                | ✓                   | No                    | The Broome Prawn Managed Fishery uses demersal otter trawl net systems to target Western king prawns ( <i>Penaeus latisulcatus</i> ) and coral prawns ( <i>Parapenaeopsis cornuta</i> and <i>Metapenaeopsis crassissima</i> ) in nearshore waters between 30 and 60 m deep. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Exmouth Gulf Prawn Managed Fishery                  | -                | ✓                   | No                    | The Exmouth Gulf Prawn Managed Fishery targets the brown tiger prawn ( <i>Penaeus esculentus</i> ) and the Western king prawn ( <i>Penaeus latisulcatus</i> ) using low-opening  |

| Fishery Name                                     | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>   |
|--|------------------|---------------------|-----------------------|--|
|  |                  |                     |                       | demersal otter trawl nets in deeper waters of the Exmouth Gulf. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Kimberly Crab Managed Fishery                    | -                | ✓                   | Yes                   | The Kimberley Crab Managed Fishery primarily targets the blue swimmer crab ( <i>Portunus pelagicus</i> ) and mud crab ( <i>Scylla serrata</i> ) using trap methods. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Kimberley Gillnet and Barramundi Managed Fishery | -                | ✓                   | Yes                   | The Kimberley Gillnet and Barramundi Managed Fishery operates in nearshore and estuarine zones from the Northern Territory border with Western Australia to the top end of Eighty Mile Beach, south of Broome targeting threadfin species.   |
| Kimberley Prawn Managed Fishery                  | -                | ✓                   | No                    | The Kimberley Prawn Managed Fishery predominantly targets banana prawns ( <i>Penaeus merguianus</i> ) but also catches tiger prawns ( <i>Penaeus esculentus</i> ), endeavour prawns ( <i>Metapenaeus endeavouri</i> ) and western king prawns ( <i>Penaeus latisulcatus</i> ) using trawl fishing methods between Kolan Island and Cape Londonderry in northern Western Australia.   |
| Nickol Bay Prawn Managed Fishery                 | -                | ✓                   | No                    | The Nickol Bay Prawn Managed Fishery operates along the western part of the Northwest shelf of Western Australia and primarily targets banana prawns ( <i>Penaeus merguianus</i> ) using trawl fishing methods. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Northern Demersal Scalefish Managed Fishery      | -                | ✓                   | No                    | The Northern Demersal Scalefish Managed Fishery uses predominantly small-scale trap systems and also handline/dropline methods to target mostly red emperor ( <i>Lutjanus sebae</i> ) and goldband snapper ( <i>Pristipomoides multidens</i> ) beyond the 30 m depth contour. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Octopus Interim Managed Fishery                  | -                | ✓                   | Yes                   | The Octopus Interim Managed Fishery uses shelter pot and trigger trap methods to target the Western Australian Common Octopus ( <i>Octopus aff. tetricus</i> ) in water depths shallower than 20 m to prevent loss and burying of fishing gear in sediments by wave action. Whilst the EMBA overlaps with the fishery management area, there is very little potential for interaction given the current distribution of target species and distance from operational area. |
| Shark Bay Crab Managed Fishery                   | -                | ✓                   | No                    | The Shark Bay Crab Managed Fishery primarily targets the blue swimmer crab ( <i>Portunus pelagicus</i> ) using trap methods. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.   |

| Fishery Name  | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>   |
|---|------------------|---------------------|-----------------------|--|
| South West Trawl Managed Fishery                                  | -                | ✓                   | No                    | The South West Trawl Managed Fishery uses trawling methods to target various prawn, scallop and finfish species along the continental shelf of the south west of Western Australia. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| Southern Demersal Gillnet and Demersal Longline Managed Fishery   | -                | ✓                   | No                    | The Southern Demersal Gillnet and Demersal Longline Managed Fishery operates in continental shelf waters along the south and lower west coasts of Western Australia primarily targeting shark species and to a lesser extent other scalefish species using demersal gillnet and power-hauled reel fishing systems. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.   |
| West Coast Beach Bait Managed Fishery                             | -                | ✓                   | Yes                   | The West Coast Beach Bait Managed Fishery uses seine net fishing methods to primarily target whitebait ( <i>Hyperlophus vittatis</i> ), but blue sprat ( <i>Spratelloides robustus</i> ), sea mullet ( <i>Mugil cephalus</i> ), yellow-finned whiting ( <i>Sillago schomburgkii</i> ), southern sea garfish ( <i>Hyporhamphus malinchoii</i> ) and yellow-eye mullet ( <i>Aldrichetta forsteri</i> ). Whilst the EMBA overlaps with the fishery management area, there is very little potential for interaction given the current distribution of target species and distance from operational area. |
| West Coast Demersal Gillnet and Demersal Longline Managed Fishery | -                | ✓                   | No                    | The West Coast Demersal Gillnet and Demersal Longline Managed Fishery operates in continental shelf waters along the south and lower west coasts of Western Australia primarily targeting shark species and to a lesser extent other scalefish species using demersal gillnet and power-hauled reel fishing systems. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.   |
| West Coast Demersal Scalefish Managed Fishery                     | -                | ✓                   | No                    | The West Coast Demersal Scalefish Managed Fishery primarily uses wetline hook methods to target the West Australian dhufish ( <i>Glaucosoma hebraicum</i> ) and pink snapper ( <i>Chrysophrysauratus</i> ) species in waters 20 – 250 m deep. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA.  |
| West Coast Estuarine Managed Fishery                              | -                | ✓                   | Yes                   | The West Coast Estuarine Managed Fishery operates in the Swan-Canning and Peel-Harvey estuaries and in the Hardy Inlet using trap methods to target blue swimmer crabs ( <i>Portunus pelagicus</i> ) and gillnets and seine nets to target various finfish species. Whilst the EMBA overlaps with the fishery management area, there is very little potential for interaction given the current distribution of target species and distance from operational area.   |

| Fishery Name   | Operational Area | Socio-cultural EMBA | Potential Interaction | Description <sup>1</sup>  |
|--|------------------|---------------------|-----------------------|---|
| West Coast Purse Seine Managed Fishery   | -                | ✓                   | No                    | The West Coast Purse Seine Managed Fishery primarily targets pilchards ( <i>Sardinops sagax</i> ) and the tropical sardine ( <i>Sardinella lemuru</i> ) by purse seine methods in the West Coast Bioregion. The fishery does not overlap the Operational Area, but fishing may occur within the EMBA. |
| <sup>1</sup> Fisheries descriptions derived from Fishery Status Reports 2021 (Patterson et al., 2021) and Status Report of the Fisheries and Aquatic Resources of Western Australia 2018/2019 - State of the Fisheries (Gaughan and Santoro, 2020) unless cited otherwise. |                  |                     |                       |   |

### 4.8.3 Traditional Fisheries

There are no traditional fisheries within the Operational Area. Traditional fisheries are typically restricted to coastal waters and/or areas with suitable fishing structures such as reefs. However, it is possible traditional fisheries may use the coastal waters of the socio-cultural EMBA, including coastal areas of Indonesia where there is predicted to be shoreline accumulation above socio-economic threshold levels. Specifically, traditional fishing associated with Indonesia is expected around Scott Reef, where shoreline accumulation about the socio-economic threshold may occur. This area is known as the MoU Box, which is subject to a bilateral agreement between Australia and Indonesia and permits Indonesian traditional fishers operating within that specific area of Australian waters.

**Appendix C** provides further information on traditional fisheries and traditional fishing activities expected within the EMBA.

### 4.8.4 Tourism and Recreation

While relatively close to the Ningaloo Coast, which supports extensive nature-based tourism, the Operational Area is in deep water (>800 m) with no significant natural attractions and is a considerable distance from the nearest boat-launching facilities. Given the depth of the Operational Area and distance from shore, significant recreational fishing and tourism are not expected in this area.

The socio-economic EMBA extends close to shore and presents as shoreline accumulation at a number of locations. It is expected recreation and tourism activities may occur within the EMBA where it extends close to, or on, shorelines. In particular accumulation around Scott Reef, Broome, Ningaloo and Shark Bay host a number of recreational and tourism activities including diving, fishing, swimming, camping and wildlife tourism. **Appendix C** provides detail on recreational fishing and tourism within the EMBA.

### 4.8.5 Oil and Gas Activities

The NWS is Australia's most prolific oil and gas production area, largely responsible for WA accounting for 66% of the country's oil production, 76% of the country's condensate production and 37% of the country's gas production in 2013 (Australian Petroleum Production and Exploration Association (APPEA), 2014).

Oil and gas production facilities close to the Operational Area include:

- Woodside's Ngujima-Yin FPSO (approximately 20 km east of the Operational Area)
- Santos' Ningaloo Vision FPSO (approximately 23 km east of the Operational Area), and
- Woodside's Pyrenees Venture FPSO (approximately 26 km east-south-east of the Operational Area).

The Laverda field within title WA-59-L, directly to the south of WA-32-L, is produced back to the Ngujima-Yin FPSO. Some subsea equipment associated with the Laverda field lies in proximity to the Operational Area. A very small portion of the Laverda export pipeline licence (WA-28-PL) partially overlaps the Operational Area.

**Appendix C** provides further information on oil and gas activities within the socio-cultural EMBA.

### 4.8.6 Commercial Shipping

The Operational Area hosts very low levels of commercial shipping. A fairway designed by AMSA lies to the west and north of the Operational Area, approximately 21 km from the Operational Area at the closest point. Commercial shipping is concentrated within this fairway (**Figure 4-15**). The production facilities to the east of the Operational Area will intermittently host tankers for offtakes, however all these facilities lie well beyond the Operational Area.

**Appendix C** provides further information on commercial shipping activities within the socio-cultural EMBA.

### 4.8.7 Defence

No defence areas or infrastructure intersects the Operational Area. Military exercise areas are located at Exmouth associated with Royal Australian Air Force Base Learmonth, approximately 80 km south of the Operational Area. The Operational Area is within the North Western Training Area and military restricted airspace (R8541A) a designated defence exercise area which encompasses waters and airspace off the North West Cape (**Figure 4-16**). When activated by a Notice to Airmen (NOTAM), the restricted airspace can operate

down to sea level.

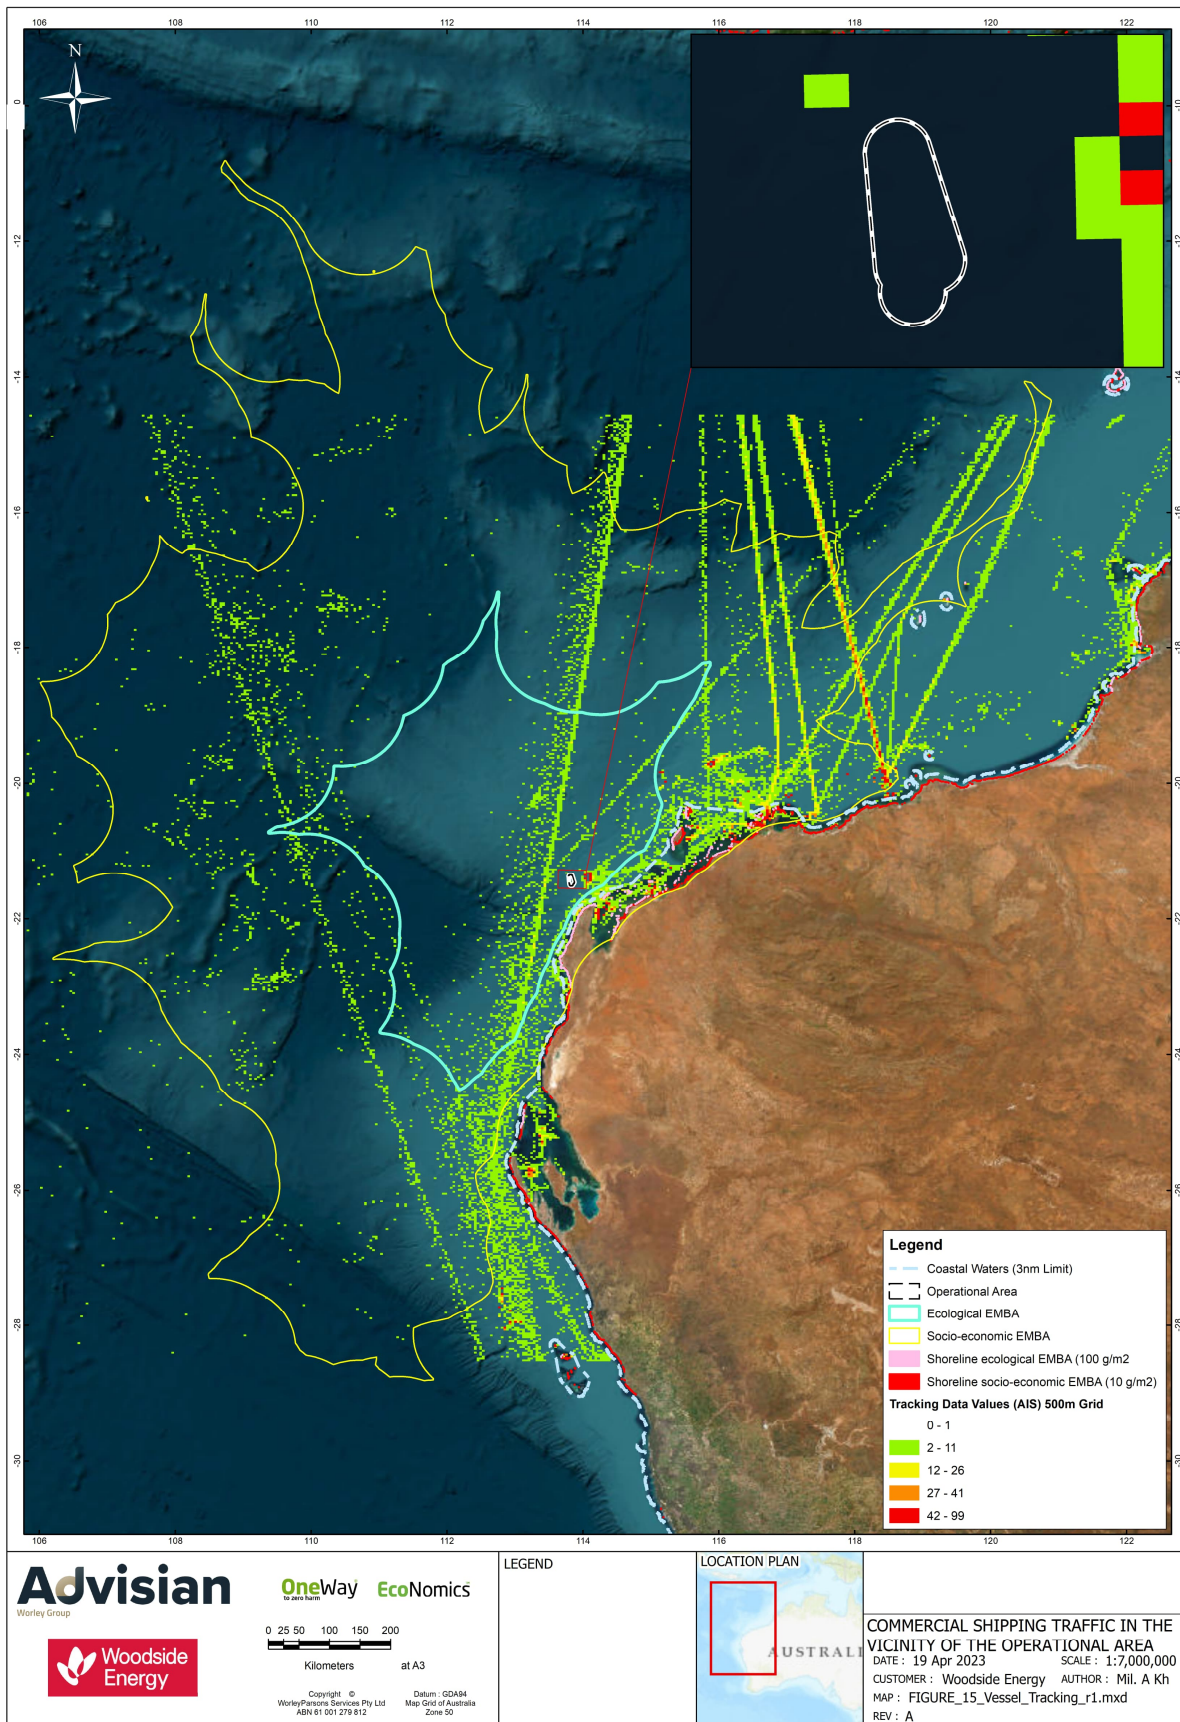

Figure 4-15: Commercial shipping traffic in the vicinity of the Operational Area, EMBA and Socio-cultural EMBA

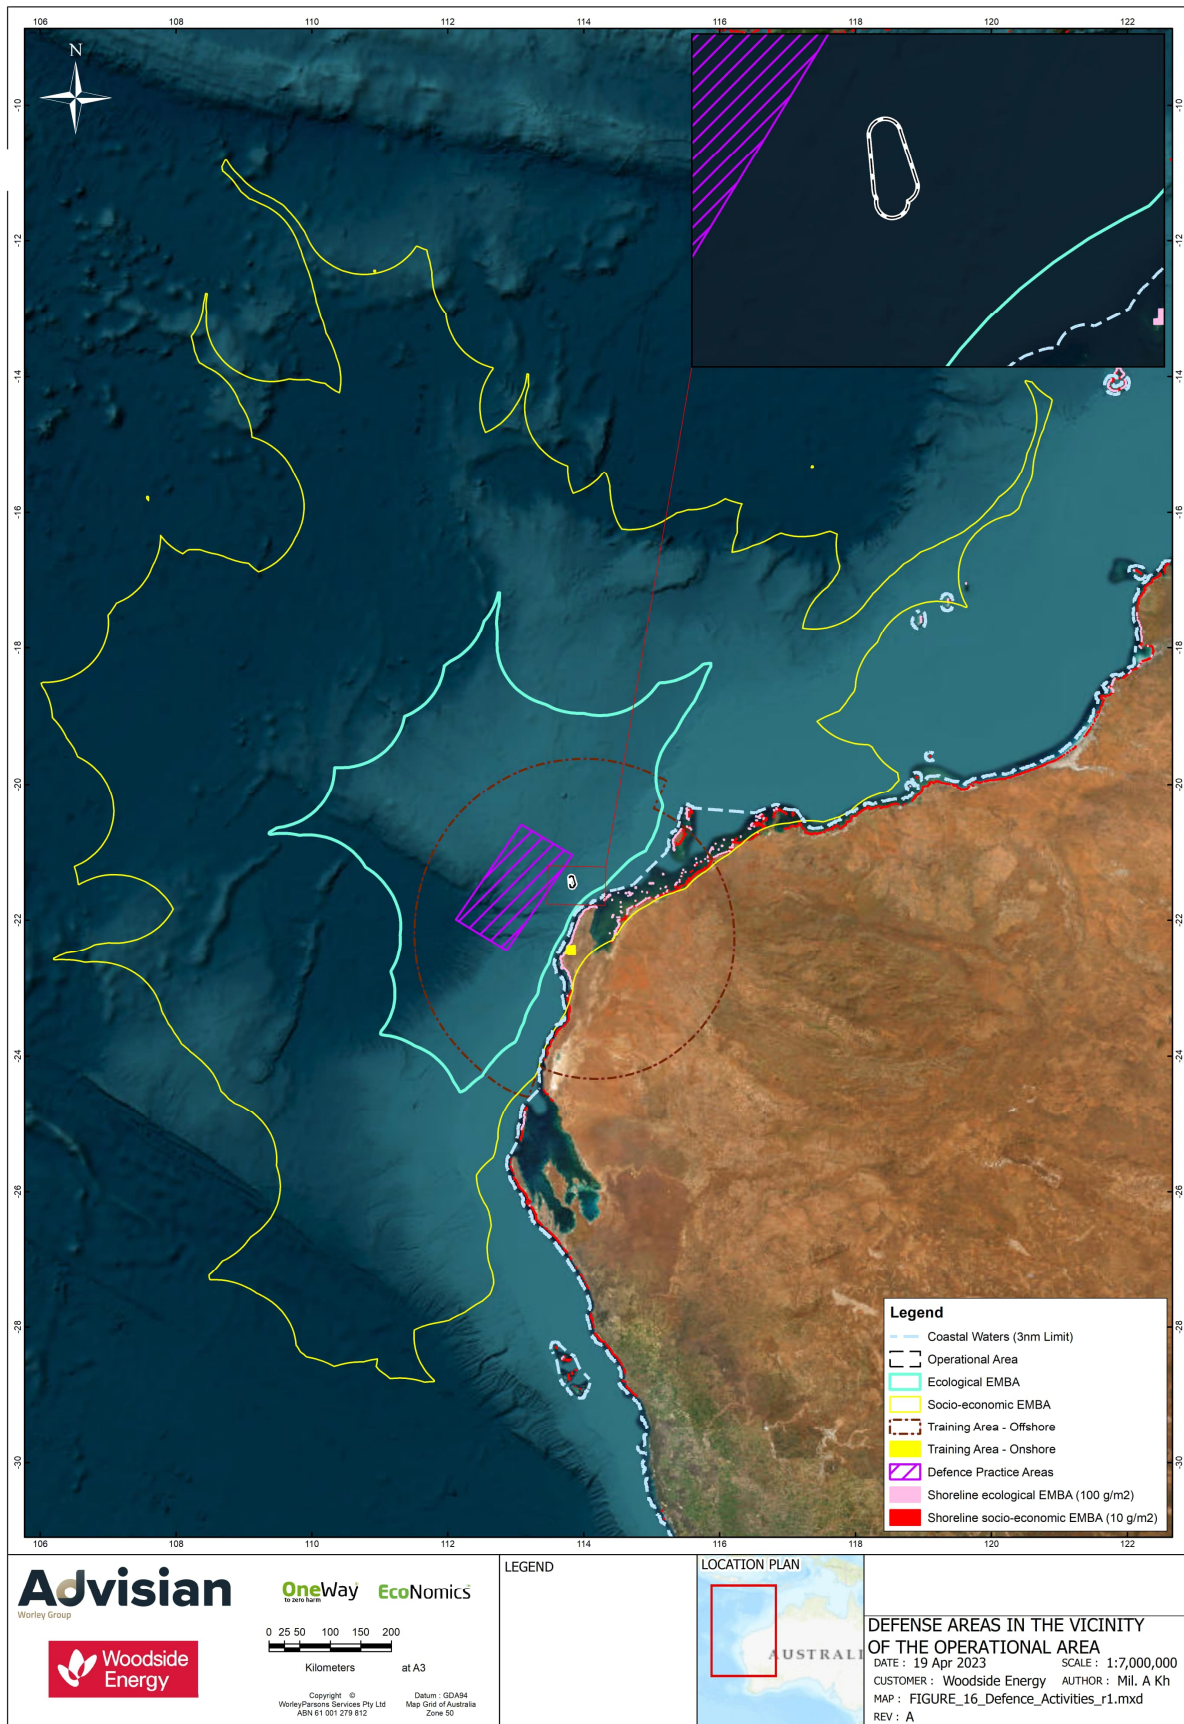

Figure 4-16: Defence Areas in the vicinity of the Operational Area, EMBA and Socio-cultural EMBA

## 5 Consultation

### 5.1 Summary

Woodside consults relevant persons in the course of preparing an environment plan (EP) in accordance with regulation 11A of the Environment Regulations. Woodside acknowledges that consultation is designed to ensure that relevant persons are identified and given sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on them and, to ensure that titleholders can consider and adopt appropriate measures in response to the matters raised by relevant persons. Consistent with regulation 3 of the Environment Regulations, consultation also supports Woodside's objective to ensure that the environmental impacts and risks of the activity are reduced to ALARP and an acceptable level.

Woodside acknowledges that a titleholder's approach to consultation must be informed by both the Environment Regulations and the findings of the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 (Tipakalippa Appeal) (see **Sections 5.2** and **5.5.1**) delivered on 2 December 2022.

For this activity, Woodside has considered both the Operational Area and the broader EMBA (environment may be affected) in undertaking consultation (see further discussion in **Sections 5.2**). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of an unplanned hydrocarbon release resulting from the activity (see **Section 4.2**).

Woodside's consultation methodology is divided into three parts:

- The first section (**Sections 5.2 to 5.7**) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 11A(1) of the Environment Regulations to identify relevant persons.
- The second section (**Section 5.8**) explains Woodside's application of the consultation methodology and Woodside's assessment of relevant persons for this EP.
- The third section (**Section 5.9**) details the:
  - opportunities provided to persons or organisations to be aware of Woodside's proposed EP and participate in consultation, including individual Traditional Custodians.
  - consultation information provided to relevant persons, feedback received and Woodside's assessment of the merits of objections or claims.
  - Engagement with persons or organisations that Woodside chose to contact who are not relevant persons for the purposes of regulation 11A(1) of the Environment Regulations (see **Section 5.3.4**).

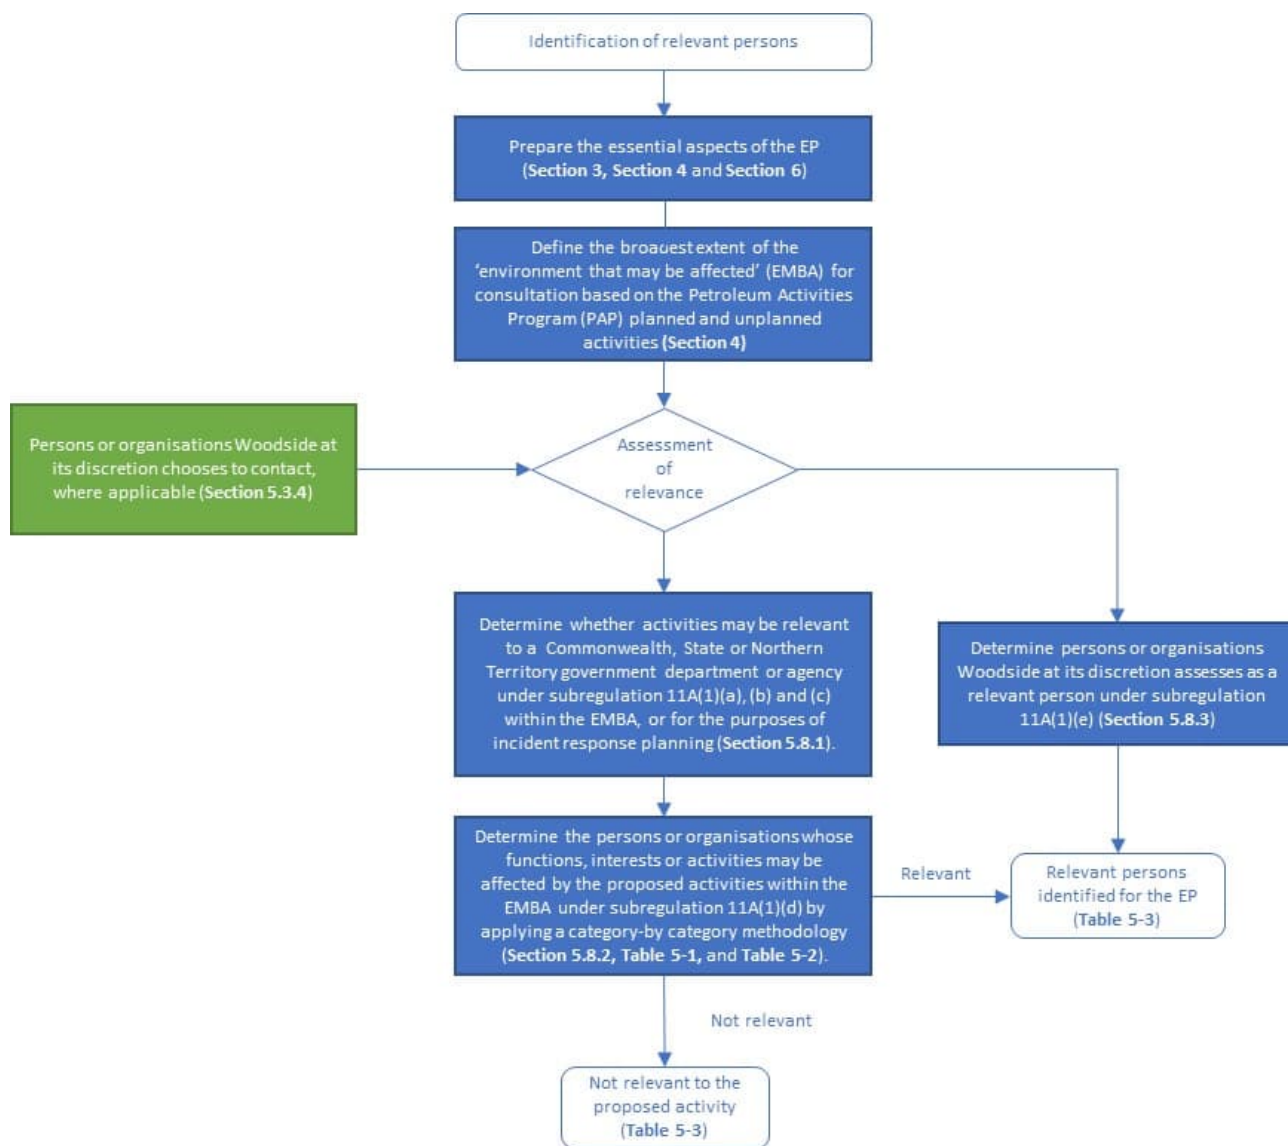

Figure 5-1: Overview of Woodside’s methodology to identify relevant persons

## 5.2 Consultation – General Context

Woodside has a portfolio of quality oil and gas assets and more than 30 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations to understand the potential risks and impacts from our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations, enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult but, rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a proposed petroleum activity. The information in the consultation list has been captured from years of experience, it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA’s *Guideline on Consultation* in the course of preparing an environment plan (12 May 2023) as well as recent judicial guidance in the Tipakalippa Appeal on the intent of consultation as follows:

- At paragraph 54 of the appeal decision: ... *provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- At paragraph 89 of the appeal decision: ... *its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The Tipakalippa Appeal has also been further considered in the context of specific methods for consultation with First Nations relevant persons (**Section 5.5.1**).

In order to undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 11A(1) of the Environment Regulations (**Section 5.3**). This methodology reflects NOPSEMA's recent guideline and demonstrates that, in order to meet the requirements of regulation 10A (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see **Section 3.3**); and
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in **Section 4.1** and assessed in **Sections 7** and **8**).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 11A of the Environment Regulations, which requires a titleholder to:

- consult with each of the following (a **relevant person**) in the course of preparing an environment plan:
  - each Department or agency of the Commonwealth to which the activities to be carried out under the environment plan, or the revision of the environment plan, may be relevant;
  - each Department or agency of a State or the Northern Territory to which the activities to be carried out under the EP, or the revision of the EP, may be relevant;
  - the Department of the responsible State Minister, or the responsible Northern Territory Minister;
  - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP, or the revision of the EP; and
  - any other person or organisation that the titleholder considers relevant (regulation 11A(1)).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the their functions, interests or activities (regulation 11A(1)(2));
- allow a relevant person a reasonable period for the consultation (regulation 11A(1)(3)); and
- tell each relevant person that the titleholder consults with that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 11A(1)(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development (ESD) set out in section 3A of the EPBC Act – see **Section 2**.
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level.
- seeks to ensure that the environmental impacts and risks of the activity will be of an acceptable level.

- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts that the petroleum activity may otherwise cause;
- is collaborative; Woodside respects that for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside collaborates with the relevant person with the aim of seeking genuine and meaningful two-way dialogue;
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to **Section 5.7** and **Section 11.7.2**).

An overview of Woodside's consultation approach is outlined at **Figure 5-2**.

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

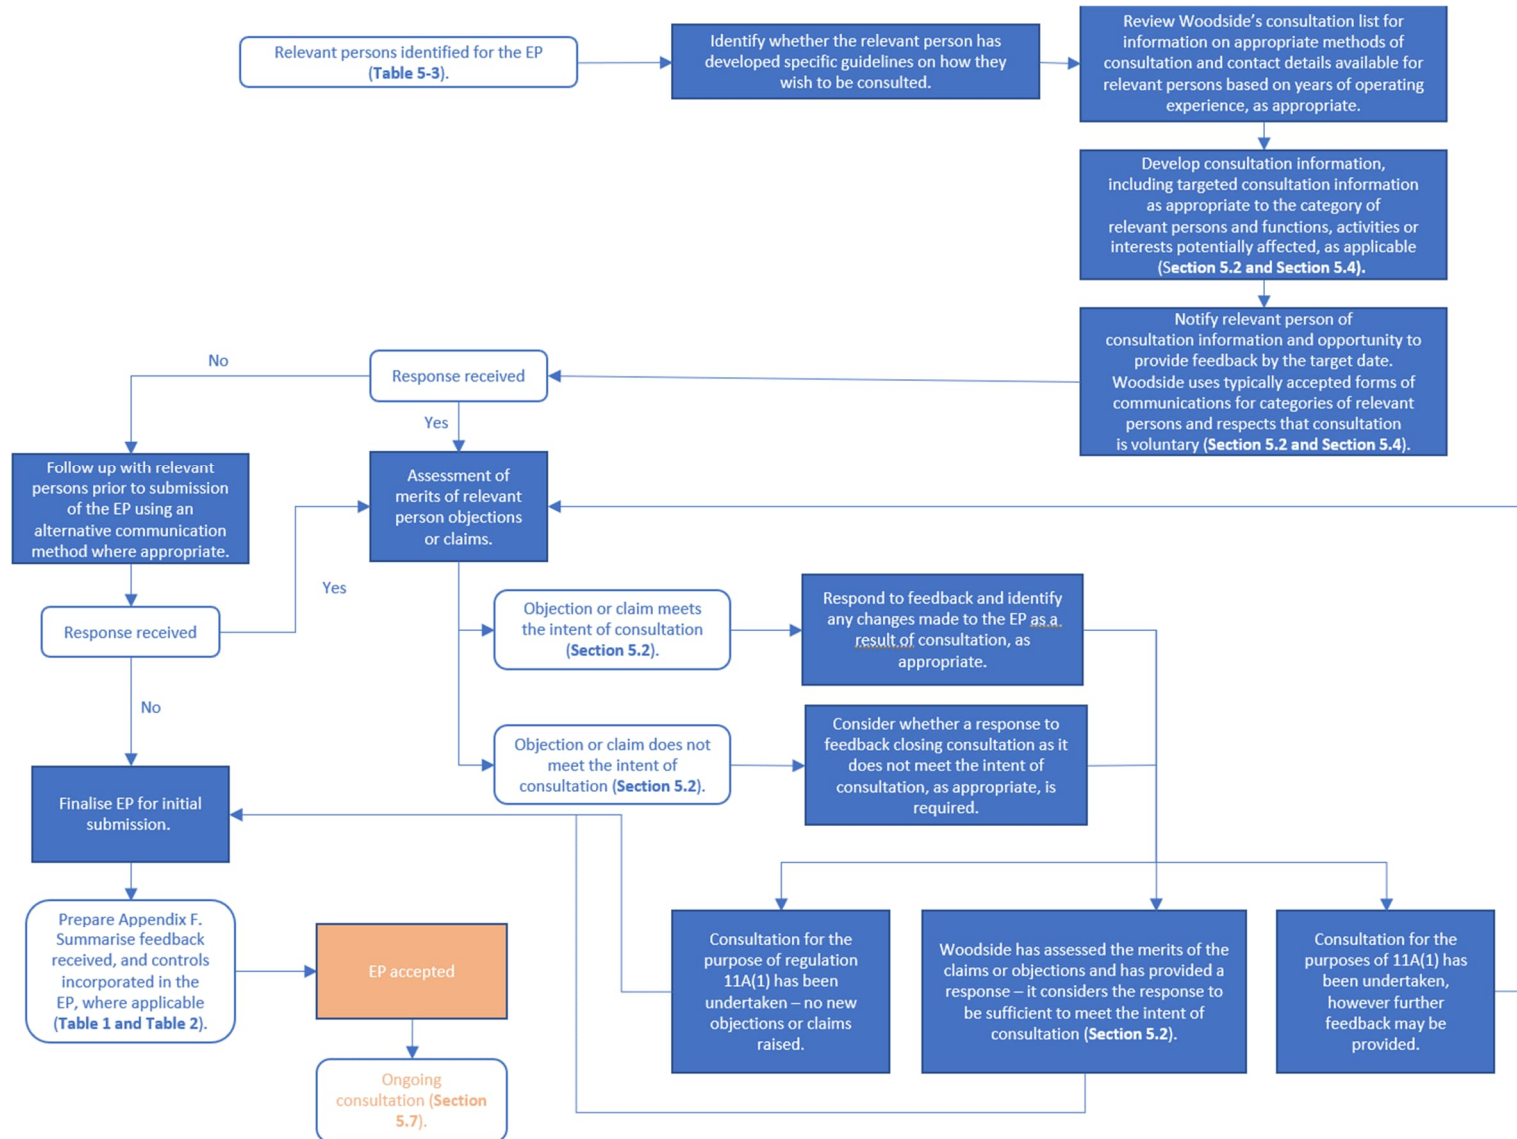

Figure 5-2: Overview of Woodside’s consultation approach

## 5.3 Identification of Relevant Persons for Consultation

### 5.3.1 Regulations 11A(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons within the description of regulations 11A(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government departments and agencies relevant to the EP are listed in Table 5-3 below. In accordance with regulation 11A(1)(c), Woodside consults with the department of the relevant State Minister, which for this EP is the Department of Mines, Industry Regulation and Safety (DMIRS).

### 5.3.2 Regulation 11A(1)(d)

In order to identify a relevant person for the purposes of subregulation 11A(1)(d), the meaning of “functions, interests or activities” needs to be understood. In subregulation 11A(1)(d), the terms “functions, interests or activities” is to be construed broadly and consistently with the regulatory objects of the OPGGS Regs (Regulation 3) and the objects of the EPBC Act (Section 3A).

In developing its methodology for consultation, Woodside acknowledges that the current guidance on the definition of functions, interests and activities is as follows in accordance with NOPSEMA’s GL2086 – Consultation in the course of preparing an environment plan guideline (May 2023):

|                   |  |
|-------------------|--|
| <b>Functions</b>  | Refers to a power or duty to do something.   |
| <b>Interests</b>  | Conforms to the accepted concept of ‘interest’ in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation. |
| <b>Activities</b> | Broader than the definition of ‘activity’ in Regulation 4 of the Environment Regulations and is likely be directed to what the relevant person is already doing.   |

As discussed in **Sections 5.1** and **5.2**, Woodside’s methodology for determining ‘relevant persons’ for the purpose of regulation 11A(1)(d) of the Environment Regulations includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA; and
- whether a person or organisation’s functions, interests or activities may be affected by Woodside’s proposed planned or unplanned activities.

On the topic of consulting outside of Australia’s jurisdiction, when assessing potential impacts from planned and unplanned activities for this EP, it was determined there was an extremely low probability of an unplanned hydrocarbon release entering international waters (**Section 8.2.3.2**), specifically Indonesian waters. Consideration has been given to the functions, interests or activities that may be affected should a worst-case scenario eventuate, noting that modelling completed to predict the extent of potential impact is based on having no mitigative controls in place. The more realistic scenario is that appropriate mitigation controls set out in Woodside’s Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans will be implemented.

The obligation to consult must be construed in a practical and pragmatic way that makes this process reasonable and workable,<sup>3</sup> and capable of being discharged within a reasonable time.<sup>4</sup> The obligation to identify relevant persons for the purpose of consultation must be capable of practicable and reasonable discharge. The Regulations require relevant persons, and their interests, to be readily ascertainable to the titleholder.<sup>5</sup> In the case of Indonesia, which comprises extensive coastlines and potentially remote communities, Woodside considers potential relevant persons within these communities are not readily ascertainable, for reasons including that there are limited electronic records and public records which allow for the identification of potential activities, interests or functions e.g. fisheries, tourism licences and permits.

For example, there are no licensing requirements either in Australia or in Indonesia for traditional Indonesian fishers, therefore, no publicly available information to identify and make contact with them for consultation purposes. The logistics of access to these fishers, the nature of their activities and distance and remoteness from the Operational

<sup>3</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [89], [109], [136], [138], [141]

<sup>4</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [136].

<sup>5</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [136], [147], [153]

Area of this activity of over 1300 kilometres makes international consultation impractical to discharge from a reasonable time and efforts perspective.

Given the extremely low probability of potential impacts, the difficulty of identifying international individuals, and the impracticality of engaging where feedback on unplanned impacts is highly unlikely to inform proposed activities, consultation with international individuals is not required for the activities described in this EP.

Having regard to nature and scale and given the extremely low probability of potential impacts (which are the highly unlikely occurrence of spill traversing international waters), the current processes in place with Department of Foreign Affairs and Trade (DFAT) and the processes and consultation triggers set out in the Woodside's Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans provide a mechanism for consultation in international waters that will be complied with at the appropriate time, if an incident occurs. In such circumstances, consultation with DFAT discharges the requirement for consultation with international persons.

Woodside will continue to consult DFAT for proposed activities outside of Australia's jurisdiction including in the event of a hydrocarbon spill that is likely to traverse international waters as described in the OPEP (**Appendix D**). The process for working with DFAT to manage activities and consultation in the highly unlikely event of a hydrocarbon spill that may traverse international waters is described in the OPEP (**Appendix D**).

### 5.3.3 Regulation 11A(1)(e)

In addition to assessing relevance under regulation 11A(1)(d), Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 11A(1)(e).

### 5.3.4 Persons or organisations Woodside chooses to contact

In addition to undertaking consultation with relevant persons under regulation 11A(1) there are persons or organisations that Woodside chooses to contact, from time to time, in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to regulation 11A(1) but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult or engage with
- that are 'not relevant' pursuant to regulation 11A(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is required to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisations relevance as it does during its initial assessment (as described in **Figure 5-1** and **Section 5.8**). The result of Woodside's assessment of relevance during the development of the EP is outlined at **Table 5-3**.

Engagement undertaken with persons or organisations Woodside assessed as not relevant but chose to contact are summarised at **Appendix F, Table 2**.

## 5.4 Consultation Material and Timing

Regulation 11A(2) provides that a Titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 11A(3) provides that the titleholder must allow a relevant person a reasonable period for the consultation.

As set out in **Section 5.2**, Woodside notifies relevant person or additional persons of the proposed activities, respecting that consultation is voluntary (for the relevant person) and collaborates on a consultation approach where further engagement is sought by the relevant person. Woodside understands that the consultation process should be appropriate for the category of relevant persons and that not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the petroleum activity. Woodside recognises published guidance for good practice consultation relevant to different sectors and disciplines (see **Section 5.2**). Woodside's methodology for providing relevant persons with sufficient information, as well as a reasonable period of time to provide feedback, is set out in this section.

### 5.4.1 Sufficient information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes a description of the proposed petroleum activity; the Operational Area where the activity will take place; the timing and duration of the activity; a location map of the Operational Area and EMBA; a description of the EMBA; relevant exclusion zones; as well as a summary of relevant risks and mitigation and/or management control measures relevant to the proposed petroleum activity. It also sets out contact details to provide feedback to Woodside.

Woodside recognises that the level of information necessary to assist a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and, also may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, for example as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Woodside also acknowledges NOPSEMA's brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which advises consultees that they may inform titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in a selected local, state and national newspaper. This typically includes the name of the EP Woodside is seeking feedback on, an overview of the activity, the consultation feedback date and the ways in which a person or organisation can provide feedback. Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the *Native Title Act* for native title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with **Section 5.8** to determine relevance and evidenced in **Appendix F, Table 1** as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website;
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group;
- Subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs;
- Emails;
- Letters;
- Phone calls;
- Face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate;
- Maps outlining a persons or organisations defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area; and
- Community meetings, as appropriate.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that, in line with the intent of consultation (see **Section 5.2**), the threshold for genuine two-way engagement is met via information on incorporation of controls, where applicable, being provided to the relevant person to ensure the relevant persons understands how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that as part of genuine two-way dialogue, these forms of communication may evolve, including for example due to changes to organisation representation, as relationships are further established, or an alternative form of communication is expressed by a person or organisation. Woodside acknowledges that there might be limitations in how it can consult with relevant persons.

Typical forms of communications for categories of relevant persons are set out below.

| Category of relevant person   | Typically accepted form of communication  |
|---|---|
| Government departments / agencies – marine  | Woodside applies NOPSEMA’s guideline for engagement with Commonwealth government departments or agencies in line with <a href="#">GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</a> by using email for its consultation unless another form of communication is requested.   |
| Government departments / agencies – environment   | Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.  |
| Government departments / agencies – industry  |   |
| Commercial fisheries and peak representative bodies                                       |   |
| Recreational marine users and peak representative bodies                                  | <p><b>Commonwealth commercial fisheries:</b> Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p> <p><b>State commercial fisheries and recreational marine users:</b> The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the <i>Fish Resources Management Act 1994</i> and <i>Aquatic Resources Management Act 2016</i>, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder’s discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p> <p><b>Peak representative bodies:</b> Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p> |
| Titleholders and Operators  | Email is used as the primary form of communication between titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.  |
| Peak industry representative bodies   | Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.  |
| Traditional Custodians and nominated representative corporations                          | There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used where requested.  |
| Native Title Representative Bodies  | There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used where requested.  |
| Historical heritage groups or organisations   | NOPSEMA’s guideline ( <a href="#">GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</a> ) for engagement with government departments or agencies is used as a reference for Woodside’s approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.  |
| Local government and recognised local community reference/liaison groups or organisations | <p><b>Local government:</b> NOPSEMA’s guideline (<a href="#">GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</a>) for engagement with local government is used as a reference for Woodside’s approach for communicating with historical heritage groups or organisations.</p> <p><b>Community reference/liaison groups and chambers of commerce:</b> Email is used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p>  |
| Other non-government groups or organisations  | Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.  |

| Category of relevant person  | Typically accepted form of communication   |
|--|--|
| Research Institutes and Local conservation groups or organisations | Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. |

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised in **Appendix F, Table 1**.

**Appendix F, Table 2** sets out the information which is provided to persons or organisations that are not relevant for the purposes of regulation 11A but which Woodside has chosen to contact (see **Section 5.3.4**).

When engaging in consultation, Woodside notifies relevant persons that, in accordance with regulation 11A(4), the relevant person may request that particular information the person or organisation provides in the consultation not be published and that information subject to that request will not be published.

### 5.4.2 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that in line with the intent of consultation (see: Section 5.2), the threshold for genuine two-way engagement is met via engagement on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understand how their input has been considered in the development of the EP.

Woodside considers its methodology allows relevant persons a reasonable period for the consultation (regulation 11A(3)). A reasonable period for all relevant persons, including Traditional Custodian relevant persons, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Consultation under regulation 11B of the Regulations sets out a public consultation period of 30 days
- The Department of Mines and Petroleum “Guidelines for Consultation with Indigenous People by Mineral Explorers” directs a period of 21- 30 days of consultation with traditional owners
- Guidance taken from the Aboriginal Cultural Heritage Act 2021—Consultation Guidelines (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period of time to allow identification, contact, and response, from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation). Woodside has met this period of time for consultation with First Nations groups on this EP.

This period of consultation demonstrates that Woodside has provided a “reasonable period” for relevant persons to consult in accordance with regulation 11A(3). Commentary in the Tipakalippa Appeal judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

“it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time...”<sup>6</sup>

Woodside seeks feedback in order to support preparation of its environment plan. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside’s typical approach to enable a reasonable period for consultation is as follows:

- advertising in a selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected

<sup>6</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [136].

- providing consultation materials directly to identified relevant persons as well as persons who are not relevant but Woodside chose to contact (see **Section 5.3.4**), and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements.
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

**Appendix F**, Table 1 and Table 2 sets out a history of consultation and demonstrates that a reasonable period of consultation has been afforded for each relevant person.

Woodside considers that the “reasonable period” of consultation for this EP has been provided and the consultation under regulation 11A is complete.

As detailed in **Section 5.7**, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate, at all stages during the life of the EP, as per Woodside’s ongoing consultation approach.

### 5.4.3 Discharge of Regulation 11A

The Full Federal Court made clear in the Tipakalippa Appeal that consultation should be approached in a “reasonable”, “pragmatic” and “not so literal” way, so that consultation obligations were capable of being met by titleholders (**Section 5.5.1**)<sup>7</sup>. Consultation is a “real world activity” and must be capable of reasonable discharge<sup>8</sup>. The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable<sup>9</sup>.

When the titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, the regulation 11A consultation requirements are met<sup>10</sup>. Meeting these requirements is the evaluative judgment to determine reasonable satisfaction of the consultation obligation, and as such, the regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted, and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded<sup>11</sup>.

The titleholder is not required to obtain consent from a consultee to engage in the activity or confirmation from a consultee that consultation is complete. A titleholder is required to provide an opportunity to consult.

The Federal Court has commented that a “reasonable opportunity” for consultation must be afforded to relevant persons<sup>12</sup>. A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed all practicable and reasonable steps to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible impacts and risks of the activity on their functions, interests or activities, and sufficient time to provide relevant feedback for Woodside to assess relevant persons’ claims and action the assessment and response. Woodside has also provided a reasonable opportunity for relevant persons to engage in genuine two-way dialogue on environmental impacts and concerns.

Woodside has discharged its duty under regulation 11A. Woodside considers that consultation under regulation 11A is complete.

**Appendix F**, **Table 1** and **Table 2** of this EP sets out the history of consultation under regulation 11A. To the extent a relevant person says that it has further information to share or claims that consultation under regulation 11A has

7 Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [89], [98], [103]-[104] and [109].

not completed, **Appendix F, Table 1** and **Table 2** provide reasons specifically why Woodside considers consultation under regulation 11A has been met, in relation to that relevant person.

## 5.5 Context of Consultation Approach with First Nations

To comply with regulation 11A, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

### 5.5.1 Approach to Methodology – Woodside’s Interpretation of Tipakalippa

Woodside has implemented a consultation methodology consistent with regulation 11A and guidance provided in the Tipakalippa Appeal (**Section 5.2**). Woodside’s consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests and activities may be affected by the activity described in this EP (**Sections 5.5.2.1 to 5.5.2.4**).

Woodside notes that the Full Federal Court discussed several *Native Title Act 1993* (Cth) (NTA) cases in response to a submission made in that case that a requirement under regulation 11A to consult “each and every” relevant person would be “unworkable”. The reference to native title cases dealt with how decision-making processes under the NTA requiring “all” members of a group to be contacted for communal approval are interpreted by courts in a “reasonable”, “pragmatic” and “not so literal” way,<sup>13</sup> and how obligations to consult “each and every” person under regulation 11A should be interpreted in a similarly pragmatic way so that consultation is workable. The reference to NTA authorities was made by analogy:

*“It can be seen that the terms of [the native title legislation] are somewhat absolute – “all”. However, [the native title legislation] has consistently been construed in a way that is not so literal ... The cases concerning [the native title legislation] ... have reiterated ... that [the native title legislation] does not require that “all” of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting.”<sup>14</sup>*

*“We consider the authorities in relation to processes under the NTA to be **illustrative** of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner”<sup>15</sup> (emphasis added).*

*“there is no definition of what constitutes “consultation for the purpose of ref 11A... A titleholder will need to “demonstrate” to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons”<sup>16</sup> (emphasis added).*

It is clear from the Court’s statement in relation to consultation with organisations that a Titleholder will have some decisional choice in identifying which natural person(s) are to be approached, how the information will be given to allow the “relevant person” to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken.<sup>17</sup> Woodside takes this to mean that consultation is not fixed to a rigid process, and indeed, will need to be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 11A requirements through its consultation methodology (**Section 5.2**).

Consistent with the Tipakalippa Appeal, Woodside considers NTA-style “full group” meetings are not the only way for there to be compliance with regulation 11A in relation to Traditional Custodian relevant persons. Nominated representative corporations (such as Prescribed Bodies Corporates (PBCs) established under the NTA) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. We do not consider it appropriate for titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

<sup>13</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96], [98], [103]-[104] and [109].

<sup>14</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [98].

<sup>15</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96].

<sup>16</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [104].

<sup>17</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [47] and [48].

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities, beyond the opportunity provided to nominated representative corporations.

### 5.5.2 Consultation Method

Woodside's First Nations team has extensive expertise in engaging and working with First Nations organisations and individuals, including having worked within the Commonwealth native title and cultural heritage systems and state and territory cultural heritage and land rights systems, for several decades. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with First Nations groups' established channels of communication and methods of consultation. The First Nations team exercises its professional judgement and is deeply respectful of long-standing relationships (where in place) when considering consultation with First Nations groups. The First Nations team's approach is also informed by the established systems of recognition for First Nations groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with First Nations groups in the Northern Territory (not relevant for this EP) tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976* (Cth)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them. By contrast, recognition for First Nations groups and their nominated representative corporations in Western Australia falls under the Native Title Act 1993 (Cth) because the vast majority of the Western Australian coastline is settled under the native title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to Native Title Representative Bodies and PBCs.

Native title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA, and also help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Full Court in the Tipakalippa Appeal explicitly endorsed methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.<sup>18</sup> Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective First Nations communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our activities, to self-identify (**Section 5.5.2.2**), and to provide feedback to inform the management of environmental impacts and risks.

Using these tools, Woodside communicates information about EPs by:

- advertising in relevant newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian
- creating carefully considered Consultation Summary Sheets with information developed by an Indigenous member of the First Nations Team to remove jargon and provide relevant information for people to have informed understandings about the activities
- direct contact through nominated representative corporations
- utilising social media (i.e., Facebook/Instagram), texts and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and on that basis used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. First Nations woman, Professor Bronwyn Castle through 10 years of research found "*...social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations*" (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018)).
- For ongoing consultation post regulation 11A consultation, Woodside introduced a Program of Ongoing Engagement with Traditional Custodians which sets out Woodside's commitment to ongoing engagement and support to care for and manage country, including Sea Country. The program was developed in response to Traditional Custodian feedback (**Section 11.8** and **Appendix J**).
- Woodside has members of its First Nations team who are based in Karratha and Roebourne and who serve as on-Country points of contact for First Nations organisations and individuals. These team members have

<sup>18</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95],[104],[153].

broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including encouraging First Nations attendance and involvement at Woodside's information sessions and Community roadshows. Team members on the ground engage in a great deal of preparatory work including by distributing information and providing notice to the community to support First Nations attendance at information sessions and Community roadshows.

- From the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and whom to appropriately consult with (such as Elders).
- Holding meetings on country at a place and time agreed with the Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate)
- Providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

### 5.5.2.1 Identification of Relevant Persons

In order to undertake consultation, Woodside has developed a methodology for identifying all relevant persons, in accordance with regulation 11A(1) of the Regulations (**Sections 5.2 and 5.3**).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (**Sections 5.5.2.4 and 5.9.2**). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporations. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in **Section 5.5.2.42** below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act 1993* (Cth), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which aims to seek, from members, authorisation of agreements and native title/compensation claims under the *Native Title Act 1993* (Cth)<sup>19</sup>.

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

### 5.5.2.2 Opportunity to Self-identify and Identifying Other Individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also

<sup>19</sup> Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193, at [104]

advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities (as described in **Section 5.9.2**) to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (**Section 5.5.2.1**). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Owners authorised representative entities.
- Recognising the function of a PBC to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so nor seek to audit the representative entities for compliance with any request.
- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practices rely on the building and maintaining of respectful relationships. Most nominated representative corporations to date have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

#### 5.5.2.2.1 Sufficient Information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and also may depend on the degree to which a relevant person is potentially affected.

Woodside produces a Consultation Information Sheet for each EP which is provided to relevant persons and organisations to provide the opportunity for feedback on the activity (**Section 5.4.1**). In response to Traditional Custodians' feedback, Woodside has tailored effective consultation methods for its activities, specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Consultation Summary Sheet (as described in **Section 5.9.2**) developed and reviewed by Indigenous representatives so that content is appropriate to the intended recipients, is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face to face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians' location of choice (where practicable) and with their nominated attendees. Key project personnel, environmental and First Nations relations experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and suggesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so nor would it be appropriate to seek to audit the representative entities for compliance with any request.

### 5.5.2.3 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (**Section 5.4.2**).

### 5.5.2.4 Discharge of Regulation 11A

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 11A. Woodside considers that consultation under regulation 11A is complete (**Section 5.4.3**).

## 5.6 Providing Feedback and Assessment of Merit of Objections or Claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in **Section 5.2**. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the environment plan and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in **Section 5.2**, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see **Section 5.3.4**). This information is summarised in **Appendix F, Table 1** and **Table 2** of the EP and includes a statement of Woodside's response, or proposed response if any, to each objection and claim.

In accordance with regulation 9(8) of the Environment Regulations, sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 11A, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

## 5.7 Ongoing Consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to **Section 11.7.2**), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation (as set out in **Section 5.2**).

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that requires implementation or updates to meet the intended outcome of consultation (see **Section 5.2**), Woodside will apply its Management of Change and Review process as appropriate (see **Section 7.6**).

## 5.8 Woodside’s Methodology to Identify Relevant Persons

### 5.8.1 Identification of relevant persons under Regulation 11A(1)(a), (b) and (c)

The Woodside’s methodology for identifying relevant persons under Regulations 11A(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities in the EMBA to be carried out under the EP may be relevant. This list of relevant department and agencies is formulated by reference to the responsibilities of the government departments as set out on their websites, in NOPSEMA’s GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline (March 2022) which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating in relation to the departments and agencies which Woodside has historically consulted over the years. This list is revised from time to time for example to accommodate government restructures, renaming of departments, shifting portfolios and new agencies that might arise.
- Woodside has categorised government department or agency groups as follows:

|  |   |
|--|---|
| <b>Government departments / agencies – marine</b>      | Agencies with legislated responsibilities for use of the marine environment.                                  |
| <b>Government departments / agencies – environment</b> | Agencies with legislated responsibilities for the protection of the marine environment.                       |
| <b>Government departments / agencies – industry</b>    | The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for industry. |

- Woodside considers each of the responsibilities of the departments and agencies and determines whether those responsibilities overlap with potential risks and impacts specific to the proposed petroleum activity in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry and AHO is responsible for maritime safety and Notices to Mariners. To undertake the petroleum activity in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the petroleum activity. Feedback received, if any, is assessed in accordance with the intended outcome of consultation (as set out in **Section 5.2**).
- The list of those government departments and agencies assessed as relevant is set out in **Table 5-3**.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation (as set out in **Section 5.2**) and summarised at **Appendix F, Table 1** and **Table 2** as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the proposed petroleum activity in the EMBA or would not be involved in incident response planning.

### 5.8.2 Identification of Relevant Persons under Regulation 11A(1)(d)

Relevant persons under Regulation 11A (1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP, or a revision of the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under this EP (described in **Section 3**); and
- the EMBA by unplanned activities (identified in **Section 4** and assessed in **Section 8**).

To identify relevant persons who fall within regulation 11A(1)(d), Woodside adopts the following methodology, and then undertakes consultation with relevant persons which is set out further in **Section 5.8**.

- As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:
  - whether a person or organisation has functions interests or activities or that overlap with the PAA and EMBA
  - whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.
- This assessment will include applying professional judgement, knowledge and current literature.
- Further, to assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities. For this EP, the broad categories are identified in **Table 5-1** below and identification methodology applied as set out in **Table 5-2**.
- The list of those persons or organisations assessed as relevant and persons or organisations Woodside chose to contact is set out in **Table 5-3**.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation (as set out in **Section 5.2**) and applying the categories of relevant persons methodology outlined in **Table 5-2**, as appropriate.
- Feedback from relevant persons is summarised at **Appendix F, Table 1**. Feedback from persons assessed as not relevant but whom Woodside chooses to contact or self-identified and Woodside assessed as not relevant are summarised at **Appendix F, Table 2**.

**Table 5-1: Categories of relevant persons**

| Category  | Explanation   |
|---|---|
| Commercial fisheries and peak representative bodies       | Commonwealth or State Commercial Fishery with a fishery management plan recognised under the Commonwealth Fisheries Management Act 1991 (Cth) and Western Australian Fish Resources Management Act 1994 (WA), which may be amended from time to time.<br><br>Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.  |
| Recreational marine users and peak representative bodies  | Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity.<br><br>Representative bodies are the recognised peak organisation(s) for recreational marine users.   |
| Titleholders and Operators                                | Registered holder of an offshore petroleum title or GHG title governed by the OPGGS Act and associated regulations.   |
| Peak industry representative bodies                       | Recognised peak organisation(s) for the oil and gas sector.   |
| Traditional Custodians (individuals and/or groups/entity) | Traditional Custodians are First Nations Australians who hold cultural rights and interests or have cultural functions or perform cultural activities over particular lands and waters.<br><br>Where a First Nations person, group or entity self-identifies and/or asserts cultural rights, interests, functions or activities they will be included in the definition of Traditional Custodian for the purpose of this EP.  |
| Nominated Representative Corporations                     | Nominated representative corporations are Traditional Custodians' nominated representative institutions such as Prescribed Body Corporates (PBC).<br><br>PBCs are established under the Native Title Act 1993 by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values. |

| Category  | Explanation   |
|---|---|
| Native Title Representative Bodies  | A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the Native Title Act 1993 (NTA) with prescribed functions, set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies. |
| Historical heritage groups or organisations   | Legislated or government enlisted groups or organisations responsible for the management of marine heritage.  |
| Local government and recognised local community reference/liaison groups or organisations | Local government governed by the Local Government Act 1995 (WA) which is responsible for representing the local community. Recognised local community reference/liaison group or organisation in relation to oil and gas matters.   |
| Other non-government groups or organisations  | Non-government organisation with public website material targeting the proposed activity.   |
| Research Institutes and local conservation groups or organisations                        | Research institutes are government or private institutions that conduct marine or terrestrial research.<br>Local conservation groups are local non-government organisations that regularly conduct conservation activities focused on the local environment or wildlife.  |

|---|---|
|   | <p>certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.</p> <ul style="list-style-type: none"> <li>Review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>Where the area for which a Native Title Representative Body is recognised under the <i>Native Title Act 1993</i>, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.</li> </ul>  |
| Historical heritage groups or organisations   | <p>Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>Using the Australasian Underwater Cultural Heritage Database to assess any known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see: <b>Section 4.8.1</b>).</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.</li> </ul>  |
| Local government and recognised local community reference/liaison groups or organisations | <p>Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>Review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries My Council database and WA Local Government Association (WALGA) Local Government Directory maps) to assess any overlap between the local government's defined area of responsibility and the EMBA.</li> <li>Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector.</li> <li>Woodside reviews the community reference/liaison group's terms of reference to determine its area of responsibility and any overlap with the EMBA. For example, the Exmouth Community Liaison Group's area of responsibility in relation to Woodside's operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e., onshore).</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant.</li> <li>The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.</li> </ul> |
| Other non-government groups or organisations  | <p>Woodside assesses relevance for other non-government groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>Review of Woodside's existing consultation list.</li> <li>Website search of registered non-government groups or organisations (i.e. registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website material specific to the proposed activity at the time of development of the EP.</li> <li>Organisation has a publicly available mission statement (or purpose) that clearly describes their collective functions, interests or activities.</li> <li>Review of current website material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with planned activities.</li> </ul>   |

| Category   | Relevant person identification methodology  |
|--|---|
|  | <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>Registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in <b>Section 5.2</b>) will be assessed as relevant.</li> </ul>   |
| Research institutes and local conservation groups or organisations | <p>Woodside assesses relevance for research institutes and local conservation groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> <li>Review of Woodside's existing consultation list.</li> <li>Website search for research institutes that may operate within the EMBA. This assessment is both activity and location based.</li> <li>Website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA.</li> </ul> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> <li>Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant.</li> <li>Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.</li> </ul> |

### 5.8.3 Identification of relevant persons under subregulation 11A(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 11A(1)(e).

### 5.8.4 Assessment of Relevant Persons for the Proposed Activity

The result of Woodside's assessment of relevant persons in accordance with regulation 11A(1) is outlined at **Table 5-3** and **Appendix F, Table 1**.

Persons or organisations that Woodside assessed as not relevant but nonetheless chose to contact at its discretion in accordance with **Section 5.3.4** or self-identified and Woodside assessed as not relevant are summarised at **Table 5-3** and **Appendix F, Table 2**.

Table 5-3: Assessment of Relevance

| Person or Organisation   | Summary of responsibilities and/or functions, interests or activities  | Assessment of relevance   | Relevant person |
|--|--|---|-----------------|
| <i>Commonwealth and WA State Government Departments or Agencies – Marine</i> |  |   |                 |
| Australian Border Force (ABF)  | Responsible for coordinating maritime security   | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>ABF’s responsibilities may be relevant to the activity as there are proposed vessel activities.  | Yes             |
| Department of Foreign Affairs and Trade (DFAT)                               | Responsible for promoting and protecting Australia’s interests internationally and contributes to global stability and economic growth. DFAT manages Australia’s relationships and interaction with the governments of our neighbouring countries. | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>DFAT has no direct role in the management of the Commonwealth marine area but has an interest in ensuring that consultation with foreign entities, both private and government, is effective and is aligned with Australia’s interests.<br>DFAT manages Australia’s relationships and interaction with the governments of our neighbouring countries. The proposed activity has the potential to impact DFAT’s functions, interests or activities as the EMBA overlaps Indonesian waters.  | Yes             |
| Australian Fisheries Management Authority (AFMA)                             | Responsible for managing Commonwealth fisheries  | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>The Western Deepwater Trawl Fishery is active in the Operational Area.<br>The North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. The Northern Prawn Fishery has been active where shoreline accumulation may occur.<br>AFMA’s responsibilities may be relevant to the activity as the Western Deepwater Trawl Fishery is active in the Operational Area and EMBA, the North West Slope and Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA, and the Northern Prawn Fishery has been active where shoreline accumulation may occur. | Yes             |
| Australian Hydrographic Office (AHO)   | Responsible for maritime safety and Notices to Mariners  | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>AHO’s responsibilities may be relevant to the activity as there are proposed vessel activities.  | Yes             |
| Australian Maritime Safety Authority (AMSA) – Marine Safety                  | Statutory agency for vessel safety and navigation  | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>AMSA – Marine Safety’s responsibilities may be relevant to the activity as there are proposed vessel activities.   | Yes             |

| Person or Organisation   | Summary of responsibilities and/or functions, interests or activities   | Assessment of relevance   | Relevant person |
|--|---|---|-----------------|
| Australian Maritime Safety Authority (AMSA) – Marine Pollution                       | Legislated responsibility for oil pollution response in Commonwealth waters   | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>AMSA – Marine Pollution’s responsibilities may be relevant to the activity as the proposed activity has a hydrocarbon spill risk which may require AMSA response in Commonwealth waters.   | Yes             |
| Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries (formerly DAWE) | Responsible for implementing Commonwealth policies and programs to support agriculture, fishery, food and forestry industries | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>The Western Deepwater Trawl Fishery is active in the Operational Area.<br>The North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. The Northern Prawn Fishery has been active where shoreline accumulation may occur.<br>DAFF – Fisheries responsibilities may be relevant to the activity as the Western Deepwater Trawl Fishery is active in the Operational Area and EMBA, the North West Slope and Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA, and the Northern Prawn Fishery has been active where shoreline accumulation may occur.   | Yes             |
| Department of Defence (DoD)  | Responsible for defending Australia and its national interests.   | Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).<br>DoD’s responsibilities may be relevant to the activity as defence training areas lie within the EMBA.  | Yes             |
| Department of Primary Industries and Regional Development (DPIRD)                    | Responsible for managing State fisheries  | Woodside has applied its methodology for ‘Government departments / agencies – environment’ under regulation 11A(1)(b).<br>No State fisheries are active in the Operational Area. The Exmouth Gulf Beach Seine and Mesh Net Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Gascoyne Demersal Scalefish Fishery, Land Hermit Crab Fishery, Mackerel Managed Fishery (Area 1, 2 and 3), Marine Aquarium Managed Fishery, Nickol Bay Managed Fishery, Onslow Prawn Managed Fishery, Pilbara Crab Managed Fishery, Pilbara Trawl Fishery, Pilbara Line Fishery, Pilbara Trap Fishery, Specimen Shell Managed Fishery, Western Australian Sea Cucumber Fishery, West Coast Deep Sea Crustacean Managed Fishery, West Coast Demersal Scalefish Fishery and West Coast Rock Lobster Managed Fishery are active in the EMBA.<br>Abalone Managed Fishery, Abrolhos Islands and Mid West Trawl Managed Fishery, Joint Authority Southern Demersal Gillnet & Demersal Longline Limited Entry Fishery, Kimberley Crab Managed Fishery, Kimberley Gillnet and Barramundi Managed Fishery, Kimberley Prawn Managed Fishery, Northern Demersal Scalefish Fishery, Octopus Interim Managed Fishery, Pearl Oyster Managed Fishery, Purse Seine Developing Fishery, Shark Bay Beach Seine and Mesh Net Managed Fishery, Shark Bay Crab Managed Fishery, Shark Bay Prawn Managed Fishery, Shark Bay Scallop Managed Fishery, South-West Coast Salmon Fishery, | Yes             |

| Person or Organisation   | Summary of responsibilities and/or functions, interests or activities  | Assessment of relevance   | Relevant person |
|--|--|---|-----------------|
|  |  | West Coast Demersal Gillnet & Demersal Longline Interim Managed Fishery, West Coast Estuarine Managed Fishery, West Coast Purse Seine Managed Fishery, West Coast Rock Lobster Managed Fishery have been active where shoreline accumulation may occur.<br>DPIRD's responsibilities may be relevant to the activity as the government department responsible for State fisheries. |                 |
| Department of Transport (DoT)  | Legislated responsibility for oil pollution response in State waters   | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(b).<br>The proposed activity has a hydrocarbon spill risk, which may require DoT response in State waters.   | Yes             |
| Department of Planning, Lands and Heritage (DPLH)  | Responsible for state level land use planning and management, and oversight of Aboriginal cultural heritage and built heritage matters.  | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(b).<br>There is known Maritime Cultural Heritage overlapping the EMBA.   | Yes             |
| Pilbara Ports Authority  | Responsible for the operation of the Port of Dampier.  | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(b).<br>The proposed activity has the potential to impact Pilbara Ports Authority's responsibilities as the EMBA overlaps the Pilbara Ports Authority's area of responsibility.   | Yes             |
| <b>Commonwealth and WA State Government Departments or Agencies – Environment</b>  |  |   |                 |
| Department of Agriculture, Fisheries and Forestry (DAFF) – Biosecurity (marine pests, vessels, aircraft and personnel) (formerly DAWE) | DAFF administers, implements and enforces the Biosecurity Act 2015. The Department requests to be consulted where an activity has the potential to transfer marine pests.<br>DAFF also has inspection and reporting requirements to ensure that all conveyances (vessels, installations and aircraft) arriving in Australian territory comply with international health regulations and that any biosecurity risk is managed.<br>The Department requests to be consulted where an activity involves the movement of aircraft or vessels between Australia and offshore petroleum activities either inside or outside Australian territory. | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a).<br>DAFF – Biosecurity's (formerly DAWE) responsibilities may be relevant to the proposed activities in the EMBA in the prevention of introduced marine species.  | Yes             |

| Person or Organisation  | Summary of responsibilities and/or functions, interests or activities  | Assessment of relevance   | Relevant person |
|---|--|---|-----------------|
| Department of Climate Change, Energy, the Environment and Water (DCCEEW)<br>(formerly DAWE) | Responsible for implementing Commonwealth policies and programs to support climate change, sustainable energy use, water resources, the environment and our heritage.<br>Administers the Underwater Cultural Heritage Act 2018 in collaboration with the States, Northern Territory and Norfolk Island, which is responsible for the protection of shipwrecks, sunken aircraft and other types of underwater heritage and their associated artefacts in Commonwealth waters. | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a).<br>DCCEEW's (formerly DAWE) responsibilities may be relevant to the proposed activities in the EMBA as there are potential environmental impacts from the proposed activity.<br>There are known Maritime Cultural Heritage overlapping the EMBA.   | Yes             |
| Director of National Parks (DNP)  | Responsible for the management of Commonwealth parks and conservation zones.   | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a).<br>DNP's responsibilities may be relevant to the activity as DNP requires an awareness of activities that occur within AMPs, and an understanding of potential impacts and risks to the values of parks (NOPSEMA guidance note: N-04750-GN1785 A620236, June 2020).<br>Titleholders are required to consult DNP on offshore petroleum and greenhouse gas exploration activities if they occur in, or may impact on the values of marine parks, including where potential spill response activities may occur in the event of a spill (i.e. scientific monitoring). | Yes             |
| Ningaloo Coast World Heritage Advisory Committee (NCWHAC)                                   | Supports the DBCA to manage the Ningaloo Coast World Heritage Area.  | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a).<br>The proposed activity has the potential to impact NCWHAC's responsibilities as the EMBA overlaps the Ningaloo Marine Park.  | Yes             |
| Department of Biodiversity, Conservation and Attractions (DBCA)                             | Responsible for managing WA's parks, forests and reserves to achieve wildlife conservation and provide sustainable recreation and tourism opportunities.   | Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(b).<br>The proposed activities overlap WA parks, forests or reserves.<br>Activities have the potential to impact marine tourism in the EMBA.   | Yes             |
| <b>Commonwealth and State Government Departments or Agencies – Industry</b>                 |  |   |                 |
| Department of Industry, Science and Resources (DISR)<br>(formerly DISER)                    | Department of relevant Commonwealth Minister.  | Required to be consulted under regulation 11A(1)(a).  | Yes             |

| Person or Organisation  | Summary of responsibilities and/or functions, interests or activities | Assessment of relevance   | Relevant person |
|---|---|---|-----------------|
| Department of Mines, Industry Regulation and Safety (DMIRS)               | Department of relevant State Minister                                 | Required to be consulted under regulation 11A(1)(c).  | Yes             |
| <b><i>Commonwealth Commercial fisheries and representative bodies</i></b> |   |   |                 |
| North West Slope and Trawl Fishery  | Commonwealth commercial fishery                                       | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.  | Yes             |
| Southern Bluefin Tuna Fishery   | Commonwealth commercial fishery                                       | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>Although the fishery overlaps the Operational Area and EMBA it has not been active in the Operational Area or EMBA within the last 5 years.<br>Woodside does not consider that the proposed activity will present a risk to licence holders, given since 1992, the majority of Australian catch has concentrated in south-eastern Australia. (Patterson et al., 2022). In addition, given fishing methods by licence holders for species fished in this fishery (Australia has a 35% share of total global allowable catch of Southern Bluefin Tuna, which is value-added through tuna ranching near Port Lincoln (South Australia), or fishing effort in New South Wales (Australian Southern Bluefin Tuna Industry Association). | No              |
| Western Deepwater Trawl Fishery   | Commonwealth commercial fishery                                       | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.   | Yes             |
| Western Skipjack Fishery  | Commonwealth commercial fishery                                       | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>Although the fishery overlaps the Operational Area and EMBA it has not been active in the Operational Area or EMBA within the last 5 years.<br>Woodside does not consider that the activity will present a risk to licence holders, given the fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (Patterson et al., 2022). In addition, interactions are not expected given the species' pelagic distribution fishing methods for species fished by licence holders.   | No              |
| Western Tuna and Billfish Fishery   | Commonwealth commercial fishery                                       | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).   | Yes             |

| Person or Organisation   | Summary of responsibilities and/or functions, interests or activities                      | Assessment of relevance   | Relevant person |
|--|--|---|-----------------|
|  |  | Although the fishery overlaps the Operational Area, it has not been active in the Operational Area within the last 5 years. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.  |                 |
| Northern Prawn Fishery   | Commonwealth commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area or EMBA.<br>The fishery has been active within the last 5 years where shoreline accumulation may occur.  | Yes             |
| Commonwealth Fisheries Association (CFA)                       | Represents the interests of commercial fishers with licences in Commonwealth waters        | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The Western Deepwater Trawl Fishery is active in the Operational Area.<br>The North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. The Northern Prawn Fishery has been active where shoreline accumulation may occur.<br>CFA's functions may be relevant to the activity as the Western Deepwater Trawl Fishery is active in the Operational Area and EMBA, the North West Slope and Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA, and the Northern Prawn Fishery has been active where shoreline accumulation may occur. | Yes             |
| Australian Southern Bluefin Tuna Industry Association (ASBTIA) | Represents the interests of the Southern Bluefin Tuna Fishery and Western Skipjack Fishery | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The Southern Bluefin Tuna Fishery has been assessed as not relevant to the proposed activity. As the peak representative body for the Southern Bluefin Tuna Fishery, the ASBTIA has also been assessed as not relevant.<br>Woodside has provided information to the ASBTIA at its discretion in line with <b>Section 5.3.4</b> on AFMA advice that it expects all Commonwealth fishers who have entitlements to fish within the proposed area to be consulted, which can be through the relevant fishing industry associations.  | No              |
| Tuna Australia   | Represents the interests of the Western Tuna and Billfish Fishery                          | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The Western Tuna and Billfish Fishery is active in the EMBA.<br>Tuna Australia's functions, interests or activities may be relevant to the activity as the Western Tuna and Billfish Fishery is active in the EMBA.  | Yes             |
| Northern Prawn Fishery Industry Pty Ltd                        | Represents the interests of the Northern Prawn Fishery                                     | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).   | Yes             |

| Person or Organisation                                      | Summary of responsibilities and/or functions, interests or activities  | Assessment of relevance  | Relevant person |
|---|--|--|-----------------|
|   |  | <p>The Northern Prawn Fishery does not overlap the Operational Area or EMBA. The fishery has been active within the last 5 years where shoreline accumulation may occur.</p> <p>The Northern Prawn Fishery Industry Pty Ltd's functions, interests or activities may be relevant to the activity as the Northern Prawn Fishery is active where shoreline accumulation may occur.</p>   |                 |
| Pearl Producers Association (PPA)                           | Peak representative organisation of The Australian South Sea Pearling Industry, with members in Western Australia and the Northern Territory | <p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>The Pearl Oyster Managed Fishery has been assessed as not relevant to the proposed activity. As the peak representative body for the Pearl Oyster Managed Fishery, the PPA has also been assessed as not relevant.</p> <p>Woodside chose to contact the PPA at its discretion in line with <b>Section 5.3.4</b>.</p> | No              |
| <b>State Commercial fisheries and representative bodies</b> |  |  |                 |
| Marine Aquarium Managed Fishery                             | State commercial fishery   | <p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>Although the fishery overlaps the Operational Area it has not been active in the Operational Area within the last 5 years. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.</p>  | Yes             |
| South West Coast Salmon Managed Fishery                     | State commercial fishery   | <p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>Although the fishery overlaps the Operational Area and EMBA, the fishery has not been active in the Operational Area or EMBA within the last 5 years.</p> <p>The fishery has been active within the last 5 years where shoreline accumulation may occur.</p>   | Yes             |
| Mackerel Managed Fishery (Area1, 2 and 3)                   | State commercial fishery   | <p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>Although Area 3 of the fishery overlaps the Operational Area, it has not been active in the Operational Area within the last 5 years.</p> <p>Area 1, 2 and Area 3 of the fishery have been active in the EMBA in the last 5 years.</p>   | Yes             |
| Pilbara Crab Managed Fishery                                | State commercial fishery   | <p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>Although the fishery overlaps the Operational Area, the fishery has not been active in the Operational Area within the last 5 years. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.</p>  | Yes             |

| Person or Organisation                         | Summary of responsibilities and/or functions, interests or activities | Assessment of relevance   | Relevant person |
|--|---|---|-----------------|
| West Coast Deep Sea Crustacean Managed Fishery | State commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>Although the fishery overlaps the Operational Area, the fishery has not been active in the Operational Area within the last 5 years. The fishery has been active in the EMBA in the last 5 years.  | Yes             |
| Specimen Shell Managed Fishery                 | State commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.  | Yes             |
| Onslow Prawn Managed Fishery                   | State commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.  | Yes             |
| Exmouth Gulf Prawn Fishery                     | State commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.  | Yes             |
| Pearl Oyster Managed Fishery                   | State commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area. The fishery overlaps the EMBA but has not been active in the EMBA within the last 5 years.<br>The fishery has been active within the last 5 years where shoreline accumulation may occur. | Yes             |
| Nickol Bay Prawn Managed Fishery               | State commercial fishery  | Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).<br>The fishery does not overlap the Operational Area. The fishery overlaps EMBA and has been active in the EMBA within the last 5 years.  | Yes             |

## 5.9 Consultation Activities and Additional Engagement for the Stybarrow Plug and Abandonment Environment Plan

Woodside has been conducting extensive consultation with relevant persons and other parties for this EP since May 2022, when consultation for the Stybarrow Plug and Abandonment Environment Plan commenced with interested and affected stakeholders as part of a planned, integrated and consistent approach to stakeholder engagement for Woodside's proposed activities. Consultation aims to be inclusive, transparent, voluntary, respectful and two-way. Consultation was undertaken by email, letter, phone call and/or meeting.

- Woodside advertised the planned activities proposed for this EP in the national, state and relevant local newspapers including The Australian, The West Australian, Pilbara News, Midwest Times, North West Telegraph (15 February 2023) and Geraldton Times (17 February 2023) (see **Appendix F, reference 2.79**). Regional newspapers do not require subscription and are available and, in some cases, delivered directly to households. All communities within or adjacent to the EMBA had access to this information via this media. No direct comments or feedback were received from the advertisements.
- A Consultation Information Sheet was provided to relevant persons and persons Woodside chose to contact (see **Section 5.3.4**), which included details such as an activity overview, maps, a summary of key risks and/or impacts and management measures (**Appendix F, reference 1.1**).
- An activity update Consultation Information Sheet was provided to relevant persons and persons Woodside chose to contact (see **Section 5.3.4**), which included an update regarding planned activities, information regarding the EMBA's for this EP and additional information relating to mitigation and management measures for this EP (**Appendix F, reference 2.1 and 2.82**).
- Since the commencement of the initial consultation period (May 2022), the Stakeholder Consultation Information Sheet (**Appendix F, reference 1.1**) was available on the BHP website, and the activity update Consultation Information Sheet has been available on the Woodside website since February 2023 (**Appendix F, reference 2.1 and 2.82**). The Woodside Information Sheets include a toll-free 1800 phone number and Woodside's feedback email address (feedback@woodside.com.au).
- Additional targeted information was provided to relevant marine users including AHO and AMSA – Marine Safety (**Appendix F, reference 2.15, reference 2.15.1**). This information included maps and additional information relevant to the specific category of persons. The relevant persons had a 30-day period in which to provide feedback.
- Where appropriate, Woodside conducted phone calls and meetings with relevant persons.
- Where appropriate, targeted follow-up emails were sent to relevant persons who had not provided a response prior to the close of the target feedback period.
- Woodside considered relevant person responses and assessed the merits and relevance of objections and claims about the potential adverse impact of the proposed activity set out in the EP, in accordance with the intended outcome of consultation (see **Section 5.2**).
- Consultation activities undertaken with relevant persons are summarised at **Appendix F, Table 1**.
- Engagement undertaken with persons or organisations Woodside assessed as not relevant but chose to contact (see **Section 5.3.4**) or self-identified and Woodside assessed as not relevant are summarised at **Appendix F, Table 2**.
- From 3 May 2023, Woodside commenced a geotargeted sponsored social media campaign to various local government authorities that are within or coastally adjacent to the EMBA for the proposed activities. The campaign brought the proposed activity to the attention of persons who may be interested; and advised persons or organisations on how they can find out about Woodside's proposed activities by visiting Woodside's website (**Appendix F, reference 3.6**).

### 5.9.1 Community Information Sessions

- On 12, 13 and 15 June 2023, Community Information Sessions were held in Broome, Derby and Kununurra respectively. Woodside advertised the sessions via the means below which provided the opportunity for local individuals to become aware of the event and have access to experts and information about the activity. The methods used to promote these consultation opportunities were developed with input from Indigenous representatives and were adapted to incorporate culturally appropriate and accessible language to encourage engagement and understanding of Woodside's proposed activities:

- Advertising the community information sessions in the Kimberley Echo and Broome Advertiser on 1 June 2023 and 8 June 2023 (**Appendix F**, reference 3.8).
  - From 8 June 2023, Woodside commenced a geotargeted social media campaign in Broome, Derby, Kununurra and surrounding areas (**Appendix F**, reference 3.9) advertising the community information sessions.
  - Directly contacting local Traditional Custodian groups to invite representatives to attend the community information sessions and providing the event information (**Appendix F**, Table 1).
  - Advertised in Roebourne with posters on four community boards and dropped posters to community locations; and put information and posters on the Roebourne Community Calendar.
  - Representatives from Woodside, including project and environment personnel equipped to answer technical questions, attended the event. Copies of the Consultation Information Sheets and bespoke targeted Consultation Summary Information Sheets were available to attendees. Community members were able to engage with Woodside representatives to understand the proposed activity and how it may affect them, ask questions and provide their feedback.
- On 17 June 2023, a Community Information Session was held in Exmouth. Ahead of the event, Woodside advertised the session via the means below which provided the opportunity for local individuals to become aware of the event and have access to experts and information about the activity. The methods used to promote these consultation opportunities were developed with input from Indigenous representatives and were adapted to incorporate culturally appropriate and accessible language to encourage engagement and understanding of Woodside's proposed activities:
    - From 15 - 17 June 2023, Woodside commenced a geotargeted social media campaign in Exmouth and surrounding areas (**Appendix F**, reference 3.7) advertising of the Community Information Session.
    - Representatives from Woodside, including project and environment personnel equipped to answer technical questions, attended the event. Copies of the Consultation Information Sheets and bespoke targeted Consultation Summary Information Sheets were available to attendees. Community members were able to engage with Woodside representatives to understand the proposed activity and how it may affect them, ask questions and provide their feedback.
    - On 22 June and 19 July 2023, a Community Information Session was held in Roebourne. Woodside advertised the session by distributing posters advising of the event details in the local community and visiting offices to raise awareness, including the offices of local Traditional Custodian groups (**Appendix F**, reference 3.10).
    - On 28 and 29 June 2023, Community Information Sessions were held in Karratha. Woodside advertised the sessions via the means below providing the opportunity for local individuals to become aware of the event and have access to experts and information about the activity. The methods used to promote these consultation opportunities were developed with input from Indigenous representatives and were adapted to incorporate culturally appropriate and accessible language to encourage engagement and understanding of Woodside's proposed activities:
      - Ahead of the 28 June 2023 event, posting a story on its Facebook page (**Appendix F**, reference 3.12), sharing details of its shopping centre stand where Consultation Information Sheets regarding planned and proposed activities were available, including the activities proposed under this EP.
      - Ahead of the 29 June 2023 event, advertising the community information session in the Pilbara News (**Appendix F**, reference 3.11), geotargeting a social media campaign in Karratha and surrounding areas and posting the event details on its Facebook page (**Appendix F**, reference 3.13).
      - Representatives from Woodside, including project and environment personnel equipped to answer technical questions, attended the event. Copies of the Consultation Information Sheets and bespoke targeted Consultation Summary Information Sheets were available to attendees. Community members were able to engage with Woodside representatives to understand the proposed activity and how it may affect them, ask questions and provide their feedback.
  - On 5 and 6 August 2023, Woodside had a stand at the annual FeNaCING Festival held in Karratha. Members of Woodside's Corporate Affairs and Operations teams actively engaged with the community to discuss proposed EP activities. The stand included consultation information sheets for a number of EPs including the Stybarrow Plug and Abandonment Environment Plan. Woodside estimates that over 2,000 people visited the Woodside stand based on the number of consultation forms and questionnaires completed. The consultation opportunity was promoted prior to the Festival, in the Pilbara News on 2 August 2023 and a

story appeared on the Woodside North West Facebook page on 2 August 2023 (**Appendix F, reference 3.15**).

- On 18 August 2023, Woodside consulted the community on Environment Plan activities at a stand at the Passion of the Pilbara festival in Onslow. Members of Woodside's Corporate Affairs actively engaged the community to discuss proposed Environment Plan activities. The stand included consultation information sheets for a number of Environment Plans including Stybarrow P&A EP. Woodside estimates that about 100 people visited the Woodside stand. The consultation opportunity was promoted prior to the Festival in a story on the Woodside North West Facebook page on 17 August 2023 (**Appendix F, reference 3.16**).
- From 18 – 20 September 2023, Woodside consulted the Karratha, Port Hedland and Roebourne Communities on EP activities. Members of Woodside's Corporate Affairs, First Nations and Environment teams actively engaged the community to discuss proposed EP activities, including this EP (**Appendix F, reference 3.21**).
  - 18 September 2023: Karratha Shopping Centre 8am–12pm; Red Earth Arts Precinct 3–6pm. Estimated number of people consulted: 20.
  - 19 September 2023: Port Hedland, South Hedland Square 10am–5pm. Estimated number of people consulted: 20.
  - 20 September 2023: Roebourne, Woodside Office 10am–4pm. Estimated number of people consulted: 0 (Sorry Business – multiple Aboriginal Corporation meetings, unknown at the time of scheduling/planning engagements).

These consultation opportunities were promoted prior to regional consultation in the Pilbara News on 13 September 2023, and via Facebook and Instagram social media campaigns from 6 to 16 September 2023. An EP consultation banner with a QR code linking to the Consultation Activities page on the Woodside website was displayed at Woodside's stand along with current EP factsheets.

- On 16 and 17 October 2023, Woodside hosted community consultation sessions in Carnarvon and Denham to enable community members to understand Woodside's proposed activities and how it may affect them, ask questions, and provide their feedback (**Appendix F, reference 3.19**). Representatives from Woodside Project, Corporate Affairs and Environment teams were available to answer questions. Copies of the Consultation Information Sheet were available to attendees. Woodside advertised the sessions to enable individuals to self-identify, become aware of the community consultation, and provide feedback on proposed activities, through the following:
  - Advertisement in the Pilbara News on 4 October 2023;
  - Geotargeted social media campaign advertising in Carnarvon and Denham and surrounding areas (+80 kms) from 9 to 16 October 2023;
  - Directly inviting local Traditional Custodian groups (**Appendix F, Table 1**);
  - An EP consultation banner with QR code (linked to the Consultation Activities page on the Woodside website) was displayed along with current EP factsheet.
- On 23 October 2023, Woodside hosted a community consultation session in Exmouth to enable community members to understand Woodside's proposed activities and how it may affect them, ask questions, and provide their feedback (**Appendix F, reference 3.20**). Representatives from Woodside Project, Corporate Affairs, First Nations, Environment, and Biodiversity and Science teams were available to answer questions. Copies of the Consultation Information Sheet were available to attendees. Woodside advertised the sessions to enable individuals to self-identify, become aware of the community consultation, and enable individuals to provide feedback on proposed activities, through the following:
  - Advertisement in the Pilbara News on 11 October 2023;
  - Geotargeted social media campaign advertising in Exmouth and surrounding areas (+80 kms) from 2 to 9 October 2023;
  - Directly inviting local Traditional Custodian groups (**Appendix F, Table 1**);
  - An EP consultation banner with QR code (linked to the Consultation Activities page on the Woodside website) was displayed at Woodside's stand along with current EP factsheets.

### 5.9.2 Traditional Custodian Specific Consultation

In addition to the approaches above including community information sessions, additional activities were undertaken with relevant Traditional Custodians, which were specifically designed to provide for effective engagement with Traditional Custodians and so that information was provided in a form that was readily accessible and appropriate (**Section 5.5**).

Consultation undertaken specifically with Traditional Custodians for this EP includes:

- Direct engagement with nominated representative bodies via the contact listed on the ORIC (Office of the Registrar of Indigenous Corporations) website, requesting advice on how they would like to be engaged and asking whether other members and/or individuals should be consulted. This has resulted in:
  - Meetings with directors, elders and any nominated representatives, on country or in Perth
  - Requests and offers of resourcing to enable and support consultation
  - Exchange of written feedback and correspondence
  - A Summary Consultation Information Sheet, developed and reviewed by Indigenous representatives in collaboration with technical experts to ensure content is appropriate to the intended recipients, was provided to relevant Traditional Custodian groups (**Appendix F**, reference 2.80) and phone calls to provide context to the consultation made.
- Ongoing efforts were made to engage and develop relationships with these bodies via a variety of means such as email, phone calls, alternative contacts, texts, social media and, in some cases, physical visits.
- Consultation meetings with attendees decided by Traditional Custodian groups, supported by senior Woodside representatives, subject matter experts, First Nations Relations advisers with skills and experience in community engagement. Meetings are developed through a two-way consultation process to ensure effective information sharing via:
  - Mutually agreed agenda avoiding time pressure
  - Encouraging Traditional Custodian attendees to control the pace of the meeting and pause at any time to ask questions, seek clarification or provide feedback;
  - Visual aids such as posters, presentations, simplified technical videos and real-world pictures and footage
  - Emphasis on potential planned and unplanned risks and impacts
  - Ample opportunity for questions and feedback
  - Discussion about ongoing relationship development and opportunities
  - Distribution of hard-copy Consultation Information Sheets and bespoke targeted Consultation Summary Sheet
  - Meeting all costs such as sitting fees, travel, legal support and executive support and other support required.
- Woodside has a geotargeted sponsored social media campaign to various communities that are coastally adjacent to the EMBA for the proposed activities (**Appendix F**, **reference 3.6**):
  - The wide-reaching campaign brought the proposed activity to the attention of persons who may be interested and advised persons or organisations how they can find out about Woodside's proposed activities by visiting Woodside's website, which details the intent of consultation with relevant persons under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth). The reach of this campaign is shown in **Appendix F**, **reference 3.6**), providing the opportunity to consult via over 139,000 views to date across various regions.
  - These social media posts were developed with input from Indigenous representatives. Social media is a highly effective means to engage Indigenous audiences as outlined in Indigenous Digital Life (Professor Carlson, 2021). Advertisements used language and information appropriate to Indigenous audiences. Feedback from community engagements indicates a high level of penetration for this technique.

Woodside has employed a diverse range of techniques to allow relevant persons to become aware of the proposed activity and how it may affect their functions activities or interests and understand their ability to provide feedback. The combination of PBC engagement meetings, traditional print media, social media and face-to face community interaction was designed with input from Indigenous representatives and adapted to the audience, so that it provides a wide-ranging opportunity to consult.

## 6 Environmental Risk Management Framework

Woodside has established a risk management governance framework with supporting processes and performance requirements that provide an overarching and consistent approach for identifying, assessing and managing risks. Woodside Policies have been formulated to comply with the intent of the Risk Management Policy and are consistent with the AS/ISO 31000-2009 Risk Management Principles and Guidance.

An integrated risk assessment and impact process is used to identify the most appropriate management strategy and relevant controls to reduce impacts and risks from planned (routine and non-routine) activities and unplanned (accidents/incidents) events to as low as reasonably practicable (ALARP) and acceptable levels. The process includes incorporating historic stakeholder and legal and environmental monitoring data for the relevant environmental impacts.

### 6.1 Evaluation of Impacts and Risks

A formal impact and risk assessment was completed for each environmental aspect and source of hazard for the activities described in **Section 3** using the Environmental Hazard Identification (ENVID) workshop process. The primary objective of the impact and risk assessment is to demonstrate that the identified impacts and risks associated with the Petroleum Activity are reduced to ALARP and are of an acceptable level. The environmental impact and risk assessment presented in this EP has been informed by recent and historic hazard identification studies and workshops (e.g. HAZID/ENVID), Process Safety Risk Assessment processes, reviews and associated desktop studies associated with the Petroleum Activity. Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in **Section 6.1.2**), the existing environment (**Section 4**) and the outcomes of Woodside's stakeholder engagement process (**Section 5**).

An ENVID workshop was conducted in June 2022 for the Stybarrow P&A activity. Participants included Woodside HSE, projects and engineering departments and specialist environmental consultants. Following the ENVID, impact and risk information was then classified, evaluated and tabulated for each planned activity and unplanned event. Environmental impacts and risks are recorded in an environmental impacts and risk register. The output of the ENVID is used to present the risk assessment and forms the basis to develop performance outcomes, performance standards and measurement criteria.

The impact and risk assessment process is illustrated in **Figure 6-1** and considers planned (routine and non-routine) activities, unplanned (accidents/incidents) events and emergency conditions. The process considered previous risk assessments for similar activities, reviews of relevant studies, reviews of past performance, external stakeholder consultation feedback and a review of the existing environment. The process includes:

- confirming the sources of hazards for the planned activities and unplanned events
- identifying environmental impact and risk receptors
- analysing environmental impact and risk receptors
- identifying potential controls to reduce the impacts and risks
- allocating a likelihood rating for all unplanned events
- allocating a severity rating for all planned activities and unplanned events
- accepting controls through an ALARP process
- assessing final acceptability of the risks and impacts using the Woodside acceptability criteria.

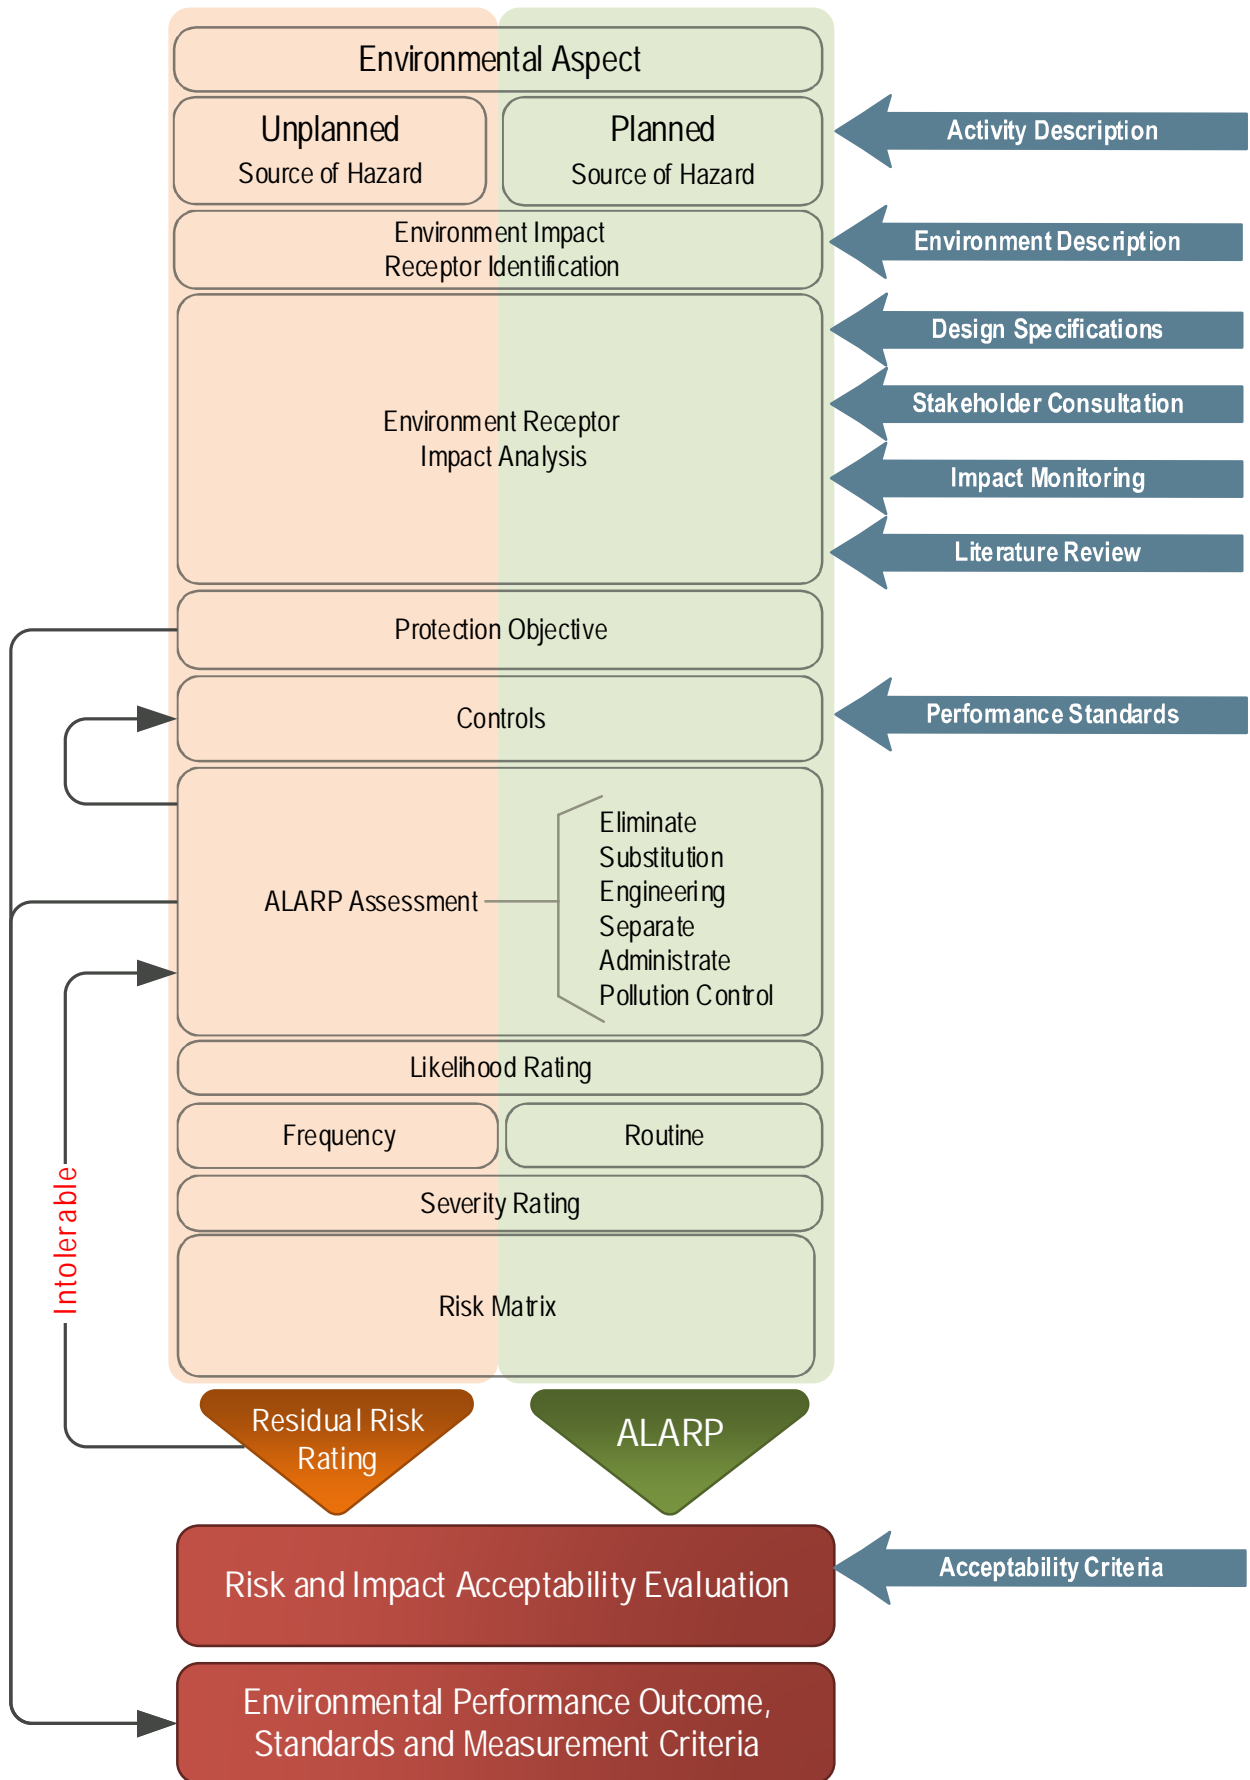

Figure 6-1 Environment Plan Integrated Impact and Risk Assessment Process

6.1.1 Decision Context

Consistent with the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014), Woodside has applied decision criteria to determine whether impacts and risks created during the Petroleum Activity constitute ‘lower-order’ or ‘higher-order’ impacts and risks, and subsequently how each are managed to ALARP (Section 6.2) and acceptable levels (Section 6.3). This approach implies a level of proportionality wherein the principles of decision-making applied to each particular hazard are proportionate to the acceptability of environmental risk of that hazard.

The decision-making principles described in Table 6-1 are consistent with the precautionary principle (as defined in the EPBC Act) and provide assurance that the environmental impacts and risks are reduced to ALARP and of an acceptable level.

Table 6-1: Risk Related Decision Making Framework

| Decision Type   | Description  |
|-----------------|--|
| Decision Type A | <p><b>Woodside considers lower-order (or ‘Type A’) impacts or risks as those that are:</b></p> <ul style="list-style-type: none"> <li>• well understood and established practice, typically derived from standard, non-complex or routine operations familiar to Woodside</li> <li>• there are clearly defined regulatory, corporate or industry (good practice) controls to manage the impact or risk</li> <li>• have no concerns or objections from relevant stakeholders</li> <li>• have a ‘severity level’ for planned operations (impacts) and unplanned events (risks) that does not exceed ‘2’ based upon the severity level definition (Table 6-3)</li> <li>• have a ‘likelihood’ for unplanned events that is either ‘unlikely’ or ‘highly unlikely’ based upon the likelihood definitions (Table 6-4).</li> </ul>  |
| Decision Type B | <p><b>Woodside considers higher-order (or ‘Type B’) impacts or risks as those that are:</b></p> <ul style="list-style-type: none"> <li>• not well understood or involve a level of uncertainty, typically derived from complex operations not routinely performed by Woodside</li> <li>• have regulatory, corporate or industry (good practice) controls that require additional definition or validation</li> <li>• have had some concerns or objections raised by relevant stakeholders</li> <li>• have a ‘severity level’ for planned operations (impacts) and unplanned events (risks) that is ‘3’ based upon the severity level definition (Table 6-3)</li> <li>• have a ‘likelihood’ for unplanned events that is considered ‘probable’ to ‘highly likely’ based upon the likelihood definitions (Table 6-4).</li> </ul>   |
| Decision Type C | <p><b>Woodside considers highest-order (or ‘Type C’) impacts or risks as those that are:</b></p> <ul style="list-style-type: none"> <li>• not understood or there is a high degree of uncertainty, typically derived from operations not previously performed by Woodside</li> <li>• have corporate or industry (good practice) controls that either do not exist or are insufficient to manage impacts or risks and therefore require adoption of the precautionary approach</li> <li>• have had multiple concerns or objections raised by relevant stakeholders or lobby groups</li> <li>• have a ‘severity level’ for planned operations (impacts) and unplanned events (risks) that is equal to or exceeds ‘4’ based upon the severity level definition (Table 6-3)</li> <li>• have a ‘likelihood’ for unplanned events that is considered ‘probable’ to ‘highly likely’ based upon the likelihood definitions (Table 6-4).</li> </ul> |

### 6.1.2 Environmental Impact Analysis

The environmental impact analysis is based on the environmental receptors identified in **Section 4**. Impact and risk descriptions are developed in an initial screening process that identifies the specific receptor that may be impacted. Quantitative or qualitative definition of the impact and risk may be completed to ensure an understanding of and to confirm the severity of the risk and impact.

### 6.1.3 Planned Activity Assessment

All planned activities were assessed as being a routine impact and defined as such in the ENVID. The description and degree of impact formed the basis for the severity rating applied, with a quantitative assessment of impact conducted where possible to ensure the impact was well understood and clearly categorised on the severity table. Where this was not possible, a robust qualitative assessment was completed and the severity rating assigned during the ENVID process in accordance with the Woodside (PetDW) HSE Risk Matrix, which is consistent with the Risk Management Severity Table (**Table 6-3**), taking into account any of the mitigative controls assigned. Given routine operations are planned, and impacts are mitigated by applying control measures, likelihood or residual risk ratings were not applied.

### 6.1.4 Unplanned Event Risk Assessment

Risk ranking of an unplanned event is the product of the consequence of an event (the severity) and the likelihood of that event occurring.

Likelihood and potential severity ratings were assigned in accordance with the Woodside (PetDW) HSE Risk Matrix (**Table 6-2**, **Table 6-3** and **Table 6-4**), which allowed the risk of individual events to be categorised in a methodical and structured process. This was completed based upon judgement by the ENVID assessment team, with detailed potential impact descriptions used to ensure a robust and comprehensive decision.

The likelihood rating was based on the frequency of the source of hazard actually occurring with all preventative controls taken into consideration. The potential severity rating was determined based on the potential impact that may occur once the source of hazard had occurred, taking into account any mitigative controls in place to reduce the impact.

**Table 6-2: Woodside PetDW HSE Risk matrix**

| Likelihood      | Severity Level |     |     |     |      |
|-----------------|----------------|-----|-----|-----|------|
|                 | 1              | 2   | 3   | 4   | 5    |
| Highly Likely   | 30             | 90  | 300 | 900 | 3000 |
| Likely          | 10             | 30  | 100 | 300 | 1000 |
| Probable        | 3              | 9   | 30  | 90  | 300  |
| Unlikely        | 1              | 3   | 10  | 30  | 100  |
| Highly Unlikely | 0.3            | 0.9 | 3   | 9   | 30   |

**Table 6-3: Woodside PetDW Severity Level Definitions**

| Severity Level | Descriptor  | Severity Factor |
|----------------|---|-----------------|
| 5              | <ul style="list-style-type: none"> <li>Severe impact to the environment and where recovery of ecosystem function takes 10 years or more; or</li> <li>Severe impact on community lasting more than 12 months or a substantiated human rights violation impacting 6 or more people</li> </ul> | 1000            |
| 4              | <ul style="list-style-type: none"> <li>Serious impact to the environment, where recovery of ecosystem function takes between 3 and up to 10 years; or</li> </ul>  | 300             |

|   |  |     |
|---|--|-----|
|   | <ul style="list-style-type: none"> <li>- Serious impact on community lasting 6-12 months or a substantiated human rights violation impacting 1-5 persons</li> </ul>  |     |
| 3 | <ul style="list-style-type: none"> <li>- Substantial impact to the environment, where recovery of ecosystem function takes between 1 and up to 3 years; or</li> <li>- Substantial impact on community lasting 2-6 months</li> </ul>                  | 100 |
| 2 | <ul style="list-style-type: none"> <li>- Measurable but limited impact to the environment, where recovery of ecosystem function takes less than 1 year; or</li> <li>- Measurable but limited community impact lasting less than one month</li> </ul> | 30  |
| 1 | <ul style="list-style-type: none"> <li>- Minor, temporary impact to the environment, where the ecosystem recovers with little intervention; or</li> <li>- Minor, temporary community impact that recovers with little intervention</li> </ul>        | 10  |

Table 6-4: Woodside PetDW Likelihood Definitions

| Uncertainty     | Frequency                                     | Likelihood factor |
|-----------------|---|-------------------|
| Highly Likely   | Likely to occur within a 1 year period.       | 3                 |
| Likely          | Likely to occur within a 1 - 5 year period.   | 1                 |
| Probable        | Likely to occur within a 5 - 20 year period.  | 0.3               |
| Unlikely        | Likely to occur within a 20 - 50 year period. | 0.1               |
| Highly Unlikely | Not likely to occur within a 50 year period.  | 0.03              |

## 6.2 Demonstration of ALARP

Regulation 10A(b) of the Environment Regulations requires demonstration that the environmental impacts and risks of the activity will be reduced to ALARP.

### 6.2.1 Planned Activity and Unplanned Event ALARP Evaluation

This section details the process for demonstrating ALARP for both planned routine operations and unplanned events. **Table 6-5** provides a description on how Woodside demonstrates different impacts and risks are ALARP based on their Decision Types identified.

Table 6-5 Summary of the criteria used for ALARP demonstration

| Decision Type   | Demonstration of ALARP Description  |
|-----------------|---|
| Decision Type A | <p><b>Demonstrating ALARP for lower-order ('Type A') impacts or risks</b></p> <ul style="list-style-type: none"> <li>• Identified regulatory, corporate and industry good practice controls are implemented, Woodside considers the impact or risk to be managed to ALARP and no further detailed engineering evaluation of controls is required.</li> <li>• The application of feasible and readily implementable alternate, additional or improved controls may be adopted opportunistically when demonstrated to further reduce potential environmental impacts or risks.</li> </ul> |
| Decision Type B | <p><b>Demonstrating ALARP for higher-order ('Type B') impacts or risks</b></p> <ul style="list-style-type: none"> <li>• In addition to relevant regulatory, corporate and industry good practice controls being implemented, alternate, additional or improved controls should be proposed and evaluated according to their feasibility, reasonableness and practicability to implement to further reduce the potential for impacts and risks associated with the activities</li> </ul>   |

| Decision Type                 | Demonstration of ALARP Description  |
|-------------------------------|---|
|                               | <ul style="list-style-type: none"> <li>Woodside applies a cost and benefit analysis when evaluating additional controls and applies those that are both feasible and where the cost (safety, time, effort and financial) are not grossly disproportionate to the potential reduction in environmental impact or risk afforded by the control.</li> </ul>  |
| <p><b>Decision Type C</b></p> | <p><b>Demonstrating ALARP for highest-order ('Type C') impacts or risks</b></p> <ul style="list-style-type: none"> <li>Alternate, additional, or improved controls over and above relevant regulatory, corporate and industry good practice must be proposed and evaluated based upon a precautionary approach</li> <li>Woodside ensures all feasible controls that have the potential to reduce environmental impacts and risks are implemented, when safe to do so and irrespective of the additional effort, time or financial cost associated with implementing the control.</li> </ul> |

When evaluating additional controls for higher order 'Type B' and 'Type C' impacts and risks, Woodside has applied the hierarchy of controls as defined below and illustrated in Figure 6-2:

- Eliminate – Remove the source preventing the impact; in other words, eliminate the hazard.
- Substitution – Replace the source preventing the impact.
- Engineer – Introduce engineering controls to prevent or control the source having an impact.
- Separate – Separate the source from the receptor preventing impact.
- Administrate – Procedures, competency and training implemented to minimise the source causing an impact.
- Pollution Control – Implement a pollution control system to reduce the impact.
- Contingency Planning – Mitigate control reducing the impact.
- Monitor – Program or system used to monitor the impact over time.

The general preference is to accept controls that are ranked in the Tier 1 categories of Eliminate, Substitute, Engineer and Separate as these controls provide a preventive means of reducing the likelihood of the hazard occurring over and above Tier 2 controls.

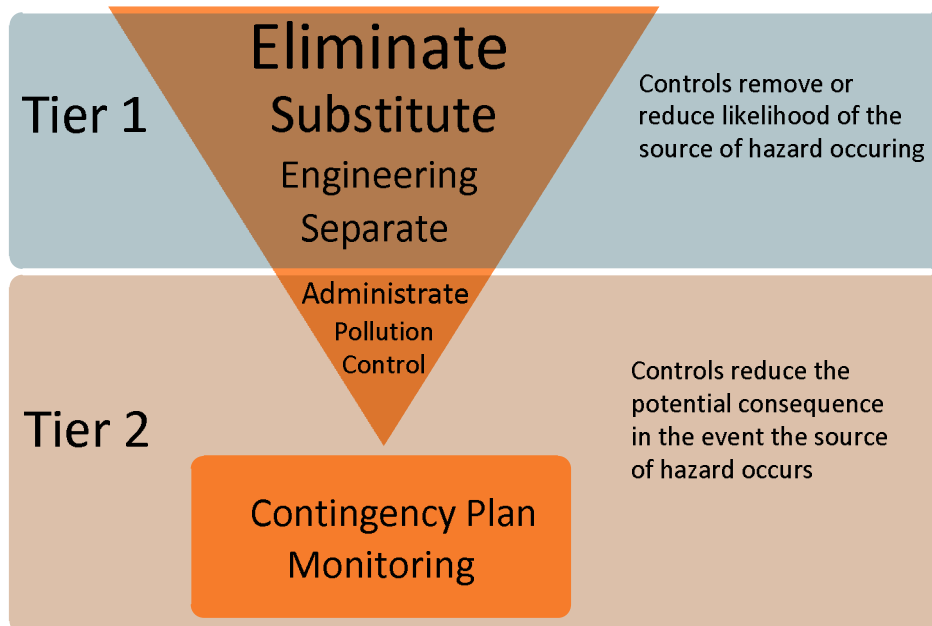

Figure 6-2: Hierarchy of control framework

**6.2.2 Spill Response Strategy Effectiveness and ALARP**

In developing the environmental performance standards that apply to each response strategy, Woodside has considered the level of performance that is reasonable to achieve for each control measure and the 'effectiveness' of the control measures.

The effectiveness of the control measures is assessed by considering:

- availability: the status of availability to Woodside
- functionality: a measure of functional performance
- reliability: the probability that the control will function correctly
- survivability: the potential of the control measure to survive an incident
- independence/compatibility: the degree of reliance on other systems and/ or controls, in order to perform its function.

These criteria follow the definitions in NOPSEMA’s *Control Measures and Performance Standards Guidance Note* (NOPSEMA, 2020b), with ranking provided in Table 6-6.

**Table 6-6: Criteria for ranking spill response effectiveness**

| Evaluation Criteria          | Response Effectiveness Ranking  |   |
|------------------------------|---|---|
|                              | Low   | High  |
| Availability                 | Woodside does not have equipment and resources on standby, or contracts, arrangements, and Memorandums of Understanding in place for providing equipment and resources.<br><br>Woodside has internal processes and procedures in place to expedite timely provision of equipment and resources. | Woodside has equipment and resources on standby, or contracts, arrangements or Memorandums of Understanding in place for providing equipment and resources.         |
| Functionality                | Implementation of the control measure does not greatly reduce the risk and impact.  | Implementation of the control measure has material difference in reducing the risk and impact.  |
| Reliability                  | The control measure is not reliable (for example, has not been tried and tested in Australian waters) or low assurance can be given to its success rate and effectiveness.  | The control measure is reliable (for example, has been tried and tested in Australian waters) or high assurance can be given to its success rate and effectiveness. |
| Survivability                | The control measure has a low operating timeframe and will need to be replaced regularly throughout its operation period in order to maintain its effectiveness.  | The control has a high operating timeframe and will not need to be replaced regularly throughout its operation period in order to maintain its effectiveness.       |
| Independence / Compatibility | The control relies on other control measures being in place or the control measure is incompatible with other control measures in place.  | The control does not depend on other control measures being in place or the control measure can be implemented in unison with other control measures.               |

Each control was then evaluated, considering the environmental benefit gained from implementation compared with its practicability (in other words, control effectiveness, cost, response capacity and implementation time) to determine if the control was either:

- accept and implement, or
- reject.

This traffic light system is used in the ALARP demonstration tables where the ‘do nothing’ option is rejected, along with a scalable option that generally involves mobilising spill response resources and equipment to site and on standby. Accepted controls in all the ALARP demonstration tables indicate those that would be implemented as part of the response.

Applying principles similar to those presented within the *Guidance on Risk Related Decision Making* (Oil and Gas UK, 2014), as described in **Section 6.1.1** of this EP, Woodside has adopted the following criteria for determining spill

response strategy preparedness that present a lower-order risk compared to those that present a higher-order risk:

- A spill response strategy is determined to present a lower-order risk where all controls have been ranked as 'high' according to the criteria for ranking spill response effectiveness (These criteria follow the definitions in the *Control Measures and Performance Standards Guidance Note* (NOPSEMA, 2020b), with ranking provided in **Table 6-6** and additional controls would unlikely reduce potential environmental impacts and risks further. As such, Woodside has considered 'Type A' spill response strategies to be managed to ALARP.
- A spill response strategy is determined to present a higher-order risk where one or more controls have been ranked as 'low' according to the criteria for ranking spill response effectiveness and additional controls would likely reduce potential environmental impacts and risks further. As such, alternate, additional, or improved controls should be proposed in an attempt to increase their effectiveness ranking to 'high'. Where improved controls have been identified but are not readily available, an improvement plan has been developed to meet the oil spill response need before performing the activity.

Woodside's ALARP assessment for resourcing for each spill response strategy is presented within **Appendix E**.

### 6.3 Demonstration of Acceptability

Regulation 10A(c) of the Environment Regulations requires demonstration that the environmental impacts and risks of the activity will be of an acceptable (tolerable) level.

The demonstration of acceptability is completed independently of the ALARP evaluation described above. However, as with the demonstration of ALARP, the demonstration of acceptability detailed below applies the decision-making principles described in **Section 6.1.1**, ensuring consistency with the precautionary principle when considering the acceptable levels of impact and risk caused by the activity.

#### Demonstrating acceptability for lower-order ('Type A') and higher-order ('Type B') impacts or risks

When an impact or risk has been evaluated as 'lower-order' or 'higher-order' based upon the Decision Context detailed in **Section 6.1.1**, acceptability of the impact or risk is evaluated based upon the following criteria:

- Relevant regulatory, corporate and industry good practice controls have been identified and implemented, including consideration of relevant actions prescribed in recovery plans and approved conservation.
- The activity does not contravene any relevant Plan of Management for a World Heritage place, National Heritage place or Ramsar wetland identified within the EMBA.
- Any alternate, additional or improved controls adopted via the detailed engineering risk assessment have been or will be implemented to manage potential impacts and risks to ALARP.
- There are either no objections or claims made by relevant stakeholders for the aspect of the activity being assessed, or any objections or claims received from relevant stakeholders are assessed for merit and controls adopted to address the objections or claims where merited.
- Where industry good practice cannot be adopted, professional judgement made by subject matter experts have been used to evaluate the acceptability of potential environmental impact or risk based upon adoption of alternate, additional or improved controls identified during detailed engineering risk assessment.
- Consideration of relevant actions prescribed in listed species recovery plans, conservation advice and threat abatement plans have informed the development of control measures.
- The application of adopted controls clearly indicates the aspect-specific EPOs can be achieved.
- The proposed impact is consistent with the principles of ESD defined in Section 3A of the EPBC Act (**Section 2.1.3**), including:
  - Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations (the 'integration principle')
  - If there are threat of serious or irreversible damage lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation (the 'precautionary principle')
  - The principle of intergenerational equity- that the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations (the 'intergenerational principle')
  - The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision making ('the biodiversity principle').

### Demonstrating acceptability for highest-order ('Type C') impacts or risks

When an impact or risk has been evaluated as 'highest-order' based upon the Decision Context detailed in **Section 6.1.1**, the potential environmental impact or risk can only be deemed acceptable once the criteria for 'Type B' demonstration of acceptability detailed above has been met and:

- any alternate, additional or improved controls adopted via implementing a precautionary approach (consistent with the 'Precautionary Principle' as defined within Section 3A of the EPBC Act) can demonstrate residual impacts have been lowered, such that a severity level of '4' becomes 'unlikely' or the severity level of '5' becomes 'highly unlikely' based upon the Woodside PetDW HSE Risk Matrix (**Table 6-2**).

## 6.4 Environmental Performance Outcomes, Performance Standards and Measurement Criteria

Regulation 10A(d) of the Environment Regulations requires the EP provides appropriate EPOs, environmental performance standards (EPSs) and measurement criteria (MC).

An objective of the EP is to ensure all activities are performed in accordance with appropriate EPSs, thus ensuring EPOs are achieved. This requires (among other things) appropriate measurement criteria for demonstrating the EPSs have been met as defined within the EP.

Establishing EPOs and EPSs involves a process of considering legal requirements and the environmental risks (described in the risk assessment presented in **Section 7** and **Section 8**) and considering available control options (**Section 7** and **Section 8**), and the views of interested parties (**Section 5**). The resulting outcomes and standards must be measurable where practicable and consistent with 'Our Values'.

### 6.4.1 Environmental Performance Outcomes

EPOs are developed to ensure protection of the environment from the impact or risk and to ensure ongoing performance and measurability of the controls. These were developed using the below criteria:

- Be specific to the source of the hazard.
- Indicate how the environmental impact will be managed (for example, minimise or prevent).
- Contain a statement of measurable performance (where applicable).
- Contain a timeframe for action (where applicable).
- Be consistent with legislative and HSE requirements.

### 6.4.2 Environmental Performance Standards

An EPS is a statement of performance required from a control measure (a system, an item of equipment, a procedure or functional responsibility (person)), which is used as a basis for managing environmental impact and risk, for the duration of the activity.

There is a specific link between the EPOs, the EPSs and control measures; each EPO has one or more standards defining the performance requirement that needs to be met by a control measure to meet the EPO.

EPSs detailed within this EP are specific, measurable, and achievable.

### 6.4.3 Environmental Measurement Criteria

MCs have been assigned for each EPS as a means of validating that each EPO and EPS will be or has been met throughout the duration of the Petroleum Activity, thus continually reducing environmental impacts and risks to ALARP and acceptable levels.

All MCs are designed to be inspected or audited via compliance assurance activities and enable a traceable record of performance to be maintained.

EPOs, EPSs, and MCs, both in relation to planned activities and unplanned events, have been detailed throughout **Section 7** and **Section 8**.

EPOs, EPSs, and MCs relating to oil spill response preparedness and the effectiveness of the response strategy implementation are provided in **Section 10**.

EPOs, EPSs, and MCs relating to Incident Management Team (IMT) capability and competency are detailed within **Section 10.4.12**.

## 7 Environmental Impact Assessment and Evaluation - Planned Activities

The purpose of this section is to address the requirements of Regulations 13(5) and 13(6) of the Environment Regulations by assessing and evaluating all the identified impacts and risks associated with the Petroleum Activity and associated control measures that will be applied to reduce the impacts and risks to an ALARP and an acceptable level.

**Table 7-1** summarises the impact analysis for the aspects associated with the planned activities. A comprehensive risk and impact assessment for each of the planned activities, and subsequent control measures proposed by Woodside to reduce the impacts and risks to ALARP and acceptable levels, are detailed in the subsections.

Table 7-1: Summary of the Environmental Impact Analysis for Planned Activities

| Aspect   | Environmental  |                 |      |                       |                          |               |             |                        |                         | Socio-economic       |          |                      | Risk Assessment & Evaluation |                   |               |               |
|--|----------------|-----------------|------|-----------------------|--------------------------|---------------|-------------|------------------------|-------------------------|----------------------|----------|----------------------|------------------------------|-------------------|---------------|---------------|
|  | Marine Mammals | Marine Reptiles | Fish | Seabirds / Shorebirds | Seabed / Benthic Habitat | Water Quality | Air Quality | Marine Protected Areas | Key Ecological Features | Commercial Fisheries | Shipping | Tourism / Recreation | Severity Factor              | Likelihood Factor | Residual Risk | Acceptability |
| <b>Physical Presence – Interaction with Other Marine Users – Section 7.1</b>                                       |                |                 |      |                       |                          |               |             |                        |                         |                      |          |                      |                              |                   |               |               |
| Presence of MODU and project vessels during petroleum activity   |                |                 |      |                       |                          |               |             |                        |                         | X                    | X        | X                    | 10                           | N/A               | -             | Tolerable     |
| Temporary and permanent continued presence of well infrastructure  |                |                 |      |                       |                          |               |             |                        |                         | X                    |          |                      | 10                           | N/A               | -             | Tolerable     |
| <b>Light Emissions – Section 7.2</b>   |                |                 |      |                       |                          |               |             |                        |                         |                      |          |                      |                              |                   |               |               |
| Routine light emissions from MODU and project vessels  | X              | X               | X    | X                     |                          |               |             |                        |                         |                      |          |                      | 10                           | N/A               | -             | Tolerable     |
| Light emissions from non-routine flaring during well P&A   | X              | X               | X    | X                     |                          |               |             |                        |                         |                      |          |                      | 10                           | N/A               | -             | Tolerable     |
| <b>Noise Emissions – Section 7.3</b>   |                |                 |      |                       |                          |               |             |                        |                         |                      |          |                      |                              |                   |               |               |
| Generation of noise from the MODU and project vessels during normal operations                                     | X              | X               | X    |                       |                          |               |             |                        |                         |                      |          |                      | 30                           | N/A               | -             | Tolerable     |
| Generation of noise from positioning equipment   | X              | X               | X    |                       |                          |               |             |                        |                         |                      |          |                      | 10                           | N/A               | -             | Tolerable     |
| Generation of noise from well infrastructure removal   | X              | X               | X    |                       |                          |               |             |                        |                         |                      |          |                      | 10                           | N/A               | -             | Tolerable     |

## 7.1 Physical Presence – Interaction with Other Marine Users

### 7.1.1 Summary of Risk Assessment and Evaluation

| Aspect            | Source of Hazard   | Potential Impact   | Severity Factor | Likelihood Factor | Residual Risk | Decision Context           | Acceptability |
|-------------------|--|--|-----------------|-------------------|---------------|----------------------------|---------------|
| Physical Presence | Presence of a MODU and project vessels during the Petroleum Activity | Interaction with or displacement of other marine users (such as commercial shipping, commercial fishing or other third-party vessels). | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |
|                   | Temporary or permanent continued presence of well infrastructure     |  | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |

### 7.1.2 Source of Hazard

#### 7.1.2.1 Presence of MODU and Project Vessels

A number of project vessels and a MODU will be present in the Operational Area during the petroleum activities. The preparatory activities prior to P&A will be conducted using one offshore support vessel and is expected to take between about 40 – 70 days. To permanently plug the 10 wells, a MODU and at least one, but up to three support vessels may be present in the Operational Area as outlined in **Section 3.7**. Permanent plugging activities are expected to take between around 18 – 24 days per well. Following permanent plugging of the wells, the well infrastructure above the mudline will be removed either by the MODU or using a project support vessel. Removal of well infrastructure is expected to take between about 1 – 5 days per well. A temporary 500 m safety exclusion zone will be maintained around the MODU while it is within the Operational Area. Marine users are requested to avoid this area during the activity to ensure the safety of the MODU and third-party vessels.

The physical presence of the MODU and support vessels in the Operational Area and associated 500 m radius temporary exclusion zone has the potential to cause interference with or displacement of other marine users, including commercial shipping and commercial fishing.

#### 7.1.2.2 Continued Physical Presence of Well Infrastructure

Permanent plugging of the Stybarrow wells is expected to take between around 6 – 8 months and is required to be completed by 30 September 2024 in accordance with Direction 1 of General Direction 833. Following permanent plugging, well infrastructure (above the mudline) may either be immediately recovered using the MODU or temporarily left in situ for a short duration and subsequently removed as part of the Stybarrow subsea infrastructure removal campaign, which covered activities defined in the Stybarrow Equipment Removal and Field Management EP. Combining recovery of well and subsea infrastructure in a separate vessel-based campaign will enable resource and execution efficiencies to be realised. Stybarrow well infrastructure above the mudline is required to be recovered by no later than 31 March 2025 in accordance with Direction 2 of General Direction 833.

Should the preferred cutting method (mechanical internal cutting) be unsuccessful at removing any of the wellheads, a diamond wire saw will be used to achieve an external cut (**Table 3-13**). This contingency option is not expected to be required for any of the wells as the mechanical cutting tool was assessed to be the preferred method for removing the infrastructure based on well specifications, status/condition (e.g., nothing within the wells inhibiting an internal cut) and water depth. Therefore, the preferred option is expected to have high feasibility for all wells.

Should this method be found not appropriate, or issues are experienced during plugging or removal that result in a diamond wire saw being required to cut the infrastructure, the cut will be made as close to the seabed as possible. However, up to 1 m above the current mudline may be required to be left in-situ due to the practicability of fitting the large equipment around the infrastructure to achieve the external cut. Other factors which may contribute to this are

excess cementing around the well or natural hard substrate which make it not possible to clear a suitable area to position the saw for a cut at the mudline.

### 7.1.3 Environmental Impact Assessment

#### 7.1.3.1 Commercial Fishing

The Operational Area overlaps four Commonwealth and six State managed fisheries (**Section 4.8.2**). The Commonwealth Fisheries overlapping the Operational Area include the Western Deep Water Trawl Fishery, the Western Tuna and Billfish Fishery, the Southern Bluefin Tuna Fishery, and the Skipjack Tuna Fishery. The State Fisheries overlapping the Operational Area include the Pilbara Crab Fishery, the Pilbara Line Fishery, the West Coast Deep Sea Crustacean Fishery, the Mackerel Fishery, the Marine Aquarium Fishery and the South West Coast Salmon Fishery.

None of these fisheries are currently active in proximity to the Operational Area, nor are they expected to become active during the Petroleum Activity with the Operational Area being too deep to support fish resources targeted by these fisheries. Of these fisheries listed above, only the Western Deep Water Trawl Fishery uses trawled gear which may interact with equipment on the seabed. However, effort in this fishery is typically greatest off the central west coast, with Carnarvon and Fremantle the major landing ports. Furthermore, environmental surveys in WA-32-L did not observe any demersal fish or crustaceans that are targeted by commercial fisheries.

Although the exclusion zone around the MODU and physical presence of support vessels has potential to displace commercial fishers (in the unlikely event they are operating near the Operational Area) the Petroleum Activity is unlikely to significantly increase the area of physical disturbance from what currently exists within WA-32-L. This is on the basis that a series of PSZs have been, and continue to be, established around the drill centres where the MODU will be positioned during the operation and cessation of the Stybarrow field. Although the Petroleum Activity will establish additional exclusion zones around the MODU, these will mostly overlap the existing PSZs and will not result in significant new areas where fishers are excluded.

If a wellhead or xmas tree is temporarily left in-situ, it is unlikely to displace or cause a risk to other marine users given the water depths where the infrastructure is located and no trawl fishers currently operate in the area. Impacts to commercial fishing activities if any well infrastructure remains *in situ* temporarily before removal by no later than 31 March 2025 are, therefore, not expected.

If a wellhead requires an external cut to be removed, a portion (up to 1 m above the current mudline) of the infrastructure may be left *in situ* permanently. Although no trawling vessels currently operate in the area there is a potential for this to change in the future in which case the infrastructure may present a snag hazard to these trawl fishers. Given the low likelihood of this occurring and the small area this infrastructure occupies in comparison to the areas available for fishing, the commitment this infrastructure would continue to be marked on navigational charts as well as that seabeds naturally comprise hazards that must be avoided by all marine users, the impact from one of more partial wellheads remaining *in situ* will be negligible.

No concerns were raised through consultation fishing representative and regulatory bodies including AFMA, DAFF - Fisheries, Northern Prawn Fishery Industry Pty Ltd, DPIRD, CFA, and WAFIC on the activities covered under this EP (**Appendix F**).

Given the negligible commercial fishing effort to date, the absence of targeted commercial fisheries within the title area and the relatively small increase in exclusion zones from what already exist in WA-32-L, no displacement of commercial fishers or interactions with fishing gear are expected.

#### 7.1.3.2 Recreational Fishing

Recreational fishing is unlikely to occur in the Operational Area due to its depth and distance from shore. Consultation did not identify any recreational activities that could be impacted by the activity (**Appendix F**). Recreational fishing in the region is concentrated around the coastal waters and islands of the NWMR, such as the Montebello Islands (about 150 km north-east from the Operational Area). Given this, no impacts to recreational fishers are expected.

If recreational fishing effort occurred within the Operational Area while activities are being performed, displacement as a result of the Petroleum Activities Program would be minimal and relate only to the temporary exclusion zones (500 m radius) that would be in place around the MODU/project vessel.

### 7.1.3.3 Commercial Shipping

The presence of the MODU and/or project vessels may potentially cause temporary disruption to commercial shipping. There are no recognised shipping routes in or near the Operational Area, with the nearest shipping fairway designated by AMSA located to the west and north of the Operational Area (**Figure 4-15**). This fairway is approximately 21 km from the Operational Area at the closest point. While not mandatory, the use of the shipping fairways is strongly recommended by AMSA. Analysis of shipping traffic data indicates commercial vessels do use the general area, with most vessels in the area associated with the oil and gas industry (typically support and offtake vessels associated with FPSOs off North West Cape). In the very unlikely event commercial shipping vessels are present in or near the Operational Area, temporary displacement of the commercial shipping vessels would relate to the 500 m exclusion zone around the MODU for the duration of the Petroleum Activity. Consultation did not identify any concerns for impacts to commercial shipping (**Appendix F**). Therefore, any impact is anticipated to be temporary and minor given the location of the Operational Area relative to shipping fairways.

### 7.1.3.4 Defence

The Operational Area lies within the NWSA, within which the DoD may undertake military exercises. Large scale exercises tend to be infrequent and are clearly communicated to other marine users by NOTMARs and civilian aviation by NOTAMs. The Stybarrow field, and the associated PSZs, have been in place since production commenced in 2007 and Woodside and DoD have an established relationship for managing potential interactions in the area accordingly. Woodside has also consulted with the DoD regarding the Stybarrow field and the petroleum activities within the scope of this EP.

Given the nature and scale of defence activities in the region, the long-term presence of the Stybarrow field and the consultations undertaken by Woodside, interactions between the petroleum activity and the DoD are not expected to occur.

### 7.1.3.5 Existing Oil and Gas Infrastructure

Interactions with operators of other nearby facilities have the potential to occur, including the Ngujima Yin FPSO, Ningaloo Vision FPSO and the Pyrenees Venture FPSO which are 20 km east, 23 km east and 26 km south east of the Operational Area, respectively. This would mainly be as a result of project-based vessel movements to and from the Operational Area not covered within this EP. Consultation did not identify any concerns for impacts to other operators in proximity to the Operational Area (**Appendix F**). **Section 3.4.1** outlines potential for cumulative impacts from SIMOPs with other Woodside decommissioning activities within WA-32-L.

### 7.1.3.6 Cumulative Impacts

There is potential for SIMOPs to occur with activities covered under this EP and other Woodside decommissioning activities within WA-32-L as described in **Section 3.4.1**. A maximum of up to four vessels and a MODU may be present in the Operational Area at one time should SIMOPs occur. A temporary 500 m exclusion zone will be established around the MODU and vessels undertaking the petroleum activities described in this EP and the Stybarrow Decommissioning Equipment Removal and Field Management EP. This may result in other marine users being temporarily displaced from a larger area than considered in the preceding impact assessments. The cumulative impact of these temporary exclusion zones is considered unlikely to have any impact on other marine users due to:

- the very low levels of activities by other marine users within WA-32-L
- petroleum activities will be concentrated within the existing Petroleum Safety Zones within WA-32-L, which other marine users are required to avoid
- the expected short duration of SIMOPS (if required at all).

Hence cumulative impacts from physical presence of the MODU and vessels on other marine users are anticipated to be minor and temporary.

## 7.1.4 Demonstration of ALARP

The ALARP process performed for the environmental aspect is summarised in **Table 7-2**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained, and final acceptance or justification if the control was rejected.

**Table 7-2: Physical Presence - ALARP Summary**

| Control Measure  | Accept / Reject | Reason  | Associated Performance Standards |
|--|-----------------|---|----------------------------------|
| <b>Legislation, Codes and Standards</b>  |                 |   |                                  |
| <p>MODU and project support vessel compliant with navigation safety requirements including the Navigation Act 2012 and any subsequent Marine Orders (21 &amp; 30), which specify:</p> <ul style="list-style-type: none"> <li>• navigation (including lighting, compass/radar), bridge and communication equipment will comply with appropriate marine navigation and vessel safety requirements</li> <li>• Automatic Identification System (AIS) is fitted and maintained in accordance with Regulation 19-1 of Chapter V of SOLAS</li> <li>• crew performing vessel bridge-watch will be qualified in accordance with AMSA Marine Order Part 3: Seagoing Qualifications or certified training equivalent</li> </ul> | Accept          | <p>Legislative requirements to be followed which reduces the risk of third-party vessel interactions due to ensuring safety requirements are fulfilled and other marine users are aware of the presence of the MODU and support vessels.</p> <p>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>   | <b>PS 1.1</b>                    |
| Establishment of a 500 m safety exclusion zone around MODU/infrastructure removal vessel and communicated to marine users.   | Accept          | <p>Establishment of a 500 m petroleum safety zone around MODU and vessel conducting infrastructure removal activities reduces the likelihood of interaction with other marine users.</p> <p>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>   | <b>PS 1.2</b>                    |
| Sea Dumping Permit for leaving partial wellheads in-situ if internal cut and external cut at the mudline cannot be achieved.   | Reject          | Determined a permit under the Environment Protection (Sea Dumping) Act 1981 is not required, given the infrastructure is considered to fall under the scope of Article 1.4.2.3 of the London Protocol, which states that sea dumping does not include the 'abandonment in the sea of matter (such as cables, pipelines and marine research devices) placed for a purpose other than the mere disposal thereof'. | Not applicable                   |
| <b>Eliminate</b>   |                 |   |                                  |
| Eliminate use of vessels.  | Reject          | Control not considered feasible. The use of vessels is required to conduct the petroleum activities.  | Not applicable                   |
| Reduce the exclusion zone around the vessels.  | Reject          | Reduces the area of displacement of other marine users; however, the exclusion zone is a legislative requirement and cannot be reduced, therefore the control is not feasible.  | Not applicable                   |
| Remove well infrastructure directly following permanent  | Reject          | Continued temporary presence of well infrastructure (wellheads and subsea trees) for  | Not applicable                   |

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| plugging of the wells   |                 | up to six months after permanent plugging has been completed has a negligible impact on other marine users given the low fishing effort in the Operational Area and that wellhead presence for up to six months will not affect the success of future removal.<br><br>Control is disproportionate. The cost/sacrifice outweighs the benefit gained. |                                  |
| <b>Engineering</b>  |                 |   |                                  |
| Remove well infrastructure above the mudline, where feasible.   | Accept          | Cutting below the mudline will remove the potential for infrastructure to react with trawl fisheries or other marine users who interact with the seabed.<br><br>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   | <b>PS 2.1</b>                    |
| <b>Administrate</b>   |                 |   |                                  |
| Where well infrastructure above the mudline cannot be removed and remaining portion may present a credible snag risk to future trawl fishers, notify AHO of wellhead location so it can continue to be marked on navigational charts. | Accept          | Notification to AHO will enable them to ensure well infrastructure that remains above the mudline (if required) is maintained on navigational charts to reduce the likelihood of any future interactions with marine users (trawling). Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.              | <b>PS 2.2</b>                    |
| AHO notified of activity no less than four working weeks prior to undertaking the petroleum activity  | Accept          | Notification to AHO will enable them to generate navigation warnings.<br><br>Control is feasible, standard practice with minimal cost. |   |                 | Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.  |                                  |
| Establish and maintain a publicly available interactive map which provides stakeholders with updated information on activities being conducted as part of the Petroleum Activity. | Accept          | Interactive map provides additional alternative method for marine users to obtain information on the timing of activities, thereby reducing the likelihood.<br><br>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 1.7</b>                    |

#### 7.1.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts of the physical presence of the MODU, support vessels and well infrastructure on other marine users to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential for interaction with other marine users associated with the physical presence of the MODU, support vessels and well infrastructure. Additional reasonable control measures were identified in **Table 7-2** to further reduce impacts but rejected since the associated cost or sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

#### 7.1.5 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, the physical presence of the MODU and project vessels will not result in potential impacts greater than a minor, temporary displacement of other marine users, such as commercial fishing and shipping. Due to the size and location of the well infrastructure, the continued presence of well infrastructure for a short duration<sup>21</sup> following permanent plugging activities is not expected to cause impact to other marine users. Should an external cut using a diamond wire saw be required for some of the wellheads and cutting results in a portion of the wellhead remaining above the mudline with a potential to act as a credible snag risk to future trawl fishers the impact is expected to be negligible and continuing to mark these wells on navigation charts will further minimise any impact.

Further opportunities to reduce the impacts have been investigated above (**Table 7-2**). The adopted controls are considered good oil-field practice/industry best practice. The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impacts are consistent with the principles of ESD:

- **Integration Principle:** Plug and abandonment activities allow ongoing decommissioning of the Stybarrow field to progress which will achieve favourable short to long term environmental, social and economic outcomes.
- **Precautionary Principle:** The physical presence aspect, and its potential impacts, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** The physical presence aspect is temporary and will not impact upon the environment such that future generations cannot meet their needs. In the event an external cut is required to recover a wellhead, and the cutting results in a small portion of the wellhead may remain above the mudline. The impact of this remanent wellhead is expected to be negligible and have no lasting impact to future generations.
- **Biodiversity Principle:** The physical presence aspect will not impact upon biodiversity or ecological integrity.

<sup>21</sup> Duration is expected to be between 6 – 8 months, and no greater than a year based on the assumption that the P&A is expected to be completed by Q3 2024 (no later than 31 September 2024) and well infrastructure above the mudline is to be recovered no later than 31 March 2025 in accordance with Direction 2 of General Direction 833.

On this basis, Woodside considers the impact to be managed to an acceptable level.

## 7.1.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes  | Controls   | Performance Standards  | Measurement Criteria  |
|---|--|--|---|
| <p><b>EPO 1</b></p> <p>No unplanned interactions between the MODU or support vessels and other marine users</p> | <p><b>C 1.1</b></p> <p>MODU and project support vessel compliant with navigation safety requirements including the Navigation Act 2012 and any subsequent Marine Orders (21, 27 &amp; 30), which specify:</p> <ul style="list-style-type: none"> <li>• navigation (including lighting, compass/radar), bridge and communication equipment will comply with appropriate marine navigation and vessel safety requirements</li> <li>• Automatic Identification System (AIS) is fitted and maintained in accordance with Regulation 19-1 of Chapter V of SOLAS</li> <li>• crew performing vessel bridge-watch will be qualified in accordance with AMSA Marine Order Part 3: Seagoing Qualifications or certified training equivalent</li> </ul> | <p><b>PS 1.1</b></p> <p>MODU and project vessels compliant to the navigation safety requirements including the <i>Navigation Act 2012</i>, International Convention of the Safety of Life at Sea (SOLAS), Marine Order 30 and Marine Order 21.</p> | <p><b>MC 1.1.1</b></p> <p>Marine assurance inspection records demonstrate compliance with standard maritime safety procedures</p>                                 |
|   | <p><b>C 1.2</b></p> <p>Establishment of a 500 m safety exclusion zone around MODU/infrastructure removal vessel and communicated to marine users.</p>  | <p><b>PS 1.2</b></p> <p>No entry of unauthorised vessels within the 500 m safety exclusion zone.</p>   | <p><b>MC 1.2.1</b></p> <p>Records of breaches by unauthorised vessels within the petroleum safety zone are recorded.</p>  |

|   | <b>C 2.2</b><br>Where well infrastructure above the mudline cannot be removed and remaining portion may present a credible snag risk to future trawl fishers, notify AHO of wellhead location so it can continue to be marked on navigational charts. | <b>PS 2.2</b><br>AHO notified of locations of infrastructure remaining above the mudline, where it presents credible snag risk to future trawl fishers. | <b>MC 2.2.1</b><br>Records demonstrate that AHO has been notified of infrastructure remaining above the mudline, where it presents credible snag risk to future trawl fishers. |

<sup>22</sup> Should contingency DWS cutting method be required to remove well infrastructure for any wells, up to 1 m of infrastructure may be required to be left above the current mudline.

## 7.2 Light Emissions

### 7.2.1 Summary of Risk Assessment and Evaluation

| Aspect          | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context           | Acceptability |
|-----------------|---|---|-----------------|-------------------|---------------|----------------------------|---------------|
| Light emissions | Routine light emissions from MODU and project vessels     | Light emissions (light spill and glow) from external lighting on the MODU and support vessels causing alterations to normal marine fauna behaviour. | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |
|                 | Light emissions from non-routine flaring during well P&A. | Light emissions generated from non-routine flaring activities causing alterations to normal marine fauna behaviour                                  | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |

### 7.2.2 Source of Hazard

#### 7.2.2.1 Vessel and MODU Operations

Routine light emissions include light sources that alter the ambient light conditions in an environment. The MODU and project vessels will routinely use external lighting to navigate and conduct safe operations at night throughout the petroleum activity. External light emissions from the MODU and project vessels are typically managed to maintain good night vision for crew members. Vessel/MODU lighting will also be used to communicate the vessel's presence to other marine users (i.e., navigation/warning lights). Subsea spot lighting may also be generated from time to time during the use of equipment such as the ROVs. Lighting is required for safely operating project vessels/MODU and cannot reasonably be eliminated.

External lighting for deck operations typically consists of bright white (metal halide, halogen, fluorescent) lights and Light Emitting Diode (LED), which is not dissimilar to lighting used for other offshore activities, including fishing and shipping. The vessels/MODU that may be required for the petroleum activity are outlined in **Section 3.7**. External lighting is located on vessel/MODU decks, with most external lighting directed towards working areas such as the main decks. These areas are typically <20 m above sea level for vessels, and ~30 m for MODUs. Indicative timing for the petroleum activity is provided in **Section 3.4** and activities may occur at any time throughout the year.

#### 7.2.2.2 Flaring

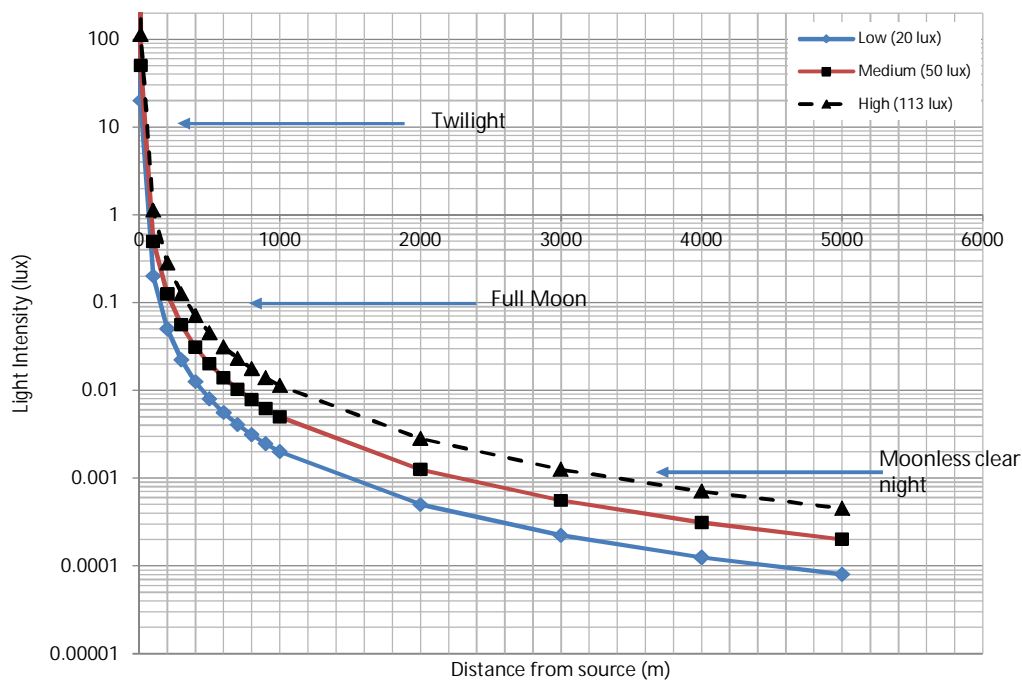

Flaring, which is a relatively bright light source, is sometimes necessary for short periods of time during permanent plugging of wells (**Section 3.8.4.2**). It is planned there will be limited flaring of gas or liquids during plugging of the wells. The base case is that residual well fluids are bullheaded back into the formation, however hydrocarbons present in the annuli of the production wells may be bled off to the MODU including any volumes in the production tubing that could not be successfully bullheaded. Flaring is for a limited duration as it is constrained by the volume of gas/liquids in the annulus and well bore. It is estimated there would be a maximum of 1,080-minutes (~18-hours) of flaring. Flaring will only be at low flow rates, unlike unload operations, and would take place during both daytime and night time.

Lighting from vessels/MODU may appear as a direct light source from an unshielded lamp with direct line of sight to the observer or through sky glow. Direct lighting falling upon a surface is referred to as light spill. Sky glow is the

diffuse glow caused by light that is screened from view, but through reflection and refraction creates a glow in the atmosphere. The distance at which direct light and sky glow may be visible from the source depends on the characteristics of vessel/MODU lighting (including height above sea level) and environmental conditions (e.g., cloud cover).

As a guide, **Figure 7-1** presents a simple calculation of diminishment of received light with distance, assuming 100 lamps on a vessel of low, medium, and high intensity, each acting additively. Light received is diminished to about the equivalent of light that would be received from a full moon within about 200 m from the vessel, and to that of a moonless clear night within about 1,500 m for low-intensity lights and 3,000 m for high-intensity lights. While a useful guide, these calculations are conducted in lux, a photometric unit which is weighted to the wavelength sensitivity of the human eye and may underestimate light intensity across the whole light spectrum which is visible to other species.

**Figure 7-1: Reduction of light received with increasing distance from source, assuming 100 lamps of low, medium, and high intensity**

### 7.2.3 Environmental Impact Assessment

Receptors that have important habitat within a 20 km buffer of the Operational Area are considered for the impact assessment within this section, based on recommendations of the *National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds* (NLPG) (Commonwealth of Australia, 2020b). The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings demonstrated to occur at 15 to 18 km and fledgling seabirds grounded in response to artificial light 15 km away (Commonwealth of Australia, 2020b).

The Multiple Use Zone of the Gascoyne Australian Marine Park lies within 20 km of the Operational Area, while the protected areas associated with the Ningaloo Coast, including the Ningaloo World Heritage Area, do not (**Section 4.6**).

Light emissions have the potential to affect fauna in two main ways:

- **Behaviour:** Many species are adapted to natural levels of lighting and the natural changes associated with the day and night cycle as well as the night-time phases of the moon. However, artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.
- **Orientation:** Species such as marine turtles and birds may also use lighting from natural sources to orient themselves in a certain direction at night. If an artificial light source is brighter than a natural source, the artificial light may override natural cues, leading to disorientation.

Artificial lighting has the potential to affect marine fauna that use visual cues for orientation, navigation, or other purposes, resulting in behavioural responses that can alter foraging and breeding activity. The species with greatest sensitivity to light are marine turtles, seabirds, and fish.

Potential impacts to marine fauna from artificial lighting may include:

- disorientation, attraction, or repulsion to the light
- disruption to natural behaviour patterns and cycles
- indirect impacts such as increased predation risks through attraction of predators.

These potential impacts depend on:

- the wavelength and intensity of the lighting, and the extent to which the light spills into important wildlife habitat (such as foraging, breeding and nesting)
- the timing of light spill relative to the timing of habitat use by marine fauna sensitive to lighting effects
- the physiological sensitivity and resilience of the fauna populations that are at risk of potential effects.

The fauna within the area that may be impacted by artificial light emissions are predominantly pelagic fish and zooplankton, with a low abundance of transient species such as marine turtles, whale sharks, cetaceans and migratory shorebirds and seabirds. There is no known critical habitat within the area that may be impacted by artificial light emissions for EPBC listed species. This area does not overlap any habitat critical for the survival of species of marine turtles. Artificial light emissions overlap (**Section 4.7.2**):

- pygmy blue whale migration and distribution BIA
- wedge-tailed shearwater breeding BIA

As described in **Section 4.7.1**, internesting buffer habitat critical for the survival of the species for flatback, green, hawksbill and loggerhead turtles are located approximately 18 km, 21 km, 52 km and 21 km, respectively, from the Operational Area (**Table 4-9**). However, as outlined below, it is considered internesting adult female turtles are not impacted by artificial light emissions, and it is more relevant to consider separation distances between light sources and nesting habitat critical for the survival of marine turtles (i.e., the nesting locations as identified in Table 6 of the *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017).

**4.7.1** At the closest point, the Operational Area is located approximately:

- 45 km from the nearest nesting locations for green turtles at the North West Cape
- 40 km from the nearest nesting locations for loggerhead turtles at Murion Island and the Ningaloo Coast
- 40 km from the nearest nesting locations for hawksbill turtles at the Ningaloo Coast
- 82 km from the nearest nesting locations for flatback turtles at Thevenard Island – South Coast

### 7.2.3.1 Fish and Zooplankton

Fish and zooplankton may be directly or indirectly attracted to light. Experiments using light traps have found some fish and zooplankton species are attracted to light sources (Meekan et al., 2001), with traps drawing catches from up to 90 m (Milicich, 1992). Lindquist et al. (2005) concluded from a study that light fields around oil and gas activities resulted in an enhanced abundance of clupeids (herring and sardines) and engraulids (anchovies), both of which are known to be highly photopositive.

The concentration of organisms attracted to light results in an increase in food source for predatory species and marine predators are known to aggregate at the edges of artificial light halos. Shaw et al. (2002), in a similar light study, noted juvenile tunas (Scombridae) and jacks (Carangidae), which are highly predatory, may have been preying upon concentrations of zooplankton attracted to the light fields around oil and gas activities. This could potentially lead to increased predation rates compared to unlit areas.

Light spill from the MODU and support vessels onto the surrounding surface waters, particularly during night-time activities, is likely to result in aggregations of fish around the project vessels as they are attracted to the light and increased food availability. However, the Operational Area does not contain any significant feeding, breeding or aggregation areas for important fish species. The potential for increased predation activity and impact to fish and zooplankton is anticipated to be temporary and minor.

Demersal fish assemblages are identified as an environmental value of the Gascoyne Marine Park (DNP, 2018). Given the water depth in the Operational Area is approximately 800 m, artificial light emissions during the petroleum activity will not credibly be observable by demersal fish due to attenuation in the water column. Hence there is no credible impact to this environmental value within the Gascoyne Marine Park.

### 7.2.3.2 Seabirds and Migratory Shorebirds

Artificial lighting can attract and disorient seabird species resulting in species behavioural changes (e.g. circling light sources or disrupted foraging), injury or mortality near the light source (Gaston et al., 2014; Longcore and Rich, 2004). As the Operational Area is offshore and away from islands or other emergent features, any presence of seabirds or shorebirds is considered likely to be of a transient nature only, such as migrating or foraging.

The most vulnerable life stages for seabirds and migratory shorebirds are nesting adults or fledglings. Nesting or fledgling seabirds and migratory shorebirds are vulnerable to artificial lighting within 20 km of the nesting location (Commonwealth of Australia, 2020). Shearwater fledglings are predominantly impacted by onshore lighting sources, which can override sea finding cues and attract fledglings further inland, preventing them from reaching the sea (Mittkus et al., 2018). The Operational Area overlaps a foraging and breeding BIA for the wedge-tailed shearwater, and is approximately 51 km from the Murion Islands, which is an important breeding site for this species.

Adult shearwaters are vulnerable to artificial lighting during the breeding cycle, when returning to and leaving the nesting colony to maintain nesting sites or forage. Foraging adult wedge-tailed shearwaters may be attracted to sources of light emissions to feed on fish drawn to the light, or may be attracted to vessel light during periods of low visibility (Catry et al., 2009; Whittow, 2020), however the species feeds primarily during the day. Artificial light can also impact behaviour and adult nest attendance, or confuse shearwater species, resulting in injury or mortality as a result of birds colliding with structures (Cianchetti-Benedetti et al., 2018; Rodríguez et al., 2017). Tagging studies of wedge-tailed shearwaters in the region by Cannell et al. (2019) showed that bi-modal foraging strategy with chick-rearing foraging activity around nesting islands and, longer ranging foraging south of Indonesia in the Indian Ocean (often in association with seamounts).

Behavioural disturbance to birds from light is expected to be localised to within the vicinity of the MODU and project vessels within the Operational Area. The light source from the MODU and vessels within the Operational Area will be temporary and only when operations are occurring. Interactions with seabirds are therefore expected to be unlikely. Any impacts are predicted to be at an individual level and not a population level. The temporary behavioural disturbance of birds will be localised around the light sources, and not result in a substantial adverse effect on a population of species or its lifecycle. Additionally, light emissions will not seriously disrupt the lifecycle of an ecologically significant proportion of any migratory species population.

Migratory shorebirds may be present in or fly through the region between July and December, and again between March and April as they complete migrations between Australia and offshore locations (Commonwealth of Australia, 2015b). The risk associated with collision from seabirds and shorebirds attracted to the light is considered to be low, based on the intermittent and localised nature of the activities in the Operational Area, as well as the distance offshore. Impacts are expected to be limited to temporary behavioural disturbance to isolated individuals, that is not expected to disrupt important migration patterns of migratory seabirds.

Seabirds are identified as an environmental value of the Gascoyne Marine Park (Director of National Parks, 2018). Light emissions from the petroleum activity could credibly result in short-term behavioural impacts to seabirds foraging or moving through the Multiple Use Zone (IUCN Category VI) of the park. Such impacts are not inconsistent with the management principles for IUCN Category VI zones stated in the *North-west Marine Parks Network Management Plan 2018* (DNP, 2018).

Based on the detailed evaluation, the magnitude of impacts to birds from light emissions during the petroleum activity are anticipated to be temporary and minor.

### 7.2.3.3 Marine Turtles

The attraction of marine turtles to light has been well documented. Adult marine turtles may avoid nesting on beaches that are brightly light (Price et al., 2018; Witherington, 1992) and adult and hatchling turtles can be disorientated and unable to find the ocean in the presence of direct light or sky glow (Lorne and Salmon, 2007; Price et al., 2018; Thums et al., 2016; Witherington, 1992).

Five marine turtle species were identified as potentially occurring in the Operational Area (**Table 4-7**). However, there are no BIAs or habitats critical for the survival of turtles that overlap the Operational Area.

### Hatchlings

The nearest marine turtle nesting site is North West Cape (approximately 40 km from the Operational Area), which exceeds the 20 km buffer set by the NLPG; therefore, sky glow and light spill from the MODU and project vessels will not reach any nesting beach. The distance of the Operational Area from the nearest nesting beach mitigates the potential effects on turtle hatchlings. Furthermore, the activity is short term in nature and no long term artificial light sources will remain in the Operational Area at the end of the Petroleum Activity, therefore it is unlikely that hatchlings would be impacted at a population level.

Any impacts to hatchling turtles from artificial light will be limited to possible short-term behavioural impacts during hours of darkness only, on isolated individual hatchlings offshore, with no lasting effect to the species population.

### Adults

Although individuals performing behaviours such as inter-nesting, migration, mating (adults) or foraging (adults and pelagic juveniles) may occur within the Operational Area, marine turtles do not use light cues to guide these behaviours. There is currently no evidence to suggest inter-nesting, mating, foraging, or migrating turtles are impacted by light from offshore vessels. Light emissions from the vessels are unlikely to result in displacement of, or behavioural changes to, individuals in these life stages.

Spending most of their lives in the ocean, adult female marine turtles nest above the high-tide mark on sandy tropical and subtropical beaches, predominantly at night (Witherington and Martin, 2003). They rely on visual cues to select nesting beaches and orient on land. Artificial lighting on or near beaches has been shown to disrupt nesting behaviour. Lighting may affect the location where turtles emerge onto the beach, the success of nest construction, whether the nesting attempts are abandoned, and even the directness of paths as adult females return to the sea (Witherington and Martin, 2003). The nearest marine turtle nesting site is 40 km from the Operational Area. Nesting sites at this distance will not be visible as sky glow to nesting adult turtles, therefore the light emissions from the project vessels will not displace females from nesting habitats.

Five marine turtle species were identified as potentially occurring in the Operational Area (**Table 4-7**), although no habitat critical for the survival of marine turtles or biologically important areas overlap the Operational Area. Individual turtles may traverse the Operational Area during the petroleum activities; however, considering the water depths of the Operational Area (around 800 m) and distance to nesting beaches (approximately 40 km to North West Cape), large numbers of inter-nesting adults are not expected. Behavioural impacts to marine turtles from light emissions from the project vessels are anticipated to be temporary and minor.

Interesting habitat for marine turtles is identified as an environmental value of the Gascoyne Marine Park (Director of National Parks, 2018), and the area that may be impacted by artificial light emissions partially overlaps the Multiple Use Zone (IUCN Category VI) of the park. Nesting habitat<sup>23</sup> critical for the survival of flatback, green and loggerhead turtles lie approximately 18 km, 21 km, and 21 km from the operational respectively and may lie within the area that may be impacted by artificial light emissions. Interesting behaviour is typically restricted to water depths < 30 m. The water depths in the area that may be impacted by artificial light emissions are > 200 m depth and therefore are anticipated to be too deep to support interesting behaviour. Hence, artificial light emissions will not impact upon interesting turtles and therefore such emissions are not inconsistent with the objectives of the Gascoyne Marine Park (DNP, 2018) and the *Recovery Plan for Marine Turtles in Australia* (Department of the Environment and Energy, 2017).

#### 7.2.3.4 Species Recovery Plans, Approved Conservation Advice and Threat Abatement Plans

Woodside has considered information contained in recovery plans, approved conservation advice and threat abatement plans (**Section 9**). This includes the *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017) as well as the NLPG (Commonwealth of Australia, 2020b).

The overarching objective of the *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017) is to reduce detrimental impacts on Australian populations of marine turtles and hence promote their recovery in the wild. All six species of marine turtle that occur in Australian waters are listed as threatened under the EPBC Act. Marine turtles are long-lived, slow to mature and are subject to multiple threats. Light pollution is identified as a high-risk threat in the *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017). Minimising light emissions from the activity, such that artificial light within or adjacent to habitat critical to the survival of marine turtles, is managed so marine turtles are not displaced from these habitats (Commonwealth of

<sup>23</sup> Note this habitat is defined by buffers extending ranging from 20 km to 40 km from nesting beaches, rather than nesting beaches themselves.

Australia, 2017). As there are no safe alternatives to using artificial lighting on the project vessels, and as lighting will be restricted to that required to provide safe working and navigational requirements, it is considered minimised to ALARP. In summary, Woodside considers the proposed activity is not inconsistent with the *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017).

The *Wildlife Conservation Plan for Seabirds* (Commonwealth of Australia, 2020a) identifies artificial light emissions as a threat for several seabird species, particularly for fledgling seabirds such as shearwaters. The plan recommends that light pollution from vessels at sea be mitigated but does not specify how this should be done. Woodside will manage artificial light emissions in accordance with the NLPG (Commonwealth of Australia, 2020b); these guidelines are good practice and are consistent with the recommendation from the *Wildlife Conservation Plan for Seabirds* (Commonwealth of Australia, 2020a) that light pollution be mitigated.

### 7.2.3.5 Cultural Values and Heritage

Through consultation and review of available literature (**Section 4.8.1**), Woodside understands that marine fauna that may be affected by light emissions, such as turtles and plankton, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes result in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described in the environmental impact assessment (**Section 7.2.3**), potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

### 7.2.3.6 Cumulative Impact Assessment

There is potential for SIMOPs to occur with activities covered under this EP and other Woodside decommissioning activities within WA-32-L as described in **Section 3.4.1**. A maximum of up to four vessels and a MODU may be present in the Operational Area at one time should SIMOPs occur. The MODU will be the highest light source within WA-32-L during the petroleum activities described in this EP and Stybarrow Decommissioning Equipment Removal and Field Management EP. Hence, the number of vessels present in WA-32-L does not affect the maximum distance at which light is directly visible at sea level. Increased numbers of vessels in WA-32-L during SIMOPS may result in a slight increase in skyglow generated in WA-32-L. Given the distance from other production facilities off North West Cape (approximately 20 km, **Section 4.8.5**) and the distance from shore (approximately 41 km, **Section 3.2**), skyglow from SIMOPS will not materially increase the skyglow observable from shore. Hence, impacts to shore-based receptors such as nesting or roosting seabirds or nesting and hatchling turtles will not credibly occur.

The Operational Area overlaps a foraging and breeding BIA for the wedge-tailed shearwater and is located approximately 51 km from the Muiron Islands, which is a significant breeding site for this species. However, the cumulative impacts from additional vessels during SIMOPS is unlikely to materially change the impacts to wedge-tailed shearwaters (e.g., behavioural disturbance such as attraction) given the relatively short duration of SIMOPS and the nature of behavioural impacts of lighting (i.e., increasing the number of vessels in WA-32-L is unlikely to increase attraction behaviour substantially more than the MODU alone). While within the broader foraging area for wedge-tailed shearwaters, the Operational Area does not represent important foraging habitat for wedge-tailed shearwaters, which forage widely and often around sea mounts or other relatively productive oceanographic features (Cannell et al., 2019). Hence, cumulative impacts from light emissions from the MODU and vessels (including SIMOPS) on marine fauna are considered minor and temporary.

#### 7.2.4 Demonstration of ALARP

The ALARP process performed for the environmental aspect is summarised in **Table 7-3**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained, and final acceptance or justification if the control was rejected.

Table 7-3: Light Emissions - ALARP Summary

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| <b>Eliminate</b>  |                 |   |                                  |
| Restrict the petroleum activities to daylight hours, eliminating the need for external work lights.   | Reject          | Components of the petroleum activity cannot safely be completed within a 12-hour day shift. As such, the need for external lighting cannot safely be eliminated. Control is not considered feasible.  | Not applicable                   |
| Eliminate requirement to use the flare  | Reject          | Flaring is the only feasible and safe way to manage the reservoir fluids brought to surface and achieve the well objectives. Control is not considered feasible.  | Not applicable                   |
| <b>Substitute</b>   |                 |   |                                  |
| Substitute external lighting with light sources designed to minimise impacts and marine turtles (as per NLPG 2020 management actions) by: <ul style="list-style-type: none"> <li>• using flashing / intermittent lights instead of fixed beam</li> <li>• using motion sensors to turn lights on only when needed</li> <li>• using luminaires with spectral content appropriate for the species present</li> <li>• avoiding high intensity light of any colour.</li> </ul> | Reject          | The retrofitting of all external lighting on the MODU and/or support vessels is significant in cost. Given the distance of the Operational Area from the nearest nesting sites (approximately 41 km) and the already minor impacts of lighting from the petroleum activities on marine fauna, the control cost outweighs the environmental benefit. | Not applicable                   |
| Manage timing of the Petroleum Activity to avoid sensitive life cycles for light sensitive marine fauna.  | Reject          | Limitation on timing of the activity imposes substantial schedule constraints. Also, given the Operational Area is located beyond the buffer defined in the NLPGs it is unlikely to have significant impacts on marine fauna from light at any time of the year.  | Not applicable                   |
| <b>Engineer</b>   |                 |   |                                  |
| Lighting will be limited to the minimum required for navigational and safety requirements, with the exception of emergency events   | Accept          | Limiting light during the Petroleum Activities Program will minimise potential for light attraction and vessel interaction with seabirds.<br><br>While the control does not result in reduction of impacts, it is good practice and not at significant cost.  | <b>PS 3.1</b>                    |
| Implement the Offshore Seabird Management Plan, including: <ul style="list-style-type: none"> <li>• Standardisation and maintenance of record keeping</li> </ul>  | Accept          | Reduction in net light emissions from the vessels reducing the likelihood of attracting nocturnal seabirds. Adaptive management framework outlined in the Offshore Seabird Management   | <b>PS 3.2</b>                    |

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| <p>and reporting of seabird interactions.</p> <ul style="list-style-type: none"> <li>Procedures on seabird intervention, care and management Regulatory reporting requirements for seabirds (unintentional death of or injury to seabirds that constitute MNES)</li> <li>A scalable adaptive management process should negative light impacts to nocturnal seabirds be detected.</li> </ul> |                 | <p>Plan will prevent population level impacts from occurring, and the care and release protocol will reduce impacts at the individual level.</p> <p>Control is feasible, however a minimum level of lighting is required on MODU and project vessels for safety.</p> <p>Benefit outweighs cost, given the low costs in implementation and potential benefits in providing certainty that population level impacts to nocturnal seabirds will not occur.</p> |                                  |
| Flaring restricted to a duration necessary to perform the activity for well bleed-off, with the exception of emergency events.  | Accept          | <p>Reduces the likelihood of atmospheric emissions impacting air quality. Consequence remains unchanged.</p> <p>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>   | <b>PS 3.3</b>                    |

### 7.2.5 ALARP Summary

Woodside have identified a number of controls (**Table 7-3**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts from light emissions from MODU, project vessels and flaring on marine fauna to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential impacts from light emissions generated during the Petroleum Activity on marine fauna. Additional reasonable control measures were identified in **Table 7-3** to further reduce impacts but rejected since the associated cost or sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

### 7.2.6 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, light emissions from the MODU, project vessels and during flaring operations, will not result in an impact greater than a localised and temporary disturbance to specific marine fauna, particularly, nocturnal seabirds, in the vicinity of the Operational Area, with no lasting effect.

Illumination of working areas on the MODU and project vessels is necessary for safe working practices, as determined as part of a Vessel Safety Case assessment under the OPGGS Act requirements. Navigational lighting is also required to satisfy AMSA's Prevention of Collision Convention (Marine Order 30, Issue 7) requirements.

Further opportunities to reduce the risks and consequences have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good oil-field practice/industry best practice. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impact is considered consistent with the principles of ESD:

- Integration Principle:** Plug and abandonment activities allow ongoing decommissioning of the Stybarrow field to progress which will achieve favourable short to long term environmental, social and economic outcomes.
- Precautionary Principle:** The light emissions aspect, and its potential impacts, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect. There is variability in the presence and timing of some environmental receptors that may be impacted by light emissions; however, the nature and scale of the potential impacts pose no risk of serious or irreversible environmental impacts.
- Intergenerational Principle:** The light emissions aspect will not impact upon the environment such that

future generations cannot meet their needs.

- **Biodiversity Principle:** The light emissions aspect will not impact upon biodiversity or ecological integrity.

No concerns or objections regarding light emissions from project vessels have been raised by relevant persons. However, marine species such as turtles and plankton have been identified, during consultation for this EP as well as for other Woodside activities, as a cultural value for Traditional Custodians. Given impacts are predicted to be temporary and minor behavioural disturbance to individuals and no impacts on a population level are expected to occur, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

The area that may be affected by artificial light emissions overlap the Gascoyne Marine Park and habitat critical for the survival of marine turtle stocks. The potential impacts from artificial light emissions on the environmental values in the Gascoyne Marine Park and habitat critical for the survival of marine turtles are consistent with the conservation objectives of the Gascoyne Marine Park (DNP, 2018) and the *Recovery Plan for Marine Turtles in Australia* (Department of the Environment and Energy, 2017).

On this basis, Woodside considers the impact to be managed to an acceptable level.

## 7.2.7 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes   | Controls   | Performance Standards  | Measurement Criteria  |
|--|--|--|---|
| <b>EPO 3</b><br>Light emissions managed to limit impacts to marine fauna to short-term behavioural impacts only. | <b>C 3.1</b><br>Lighting will be limited to the minimum required for navigational and safety requirements, with the exception of emergency events  | <b>PS 3.1</b><br>Lighting limited to that required for safe work/navigation.<br>Project vessels will use available block-out blinds on portholes and windows not necessary for safety and/or navigation when operating at night. | <b>MC 3.1.1</b><br>Inspection verifies no excessive light being used beyond that required for safe work/navigation<br><br><b>MC 3.1.2</b><br>Vessel contractor procedures include requirement to use available block-out blinds not necessary for safety and/or navigation when operating at night. |

### 7.3.2 Source of Hazard

#### 7.3.2.1 Noise Generated by MODU, Project Vessels and Operation of DP

The MODU and project vessels will generate noise both in the air and underwater, due to the operation of thrusters' engines, propeller movement, drilling operations, etc. These noises will contribute to and can exceed ambient noise levels which range from around 90 dB re 1  $\mu$ Pa (root square mean sound pressure level (RMS SPL)) under very calm, low wind conditions, to 120 dB re 1  $\mu$ Pa (RMS SPL) under windy conditions (McCauley, 2005). The following information describes the source sound levels for the MODU (P&A activity and while on DP) with standby and resupply vessel support and other project vessels. The most significant noise source will be the operation of thruster engines while operating the DP systems on the support vessels and MODU (if a DP MODU is used).

#### **MODU Operations**

During drilling operations, the MODU will produce continuous sound. Sound produced from an active MODU while drilling is predominantly below 2 kHz, with peak frequencies below 500 Hz. Measured frequencies for the West Aquarius MODU, which is dynamically positioned and considered to be representative of drilling by the MODU that will be contracted for the Stybarrow P&A activity, recorded a peak frequency at 190 Hz (Martin et al., 2019). A range of broadband values, up to 185 dB re 1  $\mu$ Pa at 1 m (SPL), have been quoted for various MODUs (Simmonds et al., 2004). McCauley (1998) recorded source noise levels for moored MODUs from 149-154 dB re 1  $\mu$ Pa at 1 m while actively drilling (with support vessel on anchor) and Greene (1987) recorded source levels of two moored drillships from 145-158 dB re 1  $\mu$ Pa at 1 m during drilling (with support vessels idling nearby). An acoustic monitoring program commissioned by Santos was conducted during an exploratory drilling program in 2003, which indicated that the drilling operation was not audible from between 8-28 km from the MODU (or beyond) (McCauley, 2005).

Austin et al. (2018) recorded broadband source levels from MODU operations (excluding DP thrusters) to be

170.7 dB re 1  $\mu$ Pa. This source level was used to inform sound transmission loss modelling studies by JASCO (Wecker et al., 2022) commissioned by Woodside to inform the underwater noise impact assessment of a DP MODU and support vessels at the Pluto field. These noise levels are expected to be similar to those generated by a MODU operating on DP during the Petroleum Activity.

Recent measurements of underwater radiated noise from MODUs operating in Australia (Otway Basin), the United States (Alaskan Beaufort and Chukchi Seas) and Canada (Scotian Slope) found mean monopole source levels ranging from 162.7 to 187 dB re 1  $\mu$ Pa at 1 m (Austin et al., 2023). **Figure 7-2** provides a summary of this data.

| MODU type              | Vessel                  | Location      | Mean monopole source level (dB re 1 $\mu$ Pa m) |
|------------------------|-------------------------|---------------|---|
| Moored semisubmersible | <i>Ocean Onyx</i>       | Otway Basin   | 162.7–175.2                                     |
|                        | <i>Polar Pioneer</i>    | Alaska        | 170.1   |
| Semisubmersible on DP  | <i>West Aquarius</i>    | Scotian Slope | 183–187   |
|                        | <i>Stena Forth</i>      |               |   |
| Drillship on DP        | <i>Stena IceMax</i>     |               |   |
| Moored drillship       | <i>Noble Discoverer</i> | Alaska        | 174.9   |
|                        | <i>Kulluk</i>           |               | 168.6   |

**Figure 7-2: Summary of mean monopole source levels for the measured MODUs**

The MODU is expected to be on location within the Operational Area for approximately 6 – 8 months for the Stybarrow P&A campaign (18 – 24 days per well).

### Project Vessels

The Petroleum Activity will be supported by a number of DP capable vessels (**Table 3-7**) including; anchor handling vessels (AHVs), Light Construction Vessel (LCV), and offshore support vessels (OSVs) used for standby and resupply services. Vessels produce low frequency sound (i.e. below 1 kHz) from the operation of machinery, hydrodynamic flow sound around the hull and from propeller cavitation, which is typically the dominant source of sound (Jiménez-Arranz et al., 2020).

Vessels in the 50-100 m size class (e.g., supply ships, crew boats) produce broadband source levels in the 165–180 dB re 1  $\mu$ Pa SPL range (Götz et al., 2009). In comparison, underwater sound levels generated by large ships can produce levels exceeding 190 dB re 1  $\mu$ Pa (Götz et al., 2009), and small vessels up to the 20 m size class typically produce sound at source levels of 151 to 156 dB re 1  $\mu$ Pa (Richardson et al., 1995). Although the exact vessels that will be used for the Petroleum Activity are not confirmed at this stage, typical vessel specifications have been provided. In the absence of exact noise measurements for the support vessels proposed to be used for the Petroleum Activity McCauley (1998) measured underwater noise generated from a supply vessel holding station in the Timor Sea, this showed noise levels being generated to about 182 dB re 1  $\mu$ Pa at 1 m (RMS SPL). In the scenario measured by McCauley (1998) metocean conditions included strong differential currents throughout the water column and skippers were required to operate the bow and main shaft thrust to hold station. It is expected that noise levels measured by McCauley (1998) would be similar to the maximum noise generated by support vessels for the Petroleum Activity, which is located in an area with weaker oceanic currents.

Project vessels and the MODU are conservatively expected to have an overall combined source level of 192 dB re 1  $\mu$ Pa (RMS SPL), which represents a doubling of sound pressure from the single loudest source (i.e., 186 dB + 6 dB).

### 7.3.2.2 Generation of Underwater Noise from Positioning Equipment

An array of long baseline (LBL) and/or ultra-short baseline (USBL) transponders may be installed on the seabed for metrology and positioning. An array of transponders is proposed within a radius of 500 m from the well locations.

Transponders typically emit pulses (impulsive noise) of medium frequency sound, generally within the range 21 to 31 kHz. The estimated SPL would be 180 to 206 dB re 1  $\mu$ Pa at 1 m (Jiménez-Arranz et al., 2017). Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders will not emit any sound when on standby and are planned to only actively emit sound for about six hours per well. When required for general positioning they will emit one chirp every five seconds (estimated to be required for four hours at a time). When required for precise positioning they will emit one chirp every second (estimated to be required

for two hours at a time). An array of transponders will be active whilst the DP MODU is on location.

### 7.3.2.3 Generation of Underwater Noise from Well Infrastructure Removal

Subsea cutting and removal of well infrastructure may be done by either an abrasive water jet or a cutting tool inserted in the wellhead. Both methods will generate underwater noise at the seabed, however the noise levels will be negligible compared to other noise sources (e.g., DP thrusters).

Twachtman Snyder & Byrd, Inc. and Center for Energy Studies, Louisiana State University (2004) studied the operations and socio-economic impact of non-explosive removal of offshore structures, including noise, and concluded mechanical cutting and abrasive water jet, as well as diamond wire cutting methods, are generally considered harmless to marine life and the environment. Similarly, Pangerc et al. (2016) described the underwater sound measurement data during an underwater diamond wire cutting of a 32-inch conductor (around 10 m above seabed in around 80 m depth) and found the sound radiated from the diamond wire cutting of the conductor was not easily discernible above the background noise at the closest recorder located 100 m from the source. The sound that could be associated with the diamond wire cutting was primarily detectable above the background noise at the higher acoustic frequencies (above around 5 kHz) (Pangerc et al., 2016) above the hearing range of low frequency cetaceans. Background noise was attributed to surface vessel activity such as dynamic positioning.

Any noise propagating at seabed from cutting of the wellhead casing and conductors is likely to attenuate to levels at, or close to, background ambient levels within 100 m of the source, with ambient levels being significantly elevated by the concurrent presence of a project vessel on DP immediately above the wellhead locations. As such, noise from the cutting of the casing and conductors will not add to cumulative noise levels for the operation to any extent.

### 7.3.2.4 Generation of Underwater and Atmospheric Noise from Helicopter Transfers within the Operational Area

Helicopter activities may occur in the Operational Area, including the landing and take-off of helicopters on the MODU or vessel helidecks. Sound emitted from helicopter operations is typically below 500 Hz (Richardson et al., 1995). The peak received level diminishes with increasing helicopter altitude, but the duration of audibility often increases with increasing altitude. Richardson et al., (1995) reports that helicopter sound is audible in air for four minutes before it passed over underwater hydrophones but was detectable underwater for only 38 seconds at 3 m depth and 11 seconds at 18 m depth. Noise levels reported for a Bell 212 helicopter during fly-over was reported at 162 dB re 1  $\mu$ Pa and for a Sikorsky-61 is 108 dB re 1  $\mu$ Pa at 305 m (Simmonds et al., 2004).

### 7.3.2.5 Generation of Underwater and Atmospheric Noise from Flaring

Minimal flaring of gas or liquids will be required during the petroleum activity (refer to section 7.4.2.2). If flaring is required, it will be for a limited duration as it is constrained by the volume of gas/liquids in the wellbore. In addition, any flaring will be carried out at low flow rates, unlike operations. Received levels from airborne propagation modelling were used to ascertain the underwater received levels during flaring activities for the Pyxis EP and are considered representative of this activity. Modelling showed only a very small fraction of the acoustic energy produced from flaring will transmit through the air/water boundary due to the surface of the water acting as a reflective plane and a significant component of acoustic energy reflecting back into the air. The angle at which the sound path meets the surface (angle of incidence) influences the transmission of noise energy from the atmosphere through the sea surface; with angles of  $\pm > 13^\circ$  from vertical being almost entirely reflected (Richardson et al., 1995). The transmission of sound from air to water was conservatively calculated assuming worst case vertical incidence. Results indicate the underwater received sound pressure level during flaring is estimated to be 136 dB re 1  $\mu$ Pa at 1 m below the sea surface and is estimated to attenuate below the marine mammal behavioural response threshold of 120 dB re 1  $\mu$ Pa within only 7 m from the sea surface.

### 7.3.2.6 Sound Transmission Loss Modelling

Woodside commissioned JASCO (Wecker et al., 2022) to undertake sound transmission loss modelling of several scenarios at two representative well locations in the Pluto field (PLA08 and XNA02), approximately 200 km from the Stybarrow P&A Operational Area. While the XNA02 well is in relatively shallow water (approximately 182 m), the PLA08 well is in approximately 820 m, which is similar to the depths in the Stybarrow field. While recognising the critical role local conditions, such as seabed geology and geomorphology, play in sound transmission loss, the JASCO sound transmission loss modelling is considered indicative of the plug and abandonment activities in the Stybarrow field given the similarity in noise sources, water characteristics and water depths between the Stybarrow

field and the PLA08 well location. Relevant scenarios from the modelling study included several permutations of support vessels and the DP MODU undertaking activities (**Table 7-4**).

**Table 7-4: Descriptions of relevant sound transmission loss modelling undertaken by JASCO (Wecker et al., 2022)**

| Scenario Number | Scenario Description   |
|-----------------|--|
| 1               | MODU under DP, drilling at PLA08 (24 hr)   |
| 2               | MODU under DP, drilling at PLA08 (24 hr) + support vessel resupply, under DP (2 hr)  |
| 3               | MODU under DP, drilling at PLA08 (24 hr) + support vessel resupply, under DP (8 hr)  |
| 4               | MODU under DP, drilling at PLA08 (24 hr) + support vessel resupply on standby (24 hr)  |
| 5               | MODU under DP, drilling at PLA08 (24 hr) + support vessel resupply, under DP (8 hr) + support vessel resupply on standby (24 hr) |

The JASCO study (Wecker et al., 2022) assessed distances from operations where underwater sound levels reached thresholds corresponding to various levels of potential impact to marine fauna. The animals considered included marine mammals, turtles, and fish. Due to the variety of species considered, several different thresholds were used for evaluating effects, including mortality, injury, temporary reduction in hearing sensitivity, and behavioural disturbance.

The modelling methodology considered scenario specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels for non-impulsive (continuous) noise sources presented as sound pressure levels (SPL,  $L_p$ ), and as accumulated sound exposure levels (SEL,  $L_E$ ) as appropriate for different noise effect criteria. In this report, the duration of the SEL accumulation is defined as integrated over a 24-hour period.

The  $SEL_{24h}$  is a cumulative metric that reflects the dosimetric impact of noise levels over 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding  $SEL_{24h}$  radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for 24 hours. Therefore, a reported radius for  $SEL_{24h}$  criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for 24 hours.

### 7.3.3 Environmental Impact Assessment

The Operational Area is located in water depths of approximately 800 – 850 m. The fauna associated with this area will be predominantly pelagic fishes, with seasonal, migratory species such as cetaceans and marine turtles potentially occurring in the area (**Section 4.7**). Anthropogenic noise has been identified as a threat to a number of migratory and threatened cetaceans and marine turtles that may occur within the Operational Area, including the pygmy blue whale. Relevant actions included in recovery plans for these species are outlined in **Section 9**.

#### 7.3.3.1 Marine Fauna

Underwater noise can affect marine fauna through:

- disturbance and stress leading to behavioural changes or displacement of fauna; the occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation
- masking or interference with other biologically important sounds (including vocal communication, echolocation, signals, and sounds produced by predators or prey)
- secondary ecological effects such as an alteration of predator/prey relationship
- injury to hearing or other organs. Hearing loss may be temporary (temporary threshold shift (TTS)) or permanent (permanent threshold shift (PTS)). Southall et al. (2007) defined TTS as a threshold shift of 6 dB above the normal hearing threshold. If the threshold shift does not return to normal, permanent threshold shift (PTS) has occurred. Threshold shifts can be caused by acoustic trauma from a very intense sound of short duration, as well as from exposure to lower-level sounds over longer time periods (Houser, 2017).

The extent of the impacts of underwater noise on marine fauna depends upon the species of fauna and the frequency range and intensity of the noise produced and the type of acoustic signal (continuous or impulsive). Marine mammal species differ in their hearing capabilities, in absolute hearing sensitivity, as well as frequency band of hearing (Southall et al., 2019). The following sections outline the potential impacts to marine fauna species likely to be found in or near the Operational Area.

### Marine Mammals

Marine mammals that may occur within the Operational Area are detailed in **Table 4-7** which predominantly include migratory and threatened cetaceans. Anthropogenic noise has been identified as a threat to a number of cetaceans that may occur within the Operational Area, including the pygmy blue whale, which has a migration BIA overlapping the Operational Area and the humpback whale which has a migration BIA in close proximity (approximately 4 km) to the Operational Area.

Marine mammals rely on sound for a lot of their critical life functions such as detecting predators, navigation and identifying prey (Erbe, 2012; Erbe et al., 2016; Weilgart, 2007). Underwater noise can affect these life functions, cause behaviour changes and/or cause injury through TTS and PTS. The continuous noise impact threshold levels shown in **Table 7-5** are derived from relevant literature and have been used to determine the likelihood of marine mammals experiencing behaviour responses, TTS or PTS from the Petroleum Activity.

**Table 7-5: Continuous noise impact thresholds for acoustic effects on marine mammals**

| Hearing Group            | Behavioural Change <sup>1</sup><br>SPL (dB re 1 µPa) | TTS Onset <sup>2</sup><br>Weighted SEL <sub>24h</sub> (dB re<br>1 µPa <sup>2</sup> .s) | PTS Onset <sup>2</sup><br>Weighted SEL <sub>24h</sub> (dB re<br>1 µPa <sup>2</sup> .s) |
|--------------------------|--|--|--|
| Low-frequency cetaceans  | 120  | 179  | 199  |
| Mid-frequency cetaceans  | 120  | 178  | 198  |
| High-frequency cetaceans | 120  | 153  | 173  |

<sup>1</sup> ESA Section 7 Consultation Tools for Marine Mammals on the West Coast (National Oceanic and Atmospheric Administration, 2019)

<sup>2</sup> Southall et al. (2019)

As outlined in **Section 4.7.2**, the Operational Area overlaps the inner part of the pygmy blue whale migration corridor, which roughly corresponds with the continental shelf break. It also lies approximately 18 km north of a foraging BIA off the Ningaloo Coast (**Figure 4-6**). Thums et al. (2022) also suggest the migration corridor may extend much further west from the shelf edge than the migration BIA established by DCCEEW. Pygmy blue whales are listed as endangered and migratory under the EPBC Act. Migrating pygmy blue whales may be exposed to underwater noise generated by vessels and the MODU. While the Operational Area lies offshore off the humpback whale migration corridor, there is the potential for humpback whales to be exposed to underwater noise generated by the Petroleum Activity.

The *Conservation Management Plan for the Blue Whale* (Commonwealth of Australia, 2015b), a recovery plan made under the EPBC Act, defines BIAs for pygmy blue whales, with particular emphasis placed on foraging areas and migration corridors. As noted above, the Operational Area partially overlaps the distribution and migration corridor, with the nearest recognised foraging BIA approximately 18 km to the south of the Operational Area. The *Guidance on Key Terms within the Blue Whale Conservation Management Plan* (DAWE, 2021) elaborates on the recovery plan and makes a number of points that relate to the assessment of underwater noise impacts to pygmy blue whales in this EP (**Table 7-6**).

**Table 7-6: Selected definitions from DAWE (2021) for elements of the *Conservation Management Plan for the Blue Whale* (Commonwealth of Australia, 2015a) relevant to the Petroleum Activity**

| Recovery Plan Element  | Definition  |
|--|---|
| “Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area” | <p>The intent of this requirement is to ensure that any blue whale can continue to forage with a high degree of certainty in a Foraging Area, and that any blue whale is not displaced from a Foraging Area. In instances where a threat of environmental harm exists and there is scientific uncertainty as to the outcome, a precautionary approach must be taken.</p> <p>A precautionary approach should be taken to the management of industry activities proposed to occur in or adjacent to designated BIAs (Foraging Areas) due to the increased likelihood of whales foraging in those locations at critically important times.</p> <p>Activities proposed to occur outside designated Foraging Areas must adopt best practice adaptive management approaches in the event that indicators of whale foraging (such as aggregating in a particular area) are evident to ensure that impacts to whales are not unacceptable e.g., injury or displacement.</p>   |
| Definition of ‘a foraging area’  | <p>Foraging – verb (i) to wander in search of supplies. (Macquarie Dictionary 8th ed. 2020)</p> <p>Feeding – verb (i) to take food; eat; graze. (Macquarie Dictionary 8th ed. 2020)</p> <p>Noting the potential for whale foraging and feeding to occur in areas of high primary productivity outside of designated Foraging Areas, consideration also needs to be given to management of industry activities and underwater anthropogenic noise where opportunistic foraging potential exists.</p> <p>In areas other than those identified in the CMP or NCVA (described in points (i) and (ii) above), where it can be reasonably predicted that blue whale foraging is probable, known or whale presence is detected, adaptive management should be used during industry activities to prevent unacceptable impacts (i.e., no injury or biologically significant behavioural disturbance) to blue whales from underwater anthropogenic noise. In-field observations of actual whale feeding are difficult to detect, so indicators of probable foraging should be used as a proxy.</p> |
| Definition of ‘displaced from a foraging area’   | <p>The recovery plan requirement, Action A.2.3, applies in relation to BIAs. A whale could be displaced from a Foraging Area if impact mitigation is not implemented. This means that underwater anthropogenic noise should not:</p> <ul style="list-style-type: none"> <li>• Stop or prevent any blue whale from foraging</li> <li>• Cause any blue whale to move on when foraging</li> <li>• Stop or prevent any blue whale from entering a Foraging Area</li> </ul> <p>It is considered that a whale is displaced from a Foraging Area if foraging behaviour is disrupted, regardless of whether the whale can continue to forage elsewhere within that Foraging Area. Mitigation measures must be implemented to reduce the risk of displacement occurring during operations where modelling indicates that behavioural disturbance within a Foraging Area may occur.</p>   |
| Definition of ‘injury to Blue Whales’  | <p>For the purpose of interpreting and applying Action Area A.2 of the Blue Whale CMP, injury is both permanent and temporary hearing impairment (Permanent Threshold Shift and Temporary Threshold Shift) and any other form of physical harm arising from anthropogenic sources of underwater noise.</p>  |

Based on the *Guidance on Key Terms within the Blue Whale Conservation Management Plan* (DCCEE, 2021), underwater noise emissions from the petroleum activities program must not:

- Result in TTS or PTS to pygmy blue whales
- Displace a pygmy blue whale from a foraging BIA.

The sound transmission loss modelling study by JASCO (Wecker et al., 2022) indicated the TTS threshold for cetaceans (including low frequency functional hearing group cetaceans) may occur out to a maximum range of 0.85 to 1.78 km from the MODU and vessel sources for the scenarios relevant to the Stybarrow field (**Table 7-7**). The TTS threshold is a frequency-weighted cumulative 24 hr. This approach assumed the animal receiving the sound is constantly within the sound field for 24 hr consecutively. This assumption is not consistent with the behaviour of migrating pygmy blue whales, which typically migrate at median speeds of 1.8 to 4.2 km/hr in the region (Thums et al., 2022). Migrating humpback whales have shown avoidance behaviours (increased movement rate and dive

frequency) when exposed to underwater noise generated by a vessel (Dunlop et al., 2015), and it is reasonable to assume pygmy blue whales would exhibit similar responses. Based on the observed migration speeds of pygmy blue whales and assumed behavioural responses to underwater noise, it is not credible pygmy blue whales would be exposed to noise levels sufficient to cause TTS. As such, no injury - as defined by the *Guidance on Key Terms within the Blue Whale Conservation Management Plan* (DAWE, 2021) – will credibly occur.

**Table 7-7: Summary of sound transmission loss modelling results for combined cetacean functional hearing groups behavioural and TTS thresholds**

| Scenario Number | Behavioural Response $R_{max}^*$ (km) | Behavioural Response $R_{95\%}^{**}$ (km) | TTS $R_{max}^*$ | TTS Area (km <sup>2</sup> ) |
|-----------------|---------------------------------------|---|-----------------|-----------------------------|
| 1               | 12.4                                  | 11.4                                      | 0.85            | 2.17                        |

| 5               | 13.1                                  | 11.9                                      | 1.78            | 5.00                        |

\*  $R_{max}$  is the maximum range from the sound source predicted by the modelling at which the threshold value occurs

\*\*  $R_{95\%}$  is the range within which the threshold value is reached 95% of the time

The *Conservation Management Plan for the Blue Whale* (Commonwealth of Australia, 2015b) and associated guidance on key terms (**Table 7-6**) requires that pygmy blue whales not be displaced from a foraging area. The nearest recognised foraging BIA is off the Ningaloo Coast, approximately 18 km south of the Operational Area at the closest point. The sound transmission loss modelling study by JASCO (Wecker et al., 2022) predicted behavioural responses (a conservative surrogate for displacement) could occur up to 13.1 km from the noise source when concurrent activities that generate relatively high intensity noise occur simultaneously (**Table 7-4**). Hence, displacement of pygmy blue whales from this foraging BIA is unlikely to occur.

The modelling and tagging study by Thums et al. (2022) identified several areas that may be important for pygmy blue whales, including the edge of the continental shelf between the Ningaloo Coast and the Rowley Shoal. These areas were identified by a combination of tagging data and modelling data that considered pygmy blue whale abundance and residence time. The Operational Area partially overlaps a relatively small area identified by Thums et al. (2022) as important, but does not overlap the substantial important area identified by Thums et al. (2022) approximately 100 km west of Barrow Island.

When considering the available information on pygmy blue whale distribution and behaviour, along with modelling to characterise the underwater noise emissions hazard, some pygmy blue whales may be exposed to underwater noise from the Petroleum Activity when they are present in the region during their northward (highest density in May and June) and southward (November and December) migrations (Thums et al., 2022). Pygmy blue whales within 13.1 km of the vessels and a DP MODU may experience behavioural impacts, such as increased swimming speeds and more frequent diving (Dunlop et al., 2015), however injury (TTS or PTS) would not credibly occur. Underwater noise emissions will not prevent pygmy blue whales from using the BIA off the Ningaloo Coast, nor displace pygmy blue whales from within the BIA.

Humpback whales occur in the region, with a migration BIA lying shoreward of the Operational Area (approximately 4 km at the closest point). Aerial surveys of migrating humpback whales in the region showed the majority of migrating humpbacks occur in the mid- and inner-continental shelf waters, rather than the outer part of the migration corridor (RPS Environment and Planning, 2010). The sound transmission loss modelling study by JASCO (Wecker et al., 2022) predicted that received noise levels within the humpback whale migration BIA are below levels that would cause TTS or behavioural impacts.

Southern Right Whales (SRW) can also occur in the region, with the Operational Area included in the far northern extent of the species range. However, identified SRW historic high use areas, reproductive BIAs and reproductive area locations which are all located thousands of kilometres away off Southern Western Australia, South Australia,

Victoria and Tasmania (DCCEEW 2022).

### ***Marine Turtles***

Marine turtles are at low risk of mortality or permanent injury from continuous anthropogenic noise sources, such as project vessels (Popper et al., 2014). Marine turtles have also been shown to avoid low-frequency sounds (DeRuiter and Doukara, 2012).

Dow Piniak (2012) found green, leatherback and hawksbill turtles have the greatest hearing sensitivity, between 50 to 400 Hz; therefore, the audible frequency range of marine turtles slightly overlaps with the frequency expected from the MODU operating on DP. Considering the United States of America National Marine Fisheries Service criteria for behavioural effects in turtles of 166 dB re 1  $\mu$ Pa (SPL) the MODU and/or support vessels operating on DP could potentially disturb turtles within a distance of a few hundred metres. Avoidance behaviour means turtles do not become exposed to noise that is likely to cause TTS or PTS. Because there is no critical habitat, habitat critical for the survival of the species or BIAs for marine turtles, marine turtles are not expected to be in the Operational Area in high numbers and avoidance behaviour is not expected to interrupt critical life functions.

Noise from the Petroleum Activity may result in localised behavioural responses of individuals transiting through the Operational Area, with minor impact only. Individuals may deviate slightly from their activities but are expected to resume normal behaviour as they move away from the activities. Any impacts are anticipated to be temporary and minor.

### ***Fish, Sharks and Rays***

All fish species can detect noise sources, although hearing ranges and sensitivities vary substantially between species. Sensitivity to sound pressure seems to be functionally correlated in fishes to the presence and absence of gas-filled chambers in the sound transduction system. These enable fishes to detect sound pressure and extend their hearing abilities to lower sound levels and higher frequencies (Popper et al., 2019). Based on their anatomy, Popper et al. (2014) classified fishes into three animal groups, comprising:

- fishes with swim bladders whose hearing does not involve the swim bladder or other gas volumes
- fishes whose hearing does involve a swim bladder or other gas volume
- fishes without a swim bladder that can sink and settle on the substrate when inactive.

The criteria defined in Popper et al. (2014) for continuous (**Table 7-8**) noise sources on the above groups have been adopted.

Table 7-8: Continuous noise exposure criteria for fishes (after Popper et al., 2014)

| Fish Group                                 | Mortality and Potential Mortal Injury | Recoverable Injury            | TTS                                | Masking                              | Behavioural Response                    |
|--|---------------------------------------|-------------------------------|------------------------------------|--------------------------------------|---|
| Fish: No swim bladder                      | (N) Low<br>(I) Low<br>(F) Low         | (N) Low<br>(I) Low<br>(F) Low | (N) Moderate<br>(I) Low<br>(F) Low | (N) High<br>(I) High<br>(F) Moderate | (N) Moderate<br>(I) Moderate<br>(F) Low |
| Fish: Swim bladder not involved in hearing | (N) Low<br>(I) Low<br>(F) Low         | (N) Low<br>(I) Low<br>(F) Low | (N) Moderate<br>(I) Low<br>(F) Low | (N) High<br>(I) High<br>(F) Moderate | (N) Moderate<br>(I) Moderate<br>(F) Low |
| Fish: Swim bladder involved in hearing     | (N) Low<br>(I) Low<br>(F) Low         | 170 dB rms for 48 h           | 158 dB rms for 12 hr               | (N) High<br>(I) High<br>(F) High     | (N) High<br>(I) Moderate<br>(F) Low     |
| Fish eggs and larvae                       | (N) Low<br>(I) Low<br>(F) Low         | (N) Low<br>(I) Low<br>(F) Low | (N) Low<br>(I) Low<br>(F) Low      | (N) High<br>(I) Moderate<br>(F) Low  | (N) Moderate<br>(I) Moderate<br>(F) Low |

Note: Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N) – tens of metres, intermediate (I) – hundreds of metres, and far (F) – thousands of metres.

Based on criteria developed by Popper et al. (2014) for noise impacts on fish, project vessel noise has a low risk of resulting in mortality and a moderate risk of TTS impacts when fish are within tens of metres from the source. The most likely impacts to fish from noise will be behavioural responses, reducing any TTS impact. Individual demersal fish may be impacted in the vicinity of the Operational Area and tuna and billfish and other mobile pelagic species may transverse the Operational Area.

The Operational Area is not known to be an important spawning or aggregation habitat for commercially caught targeted species. Therefore, no impacts to fish stocks are expected.

Any impacts from noise sources to fish, sharks and rays are anticipated to be temporary and minor and relate to behavioural changes only.

### 7.3.3.2 Generation of Underwater Noise from Positioning Equipment

Transponders used for positioning have the potential to cause some temporary behavioural disturbance to cetaceans; however, noise levels will be well below injury thresholds. Based on empirical spreading loss estimates measured by Warner and McCrodan (2011), received levels from USBL transponders are expected to exceed the cetacean behavioural response threshold for impulsive sources out to about 42 m. Given the short-duration chirps and the mid frequencies used by positioning equipment, the acoustic noise from a single transponder is unlikely to have any substantial effect on the behavioural patterns of migrating cetaceans. Therefore, potential impacts from transponder noise are likely to be restricted to temporary and localised avoidance behaviour of individuals transiting through the Operational Area, and therefore are considered localised with no lasting effect.

### 7.3.3.3 Cumulative Impact Assessment

Cumulative impacts to environmental receptors may occur when more than one hazard impacts upon a receptor. Cumulative impacts to environmental receptors may occur because of:

- more than one noise source from the Petroleum Activity impacting upon a receptor, or
- noise sources from the Petroleum Activity and third-party actions impacting upon the same receptor.

There is potential for SIMOPs to occur with activities covered under this EP and other Woodside decommissioning activities within WA-32-L as described in **Section 3.4.1**. A maximum of up to four vessels and a MODU may be present in the Operational Area at one time should SIMOPs occur.

Cumulative impact from the use of multiple vessels (e.g., during SIMOPS) is not considered to present significant impacts to marine fauna given their mobility and ability to avoid the sound source. Whilst the project vessels may generate noise emissions for a cumulative period during the Petroleum Activity, the noise levels exceeding the distances for behavioural response levels for cetaceans (presented in **Table 7-5**) remain valid given they are based on the worst-case frequency and source levels from a single project vessel (other vessels noise within the Operational Area will remain below these levels). The size of the pygmy blue whale migration BIA is presented in **Figure 4-6** and the area relating to cetacean behavioural threshold exceedance is a fraction of this overall BIA, it is predicted the cumulative project vessel noise will not substantially impact upon the migration or whales or be detrimental the individual whales or the overall populations.

Third-party activities with the potential to generate noise emissions that may result in cumulative impacts include commercial shipping and petroleum activities. There is relatively little commercial shipping in the vicinity of the Operational Area (**Figure 4-15**). Woodside is not aware of any planned seismic surveys in the vicinity of the Operational Area during the execution window for the Petroleum Activity. Any future seismic surveys seeking approval after acceptance of this EP would be required to assess cumulative noise emissions impacts, including consideration of noise generated by plug and abandonment activities. Based on the preceding, cumulative impacts to fauna from third-party noise emissions are not considered credible.

There are several operating FPSOs in the region, the nearest of which is approximately 20 km from the Operational Area. Measurements of FPSOs by Erbe and McPherson (2010) indicated that received noise levels from the FPSOs were comparable with ambient noise levels at distances > 10 km from the FPSOs. On this basis, cumulative impacts due to the operation of FPSOs are considered to be very unlikely to occur.

Impacts from noise emissions to marine fauna have been considered in the above sections. Potentially sensitive periods relate to the humpback and pygmy blue whale migrations, with relatively high densities of whales in the vicinity of the Operational Area. The annual aggregation of whale sharks off the Ningaloo Coast may also be a period in which whale sharks are vulnerable to cumulative underwater noise impacts from the Petroleum Activity.

Impacts from cumulative noise emissions will continue to relate to behavioural disturbance / avoidance only. The Operational Area is not within an area of high shipping density (**Section 4.8.6**), therefore should avoidance behaviour occur it is anticipated that marine fauna would be able to move to an area below the behavioural threshold. Any impacts from cumulative noise emissions on marine fauna are anticipated to be temporary and minor.

#### 7.3.3.4 Species Recovery Plans and Threat Abatement Plans

Woodside has considered information contained in relevant recovery plans and approved conservation advice for cetaceans and marine turtles that identify noise interference as a threat (Section 9). This includes the objectives and actions within the *Conservation management plan for the blue whale: A recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2015-2025* (Commonwealth of Australia, 2015b), which relate to noise emissions. The *Recovery Plan for Marine Turtles in Australia 2017-2027* (Commonwealth of Australia, 2017) also identifies noise as a potential threat to marine turtles, although this relates to seismic surveys and pile driving. Seismic surveys and pile driving both of present a substantially different risk (low frequency, high intensity pulsed noise) than the underwater noise generated during the Petroleum Activity.

#### 7.3.3.5 Values and Sensitivities of Nearby Marine Protected Areas

Woodside has considered potential noise impacts of the proposed activity on the values and sensitivities of nearby marine protected areas. As noted in **section 7.2.3.5**, the two nearby marine protected areas considered for potential noise impacts are the Gascoyne Marine Park and the Ningaloo Coast World Heritage Property. Details about the values and sensitivities associated with these two marine protected areas are also described in **section 7.2.3.5**.

The predicted radius of potential behavioural disturbance for cetaceans, such as pygmy blue whales, extends approximately 13.1 km from the activity as a conservative assumption. The operational area for the proposed activity is located approximately 4 km from the nearest boundary of the Gascoyne AMP (Multiple Use Zone VI designation) and approximately 23 km from the nearest boundary of the Ningaloo Coast World Heritage Property.

As noted in the environmental assessment presented in this section of the EP, for activities adjacent to the Gascoyne Marine Park, the short-term and transient nature of the activities associated with noise emissions will not be inconsistent with the objective of the Multiple Use Zone to provide for ecologically sustainable use and the conservation of ecosystems, habitats and native species and similarly for the Ningaloo Coast World Heritage Property whose closest boundary is approximately 23 km from the operational area.

In summary, Woodside considers that noise emissions from the operational area associated with the activity are not inconsistent with the values and sensitivities of both the Gascoyne AMP and the Ningaloo Coast World Heritage Property, nor inconsistent with the protection and conservation of these values.

#### 7.3.3.6 Cultural Values and Heritage

Through consultation and review of available literature (**Section 4.8.1**), Woodside understands that marine fauna that may be affected by noise emissions, such as marine mammals and turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have an obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Whale species are subject of First Nations' increase ceremonies / rituals which are performed to enhance or maintain populations. As these thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, Woodside understands the thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described in the environmental impact assessment (**Section 7.3.3**) potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to ecologically significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

### 7.3.4 Demonstration of ALARP

The ALARP process performed for the environmental aspect is summarised in Table 7-9. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained, and final acceptance or justification if the control was rejected.

**Table 7-9: Noise Emissions – ALARP Summary**

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| <b>Legislation, Codes and Standards</b>  |                 |  |                                  |
| EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures <sup>24</sup> : <ul style="list-style-type: none"> <li>vessels will not travel greater than six knots within 300 m of a cetacean or turtle (caution zone) and not approach closer than 100 m from a whale.</li> <li>vessels will not approach closer than 50 m for a dolphin or turtle and/or 100 m for a whale (with the exception of animals bow riding).</li> <li>if the cetacean or turtle shows signs of being disturbed, vessels will immediately withdraw from the caution zone at a constant speed of less than six knots.</li> <li>vessels will not travel greater than eight knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark.</li> </ul> | Accept          | Implementation of controls for reduced vessel speed around cetaceans can potentially reduce the underwater noise footprint of a vessel and lower the likelihood of noise exposure above impact thresholds. Controls based on legislative requirements and therefore must be adopted. | <b>PS 4.1</b>                    |
| Opportunistic reporting of cetacean and whale shark sightings on MODU and project vessels. Sighting reports to be collated and summarised on an annual basis and submitted to the Australian Antarctic Division of the Department of the Environment and Energy to satisfy Condition 1(a)(v) of EPBC Approval Decision 2004/1469   | Accept          | Collecting of sightings data does not provide benefit in impact reduction but may support environmental knowledge. Controls based on legislative requirements and therefore must be adopted.   | <b>PS 4.2</b>                    |
| <b>Eliminate</b>   |                 |  |                                  |
| Eliminate the use of vessels and helicopters   | Reject          | The use of vessels and helicopters is required to conduct the Petroleum Activity. Control not feasible.  | Not applicable                   |
| Eliminate flaring for the petroleum  | Reject          | Flaring is the only feasible and safe way to   | Not applicable                   |

<sup>24</sup>For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited maneuverability (e.g., anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations).

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| activity  |                 | manage the reservoir fluids brought to surface and achieve the well objectives. Control is not considered feasible.   |                                  |
| <b>Substitute</b>   |                 |   |                                  |
| Manage the timing of the removal activity to avoid periods when sensitive receptors may be present in relatively high numbers (e.g., blue and humpback whale migration) | Reject          | <p>Would reduce the risk of impacts from noise emissions during environmentally sensitive periods.</p> <p>The benefit that may accrue from avoiding periods of peak whale migration is negligible based on the observation that even with all the oil and gas development (and associated vessel movements) occurring in the Exmouth Basin over the last ten years, the humpback whale population (Stock IV) has grown at an estimated 10% per year. While pygmy blue whales have not recovered to the same extent, there is also little evidence of oil and gas activities consistent with the petroleum activities in this EP resulting in behavioural disturbance.</p> <p>The cost associated with avoiding periods of peak whale density would be several millions of dollars if it requires placing contracted vessels on standby or the Petroleum Activity to be put on hold, delaying the plug and abandonment activities. Given the low risk of impacts associated with underwater noise, it is considered the cost of this additional control is grossly disproportionate to the negligible benefit that may accrue.</p> | Not applicable                   |
| Vessel to use anchors to maintain position rather than DP.  | Reject          | <p>Would complicate and increase risk of works in proximity to subsea infrastructure.</p> <p>Anchoring will cause seabed disturbance. Given the low risk of impacts associated with underwater noise, the increased risks and impacts outweigh the marginal environmental benefit.</p>  | Not applicable                   |
| Use only a moored semi-submersible MODU to eliminate DP thruster noise from the MODU.   | Reject          | <p>Limiting the selection of MODUs to only moored semi-submersibles would constrain the choice of MODUs available to undertake the P&amp;A activities. This could result in delays in Woodside complying with Direction 1 of General Direction 833 (<b>Table 2-1</b>). The cost to Woodside of not complying with General Direction 833 is substantial.</p> <p>The mooring spread for a semi-submersible MODU may preclude Woodside from undertaking SIMOPS to remove equipment from the Stybarrow field (<b>Section 3.4.1</b>). This may delay equipment removal activities and hence risk compliance with General Direction 833.</p> <p>While using a moored MODU would eliminate DP noise from the MODU, other vessels would continue to use DP during the</p>   | Not applicable                   |

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
|   |                 | <p>petroleum activities (e.g., support vessels). Woodside has modelled various noise scenarios for a DP MODU and support vessels and demonstrated that the predicted noise emissions are acceptable and consistent with relevant requirements, such as the Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015b).</p> <p>The cost of limiting MODU selection exclude DP MODUs is grossly disproportionate to the environmental benefit.</p>  |                                  |
| <b>Engineer</b>   |                 |   |                                  |
| Reduction in number of vessels required for the petroleum activities  | Reject          | <p>May reduce the amount of noise emissions from vessels and helicopters. However, any noise impacts are anticipated to be temporary and minor and relate to behavioural changes only activities required are minimal.</p> <p>The number of vessels required to undertake the activities cannot be reduced and numbers have been chosen based on the engineering assessment. Reducing the number of vessels in the field may lead to unsafe or increased engineering risks during the plug and abandonment activities and is therefore not feasible.</p>              | Not applicable                   |
| <b>Administrate</b>   |                 |   |                                  |
| Stop or deviate from course if pygmy blue whales are observed during mobilisation or demobilisation of the MODU from the Operational Area   | Reject          | <p>Stopping the MODU in an unplanned manner if a pygmy blue whale is observed may reduce behavioural disturbance associated with vessel noise. However, the action would significantly increase the safety risk profile of the mobilisation activity through reactive interruption of planned course by vessels towing the MODU. The MODU moves relatively slowly during mobilisation (typically &lt; 10 knots) and hence pygmy blue whales are able to avoid the MODU</p> <p>The increased safety risk is grossly disproportionate to the environmental benefit.</p> | Not applicable                   |
| Engines, compressors and machinery on the MODU and Project Vessels are maintained via the MODU/Vessel Preventative Maintenance System (PMS) | Accept          | <p>Maintenance and inspection completed as scheduled on PMS reduces the generated noise emissions and associated impacts. Machinery maintenance is part of normal operations to ensure operating in accordance with manufacturer's guidelines.</p> <p>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>   | <b>PS 4.3</b>                    |

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| <p>Implement adaptive management procedure prior to resupply vessel moves alongside MODU, during daylight hours.</p>         | <p>Accept</p>   | <p>Control is considered feasible.</p> <p>Vessels holding position alongside the MODU may generate relatively high levels of underwater noise. This control delivers an environmental benefit by reducing the likelihood of pygmy blue whales being exposed to underwater noise by only coming alongside the MODU when pygmy blue whales have not been observed for 30 minutes.</p> <p>The control requires additional vessel time, which has a financial cost.</p> <p>The implementation of this control is aligned with the requirement of the Conservation Management Plan for the Blue Whale (Department of the Environment, 2015) which states “<i>Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area.</i>”</p>   | <p>PS 4.4</p>                    |
| <p>Limit vessel and MODU speeds within pygmy blue whale migration BIA year-round to reduce noise emissions.</p>              | <p>Reject</p>   | <p>Control is considered feasible.</p> <p>The control increases the duration of vessel activities, resulting in additional financial costs and extended duration of some environmental impacts and risks (e.g., operational discharges from vessels, physical presence-related impacts etc.).</p> <p>The control only delivers an environmental benefit when pygmy blue whales are present in the migration BIA in the vicinity of Operational Area. The presence of pygmy blue whales within the migration BIA off North West Cape is seasonal, with the timing of migration understood and consistent between years (April to July and October to January).</p> <p>Woodside has adopted a control limiting vessel and MODU movement speeds within the pygmy blue whale migration BIA during migration season (see PS 4.5). Limiting vessel and MODU speeds within the pygmy blue whale migration BIA outside the migration period delivers little environmental benefit relative to the cost of the control. The cost of the control is grossly disproportionate to the environmental benefit.</p> | <p>Not applicable</p>            |
| <p>Limit vessel and MODU speeds within pygmy blue whale migration BIA during migration season to reduce noise emissions.</p> | <p>Accept</p>   | <p>Control is considered feasible.</p> <p>The control increases the duration of vessel activities, resulting in additional financial costs and extended duration of some environmental impacts and risks (e.g., operational discharges from vessels, physical presence-related impacts etc.).</p> <p>Limiting vessel and MODU speeds within the pygmy blue whale migration BIA during</p>  | <p>PS 4.5</p>                    |

| Control Measure  | Accept /<br>Reject | Reason   | Associated<br>Performance<br>Standards |
|--|--------------------|--|--|
|  |                    | <p>migration season may reasonably reduce underwater noise emissions potentially received by pygmy blue whales.</p> <p>The presence of pygmy blue whales within the migration BIA off North West Cape is seasonal, with the timing of migration understood and consistent between years (April to July and October to January). By limiting the control to the migration periods, the environmental benefit will be realised whilst reducing costs and environmental impacts and risks.</p> <p>The implementation of this control is aligned with the requirement of the Conservation Management Plan for the Blue Whale (Department of the Environment, 2015), which states “Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area.”</p> |  |
| Vessels to avoid pygmy blue whales within the migration BIA to reduce noise levels received by whales. | Accept             | <p>The control delivers an environmental benefit by managing received noise levels of whales by separating the receptor and the noise source. The control relies on the detection of whales, which will be done by bridge crew during vessel movements. Bridge crew are required to maintain watch ahead of and around the vessel when underway and hence provide an appropriate method for detecting whales.</p> <p>The implementation of this control is aligned with the requirement of the Conservation Management Plan for the Blue Whale (Department of the Environment, 2015), which states “Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area.”</p>   | <b>PS 4.6</b>                          |
| Use dedicated MFOs in lieu of trained vessel crew to observe for pygmy blue whales.                    | Reject             | <p>The environmental benefit of having dedicated MFOs is a potential increase in the likelihood of detecting pygmy blue whales, which then permits actions to maintain separation with marine fauna. Trained crew will watch for marine fauna during the petroleum activity. The increase in the likelihood of detecting marine fauna by the addition of MFOs is negligible.</p> <p>The cost of implementing dedicated MFOs during vessel activities would be tens of thousands of dollars and expose additional personnel to the health and safety risks of working at sea. The cost is grossly disproportionate to the environmental benefit.</p>  | Not applicable                         |
| Pre-watch for marine fauna from  | Reject             | Pre-watch for marine fauna prior to DP   | Not applicable                         |

| Control Measure   | Accept / Reject | Reason   | Associated Performance Standards |
|---|-----------------|--|----------------------------------|
| the vessel or MODU bridge prior to DP operations and not undertaking DP operations until no marine fauna (such as pygmy blue whale and humpback) are present. |                 | <p>operations will identify if any marine fauna are in sight prior to use of DP. This may reduce the instance of behavioural impacts to marine fauna, such as pygmy blue whales, which may be present given the Operational Area overlaps with a migration BIA.</p> <p>A maximum of two vessels (a light construction vessel and a general support vessel) and the MODU will be on DP at any one time during the plug and abandonment activities. DP is also not a constant during the operations, but it is required during certain activities requiring the vessel to be stationary for periods. The noise impacts are anticipated to be temporary and minor and relate to behavioural changes only.</p> <p>Given the low risk of impacts associated with underwater noise and the low vessel use in the general vicinity of the field, which gives the species ample room to move out of the noise behavioural threshold zone. The pre-watch from the vessel and delay of DP operations if necessary is disproportionate to the negligible benefit that may accrue.</p> |                                  |
| Flaring restricted to a duration necessary to perform the activity for well bleed-off, except in emergency situations.  | Accept          | <p>Reduces noise emissions to the marine and atmospheric environment.</p> <p>Minimal cost and standard practice.</p> <p>Benefits outweigh cost/sacrifice</p>   | <b>PS 3.3</b>                    |

#### 7.3.4.1 ALARP Summary

The risk assessment and evaluation has identified controls (**Table 7-9**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts of noise emissions generated from MODU and project vessels on marine fauna to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential impacts of noise emissions generated during the Petroleum Activity on marine fauna. Additional reasonable control measures were identified in **Table 7-9** to further reduce impacts but rejected since the associated cost and sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

#### 7.3.5 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, noise emissions from the MODU and project vessels will not result in potential impacts greater than temporary and minor behavioural disturbance to marine fauna.

Further opportunities to reduce the risks and consequences have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good oil-field practice/industry best practice. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impact is considered consistent with the principles of ESD:

- **Integration Principle:** P&A activities allow ongoing decommissioning of the Stybarrow field to progress which will achieve favourable short to long term environmental, social and economic outcomes.
- **Precautionary Principle:** The noise emissions aspect, and its potential impacts, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect. There is variability in the presence and timing of some environmental receptors that may be impacted by noise emissions; however,

the nature and scale of the potential impacts pose no risk of serious or irreversible environmental impacts.

- **Intergenerational Principle:** The noise emissions aspect will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** The noise emissions aspect will not impact upon biodiversity or ecological integrity.

During consultation, WAC and CCG provided feedback related to impacts from noise emissions during decommissioning activities. CCG provided feedback to Woodside that there is heightened potential of damage to the marine environment and wildlife during Woodside decommissioning activities, including increased potential negative impacts on migrating whales from marine noise (**Appendix F**). WAC asked about potential noise impact on whale communication. Woodside responded to WAC during the meeting to clarify that controls would be in place to reduce this risk, and no further concerns were raised following this meeting (**Appendix F**). Given impacts are anticipated to be temporary and minor behavioural disturbance to individuals and no impacts on a population level are expected to occur, cultural values and intangible cultural heritage associated with these species are expected to be maintained and no heightened damage to wildlife will occur during the activities.

The area that may be impacted by noise emissions overlaps:

- the Gascoyne Marine Park
- habitat critical for the survival of marine turtle stocks identified by the Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy, 2017)
- pygmy blue whale BIAs identified by the Conservation Management Plan for the Blue Whale (Department of the Environment, 2015).

The potential impacts from and environmental management of noise emissions on the environmental values in the Gascoyne Marine Park, habitat critical for the survival of marine turtles and pygmy blue whale BIAs are consistent with the conservation objectives of the Gascoyne Marine Park (DNP, 2018), the Recovery Plan for Marine Turtles in Australia (Department of the Environment and Energy, 2017) respectively.

On this basis, Woodside considers the impact to be managed to an acceptable level.

## 7.3.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

## 7.4 Atmospheric Emissions

### 7.4.1 Summary of Risk Assessment and Evaluation

| Aspect                | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context        | Acceptability |
|-----------------------|---|---|-----------------|-------------------|---------------|-------------------------|---------------|
| Atmospheric emissions | Exhaust emissions from internal combustion engines and incinerators on MODU, project vessels and helicopters. | Localised and temporary reduction in air quality as a result of greenhouse gas (GHG) emissions, non-GHG emissions, particulates and volatile organic compounds. | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|                       | Flaring and burning of residual hydrocarbons from MODU during well P&A.                                       |   | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|                       | Venting of residual trapped gas.  |   |                 |                   |               |                         |               |

### 7.4.2 Source of Hazard

Atmospheric emissions assessed in this EP have been classified into two categories:

- Atmospheric pollutants (non-greenhouse gas emissions) are gases and particulates from an activity, or piece of machinery, which have a recognised adverse effect on human health and/or flora and fauna. The main emissions responsible for these effects include carbon monoxide (CO), oxides of nitrogen (NO<sub>x</sub>), sulphur dioxide (SO<sub>2</sub>), particulate matter less than 10 microns (PM<sub>10</sub>), non-methane volatile organic compounds (VOCs), BTEX (benzene, toluene, ethylbenzene and xylenes), which are specific VOCs of interest.
- Greenhouse gas (GHG) emissions are those gases within the atmosphere that absorb long-wave radiation and thus trap heat reflected from the Earth's surface. The main gases responsible for this effect include carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>) and nitrous oxide (N<sub>2</sub>O). Other greenhouse gases include perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF<sub>6</sub>). Internal combustion engines and incinerators.

#### 7.4.2.1 MODU, Vessel and Helicopter Operations

Atmospheric emissions will be generated by the MODU, project vessels and helicopters from internal combustion engines (including all equipment and generators, which may be diesel powered and/or LNG powered) and incineration activities (including onboard incinerators) during the Petroleum Activities Program.

Emissions generated during these operations will include SO<sub>x</sub>, NO<sub>x</sub>, ozone depleting substances, CO<sub>2</sub>, particulates and volatile organic compounds (VOCs). The MODU and support vessels will use MDO to power vessel engines, waste incinerators, generators, and mobile and fixed plant and equipment for the duration of the Petroleum Activity. The total of greenhouse gas emissions from these sources is predicted to be approximately 54,255 tCO<sub>2</sub>-e (Table 7-10).

A hybrid MODU may be used for the drilling campaign resulting in less fuel needed for station keeping if primarily moored, however dynamic positioning may be used due to the depth of the seabed within the Operational Area or in the event of adverse weather conditions. Other vessels used during the activity include a LCV or MPSV with DP capability to conduct preparatory activities and well infrastructure removal activities as described in Table 3-4. Based on historical fuel consumption data for the DPS-1 MODU, sourced from previous Woodside drilling campaigns as well as expected activity duration including mobilisation, it is estimated that a DP MODU will consume approximately 44 t/d when compared to similar scenarios. Based on historical data and indicative activity durations provided in

**Table 3-4**, e14,342 tonnes of fuel may be used by during the MODU campaign (approximately 24 days per well) and approximately 2,250 tonnes during the LCV/MPSV activities (approximately 15 days per well). Greenhouse gas emissions were estimated for the petroleum activity based on the following assumptions:

- MODU fuel usage was estimated as 44 m<sup>3</sup> per day based on historical data from previous Woodside drilling campaigns on a DP semi-submersible MODU (DPS-1).
- Two dedicated support vessels (1 x AHV and 1 x PSV) will service the MODU full time for the duration of the MODU campaign. AHV fuel was estimated at 14 kL/day and PSV fuel use was estimated at 8 kL/day based on historical performance data.
- Helicopter operations will be used to support MODU based activities, assuming three helicopter return flights per week for the duration of the campaign. Helicopter fuel use was estimated to be 100 L/h.
- A LCV or MPSV will conduct preparatory P&A activities and well infrastructure removal activities for approximately 15 days in total per well. This type of DP vessel may use approximately 15 tonnes of fuel per day.

Greenhouse gas estimates for MODU, Vessel and Helicopter activities have been provided in **Table 7-10**.

#### 7.4.2.2 Flaring, burning and venting of residual hydrocarbons

During P&A activities (including well kill, wireline and coil tubing operations), any residual hydrocarbons remaining in the wellbore are expected to be either bullheaded into the reservoir or alternatively, circulated back to the MODU for venting, flaring or burning via a dedicated fluid and gas handling bleed off package. The volumes of hydrocarbon returned to the MODU will depend on how much can be bullheaded into the formation successfully. For the purpose of this assessment, worst case volumes have been considered.

In the event, lubricate and bleed operations are required for well kill, returns from the well can include well kill fluids, residual wellbore fluids, produced water and residual hydrocarbons. Returns will be processed through a three-phase separator. Gas will be flared if there is sufficient volume and pressure for ignition, otherwise it may be cold vented via knock out/surge tanks on the MODU. Liquid hydrocarbons will be diverted to the oil burner to be burned if in small quantities or alternatively stored in tanks for onshore disposal. Flaring requirements will vary based on the type of well:

- **Oil producing wells** - there is expected gas lift gas trapped in the production annulus and small volume of gas at the top of the tubing (for production wells) and potential for trace quantities of injected gas in the production annulus of the gas injection well. Up to about 0.8 MMscf of gas per well and 500 bbl of oil per well may be directed to the flare boom / oil burner. oil volume per well is approximately 500 bbl. It is expected an average of 90 minutes of flaring is estimated per well.
- **Water injection wells** – no expected gas present in wellbore therefore no venting or flaring expected. Although not expected, if gas has migrated into the well it will require bleeding off and/or venting.

#### 7.4.2.3 Venting of Residual Gas or Trapped Gas

Small volumes of residual trapped gas may be vented directly subsea or via the Hydrate Remediation Skid during preparatory subsea tree testing to verify well barriers prior to P&A and vented from HXT cavities and flowline jumpers during P&A. The volume estimated is approximately 1000 m<sup>3</sup> of gas per tree.

During permanent P&A activities, a well kick may occur. A kick is an undesirable influx of formation fluid into the wellbore. Should the kick contain hydrocarbons, the resultant effect would be a release of a small volume of greenhouse gases via the degasser to the atmosphere during well control operations, known as 'venting'. Venting is required to ensure well integrity is maintained in the event of a kick, thereby avoiding an emergency condition. The total volume estimate of GHG emissions from venting is approximately 595 tCO<sub>2</sub>-e, based on a worst-case volume of 1000 m<sup>3</sup> of gas per tree.

Table 7-10: Greenhouse gas emissions and sources

| Source  | Approximate GHG Emissions (tCO <sub>2</sub> -e) |
|---|---|
| <b>MODU Activities</b>  |   |
| MODU Operations   | 28,866 tCO <sub>2</sub> -ee                     |
| 1 x AHV (Support Vessel)                                      | 9,891   |
| 1 x PSV (Support Vessel)                                      | 5,652   |
| Helicopter Operations   | 374   |
| Flaring (0.8 MMscf Gas, 500 bbl Oil)                          | 2,090   |
| Cold Venting – Tree Cap Removal                               | 595   |
| <b>Preparatory and Well Infrastructure Removal Activities</b> |   |
| LCV/MPSV  | 6,787   |
| <b>Total GHG Emissions Estimate</b>                           | <b>54,255</b>                                   |

Emissions Calculations based on NGERs Guideline 2023

### 7.4.3 Environmental Impact Assessment

Fuel combustion, incineration, and flaring have the potential to result in localised, temporary reduction in air quality in the environment immediately surrounding the discharge point. Potential impacts include a localised reduction in air quality, generation of dark smoke and contribution to greenhouse gas emissions. Given the short duration and exposed location of the MODU and project vessels (which will lead to the rapid dispersion of the low volumes of atmospheric emissions), the potential impacts are expected to be localised, temporary in nature and of no lasting effect.

Venting of hydrocarbon gases may result in a temporary gas plume and a localised contribution to greenhouse gas emissions. There is potential for human health effects for workers in the immediate vicinity of atmospheric emissions. Emissions are expected to quickly dissipate into the surrounding atmosphere and will not change atmospheric conditions as far away as Exmouth, which is considered the nearest residential area (over 50 km to the south-east of the Operational Area). Therefore, any risks associated with off-site human health effects are negligible beyond the immediate zone of release and dispersion. Given the isolated location of the petroleum activity (which will lead to the rapid dispersion of the low volumes of atmospheric emissions) the potential impacts are expected to be localised and no cumulative impacts are anticipated when considered in the context of existing oil and gas operations in the region.

The Petroleum Activity has potential to contribute to GHG emissions from combustion (including flaring) and venting of hydrocarbons. GHG emissions from combustion will be small volumes and therefore would present a negligible contribution to global GHG emissions. Venting of hydrocarbons has potential to contribute slightly higher GHG emissions than combustion activities. However, no routine venting is planned and if venting was to occur it would be for a short duration, therefore actual GHG emissions from venting would also be small volumes and present a negligible contribution to global GHG emissions.

### 7.4.4 Demonstration of ALARP

A summary of the ALARP process for the environmental aspect is presented in **Table 7-11**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

Table 7-11: Atmospheric Emissions - ALARP Summary

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| <b>Legislation, Codes and Standards</b>  |                 |  |                                  |
| <p>Marine Order 97 (Marine Pollution Prevention – Air Pollution), which details requirements for:</p> <ul style="list-style-type: none"> <li>International Air Pollution Prevention (IAPP) Certificate, required by vessel class</li> <li>use of low sulphur fuel when available</li> <li>Ship Energy Efficiency Management Plan, where required by vessel class</li> <li>onboard incinerator to comply with Marine Order 97.</li> </ul> | Accept          | Control may slightly reduce the likelihood of air pollution. Control based on legislative requirements and therefore must be adopted.  | <b>PS 5.1</b>                    |
| <p>OPGGS (Resource Management and Administration) Regulations 2011: Accepted Well Operations Management Plan (WOMP), which describes the well design and barriers to be used to prevent a loss of well integrity and aligns with industry guidance and good practice.</p>  | Accept          | <p>Compliance with an accepted WOMP that aligns with industry guidance and good practice will ensure a number of barriers are in place and verified, reducing the likelihood of loss of well integrity occurring.</p> <p>Although the consequence would not be reduced, the reduction in likelihood reduces the overall risk. Control based on legislative requirements and therefore must be adopted.</p> | <b>PS 5.2</b>                    |
| <p>As-built checks shall be completed during well operations as described in the WOMP.</p>   | Accept          | <p>Completing as built checks in accordance with an accepted WOMP reduces likelihood of loss of well integrity occurring. Although the consequence would not be reduced, the reduction in likelihood reduces the overall risk.</p>   | <b>PS 5.3</b>                    |
| <b>Eliminate</b>   |                 |  |                                  |
| Do not combust fuel.   | Reject          | Control is not considered feasible. There are no MODUs or project vessels that do not use internal combustion engines.   | Not applicable                   |
| Do not vent or flare well bleed-off fluids.  | Reject          | Control is not considered feasible. Venting or flaring of bleed-off fluids is a safety-critical activity.  | Not applicable                   |
| Do not vent gas during removal of tree cap for verification of well barriers or depressurisation of flowlines jumpers.   | Reject          | Control is not considered feasible. Gas may be trapped in the subsea trees, control lines or flowline jumpers and will be vented directly subsea when valves are opened to access tree, verify barriers and undertake P&A.   | Not applicable                   |
| <b>Engineering</b>   |                 |  |                                  |
| Flaring restricted to a duration necessary to perform the activity for   | Accept          | Reduces the likelihood of atmospheric emissions impacting air quality.   | <b>PS 3.3</b>                    |

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| well bleed-off.   |                 | Consequence remains unchanged. The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.  |                                  |
| Oil burner will operate efficiently to maximise combustion.   | Accept          | This control results in a reduction in likelihood of atmospheric emissions impacting air quality. Consequence remains unchanged. The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.                | <b>PS 5.4</b>                    |
| Re-inject wellbore hydrocarbons into the reservoir prior to well abandonment, where practicable.  | Accept          | Reduces the likelihood of atmospheric emissions impacting air quality through reducing volume of hydrocarbons required to be flared/vented. The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.     | <b>PS 5.5</b>                    |
| Subsea BOP and RWORS installed and function tested during permanent plugging operations.  | Accept          | BOP testing reduces the volume of influx and therefore the potential volume of gas vented in the event of a well kick. The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.                          | <b>PS 5.6</b>                    |
| <b>Administrative</b>   |                 |   |                                  |
| Well Control Bridging Document (WCBD) for alignment of Woodside and the MODU contractor to manage the equipment and procedures for preventing and handling a well influx. | Accept          | Implementing equipment and procedures in the Well Control Bridging Document will reduce the volume of gas vented in the event of a well influx. The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 5.7</b>                    |

#### 7.4.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 7-11**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts of atmospheric emissions from the MODU and project vessels to ALARP.

Woodside considers the control measures described above are appropriate to reduce the atmospheric emissions associated with fuel combustion, incineration, flaring and venting during the Petroleum Activity. Additional reasonable control measures were identified in **Table 7-11** to further reduce impacts but rejected since the associated cost and sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

#### 7.4.5 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, atmospheric emissions generated during the petroleum activity will not result in potential impacts greater than a temporary decrease in local air quality with minor impact to the environment or human health with no lasting effects.

Further opportunities to reduce the impacts have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good oil-field practice/industry best practice. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impacts are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to

decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.

- **Precautionary Principle:** The impacts associated with atmospheric emissions generated during the Petroleum Activity are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** Global warming will affect the ability for future generations to meet their needs. Atmospheric emission from the Petroleum Activity will contribute to the global inventory of GHGs in the atmosphere, however the volumes will be so small that the contribution is considered negligible. Furthermore, the Petroleum Activity cannot reasonably and safely be completed without these GHG emissions.
- **Biodiversity Principle:** Woodside recognises the threat global warming poses to biodiversity. However, the nature and scale of the impacts associated with atmospheric emissions generated during the Petroleum Activity will not impact upon biodiversity or ecological integrity in the long-term.

On this basis, Woodside considers the impact to be managed to an acceptable level.

## 7.4.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

## 7.5 MODU and Vessel Discharges

### 7.5.1 Summary of Risk Assessment and Evaluation

| Aspect   | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context        | Acceptability |
|--|---|---|-----------------|-------------------|---------------|-------------------------|---------------|
| Routine MODU and vessel discharges within the Operational Area | Routine discharge of sewage, grey water and putrescible wastes to marine environment from MODU and project vessels. | Localised and temporary reduction in water quality adjacent to the discharge point associated with minor increases in nutrients, salinity, temperature and oily water/ chemical residues. | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|  | Routine discharge of deck and bilge water to marine environment from MODU and project vessels.                      |   | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|  | Routine discharge of brine or cooling water to the marine environment from MODU and project vessels.                |   | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |

### 7.5.2 Source of Hazard

#### 7.5.2.1 Sewage, Grey Water and Putrescible Waste

The MODU and project vessels routinely generate/discharge small volumes of treated sewage, putrescible wastes and grey water to the marine environment (impact assessment based on approximate discharge of 15 m<sup>3</sup> per vessel/MODU per day), using an average volume of 75 L/person/day and a maximum of 200 persons on board. However, it is noted that vessels such as support vessels will have considerably less persons on board.

#### 7.5.2.2 Deck and Bilge Water

The MODU and project vessels routinely generate/discharge:

- Routine/periodic discharge of relatively small volumes of bilge water. Bilge tanks receive fluids from many parts of the project vessels or MODU. Bilge water can contain water, oil, detergents, solvents, chemicals, particles, biocides and other liquids, solids or chemicals.
- Variable water discharge from MODU/vessel decks directly overboard or via deck drainage systems. Sources could include rainfall events and/or deck activities such as cleaning/wash-down of equipment/decks.

No wastes contaminated with hydrocarbons or chemicals will be routinely discharged from the project vessel deck drains. Drainage from areas of a high risk of hydrocarbon or chemical contamination will be managed to ensure it has an oil content of less than 15 ppm before overboard discharge or sent to shore for disposal. Rainfall and washdown of the decks may result in minor quantities of chemical residues, such as detergent, oil and grease entering the deck drainage system and being possibly discharged overboard.

#### 7.5.2.3 Desalination Brine

Reverse osmosis (RO), distillation or desalination plants on board vessels and the MODU use seawater to produce potable and demineralised water; resulting in reject brine (i.e., hypersaline water) that is discharged to the marine environment. The potable water produced is stored in tanks on board.

During the distillation process, relatively small volumes of reject brine is produced and discharged. Reject brine

discharge is typically 20 to 50 percent higher in salinity than the intake seawater (depending on the desalination process used) and may contain low concentrations of scale inhibitors and biocides, which are used to avoid fouling of pipework (Woodside, 2014).

Models developed by the US EPA (Frick et al., 2001) for temporary brine discharges from vessels assuming no ocean current (i.e., 0 m/s) found brine discharges from the surface dilute 40-fold at 4 m from the source. This modelling can be used as an indicator for predicting horizontal attenuation and diffusion of reject brine; and suggests that the salinity concentration drops below environmental impact thresholds within 4 m of the discharge point.

#### 7.5.2.4 Cooling Water

Seawater is used as a heat exchange medium for cooling machinery engines and other equipment. Seawater is drawn up from the ocean, where it is subsequently de-oxygenated and sterilised by electrolysis (by release of chlorine from the salt solution) and then circulated as coolant for various equipment through the heat exchangers (in the process transferring heat from the machinery), prior to discharge to the ocean. Upon discharge, it will be warmer than the ambient water temperature. Cooling water is often treated with additives including scale inhibitors and biocide to avoid fouling of pipework. Scale inhibitors and biocide are usually used at low dosages, and are usually consumed in the inhibition process, so there is little or no residual chemical concentration remaining upon discharge.

In some instances, fresh water or central cooling systems may be fitted. In these systems, fresh water is used in a closed circuit to cool down the engine room machinery, and then further cooled by sea water in a seawater cooler.

Seawater used for cooling purposes will be routinely discharged at a temperature expected to be less than 70 °C and rates ~50 m<sup>3</sup>/d.

### 7.5.3 Environmental Impact Assessment

The water quality assessment undertaken in 2019 (Cardno, 2019) indicated metal and hydrocarbon concentrations in surface waters within the Operational Area were low and consistent with reference sites and the region more broadly (**Section 4.4**). Discharges from the MODU and support vessels would be quickly dispersed and diluted such that any temporary change in water quality above those baseline values will be limited to the vicinity of the discharge point for a very short time. Marine fauna within the Operational Area are likely to be transient; however, they may be come in direct contact with the releases (by passing through the immediate discharge area). If contact does occur with any marine fauna, it will be for a short duration, such that exposure time may not be of sufficient duration to cause a toxic effect. Given the small volumes of discharges, the water depth of release and the rapid dilution, the likelihood of ecological impacts to marine fauna is highly unlikely. The next subsections examine in more detail the environmental impact of each of the identified routine vessel discharges.

#### 7.5.3.1 Water Quality

##### *Sewage, Grey Water and Food Waste*

The main environmental impact associated with ocean disposal of sewage and other organic wastes (i.e., putrescible waste) is eutrophication. Eutrophication occurs when the addition of nutrients, such as nitrates and phosphates, causes adverse changes to the ecosystem, such as oxygen depletion and phytoplankton blooms. Other contaminants of concern occurring in these discharges may include ammonia, E. coli, faecal coliform, volatile and semi-volatile organic compounds, phenol, hydrogen sulphide, metals, surfactants and phthalates.

Woodside monitored sewage discharges at its Torosa-4 Appraisal Drilling campaign which demonstrated that a 10 m<sup>3</sup> sewage discharge reduced to about 1% of its original concentration within 50 m of the discharge location. In addition to this, monitoring at distances of 50, 100 and 200 m downstream of the platform and at five different water depths confirmed discharges were rapidly diluted and no elevations in water quality monitoring parameters (e.g. total nitrogen, total phosphorous and selected metals) were recorded above background levels at any station (Woodside Energy Limited, 2011). Mixing and dispersion would be further facilitated in deep offshore waters, consistent with the location of the Operational Area, through regional wind and large scale current patterns resulting in the rapid mixing of surface and near surface waters where sewage discharges may occur. Studies investigating the effects of nutrient enrichment from offshore sewage discharges indicate that the influence of nutrients in open marine areas is much less significant than that experienced in enclosed areas (McIntyre and Johnston, 1975).

Furthermore, open marine waters do not typically support areas of increased ecological sensitivity, due to the lack of nutrients in the upper water column and lack of light penetration at depth. Therefore, presence of receptors, such as

fish, reptiles, birds and cetaceans, in significant numbers within the Operational Area is unlikely. Research also suggests that zooplankton composition and distribution are not affected in areas associated with sewage dumping grounds (McIntyre and Johnston, 1975). Plankton communities are expected to rapidly recover from any such short-term, localised impact, as they are known to have naturally high levels of mortality and a rapid replacement rate.

Given the offshore deep-water location, any routine and non-routine discharges of sewage and greywater and putrescible wastes from activities associated with the Petroleum Activity will be temporary in nature and have a minor localised impact to water quality in the immediate vicinity of the discharge point. The Operational Area is located more than 12 nm from land, which exceeds the exclusion zones required by Marine Order 96 (Marine Pollution Prevention – Sewage) 2018 and Marine Order 95 (Marine Pollution Prevention – Garbage) 2013.

### ***Deck and Bilge Water***

Deck drainage and treated bilge may contain a range of chemicals, oil, grease and solid material. This particulate matter can cause an increase in the turbidity of the receiving waters close to the point of discharge. The addition of these substances into the marine environment will result in a change ambient water quality; however, these discharges are expected to rapidly dilute in the water column (Shell, 2010). Discharges will disperse and dilute rapidly, with concentrations significantly dropping with distance from the discharge point.

Bilge water and deck drainage discharges, which may include non-organic contaminants, will rapidly dilute. As such, no significant impacts from the planned routine discharges are anticipated, because of the minor quantities involved, the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area.

Due to the small volumes of deck drainage, the very low levels of contaminants likely to be entrained in the discharge and the rapid dilution and dispersal that will result in the open ocean, the environmental effects will be temporary and localised. The discharge of deck drainage is considered temporary and minor and relates to a localised reduction in water quality, with no significant impacts to marine fauna anticipated.

### ***Desalination Brine and Cooling Water***

The key physicochemical stressors that are associated with reject brine and cooling water discharge include salinity, pH, temperature and chemical toxicity. Water quality of the surrounding environment may be altered through the addition of chemicals and an increase in salinity. Scale inhibitors and biocides are commonly used within the systems described above to prevent fouling. Scale inhibitors are typically low molecular weight phosphorous compounds that are water-soluble, and only have acute toxicity to marine organisms about two orders of magnitude higher than typically used in the water phase (Black et al., 1994). The biocides typically used in the industry are highly reactive and degrade rapidly (Black et al., 1994).

The potential impacts on water quality due to cooling water discharge include chlorine toxicity and increased water temperatures. Reject brine water is typically 20 to 50% higher in salinity to the surrounding water and, based on models developed by the US EPA (Frick et al., 2001), discharges of brine water will sink through the water column where it will be rapidly mixed with receiving waters and dispersed by ocean currents, decreasing in salinity rapidly as distance from source increases.

Generally, reject brine and cooling water containing chemical additives are inherently safe at the low dosages used. They are usually consumed in the inhibition process, so there is little or no residual chemical concentration remaining upon discharge. Woodside undertook modelling of continuous wastewater discharges (including cooling water) for its Torosa South-1 drilling program in the Scott Reef complex (Woodside, 2014). This study predicted that discharge water temperature decreases quickly as it mixes with the receiving waters, with the discharge water temperature being <1 °C above ambient within 100 m (horizontally) of the discharge point, and 10 m vertically (Woodside, 2014). As such, any potential impacts to water quality are expected to be limited to 100 m of the source of the discharge where concentrations are highest.

Discharge of desalination brine will be quickly dispersed and diluted to undetectable levels within a few metres of the discharge point. Given the relatively low volume of discharge, the relatively low increase in salinity and the open ocean environment, the discharge of reverse osmosis brine streams is considered temporary and minor and relates to a localised reduction in water quality, with no significant impacts to marine fauna anticipated.

Discharge of cooling water will be subject to turbulent mixing and loss of heat to the surrounding waters. The area of detectable increase in seawater temperature is likely to be less than 10 m radius. The impact of cooling water discharge is considered temporary and minor and relates to a localised reduction in water quality, with no significant

impacts to marine fauna anticipated.

### 7.5.3.2 Marine Fauna

Open marine waters do not typically support areas of increased ecological sensitivity, due to the lack of nutrients in the upper water column and lack of light penetration at depth. Therefore, presence of receptors, such as fish, reptiles, birds and cetaceans, in significant numbers within the Operational Area is unlikely. It is possible that marine fauna transiting the Operational Area may come into contact with these discharges (e.g. marine turtles, humpback whales, whale sharks; **Section 4.7**). However, given the localised extent of cumulative impacts from multiple vessel discharges and limited exposure, within the Operational Area, significant impacts to marine fauna are not expected.

### 7.5.3.3 Plankton

Research suggests zooplankton composition and distribution are not affected in areas associated with sewage dumping grounds (McIntyre and Johnston, 1975). Plankton communities are expected to rapidly recover from any such short term, localised impact, as they are known to have naturally high levels of mortality and a rapid replacement rate.

Discharged brine sinks through the water column where it is rapidly mixed with receiving waters and dispersed by ocean currents. As such, any potential impacts are expected to be limited to the source of the discharge where concentrations are highest. Studies indicate that effects from increased salinity on planktonic communities in areas of high mixing and dispersion are generally limited to the point of discharge only (Azis et al., 2003).

Planktonic productivity in the NWMR is low. No significant impacts from the planned routine discharges are expected, because of the minor quantities involved, the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area. The Operational Area is located more than 12 nm from land, which exceeds the exclusion zones required by Marine Order 96 (Marine pollution prevention – sewage) 2018 and Marine Order 95 (Marine pollution prevention – garbage) 2013.

### 7.5.3.4 Species Recovery Plans and Threat Abatement Plans

Woodside has considered information contained in relevant recovery plans for cetaceans and marine turtles that identify chemical discharges/pollution as a threat (**Section 9**). This includes the objectives and actions within *the Recovery Plan for Marine Turtles in Australia 2017–2027* (Commonwealth of Australia, 2017), which relate to discharges.

## 7.5.4 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 7-12**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

**Table 7-12: Routine MODU and Vessel Discharges - ALARP Summary**

| Control Measure  | Accept / Reject | Reason  | Associated Performance Standards |
|--|-----------------|---|----------------------------------|
| <b>Legislation, Codes and Standards</b>  |                 |   |                                  |
| Marine Order 96 – Pollution prevention – Sewage (as appropriate to vessel class) which include the following requirements: <ul style="list-style-type: none"> <li>Valid International Sewage Pollution Prevention (ISPP) Certificate</li> <li>Sewage systems that comply with Regulation 9 of Annex IV including a sewage</li> </ul> | Accept          | Controls based on legislative requirements, must be accepted. Reduces potential impacts of inappropriate discharge of sewage. Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 6.1</b>                    |

No change in consequence would occur.<br><br>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 6.4</b>                    |

### 7.5.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 7-12**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts of routine MODU and Vessel discharges to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential impacts from routine MODU and Vessel discharges. Additional reasonable control measures were identified in **Table 7-12** to further reduce impacts but rejected since the associated cost and sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

### 7.5.5 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, routine MODU and Vessel discharges will not result in impacts greater than temporary and minor reduction in water quality with no lasting effects.

Further opportunities to reduce the impacts have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good oil-field practice/industry best practice. No concerns or objections regarding the routine MODU and Vessel discharges to the marine environment have been raised by relevant stakeholders. The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impacts are consistent with the principles of ESD:

- Integration Principle:** Woodside has undertaken a range of studies to determine the approach to

decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.

- **Precautionary Principle:** Routine MODU and Vessel Discharges, and their potential impacts to the marine environment, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** Routine MODU and Vessel Discharges generated during the Petroleum Activity will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** Routine MODU and Vessel Discharges generated during the Petroleum Activity will not impact upon biodiversity or ecological integrity.

On this basis, Woodside considers the impact to be managed to an acceptable level.

7.5.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes   | Controls   | Performance Standards   | Measurement Criteria  |
|--|--|---|---|

## 7.6 Plug and Abandonment Discharges

### 7.6.1 Summary of Risk Assessment and Evaluation

| Aspect   | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context        | Acceptability |
|--|---|---|-----------------|-------------------|---------------|-------------------------|---------------|
| Planned subsea discharges associated with P&A            | Discharge of cleaning acid (scale dissolver).   | Localised and temporary reduction in water and sediment quality | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|  | Discharge control fluids (valve actuation, pressure testing and BOP function testing).  |   |                 |                   |               |                         |               |
|  | Discharge of residual trapped fluids (inhibited seawater and hydrocarbons) during depressurisation of trees, removal of corrosion cap and disconnection of jumpers and flying leads |   |                 |                   |               |                         |               |
|  | Discharge of grit, flocculant, metal swarf and cement during wellhead removal.  |   |                 |                   |               |                         |               |
| Planned MODU discharges associated with P&A              | Discharge of well kill and clean out fluids (brine, additives, MEG, LCM).   | Localised and temporary reduction in water and sediment quality | 30              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|  | Discharge of residual well fluids (formation water, inhibited seawater and WBM) during well kill and clean out.   |   |                 |                   |               |                         |               |
|  | Discharge of cement, cement spacers and additives from cementing activities.  |   |                 |                   |               |                         |               |
| Planned MODU discharges associated with P&A (contingent) | Discharge of WBM, metal swarf, cement and formation rock cuttings from milling.   | Localised and temporary reduction in water and sediment quality | 10              | N/A               | -             | Type A Low Order Impact | Tolerable     |
|  | Discharge of WBM and cement cuttings from drilling out cement plugs.  |   |                 |                   |               |                         |               |
|  | Discharge of reservoir sand with residual hydrocarbon.  |   |                 |                   |               |                         |               |

### 7.6.2 Source of Hazard

The operational discharges associated with the well P&A, including discharges associated with preparatory activities, the MODU based P&A and the removal of well infrastructure are summarised in **Table 7-13**.

Table 7-13: Summary of discharges associated with the P&amp;A activity

| Activity  | Discharge Description   | Discharge Location and Control  | Indicative Volume  |
|---|---|---|--|
| <b>Preparatory Activities for P&amp;A</b>                             |   |   |  |
| Marine growth removal and cleaning                                    | Scale dissolver (acid based)  | Subsea  | 100 L per well   |
| Function and pressure testing (actuation of valves)                   | Hydraulic control fluid <sup>26</sup>   | Subsea  | 30 L per well  |
| Disconnection of Hydraulic Flying Leads                               | Hydraulic control fluid   | Subsea  | 10 L per well  |
| Disconnection of production and annulus flowlines                     | Treated seawater with residual hydrocarbon  | Subsea  | 7.5 m <sup>3</sup>   |
| Depressurising trees and control lines                                | Inhibited seawater with residual hydrocarbons   | Subsea  | 600 L per well   |
| Corrosion cap removal   | Inhibited seawater with residual hydrocarbons   | Subsea  | 80 L per well  |
| <b>Plug and Abandonment Activities</b>                                |   |   |  |
| Cement unit test  | Cement slurry (mainly cement and water, with small volume of cement additives and stabilisers)  | Discharged from MODU through cement discharge line, which may be up to 10m above sea surface              | Up to 10 m <sup>3</sup>  |
| Function testing BOP  | Small volume of BOP control fluid released during BOP installation and routine testing (every 7 days).  | Subsea Discharge  | 90 L per BOP test  |
| Well Kill <sup>27</sup><br>(Fluid returned to Well Bleed-off Package) | Well kill fluid (weighted brine) mixed with residual wellbore fluids (formation water, inhibited seawater, WBM)   | Processing Location:<br>Processed through MODU well bleed-off package.                                    | Discharge volume determined by success of bullheading.<br>Estimate volume ~ 30 - 150 m <sup>3</sup> per well |
|   |   | Discharge Control:<br>Discharged from MODU below sea surface, if OIW < 30 ppm.                            |  |
| Well Clean Out<br>(Fluid and solids returned to mud system)           | Well clean-out fluid (weighted brine, surfactants, high viscosity gel pills, loss circulation material) mixed with residual fluid in the tubing and annular spaces (WBM, completion fluid, inhibited seawater, small quantity of residual NWBM) | Processing Location:<br>Processed through MODU mud system.  | ~ 400 – 700 m <sup>3</sup> (per well)  |
|   |   | Discharge Control:<br>Discharged from MODU below sea surface where oil content is less than 1% by volume. |  |

<sup>26</sup> Activity and associated discharge may be conducted during preparatory activities and may also be required during rig-based P&A activities.

<sup>27</sup> Base case for well kill is to bullhead residual fluids in the reservoir. Fluids will only be circulated out of the well and processed through the well bleed off package as a contingency if bullheading is unsuccessful.

| Activity  | Discharge Description  | Discharge Location and Control  | Indicative Volume  |
|---|--|---|--|
|   | Circulating the residual base oil component of NWBM from the annulus space (B or C-annulus remediation)  | Processing Location:<br>Base oil to be circulated to mud system for processing.   | Not Applicable - base oil disposed onshore.  |
|   |  | Discharge Control:<br>Base oil will be retained and disposed of onshore.  |  |
| Mud pit and tank washing                            | Wash fluids mixed with residual drilling fluids and brines, cement fluids and dry bulk chemicals   | From MODU, below sea surface where oil content is less than 1% by volume.   | Variable based on operations   |
| Installing cement plugs                             | Small volume of cement spacer fluid and cement slurry (cement and cement additives) will be circulated back to MODU for discharge after each cement job.       | Discharged from MODU below sea surface  | 10 m <sup>3</sup> per cement job   |
|   | Excess cement slurry in the cement pump unit and surface lines will be flushed and discharged after each cement job  | Discharged from MODU below sea surface  | 5 m <sup>3</sup> per cement job  |
| Dry bulks   | Following completion of P&A activities, excess cement, barite and bentonite (dry bulks) may be required to be discharged.                                      | Discharged as dry bulk or slurry, below sea surface   | 100 tonnes of cement<br>120 tonnes of barite<br>120 tonnes of bentonite  |
|   | Dry cement may be vented and blown overboard during the pneumatic transfer process (onboard transfer operations)   | Vented from tank and blown overboard as dry bulk.   | 10 tonnes per well   |
| <b>Plug and Abandonment Activities – Contingent</b> |  |   |  |
| Milling   | WBM, metal swarf, cement and formation rock  | <b>Processing Location:</b><br>Processed through MODU solids control system<br><b>Discharge Control:</b><br>Discharged from MODU below sea surface where oil content is less than 1% by volume. | 1600 m <sup>3</sup> of WBM<br>14 m <sup>3</sup> of metal swarf<br>6 m <sup>3</sup> of cement<br>8 m <sup>3</sup> of formation rock |
| Drilling out cement plugs                           | WBM (brine and high viscosity sweeps) used to drill out the cement plugs will be circulated back to MODU with cement cuttings for treatment prior to discharge | <b>Processing Location:</b><br>Processed through MODU mud system<br><b>Discharge Control:</b><br>Discharged from MODU below sea surface where oil content is less than 1% by volume.            | 250 m <sup>3</sup> of WBM<br>25 m <sup>3</sup> of cement cuttings  |
| Sand Removal (Stybarrow-11 (H-4) well only)         | Unblocked sand from the well may be circulated to the well bleed off package on the MODU. A Dual Pot Sand Filter or Cyclonic Desander will be                  | Sand will be discharged from MODU if residual oil is less than 1 % on dry sand.<br>If discharges specification  | Maximum volume of reservoir sand is approximately 66 tonnes. <sup>28</sup>   |

<sup>28</sup> Sand volume is based on theoretical production tubing volume of 33 m<sup>3</sup> and sand density of 2000 kg/m<sup>3</sup>

| Activity   | Discharge Description   | Discharge Location and Control   | Indicative Volume                                      |
|--|---|--|--|
|  | installed within the bleed off package to separate the sand from the hydrocarbons and circulation fluids. | is not met, sand will be transported to shore for treatment and disposal.  |  |
| <b>Wellhead Removal</b>                                  |   |  |  |
| Abrasive water jet cutting of wellhead                   | Flocculant and grit   | Flocculant and grit discharged within the wellbore below mudline. Small volumes may be released to the seabed depending on the depth of the cut. A small volume may be released to the seabed if the cut is made at or near the mudline. | Grit: 4 tonnes per well<br>Flocculant: 250 L per well  |
| Mechanical cutting of wellhead (or diamond wire cutting) | Metal and cement cuttings from well infrastructure and lubrication for the cutting tool                   | Cuttings are expected to be discharged within the well. A small volume may be released to the seabed if the cut is made at or near the mudline.  | Negligible volumes may be release to surface sediments |

### 7.6.2.1 Subsea discharges associated with preparatory activities for P&A

Small planned chemical discharges may occur during preparation of the P&A and during well infrastructure removal activities. These subsea discharges are associated with typical inspection, maintenance and repair (IMR) activities and can include:

- Discharges of water-glycol based control fluids from valve functioning activities (note: valve functioning can occur during MODU based P&A);
- Discharges of cleaning acid (scale dissolver) to clean wellhead connector and remove marine growth and carbonate scale from subsea trees prior to P&A;
- Discharges of residual trapped wellbore fluids (predominately inhibited seawater with residual hydrocarbon) during subsea tree preparations (e.g., depressurisation of trees and control lines, corrosion cap removal).
- Discharges associated with the disconnection of remaining production and annulus flowlines and hydraulic flying leads from the subsea trees. Disconnection is required to enable clear access to the trees for P&A and final removal. If lines cannot be disconnected they may be cut using an ROV operated cutting tool and generate minor volumes of metal and plastic swarf. Residual fluids that may be drained from the lines includes treated seawater (30 ppm residual hydrocarbon<sup>29</sup>, scale inhibitor, methanol, hydraulic fluid and demulsifier).

Small volumes of chemicals may be discharged intermittently and for short durations as part of the preparatory activities for P&A. These fluids will be discharged subsea, directly to the marine environment.

### 7.6.2.2 Well Kill and Cleanout Fluids and Residual Wellbore Fluids

During P&A activities, fluids will be circulated back to the MODU for treatment, prior to either being discharged or sent to shore for onshore disposal. Depending on the operation, returned fluids may include reservoir fluids, residual tubing and annulus fluids, brine, WBM or solids. There are a number of chemicals that are already present in the well from either the time of drilling or injected during operations. The majority of chemicals that may be present are low toxicity and biodegradable.

#### *Fluids Returned to the Bleed off Package*

If well kill fluid fails to be bullhead pumped into the well, reservoir fluids may need to be bled off at the MODU through the bleed off package. The bleed off package will be used to separate water-based components from the

<sup>29</sup> Residual gas releases are considered in Section 7.4.

hydrocarbons and direct the hydrocarbons to be flared, vented or incinerated, depending on a number of factors including the volume, weather conditions, and safety requirements as documented in relevant procedures for this activity.

All well kill fluids and produced formation water received to the MODU during well kill will be treated via the water filtration package component of the bleed off package to less than 30 ppm oil in water content and discharged overboard or sent for onshore disposal. The bleed-off package is designed to handle fluids and cannot handle solids. It will be used for well kill operation only where the well status allows line-up to the bleed-off package.

#### ***Fluids and Solids returned to the mud system***

During well clean out, the wellbore will be circulated clean by pumping well clean out fluids (including weighted brines, seawater, hi-viscosity pills and other chemical additives as required) into the well. These fluids will be returned to the surface mixed with residual fluids remaining in the production tubing and annular spaces (predominately WBM and inhibited seawater). Returned fluids will be sent to the MODU's mud system and mud pits (tanks). Fluids may be discharged if they meet less than 1% oil concentration. Should clean out/circulation brine be contaminated with residual base oil or NWBM, it will be captured and stored on the MODU for discharge if oil concentration is <1% by volume or returned to shore if discharge requirements cannot be met.

Skimming may be used to remove separated hydrocarbons where possible (and stored for onshore disposal) but dilution with seawater will not occur to achieve the less than 1% oil concentration requirement. Operational efficiencies will be explored throughout the campaign to minimise activities like pit cleaning. Ideally this will only occur at the end of the campaign, resulting in a single fluid discharge with a maximum of 1% oil.

### **7.6.2.3 Cementing Fluids, Cement and Grout**

Cementing fluids, including cementing mix water, may require discharge to the marine environment under various scenarios.

Upon arrival on location at the Operational Area, the rig may be required to perform a cement unit test, or 'dummy cement job'. Discharges from the test are made through the usual cement unit discharge line, which may be up to 10 m above the sea level and occur as a cement slurry. The slurry is usually a mix of cement and water (~10 m<sup>3</sup>); however, may sometimes contain stabilisers or chemical additives.

After each cement job, leftover cement slurry in the cement pump unit and the surface lines is flushed and discharged to the sea to prevent clogging of the lines and equipment. This is estimated to be about 20 m<sup>3</sup> per well. In the event the cement job does not meet barrier requirements, the cement will be drilled out and cement operation redone.

Cement spacers can be used as part of the cementing process, within the well casing, to assist with cleaning of the casing sections prior to cement flow through. The spacers may consist of either seawater or a mixture of fresh water with weighting agents and other additives to aid with the cleaning of casing and cement placement. A dye may be added to the spacer where the cement is returned to the seabed surface; it is used to provide a pre-indicator of cement overflow to the seabed surface, to ensure adequate cement height.

Following completion of all plugging operations at end of campaign, excess cement (dry bulk, after well operations are completed) will either be: used for subsequent wells; provided to the next operator at the end of the drilling program (as it remains on the rig); or if these options aren't practicable, discharged to the marine environment as dry bulk or as a slurry. The process that will be followed to determine discharge is the last option is presented in **Figure 7-3**.

Dry bulk materials generally pose little or no risk to the environment (PLONOR)<sup>30</sup>, but barite may contain traces of heavy metals, such as mercury and cadmium. Woodside requires that concentrations of mercury and cadmium in barite be < 1 mg/kg and < 3 mg/kg respectively. This conforms to the American Petroleum Institute (API) specification for drilling barite. Heavy metal analysis is conducted on individual batches of stock barite prior to mobilisation offshore. This sampling confirms that heavy metals of concern (cadmium and mercury) are within limits prescribed by API Standards.

Woodside manages dry bulk material to minimise excess quantities of remaining materials at the end of the campaign, whilst also ensuring adequate stocks are maintained on the MODU for safe operations and well control. Minimum stock of barite is required on the MODU for well control, which is defined in the Woodside Well Control

<sup>30</sup> Barite (as barium sulphate) is on the OSPAR List of Substances Used and Discharged Offshore which are Considered to Pose Little or No Risk to the Environment (PLONOR). The List is available at: <https://www.cefas.co.uk/media/p3sbu3bn/ospar-list-of-substances-used-and-discharged-offshore-which-are-considered-to-pose-little-or-no-risk-to-the-environment-plonor-update-2021.pdf>

Bridging Document.

The intent is to not discharge remaining dry bulks at the end of the campaign. Woodside is planning to transfer the dry bulks to the next operator of the MODU to be re-used. The products will only be discharged as a contingency, in the event the bulks cannot be transferred. Woodside has a proven track record of successfully transferring dry bulks at the end of a drilling campaign, with the most recent example with Inpex in October 2023 on the Ocean Apex, following drilling of the Gemtree Exploration well.

Woodside has explored the option to backload dry bulks to shore at the end of the campaign with the main fluid providers, however this cannot be carried out due to safety concerns associated with high pressure transfers, as well as potential for cross contamination and moisture build-up, resulting in blockages.

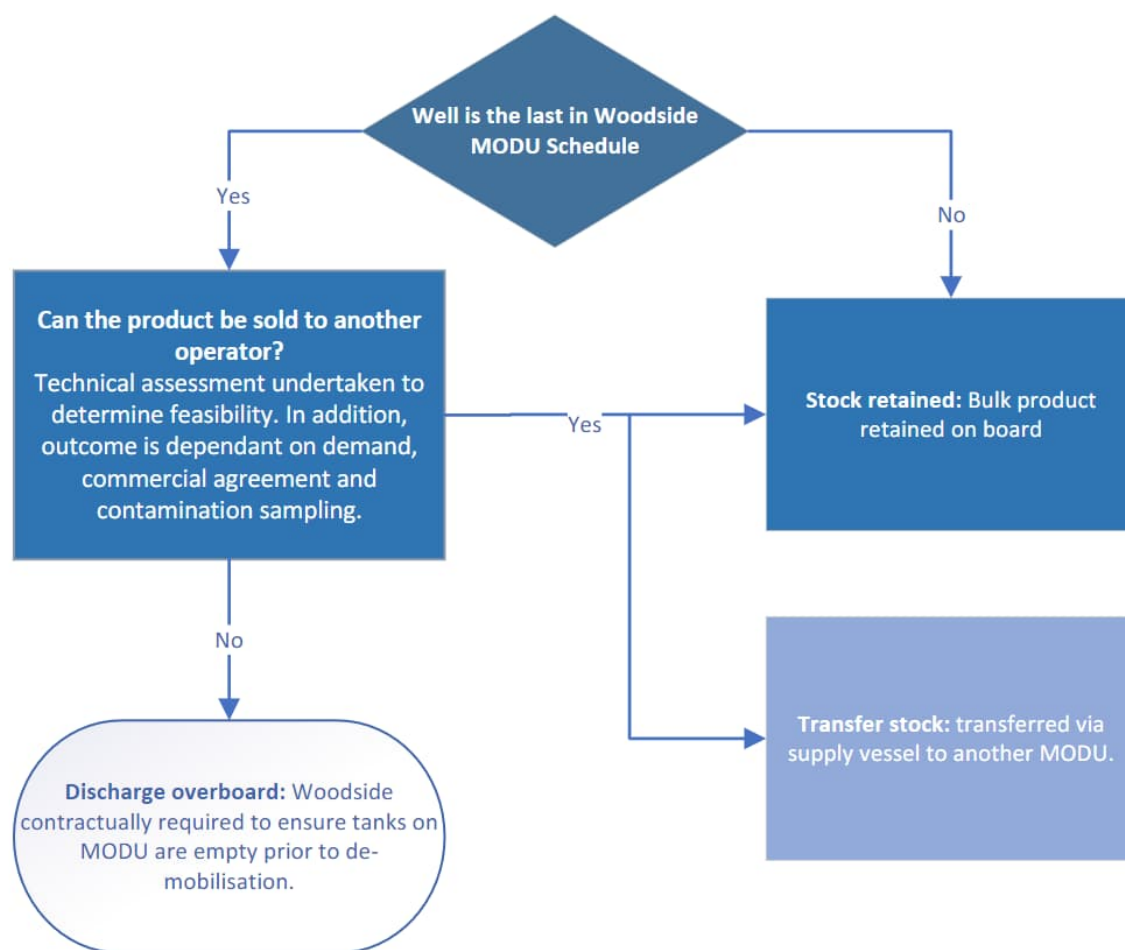

Figure 7-3: Management process for excess bulk product

### 7.6.2.4 BOP and Well P&A Control Fluids

Subsea fluids are likely to be released during permanent plugging for abandonment activities including well infrastructure removal. These substances include hydraulic fluids, subsea control fluids, dye, glycol, brine or seawater with traces of gas and liquid hydrocarbons. During permanent plugging activities, the control system for the subsea tree operates in open loop, resulting in approximately 10 m<sup>3</sup> of control fluid being expected to be discharged per well.

The BOP is required to be regularly function tested, as defined by legislative requirements. The BOP is function tested during assembly and maintenance and during operation on the seabed. As part of this testing, small volumes of BOP control fluid (generally consisting of water mixed with a glycol based detergent or equivalent water based anti-corrosive additive) is released to the marine environment. The BOP will be function tested about every seven days (when a pressure test is not occurring) and pressure tested about every 21 days as per API 53 (an American Petroleum Institute standard for Well Control Equipment Systems for Drilling Wells). The estimated volume of BOP control fluid per function is up to about 1500 L per test.

### 7.6.2.5 Removal of Well Infrastructure

The removal of wellhead will result in routine discharge of grit/flocculants (from abrasive water jet cutting) and/or metal swarf (from mechanical or diamond wire cutting). Discharges from cutting of well infrastructure are expected to be confined predominately within the well and settle on the top permanent plug. During final cut through the conductor pipe, small amounts of will be released below the mudline to sediments immediately surrounding the well. Should cutting at a shallower depth be required, these discharges may be released to the seabed surface. For the mechanical cutting tool, discharges will be limited to small quantities of metal and cement cuttings from the infrastructure itself as well as small quantities of lubricant. For the abrasive water jet cutting method, discharges include a small amount of grit and flocculant.

### 7.6.2.6 Contingency Milling

During plugging activities, there is a potential contingency activity where the well casing needs to be milled out (up to 4 x 30 m plugs or 120 m per well). This will produce milled swarf, drilled cement cuttings and formation rock and will be completed using WBM. At the end of section milling, the WBM circulating system may be discharged if contaminated with swarf, to prevent reuse and consequent equipment damage. The volume of discharged WBM is conservatively estimated to be 1600 m<sup>3</sup> per well. Operational efficiencies will be explored throughout the campaign to minimise discharge volumes.

### 7.6.2.7 Contingency Produced Sand Treatment

There may be some produced sand in one well due to the failure of a sand screen. The produced sand is expected to be contaminated with hydrocarbons. The sand may need to be circulated to the MODU, where it may be handled by equipment onboard. If the 1% by weight on dry sand discharge standard cannot be met, the produced sand will be retained onboard for onshore disposal.

### 7.6.2.8 Contingency Marine Riser Clean Out

There is potential for the marine riser and BOP to be susceptible to rust and other minor build up between wells. This can lead to operational issues. To avoid this, the marine riser will be recovered to deck and inspected. If needed, the equipment will be cleaned over a bunded area with fluids returned to tanks on the MODU. The BOP cavities will also be cleaned before deployment and, if equipment needs to be cleaned after deployment, large diameter brushes, clean drill pipe and high rate circulation subs will be available to enable riser cleaning/flushing to the MODU mud pits.

## 7.6.3 Environmental Impact Assessment

The identified potential impacts associated with P&A related discharges include a localised and temporary reduction in water and localised change in seabed sediment quality, as well as localised burial of benthic biota (species) and change to habitats and communities.

A number of direct and indirect impact pathways are identified include:

- temporary increase in total suspended solids (TSS) in the water column;
- attenuation of light penetration as an indirect consequence of the elevation of TSS and the rate of sedimentation;
- sediment deposition to the seabed, leading to the alteration of the physico-chemical composition of sediments, and burial and potential smothering effects to sessile benthic biota; and
- potential contamination and toxicity effects to benthic and in-water biota.

The Operational Area is situated in offshore waters (about 55 km north-west of Exmouth) in water depths of approximately 790 m – 850 m. The abiotic habitat in the area as concluded by BMT Oceanica (2016) is comprised of deep, soft, unconsolidated sediment, which is relatively flat and featureless. Large areas of soft ooze and fine mud sediments were observed between water depths of 600 to 900 m.

Cardno (2019) observed only unconsolidated sediment within WA-32-L, with no areas of hard substrate (with the exception of the Stybarrow field equipment). Few epifauna and demersal or benthic fish were observed by Cardno (2019), which is consistent with similar deep water habitats in the region, with heart urchins, grenadier fish and decapods the most commonly observed taxa.

Infauna sampling by ROV cores yielded very few infauna at impact and control sites in WA-32-L, indicating low

density but widely distributed infauna assemblages (Cardno, 2019). This is consistent with other surveys in the region (e.g., RPS, 2013).

Some fluids are discharged at the sea surface (or just below); and some are discharged subsea or at the seabed. All chemicals that may be operationally released or discharged to the marine environment must be selected and approved as per the Chemical Selection and Assessment Environment Guideline (**Section 3.9**). Therefore, any chemicals selected and potentially released are expected to be of low toxicity and biodegradable.

### ***Subsea Discharges***

Discharges of small volumes of chemicals (such as cleaning acids, hydraulic fluids and trapped wellbore fluids primarily inhibited seawater with residual hydrocarbons < 30 ppm) will be discharged subsea and are expected to rapidly disperse in the water column, falling quickly below threshold levels for acute toxic effects to marine fauna. Any potential impacts would be confined to localised change in the water quality immediately surrounding the release location. Impacts to transient marine fauna are not expected, particularly given the low sensitivity of the immediate environment within the Operational Area. Potential toxicity to benthic marine fauna associated with bare sediments or attracted and attached to subsea infrastructure (such as fish, infauna and sessile filter feeding organisms) are unlikely. Impacts relate to a localised, temporary (hours) and minor reduction in water quality in the immediate vicinity of the release.

### ***Well Kill, Well Clean Out and Residual Wellbore Fluid Discharges***

Discharges such as well kill and wellbore cleanout fluids are typically inert and of low toxicity. These fluids are mostly brine, with a small proportion of chemical additives such as surfactants, biocide, corrosion inhibitor, oxygen scavenger, monoethylene glycol and guar gum. Once circulated through the wellbore, these fluids will contain residual wellbore fluids which are likely to be predominately inhibited seawater with residual quantities of hydrocarbons (< 30 ppm), as well as completion brine, packer fluid, WBM and NWBM that were used during the initial drilling of the wells. Any change to water quality is expected to be localised and temporary. As this is an intermittent batch discharge, any change in water quality will be short term as discharges are discrete and of short duration. Rapid dilution due to prevailing ocean currents in the open water environment would lead to any changes in water quality such as low toxicity contaminants being temporary (only for the duration of the discharge) and reducing water quality within a short distance of the discharge location.

The combination of low toxicity and rapid dilution of unrecoverable WBM (and contingency NWBM) discharged in association with drill cuttings are of little risk of direct toxicity to water-column biota (Neff et al., 2000). Neff (2010) explains the lack of toxicity and low bioaccumulation potential of the drilling muds means the effects of the discharges are highly localised and are not expected to spread through the food web (of which planktonic species are the basis).

Indicative components of the residual completion brine and WBM have a low toxicity. Bentonite and a chemical from the family of XC polymers (Xanthan Gum or similar) are listed as 'E' category fluids under the OCNS and are included on the OSPAR list of chemicals used and discharged offshore are considered to 'pose little or no risk to the environment' (PLONOR). These metals are present primarily as insoluble mineralised salts. Consequently, they are not released in significant amounts to the pore water of marine sediments and have low bioavailability to those benthic fauna that may come into contact with the discharged barite (Crecelius et al., 2007; Neff, 2008).

The residual WBM and bentonite sweeps have very low toxicities and are included on the PLONOR list. They may, however, cause physical damage to benthic organisms by abrasion or clogging, or through changes in sediment texture that can inhibit the settlement of planktonic polychaete and mollusc larvae (Swan et al., 1994). However, these impacts are expected to be negligible, due to the low volumes that will be discharged and rapid biodegradation and dispersion of WBM drilling fluids (Terrens et al., 1998). The dilution of solid elements of the WBM into substrate largely depends on the energy level of the local environment and the 'mixing' that occurs but is expected to occur rapidly after release (especially with WBM).

Base fluids for NWBM, which may be found in residual volumes in the wells, are designed to be low toxicity and biodegradable in offshore marine sediments. Biodegradation can result in a low oxygen (anoxic) environment, resulting in changes in benthic community structure. However, given the small volumes that may be discharged, impacts to benthic habitats and communities will be negligible.

### ***Cuttings and Solids Discharges***

The P&A activities occur with a riser fitted, creating a closed loop system. Small volumes of cement cuttings, formation cuttings and reservoir sands with unrecoverable fluids are brought to the surface via the riser and

discharged below the water line from the MODU (if within discharge specifications), resulting in fluids rapidly diluting and dispersing through the water column. The dispersion and fate of the solids are determined by particle size and density of the unrecoverable fluids; the larger solid particles will drop out of suspension and deposit in proximity to the well site (tens of metres) with potential for localised spreading downstream, while the fluids and finer particles will remain in suspension and will be transported away from the well site, rapidly diluting and eventually depositing over a larger area (hundreds of metres) downstream of the well site.

Elevated TSS will occur and will be highest at the point of discharge in the water column, rapidly decreasing with depth and distance over a period of short duration (minutes). The finer particles (associated with the drilling fluids) will remain in suspension and are transported further before settling on the seabed over a wider area (hundreds of metres) downstream of the well site (defined as an area of influence). They will form an undetectable thin sediment veneer with negligible ecological impact to benthic biota. Within the area of influence, fluids are likely to be naturally reworked into surface sediment layers through bioturbation (IOGP, 2016).

Cuttings and fine solids discharged from the surface (though below the waterline) are generally confined to a maximum of 500 m from the discharge point (IOGP, 2016). For the petroleum activity, because the volumes of swarf, cement cuttings, formation cuttings and reservoir sand are only associated with contingency activities and would be in low volumes, the extent of the environment impacted is expected to be significantly lower than what is stated in the literature, which is based on drilling new wells with higher volumes of solids.

The discharge of unblocked reservoir sand will result in a localised, temporary decrease in water quality due to turbidity and residual hydrocarbons. Given the relatively small volume of produced sand that may be discharged (much smaller than the volume of cuttings discharged during typical drilling activities), water quality will recover rapidly once the discharge is ceased. Given the water depths in the Operational Area are >800 m, the sand-sized particles will be distributed as a very thin layer dispersed over a 100's of metres. Impacts to benthic fauna from smothering will be negligible.

### **Cement**

Impacts of cement on the marine environment are associated mainly with smothering of surrounding benthic and/or infauna communities. Cement is the most common material currently used in artificial reefs around the world (OSPAR, 2010) and is not expected to pose any toxicological impacts to receptors from leaching or direct contact.

Minimum cement (100 t), barite (120 t) and bentonite (120 t) volumes are required to be stored on the MODU for use in well control and P&A activities. While volumes are calculated before use to minimise excess, the requirement for additional volumes on the MODU for operational contingencies means there may be greater than the minimum onboard at the end of campaign. Discharge of excess cement, barite and bentonite may occur as dry bulk or as a slurry. Dry bulk has the potential to disperse across a wider area, but at lower concentration, compared to slurry which would have a greater tendency to settle on the seafloor closer to the well location. In either case, discharges are not expected to widely disperse before settling on the seabed. Reduction in water quality from bulk discharges will be temporary and subject to rapid dispersion and dilution by prevailing currents away from the discharge location. Impacts to plankton populations will therefore be localised over the duration of the plume and would be expected to return to previous conditions within a relatively short period of time.

The potential impacts to benthic communities caused by smothering from a surface release of cement are expected to be minimal due to the high dispersal by ocean currents and short-term duration of these discharges. Cement is inert and does not pose toxicological impacts. As described above, barite and bentonite have very low toxicities and are considered by OSPAR to pose little or no risk to the environment (PLONAR). They may, however, cause physical damage to benthic organisms by abrasion or clogging, or through changes in sediment texture that can inhibit the settlement of planktonic polychaete and mollusc larvae (Swan et al., 1994). However, these impacts are expected to be negligible, given this is a one off discharge, and due to rapid biodegradation and dispersion of bulk discharges (Terrens et al., 1998). Any impacts to soft sediment communities is not expected to affect the diversity or ecosystem function in this area and is only considered a localised impact with no lasting effect.

### **P&A Fluids (Bulk Discharges)**

Well kill/clean out brine and WBM may be bulk discharged at the end of specific P&A activities, where there is a requirement to change the fluid system or the fluid cannot be re-used (due to deterioration/contamination). A small quantity of WBM and NWBM residue (<1%) may also be discharged at the sea surface while cleaning the mud pits, typically at the conclusion of P&A activities or when changing between fluid types.

Discharge of brine or WBM will result in a buoyant plume of fine materials that will rapidly dilute and decrease in

turbidity levels immediately away from the discharge point. WBM samples collected by Jones et al. (2021) from the mud pits just before discharge during the Greater Western Flank-2 drilling campaign were ~90% silt sized (<62.5 µm) with a mean diameter of 12 µm (gel-polymer) and 33 µm (KCl-polymer). Total suspended solid (TSS) levels in the gel-polymer mud and KCl-polymer mud were 257 g/L and 245 g/L respectively. Jones et al. (2021) used an ROV to observe mud pit discharges and reported the discharge to exit the discharge outlet as a jet of material in a distinctive cloud-like plume descending rapidly to the seabed and growing in diameter with increasing depth.

The subsea plume can be expected to disperse over a wide area (up to several kilometres), with no discernible sediment deposition on the seabed and no physical or biological impacts, particularly given the water depth of the Stybarrow wells (790 m – 850 m). Impacts beyond the 500 m zone of ecological impact for the wells as described for cuttings, fine solids and retained fluids discharge is not expected.

### **Well Infrastructure Removal**

As the planned wellhead cutting depth is below the mudline, discharges from cutting the wellheads (grit, flocculants, and small quantities of metal cuttings) are expected to be confined predominantly within the well. During the final cut and removal, small amounts will be released below the mudline to sediments localised around the well. If cutting at a shallower depth is required, these discharges may be released to the seabed surface. Wellhead cuttings discharges are low volumes of inert material and any impact relates to a localised, temporary, and minor change in water quality, with no significant impacts to marine fauna anticipated.

Following wellhead severance, the remaining water-based casing and annulus fluids become exposed to the sea. The small volumes and non-instantaneous nature of the release of the well fluids is expected to result in rapid dilution to a no-effect concentration within metres of the release location. Therefore, impacts will be limited to negligible.

### **KEFs**

The Operational Area overlaps the Continental Slope Demersal Fish Communities KEF and the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF. The values and sensitivities of the Cuvier Abyssal Plain and the Cape Range Peninsula KEF occur on a broad scale outside of the Operational Area. There is potential for limited impacts on demersal fish habitat, e.g., seafloor however, given the low toxicity of the fluids to be used and the small volumes for the petroleum activity, the likelihood of any significant impact to marine biota is considered to be low.

As described above, the sediment deposition from the discharge of P&A fluids, residual wellbore fluids, cementing fluids, subsea fluids and fine solids (cuttings and reservoir sands) will be highly localised around each well location. Within the conservatively applied zone of potential ecological impact (500 m radius around each well), only a very small portion of the Continental Slope Demersal Fish Communities KEF (0.002%) and Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF (0.009%) will be affected. The fishes that constitute the KEFs are mobile and are expected to move away from areas affected by drilling discharges and fluids before experiencing impacts that result in injury or mortality. The benthic habitats around the Stybarrow wells are widely distributed in the region, hence there are no constraints on available habitat for demersal fish displaced by the discharge of P&A fluids. As a result, the environmental consequence of impacts to the Continental Slope Demersal Fish Communities KEF and the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF will be minor with no lasting effect.

#### **7.6.3.1 Cumulative Impacts**

No cumulative impacts to water quality are expected to occur, as discharged sediments are predicted to settle in between the P&A activities for each well.

#### **7.6.3.2 Species Recovery Plans and Threat Abatement Plans**

Woodside has considered information contained in relevant recovery plans and approved conservation advice for cetaceans and marine turtles that identify chemical discharges/pollution as a threat (**Section 9**). This includes the objectives and actions with the *Recovery Plan for Marine Turtles in Australia 2017–2027* (Commonwealth of Australia, 2017), which relate to discharges.

#### **7.6.4 Demonstration of ALARP**

The ALARP process for the environmental risk is summarised in **Table 7-14**. This process was completed as outlined in **Section 6.1** and included consideration of all controls, analysis of the risk reduction proportional to the benefit

gained and final acceptance or justification if the control was rejected.

**Table 7-14: Plug and Abandonment Discharges - ALARP Summary**

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| <b>Legislation, Codes and Standards</b>   |                 |   |                                  |
| No discharge of produced sand to sea except when oil concentration is lower than 1% by weight on dry sand.                                    | Accept          | The residual hydrocarbons standard represents a low environment risk and produced sand not meeting this standard may have an unacceptable environmental impact.   | PS 7.1                           |
| <b>Eliminate</b>  |                 |   |                                  |
| Fluids circulated to the MODU mud system which are contaminated with less than 1% oil by volume are not discharged to the marine environment. | Reject          | <p>Whilst this is feasible it is not considered standard practice. This control would result in significant cost, labour and resources due to the volumes of fluids expected that would require handling. Other cost/sacrifice elements which are considered include:</p> <ul style="list-style-type: none"> <li>• Further treatment of fluids onshore is required to ensure a standard suitable landfill: Class II disposed locally (e.g. Karratha); Class III Landfill requires transport to Geraldton or Perth.</li> <li>• Potential delays during permanent plugging activity if transfer operations are delayed due to weather or operational issues</li> <li>• Additional environmental impact incurred (air emissions, vessel discharges) from vessel use and onshore trucking for transporting and disposal of fluids.</li> <li>• Disposal via onshore treatment does not eliminate an environmental impact. These options have their own impacts and therefore disadvantages if implemented.</li> </ul> <p>Is control may result in a slight reduction in the consequence to the marine environment due to small volume of oil (&lt;1% by content) not being discharged. However, generates onshore disposal consequences.</p> <p>Control not adopted as cost/sacrifice outweighs benefit.</p> | Not applicable                   |
| Return bulk cement, barite and bentonite for onshore disposal   | Reject          | <p>Control is not considered feasible. The technical requirements to be able to undertake this safely are unresolved due to:</p> <ul style="list-style-type: none"> <li>• Significant health and safety risks with tank high pressure differentials to transfer material onshore</li> <li>• High health and safety risk with the vessel to waste truck transfer due to tank corrosion concerns and pressure relief valve issues.</li> </ul> <p>Control is not considered as it is not considered feasible.</p>  | Not applicable                   |

| Control Measure  | Accept / Reject | Reason  | Associated Performance Standards |
|--|-----------------|---|----------------------------------|
| <b>Engineering</b>   |                 |   |                                  |
| <p><b>Well Bleed Off Package</b></p> <p>During well kill activities, returned well kill fluids and produced water will be processed through the water treatment package of the dedicated fluid and gas handling bleed off package.</p> <p>Fluid will be treated to less than 30 ppm oil in water content prior to discharge to the environment. If this cannot be met, fluids will be returned to shore.</p>         | Accept          | <p>By treating fluids prior to overboard discharge, the consequence of the release on the environment is reduced. Although no change in likelihood is provided, the decrease in consequence results in an environmental benefit.</p> <p>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>             | <b>PS 7.2</b>                    |
| <p><b>MODU Mud System</b></p> <p>During well clean-up and when fluid is being circulated to the mud system (brine, WBM and clean-up fluids) potentially contaminated with wellbore fluids and residual hydrocarbons, fluids will be captured in the MODU mud tanks for discharge if oil concentration is less than 1% by volume.</p> <p>If discharge requirements cannot be met fluids will be disposed onshore.</p> | Accept          | <p>By treating fluids prior to overboard discharge, the consequence of the release on the environment is reduced. Although no change in likelihood is provided, the decrease in consequence results in an environmental benefit.</p> <p>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>             | <b>PS 7.3</b>                    |
| <p>Mud pit wash residue will be measured for oil content prior to discharge.</p>   | Accept          | <p>Ensuring &lt;1% oil content will provide a small reduction in consequence when residue is discharged to the environment.</p> <p>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>  | <b>PS 7.4</b>                    |
| <p>Drilled cement, formation rock and swarf cuttings returned to the MODU will be discharged below the water line.</p>   | Accept          | <p>Discharge of cement, formation rock and swarf cuttings below the water line will reduce carriage and dispersion of solids, thereby reducing the consequence of solids discharges during the petroleum activity.</p> <p>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.</p>                           | <b>PS 7.5</b>                    |
| <b>Administrative</b>  |                 |   |                                  |
| <p>Fluids used for P&amp;A activities including brine, WBM, cementing, and subsea control fluids and additives will have an environmental assessment completed prior to use.</p>   | Accept          | <p>Environmental assessment of chemicals will reduce the consequence of impacts resulting from discharges to the marine environment by ensuring chemicals have been assessed for environmental acceptability through Woodside's chemical assessment process (section 3.9). Planned discharges are required for the safe execution of activities and</p> | <b>PS 7.6</b>                    |

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
|  |                 | therefore no reduction in likelihood can occur.<br>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   |                                  |
| Bulk operational discharges conducted under MODU's Permit to Work (PTW) system (to operate discharge valves/pumps).  | Accept          | The MODU's PTW may slightly reduce the likelihood of bulk discharges occurring, but it is unlikely to be significant given that bulk discharges are often operationally required and cannot be eliminated.<br>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.                        | PS 7.7                           |
| Options for use of excess bulk cement, bentonite and barite will be managed as per <b>Figure 7-3</b> and only discharged to the marine environment as a last option. | Accept          | Using excess bulk cement, bentonite and barite for subsequent campaigns would eliminate the bulk discharge to the marine environment and eliminate the likelihood and consequence of impacts from such activities. Control is feasible and can be implemented with minor costs. Benefits outweigh any cost sacrifice.                | PS 7.8                           |
| Sampling/analysis of stock barite to ensure acceptable levels of heavy metals (cadmium and mercury).   | Accept          | Barite may contain heavy metals, such as cadmium and mercury, depending on their geological origin. Limiting the concentrations of cadmium and mercury is consistent with industry good practice. Limiting cadmium and mercury concentrations in barite reduces the environmental risk from discharges of barite to the environment. | PS 7.9                           |

#### 7.6.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 7-14**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts of operational discharges associated with P&A activities to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential impacts of operational discharges associated with the P&A of the Stybarrow wells. Additional reasonable control measures were identified in **Table 7-14** to further reduce impacts but rejected since the associated cost or sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

#### 7.6.5 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, operational discharges associated with the P&A of the Stybarrow wells will not result in potential impacts greater than temporary and minor reduction in water quality, with no lasting effects. Management of mercury in barite is consistent with Article 9(5) of the Minamata Convention, as shown in **Table 7-15** below.

Further opportunities to reduce the impacts have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good oil-field practice/industry best practice. No concerns or objections regarding the impacts associated with the operational discharges associated with the P&A activity have been raised by relevant stakeholders. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impacts are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to

decommissioning the Stybarrow field, which have informed Woodside’s deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.

- **Precautionary Principle:** Operational discharges associated with the P&A activity, and their potential impacts, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** Operational discharges associated with the P&A activity will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** Operational discharges associated with the P&A activity will not impact upon biodiversity or ecological integrity in the long-term.

On this basis, Woodside considers the impact to be managed to an acceptable level.

**Table 7-15: Consideration of control measures outlined in Article 9(5) of the Minamata Convention**

| Measures in Article 9(5) of the Minamata Convention   | Justification for Implementation or Rejection of the Measure   |
|---|--|
| Release limit values to control and, where feasible, reduce releases from relevant sources                      | <p>The performance standard limiting the concentration of mercury in barite aligns with API standards and limits the release of mercury to the environment.</p> <p>Woodside will only discharge bulk barite if it cannot be used for subsequent drilling activities.</p> <p>Woodside has considered transporting excess barite to onshore. The control was rejected due to the health and safety risks associated with the transfer of barite.</p>   |
| The use of best available techniques and best environmental practices to control releases from relevant sources | <p>Woodside has reviewed the <i>Guidance on Best Available Techniques and Best Environmental Practices - Minamata Convention on Mercury</i> (United Nations Environment Program, 2019). The best available techniques described in this document only apply to facilities listed in Annex D<sup>31</sup> of the Minamata Convention, which excludes offshore oil and gas drilling facilities; none of the best available techniques are applicable to the waste generation activity.</p> <p>Using best available techniques is intended to prevent or limit the release of mercury to the environment. This intent is met by the performance standard limiting the concentration of mercury in barite.</p> |
| A multi-pollutant control strategy that would deliver co-benefits for control of mercury releases               | <p>Woodside implements a management process to re-use barite where practicable, shown in <b>Figure 7-3</b>. This process reduces bulk discharges of barite to the environment.</p> <p>Woodside’s performance standard limiting mercury concentrations in barite also limits the concentration of cadmium, which is also a recognized toxicant. This performance standard hence is a multi-pollutant strategy.</p>  |
| Alternative measures to reduce releases from relevant sources.  | No other opportunities to reduce releases of mercury were identified.  |

<sup>31</sup> Facilities listed in Annex D of the Minamata Convention comprise coal-fired power plants, coal-fired industrial boilers, smelting, and roasting processes used in the production of non-ferrous metals, waste incineration facilities, and cement clinker production facilities.

## 7.6.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes  | Controls  | Performance Standards   | Measurement Criteria   |
|---|---|---|--|

## 7.7 Solid Waste Generation

### 7.7.1 Summary of Risk Assessment and Evaluation

| Aspect                 | Source of Hazard   | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context           | Acceptability |
|------------------------|--|---|-----------------|-------------------|---------------|----------------------------|---------------|
| Solid Waste Generation | Hazardous and non-hazardous waste generated during MODU and project vessel operations. | Increase waste to landfill.<br>Additional usage of onshore waste reception facilities.<br>Availability of materials from recycling. | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |
|                        | Disposal of recovered well infrastructure  |   | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |

### 7.7.2 Source of Hazard

#### 7.7.2.1 MODU and Project Vessels

The MODU and project vessels generate a variety of hazardous and non-hazardous solid wastes, including domestic and industrial wastes. These include aluminium cans, bottles, paper and cardboard, scrap steel, chemical containers, batteries, and medical wastes. Wastes on-board are managed in accordance with the on-board Waste Management Plan.

Solid waste is segregated on-board the project vessels and stored in designated skips and waste containers. Wastes are segregated into the categories of:

- non-hazardous waste (or general waste)
- hazardous waste
- recyclables (further segregation is conducted in line with practices at existing Woodside operations in the region).

General non-hazardous waste includes domestic and galley waste, and recyclables such as scrap materials, packaging, wood and paper and empty containers. Volumes of non-hazardous waste generated on vessels are generally minor.

Hazardous wastes are defined as those that are or contain ingredients harmful to health or the environment. Hazardous wastes likely to be generated on-board the project vessels include oil-contaminated materials (such as sorbents, filters, and rags), chemical containers and batteries. The volumes of generated hazardous wastes are also generally minor.

#### 7.7.2.2 Recovered Well Infrastructure

Well infrastructure, including production tubing, casing, wellheads and subsea trees will be recovered for onshore treatment and disposal. The production tubing and casing will be recovered by the MODU during permanent plugging of the wells. Other well infrastructure above the mudline including the wellheads and subsea trees will be recovered by the MODU directly following P&A activities or recovered using an offshore support vessel during the Stybarrow subsea infrastructure removal campaign. The recovery of well infrastructure will generate industrial waste mainly comprising of steel, polymers and smaller quantities of other materials that will require onshore handling and disposal at licenced facilities. Waste generated from decommissioning of well infrastructure could contribute to the increasing pressure on local landfills if not managed appropriately through consideration of the waste hierarchy and alternative

means of disposing to landfill. There is also the potential for recovered infrastructure to be incorrectly classified and disposed of inappropriately leading to contamination of waste streams.

Studies of potential NORM and mercury contamination in flowlines indicate that there is relatively little build-up of scale. Analysis of scale determined that concentrations of mercury were below laboratory limits of detection (SA Radiation, 2018a, 2018b) and hence mercury in any recovered infrastructure is not expected to present an environmental hazard. Radioactivity from NORM was not detectable above background levels during monitoring of the Stybarrow equipment in situ (SA Radiation, 2018a, 2018b). Very low levels of NORM were detected in thin scale in a sample from a Stybarrow flowline, which are not expected to pose a risk to human health or the environment (SA Radiation, 2018a, 2018b). Hence, harmful amounts of NORM and mercury are not expected to be present in any recovered well infrastructure.

Woodside is committed to re-use, repurposing and recycling as much of the decommissioning infrastructure as practicable. Any wastes generated during the petroleum activities, including recovery of well infrastructure, will be disposed in accordance with a Waste Management Plan. The Waste Management Plan will apply the following waste management hierarchy to minimise the amount of waste entering landfill:

- Reuse
- Repurpose
- Recycle
- Landfill

All waste streams will be managed in accordance with applicable legislative requirements, or in accordance with international guidance where applicable, for example:

- *Hazardous Waste (Regulation of Exports and Imports) Act 1989* (Cth) which implements the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal
- Environmental Protection (Controlled Waste) Regulations 2004 (WA)
- MARPOL: International Convention for the Prevention of Pollution from Ships
- International Finance Corporation: EHS Guidelines: Environmental Waste Management.

### 7.7.3 Environmental Impact Assessment

#### 7.7.3.1 MODU and Support Vessels

All solid waste generated during the Petroleum Activity will be transported to and managed appropriately by third parties. Environmental impacts associated with onshore disposal relate to the small incremental increase in waste volumes received at the onshore licensed waste recycling and disposal sites. The environmental impacts associated with waste disposal onshore are anticipated to be minor, based on the minor quantities involved and recycling of some materials.

Hazardous waste materials will be classified and managed in accordance with the waste management procedures. This will include ensuring hazardous materials are disposed of by suitable waste management facilities. The measured concentrations of potential contaminants deposited during production, such as NORM and mercury, are low. Specific management plans for contaminated equipment recovered from the seabed are not required.

#### 7.7.3.2 Recovered Well Infrastructure

Environmental impacts associated with the disposal of subsea infrastructure, specifically the wellheads and xmas trees, will depend on the waste management approach:

- Reuse of subsea infrastructure has no or very minor environmental impact.
- Recycling of subsea infrastructure requires energy use associated with a recycling process (e.g., use of heat etc). The use of energy has no or very minor environmental impact.
- The disposal of subsea infrastructure to landfill contributes to the overall volume of waste going to landfill each year.

Whilst the volumes of waste material associated with the subsea infrastructure are relatively minor compared to the volume of waste going to landfill in Australia each year (estimated at 20 million tonnes each year (Australian Bureau

of Statistics, 2020)), the exploration of reducing waste to landfill through recycling and other waste management practices is part of the *National Waste Policy Action Plan 2019* (Commonwealth of Australia, 2019). In addition, Woodside utilises an ALARP approach to waste impact reduction and follow the waste management hierarchy.

Whilst Woodside’s waste management philosophy follows the waste management hierarchy, in some instances it is not always feasible to reuse or recycle decommissioned infrastructure. If some well infrastructure waste goes to landfill the environmental impacts are anticipated to be minor, based on the relatively small quantities involved.

Hazardous waste materials will be classified and managed in accordance with the waste management procedures. This will include ensuring hazardous materials are disposed of by suitable waste management facilities.

**7.7.4 Demonstration of ALARP**

The ALARP process for the environmental aspect is summarised in **Table 7-16**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

**Table 7-16: Waste Generation - ALARP Summary**

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| <b>Legislation, Codes and Standards</b>   |                 |   |                                  |
| Marine Order 95 – Marine Pollution Prevention—Garbage (as appropriate to vessel class), prescribes matters necessary to give effect to Annex V of MARPOL, which prohibits the discharge of all garbage into the sea, except as provided otherwise.  | Accept          | Legislative requirements to be followed reduces the potential for contamination between hazardous and non-hazardous wastes by requiring waste segregation on the MODU and Project Vessels in accordance with a waste management plan.<br>The control is based on a legislative requirement and therefore must be adopted. | <b>PS 8.1</b>                    |
| Disposal of any hazardous waste associated with the subsea infrastructure will comply with relevant State and Commonwealth legislation: <ul style="list-style-type: none"> <li>Commonwealth Hazardous Waste (Regulation of Exports and Imports) Act 1989</li> <li>WA Environmental Protection (Controlled Waste) Regulations 2004.</li> </ul> | Accept          | Legislative requirements to be followed reduce the likelihood of incorrect disposal of infrastructure.<br>The control is based on a legislative requirement and therefore must be adopted.  | <b>PS 8.2</b>                    |
| <b>Administrative</b>   |                 |   |                                  |
| Implement an infrastructure disposal and resource recovery strategy that: <ul style="list-style-type: none"> <li>monitors and tracks waste from recovery to end state</li> <li>considers the waste hierarchy when determining appropriate</li> <li>end state for waste</li> <li>describes contingency procedures for dealing with</li> </ul>  | Accept          | Reduces the risk of unsuitable disposal through efficient use of resources and reduces the risk of unplanned contamination of waste streams during disposal.<br>Control is feasible and can be implemented with minimal cost. Control considered standard practice. Benefits outweigh cost sacrifice.                     | <b>PS 8.3</b>                    |

| Control Measure  | Accept / Reject | Reason  | Associated Performance Standards |
|--|-----------------|---|----------------------------------|
| contaminants offshore and onshore.   |                 |   |                                  |
| Undertake engagement with waste contractors to identify potential waste disposal pathways. | Accept          | Waste management practices will aim to reduce the volume of waste to landfill.<br>Control is feasible and can be implemented with minimal cost. Control considered standard practice. Benefits outweigh cost sacrifice. | PS 8.4                           |

#### 7.7.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 7-16**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts of solid waste generation from the petroleum activity to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential impacts of waste generation. No additional controls were identified. The impacts are therefore considered reduced to ALARP.

#### 7.7.5 Demonstration of Acceptability

Given the adopted controls, waste generation will not result in potential impacts greater than minor due to the materials handled onshore for disposal or recycling.

Waste generation cannot be eliminated. The adopted controls are considered good oil-field practice/industry best practice. No concerns or objections regarding waste generation have been raised by relevant stakeholders. The environmental impact meets the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impacts are consistent with the principles of ESD:

- **Integration Principle:** P&A activities allow ongoing decommissioning of the Stybarrow Field to progress which will achieve favourable short to long term environmental, social and economic outcomes.
- **Precautionary Principle:** The waste generation aspect, and its potential impacts, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** The waste generation aspect will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** The waste generation aspect will not impact upon biodiversity or ecological integrity.

Woodside considers the impact to be managed to an acceptable level.

## 7.7.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes  | Controls  | Performance Standards  | Measurement Criteria   |
|---|---|--|--|
| <p><b>EPO 8</b><br/>Waste generated is segregated and disposed of onshore in accordance with relevant legislation</p> | <p><b>C 8.1</b><br/>Marine Order 95 – Marine Pollution Prevention— Garbage (as appropriate to vessel class), prescribes matters necessary to give effect to Annex V of MARPOL, which prohibits the discharge of all garbage into the sea, except as provided otherwise.</p>   | <p><b>PS 8.1</b><br/>MODU and Project Vessels compliant with Marine Order 95.</p>  | <p><b>MC 8.1.1</b><br/>Records demonstrate MODU and Project Vessels are compliant with Marine Order 95.</p>  |

## 7.8 Seabed Disturbance

### 7.8.1 Summary of Risk Assessment and Evaluation

| Aspect                         | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context           | Acceptability |
|--------------------------------|---|---|-----------------|-------------------|---------------|----------------------------|---------------|
| Physical disturbance to seabed | Disturbance to seabed from MODU station keeping (mooring installation or deployment of DP positioning equipment)  | Disturbance of seabed habitat and associated communities. | 10              | N/A               | -             | Type A<br>Low Order Impact | Tolerable     |
|                                | Installation of BOP tethering system  |   |                 |                   |               |                            |               |
|                                | Disturbance to seabed from subsea cleaning and preparation for permanent plugging activities (water jetting, marine growth removal, sediment relocation) and use of ROV |   |                 |                   |               |                            |               |
|                                | Disturbance to seabed from cutting and removal well infrastructure, including disconnection of ancillary equipment and installation of mud mats for equipment laydown.  |   |                 |                   |               |                            |               |
|                                | ROV operations  |   |                 |                   |               |                            |               |

### 7.8.2 Source of Hazard

#### 7.8.2.1 MODU Positioning

A description of the seabed disturbance caused from MODU positioning activities has been summarised below, depending on whether a moored MODU or DP MODU is used to conduct P&A activities.

##### **MODU Mooring Installation and Anchor Hold Testing (Moored MODU only)**

A moored semi-submersible MODU may be used for the petroleum activity, which would require moorings to be set on the seabed. The standard mooring system aboard the Diamond Ocean Apex (an indicative moored MODU) consists of eight (3 ¼") x 4,200 ft. RQ5 chains, eight (3 ¾") x 8,800 ft. wires, and eight 15T Stevpris MK6 anchors with an individual footprint of approximately 30 m<sup>2</sup>. The capacity of the standard mooring system may be expanded to a 12-point mooring system, depending on the outcomes of the mooring analysis.

Anchors and chains from semi-submersible MODUs come into contact with the seabed during the deployment and removal of the MODU. Anchors are laid and retrieved by a support vessel, which carries the anchors to position and deploys them directly on the seabed. If the anchors are dragged accidentally during laying or retrieval, a larger localised area may be temporarily disturbed around the anchor locations.

Moorings will be placed in a radius around the well of up to 4000 m and a mooring analysis will be undertaken to

determine the appropriate mooring pattern. The area of seabed affected by anchoring operations depends upon water depth, currents, size of the vessels and anchors, and length of anchor chain (NERA, 2018a). As part of mooring preparations, anchor holding testing may be conducted and may result in short-term, localised anchor drag on the seabed. The planned anchoring activities will be within the parameters defined in the *Anchoring of Vessels and Floating Facilities EP Reference Case* (Department of Industry, Innovation and Science, undated) during the petroleum activity, including:

- installation of moorings, buoys, equipment or other infrastructure for a period of up to two years
- wet storage on seabed of anchor chains etc., during activities up to two years
- activities with total areas of seabed disturbance less than 13,000 m<sup>2</sup>
- locations of water depth greater than 70 m. This boundary is set to exclude areas of sensitive primary producer habitats (e.g. corals, seagrass) that occur in shallower waters.

#### **Installation of Transponders for DP Positioning (DP MODU)**

If a DP MODU is used to complete the petroleum activity, transponders will need to be deployed to maintain position at the required location. The transponders are typically deployed in an array on the seabed, using clump weights comprising concrete, for the duration of P&A activities at each well, and are recovered at the end, generally by ROV. If clump weights are used, they will be recovered following completion of the P&A campaign.

### **7.8.2.2 Preparatory Activities for P&A**

#### **Installation of BOP Tethering System**

A BOP tether system may be used to manage wellhead fatigue during the P&A activities. This system is planned to consist of clump weights weighing about 25 tonnes each, although the use of suction pilling may be considered instead of clump weights. There would be around four to eight clump weights used, though this may change once seabed and current conditions are better understood. The clump weights would be placed about 20 to 40 m from the wellhead, then the tether would be connected and tensioned using an ROV. If suction piles have to be used instead of clump weights, four 160-inch piles would be needed per tether system. The BOP tether system will result in localised seabed disturbance. The BOP tethering system will be recovered following completion of the P&A campaign.

#### **Subsea cleaning and sediment relocation**

Subsea cleaning activities include removing marine growth and mineral deposits from infrastructure such as the subsea trees and wellheads and if required, relocating sediment that has built up around well infrastructure to enable clear access for connection to the BOP and MODU. Cleaning and marine growth removal may be done in various ways. Those that have the potential to impact the seabed include use of high-pressure water and/or brushes on ROVs. Sediment removal involves using an ROV-mounted suction pump unit to remove sediment that has built up around the well infrastructure.

#### **Disconnection and laydown of ancillary equipment connected to the subsea trees**

ROV operated cutting tools may be required to sever the remaining connected flying leads and jumpers from the subsea tree. Once severed, the equipment will be laid on the seabed temporarily for recovery as part of the Stybarrow Subsea Removal campaign defined in the Stybarrow Equipment Removal and Field Management EP.

#### **Installation of mud mats and other ancillary equipment during preparatory activities**

It is expected at least three mud mats will be required to be deployed on the seabed adjacent to the wells to allow the three non-drill through trees to be disconnected from the wellbore and temporarily wet parked on the seabed whilst permanent plugging of the well is being conducted. In the event of any unforeseen issues with gaining access to the wellbore through the other subsea trees, further mud mats may be required if P&A activities cannot be conducted with the tree still connected. Deployment of mud mats is expected to result in temporary seabed disturbance of 3.5 m by 3.5 m per mud mat near the location of each well. Mud mats will be recovered following recovery of the subsea trees.

### **7.8.2.3 Cutting and removal of well infrastructure**

Well infrastructure removal activities may be conducted from the MODU directly following permanent plugging of the

wells, or later using a light construction vessel or anchor handling vessel as part of the Stybarrow subsea infrastructure removal campaign. To enable the recovery of the well infrastructure above the mudline, sediment that has built up around the infrastructure may require relocation (about 3 - 5 m below the mudline for recovery of the wellheads). Relocating sediment involves using an ROV-mounted suction pump/dredging unit, with sediment relocated nearby.

Removal of the wellheads will involve internal cutting, which may result in localised sediment relocation and temporary increase in turbidity, metal swarf generated during the cutting activity is expected to remain within the wellbore with only a small quantity released to the seabed in the localised area around the wellhead. If internal cutting is not possible, the wellhead will be cut externally as close to the mudline as practicable. An external cut is expected to generate metal swarf and cement cuttings that will be deposited in the localised area around the well. Removal activities would result in localised disturbance including temporary increased turbidity and relocation of sediment.

The subsea trees and wellheads may be set down on the seabed in the immediate vicinity of removal for a period to enable safe rigging before recovery. Placement of the subsea infrastructure and wellheads on the seabed will result in temporary seabed disturbance and causing turbidity and increased suspension of sediment.

#### 7.8.2.4 ROV Operations

The use of the ROV during the petroleum activity may result in temporary seabed disturbance and suspension of sediment causing increased turbidity as a result of working close to, or occasionally on, the seabed. ROV use close to or on the seabed is limited to that required for effective and safe subsea activities. The footprint of a typical ROV is about 2.5 m × 1.7 m.

### 7.8.3 Environmental Impact Assessment

MODU station keeping, subsea cleaning and preparation, installation of mud mats, well infrastructure removal and ROV operations are likely to result in localised to short-term, physical modification to the seabed and localised disturbance to soft sediments.

Benthic habitats within the footprint of the infrastructure laydown consist of soft, unconsolidated sediments which host sparse assemblages of filter- and deposit-feeding epifauna and infauna, as well as demersal fishes. These soft sediment habitats, and associated biological communities, are widely represented throughout the NWMR and are not considered to be of particular conservation significance.

Results from the pre-decommissioning environmental survey within the Stybarrow field (Cardno, 2019) are presented in **Section 4.4**. This survey found that sediment contamination was localised to areas of disturbance (e.g., drilling centres) with low levels of infauna and demersal fauna, which is consistent with other locations of similar depths.

Given the concentrations of potential contaminants in sediments were all below the guideline value-high concentrations (Commonwealth of Australia and New Zealand Government, 2018), elevated turbidity and seabed disturbance is not anticipated to have toxic impacts to marine fauna in the water column, or toxic impacts to smothered benthic habitats.

Concentrations of the sediment radionuclides (including NORM) were low and uniform, with small variations attributed to depth and/or variations in sediment size and were therefore thought representative of background conditions at all stations (Cardno, 2019). Radiation assessments of the Stybarrow equipment found very low levels of NORMs, with little NORMs apparently deposited in equipment during production (SA Radiation, 2018). No impacts from NORMs are therefore anticipated during seabed disturbance.

Visual surveys indicate very sparse benthic communities in the Stybarrow field, with soft sediments the only benthic habitat type observed in the field. This habitat type is very widely represented in the region. Installation of equipment on or near the seabed (e.g., the BOP, clump weights for the BOP tether system, etc.) will result in disturbance of the bare sediment habitat. This disturbance will be localised to the footprint of the equipment and is expected to be in the order of 10's of square metres. The habitats affected will recover over time following removal of the equipment. Consequently, the impacts to benthic habitats will be limited to widely represented habitat, localised, and will recover over time.

Sediment relocation (if required), along with activities near the seabed, will result in sediment resuspension. This will result in localised, short-term increases in turbidity. Resuspended sediments are expected to settle within 10's to 100's of meters, and the sediment plume will be localised around and down current from wellheads. Elevated turbidity and disturbance of seabed habitat and associated communities from seabed disturbance will be confined to sediment

burrowing infauna and surface epifauna invertebrates, such as filter feeders in the immediate vicinity. These species are considered to have low sensitivity to localised physical disturbance of subsea infrastructure and wellheads. Any impacts are anticipated to be localised and minor, given the low densities of benthic organisms (refer **Section 4.4**) and representation of the infauna communities within the Operational Area and the broader region.

The Operational Area overlaps the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula and Continental Slope Demersal Fish Communities KEFs; therefore, seabed disturbance may directly disturb a very small, localised area of the key ecological feature (KEF). Any disturbed areas are anticipated to recolonise over a 12-month period, any impact is determined to be temporary, localised, and minor.

#### 7.8.4 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 7-17**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

**Table 7-17: Seabed Disturbance - ALARP Summary**

| Control Measure  | Accept / Reject | Reason  | Associated Performance Standards |
|--|-----------------|---|----------------------------------|
| <b>Eliminate</b>   |                 |   |                                  |
| Only use DP MODU (no anchoring required).  | Reject          | It is feasible to use a DP MODU and would eliminate seabed disturbance and associated impacts to benthic communities from anchor placement and movement. However, impacts of anchoring are assessed as low.<br><br>While Woodside plans to use a DP MODU, flexibility is required to meet General Direction obligations and other contractual and operational constraints. Cost of implementation is considered grossly disproportionate to the benefit gained. | Not applicable                   |
| Eliminate ROV use  | Reject          | The use of ROVs (including work close to or occasionally landed on the seabed) is required during wellhead removal and field management activities. ROV usage is already limited to only that required to conduct the work effectively and safely.  | Not applicable                   |
| Eliminate equipment removal  | Reject          | Leaving the equipment <i>in situ</i> has been investigated.   | Not applicable                   |
| <b>Engineering</b>   |                 |   |                                  |
| Undertake Project-specific Mooring Design Analysis (for moored MODU)   | Accept          | The mooring design analysis determines the number and spread of anchors required based on sediment type and seabed topography, reducing the likelihood of anchor drag leading to seabed disturbance.<br><br>Mooring analysis is common practice and cost of implementing control is proportionate to the potential environmental benefit.   | <b>PS 9.1</b>                    |
| Clump weights and transponders will be recovered from the seabed upon completion of P&A activities (for DP MODU) | Accept          | If a DP MODU is used to complete the petroleum activity, transponders will need to be deployed to maintain position at the required location. The transponders are typically deployed in an array on the seabed, using clump weights comprising concrete, for the   | <b>PS 9.2</b>                    |

| Control Measure   | Accept / Reject | Reason   | Associated Performance Standards |
|---|-----------------|--|----------------------------------|
|   |                 | duration of P&A activities at each well, and are recovered at the end, generally by ROV. If clump weights are used, they will be recovered   |                                  |
| <b>Separate</b>   |                 |  |                                  |
| Do not use ROV close to, or on, the seabed.   | Reject          | Control is not considered feasible. The use of ROV (including working close and landing on the seabed) is critical as the ROV is the main tool used to guide and manipulate equipment during P&A activities. ROV usage is already limited to only that required to conduct the work effectively and safely. Due to visibility and operational issues ROV work on or close to the seabed is avoided unless necessary.   | Not applicable                   |
| <b>Administrative</b>   |                 |  |                                  |
| Wet parked items will be tracked and removed from the seabed  | Accept          | Ensures inventory of equipment is maintained and no wet parked items are unintentionally left <i>in situ</i> .<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.  | <b>PS 9.3</b>                    |
| Environmental monitoring of the seabed before and after the Petroleum Activity to assess any impacts to the seabed.   | Reject          | Environmental monitoring would not result in any additional information about the seabed above what is provided by the Woodside Well Location and Site Appraisal Data Sheet and mooring design analysis. Therefore, no additional reductions in likelihood or consequence would occur.<br>Control is considered grossly disproportionate. Monitoring will not reduce the consequence or likelihood of any impacts to the seabed, and the cost associated with the level of monitoring required to accurately assess any impacts greatly outweighs the benefits gained.<br>Although adoption of this control could be used to verify EPOs, alternative controls identified also allow demonstration that the environmental outcome has been met based on the nature of the activity (i.e., predictable impacts) and relatively low sensitivity of the area. | Not applicable                   |
| Unexpected finds of potential Underwater Cultural Heritage sites/features, including First Nations UCH, are managed in accordance with an Unexpected Finds Procedure set out in <b>Section 11.4</b> . | Accept          | Allows management of new finds in accordance with legislative requirements (including Underwater Cultural Heritage Guidance for Offshore Developments and the DRAFT Guidelines to Protect Underwater Cultural Heritage under the UCH Act), expert advice and community expectations.   | <b>PS 17.1</b>                   |
| Report any potential underwater cultural heritage finds to relevant stakeholders and authorities in accordance with the Unexpected Finds Procedure, Underwater  | Accept          | Meets legislative requirements and community expectations.   | <b>PS 17.2</b>                   |

| Control Measure   | Accept / Reject | Reason   | Associated Performance Standards |
|---|-----------------|--|----------------------------------|
| Cultural Heritage Act 2018 and the ATSIHP Act.  |                 |  |                                  |
| Relevant vessel crew and ROV operators will be advised in an induction of the potential to encounter UCH and requirement to follow the Unexpected Finds Procedure (C 17.2). | Accept          | Ensures workforce are suitably aware of legal and process requirements for managing cultural features and heritage values. | PS 17.3                          |

#### 7.8.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 7-17**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the impacts from seabed disturbance to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential impacts from seabed disturbance during the petroleum activity. Additional reasonable control measures were identified in **Table 7-17** to further reduce impacts but rejected since the associated cost and sacrifice was grossly disproportionate to any benefit. The impacts are therefore considered reduced to ALARP.

#### 7.8.5 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, seabed disturbance as a result of the petroleum activity will not result in potential impacts greater than temporary and minor reduction in water quality and disturbance to seabed habitat and benthic communities.

Further opportunities to reduce the impacts have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good oil-field practice/industry best practice. No concerns or objections regarding the impacts associated with planned seabed disturbance have been raised by relevant persons. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental impacts meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental impacts are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The planned seabed disturbance, and its potential impacts, are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** The planned seabed disturbance as a result of the petroleum activity will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity principle:** The planned seabed disturbance as a result of the petroleum activity will not impact upon biodiversity or ecological integrity in the long-term.

On this basis, Woodside considers the impact to be managed to an acceptable level.

## 7.8.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes   | Controls   | Performance Standards  | Measurement Criteria   |
|--|--|--|--|
| <b>EPO 9</b><br>No impacts to benthic habitats greater than a severity level of 2 within the Operational Area during the petroleum activity. | <b>C 9.1</b><br>Undertake Project-specific Mooring Design Analysis (for moored MODU)   | <b>PS 9.1</b><br>Seabed disturbance from MODU mooring limited to that required to ensure adequate MODU station holding capacity.   | <b>MC 9.1.1</b><br>Records demonstrate Mooring Design Analysis completed and implemented during anchor deployment. |
|  | <b>C 9.2</b><br>Clump weights and transponders will be recovered from the seabed upon completion of P&A activities (for DP MODU)   | <b>PS 9.2</b><br>Seabed disturbance from clump weights and transponders limited to that required for the petroleum activity.   | <b>MC 9.2.1</b><br>Records demonstrate recovery of clump weights and transponders from the seabed                  |
|  | <b>C 9.3</b><br>Wet parked items will be tracked and removed from the seabed   | <b>PS 9.3</b><br>Wet parked equipment inventory maintained, with equipment removed from the seabed.  | <b>MC 9.3.1</b><br>Records demonstrate wet parked equipment is recorded and removed.                               |
| <b>EPO 17</b><br>Avoid, or where not possible, minimise impacts to cultural features.  | <b>C 17.1</b><br>Unexpected finds of potential Underwater Cultural Heritage sites/features, including First Nations UCH, are managed in accordance with an Unexpected Finds Procedure set out in <b>Section 11.4</b> . | <b>PS 17.1.1</b><br>In the event that an Underwater Cultural Heritage site or feature is identified, implement an Unexpected Finds Procedure set out in <b>Section 11.4</b> .                        | <b>MC 17.1.1</b><br>No non-compliance with the Unexpected Finds Procedure.   |
|  | <b>C 17.2</b><br>Report any potential UCH finds to relevant stakeholders and authorities in accordance with the Unexpected Finds Procedure, Underwater Cultural Heritage Act 2018 and the ATSIHP Act.                  | <b>PS 17.2.1</b><br>Report any finds of potential UCH in accordance with the Unexpected Finds Procedure ( <b>Section 11.4</b> ) including to the Australasian Underwater Cultural Heritage Database. | <b>MC 17.2.1</b><br>Records of potential UCH finds reported to relevant authorities and stakeholders.              |
|  | <b>C 17.3</b><br>Relevant vessel crew and ROV operators will be advised in an induction of the potential to encounter UCH, and of their requirement to follow the Unexpected Finds Procedure ( <b>C 17.2</b> ).        | <b>PS 17.3.1</b><br>Relevant vessel crew (including ROV operators) are made aware of the requirements of the Unexpected Finds Procedure through an induction.  | <b>MC 17.3.1</b><br>Records demonstrate vessel crew are made aware of potential to encounter UCH.                  |

## 8 Environmental Risk Assessment and Evaluation: Unplanned Events

The purpose of this section is to address the requirements of Regulations 13(5) and 13(6) of the Environment Regulations by assessing and evaluating all the identified impacts and risks associated with the Petroleum Activity and associated control measures that will be applied to reduce the impacts and risks to ALARP and an acceptable level. This section presents the environmental impacts and risks associated with unplanned events of the Petroleum Activity.

**Table 8-1** summarises the impact and risk analysis for the aspects associated with the unplanned events. A comprehensive risk and impact assessment for each of the unplanned events, and subsequent control measures proposed by Woodside to reduce the risk and impacts to ALARP and acceptable levels, are detailed in the subsections.

Table 8-1: Summary of the Environmental Risk Analysis For Unplanned Events

| Aspect  | Environmental  |                 |      |                       |                          |               |             |                        |                         | Socio-economic       |          |                      | Risk Assessment & Evaluation |                   |               |               |
|---|----------------|-----------------|------|-----------------------|--------------------------|---------------|-------------|------------------------|-------------------------|----------------------|----------|----------------------|------------------------------|-------------------|---------------|---------------|

## 8.1 Quantitative Spill Risk Assessment Methodology

Quantitative hydrocarbon spill modelling was performed by RPS (RPS, 2022a, 2022b) on the worst-case credible release scenarios for the loss of well containment and vessel collision using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, SIMAP (Spill Impact Mapping and Analysis Program). SIMAP is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces. The loss of containment during bunkering scenario was not modelled as this scenario has the same hydrocarbon type, release location, and substantially smaller volume than the vessel collision scenario; hence the environmental risks from the bunkering incident will be contained within the EMBA defined by the vessel collision scenario modelling results.

The stochastic model within SIMAP performs a large number of simulations for a given release site, randomly varying the release time for each simulation. The model uses the spill time to select samples of current and wind data from a long time series of wind and current data. Hence, the transport and weathering of each slick will be subject to a different sample of wind and current conditions. More simulations will tend to use the most commonly occurring conditions, while conditions that are more unusual will be represented less frequently.

Results of the replicate simulations are statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point. The stochastic approach captures a wide range of potential weathering outcomes under varying environmental conditions, which is reflected in the aggregated spatial outcomes showing the areas that might be affected by sea surface and subsurface hydrocarbons.

The modelling outcomes are presented in **Sections 8.2** and **8.3** and provide a conservative understanding of where hydrocarbons could travel in any metocean condition. The modelling does not consider any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of the EMBA.

Environmental receptors selected for the modelling are chosen based on protected area status, sensitivity of habitats to impact and societal values. **Appendix C** presents the locations of the environmental receptors used in the modelling.

### 8.1.1 Worst-case Hydrocarbon Spill Scenarios

To determine potential impacts of an unplanned hydrocarbon release, representative worst-case scenarios (in terms of volume and location) were assessed. The credible worst case hydrocarbon spill scenarios that could occur as a result of an unplanned event during the petroleum activity have been summarised in **Table 8-2**.

**Table 8-2: Summary of worst-case hydrocarbon spill scenarios**

| Worst-case Scenario      | Number of spill simulations | Hydrocarbon type | Release type and Location                           | Total spill volume (m <sup>3</sup> ) | Release duration |
|--------------------------|-----------------------------|------------------|---|--------------------------------------|------------------|
| Loss of well containment | 300*                        | Stybarrow crude  | Subsea release from the Stybarrow-7 production well | 10,264                               | 73 days          |
| Vessel collision         | 300*                        | Marine diesel    | Surface release at DTM location                     | 1,000                                | Instantaneous    |
| Bunkering incident       | 300*                        | Marine diesel    | Surface release at DTM location                     | 37.5                                 | Instantaneous    |

\* 100 runs in each season – summer (October to March), transitional (April and September) and winter (May to August)

#### **Loss of Well Containment Scenario**

A 73-day release of Stybarrow crude from the Stybarrow-7 (H-2) at the seabed was modelled for summer, transitional and winter seasons. Stybarrow crude is heavier and more persistent than Eskdale crude and the Stybarrow-7 (H-2) well had the greatest cumulative release volume of all the wells within the scope of the Petroleum Activity. Hence a release from the Stybarrow-7 (H-2) well was determined to have a greater potential for environmental impact and

was used at the basis for the worst-case scenario. The release volume and duration for the worst-case loss of well containment was determined by a Woodside engineering study. This study considered a range of factors, such as the hydrocarbon type, reservoir characteristics and well design. The study took a conservative approach when estimating reservoir pressure, with the scenario pressure likely to be substantially higher than the actual pressure in the well. This approach is consistent with the precautionary principle. The release duration of 73 days was based on the time required to kill the Stybarrow-7 (H-2) well by drilling a relief well.

#### **Vessel Collision Scenario**

A 1,000 m<sup>3</sup> surface release of marine diesel over 1 hour, to represent the loss of containment resulting from a vessel collision was modelled at the Stybarrow Disconnectable Turret Mooring (DTM) buoy location (deemed to be a representative location for vessel-based activities considered in this EP) for summer, winter and transitional seasons. This volume and location are considered appropriate, although conservative, for informing the approximate spatial extent of potential impacts from a worst-case credible release from a vessel collision event during the Petroleum Activity. The volume is consistent with the guidance from AMSA (2015), which recommends using the entire volume of the largest fuel tank onboard a vessel for contingency planning. The volumes of the largest fuel tanks onboard vessels undertaking the Petroleum Activity are likely to be substantially smaller than 1,000 m<sup>3</sup>, making the environmental risk assessment inherently conservative. Vessels will use marine diesel, with no heavy or intermediate fuel oils used.

#### **Bunkering Scenario**

The guidance provided by AMSA (2015) for a bunkering spill under continuous supervision is considered appropriate, given bunkering will be constantly supervised. The maximum credible release volume during refuelling is calculated as transfer rate multiplied by 15 minutes of flow. The detection time of 15 minutes is seen as conservative but applicable after failure of multiple barriers followed by manual detection and isolation of the fuel supply. Based on an expected pumping rate of 150 m<sup>3</sup>/hour and a conservative time of 15 minutes to shut down the pumping operation once the fuel spill had been identified, a total release volume of around 37.5 m<sup>3</sup> is proposed as the worst-case credible volume for a bunkering incident. The release location was assumed to be where Stybarrow FPSO was previously moored during operations.

### **8.1.2 Hydrocarbon Properties**

The physical characteristics of Stybarrow crude and marine diesel as used in the hydrocarbon spill modelling studies are summarised in **Table 8-3** and **Table 8-4**.

Stybarrow crude is a Group IV oil (heavy-persistent) based on categorisation and classification by International Tanker Owners Pollution Federation (2011a). It has a high density of 916.9 kg/m<sup>3</sup> (API of 22.8) and a low pour point of -36 °C. Marine diesel is a Group II oil (light-persistent) based on categorisation and classification by International Tanker Owners Pollution Federation (2011a). It has a density of 829.1 kg/m<sup>3</sup> (API of 37.6) and a low pour point of -14 °C.

**Table 8-3: Summary of physical properties of Stybarrow crude and marine diesel (RPS, 2022a, 2022b)**

| Characteristic                      | Stybarrow Crude  | Marine Diesel    |
|-------------------------------------|------------------|------------------|
| Density (kg/m <sup>3</sup> )        | 916.9 (at 15 °C) | 829.1 (at 25 °C) |
| API                                 | 22.8             | 37.6             |
| Dynamic Viscosity (cP)              | 45.5 (at 20 °C)  | 4.0 (at 25 °C)   |
| Pour Point (°C)                     | -36              | -14              |
| Wax Content (%)                     | 16.8             | -                |
| Asphaltenes (%)                     | < 0.5            | -                |
| Hydrocarbon Property Category       | Group 4          | Group 2          |
| Hydrocarbon Property Classification | Heavy persistent | Light persistent |

Table 8-4: Boiling point ranges for Stybarrow crude and marine diesel (RPS, 2022a, 2022b)

| Oil Type        | Component          | Volatile (%)                            | Semi-volatile (%)                           | Low Volatility (%)                          | Residual (%)          |
|-----------------|--------------------|---|---|---|-----------------------|
|                 | Boiling Point (°C) | <180 (C <sub>4</sub> -C <sub>10</sub> ) | 180-260 (C <sub>11</sub> -C <sub>15</sub> ) | 260-380 (C <sub>16</sub> -C <sub>20</sub> ) | >380 >C <sub>20</sub> |
| Stybarrow crude | % total            | 3.1                                     | 23.7  | 30.6  | 42.6                  |
| Marine diesel   |                    | 6.0                                     | 34.6  | 54.4  | 5.0                   |

### 8.1.3 Hydrocarbon Exposure Values

As described in **Section 4.2**, the spatial extent of the EMBA has been derived using stochastic hydrocarbon fate and transport modelling of the worst-case credible release scenarios. To present this large amount of simulated data in a meaningful way and to inform the impact and risk assessment and environmental management actions, appropriate hydrocarbon exposure values were applied to each of the hydrocarbon components. NOPSEMA (2019) recommends selecting hydrocarbon exposure values that broadly reflect the range of consequences that could occur at various concentrations.

The EMBA presented in **Figure 4-1** was defined using exposure thresholds values presented in **Table 8-5**.

Table 8-5: Summary of exposure thresholds used to define the EMBA

| Hydrocarbon Component           | Units            | EMBA Exposure Value |
|---------------------------------|------------------|---------------------|
| Surface hydrocarbons            | g/m <sup>2</sup> | 1                   |
| Shoreline hydrocarbons          | g/m <sup>2</sup> | 10                  |
| Entrained hydrocarbons          | ppb              | 100                 |
| Dissolved aromatic hydrocarbons | ppb              | 50                  |

As the weathering of different components of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean conditions, the EMBA combines the potential spatial extent of the different hydrocarbon components. The EMBA also includes areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations.

The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for a variety of weather and metocean conditions, and the EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. Furthermore, as the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean transport mechanism, a different EMBA is presented for each fate. These EMBA together define the spatial extent for the existing environment, which is described in **Section 4.2**. Hydrocarbon contact below the defined thresholds may occur outside the EMBA and socio-cultural EMBA; however, the effects of these low exposure values will be limited to temporary exceedance of water quality triggers.

Table 8-6 presents justification for the exposure thresholds used to define the EMBA. The table also details how different exposure threshold values are relevant to the impact assessment for an MDO release (**Section 8.3**).

Table 8-6: Descriptions of hydrocarbon exposure thresholds

| Exposure Levels               | Threshold Exposure Value | Description   |
|-------------------------------|--------------------------|---|
| <b>Surface Hydrocarbons</b>   |                          |   |
| Low                           | 1 g/m <sup>2</sup>       | <p>It is recognised that 1 g/m<sup>2</sup> represents the practical limit of observing hydrocarbon sheens in the marine environment. This exposure value is below the levels that would cause ecological impacts but is considered relevant to approximate the area of effect to socio-economic receptors.</p> <p>This exposure value has been used to define the spatial extent of the EMBA from surface hydrocarbons</p>  |
| Moderate                      | 10 g/m <sup>2</sup>      | <p>This value is considered appropriate to assess ecological impact risk, as it is the estimate for the minimum thickness of oil that will result in harm to seabirds through ingestion from preening of contaminated feathers, or the loss of thermal protection of their feathers. This has been estimated by at 10 to 25 g/m<sup>2</sup> (French-McCay, 2009; Koops et al., 2004).</p> <p>Furthermore, based on literature reviews on aquatic birds and marine mammals (Clark, 1984; Engelhardt, 1983; Geraci, 1988; Jenssen, 1994), the exposure value for harmful impacts is 10 g/m<sup>2</sup>.</p> <p>This exposure value is used to determine the risk of exposure that can cause adverse impact to turtles, seasnakes, marine mammals and seabirds. This threshold was selected as a reasonable and conservative value to apply to the risk evaluation with respect to surface hydrocarbons.</p> |
| High                          | 50 g/m <sup>2</sup>      | <p>This high exposure value for surface oil is above the minimum threshold observed to cause ecological effect. At this concentration surface hydrocarbons would be clearly visible on the sea surface.</p>   |
| <b>Shoreline Hydrocarbons</b> |                          |   |
| Low                           | 10 g/m <sup>2</sup>      | <p>This low exposure value defines the area for potential socio-economic impacts (for example, reduction in aesthetic value of the area).</p> <p>This exposure value has been used to define the spatial extent of the EMBA from shoreline hydrocarbons.</p>  |
| Moderate                      | 100 g/m <sup>2</sup>     | <p>The concentration for exposure to hydrocarbons stranded on shorelines is derived from levels likely to cause adverse impacts to intertidal habitats and associated fauna. Studies have reported oil thicknesses of 0.1 mm (100 g/m<sup>2</sup>) as the lethal exposure values for benthic epifaunal invertebrates on intertidal habitats (rock, artificial or human-made) and in intertidal sediments (mud, silt, sand and gravel) (French McCay, 2004; French McCay et al., 2003; French-McCay, 2009). It is also the impact threshold assumed for oiling of birds (French McCay, 2004).</p> <p>This exposure value has been used to inform the risk evaluation with respect to accumulated shoreline hydrocarbons and the threshold for shoreline response, based on possible clean-up options.</p>  |
| High                          | 1,000 g/m <sup>2</sup>   | <p>This high exposure value predicts the area likely to require intensive clean-up effort.</p>  |
| <b>Entrained Hydrocarbons</b> |                          |   |
| Low                           | 10 ppb                   | <p>Total submerged hydrocarbons, also referred to as 'total water-accommodated fraction' or entrained hydrocarbons, encompass oil droplets in the water column. Much of the published scientific literature does not provide sufficient information to determine if toxicity is caused by the dissolved or the entrained hydrocarbon component, but rather the toxicity of total submerged hydrocarbons. Variation in the methodology of the water-accommodated fraction may account for much of the observed wide variation in reported threshold values, which also depend on the test organism, duration of exposure, oil type and the initial oil concentration.</p>  |

| Exposure Levels                        | Threshold Exposure Value | Description   |
|--|--------------------------|---|
|  |                          | The 10 ppb exposure value represents the very lowest concentration and corresponds with the lowest trigger levels for total hydrocarbons in water recommended in the <i>Australian and New Zealand Guidelines for Fresh and Marine Water Quality: Volume 1 - the Guidelines</i> (Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand, 2000).   |
| Moderate                               | 100 ppb                  | This exposure value is considered conservative in terms of potential sub-lethal impacts to most species and lethal impacts to sensitive species based on literature for toxicity testing.<br>Total oil toxicity acute effects of total oil as LC50 for molluscs range from 500 to 2000 ppb. A wider range of LC50 values have been reported for species of crustacea and fish from 100 to 258,000,000 ppb (Clark et al., 2001; Gulec et al., 1997; Gulec and Holdway, 2000) and 45 to 465,000,000 ppb (Barron et al., 2004; Gulec and Holdway, 2000) respectively.<br>This exposure value has been used to define the spatial extent of the EMBA from total submerged hydrocarbons and used to describe environmental sensitivities within the EMBA. This exposure value has been used to inform the risk evaluation with respect to entrained hydrocarbons and used to describe environmental sensitivities within the EMBA. |
| <b>Dissolved Aromatic Hydrocarbons</b> |                          |   |
| Low                                    | 10 ppb                   | This low exposure value establishes the planning area for scientific monitoring (based on potential for exceeding water quality triggers).  |
| Moderate                               | 50 ppb                   | This exposure value approximates toxic effects, particularly sub-lethal effects to sensitive species (NOPSEMA, 2019). French-McCay et al. (2002) indicates an average 96-hour LC50 of around 50 ppb could serve as an acute lethal threshold. For most marine organisms, a concentration of between 50 and 400 ppb is considered to be more appropriate for risk evaluation.<br>This exposure value has been used to inform the risk evaluation with respect to dissolved hydrocarbons and used to describe environmental sensitivities within the EMBA.  |

#### 8.1.4 Scientific Monitoring

A planning area for scientific monitoring is defined with reference to the low-exposure entrained value of 10 ppb detailed in *Oil Spill Modelling* (NOPSEMA, 2019). This low exposure threshold is based on the potential for exceeding water quality triggers.

The scientific environmental monitoring program would be activated in accordance with the Petroleum Activity OPEP, or any release event with the potential to contact sensitive environmental receptors. A scientific monitoring program would be activated following a Level 2 or Level 3 unplanned hydrocarbon release, or any release event that has the potential to contact sensitive environmental receptors (as described further in **Section 10.4.9**)

## 8.2 Hydrocarbon Release from a Loss of Well Control

### 8.2.1 Summary of Risk Assessment and Evaluation

| Aspect  | Source of Hazard   | Potential Impact  | Severity Factor | Likelihood Factor      | Residual Risk | Decision Context            | Acceptability |
|---|--|---|-----------------|------------------------|---------------|-----------------------------|---------------|
| Unplanned Hydrocarbon release due to loss of well containment | Loss of hydrocarbons (Stybarrow or Eskdale crude oil) to the marine environment due to loss of well containment during P&A | Temporary, widespread reduction in water quality with potential for toxicity effects to marine fauna and flora, oiling of offshore, nearshore and shoreline habitats.<br>Impacts to socio-economic receptors. | 300             | Highly Unlikely (0.03) | 9             | Type B<br>Higher order risk | Tolerable     |

### 8.2.2 Source of Hazard

Woodside has identified a well blowout as the scenario with the worst-case credible environmental outcome as a result of loss of well containment. A loss of well containment is an uncontrolled release of reservoir hydrocarbon or other well fluids to the environment. A blowout is an incident where formation fluid flows out of the well or between formation layers after all the predefined technical well barriers (e.g. the BOP) or activation of the same has failed.

#### Industry Experience

A risk assessment by AMSA of oil spills in Australian ports and waters (Det Norske Veritas, 2011) concluded:

- overall national exceedance frequency for oil spills from offshore drilling in Australia is 0.033 for spills > 1 tonne/year decreasing to 0.008 for spills > 100 tonnes/year.
- probability of a blow-out from a well intervention is  $1 \times 10^{-4}$  (0.0001, or 0.01%), considerably lower than drilling activities (International Association of Oil and Gas Producers 2010).

Woodside has a good history of implementing industry standard practice in well design and construction. In the company's 60-year history, it has not experienced any well containment events that have resulted in significant releases or significant environmental impacts. Industry experience shows loss of well containment during P&A activities are very rare. The credible release volumes for loss of well containment during P&A activities are typically much lower than exploration or production drilling, as the reservoirs intersected by wells being P&A are usually depleted.

Therefore, in accordance with the risk matrix, Woodside considers a loss of well containment and resulting blowout event a 'highly unlikely' event as it has not occurred in the Company's history.

#### Worst Case Credible Scenario – Loss of Well Containment

As described in **Section 8.1.1**, Woodside has identified a loss of well containment from the Stybarrow-7 (H-2) production well as the worst-case credible release within the scope of the Petroleum Activity as the well is considered the highest flowing (total release volume) well. The worst-case credible loss of well containment scenario was guided by the *Calculation of Worst-case Discharge (WCD)* (Society of Petroleum Engineers, 2015) and *Australian Offshore Titleholders Source Control Guideline* (APPEA, 2021).

During the permanent plugging activities, there may be a requirement to cut and remove the tubing string and production packer to install cement barriers. The worst-case scenario has been based on the duration following removal of the tubing in the wellbore and prior to installation of cement barriers. Given the worst-case loss of well containment applies to a constructed well, actual as built and known well flow performance were used for modelling discharge calculations.

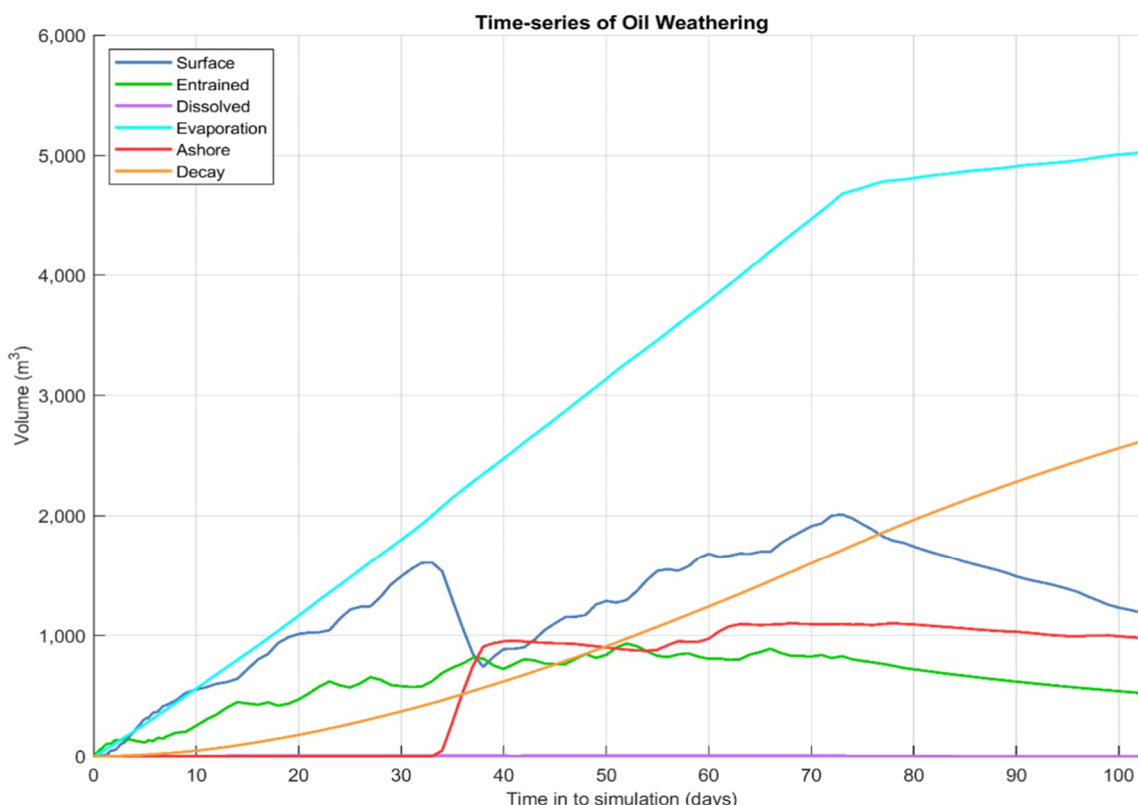

As the Stybarrow field contains a gas injection well (Eskdale-4), there is also a credible scenario for a loss of well containment to occur from this well, however, this is within the assessment of impacts to the marine environment and modelling conducted for the highest producing oil well. A loss of well containment could result from a number of scenarios, including from damage to the subsea tree or wellhead during permanent plugging operations. All potential credible scenarios are considered to be conservatively covered by the worst-case scenario modelled and risk assessed in this section.

Refer to **Section 8.1.1** for further information on the worst-case credible loss of well containment, such as hydrocarbon properties, release duration and release volumes.

### 8.2.3 Stochastic Oil Spill Modelling Results

Spill modelling undertaken by RPS APASA, on behalf of Woodside, to determine the fate of hydrocarbon released from the loss of well containment scenario, based on the assumptions in **Table 8-2**. Modelling considered metocean conditions throughout the year; this was done to inform the determination of consequence of loss of well control during intervention at any time of the year.

The Stybarrow crude contains about 3.1% (by mass) that should evaporate within the first 12 hours (BP < 180 °C), a further 23.7% should evaporate within the first 24 hours (180 °C < BP < 265 °C), and an additional 30.6% would likely evaporate over several days to a week (265 °C < BP < 380 °C). Approximately, 42.6% (by mass) of the crude will not evaporate, but rather persist in the environment and gradually decay over time. The persistent characteristics of the crude and the absence of aromatic components indicate that it has been exposed to bacterial degradation within the reservoir and as such can be classified as a biodegraded crude. An indicative weathering plot of Stybarrow crude is provided as **Figure 8-2**.

**Figure 8-1: Predicted weathering and fates for the simulation that resulted in the maximum volume of oil ashore from the loss of well containment scenario (from RPS, 2022b)**

## 8.2.3.1 Surface Hydrocarbons

| Exposure Thresholds  | Units  |
|--|--|
| <p><b>Low Exposure</b><br/>(<math>&gt; 1 \text{ g/m}^2</math>)</p>       | <p>In the event of the loss of well containment scenario occurring, surface hydrocarbons at or above <math>1 \text{ g/m}^2</math> (threshold related to socio-cultural EMBA) are forecast to potentially occur up to 1,977 km north-west of the release location.</p> <p>Four AMPs (Argo-Rowley AMP, Carnarvon AMP, Gascoyne AMP and Ningaloo AMP) were predicted to be exposed by floating oil at the low threshold across the three seasons, with probabilities ranging from 1 to 100%. Abrolhos AMP and Montebello AMP were predicted to be exposed by floating oil at the low threshold across only the summer and transitional conditions, with probabilities ranging from 1 – 29%. The Gascoyne AMP was predicted to record 100% probabilities during transitional and winter conditions and 99% during summer conditions. The minimum time before exposure at the Gascoyne AMP at the low threshold 0.25 days during winter conditions.</p> <p>Seven KEFs were predicted to be within the low exposure threshold, however all are subsea features and hence will not be exposed directly to hydrocarbons.</p> <p>Waters around Barrow Island Marine Management Area recorded floating oil exposure at the low threshold (during summer conditions only (21% probability), while Muiron Islands recorded exposure during summer (9%) and transitional (6%) conditions.</p> <p>Floating oil exposure at the low threshold was predicted during summer conditions only (8%) for Montebello Marine Park, whereas exposure to Ningaloo Marine Park was predicted for all three seasons (summer 40%, transitional 20% and winter 8%).</p> |
| <p><b>Moderate Exposure</b><br/>(<math>&gt; 10 \text{ g/m}^2</math>)</p> | <p>In the event of the loss of well containment scenario occurring, surface hydrocarbons at or above <math>10 \text{ g/m}^2</math> (threshold related to ecological EMBA) are forecast to potentially occur up to 142 km west of the release location.</p> <p>There was no exposure at the moderate threshold to any receptors other than Gascoyne AMP and the two KEFs that overlap the modelled release location (<b>Table 8-7</b>).</p>   |
| <p><b>High Exposure</b><br/>(<math>&gt; 50 \text{ g/m}^2</math>)</p>     | <p>No receptors were predicted to be contacted by floating oil above the high exposure threshold (<b>Table 8-7</b>).</p>   |

Table 8-7: Summary of sensitive receptors exposed to surface hydrocarbon from a worst-case subsea loss of well containment for moderate and high surface hydrocarbon exposure thresholds

| Receptor Group          | Receptor  | Moderate Exposure Threshold |                                 | High Exposure Threshold    |                                 |
|-------------------------|---|-----------------------------|---------------------------------|----------------------------|---------------------------------|
|                         |   | Probability of Contact (%)  | Shortest Time to Contact (days) | Probability of Contact (%) | Shortest Time to Contact (days) |
| Australian Marine Parks | Gascoyne  | 24                          | 12.29                           | 0                          | 0                               |

## 8.2.3.2 Shoreline Accumulated Hydrocarbons

| Exposure Thresholds   | Units   |
|---|---|
| <p><b>Low Exposure</b><br/>(<math>\geq 10 \text{ g/m}^2</math>)</p>       | <p>The probability of accumulation on any shoreline at, or above, the low threshold (<math>\geq 10 \text{ g/m}^2</math>) was greatest during transitional conditions at 48%, while the minimum time before shoreline accumulation was 3.88 days (transitional conditions). The maximum volume of oil ashore for a single spill above the low threshold was greatest during summer at <math>322.3 \text{ m}^3</math> and reduced to <math>52.9 \text{ m}^3</math> for winter conditions. The maximum lengths of shoreline contacted at the low threshold was 382.8 km during summer conditions (<b>Table 8-8</b>).</p> <p>The Exmouth shoreline recorded the greatest probabilities of oil accumulation at the low threshold during summer, transitional and winter seasons with probabilities of 48%, 45% and 18%, respectively. Additionally, Cunningham Island also demonstrated a probability of low threshold accumulation during summer conditions of 48%.</p> <p>During the transitional period, Exmouth recorded the quickest times before shoreline oil accumulation for the low exposure threshold with a minimum time of 3.13 days.</p> |
| <p><b>Moderate Exposure</b><br/>(<math>\geq 100 \text{ g/m}^2</math>)</p> | <p>The Exmouth shoreline also recorded the greatest probabilities of oil accumulation for the moderate thresholds which had occurred during summer (31%) (<b>Table 8-8</b>).</p> <p>During the transitional period, Exmouth recorded the quickest times before shoreline oil accumulation for the moderate exposure threshold with a minimum time of 3.25 days.</p>   |
| <p><b>High Exposure</b><br/>(<math>\geq 1,000 \text{ g/m}^2</math>)</p>   | <p>The Exmouth shoreline also recorded the greatest probabilities of oil accumulation for the high thresholds which had occurred during summer (14%). Additionally, accumulation at the high threshold (<math>\geq 1,000 \text{ g/m}^2</math>) was recorded during summer and transitional conditions and the maximum lengths predicted during these seasonal conditions were 7.7 km and 8.7 km, respectively.</p> <p>The Exmouth shoreline was also predicted to experience the greatest peak volume ashore of <math>322.3 \text{ m}^3</math>, occurring during summer conditions (<b>Table 8-8</b>).</p> <p>During the summer period, Muiron Islands recorded the quickest times before shoreline oil accumulation for the high exposure threshold with a minimum time 4.04 days.</p>   |

Table 8-8: Summary of sensitive receptors exposed to shoreline accumulated hydrocarbon from a subsea loss of well containment scenario for moderate and high shoreline accumulation exposure thresholds

| Receptor          | Mean Load on Shoreline (g/m <sup>2</sup> ) | Peak Load on Shoreline (g/m <sup>2</sup> ) | Medium Exposure Threshold (> 100 g/m <sup>2</sup> ) |  |                                    | High Exposure Threshold (> 1,000 g/m <sup>2</sup> ) |  |                                    |
|-------------------|--|--|---|--|------------------------------------|---|--|------------------------------------|
|                   |  |  | Probability of Accumulated Oil (%)                  | Average Length of Oiled Shoreline (km) | Maximum Length of Oiled Shore (km) | Probability of Accumulated Oil (%)                  | Average Length of Oiled Shoreline (km) | Maximum Length of Oiled Shore (km) |
| Airlie Island     | 88   | 515  | 13  | 1.7                                    | 2.9                                | 0   | 0                                      | 0                                  |

## 8.2.3.3 Dissolved Hydrocarbons

| Exposure Thresholds                    | Units   |
|--|---|
| <b>Low Exposure</b><br>(≥ 10 ppb)      | <p>Excluding the two KEF receptors that the release location resides within (Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula; and Continental Slope Demersal Fish Communities KEFs), the Gascoyne AMP recorded the highest probability of exposure at the low threshold during all seasonal conditions within the 0–10 m depth layer (summer 4%, transitional 7% and 5% winter conditions).</p> <p>The highest concentration in the 0–10 m depth layer was predicted to occur within the Continental Slope Demersal Fish Communities KEF during all seasons within concentrations of 28 ppb, 33 ppb and 35 ppb under summer, transitional and winter conditions, respectively.</p> <p>Within the 10–20 m depth layer, the greatest probability of exposure above the low threshold was 6% recorded within the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF during summer conditions. The greatest maximum instantaneous concentration for the above-mentioned receptors was 38 ppb under summer conditions.</p> <p>The probability of accumulation on any shoreline at, or above, the low threshold (≥ 10 g/m<sup>2</sup>) was greatest during transitional conditions at 48%, while the minimum time before shoreline accumulation was 3.88 days (transitional conditions). The maximum volume of oil ashore for a single spill above the low threshold was greatest during summer at 322.3 m<sup>3</sup> and reduced to 52.9 m<sup>3</sup> for winter conditions. The maximum lengths of shoreline contacted at the low threshold was 382.8 km during summer conditions (Table 8-8).</p> |
| <b>Moderate Exposure</b><br>(≥ 50 ppb) | <p>No receptors were predicted to be contacted by dissolved oil above the moderate exposure threshold.</p>  |

## 8.2.3.4 Entrained Hydrocarbons

| Exposure Thresholds                     | Units   |
|---|---|
| <b>Low Exposure</b><br>(≥ 10 ppb)       | <p>Entrained hydrocarbons in the 0-10 m depth layer above the low (&gt; 10 ppb) exposure threshold were predicted to be transported up to 620 km west from the release location.</p> <p>Within the 0–10 m depth layer, the Gascoyne AMP and two KEF receptors that the release location resides within (Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula; and Continental Slope Demersal Fish Communities KEFs) had all recorded 100% probability of exposure at the low threshold during all three seasons (Table 8-9).</p> <p>The maximum entrained hydrocarbon concentration was 2,245 ppb predicted during summer conditions at the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF. Within the 10–20 m depth layer the number and extent of receptors exposed to entrained hydrocarbons reduced. The probabilities at the low threshold predicted for the Gascoyne AMP during summer, transitional and winter conditions, were 4%, 5% and 5%, respectively.</p> |
| <b>Moderate Exposure</b><br>(≥ 100 ppb) | <p>Entrained hydrocarbons in the 0-10 m depth layer above the high (&gt; 100 ppb) exposure threshold were predicted to be transported up to 108 km north from the release location.</p> <p>Within the 0–10 m depth layer, the Gascoyne AMP and two KEF receptors that the release location resides within (Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula; and Continental Slope Demersal Fish Communities KEFs) had all recorded 100% probability of exposure at the high threshold during all three seasons. Exposure at the high threshold was also recorded at Exmouth Plateau KEF (winter 1%), Commonwealth waters adjacent to Ningaloo Reef KEF (2% summer) and Ningaloo AMP (2% summer). There was no exposure at the high threshold predicted within the 10–20 m depth layer, except for Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula which the release location resides within.</p>  |

Table 8-9: Summary of sensitive receptors exposed to entrained hydrocarbons from a subsea loss of well containment scenario at low and high entrained hydrocarbon exposure thresholds

| Receptor Group  | Receptor  | Probability of Entrained Oil (%)  |                                     | Maximum Predicted Instantaneous Entrained Oil Concentration (ppb) |
|---|---|-----------------------------------|-------------------------------------|---|
|   |   | Low Exposure Threshold (> 10 ppb) | High Exposure Threshold (> 100 ppb) |   |
| Australian Marine Park                                  | Carnarvon Canyon  | 5                                 | 0                                   | 16  |
|   | Gascoyne  | 100                               | 100                                 | 453   |

## 8.2.4 Environmental Impact Assessment

The following environmental impact assessment is based on potential impacts and risks to the physical environment and biological and socio-economic receptors within the area affected by hydrocarbons at the moderate exposure values.

### 8.2.4.1 Biological Receptors

Potential sensitive receptors in the vicinity of the spill area will include fish, marine mammals, marine reptiles and seabirds at the sea surface, may come into contact with the crude oil leading to potential impacts. Each of these receptors is discussed below.

#### Summary of Potential Impacts to Environmental Values

##### Marine Fauna

###### Plankton

The effects of hydrocarbons on plankton have been well studied in controlled laboratory and field situations. The different life stages of a species often show widely different tolerances and reactions to oil pollution. Usually the eggs, larval and juvenile stages will be more susceptible than the adults. Surface and entrained oil could impact fish eggs and larvae due to entrainment in surface slicks. However, fish eggs and larvae are highly dispersive and are carried significant distances by ocean currents. Any impacts to fish eggs and larvae are not anticipated to significantly impact on fish populations (International Tanker Owners Pollution Federation, 2011b).

Post-spill studies on plankton populations are few, but those that have been done have shown either no effects or temporary minor effects (Varela et al., 2006). The prime reason put forward to explain the lack of observed effects is that many marine species produce very large numbers of eggs and larval stages to overcome natural losses (such as through predation by other animals; adverse hydrographical and climatic conditions; or failure to find a suitable habitat and adequate food). Therefore, it is unlikely that any localised losses of eggs or larvae caused by a single oil spill event in the open ocean, would have no discernible effect on the size or health of future adult populations in the area.

A possible exception to this would be if the oil spill were to coincide with, and be transported to, a mass synchronous spawning event, such as that which is known to occur for corals in the region (Gilmour et al., 2016; Rosser and Baird, 2009; Simpson et al., 1993). Lethal and sub-lethal effects of water-accommodated fractions of oils have been reported for coral gametes at lesser concentrations than predicted for adult colonies ((Haapkylä et al., 2007; International Petroleum Industry Environmental Conservation Association, 1992; Loya and Rinkevich, 1980).

Recently spawned gametes and larvae may be especially vulnerable to oil spill effects since they are generally positively buoyant and would be exposed to surface slicks. The potential consequences of this vulnerability, in the unlikely event of a worst-possible release event occurring, would be mitigated by the very large numbers of eggs and larvae released (as discussed above).

###### Marine Mammals

A range of marine mammal species were identified as potentially occurring within the EMBA (**Section 4.7.1**). Marine mammals (whales, dolphins and dugongs) come to the sea surface to breathe air. They are therefore theoretically vulnerable to exposure to oil spill impacts caused by contact with hydrocarbons at the sea surface. Whales and dolphins are smooth-skinned, hairless mammals so oil tends not to stick to their skin and since they do not rely on fur for insulation, they will not be as sensitive to the physical effects of oiling.

Cetaceans that have direct physical contact with surface, entrained, or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (from prey, water and sediments), aspiration of oily water or droplets, and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts, and organs. Other potential impacts include impairment of the immune system, neurological damage (Helm et al., 2015), reproductive failure, other adverse health effects (e.g. lung disease, poor body condition), and mortality (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). Physical contact with hydrocarbons is likely to have biological consequences for these species. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Hydrocarbons may also be ingested, particularly by baleen whales (e.g., pygmy blue whales and humpback whales), which feed by filtering large volumes of water.

Baleen whales (such as humpback whales) are more likely to ingest oil than toothed whales due to their physiology and behaviour. Spilled oil may also foul the baleen fibres of baleen whales, thereby impairing food-gathering efficiency or resulting in the ingestion of oil or oil-contaminated prey. Baleen whales may therefore be vulnerable to floating oil if feeding. Weathered oil residues from an oil spill event may persist for long periods, causing a potential risk to baleen whales' feeding systems. It should be noted that adult humpback whales, which are seasonally present and relatively abundant in the region, are not thought to be feeding during their migration through the region. Pygmy blue whales have been observed exhibiting behaviours consistent with foraging near North West Cape during their annual migration (Thums et al., 2022).

The most common whale species in the North West Shelf region is the humpback whale (*Megaptera novaeangliae*) which

### Summary of Potential Impacts to Environmental Values

migrates through the region, during their movement along the Western Australian coast. Humpback whale migration in this region is characterised by three directional phases, these are:

- Northbound phase – starts June, peaks July and tapers off by early August
- Transitional phase (peak numbers expected at this time) – occurring late August and early September
- Southbound phase – occurring early August until the end of November (this phase is segmented by 2–3-week delay in appearance of peak numbers of cow/calf pairs after the main migratory body has passed).

The moderate exposure value area of the EMBA extends over known migratory paths for the humpback whale and the pygmy blue whale. In the northwest region, the pygmy blue whale migrates along the continental slope. The northbound component of this migration takes place from May to mid-August, with a peak in July/August, and the southbound component occurs from late October to November/December, with a few isolated individuals moving south in January. A spill during migratory periods for either humpback or pygmy blue whales may affect a substantial portion of the biological population of either species; however, the entire population would not credibly be impacted, and impacts would largely be sub-lethal.

Shoreline accumulation above the moderate threshold may occur as far south as the Abrolhos Islands, which host a population of Australian sea lions. Sea lions may be oiled by shoreline accumulations, which may result in mortality due to loss of insulation or ingestion of hydrocarbons when cleaning their coat. Any hydrocarbons accumulating at the Abrolhos islands would be highly weathered and is likely to be tar balls.

Modelling indicated the moderate floating and shoreline oil threshold would not occur in habitats for coastal dolphin species or dugongs. These taxa are not expected to be impacted by floating oil from a worst-case loss of well control.

#### Marine Reptiles

Marine turtles are vulnerable to the effects of hydrocarbon spills at all life stages (eggs, post hatchlings, juveniles and adults) whilst in the water or onshore (National Oceanic and Atmospheric Administration, 2010); however, there is little documented evidence of the effect of hydrocarbons on turtles. Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (National Oceanic and Atmospheric Administration, 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al., 1995). A stress response associated with this exposure includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of the salt gland (Lutcavage et al., 1995). Post-mortem investigations on dead loggerhead turtles from the Mediterranean implicated oil as a cause of death in a number of cases (Gramentz, 1988). In these cases, tar balls were found in the mouth and gastro-intestinal tract of the turtles, suggesting ingestion of tar balls as a possible cause of death.

Hydrocarbons in surface waters may also impact turtles when they surface to breathe as they may inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours, which are the most toxic component of the hydrocarbon spill (Milton and Lutz, 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia, and neurological impairment (National Oceanic and Atmospheric Administration, 2010). Contact with entrained hydrocarbons can result in hydrocarbons adhering to body surfaces, causing irritation of mucous membranes in the nose, throat and eyes and leading to inflammation and infection (Gagnon and Rawson, 2010).

Within the moderate exposure value area of the EMBA, important areas for marine turtles that may be exposed to hydrocarbons in a broad-scale spill include many beach shorelines on islands and the mainland coast which are known to host important turtle nesting activity. Turtle nesting on beaches at these locations may be vulnerable through the shoreline accumulation of oil. In addition, in the nesting season, adult turtles will tend to aggregate in the inter-nesting areas adjacent to the nesting beaches, increasing the vulnerability of turtles in this area in the event of a hydrocarbon spill due to greater turtle densities. Eggs may become directly exposed to hydrocarbons as a result of female turtles becoming oiled from surface oil exposure or when crossing shorelines, resulting in the transfer of hydrocarbons to eggs during nest preparation and laying, which may in turn effect embryo development or lead to embryo mortality (National Oceanic and Atmospheric Administration, 2010).

Newly hatched turtles entering the water from nesting beaches are likely to be highly susceptible to oiling from either shoreline accumulated oil or surface oil, however impacts would be highly seasonal and limited to the periods when hatchlings emerge from the nests 6-8 weeks following nesting by adults.

#### Sea Snakes

Several species of sea snake may occur in the moderate exposure value area of the EMBA. The sensitivity of sea snakes to hydrocarbon spills has been poorly studied. It is expected that susceptibility will be due to their need to surface in order to breathe. Impacts to sea snakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles. They may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation, 2011c). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

Sea snakes may also be susceptible to toxic effects through ingestion of contaminated prey items. It is predicted any interface with hydrocarbons is unlikely to cause an impact to significant numbers, given the widespread distribution of this fauna group within the North West Shelf region.

Sea snakes typically occur in continental shelf waters around islands, shoals and the mainland coast. Much of the EMBA for

### Summary of Potential Impacts to Environmental Values

the floating, entrained and dissolved fractions occurs in relatively deep water that does not contain sea snake habitat.

#### Fish (including Sharks and Rays and Commercial Species)

Potential direct impacts to fishes from exposure to oil may include gill contamination, enlarged livers, fin erosion, metabolic stress, reduced production and survival of eggs and larvae, and reduced survival and growth of recruits (Giari et al., 2012; Theodorakis et al., 2012). Fish may also ingest entrained oil or contaminated food leading to physiological impacts.

The toxicity of dispersed hydrocarbons to fish species has been the subject of a large number of laboratory studies. In general, fish mortalities and/or ecosystem level impacts are rarely observed following oil spills, as for example, evidenced by the lack of any shifts in species composition or abundance of coastal fishes following the Deepwater Horizon spill in the Gulf of Mexico (Fodrie and Heck, 2011). Exposure to dissolved hydrocarbons from crude oil may delay embryo development in some fish potentially prolonging their susceptibility to mechanical damage as well as increased levels of mortality (Carls et al., 2008).

Near the sea surface, fish are likely to be able to detect and avoid contact with surface slicks and as a result, fish mortalities rarely occur in open waters from floating oils (International Tanker Owners Pollution Federation, 2011b). Pelagic fish and shark species are therefore generally not highly susceptible to impacts from hydrocarbon spills. Demersal fish species living and feeding on or near the seabed in deeper waters are not likely to be affected by surface and entrained oil in open waters. The floating, entrained and dissolved hydrocarbon phases are not predicted to occur in coastal waters (< 20 m) and hence are very unlikely to affect demersal and benthic fish assemblages.

Whale sharks ram or filter feed on plankton, krill and fish bait near or on the water surface and they are often observed swimming near the surface during seasonal aggregations. This mode of feeding may result in the ingestion of entrained hydrocarbons, similar to baleen whales. A hydrocarbon spill during the annual aggregation of whale sharks off the Ningaloo Coast may result in a higher environmental risk, however modelling studies indicated that entrained and dissolved hydrocarbons would not occur above impact thresholds in the foraging BIA off Ningaloo Reef.

Several species of threatened sawfish were identified as potentially occurring within the EMBA. These species are all benthic and typically occur in coastal waters. Hence, they are very unlikely to be exposed to floating, entrained or dissolved hydrocarbons.

#### Seabirds and Migratory Shorebirds

Offshore waters are potential foraging grounds for seabirds associated with the coastal roosting and nesting habitat (e.g., Ningaloo, Muiron Islands, Barrow Island etc.). Foraging and breeding BIAs for a number of birds overlap the Operational Area and the EMBA (Table 4-8).

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may mat feathers. This may lead to hypothermia from loss of insulation, and to ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed, 2011).

Seabirds generally do not exhibit avoidance behaviour to floating hydrocarbons. Physical contact of seabirds with surface slicks is by several exposure pathways—primarily immersion, ingestion, and inhalation. Such contact with hydrocarbons may result in (AMSA, 2015; International Petroleum Industry Environmental Conservation Association, 2004):

- plumage fouling and hypothermia (loss of thermoregulation)
- decreased buoyancy and consequent increased potential to drown
- inability to fly or feed
- anaemia
- pneumonia
- and irritation of eyes, skin, nasal cavities and mouths.

Longer-term exposures may potentially impact seabird populations through loss of reproductive success, malformation of eggs or chicks (AMSA, 2015), or mortality of individuals from oiling of feathers or the ingestion of hydrocarbons.

In the event of a major spill, there is the potential for seabirds, and resident, non-breeding overwintering shorebirds that use the nearshore waters for foraging and resting, to be exposed to entrained, dissolved, and accumulated hydrocarbons. This could result in lethal or sublethal effects. Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in waters near their breeding colony. This results in relatively higher seabird densities in these areas during the breeding season, making these areas particularly sensitive in the event of a spill.

Pathways of biological exposure that can result in impact may occur through ingesting contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats, and reefs). Ingestion can also lead to internal injury to sensitive membranes and organs (International Petroleum Industry Environmental Conservation Association, 2004). Whether the toxicity of ingested hydrocarbons is lethal or sublethal will depend on the weathering stage and its inherent toxicity. Exposure to hydrocarbons may have longer-term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks affecting survivorship, and loss of adult birds.

#### Benthic Habitats

Exposure to entrained hydrocarbons ( $\geq 100$  ppb) has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column (top 20 m). However, modelling predicted that entrained and dissolved

### Summary of Potential Impacts to Environmental Values

hydrocarbons would not occur in areas of sensitive benthic habitats such as corals, macroalgae and seagrasses, with the in-water hydrocarbon phases above impact thresholds restricted to relatively deep water.

If a spill occurs at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward, 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition, some non-coral species may be affected via direct contact with entrained hydrocarbons, resulting in sublethal impacts and in some cases mortality - particularly early life-stages of coral reef animals (reef-attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide-ranging fish species.

#### Shoreline Habitats: Mangroves, Sandy Beaches and Rocky Shores

Mangrove habitat along the Ningaloo, Pilbara, Kimberley and Indonesian coastlines may be exposed to accumulations of oil above impact thresholds. Oil may adhere to the sediment particles and in low-energy environments such as in mangroves, deposited sediment bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (National Oceanic and Atmospheric Administration, 2014). Oil may persist in the sediment, potentially causing chronic sublethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from any impacts could be long-term (> 10 years). Mangroves provide a range of ecosystem services, such as nursery habitat and sediment stabilisation. Loss of mangroves may result in indirect effects to other components of the environment.

Sandy beaches are widespread in the Ningaloo, Pilbara, Kimberley and Indonesian coastlines and provide habitat for nesting turtles, roosting seabirds and migratory shorebirds. Accumulation of hydrocarbons may result in impacts to these fauna through oiling (refer to **Section 8.2.4.1**). Oil accumulation may also result in impacts to macrofauna in the intertidal beach zone, such as polychaetes (de la Huz et al., 2005; Junoy et al., 2005), which may result in indirect impacts to migratory birds which feed on sandy beaches and intertidal zones.

Rocky shores also occur widely in the EMBA. Exposed rocky shores are less vulnerable to oil accumulation than mangroves and sandy beaches, as the oil is typically remobilised by wave action. However, intertidal biota may be impacted by oil accumulation due to smothering and toxic effects. This may result in changes to biological communities, although recovery is expected to occur within month to years.

#### Protected Areas

Numerous protected areas, including Australian Marine Parks, Western Australian Marine Parks, Marine Management Areas and National Parks, and the Ningaloo World Heritage Area, have the potential to be contacted by oil above impact thresholds. The environmental values and sensitivities of these protected areas are described in **Section 4.6.5** and the potential impacts to the biological values within the protected areas are described in **Sections 8.2** and **8.3**. Impacts to socio-economic values within protected areas are described in **Section 4.6.5**.

#### Socio-economic Receptors

##### Fisheries

The EMBA overlaps a number of Commonwealth and State Managed Fisheries (refer to **Section 4.8.2**). The in-water phases of the oil from a worst-case loss of well containment are constrained to relatively deep water and will not credibly impact upon fisheries exploiting demersal fish resources. There may be an exclusion zone implemented by fisheries management agencies in the event of a spill, however this would be a temporary measure and the spatial extent is expected to be localised.

Impacts to fishes from a worst-case loss of well containment, described in **Section 8.2.4.1**, are expected to be relatively minor. Hence, effects of exploited fish resources are not expected to occur. However, other effects to fisheries may occur as a result of a spill, such as oiling of fishing gear and perceived reduction in fish quality by consumers. These impacts may result in a reduction in value of commercial fisheries, although these impacts could only occur in a very limited number of fisheries.

No impacts to traditional fisheries are expected to occur.

##### Tourism and Recreation

There is a wide variety of nature-based tourism and recreational activities including recreational fishing that occurs in the EMBA for the worst-case spill scenarios. Tourism is an important industry for the Ningaloo Coast, Pilbara and Kimberley regions, as well as Indonesia – all of which may be impacted by shoreline accumulations of oil. Much of the tourism in these areas is concentrated along the coastline, although some of the offshore islands also attract visitors such as the Muiron Islands. Shoreline accumulations of hydrocarbons may result in temporary closures of coastal areas and may also reduce the aesthetic value of the environment. These impacts may lead to a reduction in tourism activity and consequent economic impacts.

##### Oil and Gas

A number of oil and gas operators have operations within the moderate exposure value area within the EMBA. In the event of a large-scale spill, petroleum production operations in the region would likely remain unaffected, as floating oil above the moderate exposure value was not predicted to impact upon any existing production facilities.

### Summary of Potential Impacts to Environmental Values

#### Shipping

The impact on shipping in the event of a worst-case discharge is likely to be limited to the potential for minor modification of shipping routes through the implementation of exclusion zones to avoid the spill. Shipping operations may be affected by spill response efforts by way of a 'Notice to Mariners' being issued to avoid the area, leading to the potential diversion from normal shipping routes.

#### Defence

Military exercise areas are located at Exmouth associated with Royal Australian Air Force Base Learmonth. These training zones overlap the moderate exposure value area within the EMBA. However, they are designated for aerial training and are unlikely to be impacted by a hydrocarbon spill.

#### Cultural Values and Heritage

Through consultation and review of available literature (**Section 4.8.1**), Woodside understands that sea country, including marine ecosystems and species, archaeological heritage and heritage sites, marine parks, as well as intangible cultural heritage may be impacted in the event of a hydrocarbon release from a vessel collision. Cultural features and heritage values that have the potential to be impacted include:

- Marine ecosystems and species: Marine ecosystems may hold both cultural and environmental value to Traditional Custodians (see **Section 4.8.1**), with cultural and environmental values intrinsically linked (DCCEEW 2023, MAC 2021 as cited in Woodside 2023d). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country—the seascape which Traditional Custodians view, interact with or hold knowledge of. The EMBA is known to include habitat for culturally important species such as whales, whale sharks, turtles, dugongs, plankton, and seagrass (**Section 4.7** and **4.8.1**). In the event of a worst-case release of MDO individual fauna may be directly impacted or impacted through temporary degradation of their habitats, however, no population level impacts as expected. Impacts are not expected to occur to ecologically significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.
- Heritage Sites: The EMBA overlaps 14 Registered Aboriginal Heritage Sites (**Section 4.8.1.4**). Any oil that reaches the shoreline has potential to impact on registered sites and indigenous heritage places along the coastline. In the unlikely event of a hydrocarbon release, shoreline accumulation may affect sensitive artefacts or areas, which could damage their heritage value. However, due to the low maximum concentrations predicted to reach any marine park, their environmental values are expected to be maintained.
- Marine Parks: The EMBA overlaps seven AMPs under the South-West Marine Parks Network Management Plan 2018 and North-West Marine Parks Network Management Plan 2018 and 24 State Marine Parks. Management Plans for these parks recognise cultural values of Indigenous groups (**Section 4.8.1.4**). Due to the low maximum concentrations predicted to reach any marine park, their environmental values are expected to be maintained.
- Intangible cultural heritage: Impacts may occur to intangible cultural values such as songlines; creation/dreaming sites, sacred sites, ancestral beings; cultural obligations to care for Country; knowledge of Country/customary law and transfer of knowledge; connection to Country; Access to Country; kinship systems and totemic species, resource collection. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003). In the unlikely event of a hydrocarbon release, intangible cultural heritage values may be impacted.

#### Shorelines

A number of shorelines are predicted to be at risk of shoreline accumulation above 10 g/m<sup>2</sup> whereby the shoreline socio-cultural EMBA extends beyond the shoreline EMBA where ecological impact could occur.

The socio-cultural EMBA is based on low thresholds, whereby a visible sheen could occur. This sheen is not expected to impact access to, or use of shorelines.

### 8.2.4.2 Species Recovery Plans and Threat Abatement Plans

Woodside has considered information contained in relevant recovery plans for marine fauna that identify marine pollution as a threat (**Section 9**). This includes the objectives and actions within the following plans:

- Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia, 2017)
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) (Department of the Environment, 2014)
- Sawfish and River Shark Multispecies Recovery Plan (Commonwealth of Australia, 2015a)

### 8.2.5 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 8-10**. This process was completed as outlined in **Section 6.1.4** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

**Table 8-10: Stybarrow Loss of Well Containment - ALARP Summary**

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| <b>Legislation, Codes and Standards</b>  |                 |  |                                  |
| The P&A activity to be managed in accordance with NOPSEMA accepted Well Operations Management Plan (WOMP), which includes the following requirements: <ul style="list-style-type: none"> <li>• Two barriers have been maintained</li> <li>• Well barrier integrity is tested and verified</li> <li>• Wells are permanently abandoned and left in a safe state</li> </ul> | Accept          | Compliance with an accepted WOMP that aligns with industry guidance and good practice will ensure barriers are in place and verified, reducing the likelihood of loss of well integrity occurring. Although the consequence of a well blowout would not be reduced, the reduction in likelihood reduces the overall risk. Control is based on a legislative requirement under the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011. The control must be adopted.                            | <b>PS 10.1</b>                   |
| The P&A activity to be managed in accordance with the NOPSEMA accepted MODU Safety Case, which includes the following: <ul style="list-style-type: none"> <li>• Planned maintenance requirements for well control equipment</li> <li>• testing requirements of well control equipment</li> <li>• verification requirements of safety critical equipment</li> </ul>       | Accept          | The accepted safety case includes control measures to reduce the risk of an unplanned release of hydrocarbons as a result of loss of well containment. Compliance with the accepted Safety Case may reduce the likelihood of loss of well integrity occurring. Although the consequence of a well blowout would not be reduced, the reduction in likelihood reduces the overall risk. Control is based on a legislative requirement under the Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009. The control must be adopted | <b>PS 10.2</b>                   |
| <b>Eliminate</b>   |                 |  |                                  |
| Do not plug and abandon the wells.   | Reject          | Whilst not conducting P&A activities would eliminate the risk, the wells require intervention to achieve the status of permanent abandonment. Control is therefore not considered feasible.  | Not applicable                   |

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| <b>Engineering</b>   |                 |  |                                  |
| Subsea BOP installed, and function tested during permanent plugging operations.  | Accept          | Testing of the BOP will reduce the likelihood of a blowout resulting in release of hydrocarbons to the marine environment. In the event of a blowout, this control would not reduce the consequence, although the reduction in likelihood reduces the overall risk ranking.<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.                                   | <b>PS 10.3</b>                   |
| <b>Administrative</b>  |                 |  |                                  |
| Implement requirements for permanent well abandonment: <ul style="list-style-type: none"> <li>well barrier as per the internal Woodside Standard(s)</li> <li>placement, length, material and verification of a permanent barrier.</li> </ul> | Accept          | This procedure will reduce the likelihood of a spill occurring from a suspended or abandoned well. Although changes in severity wouldn't occur, the reduction in likelihood results in a reduction in overall risk.<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   | <b>PS 10.4</b>                   |
| <b>Pollution Control</b>   |                 |  |                                  |
| An approved Source Control Emergency Response Plan (SCERP) shall exist prior to drilling each well, including feasibility and any specific considerations for relief well kill.  | Accept          | The SCERP will describe the responses to a loss of well control including ROV intervention on BOP, use of capping stack to contain well, and the relief well. All of these responses are aimed at reducing the duration of the hydrocarbon release, resulting in a reduction in consequence and overall risk.<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 10.5</b>                   |
| In the event of a spill, emergency response activities implemented in accordance with the OPEP   | Accept          | Implementing the OPEP efficiently to deal with unplanned hydrocarbon spills will help to reduce impacts to the marine environment.<br>The control is feasible and standard practice. Costs associated with implementing response strategies vary dependant on nature and scale of spill event. Benefits outweigh any cost sacrifice.   | <b>PS 10.6</b>                   |
| Arrangements supporting the activities in the OPEP will be tested to ensure the OPEP can be implemented as planned.  | Accept          | Testing the OPEP activities would not reduce the likelihood, but response activities may reduce the consequence.<br>The control is feasible and standard practice. Moderate costs associated with conducting exercises for the purpose of testing arrangements. Benefits outweigh any cost sacrifice.  | <b>PS 10.7</b>                   |

### 8.2.5.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 8-10**) appropriate to the decision type (Decision Type B), that when implemented are considered to manage the risks and consequences from a highly unlikely unplanned hydrocarbon release as a result of a loss of well containment to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential risks of a loss of well containment. As no reasonable additional/alternative controls were identified that would future reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are therefore ALARP.

### 8.2.6 Demonstration of Acceptability

The impact assessment has determined, given the adopted controls, the risk of a highly unlikely unplanned hydrocarbon release as a result of a loss of well containment during P&A activities represents a tolerable risk. Woodside considers higher current risk ratings as acceptable if ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.

Acceptability is demonstrated with regard to the following considerations:

#### **Internal Context**

The petroleum activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including:

- Woodside Our Values (Appendix A)
- Woodside Risk Management Policy
- Engineering Standards – Well Barriers
- Well Acceptance Criteria Procedure
- Drilling and Completions – Well Control Procedure
- Woodside Engineering Standard – Rig Equipment
- Source Control Emergency Response Planning Guideline (SCERP Guidelines)
- Oil spill preparedness and response strategies are considered applicable to the nature and scale of the risk and associated impacts of the response are reduced to ALARP (**Section 10**).

#### **External Context**

Woodside recognises its licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding external expectations. External consultation, outlined below, has been undertaken prior to the petroleum activity:

- Woodside has consulted with AMSA and WA DoT on spill response strategies. In accordance with the Memorandum of Understanding between Woodside and AMSA, a copy of the Oil Pollution First Strike Plan was provided to AMSA and WA DoT.
- Other interested persons have been consulted (**Section 5.8**) and their feedback incorporated into this EP where appropriate.
- The impact assessment has determined there is unlikely to be a major long-term environmental impact on the offshore environment or sensitive nearshore and shoreline habitats from a loss of well containment.
- By providing additional measures to prevent loss of well containment, in addition to oil spill response measures that are commensurate with the current risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes this addresses societal concerns to an acceptable level.

#### **Other Requirements (includes laws, policies, standards and conventions)**

Impact assessment has been informed by risk-based analysis, including hydrocarbon spill modelling. The proposed control measures are consistent with industry legislation, codes and standards, good industry practice and professional judgement including:

- subsea BOP function testing in accordance with API Standard 53, 5th Edition

- Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011: accepted WOMP for P&A activities
- notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with **Section 11.9.4**
- mutual aid Memorandum of Understanding for relief well drilling is in place. Woodside develops a SCERP for each well, which is signed off by the Drilling Engineering Manager and maintains a list of rigs that are currently operating in Western Australia.

### **Environmental Context**

The EMBA overlaps a number of BIAs for threatened and migratory species, as well as a number of State and Commonwealth MPAs and the Ningaloo Coast WHA. BIAs within the Operational Area include pygmy blue whale migration BIA, pygmy blue whale distribution BIA, and wedge-tailed shearwater breeding BIA. Relevant recovery plans and consideration advice has been considered during the impact assessment. The petroleum activity is not considered to be inconsistent with the overall recovery objectives and actions of any of the applicable recovery plans or threat abatement plans. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts.

### **Acceptability Statement**

The likelihood of a loss of well containment event occurring is highly unlikely, given the adopted controls. The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and a risk-based assessment has been conducted to better understand the potential consequences and plan oil spill response. As demonstrated in **Section 9**, the potential impacts of an unplanned hydrocarbon release from loss of well containment is not inconsistent with the relevant objectives and actions of any applicable recovery plans or threat abatement plans.

The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental risks are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The risks and consequences from a highly unlikely unplanned hydrocarbon release as a result of a loss of well containment are well understood, and there is no risk of serious or irreversible environmental damage from this aspect. The risk assessment was informed by industry-standard modelling, which includes the worst-case credible spill scenario, incorporates inherent conservatism and is consistent with the precautionary principle.
- **Intergenerational Principle:** The risks and consequences from a highly unlikely unplanned hydrocarbon release as a result of a loss of well containment will not impact upon the environment such that future generations cannot meet their needs. P&A of the Stybarrow development wells is required to mitigate unplanned releases that could potential occur from Stybarrow wells in the future.
- **Biodiversity Principle:** The risks and consequences from a highly unlikely unplanned hydrocarbon release as a result of a loss of well containment will not impact upon biodiversity or ecological integrity in the long-term. The adopted controls Woodside will implement reduce the risk of a hydrocarbon release from a loss of well containment to ALARP.

During consultation, BYAC asked to be kept informed of activities given potential for coastline areas of migrating species to be impacted in the event of a spill. Malgana raised its views that it considered there are flaws in spill modelling related to Shark Bay hydrodynamics. Woodside will continue to engage with BYAC as part of ongoing engagement and has provided further information to representatives of Malgana on spill modelling inputs and results and no further objections or requests for information were raised.

During a meeting with Nanda, a number of questions related to oil spills were raised (e.g., has Woodside had a spill in the past, details of spill response measures particularly for shoreline impact, and whether Woodside's activities are resistant to cyclone events) which Woodside provided responses to and no further concerns or comments were raised. Woodside was also asked how quick the oil spill response was during a meeting with MG Corp, to which Woodside provided a response in the meeting and no further comments or concerns have been raised.

During a meeting with WAC, a number of questions related to oil spills were raised (e.g. emergency preparedness, relevance of the EMBA to consultation, whether a diesel spill would only be on the surface, how long diesel stays in the environment, and how soon a spill is responded to) which Woodside provided responses to and no further concerns or comments were raised.

During consultation, Yued noted that oil spill modelling has a degree of uncertainty which creates concern for the Yued Board and Cultural Advice Committee. Woodside notes this uncertainty and commits to notifying traditional owners who may be affected in the unlikely event of a spill. Consultation related to hydrocarbon spills also occurred with DMIRS, DBCA, NCWHAC, DNP, DoT, CCG, Shire of Carnarvon. A summary of all consultation conducted for this EP is included in **Appendix F**, Table 1 and 2.

On this basis, Woodside considers the risk to be managed to an acceptable level.

8.2.7 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes  | Controls  | Performance Standards  | Measurement Criteria   |
|---|---|--|--|
| <p><b>EPO 10</b><br/>No loss of well integrity resulting in loss of hydrocarbons to the marine environment during the petroleum activity.</p> | <p><b>C 10.1</b><br/>The P&amp;A activity to be managed in accordance with NOPSEMA accepted Well Operations Management Plan (WOMP), which includes the following requirements:</p> <ul style="list-style-type: none"> <li>• Two barriers have been maintained</li> <li>• Well barrier integrity is tested and verified</li> <li>• Wells are permanently abandoned and left in a safe state</li> </ul> | <p><b>PS 10.1</b><br/>Accepted WOMP in place for the Stybarrow P&amp;A activity to manage risks associated with plug and abandonment activities.</p>   | <p><b>MC 10.1.1</b><br/>WOMP Acceptance Letter</p>   |

## 8.3 Hydrocarbon Release from Vessel Collision or Bunkering Incident

### 8.3.1 Summary of Risk Assessment and Evaluation

| Aspect   | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context           | Acceptability |
|--|---|---|-----------------|-------------------|---------------|----------------------------|---------------|
| Unplanned surface release of marine diesel oil | Surface release of MDO from a project vessel as a result of an external impact (vessel collision) which ruptures an MDO tank. | Temporary and localised reduction in water quality with potential for toxicity effects to marine fauna and flora, oiling of offshore, nearshore and shoreline habitats. | 100             | 0.1               | 10            | Type A<br>Lower Order Risk | Tolerable     |
|  | Release of MDO or jet fuel during a bunkering or refuelling incident.   | Impacts to socio-economic receptors.  | 10              | 0.3               | 3             | Type A<br>Lower Order Risk | Tolerable     |

### 8.3.2 Source of Hazard

#### 8.3.2.1 Surface Release of Marine Diesel Oil from a Project Vessel as a Result of an External Impact (Vessel Collision) Which Ruptures a Marine Diesel Oil Tank

The temporary presence of the MODU and project vessels in the Operational Area during the petroleum activity will result in a navigational hazard for other marine users (such as commercial shipping) within the immediate area (as discussed in **Section 7.1.3**). This navigational hazard could result in a third-party vessel colliding with the MODU or a project vessel, resulting a loss of hydrocarbons from a fuel tank rupture.

A MODU will have a total marine diesel capacity of approximately 966 to 1400 m<sup>3</sup> (up to 3640 m<sup>3</sup> for DP MODU), that is distributed through a number of isolated tanks. MODU fuel tanks are located in the MODU pontoons, typically located on the inner sides of pontoons and can be over 10 m below the waterline. As such, a spill from MODU fuel tanks as a result of a vessel collision is not credible.

A typical project vessel (e.g., a light construction or subsea support vessel) is likely to have multiple isolated marine diesel tanks distributed throughout the hull of the vessel. The marine diesel storage capacity of a support vessel can be in the order of 1000 m<sup>3</sup> (total) that is distributed through multiple isolated tanks typically located mid-ships. In the unlikely event of a vessel collision involving a project vessel during the petroleum activity, the vessel will have the capability to pump marine diesel from a ruptured tank to a tank with spare volume in order to reduce the potential volume of fuel released to the environment. Project vessel fuel oil capacities are presented in **Section 3**.

The indicative largest single fuel tank on a support vessel is 350 m<sup>3</sup> and presents the maximum worst-case credible release volume in the event of a vessel collision. This worst-case vessel collision spill volume is consistent with guidance from AMSA (2015). A 1,000 m<sup>3</sup> marine diesel release was modelled at the DTM buoy (considered to be a representative location for the hydrocarbon spill risk assessment). The modelled volume is larger than the credible worst-case vessel collision spill as a contingency and makes use of spill modelling commissioned for the Stybarrow Decommissioning and Field Management EP.

A review of the potentially active commercial fisheries (**Section 4.8.2**) along with consultation feedback (**Appendix F**), determines it unlikely there will be active commercial fishing in the area. In addition, there are no recognised shipping routes in or near the Operational Area, with the nearest shipping fairway designated by AMSA located approximately 21 km to the north and west (**Figure 4-15**). Analysis of shipping traffic data indicates commercial vessels do use the general area. A vessel collision resulting in the rupture of a fuel tank would only credibly occur if a support vessel was struck by a large vessel (e.g., large container carrier) moving at cruising speed. Smaller vessels, such as typical fishing boats, would not credibly result in a fuel tank leak from a support vessel in the event of a collision.

All project vessels will use marine diesel as fuel, with no use of heavy or intermediate fuel oils.

### **Industry Experience**

Registered vessels or foreign flag vessels in Australian waters are required to report events to the Australian Transport Safety Bureau (ATSB), AMSA or Australian Search and Rescue (AusSAR).

From a review of the ATSB marine safety and investigation reports, one vessel collision occurred in 2011/12 that resulted in a spill of 25–30 L of oil into the marine environment as a result of a collision between a tug and support vessel off Barrow Island. Two other vessel collisions occurred in 2010, one in the port of Dampier, where a support vessel collided with a barge being towed. Minor damage was reported and no significant injury to personnel or pollution occurred. The second 2010 vessel collision involved a vessel under pilot control in port connecting with a vessel alongside a wharf, causing it to sink. No reported pollution resulted from the sunken vessel. These incidents demonstrate the likelihood of only minor volumes of hydrocarbons being released during the highly unlikely event of a vessel collision.

From 2010 to 2011, the ATSB's annual publication defines the individual safety action factors identified in marine accidents and incidents: 42% related to navigation action (2011). Of those, 15% related to poor communication and 42% related to poor monitoring, checking and documentation (ATSB, 2011). The majority of these related to the grounding instances.

### **Credible Scenarios**

For a vessel collision to result in the worst-case scenario of a hydrocarbon spill potentially impacting an environmental receptor, several factors must align as follows:

- The identified causes of vessel interaction must result in a collision.
- The collision must have enough force to penetrate the vessel hull.
- The collision must be in the exact location of the fuel tank.
- The fuel tank must be full, or at least of volume which is higher than the point of penetration.

The environmental risk analysis and evaluation identified and assessed a range of potential scenarios that could result in a loss of vessel structural integrity, resulting in damage to fuel storage tank(s) and a loss of marine diesel to the marine environment (**Table 8-11**). The scenarios considered damage to single and multiple fuel storage tanks in a project vessel and MODU due to dropped objects and various combinations of vessel to vessel and vessel to MODU collisions. In summary:

- It is not a credible scenario that the total storage volume of the MODU would be lost, as fuel is stored in more than one tank.
- It is not a credible scenario that a storage tank on the MODU would be damaged due to the location of the tanks within the hull, behind the bilge tanks, below the waterline.
- It is not a credible scenario that a collision between the support vessel and MODU would damage any storage tanks, due to the location of the tanks on both vessel types and secondary containment.
- It is highly unlikely that the full volume of the largest storage tank on a support vessel would be lost.

The last scenario considered was a collision between the support vessel or light construction vessel with a third-party vessel (i.e., commercial shipping, other petroleum related vessels and commercial fishing vessels). This was assessed as being credible but highly unlikely, given the standard vessel operations and equipment in place to prevent collision at sea, the standby role of a support vessel (low vessel speed) and its operation in close proximity to the MODU (exclusion areas), and the construction and placement of storage tanks. Potential spill volumes for these scenarios are summarised in the **Table 8-11**.

Given the offshore location of the Stybarrow field, vessel grounding is not considered a credible risk.

Table 8-11: Summary of credible hydrocarbon spill scenario as a result of vessel collision

| Scenario   | Hydrocarbon Volumes   | Preventative and Mitigation Controls  | Credibility   |
|--|---|---|---|
| Breach of MODU fuel tanks due to vessel collision.   | MODU has a fuel oil storage capacity of about 966 to 1400 m <sup>3</sup> (up to 3640 m <sup>3</sup> for DP MODU), distributed through multiple tanks. | Fuel tanks are located on the inside of pontoons and protected by location below water line, protection from other tanks, e.g. bilge tanks.<br><br>The draught of vessel and location of tanks in terms of water line prevent the tanks from being breached.                          | <b>Not credible</b><br>Due to location of tanks.  |
| Breach of support vessel fuel tanks due to collision with MODU.  | Activity support vessel has multiple marine diesel tanks typically ranging between 22 to 105 m <sup>3</sup> each.                                     | Typically, double wall tanks that are located mid ship (not bow or stern).<br><br>Slow support vessel speeds when in proximity to MODU.   | <b>Not credible</b><br>Collision with MODU at slow speeds is highly unlikely and, if it did occur, is highly unlikely to result in a breach of support vessel (low energy contact from slow moving vessel). |
| Breach of light construction vessel / anchor handling vessel fuel tanks due to collision with third-party vessel, including commercial shipping and fishing. | Largest volume of a single tank is likely to be <350 m <sup>3</sup> .   | Tank locations midship (not bow or stern).  | <b>Credible</b><br>Light construction vessel – third-party vessel collision could potentially result in the release from a fuel tank.   |
| Breach of project support vessel fuel tanks due to support vessel – other vessel collision including commercial shipping/fisheries.                          | Activity support vessel has multiple marine diesel tanks typically ranging between 22 to 105 m <sup>3</sup> each.                                     | Typically, double wall tanks that are located midship (not bow or stern).<br><br>Vessels are not anchored and steam at low speeds when relocating within the Operational Area or performing MODU standby duties. Normal maritime procedures would apply during such vessel movements. | <b>Credible</b><br>Activity support vessel – other vessel collision could potentially result in the release from a fuel tank.   |

### 8.3.2.2 Release of Marine Diesel Oil due to Leaking or Ruptured Bunker Transfer Equipment

Bunkering of marine diesel between support vessels and the MODU as well as the possible refuelling of cranes, helicopters and other equipment may take place on the MODU and project vessels during the Petroleum Activity. Bunkering incidents may occur as the result of a damaged refuelling hose, coupling failures, loss of connection, vessel collision or loss of vessel position.

Three credible scenarios for the loss of containment of marine diesel during bunkering operations have been identified:

- Partial or total failure of a bulk transfer hose or fittings during bunkering, due to operational stress or other integrity issues could spill marine diesel to the deck and/or into the marine environment. This would be in the order of less than 200 L, based on the likely volume of a bulk transfer hose (assuming a failure of the dry break and complete loss of hose volume).
- Partial or total failure of a bulk transfer hose or fittings during bunkering, combined with a failure in procedure to shutoff fuel pumps, for a period of up to five minutes, resulting in approximately 50 m<sup>3</sup> marine diesel lost to the deck and/or into the marine environment.
- Partial or total failure of a bulk transfer hose or fittings during helicopter refuelling could spill aviation jet fuel to the helicopter deck and/or into the marine environment. All helicopter refuelling activities are closely supervised and leaks on the helideck are considered to be easily detectable. In the event of a leak, transfer

would cease immediately. The credible volume of such a release during helicopter refuelling would be in the order of <100 L.

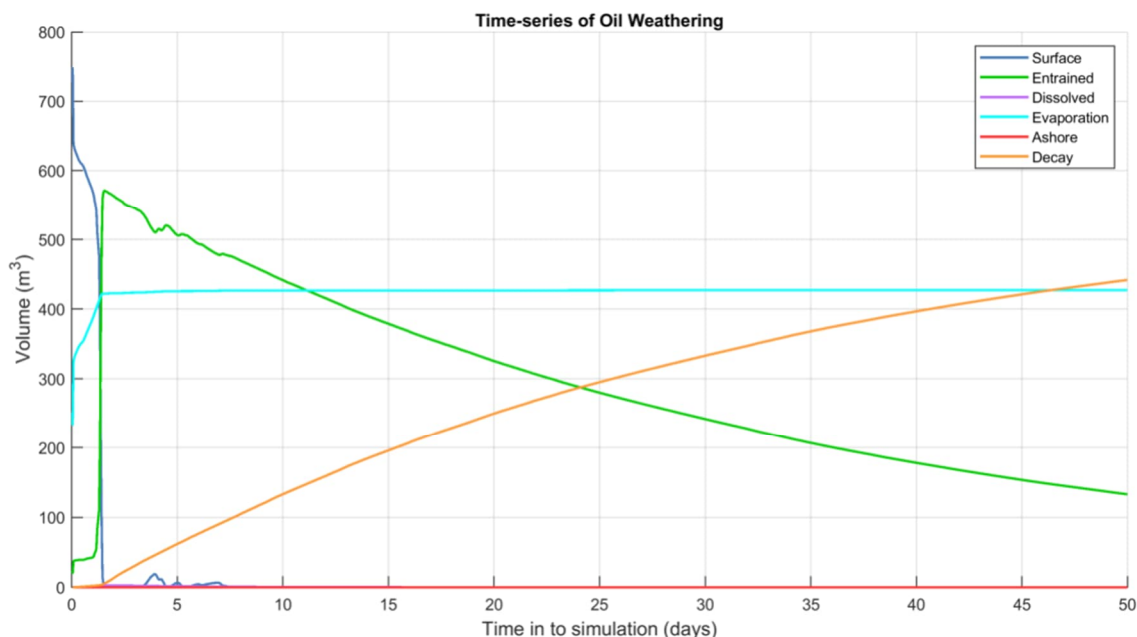

The guidance provided by AMSA (2015) for a bunkering spill under continuous supervision is considered appropriate, given bunkering will be constantly supervised. The maximum credible release volume during refuelling is calculated as transfer rate multiplied by 15 minutes of flow. The detection time of 15 minutes is seen as conservative but applicable after failure of multiple barriers followed by manual detection and isolation of the fuel supply. Based on an expected pumping rate of 150 m<sup>3</sup>/hour and a conservative time of 15 minutes to shut down the pumping operation once the fuel spill had been identified, a total release volume of around 37.5 m<sup>3</sup> is proposed as the worst-case credible volume for a bunkering incident.

### 8.3.3 Stochastic Oil Spill Modelling Results

The low viscosity (4 cP) indicates marine diesel will spread quickly when released and will form a thin to low thickness film on the sea surface, increasing the rate of evaporation. Generally, about 6.0% of the marine diesel mass should evaporate within the first 12 hours (BP < 180 °C).

About 40.6% of the marine diesel mass should evaporate within the first 24 hours (180 °C < BP < 265 °C). After several days 95% of the marine diesel mass should evaporate (265 °C < BP < 380°C). Around 5% (by mass) of marine diesel will not evaporate at atmospheric temperatures and will persist in the environment. An indicative weathering plot of marine diesel is provided as **Figure 8-2**, with the characteristics summarised in **Table 8-3** and **Table 8-4**.

Some heavy components contained in marine diesel have a strong tendency to physically entrain into the upper water column in the presence of moderate winds (in other words, > 12 knots) and breaking waves, but can re-float to the surface if these energies abate.

**Figure 8-2: Predicted weathering and fates graph for marine diesel for the vessel collision scenario simulation that led to the largest swept area of floating oil above 50 g/m<sup>2</sup> (from RPS, 2022a)**

#### 8.3.3.1 Environment that May Be Affected

The EMBA for the worst-case MDO release, combined with the worst-case loss of well containment release described in **Section 8.2**, is presented in Figure 4-1. The outer extent of the EMBA is derived from the oil spill modelling defined using the hydrocarbon exposure thresholds in **Section 8.1.3** and is based on the combined area of contact for all hydrocarbon components (surface, shoreline dissolved and entrained hydrocarbons). The modelling results below are presented for each hydrocarbon component at the hydrocarbon exposure thresholds defined in **Table 8-6**.

### 8.3.3.2 Surface Hydrocarbons

| Exposure Thresholds                                  | Units  |
|--|--|
| <b>Low Exposure</b><br>( $> 1 \text{ g/m}^2$ )       | <p>Surface hydrocarbons at the low exposure value are predicted to travel up to 164 km north-east of the release location. Receptors with the potential to be contacted at the low exposure value are:</p> <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF</li> <li>• Exmouth Plateau KEF</li> <li>• Continental Slope Demersal Fish Communities KEF</li> </ul> |
| <b>Moderate Exposure</b><br>( $> 10 \text{ g/m}^2$ ) | <p>Surface hydrocarbons at the moderate exposure value are predicted to travel up to 92 km south-west of the release location. Receptors with the potential to be contacted at the moderate exposure value are (refer to Table 8-12):</p> <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF</li> <li>• Continental Slope Demersal Fish Communities KEF</li> </ul> |
| <b>High Exposure</b><br>( $> 50 \text{ g/m}^2$ )     | <p>Surface hydrocarbons at the high exposure value are predicted to travel up to 79 km north-east of the release location. Receptors with the potential to be contacted at the high exposure value are (refer to Table 8-12):</p> <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF</li> <li>• Continental Slope Demersal Fish Communities KEF</li> </ul>         |

**Table 8-12: Summary of sensitive receptors exposed to surface hydrocarbons from a worst-case marine diesel spill (vessel collision) for moderate and high surface hydrocarbon exposure thresholds**

| Receptor  | Probability of Surface Hydrocarbon Exposure (%) |      | Minimum Time before Surface Hydrocarbon Exposure (days) |      |
|---|---|------|---|------|
|   | Moderate  | High | Moderate  | High |
| Gascoyne AMP  | 32  | 22   | 0.17  | 0.21 |
| Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF | 22  | 16   | 0.08  | 0.08 |
| Continental Slope Demersal Fish Communities KEF                           | 100   | 100  | 0.04  | 0.04 |

### 8.3.3.3 Shoreline Accumulated Hydrocarbons

| Exposure Thresholds                                      | Units  |
|--|--|
| <b>Low Exposure</b><br>( $\geq 10 \text{ g/m}^2$ )       | No predicted shoreline accumulation of hydrocarbons at or above the low exposure threshold.      |
| <b>Moderate Exposure</b><br>( $\geq 100 \text{ g/m}^2$ ) | No predicted shoreline accumulation of hydrocarbons at or above the moderate exposure threshold. |
| <b>High Exposure</b>                                     | No predicted shoreline accumulation of hydrocarbons at or above the high exposure threshold.     |

| Exposure Thresholds         | Units |
|-----------------------------|-------|
| (≥ 1,000 g/m <sup>2</sup> ) |       |

#### 8.3.3.4 Dissolved Hydrocarbons

| Exposure Thresholds                    | Units   |
|--|---|
| <b>Low Exposure</b><br>(≥ 10 ppb)      | Dissolved hydrocarbons at the low exposure value are predicted to travel up to 157 km south-south-west of the release location. Receptors with the potential to be contacted at the low exposure value are: <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF</li> <li>• Exmouth Plateau KEF</li> <li>• Continental Slope Demersal Fish Communities KEF</li> </ul>         |
| <b>Moderate Exposure</b><br>(≥ 50 ppb) | Dissolved hydrocarbons at the moderate exposure value are predicted to travel up to 40 km south-south-west of the release location. Receptors with the potential to be contacted at the moderate exposure value are (refer to <b>Table 8-13</b> ): <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF</li> <li>• Continental Slope Demersal Fish Communities KEF</li> </ul> |
| <b>High Exposure</b><br>(≥ 400 ppb)    | Dissolved hydrocarbons at the high exposure value are predicted to travel up to 2 km south-south-west of the release location. Receptors with the potential to be contacted at the high exposure value are (refer to <b>Table 8-13</b> ): <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF</li> <li>• Continental Slope Demersal Fish Communities KEF</li> </ul>          |

**Table 8-13: Summary of sensitive receptors exposed to dissolved hydrocarbon from a worst-case marine diesel spill (vessel collision) for moderate and high dissolved hydrocarbon exposure thresholds in the top 10 m below the sea surface**

| Receptor  | Probability of Dissolved Hydrocarbon Exposure (%) |                | Maximum Instantaneous Concentration (ppb) |
|---|---|----------------|---|
|   | Moderate (50 ppb)                                 | High (400 ppb) |   |
| Carnarvon Canyon AMP  | 8   | -              | 197                                       |
| Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF | 16  | -              | 306                                       |
| Continental slope demersal fish communities KEF                           | 42  | 1              | 525                                       |

## 8.3.3.5 Entrained Hydrocarbons

| Exposure Thresholds                             | Units   |
|---|---|
| <p><b>Low Exposure</b><br/>(≥ 10 ppb)</p>       | <p>Entrained hydrocarbons at the low exposure value are predicted to travel up to 1,295 km north-north-west of the release location. Receptors with the potential to be contacted at the low exposure value are:</p> <ul style="list-style-type: none"> <li>• Seven Australian Marine Parks: Abrolhos AMP, Argo-Rowley Terrace AMP, Carnarvon Canyon AMP, Gascoyne AMP, Montebello AMP, Shark Bay AMP, and Ningaloo AMP</li> <li>• KEFs: Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, Ancient coastline at 125 m depth contour KEF, Wallaby Saddle KEF, Exmouth Plateau KEF, Commonwealth waters adjacent to Ningaloo Reef KEF, Perth Canyon and Adjacent shelf break, and other west coast canyons KEFs, Western demersal slope and associated fish communities KEF, and Continental slope demersal fish communities KEF</li> <li>• Muiron Islands Marine Management Area</li> <li>• Ningaloo Marine Park</li> </ul> |
| <p><b>Moderate Exposure</b><br/>(≥ 100 ppb)</p> | <p>Entrained hydrocarbons at the high exposure value are predicted to travel up to 507 km south-south-west of the release location. Receptors with the potential to be contacted at the high exposure value are (refer to Table 8-14):</p> <ul style="list-style-type: none"> <li>• Three Australian Marine Parks: Carnarvon Canyon AMP, Gascoyne AMP, and Ningaloo AMP</li> <li>• KEFs: Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, Ancient coastline at 125 m depth contour KEF, Exmouth Plateau KEF, Commonwealth waters adjacent to Ningaloo Reef KEF and Continental slope demersal fish communities KEF</li> </ul>   |
| <p><b>Moderate Exposure</b><br/>(≥ 100 ppb)</p> | <p>Entrained hydrocarbons at the high exposure value are predicted to travel up to 507 km south-south-west of the release location. Receptors with the potential to be contacted at the high exposure value are (refer to <b>Table 8-14</b>):</p> <ul style="list-style-type: none"> <li>• Three Australian Marine Parks: Carnarvon Canyon AMP, Gascoyne AMP, and Ningaloo AMP</li> <li>• KEFs: Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, Ancient coastline at 125 m depth contour KEF, Exmouth Plateau KEF, Commonwealth waters adjacent to Ningaloo Reef KEF and Continental slope demersal fish communities KEF</li> </ul>  |

**Table 8-14: Summary of sensitive receptors exposed to entrained hydrocarbons from a worst-case marine diesel spill (vessel collision) for moderate entrained hydrocarbon exposure threshold**

| Receptor  | Maximum Instantaneous Entrained Hydrocarbon Concentration (ppb) | Probability of Instantaneous Entrained Hydrocarbon Exposure (%) |
|---|---|---|
| Carnarvon Canyon AMP  | 118   | 2   |
| Gascoyne AMP  | 12,507  | 41  |
| Ningaloo AMP  | 318   | 2   |
| Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF | 26,040  | 40  |
| Ancient coastline at 125 m depth contour KEF                              | 278   | 2   |
| Exmouth Plateau KEF   | 1,523   | 14  |
| Commonwealth waters adjacent to Ningaloo Reef KEF                         | 318   | 2   |
| Continental slope demersal fish communities KEF                           | 43,090  | 85  |

### 8.3.4 Environmental Impact Assessment

The environmental impact assessment below is based on the worst-case marine diesel spill from a vessel collision. A marine diesel spill from a bunkering incident is similar in nature to the vessel collision scenario (same release location and hydrocarbon type) but substantially smaller in scale (release volume is approximately 4% of the vessel collision scenario). The potential impacts of surface, entrained, and dissolved hydrocarbons from a marine diesel spill from a vessel collision are similar to those described for the loss of well containment (refer to **Section 8.2.4**), however there are some important differences:

- Unlike the worst-case loss of well containment scenario, a worst-case marine diesel spill from a vessel collision will not result in shoreline accumulation at or above the low, moderate, or high thresholds
- The worst-case marine diesel spill from a vessel collision occurs at the sea surface and hence is more available to rapid weathering than the seabed release from a worst-case loss of well containment
- Marine diesel has a much higher portion of volatile hydrocarbons than Stybarrow crude and will weather much more rapidly
- Marine diesel has a greater water-soluble fraction and is more easily entrained than Stybarrow crude, resulting in greater potential for this hydrocarbon type to impact upon receptors sensitive to these hydrocarbon phases.

Based on the points above, a worst-case marine diesel spill from a vessel collision has substantially smaller potential for impacts to sensitive receptors. Marine fauna that are susceptible to floating oil, such as air-breathing fauna and seabirds, have a much lower chance of encountering marine diesel than Stybarrow crude, and the impacts of such an encounter will generally pose a lower risk of mortality. Given the absence of shoreline accumulation above the ecological impact threshold, impacts to shorebirds, nesting turtles and turtle hatchlings will not credibly occur.

The entrained and dissolved hydrocarbon phases from a worst-case marine diesel spill from a vessel collision may extend considerably further than the same phases from a worst-case loss of well control. Modelling results indicate the entrained and dissolved phases would occur in continental slope and oceanic waters, with either of these phases occurring in continental shelf waters above ecological impact thresholds. Both phases would also be concentrated within the top 20 m of the water column. As such, pelagic biota such as planktonic communities, fishes and sharks may be impacted. However, given the widespread nature of these receptors and the transient nature of the

hydrocarbon hazard, impacts are expected to be localised and recover rapidly.

The Gascoyne, Ningaloo and Carnarvon Canyon AMPs are within the EMBA and have the potential to receive concentrations of entrained oil (at 100 ppb). Pelagic biota that may be impacted by entrained hydrocarbons are part of the environmental values of these protected areas. However, given the nature and scale of the potential impacts of a marine diesel spill, it is not anticipated that the AMP values will be compromised.

Several KEFs occur within the EMBA for a worst-case marine diesel spill from a vessel collision. These KEFs are all associated with benthic features and their environmental values will not credibly be impacted by a worst-case marine diesel spill from a vessel collision, as the hydrocarbons will be concentrated near the sea surface.

**8.3.4.1 Species Recovery Plans and Threat Abatement Plans**

Woodside has considered information contained in relevant recovery plans for marine fauna that identify marine pollution as a threat (**Section 8**). This includes the objectives and actions within the following plans:

- Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia, 2017)
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) (Department of the Environment, 2014)
- Recovery plan for the white shark (*Carcharodon carcharias*) (Department of Sustainability, Environment, Water, Population and Communities, 2013)
- Sawfish and River Shark Multispecies Recovery Plan (Commonwealth of Australia, 2015a)

**8.3.5 Demonstration of ALARP**

The ALARP process for the environmental aspect is summarised in Table 8-15. This process was completed as outlined in **Section 6.1.4** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

**Table 8-15: Marine Diesel Release – ALARP Summary**

| Control Measure   | Accept / Reject | Reason   | Associated Performance Standards |
|---|-----------------|--|----------------------------------|
| <b>Legislation, Codes and Standards</b>   |                 |  |                                  |
| MODU and project support vessel compliant with navigation safety requirements including the Navigation Act 2012 and any subsequent Marine Orders (21 & 30), which specify: <ul style="list-style-type: none"> <li>• navigation (including lighting, compass/radar), bridge and communication equipment will comply with appropriate marine navigation and vessel safety requirements</li> <li>• Automatic Identification System (AIS) is fitted and maintained in accordance with Regulation 19-1 of Chapter V of SOLAS</li> <li>• crew performing vessel bridge-watch will be qualified in accordance with AMSA Marine Order Part 3: Seagoing Qualifications or certified training equivalent</li> </ul> | Accept          | Legislative requirements to be followed which reduces the risk of third-party vessel interactions due to ensuring safety requirements are fulfilled and other marine users are aware of the presence of the MODU and support vessels.<br><br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 1.1</b>                    |

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| Establishment of a 500 m safety exclusion zone around MODU/infrastructure removal vessel and communicated to marine users.   | Accept          | Control is based on legislative requirements and must be adopted; reduces likelihood of vessel collision with third parties. Third-party vessels must navigate the exclusions zone to reduce the risk. The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   | PS 1.2                           |
| Marine Order 91 (marine pollution prevention – oil) 2014, requires Ship Oil Pollution Emergency Plan (SOPEP)/Spill Monitoring Programme Execution Plan (SMPEP) (as appropriate to vessel class). | Accept          | By ensuring a SOPEP/SMPEP is in place for the vessel, the likelihood of a spill entering the marine environment is reduced. Although no significant reduction in consequence could result, the overall risk is reduced. Control is based on a legislative requirement and must be adopted.<br><br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.  | PS 12.1                          |
| <b>Eliminate</b>   |                 |  |                                  |
| Eliminate use of vessels.  | Reject          | Control not considered feasible. The use of vessels is required to conduct the petroleum activities.   | Not applicable                   |
| The MODU/project vessel brought into port to refuel.   | Reject          | Control is not considered feasible and does not eliminate the fuel transfer risk.<br><br>It is not operationally practical to transit MODU/project vessel back to port for refuelling based on the frequency of the refuelling requirements and distance from the nearest port (Onslow ~ 129 km away).<br><br>Eliminates the risk in the Operational Area, However, moves risk to another location. Therefore, no overall benefit.<br><br>Significant cost sacrifice due to schedule delay and vessel transit costs and day rates. Control grossly disproportionate to the benefit gained and therefore not adopted. | Not applicable                   |
| No refuelling of helicopter on MODU.   | Reject          | Control is not considered feasible given the distance of the Operational Area from the airports suitable for helicopter operations. Helicopter flights cannot be eliminated and may be required in emergency situations.   | Not applicable                   |

### 8.3.5.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (Table 8-15) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the risks and consequences from an unplanned hydrocarbon release (marine diesel) as a result of a vessel collision or incident during bunkering or refuelling activities to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential risks of a marine diesel hydrocarbon release. As no reasonable additional/alternative controls were identified that would future reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are therefore ALARP.

### 8.3.6 Demonstration of Acceptability

Based on the impact assessment, given the adopted controls, the risk of a marine diesel spill from a vessel collision or bunkering/refuelling incident will be reduced to a tolerable level. An unlikely, unplanned marine diesel spill from a vessel collision may result in a substantial impact to the environment and community, where recovery of ecosystem function could take several years (1 – 3 years). For an unplanned marine diesel spill from bunkering or refuelling activities, may result in minor, temporary impacts to the marine environment, where the ecosystem functions recover

with little to no intervention.

Further opportunities to reduce the risks and consequences have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines, good oil-field practice/industry best practice, and in some cases are above industry best practice and meet legislative requirements of Marine Orders 30 and 21. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental risks are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The risks and consequences from an unlikely unplanned marine diesel spill as a result of a vessel collision or bunkering/refuelling incident are well understood, and there is no risk of serious or irreversible environmental damage from this aspect. The marine diesel spill risk assessment was informed by industry-standard modelling, which includes highly conservative assumptions to inform the worst-case credible spill scenario. The spill modelling outcomes incorporate inherent uncertainty and are consistent with the precautionary principle.
- **Intergenerational Principle:** The risks and consequences from an unlikely unplanned marine diesel spill as a result of a vessel collision or bunkering/refuelling incident will not impact upon the environment such that future generations cannot meet their needs. Plug and abandonment of the Stybarrow development wells is required to mitigate unplanned releases that could potential occur from Stybarrow wells in the future.
- **Biodiversity Principle:** The risks and consequences from an unlikely unplanned marine diesel spill as a result of a vessel collision or bunkering/refuelling incident will not impact upon biodiversity or ecological integrity in the long-term. The controls Woodside will implement reduce the risk of a marine diesel spill from a vessel collision or incident during bunkering/refuelling to ALARP.

During consultation, BYAC asked to be kept informed of activities given potential for coastline areas of migrating species to be impacted in the event of a spill. Malgana raised its views that there are flaws in spill modelling related to Shark Bay hydrodynamics. Woodside will continue to engage with BYAC as part of ongoing engagement and has provided further information to representatives of Malgana on spill modelling inputs and results and no further objections or requests for information were raised.

During a meeting with Nanda, a number of questions related to oil spills were raised (e.g. has Woodside had a spill in the past, details of spill response measures particularly for shoreline impact, and whether Woodside's activities are resistant to cyclone events) which Woodside provided responses to and no further concerns or comments were raised. Woodside was also asked how quick the oil spill response was during a meeting with MG Corp, to which Woodside provided a response in the meeting and no further comments or concerns have been raised.

During a meeting with WAC, a number of questions related to oil spills were raised (e.g. emergency preparedness, relevance of the EMBA to consultation, whether a diesel spill would only be on the surface, how long diesel stays in the environment, and how soon a spill is responded to) which Woodside provided responses to and no further concerns or comments were raised.

During consultation, Yued noted that oil spill modelling has a degree of uncertainty which creates concern for the Yued Board and Cultural Advice Committee. Woodside notes this uncertainty and commits to notifying traditional owners who may be affected in the unlikely event of a spill. Consultation related to hydrocarbon spills also occurred with DMIRS, DBCA, NCWHAC, DNP, DoT, CCG, Shire of Carnarvon. A summary of all consultation conducted for this EP is included in **Appendix F, Table 1 and 2**.

On this basis, Woodside considers the risk to be managed to an acceptable level.

## 8.4 Marine Fauna Interaction

### 8.4.1 Summary of Risk Assessment and Evaluation

| Aspect                        | Source of Hazard  | Potential Impact  | Severity Factor | Likelihood Factor | Residual Risk | Decision Context         | Acceptability |
|-------------------------------|---|---|-----------------|-------------------|---------------|--------------------------|---------------|
| Interaction with marine fauna | Accidental collision between project vessel and marine fauna within the operational area. | Potential injury to or death of protected marine fauna species. | 30              | 0.1               | 3             | Type A<br>Low Order Risk | Tolerable     |

### 8.4.2 Source of Hazard

Movements of the project vessels in and around the Operational Area undertaking the petroleum activity may present a potential hazard to slow-moving marine megafauna (cetaceans, marine turtles, or whale sharks). Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g., movement and reproduction) and mortality.

The factors that contribute to the frequency and severity of impacts due to collisions vary greatly due to vessel type, vessel operation (specific activity, speed), physical environment (e.g., water depth), the type of animal potentially present and their behaviours.

Project vessels used during the petroleum activities may include anchor handling vessels, light construction vessels (if required for well infrastructure removal) or general offshore support vessels. Project vessels will be stationary or moving at low speeds during the plug and abandonment activities. Project vessels will be used for preparatory activities, well removal activities (if not conducted on the MODU) and during MODU based P&A to transport equipment and materials between the MODU and port (e.g., Dampier, Onslow, Exmouth). One offshore support vessel will remain on standby duties, within the Operational Area during the MODU based campaign. Support vessels do not anchor within the Operational Area during the activities due to water depth; therefore, vessels will utilise DP.

### 8.4.3 Environmental Impact Assessment

Vessel collisions have been known to contribute to the mortality of marine fauna that spend time at the surface (i.e., breathing and feeding), including resident and migrating turtles (Hazel et al., 2007) and migratory whales (Jensen and Silber, 2004; Laist et al., 2001). For cetaceans, whale sharks and turtles, the risk of lethal collision is a function of abundance of animals in the Operational Area, probability of a collision and the probability of that collision being fatal.

The likelihood of vessel/fauna collision being lethal is influenced by vessel speed—the greater the speed at impact, the greater the risk of mortality (Jensen and Silber, 2004; Laist et al., 2001). Vanderlaan and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. Project vessels within the Operational Area are likely to be travelling less than 8 knots (and will often be stationary) within the 500 m zone for the MODU. Therefore, the chance of a vessel collision with protected species resulting in a lethal outcome is considered unlikely. The risk of marine life getting caught in operating thrusters is unlikely, given the low presence of individuals, combined with the avoidance behaviour commonly displayed during dynamic positioning operations.

#### 8.4.3.1 Cetaceans

As described above, vessel speed influences the probability of a vessel collision with a cetacean and also whether a collision may result in lethal injury (Vanderlaan and Taggart, 2007). Additionally, behaviour of individuals may also influence the likelihood of a collision occurring. Although large cetaceans are expected to show localised avoidance in response to vessel noise, studies have reported limited behavioural response to approaching ships (McKenna et

al., 2015) and individuals engaging in behaviours such as feeding, mating or nursing may be less aware of their surroundings and more susceptible to collision (Laist et al., 2001).

No known key aggregation areas for marine mammals (resting, breeding or feeding) are located within or immediately adjacent to the Operational Area. However, individuals may occasionally be present in the Operational Area, including pygmy blue whales and humpback whales during seasonal migrations (**Section 4.7.2**). Ten listed threatened and migratory species of cetacean (nine whale species and one dolphin species) were identified as potentially occurring in or having habitat in the Operational Area (**Table 4-7**).

The reaction of whales to the approach of a vessel is quite variable. Some species remain motionless when in the vicinity of a vessel, while others are known to be curious and often approach vessels that have stopped or are slow-moving, although they generally do not approach, and sometimes avoid, faster moving vessels (Richardson et al., 1995). Species may also show avoidance to vessel noise as the vessel approaches (as described in **Section 7.3**). Dolphins show preference for coastal habitats over deep offshore waters. This reduces the likelihood of dolphin species being encountered in the Operational Area and interacting with vessels.

According to the data of Vanderlaan and Taggart (2007), it is estimated that the risk of lethal injury to a large whale as a result of a vessel strike is less than 10% at a speed of 4 knots. Vessel-whale collisions at this speed are uncommon and, based on reported data contained in the NOAA database (Jensen and Silber, 2004) there are only two known instances of collisions when the vessel was travelling at less than 6 knots; both of these were from whale-watching vessels that were deliberately positioned amongst whales. Smaller cetaceans, such as dolphins, comprise a lower proportion of vessel collision records (DoEE, 2016), though it is difficult to determine if this is due to a lower collision rate or lower detection rate of incidents. Dolphins often engage in bow riding which may make them more vulnerable to entanglement with propellers or thrusters compared to larger cetaceans.

The worst-case consequence from a vessel strike would be the fatality of a single cetacean; however, as they would represent an individual within the local population, it is not expected to result in an impact to the viability or long-term survival of a population.

#### 8.4.3.2 Sharks and Rays

Shark and ray species, with the exception of whale sharks, spend minimal amount of time at the sea surface and collisions with individual sharks or rays is considered unlikely.

Whale sharks are at risk from vessel strikes as they spend time feeding at the sea surface. Whale sharks have been shown to spend approximately 25% of their time less than 2 m from the surface and greater than 40% in the upper 15 m of the water column (Gleiss et al., 2013; Wilson et al., 2006). Whale sharks may traverse offshore North West Shelf waters, including the Operational Area, during their migrations to and from aggregation areas along the Ningaloo coast. Seasonal aggregations along the Ningaloo coast can be variable, although usually between March and July, with peak numbers recorded in April and May (Sleeman et al., 2010). Outside of this period, individuals may still be present. Given the slow speeds at which project vessels operate, collisions with individual whale sharks are considered unlikely.

#### 8.4.3.3 Turtles

The Recovery Plan for Marine Turtles in Australia recognises turtles are at risk from vessel strikes, particularly in shallow coastal foraging habitats and internesting areas where there are high numbers of recreational and commercial vessels (Commonwealth of Australia, 2017). There is limited data about the incidence of marine turtle vessel strikes. Hazel and Gyuris (2006) note that at least 65 turtles were killed annually from 1999 to 2002 as a result of collisions with vessels on the Queensland east coast. Green turtles, followed by loggerhead turtles, comprised the majority of vessel-related records (Hazel and Gyuris, 2006); however, all species of marine turtle have been involved in vessel strikes (Commonwealth of Australia, 2017). It is reasonable to assume the higher the speed of collision, the greater the risk of mortality, but contact with the propeller would be lethal at almost all speeds. Studies have shown turtles are less likely to flee from a fast-moving vessel, presumably because of poor hearing and visual senses than from a slow-moving vessel (Hazel et al., 2007).

Five marine turtle species were identified as potentially occurring in the Operational Area (see **Table 4-7**). The Operational Area does not contain any BIAs for turtles. The nearest marine turtle nesting sites occur on the North West Cape, which is approximately 41 km from the Operational Area. Marine turtles are not expected to be in the Operational Area in high numbers, even during nesting and inter-nesting periods, given the distance from the known nesting beaches. Given the slow speeds at which project vessels operate, collisions with individual marine turtles are

considered unlikely.

#### 8.4.3.4 Cultural Values and Heritage

Through consultation and review of available literature (**Section 4.8.1**), Woodside understands that marine fauna that may be affected by a collision with a project vessel, such as marine mammals, whale sharks and turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well as intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Whale species may be subject of First Nations' increase ceremonies / rituals which are performed to enhance or maintain populations. As these thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, Woodside understands the thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described in the environmental impact assessment (**Section 8.3.3**), potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to ecologically significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

#### 8.4.3.5 Cumulative Impact Assessment

There is potential for SIMOPs to occur with activities covered under this EP and other Woodside decommissioning activities within WA-32-L as described in **Section 3.4.1**. A maximum of up to four vessels and a MODU may be present in the Operational Area at one time should SIMOPs occur. The increased number of vessels in WA-32-L during SIMOPS will not materially increase the risk of vessel collisions with marine fauna, as vessels performing SIMOPS will be either stationary or moving slowly, hence presenting very little risk of collision with marine fauna. The species at risk of collisions in WA-32-L are primarily pygmy blue whales and whale sharks, both of which are in the region seasonally and likely to avoid close interactions with vessels due to the behavioural disturbance from underwater noise emissions (**Section 7.3**). Hence, the likelihood of vessel collisions with marine fauna during SIMOPS are considered highly unlikely, with a measurable but limited consequence.

#### 8.4.3.6 Species Recovery Plans and Threat Abatement Plans

Woodside has considered information contained in relevant recovery plans for marine fauna that identify vessel collision as a threat (**Section 9**). This includes the objectives and actions within the following plans:

- Conservation management plan for the blue whale: A recovery plan under the *Environment Protection and Biodiversity Conservation Act 1999* 2015-2025 (Commonwealth of Australia, 2015b)
- Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia, 2017)

#### 8.4.4 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 8-16**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

Table 8-16: Marine Fauna Interactions – ALARP Summary

| Control Measure   | Accept / Reject | Reason   | Associated Performance Standards |
|---|-----------------|--|----------------------------------|
| <b>Legislation, Codes and Standards</b>   |                 |  |                                  |
| <p>EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures<sup>32</sup>:</p> <ul style="list-style-type: none"> <li>Project vessels will not travel greater than six knots within 300 m of a cetacean or turtle (caution zone) and not approach closer than 100 m from a whale.</li> <li>Project vessels will not approach closer than 50 m for a dolphin or turtle and/or 100 m for a whale (with the exception of animals bow riding).</li> <li>If the cetacean or turtle shows signs of being disturbed, project vessels will immediately withdraw from the caution zone at a constant speed of less than six knots.</li> <li>Project vessels will not travel greater than eight knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark.</li> </ul> | Accept          | Reduces interaction risk to cetaceans (modified to include turtles and whale sharks). Controls based on legislative requirements must be accepted. Control is feasible, standard practice with minimal cost.   | PS 13.1                          |
| <b>Engineering</b>  |                 |  |                                  |
| The use of dedicated MFOs on support vessels for the duration of each activity to watch for whales and provide direction about and monitor compliance with Part 8 of the EPBC Regulations.  | Reject          | Given that support vessel bridge crews already maintain a constant watch during operations in compliance with the Woodside Marine – Charterers Instructions, additional MFOs would not significantly further reduce the risk. Additional cost of MFOs considered unnecessary. Disproportionate. The cost/ sacrifice outweighs the benefit gained.          | Not applicable                   |
| Passive acoustic monitoring to detect cetaceans in the vicinity of the vessels  | Reject          | The cost of a passive acoustic monitoring system has been estimated to be unacceptably high and would require several permanent mooring locations in the Operational Area with real-time monitoring and analysis. Given the project vessels would be stationary or moving slowly, it is considered the cost is disproportionate to the benefit that may be | Not applicable                   |

<sup>32</sup>For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited manoeuvrability; e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

| Control Measure  | Accept / Reject | Reason  | Associated Performance Standards |
|--|-----------------|---|----------------------------------|
|  |                 | gained.   |                                  |
| <b>Separate</b>  |                 |   |                                  |
| Avoid periods of marine fauna sensitivity (such as humpback whale migration).                                  | Reject          | <p>Would reduce the risk of interactions during environmentally sensitive periods.</p> <p>The benefit that may accrue from avoiding periods of peak humpback whale migration is negligible based on the observation that even with all the oil and gas development (and associated vessel movements) occurring in the Exmouth Basin over the last ten years, the humpback whale population (Stock IV) has grown at an estimated 10% per year. While pygmy blue whales have not recovered to the same extent, there is also little evidence of oil and gas activities consistent with the petroleum activities in this EP resulting in behavioural disturbance.</p> <p>The cost associated with avoiding periods of peak whale density would be several millions of dollars if it requires placing contracted vessels on standby or the Petroleum Activity to be put on hold, delaying the P&amp;A activities. Given the low risk of impacts associated with underwater noise, it is considered the cost of this additional control is grossly disproportionate to the negligible benefit that may accrue.</p> | Not applicable                   |
| <b>Administrate</b>  |                 |   |                                  |
| Environmental awareness induction provided to all marine crew to advise marine fauna interaction requirements. | Accept          | Providing induction to personnel assists in understanding obligations regarding marine fauna interactions. Control is feasible, standard practice with minimal cost.  | <b>PS 13.2</b>                   |

#### 8.4.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 8-16**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the risks and consequences of potential vessel collision with protected marine fauna to ALARP.

Woodside considers the adopted control measures described above (**Table 8-16**) are appropriate to reduce the potential risks of vessel collision with protected marine fauna. As no reasonable additional/alternative controls were identified that would future reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are therefore ALARP.

#### 8.4.5 Demonstration of Acceptability

The impact assessment has determined that, given the adopted controls, a vessel collision with marine fauna represents a tolerable, low current risk rating that is unlikely to result in a risk consequence to marine fauna greater than a minor, temporary impact to species. Relevant BIAs overlapping the Operational Area include the Pygmy Blue Whale Migration and Distribution BIAs. Relevant recovery plans and conservation advice has been considered during the impact assessment, and the petroleum activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice (**Section 9**).

The adopted controls are consistent with industry good practice and professional judgement and meet the

requirements of Part 8 (Division 8.1) of the EPBC Regulations 2000. No concerns or objections regarding marine fauna interaction risks have been raised by relevant stakeholders. The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental risks are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The risks and consequences of a vessel collision with marine fauna are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** The risks and consequences of a vessel collision with marine fauna will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** The risks and consequences of a vessel collision with marine fauna will not impact upon biodiversity or ecological integrity in the long-term.

During consultation YAC expressed concern about potential impact to whales from collisions. Woodside responded to YAC during the meeting to clarify that controls would be in place to reduce this risk, and no further concerns were raised following this meeting (**Table 1, Appendix F**). During consultation, Nanda asked about control measures to avoid impacts to migratory whales, which Woodside responded to in the meeting. WAC asked, during consultation, whether activities could be stopped during whale migration. Woodside responded that it is not planned and explained the controls to limit potential impacts to whales. During consultation, NTGAC raised an interest in whale sharks, and Woodside provided further information during the consultation meeting. During consultation, BYAC advised marine life migrating through the SCIPA area of Hutt River coastline to the Abrolhos Houtman Islands may be impacted by unplanned spills from the proposed activity. No further concerns were raised. Details of consultation are provided in **Appendix F**.

Further, marine species such as cetaceans, whale sharks and turtles have been identified, during consultation for this EP as well as for other Woodside activities, as a cultural value for Traditional Custodians. Given impacts on a population level are not expected to occur, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

On this basis, Woodside considers the risk to be managed to an acceptable level.

8.4.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes   | Controls  | Performance Standards   | Measurement Criteria   |
|--|---|---|--|
| <p><b>EPO 13</b><br/>No vessel strikes with protected marine fauna (whales, whale sharks, turtles) during the petroleum activity</p> | <p><b>C 13.1</b><br/>EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures<sup>33</sup>:</p> <ul style="list-style-type: none"> <li>vessels will not travel greater than six knots within 300 m of a cetacean or turtle (caution zone) and not approach closer than 100 m from a whale.</li> <li>vessels will not approach closer than 50 m for a dolphin or turtle and/or 100 m for a whale (with the exception of animals bow riding).</li> <li>if the cetacean or turtle shows signs of being disturbed, vessels will immediately withdraw from the caution zone at a constant speed of less than six knots.</li> <li>vessels will not travel greater than eight knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark.</li> </ul> | <p><b>PS 13.1</b><br/>Vessels will comply with the EPBC Regulations 2000 – Part 8 Division 8.1 (Regulation 8.05 and 8.06) Interacting with cetaceans to manage the risk of fauna collision.</p> | <p><b>MC 13.1.1</b><br/>Records demonstrate no breaches with EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans and application of these regulations to whale sharks and marine turtles.</p> <p><b>MC 13.1.2</b><br/>Records demonstrate reporting cetacean, whale shark and marine turtle ship strike incidents to the National Ship Strike Database.</p> |

<sup>33</sup>For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited maneuverability; e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

## 8.5 Introduction of Invasive Marine Species

### 8.5.1 Summary of Risk Assessment and Evaluation

| Aspect                  | Source of Hazard   | Potential Impact   | Severity Factor | Likelihood Factor | Residual Risk | Decision Context        | Acceptability |
|-------------------------|--|--|-----------------|-------------------|---------------|-------------------------|---------------|
| Invasive marine species | Movement of project vessels and immersible equipment from known high invasive marine species risk areas. | Introduction of invasive marine species to areas, leading to impact to native species. | 100             | 0.1               | 10            | Type A Lower Order Risk | Tolerable     |

### 8.5.2 Source of Hazard

During the petroleum activity, MODU and project vessels will be transiting to and from the Operational Area, potentially including mobilising from beyond Australian waters. The vessels considered for use as part of this Petroleum Activity are defined in **Section 3.7**).

The MODU and project vessels have the potential to introduce Invasive Marine Species (IMS) through:

- discharges of vessel ballast water containing IMS
- translocation of species through biofouling of vessel hull or niches (such as sea chests, bilges or strainers)
- translocation of species on submerged equipment.

IMS typically require hard substrate in the photic zone; therefore, requiring shallow waters to become established. Highly disturbed, shallow-water environments such as shallow coastal waters, ports and marinas are more susceptible to IMS colonisation, whereas IMS are generally unable to successfully establish in deep-water ecosystems and open-water environments. The Operational Area is deep offshore in open waters, away from shorelines and critical habitat, therefore they are not conducive to the settlement and establishment of IMS.

Should a MODU or project vessel be mobilised from international waters, there is the potential for transferring IMS from international waters into the Operational Area and to Australia if the vessel is required to sail to a port. All vessels (including the MODU) entering Australian waters are subject to IMS risk management requirements. Woodside applies additional IMS risk management requirements for all vessels undertaking the Petroleum Activity.

#### 8.5.2.1 Ballast Water

The Commonwealth Department of Climate Change, Energy, the Environment and Water (DCCEEW) is the lead agency with responsibility for managing ballast water. Vessels manage ballast water in accordance with International Maritime Organisation (IMO) International Convention for the Control and Management of Ships' Ballast Water and Sediments Convention, IMO Guidelines, the mandatory Australian Ballast Water Management Requirements (Version 8) (Department of Agriculture, Water and the Environment, 2020) are enforced under the Commonwealth *Biosecurity Act 2015* and associated local measures intended to minimise the risk of transplanting harmful aquatic organisms and pathogens from ships' ballast water and associated sediments, while maintaining ship safety.

Vessels arriving from overseas or intending to discharge internationally sourced trim or ballast water within Australian waters, are required to have undertaken a ballast water exchange in accordance with DCCEEW requirements. exchanged ballast water in accordance with DCCEEW requirements. The Australian Ballast Water Management Requirements (Version 8) are now aligned with the BWM Convention:

- All vessels must carry a valid Ballast Water Management Plan (BWMP) and valid Ballast Water Management Certificate (BWMC), as appropriate to vessel class.
- Vessels with a Ballast Water Management System (BWMS) should also carry a Type Approval Certificate

specific to the type of BWMS;

- All vessels must maintain a complete and accurate Ballast Water Record System detailing all ballast water movements
- All vessels should submit a Ballast Water report. Reporting obligations differ for vessels operating domestically and vessels travelling internationally. Vessels arriving from an international location and intending to discharge internationally sourced ballast water must submit a Ballast Water Report at least 12 hours prior to arrival. Domestic trading vessels can request a low risk exemption through a Domestic Risk Assessment. All applications must be submitted through MARS.

From September 2019, all vessels that use ballast water are required to meet the Regulation D2 discharge standard of the International Convention for the Control and Management of Ships' Ballast Water and Sediments (the Convention) at their next renewal survey. Vessels using ballast water exchange as their primary ballast water management method are required to phase out this management method and meet the Regulation D2 discharge standard. Vessels may meet this standard by installing an International Maritime Organisation (IMO) Type Approved ballast water management system, or as specified within the Convention.

The project vessels will exchange ballast water outside ports where possible.

The proposed control measures for IMS introduced by ballast water are consistent with the Australian Ballast Water Management Requirements (Revision 8) and consistent with good oilfield practice.

### 8.5.2.2 Biofouling

Biofouling on the MODU and project vessel hulls, external niche areas and immersible equipment pose a potential risk of IMS in Australian waters. Under the National Biofouling Management Guidelines for the Petroleum Production and Exploration Industry and IMO Guidelines for the control and management of ships' biofouling to minimise the transfer of invasive aquatic species (resolution MEPC.207(62)), DCCEEW guidelines and Woodsides IMS Management process, a risk assessment approach is applied to manage biofouling.

Woodsides IMS Management Procedure is defined in **Section 11.3**. To minimise the potential risk of introducing IMS as a result of the petroleum activity, all applicable MODU, project vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined in **Section 11.3**). The completed IMS risk assessment must show that IMS risk is low for each project vessel and associated immersible equipment, prior to entering the Operational Area as defined under this EP.

### 8.5.3 Environmental Impact Assessment

IMS are a subset of Non-indigenous Marine Species (NIMS) that have been introduced into a region beyond their natural biogeographic range resulting in impacts to social/cultural, human health, economic and/or environmental values. NIMS are species that have the ability to survive, reproduce and establish founder populations. However, not all NIMS introduced into an area will thrive or cause demonstrable impacts and the majority of NIMS around the world are relatively benign and few have spread widely beyond sheltered ports and harbours. NIMS are only considered IMS when they result in impacts to environmental values and/or have social/cultural, economic and/or human health impacts.

Potential IMS have historically been introduced and translocated around Australia by a variety of natural and human means, including marine fouling and ballast water. Potential IMS vary from one region to another depending on various environmental factors such as water temperature, salinity, nutrient levels and habitat type, which dictate their survival and invasive capabilities. IMS typically require hard substrate in the photic zone; therefore, requiring shallow waters to become established. Highly disturbed, shallow-water environments such as shallow coastal waters, ports and marinas are more susceptible to IMS colonisation, whereas IMS are generally unable to successfully establish in deep-water ecosystems and open-water environments where the rate of dilution and the degree of dispersal are high.

The successful establishment of translocated marine pests via either ballast or hull fouling depends primarily on:

- colonisation and establishment of the marine pest on a vector (vessel, equipment, or structure) in a donor region (for example, a home port, harbour or coastal project site where a marine pest is established)
- survival of the marine pests on the vector during the voyage from the donor to the recipient region
- colonisation (for example, by reproduction or dislodgement) of the recipient region by the marine pest,

followed by successful establishment of a viable new local population.

The deep offshore open waters (approximately 800-850 m) of the Operational Area are not conducive to the settlement and establishment of IMS. The Operational Area water depths preclude light penetration to the seabed and the Operational Area is distant from any coastline (> 41 km) and critical shoreline habitats. The likelihood that any marine organisms could become established at the field is unlikely.

### 8.5.3.1 Habitats and Biological Communities

Once introduced, IMS may:

- prey on local species (which had previously not been subject to this kind of predation and therefore not have evolved protective measures against the attack)
- outcompete indigenous species for food, space or light
- interbreed with local species, creating hybrids such that the endemic species is lost.

These changes to the local marine environment result in changes to the natural ecosystem.

Epifauna and infauna in the Operational Area may be susceptible to impacts from IMS due to the risk of changes to the ecosystem dynamics such as competition for resources and predation. Benthic productivity on the outer continental shelf and slope is low, and is a function of water depth, low nutrient availability, and the absence of hard substrates. Benthic habitats in the Operational Area generally consists of sparse populations of sessile filter feeders (e.g., sponges, soft corals etc.), infauna, and a mobile epibiota (e.g., crustaceans, echinoderms, and molluscs).

However, while the MODU and project vessels have the potential to introduce IMS into the Operational Area, the deep offshore open waters of the Operational Area (approximately 810 - 850 m) are not conducive to the settlement and establishment of IMS. Furthermore, the Operational Area is far from shallow water habitats where IMS typically become established. The likelihood of IMS being introduced and establishing viable populations within the Operational Area or immediate surrounds is considered not credible. Accordingly, impact to benthic habitats and communities from IMS are not considered credible.

### 8.5.3.2 Key Ecological Features

As outlined above in Habitats and Biological Communities (**Section 8.5.3.2**), establishment of IMS within the Operational Area is not considered credible, due to water depths of approximately 800 – 850 m not being conducive for introduction and establishment of IMS on the seafloor.

### 8.5.3.3 Socio-Economic Environment

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g., shellfish stocks). IMS have proven particularly difficult to eradicate from areas once established. If the introduction is detected early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

The establishment of IMS has the potential to cause changes to the functions, interests or activities of other users through indirect impact such as changes to fisheries target species resulting in economic and social implications, or due to compromised reputation to the oil and gas industry.

Given the low likelihood of IMS translocation to, and colonisation of, environments within the Operational Area, project activities will not result in establishment of IMS, and as such not adversely affect other marine user activities in the region.

Based on the detailed impact evaluation, the magnitude of potential impacts of a change to the functions, interests or activities of other users is minor (see Table 8-17).

Table 8-17: Evaluation of risks and impacts from marine pest translocation

| IMS Introduction Location   | Credibility of Introduction  | Consequence of Introduction  | Likelihood  |
|---|--|--|---|
| Introduced to Operational Area and establishment on the seafloor or subsea structures.                              | <b>Not Credible</b>  |  |   |
|   | The deep offshore open waters of the Operational Area, away from shorelines and/or critical habitat, more than 41 km from a shoreline and in waters 800 - 850 m deep are not conducive to the settlement and establishment of IMS.   |  |   |
| Introduced to Operational Area and establishment on a MODU or project vessel.                                       | <b>Credible</b>  | <b>Environment – Not Credible</b>  | <b>Highly Unlikely</b>  |
|   | There is potential for the transfer of marine pests between MODU, project vessels within the Operational Area.   | <p>The translocation of IMS from a colonised MODU or project vessel to shallower environments via natural dispersion is not considered credible, given the distances of the Operational Area from nearshore environments (i.e., greater than 12 nm from shore and in water depths greater than 50 m). There is therefore no credible environmental risk and the assessment is limited to Woodside’s reputation.</p> <p><b>Reputational Assessment</b></p> <p>If IMS were to establish on a project vessel (i.e. MODU, light construction vessels, support vessels), this could potentially impact the vessel operationally through the fouling of intakes, result in translocation of an IMS into the Operational Area and, depending on the species, potentially transfer of an IMS to other support vessels, which would likely result in the quarantine of the vessel until eradication could occur (through cleaning and treatment of infected areas), which would be costly to perform.</p> <p>Such introduction would be expected to have slight impact to Woodside’s reputation, particularly with Woodside’s contractors, and would likely have a reputational impact on future proposals.</p> | <p>Interactions between project vessel will be limited during the Petroleum Activities Program, with minimum 500 m safety exclusion zones being adhered to around the MODU, and interactions limited to short periods of time alongside (i.e., during backloading, bunkering activities). There is also no direct contact (i.e., they are not tied up alongside) during these activities.</p> <p>Spread of marine pests via ballast water or spawning in these open ocean environments is also considered remote.</p> |
| Transfer between project vessels and from project vessels to other marine environments beyond the Operational Area. | <b>Not Credible</b>  |  |   |
|   | <p>This risk is considered so remote that it is not credible for the purposes of the activity.</p> <p>The transfer of a marine pest between project vessels was already considered remote, given the offshore open ocean environment (i.e., transfer pathway discussed above).</p> <p>For a marine pest to then establish into a mature spawning population on the new project vessel (which would have been through Woodside’s IMS process) and then transfer to another environment is not considered credible (i.e., beyond the Woodside risk matrix).</p> <p>Project vessels will be located in an offshore, open ocean, deep environment, where IMS survival is implausible. Furthermore, this marine pest once transferred would need to survive on a new vessel with good vessel hygiene (i.e., has been through Woodside’s risk assessment process), and survive the transport back from the Operational Area to shore. In the event it was to survive this trip, it would then need to establish a viable population in nearshore waters.</p> |  |   |

8.5.4 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 8-18**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

Table 8-18: Introduction of Invasive Marine Species - ALARP Summary

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| <b>Legislation, Codes and Standards</b>  |                 |  |                                  |
| MODU and project vessels will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements.   | Accept          | Controls based on legislative requirements under the <i>Biosecurity Act 2015</i> must be accepted. Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   | <b>PS 14.1</b>                   |
| MODU and project vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.  | Accept          | Reduces the likelihood of transfer of marine pests between vessels within the Operational Area. No change in consequence would occur.<br>Controls based on legislative requirements under the <i>Biosecurity Act 2015</i> – must be adopted.   | <b>PS 14.2</b>                   |
| <b>Eliminate</b>   |                 |  |                                  |
| Mandatory dry-dock cleaning of vessels and cleaning of immersible equipment before entry to the Operational Area to reduce risk of IMS introduction.   | Reject          | Substantial costs and would affect schedule, resulting in potential delays. Significant cost deemed grossly disproportionate to very low risk, given controls already in place.  | Not applicable                   |
| <b>Substitute</b>  |                 |  |                                  |
| Source project vessels based in Australia only.  | Reject          | Sourcing vessels from Australian waters may result in a slight reduction in the likelihood of introducing IMS to the Operational Area; however, it does not completely eliminate the risk of IMS introduction. The potential cost of implementing this control could be high, given the potential supply issues associated with only locally-sourcing project vessels.   | Not applicable                   |
| <b>Engineering</b>   |                 |  |                                  |
| No ballast water exchange  | Reject          | Ballast water exchange is critical for maintaining vessel stability.   | Not applicable                   |
| <b>Administrate</b>  |                 |  |                                  |
| Woodside's IMS risk assessment process will be applied to the MODU, project vessels and immersible equipment undertaking the petroleum activity that enter the Operational Area.<br>Based on the outcomes, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced. | Accept          | Risk assessment process includes initial risk screening and the application of appropriate controls measures to be implemented. In doing so, the likelihood of transferring marine pests between the MODU, project vessels, and immersible equipment within Operational Area is reduced. No change in consequence would occur.<br>Control is feasible and can be implemented at minimal cost. Control is considered good practice and implemented across all of Woodside's operations. Benefits outweigh any cost sacrifice. | <b>PS 14.3</b>                   |

#### 8.5.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 8-18**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the risks and consequences of IMS introduction associated with the petroleum activity to ALARP.

Woodside considers the control measures described above (**Table 8-18**) are appropriate to reduce the risks of introduced IMSAs no reasonable additional/alternative controls were identified that would future reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are therefore ALARP.

#### 8.5.5 Demonstration of Acceptability

The impact assessment has determined that, given the adopted controls, the risk of IMS introduction during the petroleum activity represents a tolerable, low risk. The translocation of IMS may result in a minor, localised and temporary impact and the likelihood of introducing IMS to the Operational Area is considered highly unlikely.

Further opportunities to reduce the risks and consequences have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. No concerns or objections regarding introduced IMS risks have been raised by relevant persons. The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 9**). The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental risks are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The risks and consequences of translocation of IMS to the Operational Area during the petroleum activity are well understood. While the impacts of the introduction of IMS are uncertain, the risk of IMS introduction is ALARP because of the controls that will be implemented and the unsuitable environment in the Operational Area (i.e., deep water unsuited for IMS survival).
- **Intergenerational Principle:** The risks and consequences of translocation of IMS to the Operational Area during the petroleum activity will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** While the impacts of the introduction of IMS are uncertain, the risks and consequences of translocation of IMS to the Operational Area during the petroleum activity is considered ALARP because of the controls that will be implemented and the unsuitable environment in the Operational Area (i.e., deep water unsuited for IMS survival). The introduction of IMS risk will not impact upon biodiversity or ecological integrity in the long-term.

On this basis, Woodside considers the risk to be managed to an acceptable level.

## 8.5.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes  | Controls  | Performance Standards   | Measurement Criteria   |
|---|---|---|--|
| <b>EPO 14</b><br>No introduction and establishment of invasive marine species into the Operational Area as a result of the petroleum activity | <b>C 14.1</b><br>MODU and project vessels will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements.   | <b>PS 14.1</b><br>MODU and project vessels (including foreign vessels not party to the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (BWM Convention) to manage ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements.  | <b>MC 14.1.1</b><br>Ballast Water Records System maintained by vessels which verifies compliance against Australian Ballast Water Management Requirements.   |
|   | <b>C 14.2</b><br>MODU and project vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.  | <b>PS 14.2</b><br>Compliance with Australian Biofouling Management Requirements.  | <b>MC 14.2.1</b><br>Records of implementation of biofouling management measure and pre-arrival reporting.  |
|   | <b>C 14.3</b><br>Woodside's IMS risk assessment process will be applied to the MODU, project vessels and immersible equipment undertaking the petroleum activity that enter the Operational Area.<br><br>Based on the outcomes, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced. | <b>PS 14.3</b><br>Prior to entering the Operational Area, MODU, project vessels and relevant immersible equipment are determined to be low risk <sup>34</sup> of introducing IMS of concern and maintain this low-risk status during the petroleum activity.<br><br>In accordance with Woodside's IMS risk assessment process, the IMS risk assessments will be undertaken by an authorised environment adviser who has completed relevant Woodside IMS training or by qualified and experienced IMS inspector. | <b>MC 14.3.1</b><br>Records of IMS risk assessments maintained for the MODU, project vessels and relevant immersible equipment entering the Operational to undertake the petroleum activity.<br><br><b>MC 14.3.2</b><br>Records confirm that the IMS risk assessments undertaken by an Environment Adviser or IMS inspector (as relevant). |

<sup>34</sup> Low risk of introducing IMS of concern is defined as either no additional management measures required or, management measures have been applied to reduce the risk.

## 8.6 Unplanned Spills of Chemicals and Hydrocarbons

### 8.6.1 Summary of Risk Assessment and Evaluation

| Aspect   | Source of Hazard  | Potential Impact   | Severity Factor | Likelihood Factor | Residual Risk | Decision Context        | Acceptability |
|--|---|--|-----------------|-------------------|---------------|-------------------------|---------------|
| Minor spills and leaks of chemicals and hydrocarbons | Accidental discharge of drilling and P&A fluids (brine, WBM, base oil, cementing fluids and residual wellbore fluids) to the marine environment due to failure of slip joint packers, bulk transfer hose/fitting, leaks during P&A activities such as wireline activities, emergency disconnect sequence or from MODU operations. | Localised and temporary reduction in water quality adjacent to the discharge and minor adverse toxicity effects to surface and water column biota. | 10              | 0.3               | 3             | Type A Lower Order Risk | Tolerable     |
|  | Minor spills and leaks of chemicals and hydrocarbons on the vessel deck reaching the marine environment and from subsea equipment (such as ROVs).   | Localised and temporary reduction in water quality adjacent to the discharge and minor adverse toxicity effects to surface and water column biota. | 10              | 0.3               | 3             | Type A Lower Order Risk | Tolerable     |

### 8.6.2 Source of Hazard

The petroleum activity requires handling, use and transfer of hydrocarbons and chemicals on the MODU and project vessels and subsea at the well locations. During operations involving chemicals and hydrocarbon, there is the potential for a release or loss of containment to occur that could result in minor chemical or hydrocarbon spills to the marine environment. A minor loss of containment of chemical or hydrocarbon can occur from the following:

- Deck spills of stored hydrocarbon/chemicals or equipment
- Failure of hydraulic hoses
- Leaks from fluid lines, tanks and during wireline activities
- Failures during bulk fluid transfers
- Failure of the slip joint packer on the MODU releasing well fluids to the marine environment
- Activation of the Emergency Disconnect Sequence

All chemicals selected for use that may be released or discharged to the marine environment during the petroleum activity are assessed as per Woodside Chemical Selection and Assessment (**Section 3.9**). This assessment process is used to demonstrate that the potential impacts of the chemicals that may be released are acceptable and ALARP.

#### 8.6.2.1 Unplanned Deck Spills

Deck spills can result from spills from stored hydrocarbons/chemicals or equipment. Project vessels typically store hydrocarbon/chemicals in various volumes (20 L, 205 L; up to approximately 4000–6000 L). Storage areas are typically set up with effective primary and secondary bunding to contain any deck spills. Releases from equipment

are predominantly from the failure of hydraulic hoses, which can either be located within banded areas or outside of banded or deck areas (e.g. over water on cranes).

Minor leaks during P&A activities with a live well are described to include leaks such as:

- leaks from the lubricator, stuffing box and hose or fitting failure, which are expected to be less than 10 L (0.01 m<sup>3</sup>)
- loss of containment – fluids – surface holding tanks
- back loading of raw slop fluids in an Intermediate Bulk Containers
- stuffing box leak / under pressure
- draining of lubricator contents
- excess grease / lubricant leaking from the grease injection head
- wind-blown lubricant dripping from cable / on deck
- lubricant used to lubricate hole.

Woodside's operational experience demonstrates that spills are most likely to originate from hydraulic hoses and have been less than 100 L, with an average volume <10 L.

### 8.6.2.2 Unplanned Subsea Spills

Subsea spills can result from a loss of containment of fluids from subsea equipment including the BOP or ROVs. A review of these spills to the marine environment in the past 12 months showed subsea spills did not exceed approximately 26 L in Woodside's Drilling function.

The ROV hydraulic fluid is supplied through hoses containing approximately 20 L of fluid. Hydraulic lines to the ROV arms and other tooling may become caught resulting in minor leaks to the marine environment. Small volume hydraulic leaks may occur from equipment operating via hydraulic controls subsea (subsea control fluid). These include the diamond wire cutter, bolt tensioning equipment, ROV tooling etc.

### 8.6.2.3 Spills and Leaks from Fluid Transfers

A support vessel will bulk transfer WBM, brine and other fluids required for P&A to the MODU, if and when required. During MODU operations, chemicals required for P&A (drill fluids, cementing fluids, brine) will be transferred and mixed in storage tanks prior to use and subsequently recirculated out of the wellbore after use (where they are potentially contaminated with residual wellbore fluids and hydrocarbons) and transferred to processing and treatment systems (well bleed off package, mud pits). There is potential leaks or small spills may occur due to incorrect line-ups or equipment failure when transferring fluids. Failure of a transfer hose or fittings during a transfer or backload, as a result of an integrity or fatigue issue, could result in a spill of fluids to either the banded deck or into the marine environment.

The most likely spill volume of drill fluid is likely to be less than 0.2 m<sup>3</sup>, based on the volume of the transfer hose and the immediate shutoff of the pumps by personnel involved in the bulk transfer process. However, the worst-case credible spill scenario could result in up to 8 m<sup>3</sup> of drill fluid being discharged. This scenario represents a complete failure of the bulk transfer hose combined with a failure to follow procedures, requiring transfer activities to be monitored, coupled with a failure to immediately shut off pumps (e.g. mud pumped through a failed transfer hose for a period of about five minutes).

### 8.6.2.4 Well Fluids - Slip Joint Packer Failure

The slip joint packer enables compensation for the dynamic movement of the MODU (heave) in relation to the static location of the BOP. A partial or total failure of the slip joint packer could result in a loss of well fluids to the marine environment. The likely causes of this failure include a loss of pressure in the pneumatic (primary) system combined with loss of pressure in the back-up (hydraulic) system.

Sequential failure of both slip joint packers (pneumatic and hydraulic) would trigger the alarm and result in a loss of the volume of fluid above the slip joint (conservatively 1.5 m<sup>3</sup>), plus the volume of fluid lost in the one minute (maximum) taken to shut down the pumps. At a flow rate of 3.8 m<sup>3</sup> per minute, this volume would equate to an additional 3.8 m<sup>3</sup>. In total, it is expected that this failure would result in a loss of 5.3 m<sup>3</sup>.

Failure of either of the slip joint packers at a rate not large enough to trigger the alarms could result in an undetected

loss of 20 bbl (3 m<sup>3</sup>) maximum, assuming a loss rate of 10 bbl/hr and that MODU personnel would likely walk past the moon pool at least every two hours.

#### 8.6.2.5 Drilling Fluids - Activation of the Emergency Disconnect Sequence

The EDS is an emergency system that provides a rapid means of shutting in the well (i.e. BOP closed) and disconnecting the MODU from the Lower Disconnect package of the WOCS/WORS or BOP. The EDS could be manually activated due to an identified threat to the safety of the MODU, including loss of MODU station keeping resulting from loss of multiple moorings, potential collision by a third-party vessel or a loss of well control.

During operations, activating the EDS could result in a subsurface release of a combination of WBM and solids at the seabed. The volume of material released depends on the water depth and, hence, the length of the riser (i.e. the entire riser volume would be lost), typically volumes could be between 150 – 165 m<sup>3</sup> depending on water depth.

### 8.6.3 Environmental Impact Assessment

#### 8.6.3.1 Release of P&A fluids and other chemicals

Fluids required for P&A (including weighted brine, water-based mud, cement and cementing additives) is made up of the components detailed in **Section 3.8**, including a variety of chemicals with low toxicity, incorporated into the selected drilling fluid system to meet specific technical requirements. If released to the marine environment impacts would be highly localised. Any release would be confined to the open waters of the Operational Areas that would not reach any sensitive receptors. Components of the fluid would settle in the water column and be subject to dilution. Given the low toxicity of P&A fluids, any impacts on water quality from unplanned discharges would be minor and localised.

Minor leaks and spills of other chemicals including hydraulic fluid and typical operational oils and greases are expected to only occur in minor quantities (less than 20 L). Hydraulic oils behave similarly to marine diesel when spilled to the marine environment. These are medium oils of light to moderate viscosity. They have a relatively rapid spreading rate and will dissipate quickly in ocean conditions. Any impact is temporary and minor. Impact will decrease rapidly as the release dilutes and disperses in the marine environment. No impacts are predicted to benthic habitat communities in the Operational Area.

The accidental discharge (spill/leak) of minor volumes of P&A chemicals, hydraulic fluid and other hydrocarbon has the potential to result in a localised reduction in water quality and a minor potential for toxicity impacts to plankton and fish populations (surface and water column biota). Large, more mobile fauna are likely to be transient within the Operational Area and toxic impacts are unlikely to occur to these species. The potential impacts would most likely be highly localised and restricted to the immediate area in the footprint of the release.

#### 8.6.3.2 Release of residual well fluids

Impacts from the release of well fluids from slip joint packer failure have been inferred from a loss of well containment (**Section 8.2**). This is considered to provide a highly conservative basis for assessing environmental impacts, given the nature and scale of the credible worst-case spill scenario resulting from a release of approximately 5 m<sup>3</sup> of fluids versus a loss of containment. The biological consequences of a release of well fluids on open water sensitive receptors relate to the potential for slight and temporary impacts to water quality, sediment quality and benthic habitats in the immediate vicinity of the release location.

#### 8.6.3.3 Species Recovery Plans and Threat Abatement Plans

Woodside has considered information contained in relevant recovery plans for marine fauna that identify marine pollution as a threat (**Section 9**).

### 8.6.4 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 8-19**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

Table 8-19: Minor Spills of Chemicals and Hydrocarbons - ALARP Summary

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| <b>Legislation, Codes and Standards</b>   |                 |   |                                  |
| Marine Order 91 (marine pollution prevention – oil) 2014, requires Ship Oil Pollution Emergency Plan (SOPEP)/Spill Monitoring Programme Execution Plan (SMPEP) (as appropriate to vessel class).  | Accept          | By ensuring a SOPEP/SMPEP is in place for the vessel, the likelihood of a spill entering the marine environment is reduced. Although no significant reduction in consequence could result, the overall risk is reduced. Control is based on a legislative requirement and must be adopted.<br><br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 12.1</b>                   |
| <b>Engineering</b>  |                 |   |                                  |
| Where there is potential for loss of primary containment of oil and chemicals on the MODU, deck drainage must be collected via a closed drainage system (e.g. drill floor).   | Accept          | Reduces the likelihood of contaminated deck drainage water being discharged to the marine environment. No change in consequence would occur.<br><br>Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   | <b>PS 6.4</b>                    |
| Project vessels have self-containing hydraulic oil drip tray management system.   | Accept          | Requirements for self-containing hydraulic oil drip tray management system would reduce the likelihood of contaminants being discharged to the marine environment. No change in consequence would occur.<br><br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   | <b>PS 15.2</b>                   |
| Marine riser's telescopic joint to be: <ul style="list-style-type: none"> <li>comprised of a minimum of two packers (one hydraulic and one pneumatic)</li> <li>pressure tested in accordance with manufacturers recommendations.</li> </ul> | Accept          | Reduces the likelihood of equipment failure leading to an unplanned release of drilling fluids. Although the consequence of an unplanned release would be reduced, the reduction in likelihood reduces the overall risk providing an overall environmental benefit.<br><br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.                        | <b>PS 15.3</b>                   |
| Below-deck storage of all hydrocarbons and chemicals.   | Reject          | Reduces the likelihood of contaminated deck drainage water being discharged to the marine environment. The consequence is unchanged.  | Not applicable                   |
| A reduction in the volumes of chemicals and hydrocarbons stored onboard the vessel.   | Reject          | Reduces the likelihood of a deck spill from entering the marine environment. The consequence is unchanged.  | Not applicable                   |
| <b>Separate</b>   |                 |   |                                  |
| Liquid chemical and fuel storage areas are banded or secondarily contained when they are not  | Accept          | Implementation of procedures for chemical storage and handling on the MODU and project vessels will reduce the consequence of   | <b>PS 15.4</b>                   |

| Control Measure  | Accept / Reject | Reason   | Associated Performance Standards |
|--|-----------------|--|----------------------------------|
| being handled/moved temporarily.   |                 | impacts resulting from unplanned discharges to the marine environment by ensuring chemicals have been assessed for environmental acceptability.<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.   |                                  |
| <b>Administrative</b>  |                 |  |                                  |
| Fluids and additives intended or likely to be discharged to the marine environment will have an environmental assessment completed before use.   | Accept          | Reduces the consequence of impacts resulting from discharges to the marine environment by ensuring chemicals have been assessed for environmental acceptability (refer to <b>Section 3.9</b> ). Planned discharges are required for safely executing activities; therefore, no reduction in likelihood can occur.<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 7.6</b>                    |
| Critical hoses outside banded areas (such as ROVs) are inspected and maintained as part of PMS.  | Accept          | Maintenance and inspection completed as scheduled on PMS reduces the risk of leaks to the marine environment. Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.  | <b>PS 15.5</b>                   |
| <p>Contractor procedure for managing P&amp;A fluids transfers onto, around and off the MODU, which requires:</p> <ul style="list-style-type: none"> <li>• emergency shutdown systems for stopping losses of containment (e.g. burst hoses)</li> <li>• break-away dry-break couplings for oil-based mud hoses</li> <li>• transfer hoses to have floatation devised to allow detection of a leak</li> <li>• the valve line-up will be checked prior to commencing mud transfers</li> <li>• constant monitoring of the transfer process</li> <li>• direct radio communications</li> <li>• completed PTW and JSA showing contractor procedures are implemented</li> <li>• recording and verification of volumes moved to identify any losses</li> <li>• mud pit dump valves locked closed when not in use for</li> </ul> | Accept          | Reduces the likelihood of an unplanned release occurring. Although no change in consequence would occur, the reduction in likelihood decreases the overall risk, providing environmental benefit.<br>Control is feasible and can be implemented with minimal cost. It is standard practice for Woodside to review contractor systems prior to performing activity. Benefits outweigh cost/sacrifice.                     | <b>PS 15.6</b>                   |

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| mud transfers and operated under a PTW.   |                 |   |                                  |
| Check for the functionality of: <ul style="list-style-type: none"> <li>mud tanks</li> <li>mud tank room</li> <li>transfer hoses</li> <li>SBM base fluid transfer lines and storage</li> <li>Well bleed off lines and storage tanks</li> </ul> | Accept          | Verifying functionality prior to use reduces the likelihood of a spill or leak occurring and reduces the potential consequences (by limiting volume released).<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice. | <b>PS 15.7</b>                   |
| Spill kits positioned in high-risk locations around the rig (near potential spill points such as transfer stations).  | Accept          | Spill kits would reduce the likelihood of a deck spill from entering the marine environment. The consequence is unchanged.<br>The control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.                                     | <b>PS 15.8</b>                   |

#### 8.6.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 8-19**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the risks and consequences of an accidental minor spill or leak of chemicals or hydrocarbons during the Petroleum Activity to ALARP.

Further opportunities to reduce the risks and consequences have been investigated above (**Table 8-19**). The adopted controls are consistent with the most relevant regulatory guidelines, good oil-field practice/industry best practice. No reasonable additional/alternative controls were identified that would future reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are therefore ALARP.

#### 8.6.5 Demonstration of Acceptability

The impact assessment has determined that, given the adopted controls, the risks and consequences of a minor spill or leak of chemicals or hydrocarbons during the petroleum activity represent a tolerable risk level. A minor spill or leak of chemical or hydrocarbon may result in minor, short term impacts on species and habitat (not affecting ecosystem function) or biological attributes. BIAs within the Operational Area include pygmy blue whale migration and distribution BIAs and the Wedge Tailed Shearwater Breeding BIA. However, these species are not expected to be impacted.

Further opportunities to reduce the risk have been investigated in **Table 8-19**. The adopted controls are considered consistent with industry legislation, codes and standards, good oil-field practice/industry best practice and professional judgement. No concerns or objections regarding the risk of minor spills and leaks of chemicals and hydrocarbons have been raised by relevant persons. Woodside has considered information contained in recovery plans and threat abatement plans (**Section 9**). The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental risks are consistent with the principles of ESD:

- **Integration principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The risks and consequences of a minor spill or leak of chemicals or hydrocarbons during the petroleum activity are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational principle:** The risks and consequences of a minor spill or leak of chemicals or

hydrocarbons during the petroleum activity will not impact upon the environment such that future generations cannot meet their needs.

- **Biodiversity principle:** The risks and consequences of a minor spill or leak of chemicals or hydrocarbons during the petroleum activity will not impact upon biodiversity or ecological integrity.

On this basis, Woodside considers the risk to be managed to an acceptable level.

## 8.6.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes   | Controls   | Performance Standards  | Measurement Criteria  |
|--|--|--|---|
| <b>EPO 15</b><br>No unplanned release of hazardous chemicals or hydrocarbon to the marine environment greater than a Severity Level 2 <sup>35</sup> during the petroleum activity. | <b>C 12.1</b> (refer to <b>Section 8.3.7</b> )   | <b>PS 12.1</b> (refer to <b>Section 8.3.7</b> )  | <b>MC 12.1</b> (refer to <b>Section 8.3.7</b> )   |

## 8.7 Loss of Solid Hazardous and Non-hazardous Wastes, including Dropped Objects

### 8.7.1 Summary of Risk Assessment and Evaluation

| Aspect   | Source of Hazard   | Potential Impact   | Severity Factor | Likelihood Factor | Residual Risk | Decision Context           | Acceptability |
|--|--|--|-----------------|-------------------|---------------|----------------------------|---------------|
| Loss of solid hazardous and non-hazardous wastes | Accidental loss of waste (hazardous and non-hazardous) to the marine environment | Localised decline in water quality, toxic effects to marine fauna and potential injury to fauna. | 10              | 0.3               | 3             | Type A<br>Low Order Impact | Tolerable     |
|  | Dropped objects resulting in disturbance to benthic habitats                     | Disturbance of benthic habitat and associated communities.                                       | 10              | 0.3               | 3             | Type A<br>Low Order Impact | Tolerable     |

### 8.7.2 Source of Hazard

#### 8.7.2.1 Solid Wastes

The MODU and project vessels will generate a variety of solid wastes, including domestic and industrial wastes. These include aluminium cans, bottles, paper and cardboard, scrap steel, chemical containers, batteries and medical wastes.

Waste is segregated on-board the MODU and project vessels and stored in designated skips and waste containers, in accordance with the vessel specific waste management plan. Wastes are segregated into the categories of:

- non-hazardous waste (or general waste)
- hazardous waste
- recyclables (further segregation is conducted in line with practices at existing Woodside operations in the region).

There is the potential for solid wastes to be accidentally lost overboard to the marine environment, particularly during adverse weather events and back loading activities and due to incorrect waste storage. Waste items lost overboard are typically small wind-blown items such as plastic containers and cardboard.

#### 8.7.2.2 Dropped Objects

There is the potential for objects to be dropped overboard from the MODU or project vessels to the marine environment. Small items dropped may include personal protective gear (such as glasses, gloves, hard hats) and small tools (such as spanners). There is also potential for larger equipment to be dropped during the petroleum activity, particularly during recovery of the well infrastructure from the seabed. If well infrastructure is dropped during the recovery activities, attempts will be made to locate and recover the lost equipment. Therefore, these impacts are expected to be temporary in nature. The spatial extent in which dropped objects can occur is restricted to the Operational Area

### 8.7.3 Environmental Impact Assessment

#### 8.7.3.1 Solid Waste

The potential impacts of solid wastes accidentally discharged to the marine environment include direct pollution and contamination of the environment and secondary impacts relating to potential contact of marine fauna with wastes, resulting in entanglement or ingestion and leading to injury and death of individual animals. The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on the location of the Operational Area, the types, size and frequency of wastes that could occur, and species present.

Hazardous solid wastes such as paint cans, oily rags, etc., can cause localised contamination of the water through a release of toxins and chemicals. Given the likely small volumes of any unplanned solid waste discharge, and the occasional nature of the event, these would result in temporary and highly localised changes to the water quality.

The unplanned discharge of solid wastes can result in mortality to fauna, either through contamination or physical injury depending on the nature of the waste. Marine fauna, including fish, seabirds and shorebirds, marine mammals and marine reptiles may be impacted through ingestion or entanglement of waste or through exposure to toxic chemicals. Ingestion or entanglement of marine fauna has the potential for physical harm which may limit feeding/foraging behaviours and thus can result in mortalities. Injury and fatality to vertebrate marine life caused by ingestion of, or entanglement in, harmful marine debris was listed as a key threatening process under the EPBC Act in August 2003 (Commonwealth of Australia, 2018). Impacts to species including fish, birds, marine mammals and marine reptiles from the unplanned discharge of solid waste is unlikely given low occurrence of unplanned discharges and the location of the activities at significant distance from sensitive habitats. Significant impacts are unlikely to occur at an individual level and will not occur at a population level, nor result in the decrease of the quality of the habitat such that the extent of these species is likely to decline.

The temporary or permanent loss of waste materials into the marine environment will have no lasting effect on any species or water quality, based on the types, size and frequency of wastes that could occur.

#### 8.7.3.2 Dropped Objects

In the unlikely event of loss of an object being dropped to the marine environment (including loss of larger objects such as well infrastructure), potential impacts would be limited to localised physical impacts on benthic communities over the footprint of the lost object. In most cases, objects will be able to be recovered and therefore these impacts will also be temporary in nature. Attempts will be made to locate and recover any well infrastructure accidentally dropped during the petroleum activity. Physical impacts from dropped objects are anticipated to be localised and minor and be associated with sediment burrowing infauna and surface epifauna invertebrates, particularly filter feeders, inhabiting the seabed directly over the infrastructure footprint. Any elevated turbidity would be very localised and temporary and is therefore not expected to have any significant impact to environment receptors, such as filter feeders. Lifting of well infrastructure would only occur after successful permanent plugging of a well. A loss of well containment from a dropped infrastructure impacting a well is not credible.

The temporary or permanent loss of dropped objects into the marine environment is likely to result in a localised impact only, as the benthic communities associated with the Operational Area are of low sensitivity and are broadly represented throughout the Northwest Marine Region. The Operational Area overlaps the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, therefore, seabed disturbance from dropped objects may directly disturb a very small, localised area of the KEF. Given the nature and scale of risks and consequences from dropped objects, no lasting effect is expected to seabed sensitivities associated with the Operational Area. Further, considering the types, size and frequency of dropped objects that could occur, it is unlikely a dropped object would have a significant impact on any benthic community.

#### 8.7.3.3 Species Recovery Plans and Threat Abatement Plans

Woodside has considered information contained in relevant recovery plans advice for marine fauna that identify marine debris as a threat (**Section 9**). This includes the objectives and actions within the *Recovery Plan for Marine Turtles in Australia 2017–2027* (Commonwealth of Australia, 2017) and *Threat Abatement Plan for the Impacts of Marine Debris on the Vertebrate Wildlife of Australia's Coasts and Oceans* (Commonwealth of Australia, 2018), which relate to marine debris.

The Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and

oceans (Commonwealth of Australia, 2018) identifies EPBC Act-listed species for which there are scientifically documented adverse impacts resulting from marine debris. Marine turtles and seabirds in particular may be at risk from plastics which may cause entanglement or be mistaken for food (e.g. DoEE, 2018; Commonwealth of Australia, 2017) and ingested causing damage to internal tissues and potentially preventing feeding activities. In the worst instance this could have a lethal affect to an individual. Marine debris has been identified as threat in the Recovery Plan for Marine Turtles in Australia (2017–2027).

While the threat abatement plan for impacts of marine debris on vertebrate marine life does not list explicit management actions for non-related industries (Commonwealth of Australia, 2018) management controls will reduce the risk of unplanned discharge of solid waste.

#### 8.7.4 Demonstration of ALARP

The ALARP process for the environmental aspect is summarised in **Table 8-20**. This process was completed as outlined in **Section 6.2** and included consideration of all controls, analysis of the risk reduction proportional to the benefit gained and final acceptance or justification if the control was rejected.

**Table 8-20: Loss of Solid Hazardous and Non-Hazardous Waste - ALARP Summary**

| Control Measure   | Accept / Reject | Reason  | Associated Performance Standards |
|---|-----------------|---|----------------------------------|
| <b>Legislation, Codes and Standards</b>   |                 |   |                                  |
| Marine Order 95 – Pollution prevention – Garbage (as appropriate to vessel class) which requires putrescible waste and food scraps are passed through a macerator so that it is capable of passing through a screen with no opening wider than 25 mm.   | Accept          | Controls based on legislative requirements must be accepted. Reduces probability of garbage being discharged to sea. Control is feasible, standard practice with minimal cost. Benefits outweigh any cost sacrifice.  | <b>PS 6.2</b>                    |
| <b>Administrative</b>   |                 |   |                                  |

|---|-----------------|---|----------------------------------|
| <ul style="list-style-type: none"> <li>waste streams to be handled and managed according to their hazard and recyclability class.</li> </ul>  |                 |   |                                  |
| <p>MODU and project vessels' work procedures implemented for lifts, bulk transfers and cargo loading, which require:</p> <ul style="list-style-type: none"> <li>Security of loads shall be checked before commencing lifts.</li> <li>Loads shall be covered if there is a risk of loss of loose materials.</li> <li>Lifting operations shall be conducted using the PTW and JSA systems to manage the specific risks of that lift, including consideration of weather and sea state.</li> </ul>   | Accept          | <p>Reduces the likelihood of an unplanned release. Lifting, bulk transfer and cargo loading procedures will ensure lifts are performed in a safe manner and reduce likelihood of a dropped object event.</p> <p>Control is considered standard practice and can be implemented at minimal cost. Environmental benefit outweighs cost sacrifice.</p> | PS 16.3                          |
| <p>MODU and project vessel inductions include control measures and training for crew in dropped object prevention.</p>  | Accept          | <p>By ensuring crew are appropriately trained in dropped object prevention, the likelihood of a dropped object event is reduced.</p> <p>Control is considered standard practice and can be implemented at minimal cost. Environmental benefit outweighs cost sacrifice.</p>   | PS 16.4                          |
| <p>ROV, crane or support vessel may be used to attempt recovery of solid wastes or equipment lost overboard.</p> <p>Where safe and practicable for this activity will consider:</p> <ul style="list-style-type: none"> <li>risk to personnel to retrieve object</li> <li>whether the location of the object is in recoverable water depths</li> <li>object's proximity to subsea infrastructure</li> <li>ability to recover the object (i.e. nature of object, lifting equipment or, ROV availability and suitable weather).</li> </ul> <p>Any material dropped objects / waste that remain in the title will undergo an impact assessment and be added to the inventory.</p> | Accept          | <p>Potentially reduces consequence by recovering dropped object/waste from the marine environment.</p>  | PS 16.5                          |

### 8.7.4.1 ALARP Summary

The risk assessment and evaluation has identified a range of controls (**Table 8-20**) appropriate to the decision type (Decision Type A), that when implemented are considered to manage the potential risk and consequences of a loss

of solid hazardous and non-hazardous wastes, including dropped objects to ALARP.

Woodside considers the control measures described above are appropriate to reduce the potential risks and consequences of a loss of solid hazardous and non-hazardous wastes, including dropped objects to the marine environment. As no reasonable additional/alternative controls were identified that would future reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are therefore ALARP.

#### 8.7.5 Demonstration of Acceptability

The impact assessment has determined that, given the adopted controls, a loss of solid hazardous and non-hazardous wastes, including dropped objects represents a low current risk rating that is unlikely to result in a risk consequence greater than a temporary, localised impact to environment receptors. Relevant recovery plans and conservation advice has been considered during the impact assessment, and the petroleum activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice (**Section 9**).

The adopted controls are consistent with industry good practice and professional judgement. No concerns or objections regarding the loss of solid hazardous and non-hazardous wastes (including dropped objects) have been raised by relevant persons. The environmental risks meet the Woodside environmental risk acceptability criteria (**Section 6.3**). The environmental risks are consistent with the principles of ESD:

- **Integration Principle:** Woodside has undertaken a range of studies to determine the approach to decommissioning the Stybarrow field, which have informed Woodside's deliberations. The decommissioning strategy being pursued by Woodside integrates long-term and short-term economic, environmental, social, and equitable considerations.
- **Precautionary Principle:** The risks and consequences from the accidental loss of solid hazardous and non-hazardous waste or dropped objects are well understood, and there is no risk of serious or irreversible environmental damage from this aspect.
- **Intergenerational Principle:** The risks and consequences from the accidental loss of solid hazardous and non-hazardous waste or dropped objects will not impact upon the environment such that future generations cannot meet their needs.
- **Biodiversity Principle:** The risks and consequences from the accidental loss of solid hazardous and non-hazardous waste or dropped objects will not impact upon biodiversity or ecological integrity.

On this basis, Woodside considers the risk to be managed to an acceptable level.

## 8.7.6 Environmental Performance Outcome, Performance Standards and Measurement Criteria

| Environmental Performance Outcomes  | Controls   | Performance Standards   | Measurement Criteria  |

## 9 Recovery Plan and Threat Abatement Plan Assessment

This section provides an assessment to demonstrate that the petroleum activity is not inconsistent with any relevant recovery plans or threat abatement plans.

Relevant recovery plans and threat abatement plans to the Petroleum Activity and the receiving environment are:

- *Recovery Plan for Marine Turtles in Australia 2017–2027* (Commonwealth of Australia, 2017)
- *Conservation management plan for the blue whale: A recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2015-2025* (Commonwealth of Australia, 2015b)
- *Conservation management plan for the southern right whale: a recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2011-2021* (Department of Sustainability, Environment, Water, Population and Communities, 2012)
- *Sawfish and River Shark Multispecies Recovery Plan* (Commonwealth of Australia, 2015a)
- *Threat Abatement Plan for the Impacts of Marine Debris on the Vertebrate Wildlife of Australia's Coasts and Oceans* (Commonwealth of Australia, 2018)
- *National Recovery Plan for Threatened Albatrosses and Giant Petrels* (Department of Sustainability, Environment, Water, Population and Communities, 2011)
- *Recovery Plan for the Grey Nurse Shark (Carcharias taurus)* (Department of the Environment, 2014)
- *Recovery Plan for the White Shark (Carcharodon carcharias)* (Department of Sustainability, Environment, Water, Population and Communities, 2013)
- *Wildlife Conservation Plan for Seabirds* (Commonwealth of Australia, 2020a)
- *Wildlife Conservation Plan for Migratory Shorebirds* (Commonwealth of Australia, 2015c)

Objectives and relevant actions from the above plans have been identified in **Table 9-1**. The table includes an assessment on whether the petroleum activity, including resulting impacts and risks identified in **Section 7** and **Section 8** are inconsistent with those objectives and actions.

Table 9-1: Assessment of the petroleum activity against the objectives and actions defined in relevant recovery plans and threat abatement plans

| Recovery / Threat Abatement Plan                          | Relevant Action Areas / Objectives  | Assessment of Consistency  |
|---|---|--|
| Recovery Plan for Marine Turtles in Australia 2017–2027   | Action Area A3: Reduce the impacts from marine debris: <ul style="list-style-type: none"> <li>Understand the threat posed to green turtle NWS stock by marine debris.</li> <li>Determine the extent to which marine debris is impacting Western Australian loggerhead turtles.</li> </ul>   | <b>Not inconsistent</b><br><b>Section 8.7</b> considers the impacts of unplanned releases of solid hazardous and non-hazardous wastes and considers the potential risks to marine turtles.<br>Appropriate controls have been considered and adopted to reduce the risk of unplanned releases of solid hazardous and non-hazardous wastes to ALARP and acceptable levels  |
|   | Action Area A4: Minimise chemical and terrestrial discharge: <ul style="list-style-type: none"> <li>Ensure spill risk strategies and response programs adequately include management for marine turtles and their habitats, particularly in reference to ‘slow to recover habitats’, such as nesting habitat, seagrass meadows or coral reefs.</li> </ul> | <b>Not inconsistent</b><br><b>Sections 7.5</b> and <b>Section 7.6</b> address the impacts from routine discharges to marine turtles.<br><b>Sections 8.2, 8.3</b> and <b>8.6</b> considers the risks from accidental release of chemicals and hydrocarbons to marine turtles. ## 10 Hydrocarbon Spill Response

As required by the Environment Regulations, Woodside has prepared the Stybarrow Plug and Abandonment Oil Pollution Emergency Plan (OPEP) (refer to **Appendix D**). The OPEP is the primary reference document and key control measure to be implemented in the event of an oil spill during the petroleum activities. It has been developed as a formal means of establishing the processes and procedures to ensure Woodside maintains a constant vigilance and readiness to prevent and, where required, respond to and effectively manage oil spill incidents that may occur. The OPEP has been developed to comply with the Environment Regulations.

This section of the EP provides a description of the proposed oil spill response strategies based on the worst-case spill scenarios. The response strategies presented are based on the outcome of a Strategic Net Environmental Benefit Analysis (NEBA). For each of the proposed response strategies, their benefits and constraints are presented, along with an assessment of the associated risks and impacts that may occur from their implementation.

### 10.1 Spill Response Levels

To establish oil spill response arrangements that can be scaled up or down depending on the nature of the incident by integrating with other local, regional, national and industry plans and resources, Woodside uses a tiered response approach. The criteria for determining the hydrocarbon spill 'Levels' for the purpose of the spill response have been adopted from the *National Plan for Maritime Environmental Emergencies* (AMSA, 2020) and are described in **Table 10-1**. The 'level-rating' for oil spill response provides a magnitude description of the potential impact and the effort to support oil spill response.

The 'Level' is determined by the relevant Incident Controller or Corporate Incident Management Team (CIMT) Leader. The roles and responsibilities, and related competencies for each CIMT position are described in Woodside's *Incident and Crisis Management Procedure*, position-specific *Duty Cards* and the *Security and Emergency Management Competency Dashboard*.

Typically, Level 1 spill responses can be resourced using shipboard or port-located spill kits. Vessels are required to maintain a current SOPEP and appropriate spill kits, response capabilities and trained personnel. Likewise, designated ports and harbours are required to have at least Level 1 response capability on site.

For Level 2 and 3 spills, Woodside maintains a broad set of spill response capabilities. Woodside also has contracts and Memoranda of Understanding (MoUs) with national and international third-party spill response providers to ensure response capabilities can be engaged.

**Table 10-1: Worst-case spill scenarios for the petroleum activities and incident classification used to inform spill response**

| Level   | Level Definition   | Stybarrow Decommissioning and Field Management Activities Spill Scenarios |
|---------|--|---|
| Level 1 | An incident will have minor or limited impacts on the environment which can be controlled by the resources normally available onsite without the need to mobilise Woodside IMT or other external resources.  |   |
|         | An incident: <ul style="list-style-type: none"> <li>occurs within a single jurisdiction</li> <li>with simple IAP required</li> <li>resourced from within one area</li> <li>where environment would be isolated and/or natural recovery expected within weeks</li> <li>wildlife impacts are limited to individual fauna</li> <li>that has no immediate concern of shoreline impact</li> <li>with a Woodside Risk Matrix Consequence Level 1-2.</li> </ul> | MDO spill from bunkering incident (37.5 m <sup>3</sup> MDO)               |
| Level 2 | An incident will have substantial impacts to the environment and cannot be controlled by the use of onsite resources alone and required external resources and support to combat the situation.  |   |
|         | An incident: <ul style="list-style-type: none"> <li>occurs across multiple jurisdictions</li> </ul>  | MDO spill from vessel collision (1,000 m <sup>3</sup> MDO)                |

| Level          | Level Definition  | Stybarrow Decommissioning and Field Management Activities Spill Scenarios |
|----------------|---|---|
|                | <ul style="list-style-type: none"> <li>with outline of the IAP required</li> <li>that requires intra-state resources</li> <li>with significant environmental impacts, recovery may take months, remediation required</li> <li>with wildlife impacts to groups of fauna or threatened fauna</li> <li>where shoreline impact is expected</li> <li>with a Woodside Risk Matrix Consequence Level 3+.</li> </ul>                                      |   |
| <b>Level 3</b> | <p><b>An incident will have serious impacts to the environment and occurs across multiple/international jurisdictions and requires mobilisation of state, national or international resources and support to combat the situation.</b></p>  |   |
|                | <p>An incident:</p> <ul style="list-style-type: none"> <li>occurs across multiple/international jurisdictions</li> <li>with detailed IAP required</li> <li>that requires national or international resources</li> <li>with significant environmental area impacted, recovery may take months, remediation required</li> <li>with wildlife impacts to large numbers of fauna</li> <li>with a Woodside Risk Matrix Consequence Level 4+.</li> </ul> | <p>Subsea LOWC over 73 days (10,264 m<sup>3</sup> Stybarrow crude)</p>    |

## 10.2 Source of Risk

This EP has identified the worst-case and credible hydrocarbon spill scenarios as:

- Level 1: 37.5 m<sup>3</sup> bunkering incident (refer to **Section 8.1**)
- Level 2: fuel tank rupture from a vessel collision, resulting in a surface release of 1,000 m<sup>3</sup> MDO (refer to **Section 8.1**).
- Level 3: subsea LOWC of 10,264 m<sup>3</sup> Stybarrow Crude over 73 days (refer to **Section 8.1**)

## 10.3 Strategic Net Environmental Benefit Analysis of Response Options

In the oil spill response planning process, Woodside has adopted a comprehensive strategic NEBA methodology to select and justify the appropriate response strategy combinations for the credible and worst-case hydrocarbon spill scenario. A NEBA was conducted to select the potential oil spill response strategies in the event of a Level 2 MDO spill and Level 3 Stybarrow Crude spill (**Table 10-2**). The focus of these NEBAs was to understand the consequences of ‘no action’ and to select an oil spill response strategy that delivered a net environmental benefit using the OPEP Priorities.

The NEBA methodology used is described as follows:

- LIST the response strategies available.
- IDENTIFY the benefit, environmental impact and operational challenge of each response strategy.
- EVALUATE the viability of each response strategy in a particular credible scenario.
- FILTER the result to identify all the viable strategies for a particular credible scenario.
- FORMULATE options of different strategy combinations.
- COMPARE these options and select the preferred option of strategy combination.

From these results, the priority application ZONE of each strategy was identified in the preferred strategy combination by selecting the:

- primary response strategy, which has been confirmed to be used and should be applied as soon as possible
- secondary response strategy, which will be only applied if needed and practical

- nil response strategy, which is a non-preferred option, will not be used and does not identify a net environmental benefit.

In the event of an oil spill, an Operational NEBA will be performed to select spill response options that have a net environmental benefit. It is likely spill response will involve a combination of response options and will evolve over time as conditions change.

Table 10-2: Strategic net environmental benefit analysis of response option for hydrocarbon spills

| Spill Response Strategy                                 | Overview of Environmental Benefits  | Associated Environmental Risks/Impacts   | Operational Constraints  | Apply Response                         |     | Primary or Secondary Response | Justification Note  |
|---|---|--|--|--|-----|-------------------------------|---|
| Source Control – Vessel Control                         | Limits or prevents further discharge of hydrocarbons to the marine environment by halting the spill (for example, transferring fuel to another tank).   | No significant impacts.  | Health and safety considerations may delay implementation under certain circumstances (such as vapours).   | Level 2 – MDO                          | Yes | Primary                       | Control at the vessel will always be attempted as the immediate primary response to halt further spill to marine environment.   |
|   |   |  |  | Level 3 – Crude (Loss of well control) | N/A | -                             |   |
| Source Control - Subsea Intervention                    | Prevents further discharge of hydrocarbons to the marine environment by halting the spill.  | No significant impacts. Impacts and risks from subsea intervention similar to those described for routine vessel operations.   | Health and safety considerations may delay implementation under certain circumstances (e.g., LEL's).<br>MODU operability.<br>ROV availability.   | Level 2 – MDO                          | N/A | -                             | Subsea source control will always be attempted as the immediate primary response to halt further spill to marine environment for subsea releases (when safe to do so).  |
|   |   |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Source Control – Relief Well                            | Prevents further discharge of hydrocarbons to the marine environment by halting the spill through the drilling of a relief well.  | No significant impacts. Impacts and risks from MODU operations similar to those described for routine drilling operations.   | Alternate MODU potentially required.<br>Hardware & consumables.<br>Associated logistics.   | Level 2 – MDO                          | N/A | -                             | Relief well remains the base-case for full well containment. Initiated concurrently with alternate source control options.  |
|   |   |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Source Control – Capping Stack                          | Prevents further discharge of hydrocarbons to the marine environment by halting the spill.  | No significant impacts. Impacts and risks from capping stack installation similar to those described for routine vessel operations.  | Health and safety considerations may delay implementation under certain circumstances (e.g., LEL's).<br>Environmental conditions influence deploy ability.   | Level 2 – MDO                          | N/A | -                             | Capping stack represents temporary containment solution until relief well successfully intersect wellbore and restores full well control.<br>Initiated concurrently with alternate source control options.  |
|   |   |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Source Control – Subsea First Response Toolkit (SFRT)   | Facilitates debris clearance and SSDI to enable subsequent source control operations.   | No significant impacts. Impacts and risks from SFRT deployment similar to those described for routine vessel operations. See SSDI below.   | Associated logistics from Fremantle / Henderson.<br>Deployment vessel.   | Level 2 – MDO                          | N/A | -                             | Initiated concurrently with alternate source control options.<br>May be required throughout source control operations.  |
|   |   |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Monitor and Evaluate (including operational monitoring) | Constant monitoring and evaluation by surveillance is a mandatory strategy required for real-time decision-making during a spill event.   | Risks/impacts from operations of monitoring vessels and aircraft (for example, emissions such as air, noise and liquid waste, marine fauna interaction, interference with other users).  | Weather conditions may put constraints on visual observations (vessel and aerial).<br>Vessel and aerial surveillance constrained to daylight hours.<br>Stringent safety management requirements for aerial and marine operations.<br>Potential coordination of multiple vessels/aircraft within limited area (simultaneous operations).                              | Level 2 – MDO                          | Yes | Primary                       | Surveillance activities ensure constant monitoring and evaluation of the spill.   |
|   |   |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Dispersant – Surface Application                        | Application of surface dispersant may reduce the volumes of hydrocarbons contacting sensitive surface receptors.<br>Dispersant can also enhance biodegradation and may reduce VOCs in some circumstances therefore reducing potential health and safety risk to responders. | Dispersant can increase dispersed/entrained hydrocarbons which can potentially have higher toxicity to biota in shallow water than naturally dispersed hydrocarbons.<br>Subsurface oil plume likely to increase in size resulting in greater spatial extent of entrained oil.<br>Entrained oil could potentially impact on sensitive shallow-water receptors e.g., corals. | Not applicable for MDO spills due to rapid dispersion and spreading.<br>Crude oil may only be amendable to dispersion for 24 to 48 hours after release.<br>Spill modelling of the LOWC scenario (RPS, 2022b) predicts no instances where the slick is >50 g/m <sup>2</sup> (which is considered the minimum threshold for effective surface dispersant application). | Level 2 – MDO                          | No  | -                             | Stybarrow Crude and MDO are not predicted to reach spill thicknesses that can be effectively treated with surface dispersant but the response technique is included as a contingent option. The use of surface dispersant could unnecessarily introduce additional chemical substances to the marine environment. |
|   |   |  |  | Level 3 – Crude (Loss of well control) | Yes | Secondary                     |   |

| Spill Response Strategy                       | Overview of Environmental Benefits  | Associated Environmental Risks/Impacts   | Operational Constraints  | Apply Response                                |            | Primary or Secondary Response | Justification Note  |
|---|---|--|--|---|------------|-------------------------------|---|
|   |   |  | <p>Applying dispersants to a thin slick is likely to result in dispersant droplets passing through the slick without binding to the hydrocarbon. This has the potential of introducing more chemicals into the marine environment. Although the spill is not predicted to reach the minimum thickness for surface dispersants to be effective in increasing the dispersal rate of the spill, there may be offshore areas oil coalesce and could present suitable oil thickness (&gt;50 g/m<sup>2</sup>) to consider surface dispersant spraying. Chemical dispersant application is therefore not recommended as a beneficial contingent option for the LOWC.</p>  |   |            |                               |   |
| <p>Dispersant – Subsea Application (SSDI)</p> | <p>SSDI may reduce the surface concentrations of hydrocarbons and in doing so reduce the risk of exposure to birds and surfacing marine fauna.<br/>Application of SSDI may reduce VOCs at surface (to below LELs) to enable the safe deployment of a capping stack.</p> | <p>Discharge of dispersant into environment. Adds chemical to environment when it is not likely to impact high or extreme environmental receptors. Increases entrainment of hydrocarbon in the water column, which may impact some oceanic and benthic organisms.</p>  | <p>Effectiveness of response strategy<br/>Health, safety &amp; environmental considerations may delay implementation.<br/>Mobilisation &amp; deployment of SSDI equipment.<br/>Crude oil may only be amenable to dispersion for 24 to 48 hours after release.</p>  | <p>Level 2 – MDO</p>                          | <p>No</p>  | <p>-</p>                      | <p>Strategy aims to increase dispersion (entrainment of fine oil droplets) and reduce the amount of oil expressing at sea surface and may reduce volume of oil loading on shorelines.<br/>Potential reduction of VOCs at surface to safe marine operations.</p> |
| <p>Containment and recovery</p>               | <p>If effective, can physically remove floating surface oil from the water, thereby preventing shoreline impacts.<br/>Recovered oil may be reprocessed.</p>   | <p>Operation of vessels (such as burn fuel, physical presence, discharges) for placing and moving booms. Equipment- and labour intensive.<br/>Waste disposal of recovered hydrocarbons.<br/>Cleaning and disposal of contamination from boom.<br/><b>Safety of response personnel must be ensured before deployment.</b></p> | <p>Boom deployment may be delayed in serious incident where safety of personnel is priority.<br/>Wind and surface currents are key constraint for the boom operation in the open ocean.<br/>Current speed for boom (approx. 1 knot depending on boom and angle).<br/>Inefficient and impractical on thin slicks, in inclement weather or high seas<br/>Predicted low effectiveness oil recovery typically &lt;10% of the oil spilled in open ocean environments. can be contained and recovered. Deepwater Horizon/Macondo was approx. 3–5% with the largest containment and recovery operation ever conducted.<br/>Requires surface oil thick enough for the response option to be effective Bonn Agreement Oil Appearances Code 4 (discontinuous true oil colour) and 5 (continuous true oil colour with a 50-100% coverage of 100-200 g/m<sup>2</sup>).<br/>Spill modelling of the LOWC scenario predicted that no slick would be &gt; 50 g/m<sup>2</sup> (Hook et al., 2016)(RPS, 2022b) and hence the surface slick will not reach the required threshold (&gt;50 g/m<sup>2</sup>) for containment and recovery to be a feasible response</p> | <p>Level 2 – MDO</p>                          | <p>No</p>  | <p>-</p>                      | <p>Potential to slightly reduce the magnitude, probability of, extent of, contact with and accumulation on shorelines receptors if and when appropriate encounter rates can be achieved and in conditions that are safe for response personnel.</p>             |
|   |   |  |  | <p>Level 3 – Crude (Loss of well control)</p> | <p>Yes</p> | <p>Secondary</p>              |   |

| Spill Response Strategy | Overview of Environmental Benefits  | Associated Environmental Risks/Impacts   | Operational Constraints   | Apply Response                         |     | Primary or Secondary Response | Justification Note   |
|-------------------------|---|--|---|--|-----|-------------------------------|--|
|                         |   |  | <p>strategy.</p> <p>Meteorological conditions and sea-state must allow the deployment of booms and skimmers. Surface hydrocarbon would need to be corralled to a sufficient thickness to permit efficient recovery by skimmers.</p> <p>Volatile nature of the hydrocarbon likely to lead to unsafe conditions near release location.</p>          |  |     |                               |  |
| Shoreline Protection    | Can deflect hydrocarbons from shoreline receptors for capture and recovery or dilute into water column.   | <p>Physical disturbance to intertidal and shoreline habitats from operating vessels and booms (such as anchoring booms and vessels).</p> <p>Defective booms.</p> <p>Operation of vessel (such as burn fuel, physical presence, discharges).</p> <p>Cleaning of contaminated booms and waste disposal of recovered hydrocarbons and water.</p> <p>Waste disposal of recovered hydrocarbons.</p> | <p>Wind, surface currents and tidal ranges are key constraints for operation of shoreline booms.</p> <p>Most feasible in locations where access to the coastline allows vehicles and vessels to undertake operations.</p>   | Level 2 – MDO                          | No  | -                             | Modelling predicts no shoreline accumulation associated with the worst-case scenario $\geq 10 \text{ g/m}^2$ .   |
|                         |   |  |   | Level 3 – Crude (Loss of well control) | Yes | Primary                       | Modelling shows relatively high probability of contact, above impact and response thresholds for the LOWC scenario. The effectiveness of this response will be dependent on local bathymetry, sea state, currents, tidal variations and wind conditions at the time of implementation.   |
| Mechanical Dispersion   | May be applicable for the localised entrainment of surface oil but is not considered to have a significant effect on removing oil from the surface. | <p>May temporarily increase the concentration of entrained and dissolved oil in the vicinity of submerged shallow water receptors (such as corals, seagrass and macroalgae).</p> <p>Operation of vessel (such as burn fuel, physical presence, discharges).</p>  | <p>Offshore vessels are designed not to cavitate, so not efficient at breaking up hydrocarbon films.</p> <p>Small particle size required otherwise material resurfaces.</p> <p>Wind speeds above 20 knots provide natural dispersion, making this method redundant.</p> <p>Cannot be performed where there are high concentrations of vapour.</p> | Level 2 – MDO                          | No  | -                             | <p>Mechanical dispersion uses vessels with propellers that can cavitate. The turbulence created helps break up surface slicks, dispersing hydrocarbons into the column where biodegradation is enhanced due to smaller droplet sizes.</p> <p>This strategy requires vessels on site with engines that cavitate.</p> <p>Wave action provides some effect.</p> |
|                         |   |  |   | Level 3 – Crude (Loss of well control) | No  | -                             |  |
| In-Situ Burning         | Removes oil from environment.   | <p>Operation of a four-vessel spread (two boom sweep, one igniter, one observer).</p> <p>Particulates (smoke) in air with associated health risks.</p> <p>Incomplete combustion may produce toxic chemicals.</p>   | <p>Need to build a thick film for ignition (5 to 10 mm).</p> <p>Wind is a key constraint, calm seas and ideal conditions are considered necessary for booming operations to get a thick film thickness and safe ignition.</p> <p>Availability of fire boom.</p>   | Level 2 – MDO                          | No  | -                             | Not applicable as insufficient surface slick thickness predicted.  |
|                         |   |  |   | Level 3 – Crude (Loss of well control) | No  | -                             | The experience and expertise are not readily available in Australia.   |
| Shoreline Clean Up      | Can reduce stranded oil on shorelines and reduce remobilisation of oil.   | <p>Physical disturbance to shoreline habitats from staging areas and clean-up activities.</p> <p>Contamination via spreading oil beyond shorelines.</p> <p>Labour-intensive.</p> <p>Logistics.</p> <p>Waste management.</p>  | <p>Shoreline characteristics (substrate type, beach type, exposure to wave action, biological, social, heritage or economic resources, amount of hydrocarbon present) and access requirements.</p>  | Level 2 – MDO                          | No  | -                             | Modelling predicts no shoreline accumulation associated with the worst-case scenario $\geq 10 \text{ g/m}^2$ .   |
|                         |   |  |   | Level 3 – Crude (Loss of well control) | Yes | Primary                       | Modelling shows relatively high probability of contact, above impact and response thresholds for the LOWC scenario. The overall benefit of this response strategy should be assessed for each receptor based on a NEBA,  |

| Spill Response Strategy | Overview of Environmental Benefits   | Associated Environmental Risks/Impacts   | Operational Constraints  | Apply Response                         |     | Primary or Secondary Response | Justification Note  |
|-------------------------|--|--|--|--|-----|-------------------------------|---|
|                         |  |  |  |  |     |                               | especially if the oiling is light. Consideration should be given to secondary impacts likely to occur with this response strategy, such as habitat disturbance, direct disturbance to breeding or nesting fauna, erosion and waste contamination in staging areas.              |
| Natural Recovery        | No additional impacts associated with response activities.   | No additional impacts.   | No constraints.  | Level 2 – MDO                          | Yes | Primary                       | Makes use of the natural degradation and weathering process to break down and remove surface oil and stranded hydrocarbons. Effectively, this response strategy means no direct action other than monitor and evaluate spill trajectory and rate of habitat/community recovery. |
|                         |  |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Scientific Monitoring   | Primary tool for determining the extent, severity and persistence of environmental impacts from oil spills, and determine how effective the oil spill response is in protecting the environment. | Labour intensive.<br>Logistics.<br>Operation of vessel (such as burn fuel, physical presence, discharges).<br>Noise from support vessels and helicopters.<br>Vessel collision.<br>Obstacles to other sea users.  | Weather conditions may constrain visual observations (vessel and aerial).<br>Stringent safety management requirements for aerial and marine operations.<br>Potential coordination of multiple vessels and aircraft within limited area (simultaneous operations).  | Level 2 – MDO                          | Yes | Primary                       | Applicable to Level 2/3 spills to monitor impact and recovery from oil spill events. The type and extent of scientific monitoring will depend on the nature and scale of oil contact to sensitive receptor locations as determined through monitor and evaluate activities.     |
|                         |  |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Oiled Wildlife Response | Pre-oiling activities including onshore exclusion barriers, hazing and pre-emptive capture used to reduce incidence of animals becoming oiled.   | Labour-intensive.<br>Logistics.<br>Operation of vessel (such as burn fuel, physical presence, discharges).<br>Hazing: stress to individuals, accidentally drive oiled wildlife into oil, separate groups/individuals (such as parent/offspring pairs) or disturb nesting and foraging behaviours.<br>Pre-emptive capture and post-oiled collection: Risk of injury and inappropriate field collection/handling during pre-emptive capture and after oiled collection.<br>Rehabilitation: inadequate/inappropriate animal husbandry, leading to stress, injury or death.<br>Inappropriate relocation points leading to disorientation and stress. | Wind is a key constraint, calm seas and ideal conditions are considered necessary for capture operations.<br>Weather constraints for use of aerial observation and tracking fauna.<br>Navigation of multiple vessels within a small area.<br>Availability of suitable space/location in township to handle rehabilitation and fauna treatment. | Level 2 – MDO                          | Yes | Primary                       | Applicable where surface hydrocarbons cause oiling risk to marine fauna.<br>Applicable to Level 2/3 spills.   |
|                         |  |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |
| Waste Management        | Benefits outweigh impacts.<br>Oiled waste removed from site by trained contractors and dealt with at an approved waste management facility.  | Labour intensive.<br>Logistics.  | Low persistence hydrocarbon expected to generate minimal (if any) waste.<br>Logistics constraints in moving waste from site to approved waste facility.  | Level 2 – MDO                          | Yes | Secondary                     | Applicable where surface hydrocarbons cause oiling risk to shorelines and for oiled wildlife response operations.   |
|                         |  |  |  | Level 3 – Crude (Loss of well control) | Yes | Primary                       |   |

## 10.4 Environmental Impact and Risk Assessment for Spill Response Activities

While spill response activities are intended to reduce the potential environmental consequences of a hydrocarbon spill, they can introduce new impacts and risks. In the event of a hydrocarbon spill, response strategies will be implemented where possible to reduce environmental impacts to ALARP. The response strategies deemed appropriate, based on the predicted nature and scale of the worst-case spill scenarios identified for Stybarrow plug and abandonment activities, have been identified via the strategic NEBA and ALARP demonstration (refer to **Section 10.3** and **Appendix D**).

The OPEP (**Appendix D**) provides selected response strategies in the event of a spill, being:

- source control – vessel control
- source control – relief well drilling, capping stack and subsea first response toolkit (SFRT)
- monitor and evaluate (including operational monitoring)
- subsea dispersant injection
- surface dispersant application
- containment and recovery
- shoreline protection
- shoreline clean-up
- natural recovery
- scientific monitoring
- oiled wildlife response
- waste management.

The following sub-sections present the suitable response spill strategies identified in Table 10-2, the impacts and risks associated with their implementation, and control measures for reducing impacts and risks to ALARP and acceptable levels. **Section 10.5** assesses their effectiveness and the adequacy of resourcing available to support spill response strategies to further justify reducing impacts and risks to ALARP and acceptable levels.

Typical environmental aspects, impacts and risks that may arise from conducting spill response activities are similar to those already described in **Sections 7** and **Section 8** for planned activities and unplanned events, particularly for vessel-based operations. The greatest potential for impacts additional to those described for routine activities is from oiled wildlife response operations.

A number of response strategies, namely Source Control, Monitor and Evaluate (including Operational Monitoring), Surface Dispersant Application (Vessel /aircraft based), Containment and Recovery, Shoreline Protection, Shoreline Clean-up, Scientific Monitoring and Oiled Wildlife Response, include components of their response activities that are vessel-based, and the impacts and risks associated with their implementation from vessels are assessed previously in this EP and relate to:

- Physical presence (**Section 7.1**)
- Vessel discharges and emissions (light, noise, atmospheric, routine and non-routine discharges, seabed disturbance, waste management in **Sections 7.2** to **Section 7.7**)
- Unplanned discharges (hydrocarbon spills, solids and liquids in **Sections 8.2, 8.3, 8.6** and **8.7**)
- Marine fauna interaction (**Section 8.4**)
- Introduction of invasive marine species (**Section 8.5**).

As such, impacts and risks relating to the above aspects associated with the spill response strategies are not considered further in this assessment.

### 10.4.1 Spill Response: Source Control

The purpose of this section is to describe Woodside's strategy relating to Source Control to:

- limit the release of oil discharged to the marine environment and prevent further release of oil by

isolating the source of the release

- manage to ALARP and acceptable levels the risks and impacts of the Source Control response strategy to environmental sensitivities.

The strategy includes identifying the risks and impacts associated with Source Control, which includes considering the benefits associated with vessel control. It then demonstrates these impacts and risks can be reduced to ALARP and acceptable levels, enabling source control to be a primary response strategy.

Specifically, this section includes:

- identification of the potential impacts of source control, which includes discussion on source control effectiveness, demonstrating the application of source control can reduce the total volume of oil ashore
- demonstration of oil spill preparedness
- controls in place to mitigate the impacts and risks of source control on sensitive environmental receptors
- demonstration that the source control strategy proposed by Woodside is ALARP and acceptable
- environmental performance outcomes, performance standards and measurement criteria for source control.

#### 10.4.1.1 Summary of Activity – Vessel Control

The project vessels will have a current SOPEP (as appropriate to vessel class) in accordance with the requirements of MARPOL Annex I (Prevention of Pollution by Oil). This plan outlines responsibilities, specific procedures and resources available for an oil or chemical spill. Spills that occur beyond the capability of the vessel will be managed in accordance with Woodside's *Stybarrow Plug and Abandonment OPEP*.

| Source Control: Vessel Control |  |
|--------------------------------|--|
| Initiation Criteria            | Notification of Level 1 Oil Spill.   |
| Activation Time                | Immediately, noting safety of personnel as the priority.   |
| Resources                      | Vessel Master and crew trained in vessel specific SOPEP procedures.<br>On-board spill equipment, as per vessel specific SOPEP.             |
| Termination Criteria           | Release of oil to the marine environment has ceased and the workplace environment is deemed environmentally safe and free of hydrocarbons. |

Vessel Source Control methods are implemented as the primary response strategy for responding to single point releases from hull leakage and spills in the event of a vessel collision. Vessel Source Control will be activated immediately by persons onboard, under the direction of the Vessel Master, to reduce or control the discharge, and conducted according to the vessel-specific MARPOL-compliant SOPEP for vessels, as required under International Convention for Protection of the Sea (Prevention of Pollution from Ships) Act 1983; AMSA Marine Orders – Part 91 and Part 94; and MARPOL Annexes I and III. Vessel Source Control activities will always consider human health and safety.

Vessel Source Control activities will depend on the type of incident but may include:

- closing valves, isolating pipework and shutting down pumps
- using temporary patches or bungs/plugs to seal holes to prevent further releases, until more permanent measures can be taken
- transferring product between tanks on the vessel or between vessels, in the event of a leaking tank or rupture from a vessel collision
- using spill response equipment located around the vessel, including small booms, absorbent pads, spill absorbent litter, spill recovery containers, permissible cleaning agents and other materials available onboard to clean up spilled material on deck. Remaining oily spill residues on decks or other surfaces may be washed into drains leading to the oil-water separator system to treat the effluent before discharge.

**10.4.1.2 Summary of Activity – Source Control – Relief Well**

The basis of assessment for relief well drilling source control relates to the potential subsea release of crude oil from a worst-case loss of containment from the Stybarrow well.

The primary response document for the implementation of well kill operations via a relief well in the event of a loss of well control (LOWC) is the Activity Source Control Emergency Response Plan (Activity SCERP) and SCERP Guideline. The particulars of the relief well location, design and dynamic kill plan will be detailed in the Activity SCERP.

The relief well response strategy will be implemented for LOWC spills only. A relief well is the primary response strategy for responding to a LOWC and is a necessity to intercept the uncontrolled hydrocarbon zones from the well and to stop or limit further pollution, in this case, crude oil, into the marine environment. The relief well is designed to be drilled via a MODU at a location at a safe distance from the flowing well.

A conservative approach has been adopted for the assessment of a LOWC by modelling the worst-case release scenario of 10,264 m<sup>3</sup> crude oil over 73 days.

Source Control – Relief Well activities include:

- Establishment of the Source Control Functional Support Team (FST)
- Implementation of the Activity Source Control Emergency Response Plan (SCERP) inclusive of a Relief Well Plan
- Activation of the APPEA Memorandum of Understanding: Mutual Aid to source and mobilise a MODU and AHTS vessels within the region or source a suitable MODU from international waters (if required)
- Mobilisation of resources (including Woodside, third-party responder and Contractor Drilling personnel) to oversee relief well drilling operations

A single relief well would be required to kill the well.

| Source Control: Relief Well |   |
|-----------------------------|---|
| <b>Initiation Criteria</b>  | Release of Stybarrow Crude via LOWC   |
| <b>Activation Time</b>      | Within 2 hours of CIMT Leader notifying Source Control Operations Coordinator   |
| <b>Resources</b>            | APPEA Memorandum of Understanding: Mutual Aid Alternate MODU plus AHTS vessels<br>Casing and wellhead equipment<br>Consumables<br>Engineering and operational support services<br>Specialist well control service providers |
| <b>Termination Criteria</b> | Well kill achieved and barriers reinstated  |

***Response Arrangements – Relief Well Procedure***

**Activity Source Control Emergency Response Plan (SCERP)**

Execution plans for a relief well will be similar to a standard well. A relief well is typically drilled as a vertical hole down to a planned deviation (“kick-off”) point, where it is turned toward the target well using directional drilling technology and tools. Dynamic kill well control commences after the target well is intersected, by pumping drilling fluid down the relief well into the incident well to kill the flow. Cement may follow to seal the original well bore.

Casing and wellhead inventories will be maintained to ensure there is always equipment readily available to drill a relief well.

Woodside has Master Service Agreements in place for specialist assistance to help with engineering and operational support for relief well planning and execution.

***MODU Specifications***

An alternate dynamically positioned (DP) or moored semi-submersible MODU must be capable of operating

within 850 m water depth, have a BOP meeting or exceeding APIS53 requirements and if moored, have a minimum of eight-point mooring system.

### ***MODU Availability / Tracking***

If the primary MODU undertaking the activity is non-operable, Woodside would seek an alternate MODU located regionally in the first instance. The MODU would be sourced under the arrangements of the APPEA Memorandum of Understanding: Mutual Aid agreement. Over the period of the proposed activity, Woodside anticipate there would be multiple alternate MODUs located within Australian waters capable of undertaking relief well drilling operations in the Stybarrow field. The status of these MODUs along with AHTS vessels is monitored by Woodside on a monthly basis during the activity.

In the event that a suitable MODU is unavailable within the region at the time of the activity, an alternate MODU would be sought from Southeast Asia to undertake the relief well drilling operation. Woodside actively monitors current MODU market availability through an independent market analyst and MODU broker service.

### ***Response Timing – Relief Well***

The APPEA Memorandum of Understanding: Mutual Aid allows for 'best endeavours' for a MODU to be made available. It is anticipated a regionally available MODU could be secured and mobilised to site within 21 days.

Sourcing an alternate MODU from international waters represents a worst-case scenario and has been used to inform the WCD oil spill trajectory modelling and the overall preparedness needs analysis for Woodside to gain control of the well.

It is estimated that it could take up to 73 days to drill and dynamically kill the incident well, assuming the worst case of needing to source a MODU from Southeast Asia. The general tasks and approximate timings to engage and mobilise a MODU to field are:

- Suspend operations and secure well (under APPEA MoU), source and contract MODU and mobilise to location. Estimated total duration of 21 days for a MODU within the region or up to 44 days from South-east Asia. Concurrently secure regulatory approval.
- Drill well to intercept point (approx. 13.5 days)
- Intercept and kill well (approx. 15.5 days).

### ***Legislative and Other Considerations – Relief Well***

The MODU contracted to undertake relief well drilling operations will require an Australian Safety Case (accepted by NOPSEMA) and Safety Case Revision.

In the event that an alternate MODU is required, pending technical capability review, Woodside shall prioritise engaging a locally/ regionally available MODU and vessels with existing Safety Case with best endeavours arrangements under the APPEA Memorandum of Understanding: Mutual Aid. The in-force Woodside Safety Case Revision would be leveraged to expedite the development of a MODU-specific Safety Case Revision for the relief well drilling operation. In this scenario, Woodside consider a Scope of Validation is suitable to undertake relief well drilling operations.

Should a MODU be required from an international location, in addition to availability and technical capability review, priority shall be given to a MODU that has previously operated in Australian Jurisdiction where a historical Safety Case (and Scope of Validation) may form the basis of a regulatory submission to NOPSEMA.

Where a MODU is engaged that has neither a current/ historical Safety Case and scope of validation, these documents shall be developed in consultation with both the MODU Operator and NOPSEMA immediately following contractual engagement and simultaneously with mobilisation to field.

Whilst the revision and acceptance timeframes for Safety Cases / Safety Case Revisions / Scope of Validations is subject to a number of variables, Woodside shall engage suitably qualified HSE professionals with relevant petroleum industry experience to facilitate and assist in approval development, revision and submission on 24 hour/ 7 days a week basis following MODU engagement until all required approvals are in-force.

### ***Potential Environmental Impacts and Risks – Relief Well***

There are no additional environmental impacts and risks associated with a vessel-based response in offshore waters to those already described within **Section 7** and **Section 8**.

### 10.4.1.3 Summary of Activity – Capping Stack

The basis of assessment for capping stack source control relates to the potential subsea release of crude oil from a loss of containment from the Stybarrow well.

The capping stack response strategy may be implemented for LOWC spills only, and where conditions allow. The deployment of a capping stack system is considered a primary response strategy for responding a LOWC and will only be applied given favourable environmental conditions including the open-hole flow rate from the well, the safe work zone surrounding the well site and prevailing weather conditions during the LOWC event.

Pending suitable conditions, a capping stack may be installed vertically.

Source Control – Capping Stack activities include:

- Establishment of the Source Control FST: Well Capping Group embedded within the Woodside IMT
- Implementation of the Activity Source Control Emergency Response Plan (SCERP) inclusive of a Capping Stack Mobilisation Plan
- Activation of the contract with Wild Well Control Inc. (WWCI) to prepare and transport the capping stack system from Singapore directly to the Stybarrow field
- Mobilisation of resources (including Woodside and third-party responder personnel) to oversee capping stack installation

| Source Control: Capping Stack |  |
|-------------------------------|--|
| Initiation Criteria           | Release of Stybarrow Crude via LOWC  |
| Activation Time               | Within 2 hours of Woodside IC notifying Source Control Operations Coordinator  |
| Resources                     | Contract with Capping Stack provider for equipment and key personnel<br>Engineering and operational support services<br>Vessel service providers |
| Termination Criteria          | Well kill achieved and barriers reinstated   |

#### **Response Arrangements – Capping Stack Procedure**

Activity Source Control Emergency Response Plan (SCERP)

#### **Personnel**

Woodside have contracts with Wild Well Control Inc. (WWCI) to support the Woodside IMT.

Specialist capping stack deployment personnel travel directly to site from Singapore with the capping stack and are engaged via WWCI Service Agreement.

#### **Equipment**

##### **Capping Stack System**

The subscription to WWCI WellCONTAINED™ Service provides Woodside with access to WWCI Capping Stacks.

##### **Vessel Sourcing**

Woodside maintains a contract for provision of a monthly report on the availability and status of suitable emergency vessels and equipment for source control operations and those that are closest to the incident location. The report identifies suitable vessels including those that have an approved Safety Case for working in Australia.

##### **Vessel Transport Configuration / Minimum Vessel Specification**

Minimum specifications for the deployment vessel are:

- Active heave compensated crane rated to minimum 150T in shallower waters and 250T in deeper waters

- At least 90 m in length
- Deck has water/electricity supply
- Deck capacity to hold at least 110T capping stack

#### ***Response Timing – Capping Stack***

Woodside estimates the response timeframe to be 16 days for the mobilisation and deployment of the capping stack.

#### ***Legislative and Other Considerations – Capping Stack***

The Heavy Lift Vessel (HLV) vessel engaged to deploy the capping stack will require an Australian Safety Case and safety case revision accepted by NOPSEMA.

Via vessel tracking reporting, Woodside shall prioritise the engagement of a HLV with existing Safety Case provided deployment times are not significantly impacted.

In the event the capping stack is mobilised via HLV without a current Australian Safety Case, Woodside shall engage suitably qualified HSE professionals with relevant petroleum industry experience to facilitate and assist in approval development, revision, and submission on a 24 hour / 7 days a week basis following HLV engagement until all required approvals are in-force.

#### ***Potential Environmental Impacts and Risks – Capping Stack***

There are no additional environmental impacts and risks associated with a vessel-based response in offshore waters to those already described within **Sections 7** and **8**.

#### **10.4.1.4 Summary of Activity – Subsea First Response Toolkit (SFRT)**

The basis of assessment for subsea first response toolkit (SFRT) source control relates to the potential subsea release of crude oil from a loss of containment from the Stybarrow well.

The Source Control - SFRT response strategy will be implemented for LOWC spills. The SFRT is a subsea dispersant and debris clearance toolkit allowing debris to be cleared around the area of the wellhead to enable intervention and prepare relief well drilling and safe installation of the well capping or containment device.

Subsea chemical dispersants, injected via an ROV with a dispersant wand, may be applied to assist with the installation of the Capping Stack by reducing volatile organic compounds at surface. Pending the successfully installed and operation of a capping stack system, the use of subsea chemical dispersants will no longer be required.

The Source Control – SFRT response strategy will require support from OSVs for the duration of the response activities.

Source Control – SFRT activities will include:

- Establishment of the Source Control FST
- Implementation of the Activity Source Control Emergency Response Plan
- Notification of incident to AMOSC, to request mobilisation of SFRT with dispersant stockpile from Fremantle
- Notification of incident to OSRL, to request mobilisation of global dispersant stockpile (GDS)
- Activation of agreements to mobilise OSVs
- Mobilisation of resources (including Woodside Drilling personnel) to oversee subsea operations

In conjunction with concurrent source control activities, if initial source control actions have not been successful in halting subsea release and if Operational NEBA demonstrates a net environmental benefit, activate Subsea Dispersant Response Strategy for application of subsea dispersants (refer to **Section 10.4.3**).

| Source Control: Subsea First Response Toolkit |  |
|---|--|
| Initiation Criteria                           | Release of Stybarrow Crude via LOWC  |
| Activation Time                               | Within 2 hours of CIMT Leader notifying Source Control Operations Coordinator  |
| Resources                                     | SFRT Contract with AMOSC<br>Global Dispersant Service (GDS) contract with OSRL<br>Frame agreements in place with ROV providers<br>Contract with logistics provider for road transport<br>Contracts with vessel service providers<br>Coiled tubing (located at Woodside's Fremantle and King Bay Supply Facility (KBSF) stockpiles) |
| Termination Criteria                          | Well kill achieved and barriers reinstated   |

### Response Arrangements – SFRT AMOSC Equipment (SFRT)

As a member company, Woodside has access to the Subsea First Response Toolkit (SFRT) including debris clearance and SSDI equipment and dispersant stockpiles located in Fremantle, Western Australia and maintained by Oceaneering. Oceaneering maintain support staff to facilitate the mobilisation, deployment, and operation of the SFRT.

Minimum Vessel Specification

Minimum specifications for the SFRT deployment vessel are:

- DP2 capability
- Work Class ROV with capability to reach mud line at incident well centre and survey 50 m radius around well centre with carrying capacity:100 kg
- Active heave compensated crane with minimum 36t mud line capacity

### Response Timing – SFRT

Woodside have determined the SFRT can be mobilised to the Stybarrow Field within 12 days.

### Legislative and Other Considerations – SFRT / SIRT

The application of subsea chemical dispersants is considered in **Section 10.4.3**.

#### 10.4.1.5 Source Control Environmental Performance

**Table 10-3** provides the environmental performance outcomes, performance standards and measurement criteria for the Source Control response strategy.

In the event of a spill, Operational NEBAs (refer to Section 4 of the OPEP) will be completed daily, to take into account spill trajectories, prevailing weather and planned actions for the day.

**Table 10-3: Environmental Performance – Source Control**

| Source Control                     |   |   |  |
|------------------------------------|---|---|--|
| Environmental Performance Outcomes | To stop the flow of hydrocarbons into the marine environment. |   |  |
| Response Strategy                  | Performance Standard  |   | Measurement Criteria (Section 10.4.12) |
| Well intervention                  | 1.1   | Frame agreements with ROV providers in place to be mobilised upon notification. ROV equipment deployed within 7 days. | 1, 3B, 3C                              |

| Source Control               |      |   |           |
|------------------------------|------|---|-----------|
|                              | 1.2  | Heavy lift vessel (HLV) will have the following minimum specifications: <ul style="list-style-type: none"> <li>• active-heave compensated crane, rated to at least 150 T in shallower water and 250 T in deeper water.</li> <li>• at least 90 m in length</li> <li>• deck has water/electricity supply</li> <li>• deck capacity to hold at least 110 T of capping stack.</li> </ul> | 1, 3B, 3C |
|                              | 1.3  | Identify HLV availability within 24 hours and begin contracting process. Vessel mobilised to site for deployment within 16 days for conventional capping.   | 1, 3B, 3C |
|                              | 1.4  | ROV available on MODU / vessel ready for deployment within 48 hours to attempt initial BOP well intervention.   | 1, 3B, 3C |
|                              | 1.5  | Hot Stab and/or well intervention attempt made using ROV and SFRT within 11 days.   | 1, 3B, 3C |
|                              | 1.6  | Capping stack on suitable vessel mobilised to site within 16 days. Deployment and well intervention attempt will be made once plume size is acceptable and safety and metocean conditions are suitable.   | 1, 3C     |
|                              | 1.7  | Wild Well Control Inc (WWCI) staff available all year round to assist with the mobilisation, deployment, and operation of the capping stack and well intervention equipment.  | 1, 3B, 3C |
|                              | 1.8  | MODU mobilised to site for relief well drilling within 21 days.   | 1, 3C     |
|                              | 1.9  | First well kill attempt completed within 73 days  | 1, 3B, 3C |
|                              | 1.10 | Open communication line(s) to be maintained between IMT and infield operations to ensure awareness of progress against plan(s).   | 1, 3A, 3B |
|                              | 1.11 | Monthly monitoring of the availability of MODUs through existing market intelligence including current Safety Case history, to meet specifications for relief well drilling. Titleholders of suitable MODUs notified.   | 3C        |
|                              | 1.12 | Develop activity SCERP including Testing and Exercise Plan prior to commencement of the activity.   | 1, 3B, 3C |
| <b>Source Control – SFRT</b> | 2.1  | Oceaneering support staff available all year round, via contract, to assist with the mobilisation, deployment, and operation of the SFRT equipment.   | 1, 3B, 3C |
|                              | 2.2  | Intervention vessel with minimum requirement of a working class ROV and operator.   | 1, 3C     |
|                              | 2.3  | Mobilised to site for deployment within 11 days.  | 1, 3B, 3C |
|                              | 2.4  | Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s).  | 1, 3A, 3B |
| <b>Support vessels</b>       | 3.1  | Monthly monitoring of availability of larger vessels through existing Frame Agreements and market   | 3C        |

| Source Control |     |   |           |
|----------------|-----|---|-----------|
|                |     | intelligence to meet specifications for source control.   |           |
|                | 3.2 | Frame agreements for Infield Support Vessels (ISVs) require vessels maintain in-force safety case approvals covering ROV operations and provide support in the event of an emergency. | 1, 3B, 3C |
|                | 3.3 | MODU and vessel contracts include clause outlining requirement for support in the event if an emergency   | 1, 3C     |
| Safety Case    | 4.1 | Woodside will prioritise MODU or vessel(s) for intervention work(s) that have an existing safety case.  | 1, 3C     |
|                | 4.2 | Woodside Planning, Logistics, and Safety Officers (on-roster/ call 24/7) to assist in expediting the safety case assessment process as far as practicable.                            | 1, 3C     |
|                | 4.3 | Woodside will maintain minimum safe operating standards that can be provided to MODU and vessel operators for safety case guidance.   | 1, 3C     |

## 10.4.2 Spill Response: Monitor and Evaluate (including operational monitoring)

### 10.4.2.1 Summary of Activity

The Monitor and Evaluate response strategy will be implemented for all spills. Constant monitoring and evaluation by surveillance is a mandatory strategy required for making real-time decisions during a spill. This strategy includes fate and trajectory modelling, spill tracking, weather updates and field observations. The spill will be monitored constantly and evaluated by surveillance techniques.

**Table 10-4** lists the operational monitoring plans that support the successful execution of this response technique.

**Table 10-4: Description of supporting operational monitoring plans**

| ID   | Title   |
|------|---|
| OM01 | Predictive modelling of hydrocarbons to assess resources at risk                  |
| OM02 | Surveillance and reconnaissance to detect hydrocarbons and resources at risk      |
| OM03 | Monitoring of hydrocarbon presence, properties, behaviour and weathering in water |
| OM04 | Pre-emptive assessment of sensitive receptors at risk                             |
| OM05 | Shoreline assessment  |

Woodside maintains an *Operational Monitoring Operational Plan*. If shoreline contact is predicted, Response Protection Areas (RPAs) will be identified and assessed before contact. If shorelines are contacted, a shoreline assessment survey will be completed to guide effective shoreline clean-up operations. This plan includes the process for the IMT to mobilise resources depending on the nature and scale of the spill.

The proximity of Karratha/Dampier to the spill event location means that multiple logistical options are available to monitor the spill in relatively short timeframes.

The purpose of this section is to describe Woodside's approach relating to the Monitor and Evaluate response strategy to:

- track and monitor the trajectory of the spill so real-time decisions can be made to prevent impacts to extreme and highly sensitive environmental receptors
- manage to ALARP and acceptable levels the risks and impacts of the Monitor and Evaluate response

strategy on sensitive environmental receptors.

The strategy includes a description of the impacts and risks associated with Monitor and Evaluate operations during spills, which includes consideration of the benefits associated with the Monitor and Evaluate response strategy. It then demonstrates these impacts and risks can be reduced to ALARP and acceptable levels, enabling Monitor and Evaluate to be a key response strategy in the event of hydrocarbon spills.

Specifically, this section includes:

- assessment of the potential impacts and risks of the Monitor and Evaluate response strategy and the benefits of each response activity
- controls in place to mitigate the impacts and risks of the Monitor and Evaluate response strategy on sensitive environmental receptors
- demonstration that the proposed Monitor and Evaluate response strategy is ALARP and acceptable
- environmental performance outcomes, performance standards and measurement criteria for the Monitor and Evaluate response strategy.

Monitoring and evaluation will require access to aircraft, vessels and personnel. In the event of a spill, the monitoring and evaluation methods that will typically be implemented, depending on the volume of the spill, are:

- aerial surveillance
- vessel surveillance
- oil spill tracking buoys (OSTBs)
- spill trajectory modelling
- satellite imagery
- operational water sampling
- shoreline assessment.

#### ***OM01 – Predictive modelling of hydrocarbons to assess resources at risk – Objective, Scope, Rationale and Methods***

Oil spill trajectory modelling will be conducted to predict the extent of impacts to offshore habitat for any physical disturbance that may impact shoreline, nearshore areas, or areas protected for the purpose of conservation. The CIMT will engage RPS via a call-off contract maintained by AMOSC to start modelling the spill and correlate it with real data received from aerial and vessel surveillance, and OSTBs. From these sources, RPS will develop an initial oil spill trajectory model for the next five days, which will allow the IMT to direct resources for the next phase of the response. Alternative oil spill modelling agencies may be selected based on operational requirements.

| <b>OM01 – Predictive modelling of hydrocarbons to assess resources at risk</b> |   |
|--|---|
| <b>Initiation Criteria</b>   | OM01 will be triggered immediately following all hydrocarbon spill levels.  |
| <b>Activation Time</b>   | Within four hours of notification, oil spill modelling agency to provide oil spill trajectory modelling report.   |
| <b>Resources</b>   | Oil spill tracking modellers and software available via contract with RPS Response.   |
| <b>Termination Criteria</b>  | The hydrocarbon discharge has ceased, and no further surface oil is visible<br>Response activities have ceased<br>Hydrocarbon spill modelling (as verified by OM02 surveillance observations) predicts no additional natural resources will be impacted |

**OM02 – Surveillance and Reconnaissance to Detect Hydrocarbons and Resources at Risk – Objective, Scope, Rationale and Methods**

OM02 Surveillance and reconnaissance to detect hydrocarbons and resources at risk includes the following monitoring components:

- Aerial surveillance
- Oil spill tracking buoys (OSTBs)
- Satellite imagery

OM02 will be commissioned by the Incident Controller or by a designated officer of the nominated Control Agency.

**Aerial Surveillance**

Woodside has access to helicopters under a crew transfer contract with a contracted helicopter provider. Woodside has access to trained aerial surveillance observers in AMOSC and industry mutual aid through its AMOSC Contract. In addition to the aircrew, trained aerial surveillance observers will be included on the flights to confirm the size of the spill and its location. This information will be sent back to the IMT for further processing. A schedule of flights will be developed, to ensure sufficient timely information is available for fate modelling. Aerial observations will only be performed during daylight hours. The aerial surveillance will include digital imagery of the spill, the global positioning system co-ordinates of the spill extremities, an estimate of the spill thickness and the time of the observations.

**Oil Spill Tracking Buoys**

Oil Spill Tracking Buoys (OSTBs) will monitor the movement of hydrocarbons via satellite.

**Satellite Imagery**

Satellite imagery will be a supplementary source of information that can improve awareness of the extent, trajectory and even thickness of a slick. Suitable imagery is available via KSAT satellite imagery contract. The most appropriate images for purchase will be based on the extent and location of the oil spill. Synthetic aperture radar and visible imagery may both be of value.

For further detail on OM02 Surveillance and reconnaissance to detect hydrocarbons and resources at risk, refer to Woodside’s *Operational Monitoring Operational Plan*.

| OM02 Surveillance and reconnaissance to detect hydrocarbons and resources at risk |  |
|---|--|
| <b>Initiation Criteria</b>  | OM02 will be triggered immediately for all incident levels following a hydrocarbon spill.  |
| <b>Activation Time</b>  | Aerial surveillance:<br>Trained observers deployed within 24 hours.<br>Oil Spill tracking buoys:<br>Within two hours, as per First Strike Plan<br>Satellite imagery:<br>Within two hours of forming the IMT.   |
| <b>Resources</b>  | Aerial surveillance<br>Rotary wing aircraft and flight crew:<br>Contracted helicopter provider.<br>Aerial surveillance AMOSC staff (nine), AMOSC Core Group (seven) and industry Mutual Aid.<br>Unmanned aerial vehicle and pilots.<br>AMOSC, Mutual Aid, OSRL, local WA hire companies.<br>OSTB:<br>Deployed from facility within 2 hours<br>Additional OSTBs available from KBSF stockpile.<br><u>Satellite imagery:</u> Contract with KSAT Satellite Services |

**OM02 Surveillance and reconnaissance to detect hydrocarbons and resources at risk****Termination Criteria**

72 hours has elapsed since the last confirmed observation of surface hydrocarbons.  
Latest hydrocarbon spill modelling results (OM01) do not predict surface exposures at visible levels.

**OM03 – Monitoring of Hydrocarbon Presence, Properties, Behaviour and Weathering in Water – Objective, Scope, Rationale and Methods**

OM03 Monitoring of hydrocarbon presence, properties, behaviour and weathering in water will be commissioned by the Incident Controller or by a designated officer of the nominated Control Agency. Water quality monitoring is a process that includes the monitoring of entrained hydrocarbon within the water column either from subsea releases, natural dispersion or chemical dispersant applications. Water quality monitoring can determine the effectiveness of dispersant application and will include taking water samples (both surface and subsea) that can be sent to laboratories for further analysis.

Woodside has a contract in place with a monitoring service provider to rapidly stand up a water quality monitoring service.

For further detail on OM03 Monitoring of hydrocarbon presence, properties, behaviour and weathering in water, refer to Woodside's *Operational Monitoring Operational Plan*.

**OM03 Monitoring of hydrocarbon presence, properties, behaviour and weathering in water****Initiation Criteria**

OM03 will be triggered immediately following a level 2/3 hydrocarbon spill.

**Activation Time**

Within 3 days of forming the IMT

**Resources**

Contract for access to specialist personnel and equipment.  
Access to vessel with a dedicated winch, A-frame or Hiab and ancillaries to deploy the equipment

**Termination Criteria**

Response technique has been successful  
Response technique is no longer effective  
Response technique is having a greater deleterious effect than the hydrocarbon  
Benefit of the technique is insufficient to justify the cost

**OM04 – Pre-emptive assessment of sensitive receptors at risk – Objective, Scope, Rationale and Methods**

OM04 Pre-emptive assessment of sensitive receptors at risk will be commissioned by the Incident Controller or by a designated officer of the nominated Control Agency. Pre-emptive assessment of sensitive receptors aims to undertake a rapid assessment of the presence, extent and current status of sensitive receptors prior to contact from the hydrocarbon spill, by providing categorical or semi-quantitative information on the characteristics of resources at risk. Indirectly, qualitative/semi-quantitative pre-contact information collected on the status of the environmental resources may also aid in the verification of environmental baseline data and provide context for the assessment of environmental impacts, as determined through subsequent Scientific Monitoring Programs.

Woodside has a pool of internal trained personnel and environmental contractors in place to conduct pre-emptive surveys.

For further detail on OM04 Pre-emptive assessment of sensitive receptors at risk, refer to Woodside's *Operational Monitoring Operational Plan*.

**OM04 Pre-emptive assessment of sensitive receptors at risk****Initiation Criteria**

Contact of a sensitive habitat or shoreline is predicted by OM01, OM02 and/or OM03.

| OM04 Pre-emptive assessment of sensitive receptors at risk |  |
|--|--|
|  | The pre-emptive assessment methods can be implemented before contact from hydrocarbons (once a receptor has been contacted by hydrocarbons it will be assessed under OM05).  |
| <b>Activation Time</b>                                     | Within 2 days of forming the IMT   |
| <b>Resources</b>   | Internal trained personnel<br>Contracts with environmental service providers   |
| <b>Termination Criteria</b>                                | Locations predicted to be contacted by hydrocarbons have been contacted.<br>The location has not been contacted by hydrocarbons and is no longer predicted to be contacted by hydrocarbons (resources should be reallocated as appropriate). |

#### **OM05 – Shoreline assessment – Objective, Scope, Rationale and Methods**

OM05 Shoreline assessment will be commissioned by the Incident Controller or by a designated officer of the nominated Control Agency. Shoreline assessment provides rapid accurate geo-referenced documentation and data of shoreline contamination conditions. Teams will be mobilised to systematically survey shorelines both precontact and upon contamination to advise on clean-up strategies. The information collected can be used to develop real-time decisions and to expedite shoreline clean-up planning and response operations.

Shoreline Clean up Assessment Technique (SCAT) is a well-established tool that can be used to document the status of impact shorelines and their subsequent treatment recommendations in a methodical and scientific manner. Its objective is to collect and document real-time data on stranded hydrocarbons and shoreline conditions in a rapid, accurate, systematic and consistent way in order to provide operational support and aid in the development of an effective response.

Woodside has a pool of internal trained personnel to conduct shoreline assessment surveys. In addition, Woodside has access to AMOSC Core Group members who are trained in shoreline assessment techniques, and a surge capacity can be met via contracts with OSRL.

For further detail on OM05 Shoreline assessment, refer to Woodside's *Operational Monitoring Operational Plan*.

| OM05 Shoreline assessment   |  |
|-----------------------------|--|
| <b>Initiation Criteria</b>  | OM05 will be triggered when a sensitive habitat or shoreline is predicted to be contacted by hydrocarbons by OM01, OM02 and/or OM03.   |
| <b>Activation Time</b>      | Within 2 days of forming the IMT   |
| <b>Resources</b>            | Internal trained personnel<br>AMOSC Master Services Agreement<br>OSRL Service Level Agreement  |
| <b>Termination Criteria</b> | No additional response or clean-up of wildlife or habitats is predicted.<br>Spill response and clean-up activities have ceased.<br>OM05 survey sites established at sensitive habitat and shoreline locations will continue to be monitored during SM02.<br>The formal transition from OM05 to SM02 will begin on cessation of spill response and clean-up activities. |

#### **10.4.2.2 Oil Spill Preparedness**

Oil spill preparedness for the elements of the Monitor and Evaluate response strategy comprise contractual arrangements with Oil Spill Response Agencies (OSRAs), such as AMOSC/OSRL, and/or service agreements with third party vendors for providing services such as water quality monitoring, OSTBs and satellite imagery.

### 10.4.2.3 Potential Environmental Impacts and Risks

The risks and impacts associated with the vessels involved in the Monitor and Evaluate response strategy from their physical presence, noise and atmospheric emissions, interference with marine fauna, planned and unplanned discharges, and accidental spills have been discussed in the next sections.

The impacts and risks associated with aircraft involved in the Monitor and Evaluate response strategy relate to acoustic disturbance. During the response activities, aircraft and vessels will generate noise both offshore and in coastal areas near sensitive receptors such as shorebirds, marine mammals, fish and shark species.

### 10.4.2.4 Monitor and Evaluate Environmental Performance

**Table 10-5** provides the environmental performance outcomes, performance standards and measurement criteria for the Monitor and Evaluate response strategy.

The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

**Table 10-5: Environmental Performance – Monitor and Evaluate**

| Monitor and Evaluate                  |   |   |   |
|---------------------------------------|---|---|---|
| Environmental Performance Outcome     | To gather information from multiple sources to establish an accurate common operating picture as soon as practicable and predict the fate and behaviour of the spill to validate planning assumptions and adjust response plans as appropriate to the scenario. |   |   |
| Control Measure                       | Performance Standard  |   | Measurement Criteria<br>(Section 10.4.12) |
| Oil spill trajectory modelling (OM01) | 5.1   | Initial modelling available within 6 hours using the Rapid Assessment Tool.   | 1, 3B, 3C, 4                              |
|                                       | 5.2   | Detailed modelling available within 4 hours of APASA receiving information from Woodside.   |   |
|                                       | 5.3   | Detailed modelling service available for the duration of the incident upon contract activation.   |   |
| Tracking buoy (OM02)                  | 6.1   | Tracking buoy located on facility/vessel and ready for deployment 24/7.   | 1, 3A, 3C, 4                              |
|                                       | 6.2   | Deploy tracking buoy from facility within 2 hours as per the First Strike Plan.   | 1, 3A, 3B, 4                              |
|                                       | 6.3   | Contract in place with service provider to allow data from tracking buoy to be received 24/7 and processed.   | 1, 3A, 3C, 4                              |
|                                       | 6.4   | Data received to be uploaded into Woodside COP daily to improve the accuracy of other monitor and evaluate strategies.  | 1, 3B, 4                                  |
| Satellite imagery (OM02)              | 7.1   | Contract in place with 3 <sup>rd</sup> party provider to enable access and analysis of satellite imagery. Imagery source/type requested on activation of service. | 1, 3C, 4                                  |
|                                       | 7.2   | 3 <sup>rd</sup> party provider will confirm availability of an initial acquisition within 2 hours.  | 1, 3B, 3C, 4                              |
|                                       | 7.3   | First image received with 24 hours of Woodside confirming to 3 <sup>rd</sup> party provider its acceptance of the proposed acquisition plan.                      | 1   |
|                                       | 7.4   | 3 <sup>rd</sup> party provider to submit report to Woodside per image. Report is to include a polygon of any possible or identified slick(s) with metadata.       | 1   |

| Monitor and Evaluate  |      |  |                 |
|---|------|--|-----------------|
|   | 7.5  | Data received to be uploaded into Woodside COP daily to improve accuracy of other monitor and evaluate strategies.   | 1, 3B, 4        |
|   | 7.6  | Satellite imagery services available and employed during response.   | 1, 3C, 4        |
| <b>Aerial surveillance (OM02)</b>                           | 8.1  | 2 trained aerial observers available to be deployed by day 1 from resource pool.   | 1, 2, 3B, 3C, 4 |
|   | 8.2  | 1 aircraft available for 2 sorties per day, available for the duration of the response from day 1.   | 1, 3C, 4        |
|   | 8.3  | Observer to compile report during flight as per First Strike plan. Observers report available to the IMT within 2 hours of landing after each sortie.  | 1, 2, 3B, 4     |
|   | 8.4  | Unmanned Aerial Vehicles/Systems (UAV/UASs) to support Shoreline Clean-up Assessment Technique (SCAT), containment and recovery and surface dispersal and pre-emptive assessments as contingency if required.  | 1, 2            |
| <b>Hydrocarbon detection in water (OM03)</b>                | 9.1  | Activate 3 <sup>rd</sup> party service provider as per First Strike plan. Deploy resources within 3 days:<br>3 specialists in water quality monitoring<br>2 monitoring systems and ancillaries<br>1 vessel for deploying the monitoring systems with a dedicated winch, A-frame or Hiab and ancillaries to deploy the equipment. | 1, 2, 3C, 3D, 4 |
|   | 9.2  | Water monitoring services available and employed during response.  | 1, 3C, 4        |
|   | 9.3  | Preliminary results of water sample as per contractor's implementation plan within 7 days of receipt of samples at the accredited lab.   |                 |
|   | 9.4  | Daily fluorometry reports as per service provider's implementation plan will be provided to IMT to validate modelling and monitor presence/absence of entrained hydrocarbons.  |                 |
|   | 9.5  | Use of Autonomous Underwater Vehicles (AUVs) for hydrocarbon presence and detection may be used as a contingency if the operational NEBA confirms conventional methods are unsafe or not possible.   | 1, 2, 3C, 4     |
| <b>Pre-emptive assessment of sensitive receptors (OM04)</b> | 10.1 | Within 2 days of impacts predicted by OM01/02/03, and in agreement with WA DoT (for Level 2/3 incidents), deployment of 2 specialists from resource pool in establishing the status of sensitive receptors   | 1, 2, 3B, 3C, 4 |
|   | 10.2 | Daily reports provided to IMT on the status of the receptors to prioritise Response Protection Areas (RPAs) and maximise effective utilisation of resources.   | 1, 3B, 4        |
| <b>Shoreline assessment (OM05)</b>                          | 11.1 | Within 2 days of impacts predicted by OM01/02/03, and in agreement with WA DoT (for Level 2/3 incidents), deployment of 1 specialist in SCAT for each RPA with predicted impacts greater than 100 g/m <sup>2</sup> .   | 1, 2, 3B, 3C, 4 |
|   | 11.2 | SCAT reports provided to IMT daily detailing the assessed  | 1, 3B, 4        |

| Monitor and Evaluate |      |   |   |
|----------------------|------|---|---|
|                      |      | areas to maximise effective utilisation of resources.   |   |
|                      | 11.3 | Shoreline access routes with the least environmental impact identified will be selected by a specialist in SCAT operations. | 1 |

### 10.4.3 Spill Response: Subsea Dispersant Injection

#### 10.4.3.1 Summary of Activity

The basis of assessment for subsea dispersant injection relates to the potential subsea release of crude oil from a worst-case loss of containment from the Stybarrow well. Subsea dispersant injection will be implemented via the SFRT. A summary of the SFRT activity is provided in **Section 10.4.1.4**.

| Subsea Dispersant Injection |  |
|-----------------------------|--|
| <b>Initiation Criteria</b>  | Release of Stybarrow Crude via LOWC and operational monitoring predicts shorelines with identified sensitive receptors will potentially be contacted by the spill.   |
| <b>Activation Time</b>      | Within two hours of forming the IMT.   |
| <b>Resources</b>            | SFRT Contract with AMOSC<br>Frame agreements with ROV providers<br>Contract with OSRL for Global Dispersant Service (GDS)<br>Contract with logistics provider for road transport<br>Contracts with vessel service providers<br>Coiled tubing (located at Woodside's Fremantle and KBSF stockpiles) |
| <b>Termination Criteria</b> | Chemical dispersant not effective (as determined via efficacy testing results) or at the direction of Control Agency.  |

#### 10.4.3.2 Oil Spill Preparedness

##### *Response Arrangements – Subsea Dispersant Injection Procedure*

- Activity Source Control Emergency Response Plan (SCERP)
- Subsea Dispersant Injection Operational Plan

##### *Response Need*

A subsea LOWC from Stybarrow P&A activities has a low flow rate. For the purposes of this capability assessment, it has been highly conservatively assumed that the entire daily flow rate of ~140 m<sup>3</sup> would be available for treatment via subsea dispersant injection.

The volumes of dispersant required will depend on the Dispersant to Oil ratio (DOR) used at the injection point. It has been assumed that the release would require a DOR of 1:100. To achieve a DOR of 1:100 for a flow rate of 140 m<sup>3</sup>/day for the subsea LOWC scenario, a dispersant pump rate of ~1.4 m<sup>3</sup>/day is required.

The AMOSC SFRT Package can deliver up to 110 L/min (158 m<sup>3</sup>/day), and along with the dispersant stocks specified in the GDS (Document Reference: 9193533), is therefore capable of meeting the demand for SSDI for this activity, if it is determined to be a viable strategy.

##### *Personnel*

Woodside have contracts with specialist subsea dispersant injection personnel via Oceaneering to support the Woodside CIMT.

##### *Equipment*

Woodside has access to the SFRT equipment and required vessels as outlined in **Section 10.4.1.4**.

**Response Timing**

SFRT timings are outlined in **Section 10.4.1.4**.

**Dispersant stockpiles**

Dispersant stockpiles are made available via AMOSC membership or AMSA agreement with most supplies within Australia being available within 48 to 55 hours. Woodside is also a member of the OSRL Global Dispersant Service (GDS) guaranteeing access to 5,000 m<sup>3</sup> dispersant. The overall total dispersant available for subsea response is circa 6,491 m<sup>3</sup>. Woodside can supply all required road logistics to meet these timeframes through its contracted logistics provider. Woodside can also provide air logistics for all other stockpiles throughout Australia and internationally.

Dispersant stockpiles and locations are maintained in Woodside's dispersant database: [Link](#)

**Legislative and Other Considerations**

The dispersants used will be approved under the Australian Government National Plan arrangements as listed on the Oil Spill Control Agents (OSCA) register or the transitional list, or otherwise approved through the dispersant selection process detailed below.

Consistent with selection of hazardous materials at facilities, where a product may be discharged to the environment, an assessment must be completed before the product is approved for mobilisation and subsequently approved for application.

The following dispersants will be automatically approved for mobilisation:

- Dispersants listed on the National Plan OSCA List:  
<https://www.amsa.gov.au/marineenvironment/pollution-response/register-oil-spill-control-agents>
- Dispersants listed on the National Plan transitional list

**Water Column Monitoring Equipment & Personnel**

Woodside has access to water column monitoring through their operational monitoring and scientific monitoring service provider contract. Even if SSDI is not required as a response option, the WCM Equipment provides useful instrumentation and tools to enable sampling and monitoring in deep-water settings for Operational and Scientific Monitoring Plans.

**Potential Environmental Impact and Risks – Subsea dispersant injection**

There are no additional environmental impacts and risks associated with a vessel-based response in offshore waters to those already described within **Section 7** and **Section 8**.

**10.4.3.3 Subsea Dispersant Injection Environmental Performance**

**Table 10-6** provides the environmental performance outcomes, performance standards and measurement criteria for the subsea dispersant injection response strategy.

In the event of a spill, Operational NEBAs (refer to Section 4 of the OPEP) will be completed daily, to take into account spill trajectories, prevailing weather and planned actions for the day.

**Table 10-6: Environmental Performance – Subsea Dispersant Injection**

| Subsea Dispersant Injection       |   |   |  |
|-----------------------------------|---|---|--|
| Environmental Performance Outcome | Timely application of dispersant to effectively disperse hydrocarbons to reduce overall shoreline accumulation; and/or chemical dispersant application enables the safe deployment of response equipment and personnel. |   |  |

|                             | 14.2 | Year-round access to additional dispersant stockpiles via memberships with OSRL and AMOSC  |                      |
|                             | 14.3 | OSCA approved dispersants prioritised for surface and subsea use   | 1, 3A, 3B, 3C, 4     |

#### 10.4.4 Spill Response: Surface Dispersant Application

##### 10.4.4.1 Summary of Activity

Surface dispersant application (combined vessel and aircraft) may reduce surface hydrocarbons and therefore prevent, or reduce the scale of, shoreline contact. Priority would be placed on treating high volume surface hydrocarbons closest to the release location as this is where higher surface concentrations are predicted, and dispersant application is expected to achieve the greatest benefit.

Weathering of the hydrocarbons would reduce dispersant efficacy. In the event of an ongoing loss of well control, modelling predicts hydrocarbons reaching the surface may spread below effective response thresholds. Surface dispersant application is weather and sea-state dependent. Periods of downtime can be expected.

| Surface Dispersant Application (combined vessel and aircraft) |  |
|---|--|
| <b>Initiation Criteria</b>                                    | Release of Stybarrow Crude via LOWC and operational monitoring predicts shorelines with identified sensitive receptors will potentially be contacted by the spill.   |
| <b>Activation Time</b>  | Within two hours of forming the IMT.   |
| <b>Resources</b>  | <p>Aerial spraying aircraft capability via AMOSC-FWADC, OSRL)</p> <p>Equipment and trained personnel available via Woodside response personnel, AMOSC, Mutual Aid and OSRL.</p> <p>Logistics contractor (located in Exmouth) available to Woodside via existing contracts.</p> <p>Vessel assets available to Woodside via existing marine contracts and vessels of opportunity available on local charter market in Exmouth or Onslow.</p> |
| <b>Termination Criteria</b>                                   | Operational NEBA has determined this strategy is unlikely to result in an overall benefit to the affected shoreline/s, or as directed by the Woodside Incident Controller or relevant Control Agency. Agreement is reached with the Jurisdictional Authority relevant to the spill to terminate surface dispersant operations.   |

#### 10.4.4.2 Oil Spill Preparedness

The *Surface Dispersant Operational Plan* details the mobilisation and resource requirements for dispersant operations including the logistics, support and facility arrangements to manage the movement of personnel and resources.

Equipment and personnel would be mobilised to selected locations, where the following conditions were met;

- Sea-states and hydrocarbon characteristics permit safe and effective deployment of operations. For example, crude oil may only be amendable to dispersion for 24 to 48 hours after release.
- If the Operational NEBA showed a net benefit, Woodside could mobilise equipment and resources for Aerial Dispersant Spraying to offshore areas where Operational Monitoring reports indicate oil patches present suitable oil thickness (>50 g/m<sup>2</sup>) to consider surface dispersant spraying. This would be based on Predictive modelling (OM01), direct observation/surveillance (OM02) and, where appropriate, hydrocarbon detection in water (OM03), employed from the outset of a spill to track the oil, assess where and when appropriate response techniques are deployed.

#### **Response Need**

Spill modelling of the LOWC scenario (RPS, 2022b) predicts no instances where the slick is >50 g/m<sup>2</sup> (which is considered the minimum threshold for effective surface dispersant application).

The following statements identify the key parameters upon which response need is based for LOWC scenario:

- The duration of the spill may extend up to 73 days with response operations extending up to Month 4-5
- There may be offshore areas where oil pools/coalesce and acts differently and could present suitable oil thickness (>50 g/m<sup>2</sup>) to consider surface spraying.
- Spraying operations would be prioritised to reduce predicted shoreline loading and accumulation volumes at feasible response thresholds (>100 g/m<sup>2</sup>)
- In the event that SSDI cannot be employed, surface dispersant may provide the next greatest reduction in surface hydrocarbon availability. This reduces potential impacts to shorelines and wildlife.
- Therefore, the need is based on including the response technique as a contingent (secondary option). Surface Dispersant operations would not, in general, be an effective response technique however they may be available for deployment offshore near the release location and/or when the weather window permits. In these instances, priority would be given to being prepared to deploy units if the required conditions are met., based on results Operational Monitoring.

In addition, a number of assumptions are required to estimate the response need for Surface Dispersant Application. These assumptions have been described in the table below.

**Table 10-7: Response Planning Assumptions – Surface Dispersant Application**

| Response Planning Assumptions                                 |   |   |
|---|---|---|
| Technique   | Predicted performance range <sup>37</sup><br>(% of surface oil volume available predicted to be treated by response technique)  |   |
| Surface Dispersant Application (Combined vessel and aircraft) | Lower   | 2% (1:25 DOR x 16% effectiveness x 50% encounter rate)  |
|   | Upper   | 12% (1:20 DOR x 84% effectiveness x 75% encounter rate) |
|   | The predicted performance range for surface dispersant application (SDA) is based on; <ul style="list-style-type: none"> <li>• Remaining surface oil available for SDA following weathering.</li> <li>• Monitor and evaluate operations observing surface oil at minimum BAOAC 4 (discontinuous true oil colour) or BAOAC 5 (continuous true oil colour).</li> <li>• Safe for deployment, within range of vessels and aircraft.</li> <li>• Dispersant to oil application at 1:20-1:25 (based on uniform surface oil 100g/m<sup>2</sup> and 50 litres/hectare application rate) allows for 3-4 km<sup>2</sup> per aircraft per day.</li> <li>• Predicted dispersant effectiveness of 16-84% for contacted surface oil.</li> <li>• Spraying encounter rate of approximately 50-75% (50-25% of dispersant sprayed does not contact surface oil).</li> </ul>  |   |
| Physical properties   | <p><b>Surface Threshold</b></p> <ul style="list-style-type: none"> <li>• Lower – 50g/m<sup>2</sup> (equates to 100g/m<sup>2</sup> with approx. 50% coverage and/or 200g/m<sup>2</sup> with approx. 25% coverage)                             <ul style="list-style-type: none"> <li>– BAOAC 4 – Discontinuous true oil colour - lower threshold 50g/m<sup>2</sup></li> </ul> </li> <li>• Optimum – 100g/m<sup>2</sup> (equates to &gt;100g/m<sup>2</sup> with approx. 100% coverage and/or 200g/m<sup>2</sup> with approx. 50% coverage)                             <ul style="list-style-type: none"> <li>– BAOAC 5 – Continuous true oil colour – lower threshold 200 g/m<sup>2</sup></li> </ul> </li> </ul> <p><b>Viscosity</b></p> <ul style="list-style-type: none"> <li>• Optimum – &lt;5,000 cSt at sea surface temperature</li> <li>• Upper – 15,000 cSt at sea surface temperature</li> </ul> |   |
| Dispersant Effectiveness                                      | Dispersant testing on Cossack Light Crude indicates that average dispersant efficiency (%) for oil age will be; <ul style="list-style-type: none"> <li>• ~45% (0 hours)</li> <li>• ~84% (&lt;12 hrs)</li> <li>• ~16% (48-96 hrs)</li> </ul> This data is based on a range of weathering results and five National Plan OSCA approved and/or transitional dispersants that will be the most likely dispersants used by Woodside.   |   |

**Response Arrangements – Equipment**

Woodside’s existing level of capability is based on internal and third-party resources that are available 24 hours, 7 days per week.

Woodside has access to vessels suitable for dispersant operations via marine contracts for Integrated Fleet and/or Vessels of Opportunity.

Woodside has access to aerial dispersant aircraft, for example, the AT-802 Fixed Wing via AMOSC; the B727 and C130 out of OSRL Southend (United Kingdom) and Senai (Malaysia) respectively; and via other aircraft provider contracts.

**Dispersant stockpiles**

Dispersant stockpiles are made available via AMOSC membership or AMSA agreement with most supplies within Australia being available within 48 to 55 hours. Woodside is also a member of the OSRL Global Dispersant Service (GDS) guaranteeing access to 5,000 m<sup>3</sup> dispersant. The overall total dispersant available for subsea response is circa 6,491 m<sup>3</sup>. Woodside can supply all required road logistics to meet these

<sup>37</sup> Performance ranges outlined above are indicative for response planning purposes. Where actual figures and concentrations exist based on deterministic modelling or laboratory results, these will be used for response and capability planning.

timeframes through its contracted logistics provider. Woodside can also provide air/sea logistics for all other stockpiles throughout Australia and internationally.

Dispersant stockpiles and locations are maintained in Woodside's dispersant database: [Link](#)

### ***Response Arrangements – Personnel***

Woodside have contracts with specialist oil spill response organisations (OSROs) AMOSC, OSRL and MSRC for the provisions of suitably trained and qualified responders for Vessel and/or Aerial Dispersant operations.

Woodside's internal trained capability includes responders for vessel operations (IMO1) and aerial observation.

### ***Legislative and Other Considerations – Surface Dispersant Application***

A defined Zone of Application (ZoA) to reduce environmental consequences on subsea receptors would be agreed with Commonwealth and/or State regulators prior to the commencement of surface dispersant operations.

The dispersants used will be approved under the Australian Government National Plan arrangements as listed on the Oil Spill Control Agents (OSCA) register or the transitional list, or otherwise approved through the dispersant selection process detailed below.

Consistent with selection of hazardous materials at facilities, where a product may be discharged to the environment, an assessment must be completed before the product is approved for mobilisation and subsequently approved for application.

The following dispersants will be automatically approved for mobilisation:

- Dispersants listed on the National Plan OSCA List:  
<https://www.amsa.gov.au/marineenvironment/pollution-response/register-oil-spill-control-agents>
- Dispersants listed on the National Plan transitional list

### ***Water Column Monitoring Equipment & Personnel***

Woodside has access to water column monitoring through their operational and scientific monitoring scientific monitoring service provider and OSROs.

### ***Logistical Constraints***

Woodside has arrangements for support organisations who provide specialist services (dispersant spray aircraft, logistics services for mobilising dispersant and Air Attack Supervisors) or resources (dispersants and transfer pumping systems). Plans procedures and support documents are in place for Operational and Support functions. These should be regularly reviewed and updated.

#### **10.4.4.3 Potential Environmental Impacts and Risks**

This response strategy will involve deploying vessels and associated equipment could result in damage to sensitive habitats and disturbance of fauna (such as trampling of mangroves, emergent reefs, turtle nesting beaches).

The impacts and risks associated with aircraft involved in the Surface Dispersant Application (aircraft) response strategy relate to acoustic disturbance. During the response activities, aircraft and vessels will generate noise both offshore and in coastal areas near sensitive receptors such as shorebirds, marine mammals, fish, and shark species.

#### **10.4.4.4 Surface Dispersant Application Environmental Performance**

**Table 10-12** provides the environmental performance outcomes, performance standards and measurement criteria for the Surface Dispersant Application response strategy.

The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

Table 10-8: Environmental Performance – Surface Dispersant Application

| Surface Dispersant Application     |   |   |  |
|------------------------------------|---|---|--|
| Environmental Performance Outcomes | To reduce consequences to surface and shoreline receptors and increase the bioavailability of hydrocarbons for microbial breakdown. |   |  |
| Control Measure                    | Performance Standard  |   | Measurement Criteria (Section 10.4.12) |
| Aerial spraying                    | 15.1  | One aircraft with minimum payload of 1,850 litre mobilised to site within 4 hours of activation. Three additional aircraft mobilised to site within another 20 hours of activation. | 1, 3B, 3C, 4                           |
|                                    | 15.2  | One high-capacity aircraft with minimum payload of 10m <sup>3</sup> mobilised to site within 20 hours of activation if required   |  |
|                                    | 15.3  | All aircraft to complete a minimum of 2 sorties per day .   | 1                                      |
|                                    | 15.4  | Per sortie spray log completed to record where and when dispersants were applied.   | 1, 3A, 3B,                             |
| Vessel spraying                    | 16.1  | Two offtake support vessels from integrated fleet will undertake dispersant trials within 48 hours of the release as per first strike plan.   | 1, 3A, 3B, 3C, 4                       |
|                                    | 16.2  | Two offtake support vessels will be available for deployment to spray dispersant for the duration of the response.  | 3A, 3C, 4                              |
|                                    | 16.3  | Up to 4 vessels spraying per day by day 5.  | 1, 3C                                  |
|                                    | 16.5  | Per day spray log completed to record where and when dispersants were applied.  | 1, 3A, 3B                              |
| Dispersant                         | 17.1  | Year-round access to 5,000m <sup>3</sup> of dispersant located globally which is ready to be mobilised on activation of GDS membership within 24-48 hours.                          | 1, 3A, 3B, 3C, 3D, 4                   |
|                                    | 17.2  | Year-round access to additional dispersant stockpiles via memberships with OSRL and AMOSC.  |  |
|                                    | 17.3  | OSCA approved dispersants prioritised for surface and subsea use.   | 1, 3A, 3B, 3C, 4                       |
|                                    | 17.4  | Only apply surface dispersants within the ZoA and on BAOAC 4 and 5.   |  |
|                                    | 17.5  | Continuous monitoring of dispersed oil plume and visual monitoring of effectiveness   |  |

## 10.4.5 Spill Response: Containment and Recovery

### 10.4.5.1 Summary of Activity

Containment and recovery is used to reduce damage to sensitive resources by the physical containment and mechanical removal of hydrocarbons from the marine environment. It has a lower capacity for removing surface hydrocarbons than the application of dispersant but avoids potential additional impacts created by the resulting increase in entrained hydrocarbons in the water column.

Weathering and spreading of hydrocarbons will significantly reduce containment and recovery effectiveness. In the event of an ongoing loss of well control, modelling predicts fresh hydrocarbons reaching the surface may be heavily weathered and present in small discrete patches. Containment and Recovery is weather and sea-state dependent. Periods of downtime can be expected.

In the vicinity of the release location the average wind speed range is 11.4–14.9 knots; and the maximum wind speed range is 28–53.4 knots (RPS, 2022). It is, therefore, expected that open water containment and recovery operations would not, in general, be an effective response technique. However, Containment and recovery is included as a contingent option and may be available for deployment nearshore and/or when the weather window permits, and priority would be given to being prepared to deploy units if the required conditions are met.

| Containment and Recovery    |  |
|-----------------------------|--|
| <b>Initiation Criteria</b>  | Notification of Level 2/3 Oil Spill where shorelines with identified sensitive receptors will potentially be contacted by the spill.   |
| <b>Activation Time</b>      | Within two hours of forming the IMT.   |
| <b>Resources</b>            | Shoreline protection equipment and trained personnel available via Woodside response personnel, AMOSC, OSRL, mutual aid and MCRC.<br>Logistics contractor (located in Exmouth) available to Woodside via existing contracts.<br>Vessels available to Woodside via existing marine contracts.<br>Vessels of opportunity available on local charter market in Exmouth or Onslow. |
| <b>Termination Criteria</b> | Operational NEBA has determined this strategy is unlikely to result in an overall benefit to the affected shoreline/s, or as directed by the Woodside Incident Controller or relevant Control Agency. Agreement is reached with the Jurisdictional Authority relevant to the spill to terminate Containment and Recovery operations.   |

#### 10.4.5.2 Oil Spill Preparedness

The *Containment and Recovery Operational Plan* details the mobilisation and resource requirements for response operations including the logistics, support and facility arrangements to manage the movement of personnel and resources.

Equipment and personnel would be mobilised to selected locations, where the following conditions were met;

- Sea-states and hydrocarbon characteristics permit safe and effective deployment of operations.
- If the Operational NEBA showed a net benefit, Woodside could mobilise equipment and resources for Containment and Recovery where Operational Monitoring reports indicate oil patches present suitable oil thickness (>50 g/m<sup>2</sup>). These areas may be offshore near the release location or closer to sensitive shoreline and coastal habitats.
- This would be based on Predictive modelling (OM01), direct observation/surveillance (OM02) and, where appropriate, hydrocarbon detection in water (OM03), employed from the outset of a spill to track the oil, assess where and when appropriate response techniques are deployed.

If the above conditions are met, Woodside can deploy vessels to perform containment and recovery operations to minimise the predicted arrival time of first oil. The earliest shoreline oiling at response thresholds (>100 g/m<sup>2</sup>) is predicted on Day 3 (Exmouth) and Day 4 (Muiron Islands)).

Woodside would replenish the containment stockpile, as required, if the Operational NEBA showed a net benefit. Pre-mobilisation of additional equipment or resources or improving access along the coastline for shoreline protection is not justified for the environmental benefit gained.

**Response Need**

Spill modelling of the LOWC scenario (RPS, 2022b) predicts no instances where the slick is > 50 g/m<sup>2</sup> (which is considered the minimum threshold for effective Containment and Recovery operations. The following statements identify the key parameters upon which response need is based for LOWC scenario:

- The duration of the spill may extend up to 73 days with response operations extending up to Month 4-5
- While there is no deterministic modelling showing surface hydrocarbons within threshold concentration (>50g/m<sup>2</sup>) available for Containment and Recovery operations, floating oil could pool/coalesce and present suitable oil thickness (>50 g/m<sup>2</sup>) to consider Containment and Recovery operations. This reduces potential impacts to shorelines and wildlife.
- Therefore, the need is based on including the response technique as a contingent (secondary option) which is available for deployment based on results Operational Monitoring.

In addition, a number of assumptions are required to estimate the response need for Containment and Recovery. These assumptions have been described in the table below.

**Table 10-9: Response Planning Assumptions – Containment and Recovery**

| Technique                          |  | Predicted performance range<br>(% of surface oil volume available predicted to be recovered by response technique) |
|------------------------------------|--|--|
| Containment and recovery           | Lower  | 5%   |
|                                    | Upper  | 10%  |
|                                    | The predicted performance range for containment and recovery is based on; <ul style="list-style-type: none"> <li>• remaining surface oil available for containment and recovery following weathering,</li> <li>• Monitor and evaluate operations observing surface oil at minimum BAOAC 4 (discontinuous true oil colour) or BAOAC 5 (continuous true oil colour)</li> <li>• safe for deployment, within range of vessels and aircraft,</li> <li>• encounter rate of approximately 50-75% (50-25% of surface coverage is not surface oil)</li> </ul>   |  |
| Response Capability details        |  |  |
| Containment and recovery operation | <ul style="list-style-type: none"> <li>• 1 x containment and recovery operation includes;                             <ul style="list-style-type: none"> <li>– 2 x suitable vessels (vessel specifications as per Marine Operations Plan)</li> <li>– 1 x boom system (minimum 800 mm overall height and approximately 200 m length) with all required ancillaries)</li> </ul>                             or                             <ul style="list-style-type: none"> <li>– 1 x suitable vessel (vessel specifications as per Marine Operations Plan)</li> <li>– 1 x single ship system (minimum 800 mm overall height and approximately 200 m length) with all required ancillaries)</li> </ul>                             and                             <ul style="list-style-type: none"> <li>– 1 x skimmer (min 20 m<sup>3</sup> / hr) with all required ancillaries</li> <li>– 1-2 x trained supervisor per operation</li> <li>– 8-10 x support personnel per operation</li> </ul> </li> </ul> |  |
| Physical properties                | <b>Surface Threshold</b> <ul style="list-style-type: none"> <li>• Lower – 50g/m<sup>2</sup> (equates to 100g/m<sup>2</sup> with approx. 50% coverage and/or 200g/m<sup>2</sup> with approx. 25% coverage)                             <ul style="list-style-type: none"> <li>– BAOAC 4 – Discontinuous true oil colour - lower threshold 50g/m<sup>2</sup></li> </ul> </li> <li>• Optimum – 100g/m<sup>2</sup> (equates to &gt;100g/m<sup>2</sup> with approx. 100% coverage and/or 200g/m<sup>2</sup> with approx. 50% coverage)                             <ul style="list-style-type: none"> <li>– BAOAC 5 – Continuous true oil colour – lower threshold 200 g/m<sup>2</sup></li> </ul> </li> </ul>   |  |

|                               |  |
|-------------------------------|--|
| <b>Expected effectiveness</b> | <ul style="list-style-type: none"> <li>• 1 x <b>containment and recovery</b> operation is expected to be able to contain and recover approx. 22.5 – 67.5 m<sup>3</sup> per day (10 hr operation) includes one (1) change out of temporary waste storage equipment (if required)</li> <li>• Based on the following assumptions;             <ul style="list-style-type: none"> <li>– Boom system with 70m opening = 0.07 km</li> <li>– Vessel moving at 0.7kn = 1.3 km/h</li> <li>– Area covered per hour = 0.07 km x 1.3 km = 0.09 km<sup>2</sup></li> <li>– Area covered per day = 0.09 km<sup>2</sup> x 10 hours = 0.9 km<sup>2</sup> / day</li> <li>– Recovery per day (low) = 0.9 km<sup>2</sup> x 50 g/m<sup>2</sup> x 50% coverage = 22.5 m<sup>3</sup> / 10-hour day</li> <li>– Recovery per day (high) = 0.9 km<sup>2</sup> x 100 g/m<sup>2</sup> x 75% = 67.5 m<sup>3</sup> / 10-hour day</li> </ul> </li> </ul> <p>Increased surface oil concentration may result in increased recovery capacity providing other conditions and oil properties remain suitable for containment and recovery. For planning purposes, conservative concentrations outlined above have been used.</p> |
|-------------------------------|--|

**Response Arrangements – Equipment**

Woodside has access to vessels suitable for Containment and Recovery operations via marine contracts for Integrated Fleet and/or Vessels of Opportunity.

Equipment is available via King Bay Supply Base, Mutual Aid via AMOSC/Nat-Plan Stockpile, and OSRL.

**Response Arrangements – Personnel**

Woodside have contracts with AMOSC and OSRL for the provisions of suitably trained and qualified responders for Containment & Recovery operations.

Woodside’s internal trained capability includes responders for Containment & Recovery operations (IMO1).

**Logistical Constraints**

Woodside has arrangements for support organisations who provide specialist services (logistics services for mobilising equipment, trained Offshore Supervisors and waste disposal) and/or resources (vessels, containment and recovery equipment, transfer pumping systems). Plans, procedures and support documents are in place for Operational and Support functions. These should be reviewed and updated regularly.

**10.4.5.3 Potential Environmental Impacts and Risks**

This response strategy will involve deploying vessels, equipment and personnel. The installation of booms and associated equipment could result in damage to sensitive habitats and disturbance of fauna (such as trampling of mangroves, emergent reefs, turtle nesting beaches; and damage to emergent reefs by vessels used to deploy nearshore booms and anchoring impacts), entanglement of marine fauna within booms, accidental corralling of fauna into surface oil, accidental deflection of surface oil to sensitive shorelines and environmental receptors, and damage to aboriginal registered sites of cultural significance from shoreline accumulation and deployment of protection and deflection booms.

**10.4.5.4 Containment and Recovery Environmental Performance**

Table 10-12 provides the environmental performance outcomes, performance standards and measurement criteria for the Containment and Recovery response strategy.

The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

Table 10-10: Environmental Performance – Containment and Recovery

| Containment and Recovery                                 |  |  |  |
|--|--|--|--|
| Environmental Performance Outcomes                       | To reduce consequences to surface and shoreline receptors. |  |  |
| Control Measure  | Performance Standard                                       | Measurement Criteria (Section 10.4.12)   |  |
| Vessel-based recovery systems                            | 18.1   | Woodside maintains an integrated fleet of vessels, including vessels with at least 10t bollard pull. Additional vessels can be sourced through existing contracts/frame agreements   |  |
|  | 18.2   | 2 containment and recovery operations would be mobilised by day 2.   |  |
|  | 18.3   | 4 additional containment and recovery operations using 3 <sup>rd</sup> party provider resources could be mobilised by day 10   |  |
|  | 18.4   | Each operation will have internal or added 100 m <sup>3</sup> of liquid waste storage onboard.   |  |
| Response teams   | 19.1   | 2 containment and recovery teams would be available by day 2 and 4 containment and recovery teams available by day 10.   |  |
|  | 19.2   | A containment and recovery team will be comprised of: <ul style="list-style-type: none"> <li>• 1-2 trained specialists per operation</li> <li>• 4 - 6 personnel for support</li> </ul> Personnel sourced through resource pool   |  |
|  | 19.3   | Teams will segregate liquid and solid wastes at the earliest opportunity.  |  |
| Response systems   | 20.1   | Rapid sweep systems and active boom systems to be prioritised for mobilisation in the event of a response.   |  |
| Management of Environmental Impact of the response risks | 20.2   | If vessels require anchoring locations, these will be selected to minimise disturbance to benthic primary producer habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified |  |

## 10.4.6 Spill Response: Shoreline Protection

### 10.4.6.1 Summary of Activity

The Shoreline Protection response strategy involves deploying protection and deflection booms which assist in minimising the amount of oil contacting shorelines. In a hydrocarbon spill event and if the modelling suggests sensitive shorelines and receptors are at risk of contact, protective and deflective booms will be deployed to deflect a slick away from a known sensitivity towards an area where collection can be more effective without impacting high value receptors.

This response strategy will involve deploying vessels, equipment and personnel and its success depends on weather and sea state conditions.

Sensitive shorelines that require protection and deflection by a potential oil spill will be identified and prioritised through the IAP and Operational NEBA process. Shoreline protection will be carried out as directed by the Western Australian Department of Transport (WA DoT), as the Controlling Agency in State waters.

It should be noted that shoreline protection and shoreline clean-up measures for Barrow Island (noted as a

priority protection area in Section 2.2.3 of the OPEP) are established and maintained by Chevron. Chevron's Oil Pollution Emergency Plan arrangements would be enacted following joint consultation with Chevron and the WA DoT. The need for activation would be identified during the implementation of Operational Monitoring. Should data indicate potential shoreline contact with Barrow Island or any nearby receptors, Chevron would be notified and mobilised via existing arrangements by the WA DoT as the Controlling Agency.

Potential shoreline exposure is cumulative rather than instantaneous; therefore, shoreline protection measures should be designed to manage potential peak loadings.

| Shoreline Protection        |  |
|-----------------------------|--|
| <b>Initiation Criteria</b>  | Notification of Level 2/3 Oil Spill where shorelines with identified sensitive receptors will potentially be contacted by the spill.   |
| <b>Activation Time</b>      | Within two hours of forming the IMT.   |
| <b>Resources</b>            | Shoreline protection equipment and trained personnel available via Woodside response personnel, AMOSC, Mutual Aid and OSRL.<br>Logistics contractor (located in Exmouth) available to Woodside via existing contracts.<br>Vessels available to Woodside via existing marine contracts.<br>Vessels of opportunity available on local charter market in Exmouth or Onslow. |
| <b>Termination Criteria</b> | Operational NEBA has determined this strategy is unlikely to result in an overall benefit to the affected shoreline/s, or as directed by the Woodside Incident Controller or relevant Control Agency. Agreement is reached with the Jurisdictional Authority relevant to the spill to terminate shoreline protection.  |

#### 10.4.6.2 Oil Spill Preparedness

Woodside can protect priority areas where functional shoreline protection can be implemented before the predicted arrival time of first oil. During the response, SCAT teams and specialists will continue to monitor opportunities to deploy additional shoreline protection strategies above and beyond what has already been identified as suitable for protection. Woodside would replenish the shoreline protection stockpile, as required, if the Operational NEBA showed a net benefit. Pre-mobilisation of additional equipment or resources or improving access along the coastline for shoreline protection is not justified for the environmental benefit gained.

The need is to install shoreline protection equipment before the accumulation of hydrocarbon at locations where deployment can be safely and practicably achieved. The earliest shoreline oiling at response thresholds (>100 g/m<sup>2</sup>) is predicted on Day 3 (Exmouth) and Day 4 (Muiron Islands)). The capacity for the shoreline protection will be maintained until the termination criteria for Shoreline Protection has been achieved.

#### *Response Planning Assumptions*

A number of assumptions are required to estimate the response need for Shoreline Protection and Deflection. These assumptions have been described in **Table 10-11**.

**Table 10-11: Response Planning Assumptions – Shoreline Protection and Deflection**

| Response Planning Assumptions              |  |
|--|--|
| <b>Safety considerations</b>               | Shoreline protection and deflection operations cannot be implemented if the safety of response personnel cannot be guaranteed. This requires an initial and ongoing risk assessment of health and safety hazards and risks at the site. Personnel safety issues may include <ul style="list-style-type: none"> <li>hydrocarbon gas and/or liquid exposure</li> <li>safe for deployment and conditions within range of vessels</li> <li>high ambient temperatures.</li> </ul> |
| <b>Shoreline protection and deflection</b> | 1 x Shoreline Protection and Deflection operation may include; <ul style="list-style-type: none"> <li>Quantity of shoreline sealing boom (as outlined in TRP)</li> </ul>   |

### Response Planning Assumptions

- Quantity of fence or curtain boom (as outlined in TRP)
  - 1-2 x trained supervisors
  - 8-10 x personnel / labour hire
- Specific details of each operation would be tailored to the TRP implemented (where available).

### Response Need

Shoreline protection and deflection equipment would be mobilised to selected locations, where the following conditions were met:

- Sea-states and hydrocarbon characteristics permit safe deployment of protection and deflection measures.
- Oil trajectory has been identified as heading towards identified RPAs.

The following statements identify the key parameters upon which the response need can be based:

- Deterministic spill modelling predicts for the LOWC scenario, there would be a minimum arrival time of five days for shoreline accumulation volumes at feasible response thresholds ( $>100 \text{ g/m}^2$ ) at Exmouth, with arrival at other receptors, exceeding this threshold, predicted after 35 days (Table 2-2 of the OPEP).
- Pre-emptive assessment and shoreline assessments (OM04 and OM05 respectively) will be mobilised within 2 days of operational monitoring predicted shoreline impacts.
- The duration of the LOWC spill may be up to 73 days with response operations extending up to month 4-5 based on the predicted time to complete shoreline clean-up operations.
- Spill modelling did not predict any shoreline accumulation  $>100 \text{ g/m}^2$  for the MDO spill.
- Predictive modelling (OM01), direct observation/surveillance (OM02) and, where appropriate, hydrocarbon detection in water (OM03), will be employed from the outset of a spill to track the oil, assess where and when appropriate response techniques can be deployed and to identify when the spill enters State Waters. When RPAs at threat of impact can be accurately deduced, this will trigger the undertaking of pre-emptive assessments of sensitive receptors at risk (OM04), to direct any protection and deflection operations. OM04 would be undertaken in liaison with WA DoT (if a Level 2/3 incident and within State Waters).
- Following pre-emptive assessments of sensitive receptors at risk, and in agreement of prioritisation with WA DoT (if a Level 2/3 incident and within State Waters), protection and deflection operations would commence until agreed termination criteria are reached.
- Arrangements for support organisations who provide specialist services (trained personnel, protection and deflection equipment) and/or resources should be tested regularly; and
- TRPs for RPAs along with other relevant plans, procedures and support documents need to be in place for Operational and Support functions. These should be reviewed and updated regularly.

### Response Arrangements – Equipment

Woodside maintains a stockpile of shoreline response equipment at King Bay Supply Facility (KBSF) and additionally has access to the Exmouth AMOSC stockpile. First strike response resources can be mobilised within 24-48 hours and be in place within 72 hours. Arrangements are in place with an Exmouth logistics contractor to collect and transport equipment to site.

Additional shoreline protection equipment is available via AMOSC, OSRL and AMSA as well as other industry resources available through the AMOSPlan mutual aid arrangements. It is anticipated additional shoreline protection equipment from Fremantle, Karratha and Broome stockpiles will be transported via Woodside's logistics contractor and be available in Exmouth within 72 hours. Vessels are available through Woodside's integrated fleet arrangements and other contracted vessels.

### Response Arrangements – Personnel

Woodside is planning a shoreline protection response matched to the consequence of a worst-case volume ashore. Arrangements are flexible and scalable in time to mobilise. Modelling has indicated the minimum time

to contact of oil above the moderate exposure value of >100 g/m<sup>2</sup> is around five days at Exmouth. Woodside can mobilise internal response personnel and AMOSC Core Group personnel within 24-48 hours to protect the key environmental sensitivities that may be impacted in this timeframe. Should additional skilled personnel be required to fill team lead/supervisor roles may be sought via Woodside's OSRL contract and the National Response Team (NRT).

As described in Section 6.4 of the OPEP, if required, Woodside could initiate the deployment of labour-hire personnel to fill unskilled team member roles that may be required for shoreline protection crews. Skilled personnel would be sourced from the internal response personnel, AMOSC Core Group, mutual aid, OSRL and NRT to supervise response crews. All unskilled personnel would receive relevant on-the-job training prior to undertaking shoreline protection operations.

Shoreline protection operations will continue until the termination criteria for Shoreline Protection has been achieved.

### ***Legislative and Other Considerations – Shoreline Protection***

Shoreline protection operations are administered by WA DoT as the Controlling Agency within State jurisdiction.

Several Conservation Management Plans identify marine debris as a key threatening process to recovery. Also, the relevant action from the *Threat Abatement Plan for the Impacts of Marine Debris on the Vertebrate Wildlife of Australia's Coasts and Oceans* (Commonwealth of Australia, 2018) is to "contribute to the long-term prevention of the incidence of harmful marine debris". The prevention of garbage entering the marine environment and the appropriate management of sewage and food wastes reduces the risk of impacts to the marine environment and demonstrates alignment with the various species recovery and threat abatement plans.

For nearshore vessel operations: Marine Order 91 (Pollution Prevention – Oil), Marine Order 94 (Pollution Prevention – Packaged Harmful Substances), Marine Order 95 (Pollution Prevention – Garbage) and Marine Order 96 (Pollution Prevention – Sewage) and EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with Cetaceans (modified to include whale sharks and turtles).

The Threat Abatement Plan to Reduce the Impacts of Exotic Rodents on Biodiversity on Australian Offshore Islands of less than 100,000 Hectares (Department of the Environment, Water, Heritage and the Arts, 2009), describes the threat of invasion or reinvasion of rodents on bird populations. The relevant action from the threat abatement plan is to prevent invasion or reinvasion via prevention / risk reduction for rodents gaining access to key vessels at key ports. Woodside's controls align with the intent of preventing invasion/establishment of pests.

The *Recovery Plan for Marine Turtles in Australia* (Commonwealth of Australia, 2017) identifies that light pollution and vehicle damage (and therefore possibly excessive foot traffic) are possible threats to turtle nesting, which could result from shoreline response activities during an oil spill response. Controls which align with the intent of the Recovery Plan have been adopted, including consideration of the National Light Pollution Guidelines (Commonwealth of Australia, 2020b).

### ***Logistical Constraints***

The following operational constraints limit the contribution to shoreline protection:

Multiple use of logistics contractor to support other operations: The initiation of multiple response strategies in Exmouth has the potential to cause conflicts on the available logistics contractor's movement of equipment required for the first strike shoreline protection. The equipment required to deploy shoreline protection can be delivered to the location by either the logistics contractors or the first strike teams themselves, using utility vehicles and trailers if trucks were deployed for other strategies. It has been assessed that this would not be a conflict to the required deployment timeframe.

Access to areas requiring shoreline protection: There is access to coastline around Exmouth using paved roads, with 4WD access tracks to most beaches. Vehicles for managing the logistics in these areas would be required, such as 4WD buses and trucks. Transit times would be longer. Access to the nearshore islands would be via barge or small vessel.

Locations amenable to shoreline protection: Tactical Response Plans are available for shoreline protection and clean-up for the key sensitivities at risk from a large hydrocarbon spill. During the response, SCAT teams and specialists will continue to monitor opportunities to deploy additional shoreline protection strategies above

and beyond what is described in the Tactical Response Plans. Woodside would continuously replenish the Exmouth shoreline protection stockpile to maximise the potential to use this method.

In summary, Woodside has access to shoreline protection equipment, trained personnel and supporting staff that are sufficient and appropriate for shoreline protection operations. Trained personnel requirements will be filled from the AMOSC Core Group, mutual aid, OSRL and the NRT. These resources are expected to provide sufficient capability to implement this response strategy. Woodside has pre-identified protection priorities, equipment and resource requirements, access and constraints within Tactical Response Plans that will enable efficient measures to be implemented.

#### 10.4.6.3 Potential Environmental Impacts and Risks

This response strategy will involve deploying vessels, equipment and personnel. The installation of booms and associated equipment could result in damage to sensitive habitats and disturbance of fauna (such as trampling of mangroves, emergent reefs, turtle nesting beaches; and damage to emergent reefs by vessels used to deploy nearshore booms and anchoring impacts), entanglement of marine fauna within booms, accidental corralling of fauna into surface oil, accidental deflection of surface oil to sensitive shorelines and environmental receptors, and damage to aboriginal registered sites of cultural significance from shoreline accumulation and deployment of protection and deflection booms.

The environmental sensitivity of shorelines that may be impacted by a potential Level 2/3 oil spill is a key consideration in determining priorities for shoreline response. The sensitivity of shorelines may vary depending on the time of year, as some shorelines in the region are used as turtle and bird nesting areas. Table 2-2 of the OPEP provides information regarding the seasonality of receptors at priority areas.

Sensitive receptor protection (intertidal booms and skimming) may generate a significant quantity of hydrocarbon contaminated solid and liquid waste. Contaminated solids would include PPE, oil-coated booms, skimmers etc. and the oily contaminated liquids and organic matter collected during the nearshore booming/skimming activities. Inappropriate management of oil contaminated waste could result in localised secondary contamination of the nearshore marine environment shoreline sediments and harm to individuals of protected species.

#### 10.4.6.4 Shoreline Protection Environmental Performance

**Table 10-12** provides the environmental performance outcomes, performance standards and measurement criteria for the Shoreline Protection response strategy.

The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

**Table 10-12: Environmental Performance – Shoreline Protection**

| Shoreline Protection               |  |   |   |
|------------------------------------|--|---|---|
| Environmental Performance Outcomes | To stop hydrocarbons encountering particularly sensitive areas |   |   |
| Control Measure                    | Performance Standard   |   | Measurement Criteria<br>(Section 10.4.12) |
| Response teams                     | 21.1   | In liaison with WA DoT (for Level 2/3 incidents), relevant Tactical Response Plans (TRPs) will be identified in the First Strike plan for activation within 24 hours of predicted impact.   | 1, 3A, 3C, 4                              |
|                                    | 21.2   | In liaison with WA DoT (for Level 2/3 incidents), mobilise teams to RPAs within 2 days of predicted impact. Teams to contaminated RPAs comprised of:<br>1-2 trained specialists per operation<br>8-10 personnel/labour hire<br>Personnel sourced through resource pool. | 1, 2, 3B, 3C, 4                           |

| Shoreline Protection  |      |  |                     |
|---|------|--|---------------------|
|   | 21.3 | In liaison with WA DoT (for Level 2/3 incidents), 1 operation mobilised within 2 days of predicted impact for each identified RPA. Expected to be 1 RPA within 5 days (operation as detailed above) for CS-01.   | 1, 3A, 3B, 4        |
|   | 21.4 | 12 trained personnel available (2 supervisors plus 10 additional personnel) within 2 days of predicted impact for each identified RPA. Sourced through resource pool.  | 1, 2, 3A, 3B, 3C, 4 |
|   | 21.5 | Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s).   | 1, 3A, 3B           |
|   | 21.6 | The safety of shoreline response operations will be considered and appropriately managed. During shoreline operations:<br>All personnel in a response will receive an operational/safety briefing before commencing operations<br>Gas monitoring and site entry protocols will be used to assess safety of an Operational Area before allowing access to response personnel. | 1, 3B, 4            |
| <b>Response equipment</b>                                       | 22.1 | Equipment mobilised from closest stockpile within 2 days of predicted impact.  | 1, 3A, 3C, 4        |
|   | 22.2 | Supplementary equipment mobilised from State, AMOSC, AMSA stockpiles within 2 days of predicted impact.  | 1, 3C, 3D, 4        |
|   | 22.3 | Supplementary equipment mobilised from OSRL within 5 days of predicted impact.   |                     |
|   | 22.4 | Woodside maintains integrated fleet of vessels. Additional vessels can be sourced through existing contracts/frame agreements  | 1, 3A, 3C, 4        |
| <b>Management of Environmental Impact of the response risks</b> | 23.1 | If vessels are required for access, anchoring locations will be selected to minimise disturbance to benthic primary producer habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified.                    | 1                   |
|   | 23.2 | Shallow draft vessels will be used to access remote shorelines to minimise the impacts associated with seabed disturbance on approach to the shorelines.   |                     |

### 10.4.7 Spill Response: Shoreline Clean-Up

#### 10.4.7.1 Summary of Activity

The shoreline clean-up response strategy will be implemented for Level 2 and Level 3 spills. Where shoreline protection and deflection activities are not possible or unsuccessful, shoreline clean-up will be implemented. The shoreline clean-up response strategy is typically logistic- and labour-intensive, requiring multiple vessels, equipment, clean-up crews and waste management.

Shoreline clean-up involves physically removing stranded oil from shorelines via techniques that include:

- natural recovery

- sediment relocation
- mechanical clean-up using heavy machinery
- debris removal via manual bagging
- absorbents
- pumps and vacuums
- low-pressure flushing
- high-pressure flushing.

Woodside will use the information gained from implementing the Monitor and Evaluate response strategy (**Section 10.4.2**) to predict shorelines that will be impacted and will require priority shoreline clean-up activities. Through information gathered and assessed by the IMT and DoT, the trajectory of the spill towards the specific shoreline will be confirmed and the shoreline clean-up strategy will be implemented. After identifying environmentally-sensitive receptors, it will be of the highest priority that Woodside will establish a nearshore and onshore response to manage the impacts that may occur to those sensitive shoreline receptors.

The shoreline clean-up response strategy will consider:

- shoreline characteristics (substratum type, beach type, shoreline exposure, biological, social, heritage and economic values; characteristics of the oil (e.g., degree of weathering); amount of oil present, distribution on the shoreline; shoreline sediment type)
- logistics considerations (availability of access; waste removal; availability of equipment and labour; availability of waste storage areas)
- operational risk assessment of potential shoreline clean-up methods, leading to the development of Operational NEBAs
- damage to Aboriginal registered sites of cultural significance from shoreline clean-up activities.

DoT is the Control Agency for shoreline response in WA. Woodside will develop daily IAPs as a first priority; an Operational NEBA will also be performed for shoreline protection and clean-up in consultation with DoT. The specific clean-up techniques will be risk-assessed and refined when developing the IAP to suit the circumstances of the incident response. The sensitivity of shorelines may vary depending on the time of year, such as shorelines and beaches used by birds and turtles for nesting. This will be considered during the Operational NEBA.

Based on the IAP, Woodside will establish and deploy SCAT teams for assessing the shoreline and developing recommended clean-up strategies for the IMT planning and operations group. SCAT team members will include personnel trained in oil spill response measures and environmental and coastal sensitivities of the region. Ideally, each SCAT team will include a representative from the appropriate State Agency (DoT/DBCA).

The SCAT teams will systematically survey the shoreline that will be segmented into sections. The SCAT teams will then provide sketches and reports that will include recommendations for the most appropriate clean-up strategy for the shoreline segment. This information will feed back to the IMT, who will then prioritise areas for clean-up and allocate resources.

The SCAT teams will use techniques to determine appropriate termination end points for response in consultation with the appropriate State Agency (DoT/DBCA). The endpoints can be determined through:

- qualitative field observations – to describe the presence or absence of stranded oil and/or the character of such oil
- quantitative field measurement methods – based on visual measurements and observations of the quantity of oil
- analytical measurement methods – typically require collection of representative field samples and subsequent laboratory analysis, or
- interpretive impact assessment methods – based on an evaluation of system impacts (e.g., Operational NEBA).

Through the designated Control Agency, Woodside will resource the necessary personnel and logistics associated with maintaining those crews at the impact location, which includes support arrangements to ensure the health, safety and welfare of the shoreline crews. This includes availability of personal protective

equipment, sun shelter, first aid supplies, catering, drinking water, ablutions, decontamination facilities, accommodation, transport and communications to support the number of personnel expected to be required at the impact location.

Potential shoreline exposure is cumulative rather than instantaneous; therefore, shoreline clean-up measures should be designed to manage potential peak loadings. Shoreline clean-up activities will also need to factor in the ecological sensitivities of the priority protection areas, in particular the offshore islands where access is limited and staging area sites could result in secondary impacts to beaches and dunes. Given the access constraints and ecological sensitivities of these shorelines, an Operational NEBA should evaluate the benefit of conducting shoreline clean-up operations with smaller teams for a longer period of time.

It should be noted that shoreline clean-up measures for Barrow Island (noted as a priority protection area in Section 2.2.3 of the OPEP) are established and maintained by Chevron. Chevron's Oil Pollution Emergency Plan arrangements would be enacted following joint consultation with Chevron and the WA DoT. The need for activation would be identified during the implementation of Monitor and Evaluate. Should data indicate potential shoreline contact with Barrow Island or any nearby receptors, Chevron would be notified and mobilised via existing arrangements by the WA DoT as the Controlling Agency.

| Shoreline Clean-up   |  |
|----------------------|--|
| Initiation Criteria  | Notification of Level 2/3 Oil Spill where shorelines with identified sensitive receptors will potentially be contacted by the spill.   |
| Activation Time      | Within two hours of forming the IMT.   |
| Resources            | Shoreline clean-up equipment and trained personnel available via Woodside's Burrup Response Team, AMOSC, Mutual Aid and OSRL.<br>Logistics contractor (located in Exmouth) available to Woodside via existing contracts.<br>Vessels available to Woodside via existing marine contracts.<br>Vessels of opportunity available on local charter market in Exmouth or Onslow. |
| Termination Criteria | Operational NEBA has determined this strategy is unlikely to result in an overall benefit to the affected shoreline/s, or as directed by the Woodside Incident Controller or relevant Control Agency. Agreement is reached with the Jurisdictional Authority relevant to the spill to terminate shoreline clean-up.  |

### Net Environmental Benefit Analysis of Shoreline Clean-Up

Environmentally-sensitive shorelines, cultural heritage sites and shoreline receptors that may be impacted by a potential oil spill are a key consideration in determining priorities for shoreline response and clean-up activities. This section outlines the overarching approach to identifying shore-based oil spill response and clean-up priorities in the event of spill incidents. **Table 10-13** outlines the sensitivity of coastal features and appropriate protection and clean-up procedures. **Table 10-14** identifies proposed protection and clean-up approaches for these sensitive coastal features. The associated environmental risk assessment of the identified protective measures and preferred clean-up methods is provided in **Table 10-11**. The outcomes from **Table 10-13** and **Table 10-15**, along with the Operational NEBA, inform the IAP.

**Table 10-13: Coastal Features Classification – Sensitivity, Protection and Clean-Up Methods**

| Coastal Feature                | Sensitivity * | Comments   | Protective Measure | Clean-up Method (Table 10-14) |          |                         |
|--------------------------------|---------------|--|--------------------|-------------------------------|----------|-------------------------|
|                                |               |  |                    | Preferred                     | Possible | Avoid                   |
| Sites of Cultural Significance | S1            | Potential damage to Aboriginal registered sites of cultural significance from shoreline clean-up activities and shoreline response operations. | 2, 3               | 1, 7                          | 6, 14    | 5, 8, 9, 10, 11, 12, 13 |
| Mangroves &                    | S1            | Extremely low energy areas. Oils may   | 2, 3               | 1, 7                          | 3, 6, 14 | 5, 8, 9, 10,            |

| Coastal Feature                      | Sensitivity * | Comments   | Protective Measure | Clean-up Method (Table 10-14) |             |                 |
|--------------------------------------|---------------|--|--------------------|-------------------------------|-------------|-----------------|
|                                      |               |  |                    | Preferred                     | Possible    | Avoid           |
| Tidal Flats                          |               | penetrate muddy substrate rapidly and deeply and can persist for years. Associated tidal flats are very important for wading birds. These areas should receive top protection and clean-up priority.                         |                    |                               |             | 11, 12, 13      |
| Intertidal Limestone Reef & Corals   | S2            | Unless tide is low, most corals will not be directly exposed to floating oil. However, turbulent mixing from waves can result in contact and adhesion of oil to reef areas.  | 1, 2, 3, 4         | 1, 3, 7                       | 8           | 5, 6, 9, 10, 14 |
| Sandy Beaches                        | S3<br>S1*     | Sand beaches are relatively low in ecological diversity, except during times of turtle and bird nesting. Higher clean-up priority should be given to turtle nesting and amenity beaches. High potential for oil penetration. | 1, 3               | 1, 3, 6, 7, 8, 13             | 9, 14       | 5, 10, 11       |
| Sheltered Rock Shores                | S3            | Landed oil will weather quickly and may accumulate in pools and cracks.  | 1, 3               | 7                             | 3, 8, 9     | 5,10,11         |
| Shingle, Rock and Sand Mixed Beaches | S4            | High potential for oil penetration and persistence.  | 1, 3               | 7, 9                          | 8, 14       | 5, 10, 11, 12   |
| Exposed Rock, Shores and Cliffs      | S4            | Wave reflection may keep oil offshore. Moderate diversity and recolonised quickly. Oil will accumulate in tidal pools and cracks.  | 1, 3               | 7                             | 1, 3, 9, 12 | 5, 10, 11       |
| Marina, Jetties, Piers               | S4            | Very low likelihood of marina or pier areas being affected. To be cleaned as circumstances dictate.  | 1, 3               | 1, 3, 6, 9, 10                | 11, 12      | 5               |

Sensitivity Codes:

S1: Extreme Sensitivity: High Protection and clean-up priority.

S2: High Sensitivity: Protection and clean-up priority as resource use and circumstances dictate.

S3: Moderate Sensitivity: Protection and clean-up priority as resource use and circumstances dictate.

S4: Low Sensitivity Low protection and clean-up priority.

\*Sandy beaches have an extreme sensitivity during turtle and bird nesting, which occurs at multiple sandy beaches in the region.

Table 10-14: Protection and Clean-Up Options

| Clean Up Options                       |   |
|--|---|
| 1 Containment and recovery using booms | 8 Manual clean-up of oil, or movement of substratum |
| 2 Divert to less sensitive shore       | 9 Low pressure seawater flushing                    |
| 3 Human-made sorbent methods           | 10 High pressure flushing                           |

|   |  |    |  |
|---|--|----|--|
| 4 | Earth barriers                               | 11 | Hot water steam cleaning                                     |
| 5 | Chemical dispersant                          | 12 | Low pressure warm seawater wash                              |
| 6 | Skimmers, vacuums                            | 13 | Mechanical clean-up of oil, removal or movement of substrate |
| 7 | Natural recovery, allow to weather naturally | 14 | Bioremediation   |

Table 10-15: Environmental Risks of Shoreline Protective and Preferred Clean-Up Method

| Protection/Clean-Up Options Method |  | Environmental Risks   | Likelihood Factor | Severity Factor | Residual Risk | Acceptability |
|------------------------------------|--|---|-------------------|-----------------|---------------|---------------|

### 10.4.7.2 Oil Spill Preparedness

If the Operational NEBA indicates shoreline clean-up would result in an overall benefit to the shorelines contacted by hydrocarbons, clean-up operations will aim to remove hydrocarbons from shorelines, to reduce the duration of exposure of sensitive shoreline biota and habitats to accumulated oil.

The priority coastal types for shoreline clean-up include sandy beaches, tidal mudflats and mangroves, and sites of cultural significance. Priority will be given to resourcing the shoreline clean-up response at known environmental sensitivities if a spill occurs during windows of increased ecological sensitivity (Table 2-2 of the OPEP), such as peak migratory periods for shorebirds and turtle nesting season.

The needs for a shoreline clean-up operation require capacity to respond to stranded oil in different phases: pre-cleaning areas of predicted oiling, removal of bulk oil, and polishing for final treatment, as described below:

- Pre-cleaning of beaches aims to minimise oiled waste by clearing debris from shorelines to well above the high tide mark, wherever safe and practicable to do so.
- Removal of bulk oil aims to recover as much of the hydrocarbon as expeditiously as possible to prevent remobilisation and secondary impacts to unaffected areas or those cleaned previously. It also has the environmental benefit of reducing the potential for hydrocarbon contact with wildlife.
- Polishing and final treatment aims at removing residual oil and stains.
- The need for polishing and final treatment would continue until the Shoreline Clean-Up termination criteria have been met, supported by relevant termination criteria from operational and scientific monitoring (e.g., IAP – sediment quality).

#### **Response Arrangements – Equipment**

Woodside maintains an *Oil Spill Equipment Directory* showing available and appropriate response equipment to perform shoreline clean-up techniques. The database includes internal, OSRO and AMSA equipment stockpiles, their respective locations, and is reviewed and updated on a quarterly basis. Shoreline clean-up operations will be preceded by shoreline assessments performed by SCAT teams. The SCAT teams will provide recommendations (and priorities) for the clean-up methods to be implemented. SCAT teams will consist of trained oil spill responders, who will have access to reference guides that can assist in their decision-making e.g., *Shoreline Operations Field Guide* (OSRL, 2015) and the *Oiled Shoreline Clean-Up Manual* (Cedre, 2013).

This information will be provided to the Woodside CIMT (Planning FST). The Planning FST will liaise with the Logistics and Operations FSTs on providing the various equipment and personnel to perform the clean-up operation. As shown in Table 10-12, mobilisation timeframes are compatible with the timeframes for expected hydrocarbons to contact shorelines (**Section 8.2.3**). The shoreline clean-up teams will remain onsite until the relevant termination criteria from the scientific monitoring response strategies (e.g., IAP – sediment quality) are achieved.

In addition to Woodside's resources, AMOSC has shoreline clean-up and decontamination kits that can be used in the first strike capability. The gap in the amount of equipment available to be used to establish additional staging areas and to perform clean-up operations can be closed by supplying through OSRL and existing supplier and logistical arrangements. Consumable equipment (e.g., rakes, shovels, PPE, waste bags) can be readily obtained from hardware/industrial suppliers and delivered to Exmouth to meet the arrival time of additional responders.

Mechanical equipment to support shoreline response includes bobcats, front end loaders, bulldozers, and other general civil and earthmoving equipment. This would primarily be used for transporting collected oil from the manual teams and transporting back to the staging/waste recovery area. This equipment can also be used for mechanical recovery and clean-up (where suitable). This will be sourced through arrangements with local and regional earthworks contractors initially, supplemented by larger earthmoving companies.

#### **Response Arrangements – Personnel**

Woodside has assessed personnel needs to meet the worst-case volume ashore for the OPEP. The assessment assumed a manual clean-up volume of 1 m<sup>3</sup> of oiled sediment per person per day (AMOSC), based on the industry standard to determine various effectiveness of removing the bulk oil. Actual shoreline clean-up rates will depend on factors such as the shoreline type, distribution of the hydrocarbon on the beach, debris, method used for clean-up, environmental conditions (weather) and logistical arrangements.

Woodside is planning a shoreline clean-up response matched to the consequence of a worst-case volume ashore. Arrangements are flexible and scalable in time to mobilise. Deterministic modelling has indicated the minimum time to contact of oil above the moderate exposure value of >100 g/m<sup>2</sup> is around five days at Exmouth. Woodside can mobilise its Burrup Response Team and AMOSC Core Group personnel within 24-48 hours to commence pre-impact clean-up activities (e.g., removal of beach debris to minimise oiled waste) at the key environmental sensitivities that may be impacted in this short timeframe. Should additional skilled personnel be required to fill team lead/supervisor roles may be sought via Woodside's OSRL contract and the National Response Team (NRT).

As described in Section 6.4 of the OPEP, if required, Woodside could initiate the deployment of labour-hire personnel to fill unskilled team member roles that may be required for shoreline clean-up and SCAT teams. Skilled personnel would be sourced from Woodside's Burrup Response Team, AMOSC Core Group, mutual aid, OSRL and NRT to supervise and lead clean-up and SCAT teams. All unskilled personnel would receive relevant on-the-job training prior to undertaking shoreline clean-up operations.

Shoreline protection operations will continue until the termination criteria for shoreline clean-up has been achieved.

### ***Logistical Constraints***

The following operational constraints limit the effectiveness of shoreline clean-up:

Accommodation: Availability of accommodation may be a constraint for the response. As detailed in **Section 11.10.7**, Woodside has analysed the accommodation availability and options to increase availability for responders. While Exmouth (and Onslow) has the potential to house a large influx of people, there are limitations on the amount of accommodation that would be deemed immediately suitable for a shoreline workforce being required to perform manual clean-up and other physical work. Woodside would work with the Local Government Authorities/providers to increase the availability of current accommodation in these locations and the alternative options referred to in **Section 11.10.7**.

Movement of personnel: Movement of personnel from their accommodation or transit point to the clean-up location can impact the effectiveness of the response. If the clean-up location requires a long commute, the amount of effectiveness from the shoreline crews diminishes as the amount of time spent in the actual operation is reduced.

Weather: Storms may impede actual operations on the day or access to certain locations due to flooding. Shoreline crews will need to work around tidal movements on the beaches. Clean-up activities will be arranged around tidal cycles.

Access to areas requiring shoreline clean-up: There is access to coastline around Exmouth using paved roads with 4WD access tracks to most beaches. Access to the nearshore islands would be via barge or small vessel.

### **10.4.7.3 Potential Environmental Impacts and Risks**

The physical clean-up activities associated with shoreline response strategy could result in trampling of shoreline habitats by response clean-up crew, heavy machinery and vessel anchoring, damaging shoreline habitats and emergent reef features and Aboriginal registered sites of cultural significance, flushing and pressure washing procedures, damaging habitats and altering beach profiles by removing or relocating sediment. The use of equipment, machinery and clean-up personnel in some coastal environments, such as mangroves and turtle and bird nesting beaches, could potentially cause more damage than the stranded hydrocarbons themselves, thereby reducing the recovery and net environmental benefit of the clean-up strategy. The presence of staging areas and camps for clean-up personnel, although relatively short-term, may disrupt normal behaviour of coastal species such as shorebirds and turtles, and could potentially interfere with nesting and feeding behaviours. Shoreline clean-up activities also present a risk of cross-contamination between oiled and non-oiled areas or further spreading of hydrocarbons.

### **10.4.7.4 Shoreline Clean-Up Environmental Performance**

**Table 10-16** provides the environmental performance outcomes, performance standards and measurement criteria for the Shoreline Clean-Up response strategy. The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

Table 10-16: Environmental Performance – Shoreline Clean-Up

| Shoreline Clean-up                 |   |   |                     |
|------------------------------------|---|---|---------------------|
| Environmental Performance Outcomes | To remove bulk and stranded hydrocarbons from shorelines and facilitate shoreline amenity habitat recovery. |   |                     |
| Response Strategy                  | Performance Standard  | Measurement Criteria (Section 10.4.12)  |                     |
| Response teams                     | 24.1  | In liaison with WA DoT (for Level 2/3 incidents), deployment of 1 shoreline clean-up team to each contaminated RPA comprised of: <ul style="list-style-type: none"> <li>• 1-2 trained specialists per operation</li> <li>• 8-10 personnel/labour hire</li> <li>• Personnel sourced through resource pool within 24 hours of predicted impact upon request from the IMT.</li> </ul>  | 1, 2, 3A, 3B, 3C, 4 |
|                                    | 24.2  | Relevant TRPs will be identified in the first strike plan for activation within 24 hours of operational monitoring predicting impacts.  | 1, 3A, 3C, 4        |
|                                    | 24.3  | Clean-up operations for shorelines in line with results and recommendations from SCAT outputs.  | 1, 3A, 3B           |
|                                    | 24.4  | All shorelines zoned and marked before clean-up operations commence to prevent secondary contamination and minimise the mixing of clean and oiled sediment and shoreline substrates.  | 1, 2, 3A, 3C, 4     |
|                                    | 24.5  | In liaison with WA DoT (for Level 2/3 incidents), mobilise and deploy 1 shoreline clean-up operation to each site where operational monitoring predicts an accumulation within 2 days of predicted impact.  |                     |
|                                    | 24.6  | The safety of shoreline response operations will be considered and appropriately managed. During shoreline clean-up operations: <ul style="list-style-type: none"> <li>• All personnel in a response will receive an operational/safety briefing before commencing operations</li> <li>• Gas monitoring and site entry protocols will be used to assess safety of an Operational Area before allowing access to response personnel</li> </ul> | 1, 3B, 4            |
|                                    | 24.7  | Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s).  | 1, 3A, 3B           |
| Response equipment                 | 25.1  | Contract in place with 3 <sup>rd</sup> party providers to access equipment.   | 1, 3A, 3C, 4        |
|                                    | 25.2  | Equipment mobilised from closest stockpile 2 days prior to predicted impact.  |                     |
|                                    | 25.3  | Supplementary equipment mobilised from State, AMOSC, AMSA stockpiles 2 days prior to predicted impact.  | 1, 3C, 3D, 4        |
|                                    | 25.4  | Supplementary equipment mobilised from OSRL 5 days prior to predicted impact.   |                     |

| Shoreline Clean-up                                       |      |   |   |
|--|------|---|---|
| Management of Environmental Impact of the response risks | 26.1 | If vessels are required for access, anchoring locations will be selected to minimise disturbance to benthic primary producer habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified. | 1 |
|  | 26.2 | Shallow draft vessels will be used to access remote shorelines to minimise the impacts associated with seabed disturbance on approach to the shorelines.  |   |
|  | 26.3 | Vehicular access will be restricted on dunes, turtle nesting beaches and in mangroves.  |   |
|  | 26.4 | Shoreline access route (foot, car, vessel and helicopter) with the least environmental impact identified will be selected by a specialist in SCAT operations.   |   |
|  | 26.5 | Removal of vegetation will be limited to moderately or heavily oiled vegetation.  |   |
|  | 26.6 | Oversight by trained personnel who are aware of the risks.  |   |
|  | 26.7 | Trained unit leaders brief personnel prior to operations of the environmental risks of presence of personnel on the shoreline.  |   |

#### 10.4.8 Spill Response: Natural Recovery

##### 10.4.8.1 Summary of Activity

Natural recovery, as the title suggests, uses the natural degradation and weathering processes to break down and remove surface oil and stranded hydrocarbons. Effectively, this response strategy means no direct action is taken other than to monitor and evaluate the oil spill trajectory, the rate of dispersion of the hydrocarbon, and the rate of habitat/community recovery. As such, no additional risks or impacts will occur, other than those described previously.

##### 10.4.9 Spill Response: Scientific Monitoring

A scientific monitoring program (SMP) would be activated following a Level 2 or 3 unplanned hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) for the entire predicted Environment that Maybe Affected (EMBA) and in particular, any identified Pre-emptive Baseline Areas (PBAs) for the credible spill scenarios or other identified unplanned hydrocarbon releases associated with the operational activities (refer to **Table 10-1**).

The outputs of the stochastic hydrocarbon spill modelling are used to assess the environmental risk, in terms of delineating which areas of the marine environment are predicted to be exposed to hydrocarbons exceeding environmental threshold concentrations (refer to **Table 8-9**). The summary of all the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA. The Petroleum Activities Program (PAP) worst-case credible spill scenarios (subsea LOWC and MDO spill from vessel collision) defines the EMBA and is the basis of the SMP approach presented in this section.

It should be noted that the resulting SMP receptor locations may differ from the Priority Protection Areas discussed in Appendix D of this document (Stybarrow Plug and Abandonment Oil Pollution Emergency Plan) due to the applicability of different hydrocarbon threshold levels. The SMP would be informed by the data collected via the operational monitoring program (OMP) studies, however, it differs from the OMP in being a long-term program independent of, and not directing, the operational oil spill response or monitoring of impacts from response activities (refer to **Section 10.4.2 – Monitor and Evaluate**, and **Appendix H – Environmental Monitoring Response Strategies**) for the operational monitoring overview.

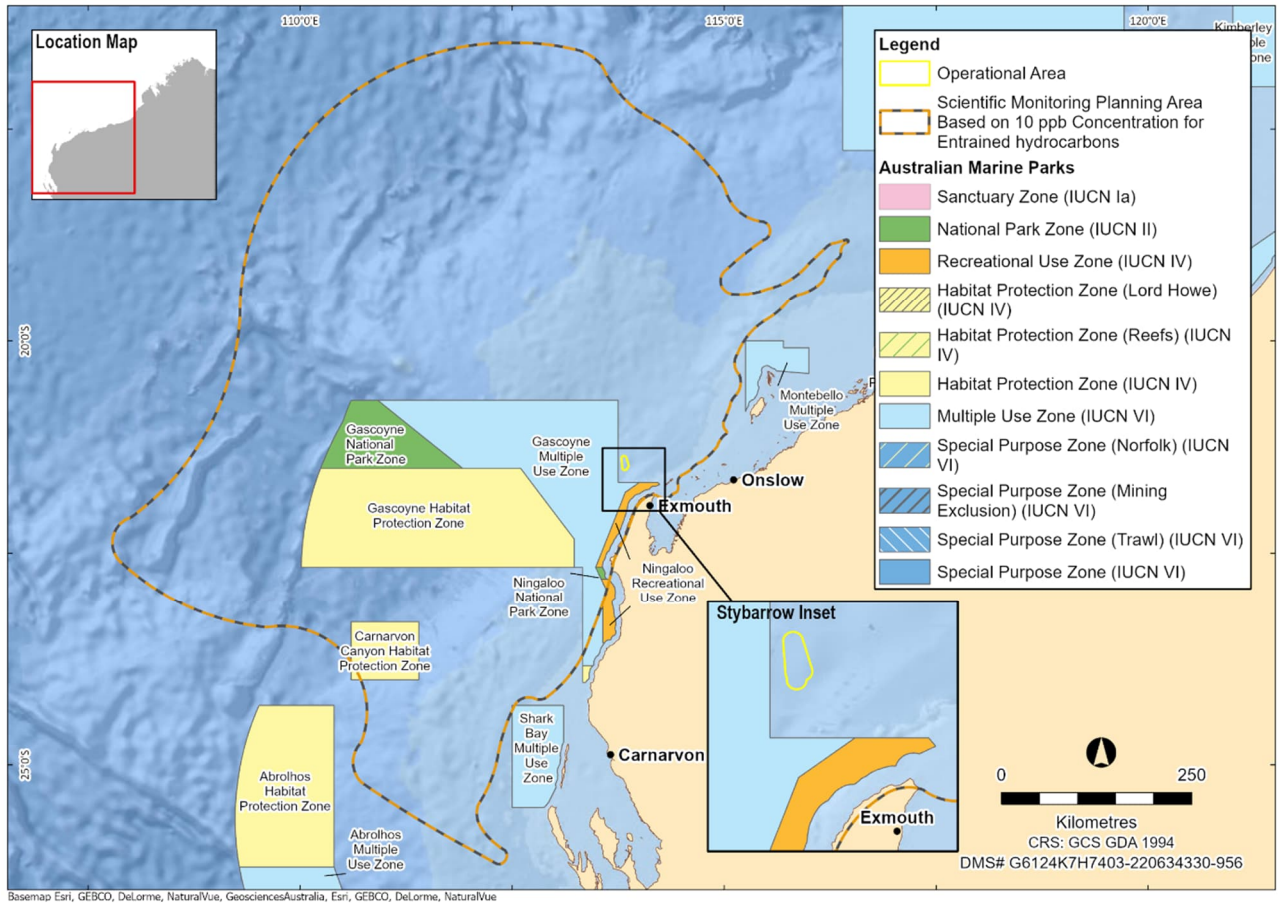

Key objectives of the Woodside oil spill scientific monitoring program are:

- Assess the extent, severity and persistence of the environmental impacts from the spill event; and
- Monitor subsequent recovery of impacted key species, habitats and ecosystems.

The SMP comprises ten targeted environmental monitoring programs to assess the condition of a range of physico-chemical (water and sediment) and biological (species and habitats) receptors including EPBC Act listed species, environmental values associated with protected areas and socio-economic values, such as fisheries. The ten SMPs are as follows:

- SM01 – Assessment of the presence, quantity and character of hydrocarbons in marine waters (linked to OM01 to OM03)
- SM02 – Assessment of the presence, quantity and character of hydrocarbons in marine sediments (linked to OM01 and OM05)
- SM03 – Assessment of impacts and recovery of subtidal and intertidal benthos
- SM04 – Assessment of impacts and recovery of mangroves/saltmarsh habitat
- SM05 – Assessment of impacts and recovery of seabird and shorebird populations
- SM06 – Assessment of impacts and recovery of nesting marine turtle populations
- SM07 – Assessment of impacts to pinniped colonies including haul-out site populations
- SM08 – Desktop assessment of impacts to other non-avian marine megafauna
- SM09 – Assessment of impacts and recovery of marine fish (linked to SM03)
- SM10 – Assessment of physiological impacts to important fish and shellfish species (fish health and seafood quality/safety) and recovery.

These SMPs have been designed to cover all key tropical and temperate habitats and species within Australian waters and broader, if required. A planning area for scientific monitoring is also identified to acknowledge potential hydrocarbon contact below the environmental threshold concentrations and beyond the EMBA. This planning area has been set with reference to the entrained low exposure value of 10 ppb detailed in the NOPSEMA Bulletin #1 Oil Spill Modelling (2019), and for this activity is shown in **Figure 10-1**.

**Figure 10-1: The planning area for scientific monitoring based on the area potentially contacted by the low (below ecological impact) entrained hydrocarbon threshold of 10 ppb in the event of the worst-case credible spill scenario.**

Please note that **Figure 10-1** represents the overall combined extent of the oil spill model outputs based on a total of 100 replicate simulations per season (winter, summer and transition) and therefore represents the largest spatial boundaries of the hydrocarbon spill combinations, not the spatial extent of a single hydrocarbon spill trajectory.

### 10.4.9.1 Scientific Monitoring Deployment Considerations

Table 10-17: Scientific monitoring deployment considerations

| Scientific Monitoring Deployment Considerations  |  |
|--|--|
| Existing baseline studies for sensitive receptor locations predicted to be affected by a spill | <p>Pre-emptive Baseline Areas (PBAs) of the following two categories:</p> <ul style="list-style-type: none"> <li> <b>PBAs within the predicted &lt;10-day hydrocarbon contact time prediction</b> <p>As part of this assessment, a desktop review was conducted of available and appropriate baseline data for key receptors for locations (if any) that are potentially impacted within 10 days of a spill (based on the EMBA). Furthermore, the need to conduct baseline data collection to address data gaps and demonstrate spill response preparedness is assessed (refer to <b>Appendix H, Section 3</b>). In the scenario that baseline data needs are identified, planning for baseline data acquisition is typically commenced pre-PAP and the execution of studies undertaken considers receptor type, seasonality and temporal assessment requirements and location conditions.</p> </li> <li> <b>PBAs predicted &gt;10 days to hydrocarbon contact</b> <p>As part of this assessment, a desktop review is conducted of available and appropriate baseline data for key receptors for locations (if any) that are potentially impacted &gt;10 days' time of a hydrocarbon spill event and documented (refer to <b>Section 10.4.9.4</b>). In the event of a spill, the SMP activation (as per the Stybarrow Plug and Abandonment Oil Pollution First Strike Plan, <b>Appendix D, Annex A</b>) directs the SMP team to follow the steps outlined in the SMP Operational Plan. The steps include: the review of availability and type of existing baseline data, with reference to any Pre-emptive Baseline Areas (PBAs) identified as &gt;10 days to hydrocarbon contact as predicted by forecast modelling trajectories. Such information is used to identify response phase PBAs and plan for the activation of SMPs for pre-emptive (i.e., pre-hydrocarbon contact) baseline assessment.</p> </li> </ul> |
| Pre-emptive Baseline in the event of a spill   | Activation of SMPs in order to collect baseline data at sensitive receptor locations with predicted hydrocarbon contact time > 10 days (refer to <b>Section 10.4.9.4</b> ) and the process as documented in Appendix H, Section 2).  |
| Survey platform suitability and availability   | In the event of the SMP activation, suitable survey platforms are available and can support the range of equipment and data collection methodologies to be implemented in nearshore and offshore marine environments.  |
| Trained personnel to implement SMPs suitable and available.                                    | Access to trained personnel and the sampling equipment contracted for scientific monitoring via a dedicated scientific monitoring program standby contract.  |
| Met-ocean conditions   | <p>The following met-ocean conditions are the identified limits for implementing SMPs:</p> <ul style="list-style-type: none"> <li>Waves &lt;1 m for nearshore systems</li> <li>Waves &lt;1.5 m for offshore systems</li> <li>Winds &lt;20 knots</li> <li>Daylight operations only</li> </ul> <p>SMP implementation will be planned and managed according to HSE risk reviews and the met-ocean conditions on a day to day basis by SMP operations.</p>   |

### 10.4.9.2 Response Planning Assumptions

Table 10-18: Scientific monitoring response planning assumptions

| Response Planning Assumptions     |  |
|-----------------------------------|--|
| Pre-emptive Baseline Areas (PBAs) | <p>Pre-emptive Baseline Areas (PBAs) identified through the application of defined hydrocarbon impact thresholds during the Quantitative Spill Risk Assessment process and a consideration of the minimum time to contact at receptor locations fall into two categories:</p> <ul style="list-style-type: none"> <li>PBAs for which baseline data exist or are planned for and data collection may commence</li> </ul> |

| Response Planning Assumptions |  |
|-------------------------------|--|
|                               | <p>pre-PAP (for locations identified as ≤ 10 days minimum time to contact).</p> <ul style="list-style-type: none"> <li>• PBAs (for locations &gt; 10 days minimum time to contact) for which baseline data may be collected in the event of an unplanned hydrocarbon release. In the event of a spill, response phase PBAs are prioritized based on vulnerability (i.e. time to contact and environmental sensitivity) to potential impacts from hydrocarbon contact and an identified need to acquire baseline data.</li> </ul> <p>Time to hydrocarbon contact of &gt;10 days has been identified as a minimum timeframe within which it is feasible to plan and mobilise applicable SMPs and commence collection of baseline (pre-hydrocarbon contact) data, in the event of an unplanned hydrocarbon release from the activity.</p> <p>The PBAs for Stybarrow Plug and Abandonment are identified and listed in <b>Appendix H, Table H-4</b>. The listed PBAs, together with the situational awareness (provided by the operational monitoring) are the basis for the response phase SMP planning and implementation.</p>   |
| Pre-Spill                     | <p><b>Activity:</b> Stybarrow Plug and Abandonment</p> <p>The worst case credible scenarios of hydrocarbon release for the activity have identified the following<sup>38</sup>:</p> <ul style="list-style-type: none"> <li>• Commonwealth marine environment</li> <li>• Ningaloo Coast<sup>39</sup></li> <li>• Muiron Islands<sup>40</sup></li> <li>• Barrow, Montebello and Lowendal Island groups (including State Marine Parks and Management Areas)</li> <li>• Southern Pilbara Island group</li> <li>• Rankin Bank.</li> </ul> <p>Refer to <b>Appendix H, Table H-5</b> – baseline data available.</p> <p>Australian Marine Parks (AMPs) potentially affected includes:</p> <ul style="list-style-type: none"> <li>• Gascoyne AMP</li> <li>• Ningaloo AMP</li> <li>• Carnarvon AMP</li> </ul> <p>All the Australian Marine Parks (AMPs) are located in offshore waters where hydrocarbon exposure is possible from floating hydrocarbons (on surface waters) and in the upper water column (0-20 m depth range, approximately).</p>   |
| In the Event of a Spill       | <p>Receptor locations with &gt;10 days to hydrocarbon contact, as well as the wider area, will be investigated and identified by the SMP team (in the Environment Unit of the ICC) as the spill event unfolds and as the situational awareness provided by the OMPs permits delineation of the spill affected area (for example, updates to the spill trajectory tracking).</p> <p>To address the initial focus in a response phase SMP planning situation, receptor locations predicted to be contacted between &gt;10 days have been identified as follows:</p> <ul style="list-style-type: none"> <li>• Shark Bay (AMP, WHA and State Marine Park) including the barrier islands of Bernier and Dorre.</li> </ul> <p>The unfolding spill affected area predictions and confirmation of appropriate baseline data will determine the selection of receptor locations and SMPs to be activated in order to gather pre-emptive (pre-hydrocarbon contact) data. Refer to Appendix H, Section 2 for further details on the process for scientific monitoring plan implementation and delivery. The timing of SMP activation and mobilisation of the individual SMPs to undertake data collection will be decided and documented by the Woodside SMP team following the process outlined in the SMP Operational Plan.</p> <p>In the event key receptors within geographic locations potentially impacted after 10 days (following a spill event or commencement of the spill), a response phase SMP effort to</p> |

<sup>38</sup> In the absence of minimum time to contact modelling results for entrained hydrocarbons a precautionary approach to the Pre-spill and in the event of a spill description of sensitive receptor location contacted by hydrocarbons is presented.

<sup>39</sup> Ningaloo Coast includes the WHA, State Marine Park

<sup>40</sup> Muiron Islands includes the WHA and State Marine Management Area

| Response Planning Assumptions |  |
|-------------------------------|--|
|                               | <p>collect baseline data would be addressed. SMP planning would assess where adequate and appropriate baseline data are not available and a response phase effort to collect baseline data for the following purposes:</p> <ul style="list-style-type: none"> <li>• Priority will be given to the collection of baseline data for receptors predicted to be within the spill affected area prior to hydrocarbon contact. The process is initiated with the investigation of available baseline and time to hydrocarbon contact (&gt;10 days which is sufficient time to mobilise SMP teams and acquire data before hydrocarbon contact). With reference to Stybarrow Plug and Abandonment, priority would be focused on the Ningaloo Coast, south of the predicted minimum time to contact locations.</li> <li>• Highly sensitive and/or valued habitats and communities in coastal waters will be prioritised for pre-emptive baseline surveys over open water areas of AMPs.</li> </ul> <p>Collection of baseline data for receptors predicted to be outside the spill affected area so reference datasets for comparative analysis with impacted receptor types can be assessed post-spill.</p> |
| Baseline Data                 | <ul style="list-style-type: none"> <li>• A summary of the spill affected area and receptor locations as defined by the EMBA for the worse case credible spill scenarios is presented in Stybarrow Plug and Abandonment EP.</li> <li>• The key receptors at risk by location and corresponding SMPs based on the EMBA for the PAP are presented in ANNEX D, Table D-1, as per the worse case credible spill event scenarios. This matrix maps the receptors at risk with their location and the applicable SMPs that may be triggered in the event of a Level two or three hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors. Receptor locations and applicable SMPs are colour coded to highlight possible time to contact based on receptor types and locations.</li> </ul> <p>The status of baseline studies relevant to the PAP are tracked by Woodside through the maintenance of a SMP Environmental Baseline Database, as well as accessing external databases such as the Department of Water and Environmental Regulation (WA) Index of Marine Surveys for Assessment (IMSA)[1] (refer to ANNEX C).</p>                            |

### 10.4.9.3 Summary – Scientific Monitoring

The resulting scientific monitoring capability has been assessed against the PAP worst case credible spill scenarios. The SMP assessment provides for a range of strategies and an ongoing approach to monitoring the response and operations to assess and evaluate the scale and extent of impacts. All known reasonably practicable control measures have been adopted with the cost and organisational complexity of these options determined to be moderate and the overall delivery effectiveness determined to be medium. The SMP's main objectives can be met, with no additional, alternative or improved control measures providing further benefit.

### 10.4.9.4 Response Planning: Need, Capability and Gap – Scientific Monitoring

The receptor locations identified in **Appendix H, Table H-4** provide the basis of the SMPs likely to be selected and activated. Once the Woodside SMP Delivery team and Standby SMP contractor have been stood up and the exact nature and scale of the spill becomes known, the SMPs to be activated will be confirmed as per the process set out in the SMP Operational Plan.

#### Scope of SMP Operations in the event of a hydrocarbon spill

Receptor locations of interest for the SMP during the response phase are:

- Ningaloo Coast
- Muiron Islands
- Ningaloo AMP
- Gascoyne AMP
- Carnarvon AMP

[1] <https://biocollect.ala.org.au/imsa#max%3D20%26sort%3DdateCreatedSort>

- Shark Bay AMP

Documented baseline studies are available for certain sensitive receptor locations including the Ningaloo Coast and Muiron Islands (**Appendix H, Table H-5**). The SMP approach in the response phase would still deploy SMP teams to maximise the opportunity to collect pre-emptive baseline data at sensitive receptor locations, i.e., the sections of the Ningaloo Coast not immediately contacted to hydrocarbons. As the exact locations where hydrocarbon contact occurs may be unpredictable, SM01 would be mobilised as a priority to be able to detect hydrocarbons and track the leading edge of the spill to verify where hydrocarbon contact occurs which will assist with where SMP resources are a priority need to obtain pre-emptive baseline data.

The option analysis in **Appendix H** considers ways to reduce the gap by considering alternate, additional, and/or improved control measures on each selected response strategy.

### **Cultural Heritage**

Monitoring of the potential impacts to cultural heritage sites due to Level 2/3 hydrocarbon spills or spill response activities shall be coordinated by the Woodside First Nations Relations team. This team will work with indigenous groups and relevant authorities (WA DoT, WA Department of Planning, Lands and Heritage) to identify, protect and monitor cultural heritage sites to meet the requirements of the *WA Aboriginal Heritage Act (1972)*. The Woodside Heritage team will form a sub-team within the Woodside CIMT Planning FST. Information from this team will be provided to the Environment Coordinator to be integrated into the daily IAP and NEBA assessments.

Woodside has procedures for managing cultural heritage sites that cover:

- the process for engaging with indigenous groups
- access to recorded heritage sites
- barriers to protect heritage sites
- the process for discovering new heritage sites
- management of information associated with cultural heritage sites which include protocols that restrict access to this information
- the approvals process for land disturbance in relation to cultural heritage sites
- reporting on incidents of unapproved access or disturbance of cultural heritage sites.

Woodside seeks to consult with the relevant indigenous groups and will apply for approval from the relevant authority if sites are vulnerable to disturbances from spill response activities. These approvals manage and enforce conditions associated with oil spill response activities and ensure compliance to cultural heritage commitments and regulatory requirements. These procedures provide the mechanism for Woodside heritage specialists to provide technical and professional advice regarding cultural heritage management of sites, including monitoring and protection requirements, to ensure compliance with legislation and relevant heritage protocols and agreements.

| <b>Scientific Monitoring</b> |   |
|------------------------------|---|
| <b>Initiation Criteria</b>   | Refer to individual monitoring programs outlined in <b>Appendix H, Table H-3</b> .  |
| <b>Activation Time</b>       | Within two hours of forming the IMT.  |
| <b>Resources</b>             | Pre-approved vendors for environmental monitoring services.<br>Logistics contractor (located in Exmouth) available to Woodside via existing contracts.<br>Vessels available to Woodside via existing marine contracts.<br>Vessels of opportunity available on local charter market in Exmouth or Onslow |
| <b>Termination Criteria</b>  | Refer to individual monitoring programs outlined in <b>Appendix H, Table H-3</b> .  |

### **10.4.9.5 Oil Spill Preparedness**

The resource capacity and ongoing scalability in the preparedness for environmental monitoring is outlined in Appendix G. Woodside maintains a list of pre-approved vendors who can be called upon at short notice to provide environmental monitoring services in the event of an oil spill.

Woodside's scientific monitoring contractor provides monthly assurance on the availability of suitably qualified personnel via the SMP resourcing register. The status of the relevant contracts is also verified quarterly as part of the Hydrocarbon Spill Preparedness 'Internal Control Environment' (ICE) assurance process. SMP arrangements are tested annually.

#### **Potential Environmental Impacts and Risks**

Environmental monitoring will be labour intensive and involve deploying vessels, equipment and personnel. Environmental monitoring activities may also result in impacts to cultural heritage sites and shoreline habitats and fauna, such as damage to intertidal, shoreline and emergent features from trampling by monitoring personnel and grounding/anchoring of monitoring vessels, and disturbance to fauna causing distress and/or changes in behaviour.

#### **10.4.9.6 Scientific Monitoring Environmental Performance**

**Table 10-19** provides the environmental performance outcomes, performance standards and measurement criteria for the Scientific Monitoring response strategy. The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

Table 10-19: Environmental Performance – Scientific Monitoring

| Scientific Monitoring  |   |   |
|--|---|---|
| Environmental Performance Outcome  | Woodside can demonstrate preparedness to stand up the SMP to quantitatively assess and report on the extent, severity, persistence and recovery of sensitive receptors impacted from the spill event.   |   |
| Control measure  | Performance Standard  | Measurement Criteria  |
| Woodside has an established and dedicated SMP team comprising the Environmental Science Team and additional Environment Advisers within the HSE Function.  | 27.1 SMP team comprises a pool of competent Environment Advisers (stand up personnel) who receive training regarding the SMP, SMP activation and implementation of the SMP on an annual basis   | <ul style="list-style-type: none"> <li>• Training materials</li> <li>• Training attendance registers</li> <li>• Process that maps minimum qualification and experience with key SMP role competency and a tracker to manage availability of competent people for the SMP team including redundancy and rostering</li> </ul>   |
| <ul style="list-style-type: none"> <li>• Woodside has a contracted SMP service provider to supply scientific personnel and equipment to implement the SMPs. The service will resource a base capability of one team per SMP (SM01-SM10), see <b>Appendix H, Table H-2</b> and as detailed in Woodside's SMP standby contractor Implementation Plan. The availability of relevant personnel is reported to Woodside on a monthly basis via a simple report on the base-loading availability of suitable people for each of the SMPs comprising field work for data collection (SMP resourcing report register).</li> <li>• In the event of a spill and the SMP is activated, the base-loading availability of scientific personnel will be provided by the SMP standby contractor for the individual SMPs and where gaps in resources are identified, the SMP standby contractor and Woodside will seek additional personnel (if needed) from other sources including Woodside's Environmental Services Panel.</li> </ul> | 28.1 Woodside maintains the capability to mobilise personnel required to conduct scientific monitoring programs SM01 – SM10 (except desktop based SM08): <ul style="list-style-type: none"> <li>• Personnel are sourced through the existing standby contract with SMP standby contractor, as detailed within the SMP Implementation Plan.</li> <li>• Scientific Monitoring Program Implementation Plan describes the process for standing up and implementing the scientific monitoring programs.</li> <li>• SMP team stand up personnel receive training regarding the stand up, activation and implementation of the SMP on an annual basis</li> </ul> | <ul style="list-style-type: none"> <li>• Hydrocarbon Spill Preparedness (HSP) Internal Control Environment tracks the quarterly review of the Oil Spill Contracts</li> <li>• SMP resource report of personnel availability provided by SMP contractor on monthly basis (SMP resourcing report register).</li> <li>• Training materials</li> <li>• Training attendance registers</li> <li>• Competency criteria for SMP roles</li> <li>• SMP annual arrangement testing and reporting</li> </ul> |

### 10.4.10 Spill Response: Oiled Wildlife Response

**Note:** the WA DoT is the Control Agency and DBCA is the Jurisdictional Authority and lead organisation (under DoT) for oiled wildlife response (OWR) within WA State waters. Woodside and AMSA are the Control Agencies for oiled wildlife response within Commonwealth waters from facility and vessel spills respectively.

#### 10.4.10.1 Summary of Activity

Oiled wildlife response (OWR) includes wildlife surveillance/ reconnaissance, wildlife hazing, pre-emptive capture, and the capture, cleaning, treatment, and rehabilitation of animals that have been oiled. In addition, it includes the collection, post-mortem examination, and disposal of deceased animals that have succumbed to the effects of oiling.

For a petroleum activity spill in Commonwealth waters, Woodside is required to take the role of Control Agency and will be responsible for the wildlife response. In such circumstances, Woodside would implement a response in accordance with the Oiled Wildlife Operational Plan, the WA Oiled Wildlife Response Plan (WAOWRP) (DBCA, 2022a) and the WA OWR Manual (DBCA, 2022b). The Oiled Wildlife Operational Plan includes the process for the IMT to mobilise resources depending on the nature and scale of the spill. Oiled wildlife operations would be implemented with advice and assistance from the Oiled Wildlife Advisor from the Department of Biodiversity, Conservation and Attractions (DBCA).

| Oiled Wildlife Response     |  |
|-----------------------------|--|
| <b>Initiation Criteria</b>  | Operational monitoring shows wildlife are contacted or are predicted to be contacted by a spill.   |
| <b>Activation Time</b>      | Within two hours of forming the IMT.   |
| <b>Resources</b>            | Oiled wildlife response equipment and trained personnel available via AMOSC, Mutual Aid and OSRL.<br>Logistics contractor (located in Exmouth) available to Woodside via existing contracts.<br>Vessels available to Woodside via existing marine contracts.<br>Vessels of opportunity available on local charter market in Exmouth or Onslow. |
| <b>Termination Criteria</b> | Oiling of wildlife has not been observed over a 48-hour period.<br>Oiled wildlife has been successfully rehabilitated.<br>Agreement is reached with Jurisdictional Authorities and stakeholders to terminate the incident response.  |

#### 10.4.10.2 Potential Environmental Impacts and Risks

OWR will require support vessels, aircraft, trained personnel and a suitable oiled wildlife facility for cleaning and aftercare treatment of oiled wildlife.

Potential risks and impacts from implementing the OWR include:

- Non-oiled fauna may be accidentally driven into surface oil slicks or impacted shorelines during hazing and pre-emptive capture activities, resulting in increased numbers of oiled wildlife.
- During hazing and pre-emptive capture activities, oiled fauna may be accidentally driven into surface oil slicks or impacted shorelines rather than away from oil.
- Inappropriate equipment and capture techniques may result in distress, fatigue, injury, death, or the separation of faunal groups (adult/juvenile pairs).
- Inadequate or inappropriate cleaning and husbandry techniques and conditions may result in distress, disease, injury, or death.
- Captured wildlife may be released to inappropriate relocation areas.
- Responding safely and efficiently to oiled wildlife.
- Protecting the health and welfare of wildlife threatened or impacted by oil.

- Coordinating field reconnaissance of at risk or impacted wildlife.
- Preventing or minimising exposure of wildlife to oil where possible.
- Recovering oiled wildlife safely and effectively.
- Prioritising the treatment of species of conservation value when resources are limited.
- Establishing an effective system for the treatment and rehabilitation of oiled wildlife.
- Releasing wildlife back into the wild as healthy, contributing members of a population.
- Identifying and removing dead oiled wildlife from the coastal environment.

### 10.4.10.3 Oil Spill Preparedness

The key plan for OWR in WA is the WAOWRP (DBCA, 2022a). The WAOWRP establishes the framework for preparing and responding to potential or actual wildlife impacts during a spill and sets out the management arrangements for implementing an OWR in conjunction with the DoT *State Hazard Plan – Maritime Environmental Emergencies* (SHP-MEE). It is the responsibility of DBCA to administer the WAOWRP under the direction of the DoT. The WA OWR Manual (DBCA, 2022b) supports, and should be used in conjunction with, the WAOWRP. The purpose of the WA OWR Manual is to standardise the operating procedures, protocols and processes for an OWR during a spill event in WA waters, and to create alignment between the wildlife response processes and the overall incident response (DBCA, 2022b).

If a spill occurs in WA State waters or enters State waters, DBCA is the Jurisdictional Authority for wildlife, and for level 2/3 spills, will also lead the oiled wildlife response under the control of the DoT. DBCA is the State Government agency responsible for administering the *Biodiversity Conservation Act 2016 (BC Act)*, which has provisions for authorising activities that affect wildlife.

For level 1 spills in State waters, Woodside is required to take the role of Control Agency, including for wildlife response. It is, however, also an expectation for level 2/3 petroleum activity spills, Woodside will conduct the initial first-strike response actions for wildlife response and continue to manage those operations until DBCA is activated as the lead agency for wildlife response and formal handover occurs. Following formal handover, Woodside will function as a support organisation for the OWR and will be expected to continue to provide planning and resources as required.

Woodside retains specialist personnel to support and manage oiled wildlife operations, including trained and competent responders for deployment in Exmouth and Dampier. Additional personnel would be sourced through Woodside's arrangements to support an oiled wildlife response as required.

French-McCay et al. (2002), based on a review of existing literature at the time, determined lethal thresholds for floating and shoreline oil for the external coating of wildlife to be 10 g/m<sup>2</sup> for floating, and 100 g/m<sup>2</sup> for shoreline accumulation. It should however be noted toxicity thresholds for wildlife are likely to be highly variable due to differences in species sensitivity, type of hydrocarbon, type of exposure (ingestion or external oiling), life-stage, and on-water versus land habitat.

For planning purposes, determination of wildlife priority protection areas is based on stochastic modelling of the worst-case spill scenarios at 10 g/m<sup>2</sup> for floating, and 100 g/m<sup>2</sup> for shoreline accumulation (acknowledging impacts to wildlife may occur at lower concentrations), the known presence of wildlife, and in consideration of the following:

- Presence of high densities of wildlife, threatened species, and/or endemic species with high site fidelity
- Greatest probability of shoreline accumulation
- Shortest timeframe to contact

**Table 10-20** outlines the wildlife response priority areas for this activity. At the time of a spill, identification and allocation of wildlife response priority areas should also take into consideration any key biological activities. Additional detail regarding species and their key biological activities within the vicinity of the activity are described in Section 4 of the Environment Plan.

For WA, the Pilbara and Kimberley Regional Oiled Wildlife Plans (DBCA [formerly Department of Parks and Wildlife], 2014) provide useful information relating to wildlife priority response areas in their respective regions.

Table 10-20: Wildlife priority protection areas

| Protection Priority                         | Wildlife   |
|---|--|
| Barrow Island, Boodie Island, Middle Island | <ul style="list-style-type: none"> <li>• Turtles</li> <li>• Regionally and nationally significant green (western side) and flatback turtle (eastern side)</li> <li>• Foraging and nesting areas around Barrow Island for green, flatback and hawksbill; mating flatback turtles.</li> <li>• Green turtle nesting: All year round (peak Dec-Jan)</li> <li>• Hawksbill turtle nesting: Oct-Jan</li> <li>• Flatback turtles: Dec-Jan</li> <li>• Loggerhead nesting: Dec-Jan</li> <li>• John Wayne Beach, logger heads + hawksbill (low density)</li> <li>• Turtle Bay is an important turtle aggregation and feeding area</li> <li>• Birds</li> <li>• Migratory birds (important habitat): Sept – Feb</li> <li>• Double Island has important bird nesting sites (shearwaters and sea eagles)</li> </ul> |
| Exmouth                                     | <ul style="list-style-type: none"> <li>• Turtle nesting</li> <li>• Loggerhead (Endangered) site</li> <li>• Significant Green turtle (Vulnerable) nesting site</li> <li>• Low density Hawksbill nesting (Vulnerable)</li> <li>• Nesting and breeding Nov to Mar with peak in late Dec/early Jan</li> <li>• Birds</li> <li>• Seabird nesting: Sep-Feb</li> <li>• Marine mammals</li> <li>• Pygmy blue whale (Vulnerable)</li> <li>• Migration: Apr-Aug</li> <li>• Dugongs (Marine/ migratory) (breeding and foraging)</li> </ul>   |
| Muiron Islands                              | <ul style="list-style-type: none"> <li>• Turtles</li> <li>• Turtle nesting: <ul style="list-style-type: none"> <li>• Major loggerhead (Endangered) site</li> <li>• Significant Green turtle (Vulnerable)</li> <li>• Low density Hawksbill nesting (Vulnerable)</li> <li>• Turtle nesting and breeding Nov to Mar with peak in late Dec/early Jan</li> <li>• Occasional Flatback (Vulnerable) presence</li> </ul> </li> <li>• Birds</li> <li>• Seabird nesting: Sep-Feb</li> <li>• Marine mammals</li> <li>• Humpback whale migration: peak between June –Aug</li> </ul>  |
| Montebello Islands                          | <ul style="list-style-type: none"> <li>• Turtles</li> <li>• Loggerhead (Endangered)</li> <li>• Green (Vulnerable) (significant rookeries)</li> <li>• Hawksbill (Vulnerable)</li> <li>• Flatback (Vulnerable) turtles</li> </ul>  |

| Protection Priority       | Wildlife   |
|---------------------------|--|
|                           | <ul style="list-style-type: none"> <li>• Turtle nesting and breeding Nov – Mar with peak in late Dec/early Jan</li> <li>• Birds</li> <li>• Significant migratory shorebirds foraging and resting</li> <li>• Seabirds significant nesting: Sep – Feb</li> <li>• Marine mammals</li> <li>• Pygmy blue whale migration (Vulnerable): Apr to Aug</li> <li>• Humpback whale migration area: peak June – Aug</li> </ul>  |
| Thevenard Island          | <ul style="list-style-type: none"> <li>• Turtles</li> <li>• Green turtles (significant rookeries)</li> <li>• Hawksbill</li> <li>• Flatback turtles</li> <li>• Turtle nesting and breeding Nov to Mar with peak in late Dec/ early Jan (Hawksbill turtles – all year nesting)</li> <li>• Birds</li> <li>• Migratory seabirds</li> <li>• Significant nesting: Sept – Feb</li> <li>• Foraging and resting areas</li> <li>• Marine mammals</li> <li>• Humpback whales migration: June – Oct</li> <li>• Southern right whale</li> <li>• Indo-Pacific humpback dolphin</li> <li>• Dugongs</li> </ul> |
| Flat Island<br>Fly Island | <ul style="list-style-type: none"> <li>• Turtles</li> <li>• Green turtles</li> <li>• Turtle nesting and breeding Nov – Mar</li> <li>• Birds</li> <li>• Seabird nesting: Sep – Feb</li> <li>• Marine mammals</li> <li>• Dugong</li> <li>• Indo-Pacific humpback dolphin</li> </ul>  |

Further preparatory measures for OWR include determining the potential magnitude of wildlife impacted for the worst-case spill scenario. Spills that result in no shoreline contact are likely to result in limited opportunities to rescue wildlife given the behaviour and distribution of wildlife in the marine environment. Under these circumstances the focus of the OWR would be on continued wildlife reconnaissance. Conversely, spills that result in shoreline accumulation are likely to result in greater impacts to wildlife and more opportunities for rescue. Using the WAOWRP guide for rating the wildlife impact of an oil spill (DBCA and DoT, 2022a), and stochastic modelling for the worst-case spill scenarios, it is predicted that high wildlife impacts may occur.

**Table 10-21: WAOWRP guide for rating wildlife impact of an oil spill (DBCA and DoT, 2022a)**

| Wildlife Impact Rating   | Low      | Medium         | High         |
|--|----------|----------------|--------------|
| What is the likely duration of the wildlife response?  | < 3 days | 3-10 days      | >10 days     |
| What is the likely total intake of animals?  | < 10     | 11-25          | >25          |
| What is the likely daily intake of animals?  | 0-2      | 2 to 5         | >5           |
| Are threatened species, or species protected by treaty, likely to be impacted, either directly or by pollution of habitat or breeding areas? | No       | Yes – possible | Yes – likely |
| Is there likely to be a requirement for building primary care facility for treatment, cleaning and rehabilitation?                           | No       | Yes – possible | Yes – likely |

### **Response Arrangements**

Where there is imminent or actual impact to wildlife, Woodside will activate the Wildlife Division and follow the oiled wildlife incident management framework and implementation plan outlined in the Woodside *Oiled Wildlife Operational Plan*.

In Commonwealth waters, Woodside will be responsible for the planning and implementation of the OWR in its entirety. In comparison to the shoreline, there are likely to be less wildlife impacted by an oil spill and limited opportunities to rescue wildlife, given the distribution and behaviour of animals in the open marine environment. At sea, continued wildlife reconnaissance, carcass recovery, sampling of carcasses that cannot be retrieved, and integration with scientific monitoring are more likely to be the focus of the OWR.

In State waters, Woodside will conduct the initial first-strike response actions for wildlife and continue to manage those operations until DBCA is activated as the lead agency for wildlife response and formal handover occurs. Following formal handover, Woodside will function as a support organisation for the OWR and will be expected to continue to provide planning and resources as required.

If a protracted response is likely, requiring preventative actions and/or wildlife rescue, and formal hand over to the Control Agency (in State waters) has not yet occurred, the Wildlife Division will be responsible for the development of the Wildlife Division portion of the IAP. Preventative actions, such as hazing, along with capture, intake and treatment require a higher degree of planning, approval (licenses) and skills and will be planned for and carried out under the IAP as outlined in the *Oiled Wildlife Operational Plan* and in accordance with the WAOWRP (DBCA, 2022a) and WA OWR Manual (DBAC, 20022b).

The oiled wildlife response technique targets key wildlife populations at risk within Commonwealth open waters and the nearshore waters.

#### **10.4.10.4 Oiled Wildlife Response Environmental Performance**

**Table 10-22** provides the environmental performance outcomes, performance standards and measurement criteria for the Oiled Wildlife Response strategy.

The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with the response strategy are detailed above.

Table 10-22: Environmental Performance – Oiled Wildlife Response

| Oiled Wildlife Response                               |  |   |  |
|---|--|---|--|
| Environmental Performance Outcomes                    | Oiled Wildlife Response is conducted in accordance with the Western Australian Oiled Wildlife Response Plan (WAOWRP, 2022) to ensure it is conducted in accordance with legislative requirements to house, release or euthanise wildlife under the <i>Biodiversity Conservation Act 2016</i> . |   |  |
| Response Strategy                                     | Performance Standard   |   | Measurement Criteria (Section 10.4.12) |
| Wildlife response arrangements                        | 37.1   | Oiled Wildlife Operational Plan in place and utilised during a response to plan, coordinate, implement and terminate operations   | 1, 3A, 4                               |
|   | 37.2   | Initiate a wildlife first strike response within 24 hours of confirmed or imminent wildlife contact as directed by relevant Operational Monitoring techniques (OM01-05) and in liaison with DBCA  | 1                                      |
| Wildlife response equipment                           | 38.1   | Maintain contract with AMOSC for immediate access to oiled wildlife response equipment.   | 1, 3C, 3D, 4                           |
|   | 38.2   | Maintain contract with OSRL to access additional oiled wildlife response equipment.   | 1, 3C, 3D, 4                           |
| Wildlife responders                                   | 39.1   | Two Woodside Oiled Wildlife Team Members to supervise the oiled wildlife operations who have completed an Oiled Wildlife Response Management course.  | 1, 2, 3B                               |
|   | 39.2   | Maintain contract with AMOSC for immediate access to trained oiled wildlife response specialists  | 1, 3B, 3C                              |
|   | 39.3   | Maintain contract with OSRL to access additional trained oiled wildlife response specialists  | 1, 3B, 3C                              |
|   | 39.4   | Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s).  | 1, 3A, 3B                              |
| Management of environmental impacts of response risks | 40.1   | Oiled wildlife operations (including hazing) would be implemented with advice and assistance from the Oiled Wildlife Advisor from the DBCA, and in accordance with the processes and methodologies described in the WA OWRP and the relevant regional plan. | 1                                      |

### 10.4.11 Spill Response – Waste Management

#### 10.4.11.1 Summary of Activity

During an oil spill clean-up, the disposal of waste material must not pose any threat to the health and safety of people or the environment and must be carried out in accordance with relevant State legislation. The type and amount of waste generated will depend on the spill itself and its location. It is important to note that the volumes of oily waste recovered from shorelines may be significantly greater than the volume of oil spilled. Typical waste volumes generated will be influenced by a bulking factor of 1:10 through shoreline clean-up activities as there will be an increase of waste volume generation due to collection of sand and detritus from the high-water mark and surrounding environment.

Woodside have a waste management contractor who can collect, transport, treat and dispose of oil wastes generated by a hydrocarbon release and implemented response strategies.

| Waste Management     |  |
|----------------------|--|
| Initiation Criteria  | Response activities that will be generating waste have been initiated.   |
| Activation Time      | Within two hours of forming the IMT.   |
| Resources            | Waste Service Provider and Logistics contractor available to Woodside via existing contracts.  |
| Termination Criteria | All waste generated from the oil spill response has been stored, transported and disposed as per the regulatory requirements.<br>Agreement is reached with Jurisdictional Authority to terminate the response. |

#### 10.4.11.2 Potential Environmental Impacts and Risks

During an oil spill clean-up, the disposal of waste material must not pose any threat to the health and safety of people or the environment and must be performed in accordance with relevant State legislation. The type and amount of waste generated will depend on the spill itself and its location.

**Table 10-23** identifies the types of waste likely to be generated from shoreline or oiled wildlife response (OWR) operations.

**Table 10-23: Response strategies and their effect on waste generation**

| Response Strategy  | Effect on Waste Stream  | Type of Waste Generated  |
|--------------------|---|--|
| Shoreline clean-up | The type of spilled oil will often have a profound effect on the amount of oily waste generated.<br>Waste segregation and minimisation techniques are critical to ensure an efficient operation. These should be established at the initial recovery site and maintained right through to the final disposal site otherwise waste volumes will spiral out of control.<br>Waste sites should be managed in such a way as to prevent secondary pollution. | <ul style="list-style-type: none"> <li>Oiled equipment</li> <li>Oiled PPE</li> <li>Recovered oil</li> <li>Oiled vegetation</li> <li>Oily water</li> <li>Oiled sorbent materials</li> <li>Oiled beach material, sand</li> <li>Oiled flotsam and jetsam</li> </ul> |
| OWR                |   | <ul style="list-style-type: none"> <li>Oiled water</li> <li>Oiled personal protective equipment and consumables</li> <li>Animal carcasses</li> <li>Medical supplies</li> </ul>   |

For any spill likely to produce significant amounts of waste, a Waste Management Plan will be developed to ensure:

- oily waste is properly handled and stored
- oil and oily debris are adequately segregated, treated and stored at the point of collection
- oil and oily debris are rapidly collected and taken to designated sites for storage, treatment or disposal
- treatment or disposal practices ensure the waste poses no future threat to the environment.

In addition, the Waste Management Plan will identify how waste volumes will be minimised (**Table 10-24**)

**Table 10-24: Waste Management Hierarchy**

| Hierarchy | Description  |
|-----------|--|
| Reduction | Efficient response strategies selected for oil spill clean-up to ensure the minimum material is used and/or contaminated during the process. |

| Hierarchy | Description   |
|-----------|---|
| Reuse     | This is the reuse of an item for its original purpose; e.g., clean-up equipment should be cleaned and reused in place of disposable items. An example might be cleaning personal protective equipment so it can be reused.  |
| Recovery  | This is the production of marketable product for waste, such as taking waste oil to a refinery for conversion into other useable products. This will be directly affected by the quality of the recovered product; e.g., highly contaminated material is less likely to be suitable for recycling.                      |
| Refuse    | Refuse is the final and least desirable option. If none of the above methods can be performed for whatever reasons, the waste must be disposed of effectively through some means. This may be the case for highly mixed wastes of oils, plastics, organic debris, water, sediments and others that cannot be separated. |

The basis for such a Waste Management Plan will include a demonstration of:

- **Temporary on-site waste storage** – Care will be taken in selecting a location for a temporary waste handling base to allow for waste separation. Local authorities and waste management contractors will be consulted regarding the selection of suitable disposal routes, local regulations and may provide local facilities.
- **Segregation of waste** – Wherever possible, wastes will be segregated in accordance with the preferred segregation. It may be required to separate oil from associated water, sediment and debris, in order to minimise volumes. It is preferable this is not attempted on the spill site.
- **Onsite handling** – Attention will be given to preventing leaching or spillage of oil from vehicles or containers. Onsite handling equipment will be arranged by Woodside.
- **Offsite transport and storage** – Only State-licenced waste contractors will be used. Care will be taken that all vessels, vehicles or containers used for transporting oily wastes are effectively sealed and leak proof.
- **Waste treatment and disposal options** – The disposal method most appropriate in an incident will depend on several factors, including the nature and consistency of the waste, the availability of suitable sites and facilities, the costs involved and regulatory restrictions.
- **Waste separation** – Waste separation is usually performed offsite at a designated waste processing area.
- **Disposal** – Waste must be disposed of in accordance with State regulations.
- **Establishment of a field decontamination facility** – The size and complexity of field decontamination facilities required will depend on the character of the oil and the scale and nature of the clean-up being implemented.

### **Monitoring and Reporting of Waste**

The Logistics Coordinator will be responsible for maintaining a Waste Management Register for all waste generated. The designated Waste Contractor will monitor, measure and record all waste streams that are disposed of onshore.

Measurement required by Waste Contractor Conditions include without limitation:

- types of waste collected (such as liquid oily waste)
- quantities of types of wastes collected (such as tonnes, litre)
- destination of waste collated (named authorised disposal facility)
- method of waste disposal (such as landfill, recycling)
- quantity of recyclable waste by type.

The Logistics FST will ensure adequate waste disposal records are being maintained by the Waste Contractor, and that the Waste Reference Number for all waste is communicated to the Logistics Coordinator for updating the Waste Management Register once waste is disposed.

Waste management reporting will comply with relevant local and national waste reporting requirements e.g. Environmental Protection (Controlled Waste) Regulations 2004

In addition to reporting all waste generated from a spill event, it will also be tracked upon mobilising the Waste Contractor using the Controlled Waste Tracking System (CWTS). This is an online user system provided by DBCA to enable electronic tracking of controlled waste loads across the state. Upon request, DBCA generates user profiles that enable access to components of the CWTS specific to waste generators, carriers and/or waste disposal sites (treatment plants) and enable them to complete their statutory obligations online.

#### 10.4.11.3 Oil Spill Preparedness

Woodside's waste management contractor provides and maintains Woodside's Oil Spill Response Waste Management Operational Plan. This plan outlines the contractor's capabilities and capacity to deal with an oil spill scenario from Woodside activities. Woodside has arrangements in place with its waste management contractor for providing waste management services during a spill incident.

Woodside's waste management contractor has and continues to perform various emergency response tasks involving a wide range of hazardous materials. Hydrocarbon spills comprise most of the emergency response tasks, and the contractor has a wealth of experience in this area. In addition to a range of waste bin collection vehicles and trailer and tanker transport, it operates a fleet of vacuum-loading heavy vehicles, with capacities ranging from 3,000 to 25,000 L.

#### 10.4.11.4 Waste Management Environmental Performance

**Table 10-25** provides the environmental performance outcomes, performance standards and measurement criteria for the Waste Management response strategy. The initiation criteria, course of action, resources, supporting documentation and termination criteria associated with each response strategy are detailed above.

**Table 10-25: Environmental Performance – Waste Management**

| Waste Management                   |  |   |   |
|------------------------------------|--|---|---|
| Environmental Performance Outcomes | To minimise further impacts, waste will be managed, tracked and disposed of in accordance with laws and regulations. |   |   |
| Response Strategy                  | Performance Standard   |   | Measurement Criteria<br>(Section 10.4.12) |
| Waste management                   | 41.1   | Contract with waste management services for transport, removal, treatment and disposal of waste.  | 1, 3A, 3B, 3C, 4                          |
|                                    | 41.2   | Access to at least 200 m <sup>3</sup> of solid and liquid waste storage available within 5 days upon activation of 3 <sup>rd</sup> party contract, if required. |   |
|                                    | 41.3   | Access to 1000 m <sup>3</sup> waste storage capacity by day 7 (CS-01).  |   |
|                                    | 41.4   | Recovered hydrocarbons and wastes will be transferred to licensed treatment facility for reprocessing or disposal.  |   |
|                                    | 41.5   | Teams will segregate liquid and solid wastes at the earliest opportunity.   |   |
|                                    | 41.6   | Waste management provider support staff available year-round to assist in the event of an incident with waste management as detailed in contract.               |   |
|                                    | 41.7   | Open communication line to be maintained between IMT and waste management services to ensure the reliable flow of accurate information between parties.         | 1, 3A, 3B                                 |

| Waste Management |      |  |                  |
|------------------|------|--|------------------|
|                  | 41.8 | Waste management to be conducted in accordance with Australian laws and regulations. | 1, 3A, 3B, 3C, 4 |
|                  | 41.9 | Waste management services available and employed during response.                    |                  |

#### 10.4.12 Incident Management System

The Incident Management System is both a control measure and a measurement criterion. As a control measure the IMS function is to prompt, facilitate and record the completion of three key response planning processes detailed below. As a measurement criterion, the IMS records the evidence of the timeliness of all response actions included in the environmental performance standards and the plans used of the activity.

As the IMS does not directly remove hydrocarbons spilt into the marine environment there is no direct relationship to the response planning need.

##### 10.4.12.1 Incident action planning

The CIMT will be required to collect and interpret information from the scene of the incident to determine support requirements to the site based IMT, develop an IAP and assist the IMT with the execution of that plan. The site-based IC may request the CIMT to complete notifications internally within Woodside, to persons/ organisations and government agencies as required. Depending on the type and scale of the incident either the CIMT Duty Manager (DM) or IC will be responsible for ensuring the development of the IAP. Incident Action Planning is an ongoing process that involves continual review to ensure techniques to control the incident are appropriate to the situation at the time.

##### 10.4.12.2 Operational NEBA process

In the event of a response Woodside will confirm the response techniques adopted at the time of EP/OPEP acceptance remain appropriate to reduce the consequences of the spill. This process verifies there is a continuing net environmental benefit associated with continuing the response technique through the operational NEBA process. This process manages the environmental risks and impacts of response techniques during the spill response, an operational NEBA will be undertaken throughout the response, for each operational period.

The operational NEBA will consider the risks and benefits of conducting and response activity. For example, if vessels are required for access to nearshore or onshore areas, anchoring locations will be selected to minimise disturbance to benthic habitats. Vessel cleanliness would be commensurate with the receiving environment. The operational NEBA will consider the risks and benefits of conducting other response techniques.

The operational NEBA process is also used to terminate a response. Using data from operational and scientific monitoring activities the response to a hydrocarbon spill will be terminated in accordance with the termination process outlined in the OPEA. In effect the operational NEBA will determine whether there is net environmental benefit to continue response operations.

##### 10.4.12.3 Consultation engagement process

Woodside will ensure persons/ organisations are engaged during the spill response in accordance with internal standards. This process requires that Woodside will:

- Undertake all required notifications (including government notifications) for persons/ organisations in the region (identified in the FSP). This includes notification to mariners to communicate navigational hazards introduced through response equipment and personnel.
- Identify and engage with relevant persons/ organisations and continually assess and review.

## 10.4.12.4 Environmental performance based on need

Table 10-26: Environmental Performance – Incident Management System

| Incident Management System                 |  |   |  |
|--|--|---|--|
| Environmental Performance Outcomes         | To support the effectiveness of all other control measures and monitor/record the performance levels achieved. |   |  |
| Response Strategy                          | Performance Standard   |   | Measurement Criteria (Section 10.4.12) |
| Operational SIMA                           | 42.1   | Confirm that the response strategies adopted at the time of acceptance remain appropriate to reduce the consequences of the spill within 24 hours.  | 1, 3A                                  |
|  | 42.2   | Record the evidence and justification for any deviation from the planned response activities.   |  |
|  | 42.3   | Record the information and data from operational and scientific monitoring activities used to inform the SIMA.  |  |
| Stakeholder engagement                     | 43.1   | Prompt and record all notifications (including government notifications) for persons/ organisations in the region are made.   |  |
|  | 43.2   | In the event of a response, identification of relevant persons/ organisations will be re-assessed throughout the response period.   |  |
|  | 43.3   | Undertake communications in accordance with: <ul style="list-style-type: none"> <li>• Woodside Crisis Management Functional Support Team Guideline – Reputation</li> <li>• External Communication and Continuous Disclosure Procedure</li> </ul> External Stakeholder Engagement Procedure  |  |
| Personnel required to support any response | 44.1   | Action planning is an ongoing process that involves continual review to ensure strategies to control the incident are appropriate to the situation at the time.   | 1, 2, 3B, 3C, 4                        |
|  | 44.2   | A duty roster of trained and competent people will be maintained to ensure that minimum manning requirements are met all year round.  |  |
|  | 44.3   | Immediately activate the IMT with personnel filling one or more of the following roles: <ul style="list-style-type: none"> <li>• Operations Duty Manager</li> <li>• Operations Coordinator</li> <li>• Deputy Operations Coordinator</li> <li>• Planning Coordinator</li> <li>• Logistics (materials, aviation, marine and support positions)</li> <li>• Management Support</li> <li>• Health and Safety Advisor</li> <li>• Environment Duty Manage</li> </ul> |  |

| Incident Management System |  |                 |
|----------------------------|--|-----------------|
|                            | <ul style="list-style-type: none"> <li>• People Coordinator</li> <li>• Public Information Coordinator</li> <li>• Intelligence Coordinator</li> </ul> Finance Coordinator.            |                 |
| 44.4                       | Collect and interpret information from the scene of the incident to determine support requirements to the site-based IMT, develop an IAP and assist with the execution of that plan. |                 |
| 44.5                       | S&EM advisors will be integrated into CIMT to monitor performance of all functional roles.   |                 |
| 44.6                       | Continually communicate the status of the spill and support Woodside to determine the most appropriate response by delivering on the responsibilities of their role.                 |                 |
| 44.7                       | Follow the OPEA, Operational Plans, FSPs, support plans and the IAPs developed.  | 1, 2, 3A, 4     |
| 44.8                       | Contribute to Woodside's response in accordance with the aims and objectives set by the Duty Manager.  | 1, 2, 3B, 3C, 4 |

#### 10.4.13 Spill Response: Measurement Criteria for all response techniques

Woodside ensures compliance with environmental performance outcomes and standards through four primary mechanisms. The performance tables aforementioned identify which of these four mechanisms monitors the readiness and records the effectiveness and performance of the control measures adopted.

##### 1. The Incident Management System

The Incident Management System (IMS) supports the implementation of the Emergency & Crisis Management Procedure. The IMS provides a near real-time, single source of information for monitoring and recording an incident and measuring the performance of those control measures.

The Emergency & Crisis Management Procedure defines the management framework, including roles and responsibilities, to be applied to any size incident (including hydrocarbon spills). The organisational structure required to manage an incident is developed in a modular fashion and is based on the specific requirements of each incident. The structure can be scaled up or down.

The IAP process formally documents and communicates the:

- incident objectives
- status of assets
- operational period objectives
- response techniques (defined during response planning)
- the effectiveness of response techniques

The information captured in the IMS (including information from personal logs and assigned tasks/close outs) confirms the response techniques implemented remain appropriate to reduce the consequences of the spill. The system also records all information and data that can be used to support the site-based IMT, development and the execution of the IAP.

##### 2. The Security & Emergency Management Competency Dashboard

The Security and Emergency Management (S&EM) competency dashboard records the number of trained and competent responders that are available across Woodside, and some external providers, to participate in

a response.

This number varies depending on expiry of competency certificates, staff attrition, internal rotations, leave and other absences. As such the Dashboard is designed to identify the minimum manning requirements and to identify sufficient redundancy to cater for the variances listed above.

**Figure 10-2** shows the minimum manning numbers for the different hydrocarbon spill response roles and the number of qualified persons against those roles.

Woodside’s pool of trained responders is composed of but not limited to personnel from the following organisations:

- Woodside internal
- AMOSC core group
- AMOSC
- OSRL
- Marine Spill Response Corporation (MSRC)
- AMSA
- Woodside contracted workforce

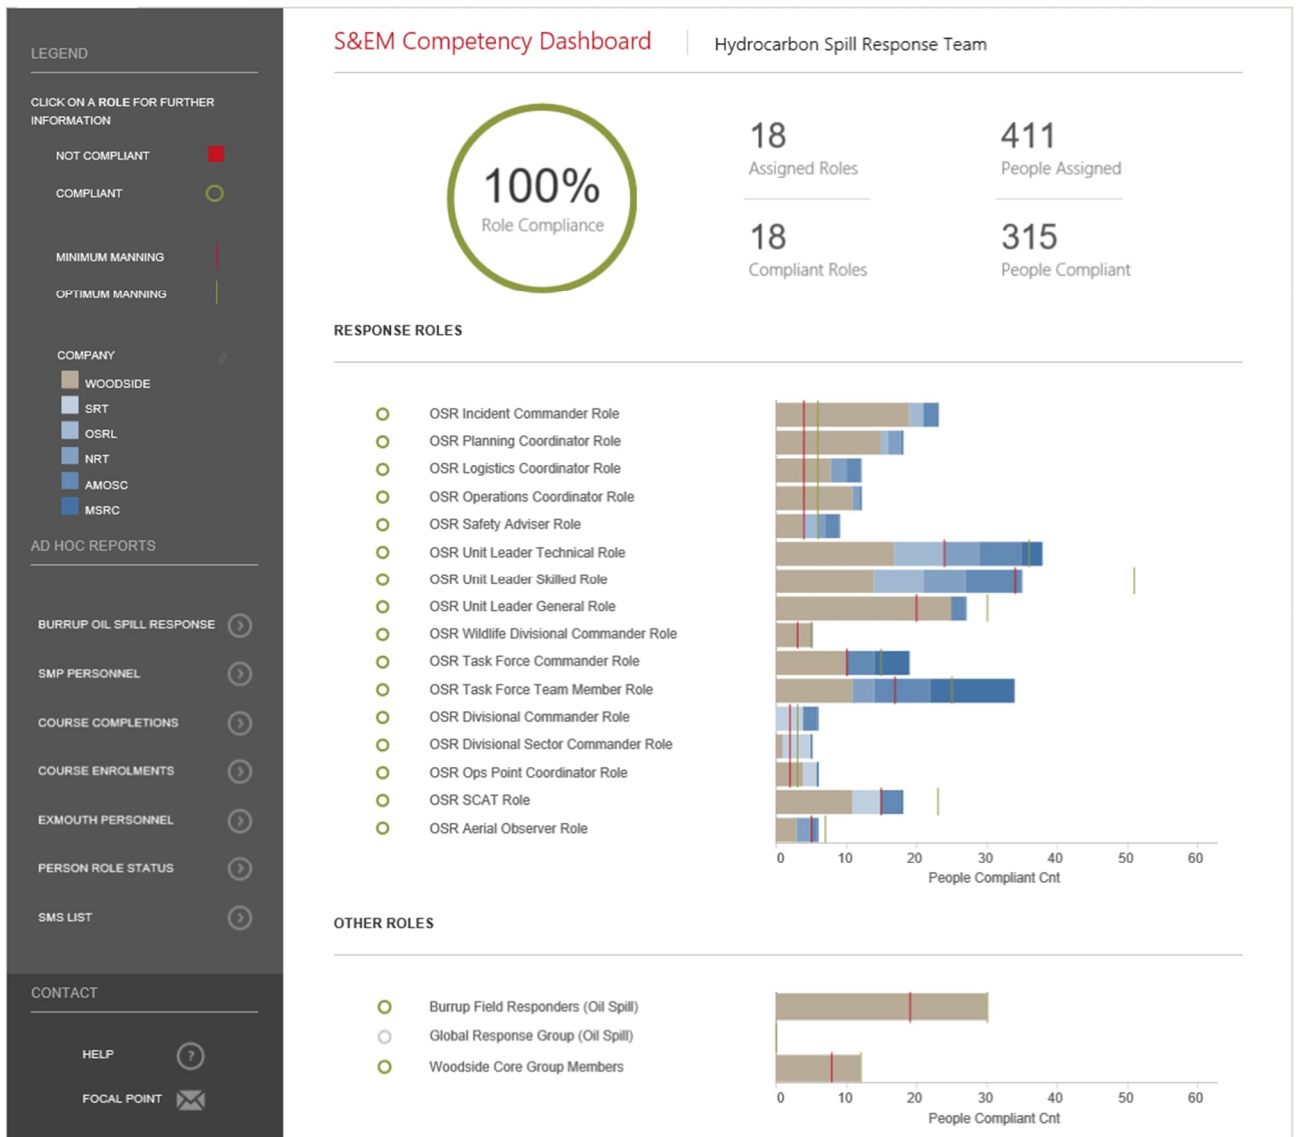

Figure 10-2: Example screen shot of the Hydrocarbon Spill Preparedness competency dashboard

The Dashboard is one of Woodside’s key means of monitoring its readiness to respond. It also shows Woodside can meet the requirements of the environmental performance standard that relate to filling certain response roles.

Figure 10-3 shows a deeper dive into the Operations Point Coordinator role and the training modules required to show competence.

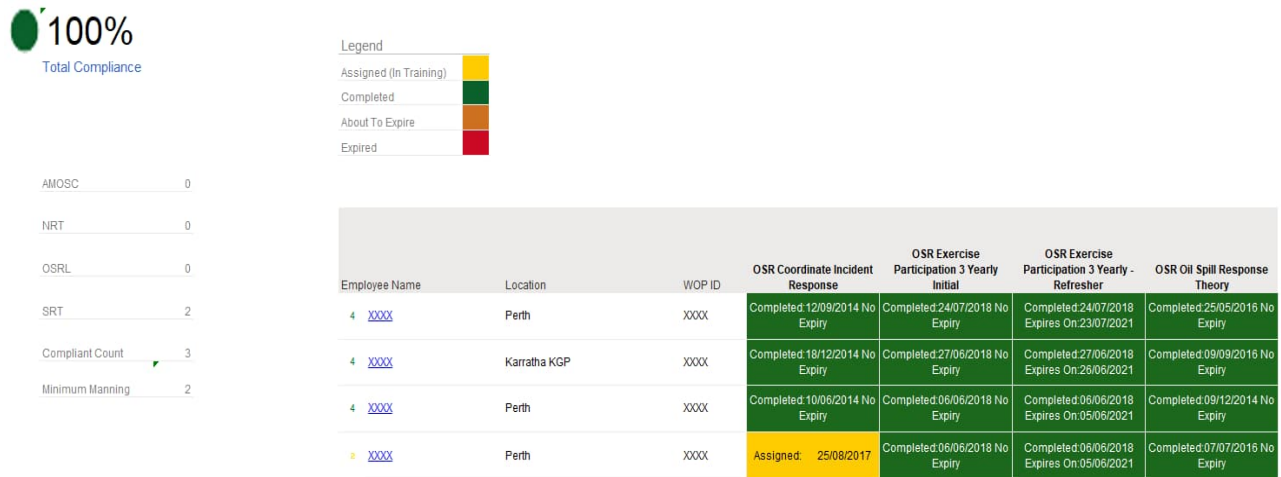

Figure 10-3: Example screen shot for the Operations Point Coordinator role

### 3. The Hydrocarbon Spill Preparedness ICE Assurance Process

The Hydrocarbon Spill Response Team has developed a Hydrocarbon Spill Preparedness and Response Internal Control Environment (ICE) process to align and feed into the Woodside Management System Assurance process for hydrocarbon spill. The process tracks compliance over four key control areas:

- A. **Plans** – Ensures all plans (including: OPEA, FSPs, operational plans, support plans and TRPs) are current and in line with regulatory and internal requirements.
- B. **Competency** – Ensures the competency dashboard is up to date and there are the minimum competency numbers across ICC, CMT and hydrocarbon spill response roles. The hydrocarbon spill training plan and exercise schedule, including testing of arrangements is also tracked. The Testing of Arrangements (TOA) register tracks the testing of all hydrocarbon spill response arrangements, key contracts and agreements in place with internal and external parties to ensure compliance.
- C. **Capability** – Tracks and monitors capability that could be required in a hydrocarbon incident, including but not limited to: integrated fleet<sup>41</sup> vessel schedule, dispersant availability, rig/vessels monitoring, equipment stockpiles, tracking buoy locations and the CIMT duty roster.
- D. **Compliance & Assurance** – Ensures all regulator inspection outcomes are actioned and closed out, the global legislation register is up to date and the key assurance components are tracked and managed. Assurance activities (including Audits) conducted on memberships with key Oil Spill Response Organisations (OSROs) including AMOSC and OSRL are also tracked and recorded in the ICE.

The ICE assurance process records how each commitment listed in the performance tables above is managed to ensure ongoing compliance monitoring. The level of compliance can be reviewed in real time and is reported on a monthly basis through the S&EM Function.

The completion of the assurance checks (over and above the ICE process) is also applied via the Woodside Integrated Risk & Compliance System (WiRCS) and subject to the requirements of Woodside’s Provide Assurance Procedure.

### 4. The Hydrocarbon Spill Preparedness and Response Procedure

This procedure sets out how to plan and prepare for a liquid hydrocarbon spill to the marine environment. (Note, this procedure does not apply to scenarios relating to gas releases in the marine environment).

<sup>41</sup> The Integrated fleet consists of vessels from multiple operators that have been contracted to Woodside to undertake a number of duties including hydrocarbon spill response

This procedure details the:

- Requirement for an OPEP to be developed, maintained, reviewed, and approved by appropriate regulators (where applicable) including:
- Defining how spill scenarios are developed on an activity specific basis;
- Developing and maintaining all hydrocarbon spill related plans;
- Ensuring the ongoing maintenance of training and competency for personnel;
- Developing the testing of spill response arrangements; and
- Maintaining access to identified equipment and personnel.
- Planning for hydrocarbon spill response preparedness
- Accountabilities for hydrocarbon spill response preparedness
- Spill training requirements
- Requirements for spill exercising / testing of spill response arrangements
- Spill equipment and services requirements.

The procedure also details the roles and responsibilities of the dedicated Woodside Hydrocarbon Spill Preparedness team. This team is responsible for:

- Assuring that Woodside hydrocarbon spill responders meet competency requirements.
- Establishing the competency requirements, annual training schedule and a training register of trained personnel.
- Establishing and maintaining the total numbers of trained personnel required to provide an effective response to any hydrocarbon spill incident.
- Ensuring equipment and services contracts are maintained
- Establishing OPEPs
- Establishing OPEAs
- Priority response receptor determination
- ALARP determination
- Ensuring compliance and assurance is undertaken in accordance with external and internal requirements.

## 10.5 Environmental Risk Assessment of Selected Response Techniques

The implementation of response techniques may modify the impacts and risks identified in the EP and response activities can introduce additional impacts and risks from response operations themselves. Therefore, it is necessary to complete an assessment to ensure these impacts and risks have been considered and specific measures are put in place to continually review and manage these further impacts and risks to ALARP and Acceptable levels. A simplified assessment process has been used to complete this task which covers the identification, analysis, evaluation and treatment of impacts and risks introduced by responding to the event.

### 10.5.1 Identification of impacts and risks from implementing response techniques

Each of the control measures can modify the impacts and risks identified in the EP. These impacts and risks have been previously assessed within the scope of the EP. Refer to Section 10.4 for details regarding how these risks are being managed. They are not discussed further in this section.

- atmospheric emissions
- routine and non-routine discharges
- physical presence, proximity to other vessels (shipping and fisheries)
- routine acoustic emissions vessels
- lighting for night work/navigational safety
- invasive marine species
- collision with marine fauna.

Additional impacts and risks associated with the control measures not included within Section 7 include:

- drill cuttings and drilling fluids environmental impact assessment for relief well drilling
- vessel operations and anchoring
- presence of personnel on the shoreline
- toxicity of dispersant
- vegetation cutting
- additional stress or injury caused to wildlife
- waste generation.

### 10.5.2 Analysis of impacts and risks from implementing response techniques

**Table 10-27** compares the adopted control measures for this activity against the environmental values that can be affected when they are implemented.

Table 10-27: Analysis of risks and impacts

|                                     | Environmental Value |                         |               |             |                    |         |                |
|-------------------------------------|---------------------|-------------------------|---------------|-------------|--------------------|---------|----------------|
|                                     | Soil & groundwater  | Marine sediment quality | Water quality | Air quality | Ecosystems/habitat | Species | Socio-economic |
| Monitor and evaluate                |                     | ✓                       | ✓             |             | ✓                  | ✓       |                |
| Source control                      |                     | ✓                       | ✓             | ✓           | ✓                  | ✓       | ✓              |
| Subsea dispersant injection         |                     | ✓                       | ✓             |             | ✓                  | ✓       | ✓              |
| Surface dispersant application      |                     |                         | ✓             |             | ✓                  | ✓       | ✓              |

### 10.5.3 Evaluation of impacts and risks from implementing response techniques

#### 10.5.3.1 Drill Cuttings and Drilling Fluids Environmental Impact Assessment for Relief Well Drilling

The identified potential impacts associated with the discharge of drill cuttings and fluids during a relief well drilling activity include a localised reduction in water and seabed sediment quality, and potential localised changes to benthic biota (habitats and communities).

A number of direct and indirect ecological impact pathways are identified for drill cuttings and drilling fluids as follows:

- temporary increase in total suspended solids (TSS) in the water column
- attenuation of light penetration as an indirect consequence of the elevation of TSS and the rate of sedimentation
- sediment deposition to the seabed leading to the alteration of the physio-chemical composition of sediments, and burial and potential smothering effects to sessile benthic biota
- potential contamination and toxicity effects to benthic and in-water biota from drilling fluids.

Potential impacts from the discharge of cuttings range from the complete burial of benthic biota in the immediate vicinity of the well site due to sediment deposition, smothering effects from raised sedimentation concentrations as a result of elevated TSS, changes to the physico-chemical properties of the seabed sediments (particle size distribution and potential for reduction in oxygen levels within the surface sediments due to organic matter degradation by aerobic bacteria) and subsequent changes to the composition of infauna communities to minor sediment loading above background and no associated ecological effects. Predicted impacts are generally confined to within a few hundred metres of the discharge point (International Association of Oil and Gas Producers 2016) (i.e. within the EMBA for a hydrocarbon spill event).

The discharge of drill cuttings and unrecoverable fluids from relief well drilling is expected to increase turbidity and TSS levels in the water column, leading to an increased sedimentation rate above ambient levels associated with the settlement of suspended sediment particles in close proximity to the seabed or below sea surface, depending on location of discharge. Cuttings with retained (unrecoverable) drilling fluids are discharged below the water line at the MODU location, resulting in drill cuttings and drilling fluids rapidly diluting, as they disperse and settle through the water column. The dispersion and fate of the cuttings is determined by particle size and density of the retained

(unrecoverable) drilling fluids, therefore, the sediment particles will primarily settle in proximity to the well locations with potential for localised spread downstream (depending on the speed of currents throughout the water column and seabed) (IOGP 2016). The finer particles will remain in suspension and will be transported further before settling on the seabed.

These conclusions were supported by discharge modelling which was undertaken by Woodside in support of the Greater Enfield Development EP. Modelling results indicating that the TSS plume of suspended cuttings will typically disperse to the south-west while oscillating with the tide and diminish rapidly with increasing distance from the well locations. Maximum TSS concentrations predicted for 100 m; 250 m and 1 km distances from the wellsite were 7, 5 and 1 mg/L, respectively. Furthermore, water column concentrations below 10 mg/L remain within 235 m of the discharge location for each modelled well. For all well discharge locations (outside of direct discharge sites), TSS concentration did not exceed 10 mg/l. Nelson et al. (2016) identified <10 mg/L as a no effect or sub-lethal minimal effect concentration.

The low sensitivity of the deep-water benthic communities/habitats within and in the vicinity of relief well locations, combined with the relatively low toxicity of water based muds (WBM) and non-water based muds (NWBM), there being no bulk discharges of NWBM and the highly localised nature and scale of predicted physical impacts to seabed biota, indicate that any localised impact would likely be of a slight magnitude (especially when considering the broader consequence of the loss of well containment event that a relief well drilling activity would be responding too).

### 10.5.3.2 Vessel Operations and Anchoring

During the implementation of response techniques, where water depths allow, it is possible that response vessels will be required to anchor (e.g. during shoreline surveys). The use of vessel anchoring will be minimal and likely to occur when the impacted shoreline is inaccessible via road. Anchoring in the nearshore environment of sensitive receptor locations will have the potential to impact coral reef, seagrass beds and other benthic communities in these areas. Recovery of benthic communities from anchor damage depends on the size of anchor and frequency of anchoring. Impacts would be highly localised (restricted to the footprint of the vessel anchor and chain) and temporary, with full recovery expected.

### 10.5.3.3 Presence of Personnel on the Shoreline

Presence of personnel on the shoreline during shoreline operations could potentially result in disturbance to wildlife and habitats. During the implementation of response techniques, it is possible that personnel may have minimal, localised impacts on habitats, wildlife and coastlines. The impacts associated with human presence on shorelines during shoreline surveys and response operations may include:

- damage to vegetation/habitat, especially in sensitive locations such as mangroves and turtle nesting beaches, to gain access to areas of shoreline oiling
- damage or disturbance to wildlife during shoreline surveys
- removal of surface layers of intertidal sediments (potential habitat depletion)
- excessive removal of substrate causing erosion and instability of localised areas of the shoreline
- compaction of sediments.

Any impacts are expected to be localised with full recovery expected.

### 10.5.3.4 Toxicity of Dispersants

The evaluation of the potential impacts to the receiving environment needs to consider not only the redistribution of hydrocarbons into the water column, but also the potential toxic nature of the dispersant applied and the toxicity effects of dispersed hydrocarbons.

The potential toxicity to the marine environment can be from the chemical/dispersant itself but also chemical dispersion of hydrocarbon can increase the concentration of toxic hydrocarbon compounds in the water column (Anderson et al 2014). Subtidal habitats and communities such as coral reefs, seagrass meadows, plankton, fish, known spawning grounds and periods of increased reproductive outputs (early life stages of fish and invertebrates i.e., meroplankton) are susceptible to toxic effects of chemically dispersed hydrocarbons.

### 10.5.3.5 Additional Stress or Injury Caused to Wildlife

Additional stress or injury to wildlife could be caused through the following phases of a response:

- capturing wildlife

- transporting wildlife
- stabilisation of wildlife
- cleaning and rinsing of oiled wildlife
- rehabilitation (e.g. diet, cage size, housing density)
- release of treated wildlife.

Inefficient capture techniques have the potential to cause undue stress, exhaustion or injury to wildlife, additionally pre-emptive capture could cause undue stress and impacts to wildlife when there are uncertainties in the forecast trajectory of the spill. During the transportation and stabilisation phases there is the potential for additional thermoregulation stress on captured wildlife. Additionally, during the cleaning process, it is important personnel undertaking the tasks are familiar with the relevant techniques to ensure that further injury and the removal of water proofing feathers are managed and mitigated. Finally, during the release phase it's important that wildlife is not released back into a contaminated environment.

### 10.5.3.6 Waste generation

Implementing the selected response techniques will result in the generation of the following waste streams that will require management and disposal:

- liquids (recovered oil/water mixture), recovered from shoreline clean-up operations and oiled wildlife response
- semi-solids/solids (oily solids), collected during shoreline clean-up operations and oiled wildlife response
- debris (e.g. seaweed, sand, woods, plastics), collected during shoreline clean-up operations and oiled wildlife response and oiled wildlife response.

If not managed and disposed of correctly, wastes generated during the response have the potential for secondary contamination similar to that described above, impacts to wildlife through contact with or ingestion of waste materials and contamination risks if not disposed of correctly onshore.

Cutting back vegetation prior to impact could minimise the amount of contaminated organic material and thus reduce the amount of oiled/hazardous waste to be handled. However, removal of vegetation also allows more extensive penetration of oil into the substrate and may lead to habitat loss. Any impacts are expected to be localised with full recovery expected.

### 10.5.4 Treatment of Impacts and Risks from Implementing Response Techniques

In respect of the impacts and risks assessed, the following treatment measures have been adopted as reflected in **Section 10.4**. It must be recognised that this environmental assessment is seeking to identify how to maintain the level of impact and risks at levels that are ALARP and of an acceptable level rather than exploring further impact and risk reduction. It is for this reason that the treatment measures identified in this assessment will be captured in Operational Plans, TRPs, and/or the FSP.

#### Vessel Operations and Access in the Nearshore Environment

- If vessels are required for access, anchoring locations will be selected to minimise disturbance to benthic primary producer habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified (Spill Response Performance Standard **(PS) 17.1, PS 20.1**).
- Shallow draft vessels will be used to access remote shorelines to minimise the impacts associated with seabed disturbance on approach to the shorelines (**PS 17.2, PS 20.2**).

#### Presence of Personnel on the Shoreline

- Vehicular access will be restricted on dunes, turtle nesting beaches and in mangroves (**PS 20.3**).
- Shoreline access route (foot, car, vessel and helicopter) with the least environmental impact identified will be selected by a specialist in SCAT operations (**PS 20.4**).
- Oversight by trained personnel who are aware of the risks (**PS 20.6**).
- Trained unit leaders brief personnel prior to operations of the environmental risks of presence of personnel on the shoreline (**PS 20.7**).

### Toxicity of Dispersants

- OSCA approved dispersants prioritised for surface and subsea use (PS 14.3).

### Additional Stress or Injury Caused to Wildlife

- Vessels used in hazing/pre-emptive capture will approach wildlife at slow speeds to ensure animals are not directed towards the hydrocarbons (PS 31.1).
- Oiled wildlife operations (including hazing) would be implemented with advice and assistance from the Oiled Wildlife Advisor from the DBCA and in accordance with the processes and methodologies described in the WA OWRP and the relevant regional plan (PS 32.2).

### Waste Generation

- All shorelines zoned and marked before clean-up operations commence to prevent secondary contamination and minimise the mixing of clean and oiled sediment and shoreline substrates (PS 18.4).
- Removal of vegetation will be limited to moderately or heavily oiled vegetation (PS 20.5)

## 10.6 Hydrocarbon Spill Response ALARP Assessment

### 10.6.1 Demonstration of ALARP

An analysis of alternative, additional and improved control measures has been undertaken to determine their reasonableness and practicability and is included in **Appendix E**. The tables document the considerations made in this evaluation. Where the costs of an alternative, additional, or improved control measure has been determined to be clearly disproportionate to the environmental benefit gained from its adoption it has been rejected. Where this is not considered to be the case, the control measure has been adopted.

The risks from a hydrocarbon spill have been reduced to ALARP because:

- Woodside has a significant hydrocarbon spill response capability to respond to the WCCS through the control measures identified
- new and modified impacts and risks associated with implementing response techniques have been considered and will not increase the risks associated with the activity
- a consideration of alternative, additional, and improved control measures identified any other control measures that delivered proportionate environmental benefit compared to the cost of adoption for this activity ensuring that:
  - all known, reasonably practicable control measures have been adopted
  - no additional, reasonably practicable alternative and/or improved control measures would provide further environmental benefit
  - no reasonably practical additional, alternative, and/or improved control measure exists.
- a structured process for considering alternative, additional, and improved control measures was completed for each control measure
- the evaluation was undertaken based on the outputs of the WCCS so that the capability in place is sufficient for all other scenarios from this activity
- the likelihood of the WCCS spill has been ignored in evaluating what was reasonably practicable

### 10.6.2 Demonstration of Acceptability

Following the ALARP evaluation process, Woodside considers the hydrocarbon spill risks and impacts to have been reduced to an acceptable level by meeting all of the following criteria:

- Techniques are consistent with Woodside's processes and relevant internal requirements including policies, culture, processes, standards, structures and systems.
- Levels of risk/ impact are deemed acceptable by relevant persons (external stakeholders) and are aligned with the uniqueness of, and/or the level of protection assigned to the environment, its sensitivity to pressures introduced by the activity, and the proximity of activities to sensitive receptors, and have been aligned with Part 3 of the EPBC Act.
- Selected control measures meet requirements of legislation and conventions to which Australia is a signatory

(e.g. International Convention for the Prevention of Pollution from Ships (MARPOL), the World Heritage Convention, the Ramsar Convention, and the Biodiversity Convention etc.). In addition to these, other non-legislative requirements met include:

- Australian IUCN reserve management principles for Commonwealth marine protected areas and bioregional marine plans
- National Water Quality Management Strategy and supporting guidelines for marine water quality)
- conditions of approval set under other legislation
- national and international requirements for managing pollution from ships
- national biosecurity requirements.

Industry standards, best practices and widely adopted standards and other published materials have been used and referenced when defining acceptable levels. Where these are inconsistent with mandatory/ legislative regulations, explanation has been provided for the proposed deviation. Any deviation produces the same or a better level of environmental performance (or outcome).

# 11 Implementation Strategy

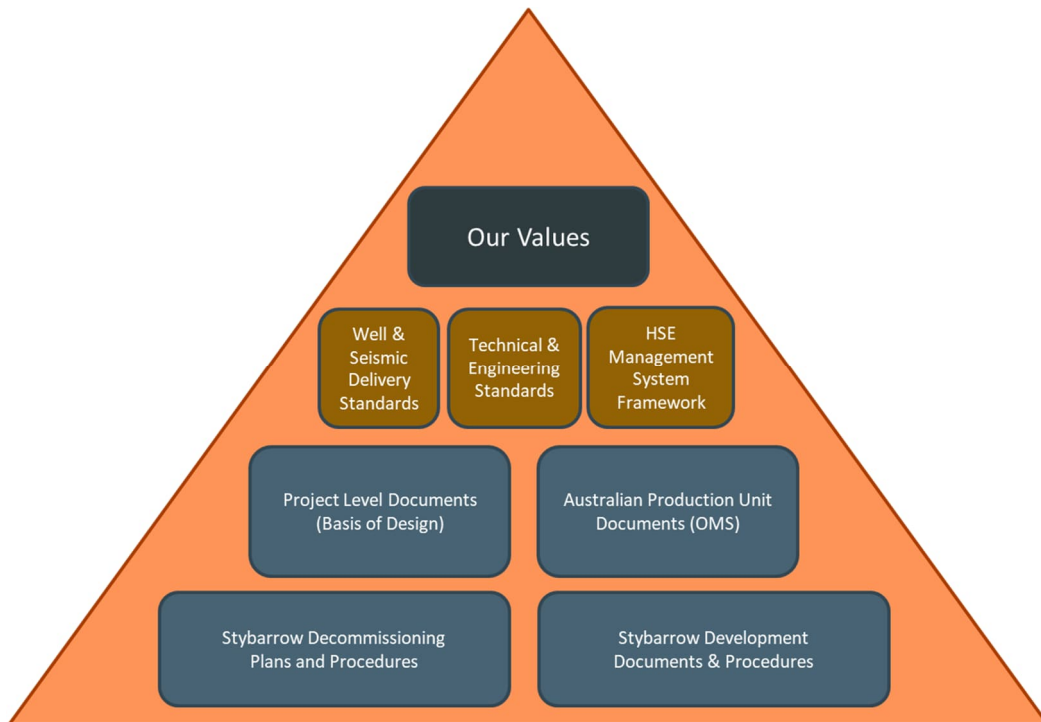

In accordance with Regulation 14 of the Environment Regulations, the EP must contain an implementation strategy for the activity and monitoring, recording and reporting arrangements. The implementation strategy presented in this section provides specific practices and procedures to ensure:

- all the environmental impacts and risks of the Petroleum Activity will be continually identified and reduced to a level that is ALARP
- control measures identified in the EP are effective in reducing the environmental impacts and risks of the activity to ALARP and acceptable levels
- environmental performance outcomes and environmental performance standards are met
- arrangements are in place to respond to and monitor impacts of oil pollution emergencies
- arrangements for ongoing consultation with relevant authorities, persons and organisations are in place and maintained through the activities.

## 11.1 Systems, Practices and Procedures

### 11.1.1 Woodside PetDW HSE Management System

The Woodside PetDW HSE Management System defines the boundaries within which all activities are conducted. It provides a structured framework to set common requirements, boundaries, expectations, governance and assurance for all activities. It also supports accountabilities and responsibilities as defined in the organisational structure. The overarching objective of the Woodside PetDW HSE Management System is to aspire to zero harm to people, communities and the environment, and achieve leading industry practice. The structure of the Woodside HSE Management System is hierarchical (Figure 11-1).

**Figure 11-1: Woodside HSE Management System**

The documents referred to in Figure 11-1 address specific areas (for example, corporate performance reporting, risk management, incident investigation) where it is important activities are conducted consistently across the organisation.

The top level of the triangle shown in Figure 11-1 is the Our Values; a copy of Our Values is provided in Appendix A. Our Values details Woodside’s values and directs the approach to all activities in Woodside. It includes value statements on each of sustainability, integrity, respect, performance, simplicity and accountability. It also provides a means of aligning Woodside’s values with strategic direction and measures of success.

The Woodside Our Requirements detail and define business planning, risk management, and assurance expectations of key process areas. They also serve as audit protocol against which all groups in Woodside are assessed. Categories of Our Requirements include (for example): HSE, Human Resources, Legal, Corporate Affairs, Supply, and Information Management.

Direction for environmental performance in Woodside is established by the Environment and Climate Change – Our Requirements. The Stybarrow P&A drilling activities will be undertaken in accordance with the objectives of Our Values, which includes compliance or exceedance with regulatory requirements, setting of objectives and targets and continual improvement.

This EP has been designed to meet the environmental aspects of the Woodside PetDW HSE Management System framework and establishes the foundation for continual improvement through the application, monitoring and auditing of consistent requirements across all aspects of the Petroleum Activity including;

- Identification of statutory obligations and commitments to ensure maintenance of license to operate
- Implementation of petroleum risk management processes, including this EP
- Scheduled monitoring and auditing of control implementation
- Completion of reviews, and reporting outcomes of these reviews

### 11.2 Environment Plan Organisation, Roles and Responsibilities

A defined chain of command with the roles and responsibilities for key Woodside and contractor personnel in relation to EP implementation, management and review are described in Table 11-1. It is the responsibility of all Woodside employees and contractors to ensure the Woodside Our Values (Appendix A) are applied in their areas of responsibility.

**Table 11-1: Key personnel and environmental responsibilities**

| Title   | Environmental Responsibilities  |
|---|---|
| <b>Office-based Roles</b>                                   |   |
| Woodside Project Manager                                    | <ul style="list-style-type: none"> <li>• Monitor and manage the activity so it is undertaken as per the relevant standards and commitments in this EP.</li> <li>• Notify the Woodside Environment Adviser of any scope changes in a timely manner.</li> <li>• Liaise with regulatory authorities as required.</li> <li>• Review this EP as necessary and manage change requests.</li> <li>• Ensure all project and support vessel crew members complete an HSE induction.</li> <li>• Verify that contractors meet environmental related contractual obligations.</li> <li>• Confirm environmental incident reporting meets regulatory requirements (as outlined in this EP) and Woodside’s Health, Safety and Environment Reporting and Investigation Procedure.</li> <li>• Monitor and close out corrective actions identified during environmental monitoring or audits.</li> </ul> |
| Woodside Head of Projects/Region (Global Wells and Seismic) | <ul style="list-style-type: none"> <li>• Ensure P&amp;A operations are undertaken as per this EP and approval conditions.</li> <li>• Provide sufficient resources to implement the P&amp;A-related management measures (i.e. controls, EPOs, PSs and MC) in this EP.</li> <li>• Ensures the MODU start-up meets the requirements of the Drilling and Managing Rig Operations Process.</li> </ul>  |
| Woodside Superintendent                                     | <ul style="list-style-type: none"> <li>• Ensure the P&amp;A program meets the requirements detailed in this EP.</li> <li>• Ensure changes to the P&amp;A program are communicated to the Woodside Environmental Adviser.</li> <li>• Ensure the Woodside’s Well Site Manager is provided with the resources required to ensure the management measures (i.e. controls, EPOs, EPs and MC) in this EP are undertaken.</li> <li>• Confirm environmental incident reporting meets regulatory requirements (as outlined in this EP) and Woodside’s Health, Safety and Environment Reporting and Investigation</li> </ul>  |

| Title  | Environmental Responsibilities   |
|--|--|
|  | <p>Procedure.</p> <ul style="list-style-type: none"> <li>• Monitor and close out corrective actions identified during environmental monitoring or audits.</li> <li>• Ensure MODU and project vessel personnel are given an Environmental Induction as per <b>Section 7.4.2</b> of this EP at the start of the drilling programs.</li> <li>• Confirms controls and performance standards in this EP are actioned, as required, before P&amp;A commences.</li> </ul>   |
| <b>Woodside Drilling, Completions and Subsea Engineers</b> | <ul style="list-style-type: none"> <li>• Ensure changes to the P&amp;A program are communicated to the Woodside Environmental Adviser.</li> <li>• Ensure all P&amp;A fluid chemical components and other fluids that may be used downhole have been reviewed by the Woodside Environmental Adviser.</li> </ul>   |
| <b>Woodside Environmental Adviser</b>                      | <ul style="list-style-type: none"> <li>• Verify relevant Environmental Approvals for the activities exist prior to commencing activity.</li> <li>• Track compliance with performance outcomes and performance standards as per the requirements of this EP.</li> <li>• Prepare environmental component of relevant Induction Package.</li> <li>• Assist with the review, investigation and reporting of environmental incidents.</li> <li>• Ensure environmental monitoring and inspections/audits are undertaken as per the requirements of this EP.</li> <li>• Liaise with relevant regulatory authorities as required.</li> <li>• Assist in preparation of external regulatory reports required, in line with environmental approval requirements and Woodside incident reporting procedures.</li> <li>• Monitor and close out corrective actions (Campaign Action Register (CAR)) identified during environmental monitoring or audits.</li> <li>• Provide advice to relevant Woodside personnel and contractors to assist them to understand their environment responsibilities.</li> <li>• Liaise with primary installation contractors to ensure communication and understanding of environment requirements as outlined in this EP and in line with Woodside's Compass values and management systems.</li> </ul> |
| <b>Woodside Corporate Affairs Adviser</b>                  | <ul style="list-style-type: none"> <li>• Prepare and implement the Consultation Plan for the petroleum activity</li> <li>• Report on consultation.</li> <li>• Ongoing liaison and notification as required as per Section 11.5.</li> </ul>   |
| <b>Woodside Marine Assurance Superintendent</b>            | <ul style="list-style-type: none"> <li>• Conducts relevant audit and inspection to confirm vessels comply with relevant Marine Orders and Woodside Marine Charters Instructions requirements to meet safety, navigation and emergency response requirements.</li> </ul>  |
| <b>Woodside CMIT Duty Manager</b>                          | <ul style="list-style-type: none"> <li>• On receiving notification of an incident, the Woodside CMIT Duty Manager shall:</li> <li>• establish and take control of the IMT and establish an appropriate command structure for the incident</li> <li>• assess situation, identify risks and actions to minimise the risk</li> <li>• communicate impact, risk and progress to the Crisis Management Team and stakeholders</li> <li>• develop the incident action plan (IAP) including setting objectives for action</li> <li>• approve, implement and manage the IAP</li> <li>• communicate within and beyond the incident management structure</li> <li>• manage and review safety of responders</li> <li>• address the broader public safety considerations</li> <li>• conclude and review activities.</li> </ul>   |
| Contractor Manager   | <ul style="list-style-type: none"> <li>• Prepare, maintain, and implement Contractor HSE Management Plans and Procedures</li> </ul>  |

| Title                                     | Environmental Responsibilities   |
|---|--|
|   | <ul style="list-style-type: none"> <li>• Ensure compliance with this EP, regulatory and HSE responsibilities relevant to their scope of work</li> <li>• Maintain clear lines of communication with the Woodside Operations Manager</li> </ul>  |
| <b>Field-based Roles (MODU)</b>           |  |
| Well Site Manager                         | <ul style="list-style-type: none"> <li>• Responsible for the management and supervision of well engineering activities at the well sites</li> <li>• Ensures operations are conducted according to the approved program</li> <li>• Management of change during drilling operations</li> </ul>   |
| Offshore HSE Advisor                      | <ul style="list-style-type: none"> <li>• Monitor and audit the activity to verify compliance with this EP</li> <li>• Ensures environmental incidents or breaches of EPOs are reported in line with Woodside's incident reporting requirements.</li> <li>• Disseminate project-specific environmental compliance requirements to field personnel as required.</li> </ul>  |
| Offshore Installation Manager – MODU      | <ul style="list-style-type: none"> <li>• Maintains operational control of the MODU</li> <li>• Managed the implementation of the MODU management system and procedural controls</li> <li>• Ensures MODU personnel are appropriately trained and competent to undertake role-specific tasks</li> <li>• Ensures MODU emergency response procedures are tested and implemented</li> <li>• Liaison with Drilling Supervisor on all aspects of drilling activities</li> <li>• Report environmental incidents or breaches of EPOs in line with incident reporting requirements.</li> </ul>  |
| Drilling Logistics Coordinator            | <ul style="list-style-type: none"> <li>• Waste is managed on the MODU and sent to shore as per the Drilling and Completions Waste Management Plan.</li> </ul>  |
| All crew                                  | <ul style="list-style-type: none"> <li>• Work in accordance with accepted HSE obligations and practices</li> <li>• Comply with this EP, and all regulatory and project obligations applicable to their assigned role</li> <li>• Report any hazardous condition, near miss, unsafe act, accident or environmental incident immediately to their supervisor</li> <li>• Report sightings of marine fauna and marine pollution</li> <li>• Attend HSE meetings and training and drills when required</li> <li>• Understand their obligation to 'stop-the-job' due to HSE concerns</li> <li>• Comply with this EP, and all regulatory and project obligations applicable to their assigned role</li> </ul>   |
| <b>Field-based Roles (Project Vessel)</b> |  |
| Vessel Contractor Representative          | <ul style="list-style-type: none"> <li>• Be responsible for managing and supervising decommissioning engineering activities in the field site</li> <li>• Ensure field activities are conducted according to the approved programme requirements</li> <li>• Monitor and audit the field activities to ensure compliance with this EP and the regulatory and HSE responsibilities</li> <li>• Manage change during field activities</li> <li>• Disseminate project-specific environmental compliance requirements as required</li> <li>• Ensure environmental incidents or breaches of EPOs, EPSs or MCs are reported and recorded in line with Woodside's incident reporting requirements</li> <li>• Comply with this EP, and all regulatory and project obligations applicable to their assigned</li> </ul> |

| Vessel Master                                   | <ul style="list-style-type: none"> <li>• Manage activities and safety on-board vessel for the duration at sea, and operate under Woodside Marine Controls, relevant Commonwealth Acts and Regulations</li> <li>• Ensure vessel operations are undertaken as per this EP and any approval conditions</li> <li>• Conduct SOPEP drills as per vessel's schedule</li> <li>• Report environmental incidents or breaches of EPOs, EPSs or MCs on vessel, in line with Woodside's incident reporting requirements</li> <li>• Report recordable incidents</li> <li>• Comply with this EP, and all regulatory and project obligations applicable to their assigned role</li> </ul>                            |
| Vessel Logistics Coordinators                   | <ul style="list-style-type: none"> <li>• Ensure waste is managed on the relevant project vessel and sent to shore as per the relevant Waste Management Plan.</li> </ul>  |
| Woodside Site Representative/ Resident Engineer | <ul style="list-style-type: none"> <li>• Ensure activities are undertaken as detailed in this EP.</li> <li>• Ensure the management measures made in this EP are implemented on the vessel</li> <li>• Ensure environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported as per the Woodside Corporate Event Notification Matrix</li> <li>• Verify HSE improvement actions identified during the project are implemented where practicable</li> <li>• Ensure periodic environmental inspections are completed.</li> </ul>  |
| All crew  | <ul style="list-style-type: none"> <li>• Work in accordance with accepted HSE obligations and practices</li> <li>• Comply with this EP, and all regulatory and project obligations applicable to their assigned role</li> <li>• Report any hazardous condition, near miss, unsafe act, accident or environmental incident immediately to their supervisor</li> <li>• Report sightings of marine fauna and marine pollution</li> <li>• Attend HSE meetings and training and drills when required</li> <li>• Understand their obligation to 'stop-the-job' due to HSE concerns</li> <li>• Comply with this EP, and all regulatory and project obligations applicable to their assigned role</li> </ul> |

## 11.3 Woodside IMS Risk Assessment Process

### 11.3.1 Objective and scope

To minimise the potential risk of introducing IMS as a result of the Petroleum Activities Program, all applicable vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below). The objective of the risk assessment process is to identify the level of threat a contracted vessel, or immersible equipment might pose if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

In context of the activities specified in **Section 3**, the IMS risk assessment process does not apply to the following:

- Vessels or immersible equipment that do not plan to enter the IMS Management Area (IMSMA)<sup>42</sup> or operational areas defined in environmental approvals
- 'New build' vessels launched less than 14 days prior to mobilisation
- Vessels or immersible equipment which have been inspected by a suitably qualified IMS inspector who has classified the vessels or immersible equipment as acceptably low risk no more than 14 days prior to

<sup>42</sup> IMSMA is based on current legal framework and includes all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 nm from land (including Australian territorial islands). The IMSMA also includes all waters within 12 nm from the 50 metre depth contour outside of the 12 nm boundary (i.e. Submerged reefs and atolls).

mobilisation

- Locally sourced vessels or immersible equipment from within the Pilbara locally sourced zone<sup>43</sup>. Vessels, or immersible equipment are defined as Locally Sourced when the same supply facilities/port have been used since their last IMS inspection, full hull clean in dry dock or application of antifouling coating (AFC<sup>44</sup>).

### 11.3.2 Risk Assessment Process

Woodside's IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species (IMO Guidelines, 2011).

In order to effectively evaluate the potential for vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each Project vessel, or immersible equipment planning to undertake activities within the Operational Areas. The risk assessment process considers a range of factors, as listed in **Table 11-2** and **Table 11-3**.

It is intended the IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. A QA/QC process is implemented for all Woodside conducted IMS risk assessments where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the risk assessment process.

**Table 11-2: Key factors considered as a part of the risk assessment process for vessels**

| Factors  | Details   |
|--|---|
| <b>Vessel type</b>   | The risk of IMS infection varies depending on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g., dredges) in comparison to simple vessels (e.g., crew transfer vessel).  |
| <b>Recent IMS inspection and cleaning history, including for internal niches</b> | In the case of biofouling on external hull niches, different risk ratings are applied dependant on whether out-of-water or in-water IMS inspections by qualified IMS inspectors and cleaning (if required) have been undertaken prior to contract commencement. If an IMS inspection (and clean if required) has not been undertaken in the past six months (from the time of contract commencement), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces. |
| <b>Out-of-water period before mobilisation</b>                                   | A risk reduction factor can be applied for vessels that are hauled out and then mobilised as deck cargo or by road during mobilisation, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.  |
| <b>Age and suitability of AFC at mobilisation date</b>                           | AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel's normal speeds and activity profile (i.e., proportion of time spent stationary or below three knots), and its main operational region (i.e., tropical, sub-tropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable the risk factor applied reduces with age since application.               |
| <b>Internal treatment systems</b>  | A risk reduction factor applied if the vessel has an internal biological fouling control system in place at the time of assessment, or evidence of manual dosing.   |
| <b>Vessel origin and proposed area of operation</b>                              | Differing risk ratings are assigned in relation to the climatic relationship between the vessel's origin and the proposed climatic region of the proposed area of operation. Highest risk rating is applied to similar climatic regions.  |
| <b>Number of stationary/slow speed periods &gt;7 days</b>                        | A risk factor is calculated based on the number of 7 day periods that the vessel has operated at stationary or at low speed (less than three knots) in port or coastal waters which is any waters less than 50 metres deep outside 12 nautical miles from land or any waters within 12 nautical miles of land. The greater the number of periods the higher the risk factor applied.  |

<sup>43</sup> The Pilbara Zone includes Port, nearshore and offshore movements between Exmouth and Port Headland (excluding high environmental value areas, World Heritage Areas, Commonwealth Marine Reserve Sanctuary Zones and State Marine Management Areas and Marine Parks).

<sup>44</sup> Vessels and immersible equipment can still be classified as locally sourced even if the AFC application occurred in a different port provided the amount of time between AFC application and departure to the locally sourced area (i.e. period of time in waters <12nm/50m water depth) did not exceed consecutive 7 days or the period of time the vessel or immersible equipment has spent within the locally sourced zone exceeds 1 year (i.e. the risk of introducing a species from a different location has already passed).

| Factors                                   | Details   |
|---|---|
| Region of stationary or slow periods      | A further multiplier is applied depending on the location of the stationary/slow speed periods. The highest risk rating applied if the stationary or slow speed periods occurred within ports or coastal waters of the same climatic region,  |
| Type of activity – contact with seafloor. | The potential for the introduction of IMS varies on the planned vessel activity taking place. Those activities that come in contact with sediments and thus have the potential to accumulate and harbour IMS in areas such as hoppers (dredges) and spud cans (drilling rigs) are considered to have a greater risk of infection. |

**Table 11-3: Key factors considered as a part of the risk assessment process for immersible equipment**

| Factors  | Details  |
|--|--|
| Region of deployment since last thorough clean, particularly coastal locations | Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (> 28 day). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (less than 50 meters deep and/or within 12 nautical miles from land) are given the highest risk rating. |
| Duration of deployments  | Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the period of immersion the higher the risk rating applied.  |
| Duration of time out of water since last deployment                            | A further risk reduction factor can be applied for immersible equipment that has been out of the water for an extended period.   |
| Transport conditions during mobilisation                                       | If the equipment is stored in damp conditions then a high risk factor is applied, while if equipment is stored in dry and well ventilated (low humidity) conditions then a low risk factor is applied.   |
| Post-retrieval maintenance regime.   | A risk reduction factor is applied if the equipment/item of interest is routinely washed, cleaned, checked and/or disassembled between project sites. While a higher risk rating is applied where no routine cleaning occurs.  |

Following implementation of the risk assessment process, vessels and/or immersible equipment are classified as one of three risk categories, as defined below.

- ‘Low’– Low risk of introducing IMS of concern and hence no additional management required, or management options have been applied to reduce the risk.
- ‘Uncertain’– Risk of introducing IMS is not apparent and as such the precautionary approach is adopted, and additional management options may be required.
- ‘High’– High risk of introducing IMS means additional management options are required prior to this vessel mobilising to the Operational Areas.

Following the allocation of a ‘low’ risk rating for a vessel or immersible equipment, the information provided by the vessel operator for the purposes of risk assessment must be confirmed prior to mobilisation. For vessels or equipment classified as posing an ‘uncertain’ or ‘high’ theoretical risk, a range of management options are presented to reduce this theoretical risk to acceptable levels and achieve a low-risk status. These management options have been developed with the intention of reducing IMS risk to levels that are as low as reasonably practicable (i.e., ALARP). It is a flexible approach that allows for a range of management actions to be tailored for a specific vessel movement. These will be assessed on a case-by-case basis and may include, but not limited to, the following:

- Inspection (desktop, in-water or dry dock) by a suitably qualified and experienced IMS inspector to verify risk status. Where practicable, the inspection shall occur within seven days (but not more than 14 days) prior to final departure to the Operational Areas.
- In-water or dry dock cleaning of the hull and other niche areas. This is typically applied where the risk assessment outcome is High risk driven by the age of the AFC on the vessel and its time spent in similar climatic region ports.
- Treatment of vessels internal seawater systems. This is typically applied in isolation for vessels with AFC applied to their hull within the last twelve months and where subsequent assessment through the process

achieves a low-risk rating.

- Limiting the duration that the vessel spends within the IMSMA to a maximum of 48 hours (cumulative entries)<sup>45</sup>. This is applicable for Uncertain risk vessels only.
- Reject the vessel.

Project vessels and immersible equipment are required to be a low risk of introducing IMS prior to entering the Operational Areas or commencing activities defined under this EP.

## 11.4 Unexpected Finds Procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as 'any trace of human existence that has a cultural, historical or archaeological character and is located under water'); the following Unexpected Finds Procedure will apply:

- All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage, including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside's Principal Heritage Adviser.
- Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.
- No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside's Principal Heritage Adviser.
- Woodside's Principal Heritage Adviser must notify a qualified underwater archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.
- If the potential Underwater Cultural Heritage appears to be Aboriginal Underwater Cultural Heritage, Woodside's Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.
- If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the UCH Act, Woodside's Principal Heritage Adviser must notify the Minister responsible for the UCH Act, the DCCEEW underwater archaeology section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.
- If the suspected heritage object includes human remains, Woodside's Principal Heritage Adviser must also notify:
  - The Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains; and
  - The Office of the Federal Environment Minister in accordance with Section 20 of the ATSIHP Act.
- Work must not recommence in the vicinity of the potential heritage object until Woodside's Principal Heritage Adviser provides written approval. Woodside's Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

## 11.5 Training and Competency

### 11.5.1 Competence, Environmental Awareness and Training

Woodside's (PetDW) HSE Management System establishes the foundation for continual improvement through applying consistent requirements across all aspects of Petroleum Activity, including establishing and maintaining the competencies for personnel, and providing training to promote expected behaviours.

<sup>45</sup>48 hours is considered an appropriate and ALARP management control, as it significantly reduces the potential for any IMS associated with a vessel to successfully establish suitable habitat within the IMSMA. This reduction of risk is primarily achieved via a direct reduction of the propugule pressure associated with a particular vessel movement.

For Woodside contractors, environmental risks in contracts are managed in accordance with the requirements outlined in the Woodside (PetDW) HSE Management Standard. As part of the contractor management process, the project vessel contractor's Environmental Management System is assessed to ensure it is aligned with the Woodside Our Values and the PetDW HSE Management Standard, and meets all commitments made in this EP. If, and wherever, the Contractor's Management System is found to be deficient, it will need to be modified before mobilisation to site.

All personnel on the project vessels are required to be competent and suitably trained to perform their assigned positions. This may be in the form of 'On the Job' or external training. Contractors are responsible for identifying training needs and keeping records of training. Environmental awareness inductions (**Section 11.5.3**) are required for all offshore personnel as part of their induction to performing Petroleum Activity. Information on the roles and responsibilities of all personnel will be provided during the environmental awareness inductions and toolbox meetings where relevant. A copy of the EP will be made available to all personnel upon request.

### 11.5.2 Operational Control

The Petroleum Activity is identified, planned and carried out in accordance with relevant legislation, EP commitments and internal environment standards and procedures. Verification processes are in place to ensure these controls and requirements are being implemented to reduce significant risks to acceptable levels. Some of the key operational controls include:

- task specific toolbox talks, Job Safety Analysis (or equivalent), and associated procedures / checklists
- contractors' vessel-specific procedures
- scheduled Preventative Maintenance Systems, tracked through dedicated software packages
- environmental inspections by the HSE Specialist.

### 11.5.3 Specific Environmental Awareness

Inductions are provided to all relevant personnel, including contractor personnel such as vessel crew, before mobilising to or on arriving at the activity location. This induction covers the HSE requirements and environmental information specific to the location of the Petroleum Activity. The induction will include environmental information about:

- Description of the activity.
- Ecological and socio-economic values of the activity location.
- Regulations relevant to the activity.
- Woodside's Environment and Biodiversity Policy.
- EP importance/structure/implementation/roles and responsibilities.
- Main environmental aspects/hazards and potential environmental impacts and related performance outcomes.
- waste management requirements and process (segregation of landfill, recycle and hazardous wastes) and location of bins
- Oil spill preparedness and response.
- Monitoring and reporting on performance outcomes and standards using MC.
- Incident reporting.

All personnel who undertake the induction are required to sign an attendance sheet, which is retained by the project vessel contractors.

The MODU and project vessels will hold regular HSE meetings which cover all crews. During these meetings, environmental incidents will be reviewed and awareness material presented. All personnel are required to attend the HSE meetings and attendance sheets are retained by the project vessel contractor. Daily meetings held onboard the MODU and project vessels also serve to reinforce environmental awareness during the Petroleum Activity.

A copy of this EP is provided to the MODU and project vessel contractor before performing the Petroleum Activity.

### 11.5.4 Pygmy Blue Whale Observation Training

Relevant crew onboard the support vessels will undertake pygmy blue whale observation training prior to commencing activities. Where relevant, Woodside and Contractor personnel will be trained to deliver the pygmy blue whale training ('train-the-trainer' model). Training materials will be developed in consultation with Woodside to ensure Project specific information is incorporated. The training package will cover:

- An overview of Project activities and the cetaceans that may be present during these activities
- An overview of the potential impacts and risks to PBW
- An overview of marine megafauna that may be present during activities
- An overview of EP controls and management procedures relevant to PBW presence
- Precautionary approach to identification i.e. assume PBW if positive ID of different species type not possible
- The observation and reporting requirements.

When trained crew are undertaking observations, expectations are that:

- Observation equipment / tools are used as required (i.e. range-finding binoculars, whale identification prompts etc.)
- Escalation process carried out if PBW are identified including alerting bridge crew so that appropriate response can be initiated
- Make and maintain records including the date, time and approximate distance from the vessel, and the action taken to comply with EPS.

Records will be maintained as evidence of the personnel who have completed pygmy blue whale observation training.

Completion of pygmy blue whale observation training is a minimum requirement for those performing observations relevant to adaptive management measures in **Section 7.3.6** in this EP (e.g., C 4.5).

For any trained crew who haven't conducted pygmy blue whale observations for greater than 12 months, refresher training is required prior to undertaking the role.

### 11.5.5 Contractor Management

For Woodside contractors, HSE risks in contracts are managed in accordance with the requirements outlined in the Woodside (PetDW) HSE Management Standard. As part of the contractor management process, Woodside implements pre- and post-contract award processes and activities aimed at ensuring contracts consistently and effectively cover the management of HSE in line with Woodside's HSE-related Our Requirements, the Woodside Our Values, and the Woodside (PetDW) HSE Standard.

While Woodside (PetDW) HSE Management System applies to the way Woodside execute its responsibilities under this EP, operational control of the MODU and project vessels remains the responsibility of the vessel contractor and shall be managed in accordance with Woodside Contractor Management Systems.

### 11.5.6 Marine Operations and Assurance

Woodside's marine assurance is managed by the Marine Assurance Team of the Logistics Function in accordance with Woodside's Marine Offshore Vessel Assurance Procedure. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

Woodside's Marine Offshore Assurance process is mandatory for all vessels (other than Tankers and Floating Production Storage and Offloading vessels) that are chartered directly by or on behalf of Woodside, including for short term hires (i.e. <3 months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust Safety Management System.

The process is multi-faceted and encompasses the following marine assurance activities:

- Safety Management System Assessment
- Dynamic Positioning (DP) System Verification
- Vessel Inspections

- Project support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard. Woodside Marine Assurance Specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- OCIMF OVID Inspection
- IMCA CMID Inspection
- Marine Warranty Survey

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval. Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, there does exist an opportunity to further scrutinise the proposed vessel.

Where a vessel inspection and/or OVMSA Verification Review is not available and all reasonable efforts based on time and resource availability to complete an vessel inspection and/or OVMSA Verification Review are performed (i.e. short term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternate means of inspection, known as a risk assessment.

### 11.5.7 Risk Assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist, where the vessel meets the short-term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

- Management control factors:
  - Company audit score (i.e. management system)
  - vessel HSE incidents
  - vessel Port State Control deficiencies
  - instances of Port State Control vessel detainment
  - years since previous satisfactory vessel inspection
  - age of vessel
  - contractors' prior experience operating for Woodside.
- Activity risk factors:
  - people health and safety risks (a function of the nature of the work and the area of operation)
  - environmental risks (a function of environmental sensitivity, activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))
  - value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
  - reputation risk
  - exposure (i.e. exposure to risk based on duration of project)
  - industrial relations risk.

- The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.
- The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

## 11.6 Monitoring, Auditing and Management of Non-conformance and Review

### 11.6.1 Monitoring Environmental Performance

Environmental performance must be consistent with the Woodside PetDW HSE Standard and commitments made in this EP.

Woodside and its contractors will perform a program of periodic monitoring during the petroleum activities – starting at mobilisation of each activity and continuing through the duration of each activity to activity completion. This information will be collected using the tools and systems outlined below, developed based on the EPOs, controls, standards and MC in this EP. The tools and systems will collect, as a minimum, the data (evidence) referred to in the MC in **Sections 7, 8 10.4.13**.

#### 11.6.1.1 Source-based Impacts and Risks

The tools and systems to monitor environmental performance, where relevant, will include:

- daily reports which include leading indicator compliance
- periodic review of waste management and recycling records
- use of contractor's risk identification program that requires personnel to record and submit safety and environment risk observation cards routinely (frequency varies with contractor)
- collection of evidence of compliance with the controls detailed in the EP relevant to offshore activities by the Woodside Offshore HSE Adviser or Woodside Site Representative (other compliance evidence is collected onshore)
- environmental discharge reports that record volumes of planned and unplanned discharges, to ocean and atmosphere
- monitoring of progress against the Projects function scorecard for KPIs
- internal auditing and assurance program as described in **Section 11.6.3**.

Throughout this activity, Woodside will continuously identify new source-based risks and impacts through the Monitoring and Auditing systems and tools described above and in **Section 11.6.3**.

### 11.6.2 Record Keeping

Record keeping will be in accordance with Regulation 14(7). The collection of compliance records (against the MC) will form part of the permanent record of compliance maintained by Woodside and will form the basis for demonstrating that the EPOs and standards are met, which will be summarised in a series of routine reporting documents.

### 11.6.3 Auditing, Assurance, Management of Non-conformance and Continuous Improvement

The environmental performance of Woodside activities will be reviewed in a number of ways to:

- ensure all significant environmental aspects of the activity are covered in the EP
- ensure management measures to achieve environmental performance outcomes are being implemented, reviewed and amended where necessary
- ensure all environmental commitments have been met
- ensure impacts and risks will be continuously identified and reduced to ALARP
- identify potential non-conformances and opportunities for continuous improvement.

Woodside reviews and audits its contractors at various stages, including before contract award, before the activities and during activities, in accordance with Woodside PetDW HSE Management System performance. The environmental performance of contractors to Woodside involved in activities will be reviewed through activities

including:

- inspections of Contractor Management systems and procedures
- pre-activity audits
- review of reporting documentation
- monitoring of progress
- auditing and assurance program
- regular review of incident, audit, inspection, observation, safety meeting and daily operations reports
- action item tracking and closeout
- end of campaign reviews.

Internal auditing is performed on a MODU-specific schedule, rather than a schedule to align with each well. This enables continuous review and improvement of environmental performance over the term of the MODU contract. The following internal audits, inspections and reviews will be performed to review compliance against activity EPOs, EPSs and MCs and the overall environmental performance of the activities:

- Survey environment rig equipment for a newly contracted MODU (if not previously contracted to Woodside within the last two years) against Woodside's Engineering Standard – Rig Equipment. This standard covers functional and technical requirements for Woodside contracted rigs and their associated equipment. An environment rig equipment survey scope typically includes mud and solids control systems, environmental discharge control (including drainage management), and loss of containment management.
- Complete a minimum of monthly environmental inspections (conducted by offshore Woodside personnel or a delegate), which may include verifying:
  - bunkering/transfers between support vessels and MODU /project vessels
  - environment containment including chemical storage, spill response equipment and housekeeping
  - general MODU environment risks including waste management, drilling fluids oil/water separation, and inspection of subsea and moonpool areas.
- Perform environment audits quarterly during the Petroleum Activities Program, while the MODU is on location (by a Woodside Environment Adviser or delegate), which may include:
  - operational compliance audits relevant to environmental risk of activities which may include compliance with training commitments, discharge requirements, bunkering activities, verification of use of approved chemicals, and satisfactory close out of items from previous audits
  - inspection of selected risk areas/activities (which may include shaker house, drill floor and mud management while commencing riser drilling or reservoir interception) during routine MODU visits throughout the MODU campaign, determined by risk, previous incidents or operation specification requirements.
  - audit findings relevant to continuous improvement of environmental performance will be tracked through the MODU or vessel compliance action register, a contractor register between the MODU operator or vessel contractor and Woodside.

All environmental management commitments from the EP will be documented and a description of compliance with each commitment will be maintained. Environment compliance monitoring allows continuous improvement initiatives to be developed and inform the development of future EPs.

## 11.7 EP Review Process

### 11.7.1 Management of Knowledge

Review of knowledge relevant to the existing environment is undertaken in order to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). Relevant knowledge is defined as:

- environmental science supporting the description of the existing environment
- socio-economic environment and consultation information
- environmental legislation.

The frequency and record of reviews, communication of relevant new knowledge and consideration of management of change are documented in the Woodside Environment Plan Guideline.

Under the Oil Spill Scientific Monitoring Program preparedness, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Environment Science Team and tracked via the Corporate Environment Baseline Database.

### 11.7.2 Program of Ongoing Engagement with Traditional Custodians

Woodside will undertake an annual review of the Program of Ongoing Engagement with Traditional Custodians (**Appendix J**) to determine its effectiveness and adapt the program accordingly. The annual review will also include an assessment of appropriateness of the methods used to undertake ongoing consultation with Traditional Custodians.

### 11.7.3 Learning and Knowledge Sharing

Learning and knowledge sharing occurs via a number of different methods including:

- event investigations
- event bulletins
- after campaign review conducted, including review of environmental incidents as relevant
- ongoing communication with vessel operators
- formal and informal industry benchmarking
- cross asset learnings
- engineering and technical authorities discipline communications and sharing.

### 11.7.4 Review of Impacts, Risks and Controls across the life of the EP

In the unlikely case that activities described in this EP do not occur continuously or sequentially, before recommencing activities after a cessation period greater than 12 months, impacts, risks and controls will be reviewed.

The process will identify or review impacts and risks associated with the newly-commencing activity, and will identify or review controls to ensure impacts and risks remain/are reduced to ALARP and acceptable levels. Information learned from previous activities conducted under this EP will be considered. Controls which have previously been excluded on the basis of proportionality will be reconsidered. Any required changes will be managed by the MOC process outlined below (**Section 11.7.6**).

### 11.7.5 EP Management of Change

Management of changes are managed in accordance with Woodside's Environmental Approval Requirements Australia Commonwealth Guideline. Management of changes relevant to this EP, concerning the scope of the activity description (**Section 3**) including: review of advances in technology at stages where new equipment may be selected such as vessel contracting; changes in understanding of the environment, DCCEEW EPBC Act listed threatened and migratory species status, Part 13 statutory instruments (recovery plans, threat abatement plans, conservation advice, wildlife conservation plans) and current requirements for AMPs (**Section 4**); and potential new advice from external relevant persons (**Appendix F**), will be managed in accordance with Regulation 17 of the Environment Regulations.

Risk will be assessed in accordance with the environmental risk management methodology (**Section 6**) to determine the significance of any potential new environmental impacts or risks not provided for in this EP. Risk assessment outcomes are reviewed in compliance with Regulation 17 of the Environment Regulations.

Minor changes where a review of the activity and the environmental risks and impacts of the activity do not trigger a requirement for a formal revision under Regulation 17 of the Environment Regulations, will be considered a 'minor revision'. Minor administrative changes to this EP, where an assessment of the environmental risks and impacts is not required (e.g., document references, phone numbers, etc.), will also be considered a 'minor revision'. Minor revisions as defined above will be made to this EP using Woodside's document control process. Minor revisions will be tracked in an MOC Register to ensure visibility of cumulative risk changes, as well as enable internal EP updates/reissuing as required. This document will be made available to NOPSEMA during regulator environment inspections.

### 11.7.6 OPEP Management of Change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulation 17 to determine if EP, including OPEP, resubmission is required. Changes with potential to influence minor or technical changes to the OPEP are tracked in management of change records, project records and incorporated during internal updates of the OPEP or the five-yearly revision.

## 11.8 Ongoing Consultation

Although consultation for the purpose of Regulation 11A is complete, in accordance with Regulation 14 (9) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who present at those meetings are from community and industry and include Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, industry representative bodies, Community and industry organisations.

Relevant persons, and those who are simply interested in the activities, can otherwise remain up to date on this activity through subscribing to the Woodside website.

Should consultation feedback be received following EP acceptance that identifies relevant new information or a measure or control that requires implementation or update to meet the intended outcome of consultation (see **Section 5**), Woodside will apply its EP Management of Knowledge process (refer to **Section 11.7.1**) and Management of Change process (refer to **Section 11.7.4**), as appropriate.

Woodside has developed a Program of Ongoing Engagement with Traditional Custodians (**Appendix J**), which is compliant with Corporate Woodside Policies Strategies and procedures and directly informed by feedback from Traditional Custodians. It provides a mechanism, established through framework agreements, for ongoing dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the activity and in relation to caring for and managing country, including Sea Country. The Program will be tailored to each Traditional Custodian group and may include, as agreed with relevant Traditional Custodians:

- social investment to support Indigenous ranger programs
- support for Indigenous oil spill response capabilities
- support for recording Sea Country values
- support to Traditional Custodian groups to build capabilities and capacity with respect to ability to engage with Woodside and the broader O&G industry on activities
- development of ongoing relationships with Traditional Custodian groups
- any other initiatives proposed for the purpose of protecting Country including cultural values.

At the time of EP submission, a number of specific activities as part of ongoing consultation regarding the activity are planned with Traditional Custodian relevant persons. These are described in Appendix J – Program of Ongoing Engagement with Traditional Custodians. Where Traditional Custodian relevant persons have requested information or further engagement considered as ongoing consultation, but have not requested a framework agreement through the Program, these requests have been captured in **Table 11-4**. However, a framework agreement may still be initiated by these groups at any time.

## 11.9 Reporting

To meet the environmental performance outcomes and standards outlined in the EP, Woodside reports at a number of levels as described in the next subsections.

### 11.9.1 Routine Reporting (Internal)

#### 11.9.1.1 Daily Progress Reports and Meetings

Daily reports for activities are prepared and issued to key support personnel and stakeholders, by relevant managers responsible for the field-based activities. The report provides performance information about operational activities, health, safety and environment, and current and planned work activities.

Meetings between key personnel are used to transfer information, discuss incidents, agree plans for future activities and develop plans and accountabilities for resolving issues.

#### 11.9.1.2 Regular HSE Meetings

The project vessels will hold regular HSE meetings which cover all crews. During these meetings, environmental incidents will be reviewed, and awareness material presented. All personnel are required to attend the HSE meetings and attendance sheets are retained by the project vessel contractor. Daily meetings held onboard the project vessels also serve to reinforce environmental awareness during the Petroleum Activity.

Dedicated HSE Meetings will also be held with the offshore and Perth based management to address targeted HSE incidents and initiatives.

### 11.9.2 Routine Reporting (External)

#### 11.9.2.1 External Reporting Requirements

Routine regulatory reporting requirements for the Petroleum Activity are summarised in **Table 11-4**. The requirements include that Woodside develop and submit an annual Environmental Performance Report to NOPSEMA, with the first report submitted within 12 months of the commencement of activities covered by this EP (as per the requirements of Regulation 14(2) (b) of the Environment Regulations).

Table 11-4: Routine external reporting requirements

| Report / Notification   | Recipient  | Frequency   | Communication  | Comment   |
|---|--|---|----------------|---|
| <b>Before the Activity</b>  |  |   |                |   |
| DoD Start of Activity Notification  | DoD  | Minimum of <b>five weeks</b> notification prior to the commencement of activities.                    | Written        | As requested by DoD during consultation.  |
| AHO Start of Activity Notification  | AHO  | No less than <b>four weeks</b> notification before the commencement of activities, where practicable. | Written        | As requested by AMSA and AHO during consultation.   |
| NOPSEMA Start of Activity Notification  | NOPSEMA  | At least <b>ten days</b> before the activity commences  | Written        | Complete NOPSEMA's Regulation 29 Start or End of Activity Notification form prior to Petroleum Activity   |
| DMIRS Start of Activity Notification  | DMIRS  | Prior to activity commencement  | Written        | Notify DMIRS of the start date recovery executions, ( <a href="mailto:petroleum.environment@dmirs.wa.gov.au">petroleum.environment@dmirs.wa.gov.au</a> ). As requested by DMIRS during consultation |
| AFMA, DAFF-Fisheries, CFA, DPIRD, WAFIC and relevant Fishery Licence Holders that have the potential to be directly impacted by planned activities in the Operational Area (Western Deepwater Trawl Fishery). | AFMA, DAFF-Fisheries, CFA, DPIRD, WAFIC, Western Deepwater Trawl Fishery Licence Holders | Prior to activity commencement  | Written        | Date of activity start and end.   |
| Start of Activity Notifications requested during consultation   | Recfishwest, BYAC, Wanparta  | Prior to activity commencement and following completion of activities                                 | Written        | As requested during consultation.   |
| AMSA JRCC Notification  | AMSA   | <b>24 to 48 hrs</b> prior to activity commencement  | Written        | As requested by AMSA during consultation.   |
| Notification (email)  | All relevant persons for the proposed activity   | Notification of significant change  | As appropriate | <b>Notification of significant change</b><br><br>Any relevant new information will be assessed using the EP Knowledge Management System and Management of Change                                    |

| Report / Notification  | Recipient        | Frequency   | Communication | Comment   |
|--|------------------|---|---------------|---|
|  |                  |   |               | Process   |
| Email including confirmed spatial data for Stybarrow infrastructure  | AIMS             | Prior to activity commencement  | Written       | As requested by AIMS during consultation.   |
| <b>During the Activity</b>   |                  |   |               |   |
| Recordable incident as required by Regulation 26B NOPSEMA must be notified of a breach of an EPO or EPS, in the environment plan that applies to the activity that is not a reportable incident.   | NOPSEMA          | Complete NOPSEMA's Recordable Environmental Incident Monthly Report form.   | Written       | Written report – The report must be submitted as soon as practicable after the end of the calendar month, and in any case, not later than 15 days after the end of the calendar month.  |
| Reportable Incident, as required by) Regulation 16I, 26 & 26A NOPSEMA must be notified of any reportable incidents. For the purposes of Regulation 16(c), a reportable incident is defined as:<br><br>An incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage. For the purposes of this EP, Severity level 3 is equivalent to moderate environmental damage. Severity levels 4 and 5 | NOPSEMA          | As soon as practicable, and in any case not later than two hours after the first occurrence of a reportable incident, or if the incident was not detected at the time of the first occurrence, at the time of becoming aware of the reportable incident.              | Oral          | The oral notification must contain: <ul style="list-style-type: none"> <li>all material facts and circumstances concerning the reportable incident known or by reasonable search or enquiry could be found out</li> <li>any action taken to avoid or mitigate any adverse environmental impacts of the reportable incident</li> <li>the corrective action that has been taken, or is proposed to be taken, to stop, control or remedy the reportable incident.</li> </ul> |
|  | NOPSEMA<br>NOPTA | As soon as practicable after the oral notification.   | Written       | A written record of the oral notification must be submitted. The written record is not required to include anything that was not included in the oral notification.   |
|  | NOPSEMA<br>NOPTA | Must be submitted as soon as practicable, and in any case not later than three days after the first occurrence of the reportable incident unless NOPSEMA specifies otherwise.<br><br>Same report to be submitted to within seven days after giving the written report | Written       | A written report must contain: <ul style="list-style-type: none"> <li>all material facts and circumstances concerning the reportable incident known or by reasonable search or enquiry could be found out</li> <li>any action taken to avoid or mitigate any adverse environmental impacts of the reportable incident</li> <li>the corrective action that has been taken, or is proposed to be</li> </ul>   |

| Report / Notification  | Recipient                       | Frequency  | Communication    | Comment   |
|--|---------------------------------|--|------------------|---|
| are equivalent to more significant environmental damage.   |                                 | to NOPSEMA.  |                  | <p>taken, to stop, control or remedy the reportable incident</p> <ul style="list-style-type: none"> <li>the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring in the future.</li> </ul> <p>Consider reporting using NOPSEMA's Report of an Accident, Dangerous Occurrence or Environmental Incident form.</p>   |
| Environmental Performance as required by Regulation 26C NOPSEMA must be notified of the environmental performance at the intervals provided for in the EP. | NOPSEMA                         | A detailed environmental performance report will be submitted within three months of submission of Regulation 29(2). | Written          | Written report must contain sufficient information to determine whether or not environmental performance outcomes and standards in the EP have been met.  |
| AMSA notification of activity change   | AMSA                            | As soon as practicable.  | Written          | Any changes to the intended operations.   |
| AMSA notification of any oil pollution incidents in Commonwealth waters  | AMSA                            | Within two hours.  | Oral and Written | <p>In accordance with the Navigation Act 2012, any oil pollution incidents in Commonwealth waters will be reported by the Vessel Master to AMSA within 2 hours via the national emergency notification contacts and a written report within 24 hours of the request by AMSA.</p> <p>The national 24-hour emergency notification contact details are:</p> <ul style="list-style-type: none"> <li>Free call: 1800 641 792</li> <li>Fax: (02) 6230 6868</li> <li>Email: mdo@amsa.gov.au</li> </ul> |
| DoT Reporting  | Oil Spill Response Coordination | Within two hours.  | Oral             | Notification of actual or impending spillage, release or escape of oil or an oily mixture that is capable of causing loss of life, injury to a person or damage to the health of a person, property or the environment  |
| All actual or impending MOP incidents that are in, or may impact, State waters resulting from an   | OSRC Unit within the DoT        | POLREP following verbal notification.<br>SITREP within 24 hours of request   | Written          | All oil pollution incidents in WA State waters will be reported by the Vessel Master to the Oil Spill Response Coordination (OSRC) Unit within the DoT as soon as practicable (within 2 hours of spill occurring) via the 24-hour reporting number (08) 9480 9924. The  |

| Report / Notification  | Recipient | Frequency  | Communication    | Comment   |
|--|-----------|--|------------------|---|
| offshore Petroleum Activity.   |           |  |                  | Duty Officer will then advise whether the following forms are required to be submitted: <ul style="list-style-type: none"> <li>Marine Pollution Form (POLREP)<br/><a href="http://www.transport.wa.gov.au/mediaFiles/marine/MAC-F-PollutionReport.pdf">http://www.transport.wa.gov.au/mediaFiles/marine/MAC-F-PollutionReport.pdf</a></li> </ul> and/ or <ul style="list-style-type: none"> <li>Marine Pollution Situation Report (SITREP)<br/><a href="http://www.transport.wa.gov.au/mediaFiles/marine/MAC-F-SituationReport.pdf">http://www.transport.wa.gov.au/mediaFiles/marine/MAC-F-SituationReport.pdf</a></li> </ul>   |
| DNP Reporting<br>Notification of the event of oil pollution within a marine park or where an oil spill response action must be taken within a marine park; or if any changes to intended operations (requested through consultation) | DNP       | So far as reasonably practicable prior to response action being written.                                     | Oral and written | The DNP should be made aware of oil/gas pollution incidences which occur within a marine park or are likely to impact on a marine park as soon as possible. Notification should be provided to the 24-hour Marine Compliance Duty Officer on 0419 293 465. The notification should include: <ul style="list-style-type: none"> <li>titleholder details</li> <li>time and location of the incident (including name of marine park likely to be affected)</li> <li>proposed response arrangements as per the OPEP (such as dispersant, containment)</li> <li>confirmation of providing access to relevant monitoring and evaluation reports when available</li> <li>contact details for the response coordinator.</li> <li>Note that the DNP may request daily or weekly Situation Reports, depending on the scale and severity of the pollution incident.</li> </ul> |
| DPIRD Reporting If marine pests or disease are suspected this must be reported to DPIRD.   | DPIRD     | Within 24 hours.   | Oral             | Notification of any suspected marine pests or diseases including any organism listed in the Western Australian Prevention List for Introduced Marine Pests and any other non-endemic organism that demonstrates invasive characteristics.   |
| DCCEEW Reporting<br>Any harm or mortality to EPBC Act-listed threatened marine fauna   | DCCEEW    | Within seven days to<br><a href="mailto:EPBC.permits@environment.gov.au">EPBC.permits@environment.gov.au</a> | Written          | Notification of any harm or mortality to an EPBC listed species of marine fauna whether attributable to the activity or not.  |

| Report / Notification   | Recipient                       | Frequency  | Communication    | Comment  |
|---|---------------------------------|--|------------------|--|
| DCCEEW Reporting Marine Fauna Sighting Data   | DCCEEW                          | As soon as practicable, in any case no later than three months of the end of the activity.   | Written          | Marine fauna sighting data recorded in the marine fauna sighting database.   |
| Reporting any ship strike incident with cetaceans will also be reported to the National Ship Strike database. | Australian Marine Mammal Centre | As soon as practicable.  | Written          | Ship strike report provided to the Australian Marine Mammal Centre:<br><a href="https://data.marinemammals.gov.au/report/shipstrike">https://data.marinemammals.gov.au/report/shipstrike</a>   |
| <b>On Completion of Activity</b>  |                                 |  |                  |  |
| NOPSEMA Annual Environment Plan Performance Report  | NOPSEMA                         | Should an activity be continuous for 12 months, then a summary environmental performance report will be submitted before the end of this period.                                   | Written          | As required by Regulation 14 (2) and 26C the report will assess compliance with the EPOs and EPSs outlined in this EP. The reporting period is 1 January to 31 December each year.   |
| DMIRS Notification  | DMIRS                           | End date of Petroleum Activity   | Written          | Notify DMIRS of the end date of the subsea equipment recovery, ( <a href="mailto:petroleum.environment@dmirs.wa.gov.au">petroleum.environment@dmirs.wa.gov.au</a> ).   |
| NOPSEMA Environmental Performance Report  | NOPSEMA                         | Annual, with the first report submitted within 12 months of the commencement of the Petroleum Activity covered by this EP  | Written          | In accordance with the Regulation 26C, confirmation of compliance with the Performance Outcomes, Performance Standards and Measurement Criteria of this EP. Reporting period 1 July to 30 June. Report must include sufficient information to enable NOPSEMA to determine whether or not the environmental performance outcomes and performance standards in the EP have been met. |
| NOPSEMA End-of-activity EP Performance Report   | NOPSEMA                         | Within three months of EP Completion   | Written          | The EP will end when Woodside notify NOPSEMA that Petroleum Activity has ended, and all of the obligations under the EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 25A of the Environment Regulations.  |
| <b>Ongoing Consultation (Section 11.8)</b>  |                                 |  |                  |  |
| Program of Ongoing Engagement with Traditional Custodians ( <b>Appendix J</b> )                               | Relevant cultural authorities   | Ongoing. Responses to any feedback received by Traditional Custodian groups will be provided by Woodside within four weeks of receipt.<br>Progress on the Program will be reported | Oral and written | Any relevant new information on cultural values will be assessed using the EP Management of Knowledge ( <b>Section 11.7.1</b> ) and Management of change Process ( <b>Section 11.7.4</b> ).  |

| Report / Notification | Recipient           | Frequency   | Communication    | Comment  |
|-----------------------|---------------------|---|------------------|--|
|                       |                     | in line with annual sustainability reporting via the Woodside website.  |                  |  |
| Ongoing Engagement    | Malgana, Nanda, KLC | Woodside will continue to engage as part of ongoing engagement. Responses will be provided within four weeks of receipt of additional feedback. | Oral and written | As requested during consultation. Engagement is not specific to this activity. |

### 11.9.2.2 General Direction 833 Reporting

To meet Direction 6 in Schedule 1 of General Direction 833, Woodside will undertake the following reporting defined in **Table 11-5**.

To meet Direction 4 and 5, Woodside will undertake final environmental surveys described in the Stybarrow Decommissioning and Field Management EP. Data will be collated from as left surveys, ROV images and sediment sampling to inform what, if anything, needs to be done to provide for the conservation and protection of natural resources in the licence area, and make good any damage to the seabed or subsoil in the licence area caused by any person engaged or concerned with the operations.

Woodside is intending to provide a report to NOPSEMA within 12 months following completion of final decommissioning activities with their demonstration for how Woodside has provided for the conservation and protection of the natural resources and made good any damage to the seabed or subsoil in the licence areas relevant to the Stybarrow field development. These reporting requirements will be provided in Section 11 of the Stybarrow Decommissioning and Field Management EP, which is intended to be the final decommissioning EP for permit area WA-32-L.

**Table 11-5: General Direction 833 Reporting Requirements**

| Report / Notification   | Recipient | Frequency                                   | Communication | Comment  |
|---|-----------|---|---------------|--|
| NOPSEMA Decommissioning Annual Progress Report in accordance with NOPSEMA General Direction (833) | NOPSEMA   | Annual, no later than 31 December each year | Written       | Submit to NOPSEMA on an annual basis, until all direction have been met, a progress report detailing planning towards and process with undertaking the actions required by directions 1, 2, 3, 4 and 5.<br><br>The report submitted under Direction 6(a) must be to the satisfaction of NOPSEMA and submitted to NOPSEMA no later than 31 December each year.<br><br>Publish the report on the registered titleholders' website within 14 days of obtaining NOPSEMA satisfaction under Direction 6(b). |

### 11.9.2.3 End of the Environment Plan

The EP will end when Woodside notify NOPSEMA that petroleum activity has ended, and all of the obligations under the EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 25A of the Environment Regulations.

Notification will be through completion and submission of NOPSEMA's Regulation 25A – End of Operation of Environment Plan Form.

### 11.9.3 Incident Reporting (Internal)

Woodside classifies non-conformances with EPOs and standards in this EP as environmental incidents. Woodside employees and contractors are required to report all environmental incidents, and these are managed as per Woodside's internal event recording, investigation and learning requirements.

An internal computerised database called First Priority is used to record and report these incidents. Details of the event, immediate action taken to control the situation, investigation outcomes and corrective actions to prevent reoccurrence are all recorded. Corrective actions are monitored using First Priority and closed out in a timely manner.

Woodside uses a severity rating for classification of environmental incidents, with the significant categories having a severity level (consequence) of 3, 4 or 5 (as detailed in **Section 6**). Detailed investigations are completed for all incidents classified as a 3, 4 or 5 severity (consequence) level and high potential environmental incidents.

## 11.9.4 Incident Reporting (External) – Reportable and Recordable

### 11.9.4.1 Reportable Incidents

A reportable environmental incident is defined in Regulation 4 of the Environment Regulations as:

*“...reportable incident, for an activity, means an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage”.*

A reportable incident for the petroleum activities is:

- An uncontrolled release of hydrocarbons or environmentally hazardous chemicals of more than 80 L to the marine environment
- An incident that has caused environmental damage with a severity (consequence) level of  $\geq 3$ , as defined in the Woodside (PetDW) HSE Risk Matrix (refer to previous Table 6-2), or
- An incident that has the potential to cause environmental damage with a severity (consequence) level of  $\geq 3$ , as defined in the Woodside (PetDW) HSE Risk Matrix (refer to previous Table 6-2)

In accordance with Regulations 26, 26A and 26AA, Woodside will report all reportable incidents orally to NOPSEMA, as soon as practicable, and in any case not later than two hours after the first occurrence of the reportable incident; or if the reportable incident was not detected at the time of the first occurrence, the time of becoming aware of the reportable incident.

Oral notifications of a reportable incident to NOPSEMA will be via telephone: 1300 674 472.

The oral notification must contain:

- all material facts and circumstances concerning the reportable incident known or could be obtained by reasonable search or enquiry
- any action taken to avoid or mitigate any adverse environment impacts of the reportable incident
- the corrective action that has been taken, or is proposed to be taken, to stop, control or remedy the reportable incident.

A written record of the reportable incident will be provided to NOPSEMA, as soon as practicable after making the oral notification, but within three days after the first occurrence of the reportable incident unless NOPSEMA specifies otherwise. The written report should use a format consistent with NOPSEMA's Report of an Accident, Dangerous Occurrence or Environmental Incident (Form FM0929).

Within seven days of giving a written report of a reportable incident to NOPSEMA, a copy of the same written report must be provided to the National Petroleum Titles Administrator (NOPTA), and DMIRS.

Written notification must be provided of any environmental incident that could potentially impact on any land or water in State jurisdiction via: [petroleum.environment@dmirs.wa.gov.au](mailto:petroleum.environment@dmirs.wa.gov.au).

### 11.9.4.2 Recordable Incident

A recordable environmental incident is defined in Regulation 4 of the Environment Regulations as:

*“...recordable incident, for an activity, means a breach of an environmental performance outcome or environmental performance standard, in the environment plan that applies to the activity, that is not a reportable incident”.*

In terms of the activities within the scope of this EP, a recordable incident is a breach of the environmental performance outcome or environmental performance standards listed in this EP.

In the event of a recordable in recordable incident, Woodside will report the occurrence to NOPSEMA as soon as is practicable after the end of the calendar month in which it occurs; and in any case, not later than 15 days after the end of the calendar month. If no recordable incidents have occurred, a 'nil incident' report will be submitted to NOPSEMA. Written reporting to NOPSEMA of recordable incidents and 'nil incidents' can be via completion of NOPSEMA's Form FM0928– Recordable Environmental Incident Monthly Report. The report will contain:

- a record of all the recordable incidents that occurred during the calendar month
- all material facts and circumstances concerning the recordable incidents that are known or can, by reasonable search or enquiry, be found out
- any action taken to avoid or mitigate any adverse environmental impacts of the recordable incidents

- the corrective action that has been taken, or is proposed to be taken, to stop, control or remedy the recordable incident
- the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring in the future

## 11.10 Emergency Preparedness and Response

### 11.10.1 Overview

Under Regulation 14(8), the implementation strategy must contain an oil pollution emergency plan (OPEP) and provide for the updating of the OPEP. In accordance with Regulation 14, the sections below detail the implementation strategy for hydrocarbon spill emergency conditions during decommissioning activities. The section outlines the response framework in the event of a hydrocarbon spill and the emergency response arrangements for a Level 1 and 2 oil spill events based on the strategic NEBA assessment. Specific Woodside practices and procedures are presented to ensure that the environmental impacts and risks of spill response activities will be continuously identified and reduced to ALARP, along with environmental performance outcomes, performance standards and management criteria for spill response activities.

As part of the implementation strategy, Woodside has developed an activity specific OPEP (**Appendix D**). The implementation strategy includes Woodside processes and procedures for how training, competencies and on-going environmental awareness will be maintained for the duration of the activity, for all personnel and contractors involved in spill response activities (resourced by Woodside).

### 11.10.2 Oil Spill Response Arrangements

#### 11.10.2.1 Incident Jurisdictions

In the event of an oil spill, Control Agencies are assigned to respond to the various levels of spills is outlined in **Table 11-6**. The ‘Statutory Agency’ and ‘Control Agency’ are defined as follows:

- **Jurisdictional Authority:** The relevant State or Commonwealth Agency assigned by legislation, administrative arrangements or within the relevant contingency plan, to control response activities to a maritime environmental emergency in their area of jurisdiction.
- **Control Agency:** is the agency with operational responsibility in accordance with the relevant contingency plan to take action to respond to an oil and/or chemical spill in the marine environment.

**Table 11-6: Statutory and lead control agencies for oil spill pollution incidents**

| Area                | Spill Source                | Jurisdictional Authority | Lead Control Agency  |                      |
|---------------------|-----------------------------|--------------------------|----------------------|----------------------|
|                     |                             |                          | Level 1              | Level 2              |
| Commonwealth waters | Offshore Petroleum Activity | NOPSEMA                  | Woodside             | Woodside             |
|                     | Vessels                     | AMSA                     | AMSA                 | AMSA                 |
| State waters        | Offshore Petroleum Activity | DoT                      | Woodside             | DoT                  |
|                     | Vessels                     | DoT                      | DoT                  | DoT                  |
| Port waters         | Vessels                     | Port authority           | Port authority / DoT | Port authority / DoT |

#### 11.10.2.2 Commonwealth Waters

Woodside holds the Control Agency role for its facility-related spills within Commonwealth waters. As defined by Schedule 3, Part 1, Clause 4 of the OPGGS Act, ‘facility’ spills include those from fixed platforms, Floating Production Storage and Offloading (FPSO)/Floating Storage and Offloading (FSO) systems, Mobile Offshore Drilling Units (MODU) and subsea infrastructure. It also includes vessels undertaking decommissioning activities in Woodside’s Operational Area.

For instances where Woodside, as the Control Agency, requests assistance of AMSA, Woodside will request an AMSA liaison officer be mobilised to the IMT as soon as possible. In the interim period until AMSA have assembled their IMT, Woodside (Incident Commander) will liaise closely with the AMSA liaison officer and or the AMSA Incident Controller to inform them of first strike/initial actions being taken.

### 11.10.2.3 Western Australia

For WA State waters, the Department of Transport (DoT) Marine Safety General Manager (or delegate) is prescribed as the Hazard Management Agency (HMA) for marine oil pollution as per the Western Australian *Emergency Management Act 2005* and *Emergency Management Regulations 2006*. The DoT as the HMA has developed the State Hazard Plan: Maritime Environmental Emergencies (DoT, 2021).

If a Level 2 spill has potential to enter WA waters, Woodside would contact the DoT Maritime Environmental Emergency Response (MEER) unit, as per the reporting requirements in Appendix–D - First Strike Plan of the OPEP (Appendix G). Upon notification, the DoT would assume the role of Control Agency and would activate its Maritime Environmental Emergency Coordination Centre (MEECC), DoT Incident Management Team (IMT) and appoint the State Maritime Environmental Coordinator (SMEEC).

Woodside will be required to work in coordination with DoT during such instances, as outlined within the DoT's Offshore Petroleum Industry Guidance Note – Marine Oil Pollution: Response and Consultation Arrangements (July 2020) (available online <https://www.transport.wa.gov.au/imirine/oil-spill-contingency-plans.asp>).

For Level 2 spills that cross from Commonwealth waters to WA waters, both DoT and Woodside will be Control Agencies and would work in partnership to coordinate the response effort. For a cross-jurisdictional response, there will be a Lead IMT (DoT or Woodside) for each spill response activity, with DoT's control resting primarily on WA State waters activities.

Appendix 2 of the Offshore Petroleum Industry Guidance Note – Marine Oil Pollution: Response and Consultation Arrangements (DoT, 2020) provides guidance on the allocation of a Lead IMT to response activities for a cross jurisdictional spill.

To facilitate effective coordination between the two Controlling Agencies and their respective IMT's during a cross-jurisdictional response, a Joint Strategic Coordination Committee (JSCC) will be established (**Figure 11-2**). The JSCC will be jointly chaired by the State Marine Pollution Coordinator (SMEEC) and Woodside's nominated senior representative and will comprise of individuals deemed necessary by the chairs to ensure an effective coordinated response across both jurisdictions. Additional details on the JSCC's key functions are outlined in the Offshore Petroleum Industry Guidance Note – Marine Oil Pollution: Response and Consultation Arrangements (DoT, 2020).

At the request of the SMEEC, Woodside will be required to provide all necessary resources, including personnel and equipment, to assist the DoT's IMT in performing duties as the Control Agency for WA State waters response. This includes providing an initial 11 personnel to work within the DoT Incident Control Centre in Fremantle, no later than 8 am following the day of the request. It also includes providing personnel to serve in DoT's Forward Operating Base (FOB) no later than 24 hours following formal request by the SMEEC. DoT will in turn, provide Woodside with Liaison Officer/s from DoT's command structure to sit within Woodside's IMT. **Figure 11-3** shows the organisational structure of DoT personnel embedded in the Woodside IMT and the structure of Woodside personnel in the DoT (State) IMT. Provision of personnel to support the WA DoT IMT and FOB may be through a combination of Woodside, AMOSC and/or AMOSC Core Group personnel. As a minimum, the Deputy Planning Officer and Deputy Logistics Officer supporting the WA DoT IMT will be filled by Woodside IMT personnel with familiarity with relevant Woodside systems and processes. Woodside will locate its IMT in the existing IMT Control Room in Perth.

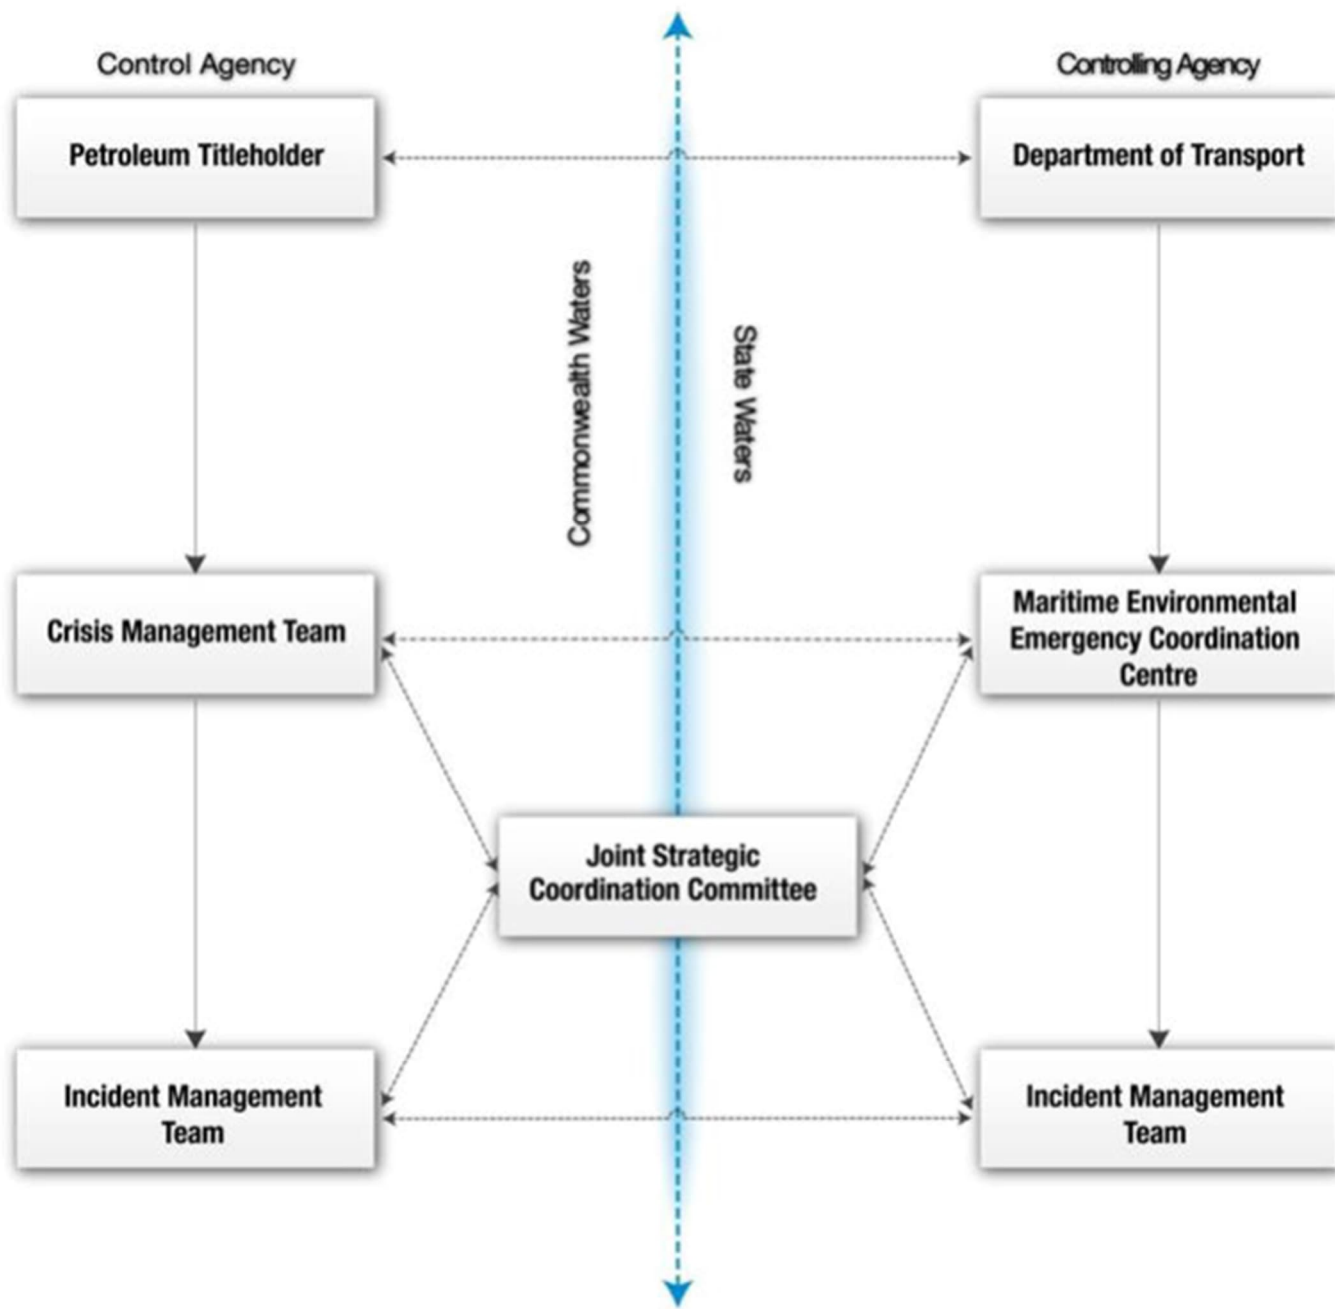

Figure 11-2: Controlling Agency coordination arrangements – Cross jurisdictional (WA DoT, 2020)

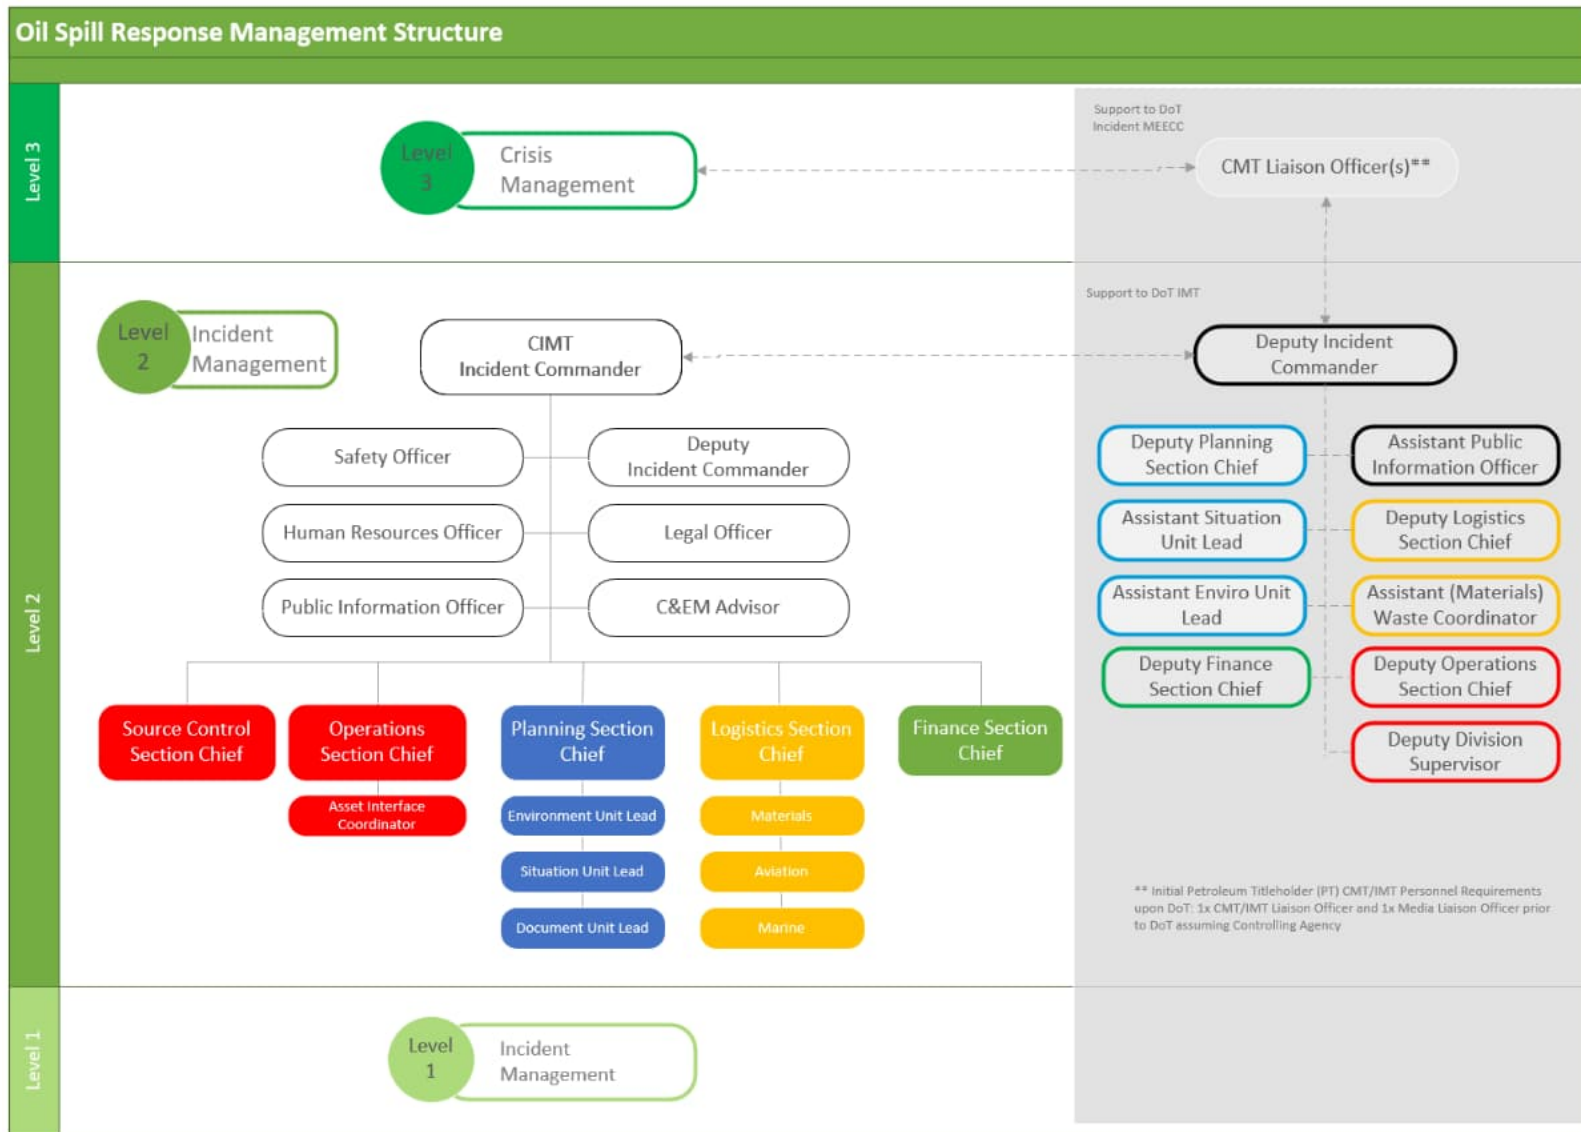

Figure 11-3: Crisis and emergency management structure and support to WA State waters Control Agency – as per WA DoT IGN requirements

### 11.10.3 External Plans

The OPEP (**Appendix D**) has been developed to meet all relevant requirements of the Environment Regulations. The following external plans listed in **Table 11-7** have been used or referred to in the development of the OPEP and the implementation strategy for hydrocarbon spill emergency conditions that may occur during decommissioning activities. The OPEP interfaces with National, State and Woodside oil spill arrangements and plans.

**Table 11-7 Relevant external Oil Spill Arrangements and Plans for Commonwealth and State Waters**

| Relevant External Plans and Guidance Documents   | Description   |
|--|---|
| National Plan for Maritime Environmental Emergencies (NatPlan)   | Sets out the national arrangements, policies and principles for the management of marine oil pollution. It defines obligations the States and various industry sectors in respect of marine oil pollution prevention, preparation, response and recovery.   |
| Australian Industry Cooperative Spill Response Arrangements (AMOSPlan)                                     | Managed by AMOSC, it details the cooperative arrangements for response to oil spills by Australian oil and associated industries.   |
| Western Australia State Hazard Plan for Maritime Environmental Emergencies (SHP-MEE) (DoT, 2021) (HazPlan) | Formally endorsed by the State Emergency Management Committee on 4 October 2019, the MEE details the management arrangements for preparation and response to marine oil pollution incidents in State waters.  |
| DoT Oil Spill Contingency Plan   | Details the procedures and arrangements for the management of marine oil pollution emergencies that are the responsibility of the DoT.<br>DoT Offshore Petroleum Industry Guidance Note (IGN) – Marine Oil Pollution (MOP) Response and Consultation Arrangements (available online: <a href="https://www.transport.wa.gov.au/imagine/oil-spill-contingency-plans.asp">https://www.transport.wa.gov.au/imagine/oil-spill-contingency-plans.asp</a> ). |
| Industry Joint Venture Plans   | Various plans developing general and assisted Oil Spill Response Capabilities   |
| Western Australian Oiled Wildlife Response Plan (WAOWRP)   | Provides guidance and sets out the management arrangements for implementing oiled wildlife response in State waters. Each region has an Oiled Wildlife Response Plan that gives further details on sensitivities and available resources. The Pilbara Region Oiled Wildlife Response Plan is the relevant regional plan for oiled wildlife associated with Stybarrow decommissioning activities.  |
| AMSA Australian Government Coordination Arrangements for Maritime Environmental Emergencies                | Provides a framework for the coordination of Australian Governmental departments and agencies in response to a maritime environmental emergency   |

#### 11.10.3.1 Woodside and Contractor Plans

Internal Woodside requirements include the need to develop Emergency Response plans that are scaled according to the Petroleum Activity, associated hazards, material risks and applicable regulatory requirements.

To support this requirement, the following documents have been developed and implemented:

- Incident & Crisis Management Procedure
- Environmental Sensitivities Exmouth Region.
- North West Cape Sensitivity Mapping.
- The Stybarrow Plug and Abandonment OPEP (**Appendix D**).
- SOPEPs and bridging documents; and
- Tactical Response Plans (TRPs) for identified receptors.

## 11.10.4 Woodside Incident Response

### 11.10.4.1 Woodside Response Organisation Structure

The Woodside Crisis and Emergency Management (CEM) philosophy is based on three levels of response teams (refer to **Table 11-8**) which allow for a flexible response with the appropriate level of leadership and support, according to the nature of the specific incident.

**Table 11-8: Woodside Response Structure – teams are progressively activated depending on the severity of an incident**

| Team                                      | Role   |
|---|--|
| Emergency Response Team                   | The ERT is responsible for physically controlling incidents in the field, where possible, and communicating known facts to the relevant IMT. The ERT will depend on the facility or vessel involved in the incident. |
| Corporate Incident Management Team (CIMT) | The CIMT's role is to provide technical and logistical support to the ERT. It is based in Perth, Australia.  |
| Crisis Management Team (CMT)              | The role of the CMT is to provide strategic leadership and support. It is based in Australia or USA.   |

The following sections describe the teams listed in **Table 11-8** based on the worst-case spill scenarios for the Stybarrow P&A Petroleum Activity.

#### **Emergency Response Team**

The ERT will depend on the vessel involved in the incident. The Vessel Master will be in command and will relay immediate emergency response information in the field to Woodside IMT.

The role of the ERT is to provide local and on-scene response by implementing priority objectives and attempts to control or contain the source and make appropriate emergency notifications. The ERT reports to the IMT.

Roles and responsibilities of the Woodside mobilised ERT are illustrated in **Table 11-9**.

**Table 11-9: ERT roles and responsibilities**

| Team                                     | Role  |
|--|---|
| Emergency Commander / On-Scene Commander | The Emergency Commander / On-Scene Commander has overall responsibility for management of an incident and is responsible for determining the status of the emergency. This will be the Vessel Master. |
| Emergency Communications Coordinator     | The role of the Emergency Communications Coordinator is to provide a link between all operating responders and to assist them in controlling the incident.  |
| Emergency Coordinator                    | The Emergency Coordinator provides technical support during the emergency response and communicates with the Emergency Commander / On-Scene Commander.  |

#### **Corporate Incident Management Team (CIMT)**

The Corporate Incident Management Team (CIMT), based in Woodside's head office in Perth, is the onshore coordination point for an offshore emergency. The CIMT is staffed by an appropriately skilled team available on call 24-hours a day. The purpose of the team is to coordinate rescues, minimise damage to the environment and facilities, and to liaise with external agencies.

Woodside will have an Emergency Response Plan (ERP) in place relevant to the Petroleum Activities Program. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident. The ERP will contain instructions for vessel emergency, medical emergency, search

and rescue, reportable incidents, incident notification, contact information and activation of the contractor's emergency centre and Woodside Communication Centre (WCC).

The CIMT is responsible for the spill response for Level 2 spills. Those responsible for an oil spill response are shown in **Figure 11-3** with allocated responsibilities detailed in **Table 11-10**.

**Table 11-10: CIMT roles and responsibilities**

| Role                        | Responsibilities  |
|-----------------------------|---|
| Leadership Function         | CIMT leadership is provided by a CIMT Leader and Deputy Leader. Accountable and responsible for the performance of the CIMT upon activation, including controlling tempo and workflow to ensure CIMT process collect and process information to support good decision making. |
| People Function             | Responsible for end-to-end welfare of personnel involved in the incident, whilst managing communication and information flow to and from staff, families, and related stakeholders.   |
| Planning Function           | Develops current and future plans. Provides longer term options for the normalisation and recovery of incident.   |
| Operations Function         | Manages operational activities that are undertaken directly to resolve the incident, including the management of all resources (people and equipment) assigned under the operations function.   |
| Logistics Function          | Ensures the resources, facilities, services, and materials required to support the incident.  |
| Public Information Function | Develops strategies to manage or mitigate reputational impacts of the incident. Additional responsibilities include the deployment of communication strategies and coordinating stakeholder engagements both internally and externally.                                       |
| Livelihood Function         | Assesses and manages the broader business impacts resulting from incidents (both short and long term). The livelihood function considers aspects such as commercial, marketing, insurance, legal, and financial implications.   |
| Leadership Function         | CIMT leadership is provided by a CIMT Leader and Deputy Leader. Accountable and responsible for the performance of the CIMT upon activation, including controlling tempo and workflow to ensure CIMT process collect and process information to support good decision making. |
| People Function             | Responsible for end-to-end welfare of personnel involved in the incident, whilst managing communication and information flow to and from staff, families, and related stakeholders.   |

The CIMT is made up of personnel designated on a roster basis, with each individual available for one week on a 24-hour basis throughout the year, based in Perth. There is a weekly handover and briefing of the operations each week. The CIMT consists of a number of defined roles, which enables Woodside to respond to a variety of incidents. The CIMT is located in the Woodside Perth offices and is fully equipped to manage incidents.

To supplement training, each CIMT member participates in desktop exercises and additional minor and major exercises. The training "desktop" exercises are also arranged during the weekly handover sessions, to test a range of CIMT responses including oil spill response.

The CIMT consists of key personnel with a broad range of disciplines (e.g., drilling, operations, engineering, maintenance, HSE, supply, external affairs, human resources, finance), together with other support service personnel as necessary.

The CIMT has key corporate and external communications responsibilities for:

- Providing tactical and strategic direction, technical expertise and support during an emergency
- Informing and liaising with relevant emergency services and regulatory authorities as appropriate
- Managing external communications with media, relatives, contractors, customers, etc.
- Managing Human Resources and Personnel Response (formerly Relative Response) activities
- Documenting all aspects of the emergency response activities and communications.

In the event that response to an oil spill incident requires a prolonged spill response, the CIMT Leader may activate Australian Marine Oil Spill Centre (AMOSC) (including its core group members) and Oil Spill Response Limited (OSRL) to augment the CIMT's capacity, and request that a Deputy/technical advisor be assigned.

AMOSC or OSRL deputies assigned to the CIMT will be responsible for providing Woodside guidance on the Incident Command Structure (ICS) process and oil spill response strategies. Guidance and support will be available via phone/video conference.

OSRL are an OSRA based in Singapore and Southampton. Woodside has contracted OSRL to provide support during an oil spill response.

Regulation 14(5) requires that the implementation strategy includes measures to ensure employees and contractors have the appropriate competencies and training (**Table 11-11**). Woodside has conducted a risk-based training needs analysis on positions required for effective oil spill response. Following the mapping of training to Woodside identified competencies, training was then mapped to positions based on their required competencies.

**Table 11-11: Minimum levels of competency for key Incident Management Team positions**

| Position   | Minimum Competency  |
|--|---|
| CIMT Leader  | <ul style="list-style-type: none"> <li>• Incident and Crisis Leadership Development Program (ICLDP).</li> <li>• IMOII or equivalent spill response Specialist level with an oil spill response organisation.</li> <li>• Participation in Level 2 oil spill exercise (initial).</li> <li>• Participation in Level 2 oil spill exercise (refresher).</li> </ul> |
| Security & Emergency Manager Duty Manager  | <ul style="list-style-type: none"> <li>• ICLDP.</li> <li>• IMOII or equivalent spill response Specialist level with an oil spill response organisation.</li> <li>• Participation in Level 2 oil spill exercise (initial).</li> <li>• Participation in Level 2 oil spill exercise (refresher).</li> </ul>  |
| Operations, Planning, Logistics and Safety   | <ul style="list-style-type: none"> <li>• OSREC.</li> <li>• ICC Fundamentals Course (internal course).</li> <li>• Participation in Level 2 oil spill exercise (initial).</li> <li>• Participation in Level 2 oil spill exercise (refresher).</li> </ul>  |
| Environment Coordinator  | <ul style="list-style-type: none"> <li>• ICC Fundamentals.</li> <li>• IMOII or equivalent spill response Specialist level with an oil spill response organisation.</li> <li>• Participation in Level 2 oil spill exercise (initial).</li> <li>• Participation in Level 2 oil spill exercise (refresher).</li> </ul>   |
| Note on competency/equivalency   |   |
| <p>In 2018, Woodside reviewed incident and crisis systems, processes and tools to assess whether these were fit-for-purpose and has rolled out a change to the Incident and Crisis Management training and the Oil Spill Response training requirements for both CIMT and field-based roles.</p> <p>The revised CIMT Fundamentals Training Program and ICLDP align with the performance requirements of the <i>PMAOMIR320 – Manage Incident Response Information</i> and <i>PMAOMOR418 – Coordinate Incident Response</i>.</p> <p>Regarding training-specific equivalency:</p> <ul style="list-style-type: none"> <li>• ICLDP is mapped to <i>PMAOMOR418</i> (which is equivalent to IMOIII when combined with Woodside's OSREC course) and ensures broader incident management principles aligned with Australasian Inter-service Incident Management System.</li> <li>• The revised CIMT Fundamentals Course is mapped to <i>PMAOMIR320</i> (which is equivalent to IMOII). The blended learning program offers modules aligned to IMOIII, IMOII, IMO I and Australian Marine Oil Spill Centre Core Group Training Oil Spill Response Organisation Specialist level training.</li> <li>• OSREC involves the completion of two online AMSA Modules (Introduction to National Plan and incident management, and Introduction to oil spills) as well as elements of IMO I and IMOII content tailored to Woodside-specific oil spill response capabilities.</li> <li>• Woodside Learning Services is responsible for collating and maintaining personnel training records. The Hydrocarbon Spill Preparedness (HSP) Dashboard reflects the competencies required for each oil spill role (Incident Management/operational).</li> </ul> |   |

**Potential Resource Needs**

Potential resource requirements for all Levels of response (per 12-hour operational period) are detailed in the Hydrocarbon Spill Preparedness (HSP) Dashboard. Woodside's response arrangements can be scaled up or down dependent on the nature and 'level' of the incident.

Potential resource requirements for all Levels of response (per 12-hour operational period) are detailed in **Table 11-12**.

**Table 11-12: Potential resource needs**

| Function / Position  | Level 1   | Level 2                  |
|--|---|--------------------------|
| Incident Commander   | 1 per incident; Incident Commander may have Deputies as needed. |                          |
| Command Staff (Safety Officer, Public information Officer, Liaison Officer)                | 1 per incident: Command Staff may have assistants as needed.    |                          |
| <b>Operations</b>  |   |                          |
| Operations Section Chief   | 1 per operational period  |                          |
| Deputy Operations Section Chief  | N/A   | 2                        |
| Recovery & Protection Branch Director [dependent on EMBA and suitable response strategies] | N/A   | 3-4                      |
| Air Operations Branch Director   | N/A   | 2                        |
| Wildlife Branch Director [dependent on EMBA]   | N/A   | 1                        |
| Staging Area Director  | N/A   | 1 per Staging Area       |
| <b>Planning</b>  |   |                          |
| Planning Section Chief   | N/A   | 1 per operational period |
| Deputy Planning Section Chief  | N/A   | 2                        |
| Resource Unit Leader   | N/A   | 1                        |
| Situation Unit Leader  | N/A   | 1                        |
| Technical Specialist   | N/A   | As needed                |
| Environmental Unit Leader  | N/A   | 1                        |
| Documentation Unit Leader  | N/A   | 1                        |
| <b>Logistics</b>   |   |                          |
| Logistics Section Chief  | N/A   | 1 per operational period |
| Deputy Logistics Section Chief   | N/A   | 1                        |
| Service Branch Director  | N/A   | As needed                |
| Support Branch Director  | N/A   | As needed                |
| <b>Finance/Admin</b>   |   |                          |

| Function / Position   | Level 1                  | Level 2 |
|---|--------------------------|---------|
| Finance/Admin Section Chief   | 1 per operational period |         |
| Deputy Finance/Admin Section Chief  | N/A                      | 1       |
| Time Unit Leader  | N/A                      | 1       |
| Procurement Unit Leader   | N/A                      | 1       |
| <i>Please note: In a large-scale response each function listed above may require a number of people or teams.</i> |                          |         |

### 11.10.4.2 Immediate Response Support

Woodside has the capability to implement a response with appropriately trained and competent staff, as follows:

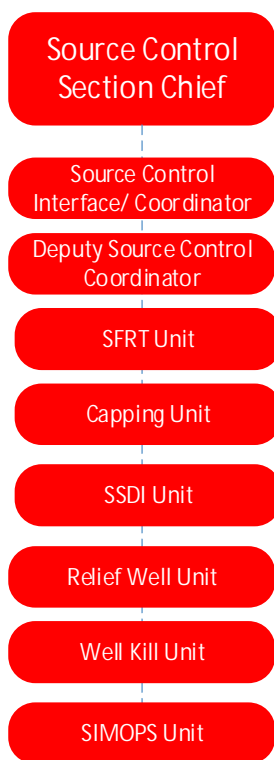

- CIMT Incident Commander
- CIMT Deputy Incident Commander
- Operations Section Chief
- Planning Section Chief
- Logistics Section Chief
- Documentation Unit Leader
- Safety Officer
- Environment Unit Leader
- Human Resources Officer
- Public Information Officer
- Situation Unit Leader
- Finance Section Chief
- Source Control Section Chief

Each core rostered position is to be within 1 hour of the office and fit for work at all times.

### 11.10.5 Source Control IMT

Source control response activities are complex and involve cross-functional activities with significant logistics and simultaneous operation (SIMOPS) considerations. Level 3 incidents are managed under Crisis Management arrangements. Source Control response will be managed under Functional support role in CMT (refer to the Crisis Management Guideline).

The drilling response structure in emergency response is provided in the Drilling and Completions Emergency Response Procedure and the Drilling and Completions – Well Control Procedure. In the Woodside Incident and Crisis Management Structure (**Figure 11-3**), for a Level 2/3 Incident, the Source Control Functional Support Team (FST) will be formed reporting to the Source Control Section Chief. The structure of the Source Control FST is shown in **Figure 11-4**.

**Figure 11-4: Source Control Functional Support Team Structure.**

Roles and responsibilities of the Source Control FST Leaders are summarised in **Table 11-13**.

**Table 11-13: Source Control Functional Support Team roles and responsibilities**

| Role   | Key Responsibilities  |
|--|---|
| Source Control Section Chief                 | <ul style="list-style-type: none"> <li>• Activate Source Control responses</li> <li>• Approve operational plans</li> <li>• Manage Source Control FST</li> <li>• Report to Incident Commander</li> </ul>                                   |
| Source Control Interface Coordinator/ Deputy | <ul style="list-style-type: none"> <li>• Approve operational plans</li> <li>• Manage Source Control Function and ensure coordination among groups/units</li> </ul>  |
| Subsea First Response Toolkit (SFRT) Unit    | <ul style="list-style-type: none"> <li>• Mobilise vessel with work class ROVs</li> <li>• Survey and attempt to function BOP</li> <li>• Debris clearance survey and operations</li> </ul>  |
| Capping Unit                                 | <ul style="list-style-type: none"> <li>• Mobilise capping stack and support equipment</li> <li>• Assemble and test capping stack for deployment</li> <li>• Hydrate remediation</li> <li>• Capping stack operations as required</li> </ul> |
| Subsea Dispersant Injection (SSDI) Unit      | <ul style="list-style-type: none"> <li>• Develop dispersant application and monitoring plans</li> <li>• Apply for local Government approvals</li> </ul>   |

| Role             | Key Responsibilities   |
|------------------|--|
|                  | <ul style="list-style-type: none"> <li>Conduct subsea dispersant application and monitoring operations</li> </ul>  |
| Relief Well Unit | <ul style="list-style-type: none"> <li>Determine if impacted rig may be utilised for relief rig or capping stack deployment</li> <li>Determine number of relief wells to be drilled</li> <li>Obtain and assess information on reservoir and wellbore geometry</li> <li>Coordinates mobilisation of relief well rig(s) and execution of relief well(s)</li> </ul> |
| Well Kill Unit   | <ul style="list-style-type: none"> <li>Obtain and review reservoir and wellbore data</li> <li>Determine kill weights and pumping rates</li> <li>Develop the well kill plan</li> <li>Conduct kill operations</li> </ul>   |
| SIMOPS Unit      | <ul style="list-style-type: none"> <li>Supervise the preparation of SIMOPS plans between different units in Source Control response.</li> <li>Interfaces with all operational parties and coordinates marine traffic within their designated zone (usually 500-1000m radius of flowing well).</li> </ul>   |

The Source Control units described above may include the following support positions:

- HSE Adviser/s
- GWS Manager/s
- D&C Superintendent/s
- Subsea Vessel Superintendent/s
- Senior D&C and Subsea Engineers
- D&C Engineering support, as required
- Subsea Engineering support, as required
- Contractor Representatives including source control contractors
- Logistics Coordinator.

#### 11.10.5.1 Source Control Response Personnel Resourcing and Competency

All Source Control Unit Leader positions will be filled with Woodside personnel from the GWS organisation.

All personnel will hold a relevant tertiary qualification, well control certifications and industry experience commensurate with the position being held.

Initial Source Control functional response will typically be led by a GWS Manager in the role of the Source Control Coordinator and the remaining FST roles would be filled by suitably experienced people, sourced from the operational team and across the broader GWS organisation.

The Source Control teams will be scaled with additional resources depending on the specifics of the scenario. As the emergency response duration increases suitable arrangements will be made to establish shifts and duty roster cycles

to ensure ongoing functional support. Woodside has access to sufficient personnel to cover 24 hour operations on a rolling roster through existing personnel capabilities.

The Source Control IMT response structure indicated in **Figure 11-4** is estimated to require from 4–12 positions per shift varying with the scale of response, or 8–24 positions for 24-hour coverage. For a prolonged response resources to provide on/off weekly cycles, an additional 8–24 positions will be required, totalling 16–48 positions over the scale of the response. These numbers are indicative and will vary depending on scale and complexity of operations.

The current organisational review indicates Woodside has approximately 75 internal staff members to support the Source Control IMT positions. In the event of a level 3 incident, response activities will be given priority and other projects may be reduced or suspended allowing reallocation of significant additional resources. Woodside would require access to external resources primarily for Specialist Services and Expertise in Source Control / Well Control operations.

Additional personnel to support the Source Control FST will be filled through the following avenues:

- Well Control Specialists through existing contracts e.g., Wild Well Control, AGR, etc
- Secondment of Personnel from other Titleholders through APPEA Industry Memorandum of Understanding (2021)
- Engineering support through call-off frame agreements

Following personnel call-off, online briefings will be held for external personnel prior to commencing work. If building access is required, onboarding will commence as per the Woodside Office Access Management Procedures. In the event of an emergency, building access can be expedited at the discretion of the CICC or identified senior leaders and facilities for remote operations would also be set up.

#### 11.10.6 Oil Spill Response Organisations

In line with Woodside Crisis and Emergency Management arrangements, Woodside has established formalised third-party contracts and agreements with defined performance standards/criteria for the provision of resources, services or equipment in support of emergency response activities. These resources will be activated, dispatched and deactivated prior to and during an emergency.

Woodside maintains contracts with a number of Oil Spill Response Organisations (OSROs). The main relationships are detailed in the sub-sections.

##### 11.10.6.1 AMOSC

AMOSC is an industry funded oil spill response facility based in Geelong, Victoria. AMOSC resources include:

- AMOSC spill response equipment stored at AMOSC and at other locations
- Oil company equipment based at various locations
- Trained industry response (“Core Group”) personnel

AMOSC form part of Woodside’s First Strike and primary response strategy to a spill and will be deployed within 12 hours of notification. Only nominated Woodside personnel can request the assistance of and this is usually conducted via the Perth IMT. AMOSC can be placed on the levels of advice listed in Table 11-14. Information regarding activation and mobilisation is outlined in the OPEP (**Appendix D**).

Table 11-14: AMOSC advice levels

| AMOSC Advice Level | Status         | AMOSC Requirements  |
|--------------------|----------------|---|
| Level 1            | Forward notice | <ul style="list-style-type: none"> <li>Advise a potential problem.</li> <li>Provide or update data on oil spill.</li> <li>Update information on spill and advise 4 hourly.</li> </ul>                     |
| Level 2            | Standby        | <ul style="list-style-type: none"> <li>AMOSC resources may be required.</li> <li>Assessment of resources and destination to be made.</li> <li>Update information on spill and advise 2 hourly.</li> </ul> |
| Level 3            | Callout        | <ul style="list-style-type: none"> <li>AMOSC resources are required.</li> <li>Detail required resources and destination.</li> </ul>   |

AMOSC maintains a core group of trained personnel from oil industry member companies around the country who are trained and regularly exercised in oil spill response operations. Access to the Core Group is via AMOSC.

The cooperative arrangements for response to oil spills by Australian oil and associated industries are brought together under the AMOSPlan. The AMOSPlan will be activated by Woodside when the response to an oil spill incident is regarded by Woodside as requiring resources beyond those of the company itself.

In the event that the oil spill response requires the call out of AMOSC's own resources, the call out request is made directly to AMOSC by the Perth IMT. Should the response require mutual aid from equipment owned and personnel employed by another company, the request for assistance is made directly company to company via each company's nominated Mutual Aid Contact.

In addition, Woodside will also be required to contact AMOSC to activate the Standing Agreement and the Service Contract (for the borrowing company), in the event that Woodside require equipment from another company.

#### 11.10.6.2 Oil Spill Response Limited

Woodside is a member of the global OSRL group.

Updates on the availability of OSRL's equipment availability is provided via a weekly Equipment Stockpile Status Report from OSRL's website at <http://www.oilspillresponse.com/activate-us/equipment-stockpile-status-report>.

The Equipment Stockpile Status Report provides a quick and timely overview of the availability of OSRL's equipment stockpile globally and is especially useful in assuring OSRL's readiness. It also provides a vital overview of the resources that Woodside would be able to access in the event of a spill. Under O'RL's Service Level Agreement, the first member who initiates mobilisation of OSRL will be entitled to a maximum 50% of the stockpile, while the second member is entitled to a maximum 50% of the remaining stockpile (and so on).

In addition to the Equipment Stockpile Status Report, OSRL provides a response equipment list that provides an overview of the size, type and ancillaries required for the equipment that is available at their bases. To ensure efficient and timely response capability, OSRL also have also pre-packaged some of the equipment into loads ready for dispatch, that are suitable for general spill situations and operating environments.

The equipment list can also be found at [http://www.oilspillresponse.com/files/OSRL\\_Equipment\\_List.pdf](http://www.oilspillresponse.com/files/OSRL_Equipment_List.pdf)

In addition to providing response equipment, OSRL also supply a selection of specialist staff who have the practical skill and experience to assist and support Woodside in a spill response and are trained in using the Incident Command System (ICS) structure. Response teams will comprise:

- Team Manager
- Operations Manager
- Senior technicians/ technicians

OSRL can be called upon to provide immediate technical advice and begin to mobilise personnel if required. OSRL would be called on to lead small specialist teams and/or provide supplementary labour and equipment if ongoing response is required. Any OSRL resources being mobilised from Singapore would be expected to be on the scene

in Perth following notification by the CIMT in a similar timeframe to resources being mobilised from eastern Australia. Only nominated Woodside personnel may request the assistance of OSRL via the CIMT Leader.

#### **11.10.6.3 Technical Support (Operational and Scientific Monitoring)**

Woodside maintains a list of pre-approved vendors who can be called upon at short notice to provide environmental monitoring services in the event of an oil spill.

#### **11.10.6.4 General Support**

Woodside has arrangements in place and access to providers to supply personnel as required to populate the response teams. Woodside has tested these arrangements and considers that personnel for shoreline clean-up operations can be sourced to match and maintain the consequence of a worst-case spill. Woodside will aim to mobilise shoreline crews prior to the predicted arrival of hydrocarbons. These crews will focus on pre-cleaning beach areas (e.g., removing debris such as seaweed to areas above the hightide mark) and establishing staging areas to enable a more efficient response when hydrocarbons are arriving ashore.

During the first strike response phase, Woodside will rely on the skilled personnel (i.e., Woodside's Burrup Response Team, AMOSC Core Group, and OSRL) to supervise and lead any unskilled workforce. In addition, personnel from the National Response Team (NRT), Aerial Operation staff from Aerotech 1<sup>st</sup> response will be mobilised. OSRL may also supply a selection of specialist staff who have the practical skills and experience to assist and support Woodside during a spill response and are trained in incident command. Woodside also has an arrangement in place with the US-based, industry-owned cooperative, Marine Spill Response Corporation (MSRC), for the provision of an additional 16 trained response specialists.

Gaps in the trained personnel numbers during the sustained response phase would be filled by providing pre-mob training to responders to skill up the workforce and reduce the dependency on the current trained personnel.

#### **11.10.7 Spill Response Logistics**

Coordination of logistical arrangements for the response will be the responsibility of Logistics. Woodside has a number of existing arrangements for the storage and transport of equipment in the Exmouth area, which will be initially used in a response. These arrangements include agreements with logistics providers for air, marine and land.

The current stockpile in Exmouth can be supplemented by regional resources within appropriate timeframes for the response. Woodside maintains a stockpile at King Bay Supply Facility, which is immediately available to support response operations. These resources involve the movement of personnel, freight and equipment over large distances.

Woodside has internal resources and utilises third-party logistics providers for movements of freight from overseas locations by air or sea. The Supply team, along with the specialist contractors, are highly experienced in procurement and supply chain management for large scale projects and ongoing offshore operational activities. These skills are directly transferable to a Level 2 response.

Freight logistics by road will utilise existing local contracts (i.e., Exmouth Freight and Logistics) and other local operators supplemented by larger regional providers (i.e., Centurion and Toll). Woodside has existing arrangements in place for large scale freight movements by road in the North West.

Accommodation is likely to be a restraint in the response as the lack of suitable accommodation may restrict the numbers of responder personnel that could be brought into the region. There is a variety of accommodation options in Exmouth ranging from hotel/motel, backpacker, holiday home rental and caravan and camping sites. The modelling indicates that islands may be affected by hydrocarbons in a Level 2 spill. Woodside has undertaken an assessment of the requirements that would be needed to support clean-up operations on these islands. A Tactical Response Plan has been developed for the Muiron Islands. Other islands in the worst-case spill EMBA have similar coastal characteristics and can expect similar scale of response in terms of personnel and equipment. Small commercial vessels/utility vessels can be used to access these islands; however, the preferred method would be the use of landing craft for transport of equipment and waste. Woodside has assessed that there are a number of suitable vessels that would be able to be contracted in a response that are operating regionally.

#### **11.10.8 State and National Resources**

In accordance with the State Hazard Plan – Maritime Environmental Emergency (SHP-MEE), and following consultation with the DoT, additional personnel to assist with labour intensive aspects of a response (if required) will be sourced through the State Response Team. Depending on the level of response required, sources of labour may

include the local shire and DBCA.

Under the National Plan, a National Response Team (NRT), comprising experienced personnel from operator to senior spill response manager level from Commonwealth/State/NT agencies, industry and other organisations, has been developed.

The services of the NRT will be obtained through AMSA, which has made arrangements with the respective government and industry agencies, for the release of designated personnel for oil spill response activities. These services will be activated when it is assessed that an oil spill incident exceeds the resource availability at the state level.

During a National Plan incident, the Woodside CIMT or the Marine Pollution Controller appointed by a Control Agency may submit a request to AMSA for personnel from other States/NT to become part of the Incident Management Team or the incident response team. Initial contact with the Environment Protection Duty Officer will be per the Stybarrow Plug and Abandonment First Strike Plan.

### 11.10.9 Industry Resources

Woodside is a Full Member of AMOSC and as such has access to Industry Mutual Aid Arrangement equipment and National Plan equipment held as part of the contingency plans of the Australian Oil Industry and the Australian Government. AMOSC require confirmation from mobilisation authorities to access equipment listed under the National Plan.

All National Plan, AMOSC and those industry equipment resources that are registered with AMOSC, which are potentially available for response to an incident, are listed in the Marine Oil Spill Equipment System (MOSES) database. The MOSES database is a computer database that lists the type, quantity, location, status and availability of pollution control equipment. It is also used to manage audits, maintenance and repair of AMSA-owned equipment.

Normal requests for assistance are directed to AMOSC in Geelong to coordinate, but equipment may also be accessed through the MOSES database, or AMSA – Marine Environmental Protection Services (MEPS).

### 11.10.10 Government Agency Notification

Woodside response teams are hierarchical in nature, and response teams and resources are progressively activated depending on the severity of an incident. Government Agencies and Industry Organisations may also be mobilised. The Stybarrow decommissioning activities Relevant Persons Database will be used to maintain contact with identified relevant persons.

### 11.10.11 Industry Joint Venture Programmes

Woodside undertake Joint Venture Programmes with other operators and organisations including, but not limited to, Santos, Vermillion, DoT and AMOSC. These programmes aim to develop operational guidelines, operational tests, training processes and plans to inform and prepare oil spill response strategies. The programmes also provide guidance and training around First Strike incident plans, key operational considerations, understanding of shoreline sensitivities and lists of resources required to implement response.

### 11.10.12 Review and Testing of the OPEP

#### 11.10.12.1 Control and Distribution of the OPEP

The Stybarrow Plug and Abandonment OPEP (**Appendix D**) shall be issued as per the distribution list. The Document Controller is responsible for the control and distribution of the OPEP.

#### 11.10.12.2 Review of the OPEP

The Australian Operations Environment Manager is responsible for assessing any changes and deciding if the changes require a resubmission of the OPEP under Section 17 of the Environment Regulations.

### 11.10.13 Response Drills, Exercises and Testing of Arrangements

Woodside categorises incidents and emergencies in relation to response requirements as defined in **Table 11-15**.

Table 11-15: Incident response category descriptions

| Incident Category | Description   |
|-------------------|---|
| Level 1           | Level 1 incidents are those that can be resolved using existing resources, equipment and personnel.<br>A Level 1 incident is contained, controlled and resolved by site/regionally based teams using existing resources and functional support services.  |
| Level 2           | Level 2 incidents are characterised by a response that requires external operational support to manage the incident. It is triggered if the capabilities of the tactical level response are exceeded. This support is provided to the activity by activating all or part of the responsible CIMT  |
| Level 3           | A Level 3 incident or crisis is identified as a critical event that seriously threatens the organisation's people, the environment, company assets, reputation, livelihood or essential services. At Woodside, the Crisis Management Team manages the strategic impacts to respond to and recover from the threat to the company (material impacts, litigation, legal & commercial, reputation, etc.). The CIMT may also be activated as required to manage the operational response to the Level 3 incident. |

#### 11.10.14 Emergency and Spill Response Drills and Exercises

Woodside's capability to respond to incidents will be tested periodically, in accordance with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in **Table 11-16**. Emergency response testing is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards/risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are reference points developing and scheduling emergency and crisis management exercises. External participants may be invited to attend exercises (e.g., government agencies, specialist service providers, oil spill response organisations, or industry members with which Woodside has mutual aid arrangements).

The overall objective of exercises is to test procedures, skills and the teamwork of the Emergency Response and Command Teams in their ability to respond to major accident / major environment events. After each exercise, the team holds a debriefing session, during which the exercise is reviewed. Any lessons learned or areas for improvement are identified and incorporated into revised procedures, where appropriate.

Table 11-16: Testing of response capability

| Response Category | Scope                                     | Response Testing Frequency  | Response Testing Objective  |
|-------------------|---|---|---|
| Level 1 Response  | Exercises are project-/ activity-specific | At least one Level 1 OPEP drill must be conducted during an activity. For campaigns with an operational duration of greater than one month this will occur within the first two weeks of commencing the activity and then at least every 6 month hire period thereafter.  | Comprehensive exercises test elements of the Oil Pollution First Strike Plan.<br>Emergency drills are scheduled to test other aspects of the Emergency Response Plan. |
| Level 2 Response  | Exercises are MODU specific               | Level 2 Emergency Management exercises are relevant to activities with an operational duration of one month or greater. At least one Emergency Management exercise per MODU/ vessel per campaign must be conducted within 3 months prior to commencing the activity and then at every 6 month hire period thereafter, where applicable based on | Testing both the facility IMT response and/or that of the CIMT following handover of incident control.  |

| Response Category | Scope   | Response Testing Frequency  | Response Testing Objective  |
|-------------------|---|---|---|
|                   |   | duration.   |   |
| Level 3 Response  | Exercises are relevant to all Woodside assets | The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Emergency Management. | Test Woodside's ability to respond to and manage a crisis level incident. |

### 11.10.15 Hydrocarbon Spill Testing of Arrangements

There are a number of arrangements which, in the event of a spill, will underpin Woodside's ability to implement a response across its petroleum activities. In order to ensure these arrangements are adequately tested, the Capability Development Team within Security and Emergency Management ensures tests are conducted in alignment with the Hydrocarbon Spill Testing of Arrangements Schedule.

Woodside's arrangements for spill response are common across its Australian operating assets and activities to ensure the controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- Ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities.
- Test response arrangements and actions to validate response plans.
- Ensure lessons learned are incorporated into Woodside's processes and procedures and improvements are made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or activity locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in **Table 11-16**, up to eight formal exercises are planned annually, across Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

#### 11.10.15.1 Testing of Arrangements Schedule

Woodside's Testing of Arrangements Schedule (**Figure 11-5**) aligns with international good practice for spill preparedness and response management; the testing is compatible with the IPIECA Good Practice Guide and the Australian Institute for Disaster Resilience (AIDR) Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

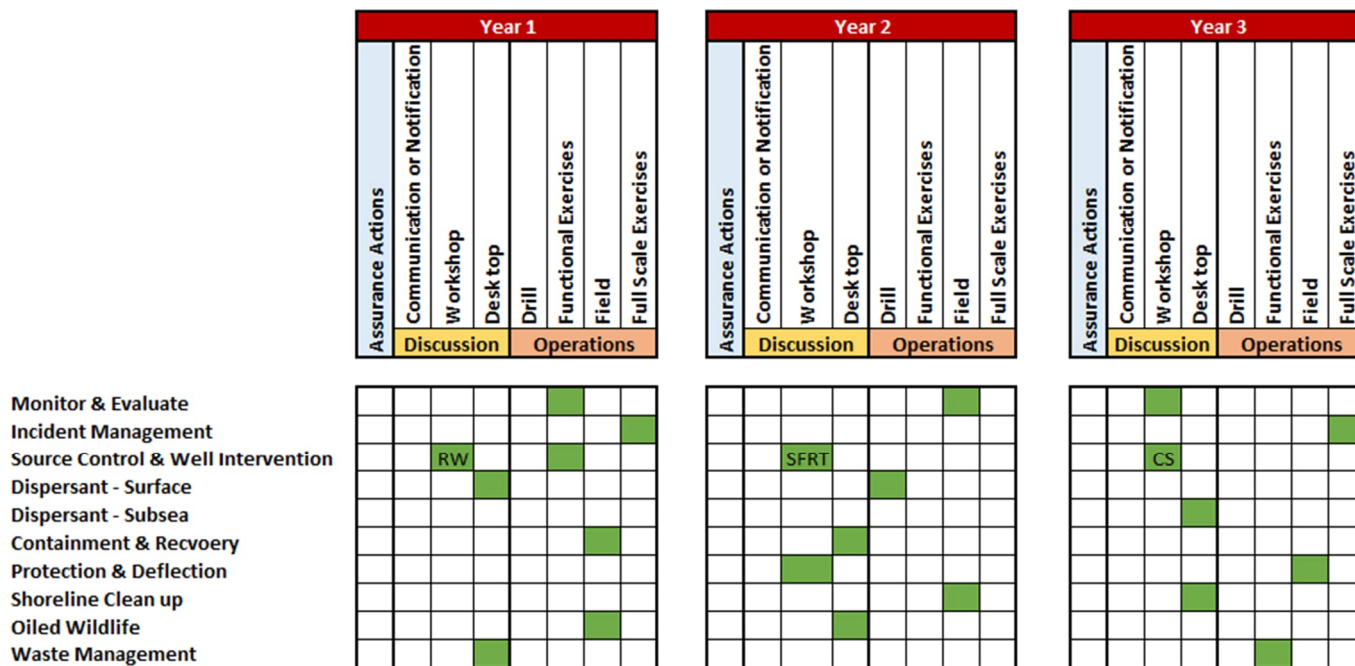

Figure 11-5: Indicative 3-yearly testing of arrangements schedule

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside’s regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g., capability, equipment and personnel). For example, an arrangement could be to test Woodside’s personnel capability for conducting scientific monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment.

The vertical columns relate to how hydrocarbon spill arrangements will be tested over the 3-year rolling schedule. The sub-heading for the column describes the standard method of testing likely to be undertaken (e.g., discussion exercise, desktop exercise), and the green cells indicate the arrangements that could be tested for each method.

Some arrangements may be tested across multiple exercises and methods (e.g., critical arrangements) or via other ‘additional assurance’ methods outside the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g., audits, no-notice drills, internal exercises, assurance drills).

**11.10.15.1.1 Source Control Emergency Response Testing**

This section aims to present the testing and exercise arrangements for Source Control techniques as recommended in the recent industry guidelines such as the APPEA Australian Offshore Titleholders Source Control Guideline (issued June 2021) and the NOPSEMA Information Paper: Source Control Planning and Procedures (issued June 2021).

The Source Control Emergency Response Planning Guideline outlines the tasks required for the planning and preparation of a campaign / region specific source control emergency response plan for subsea operations. Section 5 of the SCERP Guideline describes exercises and testing of arrangements and requirements for scope, objectives and KPIs (5.1); frequency of tests (Section 5.1.1); and close out processes (5.1.2).

The process to evaluate tests and capture outputs of the SCERP exercises including any actions will be part of normal continuous improvement activities and agreed by SMEs involved in exercises at the time of testing e.g., GWS, rig operator, S&EM. External participants (e.g., government agencies, specialist service providers, oil spill response organisations, or industry members with which Woodside has mutual aid arrangements) may be invited to attend exercises.

The paragraphs below elaborate on the scope, testing frequency, objectives, and close-out processes applicable to testing/ exercises for Source Control techniques.

**Scope, objectives and KPIs:**

The objective of tests/exercises is to verify the capability of Woodside and/or contractors to manage and deliver elements of the Source Control Plans presented in approvals documentation. Tests may include specific elements of the response cycle for source control strategy, e.g., activation of arrangements, mobilisation of equipment and

personnel and if relevant, testing of specific operational plans (e.g. SFRT, capping and relief well).

The overall objectives of testing Source Control Response are to:

- ensure relevant responders, contractors, and key personnel understand and practise their assigned roles and responsibilities
- test response arrangements and actions to validate response plans
- ensure lessons learned are incorporated into Woodside's processes and procedures and improvements are made where required.

Objectives typically include:

- testing of IMT capabilities and communications requirements
- testing of source control response plans
- evaluating specific aspects of source control arrangements, for example number of personnel, equipment list and specifications, mobilisation plans, and timeframes for response.

An example of test objectives from recent exercise are presented below for reference;

- Objective 1 - Exercising Source Control IMT against worst case credible loss of containment scenario
- Objective 2 – Sourcing of Relief well MODU
- Objective 3 – Verify key equipment and services availability to support relief well operations.
- Objective 4 – Delivery of 'xx' days Relief well as per Activity SCERP.

KPIs are taken from the ALARP commitments, as stated in the regulatory submissions. The exercises are planned utilising SMEs from the function, with independent observers or agencies as available (e.g. AMOSC, OSRL), along with Industry collaboration as available and permitted. Formal exercise plans are produced prior to tests and exercises to document the scope and objectives, allocate resources, and select relevant plans and previous lessons learnt for the test or exercise.

**Figure 11-5** provides indicative scope, testing frequency and objectives of the emergency and spill response drills and exercises which includes Source Control response techniques.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. New regions or activity locations may consider testing relevant response arrangements as soon as practical.

### ***Frequency of tests***

In addition to Testing of Arrangements for all responses listed in the schedule, source control techniques are tested on an annual basis; at least one technique per year. The schedule for testing of Source Control techniques is described in **Section 11.10.15.1**. In addition, Woodside Source Control team members participate in joint industry exercises on source control, as available, for continuous improvements to response plans.

Woodside has recently tested the below response techniques:

- SSDI and relief well response in 2019
- SFRT response (joint industry exercise hosted by Woodside) in 2020.
- Capping stack desktop Q4 2021
- Pyrenees Phase 4 Source Control Exercise with IMR, 2022
- RWIS mobilisation exercise in Q4 2022
- Capping response in Q3 2023.

In addition, Woodside Source Control team members participate in joint industry exercises on source control as available for continuous improvements to response plans.

### ***Close out Processes***

Post-exercise debriefs are held with the exercise team to identify gaps and capture learnings. The recommendations and actions are documented and assigned to the relevant function within the organisation and tracked until close-out.

Close-out reports are distributed to relevant function leads and captured under Woodside's document management systems and relevant processes. Lessons learned are incorporated into Woodside's processes and procedures and improvements are made where required.

## 11.10.16 Audits

### 11.10.16.1 Audits of External Oil Spill Response Organisations

A formal audit of OSROs is done by representatives of member companies annually. At the conclusion of an audit, improvement opportunities and corrective actions are formally noted and corrective actions assigned. In some instances, changes may be required to the OPEP, but changes will only be made in accordance with the Environment Regulations.

### 11.10.16.2 Audits of Internal Actions

Following an emergency spill incident there may be a requirement for legal and/ or other regulatory or formal HSE incident investigations to be conducted in accordance with the Woodside (PetDW) HSE Management System.

In addition to this, it is essential that the IMT response actions are reviewed as soon as practicable after an incident. The aim of the incident review is to identify any particular lessons that should be shared across the Company, and that can be used to improve the plans or response actions in the future.

Post-spill debriefs address:

- Spill causes, if known
- Spill response
- Speed
- Operation
- Effectiveness
- Equipment suitability
- Health and safety issues, as appropriate
- Integration of plan and procedures with other response organisations, consultants, and or agencies

## 11.10.17 Incident Reporting Requirements

Woodside employees and contractors are required to report all environmental incidents and non-conformance with commitments made in the EP. A computerised database is used for the recording and reporting of these incidents. Detailed investigations are completed for all actual and high potential environmental incidents. The classification, reporting, investigation and actioning of environmental incidents are undertaken in accordance with Woodside (PetDW) HSE Management System. Incident corrective actions are monitored and closed out in a timely manner. In addition to the internal notification and reporting requirements outlined above, the reporting requirements for environmental incidents are outlined in previous **Section 11.8**.

## 11.10.18 OPEP Consultation

The Woodside Hydrocarbon Spill Preparedness team shall arrange for copies of the First Strike Plan requirements to be forwarded to the following key Response Agencies:

- Australian Maritime Oil Spill Centre (AMOSOC); and
- WA DoT Maritime Environmental Emergency Response (MEER) Unit.

## **Appendix A. Woodside “Our Values”**

# OUR VALUES

## One team

We are inspired by our common purpose.

We challenge, respect, and back each other.

We are inclusive, value diversity, and can be ourselves.

## We care

We keep each other safe.

We listen and respond with humility.

We respect the environment, operate responsibly, and care for communities.

We adapt to the world's expectations of us.

## Innovate every day

We explore ideas, find creative solutions, and try new ways of doing things to provide the energy the world needs today and low-cost, lower-carbon energy for tomorrow.

## Results matter

We go after opportunities and show courage by taking the right risks and learning from our mistakes.

We spend and invest as if it's our money.

We are proud of our achievements.

## Build and maintain trust

Trust takes time and effort and will not be taken for granted.

We nurture relationships and act with integrity – doing what we say and doing it well.

PART OF  
A BETTER  
FUTURE

## Environment and Biodiversity Policy

---

### OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

### PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new exploration or development of hydrocarbons within the boundaries of natural sites on the UNESCO World Heritage List (as specified at 1 December 2022). Existing activity may continue if compatible with maintenance of the listed outstanding universal values.
- Not undertaking new exploration or development of hydrocarbons within IUCN Protected Areas (as specified at 1 December 2022) unless compatible with management plans in place for the area. Existing activity may continue if compatible with management plans in place for the area.
- Achieving net zero deforestation<sup>1</sup> associated with new projects that take a Final Investment Decision (FID) after 1 December 2022.
- Developing Biodiversity Action Plans for all new major projects (CAPEX >USD\$2 billion) that take a FID after 1 December 2022.
- Supporting positive biodiversity outcomes in regions and areas in which we operate.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

### APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

*Approved by the Woodside Energy Group Ltd Board in December 2022.*

---

<sup>1</sup> Definition of Forest: 'trees higher than 5 meters and a canopy cover of more than 10 percent on the land to be cleared'

## **Appendix B. Relevant Legislation, Regulations and Other Requirements**

## Appendix B. Relevant Legislation, Regulations and Other Requirements

### Commonwealth Legislation and Regulations

| Legislation or Regulation   | Description   | Relevance  |
|---|---|--|
| <i>Australian Maritime Safety Authority Act 1990</i>  | AMSA is a Commonwealth agency responsible for regulation of maritime safety, search and rescue, and ship sourced pollution prevention functions under the <i>Navigation Act 1912</i> (Cth), protection of the sea legislation, including the <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> (Cth) and subordinate legislation made pursuant to these Acts.                                      | Applies to the use of any vessel associated with operations and is relevant to the activity in regard to the unplanned pollution from ships.                                   |
| Australian Ballast Water Management Requirements (Commonwealth of Australia, 2020), Version 8 | The Australian Ballast Water Management Requirements (Version 8) set out the obligations on vessel operators with regards to the management of ballast water and ballast tank sediment when operating within Australian seas.   | Applies to all internationally sources vessels operating in Australian Waters which could have the potential for the introduction of IMS and potential ballast water exchange. |
| <i>Biosecurity Act 2015</i>   | This Act is about managing diseases and pests that may cause harm to human, animal or plant health or the environment. The proposed amendments also strengthen Australia's ability to manage ballast water in ships. They will provide additional protection for coastal environments from the risk of marine pest incursions by fostering new ballast water treatment technologies and phasing out ballast water exchange. | Applies to all internationally sources vessels operating in Australian Waters which could have the potential for the introduction of IMS and potential ballast water exchange. |
| Biosecurity Regulation 2016   | The Biosecurity Regulation prescribes a number of measures and obligations that are common between the <i>Biosecurity Act</i> . Pre-arrival reporting, cost recovery and the isolation and export power provisions all support business as usual activities that were available under the <i>Quarantine Act</i> and therefore represent no substantive change.  | Applies to all internationally sources vessels operating in Australian Waters which could have the potential for the introduction of IMS and potential ballast water exchange. |
| <i>Corporations Act 2001</i>  | This Act is the principal legislation regulating matters of Australian companies, such as the formation and operation of  | The titleholder has provided ACN details within the meaning of the Act.  |

| Legislation or Regulation   | Description   | Relevance   |
|---|---|---|
|   | companies, duties of officers, takeovers and fundraising.   |   |
| <p><i>Environment Protection &amp; Biodiversity Conservation Act 1999 (EPBC Act)</i></p> <p>Environment Protection and Biodiversity Conservation Regulations 2000</p> | <p>Commonwealth Department of Sustainability, Environment, Water, Population &amp; Communities administers Act that provides legal framework to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places—defined in the EPBC Act as matters of national environmental significance (NES). These include nationally threatened species and ecological communities, migratory species and Commonwealth marine areas. The Act regulates assessment and approval of proposed actions likely to have a significant impact on a matter of NES. The approval decision is made by a delegate of the Australian Government Environment Minister.</p> <p>Regulations provide for a wide range of detail essential for the operation of the Act, including regulations relating to management of Commonwealth reserves, information requirements for assessment processes, enforcement, granting of various permits, publication requirements and criteria that need to be met in relation to a wide variety of decisionmaking processes provided for under the Act.</p> | <p>This Act applies to all aspects of the activity that have the potential to impact MNES. NOPSEMA manages compliance with the relevant regulations and plans under the Act for this EP.</p> <p>Where activities have existing approvals under the Act, these will continue to apply.</p> |
| <p><i>Environment Protection (Sea Dumping) Act 1981</i></p> <p>Environment Protection (Sea Dumping) Regulations 1983</p>  | <p>The Act regulates the dumping at sea of controlled material (including certain wastes and other matter), the incineration at sea of controlled material, loading for the purpose of dumping or incineration, export for the purpose of dumping or incineration, and the placement of artificial reefs. Permits are required for any sea dumping activities. Operational discharges from vessels are not defined as 'dumping' under the 1996 Protocol to the Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972 and therefore not regulated under the Act.</p>  | <p>Not relevant to this petroleum activity.</p> <p>However, prior to permanently leaving any structure in-situ under future decommissioning EPs, Woodside will obtain a Sea Dumping Permit in accordance with the requirements of the <i>Sea Dumping Act</i>.</p>                         |

| Legislation or Regulation   | Description  | Relevance   |
|---|--|---|
| <i>Hazardous Waste (Regulation of Exports and Imports) Act 1989</i>         | Relates to controls over import and export of hazardous waste material. Permits are required to import waste into Australia.   | Activity does not involve transboundary movement of hazardous wastes.   |
| <i>Industrial Chemicals (Notification and Assessment) Act 1989</i>          | The Act establishes the National Industrial Chemicals Notification and Assessment Scheme (NICNAS) to regulate the supply of chemicals into Australia, and importers or manufacturers of chemicals or chemical products must comply. The Act involves assessing and registering industrial chemicals in a national scheme and applies to solvents, adhesives, plastics, laboratory chemicals and paints, as well as chemicals used in cleaning products. Chemicals are defined by exclusion: a substance is an industrial chemical if it is not an agricultural or veterinary product, medicine or medicinal product, food additive, contaminant or natural toxicant. | Chemicals are assessed to ensure they are ALARP and acceptable in accordance with Section <b>Error!</b><br><b>Reference source not found..</b>  |
| National Environment Protection (National Pollutant Inventory) Measure 1998 | The National Pollutant Inventory (NPI) is a database established to provide information on substances being emitted to the air, land and water, and transported in waste. The inventory tracks the magnitude of emissions and the amounts transported in waste of 93 substances. While the NPI National Environmental Protection Measures (NEPM) is a federal initiative, each state has legislation giving effect to the program.   | The act enables implementation of NEPMs, which are a set of national objectives designed to assist in protecting or managing aspects of the environment. Requires demonstration that the activity will be performed in line with the principles of ecologically sustainable development, and that impacts and risks resulting from these activities relevant to NEPM national objectives are ALARP and acceptable.          |
| National Greenhouse and Energy Reporting Act 2007                           | This Act provides for the reporting and dissemination of information related to greenhouse gas emissions, greenhouse gas projects, energy production and energy consumption, and for other purposes.   | This Act applies to the atmospheric emissions through combustion engine use to operate the project vessels and associated with the activity. The Act aims to reduce the impact of GHG emissions associated with vessel use for the installation and commissioning activity, through compliance with MARPOL Annex VI (Marine Order 97: marine pollution prevention – air pollution) and require the use of low sulphur fuel. |
| <i>Navigation Act 2012</i>  | This Act establishes framework for controls on navigation, marine safety and shipping for ships in Australian waters or territories primarily proceeding on international or interstate voyages.   | Vessel movements will be governed by marine safety regulations and Marine Orders under the Act  |

| Legislation or Regulation                              | Description   | Relevance  |
|--|---|--|
| Navigation (Orders) Regulations 1980                   | Details the penalty where Marine Orders are prescribed as 'Penal Provisions'.   | Vessel movements will be governed by marine safety regulations and Marine Orders under the Act                                   |
| Marine Orders  | Marine Orders are subordinate rules made pursuant to the <i>Navigation Act 1912</i> and <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> affecting the maritime industry. They are a means of implementing Australia's international maritime obligations by giving effect to international conventions in Australian law.  | Vessel movements, safety, discharges and emissions will be governed by the Marine Orders   |
| Marine Order 32 – Cargo Handling Equipment             | Marine Order 32 relates to loading and unloading of cargo, and the safe transfer of persons, from ships, off-shore industry vessels and off-shore industry mobile units.  | Unloading of cargo, and the safe transfer of persons, from ships, offshore industry vessels will be governed by Marine Order 32. |
| Marine Order 41 Carriage of Dangerous Goods            | MO41 gives effect to Part A Chapter VII of SOLAS, in particular the International Maritime Dangerous Goods Code (IMGDC) which deals with the carriage of dangerous goods in packaged form, together with prescribing other matters related to carriage of dangerous goods in ships, notice of intention to ship dangerous goods, and provisions related to the loading, stowing, carriage or unloading in ships of cargo. | Carriage of dangerous goods on vessels will be governed by Marine Order 41.  |
| Marine Order 58 – International Safety Management Code | MO58 specifies the requirements of the International Safety Management (ISM) Code and gives effect to Chapter IX of SOLAS. The purpose of the ISM Code is to provide an international standard for the safe management and operation of ships and for pollution prevention.   | Applies to management and operation of vessels.  |
| Marine Order 59 – Offshore Industry Supply Vessels     | MO59 specifies a number of performance-based requirements for safe navigation and a safe system of operations for off-shore industry vessel operations, including arrangements for safe operations during emergencies. The Order specifies guidelines considered to satisfy these performance-based requirements. The Order also allows alternative practices to  | Applies to safe navigation and a safe system of operations of vessels.   |

| Legislation or Regulation  | Description   | Relevance  |
|--|---|--|
|  | be considered and approved as equivalent to those practices in the specified guidelines (NWEA Guidelines). MO59 applies to vessels not registered in Australia, if vessel is engaged in operations associated with or incidental to petroleum exploration or production activity.   |  |
| Marine Order 91 – Marine Pollution Prevention – Oil                        | MO91 gives effect to Annex I of the International Convention for the Prevention of Pollution from Ships 1973, as amended by the Protocol of 1978 (MARPOL 73/78).  | Applies to pollution prevention on vessels.                        |
| Marine Order 93 – Marine Pollution Prevention – Noxious Liquid Substances  | MO93 gives effect to Annex II of the International Convention for the Prevention of Pollution from Ships 1973, as amended by the Protocol of 1978 (MARPOL 73/78). Details the discharge criteria and measures for the control of pollution by noxious liquid substances carried in bulk. It subdivides substances into and contains detailed operational standards and procedures. Some 250 substances are appended to the London Convention. The discharge of their residues is allowed only to reception facilities until certain concentrations and conditions (which vary with the category of substances) are compiled with. In any case, no discharge of residues containing noxious substances is permitted within 12 miles of the nearest land. | Applies to operational discharges from vessels.                    |
| Marine Order 94 – Marine Pollution Prevention – Package Harmful Substances | MO94 gives effect to Annex III of the International Convention for the Prevention of Pollution from Ships 1973, as amended by the Protocol of 1978 (MARPOL 73/78) in relation to packaged harmful substances.   | Applies to waste management and pollution prevention on vessels.   |
| Marine Order 95 - Marine Pollution Prevention - Garbage                    | MO95 gives effect to Regulation 8 of Annex V (dealing with port State control on operational requirements) and prescribes matters in relation to Regulation 9 of Annex V (dealing with placards, garbage management plans and garbage record-keeping) to the International Convention for the Prevention of Pollution from Ships (MARPOL 73/78).  | Applies to operational discharges and waste management on vessels. |

| Legislation or Regulation  | Description  | Relevance   |
|--|--|---|
| Marine Order 96<br>Marine Pollution Prevention – Sewage                      | MO96 sets out MARPOL requirements in relation to survey and certification requirements; how sewage should be treated or held aboard ship; and the circumstances in which discharge into the sea may be allowed.  | Applies to operational discharges from vessels.               |
| Marine Order 97 – Marine Pollution Prevention – Air Pollution                | MO96 sets out MARPOL requirements in relation to air pollution.  | Applies to air pollution from vessels.                        |
| <i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i>                | <p>Legislation concerning Australian offshore petroleum exploration &amp; production in Commonwealth Waters. National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) is an independent safety and environmental management Authority funded by levies on industry participants and regulates matters with powers conferred directly from OPGGS Act and via Regulations concerned with:</p> <ul style="list-style-type: none"> <li>• occupational health &amp; safety law at facilities and offshore operations under Schedule 3</li> <li>• environmental management</li> <li>• structural integrity of Wells under Resource management regulations.</li> </ul> <p>NOPSEMA may also declare a 500 metre petroleum safety zone around wells associated with drilling operations.</p> | Applies to the activity assessed under this Environment Plan. |
| Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 | <p>Regulations administered by NOPSEMA to ensure offshore petroleum activity is carried out in a manner consistent with the principles of ecologically sustainable development and in accordance with an accepted environment plan, in particular:</p> <ul style="list-style-type: none"> <li>• assessment of EPs, including associated OPEPs (previously oil spill contingency plans)</li> <li>• investigation of accidents, occurrences and circumstances with regard to deficiencies in environmental management.</li> </ul>  | Applies to the activity assessed under this Environment Plan. |

| Legislation or Regulation  | Description   | Relevance   |
|--|---|---|
| <i>Offshore Petroleum and Greenhouse Gas Storage (Regulatory Levies) Act 2003</i>  | Act to impose levies relating to the regulation of offshore petroleum activity, including well levies and environment plan levy.  | A levy will be applied to the petroleum activity under this EP.   |
| Offshore Petroleum and Greenhouse Gas Storage (Regulatory Levies) Regulations 2004 | Regulations prescribing the amount and method of calculation for imposition of levies relating to the regulation of offshore petroleum activity, including well levies and environment plan levy.   | A levy will be applied to the petroleum activity under this EP.   |
| <i>Ozone Protection and Synthetic Greenhouse Gas Management Act 1989</i>           | This Act gives effect to Australia's obligations under the Vienna Convention and the Montreal Protocol by introducing, a system of controls on the manufacture, import and export of substances that deplete ozone in the atmosphere and synthetic greenhouse gases.  | The activity does not include import, export or manufacture activities of ODS.<br>Applies where ODS is found on vessel refrigeration systems; however, this is a rare occurrence. |
| Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995          | Regulation contains controls relating to:<br>import/export/manufacture licensing; manufacture and disposal of scheduled substances; refrigeration and air-conditioning; methyl bromide; and fire protection; import and export of any products and equipment containing hydrofluorocarbons, perfluorocarbons and SF6; and a requirement for importers and manufacturers to pay a levy incorporating a carbon charge component based on the equivalent carbon price.   | The activity does not include import, export or manufacture activities of ODS.<br>Applies where ODS is found on vessel refrigeration systems; however, this is a rare occurrence. |
| <i>Protection of the Sea (Powers of Intervention) Act 1981</i>                     | Act authorises AMSA to take measures for the purpose of protecting the sea from pollution by oil and other noxious substances discharged from ships and implements the International Convention Relating to Intervention on the High Seas in Cases of Oil Pollution Casualties and the Protocol relating to Intervention on the High Seas in Cases of Pollution by Substances other than Oil. Act enables AMSA to take measures on the high seas to prevent, mitigate or eliminate the danger apparent upon a maritime casualty where there is grave and imminent danger to the coastline of Australia, or to the related interests of Australia from pollution or threat | This Act applies to vessel discharges and movements associated with the activity.   |

| Legislation or Regulation  | Description   | Relevance  |
|--|---|--|
|  | of pollution of the sea by oil which may reasonably be expected to result in major harmful consequences. Similar powers apply in relation to a ship which is in internal waters, is in the Australian coastal sea, or any Australian ship on the high seas where oil or a noxious substance is escaping and gives AMSA power to take such measures as it considers necessary to achieve a number of objectives detailed in the Act.   |  |
| <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i>             | Act administered by AMSA, deals with the protection of the marine environment from ship-sourced pollution. The Act implements the International Convention for the Prevention of Pollution from Ships 1973 and the subsequent 1978 Protocol to the Convention (collectively MARPOL 73/78) and setting operational and construction standards for ships to prevent pollution and regulating normal operational discharges from ships. MARPOL 73/78 annexes regulate the discharge of oil (Annex I), noxious liquid substances (Annex II), the disposal from ships of sewage (Annex IV) and garbage (Annex V) and prohibit the disposal of harmful substances carried by sea in packaged forms (Annex III). | This Act applies to vessel discharges and movements associated with the activity.  |
| Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994   | Sets penalty levels for non-compliance.   | Relates to vessel non-compliance to Marine Orders.   |
| <i>Protection of the Sea (Civil Liability of Bunker Oil Pollution Damage) Act 2008</i> | This Act implements the requirements for the International Convention on Civil Liability for Bunker Oil Pollution Damage.   | This Act applies to diesel refuelling which may be performed at sea as part of the activity.   |
| <i>Underwater Cultural Heritage Act 2018</i>   | The Act replaces the <i>Historic Shipwrecks Act 1976</i> with a modernised framework for protecting and managing Australia underwater culture heritage. The Act protects shipwrecks, sunken aircraft that are at least 75 years old, whether their location is known or unknown, and associated relics. It also enables the Minister to protect shipwrecks  | Anyone who finds the remains of a vessel or aircraft, or an article associated with a vessel or aircraft, needs to notify the relevant authorities, as soon as possible but ideally no later than after one week, and to give them information about what has been found and its location. |

| Legislation or Regulation | Description  | Relevance |
|---------------------------|--|-----------|
|                           | that have been sunk for less than 75 years if they are of historic significance, such as ships wrecked during World War II. All relics associated with historic shipwrecks are protected both while associated with the shipwreck and after their removal, provided that they went down with the ship. The Act also enables the Minister to declare protected zones around historic shipwrecks. A permit is required to carry out prescribed activities, such as trawling, diving or mooring or using ships in a protected zone. The Act prohibits conduct that may interfere with protected shipwrecks and their associated relics. |           |

## Western Australian Legislation and Regulations

| Legislation or Regulation                            | Description   |
|--|---|
| <i>Aboriginal Heritage Act 1972</i>                  | Enacted to ensure all Aboriginal cultural heritage within Western Australia could be properly protected and preserved. The Act provides recognition, protection and preservation of Aboriginal sites in Western Australia. It is an offence under Section 17 of the Act to excavate, destroy, damage, conceal, or in any way alter an Aboriginal site.  |
| <i>Conservation and Land Management Act 1984</i>     | DBCA is responsible for the day-to-day management of marine parks vested with Marine Parks and Reserves Authority (MPRA) and provide administrative support to the MPRA. MPRA is responsible for the preparation of management plans for all lands and waters which are vested in it. Marine nature reserves, marine parks and marine management areas are the three reserve categories vested in the MPRA. Offshore operations must comply with specific marine park conditions when navigating or conducting activities in or near areas designated as marine sanctuaries for conservation, recreational, ecological, historical, research, educational, or aesthetic qualities, such as Ningaloo Marine Park (state waters) (Class A reserve) and Muiron Islands Marine Management Area. |
| Conservation and Land Management Regulations 2002    | Details further requirements for protection of flora and fauna including restrictions on approaches to fauna, fishing restrictions and operation of vessels in marine protected areas. Also includes prohibition of pollution in marine protected areas.  |
| <i>Dangerous Goods Safety Act 2004</i>               | Act relating to the safe storage, handling and transport of dangerous goods and for related purposes.   |
| Dangerous Goods Safety (Explosives) Regulations 2007 | Relevant to storage and handling of explosives on marine support vessels.   |

| Legislation or Regulation   | Description   |
|---|---|
| Dangerous Goods Safety (Goods in Ports) Regulations 2007                                | 'Goods in Ports' Regulations give legal status to the provisions of Australian Standard AS 3846 The handling and transport of dangerous cargoes in port areas. Requires classification of Dangerous Goods loads based on the International Maritime Dangerous Goods Code (IMDG) rather than ADG Code. Additional requirements are for safety management and emergency plans.  |
| Dangerous Goods Safety (Storage and Handling of Non-Explosives) Regulations 2007        | Regulations adopt NOHSC Standard for the Storage and Handling of Workplace Dangerous Goods. Western Australia has retained a licensing system for dangerous goods. In relation to dangerous goods, 'handling' includes manufacture, process, pack, use, sell, supply, carry and disposal of dangerous goods. References to the Australian Dangerous Goods Code (the ADG Code) in the regulations relate to the 7th edition of the ADG Code.   |
| <i>Emergency Management Act 2005</i>  | WestPlan-MTE details the emergency management arrangements relating to the prevention of, preparation for, response to and recovery from Marine Transport Emergencies that occur in WA waters.  |
| Emergency Management Regulations 2006   | DoT Marine Safety is the prescribed Hazard Management Agency for response under the Emergency Management Regulations 2006 for all emergencies in which there is an actual or impending event involving a ship that is capable of causing loss of life, injury to a person or damage to the health of a person, property or the environment.   |
| <i>Environmental Protection Act 1986</i>  | Act contains measures for preventing or minimising pollution, which includes a general prohibition against pollution. Applicable areas include discharge of operational waste (sewage, galley waste) and oily water from vessels, gaseous emissions from diesel engines and ballast water exchange and discharge.   |
| Environmental Protection Regulations 1987   | Prescribes further matters to give effect to the Act including control of pollution and licence fees.   |
| Environmental Protection (Unauthorised Discharges) Regulations 2004                     | Prescribes further details of materials that are prohibited from discharge into the environment.  |
| <i>Fish Resources Management Act 1994</i><br>Fish Resources Management Regulations 1995 | Act establishes framework for management of fishery resources. Commercial fishing is licensed or under a Fisheries Management Plan. Fisheries in WA waters are subject to the Act and include a wide range of aquatic organisms, other than protected species. Threatened aquatic species may be protected under State and Commonwealth biodiversity conservation laws. Department of Fisheries manages commercial and recreational fishing in Western Australia within four regions: the West Coast, Gascoyne, South Coast and North Coast. The Act also has power to declare Fish Habitat Protection Areas. |
| <i>Marine and Harbours Act 1981</i>   | Act to provide for the advancement of efficient and safe shipping and effective boating and port administration through the provision of certain facilities and services.   |
| Marine and Harbours (Fuelling) Regulations 1985   | Refuelling businesses in ports to be licensed.  |
| <i>Maritime Archaeology Act 1973</i>  | The WA <i>Maritime Archaeology Act 1973</i> protects maritime archaeological sites in state waters, such as bays, harbours and rivers. Other than shipwrecks, it includes single relics, such as an anchor, and land sites associated with exploration, early settlements, whaling and pearling camps and shipwreck survivor camps.   |

| Legislation or Regulation   | Description  |
|---|--|
| <i>Pollution of Waters by Oil and Noxious Substances Act 1987</i>               | Act relating to the protection of the sea and certain waters from pollution by oil and other noxious substances discharged from ships and places on land.  |
| <i>Port Authorities Act 1999</i>  | Local Pilotage Directions apply to vessels navigating within declared ports such as the Dampier Port Authority (DPA) port limits however DPA complies with the <i>Port Authorities Act 1999</i> (WA) and Port Authorities Regulations 2001 (WA) Part 3. The Regulations take precedent over Port Directions in the event of any conflict.  |
| Port Authorities Regulations 2001   | Pilotage services within the Port are licensed by DPA in the form of a pilotage provider's licence issued under the terms of the Port Authorities Regulations 2001.  |
| Port of Dampier Marine Notice (002/2005)  | Addresses sewage and putrescible waste discharge requirements whilst vessel in Port of Dampier.  |
| <i>Shipping and Pilotage Act 1967</i>   | Act relating to shipping and pilotage in and about the ports, fishing boat harbours and mooring control areas of the State.  |
| Navigable Waters Regulations 1958   | Prescribes further matters on navigational safety in WA waters, use of jetties, obstruction and wrecks, berthing and mooring of vessels.   |
| <i>Western Australian Marine (Sea Dumping) Act 1981</i>                         | An Act to provide for the protection of the environment by regulating the dumping into the sea, and the incineration at sea, of wastes and other matter and the dumping into the sea of certain other objects.   |
| Western Australian Marine (Sea Dumping) Regulations 1982                        | Primarily concerns fees and prescribed information for reports of dumping.   |
| <i>Western Australian Marine Act 1982</i>                                       | Before any commercial vessel can operate in the State of Western Australia, the vessel is required to have onboard a valid Certificate of Survey. Certificate of Survey is only issued when the vessel satisfactorily complies with the Western Australian Marine Act in respect to its hull, machinery and equipment and is crewed according to the <i>Western Australian Marine Act 1982</i> . |
| WA Marine (Surveys and Certificates of Survey) Regulations 1983                 | Marine Safety is responsible for approving plans, inspecting, approving construction and carrying out periodical surveys of all commercial vessels under WA jurisdiction, be they passenger carrying, trading, fishing, or offshore industry vessels.  |
| W.A. Marine (Certificates of Competency and Safety Manning) Regulations 1983    | Marine Safety is responsible for administering national and internationally agreed competency standards; and for the examination of candidates for commercial Certificates of Competency as master, mate or engineer in WA vessels.  |
| Prevention of Collisions at Sea Regulations 1983                                | Regulations largely comprise the Rules set out in the International Regulations for Preventing Collisions at Sea 1972 (COLREGs) applicable in state and internal waters.   |
| <i>Wildlife Conservation Act 1950</i><br>Wildlife Conservation Regulations 1970 | An Act to provide for the conservation and protection of wildlife.   |
| Wildlife Conservation (Specially Protected Fauna) Notice 2006                   | Declaration of specially protected fauna in WA, including fauna that is rare or is likely to become extinct. List includes over 199 species, itemising scientific and common name.   |

## International Conventions

| International Convention   | Description  |
|--|--|
| Agreement between the Government of Australia and the Government of Japan for the Protection of Migratory Birds in Danger of Extinction and their Environment, 1974 (commonly referred to as JAMBA)  | JAMBA provides for cooperation between Japan and Australia to minimise harm to major areas used by birds that migrate between the two countries. The EPBC Act gives effect to JAMBA by listing migratory birds recognised by the agreement as migratory under the EPBC Act. Migratory species are MNES.  |
| Agreement between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment, 1986 (commonly referred to as CAMBA) | CAMBA provides for cooperation between China and Australia to minimise harm to major areas used by birds that migrate between the two countries. The EPBC Act gives effect to CAMBA by listing migratory birds recognised by the agreement as migratory under the EPBC Act. Migratory species are MNES.  |
| Agreement between the Government of Australia and the Government of the Republic of Korea for the Protection of Migratory Birds and their Environment, 2002 (commonly referred to as ROKAMBA)        | ROKAMBA provides for cooperation between the Republic of Korea and Australia to minimise harm to major areas used by birds that migrate between the two countries. The EPBC Act gives effect to ROKAMBA by listing migratory birds recognised by the agreement as migratory under the EPBC Act. Migratory species are MNES.  |
| Convention on the Conservation of Migratory Species of Wild Animals, 1979 (Bonn Convention)  | The Bonn Convention aims to conserve migratory species within their migratory ranges. The Bonn Convention provides specific protection for migratory species threatened with extinction or requiring international cooperation to conserve effectively. The EPBC Act gives effect to the Bonn Convention through listing species as migratory under Part 3 of the Act. Migratory species are MNES. |
| Convention on the Control of Harmful Anti-fouling Systems on Ships, 2001   | The convention prohibits the use of harmful organotins in anti-fouling paints used on ships and establishes a mechanism to prevent the potential future use of other harmful substances in anti-fouling systems. The Commonwealth <i>Protection of the Sea (Harmful Anti-fouling Systems) Act 2006</i> and subsidiary Marine Order give effect to the Convention.                                  |
| Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972 (London Convention)   | The London Convention is an agreement to control pollution of the sea by dumping. The Commonwealth <i>Environment Protection (Sea Dumping) Act 1981</i> gives effect to the London Convention.   |
| Convention on Wetlands of International Importance (Ramsar Convention)   | The Ramsar Convention provides for the conservation and sustainable use of wetlands. The EPBC Act gives effect to the Ramsar Convention by providing specific protection for wetlands recognised by the Convention under Part 3 of the EPBC Act. These wetlands are termed "wetlands of international importance" and are MNES.  |
| International Convention for the Control and Management of Ships' Ballast Water and Sediment, 2004   | The Convention aims to prevent the spread of harmful aquatic organisms from one region to another via ballast water and sediment. The Commonwealth <i>Biosecurity Act 2015</i> gives effect to the Convention.   |

| International Convention   | Description  |
|--|--|
| International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978 (MARPOL 73/78)   | <p>MARPOL 73/78 aims to minimise pollution of the sea from ships. All ships flagged under countries that are signatories to MARPOL 73/78 are subject to its requirements, regardless of where they sail. Member nations are responsible for vessels registered on their national ship registry. Several Annexes apply directly to offshore petroleum activities:</p> <ul style="list-style-type: none"> <li>• MARPOL 73/78 Annex I (Prevention of pollution by oil),</li> <li>• MARPOL 73/78 Annex II (Control of pollution by noxious liquid substances in bulk),</li> <li>• MARPOL 73/78 Annex III (Prevention of pollution by harmful substances carried by sea in packaged form),</li> <li>• MARPOL 73/78 Annex IV (Pollution by sewage from ships),</li> <li>• MARPOL 73/78 Annex V (Pollution by garbage from ships),</li> <li>• MARPOL 73/78 Annex VI (Prevention of air pollution from ships).</li> </ul> <p>The Commonwealth <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> and subsidiary Marine Orders give effect to MARPOL 73/78.</p> |
| International Convention for the Safety of Life at Sea 1974 (SOLAS Convention)   | <p>The SOLAS Convention sets minimum safety standards for construction, equipment and operation of merchant ships. The convention requires signatory flag states to ensure that ships flagged by them comply with these standards as a minimum. The Commonwealth <i>Navigation Act 2012</i> and subsidiary Marine Orders give effect to the convention.</p>  |
| International Convention on Standards of Training, Certification and Watchkeeping for Seafarers, 1978 (STCW Convention)        | <p>The STCW Convention sets out minimum standards for masters, officers and watch personnel on merchant vessels. The Commonwealth <i>Navigation Act 2012</i> and subsidiary Marine Orders give effect to the convention.</p>   |
| International Regulations for Preventing Collisions at Sea 1972 (COLREGS)  | <p>The COLREGS outline internationally recognised navigation rules to be used by vessels at sea to avoid collisions. The regulations are published by the International Maritime Organization (IMO). The Commonwealth <i>Navigation Act 2012</i> and subsidiary Marine Orders give effect to the regulations.</p>  |
| Minamata Convention on Mercury (Minamata Convention)   | <p>The Minamata Convention on Mercury requires parties to address adverse effects of mercury to protect human health and the environment. Australia is a signatory to, and has ratified, the Convention. No specific federal legislation has been introduced to give effect to the Minamata Convention, with effect given by existing Commonwealth, state and territory legislation.</p>   |
| The Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal, 1972 (Basel Convention) | <p>The Basel Convention reduces the movement of hazardous wastes (excluding radioactive wastes) between nations, particularly from developed to less developed countries. The Commonwealth <i>Hazardous Waste (Regulation of Exports and Imports) Act 1989</i> gives effect to the convention.</p>   |

## 1. INTRODUCTION

### 1.1 Purpose

This document applies, where indicated in the relevant Environment Plan, to Woodside Energy Ltd. (Woodside) activities and operations.

### 1.2 Scope

This document describes the existing environment within the Woodside areas of activity located in Commonwealth waters off north-western Western Australia (WA), with a focus on the North-west Marine Region (NWMR) (**Figure 1-1**). This document includes details of the particular and relevant values and sensitivities of the environment as required by the Commonwealth Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 in order to inform the impact and risk evaluation of Woodside's activities within the NWMR. Furthermore, the key values of the South-west Marine Region (SWMR) and the North Marine Region (NMR) are summarised to encompass areas outside the NWMR. This is with reference to the environment that may be affected (EMBA), as defined and described in individual EPs, for unplanned hydrocarbon spill risks. Additional information appropriate to the nature and scale of the impacts and risks of activities that may interact with the environment will be used to further inform impact and risk assessments and included in the Description of the Existing Environment of individual EPs.

This document is informed by a variety of resources that includes: a search of the Department of Agriculture, Water and the Environment (DAWE) Protected Matters Search Tool (PMST) for the marine bioregions (NWMR, SWMR and NMR) and the three PMST reports provided in **Appendix A**; State (WA)/Commonwealth Marine Park Management Plans, the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) Species Profile and Threats Database (SPRAT), Part 13 statutory instruments (recovery plans, conservation advices and wildlife conservation plans for listed threatened and migratory species); and peer reviewed scientific publications, as well as Woodside and Joint Venture (JV) funded studies and other titleholder funded study findings available in the public domain.

### 1.3 Review and Revision

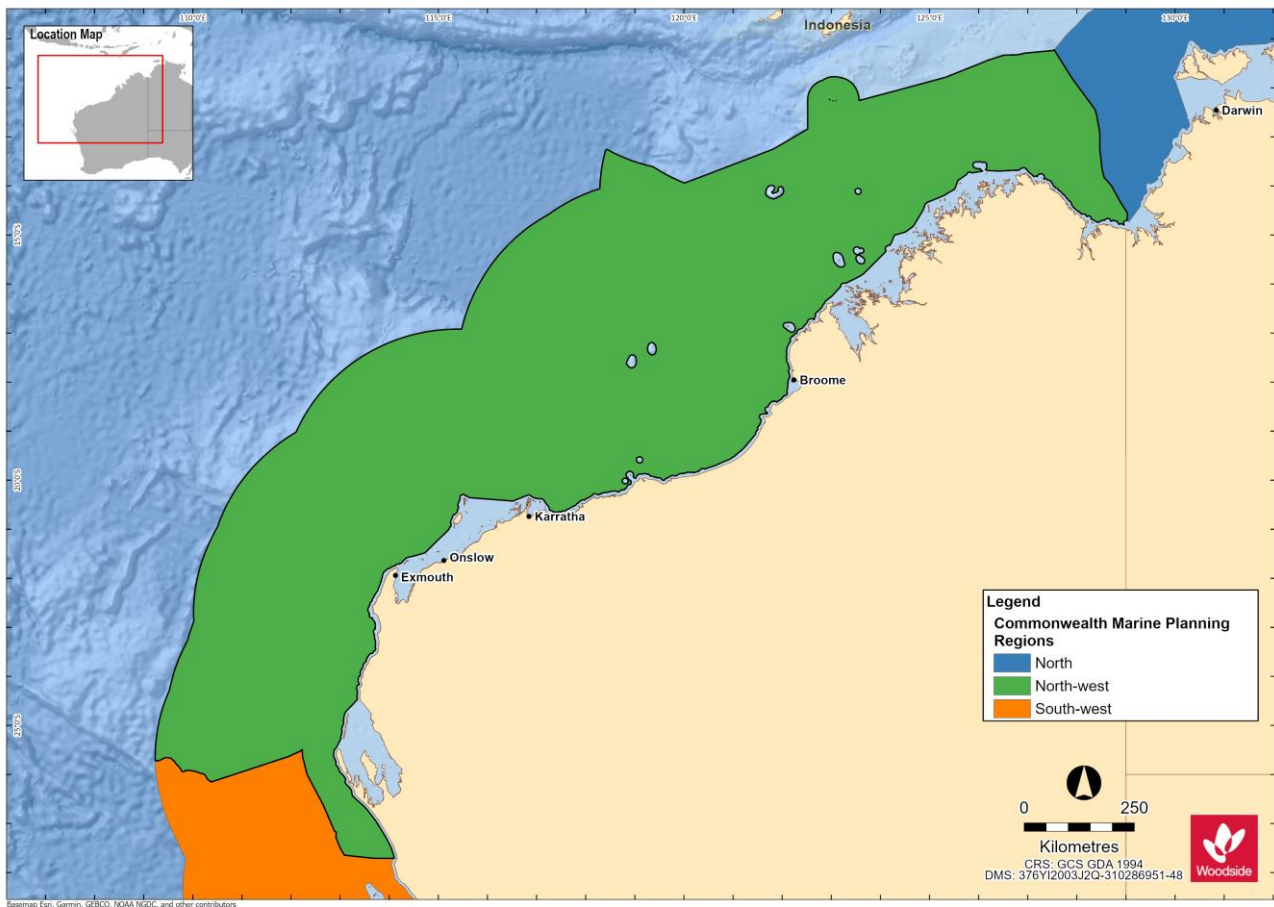

The information presented in this document is reviewed and updated, where relevant, on at least an annual basis to address any relevant changes, which includes but is not limited to the status of EPBC Act listed species, Part 13 Instruments, policies and guidelines and recently published scientific literature.

### 1.4 Regional Context

Where relevant, the physical, biological and social environments within the areas of interest are discussed with reference to the three marine bioregions of Australia—NWMR, SWMR and NMR (**Table 1-1**). The NWMR is the focal marine bioregion for the Description of the Existing Environment as this is currently the location of most of Woodside's activities.

**Table 1-1. Description of the Marine Bioregions**

| Marine Bioregion | Description   |
|------------------|---|
| North-west       | The NWMR includes all Commonwealth waters (from 3 nautical mile [nm] from the Territorial Sea Baseline [TSB] to the 200 nm Exclusive Economic Zone [EEZ] boundary) extending from the WA/Northern Territory (NT) border to Kalbarri, south of Shark Bay in WA, covering an area of approximately 1.07 million square kilometres and includes extensive areas of shallower waters on the continental shelf, as well as deep areas of abyssal plain where water depths are 5000 m or greater. |
| South-west       | The SWMR comprises Commonwealth waters from the eastern end of Kangaroo Island in SA to Shark Bay in WA. The region spans approximately 1.3 million square kilometres of temperate and subtropical waters and abuts the coastal waters of SA and WA.  |
| North            | The NMR comprises Commonwealth waters from west Cape York Peninsula to the NT/WA border). The region covers approximately 625,689 square kilometres of tropical waters in the Gulf of Carpentaria and Arafura and Timor seas, and abuts the coastal waters of Queensland and the NT.  |

**Figure 1-1. Marine Bioregions: North-west (NWMR), South-west (SWMR) and North (NMR)**

## 2. PHYSICAL ENVIRONMENT

### 2.1 Regional Context

The key physical characteristics of the NWMR, SWMR and NMR are presented in **Table 2-1**.

**Table 2-1 Key physical characteristics of the NWMR, SWMR and NMR**

| Bioregion                | Key Characteristics   |
|--------------------------|---|
| North-west Marine Region | The NWMR experiences a tropical monsoonal climate towards the northern extent of the region, transitioning to tropical arid and subtropical arid within the central and southern areas of the region (DSEWPAC, 2012a).  |
|                          | The NWMR is part of the Indo-Australian Basin, the ocean region between the north-west coast of Australia and the Indonesian islands of Java and Sumatra. Dominant currents in the Region include: the South Equatorial Current, the Indonesian Throughflow; the Eastern Gyral Current, and the Leeuwin Current (DEWHA, 2007a).   |
|                          | The seafloor of the NWMR consists of four general feature types: continental shelf; continental slope; continental rise; and abyssal plain and is distinguished by a range of topographic features including canyons, plateaus, terraces, ridges, reefs, and banks and shoals.  |
| South-west Marine Region | The SWMR contains both subtropical and temperate climates, with overall light climatic cycles.  |
|                          | The SWMR experiences complex and unusual oceanographic patterns, driven largely by the Leeuwin Current and its associated currents that have a significant influence on biodiversity distribution and abundance.  |
|                          | The major seafloor features of the SWMR include a narrow continental shelf on the west coast to the waters off south-west WA, and a wide continental shelf dominated by sandy carbonate sediments of marine origin in the Great Australian Bight, the region also contains a steep, muddy continental slope, many canyons and large tracts of abyssal plains (DSEWPAC, 2012b).          |
| North Marine Region      | The NMR experiences a tropical monsoonal climate with complex weather cycles, including high temperatures and heavy seasonal yet variable rainfall and cyclones, which can be both destructive (loss of seagrass and mangroves) and constructive (mobilisation of sediment into coastal habitats).  |
|                          | The NMR comprises Commonwealth waters from west Cape York Peninsula to the NT-WA border, covering tropical waters in the Gulf of Carpentaria and Arafura and Timor seas. Currents in the NMR are driven largely by strong winds and tides, with only minor influences from oceanographic currents such as the Indonesian Throughflow and the South Equatorial Current (DSEWPAC, 2012c). |
|                          | The seafloor of the NMR consists mainly of a wide continental shelf, as well as other geomorphological features such as shoals, banks, terraces, valleys, shallow canyons and limestone pinnacles.  |

### 2.2 Marine Systems of the North-west Marine Region.

The NWMR can be divided into three large scale ecological marine systems on the basis of the influence of major ocean currents, seafloor features and eco-physical processes (e.g. climate, tides, freshwater inflow) upon the Region (DSEWPAC, 2012a). The three large scale marine systems approximate the Woodside activity areas within the NWMR (**Figure 2-1**). The key characteristics of each marine system are outlined below in **Table 2-2**.

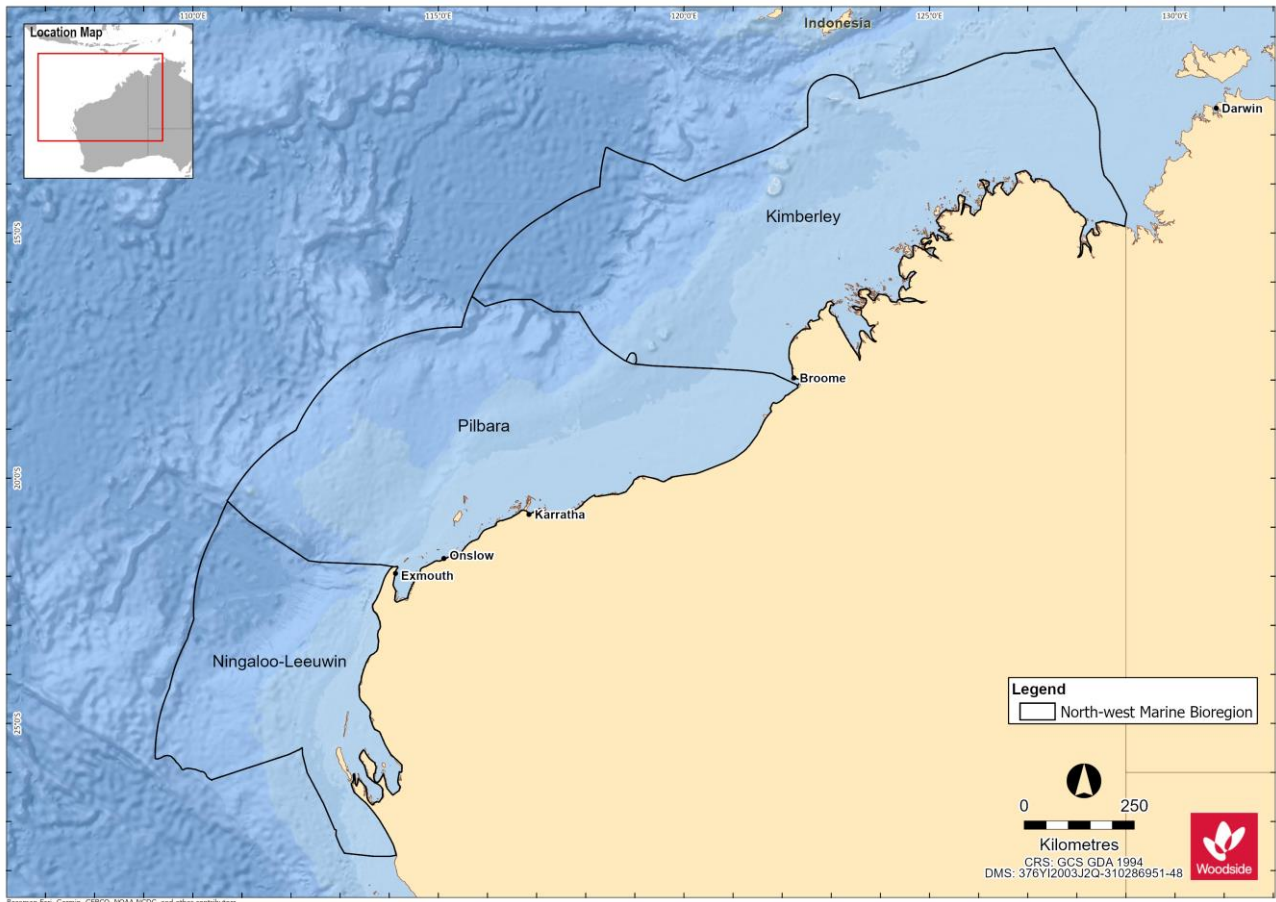

Figure 2-1. The marine systems of the North-west Marine Region (NWMR)

**Table 2-2. Key characteristics of the Marine Systems of the NWMR**

Note: Woodside areas align with the marine systems as described in DEWHA (2007a)

| Marine System    | Woodside Activity Area               | Key Characteristics  |
|------------------|--------------------------------------|--|
| Kimberley        | Browse                               | Tropical monsoonal climate<br>Strong influence from Indonesian Throughflow<br>Predominantly tropical Indo-Pacific species<br>Subject to episodic offshore cyclonic activity, rarely crossing the coast<br>Large tidal regimes<br>Freshwater input from terrestrial monsoonal run-off<br>Turbid coastal waters (i.e. light limited systems)<br>Dominated by shelf environments<br>Predominantly hard substrates in inner to mid-shelf environments<br>Includes a number of shelf-edge atolls (i.e. Scott Reef, Rowley Shoals) |
| Pilbara          | North-west Shelf (NWS) / Scarborough | Tropical arid climate<br>Transition between Indonesian Throughflow and Leeuwin Current dominated areas<br>Predominantly tropical species<br>High cyclone activity with frequent crossing of the coast<br>Transitional tidal zone<br>Internal tide activity<br>Large areas of shelf and slope<br>Dry coast with ephemeral freshwater inputs   |
| Ningaloo-Leeuwin | North-west Cape                      | Subtropical arid climate<br>Leeuwin Current consolidates<br>Transitional tropical/temperate faunal area<br>Higher water clarity in near-shore and offshore environments<br>Narrow shelf and slope<br>Marginal tidal range<br>Seasonal wind forcing more dominant influence on marine environment   |

### 2.3 Meteorology and Oceanography

This section describes the general meteorological conditions and oceanography for the NWMR and provides further detail for the three Woodside activity areas. The NWMR is influenced by a complex system of ocean currents that change between seasons and between years, which generally result in its surface waters being warm and nutrient-poor, and of low salinity (DEWHA, 2007a). The mix of bathymetric features, complex topography and oceanography across the whole north-west marine environment has created and supports a globally important marine biodiversity hotspot (Wilson, 2013).

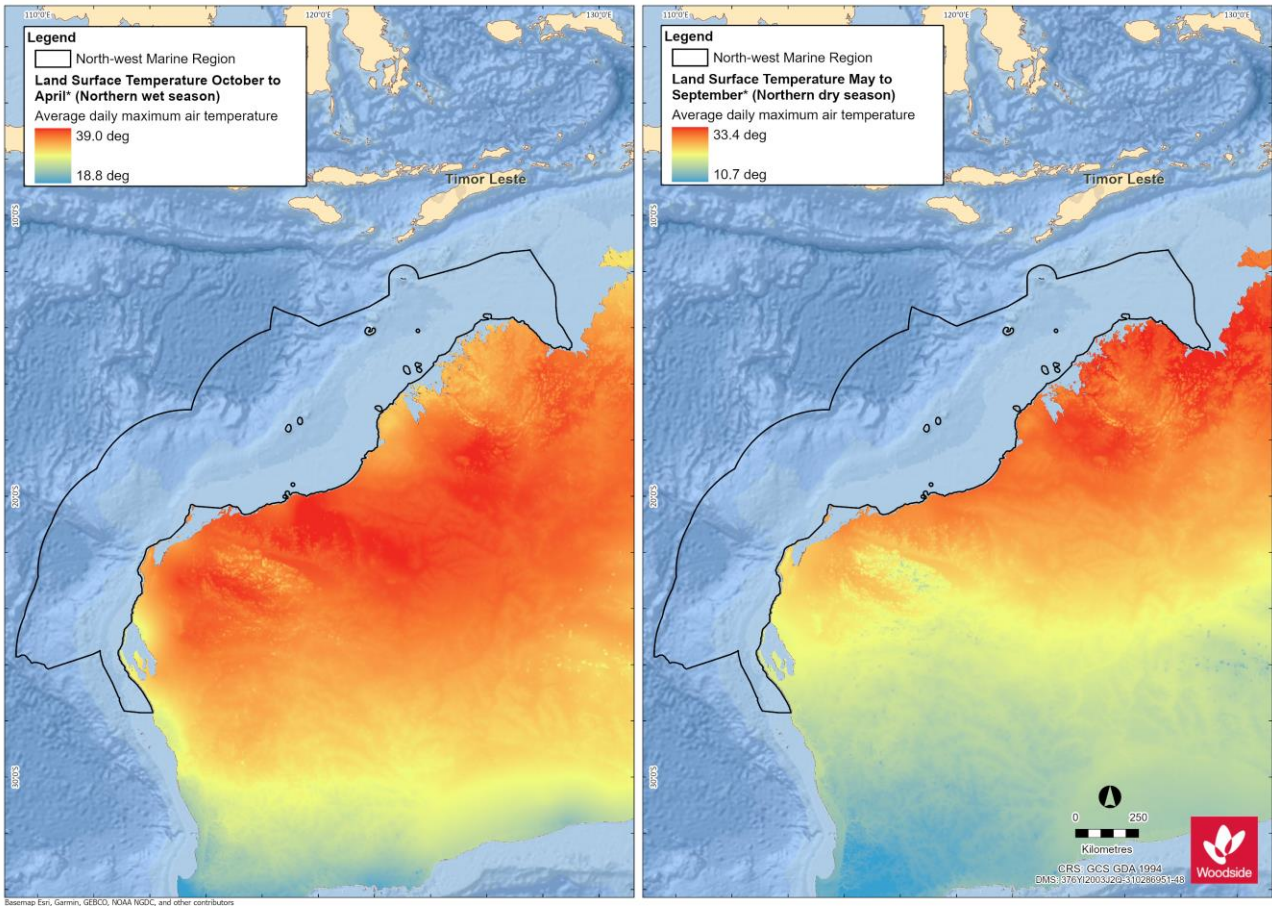

Table 2-3 NWMR climate and oceanography summary

| Receptor                            | Description  |
|-------------------------------------|--|
| <b>Meteorology</b>                  |  |
| <b>Seasonal patterns</b>            | The NWMR associated land mass of the Australian continent is characterised as a hot and humid summer climate zone. The broader NWMR experiences variations of a tropical or monsoon climate. In the far north-west (Kimberley), there is a hot summer season from December to March and a milder winter season between April and November. The Pilbara area is described as having a tropical arid climate with high cyclone activity (DEWHA, 2007a). The Pilbara and North-west Cape has a hot summer season from October to April and a milder winter season between May and September with transition periods between the summer and winter regimes.  |
| <b>Air temperature and rainfall</b> | In summer (between September and March), maximum daily temperatures range from 31°C to 33°C. During winter (May to July), mean daily temperatures range from 18°C to 31°C (BOM <sup>1</sup> ), refer to <b>Figure 2-2a</b> and <b>b</b> . Rainfall in the region typically occurs during the summer, with highest falls observed late in the season. This is often associated with the passage of tropical low-pressure systems and cyclones.  |
| <b>Wind</b>                         | Wind patterns in north-west WA are dictated by the seasonal movement of atmospheric pressure systems. During summer, high-pressure cells produce prevailing winds from the north-west and south-west, which vary between 10 and 13 ms <sup>-1</sup> . During winter, high-pressure cells over central Australia produce north-easterly to south-easterly winds with average speeds of between 6 and 8 ms <sup>-1</sup> . Refer to <b>Figure 2-3a</b> and <b>b</b> .  |
| <b>Tropical cyclones</b>            | The NWS and Pilbara coast (within the NWMR) experiences more cyclonic activity than any other region of the Australian mainland coast (BOM, 2021a). Tropical cyclone activity typically occurs between November and April and is most frequent in the region during December to March (i.e. considered the peak period), with an average of about one cyclone per month (BOM, 2021a). Refer to <b>Figure 2-4</b> .   |
| <b>Oceanography</b>                 |  |
| <b>Ocean temperature</b>            | Waters in NWMR are tropical year-round, with sea surface temperature in open shelf waters reaching ~26°C in summer and dropping to ~22°C in winter. Nearshore temperatures (as recorded for the NWS area) fluctuate more widely on an annual basis from ~17°C in winter to ~31°C in summer (Chevron Australia, 2010). Refer to <b>Figure 2-5a</b> and <b>b</b> .   |
| <b>Currents</b>                     | The major surface currents influencing north-west WA flow towards the poles and include the Indonesian Throughflow, the Leeuwin Current, the South Equatorial Current, and the Eastern Gyral Current. The Ningaloo Current, the Holloway Current, the Shark Bay Outflow, and the Capes Current are seasonal surface currents in the region. Below these surface currents are several subsurface currents, the most important of which are the Leeuwin Undercurrent and the West Australian Current. These subsurface currents flow towards the equator in the opposite direction to surface currents (DEWHA, 2007a). Refer to <b>Figure 2-6</b> .<br><br>The offshore waters of the NWMR are characterised by surface and subsurface boundary currents that flow along the continental shelf/slope and are enhanced through inflows from the ocean basins and are an important conduit for the poleward heat and mass transport along the west coast (Wijeratne <i>et al.</i> , 2018).<br><br>Local physical oceanography is strongly influenced by the large-scale water movements of the Indonesian Throughflow (Liu <i>et al.</i> 2015; Sutton <i>et al.</i> 2019). Typically, a warm and well-mixed oligotrophic surface layer and a cooler and more nutrient rich, deeper water layer (Menezes <i>et al.</i> 2013). |
| <b>Waves</b>                        | Sea surface waves within the NWMR, generally reflect the direction of the synoptic winds and flow predominately from the south-west in the summer and east in winter (Pearce <i>et al.</i> , 2003).<br><br>The NWS within the NWMR is a known area of internal wave generation. Both internal tides and internal waves are thought to be more prevalent during summer months due to the increased stratification of the water column (DEWHA, 2007a).<br><br>Along the continental slope of the NWMR, strong internal waves and interaction between semi-diurnal tidal currents and seabed topographic features facilitates upwelling events and localised productivity events (Holloway, 2001).  |
| <b>Tides</b>                        | Tides on the NWS (NWMR) increase as the water moves from deep towards the shallower coast. The highest offshore tides are experienced at the border of the Browse and Canning basins. The smallest tides are experienced at the Exmouth Plateau, near the coast.<br><br>Tides of NWS (NWMR) are predominantly semi-diurnal (two highs and two lows each day), but with increasing importance of the diurnal (once per day) inequality at the southern and northern extremities of the NWS.   |

<sup>1</sup> [http://www.bom.gov.au/jsp/ncc/climate\\_averages/temperature/index.jsp](http://www.bom.gov.au/jsp/ncc/climate_averages/temperature/index.jsp), accessed 21 January 2021.

| Receptor | Description  |
|----------|--|
|          | The tide range—represented by the Mean Spring Range (MSR)—increases northwards along the coast from 1.4 m at North-west Cape (Point Murat) to 7.7 m at Broome, before decreasing again (apart from local amplification in King Sound and Collier Bay) to about 5 m off Cape Londonderry. The MSR then increases again through Joseph Bonaparte Gulf and on up 5.5 m at Darwin (RPS, 2016). |

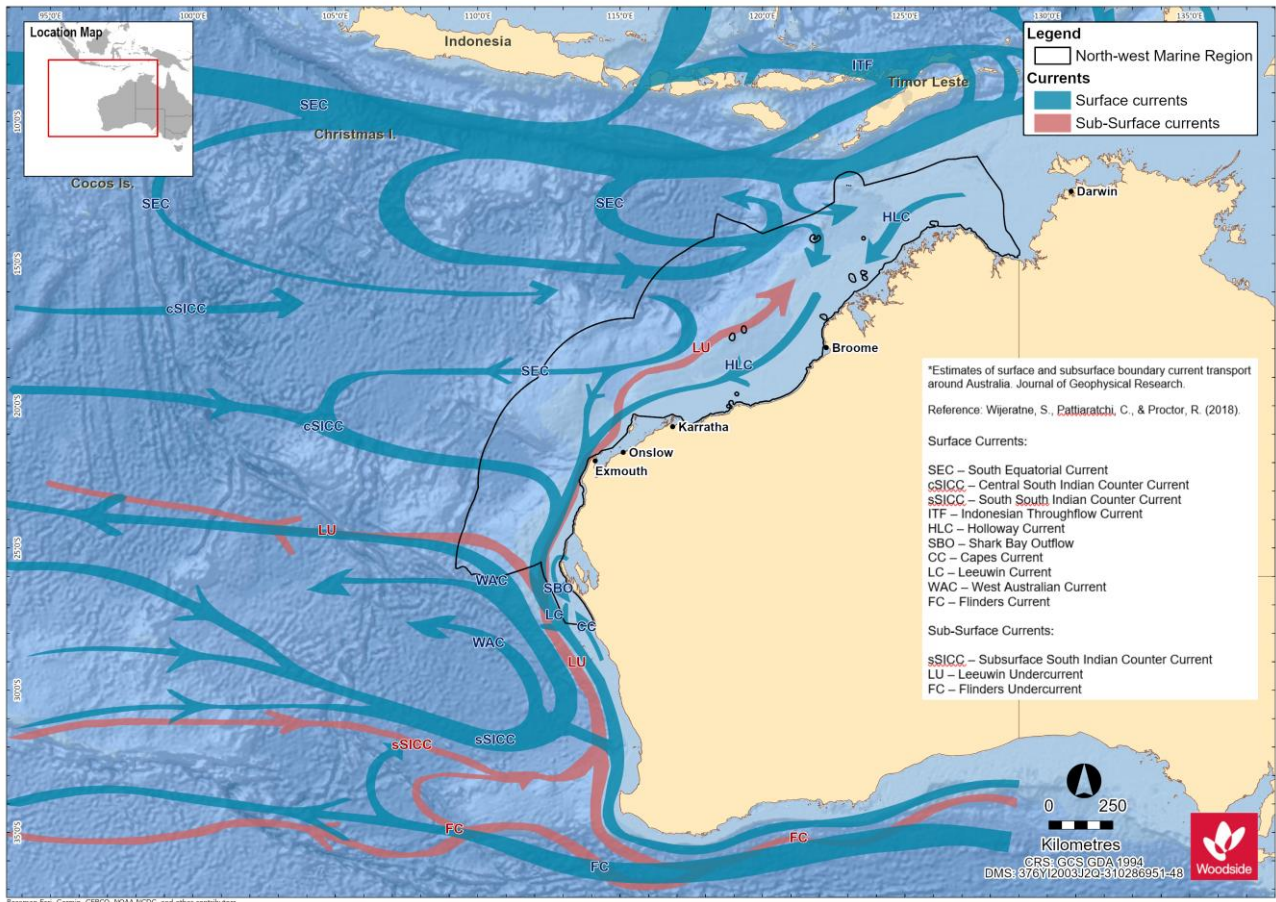

Figure 2-6. Ocean surface and sub-surface currents of the NWMR and wider region

### 2.3.1 Browse

**Table 2-4 Summary meteorology and oceanography for Browse (refer to Appendix B for supporting metocean figures)**

| Receptor                 | Description   |
|--------------------------|---|
| <b>Meteorology</b>       |   |
| <b>Seasonal patterns</b> | The Browse area overlapping the Kimberley marine system experiences tropical monsoon climate with two distinct seasons: the wet season from December to March and dry season from April to November.  |
| <b>Air temperature</b>   | The mean annual air temperature recorded at Troughton Island between 2010 and 2020 ranged from 30.1°C in 2011 to 32.6°C in 2016 and highest mean monthly air temperatures were recorded for the months of November and December (BOM, 2021b).   |
| <b>Rainfall</b>          | Rainfall recorded from Troughton Island in the Browse basin ranged from barely detectable (<1 mm) mean monthly level to >100 mm in December to March, with the highest rainfall recorded for January. Reflecting the wet monsoon season of the Kimberley marine system (BOM, 2021c).  |
| <b>Wind</b>              | The dry season experiences high pressure systems that bring east to south-easterly winds with average wind speeds during the season of approximately 16.6 km/hr and maximum wind gusts of 65 km/hr. In contrast the wet season brings predominately westerly winds with average wind speeds approximately 17 km/hr and maximum gusts exceeding 100 km/hr (generally associated with tropical cyclones (MetOcean Engineers, 2005). |
| <b>Oceanography</b>      |   |
| <b>Currents</b>          | Surface currents exhibit seasonal directionality, with flow to the south-west during March to June and more variable outside this period (Woodside, 2019). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.   |

### 2.3.2 North West Shelf / Scarborough

**Table 2-5 Summary meteorology and oceanography for the North West Shelf and Scarborough (refer to Appendix B for supporting metocean figures)**

| Receptor                 | Description  |
|--------------------------|--|
| <b>Meteorology</b>       |  |
| <b>Seasonal patterns</b> | The NWS and Scarborough areas experience the monsoonal climate of the wider NWMR with a distinct wet and dry seasonal regime and transitions periods between seasons.  |
| <b>Air temperature</b>   | Air temperatures as measured at the North Rankin A platform on NWS ranged from a maximum average of 39.5°C in summer to a minimum average temperature of 15.6°C in winter (Woodside, 2012).  |
| <b>Rainfall</b>          | Rainfall patterns annually reveal the wet season with highest rainfalls during the late summer, often associated with the passage of tropical low-pressure systems and cyclones. Rainfall in the dry season is typically extremely low. (Pearce <i>et al.</i> 2003).   |
| <b>Wind</b>              | Winds are typically from the southwest during the wet season (summer) and tending from the south-east during the dry season (winter). The summer south-westerly winds are driven by high pressure cells that pass from west to east over the Australian continent. During the winter period, the relative position of the high-pressure cells shifts further north, leading to prevailing south-easterly winds from the mainland (Pearce <i>et al.</i> 2003).  |
| <b>Oceanography</b>      |  |
| <b>Currents</b>          | The large-scale ocean currents of the NWMR, primarily the Indonesian Throughflow and Leeuwin Current (and Holloway Current), are the primary influence on the NWS and Scarborough areas. The ITF and Leeuwin Current are strongest during the late summer and winter and flow reversals to the north-east, typically short-lived and weak, when there are strong south-westerly winds can generate localised upwelling on the shelf edge (Holloway and Nye, 1985; James <i>et al.</i> 2004 and Condie <i>et al.</i> 2006). |

### 2.3.3 North-west Cape

**Table 2-6 Summary meteorology and oceanography for the North-west Cape (refer to Appendix B for supporting metocean figures)**

| Receptor                 | Description   |
|--------------------------|---|
| <b>Meteorology</b>       |   |
| <b>Seasonal patterns</b> | The climate of the NWMR is dry tropical exhibiting a hot summer season and a mild winter season. There are often distinct transition periods between the summer and winter regimes, characterised by periods of relatively low winds.   |
| <b>Air temperature</b>   | Air temperatures in the North-west Cape area range from high summer temperatures (maximum average of 37.5°C) and mild winter temperatures (minimum average of 12.2°C).  |
| <b>Rainfall</b>          | Rainfall typically occurs during the summer, with highest rainfall during later summer and autumn, often associated with the passage of tropical low-pressure systems and cyclones. Rainfall is typically low in winter.  |
| <b>Wind</b>              | Winds vary seasonally, generally from the south-west quadrant during summer months and the south, south-east quadrant during the autumn and winter months. The summer south-westerly winds are driven by high pressure cells that pass from west to east over the Australian continent. Winds typically weaken and are more variable during the transitional period between the summer and winter seasons, generally between April to August. |
| <b>Oceanography</b>      |   |
| <b>Currents</b>          | Surface currents exhibit seasonal directionality, with flow to the south-west during March to June and more variable outside this period (Woodside, 2016). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.   |

## 2.4 Physical Environment of NWMR

Based on the Integrated Marine and Coastal Regionalisation of Australia (IMCRA) Version 4.0, there are eight provincial bioregions that occur within the NWMR, which are based on patterns of demersal fish diversity, benthic habitat and oceanographic data (Commonwealth of Australia, 2006), **Figure 2-7**. Of the eight provincial bioregions that occur within the NWMR, these include four offshore (~65% of total NWMR area) and four shelf (~35% of total NWMR area) bioregions (Baker *et al.*, 2008).

The NWMR is a tropical carbonate margin that comprises an extensive area of shelf, slope and abyssal plain/deep ocean floor, as well as complex areas of bathymetry such as plateau, terraces and major canyons (Harris *et al.*, 2005). A series of reefs are located on the outer shelf/slope of the NWMR, including Ashmore, Cartier, Scott and Seringapatam reefs (Baker *et al.*, 2008). The distribution of seafloor geomorphic features has been systematically mapped over much of the Australian margin and adjacent seafloor. The mapped area can be divided into 10 geomorphic regions, of which the NWMR overlays two; the Western Margin and Northern Margin (Harris *et al.*, 2005). Most of the region consists of either continental slope (61%) or continental shelf (28%) (DEWHA, 2007a) with more than 40% of the NWMR having a water depth less than 200 m. The shallow shelf is contrasted by features such as the Cuvier and Argo abyssal plains, which reach depths more than five kilometres. A unique feature of the region is the significant narrowing of the continental shelf around North-west Cape (approximately 7 km wide) from the broad continental shelf in the north of the region (approximately 400 km wide at Joseph Bonaparte Gulf) (DEWHA, 2007a), **Figure 2-8**.

The geological history of the region, as well as its geomorphology and oceanography, has influenced the composition and distribution of sediments (DEWHA, 2007a). The sedimentology of the NWMR is dominated by marine carbonates, which show a broad zoning and fining with water depth. Main trends of the NWMR sediments include a tropical carbonate shelf that is dominated by sand and gravel, an outer shelf/slope zone that is dominated by mud and a relatively homogenous rise and abyssal plain/deep ocean floor that is dominated by non-carbonate mud (Baker *et al.*, 2008), **Figure 2-9**.

The distribution and resuspension of sediments on the inner shelf is strongly influenced by the strength of tides across the continental shelf as well as episodic events such as cyclones. Further offshore, on the mid to outer shelf and on the slope itself, sediment movement is primarily influenced by ocean currents and internal tides (DEWHA, 2007a).

This variation in bathymetry and interactions with oceanographic processes provides a diversity of habitats to marine fauna and flora within the NWMR.

## **2.5 Air quality**

The ambient air quality of all three marine regions is largely unpolluted due to the extent of the open ocean area, the activities currently carried out in each and the relative remoteness of each region.

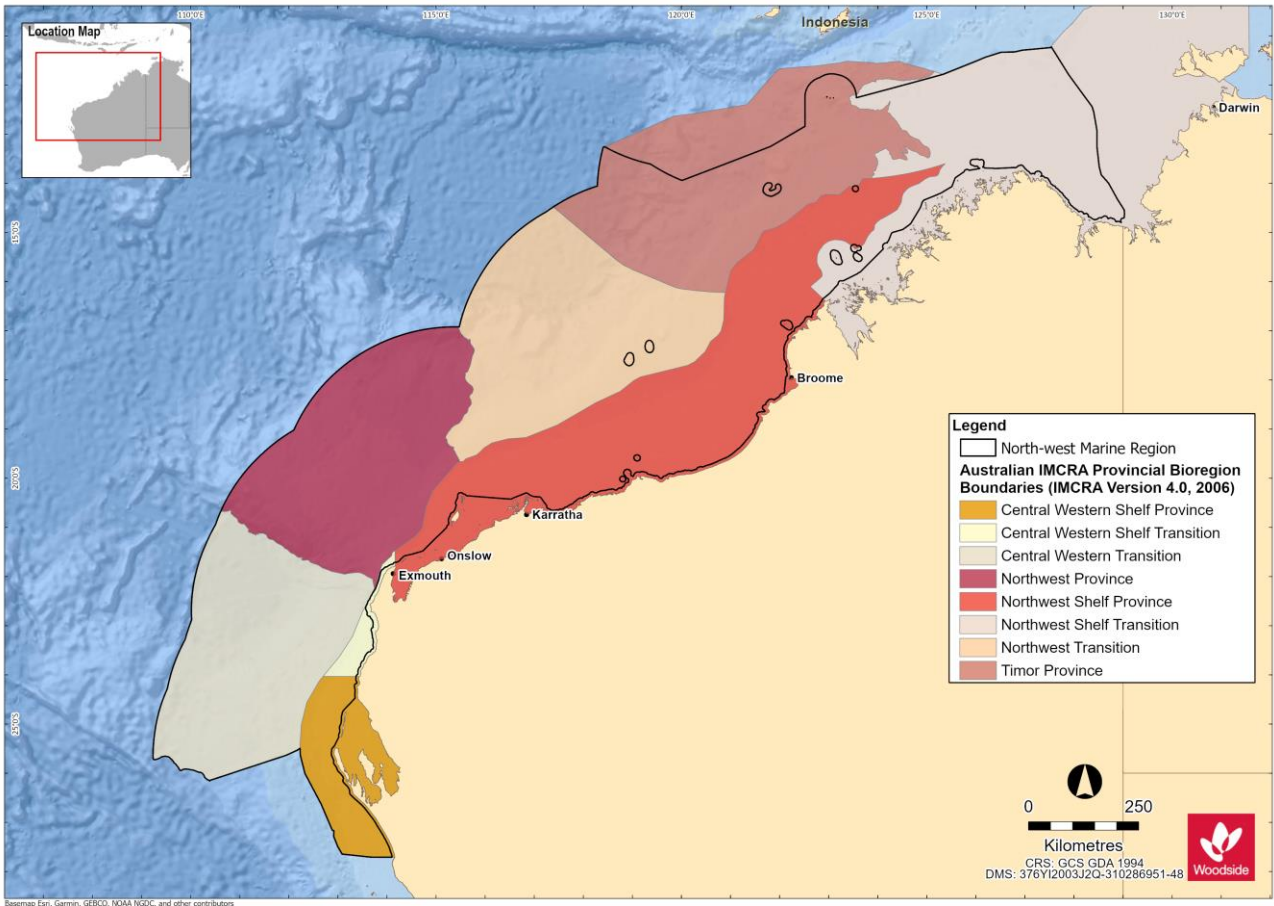

Figure 2-7. The eight provincial bioregions of the NWMR (Commonwealth of Australia, 2006)

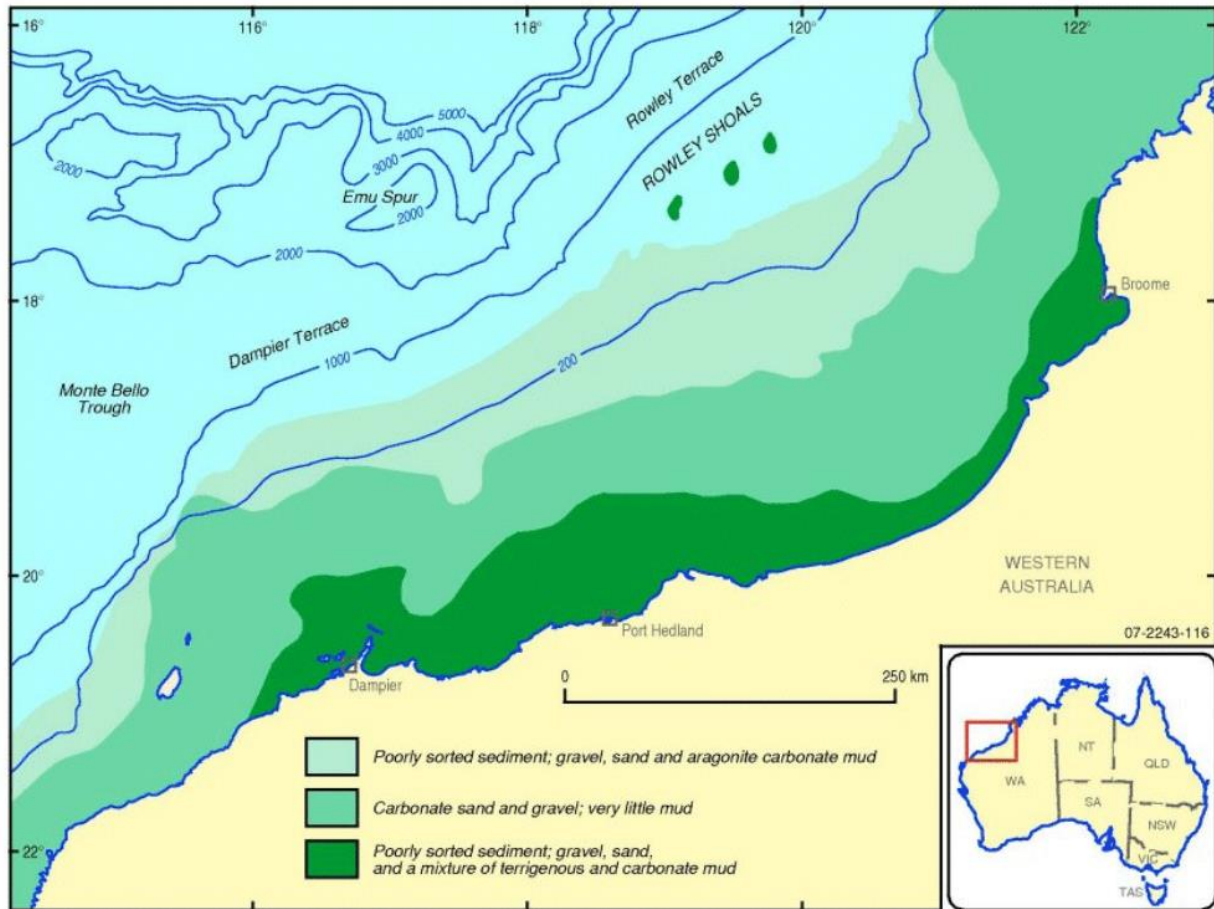

Figure 2-9. Overview of the seabed sediments of the NWMR (Baker *et al.*, 2008)

### 3. MATTERS OF NATIONAL ENVIRONMENTAL SIGNIFICANCE (EPBC ACT)

#### 3.1 Summary of Matters of National Environmental Significance (MNES)

This section summarises the matters of national environmental significance (MNES) reported for the three bioregions; NWMR (**Table 3-1**), SWMR (**Table 3-2**) and NMR (**Table 3-3**), based on the Protected Matters search reports (**Appendix A**).

Additional information on these MNES are provided in subsequent sections (referenced below).

**Table 3-1 Summary of MNES identified by the EPBC Act Protected Matters Search Tool (PMST) as potentially occurring within the NWMR**

### 3.2 Part 13 Statutory Instruments for EPBC Act Listed Threatened and Migratory Species in the NWMR, SWMR and NMR

A screening process was conducted to identify which EPBC Act listed threatened and migratory species, and associated Part 13 statutory instruments, are relevant in the context of the assessment of impacts and risks associated with petroleum activities in each of the Woodside activity areas, using the following criteria:

- overlap between the Woodside activity areas with habitat critical for the survival of marine turtles, and with BIAs (overlapping the marine environment) for any listed threatened species as reported in the PMST searches;
- published literature, unpublished reports and/or credible anecdotal information (e.g. feedback from stakeholders) indicating species presence/occurrence within the Woodside activity areas;
- temporal overlap between the likely timing of petroleum activities and peak periods for key behaviours (e.g. breeding, nesting, calving, resting, foraging, migration); and
- environmental aspects associated with petroleum activities have been identified as a key threat to a species in a Part 13 statutory instrument (e.g. anthropogenic noise, light emissions, marine debris).

Relevant EPBC Act threatened and migratory species and their Part 13 statutory instruments are listed in **Table 3-4**. For the full list of EPBC Act listed species for each marine bioregion refer to the PMST reports (**Appendix A**).

**Table 3-4 Summary of MNES identified by the EPBC Act Protected Matters Search Tool (PMST) to be considered for impact or risk evaluation for Woodside operations**

| Species   | EPBC Act Part 13 Statutory Instrument   |
|---|---|
| All vertebrate marine fauna   | Threat Abatement Plan for the impacts of marine debris on vertebrate marine life (Commonwealth of Australia, 2018)  |
| <b>Marine Mammals</b>   |   |
| Blue whale  | Conservation Management Plan for the Blue Whale: A Recovery Plan under the <i>Environment Protection and Biodiversity Conservation Act 1999</i> 2015–2025 (Commonwealth of Australia, 2015a)  |

| Lesser sand plover                     | Conservation Advice <i>Charadrius mongolus</i> Lesser sand plover (Threatened Species Scientific Committee, 2016e)                          |

## 4. HABITAT AND BIOLOGICAL COMMUNITIES

### 4.1 Regional context

The NWMR habitats range from nearshore benthic primary producer habitats such as seagrass beds, coral communities and mangrove forests, to offshore soft sediment seabed habitats and submerged and emergent reef systems. These habitats support biological communities that range from low density sessile and mobile benthos, such as sponges, molluscs and echinoids (with noted areas of sponge hotspot diversity) in offshore soft sediment habitat (DSEWPAC, 2012a) to complex, diverse, remote coral reef systems.

Benthic primary producer habitats, such as seagrass beds, coral communities and mangrove forests within the SWMR, are described as a mixture of tropical and temperate species, due to the seasonal influences of the tropical waters carried south by the Leeuwin Current and the temperate waters carried north by the Capes Current (DSEWPAC, 2012b).

The NMR shares similar habitat types to the NWMR. The predominant habitat of the region includes soft muddy sediments on relatively flat terrain. Other habitat types include seagrasses, reefs, shoals and coastal habitats such as mangroves and coastal wetlands (Rochester *et al.*, 2007).

The summary of key habitats and biological communities provided in the following sub-sections is focused on the primary features of relevance to the activity areas within the NWMR – primarily the offshore habitats of the continental shelf and slope, submerged shoals and banks, and remote oceanic reef systems of recognised conservation value.

### 4.2 Biological Productivity of NWMR

Primary productivity of the NWMR is generally low and appears to be largely driven by offshore influences (Brewer *et al.*, 2007), with periodic upwelling events and cyclonic influences driving coastal productivity with nutrient recycling and advection. Seasonal weather patterns also influence the delivery of nutrients from deep-water to shallow water. Cyclones and north-westerly winds during the North-west monsoon (approximately November–March) and the strong offshore winds of the South-east monsoon (approximately April–September) facilitate the upwelling and mixing of nutrients from deep-water to shallow water environments (Brewer *et al.*, 2007).

The Indonesian Throughflow (ITF) has an important effect on productivity in the northern areas of the Region. Generally, its deep, warm and low nutrient waters suppress upwelling of deeper comparatively nutrient-rich waters, thereby forcing the highest rates of primary productivity to occur at depths associated with the thermocline. When the ITF is weaker, the thermocline lifts bringing deeper, more nutrient-rich waters into the photic zone and hence resulting in conditions favourable to increased productivity (DEWHA, 2007a). Similarly, the Leeuwin Current has a significant role in determining primary productivity in the southern areas of the NWMR. As with the ITF, the overlying warm oligotrophic waters of the Leeuwin Current suppress upwelling. A subsurface chlorophyll maximum is therefore formed at a depth in the water column where nutrients and light are sufficient for photosynthesis to proceed. Seasonal changes in the strength of the Leeuwin Current influence primary productivity levels and seasonal interactions between the Leeuwin and Ningaloo currents in the south of the NWMR are believed to be particularly important (DEWHA, 2007a).

Internal tides (defined as internal waves generated by the barotropic tide) are a striking characteristic of many parts of the NWMR and are associated with highly stratified water columns. Internal waves (solitons), which can raise cooler, generally more nutrient rich water higher in the water column, are generated between water depths of 400 m and 1000 m where bottom topography results in a significant change in water depth over a relatively short distance. Cyclones are episodic events in the NWMR that contribute to spikes in productivity through enrichment of surface water layers due to enhanced vertical mixing of the water column. Temporary increases in primary productivity as a result of cyclones generally last between one and two weeks, and it is believed that the impacts of

cyclones are generally limited to waters less than 100 m deep and affect benthic communities more substantially than pelagic systems (DEWHA, 2007a).

Water depth also has a significant overriding influence over productivity in the marine environment, due to its influence on light availability. This is reflected by distinct onshore and offshore assemblages of major pelagic groups of phytoplankton, microzooplankton, mesoplankton and ichthyoplankton. Productivity booms are thought to be triggered by seasonal changes to physical drivers or episodic events, as detailed above, which result in rapid increases in primary production over short periods, followed by extended periods of lower primary production. The trophic systems in the NWMR are able to take advantage of blooms in primary production, enabling nutrients generated to be used by different groups of consumers over long periods (DEWHA, 2007a).

Little detailed information is available about the trophic systems in the NWMR. The utilisation of available nutrients is thought to differ between pelagic and benthic environments, influenced by water depth and vertical migration of some species groups in the water column. In the pelagic system, it is thought that approximately half of the nutrients available are utilised by microzooplankton (e.g. protozoa) with the remainder going to macro/meso-zooplankton (e.g. copepods). As primary and secondary consumers, gelatinous zooplankton (e.g. salps, coelenterates) and jellyfish are thought to play an important role in the food web, contributing a significant proportion of biomass in the marine system during and for periods after booms in primary productivity. Salps are semi-transparent, barrel-shaped marine animals that can reproduce quickly in response to bursts in primary productivity and provide a food source for many pelagic fish species (DEWHA, 2007a).

### 4.3 Planktonic Communities in the NWMR

The NWMR has two distinct phytoplankton assemblages; a tropical oceanic community in offshore waters and a tropical shelf community confined to the NWS (Hallegraeff, 1995). MODIS (Moderate Resolution Imaging Spectrometer) satellite datasets from the NWMR indicates that chlorophyll (and thus phytoplankton) levels are low in summer months (December to March) and higher in the winter months (Schroeder *et al.*, 2009). Low chlorophyll levels during summer months may be a result of lower plankton productivity during the wet season or lower nutrient inputs from warm surface waters dominant during summer. However, it is likely that much of the primary production is taking place below the surface, where the MODIS imagery does not penetrate (Schroeder *et al.*, 2009). The winter months are relatively cloud free and surface chlorophyll is high throughout most of the region.

Zooplankton and may include organisms that complete their lifecycle as plankton (e.g. copepods, euphausiids) as well as larval stages of other taxa such as fishes, corals and molluscs. Peaks in zooplankton such as mass coral spawning events (typically in March and April) (Rosser and Gilmour, 2008) and fish larvae abundance (CALM, 2005a) can occur throughout the year. Spatial and temporal patterns in the distribution and abundance of macro-zooplankton on the North-west Shelf are influenced by sporadic climatic and oceanographic events, with large inter-annual changes in assemblages (Wilson *et al.*, 2003). Amphipods, euphausiids, copepods, mysids and cumaceans are among the most common components of the zooplankton in the region (Wilson *et al.*, 2003).

#### 4.3.1 Browse

Phytoplankton within the Browse activity area is expected to reflect the conditions of the NWMR. There is a tendency for offshore phytoplankton communities in the NWMR to be characterised by smaller taxa (e.g. bacteria), whereas shelf waters are dominated by larger taxa such as diatoms (Hanson *et al.*, 2007).

Zooplankton within the activity area may include organisms that complete their lifecycle as plankton (e.g. copepods, euphausiids) as well as larval stages of other taxa such as fishes, corals and molluscs. Peaks in zooplankton such as mass coral spawning events (typically in March and April) (Rosser and Gilmour, 2008; Simpson *et al.*, 1993) and fish larvae abundance (CALM, 2005a) can occur throughout the year.

The influence of the Indonesian Throughflow restricts upwelling across the Kimberley System (approximately equates to the Browse activity area). However, small-scale topographically associated current movements and upwellings are thought to occur, which inject nutrients into specific locations within the system and result in 'productivity hot-spots'. Similarly, internal waves, generated at the shelf break (e.g. west of Browse Island and around submerged cliffs) play a role in making nutrients available in the photic zone. Productivity within shallow nearshore waters is driven primarily by tidal movement and terrestrial runoff whereby nutrients are mixed by tidal action and new inputs of organic matter come from the land.

#### 4.3.2 North-west Shelf / Scarborough

Plankton communities within the NWS / Scarborough activity area are expected to reflect conditions of the NWMR. Within the Pilbara system of the NWMR (approximately equates to the NWS / Scarborough activity area). Internal tides along the NWS and Exmouth Plateau result in the drawing of deeper cooler waters into the photic zone, stirring up nutrients and triggering primary productivity. Broadly the greatest productivity within this sub-system is found around the 200 m isobath associated with the shelf break.

#### 4.3.3 North-west Cape

Waters of the North-west Cape experience a relatively high diversity of phytoplankton groups including diatoms, coccolithophorids and dinoflagellates. During the warmer months blooms of *Trichodesmium* occur in the region, these have been observed particularly on the frontal systems around Point Murat (Heyward *et al.*, 2000).

Average Leeuwin Current phytoplankton biomass is characteristic of low productivity oceanic waters like the Indian, Pacific and Atlantic Oceans (Hanson *et al.*, 2005). However, the Canyons linking the Cuvier Abyssal Plain and Cape Range Peninsula KEF are connected to the Commonwealth waters adjacent to Ningaloo Reef, and may also have connections to Exmouth Plateau. The canyons are thought to interact with the Leeuwin Current to produce eddies inside the heads of the canyons, resulting in waters from the Antarctic intermediate water mass being drawn into shallower depths and onto the shelf (Brewer *et al.* 2007). These waters are cooler and richer in nutrients and strong internal tides may also aid upwelling at the canyon heads (Brewer *et al.* 2007). The narrow shelf width (about 10 kilometres) near the canyons facilitates nutrient upwelling and relatively high productivity. This high primary productivity leads to high densities of primary consumers, such as micro and macro-zooplankton, such as amphipods, copepods, mysids, cumaceans, euphausiids (Brewer *et al.*, 2007).

## 4.4 Habitats and Biological Communities in the NWMR

### 4.4.1 Offshore Habitats and Biological communities

The NWMR has a large area of continental shelf and continental slope, with a range of bathymetric features such as canyons, plateaus, terraces, ridges, reefs, banks and shoals. The marine environment in this region is typified by tropical to sub-tropical marine ecosystems with diverse habitats from soft sediments, canyons, remote coral reefs and limestone pavement.

The key habitats and biological communities representative of the broader NWMR are summarised in **Table 4-1**.

The key habitats and biological communities representative of the broader SWMR and NMR are summarised in **Table 4-2** and **Table 4-3**.

### 4.4.2 Shoreline habitats and biological communities

The NWMR encompasses offshore and coastal waters, islands and mainland shoreline habitats typified by mangroves, tidal flats, saltmarshes, sandy beaches, and smaller areas of rocky shores. Each of these shoreline types has the potential to support different flora and fauna assemblages due to the different physical factors (e.g. waves, tides, light, etc.) influencing the habitat.

The key shoreline habitats representative of the broader NWMR are summarised in **Table 4-1**.

The key shoreline habitats representative of the broader SWMR and NMR are summarised in **Table 4-2** and **Table 4-3**.

Table 4-1 Habitats and biological communities within the NWMR

| <b>Offshore habitats and biological communities</b>  |  |   |   |                   |
| <b>Soft sediment with infauna</b>                    | The offshore environment of the NWMR comprises predominately of seabed habitats dominated by soft sediments (sandy and muddy substrata with occasional patches of coarser sediments) and sparse benthic biota. The benthic communities inhabiting the predominantly soft, fine sediments of the offshore habitats are characterised by infauna such as polychaetes, and sessile and mobile epifauna such as crustacea (shrimp, crabs and squat lobsters) and echinoderms (starfish, cucumbers). The density of benthic fauna is typically lower in deep-sea sediment habitats (greater than 200 m) than in shallower coastal sediment habitats, but the diversity of communities may be similar. |   |   |                   |
| <b>Soft sediment with hard substrate outcropping</b> | A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope, and escarpments. This habitat is found in offshore areas of the NWMR, often associated with key ecological features such as the Ancient coastline at 125 m depth contour KEF.   |   |   | <b>Section 9</b>  |

| <b>Seagrass and Macroalgae communities</b>           | Seagrass beds and benthic macroalgae reefs are a main food source for many marine species and also provide key habitats and nursery grounds (Heck Jr. <i>et al.</i> , 2003; Wilson <i>et al.</i> , 2010). In the northern half of Western Australia, these habitats are restricted to sheltered and shallow waters, including around offshore reef systems, due to large tidal movement, high turbidity, large seasonal freshwater run-off and cyclones.   |   |   |                   |

| Habitat/Community    | Browse   | NWS / Scarborough  | North-west Cape   | Reference |
|----------------------|--|--|---|-----------|
| <b>Mangroves</b>     | Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie <i>et al.</i> , 2006). Mangrove forests can help stabilise coastal sediments, provide a nursery ground for many species of fish and crustacean, and provide shelter or nesting areas for seabirds (McClatchie <i>et al.</i> , 2006). Mangroves are confined to shoreline habitats, in nearshore areas of the NWMR.                                 |  |   |           |
|                      | Dampier Peninsula (including Carnot Bay, Beagle Bay and Pender Bay)  | Pilbara Coastline (including; Ashburton River Delta, Coolgra Point, Robe River Delta, Yardie Landing, Yammadery Island and the Mangrove Islands) Montebello, Lowendal and Barrow Island Groups Roebuck Bay | Shark Bay Mangrove Bay, Cape Range Peninsula Exmouth Gulf |           |
| <b>Saltmarshes</b>   | Saltmarshes communities are confined to shoreline habitats and are typically dominated by dense stands of halophytic plants such as herbs, grasses, and low shrubs. The diversity of saltmarsh plant species increases with increasing latitude (in contrast to mangroves). The vegetation in these environments is essential to the stability of the saltmarsh, as they trap and bind sediments. The sediments are generally sandy silts and clays and can often have high organic material content.        |  |   |           |
|                      | -  | Eighty Mile Beach Roebuck Bay  | Shark Bay   |           |
| <b>Sandy Beaches</b> | Sandy beaches are dynamic environments, naturally fluctuating in response to external forcing factors (e.g. waves, currents, etc). Sandy beaches vary in length, width and gradient, and in sediment type, composition, and grain size throughout the NWMR. Sandy beaches are important for both resident and migratory seabirds and shorebirds and can also provide an important habitat for turtle nesting and breeding. They are located along many coastlines of the nearshore environments of the NWMR. |  |   |           |
|                      | Cape Domett Lacrosse Island  | Eighty Mile Beach Eco Beach Dampier Archipelago Inshore Pilbara Islands (Northern, Middle, and Southern)   | Ningaloo coast Muiron Islands Exmouth Gulf                |           |

Table 4-2 Habitats within the SWMR

| Habitat/Community                                    | Location  |
|--|---|
| <b>Offshore</b>                                      |   |
| <b>Soft sediment with infauna</b>                    | Most of the SWMR seafloor is composed of soft unconsolidated sediments, but due to large variations in bathymetry there are marked differences in sedimentary composition and benthic assemblage structure across the region. Despite the prevalence of these habitats in the SWMR, very little is known about the composition or distribution of the region's sedimentary infauna (DEWHA, 2008b)   |
| <b>Soft sediment with hard substrate outcropping</b> | A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope, and escarpments.<br>Perth Canyon Marine Park<br>Ancient coastline at 90-120 m depth contour KEF<br>Diamantina Fracture Zone<br>Naturaliste Plateau   |
| <b>Coral Reef</b>                                    | To date, studies and understanding of the corals within the SWMR have concentrated on the shallow water areas in State Waters. Within the deeper Commonwealth waters of the SWMR little is known of the distribution of corals.   |
| <b>Filter Feeders/ heterotrophic</b>                 | Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water, by passing the water over specialised filtration structures (DEWR, 2007). Filter feeders generally inhabit deeper habitat (below the photic zone) that have strong currents and hard substratum<br>Ancient coastline at 90-120 m depth<br>Diamantina Fracture Zone<br>Naturaliste Plateau<br>Perth Canyon Marine Park<br>South-west Corner Marine Park  |
| <b>Nearshore</b>                                     |   |
| <b>Coral Reef</b>                                    | The northern extent of the SWMR coincides loosely with the disappearance of abundant and diverse coral from coastal habitats. To the south of Shark Bay, abundant corals occur predominantly around offshore islands, with corals at inshore sites occurring in very isolated patches of non-reef coral communities, usually of reduced species richness.<br>Houtman Abrolhos Islands<br>Rottneest Island   |
| <b>Seagrass and Macroalgae communities</b>           | Within the SWMR, macroalgae and seagrass communities are noted for their extent, species richness and endemism. The clear waters of the region allow light to reach greater depths, with some species found at much greater depths than usual (down to 120 m) (DEWR, 2007). Of the known species there are more than 1000 species of macro-algae and 22 species of seagrass consisting of tropical and temperate species. Seagrass and macro-algae occur in areas with sheltered bays and in the inter-reef lagoons along exposed sections of the coast.<br>Houtman Abrolhos Islands<br>Jurien Marine Park<br>Shoalwater Islands Marine Park<br>Geographe Marine Park<br>Cockburn Sound<br>Rottneest Island |

| Habitat/Community                    | Location   |
|--------------------------------------|--|
|                                      | Commonwealth marine environment within and adjacent to the west-coast inshore lagoons KEF<br>Commonwealth marine environment within and adjacent to Geographe Bay KEF<br>Commonwealth marine environment surrounding the Recherche Archipelago KEF   |
| <b>Filter Feeders/ heterotrophic</b> | Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water, by passing the water over specialised filtration structures (DEWR, 2007). Filter feeders generally live in areas that have strong currents and hard substratum.<br>Houtman Abrolhos Islands<br>Recherche Archipelago   |
| <b>Mangroves</b>                     | Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie <i>et al.</i> , 2006). Mangrove forests can help stabilise coastal sediments, provide a nursery ground for many species of fish and crustacean, and provide shelter or nesting areas for seabirds (McClatchie <i>et al.</i> , 2006). Mangroves are confined to shoreline habitats, in nearshore areas of the SWMR.<br>Houtman Abrolhos Islands   |
| <b>Sandy Beaches</b>                 | Sandy beaches within the SWMR are important for both resident and migratory seabirds and shorebirds and can also host breeding populations of the Australian sea lion. They are found along many coastlines of the nearshore environments of the SWMR. In addition to this, beaches in the SWMR provide a variety of socio-economic values including tourism, commercial and recreational fishing, and support other recreational activities.<br>Houtman Abrolhos Islands<br>Marmion Marine Park<br>Ngari Capes Marine Park<br>Walpole and Nornalup Inlets Marine Park |

Table 4-3 Habitats and Biological Communities within the NMR

| Habitat/Community  | Location   |                         |                |
|--|--|-------------------------|----------------|
| <b>Offshore habitats and biological communities</b>  |  |                         |                |
| <b>Soft sediment with infauna</b>  | Most of the offshore environment of the NMR is characterised by relatively flat expanses of soft sediment seabed. The soft sediments of the region are characterised by moderately abundant and diverse communities of infauna and mobile epifauna dominated by polychaetes, crustaceans, molluscs, and echinoderms.   |                         |                |
| <b>Soft sediment with hard substrate outcropping</b>   | A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope, and escarpments. The variability in substrate composition may contribute to the presence of unique ecosystems. Species present include sponges, soft corals and other sessile filter feeders associated with hard substrate sediments.  |                         |                |
|  | Carbonate bank and terrace system of the Van Diemen Rise KEF<br>Pinnacles of the Bonaparte Basin KEF   |                         |                |
| <b>Coral Reef</b>  | Offshore coral reefs within the NMR is generally associated with a series of submerged shoals and banks. The shoals/banks in the region support tropical marine biota consistent with that found on emergent reef systems of the Indo West Pacific region such as Ashmore Reef, Cartier Island, Seringapatam Reef and Scott Reef (Heyward <i>et al.</i> , 1997)  |                         |                |
|  | Pinnacles of the Bonaparte Basin KEF<br>Evans Shoal<br>Tassie Shoal<br>Blackwood Shoal   |                         |                |
| <b>Filter Feeders/ heterotrophic</b>   | Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water, by passing the water over specialised filtration structures (DEWHA, 2007b). Filter feeders generally live in areas that have strong currents and hard substratum and typically associated with the deeper habitats of the submerged shoals and banks, and canyon features. |                         |                |
|  | Carbonate bank and terrace system of the Van Diemen Rise KEF<br>Pinnacles of the Bonaparte Basin KEF<br>Tributary Canyons of the Arafura Depression KEF<br>Evans Shoal<br>Tassie Shoal<br>Goodrich Bank  |                         |                |
| <b>Nearshore</b>   |  |                         |                |
| <b>Coral Reef</b>  | Within the NMR corals occur both as reefs and in non-reef coral communities. Nearshore reefs include patch reefs and fringing reefs sparsely distributed within the region. Coral reefs within the NMR provides breeding and aggregation areas for many fish species including mackerel and snapper and offer refuges for sea snakes and apex predators such as sharks.  |                         |                |
|  | Submerged coral reefs of the Gulf of Carpentaria KEF<br>Darwin Harbour   |                         |                |
| <b>Seagrass and Macroalgae communities</b>   | Seagrasses provide key habitats in the NMR. They stabilise coastal sediments and trap and recycle nutrients. They provide nursery grounds for commercially harvested fish and prawns and provide feeding grounds for dugongs and green turtles. Seagrass distribution in the region is largely associated with sheltered small bays and inlets including shallow waters surrounding inshore islands.   |                         |                |

## 5. FISHES, SHARKS AND RAYS

### 5.1 Regional Context

Western Australian waters provide important habitat for listed fishes, sharks, and rays including areas that support key life stages such as breeding, foraging, and migration routes for fish species. Pelagic and demersal fishes occupy a range of habitats throughout each of the regions, from coral reefs to open offshore waters, and are an extremely important component of ecosystems, providing a link between primary production and higher predators, with many species being of conservation value and important for commercial and recreational fishing.

The fish fauna in the NWMR is diverse. Of the approximately 500 shark species found worldwide, 94 are found in the region (DEWHA, 2008). Approximately 54 species of syngnathids (seahorses, seadragons, pipehorses and pipefishes) and one species of solenostomids (ghostpipefishes) are also known to occur in the NWMR or adjacent State waters (DSEWPAC, 2012a).

The fish fauna of the SWMR includes more than 900 species occupying a large variety of habitats. However, only three species of bony fishes known to occur in the region are listed under the EPBC Act as threatened or marine species, and seven listed species of shark (DSEWPAC, 2012b).

The NMR is considered an important area for the sawfish and river shark species group, with five species of sawfishes and river sharks listed under the EPBC Act known to occur in the region (DSEWPAC, 2012c). Approximately 28 species of syngnathids and two species of solenostomids are listed marine and known to occur in the NMR, however there is a paucity of knowledge on the distribution, relative abundance and habitats of these species in the region (DEWHA, 2008).

The following sections focus on the fish species (including sharks and rays) listed as threatened or migratory that are known to occur within the NWMR. In addition, listed, conservation dependent fish and shark species for the NWMR are described. A detailed account of commercial and recreational fisheries that operate in the region is provided in **Section 11**.

**Table 5-1** outlines the threatened and migratory fish species that may occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice. **Table 5-2** provides information for species of fish that are listed as conservation dependent that may occur within the NWMR, NMR and SWMR. Note that currently there are no approved Conservation Advices in place for any of these five species.

Table 5-1 Fish species (including sharks and rays) identified by the EPBC Act PMST for the NWMR

| Species Name                   | Common Name                              | Environment Protection and Biodiversity Conservation Act 1999 |                  |        | WA Biodiversity Conservation Act 2016 | EPBC Act Part 13 Statutory Instrument  |

## 5.2 Protected Sharks, Sawfishes and Rays in the NWMR

The EPBC Act Protected Matters search (**Appendix A**) identified seven species of shark and five species of river shark or sawfish listed as threatened and/or migratory within the NWMR. In addition, two species of ray (the reef manta ray and giant manta ray) are listed as migratory within the region (refer **Table 5-2**).

### 5.2.1 Sharks and Sawfishes

The shark species known to occur within the NWMR include: the whale shark, grey nurse shark, white shark, shortfin mako, and longfin mako (**Table 5-2**).

Five species of river shark or sawfish known to occur in the NWMR and include: the narrow sawfish, northern river shark, freshwater sawfish, green sawfish and dwarf sawfish (**Table 5-2**).

There are identified BIAs within the NWMR for the whale shark, freshwater sawfish, green sawfish, and dwarf sawfish (refer **Section 5.3.2**).

**Table 5-2 Information on the threatened shark and sawfish species within the NWMR**

| Species   | Preferred Habitat and Diet  | Habitat Location  |
|---|---|---|
| <b>Whale shark</b>                              | Preferred habitat: They have a widespread distribution in tropical and warm temperate seas, both oceanic and coastal (Last and Stevens, 2009). The species is widely distributed in Australian waters.<br>Diet: Whale sharks are planktivorous sharks and feed on a variety of planktonic organisms including krill, jellyfish, and crab larvae (Last and Stevens, 2009). | Ningaloo Reef is the main known aggregation site for whale sharks in Australian waters and has the largest density of whale sharks per kilometre in the world (Martin, 2007).<br>Refer <b>Table 5-3</b> for the BIA summary for the whale shark.                        |
| <b>Grey nurse shark (west coast population)</b> | Preferred habitat: Most commonly found in temperate waters on, or close to, the bottom of the continental shelf, from close inshore to depths of about 200 m (McAuley, 2004).<br>Diet: A variety of teleost and elasmobranch fishes and some cephalopods (Gelsichter <i>et al.</i> , 1999; Smale, 2005).  | Details of movement patterns of the western sub-population are unclear (McAuley, 2004) and key aggregation sites have not been formally identified within the NWMR (Chidlow <i>et al.</i> , 2006). The NWMR represents the northern limit of the west coast population. |

| Species                         | Preferred Habitat and Diet  | Habitat Location   |
|---------------------------------|---|--|
| <b>White shark</b>              | <p>Preferred habitat: The species typically occurs in temperate coastal waters between the shore and the 100 m depth contour; however, adults and juveniles have been recorded diving to depths of 1000 m (Bruce <i>et al.</i>, 2006; Bruce, 2008).</p> <p>Diet: Smaller white sharks (less than 3 m in length) feed primarily on teleost and elasmobranch fishes, broadening their diet as larger sharks to include marine mammals (Last and Stevens, 2009).</p>   | <p>There are no known aggregation sites for white sharks in the NWMR, and this species is most often found south of North-west Cape, in low densities (DSEWPAC, 2012a).</p> <p>Given the migratory nature of the species, most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p> |
| <b>Shortfin mako</b>            | <p>Preferred habitat: The shortfin mako shark is a pelagic species with a circumglobal, wide-ranging oceanic distribution in tropical and temperate seas (Mollet <i>et al.</i>, 2000). Tagging studies indicate shortfin makos spend most of their time in water less than 50 m deep but with occasional dives up to 880 m (Abascal <i>et al.</i>, 2011; Stevens <i>et al.</i>, 2010).</p> <p>Diet: Feeds on a variety of prey, such as teleost fishes, other sharks, marine mammals, and marine turtles (Campana <i>et al.</i>, 2005).</p>   | <p>Given the migratory nature of the species, most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p>   |
| <b>Longfin mako</b>             | <p>Preferred habitat: A pelagic species with a wide-ranging oceanic distribution in tropical and temperate seas (Mollet <i>et al.</i>, 2000).</p> <p>Diet: Primarily teleost fishes and cephalopods (primarily squid) (Last and Stevens, 2009).</p>   | <p>Records on longfin mako sharks are sporadic and their complete geographic range is not well known (Reardon <i>et al.</i>, 2006).</p> <p>Given the migratory nature of the species, most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p>                                     |
| <b>Mackerel/Porbeagle shark</b> | <p>Preferred habitat: The porbeagle shark primarily inhabits offshore waters around the edge of the continental shelf. They occasionally move into coastal waters, but these movements are temporary (Campana and Joyce, 2004; Francis <i>et al.</i>, 2002). The porbeagle shark is known to dive to depths exceeding 1300 m (Campana <i>et al.</i>, 2010; Saunders <i>et al.</i>, 2011).</p> <p>Diet: Primarily teleost fish, elasmobranchs, and cephalopods (primarily squid) (Joyce <i>et al.</i>, 2002; Last and Stevens, 2009).</p>  | <p>In Australia, the species occurs in waters from southern Queensland to south-west Australia (Last and Stevens, 2009). Distribution within the NWMR is unknown, but there are several records for this species on the NWS in the Atlas of Living Australia (ALA).</p>  |
| <b>Oceanic whitetip shark</b>   | <p>Preferred habitat: The oceanic whitetip shark is globally distributed in warm-temperate and tropical oceans (Andrzejczek <i>et al.</i>, 2018). The species may occur in tropical and sub-tropical offshore and coastal waters around Australia. They primarily occupy pelagic waters in the upper 200 m of the water column; however, they have been observed diving to depths of around 1000 m, potentially associated with foraging behaviour (Howey-Jordan <i>et al.</i>, 2013; D'Alberto <i>et al.</i>, 2017). The species is highly migratory, travelling large distances between shallow reef habitats in coastal waters and oceanic waters (Howey-Jordan <i>et al.</i>, 2013). The species does exhibit a strong preference for warm and shallow waters above 120 m.</p> <p>Diet: Opportunistic feeders and generally target a variety of finfishes and pelagic squid, depending on habitat. Target pelagics such as tuna in open ocean as noted by the large bycatch numbers in the long line fisheries.</p> | <p>Given the migratory nature of the species, most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.</p>   |

| Species                                 | Preferred Habitat and Diet  | Habitat Location   |
|---|---|--|
| <b>Narrow sawfish</b>                   | Preferred habitat <sup>1</sup> : Shallow coastal, estuarine, and riverine habitats, however it may occur in waters up to 40 m deep (D'Anastasi <i>et al.</i> , 2013).<br>Diet: Shoaling fishes, such as mullet, as well as molluscs and small crustaceans (Cliff and Wilson, 1994).   | Shallow coastal waters of the Pilbara and Kimberly coasts (Last and Stevens, 2009).  |
| <b>Northern river shark</b>             | Preferred habitat <sup>1</sup> : Rivers, tidal sections of large tropical estuarine systems and macrotidal embayments, as well as inshore and offshore marine habitats (Pillans <i>et al.</i> , 2009; Thorburn and Morgan, 2004). Adults have been recorded only in marine environments. Juveniles and sub-adults have been recorded in freshwater, estuarine and marine environments (Pillans <i>et al.</i> , 2009).<br>Diet: Variety of fish and crustaceans (Stevens <i>et al.</i> , 2005) | Within the NWMR records have come from both the west and east Kimberley, including King Sound, the Ord and King rivers, West Arm of Cambridge Gulf and also from Joseph Bonaparte Gulf (Thorburn and Morgan, 2004; Stevens <i>et al.</i> , 2005; Thorburn, 2006; Field <i>et al.</i> , 2008; Pillans <i>et al.</i> , 2008, Whitty <i>et al.</i> , 2008; Wynen <i>et al.</i> , 2008). |
| <b>Large-tooth (Freshwater) sawfish</b> | Preferred habitat: Sandy or muddy bottoms of shallow coastal waters, estuaries, river mouths and freshwater rivers, and isolated water holes.<br>Diet: Shoaling fishes, such as mullet, as well as molluscs and small crustaceans (Cliff and Wilson, 1994).   | Refer <b>Table 5-3</b> for the BIA summary for the freshwater sawfish.   |
| <b>Green sawfish</b>                    | Preferred habitat <sup>1</sup> : Inshore coastal environments including estuaries, river mouths, embayments, and along sandy and muddy beaches, as well as offshore marine habitat (Stevens <i>et al.</i> , 2005; Thorburn <i>et al.</i> , 2003).<br>Diet: Schools of baitfish and prawns (Pogonoski <i>et al.</i> , 2002), molluscs and small crustaceans (Cliff and Wilson, 1994).  | Refer <b>Table 5-3</b> for the BIA summary for the green sawfish.  |
| <b>Dwarf sawfish</b>                    | Preferred habitat <sup>1</sup> : Shallow (2 to 3 m) silty coastal waters and estuarine habitats, occupying relatively restricted areas and moving only small distances (Stevens <i>et al.</i> , 2008)<br>Diet: Shoaling fish such as mullet, molluscs, and small crustaceans (Cliff and Wilson, 1994).  | Refer <b>Table 5-3</b> for the BIA summary for the dwarf sawfish.  |

<sup>1</sup> Preferred habitat as described within the Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b).

## 5.2.2 Rays

Rays are commonly found in the NWMR. Two listed and migratory species of ray known to occur within the NWMR: the reef manta ray and giant manta ray.

No BIAs for either the reef or giant manta ray species have been identified in the NWMR.

**Table 5-3 Information on migratory ray species within the NWMR**

| Species                | Preferred Habitat and Diet   | Habitat Location  |
|------------------------|--|---|
| <b>Reef manta ray</b>  | Preferred habitat: The reef manta ray is commonly sighted within productive nearshore environments, such as island groups, atolls or continental coastlines. However, the species has also been recorded at offshore coral reefs, rocky reefs, and seamounts (Marshall <i>et al.</i> , 2009).<br>Diet: Feed on planktonic organisms including krill and crab larvae. | A resident population of reef manta rays has been recorded at Ningaloo Reef.<br>No BIAs identified for NWMR.    |
| <b>Giant manta ray</b> | Preferred habitat: The species primarily inhabits near-shore environments along productive coastlines with regular upwelling, but they appear  | The Ningaloo Coast is an important area for giant manta rays from March to August (Preen <i>et al.</i> , 1997). |

|---------|---|------------------------------|
|         | to be seasonal visitors to coastal or offshore sites including offshore island groups, offshore pinnacles and seamounts (Marshall <i>et al.</i> , 2011).<br>Diet: Feed on planktonic organisms including krill and crab larvae. | No BIAs identified for NWMR. |

### 5.3 Fish, Shark and Sawfish Biological Important Areas in the NWMR

A review of the National Conservation Values Atlas identified Biologically Important Areas (BIAs) for four species of shark and sawfish (whale shark, freshwater sawfish, green sawfish and dwarf sawfish) within the NWMR. The BIAs for the whale shark and the sawfish species include foraging, nursing and pupping areas. These are described in **Table 5-4**.

Table 5-4 Fish, whale shark and sawfish BIAs within the NWMR

| Species                                | Woodside Activity Area |       |     | BIAs  |  |   |

## 5.4 Fish Assemblages of the NWMR

### 5.4.1 Regional Context for Fish Assemblages of NWMR

The NWMR contains a diverse range of fishes of tropical Indo-west Pacific affinity (Allen *et al.*, 1988). The region is characterised by the highest level of endemism and species diversity compared with other areas of the Australian continental slope. Last *et al.* (2005) recorded 1431 species from the three bioregions encompassing the continental slope, whilst also acknowledging some information gaps.

The NWMR is known for its demersal slope fish assemblages; the continental slope of the Timor Province and the North-west Transition supports more than 418 and 505 species of demersal fishes respectively, of which 64 are considered to be endemic. This is the second richest area for demersal fish species across the entire Australian continental slope. Conversely, the broad Southern Province, which covers most of southern Australia, supports 463 species, only 26 possibly being endemic. The continental slope demersal fish assemblages of the NWMR have been identified as a KEF (DEWHA, 2008), as described in **Section 9**.

The NWMR also features a diversity of pelagic fishes (those living in the pelagic zone) and benthopelagic fishes, including tuna, billfish, bramids, lutjanids, serranids and some sharks (DEWHA, 2007a). These species feed on salps and jellyfish, and more often on secondary consumers such as squid and bait fish. Water depth provides an indication of the level of interaction between pelagic and benthic communities within the NWMR; in waters deeper than 1000 m, for instance, the trophic system is pelagically-driven and benthic communities rely on particulates that fall to the seafloor (DEWHA, 2007a).

Pelagic fishes play an important ecological role within the NWMR; small pelagic fishes, such as lantern fish, inhabit a range of marine environments, including inshore and continental shelf waters and form a vital link in and between many of the region's trophic systems, feeding on pelagic phytoplankton and zooplankton and providing a food source for a wide variety of predators including large pelagic fishes, sharks, seabirds and marine mammals (Bulman, 2006; Mackie *et al.*, 2007). Large pelagic fishes, such as tuna, mackerel, swordfish, sailfish and marlin, are found mainly in oceanic waters and occasionally on the continental shelf (Brewer *et al.*, 2007). Both juvenile and adult phases of the large pelagic species are highly mobile and have a wide geographic distribution, although the juveniles more frequently inhabit warmer or coastal waters (DEWHA, 2008).

### 5.4.2 Listed Fish Species in the NWMR

The family Syngnathidae is a group of bony fishes that includes seahorses, pipefishes, pipehorses and seadragons. Along with syngnathids, members of the related Solenostomidae family (ghost pipefishes) are also found in the NWMR (DSEWPAC, 2012a).

There are 44 solenostomid and syngnathid species that are listed marine species that may occur within the NWMR, although no species is currently listed as threatened or migratory, according to the PMST report (**Appendix A**).

Syngnathids live in nearshore and inner shelf habitats, usually in shallow coastal waters, among seagrasses, mangroves, coral reefs, macroalgae dominated reefs, and sand or rubble habitats (Dawson, 1985; Lourie *et al.*, 1999, Lourie *et al.*, 2004; Vincent, 1996). Two species, the winged seahorse (*Hippocampus alatus*) and western pipehorse (*Solegnathus sp. 2*) have been identified in deeper waters of the NWMR (up to 200 m) (DSEWPAC, 2012a), however, these species were not identified by the Protected Matters search of the NWMR.

Knowledge about the distribution, abundance and ecology of both syngnathids and solenostomids in the NWMR is limited. No BIAs for syngnathids and solenostomids have been identified in the NWMR.

### 5.4.3 Browse

The proposed Browse activity area includes biologically important habitat for the whale shark and three sawfish species:

- whale shark (foraging northward from Ningaloo along the 200 m isobath (July – Nov),
- freshwater sawfish (pupping, nursing and foraging areas),
- green sawfish (pupping, nursing and foraging areas); and
- dwarf sawfish (pupping, nursing and foraging areas).

BIAs for the shark and sawfish species are outlined in **Table 5-4** and **Figure 5-1**.

The proposed Browse activity area has partial overlap with the Continental slope demersal fish communities KEF.

### 5.4.4 NWS / Scarborough

The NWS / Scarborough activity area includes biologically important habitat for the whale shark and three sawfish species:

- whale shark (foraging northward from Ningaloo along the 200 m isobath (July – Nov),
- freshwater sawfish (pupping, nursing and foraging areas),
- green sawfish (pupping, nursing and foraging areas); and
- dwarf sawfish (pupping, nursing and foraging areas).

BIAs for the whale shark and sawfish species are outlined in **Table 5-4** and **Figure 5-1**.

The NWS / Scarborough activity area has partial overlap with the Continental slope demersal fish communities KEF. The continental slope between North-west Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last *et al.*, 2005).

### 5.4.5 North-west Cape

The North-west Cape activity area includes biologically important foraging habitat for the whale shark:

- whale shark, including:
  - Foraging (high density) in Ningaloo Marine Park and adjacent Commonwealth waters (March–July); and
  - Foraging northward from Ningaloo along the 200 m isobath (July – Nov).

BIAs for the whale shark are outlined in **Table 5-4** and **Figure 5-1**.

The North-west Cape activity area coincides with part of the Continental slope demersal fish communities KEF.

## 6. MARINE REPTILES

### 6.1 Regional Context for Marine Reptiles

The NWMR contains important habitat for listed marine reptiles, including areas that support key life stages such as nesting, internesting, migration and foraging for marine turtle species, and habitats supporting resident sea snake and crocodile populations.

Six of the seven marine turtle species occur in Australian waters, and all six (the green turtle, hawksbill turtle, loggerhead turtle, flatback turtle, leatherback turtle and olive ridley turtle) occur in the NWMR and NMR.

There are 25 listed species of sea snake reported within or adjacent to the NWMR (Guinea, 2007a; Udyawer *et al.*, 2016), of which four are endemic to reef habitats in the remote parts of the region. Nineteen (19) listed sea snake species are known to occur in the NMR, as reported in the Protected Matters search (**Appendix A**).

There are significantly fewer marine reptile species that frequently occur within the SWMR and presently include three species of listed marine turtle and one sea snake species. Other species of sea snake may occur because of the southward-flowing Leeuwin Current, as vagrants in the region (DSEWPAC, 2012b).

The following sections focus on the listed marine reptile species known to occur within the NWMR.

**Table 6-1** outlines the threatened and migratory marine reptile species that occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice.

**Table 6-1 Marine reptile species identified by the EPBC Act PMST as potentially occurring within or utilising habitats in the NWMR for key life cycle stages**

| Species Name                    | Common Name           | Environment Protection and Biodiversity Conservation Act 1999 |                  |        | WA Biodiversity Conservation Act 2016 | EPBC Act Part 13 Statutory Instrument   |

| <i>Natator depressus</i>        | Flatback turtle       | Vulnerable  | Migratory        | Marine | Vulnerable                            |   |
| <i>Lepidochelys olivacea</i>    | Olive ridley turtle   | Endangered  | Migratory        | Marine | Vulnerable                            |   |
| <i>Aipysurus apraefrontalis</i> | Short-nosed sea snake | Critically endangered   | N/A              | Marine | Critically endangered                 | Approved Conservation Advice for <i>Aipysurus apraefrontalis</i> (Short-nosed Sea Snake) (DSEWPAC, 2011a) |
| <i>Aipysurus foliosquama</i>    | Leaf-scaled sea snake | Critically endangered   | N/A              | Marine | Critically endangered                 | Approved Conservation Advice for <i>Aipysurus foliosquama</i> (Leaf-scaled Sea Snake) (DSEWPAC, 2011b)    |
| <i>Crocodylus porosus</i>       | Salt-water crocodile  | N/A   | Migratory        | Marine | Other protected fauna                 | N/A   |

## 6.2 Marine Turtles in the NWMR

According to the Protected Matters search (**Appendix A**) six species of marine turtle known to occur within the NWMR are listed as threatened and migratory (three Vulnerable and three Endangered) under the EPBC Act—the green (*Chelonia mydas*), hawksbill (*Eretmochelys imbricata*), flatback (*Natator depressus*), loggerhead (*Caretta caretta*), leatherback (*Dermochelys coriacea*) and olive ridley (*Lepidochelys olivacea*) turtle (DSEWPAC, 2012a) (refer **Table 6-1**).

The NWMR supports globally significant breeding populations of four marine turtle species: the green, hawksbill, flatback and loggerhead turtle. Olive ridley turtles are known to forage within the NWMR, but there are only occasional records of the species nesting in the region. Leatherback turtles regularly forage over Australian continental shelf waters within the NWMR but there are also no records of the species nesting in the region (DSEWPAC, 2012a).

The six marine turtle species reported for the NWMR also occur within the NMR.

Three marine turtle species; the green, loggerhead, and leatherback turtle, have presumed feeding areas within the SWMR; however, no known nesting areas exist within the region (DSEWPAC, 2012b).

Discrete genetic stocks have evolved within each marine turtle species. This is the result of marine turtles returning to the location where they hatched. These genetically distinct stocks are defined by the presence of regional breeding aggregations. Stocks are composed of multiple rookeries in a region and are delineated by where there is little or no migration of individuals between nesting areas. Turtles from different stocks typically overlap at feeding grounds (Commonwealth of Australia, 2017). There are 17 genetic stocks across both the NWMR and NMR (nine in the NWMR, six in the NMR, and two overlapping both regions). Of these 17 genetic stocks, nine are known to occur within Woodside's three areas of activity (**Table 6-2**).

### 6.2.1 Life Cycle Stages

Marine turtles are highly migratory during non-reproductive life phases and have high site fidelity during breeding and nesting life phases. Majority of their lives are spent in the ocean, but the adult female marine turtles will come ashore to lay eggs in the sand above the high water mark on natal beaches (Commonwealth of Australia, 2017). **Figure 6-1** summarises the generalised life cycle of marine turtles. Species-specific life cycle information is outlined within the Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia, 2017).

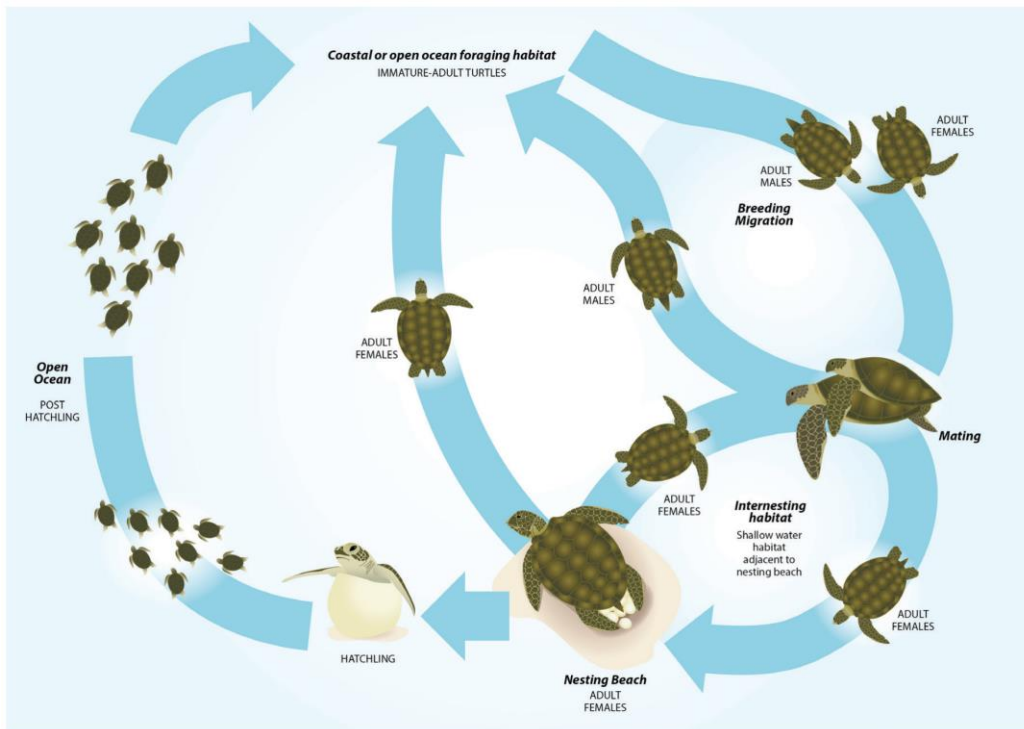

Figure 6-1 Generalised life cycle of marine turtles (Commonwealth of Australia, 2017)

### 6.2.2 Habitat Critical to Survival for Marine Turtles in the NWMR

The Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia, 2017) identifies habitat critical to the survival of a species for marine turtle stocks under the EPBC Act. Habitat critical to survival is defined by the EPBC Act *Significant Impact Guidelines 1.1 – Matters of National Environmental Significance* as areas necessary:

- for activities such as foraging, breeding or dispersal;
- for the long-term maintenance of the species (including the maintenance of species essential to the survival of the species);
- to maintain genetic diversity and long term evolutionary development; and
- for the reintroduction of populations or recovery of the species.

The Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia, 2017) has identified nesting locations and associated internesting areas as habitat critical to survival for four marine turtle species within the NWMR and these are identified, described and mapped in **Table 6-2** and **Figure 6-2**. No habitat critical to survival has been identified within the NWMR for olive ridley or leatherback turtles.

**Table 6-2** outlines the relevant genetic stock, habitat critical to survival and key life cycle stage seasonality of the four species of marine turtles within the NWMR.

Table 6-2 Genetic stock, habitat critical to survival and key life cycle stage seasonality of the four species of marine turtles within the NWMR

| Species                                 | Woodside Activity Area |       |     | Habitat Critical to Survival  |                     |                          |   |

### 6.3 Marine Turtle Biological Important Areas in the NWMR

A review of the National Conservation Values Atlas (DAWE, 2020<sup>2</sup>) identified BIAs for the four marine turtle species that occur within the NWMR. These are described in **Table 6-3**. Note that nesting and interesting BIAs are not listed in **Table 6-3** as they are defined as in the Recovery Plan as habitat critical to survival for marine turtles nesting beaches and interesting areas (refer **Table 6-2**).

## 6.4 Marine Turtle Summary for NWMR

Six of the seven marine turtle species occur within the Woodside activity areas. Across all three areas, globally significant breeding populations of four marine turtle species; the green, hawksbill, flatback and loggerhead turtle, have been recorded.

However, offshore waters do not represent biologically important habitat for marine turtles in any of the three Woodside activity areas. Isolated records of transient individuals (on post-nesting migration) are expected, but there is no evidence of important habitat or behaviours for marine turtles in offshore, open water environment of the NWS, in general.

### 6.4.1 Browse

The proposed Browse activity area includes major nesting areas that support globally significant breeding populations of two marine turtle species:

- the green turtle, including two distinct genetic stocks (Ashmore Reef and Scott Reef-Browse Island); and
- the flatback turtle, Cape Domett genetic stock.

Locations of habitat critical for each of the two species are outlined in **Table 6-2** and **Figure 6-2**.

BIAs for the green and flatback turtle are outlined in **Table 6-3** and **Figure 6-3**.

**Table 6-4 Marine turtle key information for Browse activity area**

| Species / Genetic Stock                 | Key Information  |
|---|--|
| <b>Green Turtle</b>                     |  |
| Ashmore Reef Stock (G-AR)               | <p>The G-AR stock nests in a localised area of the Indian Ocean in the Ashmore Reef and Cartier Island AMP areas. Population estimates are not available for Ashmore Reef, although annual breeding numbers are thought to be in the low hundreds (Whiting, 2000).</p> <p>Designated habitat critical for the G-AR stock are the nesting locations of Ashmore Reef and Cartier Reef, and an internesting buffer of 20 km radius around these rookeries, year-round with peak internesting activity occurring December to January (refer Table 6 of the Recovery Plan).</p> <p>Juvenile and adult turtles forage within the tidal/sub-tidal habitats of offshore islands and coastal waters with coral reef, mangrove, sand, rocky reefs, and mudflats where there are algal turfs or seagrass meadows present (Commonwealth of Australia, 2017).</p>   |
| Scott Reef-Browse Island Stock (G-ScBr) | <p>The G-ScBr stock is a discrete unit known to nest at only two locations within the north-east Indian Ocean—Sandy Islet and Browse Island. There is currently very limited data available for the G-ScBr stock, therefore population numbers are not known.</p> <p>Designated habitat critical for the G-ScBr stock are the nesting locations of Sandy Islet and Browse Island, and an internesting buffer of 20 km radius around these rookeries, for the period November to March (refer Table 6 of the Recovery Plan).</p> <p>Surveys conducted at Scott Reef in 2006, 2008 and 2009 indicate that the summer months from late November to February are the preferred breeding season for green turtles at Sandy Islet (Guinea, 2009).</p> <p>Satellite tagging studies (Pendoley, 2005; Guinea, 2011) have provided an indication of the behaviour and migratory routes of adult green turtles leaving Scott Reef. Most animals appear to swim through South Reef lagoon and disperse toward the Western Australian mainland via two distinct post-nesting migration pathways; travelling east and north toward the Bonaparte Archipelago and then north along the coast to foraging areas in NT waters, or travelling south to Cape Leveque and then south along the coast to the Turtle Islands off the mouth of the De Grey River in the Pilbara region (Ferreira <i>et al.</i>, 2021).</p> |

| Species / Genetic Stock  | Key Information  |
|--------------------------|--|
| <b>Flatback Turtle</b>   |  |
| Cape Domett Stock (F-CD) | <p>Cape Domett is an important high density nesting area. Combined with a smaller site at Lacrosse Island, the F-CD stock is one of the largest flatback turtle stocks in Australia. Average nesting abundance at Cape Domett is estimated at 3250 females per year (Whiting <i>et al.</i>, 2008).</p> <p>Designated habitat critical for the F-CD stock are the nesting locations of Cape Domett and Lacrosse Island, and an interesting buffer of 60 km radius around these rookeries, year-round with peak interesting activity occurring July to September.</p> <p>Extending further than the habitat critical interesting buffer, an interesting buffer BIA of 80 km is located at Cape Domett and Lacrosse Island.</p> |

#### 6.4.2 North-west Shelf / Scarborough

The NWS / Scarborough activity area includes major nesting areas that support globally significant breeding populations of three marine turtle species, representing four discreet genetic stocks:

- the green turtle, NWS genetic stock;
- the hawksbill turtle, WA genetic stock; and
- the flatback turtle, South-west Kimberley stock and Pilbara genetic stocks.

Locations of habitat critical for each of the four species are outlined in **Table 6-2** and **Figure 6-2**.

BIAs for the green, hawksbill, and flatback are outlined in **Table 6-3** and **Figure 6-3**.

**Table 6-5 Marine turtle key information for NWS / Scarborough activity area**

| Species / Genetic Stock              | Key Information   |
|--------------------------------------|---|
| <b>Green Turtle</b>                  |   |
| NWS Stock (G-NWS)                    | <p>The G-NWS stock is one of the largest green turtle stocks in the world and the largest in the Indian Ocean. The G-NWS stock is estimated at approximately 20,000 individuals (DSEWPAC, 2012a) and the trend for the stock is reported as stable (Commonwealth of Australia, 2017).</p> <p>Major rookeries of the G-NWS stock within the NWS / Scarborough activity area are located at Barrow Island and the Montebello Islands. These areas are designated habitat critical for the stock and include an interesting buffer of 20 km radius around these rookeries, November to March.</p>  |
| <b>Hawksbill Turtle</b>              |   |
| Western Australia Stock (H-WA)       | <p>The H-WA stock is the largest in the Indian Ocean. The majority of the nesting for this stock is located in the Pilbara. The Dampier Archipelago has the largest nesting aggregation recorded. In particular, Rosemary Island supports the most significant hawksbill turtle rookery in the WA region and one of the largest in the Indian Ocean; approximately 500-1000 females nest on the island annually, more than at any other WA rookery (Pendoley, 2005; Pendoley <i>et al.</i>, 2016).</p> <p>Major rookeries of the H-WA stock within the NWS / Scarborough activity area are located at Rosemary Island, Delambre Island and the Montebello Islands. These areas are designated habitat critical for the stock and include an interesting buffer of 20 km radius around these rookeries, October to February.</p> |
| <b>Flatback Turtle</b>               |   |
| South-west Kimberley Stock (F-swKim) | <p>The genetic relationship between this nesting aggregation and the Cape Domett and Pilbara stocks is currently under review. Population numbers of the F-swKim stock are unknown.</p> <p>Major rookeries of the F-swKim stock are located at Eighty Mile Beach and Eco Beach. These areas are designated habitat critical for the stock and include an interesting buffer of 60 km radius around these rookeries, October to March.</p>   |

| Species / Genetic Stock | Key Information  |
|-------------------------|--|
| Pilbara Stock (F-Pil)   | <p>The extent of genetic relatedness of flatback turtles along the WA coast is currently under review. Population numbers of the F-Pil stock are unknown. This stock nests on many islands in the Pilbara and southern Kimberley, with major rookeries at Mundabullangana Beach, Delambre Island and Barrow Island. These areas are designated habitat critical for the F-Pil stock and include an interesting buffer of 60 km radius around these rookeries, October to March.</p> <p>Extending further than the habitat critical interesting buffer, a year-round interesting buffer BIA of 80 km is located north and north-west of the Montebello Islands. However, use level for this BIA has been defined as very low (Commonwealth of Australia, 2017) and the habitat critical interesting buffer is the legally recognised area of protection under the EPBC Act <i>Significant Impact Guidelines 1.1 – Matters of National Environmental Significance</i>.</p> <p>Post-nesting satellite tracking indicates foraging occurs along the WA coast in water shallower than 130 m and within 315 km of shore (Commonwealth of Australia, 2017).</p> |

### 6.4.3 North-west Cape

The North-west Cape activity area includes major nesting areas that support globally significant breeding populations of two marine turtle species, representing two discreet genetic stocks:

- the green turtle, NWS genetic stock; and
- the loggerhead turtle, Western Australia genetic stock.

Locations of habitat critical for each of the two species are outlined in **Table 6-2** and **Figure 6-2**.

BIAs for the green and loggerhead turtles are outlined in **Table 6-3** and **Figure 6-3**.

A 2018 survey, including on-beach monitoring of the Muiron Islands and Ningaloo Coast from North-west Cape to Bungelup (Rob *et al.*, 2019), supports the concept that North-west Cape and the Muiron Islands are major important nesting areas for green and loggerhead turtles, as identified in the Recovery Plan (Commonwealth of Australia, 2017).

**Table 6-6 Marine turtle key information for North-west Cape activity area**

| Species / Genetic Stock         | Key Information  |
|---------------------------------|--|
| <b>Green Turtle</b>             |  |
| NWS Stock (G-NWS)               | <p>The G-NWS stock is one of the largest green turtle stocks in the world and the largest in the Indian Ocean. The G-NWS stock is estimated at approximately 20,000 individuals (DSEWPAC, 2012a) and the trend for the stock is reported as stable (Commonwealth of Australia, 2017).</p> <p>There is one major rookery of the G-NWS stock located within the North-west Cape activity area. Located on the mainland coast of the North-west Cape, this area is designated habitat critical for the stock and includes an interesting buffer of 20 km radius around the rookery, November to March.</p>  |
| <b>Loggerhead Turtle</b>        |  |
| Western Australia Stock (LH-WA) | <p>The LH-WA stock is one of the largest in the world (Limpus, 2009). The trend for the stock is reported as stable (Commonwealth of Australia, 2017).</p> <p>Major rookeries of the LH-WA stock are located at Dirk Hartog Island, Muiron Islands and Gnaraloo Bay. These areas are designated habitat critical for the stock and include an interesting buffer of 20 km radius around these rookeries, November to May.</p> <p>Dirk Hartog Island in the Shark Bay Marine Park, with an average of 122 nests per day over 2.1 km (Reinhold and Whiting, 2014), is recognised as the most important loggerhead turtle rookery in WA (Commonwealth of Australia, 2016; as cited in Rob <i>et al.</i>, 2019).</p> |

## 6.5 Sea Snakes

Sea snakes are commonly found in the NWMR and NMR, but less so in the SWMR, and occupy three broad habitat types: shallow water coral reef and seagrass habitats, deepwater soft bottom habitats away from reefs, and surface water pelagic habitats (Guinea, 2007a).

There are 25 listed species of sea snake reported within or adjacent to the NWMR (Guinea, 2007a; Udyawer *et al.*, 2016), of which four are endemic to reef habitats in the remote parts of the region:

- dusky sea snake (*Aipysurus fuscus*);
- large headed sea snake (*Hydrophis pacificus*);
- short-nosed sea snake (*Aipysurus apraefrontalis*); and
- leaf-scaled sea snake (*Aipysurus foliosquama*).

The short-nosed sea snake and the leaf-scaled sea snake are listed threatened species (Critically Endangered) under the EPBC Act (**Table 6-7**).

There is currently limited knowledge about the ranges and distribution patterns of sea snake species in the NWMR, in addition to a lack of understanding of population status and threats. Recent findings of *A. apraefrontalis* and *A. foliosquama* in locations outside of their previously defined ranges have highlighted the lack of information on species distributions in the NWMR (Udyawer *et al.*, 2016). Udyawer *et al.* (2020) used a correlative modelling approach to understand habitat associations and identify suitable habitats for five sea snake species (*A. apraefrontalis*, *A. foliosquama*, *A. fuscus*, *A. l. pooleorum* and *A. tenuis*). Species-specific habitat suitability was modelled across 804,244 km<sup>2</sup> of coastal waters along the NWS, and the resulting habitat suitability maps enabled the identification of key locations of suitable habitat for these five species (refer **Table 6-6**).

No habitat critical to survival or BIAs for sea snake species have been identified in the NWMR. While the Ashmore Reef and Cartier Island AMPs have been recognised for their high diversity and density of sea snakes (DSEWPAC, 2012a), surveys have revealed a steep decline in sea snake numbers at Ashmore Reef (Guinea, 2007b; Lukoschek *et al.*, 2013). Leaf-scaled and short-nosed sea snakes have been absent from surveys at Ashmore Reef since 2001, despite an increase in survey intensity (Guinea, 2006, 2007b; Guinea and Whiting, 2005; Lukoschek *et al.*, 2013). The reason for the decline is unknown.

**Table 6-7 Information on the two threatened sea snake species within the NWMR**

| Species                      | Preferred Habitat and Diet   | Habitat Location   |
|------------------------------|--|--|
| <b>Short-nosed sea snake</b> | Preferred habitat: Primarily on the reef flats or in shallow waters of the outer reef edges to depths of 10 m (Minton <i>et al.</i> , 1975). Typically, movement is restricted to within 50 m of reef flat habitat (Guinea and Whiting, 2005).<br>Diet: Primarily fishes and eels. | The short-nosed sea snake has been recorded from Exmouth Gulf to the reefs of the Sahul Shelf, although most records come from Ashmore and Hibernia reefs (Guinea and Whiting, 2005).<br>Key locations of suitable habitat: Ashmore Reef, Exmouth Gulf, Muiron Islands, Montebello Islands (Udyawer <i>et al.</i> , 2020). |
| <b>Leaf-scaled sea snake</b> | Preferred habitat: The leaf-scaled sea snake occurs in shallow protected areas of reef flats, typically in water depth less than 10 m.<br>Diet: Primarily shallow water coral-associated wrasse, gudgeons, clinids and eels (McCosker, 1975; Voris, 1972; Voris and Voris, 1983)   | The leaf-scaled sea snake has only been recorded at Ashmore and Hibernia reefs (Guinea and Whiting, 2005), indicating it has a very limited distribution.<br>Key locations of suitable habitat: Ashmore Reef, Shark Bay, Exmouth Gulf, Barrow Island and Montebello Islands (Udyawer <i>et al.</i> , 2020).                |

## 6.6 Crocodiles

The salt-water crocodile (*Crocodylus porosus*) is a listed migratory species under the EPBC Act known to occur within the NWMR. The species is found in most major river systems of the Kimberley, including the Ord, Patrick, Forrest, Durack, King, Pentecost, Prince Regent, Lawley, Mitchell, Hunter, Roe and Glenelg rivers. The largest populations occur in the rivers draining into the Cambridge Gulf and the Prince Regent River and Roe River systems. There have also been isolated records in rivers of the Pilbara region, around Derby near Broome and as far south as Carnarvon on the mid-west coast.

No BIAs for salt-water crocodile have been identified in the NWMR.

## 7. MARINE MAMMALS

### 7.1 Regional Context

The offshore waters of WA include important habitat for marine mammals, including areas that support key life stages such as breeding, foraging, and migration. Of the 45 species of cetacean occurring in Australian waters, 27 species occur regularly in the waters of the NWMR, nine species in the waters of the NMR and 33 species in the SWMR. The waters of the NWMR and the NMR also support significant populations of dugong (DSEWPAC, 2012a, c).

The NWMR is an important migratory pathway between feeding grounds in the Southern Ocean and breeding grounds in tropical waters of the NWMR for several cetacean species (DSEWPAC, 2012a). Numerous large mysticetes (baleen whale) species, in particular the humpback whale, are known to utilise the region for migration and calving, and the pygmy blue whale for foraging and as a migration pathway between southern feeding and northern breeding/feeding areas, north of the equator.

The SWMR is an important area for numerous marine mammal species including pinniped species, large, migratory whale species and resident coastal whale and dolphin species (DSEWPAC, 2012b).

The NMR and adjacent areas are important for several species of cetacean, particularly inshore dolphin species. These species, and other marine mammals, rely on the waters of the NMR and adjacent coastal areas for breeding and foraging. However, there is little knowledge of the seasonal movements, migrations and breeding seasonality for many of the marine mammal species in the NMR due to lack of extensive surveys (DSEWPAC, 2012c).

**Table 7-1** outlines the threatened and migratory marine mammal species that may occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice.

Table 7-1 Marine mammal species identified by the EPBC Act PMST as occurring within the NWMR

| Species Name                    | Common Name                   | Environment Protection and Biodiversity Conservation Act 1999 |                  |          | WA Biodiversity Conservation Act 2016 | EPBC Act Part 13 Statutory Instrument   |

## 7.2 Cetaceans in the NWMR

Cetaceans are generally widely distributed and highly mobile. In general, distribution patterns reflect seasonal feeding areas, characterised by high productivity, and migration routes associated with reproductive patterns. The NWMR is thought to be an important migratory pathway between feeding grounds in the Southern Ocean and breeding grounds in tropical waters for several cetacean species (DSEWPAC, 2012a).

From the Protected Matters search, 34 EPBC Act listed species were recorded as potentially occurring or having habitat within the NWMR (**Appendix A**). Of those, 12 cetacean species are listed as threatened and/or migratory, including baleen whales, toothed whales and dolphins that occur within the NWMR (**Table 7-2**).

## 7.3 Dugongs in the NWMR

The dugong is listed as migratory under the EPBC Act. Dugongs inhabit seagrass meadows in coastal waters, estuarine creeks and streams, and reef systems (DSEWPAC, 2012a).

Some of the coastal waters adjacent to the NWMR support significant populations of dugongs, including Shark Bay, Exmouth Gulf, in and adjacent to Ningaloo Reef, in coastal waters along the Kimberley coast, and on the edge of the continental shelf at Ashmore Reef (DEWHA, 2008).

Although the patterns of dugong movement in WA are not well understood, it is thought that dugongs move in response to availability of seagrass (Marsh *et al.*, 1994; Preen *et al.*, 1997) and water temperature.

There are a number of BIAs for dugong within and adjacent to waters of the NWMR (refer **Section 7.5**).

## 7.4 Pinnipeds in the NWMR

The Australian sea lion is listed as a species that may occur, or may have habitat within the NWMR (Protected Matters search - **Appendix A**). It is included here as the Australian sea lion is the only pinniped endemic to Australia (Strahan, 1983) and has been recorded within the southern extent of the NWMR at Shark Bay, WA (Kirkwood *et al.*, 1992). The most northern known breeding colony is at the Houtman Abrolhos Islands in the SWMR. The Australian sea lion's breeding range extends from the Houtman Abrolhos Islands, WA to The Pages Island, east of Kangaroo Island, SA. The Australian sea lion was listed as endangered in 2020 (Threatened Species Scientific Committee, 2020a). An assessment of the status and trends in abundance of this endemic, coastal pinniped species (Goldsworthy *et al.* 2021) documented an overall reduction in pup abundance over three generations, providing strong evidence that the species meets IUCN endangered criteria.

There are no BIAs for the Australian sea lion in the NWMR.

Table 7-2 Information on the threatened/migratory marine mammal species within the NWMR

| Species                          | Key Information  |
|----------------------------------|--|
| <b>Baleen whales (Mysticeti)</b> |  |
| <b>Humpback whale</b>            | <p>In Australian waters two genetically distinct populations migrate annually along the west (Group IV) and east coasts (Group V) between May and November. In WA, the migration pathway for the Group IV population (also known as Breeding Stock D) extends from Albany to the Kimberley coastline, passing through the NWMR (Threatened Species Scientific Committee, 2015b). Since the 1982 moratorium on commercial whaling population numbers have recovered significantly; from approximately 2000 to 3000 individuals in 1991, to between 19,200–33,850 individuals in 2008 (Bannister and Hedley, 2001; Bejder <i>et al.</i>, 2019; Hedley <i>et al.</i>, 2011). Aerial surveys off the WA coast undertaken between 2000 and 2008 produced a population estimate for the Group IV population of 26,100 individuals (CI 20,152–33,272) in 2008 (Salgado Kent <i>et al.</i>, 2012). Current population growth for the Group IV population is estimated to be between 9.7 and 13% per annum (Threatened Species Scientific Committee, 2015b). Using the Salgado-Kent <i>et al.</i> (2012) estimate of 26,100 individuals and an annual population growth rate of ~10%, current population size could be in excess of 75,000 individuals (Woodside, 2019).</p> <p>The Group IV population migrates northward from their Antarctic feeding grounds around May each year, reaching the NWMR around early June. The southward migration subsequently starts in mid-September, around the time of breeding and calving (typically August to September) (Threatened Species Scientific Committee, 2015b). Within the NWMR there are key calving areas between Broome and the northern end of Camden Sound, and resting areas in the southern Kimberley region, Exmouth Gulf and Shark Bay. In particular, high numbers of humpback whales are observed in Camden Sound and Pender Bay from June to September each year (Threatened Species Scientific Committee, 2015b). There are reports of neonates further south, suggesting that the calving areas may be poorly defined. Aerial photogrammetric surveys in 2013 and 2015 recorded large numbers of humpback whale calves along North-west Cape, with estimated minimum relative calf abundance of 463–603 in 2013 and 557–725 in 2015 (Irvine <i>et al.</i>, 2018). The majority of calves sighted in both years (85% in 2013; 94% in 2015) were neonates, and these observations indicate that a minimum of approximately 20% of the expected number of calves of this population are born near, or south of, North-west Cape. Thus, the calving grounds for the Group IV population extend south from Camden Sound to at least North-west Cape, 1000 km south-west of the currently recognized calving area (Irvine <i>et al.</i>, 2018).</p> <p>There are BIAs for migration and breeding and calving for the humpback whale along the WA coast and within the NWMR (refer <b>Table 7-3</b> and <b>Figure 7-1</b>).</p> |
| <b>Blue whale</b>                | <p>There are two recognised sub-species of blue whale in the Southern Hemisphere, both of which are recorded in Australian waters. These are the southern (or 'true') blue whale (<i>Balaenoptera musculus</i>) and the 'pygmy' blue whale (<i>Balaenoptera musculus breviceauda</i>) (Commonwealth of Australia, 2015a). In general, southern blue whales occur in waters south of 60°S and pygmy blue whales occur in waters north of 55°S (i.e. not in the Antarctic). On this basis, nearly all blue whales sighted in the NWMR are likely to be pygmy blue whales.</p> <p>The East Indian Ocean (EIO) pygmy blue whale population is seasonally distributed from Indonesia (a potential breeding ground) to south-west of Australia and east across the Great Australian Bight and Bonney Upwelling to beyond the Bass Strait (Blue Planet Marine, 2020). Migration seems to be variable, with some individuals appearing as resident to areas of high productivity and others undertaking migrations across long distances (Commonwealth of Australia, 2015a). McCauley <i>et al.</i> (2018) describe three migratory stages around Australia for the EIO pygmy blue whale population: a 'southbound migratory stage' where whales travel southwards from Indonesian waters offshore from the WA coastline, mostly from October to December but possibly into January of the following year; a protracted 'southern Australian stage' (January to June) where animals spread across southern waters of the Indian Ocean and south of Australia; and a 'northbound migratory stage' (April to August) where animals travel north back to Indonesia again.</p> <p>There are currently insufficient data to accurately estimate population numbers of the pygmy blue whale in Australian waters (Blue Planet Marine, 2020; Commonwealth of Australia, 2015a). There are, however, two estimates of population size of the EIO pygmy blue whale for WA. McCauley and Jenner (2010) calculated the population to be between 662 and 1559 individuals in 2004 based on passive acoustics (whale vocalisations), and Jenner <i>et al.</i> (2008) (based on photographic mark and recapture) calculated between 712 and 1754 individuals, but both estimates did not account for animals</p>   |

| Species                      | Key Information   |
|------------------------------|---|
|                              | <p>travelling further west into the Indian Ocean (McCauley <i>et al.</i>, 2018). More recent passive acoustic data estimates a 4.3% growth rate that applies to the proportion of EIO pygmy blue whales seasonally present in offshore water of the south-eastern Australia and may not reflect the full population but does imply an increasing population (McCauley <i>et al.</i>, 2018).</p> <p>The pygmy blue whale is typically present in the Perth Canyon from November to June, with an observed peak between March and May (Commonwealth of Australia, 2015a; Blue Planet Marine, 2020). The pygmy blue whale feeds in the Perth Canyon at depths of 200 to 300 m, which overlaps the typical distribution of krill (200–500 m water depth (day) to surface (night) (McCauley <i>et al.</i>, 2004; Commonwealth of Australia, 2015a). Other possible feeding grounds off the WA coast include the wider area around the Perth Canyon, and possible foraging areas off the Ningaloo Coast and at Scott Reef (Commonwealth of Australia, 2015a).</p> <p>Refer <b>Table 7-3</b> and <b>Figure 7-2</b> for the location and type of BIAs for blue whales in the NWMR. There is a migratory BIA for the pygmy blue whale within WA waters, which extends for most of the length of the NWMR within offshore waters.</p> |
| <b>Bryde's whale</b>         | <p>The Bryde's whale is the least migratory of its genus and is restricted geographically from the equator to approximately 40°N and S, or the 20° isotherm (Bannister <i>et al.</i>, 1996). The species is known to exhibit inshore and offshore forms in other international locations that vary in morphology and migratory behaviours (Bannister <i>et al.</i>, 1996). This appears to also be the case within Australian waters. Bryde's whales have been identified as occurring in both oceanic and inshore waters, with the only key localities recognised in WA being in the Houtman Abrolhos Islands and north of Shark Bay (Bannister <i>et al.</i>, 1996). Data suggests offshore whales migrate seasonally, heading towards warmer tropical waters during the winter; however, information about migration within the NWMR is not well known (McCauley and Duncan, 2011). McCauley (2011) detected Bryde's whales using acoustic loggers deployed in and around Scott Reef from 2006 to 2009. Other acoustic logger data of Bryde's whale vocalisations recorded between Ningaloo and north of Darwin showed no apparent trends or seasonality (McCauley, 2011).</p> <p>There are no identified BIAs for this species in the National Conservation Values Atlas.</p>   |
| <b>Southern right whale</b>  | <p>The southern right whale occurs primarily in waters between about 20°S and 60°S and moves from high latitude feeding grounds in summer to warmer, low latitude, coastal locations in winter (Bannister <i>et al.</i>, 1996). Southern right whales aggregate in calving areas along the south coast of WA outside of the NWMR. However, there have been sightings in waters of the NWMR as far north as Ningaloo (Bannister and Hedley, 2001), and a stranding record exists for the far north Kimberley coast (ALA, 2020). Southern right whale calving grounds are found at mid to lower latitudes and are occupied during the austral winter and early-mid spring. They are regularly present on the southern Australian coast from about mid-May to mid-November, and peak periods for mating are from mid-July through August. Mating occurs within these breeding grounds as evidenced by many observations of intromission and mating behaviours. Southern right whales in south-western Australia appear to be increasing at the maximum biological rate but there is limited evidence of increase in south-eastern Australian waters (DSEWPAC, 2012d).</p> <p>There are no identified BIAs for this species in the NWMR.</p>  |
| <b>Antarctic minke whale</b> | <p>The Antarctic minke whale is distributed worldwide and has been recorded off all Australian states (but not in the NT), feeding in cold waters and migrating to warmer waters to breed. It is thought that the Antarctic minke whale migrates up the WA coast to about 20°S to feed and possibly breed (Bannister <i>et al.</i>, 1996); however, detailed information about timing and location of migrations and breeding grounds within the NWMR is not well known. In the high latitudinal winter breeding grounds in other regions, the species appears to be distributed off the continental shelf edge. No population estimates are available for Antarctic minke whales in Australian waters.</p> <p>There are no identified BIAs for this species in the National Conservation Values Atlas.</p>   |
| <b>Sei whale</b>             | <p>The sei whale is a baleen whale with a worldwide oceanic distribution and is expected to seasonally migrate between low latitude wintering areas and high latitude summer feeding grounds (Bannister <i>et al.</i>, 1996; Prieto <i>et al.</i>, 2012). There are no known mating or calving areas in Australian waters. The species has a preference for deep waters, typically occurs in oceanic basins and continental slopes (Prieto <i>et al.</i>, 2012), and exhibits a migration pathway influenced by seasonal feeding and breeding patterns. Sei whales have been infrequently recorded in Australian waters (Bannister <i>et al.</i>, 1996). Reliable estimates of the sei whale population size in Australian waters are currently not possible due to a lack of dedicated surveys and their elusive characteristics. Similarly, the extent of occurrence and area of occupancy of sei whales in Australian waters cannot be calculated due to the</p>   |

| Species                            | Key Information   |
|------------------------------------|---|
|                                    | <p>rarity of sighting records. They will typically travel in small pods of three to five individuals, with some segregation by age, sex and reproductive status. Calving grounds are presumed to exist in low latitudes with mating and calving potentially occurring during winter months (Threatened Species Scientific Committee, 2015a).</p> <p>There are no known mating or calving areas in Australian waters, and there are no identified BIAs for this species in the National Conservation Values Atlas.</p>   |
| <b>Fin whale</b>                   | <p>The fin whale is a large baleen whale distributed worldwide. Fin whales migrate annually between high latitude summer feeding grounds and lower latitude over-wintering areas (Bannister <i>et al.</i>, 1996) and follow oceanic migration paths. The species is uncommonly encountered in coastal or continental shelf waters. Australian Antarctic waters are important feeding grounds for fin whales but there are no known mating or calving areas in Australian waters (Morrice <i>et al.</i>, 2004). The species has been observed in groups of six to 10 individuals, as well as in pairs and alone (Threatened Species Scientific Committee, 2015c). Accurate distribution patterns are not known within Australian waters and the majority of data are from stranding events.</p> <p>Fin whales have been recorded vocalising off the Perth Canyon, WA, between January and April 2000 (McCauley <i>et al.</i>, 2000). It is currently not possible to accurately estimate the population size of fin whales in Australian waters predominantly due to the species' behaviour and local ecology, as the proportion of time they spend at the surface varies greatly depending on these factors. In addition, natural fluctuations of fin whales in Australian waters are unknown; however, long-range movements do appear to be prey-related. A recent study by Aulich <i>et al.</i> (2019) used passive acoustic monitoring as a tool to identify the migratory movements of fin whales in Australian waters. On the west coast, the earliest arrival of these animals occurred at Cape Leeuwin in April, and between May and October they migrated along the WA coastline to the Perth Canyon, which likely acts as a way-station for feeding (Aulich <i>et al.</i>, 2019). Some whales were found to continue migrating as far north as Dampier (Aulich <i>et al.</i>, 2019).</p> <p>There are no identified BIAs for this species in the National Conservation Values Atlas.</p>   |
| <b>Toothed whales (Odontoceti)</b> |   |
| <b>Sperm whale</b>                 | <p>Sperm whales are the largest of the toothed whales and are distributed worldwide in deep waters (greater than 200 m) off continental shelves and sometimes near shelf edges (Bannister <i>et al.</i>, 1996). The species tends to inhabit offshore areas at depths of 600 m or more and is uncommon in waters less than 300 m deep (Ceccarelli <i>et al.</i>, 2011). There is limited information about sperm whale distribution in Australian waters, however, they are usually found in deep offshore waters, with more dense populations close to continental shelves and canyons. In the open ocean, there is a generalised movement of sperm whales southwards in summer, and corresponding movement northwards in winter, particularly for males. Detailed information about the distribution and migration patterns of sperm whales off the WA coast is not available. Females with young may reside within the NWMR all year round, males may migrate through the region and the species may be associated with canyon habitats (Ceccarelli <i>et al.</i>, 2011).</p> <p>Sperm whales have been recorded in deep waters off North-west Cape and appear to occasionally venture into shallower waters in other areas. Twenty-three (23) sightings of sperm whales (variable pod sizes, ranging from one to six animals) were recorded by marine mammal observers (MMOs) during the North West Cape MC3D marine seismic survey (December 2016 to April 2017) (Woodside, 2020). These animals were observed in deep, continental slope waters of the Montebello Saddle (maximum distance of approximately 90 km from North-west Cape), and the waters overlying the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF. The deep waters above the gully/saddle on the inner edge of the plateau (the Montebello Saddle) are thought to be important for sperm whales that may feed in the region (based on 19<sup>th</sup> Century whaling records; Townsend, 1935).</p> <p>There are no identified BIAs for this species in the NWMR.</p> |
| <b>Killer whale</b>                | <p>The preferred habitat of killer whales includes oceanic, pelagic and neritic (relatively shallow waters over the continental shelf) regions, in both warm and cold waters. Killer whales appear to be more common in cold, deep waters; however, they have been observed along the continental slope and shelf, particularly near seal colonies, as well as in shallow coastal areas of WA (Bannister <i>et al.</i>, 1996; Thiele and Gill, 1999). The total number of killer whales in Australian waters is unknown, however, it may be that the total number of mature animals within waters around the continent is less than 10,000. Killer whales are known to make seasonal movements, and probably follow regular migratory routes, but no information is available for the</p>   |

| Species   | Key Information  |
|---|--|
|   | <p>species in Australian waters. Killer whales are top-level carnivores, and there are reports from around Australia of attacks on dolphins, juvenile humpback whales, blue whales, sperm whales, dugongs and Australian sea lions (Bannister <i>et al.</i>, 1996). Killer whales are known to target humpback whales, particularly calves, off Ningaloo Reef during the humpback southern migration season (Pitman <i>et al.</i>, 2015). Overall, observations suggest that humpback calves are a predictable, plentiful, and readily taken prey source for killer whales off Ningaloo Reef for at least five months of the year. Additionally, there are records of killer whales attacking dugongs in Shark Bay (Anderson and Prince, 1985). However, there are no recognised key localities or important habitats for killer whales within the NWMR (DSEWPAC, 2012a). There are no identified BIAs for this species in the NWMR.</p>   |
| <b>Australian snubfin dolphin</b>                                   | <p>Stranding and museum specimen records indicate that Australian snubfin dolphins occur only in waters off northern Australia, from approximately Broome on the west coast to the Brisbane River on the east coast (Parra <i>et al.</i>, 2002). Aerial and boat-based surveys indicate that Australian snubfin dolphins occur mostly in protected shallow waters close to the coast, and close to river and creek mouths (Parra, 2006; Parra <i>et al.</i>, 2006; Parra <i>et al.</i>, 2002). Within the NWMR, species has been found in the shallow coastal waters and estuaries along the Kimberley coast. Beagle and Pender bays on the Dampier Peninsula, and tidal creeks around Yampi Sound and between Kuri Bay and Cape Londonderry are important areas for Australian snubfin dolphins (DEWHA, 2008). Roebuck Bay has generally been considered the south-western limit of snubfin dolphin distribution across northern Australia, but the species has been recorded in Port Hedland harbour, the Dampier Archipelago, Montebello Islands, Exmouth Gulf and off North-west Cape (Allen <i>et al.</i>, 2012). A first comprehensive catalogue of snubfin dolphin sightings has been compiled for the Kimberley, north-west Western Australia (Bouchet <i>et al.</i> 2021) and documented that snubfin dolphins are consistently encountered in shallow water (&lt;21 m depth) close to (&lt;15 km) freshwater inputs with high detection rates in known hotspots such as Roebuck Bay and Cygnet Bay as well as suitable coastal habitat in the wider Kimberley region. Refer <b>Table 7-3</b> and <b>Figure 7-3</b> for the location and type of BIAs for Australian snubfin dolphins in the NWMR.</p>  |
| <b>Indo-Pacific humpback dolphin (Australian humpback dolphin)</b>  | <p>Previously included with <i>Sousa chinensis</i>, the Australian humpback dolphin (<i>S. sahalensis</i>) was elevated to a species in 2014. <i>S. chinensis</i> is now applied for humpback dolphins in the eastern Indian and western Pacific Oceans and <i>S. sahalensis</i> for humpback dolphins in the waters of the Sahul Shelf from northern Australia to southern New Guinea (Jefferson and Rosenbaum, 2014). The Australian humpback dolphin is listed as <i>S. chinensis</i> under EPBC Act.</p> <p>The Australian humpback dolphin (referred to as 'humpback dolphin' hereafter) inhabits the tropical/subtropical waters of the Sahul Shelf across northern Australia and southern Papua New Guinea (Jefferson and Rosenbaum, 2014). Based on historical stranding data, museum specimens and opportunistic sightings collected during aerial and boat-based surveys for other fauna it has been inferred that humpback dolphins occur from the WA/NT border south-west to Shark Bay (Hanf <i>et al.</i>, 2016). Allen <i>et al.</i> (2012) suggested that humpback dolphins use a range of inshore habitats, including both clear and turbid coastal waters across northern WA. The waters surrounding North-west Cape are an important area for the species. Boat-based surveys up to 5 km out from the coast (Brown <i>et al.</i>, 2012) recorded humpback dolphins from 0.3 to 4.5 km away from shore and in depths ranging from 1.2 to 20 m, with a mean of ~8 m. Other studies around North-west Cape, surveying waters up to 5 km from the coast, recorded humpback dolphins in water depths of up to 40 m (Hanf <i>et al.</i>, 2016). Based on density, site fidelity and residence patterns, North-west Cape is clearly an important habitat toward the south-western limit of this species' range (Hunt <i>et al.</i>, 2017).</p> <p>Aerial surveys targeting dugongs over the western Pilbara have recorded humpback dolphins more than 60 km from the mainland in shallow shelf waters (i.e. &lt;30 m deep) near Barrow Island and the western Lowendal Islands (Hanf, 2015). The species has also been recorded in fringing coral reef and shallow, sheltered sandy lagoons at the Montebello Islands (Raudino <i>et al.</i>, 2018). Over the past ten years a number of studies have focused on populations of humpback dolphins along the Kimberley coast, including Roebuck Bay, the Dampier Peninsula, Cone Bay, Yampi Sound, Prince Regent River and the Cambridge Gulf (Brown <i>et al.</i>, 2016).</p> <p>Refer <b>Table 7-3</b> and <b>Figure 7-4</b> for the location and type of BIAs for Indo-Pacific humpback dolphins in the NWMR.</p> |
| <b>Indo-Pacific bottlenose dolphin (Spotted bottlenose dolphin)</b> | <p>There are four known sub-populations of spotted bottlenose dolphins, of which the Arafura/Timor Sea populations were identified as potentially occurring within the NWMR. The species is restricted to inshore areas such as bays and estuaries, nearshore waters, open coast environments, and shallow offshore waters including coastal areas around oceanic islands, from Shark Bay to the western edge of the Gulf of Carpentaria. The species</p>  |

| Species                    | Key Information  |
|----------------------------|--|
|                            | forages in a range of habitats but is generally restricted to water depths of less than 200 m (DSEWPAC, 2012a). Important foraging/breeding areas include the shallow coastal waters and estuaries along the Kimberley coast and Roebuck Bay. Refer <b>Table 7-3</b> the location and type of BIAs for spotted bottlenose dolphins in the NWMR.  |
| <b>Sirenians</b>           |  |
| <b>Dugong</b>              | Dugongs are distributed along the WA coast throughout the Gascoyne, Pilbara and Kimberley. Specific areas supporting dugong populations include: Shark Bay; Ningaloo and Exmouth Gulf; the Pilbara coast (Exmouth Gulf to De Grey River [Marsh <i>et al.</i> , 2002]); and Eighty Mile Beach and the Kimberley coast, including Roebuck Bay (Brown <i>et al.</i> , 2014). Dugong distribution is correlated with the seagrass habitats upon which it feeds, although water temperature has also been correlated with dugong movements and distribution (Preen <i>et al.</i> , 1997; Preen, 2004). Dugongs are known to migrate between seagrass habitats (hundreds of kilometres) (Sheppard <i>et al.</i> , 2006), and in Shark Bay they exhibit seasonal movements as a behavioural thermoregulatory response to winter water temperatures (Holley <i>et al.</i> , 2006; Marsh <i>et al.</i> , 2011). Aerial surveys since the mid-1980s indicate that dugong populations are now stable at a regional scale in Shark Bay and in the Exmouth/Ningaloo Reef. Refer <b>Table 7-3</b> and <b>Figure 7-5</b> for the location and type of BIAs for dugong in the NWMR.  |
| <b>Pinnipeds</b>           |  |
| <b>Australian sea lion</b> | <p>The Australian sea lion is the only endemic pinniped (true seals, fur seals and sea lions) in Australian waters. It is a member of the Otariidae (eared seals) family. The birth interval in Australian sea lions is around 17–18 months. The Australian sea lion is unique among pinnipeds in being the only species that has a non-annual breeding cycle that is also temporally asynchronous across its range (DSEWPAC, 2013a; Threatened Species Scientific Committee, 2020a). This means the breeding period (copulation and birthing) in one colony will occur at different times to breeding in another colony. The Australian sea lion is considered to be a specialised benthic forager—that is, it feeds primarily on the sea floor. Studies have shown that the species will eat a range of prey, including fish, cephalopods (squid, cuttlefish and octopus), sharks, rays, rock lobsters and penguins (DSEWPAC, 2013a; Threatened Species Scientific Committee, 2020a). The Australian sea lion feeds on the continental shelf, most commonly in depths of 20–100 m, and they typically travel up to about 60 km from their colony on each foraging trip, with a maximum distance of around 190 km when over shelf waters.</p> <p>The current breeding distribution of the Australian sea lion extends from the Houtman Abrolhos Islands on the west coast of WA to the Pages Islands in SA. Sites for the 58 breeding colonies occurring in WA and SA are designated as habitat critical to the survival of the species under the Recovery Plan for the Australian sea lion (DSEWPAC, 2013a). Of these, four are located in the SWMR along the west coast of WA: Abrolhos Islands (Easter Group), Beagle Island, North Fisherman Island and Buller Island. There are also a number of foraging BIAs for both males and females along the west coast, extending from the Abrolhos Islands south to Rockingham.</p> <p>There is no designated habitat critical to survival or identified BIAs for this species in the NWMR. <b>Figure 7-6</b> shows the foraging BIAs for the Australian sea lion to the south of the NWMR.</p> |

## 7.5 Biological Important Areas in the NWMR

BIAs representing important life cycle stages and behaviours for six species of marine mammal in the NWMR: the humpback whale, the pygmy blue whale, Australian snubfin dolphin, Australian humpback dolphin, spotted bottlenose dolphin and dugong, are presented in **Table 7-3**.

Table 7-3 Marine mammal BIAs within the NWMR

## 7.6 Marine Mammal Summary for the NWMR

### 7.6.1 Browse

The Browse activity area includes biologically important habitat for five threatened and/or migratory marine mammal species:

- blue whale and pygmy blue whale (foraging and migration areas);
- humpback whale (breeding, calving and migration areas);
- Indo-Pacific humpback dolphin (foraging, breeding and calving areas);
- Australian snubfin dolphin (foraging, breeding and calving areas); and
- dugong (foraging).

BIAs for the marine mammal species are outlined in **Table 7-3**.

### 7.6.2 North-west Shelf / Scarborough

The NWS / Scarborough activity area includes biologically important habitat for five threatened and/or migratory marine mammal species:

- blue whale and pygmy blue whale (foraging and migration areas);
- humpback whale (resting and migration areas);
- Indo-Pacific humpback dolphin (foraging, breeding and calving areas);
- Australian snubfin dolphin (foraging, breeding and calving areas); and
- dugong (foraging and calving areas).

BIAs for the marine mammal species are outlined in **Table 7-3**.

### 7.6.3 North-west Cape

The North-west Cape activity area includes biologically important habitat for three threatened and/or migratory marine mammal species:

- blue whale and pygmy blue whale (foraging and migration areas);
- humpback whale (resting and migration areas); and
- dugong (foraging and calving areas).

BIAs for the marine mammal species are outlined in **Table 7-3**.

## 8. SEABIRDS AND MIGRATORY SHOREBIRDS OF THE NWMR

### 8.1 Regional Context

The NWMR supports high numbers and species diversity of seabirds and migratory shorebirds including many that are EPBC Act listed, threatened and migratory. The NWMR marine bioregional plan reported 34 seabird species (listed as threatened, migratory and/or marine) that are known to occur, and 30 of 37 species of migratory shorebird species that regularly occur in Australia, are recorded at Ashmore Reef in the NWMR (DSEWPAC, 2012e). The NWMR marine bioregional plan also noted that Roebuck Bay and Eighty Mile Beach are internationally significant and recognised migratory shorebird locations.

Many migratory seabirds and shorebirds are protected through bilateral agreements between Australia and Japan (JAMBA), China (CAMBA) and the Republic of Korea (ROKAMBA), recognising the migratory route and important stopover and resting habitats of the East Asian-Australasian Flyway (EAAF). Important migratory bird habitats are also recognised as part of protected wetlands of the international significance under the Ramsar Convention. Important Bird Areas (IBAs) for the NWMR, which are also recognised as global Key Biodiversity Areas (KBAs) (BirdLife Australia<sup>4</sup>), include:

- Roebuck Bay KBA (and Ramsar site): Internationally significant migratory shorebird species.
- Mandora Marsh and Anna Plains KBA (adjacent to Eighty Mile Beach, Ramsar site): Internationally significant migratory shorebird species.
- Dampier Saltworks KBA: Internationally significant migratory shorebird species.
- Montebello Islands KBA: Shorebird and seabird species.
- Barrow Island KBA: Shorebird and seabird species.
- Exmouth Gulf Mangroves KBA: Internationally significant migratory shorebird species.

**Table 8-1** presents a list of the threatened and migratory seabird and shorebird species that occur within the NWMR, with their conservation status and relevant recovery plans and/or conservation advice.

## 8.2 Seabirds in the NWMR

Seabirds are birds that are adapted to life within the marine environment (oceanic and coastal) and are generally long-lived, have delayed breeding and have fewer young than other bird species (Commonwealth of Australia, 2019). At least 34 seabird species listed as threatened, migratory and/or marine under the EPBC Act are known to occur regularly in the NWMR and include a variety of species of terns, noddies, petrels, shearwaters, frigatebirds, and boobies. Many of these species spend most of their lives at sea (predominately pelagic species), ranging over large distances to forage. These pelagic species only come onshore to breed and raise chicks at natal or high-fidelity breeding colonies on remote, offshore island locations in and adjacent to the NWMR. Many species are ecologically significant to the NWMR, as they are endemic to the region, can be present in large numbers in breeding seasons and non-breeding seasons, and many exhibit extensive annual migrations that include marine areas outside the Australian EEZ (DSEWPAC, 2012e).

The presence of seabirds within the NWMR is influenced by seabird species that migrate and forage in the area during the non-breeding season and this includes many seabird species that breed on the Houtman Abrolhos in the SWMR. Pelagic seabirds have been documented foraging at current boundaries and seasonal upwellings within the NWMR (refer to Sutton *et al.*, 2019). The Houtman Abrolhos Islands National Park located in the SWMR, is one of the most significant seabird breeding locations in the eastern Indian Ocean. Sixteen (16) species of seabirds breed there. Eighty percent of common (brown) noddies, 40% of sooty terns and all the lesser noddies found in Australia nest at the Houtman Abrolhos (Surman, 2019). Important seabird areas in the NWMR are as identified by the KBAs (refer to **Section 8.1**) and the information on a select number of seabird species documented for the NWMR (based on the screening criteria presented in **Section 3**), as presented in **Table 8-2**.

**Table 8-2 Information on threatened/migratory seabird species of the NWMR**

| Species  | Key Information  |
|--|--|
| <b>Seabirds</b>  |  |
| <b>Southern giant petrel</b>   | This species is included in the National recovery plan for threatened albatrosses and giant petrels. Habitat critical to survival is defined for breeding and foraging. There are six known breeding localities under Australian jurisdiction (for all species giant petrels) and all are located in the Southern Ocean including islands off Tasmania and within the Australian Antarctic Territory (DSEWPAC, 2011c). Habitat critical to survival identified for foraging is defined as waters south of 25 degrees latitude. The giant petrel species distribution is mainly within the Southern Ocean but this species does migrate into subtropical waters during the winter and its distribution includes the southern extent of the NWMR.<br>No BIAs for this species are located in the NWMR. |
| <b>Abbott's booby</b>  | The Abbott's booby is a large, long-lived seabird known to nest only at Christmas Island. The recovery of this species is strongly dependent on the protection of breeding habitat defined habitat critical to the survival of this species on Christmas Island (Threatened Species Scientific Committee, 2020b). This species spends much of its time at sea and known to forage over large distances offshore when nesting and its range includes off the coast of Java, near the Chagos and in the Banda Sea, and may possibly extend into the north-western extent of the NWMR.<br>No BIAs for this species are located in the NWMR.   |
| <b>Soft-plumaged petrel</b>  | This petrel species breeds only at two locations in Australian waters within the Southern Ocean (one off Tasmania and Macquarie Island) (Threatened Species Scientific Committee, 2015f). As a mainly sub-Antarctic species they are usually distributed in cooler seas but distribution extends into subtropical waters and its known distribution includes the southern extent of the NWMR.<br>No BIAs for this species are located in the NWMR.   |
| <b>Australian fairy tern</b>   | The Australian fairy tern is listed as Vulnerable for the sub-species only recorded for WA. It has a coastal distribution from Sydney, south to Tasmania and around southern WA up to the Dampier Archipelago and out on the offshore island groups of Barrow, Montebello and the Lowendals (DSEWPAC, 2011d). The Australian fairy tern feeds on small baitfish and roosts and nests on sandy beaches below vegetation. These behaviours, generally, occur in inshore waters of island archipelagos and on the Australian mainland shores and adjacent wetlands. Fairy terns breed from August to February. The Australian fairy tern is unlikely to be present  |

| Species   | Key Information  |
|---|--|
|   | within the offshore environment of the NWMR. The largest breeding colony in Western Australia for this species is in the Houtman Abrolhos Islands, SWMR (Surman, 2019). For the description and location of BIAs in the NWMR, refer to <b>Table 8-3</b> and <b>Figure 8-2</b> .  |
| <b>Australian lesser noddy</b>                  | The Houtman Abrolhos, WA is an important breeding habitat for the Australian lesser noddy in the eastern Indian Ocean. This species exhibits nesting habitat specialisation (white mangrove stands) and has a limited foraging range during the breeding season. Furthermore, the lesser noddy forages over shelf waters and appears not to disperse over their non-breeding period as they remain largely in the general vicinity or slightly to the south of the colony in the non-breeding season (February to September; Surman <i>et al.</i> , 2018). No BIAs for this species are located in the NWMR.   |
| <b>Indian yellow-nosed albatross</b>            | This species is included in the National recovery plan for threatened albatrosses and giant petrels. Habitat critical to survival is defined for breeding and foraging. There are six known breeding localities under Australian jurisdiction (for all species of albatrosses) and all are located in the Southern Ocean including islands off Tasmania and within the Australian Antarctic Territory (DSEWPAC, 2011c). Habitat critical to survival identified for foraging is defined as waters south of 25 degrees latitude. All albatross species distribution (including the Indian yellow-nose albatross) is mainly within the Southern Ocean but this species does migrate into subtropical waters during the winter and its distribution includes the southern extent of the NWMR. No BIAs for this species are located in the NWMR.                         |
| <b>Common noddy</b>                             | This species is listed as migratory and marine. The common (or brown) noddy is the largest species of noddy found in Australian waters. The species is widespread in tropical and subtropical areas beyond Australia. This seabird species is gregarious and normally occurs in flocks, up to hundreds of individuals, when feeding or roosting. The Houtman Abrolhos, WA is the primary breeding habitat for the common noddy in the Eastern Indian Ocean. This species spends their non-breeding season (March to August) in the NWS area, around 950 km north from the breeding colony (Surman <i>et al.</i> 2018). The species occurs within NWMR waters, particularly around offshore islands such as the Montebello Island group. This species is recorded on unmanned oil and gas platforms within the NWS. No BIAs for this species are located in the NWMR. |
| <b>Lesser frigatebird<br/>Great frigatebird</b> | Both species of frigatebird are listed as migratory and marine. Within the NWMR, the lesser frigatebird is known to breed on Adele, Bedout and West Lacepede islands, Ashmore Reef and Cartier Island (Commonwealth of Australia, 2019). The lesser frigatebird feeds mostly on fish and sometimes cephalopods, and all food is taken while the bird is in flight. Lesser frigatebirds generally forage close to breeding colonies. Breeding/foraging BIAs for the lesser frigatebird are located in the NWMR; refer to <b>Table 8-3</b> .   |
| <b>Brown booby</b>                              | The brown booby is the most common booby, occurring throughout all tropical oceans bounded by latitudes 30° N and 30° S. There are large colonies on offshore islands within the NWMR such as the Lacepede Islands (one of the largest colonies in the world), Ashmore Reef, and other offshore Kimberley islands. This seabird species is a specialised plunge diver, mostly eating fish and some cephalopods (Commonwealth of Australia, 2019). Breeding/foraging BIAs for the brown booby are located in the NWMR; refer to <b>Table 8-3</b> and <b>Figure 8-3</b> .  |
| <b>Red-footed booby</b>                         | Within the NWMR, its known breeding sites for this species include Ashmore Reef and Cartier Island. It is a pelagic species and generally occurs away from land. It mainly eats flying fish and squid. Prey abundance is reliant on the high productivity in slope areas off remote islands where the birds breed (Commonwealth of Australia, 2019). Breeding/foraging BIAs for the red-footed booby are located in the NWMR; refer to <b>Table 8-3</b> and <b>Figure 8-3</b> .  |
| <b>Greater crested tern</b>                     | The greater crested tern has a widespread distribution recorded on islands and coastlines of tropical and subtropical areas, ranging from the Atlantic coast of South Africa, Indian Ocean and through south-east Asia and Australia. Outside the breeding season it can be found at sea throughout its range, with the exception of the central Indian Ocean (Commonwealth of Australia, 2019). The largest breeding colony in WA for this species is the Houtman Abrolhos Islands, SWMR (Surman, 2019). No BIAs for this species are located in the NWMR.  |
| <b>Little tern</b>                              | There are three sub-populations of this species in Australia and two of these occur in the NWMR: northern Australian breeding sub-population occurring around Broome and extending across in to the NMR, and an east Asian breeding sub-population, with the terns present from Shark Bay to south-eastern Queensland during the austral summer. Little terns  |

| Species                        | Key Information  |
|--------------------------------|--|
|                                | usually forage close to breeding colonies in the shallow water of estuaries (Commonwealth of Australia, 2019).<br>For the description and location of BIAs in the NWMR, refer to <b>Table 8-3</b> and <b>Figure 8-2</b> .  |
| <b>Roseate tern</b>            | This species is generally tropical in distribution and there are many breeding populations in the NWMR, including Ashmore Reef, Napier Broome Bay, Bonaparte Archipelago, Lacepede Islands, Dampier Archipelago and the Lowendal Islands. A large number of non-breeding roseate terns have been observed at several remote locations in the Kimberley and there are high numbers also recorded for Eighty Mile Beach Ramsar site. The Kimberley colonies are likely to be another sub-species that breeds in east Asia. Roseate terns predominately eat small pelagic fish (Commonwealth of Australia, 2019). The largest breeding colony in Western Australia for this species is in the Houtman Abrolhos Islands, SWMR (Surman, 2019).<br>For the description and location of BIAs in the NWMR, refer to <b>Table 8-3</b> and <b>Figure 8-2</b> .   |
| <b>Wedge-tailed shearwater</b> | The wedge-tailed shearwater is a pelagic, marine seabird known from tropical and subtropical waters. Its distribution is widespread across the Indian and Pacific oceans. It is known to breed on the east and west coasts (and offshore islands) of Australia. This species is known to consume fish, cephalopods, and other biota primarily via contact-dipping. Wedge-tailed shearwaters are now understood to undertake extensive foraging trips (over thousands of kilometres over periods of days when chicking and provisioning young) and much longer and extensive pelagic travels over the north-west Indian Ocean during the non-breeding season, targeting current boundaries and upwellings. The species breeds throughout its range, mainly on vegetated islands, atolls and cays and excavates burrows in the ground where chicks are raised (Commonwealth of Australia, 2019). Large breeding colonies of the wedge-tailed shearwater are located on the Houtman Abrolhos islands (SWMR) (Surman <i>et al.</i> , 2018) and several locations in the NWMR including: Muiron Islands (North-west Cape), Varanus Island and the Dampier Archipelago in the Pilbara where burrow numbers were estimated to several hundred thousand to half a million such as on the Muiron Islands, though it is not known if all burrows are utilised on an annual basis (Birdlife Australia, 2018; Surman <i>et al.</i> , 2018). Cannell <i>et al.</i> (2019) satellite tracked adult wedge-tailed shearwaters during egg incubation and chick rearing on the Muiron Islands in January 2018. For the incubation trips, there was a strong consistency for the birds to travel towards seamounts, typically located north-west of the Muiron Islands, between Australia and Indonesia. One bird however remained south-west of the islands, in the Cape Range Canyon. A similar pattern to utilise areas associated with sea mounts was also observed for the long foraging trips during chick rearing, though some of the foraging was concentrated in deeper waters. A bimodal foraging strategy during chick-rearing was observed, with adults undertaking long foraging trips after a series of shorter foraging trips within the NWMR. Surman <i>et al.</i> (2018) reported most wedge-tailed shearwaters from the breeding colonies on the Houtman Abrolhos undertook extensive non-breeding migrations. This seabird species occupied waters adjacent or to the north of their nesting sites or migrated 4200 km north-west into the equatorial central Indian Ocean near the Ninety East Ridge during the non-breeding season (later April to mid-November).<br>For the description and location of BIAs in the NWMR, refer to <b>Table 8-3</b> and <b>Figure 8-1</b> . |
| <b>Flesh-footed shearwater</b> | The species mainly occurs in the subtropics, over continental shelves and slopes and occasionally inshore waters, with individual birds pass through the tropics and over deeper waters during migration to the North Pacific and Indian oceans (Commonwealth of Australia, 2019). They are a common visitor to the waters off southern Australia, from south-western WA to south-eastern Queensland. The fleshy-footed shearwater is a trans-equatorial migrant, breeding from late September to May off south-western Australia, and migrating north by early May, across the southern Indian and possibly Indonesia to the northern Pacific Ocean. No BIAs for the flesh-footed shearwater are located in the NWMR.   |
| <b>Streaked shearwater</b>     | The streaked shearwater has a broad distribution in the western Pacific Ocean, breeding on the coast and offshore islands of Japan, Russia, China and the Korean Peninsula. During winter months (non-breeding season), the species undertakes trans-equatorial migration to the coasts of Vietnam, New Guinea, the Philippines, Australia, southern India and Sri Lanka. The streaked shearwater feeds mainly on fish and squid that it catches by surface-seizing and shallow plunges (Commonwealth of Australia, 2019).<br>No BIAs for the streaked shearwater are located in the NWMR.   |
| <b>White-tailed tropicbird</b> | Tropicbirds are predominately pelagic species and the white-tailed tropicbird forages in warm waters and over long distances (pan-tropical). The species is most common off north-west Australia. In the NWMR, this species is considered a sub-species and are limited in number and distribution. Nesting sites are known for Clerke Reef (Rowley Shoals) and Ashmore  |

| Species            | Key Information   |
|--------------------|---|
|                    | Reef. Christmas Island is also a known nesting site and the species can disperse several thousand kilometres during foraging trips. This species feeds mainly on fish and cephalopods, captured by deep plunge diving (Commonwealth of Australia, 2019). There are breeding BIAs at the Rowley Shoals and Ashmore Reef within the NWMR for the white-tailed tropicbird; refer to <b>Table 8-3</b> . |
| <b>Silver gull</b> | The silver gull is typically described as an inshore and coastal foraging seabird and has an Australian-wide distribution including locations within the NWMR. It is noted as it has been recorded on unmanned oil and gas platforms located within the NWS.  |

### 8.2.1 Biologically Important Areas in the NWMR

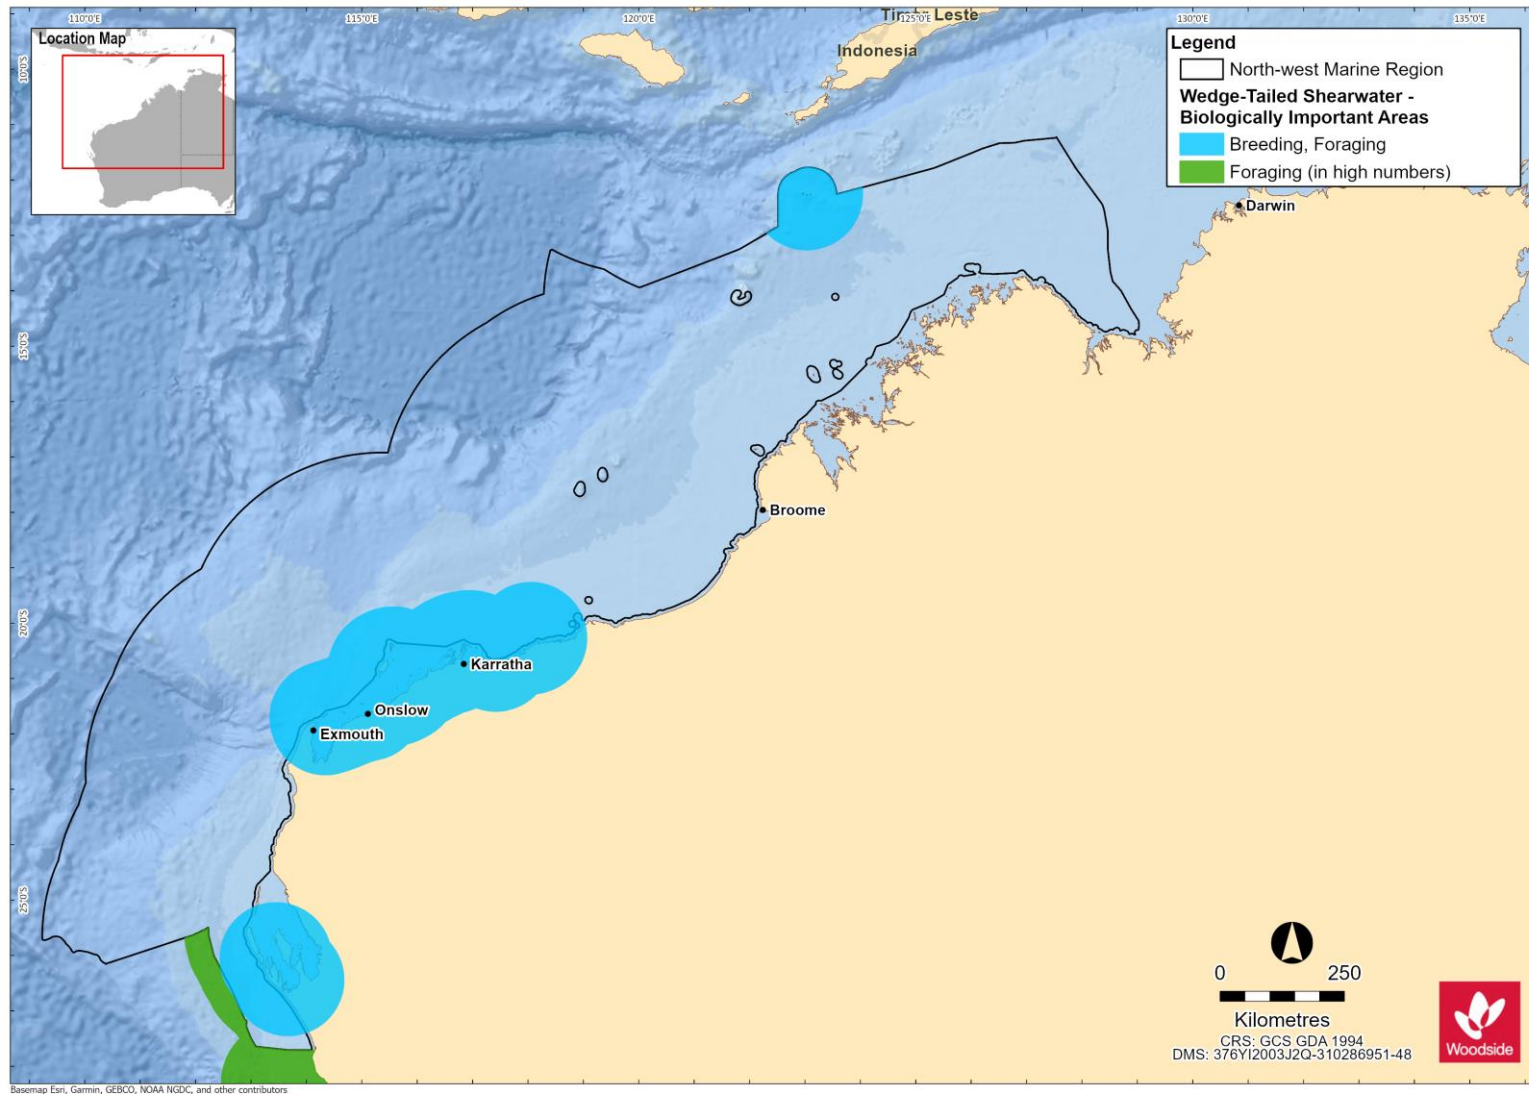

BIAs representing important life cycle stages and behaviours for eight species of seabird in the NWMR are presented in **Table 8-3**.

Table 8-3 Seabird BIAs within the NWMR

## 8.2.2 Seabird Summary for NWMR

### 8.2.2.1 Browse

The Browse activity area includes biologically important habitat for seven threatened and/or migratory seabird species:

- wedge-tailed shearwater (breeding/foraging);
- great and lesser frigatebirds (breeding/foraging);
- brown booby (breeding/foraging);
- red-footed booby (breeding/foraging);
- little tern (breeding/foraging);
- roseate tern (breeding and resting); and,
- white-tailed tropicbird (breeding).

BIAs for the seabird species are outlined in **Table 8-3**.

### 8.2.2.2 NWS / Scarborough

The NWS / Scarborough activity area includes biologically important habitat for five threatened and/or migratory seabird species:

- wedge-tailed shearwater (breeding/foraging);
- lesser frigatebird (breeding/foraging);
- brown booby (breeding/foraging);
- little tern (breeding/foraging); and
- roseate tern (breeding and resting).

BIAs for the seabird species are outlined in **Table 8-3**.

### 8.2.2.3 North-west Cape

The North-west Cape activity area includes biologically important habitat for five threatened and/or migratory seabird species:

- Australian fairy tern (breeding);
- wedge-tailed shearwater (breeding/foraging); and
- roseate tern (breeding and resting).

BIAs for the seabird species are outlined in **Table 8-3**.

## 8.3 Shorebirds

Shorebirds (migratory and resident species) are generally associated with wetland or coastal environments, and the NWMR hosts a large number of many shorebird species, particularly in the Austral summer (refer to **Appendix A** for the EPBC Act PMST reports on listed species of shorebirds). Shorebirds may use coastal environments for feeding, nesting or migratory stopovers. In coastal environments, shorebirds generally feed during low tide on exposed intertidal mud and sand flats, and roost in suitable habitat above the high water mark. Many shorebird species undergo annual migrations, typically breeding at high latitudes of the Northern Hemisphere and migrating south for the non-breeding season and Australia is part of the East Asian-Australasian Flyway (EAAF). The EAAF extends from breeding grounds in the Russian tundra, Mongolia and Alaska

southwards through east and south-east Asia, to non-breeding areas of Indonesia, Papua New Guinea, Australia and New Zealand (Weller and Lee, 2017). The EAAF is of most relevance to the NWMR. There are 37 species of shorebird which annually migrate to Australia via the EAAF and 36 of these species spend the austral summer (non-breeding season) foraging and roosting in coastal and wetland habitats (Commonwealth of Australia, 2015c; Weller and Lee, 2017).

Ashmore Reef is documented as a BIA for migratory shorebirds in the NWMR (DSEWPAC, 2012a).

**Table 8-4. Information on threatened/migratory shorebird species of the NWMR**

| Species                                     | Key Information  |
|---|--|
| <b>Shorebirds</b>                           |  |
| <b>Eastern curlew, Far eastern curlew</b>   | This species is the largest, migratory shorebird in the world, with a long neck, long legs and a very long downcurved bill and is a long-haul flyer. The eastern curlew is a coastal species with a continuous distribution north from Barrow Island to the Kimberley region. The species is endemic to the EAAF and is a non-breeding visitor to Australia from August to March, primarily foraging on crabs and molluscs in intertidal mudflats. During the non-breeding season in Australia, this species is most associated with sheltered coasts, especially estuaries, bays, harbours, inlets and coastal lagoons, with large intertidal mudflats or sandflats, often with beds of seagrass (DOE, 2015a).  |
| <b>Curlew sandpiper</b>                     | The curlew sandpiper breeds in northern Siberia but has a non-breeding range that extends from western Africa to Australia, with small numbers reaching New Zealand (Bamford <i>et al.</i> , 2008). In Australia, curlew sandpipers occur around the coasts and are also quite widespread inland, though in smaller numbers. Records occur in all states and the NT during the non-breeding period, and also during the breeding season when many non-breeding one-year old birds remain in Australia rather than migrating north along the EAAF. The species preferred habitat for foraging is mudflats and nearby shallow waters in sheltered coastal areas such as estuaries, bay, inlets and lagoons (DOE, 2015b).   |
| <b>Great knot</b>                           | The great knot breeds in the Northern Hemisphere and undertakes biannual migrations along the EAAF to non-breeding habitat in Australia. The great knot winters in Australia and has been recorded around the entirety of the Australian coast the greatest numbers are found in northern Western Australia (Pilbara (Dampier Archipelago) and Kimberley and the Northern Territory. In Australia, this species prefers sheltered, coastal habitat with large intertidal mudflats or sandflats (inkling inlets, bays, harbours, estuaries and lagoons). High numbers (exceeding several thousand birds are regularly recorded from Roebuck Bay. The great knot feeds on a variety of invertebrates by pecking at or just below the surface of moist mud or sand (Threatened Species Scientific Committee, 2016a).  |
| <b>Bar-tailed godwit (<i>menzbieri</i>)</b> | The bar-tailed godwit is a large, migratory shorebird and there are two sub-species in the EAAF ( <i>Limosa lapponica baueri</i> and <i>L. l. menzbieri</i> ). The sub-species <i>L. l. menzbieri</i> breeds in northern Siberia and spends its non-breeding period mostly in the north of WA but also in South-east Asia. The bar-tailed godwit ( <i>menzbieri</i> ) usually forages near the water in shallow water, mainly in tidal estuaries and harbours with a preference for exposed sandy or soft mud substrates on intertidal flats, banks and beaches (Threatened Species Scientific Committee, 2016c).  |
| <b>Red knot (<i>piersmai</i>)</b>           | This species is a small to medium migratory shorebird. There are two sub-species that cannot be distinguished from each other in nonbreeding plumage, however, <i>Calidris canutus piersmai</i> tend to overwinter almost exclusively in north-west Australia. The red knot migrates long distances from breeding grounds in high northern latitudes, where it breeds during the boreal summer, to the Southern Hemisphere during the austral summer with migration along the EAAF. Very large numbers are recorded for the north-west Australia and is common in all suitable habitats around the coast, including inland clay pans near Roebuck Bay (where the species roosts). The red knot usually forages in soft substrate along the waters edge on intertidal mudflats, sandflats and sandy beaches of sheltered coasts (Threatened Species Scientific Committee, 2016b). |
| <b>Lesser sand plover</b>                   | The lesser sand plover is a small to medium shorebird and one of 36 migratory shorebirds that breed in the Northern Hemisphere during the boreal summer and are known to annually migrate to the non-breeding grounds of Australia along the EAAF for the austral summer. There are five different sub-species and it is most likely the non-breeding ranges of the sub-species <i>Charadrius m. mongolus</i> overlaps with the NWMR. This species is widespread in coastal regions, preferring sandy beaches, mudflats of coastal bays and estuaries (Threatened Species Scientific Committee, 2016e).  |
| <b>Greater sand plover</b>                  | The greater sand plover is a small to medium shorebird and in its non-breeding plumage is difficult to distinguish from the lesser sand plover. This species breeds in the Northern  |

| Species | Key Information  |
|---------|--|
|         | Hemisphere and undertakes annual migrations to and from Southern Hemisphere feeding grounds in the austral summer along the EAAF. The species distribution in Australia during the non-breeding season is widespread, in WA the greater sand plover is widespread between Northwest Cape and Roebuck Bay (Threatened Species Scientific Committee, 2016d). |

## 9. KEY ECOLOGICAL FEATURES

Key ecological features (KEFs) are elements of the Commonwealth marine environment that are considered to be important for a marine region's biodiversity or ecosystem function and integrity. KEFs have been identified by the Australian Government based on advice from scientists about the ecological processes and characteristics of the area.

KEFs meet one or more of the following criteria:

- a species, group of species, or a community with a regionally important ecological role (e.g. a predator, prey that affects a large biomass or number of other marine species),
- a species, group of species or a community that is nationally or regionally important for biodiversity,
- an area or habitat that is nationally or regionally important for:
  - enhanced or high productivity (such as predictable upwellings – an upwelling occurs when cold nutrient-rich waters from the bottom of the ocean rise to the surface),
  - aggregations of marine life (such as feeding, resting, breeding or nursery areas), or
  - biodiversity and endemism (species which only occur in a specific area),
- a unique seafloor feature, with known or presumed ecological properties of regional significance.

Thirteen KEFs are designated within the NWMR, twelve KEFs within the SWMR and eight KEFs within the NMR. These KEFs have been identified in the Protected Matters search (**Appendix A**) and outlined in **Table 9-1**, **Table 9-2** and **Table 9-3**, and **Figure 9-1**, **Figure 9-2** and **Figure 9-3**.

Table 9-1 Key Ecological Features (KEF) within the NWMM

| KEF Name   | Woodside Activity Area |       |         | Values <sup>1</sup>   | Description   |
|--|------------------------|-------|---------|---|---|
|  | Browse                 | NWS/S | NW Cape |   |   |
| <b>Carbonate bank and terrace system of the Sahul Shelf</b>                | ✓                      | -     | -       | <p>Unique seafloor feature with ecological properties of regional significance</p> <p>Regionally important because of their role in enhancing biodiversity and local productivity relative to their surrounds. The carbonate banks and terraces provide areas of hard substrate in an otherwise soft sediment environment which are important for sessile species</p>                 | <p>The Carbonate banks and terrace system of the Sahul Shelf are located in the western Joseph Bonaparte Gulf and to the north of Cape Bougainville and Cape Londonderry. The carbonate banks and terraces are part of a larger complex of banks and terraces that occurs on the Van Diemen Rise in the adjacent NMR.</p> <p>The bank and terrace system of the Van Diemen Rise covers approximately 31,278 km<sup>2</sup> and forms part of the larger system associated with the Sahul Banks to the north and Londonderry Rise to the east. The feature is characterised by terrace, banks, channels and valleys (DSEWPAC, 2012c). The banks, ridges and terraces of the Van Diemen Rise are raised geomorphic features with relatively high proportions of hard substrate that support sponge and octocoral gardens. These, in turn, provide habitat to other epifauna, by providing structure in an otherwise flat environment (Przeslawski <i>et al.</i>, 2011). Plains and valleys are characterised by scattered epifauna and infauna that include polychaetes and ascidians. These epibenthic communities support higher order species such as olive ridley turtles, sea snakes and sharks (DSEWPAC, 2012c)</p> |
| <b>Pinnacles of the Bonaparte Basin</b>                                    | ✓                      | -     | -       | <p>Unique seafloor feature with ecological properties of regional significance</p> <p>Provide areas of hard substrate in an otherwise soft sediment environment and so are important for sessile species</p> <p>Recognised as a biodiversity hotspot for sponges</p> <p>The Pinnacles of the Bonaparte Basin KEF is located within both the NWMM and NMR (refer <b>Table 9-3</b>)</p> | <p>The Pinnacles of the Bonaparte Basin provide areas of hard substrate in an otherwise relatively featureless environment, the pinnacles are likely to support a high number of species, although a better understanding of the species richness and diversity associated with these structures is required (DSEWPAC, 2012a, 2012c). Covering &gt;520 km<sup>2</sup> within the Bonaparte Basin, this feature contains the largest concentration of pinnacles along the Australian margin. The Pinnacles of the Bonaparte Basin are thought to be the eroded remnants of underlying strata; it is likely that the vertical walls generate local upwelling of nutrient-rich water, leading to phytoplankton productivity that attracts aggregations of planktivorous and predatory fish, seabirds, and foraging turtles (DSEWPAC, 2012a, 2012c).</p>  |
| <b>Ashmore Reef and Cartier Island and surrounding Commonwealth waters</b> | ✓                      | -     | -       | <p>High productivity, biodiversity and aggregation of marine life that apply to both the benthic and pelagic habitats within the feature</p>  | <p>Ashmore Reef is the largest of only three emergent oceanic reefs present in the north-eastern Indian Ocean and is the only oceanic reef in the region with vegetated islands. Ashmore contains a large reef shelf, two large lagoons, several channelled carbonate sand flats, shifting sand cays, an extensive reef flat, three vegetated islands—East, Middle and West islands—and</p>   |

| KEF Name   | Woodside Activity Area |       |         | Values <sup>1</sup>  | Description  |
|--|------------------------|-------|---------|--|--|
|  | Browse                 | NWS/S | NW Cape |  |  |
|  |                        |       |         |  | surrounding waters. Rising from a depth of more than 100 m, the reef platform is at the edge of the NWS and covers an area of 239 km <sup>2</sup> . Ashmore Reef and Cartier Island and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of birds and other marine life; they are areas of enhanced primary productivity in an otherwise low-nutrient environment (DSEWPAC, 2012a). Ashmore Reef supports the highest number of coral species of any reef off the WA coast.  |
| <b>Seringapatam Reef and the Commonwealth waters in the Scott Reef complex</b> | ✓                      | -     | -       | Support diverse aggregations of marine life, have high primary productivity relative to other parts of the region, are relatively pristine and have high species richness, which apply to both the benthic and pelagic habitats within the feature | Seringapatam Reef and the Commonwealth waters in the Scott Reef complex are regionally important in supporting the diverse aggregations of marine life, high primary productivity, and high species richness associated with the reefs themselves. As two of the few offshore reefs in the north-west, they provide an important biophysical environment in the region (DSEWPAC, 2012a).   |
| <b>Continental slope demersal fish communities</b>                             | ✓                      | ✓     | ✓       | High biodiversity of demersal fish assemblages, including high levels of endemism  | The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the North-west Province is high compared to elsewhere along the Australian continental slope (DSEWPAC, 2012a). The continental slope between North-west Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last <i>et al.</i> , 2005). The slope of the Timor Province and the Northwest Transition also contains more than 500 species of demersal fishes of which 64 are considered endemic (Last <i>et al.</i> , 2005), making it the second richest area for demersal fishes throughout the whole continental slope.<br><br>Demersal fish species occupy two distinct demersal biomes associated with the upper slope (225–500 m water depths) and the mid-slope (750–1000 m). Although poorly known, it is suggested that the demersal slope communities rely on bacteria and detritus-based systems comprised of infauna and epifauna, which in turn become prey for a range of teleost fishes, molluscs and crustaceans (Brewer <i>et al.</i> , 2007). Higher-order consumers may include carnivorous fishes, deepwater sharks, large squid, and toothed whales (Brewer <i>et al.</i> , 2007). Pelagic production is phytoplankton-based, with hot spots around oceanic reefs and islands (Brewer <i>et al.</i> , 2007). |

| KEF Name  | Woodside Activity Area |       |         | Values <sup>1</sup>  | Description   |
|---|------------------------|-------|---------|--|---|
|   | Browse                 | NWS/S | NW Cape |  |   |
| <b>Ancient coastline at 125 m depth contour</b>                 | ✓                      | ✓     | ✓       | <p>Unique seafloor feature with ecological properties of regional significance</p> <p>Provides areas of hard substrate and therefore may provide sites for higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment</p> | <p>Several steps and terraces as a result of Holocene sea level changes occur in the region, with the most prominent of these features occurring as an escarpment along the NWMR and Sahul Shelf at a water depth of 125 m.</p> <p>The Ancient Coastline is not continuous throughout the NWMR and coincides with a well-documented eustatic stillstand at about 130 m worldwide (Falkner <i>et al.</i>, 2009).</p> <p>Where the Ancient Coastline provides areas of hard substrate, it may contribute to higher diversity and enhanced species richness relative to soft sediment habitat (Falkner <i>et al.</i>, 2009). Parts of the Ancient Coastline, represented as rocky escarpment, are considered to provide biologically important habitat in an area predominantly made up of soft sediment.</p> <p>The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient-rich environment. Although the Ancient Coastline adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner <i>et al.</i>, 2009)</p> |
| <b>Canyons linking the Argo Abyssal Plain and Scott Plateau</b> | -                      | ✓     | -       | <p>Facilitates nutrient upwelling, creating enhanced productivity and encouraging diverse aggregations of marine life</p>  | <p>Interactions with the Leeuwin Current and strong internal tides are thought to result in upwelling at the canyon heads, thus creating conditions for enhanced productivity in the region (Brewer <i>et al.</i>, 2007). As a result, aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, predatory fishes and seabirds are known to occur in the area due to its enhanced productivity (Sleeman <i>et al.</i>, 2007).</p>  |
| <b>Glomar Shoal</b>   | -                      | ✓     | -       | <p>An area of high productivity and aggregations of marine life including commercial and recreational fish species</p>   | <p>Glomar Shoal is a submerged littoral feature located about 150 km north of Dampier on the Rowley shelf at depths of 33–77 m (Falkner <i>et al.</i>, 2009). Studies by Abdul Wahab <i>et al.</i> (2018) found a number of hard coral and sponge species in water depths less than 40 m. One hundred and seventy (170) different species of fishes were detected with greatest species richness and abundance in shallow habitats (Abdul Wahab <i>et al.</i>, 2018). Fish species present include a number of commercial and recreational species such as Rankin cod, brown striped snapper, red emperor, crimson snapper, bream and yellow-spotted triggerfish (Falkner <i>et al.</i>, 2009; Fletcher and Santoro, 2009). These species have recorded high catch rates associated with Glomar Shoal, indicating that the shoal is likely to be an area of high productivity.</p>  |

| KEF Name   | Woodside Activity Area |       |         | Values <sup>1</sup>  | Description   |
|--|------------------------|-------|---------|--|---|
|  | Browse                 | NWS/S | NW Cape |  |   |
| <b>Mermaid Reef and Commonwealth waters surrounding Rowley Shoals</b>        | -                      | ✓     | -       | Regionally important in supporting high species richness, higher productivity and aggregations of marine life  | The Mermaid Reef and Commonwealth waters surrounding the Rowley Shoals KEF and is adjacent to the three nautical mile State waters limit surrounding Clerke and Imperieuse reefs, and include the Mermaid Reef Marine Park as described in <b>Section 10</b> .<br>The reefs provide a distinctive biophysical environment in the region. They have steep and distinct reef slopes and associated fish communities. In evolutionary terms, the reefs may play a role in supplying coral and fish larvae to reefs further south via the southward flowing Indonesian Throughflow. Both coral communities and fish assemblages differ from similar habitats in eastern Australia (Done <i>et al.</i> , 1994).  |
| <b>Exmouth Plateau</b>   | -                      | ✓     | ✓       | Unique seafloor feature with ecological properties of regional significance, which apply to both benthic and pelagic habitats<br>Likely to be an important area of biodiversity as it provides an extended area offshore for communities adapted to depths of approximately 1000 m | The Exmouth Plateau is a large, mid-slope, continental margin plateau that lies off the northwest coast of Australia. It ranges in depth from about 500 to more than 5000 m and is a major structural element of the Carnarvon Basin (Miyazaki and Stagg, 2013). The large size of the Exmouth Plateau and its expansive surface may modify deep water flow and be associated with the generation of internal tides; both of which may subsequently contribute to the upwelling of deeper, nutrient-rich waters closer to the surface (Brewer <i>et al.</i> , 2007). Satellite observations suggest that productivity is enhanced along the northern and southern boundaries of the plateau (Brewer <i>et al.</i> , 2007).<br>Sediments on the plateau suggest that biological communities include scavengers, benthic filter feeders and epifauna (DSEWPAC, 2012a). Fauna in the pelagic waters above the plateau are likely to include small pelagic species and nekton attracted to seasonal upwellings, as well as larger predators such as billfishes, sharks and dolphins (Brewer <i>et al.</i> , 2007). Protected and migratory species are also known to pass through the region, including whale sharks and cetaceans. |
| <b>Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula</b> | -                      | -     | ✓       | Unique seafloor feature with ecological properties of regional significance<br>The feature is an area of moderately enhanced productivity, attracting aggregations of fish and higher-order consumers such as large predatory  | The canyons are associated with upwelling as they channel deep water from the Cuvier Abyssal Plain up onto the slope. This nutrient-rich water interacts with the Leeuwin Current at the canyon heads (DSEWPAC, 2012a). Aggregations of whale sharks, manta rays, sea snakes, sharks, large predatory fish, and seabirds are known to occur in this area.   |

| KEF Name   | Woodside Activity Area |       |         | Values <sup>1</sup>   | Description  |
|--|------------------------|-------|---------|---|--|
|  | Browse                 | NWS/S | NW Cape |   |  |
|  |                        |       |         | fish, sharks, toothed whales and dolphins<br>Likely to be important due to their historical association with sperm whale aggregations   |  |
| <b>Commonwealth waters adjacent to Ningaloo Reef</b> | -                      | -     | ✓       | High productivity and diverse aggregations of marine life<br>The Commonwealth waters adjacent to Ningaloo Reef and associated canyons and plateau are interconnected and support the high productivity and species richness of Ningaloo Reef, globally significant as the only extensive coral reef in the world that fringes the west coast of a continent | The Leeuwin and Ningaloo currents interact, leading to areas of enhanced productivity in the Commonwealth waters adjacent to Ningaloo Reef. Aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, large predatory fish, and seabirds are known to occur in this area (DSEWPAC, 2012a).<br>The spatial boundary of this KEF, as defined in the NCVA, is defined as the waters contained in the existing Ningaloo AMP provided in <b>Section 10</b> . |
| <b>Wallaby Saddle</b>                                | -                      | -     | ✓       | High productivity and aggregations of marine life: Representing almost the entire area of this type of geomorphic feature in the NWMR. It is a unique habitat that neither occurs anywhere else nearby (within hundreds of kilometres) nor with as large an area (Falkner <i>et al.</i> 2009)   | The Wallaby Saddle may be an area of enhanced productivity. Historical whaling records provide evidence of sperm whale aggregations in the area of the Wallaby Saddle, possibly due to the enhanced productivity of the area and aggregations of baitfish (DSEWPAC, 2012a).  |

Table 9-2 Key Ecological Features (KEF) within the SWMR

| KEF Name   | Values <sup>1</sup>   | Description   |
|--|---|---|
| <b>Albany Canyons group and adjacent shelf break</b>   | High productivity and aggregations of marine life, and unique seafloor feature with ecological properties of regional significance<br>Both benthic and demersal habitats within the feature are of conservation value                   | The Albany Canyons group is thought to be associated with small, periodic subsurface upwelling events, which may drive localised regions of high productivity. The canyons are known to be a feeding area for sperm whale and sites of orange roughly aggregations. Anecdotal evidence also indicates that this area supports fish aggregations that attract large predatory fish and sharks.                           |
| <b>Ancient coastline at 90-120 m depth</b>   | Relatively high productivity and aggregations of marine life, and high levels of biodiversity and endemism<br>The feature creates topographic complexity, that may facilitate benthic biodiversity and enhanced biological productivity | Benthic biodiversity and productivity occur where the ancient coastline forms a prominent escarpment, such as in the western Great Australian Bight, where the sea floor is dominated by sponge communities of significant biodiversity and structural complexity.  |
| <b>Cape Mentelle upwelling</b>   | Facilitates nutrient upwelling, supporting high productivity and diverse aggregations of marine life  | The Cape Mentelle upwelling draws relatively nutrient-rich water from the base of the Leeuwin Current, up the continental slope and onto the inner continental shelf, where it results in phytoplankton blooms at the surface. The phytoplankton blooms provide the basis for an extended food chain characterised by feeding aggregations of small pelagic fish, larger predatory fish, seabirds, dolphins and sharks. |
| <b>Commonwealth marine environment surrounding the Houtman Abrolhos Islands (and adjacent shelf break)</b> | High levels of biodiversity and endemism within benthic and pelagic habitats  | The Houtman Abrolhos Islands and surrounding reefs support a unique mix of temperate and tropical species, resulting from the southward transport of species by the Leeuwin Current over thousands of years. The Houtman Abrolhos Islands are the largest seabird breeding station in the eastern Indian Ocean. They support more than one million pairs of breeding seabirds.  |

| KEF Name   | Values <sup>1</sup>   | Description  |
|--|---|--|
| <b>Commonwealth marine environment surrounding the Recherche Archipelago</b>                 | Aggregations of marine life and high levels of biodiversity and endemism within benthic and demersal communities  | The Recherche Archipelago is the most extensive area of reef in the SWMR. Its reef and seagrass habitat supports a high species diversity of warm temperate species, including 263 known species of fish, 347 known species of molluscs, 300 known species of sponges, and 242 known species of macroalgae. The islands also provide haul-out (resting areas) and breeding sites for Australian sea lions and New Zealand fur seals.   |
| <b>Commonwealth marine environment within and adjacent to the west-coast inshore lagoons</b> | High productivity and aggregations of marine life within benthic and pelagic habitats<br>Important for benthic productivity and recruitment for a range of marine species   | These lagoons are important for benthic productivity, including macroalgae and seagrass communities, and breeding and nursery aggregations for many temperate and tropical marine species. They are important areas for the recruitment of commercially and recreationally important fish species. Extensive schools of migratory fish visit the area annually, including herring, garfish, tailor and Australian salmon.  |
| <b>Commonwealth marine environment within and adjacent to Geographe Bay</b>                  | High productivity and aggregations of marine life, and high levels of biodiversity, recruitment within benthic and pelagic communities  | Geographe Bay is known for its extensive beds of tropical and temperate seagrass that support a diversity of species, many of them not found anywhere else. The bay provides important nursery habitat for many species. Juvenile dusky whaler sharks use the shallow seagrass habitat as nursery grounds for several years, before ranging out to adult feeding grounds along the shelf break. The seagrass also provides valuable habitat for fish and invertebrates (Carruthers <i>et al.</i> , 2007).<br>It is also an important resting area for migratory humpback whales. |
| <b>Diamantina Fracture Zone</b>  | Unique seafloor feature with ecological properties of regional significance which apply to its benthic and demersal habitats  | The Diamantina Fracture Zone is a rugged, deep- water environment of seamounts and numerous closely spaced troughs and ridges. Very little is known about the ecology of this remote, deep- water feature, but marine experts suggest that its size and physical complexity mean that it is likely to support deep-water communities characterised by high species diversity, with many species found nowhere else.  |
| <b>Naturaliste Plateau</b>   | Unique seafloor feature with ecological properties of regional significance including high species diversity and endemism which apply to its benthic and demersal habitats  | The Naturaliste Plateau is Australia's deepest temperate marginal plateau. The combination of its structural complexity, mixed water dynamics and relative isolation indicate that it supports deep- water communities with high species diversity and endemism.   |
| <b>Perth Canyon and adjacent shelf break, and other west-coast canyons</b>                   | An area of higher productivity that attracts feeding aggregations of deep-diving mammals and large predatory fish. It is also recognised as a unique seafloor feature with ecological properties of regional significance | The Perth Canyon is the largest known undersea canyon in Australian waters. Deep ocean currents rise to the surface, creating a nutrient-rich cold- water habitat attracting feeding aggregations of deep-diving mammals, such as pygmy blue whales and large predatory fish that feed on aggregations of small fish, krill and squid.   |

| KEF Name  | Values <sup>1</sup>  | Description   |
|---|--|---|
| <b>Western demersal slope and associated fish communities of the Central Western Province</b> | Provides important habitat for demersal fish communities and supports species groups that are nationally or regionally important to biodiversity | The western demersal slope provides important habitat for demersal fish communities, with a high level of diversity and endemism. A diverse assemblage of demersal fish species below a depth of 400 m is dominated by relatively small benthic species such as grenadiers, dogfish and cucumber fish. Unlike other slope fish communities in Australia, many of these species display unique physical adaptations to feed on the sea floor (such as a mouth position adapted to bottom feeding), and many do not appear to migrate vertically in their daily feeding habits. |
| <b>Western rock lobster</b>   | A species that plays a regionally important ecological role  | This species is the dominant large benthic invertebrate in the region. The lobster plays an important trophic role in many of the inshore ecosystems of the SWMR. Western rock lobsters are an important part of the food web on the inner shelf, particularly as juveniles.  |

Table 9-3 Key Ecological Features (KEF) within the NMR

| KEF Name  | Values <sup>1</sup>   | Description   |
|---|---|---|
| <b>Carbonate bank and terrace system of the Van Diemen Rise</b> | Important for its role in enhancing biodiversity and local productivity relative to its surrounds and for supporting relatively high species diversity<br>The feature has been identified as a sponge biodiversity hotspot (Przeslawski <i>et al.</i> 2014)   | The bank and terrace system of the Van Diemen Rise is part of the larger system associated with the Sahul Banks to the north and Londonderry Rise to the east; it is characterised by terrace, banks, channels and valleys. The variability in water depth and substrate composition may contribute to the presence of unique ecosystems in the channels. Species present include sponges, soft corals and other sessile filter feeders associated with hard substrate sediments of the deep channels; epifauna and infauna include polychaetes and ascidians. Olive ridley turtles, sea snakes and sharks are also found associated with this feature. |
| <b>Gulf of Carpentaria basin</b>                                | Regional importance for biodiversity, endemism and aggregations of marine life relevant to benthic and pelagic habitats   | The Gulf of Carpentaria basin is one of the few remaining near-pristine marine environments in the world. Primary productivity in the Gulf of Carpentaria basin is mainly driven by cyanobacteria that fix nitrogen but is also strongly influenced by seasonal processes. The soft sediments of the basin are characterised by moderately abundant and diverse communities of infauna and mobile epifauna dominated by polychaetes, crustaceans, molluscs, and echinoderms. The basin also supports assemblages of pelagic fish species including planktivorous and schooling fish, with top predators such as shark, snapper, tuna, and mackerel.     |
| <b>Gulf of Carpentaria coastal zone</b>                         | High productivity, aggregations of marine life (including several endemic species) and high biodiversity compared to broader region   | Nutrient inflow from rivers adjacent to the NMR generates higher productivity and more diverse and abundant biota within the Gulf of Carpentaria coastal zone than elsewhere in the region. The coastal zone is near pristine and supports many protected species such as marine turtles, dugongs, and sawfishes. Ecosystem processes and connectivity remain intact; river flows are mostly uninterrupted by artificial barriers and healthy, diverse estuarine and coastal ecosystems support many species that move between freshwater and saltwater environments.   |
| <b>Pinnacles of the Bonaparte Basin</b>                         | Unique seafloor feature with ecological properties of regional significance<br>Provide areas of hard substrate in an otherwise soft sediment environment and so are important for sessile species<br>Recognised as a biodiversity hotspot for sponges<br>The Pinnacles of the Bonaparte Basin KEF is located within both the NWMR and NMR (refer <b>Table 9-1</b> ) | Covering more than 520 km <sup>2</sup> within the Bonaparte Basin, this feature contains the largest concentration of pinnacles along the Australian margin. The Pinnacles of the Bonaparte Basin are thought to be the eroded remnants of underlying strata; it is likely that the vertical walls generate local upwelling of nutrient-rich water, leading to phytoplankton productivity that attracts aggregations of planktivorous and predatory fish, seabirds and foraging turtles.  |

| KEF Name   | Values <sup>1</sup>  | Description  |
|--|--|--|
| <b>Plateaux and saddle north-west of the Wellesley Islands</b> | High species abundance, diversity and endemism of marine life  | Abundance and species density are high in the plateaux and saddle as a result of increased biological productivity associated with habitats rather than currents. Submerged reefs support corals that are typical of northern Australia, including corals that have bleach-resistant zooxanthellae; and particular reef fish species that are different to those found elsewhere in the Gulf of Carpentaria. Species present include marine turtles and reef fish such as coral trout, cod, mackerel, and shark. Seabirds frequent the plateaux and saddle, most likely due to the presence of predictable food resources for feeding offspring. |
| <b>Shelf break and slope of the Arafura Shelf</b>              | The Shelf break and slope of the Arafura Shelf is defined as a key ecological feature for its ecological significance associated with productivity emanating from the slope<br>It also forms part of a unique biogeographic province (Last <i>et al.</i> , 2005) | The shelf break and slope of the Arafura Shelf is characterised by continental slope and patch reefs and hard substrate pinnacles. The ecosystem processes of the feature are largely unknown in the region; however, the Indonesian Throughflow and surface wind-driven circulation are likely to influence nutrients, pelagic dispersal and species and biological productivity in the region. Biota associated with the feature is largely of Timor–Indonesian Malay affinity.  |
| <b>Submerged coral reefs of the Gulf of Carpentaria</b>        | High aggregations of marine life, biodiversity and endemism<br>Twenty per cent of the reefs found in the NMR are situated within this KEF (Harris <i>et al.</i> , 2007)  | The submerged coral reefs of the Gulf of Carpentaria are characterised by submerged patch, platform and barrier reefs that form a broken margin around the perimeter of the Gulf of Carpentaria basin, rising from the sea floor at depths of 30–50 m. These reefs provide breeding and aggregation areas for many fish species including mackerel and snapper and offer refuges for sea snakes and apex predators such as sharks. Coral trout species that inhabit the submerged reefs are smaller than those found in the Great Barrier Reef and may prove to be an endemic sub-species.   |
| <b>Tributary Canyons of the Arafura Depression</b>             | High productivity and high levels of species diversity and endemism of marine life within the benthic and pelagic habitats of the feature  | The tributary canyons are approximately 80–100 m deep and 20 km wide. The largest of the canyons extend some 400 km from Cape Wessel into the Arafura Depression, and are the remnants of a drowned river system that existed during the Pleistocene era. Sediments in this feature are mainly calcium-carbonate rich, although sediment type varies from sandy substrate to soft muddy sediments and hard, rocky substrate. Marine turtles, deep sea sponges, barnacles and stalked crinoids have all been identified in the area.  |

## 10. PROTECTED AREAS

### 10.1 Regional Context

Protected areas included World Heritage Properties, National Heritage Places, Wetlands of International Importance, Australian Marine Parks, State Marine Parks and Reserves, Threatened Ecological Communities and the Australian Whale Sanctuary. The PMST Reports (**Appendix A**) shows that there are twenty-nine protected areas found in the NWMR, eighteen in the SWMR and nine in the NMR.

**Table 10-1**, **Table 10-2** and **Table 10-3** outline the protected areas of each of the marine regions NWMR, SWMR and NMR, respectively.

### 10.2 World Heritage Properties

Properties nominated for World Heritage listing are inscribed on the list only after they have been carefully assessed as representing the best examples of the world's cultural and natural heritage. Only World Heritage listings classed as natural are discussed in this section. World Heritage sites classed as cultural are discussed in **Section 11**.

The list of Australia's World Heritage Properties and the PMST Reports (**Appendix A**) show two World Heritage Properties within the NWMR (**Table 10-1**), no World Heritage Properties within the SWMR (**Table 10-2**), and though not reported in the NMR PMST Report, Kakadu National Park and World Heritage Area is included in **Table 10-3**.

### 10.3 National and Commonwealth Heritage Places - Natural

The National Heritage List is Australia's list of natural, historic, and Indigenous places of outstanding significance to the nation. The National Heritage List Spatial Database describes the place name, class (Indigenous, natural, historic), and status. Commonwealth Heritage Places are a collection of sites recognised for their Indigenous, historical and/or natural values which are owned or controlled by the Australian Government.

Only National and Commonwealth Heritage Places classed as natural are discussed in this section. Heritage Places classed as indigenous or historic are discussed in **Section 11**.

A search of the National Heritage List Spatial Database and the PMST Reports (**Appendix A**) identified three natural National Heritage Places in the NWMR (**Table 10-1**), three in the SWMR (**Table 10-2**) and for the NMR, Kakadu National Park (not included in the PMST report) is included in **Table 10-3**.

A search of the Commonwealth Heritage List identified four natural commonwealth heritage places within the NWMR (**Table 10-1**).

### 10.4 Wetlands of International Importance (listed under the Ramsar Convention)

Australia has 65 Ramsar wetlands that cover >8.3 million ha. Ramsar wetlands are those that are representative, rare, or unique wetlands, or that are important for conserving biological diversity.

The List of Wetlands of International Importance held under the Ramsar Convention and the PMST Reports (**Appendix A**) identified four Ramsar Sites with coastal features within the NWMR (**Table 10-1**), four in the SWMR (**Table 10-2**) and two for the New Territory, included for the NMR (**Table 10-3**).

### 10.5 Australian Marine Parks

Australian Marine Parks (AMPs), proclaimed under the EPBC Act in 2007 and 2013, are located in Commonwealth waters that start at the outer edge of State and Territory waters, generally three

nautical miles (~5.5 km) from the shore, and extend to the outer boundary of Australia's EEZ, 200 nm (~370 km) from the shore.

PMST Reports (**Appendix A**) show sixteen AMPs within the NWMR (**Table 10-1**), ten within the SWMR (**Table 10-2**) and eight within the NMR (**Table 10-3**).

## 10.6 Threatened Ecological Communities

No Threatened Ecological Communities (TECs) as listed under the EPBC Act are known to occur within the marine waters of the NWMR, SWMR or NMR as indicated by the PMST Reports (**Appendix A**).

## 10.7 Australian Whale Sanctuary

The Australian Whale Sanctuary has been established to protect all whales and dolphins found in Australian waters. Under the EPBC Act all cetaceans (whales, dolphins and porpoises) are protected in Australian waters.

The Australian Whale Sanctuary includes all Commonwealth waters from the three nautical mile State/Territory waters limit out to the boundary of the EEZ (i.e. out to 200 nm and further in some places). Within the Sanctuary it is an offence to kill, injure or interfere with a cetacean. Severe penalties apply to anyone convicted of such offences.

## 10.8 State Marine Parks and Reserves

State Marine Parks and Reserves, proclaimed under the *Conservation and Land Management Act 1984* (CALM Act), are located in State waters and vested in the WA Conservation and Parks Commission. State Marine Parks and Reserves of Western Australia have been considered, with 14 occurring in the NWMR (**Table 10-1**) and six occurring in the SWMR (**Table 10-2**).

## 10.9 Summary of Protected Areas within the NWMR

Table 10-1 Protected Areas within the NWMR

| Protected Area                             | Woodside Activity Area |       |         | IUCN Protected Area Category* or Relevant Park Zone | Description  | Conservation Values  |
|--|------------------------|-------|---------|---|--|--|
|  | Browse                 | NWS/S | NW Cape |   |  |  |
| <b>World Heritage Properties</b>           |                        |       |         |   |  |  |
| Shark Bay World Heritage Property          | -                      | -     | ✓       |   | The Shark Bay World Heritage Property is adjacent to the Shark Bay AMP and was included on the World Heritage List in 1991.  | Universal values of the Shark Bay World Heritage Property include large and diverse seagrass beds, stromatolites and populations of dugong and threatened species. Inscribed under Natural Criteria vii, viii, ix and x.   |
| The Ningaloo Coast World Heritage Property | -                      | -     | ✓       |   | The Ningaloo Coast World Heritage Property lies within the Ningaloo AMP and was included on the World Heritage List in 2011.   | Universal values of the Ningaloo Coast World Heritage Property include high marine species diversity and abundance; in particular, Ningaloo Reef supports both tropical and temperate marine reptiles and mammals. Inscribed under Natural Criteria vii and x.   |
| <b>National Heritage Places - Natural</b>  |                        |       |         |   |  |  |
| Shark Bay                                  | -                      | -     | ✓       |   | The Shark Bay National Heritage Place consists of the same area included in the Shark Bay World Heritage Property (refer above) and was established on the National Heritage List in 2007. | The national heritage place has a number of exceptional natural features, including one of the largest and most diverse seagrass beds in the world, colonies of stromatolites and rich marine life including a large population of dugongs, and also provides a refuge for a number of other globally threatened species. Shark Bay meets the national heritage listing criteria a, b, c, d, e, f, g, h and i. |
| The Ningaloo Coast                         | -                      | -     | ✓       |   | The Ningaloo Coast National Heritage Place consists of the same area included in the Ningaloo  | The Ningaloo Coast contains one of the best developed near-shore reefs in the world, being home to rugged limestone peninsulas, spectacular coral and sponge gardens and the whale shark.  |

|   |                        |       |         |   | Coast World Heritage Property (refer above) and was established on the National Heritage List in 2010.  | The Ningaloo Coast meets the national heritage listing criteria a, b, c, d, and f.   |
| The West Kimberley                            | ✓                      | ✓     | -       |   | The West Kimberley National Heritage Place covers an area of around 192,000 km <sup>2</sup> located in the north-west of Australia from Broome to Wyndham, and was established on the National Heritage List in 2011. | The Kimberley plateau, north-western coastline and northern rivers of the West Kimberley provide a vital refuge for many native plants and animals that are found nowhere else or which have disappeared from much of the rest of Australia. In addition, Roebuck Bay is internationally recognised as one of Australia's most significant sites for migratory wading birds.<br>The national heritage place also contains a remarkable history of Aboriginal occupation, with many places of indigenous sacred value.<br>The West Kimberley meets the national heritage listing criteria a, b, c, d, e, f, g, h and i. |
| <b>Commonwealth Heritage Places - Natural</b> |                        |       |         |   |   |  |
| Mermaid Reef – Rowley Shoals                  | -                      | ✓     | -       | N/A   | The Mermaid Reef – Rowley Shoals Commonwealth Heritage Place is located within the boundary of the Mermaid Reef Marine National Nature Reserve. The site was listed as a Commonwealth Heritage Place in 2004.         | The Mermaid Reef-Rowley Shoals Commonwealth Heritage Place is regionally important for the diversity of its fauna and together with Clerke and Imperieuse reefs, has biogeographical significance due to the presence of species which are at, or close to, the limits of their geographic ranges, including fishes known previously only from Indonesian waters.<br>Rowley Shoals is important for benchmark studies as one of the few places off the north-west coast of Western Australia which have been the site of major biological collection trips by the WA Museum.   |

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

| Protected Area                               | Woodside Activity Area |       |         | IUCN Protected Area Category* or Relevant Park Zone | Description  | Conservation Values  |
|--|------------------------|-------|---------|---|--|--|
|  | Browse                 | NWS/S | NW Cape |   |  |  |
| Ashmore Reef National Nature Reserve         | ✓                      | -     | -       |   | The Ashmore Reef Commonwealth Heritage Place is located within the boundary of the Ashmore Reef Marine Park (refer AMPs below). The site was listed as a Commonwealth Heritage Place in 2004.                      | Ashmore Reef has major significance as a staging point for wading birds migrating between Australia and the Northern Hemisphere and supports high concentrations of breeding seabirds, many of which are nomadic and typically breed on small isolated islands.<br>Ashmore Reef is an important scientific reference area for migratory seabirds, sea snakes and marine invertebrates. The Ashmore Reef Commonwealth Heritage Place is significant for its history of human occupation and use. The island is believed to have been visited by Indonesian fisherman since the early eighteenth century. The islands were used both for fishing and as a staging point for voyages to the southern reefs off Australia's coast. |
| Scott Reef and Surrounds – Commonwealth Area | ✓                      | -     | -       |   | Scott Reef and Surrounds Commonwealth Heritage Place is located within the Western Australian Coastal Waters surrounding North and South Scott Reef. The site was listed as a Commonwealth Heritage Place in 2004. | The Scott Reef and Surrounds Commonwealth Heritage Place is regionally important for the diversity of its fauna and has biogeographical significance due to the presence of species which are at, or close to, the limits of their geographic ranges, including fish known previously only from Indonesian waters.<br>Scott Reef is recognised as important for scientific research and benchmark studies due to its age, the extensive documentation of its geophysical and physical environmental characteristics and its use as a site of major biological collection trips and surveys by the WA Museum and the Australian Institute of Marine Science.  |

| Protected Area                                       | Woodside Activity Area |       |         | IUCN Protected Area Category* or Relevant Park Zone | Description  | Conservation Values  |
|--|------------------------|-------|---------|---|--|--|
|  | Browse                 | NWS/S | NW Cape |   |  |  |
| Ningaloo Marine Area – Commonwealth Waters           | -                      | -     | ✓       |   | The Ningaloo Marine Area Commonwealth Heritage Place is located within the Commonwealth waters of the Ningaloo Marine Park (refer AMPs below). The site was listed as a Commonwealth Heritage Place in 2004. | The Ningaloo Marine Area Commonwealth Heritage Place provides a migratory pathway for humpback whales and foraging habitat for whale sharks. The place is an important breeding area for billfish and manta ray. The Ningaloo Marine Area provides opportunities for scientific research relating to aspects of the area's unique features including tourism (marine ecology, whales, turtles, whale sharks, fish and oceanography). |
| <b>Wetlands of International Importance (Ramsar)</b> |                        |       |         |   |  |  |
| Ashmore Reef National Nature Reserve                 | ✓                      | -     | -       | Ramsar  | The Ashmore Reef Ramsar site is located within the boundary of the Ashmore Reef Marine Park (refer AMPs below). The site was listed under the Ramsar Convention in 2002.                                     | Ashmore Reef Ramsar site supports internationally significant populations of seabirds and shorebirds, is important for turtles (green, hawksbill and loggerhead) and dugong, and has the highest diversity of hermatypic (reef-building) corals on the WA coast. It is known for its abundance and diversity of sea snakes. However, since 1998 populations of sea snakes at Ashmore Reef have been in decline.                      |
| Eighty Mile Beach                                    | -                      | ✓     | -       | Ramsar  | The Eighty Mile Beach Ramsar site covers an area of 1250 km <sup>2</sup> , located along a long section of the Western Australian coastline adjacent to the Eighty Mile Beach AMP (refer below).             | The Eighty Mile Beach Ramsar site includes saltmarsh and a raised peat bog more than 7000 years old. The site contains the most important wetland for waders in north-western Australia, supporting up to 336,000 birds, and is especially important as a land fall for waders migrating south for the austral summer.   |
| Roebuck Bay  | -                      | ✓     | -       | Ramsar  | The Roebuck Bay Ramsar site covers an area of 550  | The Roebuck Bay Ramsar site is recognised as one of the most important areas for migratory shorebirds in Australia.  |

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

| Protected Area                                      | Woodside Activity Area |       |         | IUCN Protected Area Category* or Relevant Park Zone | Description   | Conservation Values  |

|   |                        |       |         |   | km <sup>2</sup> , located south of Broome and adjacent to the Roebuck AMP (refer below).  | The site regularly supports over 100,000 waterbirds, with numbers being highest in the austral spring when migrant species breeding in the Palearctic stop to feed during migration.   |
| Ord River Floodplain                                | ✓                      |       |         | Ramsar  | The Ord River Floodplain Ramsar Site is in the East Kimberley region and encompasses an extensive system of river, seasonal creek, tidal mudflat, and floodplain wetlands. The Ramsar Site is a nursery, feeding and/or breeding ground for migratory birds, waterbirds, fish, crabs, prawns, and crocodiles. | The site represents the best example of wetlands associated with the floodplain and estuary of a tropical river system in the Tanami-Timor Sea Coast Bioregion in the Kimberley.<br>In addition, the False Mouths of the Ord are the most extensive mudflat and tidal waterway complex in Western Australia.   |
| <b>Wetlands of National Importance (DAWE, 2019)</b> |                        |       |         |   |   |  |
| Ashmore Reef  | ✓                      | -     | -       |   | Ashmore Reef is a shelf-edge platform reef located among the Sahul Banks of north-western Australia. It covers an area of 583 km <sup>2</sup> and consists of three islets surrounded by intertidal reef and sand flats.  | These islets are major seabird nesting sites with 20 breeding species recorded to date. The total bird population has been estimated to exceed 100,000 during the peak breeding season.<br>The marine reserve also has the highest diversity of marine fauna of the reefs on the NWS and differs from other reefs and coastal areas in the region.<br>The area meets criteria 1, 3, 4 and 5 for inclusion on the Directory of Important Wetlands in Australia. |
| Mermaid Reef  | -                      | ✓     | -       |   | Mermaid Reef Marine Park covers an area of around 540 km <sup>2</sup> , located ~280 km west north-west of Broome, and is the most north-easterly atoll of the Rowley Shoals.   | The reefs of the Mermaid Reef Marine Park have biogeographic value due to the presence of species that are at or close to the limit of their distribution. The coral communities are one of the special values of Mermaid Reef.<br>The area meets criteria 1, 2 and 3 for inclusion on the Directory of Important Wetlands in Australia.   |
