Distances to isopleths are generally larger for scenarios where the Helix Q7000 is present due to a higher source level than the other vessels. The ROV cutter spectra (Figure 7) is quiet in contrast to the other sources (Figure 6), with the majority of energy occurring near 10 kHz. The ROV cutter's spectrum overlaps with the hearing range of very high-frequency cetaceans, as such it increases the ranges to TTS for very high-frequency cetaceans compared with the low- and high-frequency counterparts.

For the results tables presented in Section 4.1, where a dash is used in place of a horizontal distance, these thresholds may or may not be reached. Due to the discretely sampled 20 m calculation grids of the modelled sound fields, distances to these levels could not be estimated for practicable computational purposes. It is likely that SPL isopleths could be reached at distances between the source and the modelled horizontal resolution (20 m); however, distances to injurious accumulated SEL thresholds may not be reached at any range greater than the source due to the species-specific frequency weighing functions. Additionally, if close-to-source radii are comparable to the dimensions of the modelled vessel (Helix Q7000, PSV, ROVV) then they may only be reached within proximity to a vessel, if at all.

Table 13. Summary of maximum ( $R_{max}$ ) horizontal distances (in km) from the Terahiki-1 and Gudgeon-1 platforms to the behavioural response threshold, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. The maximum across all scenarios is reported here.

Hearing group	Modelled distance to effect threshold ( $R_{max}$ )					
	Behavioural response <sup>a</sup>	TTS <sup>b</sup>	PTS <sup>b</sup>	Behavioural response <sup>a</sup>	TTS <sup>b</sup>	PTS <sup>b</sup>
	Terahiki-1			Gudgeon-1		
Low-frequency (LF) cetaceans	9.53	1.26	0.06	9.53	1.16	0.06
High-frequency (HF) cetaceans		0.03	–		0.03	–
Very High-frequency (VHF) cetaceans		0.58	0.04		0.88	0.05
Otariid Seals		–	–		–	–

Noise exposure criteria: <sup>a</sup> NOAA (2019) and <sup>b</sup> Southall et al. (2019).

## Appendix A. Acoustic Metrics

This section describes in detail the acoustic metrics, impact criteria, and frequency weighting relevant to the modelling study.

### A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of  $p_0 = 1 \mu\text{Pa}$ . Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI S1.1-2013).

The sound pressure level (SPL or  $L_p$ ; dB re  $1 \mu\text{Pa}$ ) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window ( $T$ ; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10 \log_{10} \left( \frac{1}{T} \int_T g(t) p^2(t) dt / p_0^2 \right) \text{ dB} \quad (\text{A-1})$$

where  $g(t)$  is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function.

The sound exposure level (SEL or  $L_E$ ; dB re  $1 \mu\text{Pa}^2 \cdot \text{s}$ ) is the time-integral of the squared acoustic pressure over a duration ( $T$ ):

$$L_E = 10 \log_{10} \left( \int_T p^2(t) dt / T_0 p_0^2 \right) \text{ dB} \quad (\text{A-2})$$

where  $T_0$  is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the  $N$  individual pulses. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the  $N$  individual events:

$$L_{E,N} = 10 \log_{10} \left( \sum_{i=1}^N 10^{\frac{L_{E,i}}{10}} \right) \text{ dB} . \quad (\text{A-3})$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g.,  $L_{E,LF,24h}$ ; Appendix A.4). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

## A.2. Decidecade Band Analysis

The distribution of a sound’s power with frequency is described by the sound’s spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a “1/3 octave” because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the *i*th band,  $f_c(i)$ , is defined as:

$$f_c(i) = 10^{\frac{i}{10}} \text{ kHz} \tag{A-4}$$

and the low ( $f_{lo}$ ) and high ( $f_{hi}$ ) frequency limits of the *i*th decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i) \tag{A-5}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 10 ( $f_c(10) = 10 \text{ Hz}$ ) to band 44 ( $f_c(44) = 25 \text{ kHz}$ ).

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the *i*th band ( $L_{p,i}$ ) is computed from the spectrum  $S(f)$  between  $f_{lo,i}$  and  $f_{hi,i}$ :

$$L_{p,i} = 10 \log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f) df \text{ dB} \tag{A-6}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_i 10^{\frac{L_{p,i}}{10}} \text{ dB} \tag{A-7}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient sound signal. Because the decidecade bands are wider than 1 Hz, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale. Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the power spectrum.

### A.3. Marine Mammal Noise Effect Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggest that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for auditory injury, impairment, and disturbance. The following sections summarise the recent development of thresholds; however, this field remains an active research topic.

#### A.3.1. Injury and Hearing Sensitivity Changes

In recognition of shortcomings of the SPL-only based auditory injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual auditory injury criteria for impulsive sounds that included peak pressure level thresholds and SEL<sub>24h</sub> thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas SEL<sub>24h</sub> is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for humans; see Appendix A.4). The SEL<sub>24h</sub> thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower PTS and TTS values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1  $\mu\text{Pa}^2\cdot\text{s}$ . Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced the Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1  $\mu\text{Pa}^2\cdot\text{s}$ .

As of present, a definitive approach is still not apparent. There is consensus in the research community that an SEL-based method is preferable, either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes auditory injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018 (NMFS 2018). Southall et al. (2019) revisited the interim criteria published in 2007. All noise exposure criteria in NMFS (2018) and Southall et al. (2019) are identical (for impulsive and non-impulsive sounds); however, the mid-frequency cetaceans from NMFS (2018) are classified as high-frequency cetaceans in Southall et al. (2019), and high-frequency cetaceans from NMFS (2018) are classified as very-high-frequency cetaceans in Southall et al. (2019).

### A.3.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

NMFS currently uses step function (all-or-none) threshold of 120 dB re 1  $\mu\text{Pa}$  SPL (unweighted) for non-impulsive sounds to assess and regulate noise-induced behavioural impacts on marine mammals (NOAA 2019). The 120 dB re 1  $\mu\text{Pa}$  threshold is associated with continuous sources and was derived based on studies examining behavioural responses to drilling and dredging (NOAA 2018), referring to Malme et al. (1983), Malme et al. (1984), and Malme et al. (1986), which were considered in Southall et al. (2007). Malme et al. (1986) found that playback of drillship noise did not produce clear evidence of disturbance or avoidance for levels below 110 dB re 1  $\mu\text{Pa}$  (SPL), possible avoidance occurred for exposure levels approaching 119 dB re 1  $\mu\text{Pa}$ . Malme et al. (1984) determined that measurable reactions usually consisted of rather subtle short-term changes in speed and/or heading of the whale(s) under observation. It has been shown that both received level and proximity of the sound source is a contributing factor in eliciting behavioural reactions in humpback whales (Dunlop et al. 2017, Dunlop et al. 2018).

## A.4. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound

components at particular frequencies can be scaled by frequency weighting relevant to an animal’s sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

### A.4.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10} \left[ \left( \frac{(f/f_{lo})^{2a}}{[1 + (f/f_{lo})^2]^a [1 + (f/f_{hi})^2]^b} \right) \right] \tag{A-8}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA’s technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values, however, the terminology for mid- and high-frequency cetaceans was changed to high- and very high-frequency cetaceans. Table A-1 lists the frequency-weighting parameters for each hearing group relevant to this assessment, and Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	f <sub>lo</sub> (Hz)	f <sub>hi</sub> (kHz)	K (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (most dolphins, plus sperm, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very-high-frequency cetaceans (true porpoises, <i>Kogia</i> , river dolphins, <i>Cephalorhynchus</i> spp., <i>Lagenorhynchus cruciger</i> and <i>L. australis</i> )	1.8	2	12,000	140,000	1.36
Otariid Seals in water	2.0	2	940	25,000	0.64

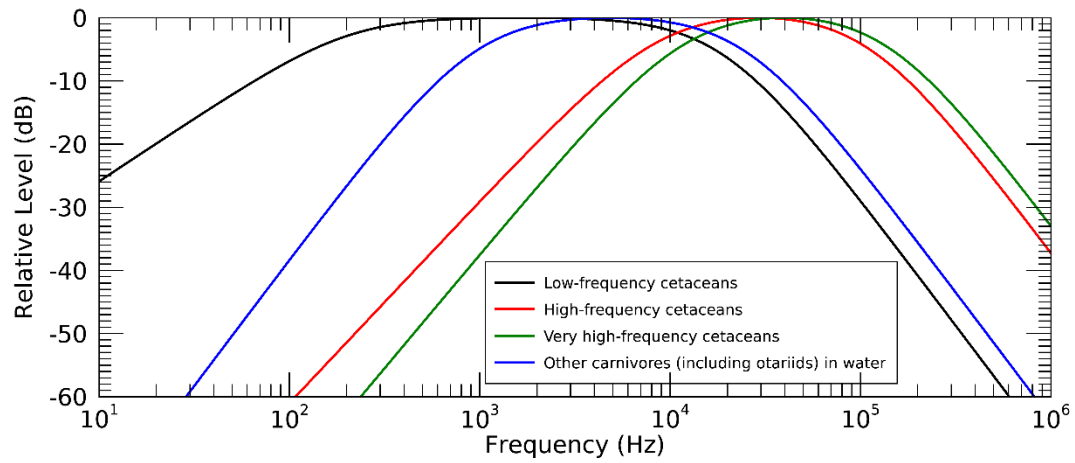

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

## Appendix B. Methods and Parameters

### B.1. Environmental Parameters

#### B.1.1. Bathymetry

Bathymetry throughout the modelled area was extracted from the Australian Bathymetry and Topography Grid, a 9 arc-second grid rendered for Australian waters (Whiteway 2009). Bathymetry data were re-gridded and combined onto a Map Grid of Australia (MGA) coordinate projection (Zone 55) with a regular grid spacing of 200 × 200 m (Figure B-1).

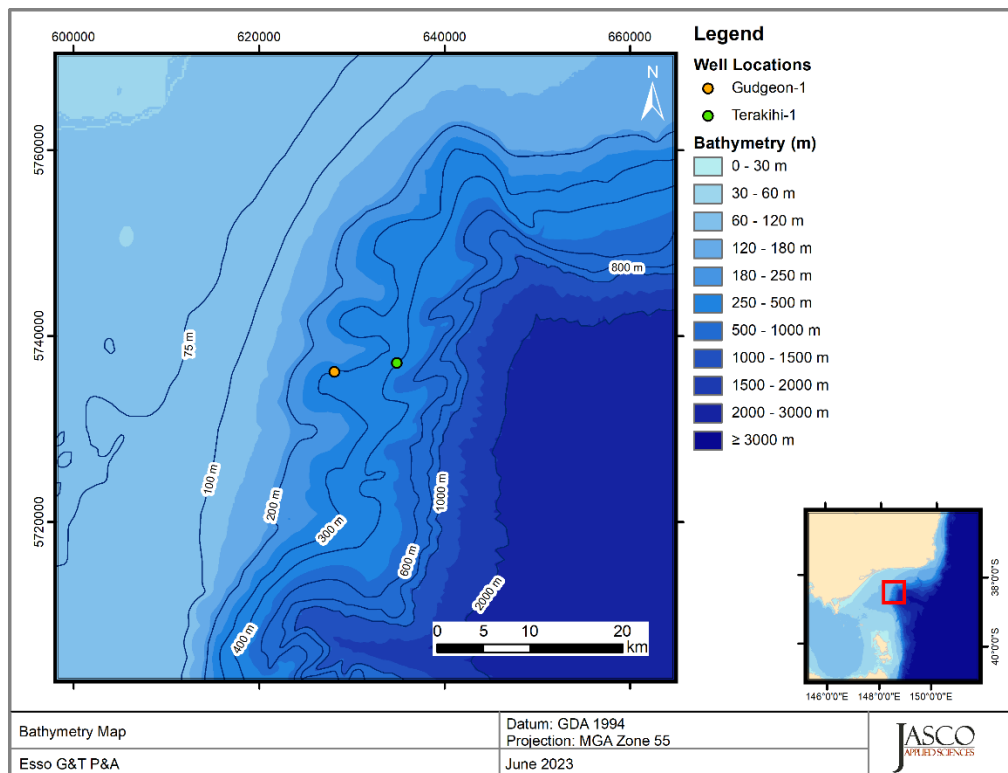

Figure B-1. Bathymetry in the modelled area.

#### B.1.2. Sound Speed Profile

The sound speed profile in the area was derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office’s Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world’s oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy’s Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles at distances less than 60 km around the modelled site. The June sound speed profile is expected to be most favourable to longer-range sound propagation across the entire year, due to a thick upward refracting layer near the sea-surface. As such, June was selected for sound propagation modelling to ensure precautionary

estimates of distances to received sound level thresholds. Figure B-2 shows the resulting profile, which was used as input to the sound propagation modelling.

Figure B-2. The modelling sound speed profile corresponding to June: full profile (left) and top 400 m (right) Profiles are calculated from temperature and salinity profiles from Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

### B.1.3. Geoacoustics

A single representative geoacoustic profile was used for all modelled sites based on a project in a similar region (Cooper Energy Limited 2022). The seabed nominally consists of a 30 m thick package of interbedded silt, sand, and sandy silt layers. Geoacoustic parameters in Cooper Energy Limited (2022) were derived from sedimentary grain size measurements. These measurements provided data to 30 m below the seafloor. After 30 m a simple profile was constructed assuming increasingly consolidated sediment (Table B-1). The geoacoustic properties were calculated using the sediment grain-shearing model of Buckingham (2005). Table B-1 presents the geoacoustic profile used for all modelled sites.

Table B-1. Geoacoustic profile for all modelled sites.

Depth below seafloor (m)	Material	Density (g/cm <sup>3</sup> )	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0-5	Very fine sand	2.02	1727.8	0.570	250	3.65
5-10	Silt	1.99	1725.6	0.633		
10-15	Very fine sand	2.01	1779.9	0.773		
15-20		2.03	1826.6	0.892		
20-25		2.01	1819.5	0.900		
25-30	Silt	1.97	1780.0	0.851		
30-100		1.97	1909.1	1.217		

## B.2. Sound Propagation Models

### B.2.1. Propagation Loss

The propagation of sound through the environment was modelled by predicting the acoustic propagation loss—a measure, in decibels, of the decrease in sound level between a source and a receiver some distance away. Geometric spreading of acoustic waves is the predominant way by which propagation loss occurs. Propagation loss also happens when the sound is absorbed and scattered by the seawater, and absorbed scattered, and reflected at the water surface and within the seabed. Propagation loss depends on the acoustic properties of the ocean and seabed; its value changes with frequency.

If the acoustic energy source level (ESL), expressed in dB re 1 μPa<sup>2</sup>·s m<sup>2</sup>, and propagation loss (PL), in units of dB, at a given frequency are known, then the received level (RL) at a receiver location can be calculated in dB re 1 μPa<sup>2</sup>·s by:

$$RL = SL - PL. \quad (B-1)$$

### B.2.2. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). While other models may be more accurate for steep-angle propagation in high-shear environment, MONM is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 10 Hz to 1.6 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the U.S. Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies > 1.6 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

MONM computes acoustic fields in three dimensions by modelling propagation loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of  $\Delta\theta$ , yielding  $N = 360^\circ/\Delta\theta$  number of planes (Figure B-3).

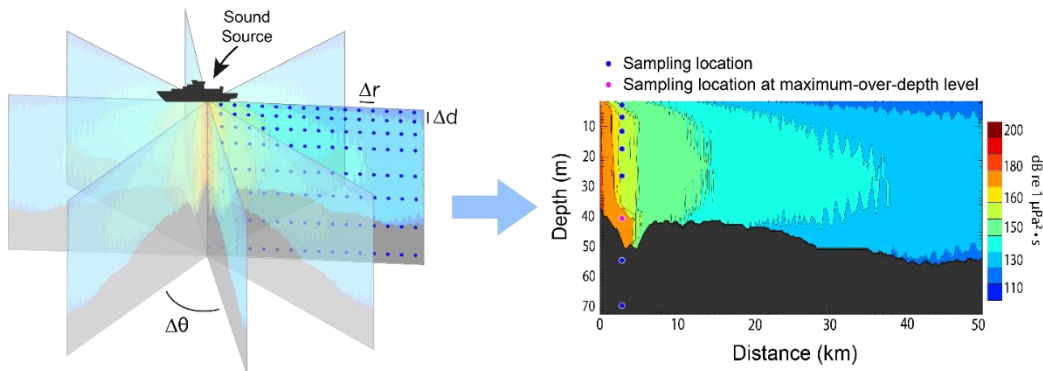

Figure B-3. The N×2-D and maximum-over-depth modelling approach used by MONM.

MONM treats frequency dependence by computing acoustic propagation loss at the centre frequencies of decidecade bands. Sufficiently many decidecade frequency-bands, starting at 10 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the propagation loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade received per-second SEL are computed by subtracting the band propagation loss values from the directional source level in that frequency band. Composite broadband received per-second SEL are then computed by summing the received decidecade levels.

The received 1-s SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. For areas with deep water, sampling is not performed at depths beyond those reachable by marine mammals. The received per-second SEL at a surface sampling location is taken as the maximum value that occurs over all samples within the water column, i.e., the maximum-over-depth received per-second SEL. These maximum-over-depth per-second SEL are presented as colour contours around the source.

### B.3. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1)  $R_{\max}$ , the maximum range to the given sound level over all azimuths, and 2)  $R_{95\%}$ , the range to the given sound level after the 5% farthest points were excluded (see examples in Figure B-4).

The  $R_{95\%}$  is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure B-4(a). In cases such as this, where relatively few points are excluded in any given direction,  $R_{\max}$  can misrepresent the area of the region exposed to such effects, and  $R_{95\%}$  is considered more representative. In strongly asymmetric cases such as shown in Figure B-4(b), on the other hand,  $R_{95\%}$  neglects to account for significant protrusions in the footprint. In such cases  $R_{\max}$  might better represent the region of effect in specific directions. Cases such as this are usually associated with

bathymetric features affecting propagation. The difference between  $R_{\max}$  and  $R_{95\%}$  depends on the source directivity and the non-uniformity of the acoustic environment.

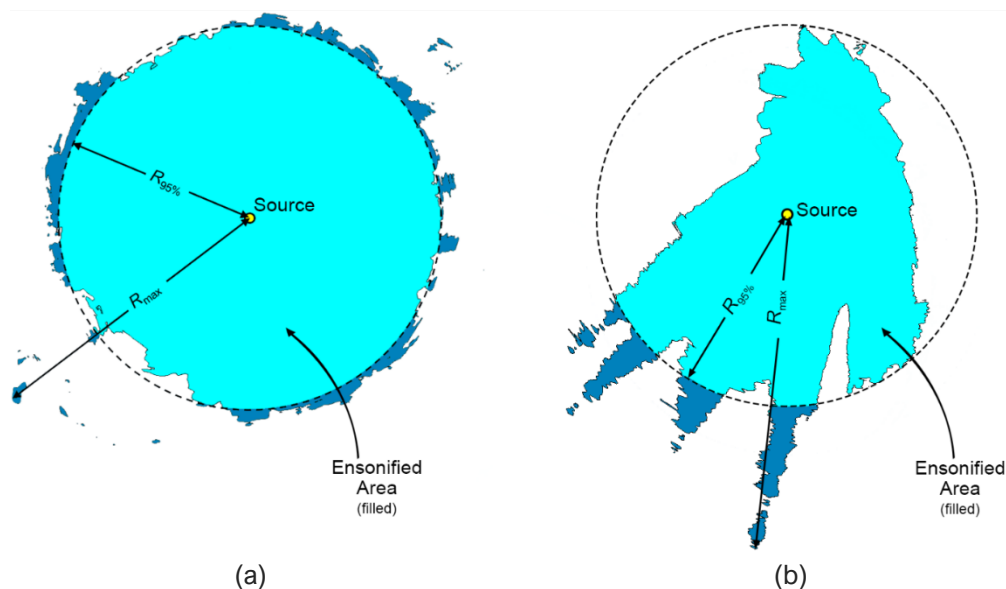

Figure B-4. Sample areas ensonified to an arbitrary sound level with  $R_{\max}$  and  $R_{95\%}$  ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by  $R_{95\%}$ ; darker blue indicates the areas outside this boundary which determine  $R_{\max}$ .

## B.4. Model Validation Information

Predictions from JASCO's propagation models (MONM, FWRAM, and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Arctic, Canadian and southern United States waters, Greenland, Russia and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities that have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016, Austin et al. 2018, Beach Energy Limited 2020).

## Appendix C. Additional Results

Additional maximum-over-depth accumulated sound field results considering an accumulation time of 8 h are presented below. The ten modelled scenarios (described in Section 1.1) are presented as tables and, where the distances are long enough, as contour maps showing distance to thresholds.

### C.1. Tabulated Results

Table 14. *Vessel Scenarios at Terahiki-1, SEL<sub>8h</sub>*: Maximum ( $R_{max}$ ) horizontal distances (in km) to frequency-weighted SEL<sub>8h</sub> PTS and TTS thresholds based on Southall et al. (2019) and Finneran et al. (2017) from most appropriate location for considered sources per scenario and ensonified area (km<sup>2</sup>).

## 1. Introduction

This volume of the Environment Plan describes potential response options available for an oil spill occurring from any of Esso's activities within the Gippsland Basin as described in:

- Volume 2: Bass Strait Operations Environment Plan,
- Volume 2a: JUR Drilling Environment Plan,
- Volume 2b: Whiting Plug and Abandonment Environment Plan<sup>#</sup>
- Volume 2c: SHA / TWA Plug and Abandonment Environment Plan<sup>#</sup>
- Volume 2d: BTW Installation, Commissioning and Initial Operations Environment Plan

<sup>#</sup>Activities completed in 2020

This volume assesses and evaluates:

- Potential environmental impacts from implementing response options in accordance with Regulation 13(6); and
- Esso's capabilities for each response option in accordance with Regulation 14(8AA).

The Oil Pollution Emergency Plan (OPEP) details the initial and ongoing actions to take following a spill incident, the response framework and organisation structure, and step by step guides for key roles and responsibilities. The OPEP is an operational document which provides the response resources available for all levels of incidents, tools for spill response assessment, timeframes to initiate a response, notifications, and steps for response escalation, monitoring and stand down.

The Operational and Scientific Monitoring Plan (OSMP) outlines environmental monitoring that may be implemented in the event of an oil spill to the marine or coastal environment. Information from oil spill monitoring enables the Incident Management Team (IMT) to make informed decisions regarding response options. Oil spill monitoring provides the principle tools for determining the extent, severity and persistence of environmental impacts from a hydrocarbon spill and associated response and/or remediation activities.

## 2. Overview of Emergency Oil Spill Response Strategies

In an oil spill event, response options and tactics employed will vary depending on a number of factors related to the specific spill incident including: oil types, volumes, location of spill and whether it is a discrete spill or an ongoing flow.

The response options for the Bass Strait are listed below:

- Source Control;
- Surveillance and Monitoring;
- Application of Dispersant;
- Containment & Recovery (Offshore and Nearshore);
- Shoreline Protection and Clean-up; and
- Oiled Wildlife Response.

In-situ burning was considered however has not been included as a viable response strategy as:

- This response strategy is not approved as part of the national plan
- This response strategy has not been used previously in Australia
- Potential issues with local community and stakeholder engagement due to visual amenity

An effective response strategy may require a combination of different response options and may be scaled up or down depending on the oil spill event.

This Volume details the following information for each response option:

- Description of Response;
- Assessment of Environmental Impacts caused by Response Activities; and

- Assessment of required capability.

Environmental Performance Outcomes (EPOs), Standards (EPSs) and Measurement Criteria (MC) have been identified and put in place to ensure environmental impacts from response activities are acceptable and reduced to as low as reasonably practicable (ALARP).

In addition, EPOs, EPSs and MC have been identified to ensure resources remain current and available to respond to an oil spill event.

The EPOs, EPSs and MC are detailed in Volume 4 of the EP for emergency response capability and in Appendix C of the OPEP for oil spill response. These will be monitored and reported as per the implementation strategy.

## 2.1 Environmental Impact Assessment of Oil Spill Response

All oil spill response activities are implemented with the aim of reducing the overall environmental impact of the spill however, each activity in itself may also impact the environment, therefore it is important to understand impacts, assess the level and acceptability of impacts, and reduce impacts to ALARP.

This volume addresses assessment and evaluation of the consequence of mobilising the response strategies in the Bass Strait, which considers specific environmental aspects (Section 2.1.1) and receptors in the Bass Strait environment.

The environmental impact assessment of each response option has been undertaken in accordance with the following sections which can be found in Volume 2

- Environmental Impact Assessment (including assessment of consequence)
- Demonstration of ALARP
- Demonstration of Acceptability

The environmental receptors that may be impacted in a spill scenario have been described in the Description of Environment Volume 1 and summarised in the impact tables below.

### 2.1.1 Environmental Aspects

After identifying and describing the possible response options, an assessment was carried out to identify environmental receptors and potential interactions between the response activities and the receiving environment. The environmental receptors identified as occurring in the area are described in the Description of Environment Volume 1. The environmental aspects have been identified for each oil spill response option and are shown in Table 2-1.

Based upon an understanding of the environmental aspects, potential impacts were defined and ecological and social receptors identified enabling a systematic evaluation to be undertaken. Many aspects align with those already described in the activity specific Impacts and Risks Volume (i.e. Volume 2, 2a, 2b etc.) such as aspects associated with vessels, therefore this volume only evaluates aspects and impacts that are unique to oil spill response activities.

**Table 2-1 Applicable Environmental Aspects**

Environmental Aspect	Response Strategies	Environmental Impact Assessment

## 2.2 Assessment of Oil Spill Response Strategies and Required Capabilities

Oil pollution preparedness and response arrangements should be commensurate with the identified risk and be fit for purpose, performance based, adaptable, scalable, sustainable, and clearly identify roles and responsibilities. All necessary arrangements to support timely response to foreseeable oil pollution emergencies must be in place prior to an activity commencing, and be maintained for the duration of the activity.

As per the IPIECA & OGP (2013) guidelines, the results from the spill modelling and impact assessment of the worst case discharge scenarios (see Volume 2) provide important input related to the likelihood of different spill scenarios, the ecological and socio-economic consequences of the scenarios, and the likelihood of exposure and oil volumes in geographical areas. Such information supports response planning analysis including NEBA, establishing response strategies and assessing resource needs across all response tiers.

Assessment of Oil Spill Response Strategies aims to identify:

- Viable strategies for delivering a response with the greatest net environment benefit

- Tactical measures required to implement the identified response strategies, considering technical, practical and safety factors
- Tiered resources required to mount the tactical measures and achieve an effective and realistic response

In order to address these items, Esso engaged AMOSC to conduct a detailed review of the selected worst case discharge scenarios in order to establish:

- Response strategies and required capability to respond to each worst case discharge scenario;
- Resource and personnel requirements for mobilisation and implementation of each response strategy;
- Consideration of resources and personnel for mobilisation and implementation of applicable Tactical Response Plans (TRPs); and
- Assessment of the availability of resources from Tier I, II, III equipment stockpiles.

The results from the AMOSC assessment have been used to generate a summary of resources required, resources available and expected timeframes to mobilise the personnel and equipment for each response option within this Volume.

The *APPEA Guidance Document: Incident Management Team- Knowledge requirements for responding to marine oil spills* has also been considered in assessing the capability and competency requirements of the IMT managing response activities. Designated members of the Esso IMT must complete all hazards training (PMAOMIR418/ PMAOMIR322) and oil spill response training to IMO II or IMO III equivalent. Training and competency requirements by position are detailed in the implementation strategy of the relevant EP.

Ability to scale up the IMT for a larger scale incident is managed via access to tiered response resources as detailed in Table 2-2 IMT Scaling

**Table 2-2 IMT Scaling**

Position	Initial Response	Secondary Resource	Tertiary Resource
Incident Controller		Esso	EM RRT
Liaison Officer		Esso	EM RRT
Safety Officer		Esso	EM RRT

RRT and OSRO members will complete an induction/onboarding prior to integrating into the Esso Australia IMT  
 \*Specialist training required to implement OSMP/SCAT as outlined in OSMP.

### 2.2.1 Response Strategies

For each worst case discharge scenario, a full range of response strategies were considered. Strategies which were not viable (e.g. due to oil type or proximity to sensitive receptors) were identified. The details of response strategies applicable to each worst case discharge scenario can be found in OPEP Appendix D – Quick Reference Information.

Note that these are the proposed response strategies based on the available spill response modelling information. Actual response strategies implemented will be decided using the process described in Section 2.3 and in consultation with relevant state agencies. Guidance will be sought from relevant state agencies as to external factors which may influence the implementation of planned response strategies (e.g. natural disasters, pandemics).

### 2.2.2 Resource Requirements and Timeframe

Resource requirements were determined for each response strategy applicable to each worst case discharge scenario. Resource and personnel requirements are determined based on modelling outputs which indicate the location and intensity of the impact. Both deterministic and stochastic modelling was referenced to understand the overall resource requirements and where these resources may need to be located.

Considerations for resource requirements for each response strategy are outlined in Table 2-3.

**Table 2-3 Considerations of resource requirements for response strategies**

Response Strategy	Considerations for resource requirements
Surveillance and monitoring	Time to shoreline impact Location and type of oil
Dispersant Application	Type of oil Location of spill in proximity to sensitive receptors Surface oil loading
Containment and recovery	Type of oil Location and loading to sensitive receptors Surface oil loading
Source control	Well and facility design

Response Strategy	Considerations for resource requirements
	Reservoir characteristics Release rates
Shoreline protection and clean-up	Time to shoreline impact Type of oil Shoreline loading Geographical distance of impact Location and loading to sensitive receptors Shoreline characteristics
Oiled wildlife response	Time to shoreline impact Type of oil Shoreline loading Potential for protected species to be located in the area

### 2.2.3 Assessment of required resource availability

An assessment of required resource availability has been completed based on the greatest requirements and the fastest required response time. For example, the MLA spill scenario has the greatest surface volume of oil and requires the largest volume of dispersant, therefore, resources for dispersant application have been determined based on this scenario. Details of which scenario is relevant to assessment of resource availability for each response strategy is outlined in Table 2-4. The assessments can be found in the relevant sections of this Volume 3.

Resource needs were assessed against resources available using a tiered response model, i.e. Tier 1 – Esso; Tier 2 – AMOSC; Tier 3 - National Plan / international resources to identify any gaps in capability. State owned equipment was not considered in this assessment and so provides additional capability.

A summary of the required capabilities is included in the relevant Quick Reference Guides (see OPEP Appendix D – Quick Reference Information).

**Table 2-4 Applicable WCDS to Response Strategy resource requirements**

Response Strategy	Relevant WCDS	
	Resources	Timeframe
Surveillance and monitoring	Applicable to all scenarios	
Dispersant Application	MLA	MLA
Containment and recovery	MLA / TNA	MLA
Source control	Specific to parameters of relevant scenario	
Shoreline protection and clean-up	SHA <sup>1</sup>	SHA
Oiled wildlife response	Applicable to all scenarios	

### 2.2.4 Demonstration of ALARP

An ALARP assessment has been completed to confirm that risks continue to be reduced to ALARP and all alternative options to meet resource requirements have been considered. Additional, alternative or improved controls considered but not adopted have also been included in the ALARP assessment.

<sup>1</sup> Note that the SHA well was abandoned in October 2020. However the modelling for this 'workover' discharge scenario was used to represent an oil spill close to shore

This ALARP assessment applies an ‘Engineering Risk Assessment’ in which a comparative assessment of risks, costs, and environmental benefit is conducted (OGUK, 2014). The cost–benefit analysis shows the balance between the environmental benefit and the cost of implementing the identified measure.

### 2.2.5 Ongoing monitoring and maintenance of capability

To ensure risks continue to be reduced to ALARP throughout the lifetime of the activity, performance standards and outcomes have been established to monitor response capability and ensure it is maintained.

For each response strategy, all activities have been provided a standard of performance and a performance outcome. These EPOs and EPSs will be monitored in accordance with the relevant measurement criteria (e.g. through tests and drills or validation of agreements). Refer to Volume 4 for further details.

If external factors are identified to have a potential to impact spill response capability (e.g. natural disasters, pandemics) a review of available capability against required capability will be completed to ensure risks continue to be reduced to ALARP. The management of change process will be used to make required changes or updates to capability, if required.

### 2.2.6 Selection of Protection Priorities

To inform prioritisation and implementation of response strategies in the event of an incident, resources at risk have been identified for each worst case scenario. These are listed in the relevant Quick Reference Guides. Protection priorities are selected based on:

- sensitivity and predicted consequence (as assessed in Volume 2)
- protected / actionable areas
- minimum time to exposure
- feedback from stakeholder engagement

In the event of an incident, the NEBA process (refer to Section 2.3) will be applied to the protection priorities defined in the Quick Reference Guides to assist in planning the response.

## 2.3 Net Environmental Benefit Analysis

A process known as Net Environmental Benefit Analysis (NEBA) considers the advantages and disadvantages of oil spill response options in terms of their respective impacts on the environment. NEBA recognises that oil spill response activities have the potential to cause environmental impacts but may be justifiable due to overriding benefits and/or the avoidance of further impacts. The NEBA process can be applied to offshore and nearshore spill response, and to shoreline cleanup. An effective Net Environmental Benefit Analysis is a three-step process (Table 2-5).

The Esso NEBA process has been developed using guidance documents *Response Strategy Development Using Net Environmental Benefit Analysis (NEBA)* (IPIECA, 2015) and *Guidelines on implementing spill impact mitigation assessment (SIMA)* (IPIECA, 2017).

**Table 2-5 Steps of the NEBA process**

Step	Activities
1	Identify and prioritise an area’s ecological, socioeconomic, and cultural resources according to environmental sensitivity.
2	Evaluate feasible response options and compare them to each other in addition to the option of natural recovery in order to define environmental benefits and drawbacks for all options.
3	Select the response option or combination of options that result in the greatest environmental benefit and/or least adverse effects on key resources.

### 2.3.1 Identifying and categorising sensitivities

Esso has undertaken a 'preparedness NEBA' which is essentially a draft of Step 1 & 2 of the NEBA Process (Table 2-5). This tool has identified resources at risk in over 40 geographic areas in an oil spill event which are located within the Bass Strait Described Area (DA) (refer to Volume 1). The resources identified span Victoria, Tasmania, New South Wales and Queensland.

The protection priorities defined in the Quick Reference Guides and the preliminary preparedness NEBA can be referenced in the event of an incident and used as a template during the response. In the event of an incident, it will be necessary to confirm the priorities are current and supported by stakeholders, and check the response strategies are indeed feasible given the specifics of the situation.

Each resource at risk has been subdivided further into resource types e.g. sandy beach, shipwrecks, fisheries, estuaries, rocky shores etc. Each of these resource types has been allocated:

1. Intrinsic Protection Priority (IPP)
2. Spill Impact Ranking; and (SIR)
3. Protection Priority Ranking (PPR).

The Intrinsic Protection Priority is calculated through:

- Irreplaceability / Significance of a Resource (Navigatus 2011)
- Vulnerability of a resource to oiling (NOAA ESI)
- Influence (criticality to human beings, ecosystems or their components)

The Spill Impact Ranking is determined based on the following impacts:

- Time before exposure;
- Duration of exposure;
- Size/scale;
- Intensity;
- Surface thickness;
- Dissolves aromatics; and
- Entrained hydrocarbons.

The IPP and the SIR are combined to give an overall PPR.

In a spill incident, the preparedness NEBA will be updated to reflect overall incident specific PPR for each resource at risk. This is achieved by:

- Determining SIR using data from incident-specific trajectory modelling; and
- Review of the IPP with stakeholders who have current and local knowledge of the resource areas.

Once this has been completed, the NEBA can be updated to select response strategies to protect the highest priority resources at risk.

### 2.3.2 Evaluate feasible response options

A summary of the outcomes of potential response options for each hydrocarbon type i.e. diesel, light crude and condensate is provided in the OPEP. The preparedness NEBA details the pros and cons for each response strategy based on each resource type, taking into account the impact of the response itself on the resource. The potential effects of response options (both positive and negative) are assessed compared to the 'no intervention' option and identified as:

- Proposed;
- Viable;
- Not recommended;
- Not applicable; and
- Not viable.

The potential response options for a spill have been categorised as one of the above in the preparedness NEBA for each of the resource types within each resource area. This information is

summarised in OPEP Appendix D – Quick Reference Information. In an actual incident, the spill responses should be reviewed and updated to consider fluid type, safety, feasibility, timing, current and local and knowledge of the resource areas.

### 2.3.3 Selecting the best or a combination of response options

This step requires a range of stakeholders to reach consensus on the relative priority of the environmentally-sensitive resources and to understand the trade-offs associated with available response technologies (IPIECA-IOGP, 2015).

Two trade-off aspects are balanced in this step (i.e., protection and response, and the benefits and drawbacks of selected response options). For the former, this priority may be influenced by the ease of protection and response, recovery times, and the importance for subsistence, economic value, and seasonal changes (IPIECA-IOGP, 2015).

Once the response options and priorities have been selected, this should be reviewed by relevant IMT members and considerations to logistics, safety and resources finalised. The NEBA is an ongoing process and should be updated on a regular basis for the duration of the spill to allow for “real-time” alignment with changing field conditions and address the health of response personnel, community health, and socioeconomic considerations (e.g. beach closures). Further, these tools should be used to gain stakeholder input on local or regional priorities, expand awareness, and gain trust in the decision-making process.

Net environmental benefit should always be a key factor when making decisions on the optimum spill response options to implement.

## 3. Source Control

### 3.1 Response Option Description

Source control activities are implemented to prevent or minimise the release of hydrocarbons into the marine environment. The release of hydrocarbons may occur from one of the following scenarios:

- Operational spills (overfills, transfers and process equipment and drains system);
- Storage tank or piping leak/rupture;
- Pipeline leak/rupture;
- Well blowout (surface and subsea).

The origin and nature of hydrocarbon spill will determine the type of source control activities required and the duration of the response. Source control activities may include:

- Isolation of tanks / pipes;
- Remote Operated Vehicle (ROV) intervention;
- Well capping;
- Relief well;
- Use of the Well Kill Equipment Skid;
- Use of resources from a third party response provider (e.g. Wild Well Control);
- Pipeline isolation, depressuring and repair.

The source of the spill will be assessed and evaluated by the Emergency Response Team (ERT) and Incident Management Team (IMT) on a case by case basis. The origin and nature of the spill (wells, pipeline or vessel) and metocean conditions will influence the source control response options selected based on technical feasibility.

An advantage of Source Control:

- Stops / minimises the flow of hydrocarbons into the environment.

Disadvantages of Source Control:

- Increase in environmental impacts from response activities e.g. planned discharges; and

- Presents safety risks.

Potential source control options are detailed below.

### 3.1.1 Isolation of Tanks / Pipes

Isolation provides a way for separating process systems and equipment from one another and may be used to prevent flow of hydrocarbons. Many types of isolations exist on subsea infrastructure, pipelines, wells and vessels. Isolation of a pipeline is the primary source control of containing a pipeline rupture/failure.

### 3.1.2 Remote Operated Vehicle (ROV) Intervention

ROVs can be used subsea to inspect the condition of wellheads, pipelines and subsea equipment and have arms which may be used to manipulate valves and manually isolate equipment. Specialist ROVs can be fitted with a range of equipment including: debris clearing tools, specialist tooling, subsea dispersant spraying capabilities, cameras and cutting tools.

Note that per NOPSEMA Guidance Note GN166, vessels remotely supporting a ROV that is being used in connection with inspection, the operation of a valve and/or the recovery of debris are not required to have a safety case. Per NOPSEMA Guidance Note GN166, if other activities are undertaken where a vessel is subject to the Australian Offshore Petroleum Safety Legislation, vessels will comply with duties of an operator and safety case.

### 3.1.3 Well Capping Stack

A “capping stack” is a piece of equipment that is placed over the blown-out well as a “cap.” Its purpose is to stop or redirect the flow of hydrocarbons, establishing a barrier to the marine environment. Once subsea, the capping stack is installed on the wellhead/subsea BOP to stop flow. The capping stack provides a safe barrier until the well can be permanently sealed. This option will require the use of a Construction Support Vessel (CSV) to install the capping stack.

As described in Volume 2, Section 6.7.6 of the Bass Strait EP, use of a capping stack is not generally technically feasible in shallow water depths.

OSRL’s offset capping stack system is limited due to minimum depth requirements (>75 m) and long mobilisation times.

For well activities in greater than 75m water depth, including drilling and plug and abandonment projects, a capping stack feasibility assessment will be undertaken to confirm its viability and will be detailed in the relevant EP.

### 3.1.4 Well Kill Equipment Skid

The Well Kill Equipment Skid can be used for bullhead killing or lubricating production wells in the event of a critical well failure. The dedicated Well Kill Equipment Skid is a standalone hydraulic / diesel drive unit which requires minimal platform facility support. The Well Kill Equipment Skid is stored at BBMT when it is not in use offshore.

Use of the platform based well kill equipment skid is accounted for in platform specific safety cases as part of the Well Kill Contingency Plan.

### 3.1.5 Third Party Well Control Equipment

In the event of a loss of well control in which flowrates are too great to be able to use the Well Kill Equipment Skid, but not great enough to warrant drilling a relief well, resources from a third party well control can be used to control a loss of containment from the well (e.g. Wild Well Control).

### 3.1.6 Relief Well

A relief well is constructed like a standard well, and is directionally drilled to intersect the original well to allow specialised fluids to be pumped into the well to overcome reservoir pressure and stop the flow of the original well.

### 3.1.7 Pipeline depressuring and watering out

Pipelines can be depressured and watered out to reduce the flow of hydrocarbons released from a pinhole. Watering out pipelines replaces hydrocarbons with produced water and reduces the volume of hydrocarbons released to sea.

Pipeline depressuring procedures are in place for each pipeline which provide guidance on how to safely depressure a pipeline at the relevant end and start platforms. Watering out procedures are also available.

### 3.1.8 Pipeline repair

Pipeline repair activities will be dependent on the type of initiating event and the feasible engineering solutions to repair the hole. Repairs to stem the flow of hydrocarbons would be completed using ROV from a vessel and may require the use of:

- Cap
- Plug
- Clamp
- Repair sleeve

Caps or plugs may be feasible for use to repair a pipeline after rupture however are less likely to be feasible given the difficulty in installation over a large area.

Once the hydrocarbon flow has been stemmed (or the pipeline pressure has reached equilibrium with the water if repair is not feasible), the pipeline will be repaired to reinstate production. For pinhole leaks and minor holes this could involve operation with the cap/plug/clamp/sleeve in place.

For a full rupture, a DSV with divers or a construction or pipe lay barge fitted with a dive spread will be required. This would need to mobilise from SE Asia or Europe and would likely need a number of regulatory documents prepared including a safety case, a dive safety management system and a dive project plan. Repair time is estimated to be a minimum of 3 months. Note that this is not considered a source control response option as repair of the pipeline to reinstate production will not reduce the volume of hydrocarbon released.

### 3.1.9 New Technologies under investigation

ExxonMobil continues to study new offshore drilling technologies including ways to mitigate the potential impacts of an uncontrolled flow of hydrocarbons to the environment for a well incident (LOWC). The following strategies are not proposed to be used as part of this Environment Plan but demonstrate ExxonMobil's commitment to continually improving knowledge and technology for source control.

- **Seawater Injection Method (SWIM)** (Jain, Nedwed, Kulkarni, Mitchell, & Meeks) utilises seawater pumped at a high rate into a failed and leaking blow out preventer (BOP) to generate enough back pressure to overcome reservoir pressure and stop the flow of oil and gas.
- **Rapid Crosslinking Polymer Injection** (Nedwed, et al., 2019) is a method that mixes monomers and a catalyst that causes a rapid polymerisation reaction, resulting in a stable solid. The reaction can occur under extreme temperatures and pressures and can withstand significant contamination from other fluids and solids.

### 3.2 Environmental Impact Assessment of Source Control Response

Many environmental aspects associated with implementing source control activities (e.g. aspects associated with vessels, ROV and subsea installation) apply to multiple activities and are assessed in Volume 2. Environmental aspects associated with drilling a relief well and capping stack are assessed below. These include:

- Physical Presence – Seabed disturbance;
- Planned Discharge – Cement;
- Planned Discharge – Drilling muds and cuttings; and
- Sound Emissions.

Further assessment of the acceptability of these impacts in an oil spill response context and controls identified for minimising the environmental impact of mobilising a source control response are described below.

**Table 3-1 Environmental Impact Assessment of Source Control Options**

Environmental Aspect:	Impact Assessment	Consequence Level
<b>Relief well drilling</b>		
Physical Presence – Seabed Disturbance	<p>Smothering and alteration to benthic habitats can occur as a result of seabed disturbance. The type of damage that could be sustained due to smothering may include destruction of habitat.</p> <p>Benthic habitats and communities within the Bass Strait show natural small scale variation, however the area is mostly considered homogenous. Studies conducted by Esso (Cardno, 2019) demonstrate similarities in taxa but variation in composition between different sites.</p> <p>Seabed disturbance from relief well drilling activities will be limited to close proximity to existing infrastructure, and typically in areas which have previously been disturbed during installation of infrastructure. Benthic habitats and communities within the Operational Area show natural small scale variation, however, are mostly homogenous, with no particular areas of value or sensitivity. It is possible that activities will produce a slight alteration of the local habitat and community structure due to the small amount of changed substrate in an area of uniform soft sediments; however the naturally homogenous nature of the habitats and communities in the Operational Area will result in quick recovery, and no long-term changes to ecosystem are expected. Any impacts will be inconsequential or have no adverse effects.</p> <p>No additional controls identified.</p>	IV
Planned Discharge – Cement	<p>Impacts to ambient water quality from planned discharge of cement will be highly localised and temporary, with turbidity and chemical toxicity impacts quickly ceasing following discharge. Any impacts will be inconsequential or have no adverse effect, and impacts to pelagic organisms (such as plankton, fish, and marine fauna) are not expected.</p> <p>Once cement has hardened, the sediment quality will be permanently changed. Any impacts to ambient sediment quality will be inconsequential or have no adverse effect and impacts to benthic habitats and communities are not expected.</p> <p>No additional controls identified.</p>	IV
Planned Discharge – Drilling muds and cuttings	<p>Chemicals will be discharged to the marine environment resulting in a change in water quality.</p> <p>Due to the high energy marine environment, discharges will quickly dissipate. Impacts to ambient water quality will be localised and temporary, and any impacts will be inconsequential or have no adverse effect.</p> <p>Prior to discharge the chemicals will be assessed using the Esso Chemical Discharge Assessment Process (described as part of the Implementation Strategy in Volume 4) which uses the OCNS ranking in conjunction with</p>	IV

Environmental Aspect:	Impact Assessment	Consequence Level
	toxicity, biodegradation and bioaccumulation data to determine potential impacts to the environment and acceptability of planned discharges. No additional controls identified.	
Sound Emissions	Gales (1982), cited in NCE (2007), reports that underwater sound measured from fixed drilling platforms did not exhibit markedly different characteristics from those engaged in production, and that none of the measured sound could be directly related to the mechanical action of the drill bits. It is therefore believed that most sound associated with drilling is created by the operation of the rig itself. No additional controls identified.	IV

#### Acceptability of Environmental Impact from Source Control

Factor	Demonstration Criteria	Criteria Met	Rationale
Principles of Ecologically Sustainable Development (ESD)	No potential to affect biological diversity and ecological integrity.	✓	All aspects related to source control activities, including EPO's, EPS's and controls have been detailed in Volume 2 or have been evaluated as having the potential to result in a Level IV consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	All oil spill response activities are implemented with the aim of reducing the overall environmental impact from a spill incident. Source control activities are implemented to stop the flow of oil and minimise safety risks and environmental damage. Impacts associated with source control are offset by the broader positive effects of reducing the impact of a spill incident on coastal and marine sensitivities and socio-economic receptors (e.g. fishing, tourism).
Legislative and Other Requirements	Legislative and other requirements have been identified and met.	✓	<ul style="list-style-type: none"> <li>• The Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009 (OPGGS(S)) requirements for NOPSEMA approved facility Safety Case.</li> <li>• Protection of the Sea (Prevention of Pollution from Ships) Act 1983.</li> <li>• Navigation Act 2012.</li> <li>• Marine Order 96 (Marine pollution prevention – sewage) 2013.</li> <li>• Marine Order 95 (Marine pollution prevention - garbage) 2013.</li> </ul> <p>All well specific source control activities will have an approved WOMP and comply with:</p> <ul style="list-style-type: none"> <li>• Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011.</li> </ul>
Internal Context	Consistent with Esso's Environment Policy.	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".

Factor	Demonstration Criteria	Criteria Met	Rationale
	Meets ExxonMobil Environmental Standards.	✓	Proposed controls meet the requirements of the ExxonMobil Drilling Emergency Preparedness and Response Manual.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations</li> </ul>
<b>External Context</b>	Stakeholder concerns have been considered / addressed through the consultation process.	✓	No specific stakeholder concerns have been raised.

**Table 3-2 ALARP Demonstration of Environmental Impacts from Source Control**

<b>ALARP Context and Justification</b>	<b>Decision and</b>	<p>Decision Context A.</p> <p>Source control equipment and resources (ROVs, capping stacks, vessels and rigs for relief well drilling) are standard practices that have been accepted for use in the Australian and International Offshore Petroleum Industry in the event of a hydrocarbon spill.</p> <p>Impacts associated with source control activities are well understood and source control response activities have been initiated and managed by industry previously.</p> <p>Source control activities are aligned with company and partner values.</p> <p>Good Practice control(s) have been identified to ensure environmental impacts associated with implementing this response are reduced to ALARP, these controls will be implemented in a response scenario and have been included in the OPEP.</p> <p>Esso believes ALARP Decision Context A should apply.</p>	
<b>Good Practice</b>	<b>Adopted</b>	<b>Control</b>	<b>Rationale</b>
Vessel compliant with MARPOL Annex I, IV, V and VI as appropriate to vessel class.	✓	Vessel Requirements.	The vast majority of commercial ships are built to and surveyed for compliance with the standards (i.e. Rules) laid down by classification societies. The role of vessel classification and classification societies has been recognised by the International Maritime Organisation (IMO) across many critical areas including the International Convention for the Safety of Life at Sea, (SOLAS), the 1988 Protocol to the International Convention on Load Lines and the International Convention for the Prevention of Pollution from Ships (MARPOL).
AMSA JRCC notified before operations commence to enable	✓	Pre-start Notification.	Under the Navigation Act 2012, the Australasian Hydrographic Society is responsible for maintaining and disseminating hydrographic and other nautical information.

AMSA to distribute an AUSCOAST warning.			Details for AUSCOAST warning will be provided to the JRCC (24<48 hours) prior to commencing operations.
All planned drilling discharges are evaluated in accordance with the Chemical Discharge Assessment Process.	✓	Chemical Discharge Assessment Process.	All cements, drill fluids, additives and/or their components planned for discharge are evaluated as acceptable.
Cuttings are treated to reduce Residual Oil on Cuttings (ROC).	✓	Solids Control Equipment.	It is industry standard practice to remove Non Aqueous Fluid (NAF) muds from cuttings using a combination of shale shakers and/or cuttings driers to minimise the residual oil on cuttings.

### 3.3 Capability Assessment of Source Control

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources to complete source control activities in a timely manner.

This section summarises outcomes of the capability assessment.

**Table 3-3 Source Control Resource Availability**

Activity	Resource Required	Resource Availability	Expected Timeframes
Specialist ROV	1 x ROV for subsea well pipelines intervention / SFRT and surveillance.	<u>Resource</u> Agreements in place with ROV specialists.	Estimated 5 days from call out request to arrival in Victoria.
Construction Support Vessel (CSV)	1 x CSV to assist in source control activities: Specialist ROV subsea well /pipelines interventions and surveillance Deployment of SFRT including debris clearance Deployment of capping stack	<u>Resource</u> A construction support vessel with a current Australian safety case sourced from the Australasian region.	Estimated 23 days from spill occurring to arrival in field.
Capping stack	1 x capping stack	<u>Resource</u> <u>Capping stack held in Singapore and Norway with OSRL</u> <u>Capping stack held in Singapore and Aberdeen with Wild Well Control</u>	Estimated 4 days lead time ready to load on CSV or air freight.
Relief Well	1 x rig per relief well.	<u>Resource</u> A rig will be mobilised from the Australasian region.	Estimated 98 days to drill the relief well.
Well Kill Skid	1 x well kill skid (including all relevant equipment as defined in the response plan)	<u>Resource</u> A well kill skid will be mobilized from BBMT or platform. <u>Personnel</u> Trained wellwork personnel available to operate wellwork skid	The well kill skid can be at the platform within 48 hours with appropriately trained personnel (24 hour pack up time and moved on the next available boat)

Activity	Resource Required	Resource Availability	Expected Timeframes
Third party well control equipment	Specialised well control equipment	<u>Resource</u> Agreement with Wild Well Control	Estimated time to contain well release incident is 14 days
Pipeline de-pressuring and watering out	1 x Competent operators on relevant platform	<u>Personnel</u> Trained personnel available to operate facilities	As soon as practicable once location of spill has been confirmed
Pipeline repair	Pipeline repair equipment Specialist ROV equipment (as above)	<u>Resource</u> Agreements in place with pipeline repair equipment specialists Agreements in place with ROV specialists	Available within 45 days

**Table 3-4 Source Control Capabilities**

Good Practice	Adopted	Control	Rationale
Established Incident Management Team.	✓	Esso Incident Management Team (IMT).	Esso's IMT includes trained personnel able fulfil Incident Commander, Operations Section Chief, Planning Section Chief, Logistics Section Chief, Safety Officer, Source Control Branch Director and Environmental Unit Lead roles.
Pre-arranged agreement with ROV provider.	✓	Agreements with ROV providers.	ExxonMobil's global agreements provides Esso with access to ROVs.
For Rig Activities and capping stack mobilisation : Identification of suitable support vessels and their location prior to the commencement of rig activities.	✓	Support vessel identification process.	Support vessel identification process enables understanding of the availability of suitable vessels which may reduce response time.  In the event that a vessel safety case must be revised to complete the activities, Esso will work with vessel contractors to revise and resubmit the vessel safety case within one week of the incident occurring.
Pre-arranged access to Subsea First Response Toolkit (SFRT).	✓	Agreement with AMOSC for SFRT.	The agreements with AMOSC provide access to SFRT designed with the following capabilities:  Survey and provide a detailed image of condition of subsea infrastructure Ability for subsea intervention
Ability to access drilling rigs in an emergency event.	✓	MoU with APPEA.	APPEA Memorandum of Understanding (MoU) states that signatories will make best endeavors to make drilling units available for transfer between operators when requested for emergency response.
Existing arrangements with source control contractors	✓	Agreement with Wild Well Control and OSRL	Agreements with Wild Well Control and OSRL provide access to specially trained personnel and equipment to assist in the event of a LOWC.
Existing contract for access to capping stack	✓	Agreement with Wild well control and OSRL	Agreement in place with Wild Well Control and OSRL for access to a capping stack

**Table 3-5 Consideration of Additional/ Alternative/ Improved Capability for Source Control**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Pre-drilling top holes	<p>This option may result in a reduction of 1-2 days for drilling a relief well, however due to the uncertainty of the location and trajectory it is unknown if the top hole could get utilised in specific spill scenarios.</p> <p>This option may result in unnecessary environmental impacts, including:</p> <ul style="list-style-type: none"> <li>• Discharge drill cuttings;</li> <li>• Discharge of chemicals;</li> <li>• Discharge of muds; and</li> <li>• Benthic habitat disturbance.</li> </ul>	<p>The position of a relief well vary in location and trajectory according to the actual conditions at the time the loss of containment event occurs.</p> <p>Limited reduction in days (potentially 1-2), this equates to approximately 2% of the time it would take to drill a relief well.</p>	Not adopted.
Standby rig during drilling activities	A rig on standby may reduce the time required to drill a relief well.	<p>Significant costs are associated with having a standby rig.</p> <p>Given the high potential cost, implementing this control measure is considered grossly disproportionate, given that the source control event has an extremely low likelihood of occurrence.</p>	Not adopted.
Purchase and have available pipeline repair equipment locally	Having pipeline repair equipment available locally may reduce the time taken to repair a pipeline and reduce the overall volume of oil released.	Pipeline repair equipment to be used is specific to the type of pipeline failure and must be determined at the time of incident. Significant cost associated with having access to a wide variety of pipeline repair equipment.	Partially adopted. Some pipeline repair equipment for higher likelihood scenarios (e.g. clamps for pinhole leaks) are available locally.

## 4. Surveillance and Monitoring

### 4.1 Response Option Description

Surveillance and monitoring activities are essential in an oil spill response strategy to characterise and quantify volumes and determine the movement of the slick. This information is fundamental to mobilising an effective oil spill response strategy and critical in determining the scale and nature of the oil spill incident.

To understand the scale and fate of the oil, the spill should be observed as soon as possible and monitored throughout the response until the decision has been made to stand down.

Advantages of Surveillance and Monitoring:

- Validate trajectory and weathering models;
- Determine effectiveness of response techniques; and
- Outputs will be used to guide decision making on the use of other monitoring or response options.

Disadvantages of Surveillance and Monitoring:

- Increase in environmental impacts from response activities e.g. vessels; and
- Increase in safety risks.

A variety of surveillance and monitoring techniques can be used to gather information required to support the ongoing response. These may include:

#### 4.1.1 Aerial and/or vessel observation

Aerial and vessel observation provides the IMT with real time data of magnitude, direction of travel, and visual characteristics of surface oil. This information can be used in response planning and forming the incident specific NEBA.

#### 4.1.2 Computer-based modelling software

Computer software can generate maps that show predictions for the path of the oil spill. It can also forecast the effects that currents, winds, and other physical processes have on the movement of oil in the ocean. This information can be used in response planning and the incident specific NEBA.

#### 4.1.3 Utilisation of satellite tracking buoys

Satellite tracking buoys provide real time current data to use to predict forecasts of surface behaviour of the oil and direction of travel.

#### 4.1.4 Remote sensing from aircraft and/or satellites

Airborne remote sensing equipment supplements visual observations by using sensors which detect radiation outside of the visible spectrum.

Satellite imagery can provide real time imagery over large areas and assist with determining the movement of the slick and determining response activities

#### 4.1.5 Water quality and oil sampling

Water sampling will confirm the properties of oil. These details can be inputted into computer based modelling for increased accuracy and assist with determining response activities.

When oil enters the marine environment, a proportion of it will float and spread out on the sea surface where it will be influenced by the wind and ocean currents. In some situations, where natural dispersion and weathering processes are considered the most appropriate response, surveillance and monitoring may be the primary response strategy.

In this case, the response will monitor the oil as it undergoes the natural weathering processes of evaporation and dispersion, in which wind and wave action breaks the oil into small droplets in the water column increasing bioavailability and allowing the oil to be naturally degraded. Higher levels of surveillance such as vessel/aircraft surveillance, oil spill trajectory modelling and deployment of satellite tracking drifter buoys are options to be considered for Level 2/3 spills given the nature and scale of the spill risk.

## 4.2 Environmental Impact Assessment of Surveillance and Monitoring Response

Environmental aspects associated with surveillance and monitoring were identified and evaluated in Table 4-1. All associated environmental impacts have been described and assessed within Volume 2 and no additional environmental impacts have been identified as a result of surveillance and monitoring response activities.

**Table 4-1 Acceptability of Environmental Impacts from Surveillance and Monitoring**

Factor	Demonstration Criteria	Criteria Met	Rationale
<b>Principles of Ecologically Sustainable Development (ESD)</b>	No potential to affect biological diversity and ecological integrity.	✓	All aspects related to surveillance and monitoring activities are assessed in Volume 2 and have been evaluated as having the potential to result in a Level IV consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	All oil spill response activities are implemented with the aim of reducing the overall environmental impact. Surveillance and monitoring response activities are critical in determining the scale and nature of the oil spill incident. This information is fundamental to mobilising an effective oil spill response strategy to minimise potential environmental damage from a spill incident.
<b>Legislative and Other Requirements</b>	Legislative and other requirements have been identified and met.	✓	The proposed control measures align with the requirements of: <ul style="list-style-type: none"> <li>• OPGGS Act 2006;</li> <li>• Protection of the Sea (Prevention of Pollution from Ships) Act 1983;</li> <li>• Navigation Act 2012 – Chapter 4 (Prevention of Pollution);</li> <li>• Marine Order 96 (Marine pollution prevention – sewage) 2013; and</li> <li>• Marine Order 95 (Marine pollution prevention - garbage) 2013.</li> </ul>
<b>Internal Context</b>	Consistent with Esso's Environment Policy.	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to the Surveillance and Monitoring however the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>• OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations.</li> </ul>

Factor	Demonstration Criteria	Criteria Met	Rationale
External Context	Stakeholder concerns have been considered / addressed through the consultation process.	✓	No specific stakeholder concerns have been raised.

**Table 4-2 ALARP Demonstration of Environmental Impacts from Surveillance and Monitoring**

ALARP Context and Justification	Decision and		
	Decision Context A. The potential environmental aspects associated with mobilising a Surveillance and Monitoring response have been evaluated and no new impacts have been identified. Surveillance and monitoring response activities are standard practices that are routinely used in the Australian and International Offshore Petroleum Industry as well as many other industries. Impacts associated with surveillance and monitoring are well understood and well implemented by the industry. Good Practice control(s) have been identified to ensure environmental impacts associated with mobilising this response are reduced to ALARP, these controls will be implemented in a response scenario and have been included in the OPEP. Esso believes ALARP Decision Context A should apply.		
Good Practice	Adopted	Control	Rationale
Vessel compliant with MARPOL Annex I, IV, V and VI as appropriate to vessel class.	✓	Vessel Requirements	The vast majority of commercial ships are built to and surveyed for compliance with the standards (i.e. Rules) laid down by classification societies. The role of vessel classification and classification societies has been recognised by the International Maritime Organisation (IMO) across many critical areas including the International Convention for the Safety of Life at Sea, (SOLAS), the 1988 Protocol to the International Convention on Load Lines and the International Convention for the Prevention of Pollution from Ships (MARPOL).

**Table 4-3 Engineering Risk Assessment**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
None Identified.			

### 4.3 Capability Assessment of Surveillance and Monitoring

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources to complete surveillance and monitoring activities in a timely manner. The assessment concluded sufficient resources are available within acceptable timeframes to conduct this response.

This section summarises outcomes of the capability assessment.

**Table 4-4 Surveillance and Monitoring Resource Availability**

Activity	Resource Required	Resource Availability	Expected Timeframe
<b>Visual Observation - Aerial Surveillance</b>	1x observer per aircraft. Aircraft to have 100nm range and 3 hour duration.	<u>Resource</u> Esso helicopters can assist in aerial surveillance. Agreement with third party to provide fixed wing aircraft. AMSA Search and Rescue Aircraft. <u>Personnel</u> 4x Trained spill observers provided by Esso. Supplemented by AMOSC staff, AMOSC core group and OSRL.	Initial overflight <4 hours service requested. Trained observer <12 hours of spill occurring. Twice daily aerial surveillance.  <i>(Note: Assumes good visibility, daylight hours and suitable flying conditions).</i>
<b>Visual Observation – Vessel or Asset</b>	An observer to conduct 2 hour watch from staffed assets.	<u>Resource</u> Platform /Drilling Rig /Vessel <u>Personnel</u> 1x Observer and /or available crew.	<2 hours, from time of spill.
<b>Manual Oil Spill Trajectory Modelling</b>	1x trained person.	<u>Resource</u> Trajectory vectoring. Relevant set of marine charts for Bass Strait. GIS mapping. <u>Personnel</u> IMT member trained trajectory vectoring. Internal Esso GIS mapping specialists.	<4 hours of service requested.
<b>Oil Spill Trajectory Modelling</b>	1x contract with specialist.	<u>Resource</u> AMOSC - Access to RPS modelling services. OSRL – Access to modelling services. ExxonMobil EMBSI (USA) – Access to modelling (available 24/7).	<4 hours of service requested.
<b>ADIOS - Weathering Modelling</b>	1x trained person.	<u>Resource</u> Automated Data Inquiry for Oil Spills 2 (ADIOS2) installed on IMT computers. <u>Personnel</u> IMT personnel trained in ADIOS.	<4 hours of the service requested.
<b>Satellite Tracking Drifter Buoys</b>	1x buoy available.	<u>Resource</u> 2x tracking buoys within 12 hours. 2x Tracking buoy available 24-48 hours.	Deployed <12 hours of spill occurring (dependent on weather conditions) (Level 2 & 3 spill).
<b>Remote Observation Using Satellite Imagery</b>	1x contract with specialist.	<u>Resource</u> AMOSC agreement with KSAT.	Initiated <24 hours of Level 3 spill occurring.

Activity	Resource Required	Resource Availability	Expected Timeframe
		OSRL Agreement with Radiant Solutions. ExxonMobil Geospatial Emergency Response Service (available 24/7).	
<b>Initial Oil in Water Sampling</b>	1x vessel. 1x initial sampling kit. 1x contract with laboratory.	<u>Resource</u> Vessel and crew (Esso). Initial Sampling kits available at various Esso locations. <u>Personnel</u> Field Service technician. Laboratory services and experienced analyst provided by NATA accredited lab as per OSMP.	Samples obtained <24 hours of spill occurring. Analysis initiated <24 hours of receipt in laboratory.  Results <5 days.
<b>Ongoing Oil in Water Monitoring</b>	1x vessel. 1x sampling services contract.	<u>Resource</u> Vessel contractor/ crew (Esso). Sampling services via environmental consultancy. <u>Personnel</u> Sampling services via environmental consultancy. Laboratory services and experienced analyst provided by NATA accredited lab as per OSMP.	Samples obtained 48 hours hrs. of spill occurring. Analysis initiated <24 hours of receipt in laboratory Results within 5 days.
<b>ExxonMobil</b>	<u>Personnel</u> Trained and capable Esso IMT  Regional Response Team	Available to fulfil roles in accordance with requirements and timeframes in OPEP Table 3-2.  Remote support <12 hours from notification. In-country support <72 hours from notification.	ExxonMobil

**Table 4-5 Surveillance and Monitoring Capabilities**

Good Practice	Adopted	Control	Rationale
• Pre-arranged access to helicopters for aerial surveillance.	✓	Esso helicopter fleet.	Esso owns and operates its own helicopter fleet that can be used for surveillance and monitoring.
• Pre-arranged access to fixed wing aircrafts for aerial surveillance.	✓	Arrangement with third party for provision of fixed wing aircraft.	Arrangement with third party enables provision of fixed wing aircraft.
• Pre-arranged access to vessels for Surveillance and Monitoring activities.	✓	Support vessel.	The support vessel that is used for ongoing Esso operations can be used for surveillance and monitoring.
	✓	Agreement with third party suppliers for provision of additional vessels.	Agreement with supplier of vessel services has provision for supply of additional vessels

Good Practice	Adopted	Control	Rationale
<ul style="list-style-type: none"> <li>Pre-arranged access to trajectory modelling capabilities.</li> </ul>	✓	Agreement with AMOSC for trajectory modelling.	Agreement with AMOSC, and the associated service level statement, includes provision for trajectory modelling.
<ul style="list-style-type: none"> <li>Pre-arranged access to satellite tracking buoys.</li> </ul>	✓	Esso owned tracking buoys.	Esso owns satellite tracking buoys to enable quick deployment.
<ul style="list-style-type: none"> <li>Pre-arranged access to satellite imagery</li> </ul>	✓	Agreements in place to access satellite imagery.	Agreements in place with satellite imagery provider enables access to satellite imagery services.
<ul style="list-style-type: none"> <li>Pre-arranged access to water testing services.</li> </ul>	✓	Agreement with service provider for monitoring and sampling.	Agreement with third party service provider enables access to monitoring and sampling services.
<ul style="list-style-type: none"> <li>Pre-arranged access to personnel to support Tier III response activities.</li> </ul>	✓	ExxonMobil Regional Response Team	ExxonMobil have a global team available to assist response for Tier III activities.

**Table 4-6 Consideration of Additional/ Alternative/ Improved Capability for Surveillance and Monitoring**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Night-time monitoring - infrared.	Enable night time monitoring of the location of oil on the water's surface.	Infrared may be used to provide aerial monitoring at night time, however the benefit is minimal given trajectory monitoring (and infield monitoring during daylight hours) will give good operational awareness. Safety considerations may also restrict night time operations.	Not Adopted.
Initial sampling kits available on supply vessels and rigs.	Enable rapid sampling from supply vessels and rigs	<ul style="list-style-type: none"> <li>Sampling kits on-board vessels and rigs will enable rapid sampling of the oil.</li> <li>The results from the testing will provide details of the oil properties and confirm the properties of oil, assist with source identification.</li> <li>Results can be used in the modelling for increased accuracy and assist with determining response activities.</li> </ul>	Adopted.

## 5. Dispersant Application

### 5.1 Response Option Description

Dispersants enhance the rate and extent of natural dispersion in an oil spill event. The surfactants in dispersants allow wave energy to rapidly break oil slicks into small oil droplets. These droplets are pushed into the upper water column by wave action and maintained there by turbulence. The dispersed oil droplets are much more available to naturally-occurring, hydrocarbon-degrading microorganisms.

The principal ecological benefit of dispersant use is to keep oil from entering near-shore bays and estuaries, or stranding on shorelines, thereby protecting sensitive coastal habitats and the species that inhabit them. In previous oil spill incidents elsewhere in the world, it is the species in the areas near or

onshore that have been most affected by an oil spill event (National Academies of Science, Engineering and Medicine, NASEM, 2019).

The mixture of solvents and surfactants that comprise typical commercial dispersants (Place et al., 2010) contain compounds with different physicochemical properties and therefore potential fates in the environment. Once introduced to open ocean waters, dispersant mixtures will be quickly diluted and subjected to degradation processes including biodegradation and photodegradation (NASEM, 2019).

For maximum effectiveness, dispersants should be applied as close to the source and as soon as possible to avoid losing the “window of opportunity”. Dispersant can be applied either subsea at the source of a subsurface spill or directly to any surface slicks from aircraft or vessels.

Dispersants may be applied in a broad range of weather conditions including high winds and rough seas that may not be suitable for other strategies, e.g., mechanical containment and recovery. Dispersants are mainly amenable to certain oil types and are generally not considered to be suitable for Group I and lighter Group II oils, including diesel. The oil type and the metocean conditions (e.g. temperature, wave height, swell) will dictate the effectiveness of dispersant application.

The main objectives of dispersant application are:

- Reduce environmental impacts;
- Rapidly reduce oil toxicity through dilution;
- Enhance the natural dispersion processes;
- Enhance natural microbial biodegradation;
- Minimise impacts to shoreline habitats;
- Reduce the requirement for shoreline clean up; and
- Reduce concentrations of Volatile Organic Compounds (VOCs) at the sea surface.

The decision whether or not to use dispersants will be made after considering the potential effects of dispersed oil versus undispersed oil, i.e. after employing a Net Environmental Benefit Analysis (NEBA) process which provides a methodology for comparing the base case of no spill response to those where individual response tools (mechanical containment and recovery, subsea and surface dispersants) are considered (IPIECA, 2017). Dispersants will only be considered for use at specific locations/times where testing shows oil to be amenable and decision is supported by the spill specific conditions.

### 5.1.1 Surface Application

Dispersants can be applied to surface oil from vessels or aircraft. Aerial application allows wide coverage for treatment of large volumes of oil. Potential advantages include; minimal human resource, enhanced biodegradation, and ability to spray large areas in a timely manner through the use of aircraft. A potential constraint is the limited time-frame for dispersant application; there is a relatively short “window of opportunity” for treating the spilled oil before it weathers and may become too viscous, although this can vary depending on specific oil properties and environmental conditions. Aerial dispersant operations are limited to appropriate weather conditions (e.g., visibility, ceiling and winds), daylight hours, and sufficient turbulence (from waves) to mix the dispersant into the oil.

#### **Aircrafts**

Aerial application of dispersant requires aircrafts to be fitted with dispersant spraying equipment. For best effectiveness, aerial dispersant should be administered at steady airspeeds (150 kts) and low altitudes, generally 50 – 100 ft above the sea level. Aerial platforms include those available through the fixed wing aerial contract and additional aircrafts are available through OSRL.

#### **Vessels**

Vessels can be fitted with dispersant spraying equipment for surface application. For best effectiveness the dispersant should be applied to the thickest concentrations of oil, via spray arm systems or specialised dispersant spraying equipment.

### 5.1.2 Subsea Application

Subsea dispersant injection is the process of injecting dispersants directly into the stream of oil that is leaving the well, ideally before the oil leaves the wellhead. The process allows the dispersant to come into contact with a much greater proportion of the oil and uses the turbulent jet effect of the force of the exiting oil to mix the dispersant effectively. SSDI can be operated continuously by offshore vessels, which can locate themselves offset from the position of the well release or by using the Subsea First Response Toolkit (SFRT) located in Perth.

Subsea dispersant injection (SSDI) operations can take place continuously and are effective in ongoing spill scenarios e.g. well blow outs.

Advantages of SSDI include:

- Requires less manpower than other response options and may reduce the VOCs at the surface improving health and safety of responders;
- Delivery of the dispersant directly to the release;
- At depth, dispersed oil will be subject to greater loss of soluble components and increased dispersion than surface application;
- Subsea injection operations can take place continuously, while surface application is limited to daylight hours and favourable wind and sea state conditions.

Potential disadvantages of SSDI include the need for specialised equipment to deliver the dispersant and to monitor effectiveness, although this equipment is available from Tier 3 response organisations (NASEM, 2019).

Use of subsea dispersant is highly dependent on the specifics of the release. In the event of an incident, a number of factors will be considered to inform the use of subsea dispersant. These include:

- Release type (surface or subsea)
- Release rate
- Oil type
- Location to sensitive receptors
- Water depth
- Safety of personnel in proximity to the release location

The decision to mobilise the SFRT and to use subsea dispersant will be taken based on advice from the Source Control Branch in consultation with relevant technical, environmental and regulatory stakeholders.

#### **ROVs**

Vessels can be fitted with specialist ROVs that have SSDI capabilities for subsea dispersant application. SSDI treats oil released at the point of release which reduces the volume of dispersant required and can be applied continuously in all-weather scenarios.

## 5.2 Types of Dispersant Available to Esso in an Oil Spill Incident

Since the 2010 Deep Water Horizon (Macondo) spill response, the petroleum industry has invested significantly in the purchase of the most studied, modern products (Dasic Slickgone NS, Finasol® OSR 52, Corexit® EC9500A) and their placement in strategic global locations to facilitate rapid response in an event where dispersants represent a viable response option (NASEM, 2019). The Corexit products remain the most studied products available and there is a wealth of information regarding their effectiveness (high) and relative toxicity (low). As a result of this, industry continues to work toward maintaining/reinstating their status as products approved for possible use.

Several types of dispersant are available to Esso and are proposed for use during an oil spill incident. A summary of each is given in Table 5-1.

### 5.2.1 Dispersant Testing

Esso undertook dispersant efficacy testing on five Bass Strait crudes against two of the available dispersants (Dasic Slickgone NS and COREXIT 9500). Testing was also conducted on a third dispersant COREXIT 9527, although this is no longer available for use as it is not accepted by AMSA on the National Plan.

The testing was carried out on fresh crude, 12 hour weathered, 24 hour weathered and 48 hour weathered under Bass Strait summer and winter conditions. Each dispersant was tested at an application rate of 20:1 (oil: dispersant). A summary of the results is provided in OPEP Appendix E – Dispersant Testing Results. Key findings from the dispersant efficacy testing include:

- Testing shows that dispersant is highly effective on most types of fresh oil, but not all Esso crudes tested are amenable to dispersant;
- Non-spreading oils are considered to be non-dispersible;
- Effectiveness of dispersant decreases significantly on weathered oils;
- Once pour point of the oil is above temperature of the seawater, the dispersability rapidly drops off; and
- Dispersability of the oil generally increases at higher temperatures.

**Table 5-1 Summary of dispersant stock available to Esso**

Dispersant	Details	Stockpiled	AMSA OSCA Accepted	Dispersant tested on Esso Crude
Dasic Slickgone NS	Slickgone is widely used in the offshore industry worldwide and meets the requirements of the UK, French, Norwegian and Australian dispersant protocols. Extensive field trials in the UK indicate that an effective treatment rate for dispersants is approximately 1 part dispersant to 20-30 parts of oil and can be effective when applied from aircraft, vessels and directly on shorelines.	AMOSC, AMSA, OSRL	✓	✓** ✓***
Dasic Slickgone EW	Slickgone EW is the latest addition to the Dasic International product range and is exceptionally efficient on a broad spectrum of oils. It is also effective on water-in-oil emulsions (mousses) and will even delay the formation of such emulsions if applied early enough. It is highly effective at emulsifying crude oils, fuel oils and water-in-oil emulsions even at low temperatures, producing oil droplets minute enough to be retained beneath the sea surface where they are rapidly diluted by subsurface mixing and are eventually biodegraded by micro-organisms.	AMSA	✓	
Total Finasol OSR52	Finasol OSR52 provides a rapid and effective breakdown of hydrocarbons. It was the first product on the market to comply with all three major international regulations; EPA, MMO and CEDRE. It can be applied either neatly or at 10% by aircraft, boats or by hand held sprayers with backpack spray units.	OSRL	✓	
Nalco Corexit 9500A	COREXIT EC9500A contains an improved oleophilic solvent delivery system than that used in earlier formulations of Corexit. Aircraft provide the most rapid method of applying dispersants to an oil spill for aerial spraying. Corexit is a solvent-based "concentrate" dispersants, which may either be applied undiluted (neat) or sprayed in a stream of seawater. COREXIT 9500 can be used during early stages of a response and may be is more effective on viscous, emulsified, and weathered spills than alternative options.	Esso, BHP, AMOSC OSRL	✓	✓**

\*\*2019 Crudes tested: Snapper, Moonfish, Flounder, West Kingfish and Halibut

\*\*\* 2012 Crudes tested: Tuna, Halibut and West Kingfish

## 5.2.2 Acceptance of Dispersant Application

### AMSA

An oil spill clean-up agent (OSCA) is defined as a chemical, or any other substance, used for removing, dispersing, or otherwise cleaning up oil or any residual products. The Australian Maritime Safety Authority (AMSA) have products on the OSCA register which are considered to have met the requirements of acceptable practice for the National Plan.

All existing stocks of previously accepted Oil Spill Control Agents held within the National Plan (AMSA and AMOSC) inventories, as of 1 January 2012, remain acceptable for National Plan use until used or disposed of. They are listed in the OSCA Register as 'transitional OSCAs' and almost exclusively comprise the AMSA, AMOSC and Esso's pre-2012 stockpiles of dispersants

### NOPSEMA

The EP submission process provides the mechanism for Esso to gain 'acceptance' for the use of location, activity or OPEP specific oil spill dispersant products and deployment strategies (e.g. surface and/or subsea application) prior to any incidents.

Any dispersant use in response to a pollution incident from an offshore petroleum activity must be carried out in accordance with an accepted EP and no additional 'approvals' are required to implement response arrangements.

### State Waters

Any dispersant application within state waters (<3 nm) must be approved by the state control agency prior to use.

## 5.3 Environmental Impact Assessment of Dispersant Application

### 5.3.1 Dispersant Toxicity

Modern dispersant products (e.g., Dasic Slickgone NS, Finasol® OSR 52, Corexit® EC9500A) are a mixture of solvents and surface active agents (surfactants) with different physicochemical properties and therefore potential fates in the environment. Once released into the aquatic environment, dispersants are subject to rapid dilution, dissolution, biodegradation, and photodegradation processes (NASEM, 2019). Consequently, there is a brief time window in which marine organisms will be subject to the full toxicity of the dispersant and dispersed oil.

When a dispersant is introduced at depth by subsea injection, dispersant components will differentially dilute and dissolve, with some being retained at depth. In this situation, biota could be exposed to dilute concentrations of the more persistent and water-soluble dispersant components, such as the anionic surfactant di (2-ethylhexyl) sodium sulfosuccinate (DOSS). The US EPA benchmark for the protection of aquatic life is 40 µg/L. A study conducted by the Operational Science Advisory Team (OSAT) following the Macondo spill investigated the footprint of Corexit at sea by measuring the concentrations of DOSS. It was found that DOSS was more persistent at depth however no dispersant water quality exceedances were measured in the OSAT program (OSAT, 2010) and only one sample was found that exceeded the US EPA guideline for aquatic organisms (Gray et al., 2014). Both DOSS and the solvent used in Corexit (dipropylene glycol butyl ether) are expected to rapidly degrade following application at the cool, shallow Gippsland waters, as they are known to rapidly degrade in light (Gray et al., 2014; Glover et al., 2014), and Corexit has been shown to be microbially degraded at 5 and 20 degrees (Campo et al., 2013).

The current protocols for registering an Oil Spill Control Agent for use in Australia (described in detail by AMSA (2011)) use NATA-accredited standardised toxicity tests on a variety of taxa. These tests include lethal and sub-lethal endpoints and to be registered in Australia, the LC50 values must be greater than 10 mg/L for the tested fish larvae and crustaceans. This is considered is considered "slightly toxic" by the US EPA (Hemmer et al., 2011).

Dispersants currently used in the industry are less toxic than oil (EMSA, 2010) and recent studies have found that Corexit 9500 is not more acutely toxic in standardized tests than common household cleaning

products (Word et al., 2014). All dispersants proposed to be used by Esso in the event of an incident are accepted on to the National Plan OSCA Register meaning they meet toxicology requirements for use.

CSIRO (2015) also noted that modern dispersants are much less toxic than spilled oil. However, their use can increase localised oil toxicity, but this is very short-lived due to the dilution effects and will result in much lower exposure and dosage than without dispersant use.

In laboratory experiments, dispersant components (including the solvents and surfactants) degrade rapidly, within hours to days. In field conditions, the few studies on the effects of dilution on dispersant fate and transport have shown that concentrations of dispersants reach a maximum of 5-13 ppm after surface applications and generally decrease to less than 1 ppm within minutes to hours (NASEM, 2019).

Products available today are low in toxicity and do not increase the toxicity of the dispersed oil because they are present in the water column at very low concentrations (Lessard, 2000). The toxicities of dispersants are usually lower than those of the soluble fractions of oils and this, together with the lower concentrations of dispersant in the dispersed oil, indicates that the toxicity of dispersed oil is predominantly due to the toxic components of the oil, and not the dispersant (NRC, 1989).

### 5.3.2 Increase in Dispersed Oil in the Water Column

The application of dispersants will increase the amount of oil that is entrained and dissolved in the water column, reducing exposure of coastal ecosystems to floating weathered oil, as well as reducing the risk of exposure of seabird and marine mammal populations to the floating oil (Bock et al. 2018; French-McCay et al. 2018; NRC 2005, 2013). It also has the potential to reduce contamination of sensitive intertidal habitats such as mangroves, coral reefs, salt marshes and sandy shores (recreational and tourist areas) through the reduction in shoreline impacts. However, in open ocean environments, the processes involved in dispersion will rapidly dilute the oil droplets and the soluble components of the oil (NRC, 2005). In fact, in deep waters, dispersants are thought to have minimal ecotoxicological effects because of dilution (NRC, 2005).

The application of surface dispersants may result in a greater risk that water column and subtidal habitats could be exposed to elevated concentrations of dispersed hydrocarbons. Surface dispersant application is usually restricted to greater than 3 nm from shorelines and in water depths greater than 10 meters. Maximum dispersed oil concentrations could reach 100-200 ppm in the top 10 meters initially, but it is expected to decrease to 1 ppm or less within 5-10 hours (Lessard, 2000).

A negative effect of subsurface dispersant injection is that the surfactants increase the bioavailability of oil components in the water column and more oil may remain at depth, potentially increasing the toxicity risk to deep-water fauna although dilution will reduce concentrations below toxicity thresholds rapidly (French-McCay et al. 2018).

Similarly, there is a potential for exposure of planktonic, pelagic, demersal and benthic organisms to increased levels of dispersed or dissolved oil components, although dilution is expected to be a significant factor (Hook & Lee, 2015).

### 5.3.3 Subsea Dispersant Injection (SSDI)

A variety of studies in the aftermath of the Macondo spill response in the Gulf of Mexico have shown that the dispersants that were developed for use on surface spills are also effective when applied during a subsea well response via Sub-Sea Dispersant Injection (SSDI). Research funded by the American Petroleum Institute (API) through a Joint Industry Task Force (JITF) and IPIECA/International Maritime Organization (IMO) through a Joint Industry Program (JIP) demonstrated that Dasic Slickgone NS, Finasol® OSR 52, Corexit® EC9500A are all effective at significantly reducing oil droplet size, a key measure of successful dispersant application. The work was performed at a number of independent research facilities in Europe (CEDRE, Sintef) and the US (Southwest Research Institute) and in conjunction with a number of universities including MIT and the University of Hawaii.

As a result of a reduction of oil droplet size, the surface expression of released oil is expected to be significantly reduced (NASEM, 2019), especially directly above the point of subsea release. This can help protect birds and aquatic mammals since less oil will be present in their habitats. Less surface oil

will also be beneficial to response workers since there is an expectation of reduced volatile organic compounds (VOC) in the area in which they work, especially in the early stages of a response (French-McKay *et al.*, 2019).

The reduction of oil droplet sizes in the water column will lead to dispersion at depth where concentrations are expected to decrease to levels well below aquatic toxicity thresholds and microbial biodegradation will be significant, even over extended periods of SSDI. A number of studies support these findings (including reports by T. Hays; R. Prince; K. Lee; D. French-McKay; NASEM 2019).

#### 5.3.4 Impact Assessment

The application of dispersant in the event of a loss of well control and major spill will result in an increase in the proportion of spilled hydrocarbons in the water column as either dissolved or entrained oil. This has the effect of decreasing surface and shoreline loading, but increasing exposure to pelagic biota in offshore waters and possibly localised sedimentation of hydrocarbons to the seabed in the deep offshore waters.

An impact assessment has been completed to assess the impacts to receptors following the use of dispersant to mitigate a spill. The impact assessment considers the effects of increased exposure to hydrocarbons in the water column due to dispersant use and addresses any additional or reduced potential impacts from the use of dispersants, as compared to the unmitigated scenario described in Volume 2, Section 6.7.2.

This assessment has been completed based on the proposed response scenario described in Table 5-6 for dispersant application in response to the LOWC in the Northern region, as represented by the Marlin scenario (from the TRA A10 well) as described in Volume 2, Section 6.7.

This scenario has been selected as it results in the largest volume of oil spilled to surface and therefore, requires the largest volume of dispersant in response. Consistent with the assessment of dispersant toxicity described in Section 5.3.1, the impact assessment provided in Table 5-2 has been prepared based on the response scenario which results in the most oil being dispersed into the water column. Given the use of surface dispersants, this aligns with the scenario which uses the most dispersant. This being the surface and SSDI scenario described in Table 5-6.

Note that application via SSDI results in a greater volume of oil being dispersed into the water column. However, following the abandonment of SHA, TWA and BKA subsea facilities, there are no subsea oil wells producing in the Gippsland region. All producing oil wells are located on platforms and therefore, any spills from a loss of well control are assumed to occur at surface.

Remaining subsea facilities (KPA and BTW) produce gas and condensate (See Volume 2, Table 6-21). Discharge of gas with condensate is highly volatile and natural weathering processes will disperse oil and dispersant application is not considered a recommended response option. Therefore, SSDI is not considered to be a primary response option.

Through the use of surface dispersants, in-water hydrocarbon levels are likely to increase above high levels in areas predicted to be impacted by in water oil (see Volume 2, Table 6-7 and 6-8 for likelihood of impacts from LOWC) however, shoreline impacts are expected to be reduced.

Surface application of dispersant will be directed to the thickest part of the slick and to fresh oil which will be found close to the release location in water with sufficient depth to allow dilution of hydrocarbons and dispersant throughout the water column. Dispersants will only be used in Commonwealth waters, in waters of >10m depth and outside of Australian Marine Parks. Use of dispersants in State waters would only be with the approval of the State control agency.

**Table 5-2 Aspect: Planned Discharge of Dispersant**

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
Plankton	The impact to plankton is predicted to be <b>Level III</b> with potential effects on the food web recognised.	<p>Plankton, specifically zooplankton, are vulnerable to hydrocarbons (Hook et al., 2016). Water column organisms that come into contact with oil and chemicals risk exposure through ingestion, inhalation and dermal contact (NRDA, 2012), which can cause immediate mortality or declines in egg production and hatching rates along with a decline in swimming speeds (Hook et al., 2016).</p> <p>Plankton are at their highest concentrations below surface waters (e.g. 60 m water depth for phytoplankton during the day) and undertake a vertical migration which would likely reduce their potential for (and duration of) exposure to dissolved hydrocarbons in the surface layer of the water column.</p> <p>Plankton are typically abundant in the upper layers of the water column and decline with depth. Once background water quality is re-established, plankton takes weeks to months to recover (ITOPF, 2011).</p> <p>Following use of dispersant, plankton are likely to be exposed to in-water hydrocarbons above the high exposure threshold along the Gippsland coastline. However, once background water quality is re-established, plankton takes only weeks to months to recover (ITOPF, 2011). Further, plankton found in open waters of the exposure zone is expected to be widely represented within waters of the wider Bass Strait region and generally across all waters in the south eastern offshore region, which aids in the re-establishment of communities.</p> <p>Exposure to greater concentrations of dissolved and entrained hydrocarbons due to the use of dispersants is predicted to result in short-term impacts to local plankton populations.</p>	The impact to plankton is predicted to be consistent with the assessed LOWC scenario described in Volume 2, Table 6-9 being <b>Level III</b> .
Benthic Habitats and Communities -- Bare Substrate, Coral,	The consequence of a LOWC on benthic habitats is assessed as <b>Level II</b> .	Species residing in offshore locations are more likely to be exposed to increased significant levels of in-water hydrocarbons with the application of surface dispersant application depending on their water depth and location with	The consequence of a LOWC mitigated through use of dispersant application on benthic habitats is assessed as <b>Level II</b> .

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
Seagrass, Macroalgae, Subtidal Rocky Reef		<p>respect to the spill. Impacts to deep water benthic sediments are not expected as a result of surface dispersant application.</p> <p>Known areas of seagrass which may be exposed to increased concentrations of dispersed oil include Corner Inlet, Lakes Entrance, Bemm River Estuary and Tamboon Inlet. There is the potential that exposure could result in sub-lethal impacts however seagrass in this region isn't considered a significant food source for marine fauna.</p> <p>Suitable hard substrate for macroalgal around Gabo Island and within the Bemm River Estuary may be impacted by increased concentrations of dispersed oil however are suggested to be some of the least sensitive marine species to oil exposure.</p> <p>Benthic invertebrate species closer to shore may be affected by increased in-water oil concentrations. Invertebrates of value (i.e. target species for fisheries) have been identified to include squid, crustaceans (rock lobster, crabs) and molluscs (scallops, abalone). While exposure can lead to impacts including mortality, recovery of benthic invertebrates exposed to in-water hydrocarbons would be expected to return to background water quality conditions within weeks to months of contact. Several studies have indicated that rapid recovery rates may occur even in cases of heavy oiling (Burns et al., 1993; Dean et al., 1998).</p> <p>Acute or chronic exposure, through both surface contact, and/or ingestion can result in toxicological risks. However, the presence of an exoskeleton (e.g., crustaceans) will reduce the impact of hydrocarbon absorption through the surface membrane. Other invertebrates with no exoskeleton and larval forms may be more prone to impacts from pelagic hydrocarbons. Complex assemblages (e.g. sponge habitat) or deep-water slow-growing sessile invertebrates are likely to recover much more slowly.</p> <p>Exposure to in-water hydrocarbons poses the greatest threat to sensitive macroalgal assemblages, specifically the Giant Kelp Forests TEC. These grow on rocky reefs from the sea floor 8 metres below sea level and deeper growing towards the sea surface.</p> <p>Benthic invertebrates are potentially at risk of toxic impacts of exposure to in-water hydrocarbons. While exposure can lead to impacts including mortality, recovery of benthic</p>	

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
		<p>invertebrates exposed to entrained hydrocarbons would be expected to return to background water quality conditions within weeks to months of contact. Several studies have indicated that rapid recovery rates may occur even in cases of heavy oiling (Burns et al., 1993; Dean et al., 1998).</p> <p>It is possible that injury or mortality associated with acute or chronic exposure could result in a slight alteration of the local habitat and community structure, however no long-term changes to ecosystem are expected.</p> <p>Offshore benthic habitats are more likely to be exposed to increased significant levels of in-water hydrocarbons although this is expected to be limited to very shallow waters (e.g., 10 to 50m) due to the nature of surface application. These areas of highly mobile sediment, where diversity and abundance are relatively low, will likely recover quickly.</p>	
Fish	The consequences to fish and sharks are assessed as <b>Level II</b> , taking into consideration the potential impacts to threatened species such as the White and Grey nurse sharks.	<p>Exposure to dissolved / entrained hydrocarbons and chemicals in the water column can be toxic to fishes. Studies have shown a range of impacts including changes in abundance, decreased size, inhibited swimming ability, changes to oxygen consumption and respiration, changes to reproduction, immune system responses, DNA damage, visible skin and organ lesions, and increased parasitism. However, many fish species can metabolise hydrocarbons, which reduces the risk of bioaccumulation (NRDA, 2012).</p> <p>Shallow inshore fish species including various syngnathids (seahorses, pipefish, pipehorses and seadragons) are less likely to be able to move away from in-water oils and therefore may be exposed to elevated levels or for longer periods. Their habitats are typically widespread however any impacts are expected to be local on individual organism levels.</p> <p>Fish are most vulnerable to hydrocarbon discharges during their embryonic, larval and juvenile life stages. Oil and chemical exposure may result in decreased spawning success and abnormal larval development. Impacts on eggs and larvae entrained in the upper water column are expected to be short term given the temporary period of water quality impairment, and the limited areal extent of the spill. As egg/larvae is widely distributed in the upper layers of the water column it is expected that current induced drift will rapidly replace any affected populations.</p>	Consequences to fish and sharks are assessed as <b>Level II</b> , taking into consideration the potential impacts to threatened species such as the White and Grey nurse sharks.

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
		<p>Pelagic free-swimming fish and sharks are unlikely to suffer long-term damage from exposure because dissolved/entrained hydrocarbons in water are not expected to be sufficient to cause harm (ITOPF, 2010). Pelagic free-swimming fish and sharks are also generally highly mobile and as such are not likely to suffer extended exposure (e.g. &gt;96 hours) at concentrations that would lead to chronic effects due to their patterns of movement.</p> <p>Demersal fish are more likely to be exposed to significant levels of in-water hydrocarbons associated with the application of subsea dispersant application.</p> <p>Predicted zones of moderate exposure to dissolved hydrocarbons contacting the White shark distribution and breeding BIAs and Grey nurse shark foraging and migration BIAs may increase to high exposure levels following use of dispersant. These species are widely distributed and areas of increased impact due to dispersed oil are not considered significant compared to overall species distribution.</p>	
Marine Reptiles - Turtles	<p>Although the effects of hydrocarbons on marine reptiles, specifically turtles can be severe, the low density of turtles expected in the region (due to lack of BIA or aggregations) suggests that a LOWC would affect individuals rather than population level. Consequently, the potential impacts to marine reptiles are considered to be Consequence <b>Level II</b>.</p>	<p>Effects to marine turtles have been assessed to be most significant for surface oil and shoreline oil (See Volume 2, Table 6-9).</p> <p>Marine turtles are vulnerable to the effects of oil at all life stages; eggs, hatchlings, juveniles, and adults. Marine turtles can be exposed to oil externally (e.g. swimming through oil slicks) or internally (e.g. swallowing the oil, consuming oil affected prey, or inhaling of volatile oil related compounds). Effects of oil on turtles include increased egg mortality and developmental defects; direct mortality due to oiling in hatchlings, juveniles, and adults; and negative impacts to the skin, blood, digestive and immune systems, and salt glands.</p> <p>French-McCay 2018 performed a comparative risk assessment for a large blowout in the Gulf of Mexico and found that turtles are the marine species that undergo the most benefit from dispersing oil because of their vulnerability to surface slicks and their long lives and slower reproduction.</p> <p>While marine turtles, including threatened species, are known to occur in the area potentially exposed to in-water dispersed oils they are not noted to reside or aggregate in significant numbers, and there are no recognized BIAs in the region.</p>	<p>Although the effects of hydrocarbons on turtles is driven by surface and shoreline oils, the low density of turtles expected in the region (due to lack of BIA or aggregations) suggests that additional in-water oil would affect individuals rather than population level. Consequently, the potential impacts to marine reptiles are considered to be <b>Consequence Level II</b>.</p>

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
		<p>It should be noted that the threat and relative impacts of an oil / pollution on some marine reptile species are considered less damaging than other stressors. Report cards produced on protected marine reptiles in Australia generally ranked oil pollution as either 'not of concern' or 'of less concern' depending on the marine region (DSEWPAC 2012).</p> <p>Impacts from increased concentrations of in-water dispersed oil are expected to be largely consistent with that of the assessed LOWC scenario described in Volume 2, Table 6</p>	
Birds	<p>The potential consequence of risks to seabirds and shorebirds from a LOWC are considered to be <b>Level II</b>.</p>	<p>Birds foraging at sea have the potential to directly interact with oil on the sea surface some considerable distance from breeding sites in the course of normal foraging activities. Seabird species most at risk include those that readily rest on the sea surface (e.g. shearwaters) and surface plunging species (e.g. terns, boobies).</p> <p>As seabirds are a top order predator, any impact on other marine life (e.g. pelagic fish) may impact food supply both for the maintenance of adults and the provisioning of young. However, it is likely that the use of dispersant will be offset by the decrease in surface oil and reduction in the consequences for smothering of birds feeding at the surface.</p> <p>For the unmitigated scenario (see Volume 2, Section 6.7.2) oil concentrations at the moderate to high threshold are predicted to accumulate on the shorelines of Gabo Island, which supports the world's largest Little penguin colony, The Skerries and Tasmanian Bass Strait islands such as Curtis Island potentially impacting local populations. Under certain metocean conditions the zone of moderate surface exposure is predicted to overlap with the Little penguin breeding BIA. Impacts to these colonies are expected to be reduced following use of dispersant due to reduced shoreline loading.</p> <p>There are many listed threatened and migratory shorebird species likely to occur in the area overlapping the extent of exposed shoreline. However, in the event of a LOWC, these birds are potentially at risk of shoreline exposure and are not likely to be significantly affected by in-water concentrations of hydrocarbons due to their limited exposure time in the water column. Reduction in shoreline oil as a result of dispersant application is expected to reduce impacts to shorebird species.</p>	<p>Given the potential impacts to birds from oil spills are largely driven by shoreline and surface impacts, the potential impacts to birds due to a LOWC mitigated through use of dispersant application is assessed to be a <b>Consequence Level III</b></p>

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
Marine Mammals (Pinnipeds)	The consequence of a LOWC on pinnipeds is assessed as Level II.	<p>There may be physical impacts from ingestion of in-water and surface oil. However, as mammals are highly mobile species, it is very unlikely that these animals will be continuously exposed to elevated concentrations of dispersed hydrocarbons for extended durations (e.g. &gt;96 hours) that could lead to chronic effects.</p> <p>Both the New Zealand fur-seal (<i>Arctocephalus forsteri</i>) and the Australian fur-seal (<i>Arctocephalus pusillus doriferus</i>) are listed marine species with habitat and breeding sites known to occur in areas potentially exposed to surface, in-water and shoreline oil above the moderate threshold. Both the Australian and New Zealand fur seals are at risk to surface oil while at sea and shoreline accumulated oil at haul out sites or rookeries. While some individuals may be affected, population level effects on these other transient species are considered unlikely. It is likely that the use of dispersant will be offset by the decrease in surface oil and reduction in the consequences for whales feeding at the surface.</p> <p>French-McCay 2018 found that marine mammals in the Gulf of Mexico also were protected by use of dispersants for the same reason as turtles.</p> <p>As described in Volume 2, Table 6-9, the potential impacts to pinnipeds from oil spills are largely driven by surface and shoreline impacts.</p>	Given the potential impacts to pinnipeds from oil spills are largely driven by shoreline and surface impacts, the potential impacts to pinnipeds due to a LOWC mitigated through use of dispersant application is assessed to be a <b>Consequence Level III</b>
Marine Mammals (Cetaceans)	The consequence of a LOWC on cetaceans is assessed as <b>Level II</b> .	<p>There may be physical impacts from ingestion of in-water and surface oil. However, as mammals are highly mobile species, it is very unlikely that these animals will be continuously exposed to elevated concentrations of dispersed hydrocarbons for extended durations (e.g. &gt;96 hours) that could lead to chronic effects.</p> <p>While some individuals may be affected, population level effects on these other transient species are considered unlikely. It is likely that the use of dispersant will be offset by the decrease in surface oil and reduction in the consequences for whales feeding at the surface.</p> <p>Impacts from increased concentrations of in-water dispersed oil are expected to be largely consistent with that of the assessed LOWC scenario described in Volume 2, Table 6-9.</p>	The potential impacts to cetaceans are considered to be <b>Consequence Level II</b> .
Coastal Habitats and Communities– Sandy	The impact of LOWC is assessed conservatively as a <b>Consequence Level II</b>	There are different types of shorelines found along the Gippsland and southern NSW coast and offshore islands	Given the potential impacts to coastal habitats from oil spills are largely driven by shoreline oil loading, the

Emergency Preparedness and Response

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
Shoreline, Rocky Shoreline, Mangroves and Saltmarsh		<p>(including Tasmanian islands), however this coastline is dominated by wide sandy beaches with intermittent rocky shores, and salt marshes and isolated mangroves within tidal estuaries, coastal lakes and bays.</p> <p>The impacts to these coastal habitats (as described in Volume 2, Table 6-9) are influenced by the volume of hydrocarbon that could be stranded ashore and its thickness before the shoreline saturation point occurs (ITOPF, 2014).</p> <p>Use of dispersant is expected to reduce the volume of oil that reaches the shoreline and therefore reduce impacts to coastal habitats and communities, compared to impacts assessed in Volume 2, Table 6-9.</p>	potential impacts to coastal habitats due to a LOWC mitigated through use of dispersant application is assessed to be a <b>Consequence Level III</b>
Wetlands	The consequence of LOWC is assessed as <b>Level III</b> .	<p>As described in Volume 2, Table 6-9, wetlands of international importance which may be impacted (e.g., Corner Inlet Ramsar Site) have minimal risk of receiving oil following a LOWC because they have no, or very narrow and/or seasonal, connections to the sea.</p> <p>Under certain conditions shoreline oil is predicted to accumulate at high – moderate thresholds along the shoreline of Corner Inlet, however, following use of dispersant, it would be expected that surface oil will be significantly reduced.</p>	The consequence is assessed as <b>Level III</b> .
National Parks and Reserves	The consequence is assessed as <b>Level II</b> taking into consideration the length of shoreline potentially impacted and the extent of oil accumulation predicted.	<p>Spill modelling predicted that no AMPs would experience exposure to surface oil at or above the moderate threshold.</p> <p>However, modelling indicated that six AMPs (East Gippsland, Beagle, Flinders, Jervis, Freycinet and Central Eastern), could be exposed to moderate thresholds of dissolved oil.</p> <p>Impacts to National Parks and Reserves along the area of shoreline exposure (as identified in Volume 2, Table 6-7 and Table 6-8) are expected to be reduced following the use of dispersant due to decreased shoreline loading.</p> <p>This decrease in impact to Marine Parks is consistent with the conservation management aims of the South East Marine Reserves Network Management Plan.</p> <p>The East Gippsland and Beagle Marine Parks are ranked as Category VI protected areas meaning they should be</p>	The consequence is assessed as <b>Level III</b> taking into consideration the reduction in shoreline impacts due to dispersant use.

Emergency Preparedness and Response  
Volume 3

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
		<p>managed mainly for ecosystem protection and passive recreation.</p> <p>The Flinders and Freycinet Marine Parks are ranked as Category II protected areas meaning they should be managed mainly for the ecologically sustainable use of natural ecosystems.</p> <p>The application of surface dispersant aims to protect and minimise the impacts to ecosystems from hydrocarbon spill releases thereby allowing future sustainable use of the ecosystems in the region.</p>	
AMPs	The consequence is assessed as <b>Level III</b> .	<p>Although initial spill modelling indicated that no AMPs would be exposed to moderate thresholds of in water (dissolved) oil, it may be expected that in water exposure to hydrocarbons is increased to high levels following the use of dispersant.</p> <p>Surface and in-water (dissolved) oil entering these AMPs will degrade water quality until the oil is broken down and or currents shift the weathering oil outside the boundaries of the AMPs. Thus, water quality effects are predicted to persist only over the short to medium term in the AMPs.</p>	The overall consequence is assessed as <b>Level III</b> .
KEFs	The consequence is assessed as <b>Level III</b> .	While a spill would not affect the KEF Upwelling East of Eden itself, if the spill occurs at the time of an upwelling event, it may result in krill being exposed to in-water phase hydrocarbons. Pygmy blue whales feeding at this time may suffer from reduced availability of prey however, even with increased in-water hydrocarbon concentrations due to dispersant use, these impacts are expected to be localised and temporary.	The consequence is assessed as <b>Level III</b>
Cultural –Indigenous and Historic	The consequence level is considered <b>Level III</b> based on public impact consequence considerations	<p>Use of dispersant is expected to reduce shoreline impacts to the visual or cultural (including activities such as camping, rituals and ceremonies) amenity of cultural heritage sites such as historic (e.g. shipwreck) or indigenous protected areas</p> <p>It is expected that use of dispersant will reduce the duration of impacts from degraded aesthetics of sites as a result of reduced shoreline loadings.</p> <p>Parts of the Gippsland coast over which the Gunai-Kurnai people hold native title would be exposed to lesser impacts</p>	The consequence level is considered <b>Level III</b> taking into consideration the reduction in shoreline impacts due to dispersant use

Emergency Preparedness and Response  
Volume 3

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
		than compared to the unmitigated spill described in Volume 2, Table 6-9.	
Commercial Fisheries	The potential economic impacts to commercial fisheries from LOWC are considered to be Public Impact Consequence <b>Level I</b> based on public impact consequence considerations	<p>Several commercial fisheries may operate within the area potentially exposed in the event of a LOWC. For the unmitigated scenario (see Volume 2, Section 6.7.2), floating oil is predicted to extend 10's of kilometers outside the subsea facility PSZ (from which fishing vessels are already excluded) making it likely that in these situations an exclusion zone (or fisheries closure) would be established.</p> <p>Fishing areas may be closed for fishing for shorter or longer periods because of the risks of the catch being tainted by oil. Increased oil in water concentrations could result in increased fish taint and prolonged fishing restrictions.</p> <p>As described in Volume 2, Table 6-9, a temporary fisheries closure and the flow on losses from the lack of income derived from these fisheries based on reduced market confidence and the potential for extended media coverage (potentially greater than 3 months) has the possibility of exceeding medium community disruption (&gt; 100 – 1000 people) such as reduced employment (in fisheries service industries and the seafood supply chain).</p>	The potential economic impacts to commercial fisheries from LOWC are considered to be Public Impact <b>Consequence Level I</b> based on public impact consequence considerations (media coverage, the scope of the disruption (personal, commerce, transportation or socio-economic) and the size of the population affected) as per ExxonMobil Risk Matrix Application Guide, 2018 (Refer Section 3.5, Table 3 5).
Tourism and Recreation	The potential economic impacts to tourism and recreation from LOWC are considered to be Public Impact Consequence <b>Level I</b> based on public impact consequence considerations.	<p>Impacts to tourism and recreation are driven by visual oil leading to reduced amenity of areas used by coastal tourists and recreational visitors, temporary health implications and possible closures. Use of dispersant is expected to reduce volume of shoreline oil meaning impacts to tourism and recreation are expected to be reduced.</p> <p>Modelling in Volume 2, Section 6.7 predicts visible oil extending into nearshore Victorian waters (including waters of Ninety Mile Beach, Point Hicks and Cape Howe Marine National Parks and Beware Reef Marine Sanctuary) and a number of National Parks and Reserves including the very popular Wilsons Promontory and (Gippsland) Lakes National Parks.</p> <p>It is expected that use of dispersant will reduce the duration of impacts from degraded aesthetics of sites as a result of reduced shoreline loadings.</p>	<p>Despite taking into consideration the reduction in shoreline impacts due to dispersant use, the consequence level is considered <b>Level I</b>.</p> <p>This is based on public impact consequence considerations (media coverage, the scope of the disruption (personal, commerce, transportation or socio-economic) and the size of the population affected) as per ExxonMobil Risk Matrix Application Guide, 2018 (Refer Section 3.5, Table 3 5).</p>

Emergency Preparedness and Response  
Volume 3

Affected Receptor	Unmitigated LOWC Consequence (per Volume 2, Table 6-9)	Consequence of LOWC mitigated through use of dispersant	Consequence Level
		As described in Volume 2, Table 6-9, the extent of potential impacts to tourism and recreation depends on when the spill occurs, size and where it comes ashore.	

**Table 5-3 Acceptability of Environmental Impacts from Dispersant Application**

Factor	Demonstration Criteria	Criteria Met	Rationale
<b>Principles of Ecologically Sustainable Development (ESD)</b>	No potential to affect biological diversity and ecological integrity.	✓	The activities were evaluated as having the potential to result in a Level III to IV consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The application of dispersants will decrease the volume of oil on the surface which may reduce exposure to coastal sensitives and seabird and marine mammal populations to floating oil. Dispersant application will only be a selected following an incident NEBA, which must demonstrate potential environment impacts from dispersant outweigh the potential for shoreline, fauna and marine sensitivity impacts.
<b>Legislative and Other Requirements</b>	Legislative and other requirements have been identified and met.	✓	The proposed control measures align with the requirements of the: <ul style="list-style-type: none"> <li>• OPGGS Act 2006</li> <li>• Protection of the Sea (Prevention of Pollution from Ships) Act 1983.</li> <li>• Navigation Act 2012 – Chapter 4 (Prevention of Pollution).</li> <li>• Marine Order 96 (Marine pollution prevention – sewage) 2013</li> <li>• Marine Order 95 (Marine pollution prevention - garbage) 2013.</li> </ul>
<b>Internal Context</b>	Consistent with Esso's Environment Policy	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	Proposed controls meet the requirements of the ExxonMobil Dispersant Guidelines 2008.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>• OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations</li> </ul>
<b>External Context</b>	Stakeholder concerns have been considered / addressed through the consultation process.	✓	No specific stakeholder concerns have been raised.

**Table 5-4 ALARP Demonstration of Environmental Impacts from Dispersant Application**

<b>ALARP Decision Context and Justification</b>	<p>Decision Context B</p> <p>Dispersant application is a standard response strategy that has been accepted for use in the Australian and International Offshore Petroleum Industry.</p> <p>Impacts associated with dispersant application are well understood and have been implemented by industry. The application of dispersants must be supported by an incident NEBA in commonwealth waters or have approval from state control agency within state waters.</p> <p>Dispersant application activities are aligned with company and partner values.</p> <p>Good Practice control(s) have been identified to ensure environmental impacts associated with mobilising this response are reduced to ALARP, these controls will be implemented in a response scenario and have been included in the OPEP.</p> <p>Esso believes ALARP Decision Context B should apply.</p>		
<b>Good Practice</b>	<b>Adopted</b>	<b>Control</b>	<b>Rationale</b>
Vessel compliant with MARPOL Annex I, IV, V and VI as appropriate to vessel class.	✓	Vessel Requirements.	The vast majority of commercial ships are built to and surveyed for compliance with the standards (i.e. Rules) laid down by classification societies. The role of vessel classification and classification societies has been recognised by the International Maritime Organisation (IMO) across many critical areas including the International Convention for the Safety of Life at Sea, (SOLAS), the 1988 Protocol to the International Convention on Load Lines and the International Convention for the Prevention of Pollution from Ships (MARPOL).
NEBA completed prior to conducting dispersant application operations.	✓	Incident specific NEBA.	The NEBA takes into account the circumstances of spill, fate of the oil, potential environmental and social impacts and relative oil spill response options.  NEBA will take into account IUCN Ranking of relevant Marine Parks.
Halting dispersant use if operational monitoring detects protected or migratory species at the water surface in the path or vicinity of spraying operations.	✓	Halt dispersant application if wildlife are identified in the area	If EPBC Act listed migratory species (e.g. whales) are observed in the immediate vicinity of dispersant operations, aerial dispersant operations will cease until the animal has not been sighted for 30 minutes or unless otherwise advised by the relevant state authority.
Dispersant pre-selection and assessment.	✓	Dispersant pre-and assessment.	Only dispersants listed in Section 5.2 will be utilized in the event of an incident, unless otherwise endorsed by a Statutory Authority
Pre-incident dispersant effectiveness testing	✓	Laboratory dispersant effectiveness testing.	Laboratory testing of five Gippsland crude oils against three types of dispersant has been completed under summer and winter conditions. Testing shows that dispersant is highly effective on most types of fresh oil. Effectiveness

			of dispersant decreases significantly on weathered oils.
Effectiveness of dispersant confirmed prior to application.	✓	Basic field dispersant effectiveness test.	Testing effectiveness of the dispersant on the oil spill will inform the response option strategy and assist IMT determining response activities.
Dispersant application is only accepted for: <ul style="list-style-type: none"> <li>Commonwealth waters</li> <li>&gt;10 m water depth</li> <li>Outside Australian marine parks</li> </ul>	✓	Exclusion zones	Defined area of where the application of dispersant is acceptable to reduce potential environmental impacts to marine fauna and flora.
Continuous monitoring of dispersed oil plume and visual monitoring of effectiveness.	✓	Monitoring of dispersant effectiveness	The OSMP implementation modules detail the requirement to monitor an oil slick for the effectiveness of the dispersants.
Monitoring of dispersant concentrations in water	✓	Monitoring of dispersant in water	Operational module O2 provides for monitoring of dispersant concentrations in water.
A record of the volumes of dispersant used in both subsea and surface application will be kept throughout the response.	✓	Records of dispersant volumes	The OPEP instructs IMT to record daily dispersant operations (types, volume and locations).
Dispersants will be targeted at areas of thickest oil and considerations of oil type, amenability and volume will be assessed prior to any dispersant application.	✓	Targeted dispersant application	The Exxon Mobil Oil Spill Response Field Manual details techniques for aerial and vessel <del>and to a lesser extent, subsea</del> dispersant application.
Surface dispersants only applied in daylight hours	✓	Surface dispersant only applied within daylight hours	Spraying surface oil slicks in daylight hours ensures that dispersants are targeted in areas where the oil is the thickest and helps prevent overdosing or application of dispersants in areas that will not be effective.  Response during daylight hours also has significant benefits in reducing safety risks (e.g. night time flying) to personnel.
Verify effectiveness of dispersant application	✓	Additional monitoring will be implemented to verify dispersant use is effective and implemented as expected	Water monitoring (as in OSMP Module O2) will be used to monitor concentrations of hydrocarbons and dispersant in the water column.

**Table 5-5 Engineering Risk Assessment**

<b>Additional, Alternative, Improved Controls</b>	<b>Benefit</b>	<b>Cost / Feasibility</b>	<b>Adopted</b>
Lab based efficacy testing for surface application on all Esso crudes against all of the dispersants detailed in table.	Provide a better understanding of the amenability of each Esso crude in relation to each dispersant stock.	The rationale for the selected 5 crudes for laboratory testing was that they represent a cross-section of the types of	Not Adopted

Additional, Improved Controls	Alternative, Benefit	Cost / Feasibility	Adopted
		<p>crudes produced in the Bass Strait. Results of testing can be found in OPEP Appendix E.</p> <p>Laboratory experiments and modeling are often limited by their inability to capture the complexity or scale found in the field.</p> <p>In the event of a spill, verification of incident specific dispersant effectiveness will be done before ongoing dispersant use occurs.</p>	
<p>Lab based efficacy testing for subsea dispersant injection using Esso Gippsland crudes.</p> <p>As part of a joint industry project, SINTEF and Cedre developed lab scale tests for measuring dispersed oil droplet distributions. Test results have shown that droplet size distributions are affected by crude type, different dispersant products and dispersant concentrations. The overall outcome was that increased SSDI effectiveness was indicated by the formation of smaller droplets. The tests have not been broadly employed.</p>	<p>Provide a better understanding of the effectiveness of SSDI for specific crudes and dispersant to oil (DOR) ratios</p>	<p>Dispersant efficacy testing has not been undertaken for subsea conditions, but industry experience estimates a subsea amenability to dispersant of approximately 50-70% effectiveness.</p> <p>Laboratory experiments for SSDI effectiveness testing is not as mature and available as those used for surface dispersant effectiveness measurement. The use of modeling to estimate effectiveness is often limited by an inability to capture the complexity or scale found in the field.</p>	Not Adopted
<p>Dispersants are selected from the Oil Spill Control Agents (OSCA) Register, including grandfathered stocks, unless otherwise endorsed by the Statutory Authority.</p>	<p>Dispersants which have been pre-approved for use in Australia by AMSA are placed on the Oil Spill Control Agent (OSCA) Register. The AMSA Efficacy Test Protocol for the Register (AMSA 2012) lists the toxicity testing requirements that ensure products meet the requirements of acceptable practice for the National Plan, and products with a high acute toxicity (LC50 &lt; 10 ppm, 96 hrs.) or containing prohibited substances are not permitted.</p>	<p>All dispersants proposed for use meet the OSCA requirements and are listed on the National Plan Register.</p> <p>Capability assessments have been completed based on the use of approved dispersants and have confirmed enough dispersant is available for the proposed response.</p>	Adopted

#### 5.4 Capability Assessment of Dispersant Application

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources to complete dispersant application activities in a timely manner. Calculations of needs are

conservative and could be overstating requirements by 25-50%. The reason for this is that capability needs have been calculated based on treating all surface oil, and do not take into account that oil will quickly disperse and spread below the ideal thickness required for spraying. Using a combination of surface (aerial or vessel application) and subsea dispersant injection significantly reduces the overall volume of dispersants required as summarised in Table 5-6. The assessment concluded sufficient resources are available within acceptable timeframes to conduct this response. This section summarises outcomes of the capability assessment.

Dispersants will be sourced from Esso's own stock in addition those available from AMOSC, AMSA National Plan Stock and OSRL. There is potential to obtain additional stock from mutual aid, and dispersant manufacturers would be requested to increase dispersant production.

Based on the capability assessment for the scenario with the highest dispersant requirement (45 m<sup>3</sup>/day), continuity of supply can be maintained drawing on stocks as follows in Table 5-7.

**Table 5-6 Dispersant source**

	Surface Application only	
	Surface (Day 1-98)	Total (98 day)
<b># Aircraft</b>	4	-
<b>Sorties</b>	15 / day	1455
<b>Aerial dispersant (m<sup>3</sup>)</b>	42 / day	4080
<b>Vessel dispersants (m<sup>3</sup>)</b>	3 / day	294
<b>SSDI (m<sup>3</sup>)</b>	N/A	N/A
<b>Total volume (m<sup>3</sup>)</b>	45 / day	4371
Planning assumptions:	<p>Day 1 - 1 x air tractor available on Day 1 with 2 additional aircraft available from Day 2. Fourth aircraft from Day 3.</p> <p>Day 1-98. Aerial dispersant needs based on treating 100% release volume @ 20:1 application rate. No allowance made for natural weathering.</p> <p>Day 1-98. Vessel dispersant volume based on treating 10% of release volume @ 20:1 application rate</p> <p>Capability requirements based on MLA workover WCDS scenario (Refer Volume 2, Section 6.7.2) which results in the largest spill volume.</p>	

**Table 5-7 Dispersant source**

Source	Location	Day
Esso	Victoria	1 to 2
AMOSC (surface)	Australia - various	3 to 7
AMOSC SFRT (50%)	Western Australia	8 to 13
AMSA	Australia – various	14 to 20
Mutual Aid	Australia – various	21
OSRL	Singapore	22 to 42
OSRL	Southampton	43 to 83
GRN	Worldwide	84+

**Figure 5-1: Dispersant Supply chain**

**Table 5-8 Dispersant Application Resource Availability**

Activity	Resource Required	Resource Availability	Expected Timeframe
<b>Dispersant Stocks Available</b>	4371 m <sup>3</sup> of dispersant based on the MLA WCDS using surface application only.	Dispersant stockpiles available in Australia between Esso, AMOSC, mutual aid and AMSA.  Additional dispersant available from OSRL Global Dispersant Stockpile (GDS). GDS required after 21 days.	Victoria stockpiles <24 hours.  National stockpiles <48 hours.
<b>Dispersant Application from Aircraft*<sup>1</sup></b>	Ability to spray 42 m <sup>3</sup> of dispersant per day.	AMOSC (AMSA Fixed Wing Aerial Dispersant Contract (FWADC)) NatPlan. Air Attack Supervisor to be sourced under NatPlan arrangements to direct overhead spraying operations.  Additional dispersant aircraft via OSRL.	Mobilisation of FWAD aircraft <4 hours of request for service.  Dispersant application ability <24 hours.  <i>(Note: Assumes good visibility, daylight hours and suitable flying conditions).</i>
<b>Dispersant Application from Vessels</b>	Ability to spray 4-6 m <sup>3</sup> of dispersant per day per strike team.	Esso Production support vessels loaded with dispersant and spraying equipment from BBMT.  Agreements third party vessel operators.  Vessels of opportunity are available at Barry Beach Marine Terminal, Lakes Entrance, Port Albert, Port Welshpool, Port Franklin and Mallacoota and Hobart.	1 <sup>st</sup> team dispersant application ability <48 hours of request for service.  2 <sup>nd</sup> team dispersant application ability <72 hours of request for service.

Activity	Resource Required	Resource Availability	Expected Timeframe
<b>Testing Dispersant</b>	Dispersant effectiveness test kit.	Access to 3 x test kits.	Available locally and within less than 48 hours of request.
<b>ExxonMobil</b>	<u>Personnel</u> Trained and capable Esso IMT  Regional Response Team	Available to fulfil roles in accordance with requirements and timeframes in OPEP Table 3-2.  Remote support <12 hours from notification. In-country support <72 hours from notification.	ExxonMobil

**Table 5-9 Dispersant Application Capabilities**

Good Practice	Adopted	Control	Rationale
Access to dispersant and dispersant application equipment for initial response.	✓	Esso owned dispersant stocks.	Esso owns stock of dispersant volume (estimated 12m <sup>3</sup> ) is available to mobilise for the first 24 hours of a response.
		Esso owned dispersant application equipment.	Esso have dispersant application equipment in Victoria and available to mobilise when required.
Pre-arranged access to additional dispersant stockpiles and equipment for applying dispersant.	✓	Agreement with AMOSC for dispersant capabilities.	Response capabilities maintained per service level statement including access to mutual aid and the National Plan (which provides dispersant stockpiles).
		Agreement with OSRL for dispersant capabilities.	Response capabilities maintained and available per OSRL service level statement.
Pre-arranged access to vessels for dispersant application.	✓	Support vessel.	The support vessel that is used for ongoing Esso operations can be used for dispersant application.
		Agreement with third party suppliers for provision of additional vessels.	Agreement with supplier of vessel services has provision for supply of additional vessels
Pre-arranged access to personnel to support Tier III response activities.	✓	ExxonMobil Regional Response Team	ExxonMobil have a global team available to assist response for Tier III activities.

**Table 5-10 Consideration of Additional/ Alternative/ Improved Capability for Dispersant Application**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Quarterly AMOSC equipment availability review.	Provides status update on available equipment.	No cost associated with this control.	Adopted.
Dispersant and application equipment stored on vessel.	Reduce time to apply dispersant.	No cost associated with control.	Adopted.

## 6. Containment & Recovery

### 6.1 Response Option Description

Containment and recovery involves controlled collection and recovery of oil from the water's surface. The response typically involves the deployment of booms and oil skimmers from suitable vessels, as well as the collection, transfer and disposal of oil and oily water recovered during the response. Floating barriers or booms are used to enclose the spilled oil on the sea surface into a suitable surface thickness, to allow its mechanical removal using a recovery device such as a skimmer, which pumps the oil from the water surface into temporary storage. The oil and water mix are stored temporarily in vessel tanks on the deck or in internal tanks. Recovered sea water may need to be decanted and returned to the sea to free up storage capacity and enable greater volumes of oil to be recovered without making the potentially long voyage back to port, increasing the effectiveness of the Containment and Recovery. The decanted water will contain traces of hydrocarbons and cannot be discharged unless approval has been provided by AMSA.

Effective containment and recovery can reduce the potential risks and impacts associated with:

- Marine fauna;
- Sensitive shoreline environments;
- Shoreline response; and
- Waste generation.

Containment and recovery is often considered the primary or preferred response option due to the minor impact of its operation on the environment, however, the overall effectiveness of containment and recovery can be limited by a combination of operational constraints and the fate of the oil on the surface (e.g. thickness and patchiness) which may include but not limited to:

- Weather: suitable weather and sea state conditions, which is estimated at <50% of the time in the Bass Strait
- Logistics: availability of suitably equipped vessels, aerial surveillance support and adequate facilities for the storage and disposal of oil and water;
- Personnel: availability of competent responders;
- Location: accessibility and transit time;
- Health and Safety: health effects from exposure to the oil and ability to safely deploy and use equipment; and
- Environment: increased environmental risks and impacts from increased vessels/ aircraft use and treatment/disposal of oily waste.

Experience has shown that the efficiency of at-sea containment and recovery operations can vary widely depending on the above constraints, and recovery is usually limited to between 5% and 20% of the initial spilled volume (IPECA /IOGP – At Sea Recovery - Good Practice Guidance). Esso propose to use containment and recovery as a targeted strategy to mitigate impacts of oil contact with sensitive receptors where other strategies have been ineffective (e.g. dispersants) or may not be viable (e.g. shoreline clean up where there are access issues).

Estimated recovery rates have been calculated based on the encounter rate of strike teams utilising 400 metre of boom with a 120 m swath width travelling at 0.5 knots. Upper and lower recovery rates were calculated based on Bonn appearance code thickness of 50 to 200 micron.

Advantages of containment and recovery:

- Containment and recovery removes hydrocarbon from the environment
- Reduces exposure to surface wildlife e.g. cetaceans, birds

Disadvantages of containment and recovery:

- Labour intensive
- Presents safety risks
- Generation of large volumes of contaminated water  
Increase in environmental impacts from response activities e.g. vessels

## 6.2 Environmental Impact Assessment of Containment and Recovery

Resources for offshore containment and recovery activities will include offshore vessels that will be mobilised from established ports. Nearshore containment and recovery activities are likely to be undertaken from smaller crafts that may be launched from a number of different locations along the coastline. Access to the crafts, equipment and transit to the affected areas may disturb local port operations, recreational activities, fauna and sensitive habitats.

The collection, handling and disposal of hydrocarbons introduces potential environmental impacts from the oily waste generated. The oily waste must be handled and disposed of correctly to prevent secondary contamination from contaminated equipment and decanting activities.

Environmental aspects associated with implementing containment and recovery were identified and evaluated in Table 6-1 and Table 6-2. Implementing this response option introduces new environmental aspects which are not assessed within Volume 2:

- Physical Presence - Nearshore and Shoreline Users (Socioeconomic)
- Physical Presence - Interaction with Fauna and Flora
- Waste generation and Secondary Contamination

### 6.2.1 Impact Assessment

An impact assessment for each environmental aspect has been undertaken and additional controls have been identified to minimise the environmental impacts associated with containment and recovery which are detailed within the ALARP assessment. Further assessment of the acceptability of these impacts in an oil spill response context and controls identified for minimising the environmental impact of containment and recovery activities are described below.

Change to the function, interests or activities of other users could occur through disruption to recreational and commercial activities from vessel operations and site access is assessed in Table 6-1.

**Table 6-1 Environmental Aspect: Physical Presence - Nearshore and Shoreline Users**

Affected Receptor	Impact Assessment	Consequence Level
Socioeconomic (fisheries, tourism, culture)	<p>Recreational fishing is generally concentrated inside the Gippsland Lakes or along the Ninety Mile Beach coastline. Additional vessels and personnel in the area may cause disruption to fishing activities.</p> <p>The movement of personnel, vehicles and equipment may disturb or damage cultural heritage artefacts or sites.</p> <p>The mobilisation of equipment and personnel for containment and recovery operations will be localised. The Oil Spill Tactical Response Plans (TRPs) detail socioeconomic sensitivities for each location.</p> <p>The response activities will be in accordance with state response agency directions and Esso will provide the incident specific NEBA, TRPs and Shoreline Protections Plan and support where requested.</p> <p>The additional presence of vessels and personnel will only be short-term and in localised area for the response period. Once the response has been stood down nearshore socioeconomic activities can resume without disruptions, therefore the consequence of the impacts of the response activity is considered to be Level III.</p>	III

The environmental impacts associated with containment and recovery operations include:

- Water Quality – Decanting
- Physical Presence - Interaction with Fauna and Flora
- Physical Presence – Sensitive and protected areas and parks
- Waste generation and Secondary Contamination

**Table 6-2 Environmental Aspect: Physical Presence - Interaction with Fauna and Flora**

Affected Receptor	Impact Assessment	Consequence Level
Water Quality	<p>Containment and recovery operations will generate large volumes of oily water. Within Australia, the recovered water may be decanted and returned to the sea with approval from AMSA. This frees up valuable storage capacity in the temporary storage device which would otherwise have to be emptied before response operations can continue.</p> <p>The discharge of the oil and water mix may lead to localised, short-term impacts.</p> <p>The consequence to the marine environment is considered inconsequential as the decanted water will have removed much larger volumes of the oil in the marine environment than was present from the spill incident.</p>	III
Physical Presence - Interaction with Fauna and Flora	<p>The sandy beaches, mangroves and salt marshes in the Bass Strait provide potential foraging and breeding habitat for numerous bird species and benthic communities. The flora and fauna within these habitats have the potential to be trampled due to increased numbers of personnel accessing sites. However, containment and recovery response activities primarily occur in the ocean with exception of haul outs and waste and equipment storage. Response activities should avoid sensitive areas unless they have been selected specifically for clean-up or OWR activities. Exclusion zones can be set up to protect these areas and minimise environmental impacts. Haul out sites will use existing road and paths for access to reduce environmental impacts associated with increased foot and vehicle traffic. Shoreline impacts are expected to be inconsequential and have no adverse effects.</p>	IV
	<p>Containment and recovery operations utilise booms which sit on the water's surface, therefore fauna capable of diving, such as cetaceans and pinnipeds can avoid contact. Pinnipeds are likely to be present in the largest number. Impacts to species that inhabit the water column such as sharks and fish are not expected. The noise of the vessel motors may have a positive effect on scaring marine fauna from the immediate area.</p> <p>The additional presence of vessels, equipment and personnel will only be short-term and in localised area for the response period, therefore, the consequence of the impacts of the response activity is considered to be Level III.</p>	III
Physical Presence - Sensitive and protected areas and parks	<p>Potential impacts to sensitive and protected areas may be impacted from containment and recovery activities.</p> <p>Human presence in sensitive areas may adversely affect important natural behaviors of biota, e.g. nesting of shorebirds and seabirds, or pinnipeds.</p> <p>Haul out sites for containment and recovery activities will use existing road and paths for access, therefore, the impacts to sensitive and protected areas and parks are expected to be inconsequential and have no adverse effects.</p>	IV
Waste Management and Secondary Contamination	<p>The Esso Bass Strait Oil Spill Response Waste Management Plan, details requirement for selecting waste management options, and equipment and storage to be utilised to prevent secondary contamination.</p> <p>The Tactical Response Plan - Shoreline Protection &amp; Clean-Up and site specific Tactical Response Plans include information on staging areas and access points. The location of waste will be within the specified exclusion zone.</p> <p>The generation of waste will be short-term and is localised to the response area, for the duration of the response. Therefore, the</p>	III

Affected Receptor	Impact Assessment	Consequence Level
	consequence of the impacts of the response activity is considered to be Level III.	

**Table 6-3 Acceptability of Environmental Impacts from Containment and Recovery**

Factor	Demonstration Criteria	Criteria Met	Rationale
<b>Principles of Ecologically Sustainable Development (ESD)</b>	No potential to affect biological diversity and ecological integrity	✓	All the aspects related to containment and recovery have been evaluated as having the potential to result in a maximum Level III consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	All oil spill response activities are implemented with the aim of reducing the overall environmental impact. Containment and recovery activities may limit the volume of oil that could impact the shoreline and marine sensitivities.
<b>Legislative and Other Requirements</b>	Legislative and other requirements have been identified and met.	✓	Activities will comply: <ul style="list-style-type: none"> <li>• OPGGS Act 2006.</li> <li>• Protection of the Sea (Prevention of Pollution from Ships) Act 1983.</li> <li>• Marine Order 96 (Marine pollution prevention – sewage) 2013.</li> <li>• Marine Order 95 (Marine pollution prevention - garbage) 2013.</li> </ul>
<b>Internal Context</b>	Consistent with Esso's Environment Policy.	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to the containment and recovery however the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>• OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations</li> </ul>
<b>External Context</b>	Stakeholder concerns have been considered /	✓	No specific stakeholder concerns have been raised.

	addressed through the consultation process.		
--	---	--	--

**Table 6-4 ALARP Demonstration of Environmental Impacts from Containment and Recovery**

ALARP Decision Context and Justification	<p>Decision Context A.</p> <p>Containment and recovery activities are standard practice for hydrocarbon spills to reduce hydrocarbons in the marine environment and minimise impacts to shorelines and marine sensitivities.</p> <p>There is a good understanding of potential impacts from containment and recovery. This response option would be supported by an incident specific NEBA.</p> <p>All activities undertaken in state waters will be led by the state control agency.</p> <p>Good Practice controls have been identified to ensure environmental impacts associated with mobilising this response are reduced to ALARP, these controls will be implemented in a response scenario and have been included in the OPEP.</p> <p>Esso believes ALARP Decision Context A should apply.</p>		
Good Practice	Adopted	Control	Rationale
Vessel compliant with MARPOL Annex I, IV, V and VI as appropriate to vessel class.	✓	Vessel Requirement.	The vast majority of commercial ships are built to and surveyed for compliance with the standards (i.e. Rules) laid down by classification societies. The role of vessel classification and classification societies has been recognised by the International Maritime Organisation (IMO) across many critical areas including the International Convention for the Safety of Life at Sea, (SOLAS), the 1988 Protocol to the International Convention on Load Lines and the International Convention for the Prevention of Pollution from Ships (MARPOL).
NEBA completed prior to conducting containment and recovery activities.	✓	Incident specific NEBA.	The NEBA takes into account the circumstances of spill, fate of the oil, potential environmental and social impacts and relative oil spill response options.
Containment and recovery operations only undertaken within daylight hours	✓	Containment and recovery operations only undertaken within daylight hours	Containment and recovery activities will only be undertaken in daylight hours to monitor the boom to ensure trapped fauna are released as soon as possible.  Response during daylight hours also has significant benefits in reducing safety risks (e.g. injury) to personnel.
Ensure daily Containment and Recovery operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered)	✓	Daily records of oil recovered	Daily logs and records of containment and recovery operations demonstrate that CAR equipment was deployed safely, effectively and following consideration of environmental conditions.
Exclusion zones established	✓	Exclusion zones	The OPEP requires that exclusion zones are put in place which consider health and safety and environment risks. These exclusion zones are determined in consultation with the state control agency.
Discharge of de-oiled water (decanting) must meet MARPOL requirements.	✓	Decanting performed in commonwealth waters in accordance with MARPOL requirements.	MARPOL sets out requirements for discharge of de-oiled water (decanting) to avoid undue environmental impact. Decanting performed in commonwealth waters in accordance

			Prevention of Pollution from Ships) Act 1983, Section 9, subsection (2) (e)
Incident specific Waste Management Plan.	✓	Bass Strait Oil Spill Response Waste Management Plan	The Esso Emergency Response Waste Management Plan will assist in the development of an incident specific Waste Management Plan.

### 6.3 Capability Assessment of Containment and Recovery

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources to complete containment and recovery activities in a timely manner. The assessment concluded sufficient resources are available within acceptable timeframes to conduct this response.

This section summarises outcomes of the capability assessment.

**Table 6-5 Containment and Recovery Resource Availability**

Task	Resource Required	Resource Availability	Expected Timeframe
<b>Containment &amp; Recovery Vessels</b>	8 x vessels available for 4 x strike teams based on the MLA crude WCDS	Esso Support vessel. Agreement with third party vessel operators to supply additional vessels. Vessels of opportunity are available at Barry Beach Marine Terminal, Lakes Entrance, Port Albert, Port Welshpool, Port Franklin and Mallacoota and Hobart.	1x Vessel C&R strike team will be on site <48 hours of service request. 2x Vessel C&R strike teams will be on site <72 hours of service request.
<b>Containment &amp; Recovery Equipment</b>	Equipment for 4 x vessel strike teams.	<u>AMOSC</u> Geelong stockpile 3x C&R systems. Fremantle stockpile 3 x C&R strike systems. <u>OSRL</u> Additional equipment available through OSRL. <u>AMSA</u> Additional equipment available through AMSA.	Load out from Geelong <4 hours service request. 7 C&R systems available in Victoria Additional 3 C&R systems available in Australia that can be mobilised to Gippsland within 72 hours.
<b>Containment &amp; Recovery Personnel</b>	2 x trained and 4 x personnel per strike team.	<u>Esso</u> Core Group (10) <u>AMOSC</u> Staff (6) Core Group (50) <u>OSRL</u> Response Technicians (18)	<u>Esso</u> <24 hours from request <u>AMOSC</u> <24 hours from request of service
<b>Waste Management</b>	Onshore waste management arrangements.	Esso have a contract with a third party waste management service to provide transport and disposal of solid and liquid wastes. Refer Section 9.3.	<24 hours of service request.

Task	Resource Required	Resource Availability	Expected Timeframe
ExxonMobil	<u>Personnel</u> Trained and capable Esso IMT  Regional Response Team	Available to fulfil roles in accordance with requirements and timeframes in OPEP Table 3-2.  Remote support <12 hours from notification.  In-country support <72 hours from notification.	ExxonMobil

**Table 6-6 Containment and Recovery Resource Availability**

Good Practice	Adopted	Control	Rationale
Pre-arranged access to vessels for containment and recovery activities.	✓	Support vessel.	The support vessel that is used for ongoing Esso operations can be used for containment and recovery.
	✓	Agreement with third party suppliers for provision of additional vessels.	Agreement with supplier of vessel services has provision for the supply of additional vessels.
Pre-arranged access to additional equipment for containment and recovery.	✓	AMOSOC agreement.	Agreement with AMOSOC provides access to additional containment and recovery equipment.
Pre-arranged access to additional labour.	✓	Personnel trained for containment and recovery activities	Agreement with AMOSOC provides access to additional containment and recovery personnel.
Pre-arranged Waste facilities.	✓	Agreement with waste management contractor.	Waste arrangements for removal of waste to approved disposal or treatment facilities in accordance with EPA requirements.
Pre-arranged access to personnel to support Tier III response activities.	✓	ExxonMobil Regional Response Team	ExxonMobil have a global team available to assist response for Tier III activities.

**Table 6-7 Consideration of Additional/ Alternative/ Improved Capability for Source Control for Containment and Recovery**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Standby dedicated emergency response vessel.	A dedicated standby emergency response vessel may reduce time required to implement containment and recovery activities and increase recovery capacity.	Significant costs are associated with leasing a suitable vessel.  Given the high potential costs to the program, implementing this control measure is considered grossly disproportionate, given that the event has an extremely low likelihood of occurrence.	Not adopted.

## 7. Shoreline Protection and Clean-up

### 7.1 Response Option Description

Shoreline protection and clean-up consists of different techniques to prevent or reduce exposure of shoreline sensitives.

This shoreline response strategy is based on:

- Protection and deflection; and
- Shoreline response operations.

Advantages of Shoreline protection and clean-up:

- Deflection prevents oiling of sensitivities areas
- Clean-up removes hydrocarbon from the environment
- Reduces hydrocarbon exposure to wildlife e.g. cetaceans, birds

Disadvantages of Shoreline protection and clean-up:

- Presents safety risks
- Labour intensive response
- Increase in environmental impacts from response activities e.g. vessels
- May generate large volumes of waste

#### 7.1.1 Protection and Deflection

Protection - Booms may be used to exclude slicks from targeted sensitive shorelines and/or amenities where it is safe and conditions permit access and effective deployment.

Deflection - Booms may be deployed at an angle to a drifting slick to divert oil away from targeted sensitive areas or to a collection point where it is safe to contain and recover.

Containment and Recovery – Near shore containment and recovery (refer to Section 6) may be deployed when there is little or no current and the sea-state permits.

This response is restricted by specific weather and metocean conditions and site accessibility. In strong winds, currents and/or waves this option may not be effective. In the event of an incident, the preparedness NEBA shall be updated with incident specific information to identify the priority sites for protection. Shoreline protection and clean-up will only be used as directed by state agencies.

#### 7.1.2 Shoreline Clean-up

If a spill has reached or is predicted to reach the shoreline, an assessment of the area will be undertaken using the Shoreline Clean-up Assessment Technique (SCAT). This consists of a series of consistent and repeatable shoreline assessments that prioritise clean-up response based upon shoreline type. The assigned team will identify the appropriate shoreline clean-up technique, report the potential for, or any incidents of, oiled wildlife and undertake routine assessments throughout the response in terms of rehabilitation progress.

Shoreline clean-up consists of different manual and mechanical recovery techniques to remove oil and contaminated debris from the shoreline to reduce ongoing environmental contamination and impact.

Esso Australia and Cooper Energy have developed a Shoreline Protection and Clean-Up Plan and site specific Tactical Response Plans for Gippsland Basin oil and gas activities.

The plans outline the strategies that may be adopted and actions required to undertake safe and effective shoreline protection and clean-up response. The area assessed ranges from Port of Eden to Wilsons Promontory to Flinders Island in the Bass Strait (Figure 7-1).

**Figure 7-1 Overview of Gippsland Basin field locations**

Tactical Response Plans (TRPs) are available for primary, secondary and tertiary sites that have been assessed and chosen based on appropriate access for shoreline response, shoreline type and key sensitive receptors. The application of Global Information Systems (GIS), cross referenced with the Oil Spill Response Atlas sensitivity mapping was carried out prior to site visits to validate both the identification of specific sites as 'high priority', and the strategies proposed for shoreline response.

The TRPs are designed to be used by both the Incident Management Team and field responders. The TRPs include the following information:

- Site description;
- Site access;
- Site constraints;
- Main sensitivities;
- Facilities / services i.e. food / accommodation / medical facilities / vessel and equipment hire;
- Key local contacts i.e. land manager, local emergency services, port authority; and
- Images / diagrams marked with staging areas, access points and tactics to be implemented.

TRPs set out a series of tasks to be executed by responders and a breakdown of resources (personnel and equipment) required to implement each task.

The locations shown in Table 7-1 have pre-drafted TRPs which should be used to guide response planning. Development of additional incident specific response plans may be required for locations without a pre-determined plan.

The collection, handling and disposal of hydrocarbons introduces potential environmental impacts from the oily waste generated. The oily waste must be handled and disposed of correctly to prevent secondary contamination from contaminated equipment and decanting activities.

### 7.1.3 State Government Agencies

In response to a spill, a shoreline protection and clean-up response will be led by the respective state response agency.

The National Plan also provides guidance on shoreline clean-up techniques as outlined in National Plan Guidance Response, assessment and termination of cleaning for oil contaminated foreshores (AMSA 2015).

The State Governments of Victoria, Tasmania and New South Wales will ultimately decide, through their control agencies, how oil spill response operations will occur on these shorelines, however, Esso will make the Shoreline Protection Plan and Tactical Response Plans, incident specific NEBA and resources to support the response available. Liaison Officers will be exchanged between IMTs to manage a coordinated response.

## 7.2 Environmental Impact Assessment of Shoreline Protection and Clean-up

Nearshore shoreline protection activities are likely to be undertaken from smaller crafts that may be launched from a number of different locations along the coastline. Access to the crafts, equipment and transit to the affected areas may disturb local fauna, sensitive habitats, and cultural heritage areas and disrupt local recreational activities.

Shore clean-up activities may disturb a number of nearshore habitats as identified in the prepared Shoreline Protection Plans. The collection, handling and disposal of hydrocarbons introduces potential environmental impacts from the oily waste generated.

### 7.2.1 Impact Assessment

An impact assessment for each environmental aspect has been undertaken and additional controls have been identified to minimise the environmental impacts associated with shoreline protection and clean-up which are detailed within the ALARP assessment. Further assessment of the acceptability of these impacts in an oil spill response context and controls identified for minimising the environmental impact of shoreline protection and clean-up activities are described below.

Change to the function, interests or activities of other users could occur through disruption to recreational and commercial activities from vessel operations and site access, Table 7-2.

**Table 7-2 Environmental Aspect: Physical Presence - Nearshore and Shoreline Users**

Affected Receptor	Impact Assessment	Consequence Level
-------------------	-------------------	-------------------

<p>Socioeconomic (fisheries, tourism, culture)</p>	<p>Recreational fishing is generally concentrated inside the Gippsland Lakes or along the Ninety Mile Beach coastline. Additional vessels and personnel in the area may cause disruption to fishing activities.</p> <p>The movement of personnel, vehicles and equipment may disturb or damage aboriginal and non-aboriginal cultural heritage artefacts or sites).</p> <p>The presence of stranded oil and clean-up operations may require temporary beach closures.</p> <p>The mobilisation of equipment and personnel for shoreline protection and clean-up activities will be localised. The Oil Spill Tactical Response Plans (TRPs) detail socioeconomic sensitives for each location.</p> <p>The response activities will be in accordance with state response agency directions and Esso will provide the incident specific NEBA, TRPs and Shoreline Protections Plan and support where requested.</p> <p>The additional presence of vessels and personnel will only be short-term and in localised area for the response period. Once the response has been stood down nearshore socioeconomic activities can resume without disruptions, therefore the consequence of the impacts of the response activity is considered to be Level III.</p>	III
--	---	-----

The environmental impacts associated with containment and recovery operations include:

- Physical Presence - Interaction with Fauna and Flora
- Physical Presence – Sensitive and protected areas and parks
- Waste generation and Secondary Contamination

**Table 7-3 Environmental Aspect: Physical Presence - Interaction with Fauna and Flora**

Affected Receptor	Impact Assessment	Consequence Level
<p>Physical Presence - Interaction with Fauna and Flora</p>	<p>Shoreline clean-up activities could lead to damage to shoreline habitats from high-pressure washing, trampling of shoreline sediments, flora and fauna from vehicles and mechanical recovery techniques, and disturbance of shoreline biota by human responders and vehicles.</p> <p>The sandy beaches, lakes, mangroves and salt marshes in the Bass Strait provide potential foraging and breeding habitat for numerous bird species and benthic communities. Environmental impacts to intertidal shoreline habitats and communities may have indirect effects on the food chains, affecting the macro fauna communities which they support. In addition, the removal of habitat (such as sand from beaches) may also make them more vulnerable to ongoing erosion.</p> <p>The Tactical Response Plans (TRPs) detail environmental sensitives for each location and the OPEP states the requirement for setting up exclusion zones in conjunction with the state control agency. Response activities should avoid these exclusion zones, unless they have been selected specifically for clean-up or OWR activities.</p> <p>Shoreline clean-up activities may adversely affect important natural behaviors of biota, e.g. nesting of shorebirds and seabirds, or pinnipeds. Human presence may also cause ground disturbance due to manual raking and turnover of sandy beaches or intertidal flats to remove accumulations of weathered oil, which could affect sediment infauna, cultural heritage sites. The consequences will be localised and short term, it will recover quickly once activities cease.</p>	III

Affected Receptor	Impact Assessment	Consequence Level
	<p>Protection and Deflection activities utilise booms which sit on the water's surface, therefore fauna capable of diving, such as cetaceans and pinnipeds can avoid contact. Pinnipeds are likely to be present in the largest number. Impacts to species that inhabit the water column such as sharks and fish are not expected. The noise of the vessel motors may have a positive effect on scaring marine fauna from the immediate area.</p> <p>Protection and Deflection response activities primarily occur in the ocean with exception of haul outs sites. The mobilisation of equipment and personnel for shoreline protection and clean-up activities will be localised. The Oil Spill Tactical Response Plans (TRPs) detail environmental sensitivities for each location and the OPEP states the requirement for setting up exclusion zones in conjunction with the state control agency. Haul out sites will use existing road and paths for access, therefore, the shoreline impacts are expected to be inconsequential and have no adverse effects.</p> <p>The additional presence of vessels, equipment and personnel will only be short-term and in localised area for the response period, therefore, the consequence of the impacts of the response activity is considered to be Level III.</p>	III
Physical Presence - Sensitive and Protected Areas and Parks	<p>Potential impacts to sensitive and protected areas may be impacted from Shoreline protection and clean-up activities.</p> <p>Human activity in sensitive areas may adversely affect important natural behaviors of biota, e.g. nesting of shorebirds and seabirds, or pinnipeds. Human presence may also cause ground disturbance due to manual raking and turnover of sandy beaches or intertidal flats to remove accumulations of weathered oil, which could affect sediment infauna, cultural heritage sites, temporary exclusion of residents and tourists from amenity beaches.</p> <p>Haul out sites for protection and deflection activities will use existing road and paths for access, therefore, the impacts to sensitive and protected areas and parks are expected to be inconsequential and have no adverse effects.</p> <p>The Oil Spill Tactical Response Plans (TRPs) detail environmental sensitivities for each location and the OPEP states the requirement for setting up exclusion zones in conjunction with the state control agency. The consequence to sensitive areas is assessed as localised and short term, it will recover quickly once activities cease.</p>	III
Waste Management and Secondary Contamination	<p>Accidental loss of waste during recovery, transport and disposal activities may result in secondary contamination.</p> <p>The Esso Bass Strait Oil Spill Response Waste Management Plan, details requirement for selecting waste management options and equipment and storage to be utilised to prevent secondary contamination.</p> <p>The Shoreline Protection and Clean-Up Plan and site specific Tactical Response Plans include information on staging areas and access points. The generation of waste will be short-term and is localised for the response period, therefore, the consequence of the impacts of the response activity is considered to be to be Level III.</p>	III

**Table 7-4 Acceptability of Environmental Impacts from Shoreline Protection and Clean-up**

Factor	Demonstration Criteria	Criteria Met	Rationale
<b>Principles of Ecologically Sustainable Development (ESD)</b>	No potential to affect biological diversity and ecological integrity	✓	All aspects related to shoreline protection and clean-up activities have been evaluated as having the potential to result in a maximum Level III consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	All oil spill response activities are implemented with the aim of reducing the overall environmental impact. The purpose of shoreline protection and clean-up activities is to minimise the environmental impacts resulting from an oil spill.
<b>Legislative and Other Requirements</b>	Legislative and other requirements have been identified and met.	✓	The proposed control measures align with the requirements of: <ul style="list-style-type: none"> <li>• OPGGS Act 2006.</li> <li>• Emergency Management Act 2013 (Vic).</li> <li>• Emergency Management Act 1989 (NSW).</li> <li>• Emergency Management Act 2006 (Tas).</li> <li>• Wildlife Act 1975 (Vic).</li> <li>• EPBC Act.</li> <li>• Wildlife Act 1975 (Vic).</li> <li>• Nature Conservation Act 2002 (Tas).</li> <li>• National Parks and Wildlife Act 1974 (NSW).</li> </ul>
<b>Internal Context</b>	Consistent with Esso's Environment Policy.	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to the shoreline protection and clean-up however the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>• OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations</li> </ul>
<b>External Context</b>	Stakeholder concerns have been considered / addressed through the consultation process.	✓	No specific stakeholder concerns have been raised.

**Table 7-5 ALARP Demonstration of Environmental Impacts from Shoreline Protection and Clean-up Activities**

<b>ALARP Decision Context and Justification</b>	<p>Decision Context A</p> <p>Shoreline protection and clean-up activities are standard practice for hydrocarbon spills to reduce hydrocarbons in the marine environment and minimise impacts to shoreline sensitivities.</p> <p>There is a good understanding of potential impacts from shoreline protection and clean-up activities. This response option would be supported by an incident specific NEBA.</p> <p>All activities undertaken in state waters will be led by the State Control Agency. Good Practice controls have been identified to ensure environmental impacts associated with mobilising this response are reduced to ALARP. These controls will be implemented by the state led control agency in a response scenario and have been included in the OPEP.</p> <p>Note that the response must be led by State Control Agencies, with Esso providing support and resources when requested.</p> <p>Esso believes ALARP Decision Context A should apply.</p>		
<b>Good Practice</b>	<b>Adopted</b>	<b>Control</b>	<b>Rationale</b>
NEBA completed prior to conducting shoreline protection and clean-up activities application operations.	✓	Incident specific NEBA.	The NEBA takes into account the circumstances of spill, fate of the oil, potential environmental and social impacts and relative oil spill response options.
Environmental consideration of Gippsland basin local shorelines.	✓	Primary & Secondary Shoreline Tactical Response Plans (TRPs).	Shoreline Protection Plan & Tactical Response Plans (TRPs) describe the shoreline types and have categorised primary and secondary sites which have been assessed and chosen based on appropriate shoreline response options, shoreline type and key sensitive receptors.  These plans will be made available to the control agency.
Incident specific Waste Management Plan.	✓	Bass Strait Oil Spill Response Waste Management Plan	The Esso Emergency Response Waste Management Plan will assist in the development of an incident specific Waste Management Plan.
Ensure daily Containment and Recovery operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered)	✓	Daily records of oil recovered	Daily logs and records of containment and recovery operations demonstrate that CAR equipment was deployed safely, effectively and following consideration of environmental conditions.
Exclusion zones established	✓	Exclusion zones	The OPEP requires that exclusion zones are put in place which consider health and safety and environment risks. These exclusion zones are determined in consultation with the state control agency.

**Table 7-6 Engineering Risk Assessment**

Additional, Alternative, Improved Controls	Benefit	Cost Feasibility /	Adopted
Shoreline protection and clean up only undertaken within daylight hours	Undertaking shoreline protection and clean up during daylight hours to ensure personnel can see sensitive environmental receptors and minimize impacts cause by unplanned interactions with flora and fauna.	Response duration will be extended.	Yes

Additional, Alternative, Improved Controls	Benefit	Cost Feasibility	/	Adopted
	Response during daylight hours also has significant benefits in reducing safety risks (e.g. injury) to personnel.			

### 7.3 Capability Assessment of Shoreline Protection and Clean-up

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources to support the State Control Agency with an effective response in a timely manner. The assessment concluded sufficient resources are available within acceptable timeframes to conduct a response should it be required. The shoreline protection and clean-up capability assessment has been completed for planning and preparedness purposes. The State Control Agency will ultimately decide what strategies are to be implemented and the quantity and source of resources to be used during an incident.

#### 7.3.1 Shoreline protection

Tactical response plans are used to assist in determining capability requirements, taking into account the specifics of the receiving environment.

Spill modelling is used to determine required resources to undertake shoreline protection and clean up. The ExxonMobil Oil Spill Response Field Manual [2014 edition], Section 12, Tables 12-1 to 12-23 is used to calculate resources for shoreline protection and clean-up including:

- Primary equipment required
- Size/type/description of equipment
- Numbers required
- Likely treatment rates and capacities

The above information is then aligned with shoreline protection planning based on location specific tactical response plans (TRPs) that have been developed for pre-identified priority locations (see Table 7-1). There exists the potential requirement to implement multiple TRPs during a single incident. EAPL considers the numbers and response timing requirements are conservative given that:

- a. Modelling of the worst case minimum time to shoreline contact has been used, and;
- b. Stochastic modelling results have been used to identify the potential TRP's that may need to be implemented concurrently, and;
- c. Secondary TRP locations will not necessarily require a response, should the incident occur when the estuaries are closed.

The sum of resources required to implement the identified TRPs is summarised in the activity specific Quick Reference Guides. EAPL has also considered the concurrent implementation of the worst case scenario shoreline protection requirements which include the bulk of the TRPs, totalling 22 sites with the highest resource requirements, which are summarised in Table 7-10. While these calculations consider overall requirements, modelling demonstrates that oil will accumulate on different sections of the coast over time requiring a phased approach to resource deployment and implementation of TRP's. The below table provides an example of progressive personnel requirements using the phase of response concept as detailed in the OPEP. This approach has also been used to assess phased equipment needs and availability.

**Table 7-7 Progressive Personnel Required - Shoreline Impact and TRP Activation**

Assessment based on Seahorse Crude WCDS Modelling as a representative example of near shore loss of well control. Seahorse has now been plugged and abandoned.

### 7.3.2 Shoreline protection

Strategies and resource needs for shoreline clean up have been assessed based on the shoreline type within each sector of the coastline with >100 gm/m<sup>3</sup> predicted shoreline loading based on stochastic modelling outputs. An indication of the level of resources required is provided using spill resource calculations. The spill resource calculations provide an indication of the levels of resources required to respond based on a number of estimates and assumptions, taking into account best practice and utilising detailed data on the shorelines involved. A detailed explanation of the resource calculations is provided in Section 7.3.3. The figures provided represent a target resource estimate and can be applied across a variety of scenarios. The resource numbers indicated are for response on a continuous basis and do not reflect a rapid initial demand for resources with slow taper off over the duration of the response. Initial resource requirements can be scaled up as required to achieve quicker results on a smaller scale response, while a larger scale response may continue to escalate.

As well as the numbers provided through resource calculations, a capability assessment for shoreline clean up was conducted based on stochastic modelling using the maximum predicted shoreline loading for each sector. This method provides an understanding of the potential resource needs for all sectors of coastline that maybe impacted, however, significantly over estimates the resources likely to be required for an individual incident.

The modelling provides an indication of the outer limits of a response however additional resources may be required for locations beyond the identified Sub-LGAs. These resources have not been considered within the scope of the capability assessment and TRP's have not been prepared for locations with low probability of moderate shoreline impact (<10%) or where shoreline impact is predicted in a minimum contact time of >7 days. Operational monitoring will be used to inform the need for incident specific response plans for these locations.

### 7.3.3 Shoreline clean up capability methodology

Oil spill trajectory modelling based on worst case discharge scenarios has been used to calculate shoreline response capability requirements. The modelling outputs included a summary of potential shoreline impacts, probability of impact, maximum load on the shoreline, length of shoreline affected at > 10 gm/m<sup>2</sup>, and the length of shoreline affected at > 100 gm/m<sup>2</sup>.

A resource calculator was designed using the resultant shoreline impacts, lengths of shoreline affected, degree of oiling, and best practice spill response tactics and resourcing estimates to undertake those tactics. Calculations have been based on no other interventions, such as containment & recovery or chemical dispersants, being utilised and so represent resource needs significantly greater than would be likely in an actual response where a range of strategies would be utilised in combination.

The ExxonMobil Oil Spill Response Field Manual provides industry best practice guidelines and information which was utilised as the basis for typical resources required for particular strategies and recognised shoreline types.

The resource calculator spreadsheet uses the shoreline type to determine the response strategies, then calculates the recommended number of personnel and equipment to enact the strategy. Each shoreline type may require a combination of response strategies, so each strategy per shoreline type was

assigned a likelihood percentage that it would be applied. The below table shows the shoreline type, along with the strategies and percentages used in the calculations.

**Table 7-8 Shoreline Clean-up – Shoreline type and methodology used for clean-up**

<i>Shoreline Type</i>	<i>Clean-up method to be used</i>	<i>% of oiled shoreline type for clean-up method</i>
1. Manmade structures	flooding	10%
	HP, ambient-water flushing	60%
	hot water flushing	10%
	natural recovery	20%
2. Rocky Shores (sheltered)	natural recovery	100%
3. Rocky platform / cliff face (exposed)	natural recovery	100%
4. Sandy beach (mixed sand/shell)	manual removal - light oil	20%
	manual removal - heavy oil	30%
	flooding	20%
	mechanical removal	10%
	natural recovery	20%
5. Tidal flats (mud/sand) and vegetative salt/brackish marsh	LP, ambient-water flushing	30%
	natural recovery	70%
6. Shallow seagrass	natural recovery	100%
7. Reef	natural recovery	100%
8. Mangroves	LP, ambient-water flushing	20%
	natural recovery	80%

The Resource Calculator provides for calculating resources for an entire stretch of affected coastline to be cleaned in a single day. Corresponding numbers for the resources required were very large and do not take into account:

- (1) External factors that act as constraints on the effective deployment or control of these resources, or secondary damage that they could cause, or
- (2) The fact that these resources take time to 'ramp-up.'

Given that a response will commence with a first strike plan and escalate from lower initial numbers to those required to manage the clean-up in the longer term, having 100% of resources from an early stage is an inaccurate representation of resources required.

In a large-scale response it has been demonstrated that 100% of the resources are unable to be applied within 7 to 10 days as the sheer numbers and the scale of the operation would be unmanageable.

Based on examples of incidents, estimates, and physical comparison of the numbers that would be both manageable and reasonably required to clean up known sections of beach within the boundaries of the modeling output, a conservative figure of 10% was applied to the calculator to best represent a target resource estimate across the variety of scenarios.

The outputs from the calculator, while indicating the level of possible resources, are not an upper limit and the reduction factor can be adjusted. Scaling up a response quickly to affect a faster resolution for a smaller scale spill can be managed through multiplication of the original resource requirements. A more accurate, detailed analysis of the resources required during an escalating response could be produced by the Logistics Section.

The table below shows estimates from the ExxonMobil Oil Spill Field Manual versus output of the Resource Calculator and indicates a reasonable correlation between the two:

**Table 7-9 Comparison between ExxonMobil Oil Spill Field Manual resource recommendations and Resource Calculator output requirements for SHA shoreline cleanup**

ExxonMobil Oil Spill Response Field Manual					
		lightly oiled shoreline		heavily oiled shoreline	
No timeframe	Resources Required	2 km	100 km	2 km	100 km
	Workers	10 - 20	100 - 200	50 - 100	500 - 1,000
	Foremen	1 - 2	10 - 20	5 - 10	50 - 100
Resource Calculator					
	Resources Required	2 km shoreline		100 km shoreline	
10% capacity per day for duration of spill	Foreman	2		44	
	Worker	10		420	
	Specialised Operators	2		26	
	Total People	14		490

	Worker	84		4200	
	Specialised Operators	6		260	
	Total People	100		4900	

If relative short section of shoreline is affected, then a valid response would be the allocation of 100% of the resources available to clean it up in a day. Conversely, if hundreds of kilometres of shoreline is affected, the allocation of 100% of the required resources immediately would present a number of practical problems that could not be overcome including:

- Exceeding span of control through the divisions, branches, and clean up teams at one or more Forward Operating Bases and staging areas,
- Overloading the carrying capacity of the regional community support resources (Accommodation, messing, ablutions, etc.),
- Overloading the response location environment (Crowded carparks, traffic on beaches, etc.), and

- Under COVID-19 conditions, exceeding the ability to maintain social distancing or accommodation/isolation arrangements.
- Managing the safety and security of personnel.

Contained within the Resource Calculator is an interface which requires the input of length affected and % of shoreline type for the affected area. From these it then produces a resource list, as per below table.

Total Oiled Shoreline (km)	21	Resources Needed					
		Personnel	14 days	28 days	56 days	84 days	112 days
% of shoreline cleaned in 1 day.	10						
<b>Shoreline Type</b>	<b>%</b>	Foreman	3	6	6	6	6

**Figure 7-2 Oil Spill Response Calculator extract**

Analysis of the modelling allowed determination of shoreline areas that would be impacted. Potential impact zones with a probability of impact <10% were eliminated, leaving a comprehensive list of sites with 10% or greater probability of being impacted at or above the 10 g/m<sup>2</sup>.

Comprehensive shoreline surveys using Google Earth imagery and cross referenced with a VIC DOT layer of shoreline types was used to categorise the shoreline makeup in each Sector. Shoreline types specified were then utilised in the calculations to determine strategies and resourcing requirements.

The combined total for the sectors affected in each scenario provides total resources required for that scenario.

In addition to personnel, the Resource Calculator estimates other required resources and is based on a number of assumptions. Taken from the ExxonMobil Oil Spill Response Field Manual for each of the recommended response strategies, the following have been applied relating to the personnel columns:

- Based on 14 day shifts of workers
- Based on oil stranding daily/Continuously
- Based on 1 primary crew and a replacement crew in rotation.
- Based on heavily oiled shorelines and resources required per km.
- Based on average of shoreline strategies for each shoreline type (described previously)

For the vehicles & vessels section, all totals were based on the resources required for a stretch of shoreline affected based on the strategy used as described above in the master calculations spreadsheet.

For the Manual equipment section:

- Shovels based on 1 per worker per week

- Rakes based on 1 per worker per week
- Pick based on 1 per worker per week
- Plastic bags based on 50 per worker per day (50\*20 kg each = 1000 kg/day)
- Wheel Barrows based on 1 per team (5 persons) per week then replaced

Adjustment of the percentage of shoreline cleaned per day, or the percentage of shoreline strategy applied to a given shoreline type, the resultant resources required will change, however it must be pointed out that where a range has been presented, we have erred to the worst-case scenario to produce conservative figures.

**Table 7-10 Shoreline Protection and Clean-up Resource Availability**

Task	Resource requirement	Resource Availability	Expected Timeframe
<b>O3: Shoreline Assessment Personnel</b>	<p>SCAT teams will comprise of:</p> <ul style="list-style-type: none"> <li>• 2 shoreline assessment trained (SAT) personnel (for primary TRPs) or 1 shoreline assessment trained person (for secondary TRPs)</li> <li>• State representatives</li> <li>• Operations and safety officers as needed</li> </ul> <p>Trained shoreline assessment personnel needed:</p> <ul style="list-style-type: none"> <li>• 3 in first 48 hrs</li> <li>• 9 in hours 48 – 96</li> <li>• Up to 18 post 96 hrs</li> </ul> <p>Based on simultaneous implementation of all TRPs described in Table 7-7.</p>	<p>OSMP consultant has the following trained personnel available to respond.</p> <ul style="list-style-type: none"> <li>• 12 SAT personnel available within 24 hrs. of activation.</li> <li>• An additional 12 SAT staff are available within 14 days of activation.</li> </ul> <p>SAT personnel completing SCAT assessments in the first 48hrs will be made available to complete more assessments once initial SCAT assessments are complete.</p>	<p>12 field personnel to be mobilised within 24 hours of activation.</p> <p>Additional 12 field personnel to be mobilised within 14 days of activation.</p>
<b>Vessels for Shoreline Protection</b>	<p>12 x vessels* based on SHA crude WCDS.</p>	<p>Gippsland Ports have suitable vessels for nearshore response activities.</p> <p>Agreements with third party vessel operators to supply additional vessels.</p> <p>Vessels of opportunity are available at Barry Beach Marine Terminal, Lakes Entrance, Port Albert, Port Welshpool, Port Franklin and Mallacoota and Hobart.</p>	<p>6x vessels required within 24 hours</p>
<b>Shoreline Protection Response Equipment</b>	<p>3,250 m x Shoreboom 2,025 m x Near shore boom 1 x Offshore skimming system Anchor kits + accessories</p> <p>Based on simultaneous implementation of all TRP's from Merriman Creek (Vic) through to Nullica River (NSW)</p>	<p><u>Esso/AMOSC (Geelong)</u> Shoreboom: 2,025m Near Shore boom: 6500m Anchor kits + accessories: 47 Offshore skimming system: 8 Temporary waste storage: 12</p> <p><u>AMOSC/AMSA/Mutual Aid:</u> Shoreboom: 5750 m</p>	<p>Esso/AMOSC (Geelong) &lt;48 hours of request for service.</p> <p>Additional equipment &lt;5 days of request of service</p>

Task	Resource requirement	Resource Availability	Expected Timeframe
		Near Shore boom: 10975 m Anchor kits + accessories: 112 Offshore skimming system: 30 Temporary waste storage: 65	Refer to Quick Reference Guides for scenario specific requirements
<b>Shoreline Protection Response Personnel</b>	Up to 518 personnel based on the SHA crude WCDS.	<u>State Response Team</u> >200 trained personnel. <u>AMOSC</u> Core group <120 trained personnel (inc Esso). <u>Esso</u> Esso responders Agreements in place with labour hire companies.	<u>State Response Team</u> Notify <2 hours of incident.  Initiate request to call out core group <3 hours.
<b>Shoreline Clean-up Personnel</b>	Up to 1926 personnel based on the SHA crude WCDS	<u>Esso</u> Esso responders Agreements in place with labour hire companies. <u>AMOSC</u> Core group >140 trained personnel (including Esso). <u>State Response Team</u> >200 trained personnel.	<48 hours of request for service. Refer to Quick Reference Guides for scenario specific requirements
<b>Waste Management</b>	Onshore waste management arrangements.	Esso have a contract with a third party waste management service to provide transport and disposal of solid and liquid wastes.	<48 hours of service request.
<b>ExxonMobil</b>	<u>Personnel</u> Trained and capable Esso IMT  Regional Response Team	Available to fulfil roles in accordance with requirements and timeframes in OPEP Table 3-2.  Remote support <12 hours from notification.  In-country support <72 hours from notification.	

**Table 7-11 Shoreline Protection and Clean-up Capabilities**

Good Practice	Adopted	Control	Rationale
Pre-arranged access to personnel for O3 Shoreline Assessment	✓	Agreement with Third Party OSMP Consultant for personnel and resources required for implementation of OSMP.	Esso has an agreement in place with a Third Party OSMP Consultant who can provide access to personnel with the required training/experience for SCAT under OSMP module O3.
Pre-arranged access to vessels for shoreline protection.	✓	Agreement with third party suppliers for provision of additional vessels.	Agreement with supplier of vessel services has provision for the supply of additional vessels.

Good Practice	Adopted	Control	Rationale
Shoreline protection and deflection equipment available.	✓	Esso owned shoreline protection and deflection equipment.	Esso owns its own equipment that can be utilised for shoreline protection and clean up
Pre-arranged access to additional equipment for shoreline protection and deflection.	✓	AMOSOC agreement.	Agreement with AMOSOC provides access to additional equipment for shoreline protection and clean up equipment
Pre-arranged access to additional labour.	✓	Personnel hiring agreements.	Esso has personnel hiring agreements in place which can be utilised to provide personnel for shoreline protection and clean up activities.
Pre-arranged Waste facilities.	✓	Agreement with waste management contractor.	Waste arrangements for removal of waste to approved disposal or treatment facilities in accordance with EPA requirements.
Pre-arranged Heavy Plant Equipment	✓	Agreement with contractor for heavy lift equipment	Agreement with third party provides access to heavy plant equipment for shoreline protection and clean up.
Pre-arranged access to personnel to support Tier III response activities.	✓	ExxonMobil Regional Response Team	ExxonMobil have a global team available to assist response for Tier III activities.

**Table 7-12 Consideration of Additional/ Alternative/ Improved Capability for Shoreline Protection and Clean-up**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Reconfigure and relocate equipment	Reduce mobilisation times.	Relocation of equipment will be costly. The current equipment location allows for rapid mobilisation to the priority shorelines which are most likely to be impacted based on modelling. Relocation of shoreline protection and clean up equipment will only bring minimal, if any, benefits in response capability.  Esso has assessed that sufficient equipment is available in Tier I & II equipment stockpiles located in Victoria to support shoreline protection and response requirements during the initial response phase (first 48hrs).	Not adopted
Resource to implement shoreline protection strategies prior to minimum shoreline contact time.	Reduce environmental impacts to estuaries.	Stochastic modelling of 100 weather and current scenarios indicates a minimum time to shore of 20hrs (Lakes Entrance / Seaspray) at low threshold and 30hrs (Lakes Entrance) at moderate threshold, with other weather combinations indicating longer times to shore.  Given the complexity of implementing tactical response plan at Lakes Entrance an estimated 103 personnel are required to implement the response strategies in up to five locations.  Additional cost in maintaining response capacity of this size to implement TRP's prior to shoreline impact is disproportionate to the risk.	Not adopted

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
		Esso has assessed that sufficient equipment is available in Tier I & II equipment stockpiles located in Victoria to support shoreline protection and response requirements during the initial response phase (first 48hrs).	
Agreement with response company	Access to additional shoreline protection and clean-up equipment and personnel.	Esso owns equipment that can be used for shoreline protection and clean-up and has an agreement in place with AMOSC and OSRL to allow access to AMOSC/OSRL equipment. Esso can provide some of its own responders, has agreements in place with labour hire companies and has access to personnel from AMOSC core group and OSRL. The cost of having an agreement in place with additional response companies outweighs the small benefit that would come from such an agreement.	Not adopted
Additional agreements in place with monitoring providers	Access to additional personnel for implementation of O3 Shoreline Assessment	There would be added costs associated with having additional agreements in place and assessing and maintaining the capability to respond. While the length of shoreline to be assessed is significant, the number of field teams only needs to be enough to stay 2-3 days ahead of the shoreline operations (IPIECA, 2014) in order to support the effective and timely implementation of shoreline cleanup and protection. The Third Party OSMP Consultant has access to up to 24 staff with shoreline assessment experience. Logistics planning based on the SHA WDCS and TWA P&A WDCS affected TRP's indicates that based on a scaling up of resources this would be sufficient for the implementation of the OSMP O3 module. The resources available through the existing agreement easily meet this requirement.  In the case of a Level 3 incident, Esso would draw upon relationships and/or agreements with SCAT specialists that will be called upon on a best endeavours basis.	Not adopted
Increase number of trained personnel	Additional trained personnel available who could direct untrained laborers.	There is a significant cost associated with increasing the number of trained personnel and maintaining training status. Esso has access to AMOSC core group and State Response Team trained personnel in addition to agreements with labour hire companies which is sufficient to meet required the capability.  Should additional personnel be required to support a response, just in time training can be utilised to train labourers and management staff for these laborers.	Not adopted
Agreements with vessel operators	Rapid and guaranteed access to vessels in the event of a spill.	As described above, Gippsland Ports can provide suitable vessels for nearshore response activities. Some agreements are in place with third party vessel operators to supply additional vessels. Capability assessment indicates that vessel requirements are able to be met so the costs	Not adopted

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
		of additional agreements with vessel operators are not justified.	
TRP / GRPs for the whole coastline	Increased understanding of capability requirements beyond the areas currently covered by TRPs.	TRPs have been developed for priority sites that are appropriate for shoreline response, covering a large stretch of coastline. TRP's are supported by the Shoreline Protection & Clean Up Plan which provides non-location specific guidance. Given the low likelihood for shoreline exposure beyond this area, the benefit of addition TRPs is considered minimal.	Not adopted

## 8. Oiled Wildlife Response

### 8.1 Response Option Description

Coastal areas are most likely to have the largest number of affected wildlife from an oil spill given that coastal areas provide habitat for breeding and foraging as well as protection from the elements. The scale of the impacts to wildlife does not correlate with the amount of oil spilled but is dependent on factors such as the timing and location of an incident, the product type, oceanography and weather patterns, and the corresponding movements of species that feed, nest or generally inhabit a particular area.

Oiled wildlife response (OWR) is a combination of activities with the objective to minimise the impacts of an oil spill on wildlife (such as birds, mammals and reptiles) by both prevention of oiling where possible and mitigating the effects on individuals following an oil spill incident.

Oiled wildlife response consists of a three-tiered approach involving:

- Primary: Situational understanding of the species/populations potentially affected (NEBA, SCAT, aerial surveillance);
- Secondary: Deterrence or displacement strategies (e.g. hazing, visual flags/balloons, barricade fences; or pre-emptive capture); and
- Tertiary: Recovery, construction of operating unit, transport, waste management, veterinary examination, triage, stabilisation, cleaning/washing, rehabilitation, release.

The oiled wildlife response may lead to the survival of vulnerable wildlife populations. The level of oiled wildlife response required can be scaled up or down based on the predicted number of wildlife affected.

Site-specific wildlife reconnaissance would be undertaken on foot, by vehicle, by vessel or by aircraft, and should be conducted across areas potentially at risk. This activity is key to gather baseline information on the numbers of wildlife present and/or individuals oiled.

Information from the reconnaissance is then used to inform the NEBA and assist the IMT to select suitable response options.

Ongoing surveillance and monitoring may utilise surveillance and monitoring aircraft and vessel resources.

An Area Response Plan has been developed for Gabo Island which provides guidance on initial oiled wildlife response actions. A number of Species Response Plans have also been developed to provide responders with guidance on appropriate response strategies for individual species.

Advantages of oiled wildlife response:

- Protection / hazing methods may minimise oiling of wildlife;
- Reduces hydrocarbon exposure to wildlife e.g. cetaceans, birds

Disadvantages of oiled wildlife response:

- Presents safety risks;
- Distress caused to wildlife;
- Labour intensive
- Increase in environmental impacts e.g. generates waste and potential for secondary contamination

#### 8.1.1.1 Protection of nesting/haul-out sites

Sensitive areas may be protected from the spill using protection and deflection (Section 7.1.1) and containment and recovery (Section 6) response options.

#### 8.1.1.2 Hazing and deterrence

Hazing and deterrence are terms used for activities that are undertaken to prevent or discourage wildlife from entering contaminated sites or move them away from areas that are likely to be affected by the spill. A potential negative outcome of hazing can be disturbance of target biota with potential for behavioural impacts and stress-related responses.

#### 8.1.1.3 Pre-emptive capture

Pre-emptive capture is the capture of healthy, unoiled wildlife and transporting them to an area that is unlikely to be affected by the spill. Potential negative impacts of this method is inadequate capture techniques that have potential to cause stress, exhaustion or injury to wildlife and pre-emptive capture could cause undue impacts when oiling is not certain.

#### 8.1.1.4 Triage assessments

Depending on the numbers and species of animals affected from the spill, a triage assessment may be required to ensure the best chance of long term survival. The assessment process is typically undertaken by a veterinarian under direction of the state agency.

#### 8.1.1.5 Rehabilitation centres for oiled wildlife

Rehabilitation methods have been developed that aim to effectively reverse the effect of oiling, and return the health of an oiled animal back to an assumed pre-oiling state. The key stages associated with rehabilitation are:

- Capture;
- Transportation;
- Stabilisation;
- Decontamination;
- Conditioning; and
- Release.

Potential negative impacts of wildlife rehabilitation are inefficient techniques at any of the above key stages can have the potential to cause injury, stress and pressures to wildlife.

### 8.1.2 Waste management

OWR generates large volumes of waste contaminated with hydrocarbon attributed to large volumes of water associated with cleaning, washing and rehabilitating the oiled wildlife. Estimated volumes are provided in Table 8-1. Refer to Section 9.3 for waste handling.

**Table 8-1 Estimated Waste Types and Volumes**

Waste Type	Waste Volume	No. of Units	Estimated Volume
Waste Water	1 m <sup>3</sup> per unit (1 unit per bird)	50 <sup>1</sup>	50 m <sup>3</sup>
PPE	5 kg per unit	50 <sup>1</sup>	250 kg, ~2 m <sup>3</sup>

<sup>1</sup>Number of units based upon a Level 3 incident as described in DPAW (2014). This was considered to provide a suitable indication as to the number of units potentially exposed in lieu of any other appropriate estimation tool.

### 8.1.3 State Government Agencies

In response to a spill, an Oiled Wildlife Response will be led by the respective state response agency.

The State Governments of Victoria, Tasmania and New South Wales will ultimately decide, through their control agencies, how oiled wildlife spill response operations will occur on these shorelines, however, Esso will make the Shoreline Protection Plan and Tactical Response Plans and resources to support the response available.

#### 8.1.3.1 Victoria

The DELWP (Department of Environment, Land, Water and Planning) has primary responsibility for wildlife impacted by marine pollution in Victorian state waters, which will be defined in the Victorian Emergency Wildlife Plan for Marine Pollution (under development) and the Victorian State Maritime Emergencies (non-search and rescue) Plan (SMEP).

#### 8.1.3.2 Tasmania

The control agencies within Tasmania are Tasmanian Ports Corporation (Tasports) within port waters and the Tasmanian EPA outside of port waters. The state Tasmanian Marine Oil Spill Contingency Plan (TasPlan) is administered by the EPA and is integrated with the National Plan, the Tasports Oil Spill Contingency Plan, the Tasmanian Emergency Management Plan and the Tasmanian Oiled Wildlife Response Plan (WildPlan).

#### 8.1.3.3 New South Wales

New South Wales Maritime is the control agency for marine pollution control incidents within state waters in accordance with the NSW State Emergency Management Plan (EMPLAN) and the NSW State Waters Marine Oil and Chemical Spill Contingency Plan which is a sub-plan of the EMPLAN.

If an incident occurs in Commonwealth waters and has the potential to enter state waters, State Agencies must be immediately notified and Esso will support and provide resources when requested. Esso personnel may also be deployed under the direction of State to undertake wildlife response activities, however only trained people can interact with oiled fauna species.

## 8.2 Environmental Impact Assessment of Oiled Wildlife Response

Nearshore OWR activities are likely to be undertaken on foot or by smaller crafts that may be launched from a number of different locations along the coastline. Access to the crafts, equipment and transit to the affected areas may disturb local fauna and sensitive habitats.

A number of activities associated with this response involve direct contact with wildlife e.g. pre-emptive capture, rehabilitation and cleaning animals, and their release. These activities will only be undertaken by trained personnel and vets.

Wildlife rehabilitation centres will be constructed where required and should include reliable systems for the supply of potable water, electricity, heating or cooling, and ventilation that meet the specific wildlife requirements as well as amenities for personnel including food and lodging, waste disposal and communications. The construction of rehabilitation centres for OWR activities will be controlled by the state agency.

One of the disadvantages of running a rehabilitation centre is that it generates large volumes of waste. There is also a potential for secondary contamination through the handling of oiled wildlife and waste generation. The oily waste must be handled and disposed of correctly to prevent secondary contamination from contaminated equipment and PPE.

### 8.2.1 Impact Assessment

An impact assessment for each aspect has been undertaken and additional controls have been identified to minimise the environmental impacts associated with Oiled Wildlife Response which are detailed within the ALARP assessment. Further assessment of the acceptability of these impacts in an

oil spill response context and controls identified for minimising the environmental impact of OWR activities are described below.

Change to the function, interests or activities of other users that could occur through disruption to recreational and commercial activities from an OWR are provided in Table 8-2.

**Table 8-2 Environmental Aspect: Physical Presence - Nearshore and Shoreline Users**

Affected Receptor	Impact Assessment	Consequence Level
Socioeconomic (fisheries, tourism, culture)	<p>Recreational fishing is generally concentrated inside the Gippsland Lakes or along the Ninety Mile Beach coastline. Additional vessels and personnel in the area may cause disruption to fishing activities.</p> <p>The movement of personnel, vehicles and equipment may disturb or damage aboriginal or non-aboriginal cultural heritage artefacts or sites.</p> <p>The mobilisation of equipment and personnel for OWR activities will be localised. The Oil Spill Tactical Response Plans (TRPs) detail socioeconomic sensitives for each location.</p> <p>The response activities will be in accordance with state response agency directions and Esso will provide the incident specific NEBA, TRPs and Shoreline Protections Plan and support where requested.</p> <p>The additional presence of vessels and personnel will only be short-term and in localised area for the response period. Once the response has been stood down nearshore socioeconomic activities can resume without disruptions, therefore the consequence of the impacts of the response activity is considered to be Level III.</p>	III

The environmental impacts associated with containment and recovery operations include:

- Physical Presence – Interaction with Fauna and Flora
- Physical Presence – Sensitive and protected areas and parks
- Waste generation and Secondary Contamination

**Table 8-3 Environmental Aspect: Physical Presence - Interaction with Fauna and Flora**

Affected Receptor	Impact Assessment	Consequence Level
Physical Presence - Interaction with Fauna and Flora	<p>The sandy beaches, mangroves and salt marshes in the Bass Strait provide potential foraging and breeding habitat for numerous bird species and benthic communities. The flora and fauna within these habitats have the potential to be disturbed due to large numbers of personnel accessing sites. Human presence may also cause ground disturbance due to construction of OWR rehabilitation centers.</p> <p>Fauna casualties from OWR techniques have the potential to result in an incremental effect on fauna populations (though oiling is expected to pose a greater risk). However, there is still the potential for the techniques to result in localised degradation of the environment or effects on individuals as opposed to population level.</p> <p>Hazing and pre-emptive capture of wildlife may result in the prevention of species accessing their preferred resources. This approach may also result in additional disturbance/handling stress without any benefit as many species tend to return to sites from which they have been moved. This may result in reduced reproduction and reduced energy stored for migratory animals.</p> <p>The incorrect handling of fauna may also result in increased stress levels and therefore increased fauna casualties.</p> <p>OWR activities will generally be conducted onshore. Wildlife rehabilitation centers will be set up in areas which have site access, electricity and amenities for personnel including food and lodging,</p>	III

Affected Receptor	Impact Assessment	Consequence Level
	<p>waste disposal and communications. The Shoreline Protection and Clean-Up Plan and site specific Tactical Response Plans include information on staging areas and access points, personnel shall use existing road and paths for access to minimise the impacts of increased foot and vehicle traffic.</p> <p>Fauna and flora interactions as a result of oiled wildlife response and shoreline clean-up techniques will be localised and short term. Flora and fauna are expected to recover quickly once activities cease.</p>	
Physical Presence - Sensitive and protected areas and parks	<p>Potential impacts to sensitive and protected areas may be impacted from OWR activities. There is a potential that personnel may have to travel through sensitive areas to access wildlife or conduct hazing, wildlife deterrence activities.</p> <p>The OWR activities may adversely affect natural behaviors of biota, e.g. nesting of shorebirds and seabirds. Human presence may also cause ground disturbance due to construction of OWR rehabilitation centers.</p> <p>The mobilisation of equipment and personnel for OWR activities will be localised. The Oil Spill Tactical Response Plans (TRPs) detail environmental sensitives for each location. Temporary exclusion zones can be set up to avoid sensitive areas.</p> <p>The environmental consequence to sensitive marine areas is assessed as localised and short term, it will recover quickly once activities cease.</p>	III
Waste Management and Secondary Contamination	<p>Wildlife response activities, specifically running a rehabilitation center, generates large volumes of waste. There is a potential for secondary contamination through the handling of oiled wildlife and waste generation.</p> <p>The Esso Bass Strait Oil Spill Response Waste Management Plan, details requirement for selecting waste management options and equipment and storage to be utilised to prevent secondary contamination.</p> <p>The Shoreline Protection and Clean-Up Plan and site specific Tactical Response Plans include information on staging areas and access points.</p> <p>The generation of waste will be short-term and is localised for the response period, therefore, the consequence of the impacts of the response activity is considered to be Level III.</p>	III

**Table 8-4 Acceptability of Environmental Impacts from Oiled Wildlife Response**

Factor	Demonstration Criteria	Criteria	Rationale
<b>Principles of Ecologically Sustainable Development (ESD)</b>	No potential to affect biological diversity and ecological integrity	✓	All the aspects related to oiled wildlife response have been evaluated as having the potential to result in a maximum Level III consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	All oil spill response activities are implemented with the aim of reducing the overall environmental impact. Mobilising an OWR is an inherent part of minimising the impacts from an oil spill incident on wildlife.
<b>Legislative and other Requirements</b>	Legislative and other requirements have been identified and met.	✓	Legislation and other requirements have been considered as relevant and include: <ul style="list-style-type: none"> <li>OPGGS Act 2006;</li> </ul>

			<ul style="list-style-type: none"> <li>• Protection of the Sea (Prevention of</li> <li>• EPBC Act;</li> <li>• Wildlife Act 1975 (Vic);</li> <li>• Nature Conservation Act 2002 (Tas); and</li> <li>• National Parks and Wildlife Act 1974 (NSW).</li> </ul>
<b>Internal Context</b>	Consistent with Esso's Environment Policy.	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to oiled wildlife response, however the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>• OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations</li> </ul>
<b>External Context</b>	Stakeholder concerns have been considered / addressed through the consultation process.	✓	No specific stakeholder concerns have been raised.

**Table 8-5 ALARP Demonstration of Potential Impacts of Oiled Wildlife Response**

<b>ALARP Context and Justification</b>	<b>Decision and</b>	Decision Context A	
	<b>Justification</b>	<p>Oiled wildlife response activities are standard practice for hydrocarbon spills to minimise the impacts resulting from an oil spill on wildlife.</p> <p>There is a good understanding of potential impacts from oiled wildlife response activities. This response option would be supported by an incident specific NEBA.</p> <p>All activities undertaken in state waters will be led by the state control agency.</p> <p>Good Practice control(s) have been identified to ensure environmental impacts associated with mobilising this response are reduced to ALARP, these controls will be implemented by the State Control Agency in a response scenario and have been included in the OPEP.</p> <p>Esso believes ALARP Decision Context A should apply.</p>	
<b>Good Practice</b>	<b>Adopted</b>	<b>Control</b>	<b>Rationale</b>

NEBA completed prior to conducting OWR operations.	✓	Incident specific NEBA.	The NEBA supports the implementation of the response strategies, and an operational NEBA is undertaken throughout the emergency response.
Minimise impacts to coastal environmental sensitivities.	✓	Primary & Secondary Shoreline Tactical Response Plans (TRPs).	Shoreline Protection Plan & Tactical Response Plans (TRPs) that consider local environmental sensitivities and habitats are provided to the control agency.
Incident specific Waste Management Plan.	✓	Bass Strait Oil Spill Response Waste Management Plan.	The Esso Emergency Response Waste Management Plan will assist in the development of an incident specific Waste Management Plan.
Ensure daily OWR operations are recorded (numbers, type and status of fauna)	✓	Daily OWR Records	Daily logs and records of oiled wildlife response operations demonstrate that OWR was deployed safely, effectively and following consideration of environmental conditions.
Exclusion zones established	✓	Exclusion zones	The OPEP requires that exclusion zones are put in place which consider health and safety and environment risks. These exclusion zones are determined in consultation with the state control agency.

### 8.3 Capability Assessment of Oiled Wildlife Response

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources to complete oiled wildlife response activities in a timely manner. The assessment concluded sufficient resources are available within acceptable timeframes to conduct this response.

Oiled wildlife is led by the state government and a variety of organisations will provide resources to assist the response, therefore

Table 8-6 details the resources available by organisation.

**Table 8-6 Oiled Wildlife Resources Availability**

Organisation	Resource Availability	Expected Timeframe
DELWP	<u>Resources</u> 1 x OWR Kit Bairnsdale 1 x OWR Kit (Colac) 1 x OWR Kit (Port Phillip) 1 x OWR Kit (Warrnambool) 1 x State-wide Trailer <u>Agreement - Phillip Island Nature Park</u> 6 x staff - Wildlife emergency response. 17 x Wildlife Team Leaders. 5 x IMT Members. Approx. 45 volunteers – Collection/Facility Operations/Rehabilitation. Approx. 20 staff – Animal Feeding.	DELWP will make the decision to stand up resources which are based in Victoria.  They are expected to be available <24 hours from request for services.
ExxonMobil	<u>Personnel</u> 6 x Esso Australia IMT members with OWR training Regional Response Team - OWR Core Team 12 x Trained Personnel	Remote support <12 hours from notification.

Organisation	Resource Availability	Expected Timeframe
		In-country support <72 hours from notification.
AMOSC	<p><u>Resources</u> 2 x OWR Containers (Geelong and Fremantle). 4 x OWR Box Kits.</p> <p><u>Personnel</u> OWR Coordinator 18 x OWR Industry Team Contingency</p> <p><u>Agreements</u> Memorandum of Understanding with Phillip Island Nature Park Call off Contract with DWYERtech NZ. A minimum of two personnel teams, to fulfil role of facilities manager and facilities coordinator.</p>	<p>Geelong container available onsite &lt;24 hours of request for services.</p> <p>Kits would be available at site &lt;24 hours of request for services.</p> <p>OWR Coordinator &lt;24 hours OWR Industry Team &lt;48 hours</p> <p>DWYERtech available &lt;24 hours of AMOSC request for service.</p>
OSRL	<p><u>Resources</u> 3 x OWR Search and Rescue kits 1 x OWR Intake and Triage kit 4 x Cleaning and Rehabilitation kits 1 x Wildlife Rehabilitation Unit 50% of the above inventory is available during an incident.</p> <p><u>Agreements</u> Sea Alarm 1 x Full time availability of one Sea Alarm expert for advice and potential mobilisation to the affected site. 1 x Full time availability of one Sea Alarm expert for advice and response support. This expert will not be mobilised but provide advice and support from Sea Alarm office in Brussels or OSRL Premises.</p>	<p>Singapore based equipment can be mobilized to Melbourne airport &lt;72 hours.</p> <p>Can be activated 24/7 as part of a wider OSRL mobilization.</p>
AMSA	<p><u>Resources</u> 4 x OWR Containers</p> <p><u>Personnel</u> National Plan: State/NRT Personnel (&gt;100 persons)</p>	<p>Available through NATPLAN. Containers process approximately 100 units per day. Deployment of such resources to the Gippsland region would be expected to take 48-72 hours (road travel) from request for services.</p>
NSW Maritime	<p><u>Resources</u> 1 x OWR Container</p>	<p>Available through NATPLAN. Containers process approximately 100 units per day. Deployment to the Gippsland region would be expected to take 48-72 hours (road travel) from request for service.</p>
WA Department of Biodiversity and Attractions	<p><u>Resources</u> 1 x OWR Container</p>	<p>Deployment to the Gippsland region would be expected &gt;72 hours (road travel) from request for service.</p>
Waste Management Contractor	Onshore waste management arrangements.	Esso have a contract with a third party waste management service to provide transport and disposal of solid and liquid wastes.

Organisation	Resource Availability	Expected Timeframe
		4,500 m <sup>3</sup> bulk hard waste (soil/sand). 3,000,000 L of liquid waste (oil in water).

**Table 8-7 Oiled Wildlife Resources Availability**

Good Practice	Adopted	Control	Rationale
Pre-arranged access to equipment and personnel to support OWR.	✓	Agreement in place with AMOSC.	Agreement with AMOSC provides resources and equipment required for OWR activities.
Pre-arranged access to equipment and personnel to support OWR.	✓	Agreement in place with OSRL.	Agreement with OSRL will provide equipment and personnel for OWR activities.
Pre-arranged access to personnel to support oiled wildlife response.	✓	ExxonMobil Regional Response Team	ExxonMobil have a global team available for OWR activities.
Agreement with waste contractor in place.	✓	Agreement with waste management contractor.	Waste arrangements for removal of waste to approved disposal or treatment facilities in accordance with EPA requirements.

**Table 8-8 Consideration of Additional/ Alternative/ Improved Capability for Oiled Wildlife Response**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Develop OWR Management Plan for the Bass Strait.	Reduced time to implement strategy.	Regulations establish that the State is responsible for management of wildlife impacted by marine pollution and the State has established plans and arrangements for this hazard.  In consultation with State agencies, Esso has developed an oiled wildlife area response plan for Gabo Island and also Species Response Plans to provide supplementary information for management of oiled wildlife.	Not Adopted.

## 9. Waste Management

### 9.1 Response Option Description

The response to an oil spill often results in the rapid generation and accumulation of large quantities of oily waste. Waste generated from an oil spill response may come in many forms including; oily solid and liquid wastes, contaminated equipment and wash water from recovery activities and a range of mixed consumables required by the response team and activities.

Emulsified oil, oiled sand, gravel and entrained debris can increase the volume of waste to many times the volume of oil originally spilt. This waste often exceeds the capacity of the locally available waste management infrastructure.

The quantity of waste produced from a spill is influenced by many factors, principally the quantity of oil spilled, the environmental fate of that oil and the clean-up strategy and techniques adopted.

Waste management within Australia is regulated and managed by each state independently through each states Environmental Protection Agency (EPA). The majority of waste management activities associated with an oil spill response from a Bass Strait operation would be undertaken within Victoria.

### 9.2 Impact Assessment of Waste Management

Impacts from the containment and recovery of waste offshore and from clean-up of shorelines impacted by oil have been described in Section 6.2 and Section 7.2 respectively.

Accidental loss of waste during recovery, transport and disposal activities may result in secondary contamination. Secondary contamination is the spread of oil to otherwise unpolluted areas via response activities associated with people, transport and equipment. Secondary contamination could lead to pollution of the environment adjacent to storage areas or runoff of waste into waterways.

The Esso Bass Strait Oil Spill Response Waste Management Plan, details requirement for selecting waste management options and equipment and storage to be utilised to prevent secondary contamination. The Shoreline Protection and Clean-Up Plan and site specific Tactical Response Plans include information on staging areas and access points (refer Section 9.3.2 for details).

The generation of waste will be short-term and is localised for the response period, therefore, the consequence of the impacts of the response activity is considered to be Level III.

**Table 9-1 Acceptability of Environmental Impacts from Waste Management**

Factor	Demonstration Criteria	Criteria Met	Rationale
<b>Principles of Ecologically Sustainable Development (ESD)</b>	No potential to affect biological diversity and ecological integrity	✓	The impacts associated with generation of waste during oil spill cleanup activities have been evaluated to have a potential Level III consequence.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
<b>Legislative and Other Requirements</b>	Legislative and other requirements have been identified and met.	✓	The proposed control measures align with the requirements of: <ul style="list-style-type: none"> <li>• OPGGS Act 2006.</li> <li>• Emergency Management Act 2013 (Vic).</li> <li>• Emergency Management Act 1989 (NSW).</li> <li>• Emergency Management Act 2006 (Tas).</li> <li>• Wildlife Act 1975 (Vic).</li> </ul>

Factor	Demonstration Criteria	Criteria Met	Rationale
			<ul style="list-style-type: none"> <li>• EPBC Act.</li> <li>• Wildlife Act 1975 (Vic).</li> <li>• Nature Conservation Act 2002 (Tas).</li> <li>• National Parks and Wildlife Act 1974 (NSW).</li> <li>• Environment Protection Act 2018 (Vic)</li> <li>• Environmental Management and Pollution Control Act 1994 (Tas)</li> </ul>
<b>Internal Context</b>	Consistent with Esso's Environment Policy.	✓	Proposed control measures are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	The responsible management of waste collected from oil spills meets the Upstream Waste Management Standards which calls for consideration of the waste hierarchy.  Further, the use of piles meets expectations of the Upstream Water Management Standard The Upstream Water Management Standards and standards for appropriate disposal of contaminated water.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed control measures meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OI requirements to contractors.</li> <li>• OIMS System 10-2 objective to ensure effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations</li> </ul>
<b>External Context</b>	Stakeholder concerns have been considered / addressed through the consultation process.	✓	No specific stakeholder concerns have been raised.

**Table 9-2 ALARP Demonstration of Environmental Impacts from Waste Management Activities**

<b>ALARP Decision Context and Justification</b>	<p>Decision Context A</p> <p>Waste management is a standard practice resulting from hydrocarbon spills cleanup.</p> <p>There is a good understanding of potential impacts from waste management activities and the regulatory requirements to manage waste in accordance with State based regulations.</p> <p>Good Practice controls have been identified to ensure environmental impacts associated with mobilising this response are reduced to ALARP. These controls</p>

<b>Good Practice</b>	<b>Adopted</b>	<b>Control</b>	<b>Rationale</b>
Implement measures to minimise secondary contamination at temporary storage locations	✓	Implement measures to minimise secondary contamination at temporary storage locations	<p>will be implemented by the state led control agency in a response scenario and have been included in the OPEP. Note that the response must be led by State Control Agencies, with Esso providing support and resources when requested. Esso believes ALARP Decision Context A should apply.</p> <p>In order to minimise the potential impacts from secondary contamination at waste storage locations, each hot zone temporary holding site will have</p> <ul style="list-style-type: none"> <li>• bunding adequate to hold the daily bagged totals</li> <li>• will be initially sampled to establish baseline 'clean' levels for final restoration</li> <li>• access for waste removal vehicles to transit from cold to hot zones</li> </ul>

### 9.3 Capability Assessment of Waste Management

A detailed capability assessment has been undertaken to ensure that Esso has access to sufficient resources available to manage waste as a result of spill clean up operations (both offshore containment and recovery (Section 6) and shoreline protection and clean-up (Section 7)) to ensure that waste is removed from clean-up sites and disposed of in a timely manner.

The availability of resources is assured through contractual arrangements with waste handling and processing providers, response agencies, industry bodies and labour hire organisations. Incident response planning is done in accordance with the Esso Waste Management Plan. These good practice measures are summarised in Table 9-3 with additional considerations shown in Table 9-4.

**Table 9-3 Waste Management Resources Availability**

Good Practice	Adopted	Control	Rationale
Pre-arranged access to vessels for waste management	✓	Agreement with third party suppliers for provision of additional vessels.	Agreement with supplier of vessel services has provision for the supply of additional vessels.
Pre-arranged access to additional equipment for waste management	✓	AMOSC agreement.	Agreement with AMOSC provides access to additional resources and operational personnel for shoreline protection and clean up equipment. Temporary waste storage, decontamination stations, PPE stockpile containers and transfer pumps are included
Pre-arranged access to additional labor.	✓	Personnel hiring agreements.	Esso has personnel hiring agreements in place which can be utilised to provide personnel for waste management activities.
Reduction of solid waste volumes	✓	Training / induction of response personnel in shoreline cleanup operations	Waste volumes can be reduced through provision of just in time training to response personnel with oversight by experienced personnel.
Pre-arranged Waste facilities.	✓	Agreement with waste management contractor.	Waste arrangements for removal of waste to approved disposal or treatment facilities in accordance with EPA requirements.

Good Practice	Adopted	Control	Rationale
			Pre-planning for transport, temporary storage and scale up of waste management arrangements.
Pre-arranged Heavy Plant Equipment	✓	Agreement with contractor for heavy lift equipment	Agreement with third party provides access to heavy plant equipment for shoreline protection and clean up.
Pre-arranged access to personnel to support Tier III response activities.	✓	ExxonMobil Regional Response Team AMOSC Team & Core group OSRL	ExxonMobil have a global team available to assist response for Tier III activities. ExxonMobil has an agreement with AMOSC and OSRL to provide highly trained personnel from within AMOSC's core group and staff.
Access to Shoreline Response Trailers	✓	2 x Shoreline Response Trailers owned by Esso	Trailers equipped with shoreline cleanup first strike equipment available for immediate deployment.
Incident specific Waste Management Plan.	✓	Bass Strait Oil Spill Response Waste Management Plan	The Esso Emergency Response Waste Management Plan will assist in the development of an incident specific Waste Management Plan.

**Table 9-4 Consideration of Additional/ Alternative/ Improved Capability for Waste Management**

Additional, Alternative, Improved Controls	Benefit	Cost / Feasibility	Adopted
Additional, Alternative, Improved Controls were considered but none identified.			

### 9.3.1 Waste capability methodology

Waste management capability assessment is based on deterministic outcomes from modelling of the worst case discharge from the facility/field with the worst-case potential. For solid waste the Seahorse workover scenario of 127 kbbl total spill volume representing a LOWC from a crude well close to shore (Refer Volume 2, Section 6.7.2), is the scenario which resulted in the largest volume of oil ashore and is used to demonstrate capability of waste handling from shoreline cleanup. For liquid waste the Marlin (MLA) workover scenario of 519 kbbl total spill volume representing LOWC from a crude well in the northern fields (Refer Volume 2, Section 6.7.2), is the scenario which results in the largest spill volume and is also the scenario used to demonstrate capability of dispersant application in Section 5.4.

The assessments are conservatively based on an unmitigated amount of oil stranding on the shoreline for solid waste and for surface oil for liquid waste. While unmitigated volumes have been used for the capability assessments, the volumes of stranded oil and surface oil will be significantly reduced in a response situation through the use of offshore response strategies such as dispersant application which will reduce the amount of surface oil for offshore containment and recovery and will therefore also result in reduced volume of oil being stranded ashore and the quantity of waste generated as a result of cleanup.

Whereas capability has been demonstrated on this SHA scenario, Esso's capability to respond is not limited to the areas described by this scenario. The response capability is designed to enable response to the areas that could be affected by a spill from the Bass Strait activities described in Volume 2.

Capability for handling waste is determined for the duration of the spill scenario (98 days), however it is important to note ~~noting~~ that:

- Victoria DoT will have a major influence on waste streams after the first 7 days,
- Victoria EPA and EM VIC will also impact waste stream decisions after 7 days.

**Solid Waste**

Table 9-5 shows the volume and distribution of oil ashore resulting from the SHA workover WCDS (deterministic model scenario [run 35]) which represents the largest volume of oil ashore for the Bass Strait operations activity. The total volume (without bulking) to be stranded ashore is predicted to be 3,123 m<sup>3</sup> affecting 14 sub-Local Government Areas, with a total shoreline length of 254 kms. The minimum time to contact is predicted to be 36 hrs, occurring at Ninety Mile Beach. Each location has been assessed based on the shoreline type (sand, rock, cliff, tidal flats etc.) to determine what proportion can be accessed to clean. The volume of oil ashore accessible to clean has been calculated based on the accessibility and a bulking factor of 10 times the volume of oil has been incorporated to allow for volume of sand and other material which is collected with the oil. The resources required to respond to this scenario spill are shown in the SHA Quick Reference Guide (QRG) (Refer Appendix A, OPEP). The QRG shows 1614 workers would be allocated for beach clean-up (807 per shift) and the table shows the workers distributed proportionally to the volume ashore at each location. Based on the assumption that the oil is stranded at a constant rate over the 98 day scenario period, the volume of waste generated per day is shown, assuming that 1 m<sup>3</sup> per/person/day is able to be cleaned per guidance provided in the ExxonMobil Oil Spill Response Field Manual. The volume of waste generated determines the number of trucks required per day at each location (based on 25T capacity per truck); for this worst case scenario this amounts to 13 trucks per day.

**Table 9-5 Total shoreline waste volumes that may occur from a WCD Scenario (SHA crude deterministic [run 35]) - Basis for calculating resource needs**

Location	Minimum time before shoreline accumulation (hours) >100 g/m <sup>2</sup>	Max vol ashore deterministic m <sup>3</sup>	Max length shoreline contacted deterministic	Sand %	Rock % (Sheltered)	Rock % (Cliff face/reef)	% Accessible	Avg onshore loading per day m <sup>3</sup>	Avg onshore bulked to clean/day m <sup>3</sup>	No of people cleaning	m <sup>3</sup> cleaned /day	Number of trucks needed per day	Days till full truck load collected

Croajingolong (West)	101	46.35	12.00	80	0	20	80	0.5	4.7	12	5	0.2	5.29
<b>Totals</b>		<b>3123</b>					<b>91%</b>	<b>3123</b>	<b>31,230</b>	<b>808</b>	<b>318</b>	<b>13</b>	

**OWR Waste**

Where oiled wildlife response (OWR) is required, it is managed by the state response agency with support from Esso through provision of resources such as fully equipped OWR containers including washing / storage facilities. The need for waste handling would be managed via the state. Based on Section 8.1.2 which identifies that for a Level 3 incident spill, per this scenario, an estimated total of 52 m<sup>3</sup> of OWR waste would be generated across the affected locations. This corresponds to approximately 2 – 5 trucks for handling non-flammable liquids over the duration and 1-2 trucks for solid wastes. Temporary storage would be provided at beach head control points at each impacted location and transferred to layup areas such as Longford if required before being transported to waste processing facilities.

**Liquid Waste**

The volume of liquid waste is calculated based on the volume of oil which is estimated to be recovered through the offshore containment and recovery strategy as described in Section 6 above. The resourcing requirements in each Quick Reference Guide (QRG) show the number of strike teams required for each spill, for the MLA Crude scenario (the scenario which results in the largest spill volume) used here to demonstrate capability, the QRG shows four strike teams will be needed to respond for offshore containment and recovery. The maximum volumes of oil and waste recovered is based on the highest volume (upper range) of oil that is predicted to be recovered each day by each strike team; therefore, the maximum volume of liquid waste per day is predicted to be 160 m<sup>3</sup>, equivalent to 160 kL (40 m<sup>3</sup> x 4 strike teams). Table 9-6 shows the total waste liquid volume accumulated daily and over the duration of the spill scenario.

**Table 9-6 Total liquid waste volumes that may occur from Containment & Recovery - Basis for calculating waste resource needs**

Containment and Recovery	Liquid Volume		Transport Needs
	Lower range kL	Upper range kL	Trucks per day needed (Upper range)
Cleanup volume/ strike team/ day	5	40	
Number of strike teams	4	4	
Volume collected per day	20	160	6
Number of days of cleanup*	96	96	
<b>Total amount liquid waste collected over 96 days</b>	<b>1920</b>	<b>15360</b>	

\*A conservative 96 days of cleanup is assumed with 4 strike teams, in practice the first strike team will be available within 48 hrs however the activation of 4 teams will take longer therefore reducing the volume of oil that is recovered in the initial days of the response.

**Transport, storage and processing - VIC**

Transportation of waste is provided by the waste contractor; Table 9-7 below shows the availability of trucks per day and their capacity. Table 9-8 provides additional equipment and temporary storage which is available within 48 hours and can be used in layup or temporary storage sites to facilitate the waste management process. Additional equipment will be hired by contractors through equipment hire services.

**Table 9-7 Solid and Liquid Transport Capability Victoria**

Transport**	Liquids		Solids
	ISO (Flammable)	Non Flammable	
Trucks per day	10	10	20
Volume per truck	30 kL	20 kL	25 T
Volume transported /day (1 trip each)*	300 kL	200 kL	500 T

\*\* The number of trucks per day is based on 48 hrs+ from spill occurring, trucks are available prior to the 48 hrs but are not likely to be needed in that timeframe

\*Capability is conservatively based on one trip per day per truck, multiple trips would be possible depending on the specific logistics requirements, although not needed for the scenarios presented in this EP.

**Table 9-8 Additional equipment and temporary storage capability**

Additional Resources	Resource	Available within 48 hours
Equipment	Cleanaway EPA approved walking floor truck 24 t loads	3
	Fergusons Rough terrain forklift	2
Temporary solid waste storage	Esso Plastic drums (~200 liter)	70
	Esso Skips approx. 15 m <sup>3</sup> (not suitable for transport when loaded)	5
	Cleanaway Bulk bins hook lift 10 t pay loads;	2
Temporary liquid waste storage	Esso Fast Tanks	5
	Esso Stainless Steel IBC (2 kL)	15
	Esso Plastic drums (~200 liter)	70
	AMOSC Lancer barge (25 kL capacity)	4
	AMOSC Deck Bladders (25 kL capacity)	6
	AMOSC Viko Tanks (13 kL capacity)	2
	AMOSC Fast Tanks	6
	AMOSC Collapsible storage tank	4
	AMOSC IBC (1 kL)	13
	Cleanaway Poly Tanks (50 kL)	10

Accumulated waste is taken directly to designated waste facilities where waste can be stored and processed. Where waste volume exceeds processing rate, it is stored at the waste facility (where possible) or at offsite storage facilities where it can be progressively transported for processing.

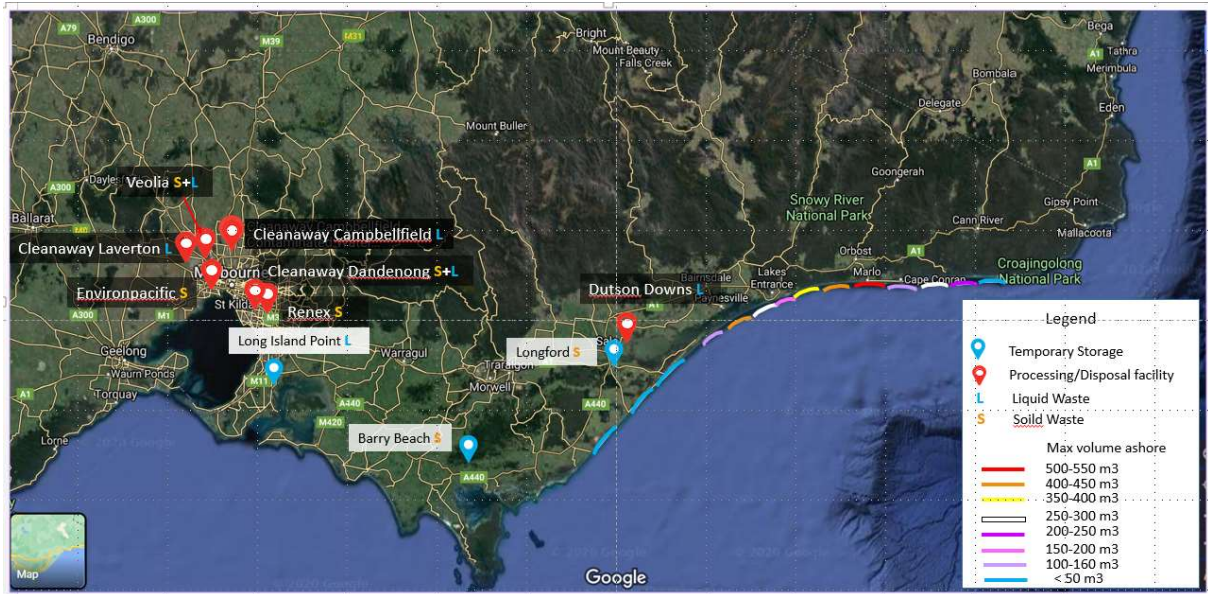

Table 9-9 shows the storage and processing facilities available to Esso to handle solid and liquid waste. The table shows that waste facilities have capacity to store solid waste (up to 33,500 T) on site, however not liquid wastes. Where daily liquid waste volume generated exceeds the daily liquid waste processing capacity, the waste must be stored at offsite facilities and transported from there for processing. Esso's Long Island Point (LIP) facility has the capacity to store up to 63,000 kL in two separate tanks.

**Table 9-9 Solid and Liquid Storage and Processing Facilities in Victoria**

Facility	Liquids			Solids		
	Storage	Processing	Trucks/day	Storage	Processing	Trucks/day
	kL	kL /day	able to be processed	Tonne	Tonne/day	able to be processed

<b>Storage Facility</b>						
Esso LIP Crude Oil Tank	60000					
Esso LIP Ballast Tank	3000					
Barry Beach Marine Terminal				300		
<b>Total</b>	<b>63000</b>	<b>280</b>	<b>9</b>	<b>33500</b>	<b>1050</b>	<b>42</b>

\*The Esso Longford site can temporarily store solid waste subject to attaining an amendment to its existing licence for emergency purposes. Two separate areas have been identified that could store minimum 300 m<sup>3</sup> and 25,000 m<sup>3</sup> of solid waste respectively. Longford site would be used if required (primarily as a layup facility before transporting to waste facility) and its storage capacity would be in addition to that shown in the table above.

Figure 9-1 shows the storage and processing locations in Victoria in relation to the potential locations for shoreline accumulation per the modelling scenario. In this case, and as shown in Table 9-5, the highest volumes are accumulated at Marlo, Corringale, Ocean Grange and Lake Tyers.

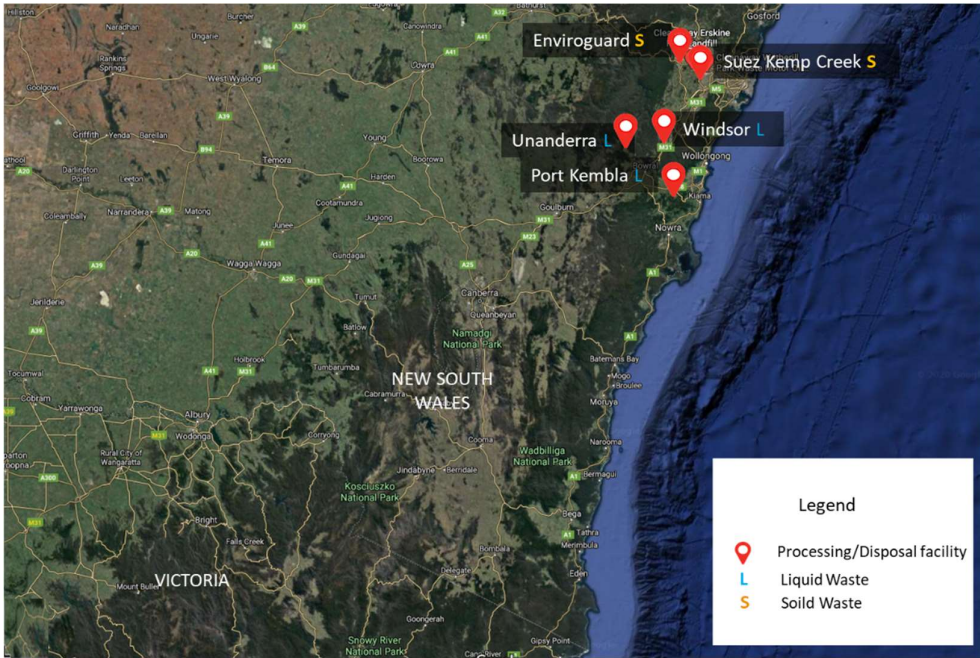

**Figure 9-1 Waste storage and processing facility locations in Victoria, proximity to accumulation sites from worst case oil ashore scenario**

**Transport, storage and processing- NSW**

If a spill reached shorelines in NSW, waste from beach clean-up would need to be processed in NSW. As offshore containment and recovery occurs near the source of the spill, it is unlikely that oily water waste collection/processing would be needed in the NSW. Table 9-10 shows transport availability in NSW. The locations available for storage and processing solids and liquids are shown in Figure 9-2. Processing capacity for NSW is shown in Table 9-11.

**Table 9-10 Solid and Liquid Transport Capability NSW**

Transport	Liquids		Solids
	ISO (Flammable)	Non Flammable	
Trucks per day	4	10	20
Volume per truck	20 kL	20 kL	25 T
Volume transported /day (1 trip each)	80 kL	200 kL	500 T

<b>Total</b>	<b>740</b>	<b>580</b>	<b>29</b>		<b>3460</b>	<b>138</b>

**9.3.1.1 Capability Summary Solid Waste**

The theoretical worst case spill scenario for oil ashore (SHA workover scenario which represents the largest volume of oil ashore) predicts that 32,230 m<sup>3</sup> of bulked solid waste would accumulate over 14 locations on the Gippsland coast (refer Table 9-5). The daily quantities of waste collected is equivalent to the predicted amount of oil deposited ashore at each location each day, as sufficient workers for cleaning have been allocated to clean all of the oil stranded per day. Based on the daily quantity of waste collected each day (318 m<sup>3</sup>), the number of trucks required for transporting the waste per day is 13 (refer Table 9-5). With twenty trucks being available each day for transportation of solids (refer Table

9-7), waste can be transported directly to waste processing facilities (refer Table 9-9) which have the capacity to process up to 1050 m<sup>3</sup> per day, or store up to 33,500 m<sup>3</sup> if processing was not limited. As also shown in Table 9-9, additional temporary or layup storage of solids is available at Longford, or Barry Beach Marine Terminal, closer to the affected receptor sites providing additional logistical flexibility (Refer Figure 9-1).

### 9.3.1.2 Capability Summary Liquid Waste

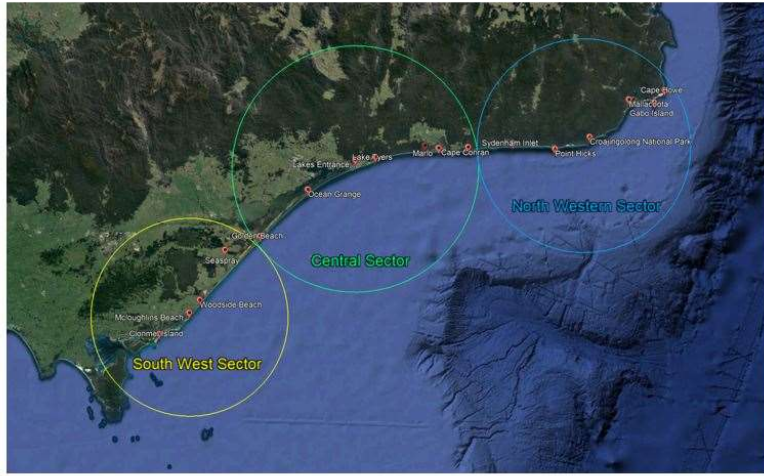

The QRG for the MLA theoretical spill scenario (the scenario which results in the largest spill volume) allocates four strike teams to enact offshore containment and recovery. The number of strike teams have been used to determine the upper range of liquid waste that would be generated, indicating that 160 kL/day would need to be handled each day for 96 days (refer Table 9-6). Liquid waste will be shipped to Barry Beach Marine Terminal where it will be offloaded directly into trucks. Table 9-6 shows that 6 trucks per day are needed to transport 160 kL, which can all be transported by ISO trucks able to handle flammable liquids if this was needed, without having to use the non-dangerous goods rated trucks. Esso would work with the transport company and the authorities to classify the liquid waste stream, however it is unlikely that all waste would be classified as flammable given it would be mixed with seawater and would have undergone some degree of evaporation and weathering.

As the waste facilities are able to process up to 280 kL/day (9 truckloads) of liquid waste, the waste would be taken directly to the facilities for processing without needing temporary storage (refer Table 9-9). If processing was not able to occur at this rate, liquids would be temporarily stored at the Esso LIP facility until such time as it could be processed.

### 9.3.2 Response Planning

The Waste Management Plan outlines collection and transfer methodology for the two primary waste streams – oil/water liquid stream (from offshore C&R activities) and oil/solid stream (from shorelines) as has been shown in Section 9.3.1 above. The waste plan would be enacted from Day 2 of a response to allow operational response strategies to be employed. This is consistent with the resourcing needs being shown from the 48 hr timeframe. Unmitigated marine oil spill modelling would be conducted at the time of the spill to evaluate shoreline response clean up requirements based on time of impact and geographic sectors that would likely be impacted by the unmitigated marine oil spill, producing a listing and analysis of the receptors, likely volume ashore with time of predicted impact and accessibility at each location per the information provided in Table 9-5. This will form the basis for the development of incident specific response plans outlining shoreline sector designations, expected waste volumes and waste transfer processes for specific locations in each sector. The shoreline sector designations provide an overview of the scale of the response and allow a breakdown of the tasks into segments. Location specific plans within each sector describe the waste transfer process at that location with consideration given to site specific access points, hotspot storage locations and site specific equipment and resource needs. Figure 9-3 to Figure 9-5 show the overall sector designations and the central sector example for the SHA workover scenario (which represents the largest volume of oil ashore per Section 9.3) and an example of a corresponding Tactical Response Plan for one of the locations within the sector. While Esso has assessed resource requirements and has plans and necessary agreements in place to be able to execute those plans, the State Control Agency will ultimately determine how waste will be managed for any waste collected in State waters and shorelines. Through use of liaisons, Esso will coordinate access to plans and resources for waste management.

Waste Management – Overview <span style="color: orange;">FOR SHA WORKOVER SCENARIO</span>													
<b>Proposed Activity</b>	Waste generated by shoreline clean-up teams will be collected from multiple coastal locations, transferred to centralised distribution points and then transported to designated waste treatment facilities.												
<b>Shoreline Sector Designations</b>	<p>The following sectors have been identified as likely to be impacted by oil from the Seahorse workover WCDS spill well location:</p> <p><b>Sector 1 - Central Sector</b>  <b>Sector 2 - South West Sector</b>  <b>Sector 3 - North East Sector</b></p>

Lakes Entrance		
	<b>Waste Transfer process</b>	
	<ol style="list-style-type: none"> <li>1 Waste accumulated on shoreline is transported to collection points along each beach. Depending on local logistics and access for vehicles between shoreline locations, additional collection points may be used between beaches and vessel collection point.</li> <li>2 Waste at collection points are transferred out of the hot zones and onto the vehicle access points at each decontamination station – vehicles are jet-washed to eliminate secondary contamination (into a <b>bunded area</b>) and the vehicle departs.</li> <li>3 Hazardous waste is stockpiled at laydown area adjacent to both Lakes Entrance heads for transfer to B-Double.</li> <li>4 Waste is either transferred to the nominated treatment facility or onto Longford waste temporary holding.</li> </ol>	
Logistics	Location	Requirements/Considerations
Primary Collection Point/s	Lakes Entrance beach (~34km) Various locations	Accessible by vehicle
Transfer Point/Laydown (Lakes Entrance East)	Eastern Beach road West of golf course 	Manual handling/mechanical lift capacity for offloading. Waste transfers to B-Double for onward movement to designated Waste Treatment Facility.
Transfer Point/Laydown (Lakes Entrance West)	Ocean Grange Track Beach Access Track 	4WD vehicles and trailers to be used for transport on Ocean Grange track, no B-Double access. Only road access to Lakes Entrance West.
Waste Treatment Facility	Primary: <b>Dulson Downs</b> waste treatment plant Secondary: Cleanaway Longford Gas Plant temporary storage	Pending acceptance of waste.
Personnel transfer	Great Lakes Airport (YGRL)	Regional airfield 6km North of Lakes Entrance
	Vehicle from Melbourne	~320km 4hrs.
Equipment	Units	Requirements/Considerations
25kg heavy duty plastic bags	1,760	= (27m <sup>3</sup> /day x 40 per 1m <sup>3</sup> ) + (16m <sup>3</sup> /day x 40 per 1m <sup>3</sup> )
B-double truck and trailer combination	2	30t (m <sup>3</sup> ) per unit. 2 loads required per day.
Rough terrain forklift	2	One either side of the Inlet for each collection area.
UTV	2	Personnel transport in addition to 4WD and local vehicles
FOB/Sector command post	1	Facility, portable office, or cabin onsite to coordinate movements

**Figure 9-5** Example Tactical Response Plan for one response location within the Central sector for the SHA workover WCDS *continued overleaf*

1. Waste Management: Lakes Entrance			
<b>Desired Outcome</b>	Teams access the shoreline using appropriate vehicles/vessels at pre-determined sites (from SCAT recommendations) to remove waste accumulated by shoreline clean-up teams.		
<b>Conduct</b>	<b>Transport</b>	Vehicles/vessels capable of providing access to Lakes Entrance for team or teams of personnel (up to 25 pax) to manually or mechanically remove accumulated waste. Vehicle (or potentially vessels) capable of transporting teams and equipment to and from pre-determined sites, and waste (plastic bag waste) from Lakes entrance West to Lakes Entrance East collection point.	
	<b>Equipment</b>		
	<b>Offshore – for all vessels</b>	Waste storage – sealed skips or containers capable of holding collected hazardous waste	
		Decontamination equipment – full decontamination of personnel and shoreline equipment	
		HSSE and First Aid equipment (May include specialist safety equipment related to the treatment of issues related to local region or environment)	
	<b>Onshore</b>	Waste storage – heavy duty plastic bags (Max 25lt)	
		Shoreline response tools and equipment (appropriate collection and cleaning equipment will require validation prior to or during deployment)	
		Site setup and site management equipment	
		Communications equipment (UHF, VHF, Satphone, Spot gen3, BGAN)	
		HSSE equipment including PPE and First Aid	
		Decontamination equipment – personnel decontamination to reduce potential for secondary contamination as personnel leave the shoreline.	
	<b>Personnel</b>	Divisional Command	HSE Safety Officers
		Sector Commands	General labourers
Team Leads		Local Ranger	
Decontamination Teams			
<b>Method</b>	All-terrain vehicles are used to transport personnel and equipment to pre-determined locations along the Lakes Entrance shoreline. Teams transfer by day from vehicle to the shoreline and conduct waste recovery operations. Welfare, equipment movements and waste collection are managed with ongoing vessel & vehicle support and teams are returned to the mainland overnight.

NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
OIM	Offshore installation manager
OSC	Operations section chief
OPEP	Oil Pollution Emergency Plan
OPGGSA	Offshore Petroleum and Greenhouse Gas Storage Act 2006 (Cth)
OSA	Oiled shoreline assessment
OSMP	Oil Spill Monitoring Program
OSR	Oil spill response
OSRA	Oil Spill Response Atlas
OSRL	Oil Spill Response Limited
OSTM	Oil spill trajectory modelling
OWR	Oiled wildlife response
PCR	Production control room
PEAR	People, environment, assets, reputation
P&GA	Public & Government Affairs

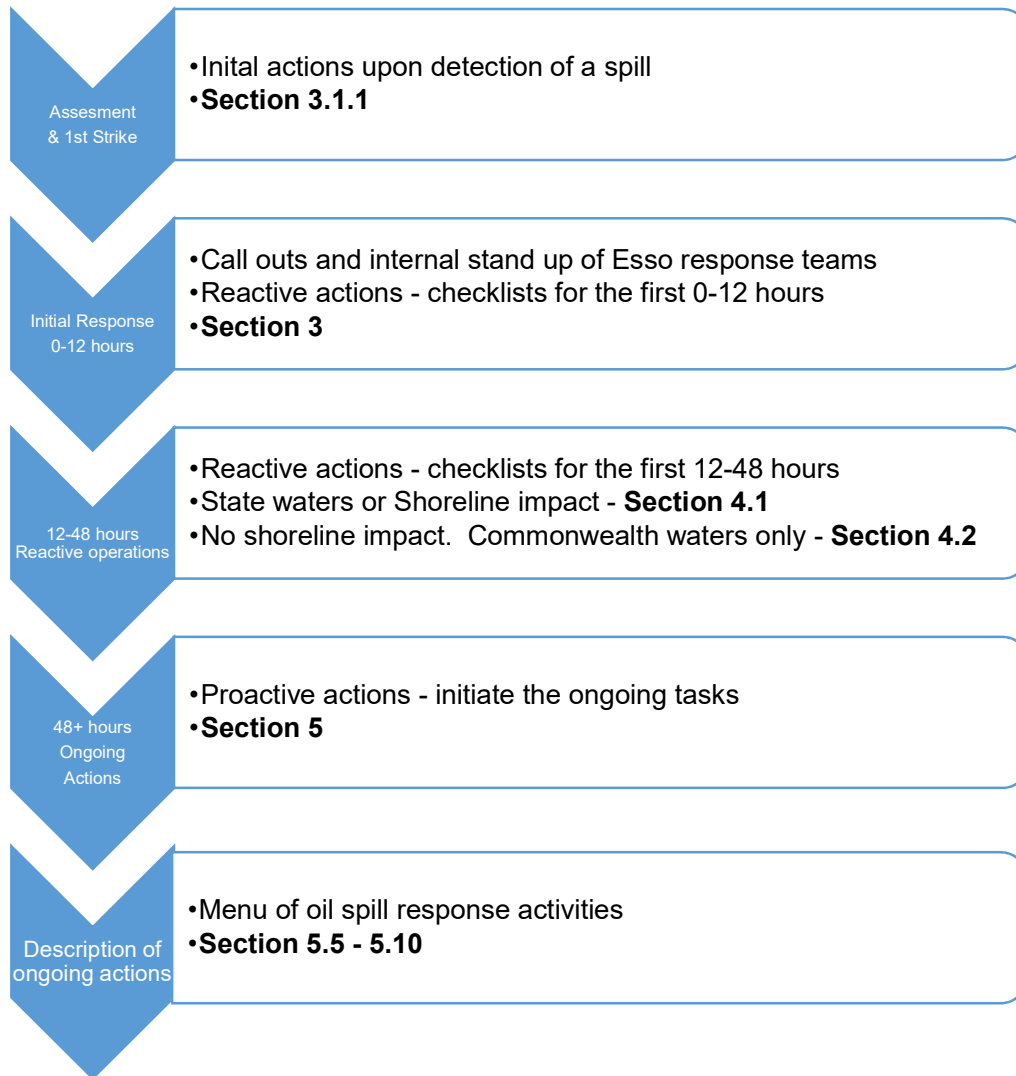

PPE	Personnel protective equipment
PSC	Planning section chief
PSZ	Petroleum safety zone
POLREP	Pollution report form
POWBONS	Pollution of Waters by Oil and Noxious Substances Act 1987 (Cth)
RRT	Regional response team
SC	Section chief
SCAT	Shoreline clean-up assessment technique
SDS	Safety data sheet (formerly MSDS)
SERP	Victorian State Emergency Response Plan
SMV	Surveillance Monitoring and Visualisation
SO	Safety Officer
SSH&E	Safety, security, health, and environment
SITREP	Situational report
SITL	Situation unit lead
SITU	Situation unit of the incident management team
SMPC	State Marine Pollution Controller
SOPEP	Shipboard Oil Pollution Emergency Plan
SREC	Safety Resilience and Emergency Coordination (part of DTP)
TASPLAN	Tasmanian Marine Oil Spill Contingency Plan
TRP	Tactical response plan (see Volume 3)
WCDS	Worst Case Discharge Scenario
WOMP	Well operations management plan
WMP	Waste management plan
WMM	Waste management manual
WWV	ExxonMobil Drilling Worldwide Ventures
VM	Vessel Master

# 1 Spill Response Operations

This section of the plan details the actions that Esso will undertake in the event of a hydrocarbon spill resulting from an Esso activity.

All staff are to be guided by the spill response incident flow chart in Figure 1-1.

**Figure 1-1 Spill Response Incident Flow Chart**

Sustain spill response until termination end points (refer to Section 5) and environmental performance objectives are reached for each activity.

## 2 Quick Reference OPEP Information

### 2.1 Location

This OPEP applies to spills from petroleum activities linked to Esso's Gippsland Basin operations and project activities as described in Volume 2 (and Volumes 2a, 2b, 2c, 2d etc., hereafter referred to as Volume 2) of the Environment Plan.

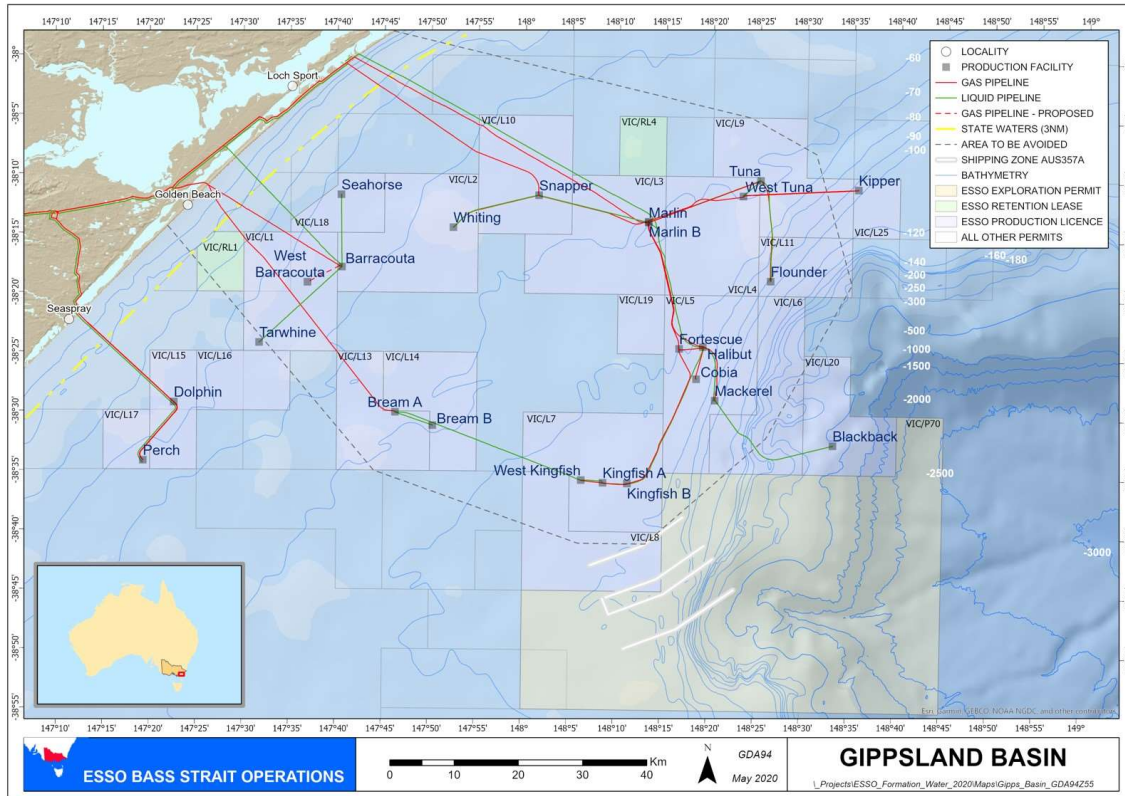

Figure 2-1 Asset Location

### 2.2 Potential Oil Types

- Condensates (Group I)
- Marine Diesel Oil (Group II)
- Light Crude (Group II)
- Persistent Crude (Group IV)

Properties of hydrocarbons used for modelling are detailed in Section 7.2.2.

### 2.3 Potentially Exposed Area

Stochastic spill trajectory modelling has been conducted to evaluate the effect of worst case discharge scenarios from Esso's Bass Strait petroleum activities.

In addition to the stochastic modelling, deterministic runs were also assessed and presented based on the following criteria;

1. largest volume of oil on shorelines;
2. longest length of shoreline contacted at or above 100 g/m<sup>2</sup> (actionable shoreline oil);

3. minimum time before contact to nearby shoreline by visible oil ( $0.5 \text{ g/m}^2$ ); and
4. largest swept area of oil on the sea surface above  $10 \text{ g/m}^2$  (actionable sea surface oil).

The criteria listed above were determined for the “worst case” simulation between the modelled scenarios.

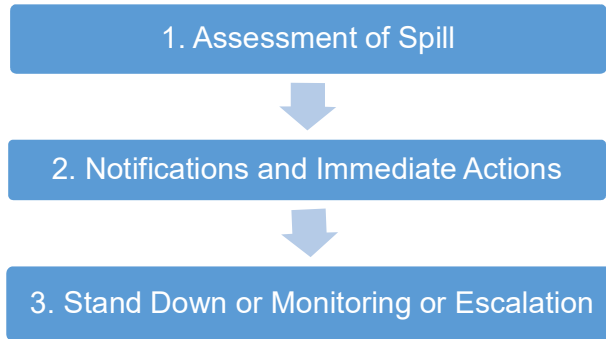

Appendix D - Quick Reference Guides provides maps and a descriptions of predicted impacts of the representative worst case scenarios.

An extensive description of the different types of sensitivities can be found in Volume 2 of the Environment Plan related to each activity.

### 3 Initial Oil Spill Response Actions – Assessment & Escalation 0–12 hours

#### 3.1 Flowchart of Initial Processes

Upon detection of a spill, Esso will undertake a three-step process, as follows:

Each step is outlined in greater detail below.

#### 3.1.1 Assessment of Spill – Emergency Response Incident Management Teams

Upon detection of a spill, Esso will form a field-based Emergency Response Team (ERT), which will undertake the following actions:

- Begin a risk assessment in order to determine (and then execute) safety mitigations,
- Determine the size, bearing/trajjectory and fate (weathering) of the spill,
- Judge the potential environmental impacts and the appropriate actions necessary to reduce those impacts,
- Execute any available source control options/first-strike response actions, and
- Notify the shore-based Esso duty IC of the incident await further instructions as to the appropriate actions to take.

The ERT is to use the following checklist as a way to direct these immediate steps.

**Table 3-1 ERT Immediate Actions**

ERT Immediate Actions			
Who	What	Minimum time to implement	✓/✗
Observer of Spill	Report the spill to the Offshore Installation Manager (OIM) or Vessel Master (VM).	ASAP	<input type="checkbox"/>
OIM/VM	Secure operations, assess and report damage. Isolate spill source if it is safe to do so – implement pipeline de-pressurisation or leak response procedures. Refer to ERM V2-052-008 for response to unknown source.	ASAP	<input type="checkbox"/>
OIM/VM	Ensure that all personnel are accounted for.	ASAP	<input type="checkbox"/>
OIM/VM	Conduct a hazard assessment to determine the potential for fire, explosion, and hazardous/toxic vapours as well as to define the personal protective equipment (PPE) needed by responders.	ASAP	<input type="checkbox"/>

ERT Immediate Actions			
OIM/VM	Implement spill mitigation measures to prevent further oil from entering the water, providing it is safe to do so. Activate the ERT as required.	ASAP	<input type="checkbox"/>
OIM/VM	Report the incident to the Field Superintendent. The Field Superintendent is then to initiate upward internal communications to the Duty Incident Commander. Observe and include the following information in the brief: <ul style="list-style-type: none"> <li>• Number of injuries.</li> <li>• Note ongoing immediate hazards to life (such as risk of fire or explosion).</li> <li>• Description of incident.</li> <li>• Location of the incident.</li> <li>• Status of source.</li> <li>• Time of incident.</li> <li>• People and assets involved in the incident.</li> <li>• Current field objectives/actions.</li> <li>• Details of support required from the Esso IMT.</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Observe and report on weather and sea states, including: <ul style="list-style-type: none"> <li>• Current/tide-stream speed, direction and period</li> <li>• Wind speed, direction and period</li> <li>• Wave height and direction</li> <li>• Swell height and direction.</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Observe and determine the spill trajectory (manual estimation), noting: <ul style="list-style-type: none"> <li>• The speed and direction of the spill.</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Observe and determine the likely spill type and volume: <ul style="list-style-type: none"> <li>• Is the source contained, ongoing, isolated or stopped?</li> <li>• Provide a visual description of the slick (e.g. is it breaking up, floating, sinking, etc.)</li> <li>• What type of spill is it (diesel, gas, condensate, slops, light crude or waxy crude oil)?</li> <li>• Calculate/estimate the spill volume</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Observe and note any immediate sensitivities in the area at risk from the spill: <ul style="list-style-type: none"> <li>• Note the presence of people, environmental sensitives (e.g. fauna, reef, etc.), as well as any of Esso's or other organisations' assets.</li> </ul>	ASAP	<input type="checkbox"/>
OIM/VM	Request helicopter overflight and commence regular surveillance of the spill. Evaluate spill weathering.	ASAP	<input type="checkbox"/>
OIM/VM	Remain available to update the Offshore Incident Management Team.	Ongoing	<input type="checkbox"/>
OIM/VM	Evaluate the incident and determine the incident classification/level based on the below national plan levels (refer to Table 3-3). Confirm this level with the on-call/duty Incident Commander.	ASAP	<input type="checkbox"/>
OIM/VM	Report the incident to NOPSEMA as per Table 3-4.	ASAP and within 2hours	<input type="checkbox"/>

Once the Duty IC has been notified of the spill, go to Table 3-2.

**Table 3-2 IMT Immediate Actions**

IMT Immediate Actions			
Who	What	Minimum time to implement	✓/✘
Duty IC	Establish communications with the Platform/Vessel/ERT Leader, obtain situational awareness briefing and determine the next steps. Confirm the following details with the field-based team: <ul style="list-style-type: none"> <li>• Incident details – what happened?</li> <li>• What are the current field operations?</li> <li>• What are the immediate incident objectives and priorities?</li> <li>• What support is required from the Esso IMT in order to execute the immediate objectives?</li> </ul>	ASAP	<input type="checkbox"/>
IC	Activate the Esso IMT – Deputy IC, OSC, PSC, LSC, SO and EUL, following which: <ul style="list-style-type: none"> <li>• Provide an initial incident briefing to the Esso IMT</li> <li>• Commence the incident action-planning process</li> <li>• Commence the size-up of the incident</li> <li>• Establish incident response aim and objectives and offer support to the affected facility.</li> <li>• Begin working to meet incident and oil spill response objectives.</li> </ul>	< 60 mins	<input type="checkbox"/>
IC	Notify the ESG Leader of the incident and request ESG support as required.	ASAP	<input type="checkbox"/>
IC	Notify SHE&S, P&GA and security of the incident.	ASAP	<input type="checkbox"/>
IC	In conjunction with the PSC, EUL and the SHE&S team, determine and confirm the appropriate response level. Use the <i>Response Level Assessment</i> Table 3-3 below to drive this process.	4 hours	<input type="checkbox"/>
IC, PSC and OSC	Determine the response required of Esso: <ul style="list-style-type: none"> <li>• Stand down – no spill/no oil left</li> <li>• Level One – monitoring of site-based response until completion</li> <li>• Level Two or Three – significant field and IMT escalation with significant additional resources required.</li> </ul>	5 hours	<input type="checkbox"/>
Once ERT- and IMT-based assessment tasks are completed, move on to Section 3.1.2			

### 3.1.2 Notifications and Immediate Actions

Once a spill has occurred, the Esso IMT is required to complete several statutory notifications, which vary based on the spill level. Notifications and immediate actions are to be concurrently completed by different members and sections of the IMT.

As these tasks are completed, the Esso IMT should be aiming to mobilise resources in line with the following guide:

**Table 3-3 Response Level Assessment & Resourcing Guide**

<b>Response Level Assessment</b>			
On the basis of information gathered by the ERT/IMT, and in conjunction with the PSC/SHE&S team, a spill level is to be determined using the following indicators:			
Criteria	Level One Indicators	Level Two Indicators	Level Three Indicators
Type	Non-persistent oils (>50% loss after 24 hours)	Persistent oils (<50% loss after 24 hours)	Persistent oils (<25% loss after 24 hours)
Location	Located within a 3 NM radius of the spill location	Spreading/moving into adjacent waters, presenting a threat to state waters	Spreading/moving into state waters and shorelines
Direction/heading	Not moving/heading offshore	Heading onshore/towards state waters	
Spill status	Small single release	Ongoing/large single release	
Ecological impact	Isolated impacts/no impact; natural recovery expected within days/weeks	Significant impacts across a single area; natural recovery may take weeks/months	Significant impacts across a large area; recovery may take months/years
If any one of the above criteria are triggered, adopt the higher-level response until de-escalation can occur.			

<b>Resourcing Guide by Level</b>		
Level 1 Response	Level 2 Response	Level 3 Response
<ul style="list-style-type: none"> <li>Dealt with predominantly by the ERT, using existing Esso business-as-usual resources*.</li> <li>Supported by Victoria-based Esso resources; may involve the use of AMOSC technical advice or resources.</li> <li>Of short duration.</li> <li>Requires Tier One (local) resources.</li> </ul>	<ul style="list-style-type: none"> <li>Requires assistance external to the site and a formal command and control structure.</li> <li>IMT and ERT stood up; planning 'P' process implemented as soon as possible.</li> <li>ERT resources supplemented by AMOSC resources, Victoria State and NatPlan resources.</li> <li>Of short or medium-term duration.</li> <li>Potential for significant state government engagement (shoreline and P&amp;GA).</li> <li>Requires both Tier One and Tier Two resources.</li> </ul>	<ul style="list-style-type: none"> <li>Requires expanded IMT and full use of ICS processes with multiple planning periods.</li> <li>Planning 'P' process used fully.</li> <li>Extensive external national and (potentially) global resources (both in terms of personnel and technical and equipment-based resources).</li> <li>Results in a lasting campaign/project duration.</li> <li>Requires significant state and Australian government engagement.</li> <li>Tiers One, Two and Three resources mobilised.</li> </ul>

*\*Esso activities involving other facility operators (e.g., MODU for a drilling campaign) may form agreements through bridging documents to coordinate Level 1 response activities within the assigned operating area (usually 500m radius from location).*

The required notifications are outlined in Table 3-4.

**Table 3-4 Notifications**

Notifications			
Who	What	Minimum time to implement	✓/✗
IC or Deputy IC	<p>A reportable incident is one that has caused, or has the potential to cause, moderate to significant environmental damage (interpreted as the following):</p> <ul style="list-style-type: none"> <li>• Unplanned release of hydrocarbon liquid or chemicals exceeding &gt; 80 L into the marine environment caused by, or suspected to have been caused by, petroleum activities.</li> <li>• Unplanned injury or death of a cetacean or listed threatened/migratory/marine species caused by, or suspected to have been caused by, petroleum activities.</li> </ul> <p>Required for: all spills &gt; 80 L</p> <p>Ensure the NOPSEMA Duty Officer has been notified: Tel: 1300 674 472</p> <p>Relay the known key facts of the spill – location, source, size and type – as well as incident factors causing the spill, and current assessed spill level.</p> <p>Report incident to the DEECA ERR Duty Officer: Tel: 0419 597 010</p> <p>Relay the known key facts of the spill – location, source, size and type – as well as incident factors causing the spill, and current assessed spill level.</p>	<2 hours	<input type="checkbox"/>
EUL	Follow up with a written record of the oral notification to NOPSEMA as soon as practicable.	As soon as practicable	<input type="checkbox"/>
EUL	<p>A written report must be provided to NOPSEMA as soon as practicable, but in any case within 3 days<sup>1</sup> of a reportable environmental incident (as described above) unless otherwise agreed by NOPSEMA. This report can be made on NOPSEMA report form N-03000-FM0831.</p> <p>A copy of the written report must be given to DEECA ERR within 3 days.</p> <p><a href="mailto:ERRChiefInspector@ecodev.vic.gov.au">ERRChiefInspector@ecodev.vic.gov.au</a></p> <p>A copy of the written report must be given to both NOPTA within 7 days of giving the written report to NOPSEMA.</p>	<p>&lt;3 days</p> <p>&lt; 7 days after report given to NOPSEMA</p>	<input type="checkbox"/>
Vessel Master	<p>Required for: all spills from vessels.</p> <p>Notify the Rescue Coordination Centre: Tel: 1800 641 792</p> <p>Follow up with the completion and submission of a pollution report.</p> <p><a href="https://www.amsa.gov.au/forms/harmful-substances-report-polrep-oil">https://www.amsa.gov.au/forms/harmful-substances-report-polrep-oil</a></p>	<p>&lt;2 hours</p> <p>&lt;24 hours</p>	<input type="checkbox"/>

<sup>1</sup> As per Schedule 3 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) and as outlined in the NOPSEMA Notification and Reporting of Environmental Incidents Guidance Note N-03000-GN0926.

Notifications			
Who	What	Minimum time to implement	✓/✘
	Relay the known key facts of the spill – location, source, size and type – as well as incident factors causing the spill, and current assessed spill level.		
EUL	Required for: all spills > 80 L Notify the DEECA ERR and NOPTA via email: Email: DJPR: <a href="mailto:Operational.reports@ecodev.vic.gov.au">Operational.reports@ecodev.vic.gov.au</a> Email: NOPTA: <a href="mailto:reporting@nopta.gov.au">reporting@nopta.gov.au</a> Relay the known key facts of the spill – location, source, size and type – as well as incident factors causing the spill, and current assessed spill level.	<6 hours	<input type="checkbox"/>
IC or Deputy IC	Requirement: all spills that could impact Victorian state waters (> 80 L). Notify the DTP SREC State Duty Officer: Tel: 0409 858 715 Email: <a href="mailto:semincidentroom@ecodev.vic.gov.au">semincidentroom@ecodev.vic.gov.au</a> Relay the known key facts of the spill – location, source, size and type – as well as incident factors causing the spill, and current assessed spill level. For Level Two and Level Three spills, exchange liaison officers between Esso and the DTP SREC.	<6 hours	<input type="checkbox"/>
	Required for: all spills that could impact NSW waters. Notify the <i>Transport for NSW</i> Duty Officer of the need to stand-up state response arrangements. Transport for NSW Duty Officer: Tel: 02 9962 9074		<input type="checkbox"/>
	Required for: all spills that could impact Tasmanian waters. Notify the Tasmanian DPIPWE of the need to stand-up state response arrangements. Tasmanian DPIPWE Pollution Incidents and Complaints: Tel: 1800 005 171 The initial verbal notification must be followed up by an email containing a more detailed Pollution Incident Report to <a href="mailto:incidentresponse@epa.tas.gov.au">incidentresponse@epa.tas.gov.au</a>		<input type="checkbox"/>
EUL	Required for: all spills that are within a marine park, or could impact a marine park. Notify the Director of National Parks via the 24-hour Marine Compliance Duty Office: Tel: 0419 293 465	<12 hours	<input type="checkbox"/>
EUL	Required for: all spills that impact or have the potential to impact on matters of national environmental significance (NES) including protected and migratory species, Commonwealth Marine Reserves and Ramsar Wetlands. Notify the Department of Agriculture, Water and the Environment: Tel: 1800 803 772	< 12 hours	<input type="checkbox"/>
Once all appropriate authorities have been notified, move onto the appropriate immediate actions tables, for levels <b>one</b> , <b>two</b> or <b>three</b> below, depending on severity.			

Following the notifications, immediate actions by spills level are as follows coded by **planning**, **operations**, and **logistics** sections/areas:

**Table 3-5 Level One - 0-12 hour Actions**

Level One 0-12 hours			
Who	What	Minimum time to implement	✓/✗
IC	In conjunction with the ESG leader, ensure all necessary regulatory notifications have been made.	12 hours	<input type="checkbox"/>
IC	Commence the planning cycle (the 'stem' of the planning 'P'): <ul style="list-style-type: none"> <li>Establish incident aim</li> <li>Establish incident response aim and objectives</li> <li>Determine appropriate initial strategies and tactics to achieve objectives.</li> </ul>	ASAP – <2 hours	<input type="checkbox"/>
OSC	If the source is not controlled, establish a Source Control Branch to develop and implement the Source Control Plan.	ASAP	<input type="checkbox"/>
OSC	Undertake aerial surveillance: <ul style="list-style-type: none"> <li>Deploy surveillance by crew change or contracted aircraft.</li> <li>Initiate mobilisation of a trained aerial observer – Esso or AMOSC.</li> <li>Obtain photographs or video footage.</li> <li>Obtain completed aerial observer's report and pass to the PSC/SITL.</li> </ul>	ASAP, then 2x daily	<input type="checkbox"/>
OSC	Deploy a regular watch of the affected assets/vessel – confirm heading/changes to the situation.	ASAP then by reporting exception.	<input type="checkbox"/>
LSC	Confirm the location of aerial and marine assets currently contracted to Esso.	4 hours	<input type="checkbox"/>
PSC	Initiate specific elements of O1 of OSMP, including the tasks below.	ASAP	<input type="checkbox"/>
PSC	Monitor and predict weather and sea states: <ul style="list-style-type: none"> <li>Consult meteorology services to determine water current and wind speed data, either from <a href="http://www.bom.gov.au">http://www.bom.gov.au</a>, <a href="http://www.marineweather.net.au">http://www.marineweather.net.au</a>, or MetConnect (<a href="http://www.metconnect.co.nz">http://www.metconnect.co.nz</a>): <ul style="list-style-type: none"> <li>Username: Esso</li> <li>Password: basswx.</li> </ul> </li> </ul>	4 hours	<input type="checkbox"/>
PSC	Conduct a manual forecast of the spill trajectory: <ul style="list-style-type: none"> <li>Determine the direction of the spill.</li> <li>Determine if the spill is likely to cross into state waters or shorelines or if it might impact other sensitivities.</li> </ul>	4 hours	<input type="checkbox"/>
PSC	Should oil cross into state waters or impact shorelines, organise third-party trajectory modelling of the spill trajectory: <ul style="list-style-type: none"> <li>Organise urgent oil-spill trajectory modelling via AMOSC, OSRL, or EMBSI.</li> </ul>	4 hours	<input type="checkbox"/>
SITL	Establish a common operating picture – a graphical representation of the spill and its location. <ul style="list-style-type: none"> <li>Display overflight, OSTM/manual vectoring data on CoP.</li> </ul>	4 hours	<input type="checkbox"/>

Level One 0-12 hours			
Who	What	Minimum time to implement	✓/*
PSC	Prepare and disseminate SITREPs as more information becomes available. The IC is responsible for determining the frequency of these updates.	Ongoing	<input type="checkbox"/>
PSC	Consult the preparedness NEBA and Appendix D – Quick Reference Information to identify potential exposed environmental sensitivities based on spill trajectory, and develop an incident action plan, including a spill-specific NEBA (ref OPEP 5.2).	12 hours	<input type="checkbox"/>
EUL	Activate the OSMP 'O' modules 1.1, 1.2, 1.3 and 4.1	ASAP	<input type="checkbox"/>
EUL	Review the OSMP to determine which other modules may need to be initiated.	ASAP	<input type="checkbox"/>
Once these actions are complete, please move to <b>Section Four</b> of this plan			

\* Ability to deploy subject to available daylight and weather conditions

Table 3-6 Level Two - 0-12 hour Actions

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/✗
IC	Seek alignment on incident objectives from the ESG.	ASAP	<input type="checkbox"/>
IC	In conjunction with the ESG leader, confirm all necessary regulatory notifications have been made.	<2 hours	<input type="checkbox"/>
IC	Commence the planning cycle (the 'stem' of the planning 'P'): <ul style="list-style-type: none"> <li>Establish the incident response aim.</li> <li>Establish the incident objectives.</li> <li>Determine appropriate strategies and tactics to achieve objectives.</li> </ul>	ASAP – <6 hours	<input type="checkbox"/>
IC	Establish a locally based Esso IMT, including representatives from the Deputy IC, Ops SC, Aviation Unit, Log SC, Planning SC, Environmental Unit and Situation Unit.	<2 hour	<input type="checkbox"/>
IC	Establish a line of communications with DTP IMT and exchange Liaison Officers.	ASAP – <2 hours	<input type="checkbox"/>
IC/OSC/PSC	Determine and agree on the need for a separate Source Control Branch	ASAP	<input type="checkbox"/>
OSC	If the source is not controlled, establish a Source Control Branch to develop and implement the Source Control Plan.	ASAP	<input type="checkbox"/>
OSC	Undertake aerial surveillance: <ul style="list-style-type: none"> <li>Initiate aerial surveillance using the crew change helicopter or contracted aircraft.</li> <li>Initiate the mobilisation of a trained aerial observer – Esso or AMOSC</li> <li>Obtain photographs or video footage of the incident</li> <li>Obtain a completed aerial observer's report and pass to the PSC/SITL.</li> </ul>	ASAP, then twice daily	<input type="checkbox"/>
OSC	Mobilise a satellite tracking buoy to spill location (weather dependent).	ASAP – <12 hours	<input type="checkbox"/>
LSC	Confirm the location of aerial and marine assets currently contracted to Esso. Confirm the location and availability of vessels of opportunity in Victoria, as follows: <ul style="list-style-type: none"> <li>Contact Atoll Offshore on 03 5116 1511 or 0409 803 588.</li> <li>Contact Bhagwan Marine on +61 7 3907 3111 or 0409 979 551.</li> <li>Confirm the location and availability of aerial assets that may be used for aerial observation.</li> <li>Contact Bairnsdale Air Charter on 03 5152 4617.</li> <li>Consider utilisation of idle fishing vessels (which meet required specifications) by calling Gippsland Ports on 0427 610 025 (Harbour Master) or 0427 833 388 (Chief Executive Officer)</li> </ul>	4 hours	<input type="checkbox"/>
LSC	Notify the waste contractor of potential resource needs.	<12 hours	<input type="checkbox"/>

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/✗
LSC	<p>Notify the marine and aviation FOBs of the need to conduct spill response operations and prepare area and hardstand. Marine bases</p> <ul style="list-style-type: none"> <li>• BBMT Marine Supervisor 0407 846 457</li> <li>• Lakes Entrances 03 5116 1511 (Atoll Offshore)</li> <li>• Airfields</li> <li>• Esso Longford Heliport 03 5143 4256</li> <li>• Bairnsdale Airport 0447 132 980</li> </ul>	<6 hours	<input type="checkbox"/>
LSC	Identify and call-out Esso Core Group members – establish current location and timeframe to deploy to field-based ICP.	<6 hours	<input type="checkbox"/>
LSC	<p>Request that the AMOSC Technical Advisor come to the site (IMT) and that the AMOSC Operations Officer enters the field (ICP). Request that AMOSC undertake the call-out of CG resources (these should be mobilised in the Gippsland region). Request that AMOSC hire and mobilise x 6 satellite tracking buoys to Longford Heliport. Discuss potential equipment and service needs (Must be spill-size and type specific) with AMOSC, consisting of:</p> <ul style="list-style-type: none"> <li>• Equipment for three x offshore containment &amp; recovery strike teams, each comprising: <ul style="list-style-type: none"> <li>○ 3 reels of Ro-boom (or a single high speed sweep system)</li> <li>○ Skimmer package comprising an LWS500 or similar</li> <li>○ Temporary vessel storage (deck bladders, intermediate bulk containers or towable barges)</li> </ul> </li> <li>• Equipment to execute the shoreline TRPs <ul style="list-style-type: none"> <li>○ Shore seal boom; fence boom; anchor kits and ancillaries.</li> </ul> </li> <li>• Dispersant and National Plan aerial dispersant spraying capability.</li> <li>• Liaison to National Plan for the use of Victorian based C&amp;R equipment</li> </ul>	<3 hours	<input type="checkbox"/>
LSC	<p>Stage BBMT-based dispersant and offshore containment and recovery equipment for deployment, consisting of:</p> <ul style="list-style-type: none"> <li>• 1 x AFEDO dispersant spray sets.</li> <li>• 10m<sup>3</sup> IBCs of Corexit 9500a</li> <li>• Waste liquid storage (vessel dependent).</li> </ul> <p>Move equipment package to wharf face, ready for load out.</p>	<6 hours	<input type="checkbox"/>
LSC	Prepare LIP-based nearshore/shoreline oil spill response equipment for deployment.	<24 hours	<input type="checkbox"/>
LSC/PSC	Contact the waste management provider. Refer to PSC for advice on potential volumes and types of waste.	<24 hours	<input type="checkbox"/>
PSC	Initiate specific elements of O1 of OSMP, including the tasks below.	ASAP	<input type="checkbox"/>
PSC	<p>Monitor and predict weather and sea states:</p> <ul style="list-style-type: none"> <li>• Consult meteorology services to determine water current and wind speed data, either from <a href="http://www.bom.gov.au">http://www.bom.gov.au</a>, <a href="http://www.marineweather.net.au">http://www.marineweather.net.au</a>, or MetConnect (<a href="http://www.metconnect.co.nz">http://www.metconnect.co.nz</a>): <ul style="list-style-type: none"> <li>○ Username: Esso</li> <li>○ Password: basswx.</li> </ul> </li> </ul>	4 hours	<input type="checkbox"/>

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/✗
PSC	Conduct ADIOS2 forecasting of oil weathering and conduct manual vectoring of the spill trajectory, as follows: <ul style="list-style-type: none"> <li>Determine the direction of the spill.</li> <li>Determine if the spill is likely to cross into state waters or shorelines or if it might impact other sensitivities.</li> </ul>	4 hours	<input type="checkbox"/>
PSC	Conduct a third-party trajectory modelling of the spill trajectory: <ul style="list-style-type: none"> <li>Organise urgent oil spill-trajectory modelling using AMOSC, OSRL, or EMBSI.</li> </ul>	4 hours	<input type="checkbox"/>
SITL	Establish a common operating picture – a graphical representation of the spill and its location. Display overflight and OSTM/manual vectoring data on the CoP.	6 hours	<input type="checkbox"/>
PSC	Prepare and disseminate SITREPs as more information becomes available. The IC is responsible for determining the frequency of these updates.	Ongoing	<input type="checkbox"/>
EUL	Consult the NEBA (Ref OPEP Section 5.2), identify potential exposed environmental sensitivities based on spill trajectory, and develop an incident action plan, including a spill-specific NEBA (ref OPEP 5.2).	ASAP	<input type="checkbox"/>
EUL	Activate the OSMP 'O' modules 1.1, 1.2, 1.3, 2.1, 2.3 and 4.1	ASAP	<input type="checkbox"/>
EUL	Review the OSMP to determine which other modules may need to be initiated.	ASAP	<input type="checkbox"/>
EUL	Liaise with the States Scientific Support Coordination if it is anticipated that state waters or shorelines will be impacted.	6 hours	<input type="checkbox"/>
EUL	Assess the need for and coordinate additional personnel to support the environmental unit.	12 hours	<input type="checkbox"/>
EUL	Assess the need for and coordinate the development of specific plans, including the following: <ul style="list-style-type: none"> <li>Wildlife Management Plan</li> <li>SCAT Plan</li> <li>WMP</li> <li>Sample Plan</li> <li>Dispersant Plan</li> <li>Remediation Plan.</li> </ul> <p>Monitor the environmental consequences of any actions. Participate in the development of plans for the next operational period.</p>	12 hours	<input type="checkbox"/>
Once these actions are complete, please move to <b>Section Four</b> of this plan.			

**Table 3-7 Level Three - 0-12 hour Actions**

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/*
IC	Seek alignment on incident objectives from the ESG.	ASAP	<input type="checkbox"/>
IC	In conjunction with the ESG leader, confirm all necessary regulatory notifications have been made.	<2 hours	<input type="checkbox"/>
IC	Commence the planning cycle (the 'stem' of the planning 'P'): <ul style="list-style-type: none"> <li>Establish the incident response aim.</li> <li>Establish the incident objectives.</li> <li>Determine appropriate strategies and tactics to achieve objectives.</li> </ul>	ASAP – <6 hours	<input type="checkbox"/>
IC	Establish full, locally-based Esso IMT including representatives from Deputy IC, Ops SC, Aviation Unit, Log SC, Planning SC, Environmental Unit and Situation Unit.	<2 hours	<input type="checkbox"/>
IC	Establish a line of communications with the Control Agency IMT and exchange Liaison Officers.	<2 hours	<input type="checkbox"/>
IC	Offer a line of communication with the AMSA and swap liaison officers.	<2 hours	<input type="checkbox"/>
IC / ESG	Initiate the activation of the ExxonMobil Regional Response Team. Tel: +44 1372 223 232	<24 hours	<input type="checkbox"/>
IC/OSC/PSC	Determine and agree on the need for a separate Source Control Branch.	<2 hours	<input type="checkbox"/>
OSC	If the source is not controlled, establish a Source Control Branch to develop and implement the Source Control Plan (this should be made up of pipeline or well engineering teams).	ASAP	<input type="checkbox"/>
OSC	Undertake aerial surveillance: <ul style="list-style-type: none"> <li>Initiate aerial surveillance using the crew change helicopter or contracted aircraft.</li> <li>Initiate the mobilisation of a trained aerial observer – Esso or AMOSC.</li> <li>Obtain photographs or video footage of the incident.</li> <li>Obtain a completed aerial observer's report and pass to the PSC/SITL.</li> </ul>	ASAP, then twice daily	<input type="checkbox"/>
OSC	Mobilise a satellite tracking buoy to spill location (weather dependent).	ASAP – <12 hours	<input type="checkbox"/>
OSC	Deploy a twice-daily watch from assets/vessel – confirm heading/changes to the situation.	ASAP then by reporting exceptions.	<input type="checkbox"/>
OSC/LSC	On the advice of the Drilling Engineer/Source Control Branch, mobilise the Subsea First Response Toolkit (SFRT) via the AMOSC.	4 hours	<input type="checkbox"/>

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/✗
LSC	<p>Confirm the location of aerial and marine assets currently contracted to Esso.</p> <p>Confirm the location and availability of vessels of opportunity in Victoria, as follows:</p> <ul style="list-style-type: none"> <li>• Contact Atoll Offshore on 03 5116 1511 or 0409 803 588</li> <li>• Contact Bhagwan Marine on +61 7 3907 3111 or 0409 979 551.</li> </ul> <p>Confirm the location and availability of aerial assets of opportunity that are suitable for aerial observation tasks.</p> <ul style="list-style-type: none"> <li>• Contact Bairnsdale Air Charter on 03 5152 4617.</li> </ul>	<3 hours	<input type="checkbox"/>
LSC	<p>Request that 3 x AMOSC Technical Advisors come to the site (IMT) and that 3 x AMOSC Operations Officers are deployed to enter the field (Marine or aviation ICPs).</p> <p>Request that AMOSC undertake the call-out of CG resources (these should be mobilised in the Gippsland region).</p> <p>Request that AMOSC hire and mobilise x 6 satellite tracking buoys to Longford Heliport.</p> <p>Discuss potential equipment and service needs (spill-type specific) with AMOSC, consisting of:</p> <ul style="list-style-type: none"> <li>• Equipment for three x offshore containment &amp; recovery strike teams, each comprising: <ul style="list-style-type: none"> <li>○ 3 reels of ro-boom (or high speed sweep system)</li> <li>○ Skimmer package comprising and LWS500 or similar</li> <li>○ Temporary vessel storage (deck bladders, intermediate bulk containers or towable barges)</li> </ul> </li> <li>• Equipment to execute the shoreline TRPs <ul style="list-style-type: none"> <li>○ shore seal boom; fence boom; anchor kits and ancillaries</li> </ul> </li> <li>• Dispersant – 50 m<sup>3</sup> of Corexit 9500A to be moved to Bairnsdale Airport.</li> </ul> <p><i>For worse case loss of well containment scenarios:</i></p> <ul style="list-style-type: none"> <li>• Additional booming and skimming equipment from Fremantle and Exmouth for a further three x C &amp; R strike teams</li> <li>• Liaison to National Plan for the use of Victorian, NSW and South Australian based C&amp;R equipment, sufficient for a further four Strike teams.</li> <li>• Refer to Quick Reference Guides in Appendix D for further detail</li> </ul>	<3 hours	<input type="checkbox"/>
LSC	<p>Notify the marine and aviation FOBs of the need to conduct spill response operations and prepare area and hardstand. Marine bases</p> <ul style="list-style-type: none"> <li>• BBMT Marine Supervisor 0407 846 457</li> <li>• Lakes Entrances 03 5116 1511 (Atoll Offshore)</li> <li>• Airfields</li> <li>• Esso Longford Heliport 03 5143 4256</li> <li>• Bairnsdale Airport 0447 132 980</li> </ul>	<6 hours	<input type="checkbox"/>

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/✗
LSC	Identify and call-out Esso Core Group members – establish current location and timeframe to deploy to field-based ICP	<6 hours	<input type="checkbox"/>
LSC	Request OSRL technical resources and notify the OSRL Duty Manager of the potential need for resources, as follows: <ul style="list-style-type: none"> <li>Contact the OSRL Duty Manager in Singapore +65 6266 1566.</li> <li>Request 5 x Technical Advisors to mobilise and join the IMT.</li> </ul>	<6 hours	<input type="checkbox"/>
LSC	Stage BBMT-based dispersant and offshore containment and recovery equipment for deployment: <ul style="list-style-type: none"> <li>1 x AFEDO dispersant spray sets.</li> <li>10m<sup>3</sup> IBCs of Corexit 9500a</li> <li>Waste liquid storage (vessel dependent).</li> </ul> Move equipment package to wharf face, ready for load out.	<6 hours	<input type="checkbox"/>
LSC	Notify waste contractors to prepare for potential liquid, and solid wastes – specific amounts and types to be determined.	<12 hours	<input type="checkbox"/>
LSC	Prepare LIP-based nearshore/shoreline oil-spill response equipment for deployment.	<24 hours	<input type="checkbox"/>
LSC/PSC	Contact the waste management provider PSC for advice on potential volumes and types of waste.	<24 hours	<input type="checkbox"/>
PSC	Initiate specific elements of O1 of OSMP, including the tasks below.	ASAP	<input type="checkbox"/>
PSC	Monitor and predict weather and sea states: <ul style="list-style-type: none"> <li>Consult meteorology services to determine water current and wind speed data, either from <a href="http://www.bom.gov.au">http://www.bom.gov.au</a>, <a href="http://www.marineweather.net.au">http://www.marineweather.net.au</a>, or MetConnect (<a href="http://www.metconnect.co.nz">http://www.metconnect.co.nz</a>): <ul style="list-style-type: none"> <li>Username: Esso</li> <li>Password: basswx.</li> </ul> </li> </ul>	4 hours	<input type="checkbox"/>
PSC	Conduct ADIOS2 forecasting of oil weathering and conduct manual vectoring of the spill trajectory, as follows: <ul style="list-style-type: none"> <li>Determine the direction of the spill.</li> <li>Determine if the spill is likely to cross into state waters or shorelines or if it might impact other sensitivities.</li> </ul>	4 hours	<input type="checkbox"/>
PSC	Conduct third-party trajectory modelling of spill trajectory: <ul style="list-style-type: none"> <li>Organise urgent oil-spill trajectory modelling via Esso/APASA/AMOSC.</li> <li>Does the spill cross into state waters, shorelines or impact other sensitivities?</li> </ul>	4 hours	<input type="checkbox"/>
SITL	Establish a common operating picture – a graphical representation of the spill and its location. Display overflight and OSTM/manual vectoring data on the CoP.	4 hours	<input type="checkbox"/>
PSC	Prepare and disseminate SITREPs as more information becomes available. The IC is responsible for determining the frequency of these updates.	Ongoing	<input type="checkbox"/>

Level Two 0-12 hours			
Who	What	Minimum time to implement	✓/✗
EUL	Consult the NEBA (Ref OPEP section 5.2), identify potential exposed environmental sensitivities based on spill trajectory, and develop an incident action plan, including a spill-specific NEBA (ref OPEP 5.2).	ASAP	<input type="checkbox"/>
EUL	Activate the OSMP 'O' modules 1.1, 1.2, 1.3, 1.4, 1.5, 2.1, 2.2, 2.3 and 4.1.	ASAP	<input type="checkbox"/>
EUL	Review the OSMP to determine which other modules may need to be initiated.	ASAP	<input type="checkbox"/>
EUL	Liaise with the States Scientific Support Coordination if it is anticipated that state waters or shorelines will be impacted.	6 hours	
EUL	Assess the need for and coordinate additional personnel to support the environmental unit.	12 hours	<input type="checkbox"/>
EUL	Assess the need for and coordinate the development of specific plans, including the following: <ul style="list-style-type: none"> <li>• Wildlife Management Plan</li> <li>• SCAT Plan</li> <li>• Waste Management Plan</li> <li>• Sample Plan</li> <li>• Dispersant Plan</li> <li>• Remediation Plan.</li> </ul> Monitor the environmental consequences of any actions. Participate in the development of plans for the next operational period.	12 hours	<input type="checkbox"/>
Once these actions are complete, please move to <b>Section Four</b> of this plan.			

## 4 Initial Oil Spill Response Actions: Reactive Operations 12–48 hours

Following the immediate action and assessment process, Esso will establish an IMT structure appropriate to mount actions as required for the response. Recommended minimum IMT structures are as below in Figure 4-1.

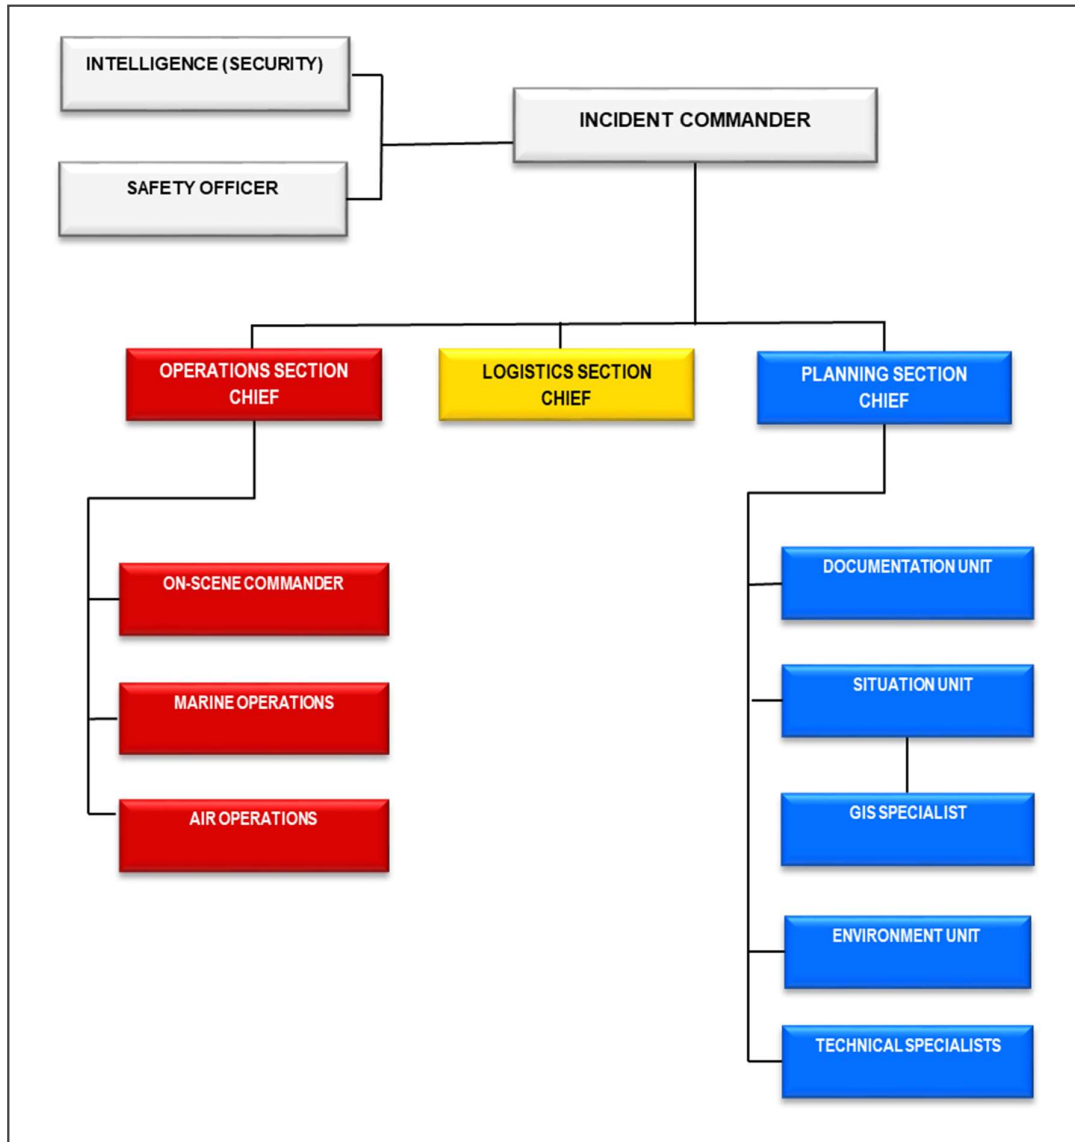

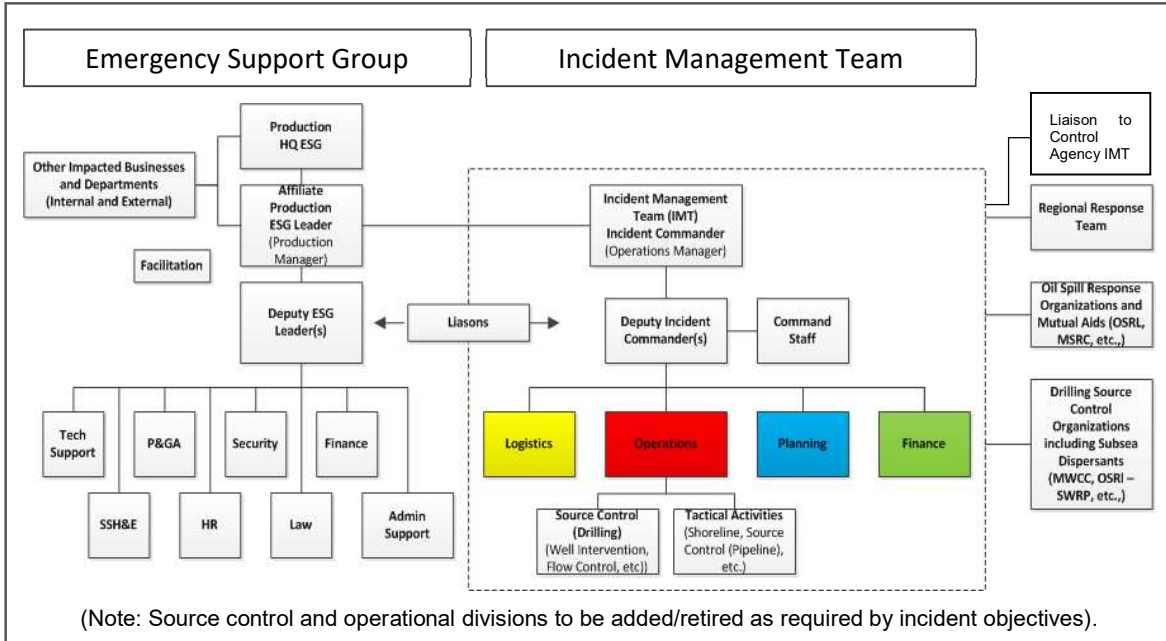

Figure 4-1 Level one – IMT for Localised Response Activities and Impacts (Offshore Incident Management Team)

**Figure 4-2 Level Two/Three – Esso IMT for Expanded Multi-Jurisdictional Impacts**

Once the IMT is established, the following checklists are to be used by the functional areas of the IMT to assist each area to execute tasks in support of spill response strategies:

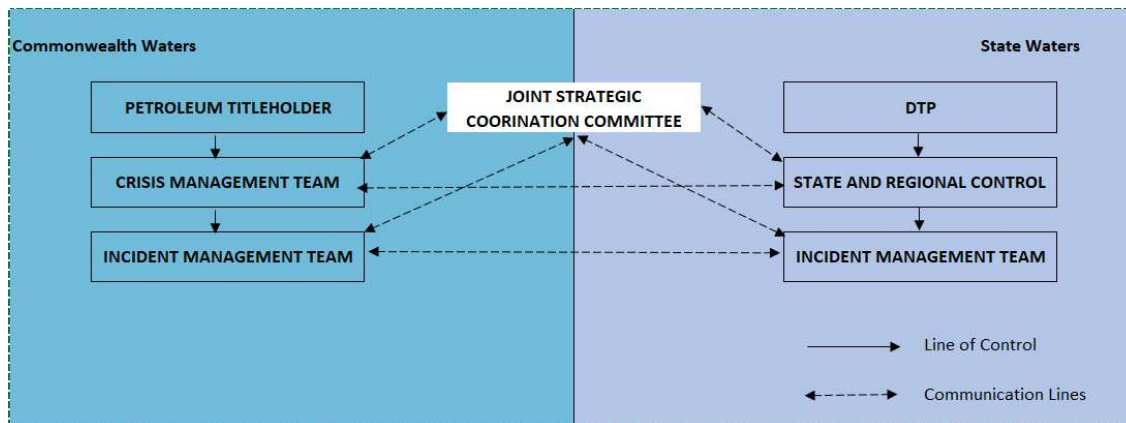

Spill Classification	Relevant Section
Level Two/Three Spills: State water & predicted shoreline impacts.	Section 4.1
Level Two/Three Spills: Commonwealth water impacts & no predicted State water or shoreline impacts.	Section 4.2
Level One Spills: localised	Section 4.3

#### 4.1 Level Two and Three Spills – State Water and Shoreline Impacts.

In Victoria, DTP will assume responsibility for marine pollution incidents in coastal waters, up to 3 nautical miles from shore. Esso, as the petroleum titleholder, is the control agency for marine pollution incidents in Commonwealth waters resulting from an offshore petroleum activity. In the event of a marine pollution incident originating in Commonwealth waters that impacts or threatens State waters, DTP assumes jurisdictional control for such incidents within coastal waters from a State consequence management perspective. Esso will work with DTP to ensure an adequate response, including provision of personnel, equipment and other response resources.

DTP's role of control agency will not extend to response operations in Commonwealth waters including those directly associated with source control or relief well drilling; management of these operations will be performed by Esso. Emergency Management Liaison Officers (EMLOs) may be required between DTP's and Esso's Incident Management Team (IMT).

In the event of a cross-jurisdictional marine pollution incident, the Esso and DTP will work collaboratively, sharing response resources and providing qualified personnel to the DTP IMT. To facilitate effective coordination between the two control agencies and their respective IMTs, a Joint Strategic Coordination Committee (JSCC) will be established. The control and coordination arrangements for cross-jurisdictional maritime emergencies is outlined in Figure 4-3.

**Figure 4-3 Joint Strategic Coordination Committee arrangements**

The role of the JSCC is to ensure appropriate coordination between the respective IMTs established by multiple control agencies. The key functions of the JSCC include:

- Ensuring key objectives set by multiple IMTs in relation to the marine pollution incident are consistent and focused on achieving an effective coordinated response.
- Resolving competing priorities between multiple IMTs.
- Resolving competing requests for resources between the multiple IMTs, including those managed by Australian Maritime Safety Authority (AMSA), such as national stockpile equipment, dispersant aircraft and the National Response Team.
- Resolution of significant strategic issues as they arise during the incident response.
- Ensuring that there is a shared understanding of the incident situation and its meaning amongst all key stakeholders.
- Ensuring there is agreement on how information is communicated to the public, particularly those issues that have actual or perceived public health implications.
- Ensuring adequate coordination and consistency is achieved in relation to access and interpretation of intelligence, information and spill modelling to promote a common operating picture.

The JSCC is a committee, not a team operating from a specified location. The JSCC will be administered by DTP and the inaugural JSCC meeting will be convened by the State Controller Maritime Emergencies (SCME) once both the titleholder and DTP formally assume the role of control agency in respective jurisdictions.

The JSCC will be jointly chaired by the SCME and Esso’s nominated senior representative, who will determine whom will sit in the committee for a coordinated response. As the relevant jurisdictional authority in Commonwealth waters, NOPSEMA may opt to participate in the JSCC as they see fit.

While the above arrangements described are specific to Victoria, Esso will work with other NSW or Tasmania State government IMT’s in a similar manner should their State waters or shorelines be impacted.

For further information on Tasmanian cross jurisdiction arrangements, refer to [EPA Tasmania - Offshore Petroleum Industry Guidance Note](#)

**Table 4-1 Incident Management Team Tasking**

Incident Management Team Tasking		
<b>Establish an Incident Management Team that oversees the implementation of oil spill response measures – Unity of Command Model with DTP</b>		
Tactic: Establish and staff a full Esso IMT		Completed?
IC / ESG Lead	Nominate Liaison Officers for Control Agency IMT	<input type="checkbox"/>
	Nominate senior company representative to participate in JSCC	<input type="checkbox"/>
PSC Day One	Establish full Esso IMT <ul style="list-style-type: none"> <li>• Call out IC/OSC/LSC/PSC/Situation &amp; Enviro Units.</li> <li>• Staff each function with teams – actual and virtual.</li> </ul>	<input type="checkbox"/>
PSC Day two	<ul style="list-style-type: none"> <li>• Review team make up for current, and future operational period.</li> <li>• Ensure that functional areas are aligned with the needs of the response.</li> </ul>	<input type="checkbox"/>
Tactic: Draft and execute an Incident Action Plan		Completed?
IC lead	Commence planning cycle ('stem of P')	<input type="checkbox"/>
PSC Day One	<ul style="list-style-type: none"> <li>• Complete the initial IAP (ICS 201s);               <ul style="list-style-type: none"> <li>○ Establish current operational period aim, objectives, strategy, tactics &amp; resources.</li> <li>○ Draft 24, 48 &amp; 72 incident potential worksheet (size up).</li> <li>○ Complete NEBA.</li> <li>○ Determine the potential <u>shoreline impact</u>.</li> <li>○ Assess weather and sea state for the next 48 hours for suitability to conduct <u>marine response</u> and/or <u>aviation response</u> activities.</li> </ul> </li> <li>• NEBA outcomes to drive the selection of strategies from Table 4-3 onwards.</li> <li>• Exchange Liaison Officers between Control Agency IMT and Esso IMT.</li> <li>• Use Liaison Officers to inform Control Agency IMT of Esso ICS201 outputs.</li> </ul>	<input type="checkbox"/>
EUL Day One / Two	<ul style="list-style-type: none"> <li>• Undertake an environmental risk assessment of each proposed tactical execution of strategy (below actions – shoreline/marine/aviation operations).</li> </ul>	<input type="checkbox"/>
PSC Day Two	<ul style="list-style-type: none"> <li>• Review the ICS201 from the previous day               <ul style="list-style-type: none"> <li>○ Are the aim, objectives, strategies, tactics &amp; resources still current given the current conditions for the operational period?</li> <li>○ Review response organisation and staffing needs.</li> <li>○ Continue execution of previous day's plan.</li> <li>○ Modify the plan.</li> </ul> </li> <li>• In consultation with IC, assess readiness to move into the Proactive Planning Phase.</li> <li>• IMT commences proactive planning cycle (Planning 'P')</li> </ul>	<input type="checkbox"/>
OSC Day One	<ul style="list-style-type: none"> <li>• Plan and execute immediate/first strike operations (as per the list below), and include the following:</li> <li>• Shoreline operations               <ul style="list-style-type: none"> <li>○ Close off sensitive areas through the implementation of Tactical Response Plans (TRP).</li> <li>○ Provide materials and personnel to state response teams to undertake shoreline SCAT surveys.</li> <li>○ Provide materials and personnel to state response teams to undertake further shoreline protection.</li> </ul> </li> </ul>	<input type="checkbox"/>

Incident Management Team Tasking		
	<ul style="list-style-type: none"> <li>○ Marine operations – vessel-based dispersant and containment &amp; recovery operations,</li> <li>○ Vessels – direct vessel of opportunity fleets.</li> <li>○ Equipment – source from Esso, AMOSC, NatPlan and OSRL.</li> <li>○ Personnel – source from Esso, AMOSC, AMOSC Core Group, NatPlan CG, ExxonMobil Regional Response Team, OSRL.</li> <li>● Aviation operations – surveillance and dispersant operations.</li> <li>● Operations to follow the relevant section of ExxonMobil Field Response Manual and/or Shoreline Treatment Plans.</li> </ul>	
Safety Officer Day One	<ul style="list-style-type: none"> <li>● Complete Safety Risk Assessment of all operational activities.</li> <li>● Incorporate Safety Risk Assessment into a Safety Plan.</li> </ul>	□
OSC / Source Control Branch Director Day one	<ul style="list-style-type: none"> <li>● Execution of source control arrangements as required:               <ul style="list-style-type: none"> <li>○ Activate Australia Wells Team Tier II/III Emergency Response Plan.</li> <li>○ Pipeline response plan.</li> </ul> </li> <li>● Activate source control resource contracts/assistance contracts:               <ul style="list-style-type: none"> <li>○ SFRT – AMOSC</li> <li>○ SWIS – OSRL</li> <li>○ Wild Well Control</li> </ul> </li> <li>● Activate pipeline repair</li> <li>● Activate marine salvers</li> </ul>	□
LSC Day Two	<ul style="list-style-type: none"> <li>● Request and stage resources into Gippsland to enable long-term operations to occur:               <ul style="list-style-type: none"> <li>○ Integration of Level Two and Level Three resources into the response.</li> </ul> </li> <li>● Execute the waste management plan:               <ul style="list-style-type: none"> <li>○ Call out the third-party contractor (Cleanaway),</li> <li>○ Liaise with EPA for ongoing waste management requirements (temporary storage and transportation).</li> </ul> </li> <li>● Equipment mobilisation for temporary storage and decontamination.</li> </ul>	□

**Table 4-2 Surveillance Monitoring & Visualisation (SMV) Strategy**

Surveillance Monitoring & Visualisation (SMV) Strategy		
Tactic: Satellite tracking buoys will be deployed to monitor the leading edge of the slick and deployed in 24-hour intervals to indicate swept pathways.		Completed?
OSC Day one	<ul style="list-style-type: none"> <li>● Deploy satellite tracking buoys (STBs) from Longford (via helicopter or vessel). Place on the leading edge of the spill</li> <li>● Tracking Buoy Deployment Instructions</li> </ul>	□
	<ul style="list-style-type: none"> <li>● Request AMOSC for all available STBs to be contracted to Esso</li> <li>● STBs moved to Longford ASAP</li> </ul>	□
Day two +	<ul style="list-style-type: none"> <li>● Monitor location of deployed STBs               <ul style="list-style-type: none"> <li>○ At last light, deploy STB close to the spill source</li> </ul> </li> </ul>	□
<ul style="list-style-type: none"> <li>● Tactics: Twice daily manned overflights will be undertaken to monitor the spreading, location, and weathering of the slick.</li> </ul>		Completed?
OSC Day One	<ul style="list-style-type: none"> <li>● Commence twice daily aerial overflights to determine size/bearing               <ul style="list-style-type: none"> <li>○ Obtain a completed aerial observer's report and pass to the PSC/SITL.</li> <li>○ Use crew change helicopter where possible.</li> </ul> </li> </ul>	□

Surveillance Monitoring & Visualisation (SMV) Strategy		
	<ul style="list-style-type: none"> <li>○ If Esso asset unavailable, contact and contract the use of third-party aircraft.</li> </ul>	
OSC / PSC/LSC	<ul style="list-style-type: none"> <li>● Activate Bairnsdale Air Charter for overflight duties</li> <li>● Request aircraft to fly over the Gippsland shoreline, noting the status (closed/open) of the following intermittently open estuaries:               <ul style="list-style-type: none"> <li>○ Davis Creek - 37°34'43.46"S, 149°44'59.14"E,</li> <li>○ Bunga Arm - 37°56'50.00"S, 147°48'18.98"E</li> <li>○ Lake Tyers - 37°51'33.78"S, 148° 5'18.55"E</li> <li>○ Merrimen Creek - 38°22'56.18"S, 147°11'4.26"E</li> <li>○ Mueller River - 37°46'44.51"S, 149°19'41.29"E</li> <li>○ Shipwreck Creek - 37°38'51.45"S, 149°41'58.05"E</li> <li>○ Sydenham Inlet - 37°46'49.61"S, 149° 1'11.26"E</li> <li>○ Tamboon Inlet - 37°46'39.31"S, 149° 9'11.11"E</li> <li>○ Thurra River - 37°46'56.67"S 149°18'45.94"E</li> <li>○ Yeerung River - 37°47'28.02"S, 148°46'26.67"E</li> </ul> </li> <li>● Report this data back to the EUL/PSC</li> </ul>	□
OSC Day two	<ul style="list-style-type: none"> <li>● Continue twice daily aerial overflight to determine size/bearing               <ul style="list-style-type: none"> <li>○ Use crew change helicopter where possible).</li> <li>○ If Esso asset unavailable, contact and contract the use of third-party aircraft.</li> <li>○ Aircraft over slick 30 mins after first light.</li> </ul> </li> <li>● Use the location of deployed satellite tracking buoys as initial extents for aircraft bearing</li> </ul>	□
Tactics: Daily oil spill trajectory modelling will be used to predict the weathering and direction that the oil will spread.		Completed?
PSC  Day One; then each day	<ul style="list-style-type: none"> <li>● Request OSTM runs to verify data gained through manual means via AMOSC twice daily. The request should include:               <ul style="list-style-type: none"> <li>○ 12/24/36/48/60/72 hour outlook deterministic trajectory modelling.</li> <li>○ Shoreline loadings (1, 10 and 100 gm p/sqm) – time frames, volumes and locations.</li> <li>○ Request via initial phone call and completion of Oil Spill Trajectory Modelling request form .</li> <li>○ Data to be relayed back to the Situation Unit.</li> <li>○ Via AMOSC, request the Technical Officer to be deployed to the Esso IMT to provide direct support to the Situation Unit.</li> </ul> </li> <li>● For facility coordinates, refer to <a href="#">Gippsland platform location coordinates</a></li> </ul>	□
Tactics: Set a twice-daily watch to confirm the extent and spreading of the spill from the assets.		Completed?
OSC Day One; then each day	<ul style="list-style-type: none"> <li>● If there is a spill from a manned asset, set a two-hourly watch to confirm the bearing/size.</li> <li>● Have observers take photographs or video. Where possible, include vessels or other objects in photos to provide scale.</li> </ul>	□
Tactics: Establish the Esso Common Operating Picture in the Esso IMT.		Completed?
OSC / SITL  Day one, then for the duration of the spill	<ul style="list-style-type: none"> <li>● Establish Esso's Common Operating Picture</li> <li>● Commence data capture and graphical display.</li> <li>● Key data to be displayed include:               <ul style="list-style-type: none"> <li>○ Spill location,</li> <li>○ Spill extent, direction and trajectory,</li> <li>○ Environmental sensitives ,</li> <li>○ Bass Strait oil &amp; gas facilities,</li> <li>○ Location of the staging area and forward operating base</li> <li>○ Esso-controlled contracted resources – aircraft and vessels, and</li> <li>○ Third-party-controlled potential resources of opportunity – aircraft and vessels.</li> </ul> </li> </ul>	□

Surveillance Monitoring & Visualisation (SMV) Strategy		
Tactics: OSMP as triggered.		Completed?
	Activate the various Operational Monitoring Programmes contained within the OSMP: <ul style="list-style-type: none"> <li>○ O1 – O5 as per triggers in OSMP</li> </ul>	<input type="checkbox"/>
For Level Three Spills only		
Tactics: Obtain satellite imagery of the spill location.		Completed?
PSC/ SITL	<ul style="list-style-type: none"> <li>• Request satellite imaging of spill               <ul style="list-style-type: none"> <li>○ Refer to <a href="#">ExxonMobil Production Geospatial Emergency Response Service</a>)</li> </ul> </li> <li>• Alternative options:               <ul style="list-style-type: none"> <li>○ Request satellite imagery via AMOSC.</li> <li>○ Request satellite imagery via OSRL – Agreement in place with Radiant Solutions</li> </ul> </li> </ul>	<input type="checkbox"/>

**Table 4-3 Shoreline Protection and Clean up Strategy**

Shoreline Protection and Clean up Strategy		
Note: Implementation is dependent on NEBA and oil trajectory.		
Tactic: Inform and agree with Control Agency IMT tactical execution of shoreline planning.		Completed?
PSC/Esso LO  Day one, then each day	<ul style="list-style-type: none"> <li>• Inform DTP/ Control Agency IMT of Esso's intention to undertake planning for shoreline impacts.</li> <li>• Using data from SMV, establish shoreline planning:               <ul style="list-style-type: none"> <li>○ Shoreline extents.</li> <li>○ Nearest potential Incident Command Points.</li> <li>○ Shoreline incident control structure (sectors, segments &amp; divisions).</li> <li>○ Draft a sector command structure.</li> <li>○ Shoreline access points - people and vehicles.</li> </ul> </li> <li>• Share this data with DTP Control Agency IMT for implementation.</li> </ul>	<input type="checkbox"/>
Tactics: Commence pre-impact surveys and pre-impact shoreline cleaning.		Completed?
OSC  Day 1	<ul style="list-style-type: none"> <li>• Commence pre-impact surveys               <ul style="list-style-type: none"> <li>○ Shoreline surveys by foot – AMOSC and Esso personnel.</li> <li>○ Shoreline surveys by air – UAV / contracted platforms.</li> </ul> </li> </ul>	<input type="checkbox"/>
OSC  Day 2	<ul style="list-style-type: none"> <li>• Implement operations               <ul style="list-style-type: none"> <li>○ Commence shoreline pre-cleaning for areas at immediate risk (first light of day 2).</li> </ul> </li> </ul>	<input type="checkbox"/>
Tactics: Implement Shoreline TRP's to reduce oil impact on sensitive receptors.		Completed?
PSC  Day one	<ul style="list-style-type: none"> <li>• Based on trajectory, agree with Control Agency IMT regarding the shoreline TRPs to be implemented</li> </ul>	<input type="checkbox"/>
LSC  Day One	<ul style="list-style-type: none"> <li>• Esso to tally equipment and personnel required for the selected TRPs               <ul style="list-style-type: none"> <li>○ Mobilise equipment from (i) Esso stockpiles, (ii) AMOSC Geelong stockpile &amp; (iii) Gippsland Ports/State equipment cache.</li> </ul> </li> </ul>	<input type="checkbox"/>

Shoreline Protection and Clean up Strategy		
	<ul style="list-style-type: none"> <li>○ Request personnel from Esso CG and operational workforces; AMOSC Staff/Core Group &amp; Gippsland Ports.</li> <li>● Decide upon ICP's and shoreline staging areas (east and west extents) for equipment.</li> <li>● Commence the mobilisation of equipment and personnel to the staging area (Lakes Entrance – Bullock Island or BBMT).</li> </ul>	
OSC Day One,	<ul style="list-style-type: none"> <li>● Liaise with Gippsland Ports (on ground 1st strike agency) to commence execution of TRPs.</li> <li>● Commence TRP implementation (based on the agreement with Control Agency IMT/Gippsland Ports).</li> </ul>	☐
Tactics: Mass mobilisation of equipment, personnel and support for large-scale shoreline operations.		Completed?
LSC Day 1	<ul style="list-style-type: none"> <li>● Activate supply and service contracts for ground support;</li> <li>● Establish equipment staging areas,</li> <li>● Use a third-party to identify accommodation providers (hotels, motels, caravan parks, and campsites),</li> <li>● Select ground transport providers (bus charter),</li> <li>● Use a third-party to identify remote camp options including:               <ul style="list-style-type: none"> <li>○ Locations</li> <li>○ Services</li> <li>○ Catering</li> <li>○ Laundry</li> <li>○ Water treatment options</li> </ul> </li> </ul>	☐
LSC Day 1	<ul style="list-style-type: none"> <li>● Activate specialised labour and OSR equipment support               <ul style="list-style-type: none"> <li>○ Request AMOSC core group projections.</li> <li>○ Request AMOSC immediate deployment of availed CG to lead shoreline clean up teams (&lt;24 hours).</li> <li>○ Include PPE, shoreline consumables, and other shoreline kits.</li> <li>○ Request OSRL shoreline team leaders (operations).</li> </ul> </li> </ul>	☐

**Table 4-4 Marine Dispersant, and Containment & Recovery Operations**

Marine Dispersant, and Containment & Recovery Operations		
Note: Dependant on NEBA and oil trajectory.		
Tactic: Establish strike teams able to undertake containment and recovery, and/or dispersant operations.		Completed?
LSC Day One	<ul style="list-style-type: none"> <li>● Establish BBMT as initial Marine FOB.</li> <li>● Secure four vessels for marine operations – if not engaged in other safety critical mission.</li> <li>● Direct vessels to BBMT to load out equipment.</li> <li>● Direct AMOSC to shift C&amp;R equipment from Geelong to BBMT:               <ul style="list-style-type: none"> <li>○ 6 x offshore boom reels.</li> <li>○ 2 x offshore skimmer unit.</li> </ul> </li> <li>● If vessel tanks are &lt;500 m<sup>3</sup> arrange temporary storage units.</li> <li>● Move BBMT offshore vessel based dispersant systems to wharf edge:               <ul style="list-style-type: none"> <li>○ 2 x afedo dispersant spray systems.</li> <li>○ 20 m<sup>3</sup> dispersant (10 per vessel).</li> </ul> </li> <li>● Request available Esso Core group recall for duty – vessel-based operations from day two.</li> <li>● Load out vessel for operations.</li> </ul>	☐
OSC	<ul style="list-style-type: none"> <li>● Prepare ICS204 for vessel-based C&amp;R and dispersant operations:               <ul style="list-style-type: none"> <li>○ Refer to Appendix A draft ICS204 for operations.</li> </ul> </li> </ul>	☐

Marine Dispersant, and Containment & Recovery Operations		
Day One		
OSC	<ul style="list-style-type: none"> <li>Brief teams to the two separate ICS204.</li> <li>Direct strike teams (each strike team comprises a pair of vessels) to area of operations:</li> </ul>	□
Day Two		<ul style="list-style-type: none"> <li>For dispersant operations, field test must be conducted prior to operational spraying, with results reported to the IMT.</li> <li>Report back of OSMP O2.2 to validate dispersant effectiveness.</li> <li>PSC to confirm based on the field dispersant testing move to large scale operational spraying.</li> <li>Volume of dispersant used to be reported to SITL</li> </ul>
Tactic: Establish Marine Forward Operating Base for ongoing large-scale marine operations.		Completed?
LSC	<ul style="list-style-type: none"> <li>Based on shoreline impacts, plan for either/or BBMT and Lakes Entrance as marine FOB for ongoing C&amp;R operations:               <ul style="list-style-type: none"> <li>Offshore C&amp;R operations (large vessel operations – wharf considerations - under keel clearance, width, vessel availability).</li> <li>Nearshore/shoreline vessel support operations.</li> </ul> </li> <li>Demarcate in each location:               <ul style="list-style-type: none"> <li>OSR Equipment receipting and laydown areas.</li> <li>Office and briefing space.</li> <li>Temporary waste storage area (coming off vessel, after shift).</li> </ul> </li> </ul>	□
Day Two		
Tactics: Request and contract extended offshore response support – escalated resourcing.		Completed?
LSC	<ul style="list-style-type: none"> <li>Contract additional vessels for C&amp;R:               <ul style="list-style-type: none"> <li>Nearshore/shoreline needs – marine surveyed vessels.</li> <li>Coastal/offshore needs – marine surveyed.</li> </ul> </li> <li>Shift all Esso OSR equipment to BBMT/Lakes Entrance:               <ul style="list-style-type: none"> <li>Boom reels.</li> <li>Skimmer units.</li> <li>Temp storage.</li> <li>Dispersant spray sets.</li> </ul> </li> <li>Operations and Planning to advise how many strike teams are required. Refer to applicable Quick Reference Guide in Appendix D for guidance on resource requirements for worst case scenarios</li> <li>Request and shift AMOSC nearshore and offshore C&amp;R equipment, and all shoreline equipment to BBMT/Lakes Entrance:               <ul style="list-style-type: none"> <li>Offshore booms reels.</li> <li>Offshore skimmer packages (in addition to TRP requirements)</li> <li>Nearshore/shoreline booming equipment.</li> <li>Nearshore/shoreline skimming packages.</li> <li>Shoreline surveillance equipment – drone, unmanned aerial vehicle.</li> </ul> </li> </ul>	□
Day two		

**Table 4-5 Aviation Dispersant Operations**

Aviation Dispersant Operations		
Note: dependant on NEBA, oil type and oil trajectory		
Tactic: Mobilise tier two aviation dispersant operations and dispersant resupply.		Completed?
LSC  Day One	<ul style="list-style-type: none"> <li>• Source domestic dispersant spraying aircraft via AMOSC (AMSA Fixed Wing Aerial Dispersant) NatPlan link:</li> <li>• Aircraft to move to Bairnsdale as nominated airfield.</li> <li>• Request re-location of dispersant stockpiles to Bairnsdale from Esso BBMT (10 m<sup>3</sup>).</li> <li>• Request AMOSC Geelong to move all available Corexit 9500a and Slickgone NS to Bairnsdale airfield.</li> </ul>	□
OSC/Aviation Branch Director  Day One	<ul style="list-style-type: none"> <li>• Complete actions per checklists in the <i>Aerial Dispersant Operations Plan for Oil Spills in Bass Strait</i> <ul style="list-style-type: none"> <li>○ 1st spraying operation – Victoria-based aircraft to fly to Bairnsdale as the nominated airfield</li> <li>○ Secondary overhead coverage aircraft to be provided by third party contractor.</li> <li>○ 2nd and subsequent operations to be undertaken from Bairnsdale Airport.</li> <li>○ 2nd and 3rd aircraft arriving during day two of operation.</li> </ul> </li> <li>• Establish communications links with AMSA air base manager and dispersant loading operator.</li> <li>• Volume of dispersant used to be reported to SITL</li> </ul>	□
OSC/Aviation Branch Director  Day One	<ul style="list-style-type: none"> <li>• Prepare and brief on ICS204 for aerial dispersant operations:           <ul style="list-style-type: none"> <li>○ Refer to attached draft ICS204 for operations.</li> <li>○ Field test spray to be conducted prior to operational spraying, with results reported to the IMT.</li> <li>○ Field test spray to be reported via visual efficacy results from overhead aircraft and on-scene vessels.</li> </ul> </li> </ul>	□
PSC /EUL	- Ensure ongoing OSMP deployment of O2.2	□
OSC/Aviation Branch Director  Day Two	<ul style="list-style-type: none"> <li>• Prepare and brief on ICS204 for aerial dispersant operations with additional aircraft.</li> <li>• Update <i>Aerial Dispersant Operations Plan</i> with additional aircraft:           <ul style="list-style-type: none"> <li>○ Refer to attached drafted ICS204 for operations</li> <li>○ Field test spray to be conducted prior to operational spraying, with positive results reported to the IMT.</li> </ul> </li> <li>• Field test spray to be reported via visual efficacy results from overhead aircraft and on-scene vessels.</li> <li>• Mount on-going operations of dispersant based</li> <li>• Volume of dispersant used to be reported to SITL</li> </ul>	□
For level three crude oil spills only		
Tactic: Consider tier three aviation dispersant resupply		
LSC  Day Two	<ul style="list-style-type: none"> <li>• Based on dispersant dosage rates per day, predict future ten day dispersant needs. If AMOSC and Esso forward stockpiles are &lt;50 m<sup>3</sup>, request dispersant via OSRL:</li> <li>• Request OSRL activation of Global Dispersant Stockpiles:</li> <li>• Develop mobilisation plan with OSRL to shift dispersant to Australia utilising freight aircraft operating from Singapore.</li> </ul>	□

**Table 4-6 Oiled Wildlife Response Strategy**

Oiled Wildlife Response Strategy		
Note: Dependant on NEBA and oil trajectory		
Tactic: Through the DTP/ Control Agency IMT, liaise with DEECA and aid their Concept of Operations for <i>Oiled Wildlife Response</i> .		Completed?
PSC/EUL  Day 1	<ul style="list-style-type: none"> <li>• Based on the NEBA, fates and trajectory modelling, ascertain likely wildlife impacts – provide this data to DTP/ Control Agency IMT.</li> <li>• Send Liaison Officer to Control Agency IMT.</li> <li>• Propose tactics to Control Agency IMT that may reduce wildlife impacts. Refer to Area Response Plan or Species Response Plans for guidance.</li> </ul>	<input type="checkbox"/>
OSC  Day 1	<ul style="list-style-type: none"> <li>• Establish Industry OWR coordinator (from AMOSC) to oversee Esso OWR activity.</li> </ul>	<input type="checkbox"/>
LSC  Day 1	<ul style="list-style-type: none"> <li>• As requested, or directed by DELWP and based on the advice of the OWR Coordinator, stand up AMOSC OWR resources:               <ul style="list-style-type: none"> <li>○ Facility support contract</li> <li>○ Equipment and clean-up resources from Geelong</li> <li>○ Equipment and clean-up resources from Perth</li> <li>○ AMOSC OWR support team</li> </ul> </li> <li>• Establish availability of ExxonMobil RRT personnel trained in OWR.</li> <li>• Coordinate ground transport, accommodation, and other support needs for industry response personnel.</li> </ul>	<input type="checkbox"/>
LSC  Day 2	<ul style="list-style-type: none"> <li>• Deploy requested OWR resources to the DELWP OWR ICP/field facility.</li> </ul>	<input type="checkbox"/>
OSC/Industry OWR coordinator  Day 2	<ul style="list-style-type: none"> <li>• Execute Esso OWR response operations as required or directed by Control Agency IMT.</li> </ul>	<input type="checkbox"/>

#### 4.2 Level Two and Three Spills – Commonwealth Waters, No Predicted Shoreline Impacts

Table 4-7 Incident Management Team

<b>Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts Incident Management Team</b>		
Tactic: Establish and staff a full Esso IMT that oversees the implementation of oil spill response measures.		Completed?
IC Day One	<ul style="list-style-type: none"> <li>• Establish Esso IMT:               <ul style="list-style-type: none"> <li>○ Call out IC/OSC/LSC/PSC/Situation and Environmental Unit.</li> <li>○ Staff each function with teams – actual and virtual.</li> </ul> </li> </ul>	<input type="checkbox"/>
IC Day two	<ul style="list-style-type: none"> <li>• Review team make up for current, and future operational period.</li> <li>• Assess if the functional areas aligned with the needs of the response.</li> </ul>	<input type="checkbox"/>
Tactic: Draft and execute an incident action plan		Completed?
IC lead	<ul style="list-style-type: none"> <li>• Commence planning cycle ('stem of P').</li> </ul>	<input type="checkbox"/>
PSC Day One	<ul style="list-style-type: none"> <li>• Complete the initial IAP (ICS 201's):               <ul style="list-style-type: none"> <li>○ Establish current operational period aim, objectives, strategy, tactics and resources</li> <li>○ Draft 24, 48 and 72 incident potential worksheet (size up)</li> <li>○ Complete NEBA</li> <li>○ Confirm the low potential for shoreline impact, or shoreline impact for monitoring only (&gt;10gm/sqm.)</li> </ul> </li> <li>• Assess weather and sea state for the next 48 hour for suitability to conduct marine response and/or aviation response activities.</li> <li>• Exchange Liaison Officers between Control Agency IMT, AMSA and Esso.</li> <li>• Use Liaison Officers to inform Control Agency IMT of Esso ICS201 outputs and SitReps.</li> <li>• Undertake risk assessment of each proposed tactical execution of strategy (below actions – marine/aviation operations).</li> </ul>	<input type="checkbox"/>
PSC Day Two	<ul style="list-style-type: none"> <li>• Review the ICS201 from the previous day. Assess :               <ul style="list-style-type: none"> <li>○ The aim, objectives, strategies, tactics and resources suitability against the current conditions for the operational period.</li> <li>○ Review response organization and staffing needs.</li> <li>○ Continue execution of previous day's plan</li> <li>○ If needed, modify the plan.</li> </ul> </li> <li>• In consultation with IC, assess readiness to move into Proactive Planning Phase.</li> <li>• IMT commences planning cycle (planning 'p').</li> </ul>	<input type="checkbox"/>
OSC Day Two	<ul style="list-style-type: none"> <li>• Plan and execute immediate/first strike operations (as per following checklist). Include:               <ul style="list-style-type: none"> <li>• Marine operations – dispersant, containment and recovery.                   <ul style="list-style-type: none"> <li>○ Vessels – Vessels of Opportunity.</li> <li>○ Equipment – Esso, AMOSC, NatPlan and OSRL.</li> <li>○ Personnel – Esso, AMOSC, AMOSC CG, NatPlan CG, Esso RRT, OSRL.</li> </ul> </li> <li>• Aviation operations – surveillance, and dispersant operations                   <ul style="list-style-type: none"> <li>○ Aircraft.</li> </ul> </li> </ul> </li> </ul>	<input type="checkbox"/>
OSC/SC Branch Manager	<ul style="list-style-type: none"> <li>• As needed execution Source Control arrangements:               <ul style="list-style-type: none"> <li>○ Activate Australia Wells Team Tier II/III Emergency Response Plan.</li> <li>○ Pipeline Emergency Response Plan.</li> </ul> </li> </ul>	<input type="checkbox"/>

Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts		
Incident Management Team		
Day one	<ul style="list-style-type: none"> <li>○ Containment contracts/assistance contracts:</li> <li>○ Subsea first response toolkit– AMOSC, Oceaneering and AdEnergy</li> <li>○ Subsea well intervention service - OSRL</li> <li>○ Wild Well Control.</li> <li>● Activate pipeline repair.</li> <li>● Activate marine salvers.</li> </ul>	
LSC Day Two	<ul style="list-style-type: none"> <li>● Request and stage resources into Gippsland to enable long term operations to occur:               <ul style="list-style-type: none"> <li>○ Integration of tier two and tier three resources into the response.</li> </ul> </li> <li>● Execute waste management plan:               <ul style="list-style-type: none"> <li>○ Call out third party contractor (Cleanaway)</li> <li>○ Estimate volumes of liquid waste consistent with large scale containment and recovery.</li> </ul> </li> <li>● Equipment mobilization – temporary storage and decontamination.</li> <li>● Supporting resources for response personnel.</li> </ul>	□

**Table 4-8 Surveillance Monitoring and Visualisation Strategy**

Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts		
Surveillance Monitoring and Visualisation Strategy		
Tactic: satellite tracking buoys will be deployed to monitor the leading edge of the slick; and deployed in 24-hour intervals to indicate swept pathways.		Completed?
OSC Day one	<ul style="list-style-type: none"> <li>● Deploy STB from Longford (helicopter or vessel) – place on leading edge of spill.</li> <li>● <a href="#">Tracking Buoy Deployment Instructions</a></li> </ul>	□
	<ul style="list-style-type: none"> <li>● Request AMOSC all available STB's to be contracted to Esso: STBs move to Longford as soon as possible. At last light, deploy STB from the spill source.</li> </ul>	□
Day two +	<ul style="list-style-type: none"> <li>● Monitor location of deployed STBs: At last light, deploy STB from the spill source.</li> </ul>	□
Tactics: twice daily manned overflights will be undertaken to monitor the spreading, location, and weathering of the slick.		Completed?
OSC Day One	<ul style="list-style-type: none"> <li>● Commence twice daily aerial overflights to determine size/bearing: Divert aircraft to track spill (or use of scheduled crew change helicopter routing). If Esso asset unavailable, contact and contract the use of third-party aircraft.</li> </ul>	□
OSC Day two	<ul style="list-style-type: none"> <li>● Continue twice daily aerial overflight to determine size/bearing: Divert vessel/aircraft to track spill (or use of scheduled crew change helicopter routing). If Esso asset unavailable, contact and contract the use of third-party aircraft. Aircraft over slick 30 mins after first light</li> </ul>	□

<b>Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts</b>		
<b>Surveillance Monitoring and Visualisation Strategy</b>		
Use location of deployed satellite tracking buoys as initial extents for aircraft bearing.		
Tactics: daily oil spill trajectory modelling will be used to predict the weathering and direction that the oil will spread.		Completed?
PSC  Day One; then each day	<ul style="list-style-type: none"> <li>Request through AMOSC twice daily OSTM runs to verify data gained through manual means, request to include: 12/24/36/48/60/72-hour outlook deterministic trajectory modelling. Potential for shoreline or state water contact</li> <li>Data to be relayed back to the SITU.</li> <li>Request through AMOSC for OSTM third party be deployed into the Esso IMT to provide direct support to the SITU.</li> <li>Monitor movement of tracking buoys. <a href="#">Fastwave Dashboard - User guide</a></li> </ul>	<input type="checkbox"/>
Tactics: Set a twice daily watch to confirm the extent and spreading of the spill from the assets.		
OSC  Day One; then each day	<ul style="list-style-type: none"> <li>If spill from a manned asset, set two hourly watch to confirm bearing/size.</li> </ul>	<input type="checkbox"/>
Tactics: OSMP as triggered		Completed?
	Activate the various Operational Monitoring Programmes contained within the OSMP: <ul style="list-style-type: none"> <li>O1 – O5 as per triggers in OSMP</li> </ul>	<input type="checkbox"/>
Tactics: Establish the Esso Common Operating Picture in the Esso IMT		Completed?
OSC/SITL  Day one, then for the duration of the spill	<ul style="list-style-type: none"> <li>Establish Esso's CoP.</li> <li>Commence data capture and graphical display.</li> <li>Key data to be displayed includes: Spill location. Spill extent, direction and trajectory. Environmental sensitives. Bass Strait oil and gas facilities. Passing ships. Esso controlled contracted resources – aircraft and vessels. Third party controlled potential resources of opportunity – aircraft and vessels.</li> </ul>	<input type="checkbox"/>
For Level Three Spills only		
Tactics: Request satellite imagery of the spill location.		Completed?
PSC/ SITL	<ul style="list-style-type: none"> <li>Request satellite imaging of spill  Refer <a href="#">ExxonMobil Production Geospatial Emergency Response Service</a></li> <li>Alternative options:               <ul style="list-style-type: none"> <li>Request satellite imagery via AMOSC.</li> <li>Request satellite imagery via OSRL – Agreement in place with Radiant Solutions.</li> </ul> </li> </ul>	<input type="checkbox"/>

**Table 4-9 Marine Dispersant, and Containment & Recovery Operations**

<b>Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts Marine Dispersant, and Containment &amp; Recovery Operations</b>		
Note: This strategy is dependent on NEBA outcomes and oil trajectory		
Tactic: Establish strike teams able to undertake containment and recovery, and/or dispersant operations.		Completed?
LSC  Day One	<ul style="list-style-type: none"> <li>Establish BBMT as initial Marine FOB.</li> <li>Secure four vessels for marine operations – if not engaged in other safety critical mission.</li> <li>Direct vessels to BBMT to load out equipment.</li> <li>Direct AMOSC to shift C&amp;R equipment from Geelong to BBMT:               <ul style="list-style-type: none"> <li>6 x offshore boom reels.</li> <li>2 x offshore skimmer unit.</li> <li>If vessel tanks are &lt;500 m3 arrange temporary storage units.</li> </ul> </li> <li>Move BBMT offshore vessel based dispersant systems to wharf edge:               <ul style="list-style-type: none"> <li>2 x afedo dispersant spray systems.</li> <li>30 m3 dispersant (15 per vessel).</li> </ul> </li> <li>Request available Esso Core group recall for duty – vessel-based operations from day two.</li> <li>Load out vessel for operations.</li> </ul>	□
OSC  Day One	<ul style="list-style-type: none"> <li>Prepare ICS204 for C&amp;R and dispersant operations: Refer to draft ICS204 for operations Appendix A.</li> </ul>	□
OSC  Day Two	<ul style="list-style-type: none"> <li>Brief teams on the two separate ICS204.</li> <li>Direct strike teams (each strike team comprises a pair of vessels) to area of operations:  For dispersant operations, field test must be conducted prior to operational spraying, with positive results reported to the IMT. PSC to confirm based on the field dispersant testing move to large scale operational spraying.</li> </ul>	□
Tactic: Establish Marine FOBs for ongoing large-scale marine operations.		Completed?
LSC  Day Two	<ul style="list-style-type: none"> <li>Based on shoreline impacts, plan for either/or BBMT and Lakes Entrance as marine FOB for ongoing C&amp;R operations:  Offshore C&amp;R operations (large vessel operations – wharf considerations - under keel clearance, width, tug availability). Nearshore/shoreline vessel support operations.</li> <li>Demarcate in each location:               <ul style="list-style-type: none"> <li>OSR Equipment receipting and laydown areas.</li> <li>Office and briefing space.</li> <li>Temporary storage of waste management (coming off of vessel after shift).</li> </ul> </li> </ul>	□
Tactics: Request and contract level three offshore response support – escalated resourcing.		Completed?
LSC	<ul style="list-style-type: none"> <li>Contract additional vessels for C&amp;R:  Nearshore/shoreline need – marine surveyed vessels.</li> </ul>	□

Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts Marine Dispersant, and Containment & Recovery Operations		
Day two	<p style="text-align: center;">Coastal/offshore need – marine surveyed.</p> <ul style="list-style-type: none"> <li>Shift all Esso OSR equipment to BBMT/Lakes Entrance: <ul style="list-style-type: none"> <li>Boom reels.</li> <li>Skimmer units.</li> <li>Temp storage.</li> <li>Dispersant spray sets.</li> </ul> </li> <li>Request and shift AMOSC nearshore and offshore C&amp;R equipment, and all shoreline equipment to BBMT/Lakes Entrance: <ul style="list-style-type: none"> <li>Offshore booms reels.</li> <li>Offshore skimmer packages.</li> <li>Shoreline surveillance equipment – drone, Unmanned aerial vehicles.</li> </ul> </li> </ul>	

**Table 4-10 Aviation Dispersant Operations**

Level two and three spills - Commonwealth Waters, No Predicted Shoreline Impacts Aviation Dispersant Operations		
Note: This strategy is dependent on NEBA outcomes and oil trajectory.		
Tactic: Mobilise tier two aviation dispersant operations and dispersant resupply.		Completed?
LSC  Day One	<ul style="list-style-type: none"> <li>Source domestic dispersant spraying aircraft Via AMOSC (AMSA Fixed Wing Aerial Dispersant) NatPlan link: <p style="text-align: center;">Victorian based aircraft move to Bairnsdale as nominated airfield.</p> </li> <li>Request re-location of dispersant stockpiles to Bairnsdale from Esso BBMT (10 m<sup>3</sup>).</li> <li>Request AMOSC Geelong to move Corexit 9500a and Slickgone NS to Bairnsdale airfield.</li> </ul>	<input type="checkbox"/>
OSC/Aviation Branch Director  Day One	<ul style="list-style-type: none"> <li>Complete actions per checklists in the <i>Aerial Dispersant Operations Plan for Oil Spills in Bass Strait</i>: <ul style="list-style-type: none"> <li>1st spraying operation – Victoria-based aircraft to fly to Bairnsdale as the nominated airfield.</li> <li>Secondary overhead coverage aircraft to be provided by third party contractor.</li> <li>2nd and subsequent operations to be undertaken from Bairnsdale Airport.</li> <li>2nd and 3rd aircraft arriving during day two of operation.</li> <li>Volume of dispersant used to be reported to SITL</li> </ul> </li> <li>Establish communications links with AMSA air base manager and dispersant loading operator.</li> </ul>	<input type="checkbox"/>

PSC to confirm based on the field dispersant testing move to large scale operational spraying.</li> </ul> </li> </ul>	□

**Table 4-15 Oiled Wildlife Response**

<b>Level one spills - Commonwealth Waters, Localised Impacts Only Oiled Wildlife Response</b>		
Note: This strategy is dependent on NEBA outcomes and oil trajectory.		
Tactic: Through the DTP, engage with DEECA and provide support to their Concept of Operations for <i>Oiled Wildlife Response</i> .		Completed?
PSC/EUL  Day 1	<ul style="list-style-type: none"> <li>Based on the NEBA, fates and trajectory vectoring, ascertain likely wildlife impacts – provide this data to DEECA and DTP.</li> <li>Refer to Area Response Plan and/or Species Response Plans to determine likely tactics to reduce wildlife impacts:  Hazing Trans-location Other OSR tactics.</li> </ul>	<input type="checkbox"/>
LSC  Day 1	<ul style="list-style-type: none"> <li>As requested, or directed by DELWP and based on advice of the OWR Coordinator, stand up AMOSC OWR resources:  Facility support contract. Equipment and clean-up resources from Geelong. Equipment and clean-up resources from Perth. AMOSC OWR support team.</li> </ul>	<input type="checkbox"/>
OSC/Industry OWR coordinator  Day 2	<ul style="list-style-type: none"> <li>Execute Esso OWR response operations as required or directed by DELWP.</li> </ul>	<input type="checkbox"/>

## 5 Ongoing Incident Management Activities 48 hours +

Note: From this point forward, IMT members are to utilise their Incident Management handbooks and IMT role descriptions to guide their daily activities, with this OPEP informing the subject matter expertise.

By following the checklists in section three and four, an appropriately sized and resourced IMT will have been set up, with operational resources deployed and pre-moved to execute confirmed and likely time-sensitive response strategies.

Sections of the OPEP continue to be colour coded to provide section-specific guidance to command, **planning**, **operations**, and **logistics** sections/areas.

Spill response operations are to continue during each operational period to put in place desired environmental outcomes until termination criteria can be applied to the tactical implementation of each spill response strategy.

Esso's Operational Monitoring Programme will inform the application of measures, and the Scientific Monitoring Programme will need to continue parallel to the response operations until such time as its own independent termination criteria have been met.

Once Esso has moved through the first 48 hours of response, laying the foundation for an ongoing response, the IMT and spill response operations will settle on a planning and operations implementation cycle, based on the ICS planning 'p'.

This section describes the (1) process used to evaluate oil spill response strategies by the Environmental Unit of the planning section and the (2) guidelines for the operations section to execute the chosen strategies.

The IMT is expected to go through the planning 'p' on a daily basis, even if the outcome of that process is to validate the current Incident Action Plan as appropriate for multiple operational periods.

### 5.1 Incident Action Planning Process

Once established, the task of the IMT is to establish situational awareness by gathering information, analysing this data, and applying the appropriate, defensible procedures and processes listed in the OPEP and EP to reduce harm to the environment.

The cornerstone document to guide the response to this end is the production and execution of the 'Incident Action Plan' – the business plan for the response.

In its basic form, an IAP is a simple document that tells responders what they need to do to resolve/mitigate an unplanned incident. It will include an aim, objectives, description of the situation, a worst case 'size up' consequence description, a NEBA, a description of what resources are at risk, and the activities that will be undertaken to resolve the situation/minimise environmental impacts.

For all oil spills, a level one IAP will comprise the completion of the following documents that comprise the Initial IAP:

- Weather report
- ICS201-1 Incident Briefing Map/Sketch
- ICS201-2 Summary of Current Actions
- ICS201-3 Organisation Chart
- ICS201-4 Resource Summary
- Notification Status Report

Additional forms may be used as required. Refer to Incident Management Handbook – IAP Preparation Guidance – Initial IAP Listing.

For level two and level three spills, a more comprehensive IAP is to be developed. This will require significant IMT resources to ensure that the plan is developed properly and that operations are simultaneously undertaken. The content of the IAP will be determined by the Incident Commander in consultation with the Planning Section Chief. Typically required components include

- Weather Report
- Incident Map
- ICS 202 Incident Objectives
- ICS 203 Organisation Assignment List
- ICS 204 Assignment List
- ICS 205 Communications Plan
- ICS 206 Medical Plan
- ICS 207 Organisation Chart

Note: Refer to Incident Management Handbook – IAP Preparation Guidance – Detailed IAP Listing for further guidance.

Note: The IAP must also include two additional pieces of analysis specific to the oil spill response

A description of the ICS 232 – Resources at Risk (derived from the execution of the SMV strategy)

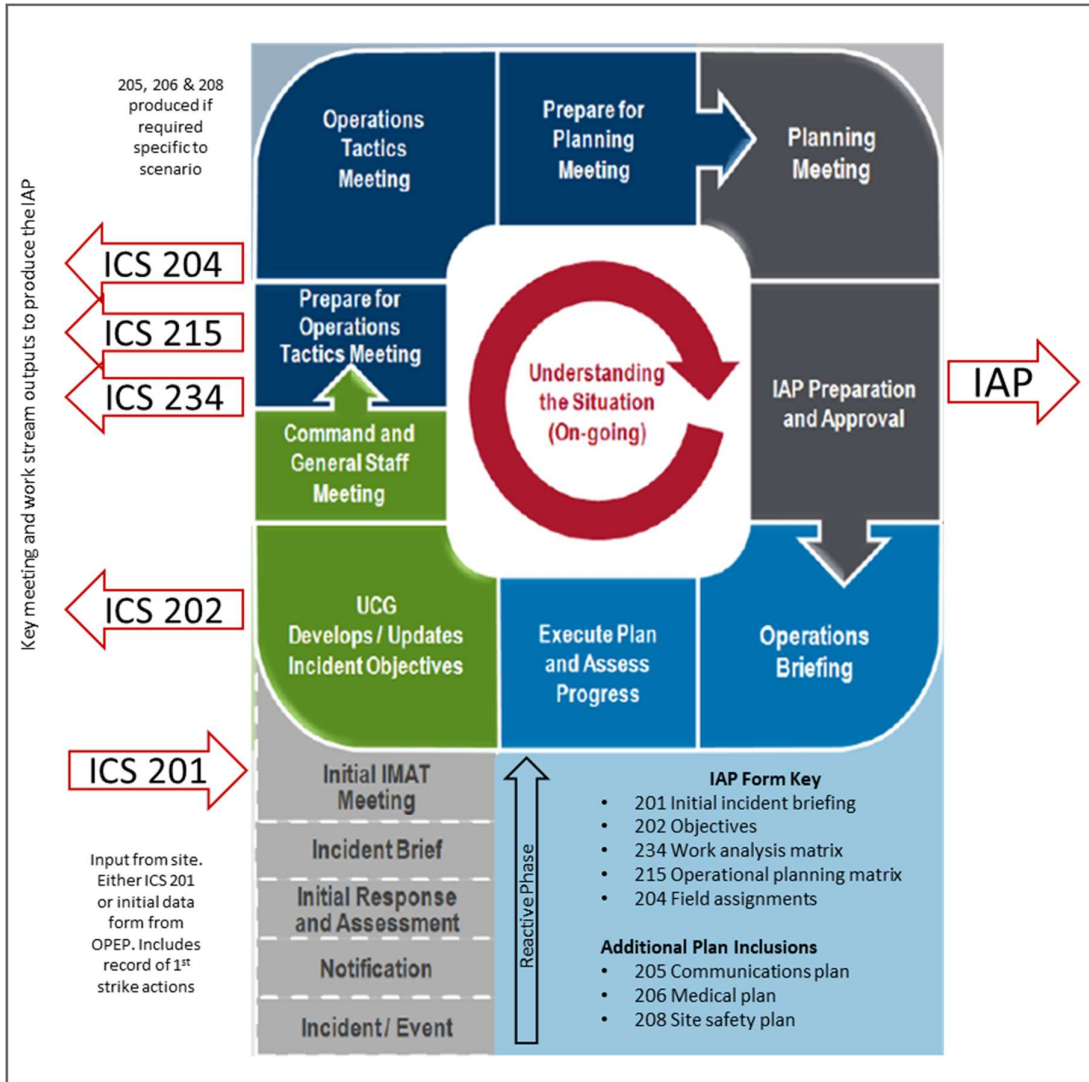

An analysis of the benefits and dis-benefits of executing oil spill response strategies – the NEBA (derived from the execution of the SMV strategy).

The typical daily work pattern for the production of the IAP is as follows:

Time	Meeting [ICS 230]	Attendance
ASAP (<4hours)	<ul style="list-style-type: none"> <li>• Initial Incident Brief</li> <li>• Initial incident IC/UC meeting</li> </ul>	<ul style="list-style-type: none"> <li>• IC Command Staff reps;</li> <li>• General Staff reps</li> <li>• Handover meeting/brief</li> </ul>
0800	<ul style="list-style-type: none"> <li>• Objectives Meeting</li> <li>• Review/ identify objectives for the next operational period.</li> </ul>	<ul style="list-style-type: none"> <li>• Esso IC; Command Staff reps; General Staff reps</li> </ul>
1000	<ul style="list-style-type: none"> <li>• Command &amp; General Staff Meeting</li> <li>• IC/UC gives direction to Command &amp; General staff including incident objectives and priorities.</li> </ul>	<ul style="list-style-type: none"> <li>• Incident Commander</li> <li>• Public Information Officer</li> <li>• Liaison Officer</li> <li>• Safety Officer</li> <li>• Legal</li> <li>• Security / Intelligence Officer</li> <li>• Operations Section Chief</li> <li>• Planning Section Chief</li> <li>• Logistics Section Chief</li> <li>• Finance Section Chief</li> <li>• Documentation Unit Lead</li> <li>• Situation Unit Lead</li> </ul>
1100	<ul style="list-style-type: none"> <li>• Strategic stakeholder briefing</li> <li>• Brief OPICC/NOPSEMA/States</li> </ul>	<ul style="list-style-type: none"> <li>• Esso ESG Leader</li> <li>• Esso Incident Commander</li> <li>• Liaison Officer</li> <li>• OPICC</li> <li>• NOPSEMA</li> <li>• DTP</li> </ul>
1300	<ul style="list-style-type: none"> <li>• Tactics Meeting</li> <li>• Develop/Review primary and alternate strategies to meet Incident Objectives for the next Operational Period.</li> </ul>	<ul style="list-style-type: none"> <li>• Operations Section Chief</li> <li>• Planning Section Chief</li> <li>• Logistics Section Chief</li> <li>• Finance Section Chief</li> <li>• Resource Unit Lead</li> <li>• Documentation Unit Lead</li> <li>• Situation Unit Lead</li> <li>• Env. Unit Lead</li> <li>• Safety Officer</li> <li>• Documentation Unit Lead</li> </ul>

Time	Meeting [ICS 230]	Attendance
1500	<ul style="list-style-type: none"> <li>• Planning Meeting</li> <li>• Review status and finalize strategies and assignments to meet Incident Objectives for the next Operational Period.</li> </ul>	<ul style="list-style-type: none"> <li>• Esso Incident Commander</li> <li>• Agency Representative</li> <li>• Public Information Officer</li> <li>• Liaison Officer</li> <li>• Security/Intelligence Officer</li> <li>• Legal Officer</li> <li>• Operations Section Chief</li> <li>• Planning Section Chief</li> <li>• Logistics Section Chief</li> <li>• Finance Section Chief</li> <li>• Resource Unit Lead</li> <li>• Documentation Unit Lead</li> <li>• Situation Unit Lead</li> <li>• Env. Unit Lead</li> <li>• Safety Officer</li> <li>• Documentation Unit Lead</li> </ul>
1700	<ul style="list-style-type: none"> <li>• Operations Brief</li> <li>• Present IAP and assignments to the Supervisors / Leaders for the next Operational Period.</li> </ul>	<ul style="list-style-type: none"> <li>• Esso Incident Commander</li> <li>• Operations Field leadership</li> <li>• Safety Officer</li> <li>• Public Information Officer</li> <li>• Liaison Officer</li> <li>• Security Officer</li> <li>• Legal Officer</li> <li>• Section Chiefs</li> <li>• Documentation Unit Lead</li> <li>• Resource Unit Lead</li> <li>• Situation Unit Lead</li> <li>• Environment Unit Lead</li> </ul>

This cycle is represented in the planning 'p' below, Figure 5-1, with key written outputs noted by the arrows.

**Figure 5-1 Incident Planning**

**5.2 Selection of Response Strategies – Net Environmental Benefit Analysis**

Activity specific protection priorities and selection of response options are summarised in Appendix D – Quick Reference Information.

A 'preparedness NEBA' (which is essentially a draft of Step 1 & 2 of the NEBA Process described in Volume 3, Table 2-4) can be referenced in the event of an incident and used as a template during the response.

A summary of potential applicable response options for different types of hydrocarbon spills has also been provided below.

In the event of an incident, it will be necessary to check the priorities defined in the Quick Reference Guides (Appendix D) are current and supported by stakeholders, and check the response strategies are indeed feasible given the specifics of the situation.

Key:

P	Proposed	The tactic will be deployed where safe to do so and where the NEBA indicates the strategy will result in net environmental benefit, and if the response or the spill is likely to impact State waters, the response will be approved by the State Authority.
V	Viable	The tactic will be considered as a viable option, but deployment may not be warranted because of the size of spill, conditions, and other factors at the time of the spill.
NR	Not recommended	The tactic may be viable but is not recommended either due to safety considerations or impacts of the tactic itself.
NV	Not viable	The potential to deploy the tactic effectively is limited.
NP	Not practical	The tactic cannot be implemented for the resource type; e.g., resource type is inaccessible.
NA	Not applicable	The resource type does not warrant this response.

5. Shipwrecks.	P	NA	P	NA	V	NR	NR	NR
6-10. Fisheries	P	NA	P	V	V	NA	P except in shallow water over sessile aquaculture.	V

Where shoreline impacts are predicted, a response-specific NEBA will be undertaken, in conjunction with DTP, to determine and agree on the appropriate response strategies.

A simple grouping of these tactics by location / hydrocarbon type:

Location	Loss of diesel, lubricating, condensate or mechanical oils	Crude oil releases
All locations	<ul style="list-style-type: none"> <li>• Surveillance, monitoring, and visualisation</li> <li>• Exclusion zones, considering health and safety and environment risks are determined in consultation with the control agency.</li> <li>• Oiled wildlife response</li> </ul>	
Spill site	<ul style="list-style-type: none"> <li>• Source control (BOP intervention, relief well drilling, pipeline engineering efforts)</li> </ul>	
Offshore environment (Commonwealth waters)	<ul style="list-style-type: none"> <li>• Mechanical dispersion</li> </ul>	<ul style="list-style-type: none"> <li>• Chemical dispersant</li> <li>• Containment and recovery</li> </ul>
Offshore and nearshore environments (Commonwealth and coastal waters)		<ul style="list-style-type: none"> <li>• Containment and recovery</li> </ul>
Coastlines and islands	<ul style="list-style-type: none"> <li>• Protection deflection</li> <li>• Containment and recovery</li> <li>• Shoreline response – assessment and clean-up</li> <li>• Oiled wildlife response</li> </ul>	

Each tactic will be applied in a manner as determined by a dynamic planning process, adapted at the time to the current weather and sea conditions.

**NEBA instructions:**

For all spills, a spill-specific NEBA needs to be developed as outlined in Figure 5-2 and summarised as follows:

- a. Select the appropriate NEBA worksheets from [http://ishareteam1.na.xom.com/sites/EMPC0263/EPP/Environment%20Plans/6\\_NEBA.xlsx](http://ishareteam1.na.xom.com/sites/EMPC0263/EPP/Environment%20Plans/6_NEBA.xlsx) by oil type.
- b. Refer to OSRA<sup>2</sup> maps and cull non-relevant Resource Types according to the areas of the environment that are predicted to be impacted.
- c. Review the protection priority of the remaining resources (using relevant sections of EP Volume 2 Section (Loss of Containment / Loss of Well Control). Also refer to Quick Reference Information for specific activities OPEP- Appendix D.
- d. Review and expand on each of the benefits and disbenefits within the NEBA worksheet according to incident-specific details and further response considerations.
- e. Assess the effectiveness of the response strategies in protecting the resources at risk.
- f. Summarise the preferred strategy into the Incident Action Plan.

<sup>2</sup> The Oil Spill Response Atlas (OSRA) is a national database and decision support system in a computerised GIS format. It is designed to provide comprehensive information about Australia's coastal resources and spill response logistics. OSRA includes information on: shoreline geomorphology, marine habitats, environmental resources, cultural and heritage sites, commercial resources, logistics and infrastructure information to support spill response. OSRA is accessed through AMSA in emergency situations.

Detailed information on priorities for protection, potential impacts, and preferred response strategies will be used in conjunction with incident-specific trajectory modelling and real-time conditions to determine the most appropriate incident-specific response.

Using the outputs of the NEBA as a feed into the planning 'P' process, the IMT will then draft/validate tactical plans for specific areas and execute those plans.

A link to the NEBA tool can be found here:

[NEBA Tool](#)

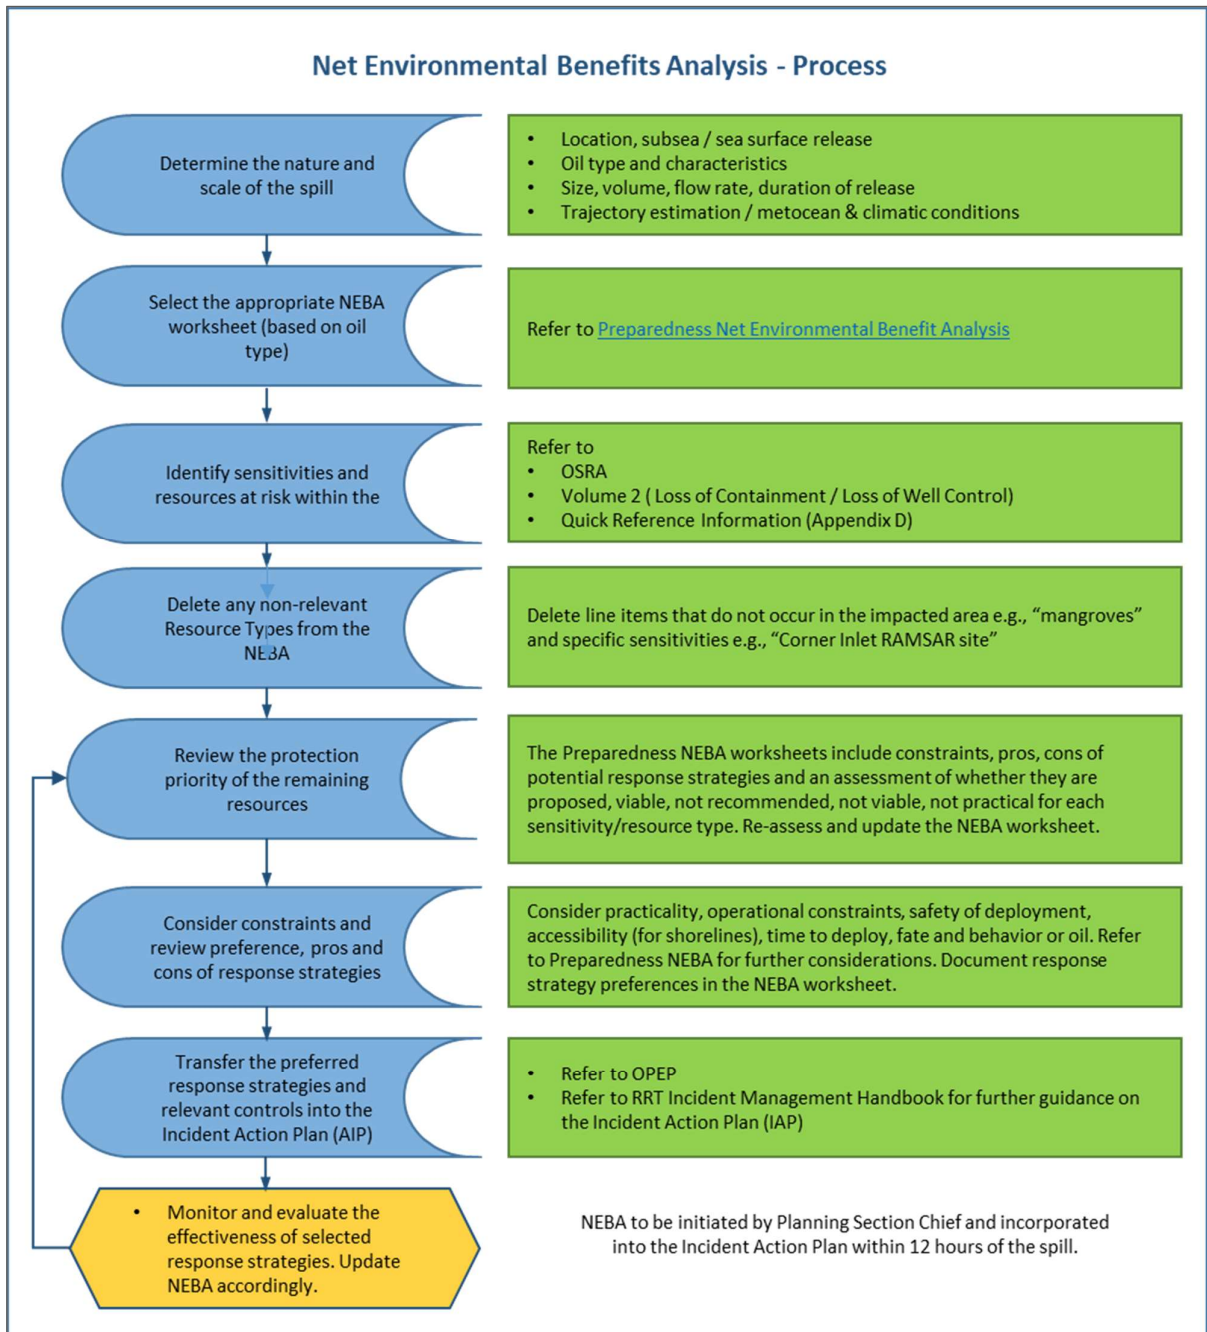

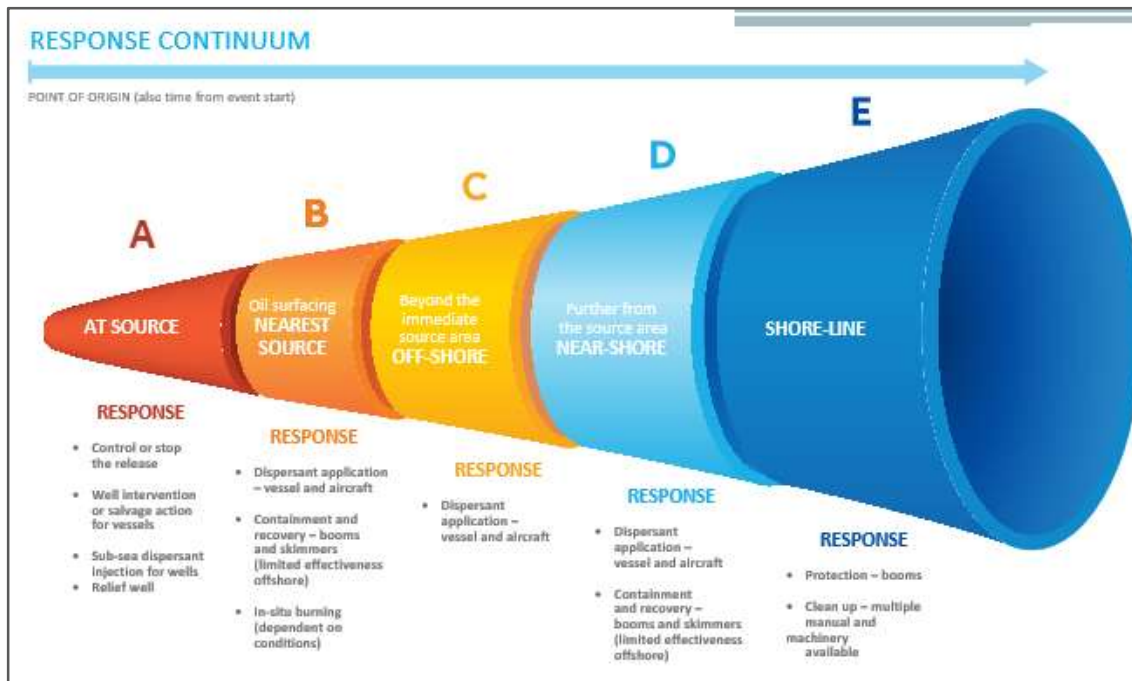

Figure 5-2 NEBA Process Flowchart

### 5.3 Cone of Response

For all offshore spills, Esso will utilise a 'cone of response' approach to spill response operations. This means proportioning resources to the spill response strategies that have a bulk removal/treatment affect closest to the source of the spill. The 'cone' is visually depicted below:

**Figure 5-3 Cone of Response**

For spills in near-shore waters or where shoreline impacts are imminent (<48 hours), the cone will be modified – Esso’s efforts will focus on minimising impacts to sensitives, particularly the shoreline, while also prioritising control of the source of the spill. Once shoreline protective/response measures are in place, efforts will revert back other areas of the ‘cone’.

The ‘cone’ directs response resources to where maximum effectiveness will occur. Using this methodology, each tactic or strategy is executed cogniscent of the volume of remaining oil to be treated from the previous strategy.

In practical terms this means that Esso will, in priority order:

1. Capitalise on window of opportunity for dispersant application with appropriate type and quantity of dispersant to reduce bulk surface and shoreline loading; and then
2. Utilise offshore and nearshore containment & recovery strike teams to recover oil not dispersed, so as to reduce bulk surface and shoreline loadings; and then
3. In coordination with control agency, execution of shoreline protection measures, to reduce volumes of remaining oil from reaching and impacting shore-based sensitivities.

The following is a description of each oil spill response strategy that Esso will put in place where applicable to the incident:

#### 5.4 Source Control

Strategy Description:

Well intervention, subsea infrastructure repairs, pipeline repair and vessel salvage will be used as appropriate to the source of the spill to control and cease the uncontrolled flow of hydrocarbons into the environment.

Relevant environmental performance outcomes and standards are provided in Appendix C.

<b>Source Control</b>	
<b>Response Objective</b>	To prevent further uncontrolled release of hydrocarbons into the marine environment.
<b>Critical Outputs</b>	<p>Wells/drilling: All source control operations will be done in accordance with the Esso Gippsland Well Kill Contingency Plan (for source control using the Well Kill Skid) and the Drilling Emergency Preparedness and Response Manual (where required) relevant to that particular well and the source control options within that plan.</p> <p>Depending on the circumstances, the plans outlines the following options that will be followed:</p> <ul style="list-style-type: none"> <li>• Blowout preventer intervention</li> <li>• Seabed debris clearance</li> <li>• Rig for relief well drilling.</li> </ul> <p>Pipeline/subsea infrastructure: All pipeline/subsea infrastructure will be done in accordance with [Pipeline Management Plan]. Pipeline repairs include the use of ROVs with cutting or working tools, valve interventions, and pipeline de-pressurisation.</p> <p>Vessel salvage: Esso will provide support to AMSA or Marine Safety Victoria to ensure appropriate salvage operations.</p>
<b>Planning Section Instructions</b>	As per individual source control plan/incident action plan.
<b>Operations Section Instructions</b>	
<b>Logistics Section Instructions</b>	

## 5.5 Surveillance and Monitoring

### Strategy Description:

Using field observations and modelling, the IMT will assess the incoming data to plan and tailor spill response operations to the scenario of the day. This process will continue for the duration of the response.

Relevant environmental performance outcomes and standards are provided in Appendix C.

Surveillance and Monitoring	
<b>Response Objective</b>	To gather information and validate planning assumptions to adjust response plans as appropriate to the scenario. To quantitatively assess the extent, severity, persistence, and recovery environmental values and sensitivities affected by the spill.
<b>Critical Outputs</b>	<p>Level One Spills:</p> <ul style="list-style-type: none"> <li>• Aerial Surveillance</li> <li>• Oil Spill Trajectory Monitoring (Vectoring + ADIOS).</li> </ul> <p>Level Two Spills (in addition to the above)</p> <ul style="list-style-type: none"> <li>• Twice daily Oil Spill Trajectory Modelling.</li> <li>• Continuous monitoring from Oil Spill Tracking Buoys.</li> <li>• Surveillance from:</li> </ul> <p>Production assets – 4 hourly watch Aircraft – 2 x daily overflights Vessels – Opportunistically to sense check aerial observations.</p> <ul style="list-style-type: none"> <li>• Shoreline surveys (pre-emptive and post impact).</li> <li>• Operational and Scientific Monitoring programmes.</li> </ul> <p>Level Three Spills (in addition to the above)</p> <ul style="list-style-type: none"> <li>• Satellite photography runs as requested by the SITU.</li> </ul>

**Surveillance and Monitoring**

**Planning Section Instructions**

The Planning Section – Environment and Situational units in particular – needs to receive and interpret field/modelling data to inform

- The Net Environmental Benefit Assessment.
- The list of Resources at Risk from the spill.
- The development of the ICS 201 and IAP (for level two and three spills).

Critical Daily Tasking:

- Drive the planning process (refer to IMH schedules and timings).
- Liaise with OSC to ensure field activities are in place to gather field data.
- Liaise with LSC to activate and then receive the OSTM.
- Establish and activate the OSMP with data reporting back to the SITU.
- Gather data, establish, and keep up to date Status Boards and CoP GIS (refer to IMH Section 6).

The Planning Section will ensure that the SMV strategy is scaled up or down to provide sufficient information for the IMT to plan and execute appropriate oil spill response activities.

All data gathered through remote means are to be captured and displayed in the Common Operating Picture (Esso GIS) so that all members of the IMT have situational awareness.

For level two or three spills, the Planning Section includes coordination of SCAT teams on shorelines, feeding data directly into the SITU.

**Operations Section Instructions**

The Operations Section is to task assets (marine and aviation divisions; shoreline) to gather data that can be used by the Planning Section to inform the development of the IAP and the operational response.

This is done as a part of the execution of the IAP developed the previous day.

Critical Daily Tasking:

- Execute the IAP for the current Operational period.
- Liaise with the PSC to ensure that field tasking (ICS 204) is drafted and used for SMV proposes.
- All Spills:

Surveillance and Monitoring	
	<ul style="list-style-type: none"> <li>• Direct aviation assets to complete aerial surveillance consistent with aerial observer guides and standard operating procedures.</li> </ul> <p>Spill Level Two and Above</p> <ul style="list-style-type: none"> <li>• Deploy satellite tracking buoys (Longford and third party).</li> <li>• Direct dedicated aviation assets to undertake surveillance with trained aerial observers.</li> <li>• Direct marine assets to undertake surveillance.</li> <li>• Set watch from manned platforms (4-hour report back).</li> <li>• Deploy vessel for OSMP activities.</li> </ul>
Logistics Section Instructions	<p>The Logistics Section is to activate contracts and provide ongoing services and supply (from in-house resources or from third parties) in support of the execution of this strategy.</p> <p>Critical Daily Tasking:</p> <p>All Spills:</p> <ul style="list-style-type: none"> <li>• Business-As-Usual assets to be redeployed as per operational requirements – Dispersant spraying strike team.</li> <li>• Shift dispersant to BBMT as per 1st strike checklist. Activate contract with AMOSC and request dispersant.</li> </ul> <p>Spill Levels Two and Three</p> <ul style="list-style-type: none"> <li>• Maintain Air Operations base at Bairnsdale</li> <li>• Activate contracts with third-party aircraft providers.</li> <li>• Marine Operations Base at BBMT or Lakes Entrance.</li> <li>• Activate contract with AMOSC, request aerial observers for daily sorties, satellite tracking buoys to Longford, and twice-daily OSTM.</li> </ul> <p>Spill Level Three Only</p> <ul style="list-style-type: none"> <li>• Activate contract with AMOSC/internal for the provision of Satellite photography services.</li> </ul>
Termination Criteria	Detectable oils are below the thresholds outlined in the OSMP

## 5.6 Dispersant Operations

Strategy Description:

Dispersant will be applied to ongoing crude oil spills using, aircraft and/or vessel.

Relevant environmental performance outcomes and standards are provided in Appendix C.

Dispersant Operations	
<b>Response Objective</b>	To reduce consequences to surface and shoreline values and sensitivities. To increase the bioavailability of oil for microbial breakdown.
<b>Critical Outputs</b>	<p>Level One Spills: Based from BBMT; one vessel-based dispersant strike team. Daily dispersant spray capacity will be based on amount spilled.</p> <p>Levels Two and Three Spills (surface) Based from BBMT; two vessel-based dispersant strike teams Based from Bairnsdale Airfield; up to three air tractor aircraft (AT502 &amp; AT802) flying multiple daily sorties to spray oil located in Commonwealth waters.</p> <p>Surge Resources – Dependent on observations of dispersant effectiveness and additional need determined by the IMT at the time For dispersant operations that project the exhaustion of Australia’s dispersant supplies, global dispersant stockpiles from Singapore, may be air freighted to Australia and shifted to the operating airfields Based on the WCDS daily dispersant maximum spray requirements is calculated to be no greater than 42 m<sup>3</sup> per day.</p>
<b>Planning Section Instructions</b>	<p>The Planning Section – Environment Unit in particular – needs to assess on a daily basis that dispersant use will demonstrably achieve net positive outcomes. Chemical dispersants are not recommended for diesel or Group 1 oil spills.</p> <p>Demonstrable positive outcomes include reduction in large-scale shoreline loadings, particularly on remote coastlines such as the Bass Strait Islands, the wilderness areas of far-east Gippsland, Corner Inlet, and surrounding estuaries, and sensitivity specific positive impacts as demonstrated by the daily NEBA.</p> <p>Dispersants are only to be used in Commonwealth waters, where water depths (&gt;10M) and currents will encourage mixing and dispersion. Dispersants are <u>not</u> to be used in State waters without approval of the Control Agency IMT.</p> <p>The state must be notified if dispersants used offshore have the potential to enter state waters.</p> <p>Critical Daily Tasking:</p> <ul style="list-style-type: none"> <li>Develop incident specific dispersant operations plans based on the <i>Aerial Dispersant Operations Plan for Oil Spills in Bass Strait</i> plan (controlled copy available on AMOSC website).</li> </ul>

Dispersant Operations	
	<ul style="list-style-type: none"> <li>Establish through a daily <u>Net Environmental Benefit Assessment</u> the ongoing benefit of dispersant spraying.</li> <li>Ensure that operational and scientific monitoring programmes are in place, with data being collated and sent back to the EUL and SITU</li> <li>Ensure daily dispersant operations are recorded (types, volumes, and locations).</li> <li>Predict future dispersant 'consumption/burn rates' across all delivery means.</li> <li>Assist operations to draft daily ICS 204 operations orders used by the aviation branch and complete the AMSA/AMOSC JSOP for the deployment of the FWADC.</li> <li>The Planning Section needs to continuously monitor dispersant operations and <u>scale them up or down</u> to the number of daily sorties required to provide 100% spray coverage of slightly weathered (24 hours) crude oil.</li> </ul> <p>Dispersant selection will preference:</p> <ul style="list-style-type: none"> <li>Dispersants listed on the AMSA Oil Spill Control Agents Register.</li> <li>Those with highest efficacy testing against Esso Bass Strait crudes. Refer to <u>2019 Esso Dispersant Testing Report</u> for details of laboratory analysis of a range of dispersants on Gippsland crude oils. A summary of the results is provided in Table E-1 in Appendix E.</li> </ul> <p>All data gathered through the OSMP in relation to dispersant operations are to be captured and displayed in the Common Operating Picture (Esso GIS) so that all members of the IMT have situational awareness.</p>
<b>Operations Section Instructions</b>	<p>The Operations Section, Marine, Aviation, and Source Control Branch Directors will task assets under their command to undertake daily dispersant operations as a part of the execution of the IAP developed the previous day.</p> <ul style="list-style-type: none"> <li>Aviation operations will be split between: <ul style="list-style-type: none"> <li>Bairnsdale (AMSA/NatPlan-provided small air tractor aircraft and attack aircraft)</li> <li>Longford Heliport.</li> </ul> </li> <li>Operational planning needs to assert control around the two distinct aircraft types. Safety planning to include separate, dedicated search and rescue (SAR) capability.</li> </ul> <p>Operational planning for aerial surface application will be based on the <i>Aerial Dispersant Operations Plan for Oil Spills in Bass Strait</i> and the completion of the AMSA / AMOSC FWADC JSOP available at <a href="http://www.amosc.com.au">www.amosc.com.au</a>.</p> <p>Vessel spraying operations will come out of BBMT/Lakes Entrance on 3-4 day swings, dependent on deck space for dispersant and waste. Resupply will occur at these locations.</p> <p>Critical Daily Tasking:</p> <p>All Spills:</p> <ul style="list-style-type: none"> <li>Execute the IAP for the current operational period.</li> <li>Liaise with the PSC to ensure that field tasking (ICS 204) is drafted and used for dispersant operations. – Maintain records of dispersant application including quantities, types, and locations of spraying. Refer Appendix A for draft ICS 204.</li> <li>Direct-vessel-based dispersant operations.</li> <li>Spill Levels Two and Above (in addition to the above):</li> </ul>

Dispersant Operations	
	<ul style="list-style-type: none"> <li>• Operations are to be directed to the thickest part of the slick, to fresh oil.</li> <li>• De-confliction of aerial and vessel-based dispersant spraying – SimOps planning needs to be part of the daily tasking.</li> <li>• Vessel assigned for the OSMP water sampling/monitoring activities.</li> </ul>
<b>Logistics Section Instructions</b>	<p>The Logistics Section is to activate contracts and provide ongoing services and supply (Esso resources and/or from third parties) in support of the execution of this strategy. This is focused on aerial operations from Essendon and Bairnsdale and vessels from BBMT and Lakes Entrance.</p> <p>For level two and three spills, the key tasks are to</p> <p>Ensure correct activation with AMOSC of the AMSA fixed wing aerial dispersant spraying contract – aircraft is to move to Bairnsdale airfield for ongoing operations</p> <p>Ensure internal (Esso-owned stockpiles) dispersants are moved to the aerial and marine operational points</p> <p>Ensure AMOSC and NatPlan stockpiles of dispersant are moved to aerial and marine operational points</p> <p>If needed, ensure activation of OSRL for large dispersant aircraft and transfer by air of additional dispersant to Australia.</p> <p>Critical Daily Tasking:</p> <ul style="list-style-type: none"> <li>• Monitoring dispersant rate of use.</li> <li>• Sustaining marine/aviation operations with contractors and third parties to ensure that operations can continue:</li> <li>• Operational bases,</li> <li>• Services and supply for operations.</li> <li>• Anticipate future needs of the operations</li> </ul>
<b>Termination Criteria</b>	<p>Dispersant operations will cease based on any of the below triggers:</p> <ul style="list-style-type: none"> <li>• NEBA determines that dispersant operations no longer provide demonstrable environmental benefits.</li> <li>• Oil is too weathered for effective operations.</li> </ul>

### 5.7 At-Sea Containment and Recovery (Vessel Based)

#### Strategy Description:

Using containment boom and skimmers, strike teams will corral fresh oil and then mechanically recover it into vessel tanks and temporary storage.

Relevant environmental performance outcomes and standards are provided in Appendix C.

At-Sea Containment and Recovery (Vessel Based)	
<b>Response Objective</b>	To recover spilt oil before shoreline or other sensitivity contact. To remove bulk floating oil and improve water quality.
<b>Critical Outputs</b>	<p>For Level One Spills (subject to NEBA):</p> <ul style="list-style-type: none"> <li>Using a pair of large vessels, offshore booms will be towed in the optimal configuration to concentrate and collect floating oil. Alternatively, single vessel high speed booming systems may be used.</li> <li>The optimal mechanical skimmer for the type and condition of oil will be used to recover as much oil as possible from the pocket of the boom.</li> <li>Refer to the <i>ExxonMobil Oil Spill Response Handbook</i> s. 5 for more information on booming configurations.</li> </ul> <p>For level two and above spills (subject to NEBA):</p> <ul style="list-style-type: none"> <li>Based from BBMT and Lakes Entrance, up to six strike teams (each comprising two vessels) may be needed considering the volume of oil required to be collected via this method. Each will use the configurations noted above.</li> </ul> <p>In ideal conditions, 'advanced' booming techniques will be used to concentrate oil using two pairs of vessels per strike team.</p> <ul style="list-style-type: none"> <li>Vessels of opportunity from fishing and offshore service fleets will be sourced from around southern Australia.</li> <li>Equipment and trained personnel will come from Esso, AMOSC, AMOSC Mutual Aid and Australian National Plan (government) stockpiles. These will be cascaded in from stockpiles across Australia.</li> <li>Daily calculated volumes of oil to be contained and recovered through this method will be between 150 m<sup>3</sup> and 450 m<sup>3</sup> of oil in total.</li> </ul>
<b>Planning Section Instructions</b>	<p>The Planning Section to determine through the NEBA, and surveillance and monitoring inputs, that Containment and Recovery operations should be conducted.</p> <p>In particular, Containment and Recovery operations will be used to reduce shoreline loadings, particularly on remote coastlines such as the Bass Strait Islands, the wilderness areas of far-east Gippsland, Corner Inlet, and surrounding estuaries, and sensitivity-specific positive impacts as demonstrated by the daily NEBA.</p> <p>Weather conditions in Bass Strait are known to be volatile and challenging, so forward 24-48-hour forecasts (wave and swell height; wind speed) must be within operational limits for this tactic to proceed.</p>

**At-Sea Containment and Recovery (Vessel Based)**

Containment and recovery activities should only be carried out during daylight hours.

Critical Daily Tasking:

- Establish through a daily Net Environmental Benefit Assessment the ongoing benefit of Containment and Recovery
- Ensure that weather conditions are amenable to safe and effective operations
- Ensure that the operational and scientific monitoring programme is in place, with data being collated and sent back to the EUL and SITU
- Ensure daily Containment and Recovery operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered)
- Assist operations to draft daily ICS 204 operations orders used by the marine division for Containment and Recovery. Refer Appendix A for draft ICS 204
- Seek approval from AMSA to decant separated water to increase waste storage of recovered oil (refer to decanting IPEICA Good Practise Guide #17 <http://www.oilspillresponseproject.org/wp-content/uploads/2016/02/JIP-17-Decanting.pdf> ) and National Plan Guidance NP-GUI016 for further details.
- Working with the safety officer, ensure that WHS risks are appropriately identified and managed.
- Plan temporary waste reception facilities at BBMT and Lakes Entrance.
- Activate long-term waste treatment contracts from temporary waste storage sites.

All data gathered through the OSMP in relation to Containment and Recovery operations are to be captured and displayed in the Common Operating Picture (Esso GIS) so that all members of the IMT have situational awareness.

The Planning Section needs to continuously monitor Containment and Recovery operations and scale them up or down as needed when compared to the other spill response strategies. As the oil changes over time (weathering) Containment and Recovery will likely become favoured over dispersant operations.

**Operations Section Instructions**

The Operations Section and Marine Branch Directors will task assets under their command to undertake Containment and Recovery operations as part of the execution of the IAP developed the previous day.

Vessels will operate in pairs, focusing on different sections of the thickest part of the slick within the Containment and Recovery zone. Utilise overhead aerial assets to provide real-time direction to the vessel strike teams.

Where approved, regular de-canting by strike teams is to be done to maximise the volume of oil recovered from the vessel's waste tanks. Safety planning for this strategy must focus on de-confliction with aerial or vessel based dispersant operations. Operational planning will be based on *ExxonMobil Oil Spill Response Handbook* s. 5.

**At-Sea Containment and Recovery (Vessel Based)**

**Critical Daily Tasking:**

**All Spills:**

- Execute the IAP for the current Operational period.
- Liaise with the PSC to ensure that field tasking (ICS 204) is drafted and used for C&R operations. Refer Appendix A for draft ICS 204
- Ensure daily Containment and Recovery operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered).
- Operations are to be directed to continuous parts of the slick to maximise effectiveness.
- SimOps planning needs to be a part of the daily tasking.
- Vessels assigned for the OSMP water sampling/monitoring activities.

**Logistics Section Instructions**

The Logistics Section is to activate contracts and provide ongoing services and supply (from Esso resources and/or third parties) in support of the execution of this strategy.

This is focused on supporting Containment and Recovery strike team operations from BBMT and Lakes Entrance. Vessels of opportunity are to be sourced and wet chartered through Esso's marine team. Oil spill response equipment is to be sourced from AMOSC, NatPlan sources, and OSRL if required.

Logistics is to use the technical advice of AMOSC LO/OSRL LO as to the best equipment selection for the operation at the time. Factors to be considered include

- Known and anticipated weather conditions.
- Weathering of oil.
- Anticipated volumes of oil.
- Length of operation/swing.

Only large/heavy offshore booms are to be ordered from providers (i.e. 1.5 metres in height or greater), or advanced booming single vessel systems (i.e. NOFI Current buster 2/4/6/8/ or SpeedSweep Systems) with skimmer selection focusing on high capacity, high volume oil removal (i.e. greater than 30 m<sup>3</sup> per hour pumping capacity).

For Level One Spills:

- Utilise the chartered Esso vessels to load out equipment from BBMT with Esso OSR trained personnel.
- Contract AMOSC personnel and AMOSC CG personnel if needed.

**At-Sea Containment and Recovery (Vessel Based)**

For Levels Two and Three:

- Request additional skimming equipment, booms, and temporary storage from AMOSC to match the need, as directed by the planning section – quantities and types of equipment.
- Request AMOSC personnel and AMOSC CG in numbers suitable for equipment deployment.
- Contract offshore surveyed vessels suitable for strike team duties – deck size and bollard 'pull'.
- Ensure that temporary storage facilities at BBMT and Lakes Entrance are in place to receive the volume of waste that will be offloaded from the strike teams.
- Ensure that waste contractors are in place to remove the temporary waste from BBMT and Lakes Entrance to final waste storage/disposal sites or processing.

Critical Daily Tasking:

- Sustain the activities for the duration of the spill with contractors and third parties to ensure that operations can continue

Marine Bases.

Services and supply for operations – vessel consumables, goods, and resupply.

- Track vessels for compliance with Esso marine requirements.
- Track volumes of oil recovered by strike teams and anticipate temporary storage requirements at marine bases.

**Termination Criteria**

Containment and Recovery operations will cease based on any of the below triggers:

- NEBA determines that Containment and Recovery operations no longer provide demonstrable environmental benefits.
- OSMP triggers are met.
- Oil is too thin for effective booming and containment to take place
- Weather/sea conditions make Containment and Recovery operations unsafe or ineffective.

### 5.8 Protection of Sensitive Shoreline Resources

Strategy Description:

Booms will be used to protect shoreline resources and to corral oil for skimming.

Relevant environmental performance outcomes and standards are provided in Appendix C.

Protection of Sensitive Shoreline Resources	
<b>Response Objective</b>	To recover spilt oil before shoreline or other sensitivity contact. To remove bulk floating oil and improve water quality.
<b>Critical Outputs</b>	<p>For All Spills</p> <ul style="list-style-type: none"> <li>• Modelling predicts shoreline impacts over time</li> <li>• Where shoreline impact is predicted a Tactical Response Plan (TRP) will be implemented</li> <li>• TRPs consist of detailed response information and resources required including the equipment and personnel to carry out identified taskings related to the protection of specific sensitivities</li> <li>• Taskings within the TRPs include:               <ul style="list-style-type: none"> <li>○ SCAT</li> <li>○ Pre-cleaning of shoreline</li> <li>○ Protection and deflection booming</li> <li>○ Containment and recovery</li> </ul> </li> <li>• Primary TRP sites identify sensitivities permanently exposed which will require a definitive response. The TRP identifies specific tasks aimed at minimising environmental impact.</li> <li>• Secondary TRP sites identify sites at which exposure is seasonal or irregular and require confirmation of a requirement prior to response. The TRP identifies sensitivities, site information, likely response strategies, and resources required that would require validation based on conditions at time of event</li> <li>• Secondary TRP sites that do not require a response would allow additional resources to be directed towards other response activities</li> </ul>

**Protection of Sensitive Shoreline Resources**

**Planning Section Instructions**

The Planning Section EUL to provide advice about whether there are any specific sections of coastline with high-value sensitivities – in these areas, specific tactical planning should be put in place.

All planning for protection of coastlines is to be done in conjunction with the Control Agency IMT.

The following locations have pre-drafted TRPs which should be used to guide response planning.

**Primary Sites**

SITE NAME	Site Type	Latitude	Longitude
<b>VICTORIA</b>

TRPs may need to be drafted in conjunction with the operations section for locations without existing TRPs. Shoreline TRPs and shoreline clean-up more generally should be executed consistent with guidance in the [Tactical Response Plan - Shoreline Protection & Clean Up](#) and/or the *ExxonMobil Oil Spill Response Handbook* s.12.

**Critical Daily Tasking:**

- Establish through a daily Net Environmental Benefit Assessment and SMV the ongoing benefit of shoreline booming.
- Ensure that weather conditions are amenable to safe and effective operations.
- Ensure that an operational and scientific monitoring programme is in place, with data being collated and sent back to the EUL and SITU.
- Ensure daily operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered).
- Assist operations to draft daily ICS 204 operations orders used by the shoreline and nearshore division for booming.
- Work with the DTPT LO to ensure agreement on the location of specific tactical operations.
- Work with the safety officer to ensure that WHS risks are appropriately identified and managed.
- Plan local temporary waste reception facilities co-located with shoreline recovery.
- Activate long-term waste treatment contracts from temporary waste storage sites.

**Operations Section Instructions**

The Operations Section and Shoreline Protection Branch Director will need to coordinate with the DTP to ensure that resources under Esso command undertake shoreline protection tactics consistent with the requirements of the DTP.

**Protection of Sensitive Shoreline Resources**

The Shoreline Protection Branch must work closely with the Planning Section to draft and 'truth' tactical response plans. Plan drafting will be prioritized based on time frame of impacts – with soonest and most critical sensitivities being done first.

All operations are to be consistent with the IAP developed the previous day.

The Shoreline Protection Branch is to divide the tasking between teams that are geographically focused – each with a number of plans to execute. For protection / deflection booming, teams will need to continuously monitor boom for effectiveness and adjust for changes in tide, current, and weather.

When booming is used for containment with recovery operations, effective temporary waste storage must also be put in place.

Safety planning for this strategy must focus on remote operations, the use of manual handling risks, and potential for exposure to hydrocarbons.

Operational planning will be based on [Tactical Response Plan - Shoreline Protection & Clean Up](#) and/or the *ExxonMobil Oil Spill Response Handbook* s.12.

Critical Daily Tasking:

All spills

- Execute the IAP for the current operational period.
- Liaise with the planning section to ensure that field tasking (ICS 204's) is drafted and used for shoreline protection operations.
- Booming operations are to be continuously monitored to ensure ongoing effectiveness.
- SimOps planning needs to be part of the daily tasking.

Operations must also adhere to good practice decontamination practices, establishing and keeping to hot, warm, and cold zones as well as personnel and equipment washdown facilities. Site setup must follow the practices outlined in the *ExxonMobil Oil Spill Response Handbook*.

**Logistics Section  
Instructions**

The Logistics Section is to activate contracts and provide ongoing services and supply (from in-house resources or from third parties) in support of the execution of this strategy.

### Protection of Sensitive Shoreline Resources

Shoreline protection strike teams may be directed to put in place tactics along any part of the mainland, Bass Strait, or Tasmanian Islands. Logistical support will be required at each of these locations to support spill response – moving operators in and out of these locations and supporting them while they are there. In extreme non-assessable locations, this could require rotary wing aircraft moving personnel and freight and equipment lifts/movement.

The logistics section must ensure the correct type and volume of spill response equipment is divided into caches for each of the tactical response plans.

This includes

- Appropriate lengths of shoreline and shore seal booms, including land and sea anchoring systems.
- Smaller portable skimming systems.
- Temporary waste storage (on-site) of a volume equivalent to anticipated recovery.

Support and services for on ground operators must also be provisioned, including

- Shelter
- Sustenance
- Ablutions
- Transport.

The Logistics Section is to liaise with DTP on the shoreline needs and then utilise Esso standing support contractors for the provision of these services where there are gaps between what the DTP is able to provide and the need.

Logistics is to also use the technical advice of AMOSC LO/OSRL LO as to the best equipment selection for the operation at the time. Factors to be considered include

- Known and anticipated weather conditions.
- Weathering of oil.
- Anticipated volumes of oil.
- Duration of operation.

The logistics section is to prioritise Esso and AMOSC equipment for deployment for the execution of shoreline protection booming, with NatPlan/DTP/OSRL equipment to be deployed if there is a shortfall.

**Protection of Sensitive Shoreline Resources**

For All Spills:

- Tally up the total amount of booms, number of skimmers, and ancillaries required based on the recommended tactical response plans and those that are drafted at the time.

These totals are to be tallied, and requests made to Esso, AMOSC and to AMSA for equipment as required.

- Tally up the amount of personnel required to implement and monitor the tactical response plans:

Source these personnel from the same sources as above – Esso and AMOSC, AMSA (NatPlan), and OSRL – and divide these personnel into appropriate teams.

- Source the required transport and accommodation appropriate to the number of responders.

Critical Daily Tasking:

- Validate the quantities of oil spill equipment and personnel – adjust as needed.
- Monitor that transfers, accommodation and provisioning arrangements are fit for the purpose.
- Validate that temporary waste management storage capacity at each site is sufficient.

**Termination criteria**

Oil no longer threatens sensitive receptors.  
DTP directs that Esso is to demobilise from sites.

## 5.9 Shoreline Clean-up

Strategy Description:

Shorelines will be (1) assessed using SCAT and (2) shoreline treatment recommendations put in place.

Relevant environmental performance outcomes and standards are provided in Appendix C.

Shoreline Cleanup	
<b>Response Objective</b>	To remove bulk stranded oil from accessible shorelines and speed up natural recovery of habitats.
<b>Critical Outputs</b>	<p><u>Initial Response</u></p> <ul style="list-style-type: none"> <li>- EAPL coordinate with contractors (GHD / AMOSC) and jurisdiction (Vic DTP ) to mobilise SCAT teams to conduct shoreline assessment</li> <li>- EAPL mobilise Shoreline Response Planning function</li> <li>- SCAT feedback initiates development of initial Shoreline Treatment Recommendations (STRs)</li> <li>- EAPL/AMOSC/Vic DTP support initial shoreline clean-up operations</li> </ul> <p><u>Planned Phase – Decision Making</u></p> <ul style="list-style-type: none"> <li>- EAPL resources support jurisdiction in maintaining ongoing SCAT program and development of STRs</li> <li>- EAPL resources support jurisdiction in development of Shoreline Response Plan (SRP)</li> </ul> <p><u>Planned Phase – Project Implementation</u></p> <ul style="list-style-type: none"> <li>- EAPL resources support jurisdiction in implementation of SRP and support operations</li> </ul> <p><u>Response Completion/Termination</u></p> <ul style="list-style-type: none"> <li>- EAPL resources continue to support SCAT inspections</li> </ul>
<b>Planning Section Instructions</b>	<p>All planning for protection of coastlines is to be done in conjunction with the Control Agency IMT.</p> <p>The Planning Section will oversee two distinct elements of the shoreline response:</p> <p>(1) Gathering data through the SCAT function (using Esso's or the State's collector application) and,</p> <p>(2) Using this data to plan for an extended shoreline clean-up.</p>

### Shoreline Cleanup

Shoreline surveys will ideally be done in conjunction with jurisdictional control agencies. Shoreline clean-up operations must be performed under the control and coordination of jurisdictions, unless this has been formally devolved to Esso or another group.

#### Data Collection

SCAT teams undertaking field surveys need to consistently gather data on shoreline type, oiling description, and clean-up recommendations. This data gathering is a planning, not operations, function, so it becomes a prominent field component of the planning section.

Ideally, teams will be multi-disciplinary/multi-agency and include an oil spill operator (for practical clean-up recommendations) combined with an environmental advisor/scientist.

SMEs should be consulted for specialist shoreline types or where there are specific sensitivities exist (e.g. indigenous heritage areas).

Data will be fed back from these teams to the Esso GIS CoP, allowing (close to) real-time data sharing with the IMT and forward planning for future operations.

#### Critical Daily Tasking:

- SCAT teams form up in the morning, head out to the fields, and report back on data collected.
- Shoreline Treatment Recommendations to be issued for the section of the shoreline where oiling has occurred. These form the basis of the ICS204 for shoreline clean-up operations.
- Where oil is likely to affect the shoreline, SCAT teams should be recommending the pre-cleaning of beaches to reduce future organic waste.

#### Shoreline Clean-up

Based on the data collected from the SCAT surveys, work assignments (ICS 204 or similar) to be drafted that guide clean-up teams to execute the shoreline treatment recommendations.

Shoreline divisions based on a span of control adequate to manage clean-up teams will need to be agreed on and established with the jurisdictional control agency. Pre-defined shoreline sectors have been developed for the Victorian coastline and should form the basis of planning.

The EUL to provide advice on whether there are any specific sections of coastline with high-value sensitivities – in these areas, specific separate shoreline cleaning will be required.

Refer to [Tactical Response Plan - Shoreline Protection & Clean Up](#) and/or the *ExxonMobil Oil Spill Response Handbook* for further guidance.

#### Critical Daily Tasking:

- Establish through a daily Net Environmental Benefit Assessment and SMV the ongoing benefits of shoreline clean-up.

**Shoreline Cleanup**

- Ensure that weather conditions are amenable to safe and effective operations.
- Ensure that the operational and scientific monitoring programme is in place, with data being collated and sent back to the EUL and SITU.
- Ensure daily operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered)
- Assist operations to draft daily ICS 204 operations orders used by the shoreline clean-up operations.
- Work with the DTP LO to ensure agreement on the location of specific tactical operations.
- Work with the safety officer to ensure that WHS risks are appropriately identified and managed.
- Plan local temporary waste reception facilities co-located with the shoreline clean-up.
- Activate long-term waste treatment contracts from temporary waste storage sites.

**Operations Section Instructions**

Based on the advice received from Esso by DTP, the Operations Section, Shoreline Clean-Up Branch, will work along with DTP to ensure that resources under Esso command undertake shoreline clean-up consistently and under the control of the DTP.

With no marine, aviation, or other spill response/source control interventions, the predicted shoreline loadings for all discharge scenarios are provided in Appendix D Quick Reference Information. These volumes will be reduced with spill response measures, but oil is still very likely to be stranded along the coastline in the majority of modelled scenarios.

Shoreline divisions based on a span of control adequate to manage these clean-up teams will need to be agreed on and established with the jurisdictional control agency.

Esso's resources are likely to work in a blended teams with State resources. Teams to execute the shoreline treatment recommendations developed by the SCAT teams in the planning section.

Shorelines within the Potentially Exposed Area are predominantly fine, medium, and coarse-grained beaches, interspersed with rocky headlands. There also exists a number of estuarine systems which shelter much higher sensitivity shorelines. The principle issue for response will be accessing the more isolated portions of coastline (far-east Victoria) and how to manage and stage large work forces working in these areas.

Safety planning for this strategy must focus on remote operations, manual handling risks, and potential for exposure to hydrocarbons.

Operational planning should be based on the [Tactical Response Plan - Shoreline Protection & Clean Up](#) and/or the [ExxonMobil Oil Spill Response Field Manual s 12](#), and the instructions given by the Control Agency.

Critical Daily Tasking:

All Spills:

- Execute the IAP for the current operational period.
- Liaise with the planning section to ensure that field tasking (ICS 204's – Shoreline Treatment Recommendations) is drafted and used for shoreline protection operations.
- Work closely with the DTP Operations Officer as required to ensure ongoing unity of command.
- Shoreline clean-up is continuously monitored to ensure ongoing effectiveness.
- SimOps planning needs to be a part of the daily tasking.

Shoreline Cleanup	
	Operations must also adhere to good practice decontamination practices, establishing and keeping to hot, warm, and cold zones, as well as personnel and equipment washdown facilities.
<b>Logistics Section Instructions</b>	<p>Based on the advice received from Esso by DTP, the Logistics Section will work alongside with DTP to ensure that resources are deployed to assist in the shoreline clean-up consistent with the request of the jurisdictional control agency DTP.</p> <p>With no marine, aviation, or other spill response/source control interventions, the predicted shoreline loadings for all discharge scenarios are provided in Appendix D Quick Reference Information. These volumes will be reduced with spill response measures, but oil is still very likely to be stranded along the coastline in the majority of modelled scenarios.</p> <p>Shoreline divisions based on a span of control adequate to manage these clean-up teams will need to be agreed on and established with the jurisdictional control agency.</p> <p>Key support from Esso in this task includes</p> <ul style="list-style-type: none"> <li>• Activation of labour hire contracts* to provide 50 – 500 personnel available for medium-term (2–4 months) shoreline clean-up tasking.</li> <li>• AMOSC CG personnel to supervise and oversee clean-up teams.</li> <li>• Safety and Security personnel to support response activities</li> <li>• Working with the EPA and Esso’s waste management contractor to come up with acceptable bunded temporary storage areas for recovered waste.</li> <li>• Deployment of all AMOSC, mutual aid, and NP temporary storage equipment to points along the coastline as directed by the DTP.</li> <li>• Activation of accommodation, transport, and sustenance.</li> </ul> <p>**Utilise base business contractor or escalate to ExxonMobil Contingent Worker Contractors team to coordinate hire of additional personnel.</p> <p>Critical Daily Tasking:</p> <p>All Spills:</p> <ul style="list-style-type: none"> <li>• Execute the IAP for the current operational period;</li> <li>• Liaise with the planning/operations section to ensure that support and services for the ICS 204’s – Shoreline Treatment Recommendations are delivered.</li> <li>• Work closely with the DTP logistics section to deliver services and supply under a unity of command.</li> <li>• Ensure that recovered waste is efficiently managed.</li> <li>• Develop a forward plan of rotations for shoreline staff engaged in physical labouring activity.</li> </ul>
<b>Termination Criteria</b>	<ul style="list-style-type: none"> <li>• Shoreline operations will cease once pre-spill levels are returned, and/or by direction of the jurisdiction control agency.</li> </ul>

### 5.10 Oiled Wildlife Response

Strategy Description:

Esso will assist the state-led OWR response with equipment and technical personnel as requested.

Relevant environmental performance outcomes and standards are provided in Appendix C.

Oiled Wildlife Response	
<b>Response Objective</b>	Esso assists state government efforts through the timely provision of industry OWR resources.
<b>Critical Outputs</b>	<p>For All Spills:</p> <ul style="list-style-type: none"> <li>• Esso will activate the OWR resources of AMOSC and OSRL, equipment, personnel, and technical.</li> <li>• These resources will be provided to the Control Agency led IMT for use in reducing the impact of oil on wildlife.</li> </ul>
<b>Planning Section Instructions</b>	<p>Allocate an Esso IMT member to act as Liaison Officer to Control Agency IMT. A dedicated Liaison Officer for oiled wildlife response will likely be required. This role may be filled by the AMOSC OWR Coordinator.</p> <p>Details of numbers, type, status and type of fauna impacted by marine pollution to be collated by SITU.</p> <p>Daily ICS 204 work assignments to be developed in consultation with Operations, Logistics and Control Agency IMT.</p> <p>Utilise Area Response Plans and/or Specied Response Plans to assist with incident specific response planning.</p>
<b>Operations Section Instructions</b>	Support OWR activities as directed by Control Agency IMT and per ICS 204 work assignments
<b>Logistics Section Instructions</b>	<p>On request from Control Agency IMT, mobilise OWR equipment from AMOSC and/or OSRL.</p> <p><b>AMOSC</b></p> <ul style="list-style-type: none"> <li>• 2x OWR Containers (Geelong and Fremantle)</li> <li>• 4x OWR Box Kits</li> <li>• OWR Facilities support via DwyerTech contract</li> <li>• OWR Industry Team</li> <li>• AMOSC OWR Coordinator</li> </ul> <p><b>OSRL*</b></p> <ul style="list-style-type: none"> <li>• 3x OWR Search and Rescue kits</li> <li>• 1x OWR Intake and Triage kit</li> <li>• 4x Cleaning and Rehabilitation kits</li> </ul>

Bass Strait  
Oil Pollution Emergency Plan

<b>Oiled Wildlife Response</b>	
	<ul style="list-style-type: none"><li>• 1x Wildlife Rehabilitation Unit</li></ul> <p>* 50% of the above inventory is available during an incident.</p> <p>Sea Alarm (via OSRL)</p> <ul style="list-style-type: none"><li>• 1x Full time availability of one Sea Alarm expert for advice and potential mobilisation to the affected site.</li><li>• 1x Full time availability of one Sea Alarm expert for advice and response support (based in Brussels).</li></ul> <p>ExxonMobil RRT</p> <ul style="list-style-type: none"><li>• RRT OWR Core Team</li><li>• Third party OWR specialists</li></ul> <p>Equipment owned by State agencies will be requisitioned via the Control Agency IMT under NatPlan arrangements.</p>
<b>Termination Criteria</b>	Resources are no longer required/requested by the State government.

### 5.11 Waste Management

An oil spill waste management plan [AUGO-EV-ELI-011](#) has been developed which provides guidance on contractor activation, equipment available, waste segregation, storage and disposal options. This document should be referenced to develop an incident specific waste management plan.

Esso holds a number of waste management contracts with third parties that will be called upon in the event of a spill. These parties will be used to:

- Provide a waste subject matter expert to the logistics section of the IMT;
- Work with the EPA to put in place waste management chains from point of collection to final disposal; and
- Ensure that the waste management practises put in place are ethical, legal and follow Australian best practise waste management principles.

Different wastes will be generated from a variety of different sources including:

- Liquid wastes (oil / water) – collected offshore by vessels from the shoreline through booming operations;
- Bulk hard wastes (oils mixed with organic materials, sand, rocks, pebbles, etc.) collected in bulk from shorelines by mechanical and manual means;
- Sundry wastes generated as a result of employing a large temporary workforce including PPE, waste from catering, etc.

Esso's waste management resource capability is described in detail in Section 9.3.1 of Volume 3. Relevant environmental performance outcomes and standards are provided in Appendix C.

## 6 Concept of Plan

### 6.1 Purpose

The purpose of the Esso Bass Strait Oil Pollution Emergency Plan (OPEP) is to describe the actions and arrangements Esso Australia has in place to respond to an oil pollution incident from any one of the company's Bass Strait petroleum activities (refer Figure 2-1).

Spills can range from Tier One, small single event releases, to Tier Two-Three, ongoing/large releases. This plan is designed to provide the full range of available response options and plans for all spills, regardless of the Tier level and is therefore, not specific to a particular activity or scenario.

It is designed such that the Incident Management Team and Emergency Response Team have immediate access to the full suite of response action plans (from Tier One to Tier Two-Three) and can select and implement the appropriate plan based on the specific emergency situation.

This OPEP provides the processes and tools to be able to select and apply the viable response options (and therefore eliminate options that are not viable) for the specific spill event.

### 6.2 Objectives

The objectives of this OPEP are to:

- Define the roles and responsibilities for Esso to assess and then respond to an oil spill;
- Describe the process for deployment of oil spill response strategies that will be used by Esso (and its partners);
- Describe the procedures for mobilising company, industry and national support resources to support these spill response strategies;
- Clearly outline guidance to plan-users on how the above is to be undertaken, consistent with regulatory requirements;
- Integrate Esso's response with relevant government and industry plans:
  - National Plan for Maritime Environmental Emergencies (National Plan)<sup>3</sup>
  - Victorian Maritime Emergencies (Non-Search & Rescue) Plan (SERP [NSR])<sup>4</sup>
  - NSW State Waters Marine Oil and Chemical Spill Contingency Plan<sup>4</sup>
  - Tasmanian Marine Oil Spill Contingency Plan (TASPLAN)<sup>5</sup>
  - The Australian Industry Cooperative Oil Spill Arrangements (AMOSPlan)<sup>6</sup> and
- Describe how Esso will implement its Incident Management System in responding to oil spills; and
- Describe the link for ExxonMobil's global resources and services to be deployed as part of Esso's local response.

### 6.3 Scope

This OPEP provides oil spill response plans to respond to any spill from Esso's Bass Strait operations and project activities. Project activities which could result in a spill to environment have been identified as:

- Drilling
- Well operations (platforms, both manned and unmanned)
- Workovers of wells
- Workovers of subsea, seabed or platform infrastructure

<sup>3</sup> [https://www.amsa.gov.au/forms-and-publications/Publications/national\\_plan.pdf](https://www.amsa.gov.au/forms-and-publications/Publications/national_plan.pdf).

<sup>4</sup> <https://www.emv.vic.gov.au/responsibilities/state-emergency-plans/state-maritime-emergencies-non-search-and-rescue-plan>

<sup>4</sup> <http://www.rms.nsw.gov.au/documents/about/environment/oil-spill-contingency-plan-nsw-state-waters.pdf>

<sup>5</sup> <http://epa.tas.gov.au/Documents/TasPlan.pdf>

<sup>6</sup> <http://www.amosc.com.au/amosc.php>

- Pipelines running from offshore fields to coastlines, and
- Plug and abandonment activities.

Specifics of the scope of accepted activities is contained in relevant Environment Plans applicable to this OPEP. This OPEP has been prepared to be applicable to the following Environment Plans:

- Jack Up Rig Drilling
- Bass Strait Operations
- West Barracouta Installation, Commissioning and Initial Operations

For vessel activities that enable Esso's petroleum activities, the OPEP includes arrangements for Esso to respond to such spills under the direction of the relevant control agency.

The geographic scope of activities as directed by the OPEP (particularly for level two and three hydrocarbon spills) would likely apply to an area significantly beyond Esso's petroleum titles. This includes Commonwealth waters off south eastern Australia, and state waters of Victoria, New South Wales (NSW) and Tasmania. Staging areas for activities as far as practicable will be based in Victoria.

#### 6.4 Division of Responsibilities

Spill response activities in the zones outlined above are shared between a number of parties, known as control agencies (organisations leading response activities) and support agencies (organisations that help with the provision of labour, platforms, or services). The (legal) obligation to respond is outlined as below:

**Table 6-1 Control Agencies**

Location of spill	Source	Control Agency for oil spills	Supporting Agency
Commonwealth Waters (>3NM from shorelines)	Petroleum activity	Esso	AMSA
	Ship associated with petroleum activity	Esso as first responder, under the direction of the Australian Maritime Safety Authority	Esso
State waters or shorelines (<3NM of coastline)	Petroleum activity / Ship	State Government (Vic — DTP; NSW — Transport for NSW; Tas — EPA) with Esso supporting operations	Esso, local state port authorities, AMSA, state-based wildlife agencies

In all instances of spills from Esso's petroleum activities, Esso's response activities should be considered to be regulated by NOPSEMA and directed by this OPEP, until such time as another control agency verifies its intention to stand up and assert control.

As a response grows in size and complexity, a range of other parties and agencies may become involved, either to acquit a legislative obligation, or to provide support to a control agency.

In all cases, for spills originating from Esso assets and activities, Esso will facilitate the provision of resources to the control agency for their use in mitigating the consequences of the spill.

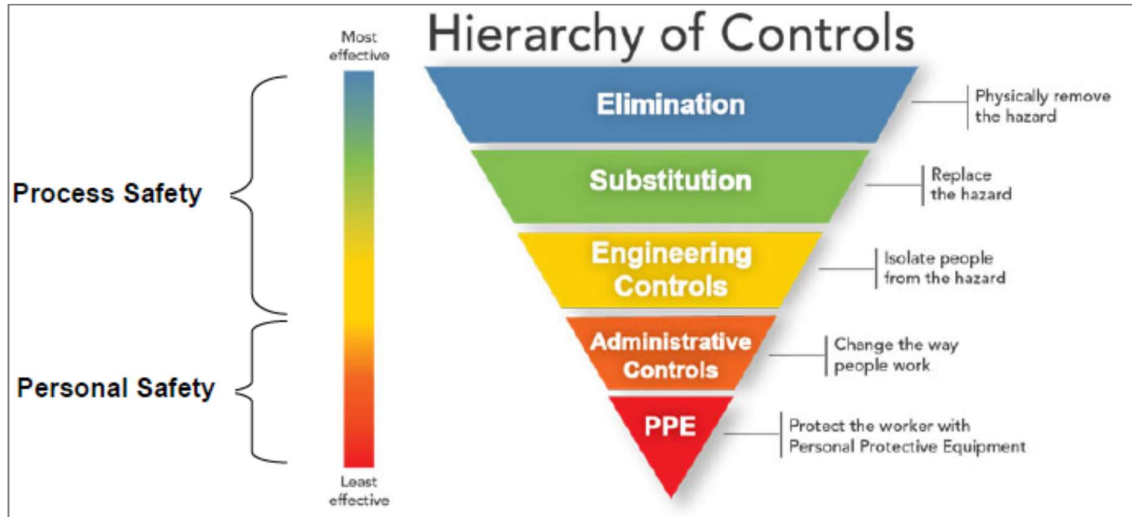

#### 6.5 Safety, Health and Environment Policy

Oil spill response activities under the control of Esso shall be implemented in a manner that reflects Esso's legal commitments to best practice workplace health and safety (WHS). That is, in accordance with (1) Esso's Safety, Health and Environmental policies and consistent with the outcomes sought from the (2) National Plan guidance paper *NP-GUI-026: Marine oil spill response health and safety*.

Prior to implementing spill response operations, for activities that are outside Esso's business as usual operations, activities will be risk assessed and should additional consequences be introduced, these shall be mitigated as appropriate.

Esso will develop and implement a spill safety plan which documents this process.

Safety risk mitigation measures, using a mix of process and personnel safety, will be put in place using the established hierarchy of control methods, as shown below in the Fig 10:

**Figure 6-1 Workplace Health and Safety Hierarchy of Controls for Risk Mitigation**

‘Baseline’ measures such as establishing controlled entry at polluted sites, wearing personal protective equipment and the use of safe working practices supported by suitable training, will be an integral part of response operations.

In cases where available measures to reduce the risk of injury or detrimental health implications cannot be lowered to an acceptable level, that activity or specific response strategy will not be viable until conditions change. Examples of this include situations where fresh hydrocarbons are releasing vapours, where sea conditions prevent safe working on the deck of a vessel, or where platforms and assets no longer present stable safe working platforms.

In implementing spill response activities, Esso, its contractors, and other parties supporting the response, shall always be mindful of the company’s emergency response priorities, using the acronym ‘PEAR’:

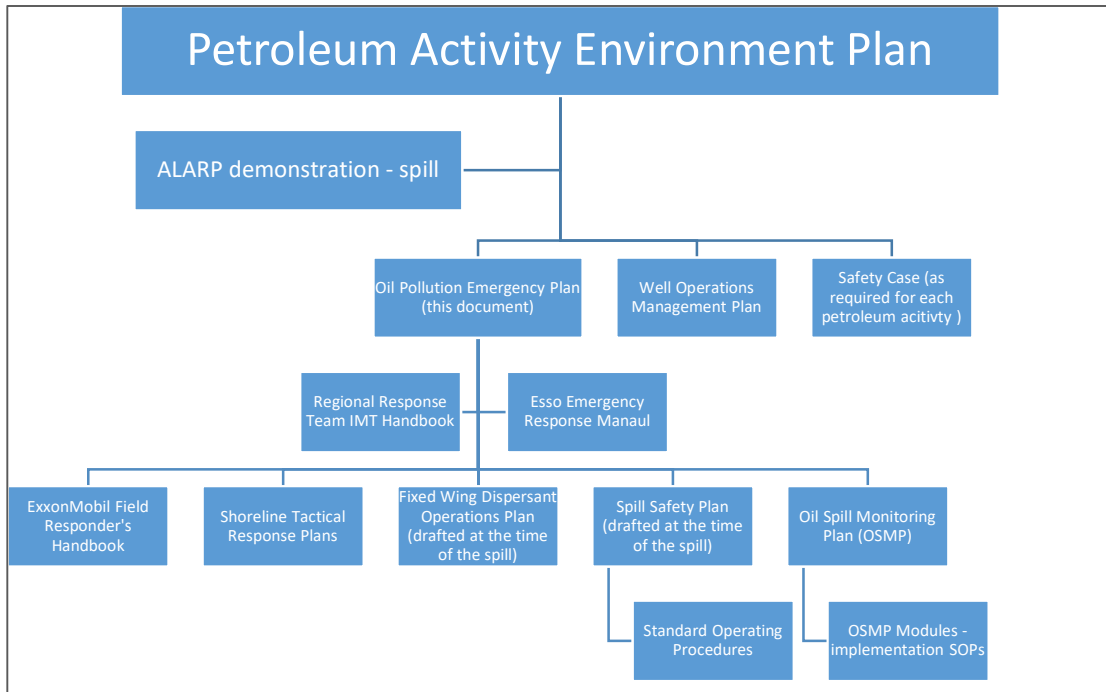

P – People, E – Environment, A – Assets, R – Reputation

### 6.6 Interface with Other Documentation and Plans

This OPEP is a component of the EP in force for the specific Esso petroleum activity taking place and outlines the measures that Esso will put in place for hydrocarbon spills from that activity.

The OPEP also has a relationship with a number of other key Esso documents as outlined below:

**Figure 6-2 OPEP Relationship With Other Key Esso Environmental Documentation**

This OPEP also has a number of linkages to external third-party spill response plans or documents. These outline how Esso is to engage with national and state government agencies for the provision of assistance to Esso, or from Esso to those parties, for spill response activities, and who is ultimately 'in charge' of clean up efforts in a particular geographical area. These links are detailed below:

**Table 6-2 External Plans That Inform and Influence Actions Under This OPEP**

Plan / Document
<p>National Plan for Maritime Environmental Agencies (National Plan) (AMSA, 2020)  <a href="https://amsa.gov.au">National Plan for Maritime Environmental Emergencies 2020 (amsa.gov.au)</a></p>
<p>Outlines the resources and services that may be provided by AMSA and other government agencies to assist Esso            Details nationally consistent processes and procedures spill response management and tactics and            Outlines a range of guidance documents on the same.</p>
<p>Victorian Maritime Emergencies (Non-Search &amp; Rescue) Plan  <a href="https://www.emv.vic.gov.au/responsibilities/state-emergency-plans/state-maritime-emergencies-non-search-and-rescue-plan">https://www.emv.vic.gov.au/responsibilities/state-emergency-plans/state-maritime-emergencies-non-search-and-rescue-plan</a></p>
<p>Specifies control agency responsibilities and obligations under Victorian laws in Victorian waters.            Specifies the mechanism by which Esso will engage to support the state for oil spill response and wildlife affected by marine pollution.</p>

<p>Specifies response agency responsibilities and obligations under Tasmanian laws in Tasmanian waters            Specifies the mechanism by which Esso will support the state for oil spill response.</p>
<p>NSW State Waters Marine Oil and Chemical Spill Contingency Plan  <a href="https://www.emergency.nsw.gov.au/Pages/publications/plans/sub-plans/state-waters-marine-oil-and-chemical-spill-contingency-plan.aspx">https://www.emergency.nsw.gov.au/Pages/publications/plans/sub-plans/state-waters-marine-oil-and-chemical-spill-contingency-plan.aspx</a></p>
<p>Specifies control agency responsibilities and obligations under NSW laws in NSW waters            Specifies the mechanism by which Esso will support the state for oil spill response.</p>
<p>AMOSPlan  <a href="http://www.amosc.com.au">www.amosc.com.au</a></p>
<p>Outlines the support (people, services and equipment) from AMOSC to Esso.            Outlines the mutual aid (people, services and equipment) available from AMOSC's members to Esso.            Details process to access surge spill response people, services and equipment.</p>

## 7 Concept of Spill Response Operations

Esso's concept of operations for responding to spills is based on Esso's environmental commitment detailed in the ExxonMobil Environment Policy.

This translates to a series of commitments by Esso for each occasion that a loss of containment occurs or is suspected. Esso will undertake

1. To conduct early and accurate identification of split hydrocarbons
2. To conduct an assessment and identification of defensible and proportionate spill response strategies
3. To tactically implement identified spill response strategies in a timely fashion and
4. To monitor the effectiveness of those strategies in order to achieve Esso's stated environmental performance outcomes for this OPEP.

Esso will mobilise its significant national and global processes, services, contracts and resources to achieve the above.

### 7.1 Reactive and Proactive Response Stages

This OPEP is broken into two broad sections: (1) background, contextual and supporting information; and (2) response processes. Response processes are then broken down into two further stages: (A) assessment / reactive planning and (B) proactive planning stages.

(A) Assessment/reactive planning are the actions that Esso will undertake in the field by the Esso IMT based on a first-pass assessment of the situation. They are the best planned, reactive actions that can be reasonably expected to assist in achieving Esso's Environmental Performance Outcomes (EPO). Should the assessment indicate a Level Two or Three spill, many of these actions will be focused on the mobilisation of resources likely to be used in future operational periods for the tactical spill response.

(B) Proactive planning is the more settled, longer term project planning mode that Esso will undertake. It requires the mobilisation and setup of a full incident management team and will be supported by Esso's Emergency Support Group for strategic support.

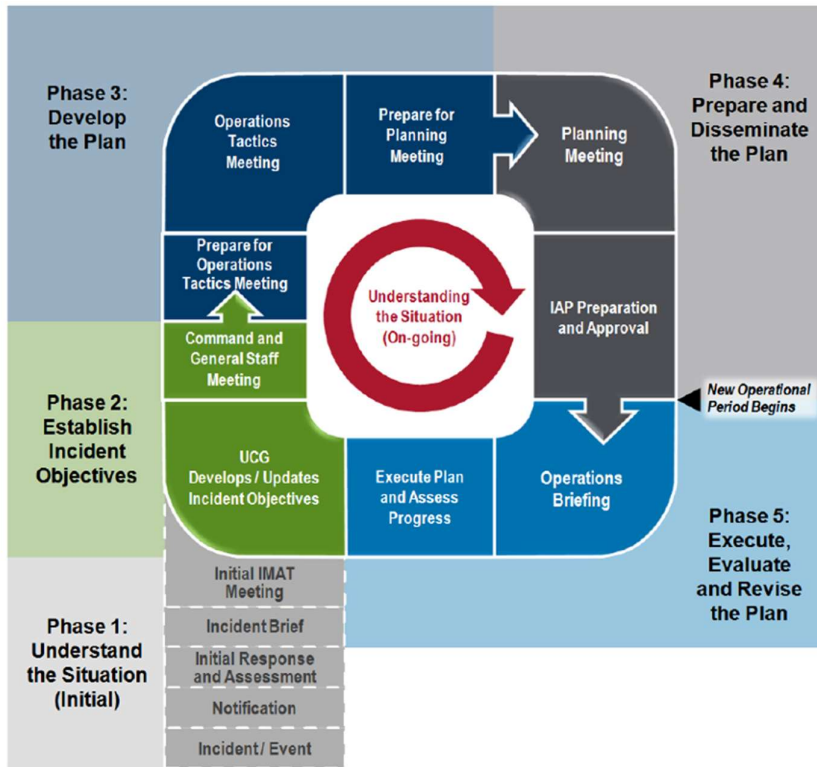

#### 7.1.1.1 Incident Management System

Esso Australia has adopted the global ExxonMobil standard of the incident control system (ICS) as its internal incident management system. ICS maps well onto, and is compatible with, the Australian interagency incident management system (AIIMS) adopted by Australian governments under the National Plan.

At the core of ICS is the concept of the 'planning p'. This is a standardised, systemic process used to identify and then action all incidents. It follows a basic five-step process outlined below:

1. Understand the situation
2. Establish incident objectives and strategy
3. Develop the plan that details the tactics to achieve the strategy/(ies)
4. Prepare and disseminate the plan
5. Execute, evaluate, and revise the plan

These steps are turned into the flow diagram below. This OPEP has the assessment/reactive and proactive stages mapped onto this diagram:

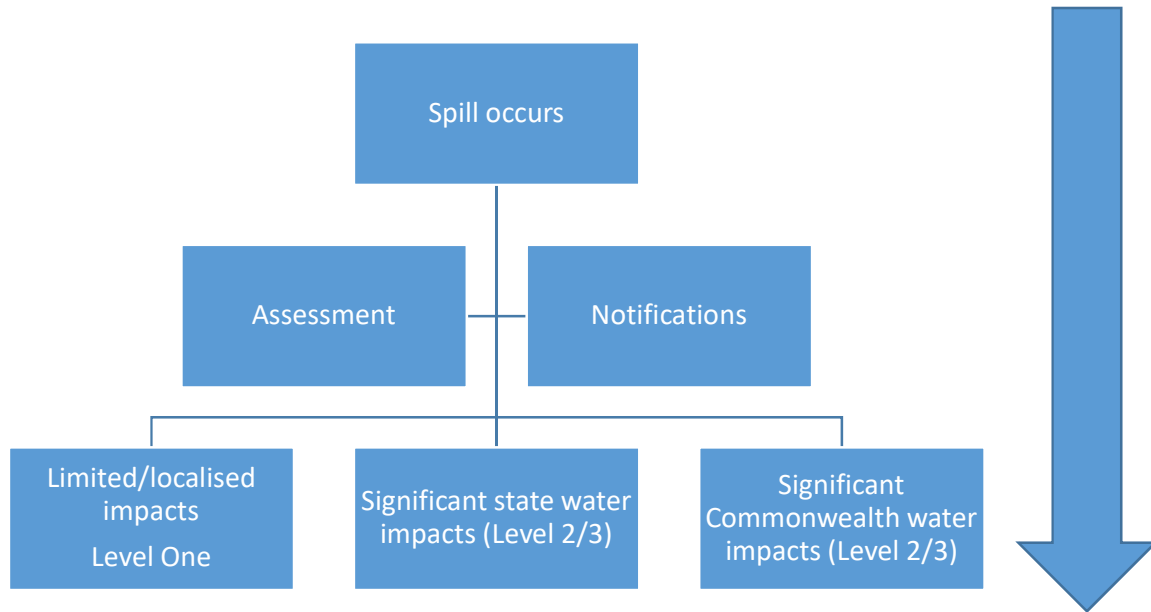

**Figure 7-1 ICS Planning 'P'**

Esso considers the use of ICS as one of the key controls to develop a robust and defensible incident action plan, which in turn is critical to achieve the best environmental outcomes at the time of the spill.

**7.2 Banding of Responses Based on Control Agency Triggers and Stakeholder Interfaces with Esso**

To hasten the implementation of appropriate spill response measures, Esso has developed three different action lists for use by the incident management team, based on the proximity of spilled oil to Victorian coastal waters and shorelines. The intent behind this 'banding' is to establish response measures which quickly establish the structure of and implement the most time critical responses using available resources.

Figure 7-2 outlines this intent:

**Figure 7-2 Banding Responses**

### 7.2.1 Command Points, Staging and Locations

Esso has a number of operational hubs located in metropolitan Melbourne and Gippsland, which have been predetermined as suitable areas to stage marine, aviation and personnel operations. If available for use, incident command points will be located in Victorian government identified regional ICCs (ref: Victorian Emergency Operations Handbook, pp 117).

These are as below:

Type of area	Location	Address
Incident Command Centre	Esso HQ, Docklands Melbourne	9/644 Collins Street Melbourne, VIC
Gippsland Incident Command Points	Bullock Island, Lakes Entrance	2 Bullock Island Lakes Entrance, VIC
Equipment staging area	Longford Plants, Longford	Garretts Rd, Longford, Vic
	Barry Beach Marine Terminal	Main Access Rd, Agnes VIC
Marine staging areas	Barry Beach Marine Terminal	Main Access Rd, Agnes VIC
	Bullock Island, Lakes Entrance	2 Bullock Island Lakes Entrance, VIC
Fixed wing staging areas & heliports	Bairnsdale Airport	345 Bengworden Road, Bairnsdale, Vic
	Longford Heliport	Garretts Rd, Longford, Vic

The relative location of these points is show on the map below:

## 7.2.2 Oil Characteristics

The main physical properties that affect the behaviour of spilt oil are specific gravity, distillation characteristics, viscosity and pour points.

In the event of a spill, these oils will weather, or degrade, differently depending on the oil type and its physical / chemical properties as well as on the weather, the sea conditions and the length of time it is exposed to these conditions.

### 7.2.2.1 Diesel

Diesel is loaded from supply vessels onto all offshore platforms and is stored on platforms and vessels in bulk tanks. It is used in vessel and platform engines and operating equipment such as cranes.

Diesel (Group<sup>7</sup> 2 Oil) is a common marine fuel and is classed as a medium petroleum distillate. Marine diesel is a mixture of both volatile and persistent hydrocarbons.

Behaviour when spilt generally, rapid spreading, rapid evaporation and some dispersion or dissolution. Diesel may emulsify at low temperatures when fresh, but the emulsification is likely to be 'unstable'.

Marine diesel contains 95% light hydrocarbons (or non-persistent constituents) that are likely to evaporate when exposed to the atmosphere. The remaining 5% is composed of heavy hydrocarbons (or persistent compounds) that may persist on the sea-surface for extended periods.

The viscosity of marine diesel does not change significantly over time and hence has a strong tendency to physically entrain into the upper water column as oil droplets in the presence of waves but can refloat to the surface if wave energies abate (APASA, 2013).

### 7.2.2.2 Condensate

Condensate is a Group 1 liquid hydrocarbon resulting from a change in pressure and or temperature of gas — 'liquid gas'.

---

<sup>7</sup> Classification of petroleum-based oils or 'oil groups' are compiled from various IMO, ITOPI, US EPA and US Coastguard publications. Ref AMSA 2012 Table 8 for classification criteria.

When spilled, condensate behaves in a manner similar to diesel, with generally rapid spreading, rapid evaporation and dispersion/dissolution. There is a low likelihood of emulsification. However, it may contain inert, relatively non-toxic waxes which will persist for some time as they degrade.

Condensates comprise a very high content of volatile (or non-persistent) constituents (~97–99%). Therefore, it is expected that any hydrocarbons reaching the sea-surface would quickly be lost to the atmosphere via evaporation. Smaller droplets may remain in the water column for a longer period undergoing microbial degradation over time. Any persistent (heavy) hydrocarbons may persist longer in the form of small solid relatively non-toxic waxy flakes on the sea-surface or entrained in the water column in turbulent waters given the rough environmental conditions of the region.

### 7.2.2.3 Light Crude

Light crude oil is produced from a number of fields in the Gippsland Basin. .

Analysis of crudes indicates volatiles and semi to low volatile compounds constitute 84.8 - 86.3%. The remaining heavy hydrocarbons (or persistent compounds) will persist in the environment for a longer period of time as a liquid or semi-solid state, either on the sea surface, entrained in the water column or on shore. The nature of the weathered residues is likely to be a sticky, waxy paste-like oil that will become more crystalline over time as it weathers further.

The loss of volume through evaporation for some crude oils may be offset by tendency to form viscous emulsions ('water in oil'). Oils with more than 3% by weight of asphaltenes create 'stable emulsions' while oils containing less than 3% by weight of asphaltenes only develop unstable emulsions (Fingas and Fieldhouse, 2004).

The maximum value of asphaltenes present in the light crude oils are all less than 0.05%wt so are unlikely to form stable emulsions that would impact on shoreline response and clean-up strategies. It is more likely that only temporary emulsions are likely to be generated and only at sea.

### 7.2.2.4 Waxy Crude

Waxy crudes are produced from some reservoirs, including Flounder and Moonfish. These crudes contain a high proportion of wax—with a corresponding high pour point. Waxy crudes are likely to solidify in the environment as it weathers over time.

The properties of these crudes classify them as a Group IV oil due to the high pour point (above ambient temperature) according to ITOPF (2014).

Given the tendency to form solid masses at ambient sea temperatures, the opportunity to use and effectiveness of chemical dispersants is diminished.

### 7.2.2.5 Summary of Hydrocarbon Characteristics Used in Oil Spill Trajectory Models

The physical characteristics of the oil types that were used for modelling are as follows:

	Density @ 15°C	API	Dynamic Viscosity	Pour Point	Wax Content	Oil Property Category
<b>Marine Diesel Oil (MDO)</b>	829 kg/m <sup>3</sup>	37.6	4.0 cP @ 25°C	-14 °C	-	Group II (light persistent oil)
<b>Condensate (surrogate)</b>	770.6 kg/m <sup>3</sup>	52.15	0.14 cP @ 25°C	-3 °C	-	Group I (non-persistent oils)
<b>Barracouta Condensate</b>	772.3 kg/m <sup>3</sup>	51.6	1.291 @ 20°C	-39 °C	1.8%	Group I (non-persistent oils)
<b>Kipper Condensate</b>	760.6 kg/m <sup>3</sup>	54.5	0.91 @ 20°C	-39 °C	2.3%	Group I (non-persistent oils)

Bass Strait  
Oil Pollution Emergency Plan

	Density @ 15°C	API	Dynamic Viscosity	Pour Point	Wax Content	Oil Property Category
<b>West Seahorse 3 Crude</b>	792.5 kg/m <sup>3</sup>	48.0	2.0 cP @ 20°C	-15 °C	-	Group II (light persistent oil)
<b>West Kingfish Crude</b>	798.1 kg/m <sup>3</sup>	45.7	2.4 cP @ 20°C	9°C	25%	Group II (light persistent oil)
<b>Halibut Crude</b>	821.5 kg/m <sup>3</sup>	40.6	3.4 cP @ 20°C	0°C	23.7%	Group II (light persistent oil)
<b>Flounder Crude</b>	799.9 kg/m <sup>3</sup>	45.3	2.8 cP @ 20°C	18°C	32%	Group IV oil due to the high pour point
<b>Moonfish Crude</b>	887.6 kg/m <sup>3</sup>	27.8	5.14 (at 40 °C)	27°C	38.5%	Group IV oil due to the high pour point

## 8 Supporting Activities to Operations

### 8.1 Tiered Response Arrangements – Equipment, People and Staging Areas

Logistical and support arrangements for the supply of people, equipment and resources will operate in a tiered approach as below:

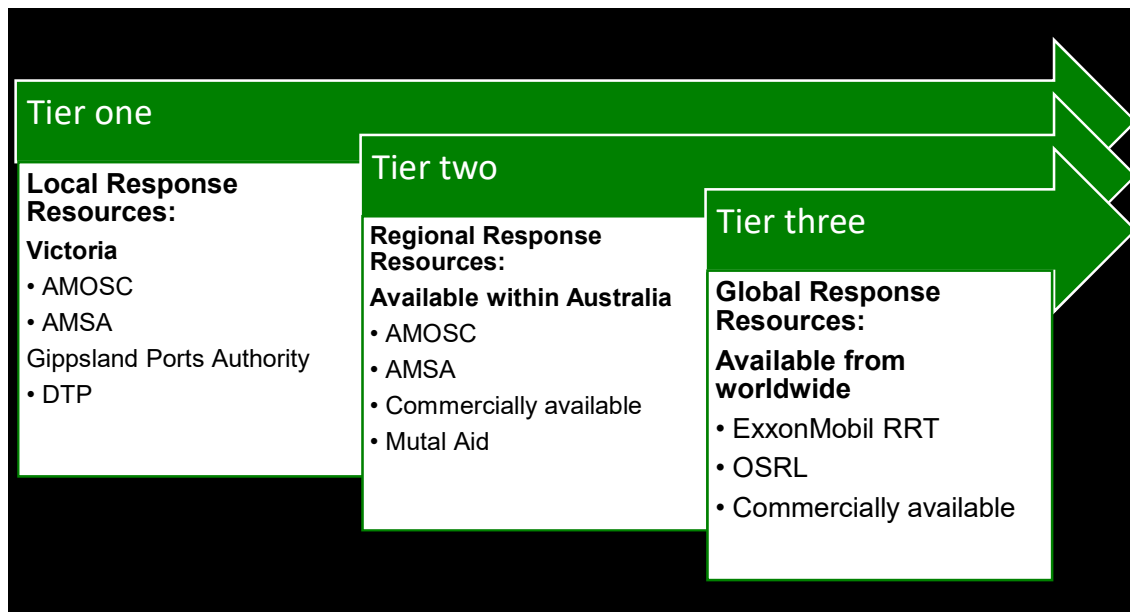

Figure 8-1 Tiered Response Arrangements

#### 8.1.1 Tier 1 – Local Response Resources

EAPL maintains two stockpiles of oil spill response equipment based in the Gippsland region of Victoria at the Barry Beach Marine Terminal and the Long Island Point Fractionation Plant. The stockpiles include equipment suitable for offshore operations, dispersant application, shoreline and nearshore protection, and shoreline clean-up. Quantities of equipment held between the two locations are sufficient, based on the activation of TRPs in line with modeling indications of impact, to provide an initial response and include:

- shoreline protection/deflection boom
- shoreline skimming systems
- offshore booming packages
- offshore skimming systems
- shoreline temporary storage units,
- dispersant and
- decontamination kits

EAPL's immediate spill response equipment will come from its own tier one stockpiles and additional detail of capability in the initial phase of response is included in the Quick Reference Guides. For an up to date list of EAPL's oil spill response equipment refer to [\*\*EAPL OSR Equipment List\*\*](#).

EAPL maintain trained oil spill response personnel to mobilise an initial response to support the enactment of TRPs, SCAT, and shoreline clean-up.

### 8.1.2 Tier 2 – Regional Response Resources

*Response is conducted by Esso using resources available from within Australia.*

In response to a Tier 2 activation EAPL has the capability to mobilise sufficient oil spill response specific resources via AMOSC, AMSA (National Plan), third party contractors, and mutual aid (Industry stockpiles via AMOSPlan). A tiered response would evolve from the 'Initial Response Phase' into a 'Planned Phase – Decision Making', before graduating to a 'Planned Phase – Project implementation'. Staffing requirements for the initial phase would be met by the following with additional support continuing to be provided based on jurisdictional requirements in later phases.

#### AMOSC

As a member of AMOSC, equipment and resources from the Geelong, Fremantle, Broome, and Exmouth stockpiles are available for mobilisation to Gippsland. The bulk of the equipment, based in Geelong, is available within <12 hours. Additional equipment in Fremantle, Exmouth and Broome can be mobilised to Gippsland as needed by road or air.

A full inventory of AMOSC equipment is available from the AMOSC website  
<http://www.amosc.com.au/equipment.php>

In addition to the AMOSC stockpiles, membership of AMOSC provides access through AMOSPlan to equipment, personnel, and resources owned or held by other oil companies within Australia. Further details of mutual aid capability is available through the AMOSC website above.

#### AMSA / National Plan Equipment

EAPL has access to AMSA equipment Australia-wide through AMOSC and the National Plan. AMSA maintains significant stockpiles of equipment in Melbourne, Adelaide, Brisbane, Dampier, Darwin, Devonport, Fremantle, Sydney, and Townsville. The closest National Plan stockpile is located in Melbourne, less than 7 hours from the furthest point of eastern Gippsland in Victoria. A full inventory of AMSA equipment is available from the AMSA website:

<https://amsa-forms.nogginoca.com/public/equipment.html?loc=%2Fapi%2Fv1%2Fasset%2F2615901>

#### Oil Spill Response Personnel

In addition to the Tier 1 capacity provided by trained EAPL oil spill response personnel, EAPL can activate and mobilise AMOSC staff and AMOSC Core Group, and, through National Plan arrangements, state and national response team personnel.

#### General Personnel

Surge labour hire personnel can be accessed through local providers and EAPL contractors.

ExxonMobil also has a Singapore based Contingent Worker Contractors Team who can coordinate hire of additional personnel through a number of labour hire firms that ExxonMobil routinely work with to fulfil additional capacity requirements for longer term shoreline clean-up of a Tier 2 spill.

### 8.1.3 Tier 3 – Global Response Resources

*Response is conducted by Esso using internationally available resources.*

Additional resources, personnel and equipment shall be sourced internationally from Oil Spill Response Ltd through the Singapore base, and then from its other bases around the world to Gippsland. Esso global resources — such as the Regional Response Team — can also be mobilised to Gippsland or the IMT.

#### **ExxonMobil Regional Response Team**

The ExxonMobil Regional Response Team (RRT) is a Tier 3 Incident Management Team and is made up of approximately 500 trained personnel from across all business and service lines. The RRT is managed as two sub-teams, with one for the Americas and the other covering the rest of the world. Resources can be shared across regions as needed.

**RRT Activation: +44 1372 223 232 (24/7 hotline)**

The RRT's structure and processes are based on the Incident Command System (ICS). All RRT members receive initial training in the ICS and oil spill response through participation in the ExxonMobil University of Spill Management course. Additional training is provided based on role and function.

In the event of a major incident, the RRT can provide personnel and expertise to the Business Line to undertake an effective and sustained response. Services that can be provided by the RRT include, and are not limited to, the following:

#### **Command**

- Provide experienced Incident Commanders and Facilitators to work with the local Business Line in coordinating the response.

#### **Operations**

The RRT is able to provide experienced response team and coordination of third party experts for activities including:

- On water recovery
- Protection / deflection
- Shoreline clean up
- SCAT
- Waste Management
- Surveillance and monitoring
- Dispersant application
- Oiled wildlife response

#### **Planning**

- Development of the Incident Action Plan
- Resource Tracking
- Volunteer Management
- Situation mapping / Common Operating Picture
- Modelling
- Environmental specialist
- SCAT coordination
- Documentation and translation services

#### **Logistics**

- Mobilisation of Equipment & Personnel (including third party equipment)
- Customs/Freight Clearance advice
- Staging Area set up
- Security of impacted sites
- Personnel Transportation
- Accommodation for Response Personnel
- Food and Beverage for Response Personnel
- Procurement Services of Required Materials and Services
- Communications Equipment and Services
- Establish and manage large Incident Command Centre

#### **Finance**

- Claims Handling
- Time & Cost tracking
- Guidance on ExxonMobil's System of Management Controls
- Response Inquiry Centre - establish and manage a call centre to handle these inquiries in the local language.

### **Safety, Security & Health**

- Industrial hygiene professionals to assist with establishing a safe working environment.
- Safety plans - undertake task risk assessment and implementing mitigating measures.
- Medical professionals to ensure the well-being of the responders.
- Security specialist to assist with planning and monitoring security in the areas of operations.

### **Public & Government Affairs**

- Media and Social Media Monitoring
- Develop Communications Materials and Incident Website
- Organise Press Conferences, Town Hall Meetings and Official Visits

### **Law**

- Provide guidance on all matters of a legal nature

## **OSRL**

From the Esso global Tier 3 response contractor (OSRL) Esso can access 50% of the available stock. To this end the figures quoted for OSRL are representative of 50% of the total stockholding. A full inventory of OSRL equipment is available from the OSRL website <http://www.oilspillresponse.com/activate-us/response-equipment>

OSRL (UK) mobilisation to Gippsland, 3–5 days. OSRL (Singapore) mobilisation to Gippsland 2–4 days

## **Ambipar**

ExxonMobil has an agreement with Ambipar Response (Ambipar) for provision of emergency response support.

During an incident Ambipar can support the ExxonMobil by providing up to 9 trained responders, per the contract, organized as a Tactical Team and Operational Team. These include:

- Tactical Team: Incident and Crisis Management Advisor and Technical Advisor to liaise with RRT leadership and direct the Ambipar Operational Team;
- Operational Team: Team Leader and 6 Response Specialists who can provide a range of intervention services including clean-up, assessment, remediation, confined space entry and decontamination.

Provision also exists to increase the number of Ambipar personnel, subject to availability.

Ambipar also maintain their own response equipment stockpile. The existing agreement does not provide assured access to equipment.

Activation and coordination of Ambipar is the responsibility of the RRT.

## Appendix B – OPEP Consultation Plan

### Relevant control agencies

The OPGGS Environmental Regulation 11A establishes that titleholders (and those with access authority) detail consultation arrangements with relevant control agencies within the potentially exposed area as described in the Environment Plan.

To address this, control agencies within the potentially exposed area as described in the Environment Plan shall be consulted to inform content of the OPEP (see Table B-1).

Relevant control agencies will act as a single point of contact for their jurisdiction and may coordinate review and comment from other agencies.

**Table B-1** Relevant control agencies (includes but not limited to)

Control Agency	Relevance
Australian Maritime Safety Authority	Commonwealth government agency responsible for maritime safety, protection of the marine environment including marine pollution and maritime aviation search and rescue.
Department of Transport and Planning (VIC)	Relevant for unplanned events. A branch of Transport Safety Victoria, working closely with vessel operators and waterway and port managers to provide expert knowledge, education, support and direction
Transport for NSW (NSW)	Relevant for unplanned events. The control agency for marine pollution incidents impacting NSW state waters. NSW waters could potentially be affected by an extended duration unplanned event.
Department of Primary Industries, Parks, Water and Environment (TAS)	Relevant for unplanned events as the control agency for marine pollution in Tasmanian state waters.

### Sufficient time

Four to six weeks is generally considered sufficient time for relevant control agency to complete an internal review, based on prior feedback.

### Relevant information

The following information may be provided to relevant control agencies:

- Brief description of activity, including the intended schedule, location, distances to nearest landfall and map
- Worst case discharge volumes
- Known or indicative oil type/properties
- Amenability of oil to dispersants
- Brief description of existing environment and protection priorities
- Key inputs and outputs of the environmental risk assessment
- Outcomes of oil spill trajectory modelling, including predicted times to enter State waters and contact shorelines
- Details on initial response actions and key activation timeframes
- Potential Incident Control Centre arrangements
- Potential staging areas / Forward Operating Base
- Details on response strategies
- Details on proposed IMT structure
- Details on exercise and testing arrangements of OPEP/OSCP

This list has been extracted from the EPA Tasmania – Offshore Petroleum Industry Guidance Note – Annex 3 and forms the basis of information provided. Additional information may be requested by individual agencies.

The information may be provided in summary form or through the provision of a draft EP or OPEP.

### Ongoing consultation

The methods and content of ongoing consultation will be determined with relevant stakeholders and may include meetings, exercises, forums or written communication (see Table B-2).

**Table B-2 Ongoing consultation with relevant stakeholders**

Stakeholder	Meeting	Exercises	Collaborative Forums	Ad-hoc
<b>Victoria State Control Agency Department of Transport &amp; Planning (DTP)</b>	Annual meeting	Annual review of Esso OSR exercise plan Participation in Esso and/or State exercises	Regional Marine Pollution Reference Group	Prior to commencement of new activities Changes to risk
<b>Victoria Department Environment, Land, Water &amp; Planning</b>	Annual meeting	Annual review of Esso OSR exercise plan Participation in Esso and/or State exercises	Regional Marine Pollution Reference Group	-
<b>NSW State Control Agency</b>	Annual meeting	Participation in Esso and/or State exercises	-	Prior to commencement of new activities Changes to risk
<b>Tasmania State Control Agency Department of Primary Industries, Parks, Water and Environment</b>	Annual meeting	Participation in Esso and/or State exercises	-	Prior to commencement of new activities Changes to risk
<b>Australian Maritime Safety Authority</b>	Annual meeting	Participation in Esso, National Plan and/or State exercises	ES&T Workshops	Prior to commencement of new activities Changes to risk
<b>Gippsland Ports</b>	-	Participation in Esso, Regional and/or State exercises	Regional Marine Pollution Reference Group Esso Community Day	-
<b>East Gippsland Shire Council</b>	-	-	Regional Marine Pollution Reference Group Esso Community Day	-
<b>Victorian Environmental Protection Authority</b>	-	-	Regional Marine Pollution Reference Group	-

### Consultation during an unplanned event

In the occurrence of an unplanned event, the methods and content of consultation with relevant stakeholders may be determined by notification requirements and can include meetings, phone calls or written communication (see Table B-3).

**Table B-3 Consultation with relevant stakeholders during an unplanned event**

Stakeholder	Incident Notification Requirement	Trigger	Method
<b>Australian Maritime Safety Authority</b>	Required for all spills from vessels	Notification requirement met NatPlan resources needs Impact to shipping	PolRep / SitRep Liaison Officer JSCC
<b>Department of Agriculture, Water and the Environment Parks Australia - Director of National Parks</b>	Required for all spills that are within a marine park, or could impact a marine park.	Notification requirement met	Verbal
<b>Department of Agriculture, Water and the Environment</b>	Required for all spills that impact or have the potential to impact on matters of national environmental significance (NES)	Notification requirement met	Verbal
<b>Aboriginal Affairs Victoria</b>		Planned shoreline protection or clean-up activities	Via Control Agency IMT
<b>NSW State Control Agency Transport for NSW</b>	Required for: all spills that could impact NSW waters.	Notification requirement met	SitRep Liaison Officer JSCC
<b>Dept Energy, Environment &amp; Climate Action – Oiled Wildlife</b>		Potential impact to wildlife	Via Control Agency IMT OWR Coordinator / Liaison
<b>VIC Department of Environment, Land, Water and Planning (Energy Emergency)</b>		Potential impact to supply	Via ESG
<b>TAS State Control Agency Department of Primary Industries, Parks, Water and Environment</b>	Required for: all spills that could impact Tasmanian waters.	Notification requirement met	SitRep Liaison Officer JSCC
<b>TAS Parks and Wildlife Service</b>			Via Control Agency IMT
<b>VIC State Control Agency Department of Transport and Planning - SREC</b>	All spills that could impact Victorian state waters (> 80 L).		SitRep Liaison Officer JSCC
<b>VIC Environment Protection Authority</b>			Via Control Agency IMT
<b>Transport Safety Victoria - Maritime Safety</b>			Via Control Agency IMT
<b>Parks Victoria</b>		Impact to State waters or shoreline	Via Control Agency IMT

		Halt dispersant application if wildlife are identified in the area	If EPBC Act listed migratory species (e.g. whales) are observed in the immediate vicinity of dispersant operations, aerial dispersant operations will cease until the animal has not been sighted for 30 minutes or unless otherwise advised by the relevant state authority.	<ul style="list-style-type: none"> <li>Observation reports</li> <li>IMT log</li> </ul>
		Vessel Requirements	<p>Vessel compliant with MARPOL Annex I, IV, V and VI as appropriate to vessel class.</p> <p>Where applicable:</p> <ul style="list-style-type: none"> <li>Vessels with class certification are verified by International Association of Classification Societies (IACS) member.</li> <li>Vessels comply with AMSA Domestic Commercial Vessel (DCV) requirements</li> </ul>	<ul style="list-style-type: none"> <li>Vessel class certificates where applicable</li> <li>Records of compliance with DCV requirements</li> </ul>
		Dispersant pre-selection and assessment	Only dispersants listed in Volume 3 Section 5.1 will be utilised, unless otherwise endorsed by the Statutory Authority	<ul style="list-style-type: none"> <li>IMT log</li> <li>Incident Action Plan</li> <li>Records stating dispersant types, locations, types and volumes</li> </ul>
		Laboratory dispersant effectiveness testing	Laboratory dispersant effectiveness test results will be used to inform if use of dispersant is likely to reduce environmental impacts giving	<ul style="list-style-type: none"> <li>IMT log</li> <li>Incident Action Plan</li> </ul>

Bass Strait  
Oil Pollution Emergency Plan

Performance Outcome	Strategy	Control	Performance Standard	Measurement Criteria
			consideration to elapsed time, weathering and selection of dispersant with highest efficacy.	
		Basic field dispersant effectiveness test	Dispersants will be test sprayed on all crude oil spills for efficacy prior to operational.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Report records</li> </ul>
		Exclusion zones	Dispersant application is only accepted for: <ul style="list-style-type: none"> <li>• Commonwealth waters, and</li> <li>• &gt;10 m water depth, and</li> <li>• Outside Australian marine parks</li> </ul> Dispersants are <u>not</u> to be used in State waters without approval of the Control Agency IMT.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Incident specific NEBA</li> <li>• Approvals from Control Agency IMT</li> </ul>
		Monitoring of dispersant in water and effectiveness	Implement OSMP module: <ul style="list-style-type: none"> <li>• O2: Water and Oil Sampling</li> </ul> In accordance with requirements and timeframes in Section 3.2 of the OSMP.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Common Operating Picture</li> <li>• Operational monitoring reports</li> </ul>
		Records of dispersant volumes	A record of the volumes of dispersant used in surface application will be kept throughout the response.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating dispersant types, locations, types and volumes</li> <li>• Completed OPEP checklist</li> </ul>
		Surface dispersant only applied within daylight hours	Surface dispersants only applied in daylight hours	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating dispersant types, locations, types and volumes</li> </ul>

Bass Strait  
Oil Pollution Emergency Plan

Performance Outcome	Strategy	Control	Performance Standard	Measurement Criteria
		Targeted dispersant application	Dispersants will be targeted at areas of thickest oil and considerations of oil type, amenability and volume will be assessed prior to any dispersant application.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating dispersant types, locations, types and volumes</li> </ul>
To recover spilt oil before shoreline or other sensitivity contact.	Containment and recovery	Vessel Requirements	Vessel compliant with MARPOL Annex I, IV, V and VI as appropriate to vessel class. Where applicable: <ul style="list-style-type: none"> <li>• Vessels with class certification are verified by International Association of Classification Societies (IACS) member.</li> <li>• Vessels comply with AMSA Domestic Commercial Vessel (DCV) requirements</li> </ul>	<ul style="list-style-type: none"> <li>• Vessel class certificates where applicable</li> <li>• Records of compliance with DCV requirements</li> </ul>
		Incident specific NEBA	A incident specific NEBA is completed.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Incident specific NEBA</li> </ul>
		Containment and recovery operations only undertaken within daylight hours	Containment and recovery activities will only be undertaken in daylight hours to ensure trapped fauna are released as soon as possible.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records of fauna released</li> </ul>
		Daily records of oil recovered	Daily Containment and Recovery operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered)	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating locations, types and volumes of oil recovered</li> </ul>
		Exclusion Zones	Exclusion zones are put in place which consider health and safety and environment risks. These exclusion zones are determined in consultation with the relevant statutory agency.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating exclusion zones</li> </ul>

Bass Strait  
Oil Pollution Emergency Plan

Performance Outcome	Strategy	Control	Performance Standard	Measurement Criteria
		Decanting performed in commonwealth waters in accordance with MARPOL requirements	AMSA must approve all decanted separated water to increase waste storage of recovered oil.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records of decanted water (oil in water) concentrations</li> <li>• Approval from AMSA</li> </ul>
		Bass Strait Oil Spill Response Waste Management Plan	An incident specific Waste Management Plan is developed to ensure management of waste in accordance to Australian best practices and principals.	<ul style="list-style-type: none"> <li>• IMT log records</li> <li>• Incident Action Plan</li> <li>• Incident specific waste management plan</li> </ul>
		Containment & Recovery vessels	Mobilise containment and recovery vessels in accordance with the following timeframes; <ul style="list-style-type: none"> <li>• 1x vessel C&amp;R strike team on site &lt;48 hours of service request</li> <li>• 2x vessel C&amp;R strike team on site &lt;72 hours of service request.</li> </ul>	<ul style="list-style-type: none"> <li>• IMT log records</li> <li>• Incident Action Plan</li> <li>• OPEP checklists</li> </ul>
Reduce oil impact on shoreline environmental sensitivities	Shoreline Protection and Clean-up	Shoreline Assessment	Implement OSMP modules: <ul style="list-style-type: none"> <li>• O3.1 Shoreline segmentation</li> <li>• O3.2 Shoreline character</li> <li>• O3.3 Oil on shorelines</li> <li>• O3.4 Shoreline profile</li> </ul> In accordance with requirements and timeframes in Section 3.3 of the OSMP.  Up to 12 trained shoreline assessment field personnel will be available in the first 24 hours.  Up to an additional 12 trained shoreline assessment field personnel will be available in the first 14 days.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Operational monitoring reports</li> <li>• Field reports</li> </ul>

Bass Strait  
Oil Pollution Emergency Plan

Performance Outcome	Strategy	Control	Performance Standard	Measurement Criteria
		Shoreline Tactical Response Plans (TRPs)	Where shoreline contact is predicted, implement shoreline TRPs in consultation with control agency	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• OPEP checklist</li> </ul>
		Incident specific NEBA	A incident specific NEBA is completed	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Incident specific NEBA</li> </ul>
		Daily records of oil recovered	Daily Shoreline Protection and Clean-up operations are recorded (location, estimated amount of oil recovered, estimated amount of water recovered)	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating locations, types and volumes of oil recovered</li> </ul>
		Exclusion Zones	Exclusion zones are put in place which consider health and safety and environment risks. These exclusion zones are determined in consultation with the control agency.	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• Records stating exclusion zones</li> </ul>
		Shoreline clean up personnel	<p>Where shoreline contact is predicted from operational monitoring to be accumulations &gt;100m<sup>3</sup>, shoreline clean up personnel will be mobilised in the first 48 hours including up to</p> <ul style="list-style-type: none"> <li>• 4 Foreman</li> <li>• 20 Labourers</li> <li>• 4 Specialised Operators</li> </ul> <p>The shoreline clean up personnel will be mobilised up to:</p> <ul style="list-style-type: none"> <li>• 188 Foreman</li> <li>• 1614 Labourers</li> <li>• 124 Specialised Operators</li> </ul>	<ul style="list-style-type: none"> <li>• IMT log</li> <li>• Incident Action Plan</li> <li>• OPEP Checklists</li> </ul>

# 1. Introduction

## 1.1 Purpose

This Bass Strait Oil Spill Monitoring Plan (OSMP) is a key component of the environmental management framework (which also includes activity-specific Environment Plans (EP) and the Bass Strait Oil Pollution Emergency Plan (OPEP)) for offshore petroleum activities operated by Esso Australia Resources Pty Ltd (Esso) within the Gippsland region (Figure 1-1).

This OSMP outlines environmental monitoring that may be implemented in the event of a hydrocarbon spill to the marine or coastal environment. Information from operational monitoring provides situational awareness enabling the Incident Management Team (IMT) to make informed decisions regarding response options. Oil Spill monitoring modules are the principle tools for determining the extent, severity and persistence of environmental impacts from a hydrocarbon spill and associated response and/or remediation activities.

Note, this plan focuses on Oil Spill monitoring of a hydrocarbon spill event only. Hydrocarbon spill risks, prevention and response activities are described in the activity-specific EP and OPEP.

This OSMP is supported by a set of internal implementation guides for each of the Oil Spill monitoring modules. It is important to note that the implementation guides are not a prescriptive set of procedures that must strictly be followed, but are intended to provide Esso and their monitoring providers with sufficient information to efficiently finalise a monitoring design of an appropriate nature and scale in the event of a hydrocarbon spill. It is expected that individual monitoring plans and operating procedures would only be finalised once a spill event has occurred. This is essential to ensure the finalised monitoring plan/s are fit for purpose and tailored to the specific location, hydrocarbon type, environmental sensitivities, and the nature and scale of the individual spill.

This OSMP is to be read in conjunction with the activity-specific EP and OPEP when considering the existing environment, environmental impacts, risk management, performance standards, reporting compliance, and the decision processes that will apply in the event of a spill occurring.

**Figure 1-1: Environmental management framework for offshore petroleum activities in the Gippsland region**

## 1.2 Objectives

The objectives of this OSMP are:

- Identify and describe the Oil Spill monitoring that may be implemented in the event of a hydrocarbon spill to the marine or coastal environment;

- Demonstrate an appropriate degree of readiness to implement this monitoring in the event of a hydrocarbon spill to the marine or coastal environment.

### 1.3 Scope

#### 1.3.1. Activity types

This OSMP is relevant to all Esso petroleum activities within the Gippsland region regulated under the Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006 (OPGGS) (Environment) Regulations 2009* and the Victorian *OPGGS Regulations 2011*. This includes, but is not limited to:

- Vessel operations;
- Drilling and completions;
- Well workovers and interventions;
- Subsea activities;
- Pipelay activities;
- Operations; and
- Decommissioning.

The OSMP modules provide for the rapid assessment of the extent of spread of oil from a Level 2 or Level 3 spill and effects on the environment both as a result of the spilt hydrocarbons and any oil spill response activities that may be used in the clean-up of the oil or any monitoring activities that may occur in response to the spill. The OSMP modules include provision for the rapid assessment of impacted and potentially affected wildlife including those listed as Matters of National Environmental Significance (MNES) under the EPBC Act (1999).

#### 1.3.2. Hydrocarbon types and states

Esso's petroleum resources within the Gippsland region include both crude oil and natural gas; and petroleum activity related vessels typically use marine diesel oils. This OSMP is relevant to all hydrocarbon types and states (i.e. fresh and weathered); and all distributions throughout the environment (i.e. surface, entrained, dissolved and shoreline). Activity specific hydrocarbon properties are provided in the OPEP Appendix D Quick Reference Information.

#### 1.3.3. Geographical extent

This OSMP is relevant and applicable to all Commonwealth and State marine and coastal areas that are potentially at risk of exposure to hydrocarbons in the event of a spill resulting from petroleum activities. Petroleum titles and selected environmental features within the vicinity of the Gippsland region is shown in Figure 1-2.

The spatial boundaries of an individual monitoring study will depend primarily on the actual or potential exposed area affected by the spill. Spatial boundaries will be sufficient to meet monitoring objectives, usually by determining impacted areas and the level of effects, linking effects to the spill source, and supporting decisions on clean-up strategies. Monitoring may also be undertaken outside the boundaries of a spill where monitoring programs require un-impacted reference sites. The spatial extent of a monitoring study would only be finalised once a spill event has occurred.

Figure 1-2: Esso assets within the Gippsland region

## 1.4 Regulatory requirements

Table 1-1 provides guidance on the OSMP requirements of the Commonwealth OPGGS (Environment) Regulations 2009, and Victorian OPGGS Regulations 2011, and reference to the relevant section of this document which addresses that requirement.

This OSMP incorporates regulatory guidance from the following documents:

- Guidance Note – Oil pollution risk management (NOPSEMA 2021)
- Information Paper – Operational and scientific monitoring programs (NOPSEMA 2020).

**Table 1-1: Relevant Commonwealth and State environmental regulations for OSMPs**

Regulation	Relevant section in this OSMP
<b>OPGGS (Environment) Regulations</b>	
<u>Part 2, Division 2.3, Regulation 14 (5)</u> The implementation strategy must include measures to ensure that each employee or contractor working on, or in connection with, the activity is aware of his or her responsibilities in relation to the environment plan, including during emergencies or potential emergencies, and has the appropriate competencies and training.	Sections 2.4 and 2.5
<u>Part 2, Division 2.3, Regulation 14 (8AA)</u> The oil pollution emergency plan must include adequate arrangements for responding to and monitoring oil pollution, including the following: <ul style="list-style-type: none"> <li>(a) the control measures necessary for timely response to an emergency that results or may result in oil pollution;</li> <li>(b) the arrangements and capability that will be in place, for the duration of the activity, to ensure timely implementation of the control measures, including arrangements for ongoing maintenance of response capability;</li> <li>(c) the arrangements and capability that will be in place for monitoring the effectiveness of the control measures and ensuring that the environmental performance standards for the control measures are met;</li> <li>(d) the arrangements and capability in place for monitoring oil pollution to inform response activities.</li> </ul>	Sections 2, 3, and 4
<u>Part 2, Division 2.3, Regulation 14 (8D)</u> The implementation strategy must provide for monitoring of impacts to the environment from oil pollution and response activities that: <ul style="list-style-type: none"> <li>(a) is appropriate to the nature and scale of the risk of environmental impacts for the activity; and</li> <li>(b) is sufficient to inform any remediation activities.</li> </ul>	Sections 2, 3, and 4
<b>Victoria OPGGS Regulations</b>	
<u>Part 2.2, Division 3, Regulation 16 (5)</u> The implementation strategy must include measures to ensure that each employee or contractor working on, or in connection with, the activity is aware of his or her responsibilities in relation to the environment plan, including during emergencies or potential emergencies, and has the appropriate competencies and training	Sections 2.4 and 2.5

## 1.5 Target audience

In the event of a hydrocarbon spill, Esso is responsible for the implementation and adherence to this OSMP. This OSMP is intended for use by, but not limited to:

- Incident Management Team (IMT) personnel including:
  - Incident Commander (IC);
  - Operations Section Chief (OSC);
  - Planning Section Chief (PSC);
  - Environment Unit Lead (EUL)
  - Safety Officer (SO)
- Platform Emergency Response Team (ERT) personnel including:
  - Offshore Installation Manager (OIM);
  - Vessel Master (VM);
- Esso environment team;
- Monitoring provider personnel including:
  - Principal Investigator;
  - Monitoring/Field teams.

## 2. OSMP Framework and Implementation

### 2.1 Types of monitoring

Oil spill monitoring has been divided into two types (Oil Spill) which are undertaken for two distinct, but closely related, purposes (NOPSEMA 2016).

**Operational monitoring** collects information about the spill and associated response activities to aid planning and decision making for executing spill response or clean-up operations. Operational monitoring may include both initial response phase monitoring (i.e. rapid qualitative and observational data gathering for situational awareness) and advanced response phase monitoring (i.e. quantitative measurement) (Hook *et al.* 2016). Operational monitoring typically finishes when the spill response is terminated.

Six operational monitoring modules have been identified (see Section 3):

- O1: Oil Spill Surveillance;
- O2: Water and Oil Sampling;
- O3: Shoreline Assessment;
- O4: Fauna Observations;
- O5: Air Quality;
- O6: Sediment Sampling.

**Scientific monitoring** focusses on evaluating environmental impact and recovery from the spill and response activities. Scientific monitoring may be undertaken over an extended period to fully understand impacts.

Nine scientific monitoring modules have been identified (see Section 4):

- S1: Hydrocarbons in Intertidal Sediments and Water;
- S2: Hydrocarbons in Offshore Sediments and Water;
- S3: Fish and Shellfish Taint and Toxicity for Human Consumption;
- S4: Short-Term Impacts to Oiled Fauna and Flora;
- S5: Recovery of Commercial and Recreational Fisheries;
- S6: Recovery of Fauna;
- S7: Recovery of Subtidal and Intertidal Benthic Habitat;
- S8: Recovery of Coastal Flora;
- S9: Recovery of Ramsar Values.

Operational monitoring studies inform offshore and nearshore/shoreline response strategies, and information collected during these studies may trigger scientific monitoring. Oil Spill monitoring studies may occur simultaneously (i.e. scientific monitoring can start before a response operation is completed). Note, some data that may be used within scientific monitoring analyses can also only be collected during the initial phase of the oil spill response (e.g. 'reactive' baseline data) (Hook *et al.* 2016).

### 2.2 Initiation and termination of monitoring

Initiation and termination criteria have been defined for each individual operational monitoring (Section 3) and scientific monitoring (Section 4) module. The criteria for the initiation and termination of monitoring modules will be assessed on a daily basis during a response operation, and then as-required for any ongoing scientific monitoring modules.

Initiation for operational monitoring modules is typically dependent on presence of a spill, response options being implemented and information from surveillance activities. Termination criteria are typically based on there being no benefit to response planning or a response has ceased, no increase in environmental risk, compliance with relevant environmental guidelines or benchmarks (where

available). Termination criteria for operational monitoring also require that any related scientific monitoring initiation criteria have been assessed.

Initiation for scientific monitoring modules is typically dependant on information from operational monitoring results, specifically outcomes of monitoring, evaluation and surveillance (MES) activities, and indications that relevant environmental guidelines or benchmarks have been exceeded (where available). Scientific monitoring may also be needed to determine if ecological impact criteria as defined in the OPEP for Response Level 1 are met or not (and if not an incident should be escalated to a higher level). Termination criteria are based on sufficient evidence to demonstrate no impact from hydrocarbon and/or a return to the expected natural dynamics of the area.

All monitoring modules can also be initiated by the IMT IC (or delegate) irrespective of other criteria being met. This may be an independent Esso decision, or made in conjunction with the relevant Jurisdictional Authority. Depending on the scenario, these studies may be a full or only partial implementation of the relevant operational or scientific module.

The safety of sampling personnel will be assessed prior to the collection of any samples and will only occur if safe to do so. Sampling collection will only occur in daylight hours and when wind and sea states allow for the safe collection of samples. It may not be safe for a vessel to get close to a spill if there is positive gas detection. Samples will be undertaken when the presence of spilled oil is detectable.

### 2.3 Implementation guides

The implementation guides, which sit behind each of the modules outlined in Sections 3 and 4, are not a prescriptive set of procedures that must strictly be followed, but are intended to provide Esso and their monitoring providers with sufficient information to efficiently finalise a monitoring design of an appropriate nature and scale in the event of a hydrocarbon spill. The guides include:

- A description of minimum requirements, adopted standards and/or best practice guidance for monitoring design, sampling techniques and reporting requirements;
- A list of resources (e.g. equipment, personnel) recommended to implement the monitoring;
- Draft standard operating procedures.

It is expected that individual monitoring plans and operating procedures would only be finalised once a spill event has occurred. This is essential to ensure the finalised monitoring plan/s are fit for purpose and tailored to the specific location, hydrocarbon type, environmental sensitivities, and the nature and scale of the individual spill.

Where practicable, the draft standard operating procedures are aligned with existing standards and processes (e.g. Hook *et al.* 2016; NOAA 2006).

### 2.4 Roles and responsibilities

The key roles (and their associated responsibilities) for the implementation of this OSMP are shown in Table 2-1. Depending on the scale of the event, individual people may perform multiple roles; similarly, multiple people may share the same role.

**Table 2-1: Key roles and responsibilities relating to implementation of the OSMP**

Role	Responsibilities
IMT IC	<ul style="list-style-type: none"> <li>• Day to day responsibility for facilitating/coordinating monitoring activities under this OSMP;</li> <li>• Initiation and termination of operational monitoring modules;</li> <li>• Initiation of scientific monitoring modules</li> </ul>
PSC	<ul style="list-style-type: none"> <li>• Initiating Oil Spill monitoring modules when initiation criteria met;</li> <li>• Coordination analysis and distribution of data obtained through operational monitoring, including integration of data into the common operating picture</li> </ul>
EUL	<ul style="list-style-type: none"> <li>• Advising IC on which Oil Spill monitoring modules should be implemented when initiation criteria met;</li> <li>• Activation and liaison with service providers to implement scientific modules</li> <li>• Facilitating/coordinating data and reports from monitoring to the IMT for use in response planning;</li> <li>• Initiation and termination of operational monitoring modules, based on advice from the Principal Investigator;</li> <li>• Initiation and termination of scientific monitoring modules, based on advice from the Principal Investigator</li> <li>• Report review and approval for scientific monitoring modules, prepared by the monitoring team.</li> </ul>
OIM / VM	<ul style="list-style-type: none"> <li>• Initiation of spill surveillance in the initial response phase of a spill;</li> <li>• May undertake day to day responsibilities (e.g. under delegation from the IMT IC).</li> </ul>
Principal Investigator	<ul style="list-style-type: none"> <li>• Responsible for implementation of a particular operational or scientific monitoring module;</li> <li>• Review and/or carry out study's monitoring reporting requirements;</li> <li>• Provides advice with respect to environmental issues as required, including initiation and termination of monitoring modules.</li> </ul>
Field Teams	<ul style="list-style-type: none"> <li>• Implement the operational or scientific monitoring module;</li> <li>• Data QA/QC and reporting;</li> <li>• Compliance with the requirements of this OSMP</li> </ul>

## 2.5 Training and competency

Minimum competencies and experience for key OSMP-specific roles for the operational and scientific modules are detailed in the "Responsibilities, competencies and resources" section of each module in this OSMP. The OSMP Specific team will be scaled up according to the severity of the incident based on external capabilities.

The Esso ERT/IMT have completed oil spill response competency and training in accordance with Table 9-2 in Volume 4 of the EP. In addition to this the Environment Unit Lead is required to have a relevant tertiary degree in engineering, environment science, environmental management or similar. The selection of the Environmental Unit Lead is based on relevant experience as an Environment Advisor, with experience and/or training in the implementation of monitoring programs.

Based on the severity of an oil spill additional resources may be brought in from the ExxonMobil Regional Response Team to support the IMT.

## 2.6 External Resources

Resources for monitoring (e.g. personnel and equipment) may be outsourced to contractors. Esso currently has a contract in place with a local environmental consultancy to provide this environmental support. In the event that additional resources are required, other consultancy capacity will be utilised (as needed) and may extend to specialist contractors such as research agencies engaged in long-term marine monitoring programs.

Esso will also access specialist capabilities as required (e.g. OSTM via AMOSC).

Esso has identified a pool of NATA accredited laboratories with capabilities for undertaking analyses required as part of Oil Spill monitoring scopes (Table 2-8).

## 2.7 Third Party OSMP Consultant

### 2.7.1. Roles and responsibilities

The Third Party OSMP Consultant has an organisation that allows for considerable support to the field, laboratory and office teams involved in the implementation of the OSMP and its modules. Details of the support roles that may be required for the implementation of the OSMP are provided in Table 2-2.

**Table 2-2: Summary of support roles (as required)**

Role	Responsibilities
Third Party OSMP Consultant Project Director (PD)	Point of contact at a project level for high level contractual and commercial issues Final approver of key deliverables produced by Third Party OSMP Consultant During OSMP implementation high level of liaison with IMT
Third Party OSMP Consultant Project Manager (PM)	Overall project program, progress, budgets, & reporting Management of Third Party OSMP Consultant project team Responsible for Third Party OSMP Consultant Sub-consultancy, subcontractor and Service Provision agreements Client liaison/coordination at IMT level During OSMP implementation: <ul style="list-style-type: none"> <li>Command and control of OSMP activities undertaken by Third Party OSMP Consultant</li> <li>Liaison with IMT</li> <li>Overarching implementing and monitoring the OSMP activities undertaken by Third Party OSMP Consultant</li> </ul> Reports to Third Party OSMP Consultant Project Director
Third Party OSMP Consultant Operations Officer	Overall coordination and management of OSMP modules undertaken by Third Party OSMP Consultant Review and sign off of OSMP deliverables produced from modules undertaken by Third Party OSMP Consultant Ensuring technical compliance and maintaining quality of OSMP deliverables During OSMP implementation for modules implemented by Third Party OSMP Consultant: <ul style="list-style-type: none"> <li>Organise initial response mobilisation</li> <li>Coordinate OSMP operations</li> <li>Organise mobilisation/escalation/de-escalation/demobilisation activities</li> <li>Assist Planning and Logistical Officers in development of field activity synergies among operational and scientific monitoring modules</li> </ul> Reports to Third Party OSMP Consultant Project Manager
Principal Investigator (Third Party OSMP Consultant)	Ensuring technical compliance and maintaining quality of allocated operational or scientific monitoring module deliverables from modules implemented by Third Party OSMP Consultant

Role	Responsibilities
	Review of allocated operational or scientific monitoring module deliverables During OSMP implementation assist in coordination and management of allocated operational or scientific monitoring module Reports to Third Party OSMP Consultant Operations Officer
Field Supervisor (Third Party OSMP Consultant)	During OSMP implementation for modules implemented by Third Party OSMP Consultant responsible for SSHE requirements and meeting survey technical objectives during field monitoring Reports to Third Party OSMP Consultant Operations Officer
SSHE Advisor (Third Party OSMP Consultant)	Third Party OSMP Consultant SSHE Advisory role and monitors compliance Review/Approval of SSHE documentation (SSHE Plan, JSA) SSHE Incident Investigations and Reporting Reports to Third Party OSMP Consultant Project Manager Supports SSHE & SP performance reviews Prepare SSHE Alerts and deliver SSHE trainings, briefings
SSHE Focal Point (Third Party OSMP Consultant)	SSHE liaison with Esso SSHE Performance reports Supports project adherence to SSHE Plan Reports to Third Party OSMP Consultant Project Manager
Project Controls Officer (Third Party OSMP Consultant)	PRISM Set Up & Maintenance EVM & Reporting Scheduling Change management, document control, invoicing Reports to Third Party OSMP Consultant Project Manager
Environment & Approvals Officer	Environmental Approvals Licences, Permits, Statutory Approvals Reports to Project Manager
Quality Assurance Officer	Internal QA audits Reports to Project Manager
Third Party OSMP Consultant Logistics Officer	Reports to Project Manager During OSMP implementation: <ul style="list-style-type: none"> <li>Organise plant (e.g. aircraft, vessels)</li> <li>Estimate future service and support requirements</li> <li>Provision of logistics advice to Operations and Planning Officers</li> </ul>
Third Party OSMP Consultant Planning Officer	Reports to Project Manager During OSMP implementation: <ul style="list-style-type: none"> <li>Collect, analyse and utilise OSMP information</li> <li>Risk analysis of technical OSMP service provision (e.g. weather, spill behaviour, projections)</li> <li>Maintain record of communications and actions including resources requested/allocated/in use.</li> </ul>
Third Party OSMP Consultant Safety Officer	Reports to Project Manager During OSMP implementation: <ul style="list-style-type: none"> <li>Provide SSHE services in support of the OSMP activities</li> <li>Review and approve all SSHE documentation in the provision of OSMP services</li> <li>Risk analysis of SSHE OSMP service provision (e.g. cyclones, interface issues) and that services undertaken in a safe matter</li> </ul>
Third Party OSMP Consultant Admin Officer	Reports to Project Manager During OSMP implementation: <ul style="list-style-type: none"> <li>Same as role of Project Controls Officer during OSMP implementation</li> </ul>

Role	Responsibilities
Principal Investigator	Reports to Project Manager <ul style="list-style-type: none"> <li>Responsible for implementation of a particular operational or scientific monitoring module;</li> <li>Review and/or carry out study's monitoring reporting requirements;</li> <li>Provides advice with respect to environmental issues as required, including initiation and termination of monitoring modules.</li> </ul>
Field Teams	Reports to Principal Investigator <ul style="list-style-type: none"> <li>Implement the operational or scientific monitoring module;</li> <li>Data QA/QC and reporting;</li> <li>Compliance with the requirements of this OSMP</li> </ul>

Figure 2-1: OSMP modules implementation organogram between Esso and the Third Party OSMP Consultant

### 2.7.2. OSMP resourcing

In the activation of the OSMP substantial resources are likely to be required for an extended period of time. Although it is more likely that discontinuous deployment periods are likely this has not been assumed in developing this resourcing strategy (i.e. continuous requirement assumed). The resourcing needs are based on the likely requirements for information.

The operational modules together with S1, S2 and S4 will commence at notification of a spill. Scientific modules have slightly differing needs as their aim is to assess the potential impacts and recovery from

a spill. However there may be a need to collect reactive baseline data prior to hydrocarbons contacting the environment and potentially causing impacts to that environment. There are a number of scientific modules that are therefore initiated soon, if not immediately, after notification of a spill in order to collect a reliable reactive baseline as existing baseline data may not be available.

Generally, the following resourcing procedure will be adhered to:

- The Third Party OSMP Consultant Planning Officer and Third Party OSMP Consultant Operations Officer will develop Survey Plan(s) to meet the objectives of OM(s) survey(s) that are provided by the IMT IC. Surveys may entail carrying out acquiring information for multiple OMs with individual ground, vessel and aerial survey teams on the same plant to optimise synergies and efficiencies.
- Field personnel and office-based personnel will be sourced from the organisations that comprise the OSMP team (Table 2-3). The Mobilisation Plan will identify a pool of field staff from which to select for mobilisation to meet initial requirements. Thereafter, during escalation and/or maintenance of the OM modules staff across the pool of field personnel pool will be selected on the basis of availability and capabilities to meet the survey(s) objectives.
- The Task Leaders in consultation with the Third Party OSMP Consultant Logistics Officer will be responsible for organising equipment and laboratory supplies (if needed) for their respective modules. The Operational Response Management Group (ORMG) will support Task Leaders to facilitate the transport of equipment and laboratory supplies
- Office-based personnel will be mobilised on an 'as needed' basis for data analysis and reporting for all OM modules to ensure timely information flow to the IMT for response planning and assessment.

The Third Party OSMP Consultant has water and sediment sampling equipment, laboratory equipment, sample storage, marine monitoring equipment, ROV and cameras. A list of available equipment is included in the Third Party Staff and Equipment Register which is reviewed quarterly.

### 2.7.3. Field staff resources available

The Third Party OSMP Consultant has sufficient resources in terms of personnel to meet the staffing needs of the monitoring program in both the immediate and longer term. These are detailed in the Third Party Staff and Equipment Register. The Third Party OSMP Consultant has identified personnel and resource that are available to be deployed. This is reviewed quarterly to ensure the Third Party OSMP Consultant has the necessary resources for each worst case discharge scenario, ensuring that the number of personnel required for each module at different intervals after the spill event can be fulfilled within the required timeframes.

The Third Party OSMP Consultant has available the resources of its Victorian Environment Team which are highly experienced in the collection of water and sediment quality samples, remediation and also in flora and fauna survey and marine environmental survey. In all the Third Party OSMP Consultant has, in Victoria, 45 people. The Third Party OSMP Consultants are also able to mobilise personnel from major Australian Offices (Melbourne, Sydney, Perth and Brisbane), regional centres (Wollongong and Sunshine Coast) and New Zealand (Wellington) within a 48 hour time frame. Additional personnel, predominantly from the United States of America can be mobilised after 48 hours to supplement the Australian based teams. Overall, the Third Party OSMP Consultants have a total of 167 personnel.

In summary the Third Party OSMP Consultant team has the resources available to choose from to deploy as shown in Table 2-3.

**Table 2-3 Third Party OSMP Consultant Availability**

Module	No. Staff Available (< 48 hour mobilisation)	Total No. Staff Available*
01: Oil spill surveillance	31	51
02: Water and oil sampling	40	98
03: Shoreline assessment	44	52
04: Fauna observations	34	38
05: Air quality	6	47
06: Sediment sampling	45	52
S1: Hydrocarbons in intertidal sediments and water	40	46
S2: Hydrocarbons in offshore sediments and water	40	44
S3: Fish and shellfish taint and toxicity for human consumption	15	18
S4: Short-term impacts to oiled fauna and flora	29	33
S5: Recovery of commercial and recreational fisheries	6	10
S6: Recovery of fauna	34	39
S7: Recovery of subtidal and intertidal benthic habitat	15	18
S8: Recover of coastal flora	31	34
S9: Recovery of Ramsar values	14	14

Note: \* Total number of personnel available includes those available to deploy < 48 hours and > 48 hours.

An annual test of the capability of the Third Party OSMP Consultant to provide these resources is conducted. The Third Party OSMP Consultant maintains a register of the available resources, updated quarterly, including:

- Role in OSMP implementation
- Provider (company name)
- Provider contact details
- Contractual arrangement status
- Resource (name(s)) identified
- Minimum qualification and experience requirements
- Whether qualification and experience requirements are met
- Completion of OSMP familiarisation training

#### **2.7.4. Awareness of role in OSMP implementation**

The approach to the OSMP implementation summarised in Table 2-4 shows the activities for the Third Party OSMP Consultant that includes phases prior to and after OSMP activation. The outputs of the Readiness Phase includes the awareness of staff and resources through OSMP familiarisation training.

**Table 2-4 OSMP implementation phases**

Phase	Period	Activity	Purpose	Output
Readiness	Prior to spill	Personnel, contractors and equipment providers prepare for and continue to be prepared for activation of OSMP.	'Readiness' for timely response to implement OSMP.	Register of OSMP implementation personnel
		Register of OSMP implementation personnel is maintained and updated quarterly		Awareness by all participants that they are to be available and ready for OSMP implementation OSMP familiarisation
Mobilising	Notification of a Level 2 or 3 spill	Third Party OSMP Consultant Project Manager and Initial Field Team mobilise onsite)	Initiate modules as quickly as possible and within timeframes required by OSMP.	Timely mobilisation of monitoring program.
		Water and sediment sampling teams report to surveillance vessel(s) for deployment to site. Mobilise monitoring teams based on initiation criteria: Mobilise, personnel equipment and vessels to port Load equipment/ supplies on vessel and depart port		
Monitoring during Spill response	During a spill, before shoreline contact.	Implement relevant OM modules	Inform response planning and manage early stages of spill.	Operational data reported regularly throughout response
		Implement relevant SM modules Collect reactive baseline data. Collate and assess existing baseline data.	Establish baselines and analyse behaviour of spill hydrocarbons	Baseline data reports for each monitoring study.
	During a spill after shoreline contact.	Continue to implement modules.	Inform response planning and management	Operational data reported regularly throughout response
Spill Response Termination	At end of spill response	Terminate modules when criteria met	Discontinue modules linked specifically to spill response phase.	Consolidated data on spill response to IMT IC. Consolidated data to inform later Scientific studies.

<b>Monitoring Post-spill response</b>	From termination of spill response until termination criteria met	Update SAPs for long-term monitoring.	Modify frequency /number of long-term monitoring sites. (Not if termination criteria met during spill response phase).	Approval of long-term monitoring SAPs
---------------------------------------	---	---------------------------------------	--	---------------------------------------

### 2.7.5. Staff availability for deployment in initial response

The following table summarises staff that are available for deployment to respond to the requirements of the OSMP after the initial confirmation of a Tier 2 or Tier 3 spill. Many staff are capable of performing tasks in a number of modules. Further details are included in the Third Party Staff and Equipment Register which is reviewed on a quarterly basis.

**Table 2-5 Personnel Availability**

Module	Minimum PI Competency Requirement	Number of PIs identified	Minimum Field Staff Competency Requirement	No. Staff Available (<48hr mobilisation)	*Total No. Staff Available (including >48hr mobilisation)
<b>O1: Oil spill surveillance</b>	Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP. Level 2/3 – Relevant experience in coordination of operational monitoring	2	Lead observer to be experienced in surveillance techniques. All team members to be familiar with the relevant spill observation, estimation and recording techniques.	31	51
<b>O2: Water and oil sampling</b>	Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP. A least 10 years' experience in the collection and analysis of water quality samples. Level 2/3 – Relevant experience or training in coordination of operational monitoring	2	Familiarisation with oil and water sampling and recording techniques.	40	98
<b>O3: Shoreline assessment</b>	Familiarisation with relevant requirements of the OSMP and OPEP. A least 10 year experience in shoreline survey including the analysis of data.	2	Familiarisation with relevant observation and recording techniques. Zoologist for fauna observations.	44	52
<b>O4: Fauna observations</b>	Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP. A least 10 years' experience in the collection and analysis of fauna data. Level 2/3 - Doctorate in environmental science	2	Familiarisation with the fauna identification and recording techniques.	34	38

Module	Minimum PI Competency Requirement	Number of PIs identified	Minimum Field Staff Competency Requirement	No. Staff Available (<48hr mobilisation)	*Total No. Staff Available (including >48hr mobilisation)
<b>O5: Air quality</b>	<p>Level 1 – Experience in implementation of safety or industrial hygiene programs in the oil &amp; gas industry</p> <p>A least 10 years experience in the collection and analysis of air quality measurements and data.</p> <p>Level 2/3 - Qualifications in Occupational Health &amp; Safety, or Industrial Hygiene from a recognised institution or equivalent tertiary study in technical area;</p> <p>Familiarisation with relevant requirements of the OSMP and OPEP.</p>	2	Trained in use of personnel air monitoring equipment.	6	47
<b>O6: Sediment sampling</b>	<p>Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP.</p> <p>At least 10 years experience in the collection and analysis of sediment quality samples.</p> <p>Level 2/3 B.Sc in Env Science or engineering</p>	2	Familiarisation with sediment sampling and recording techniques.	45	52
<b>S1: Hydrocarbons in intertidal sediments and water</b>	<p>Doctorate in environmental science,</p> <p>At least 10 years' experience in the collection of environmental samples from water and sediments;</p> <p>Familiarisation with relevant requirements of the OSMP and OPEP.</p>	2	<p>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area.</p> <p>Experienced in sediment and water quality sampling and recording techniques.</p>	40	45
<b>S2: Hydrocarbons in offshore sediments and water</b>	<p>Doctorate in environmental science,</p> <p>At least 10 years' experience in the collection of environmental samples from water and sediments;</p> <p>Familiarisation with relevant requirements of the OSMP and OPEP.</p>	2	<p>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area.</p> <p>Experienced in the relevant sampling and/or recording techniques.</p>	40	44

Module	Minimum PI Competency Requirement	Number of PIs identified	Minimum Field Staff Competency Requirement	No. Staff Available (<48hr mobilisation)	*Total No. Staff Available (including >48hr mobilisation)
<b>S3: Fish and shellfish taint and toxicity for human consumption</b>	<p>Doctorate in environmental science;</p> <p>At least 10 years experience in the collection of fish and shellfish for laboratory analysis;</p> <p>Familiarisation with relevant requirements of the OSMP and OPEP.</p>	2	<p><u>Field Teams</u></p> <p>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area.</p> <p>Experienced in the fish/shellfish collection, sampling and recording techniques.</p> <p><u>Olfactory Analysis Panel</u></p> <p>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area.</p> <p>Experienced in olfactory analysis.</p>	15	18
<b>S4: Short-Term impacts to oiled fauna and flora</b>	<p>Doctorate in environmental science;</p> <p>At least 10 years' experience in fauna survey including the survey of marine fauna;</p> <p>Familiarisation with relevant requirements of the OSMP and OPEP.</p>	2	<p>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area.</p> <p>Experienced in the relevant sampling and/or recording techniques.</p>	29	33
<b>S5: Recovery of commercial and recreational fisheries</b>	<p>Doctorate in environmental science;</p> <p>At least 10 years' experience in the collection and analysis of fishery data</p> <p>Experienced in fisheries data analysis.</p>	2	N/A	6	10
<b>S6: Recovery of fauna</b>	<p>Doctorate in environmental science;</p>	2	<p>Bachelor degree in environmental science or an engineering degree from</p>	34	39

Module	Minimum PI Competency Requirement	Number of PIs identified	Minimum Field Staff Competency Requirement	No. Staff Available (<48hr mobilisation)	*Total No. Staff Available (including >48hr mobilisation)
	At least 10 years experience in the survey and analysis of fauna data; Familiarisation with relevant requirements of the OSMP and OPEP		a recognised institution or equivalent tertiary study in technical area. Experienced in the relevant sampling and/or recording techniques.		
<b>S7: Recovery of subtidal and intertidal benthic habitat</b>	Doctorate in environmental science; At least 10 years' experience in the collection and analysis of data relating to marine infauna; Familiarisation with relevant requirements of the OSMP and OPEP	2	Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area. Experienced in the relevant sampling and/or recording techniques.	15	18
<b>S8: Recovery of coastal flora</b>	Doctorate in environmental science; At least 10 years' experience in the collection and analysis of data on flora including coastal flora; Familiarisation with relevant requirements of the OSMP and OPEP	2	Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area. Experienced in the relevant sampling and/or recording techniques.	31	34
<b>S9: Recovery of Ramsar values</b>	At least 10 years experience in dealing with Ramsar values including the analysis of changes to those values; Familiarisation with relevant requirements of the OSMP and OPEP Experienced in wetland ecology	2	N/A	14	14

(\*) Total number of personnel available includes those available to deploy <48 hours and >48 hours.

### 2.7.6. Non-personnel resources

A summary of the likely key non-personnel resource requirements for each module is shown below in Table 2-6. Further information on the resources identified in this table is provided below and in the Third Party OSMP Staff and Equipment Register. The number of resources required will depend on the number of field teams for each module as well as efficiencies where one field team may collect data/samples for multiple modules.

**Table 2-6: Non-personnel resource requirements**

Equipment	O1	O2	O3	O4	O5	O6	S1	S2	S3	S4	S5	S6	S7	S8	S9
Fixed wing aircraft	✓		✓	✓											
Helicopter	✓		✓	✓											
Vehicles		✓	✓	✓	✓	✓	✓			✓		✓	✓	✓	
Vessels	✓	✓	✓	✓		✓		✓	✓	✓		✓	✓		
UAV	✓			✓						✓					
Sampling equipment		✓	✓			✓	✓	✓	✓	✓					
ROV	✓					✓	✓	✓		✓			✓		
Fluorometer		✓													
NATA accredited lab		✓	✓		✓	✓	✓	✓	✓	✓					
Oil Spill Trajectory Modelling services	✓														
Satellite imagery services	✓														

#### Aircraft

There may be a requirement for aircraft to support spill surveillance, shoreline assessment and fauna observations. There is access to helicopters through the Esso owned and operated helicopter fleet based out of Longford. An agreement is in place with a third party supplier to provide a fixed wing aircraft.

#### Vehicles

The Third Party OSMP Consultant has sufficient resources to meet the vehicle needs of the monitoring program in both the immediate and longer term. The Third Party OSMP Consultant has 4WD vehicles available (as detailed in the Third Party OSMP Staff and Equipment Register). The Third Party OSMP Consultant has Australia-wide contracts with rental car providers so that within 24 hours these vehicles can be supplemented with as many 4WD as needed for the duration of the monitoring programs.

#### Vessels

There is requirement for both large and small vessels to allow the monitoring to be completed as per the program.

Inshore vessels available through the Third Party OSMP Consultant are detailed in the Third Party OSMP Staff and Equipment Register.

Esso has an in principal agreement with a number of vessels capable of operating offshore 24 hours per day. Details of these vessels are maintained in the OSMP Vessel Register.

In addition to the vessels identified in the register, the Esso support vessel used for ongoing operations may be used for surveillance and monitoring in the event of a spill. Esso also has an agreement in place with a third party supplier for the provision of additional vessels for surveillance and monitoring.

### Sampling Equipment

The Third Party OSMP Consultant has a contract with three NATA accredited laboratories in Victoria that it can utilise, which are summarised in Table 2-7. In addition they have the required sampling equipment available for water quality and sediment quality, including a flow-through fluorometer. The Third Party OSMP Consultant also has a suite of ROVs, an automated underwater vehicle (AUV) and drones (with CASA certified operators) for rapid survey of intertidal reefs. The Third Party OSMP Consultant has fully certified divers with all required equipment including a suite of underwater cameras as well as side scan sonar units for mapping undersea habitats. All these resources are available for immediate deployment pending other commitments.

**Table 2-7: Third Party OSMP Laboratories**

Laboratory	Contact Details
Australian Laboratory Services (Melbourne)	4 Westall Road, Springvale VIC 3171 Ph: 03 8549 9600
Envirolabs (Melbourne)	25 Research Drive, Croydon South VIC 3136 Ph: 03 9763 2500
Eurofins (Melbourne)	6 Monterey Road, Dandenong South VIC 3175

### Initial response sampling kits

Given the short implementation time for sub-module O2.1, Esso has identified the following locations as stocking initial response spill sampling kits:

- Longford Plants Laboratory
- Long Island Point Laboratory
- Esso's contracted supply vessel
- Longford Heliport
- Sale Office (stored for deployment on inspection vessel when being used)
- Pipelines Warehouse - Sale
- Westbury Pumping Station

The initial response kits contain the equipment to obtain and store an oil sample from the water surface or from land.

Personnel should familiarise themselves with the sampling procedure (see Implementation Guide for O2: Water and Oil Sampling); but otherwise no specific training or qualifications are required to use the initial response kits to collect an oil sample.

### Laboratory Access

Esso has identified the following NATA accredited laboratories within the region to support the various operational and scientific monitoring modules. Laboratories with the appropriate capabilities to support specific modules have been identified within the relevant modules.

**Table 2-8: NATA accredited laboratories**

Laboratory	Contact Details
Australian Laboratory Services (Melbourne)	4 Westall Road, Springvale VIC 3171 Ph: 03 8549 9600

Laboratory	Contact Details
Australian Laboratory Services (Traralgon)	Hazelwood Road, Traralgon VIC 3844 Ph: 03 5176 4170
Ecotox Services Australia	27/2 Chaplin Drive, Lane Cove NSW 2066 Ph: 02 9420 9481
Eurofins MGT	25 Kingston Town Close, Oakleigh VIC 3166 Ph: 03 8564 5000
Intertek Geotechnical	41-45 Furnace Road, Welshpool WA 6106 Ph: 08 9458 8877
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167
Longford Plants Laboratory	Garretts Road, Longford VIC 3851 Ph: 03 5149 6259
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Ph: 03 9644 4888

### Modelling and Imagery Services

Esso (via ExxonMobil) is a member of the AMOSC. AMOSC membership allows access to RPS to provide predictive modelling capabilities in the event of an oil spill. Alternatively, modelling may also be requested from:

- Oil Spill Response Limited (OSRL);
- Exxon Mobil's in-house service (EMBSI).
- Australian Maritime Safety Authority (AMSA), noting that requests for modelling under the National Plan can only be made by Commonwealth or State/Territory spill response control agencies, or by AMOSC

Esso Australia has tracking buoys available, and additional buoys are available for hire from AMOSC. Esso also has agreements in place to allow access to satellite imagery services for remote observation of the spill.

## 2.8 Communication Management

Stakeholder (including regulators) consultation and external reporting requirements are described in the activity-specific EPs. This includes the requirement to consult with the:

- National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA)
- Department of Agriculture, Water and Environment (DAWE) in the event that a hydrocarbon spill is likely to impact matters of national environmental significance;
- Parks Australia, Director of National Parks, in the event that a hydrocarbon spill and/or response activity are likely to impact an Australian Marine Park;
- Australian Fisheries Management Authority (AFMA)

If the spill may impact Victorian waters then consultation will occur with:

- Department of Transport (DoT);
- Environment Protection Agency (EPA);
- Department of Environment, Land, Water and Planning (DELWP)

If the spill may impact Tasmanian waters then consultation will occur with:

- The Environment Protection Authority Division of the Department of Primary Industries, Parks, Water, and Environment (DPIPWE)

If the spill may impact New South Wales waters then consultation will occur with:

- NSW Environment Protection Authority;
- Transport for NSW

## 2.9 Review and Revision

Regulation 19 of the OPGGS (E) Regulations provides for the revision of this OSMP. Review and update of the OSMP may be initiated through findings from drills/exercises, actual events, internal or external assessments, audits, changes to regulation, or via planned periodic review. As per the EP&R Guide, this document is subject to:

- an annual review
- a mid-cycle (i.e. 2.5 – 3 years) comprehensive update
- 5 yearly revision and resubmission (in accordance with resubmission of Environment Plans)

Any changes made during review and revision must be tracked and documented in order to demonstrate continued compliance with regulatory accepted versions of this document. Changes made to the OSMP should be reviewed against *OPGGS (Environment) Regulations 2009* (Reg 7, Reg 8, Reg 17) to determine if a resubmission is required.

The annual review should be a general review of the OSMP to ensure it remains applicable to current operations. The annual review of the OSMP will include the annual test of the Third Party OSMP Consultants' capability to provide resources to fulfil the requirements of this OSMP (Section 2.7).

Bass Strait Operational & Scientific Monitoring Program

Table 2-9 describes the topics that should be considered when completing a mid-cycle update of the OSMP.

Table 2-9: Scope of revision of OSMP

### 3. Operational Monitoring

The following sections outline the individual operational monitoring modules that may be implemented in the event of a hydrocarbon spill to the marine or coastal environment. The tables describe the key aims, initiation and termination criteria, implementation times, and provide a high-level description of monitoring, reporting and resources. The studies are presented separately below; however, in practice they may be undertaken simultaneously.

These overviews are supported by internal implementation guides for each of the operational monitoring modules. The implementation guides have been prepared to provide Esso and their monitoring providers' sufficient information to efficiently finalise a monitoring design of an appropriate nature and scale in the event of a hydrocarbon spill.

Six operational monitoring modules have been identified:

- O1: Oil Spill Surveillance;
- O2: Water and Oil Sampling;
- O3: Shoreline Assessment;
- O4: Fauna Observations;
- O5: Air Quality;
- O6: Sediment Sampling.

#### 3.1 O1: Oil Spill Surveillance

##### 3.1.1. Purpose

The development and implementation of effective responses to oil spills depends critically on the knowledge of the extent and likely fate and behaviour of oil once exposed to ambient weather and sea state conditions. The purpose of this module is to:

- Track the location, extent and thickness of the surface oil slick to gain situational awareness of the incident and validate and inform forecasting and Oil Spill Trajectory Modelling (OSTM);
- Collect and collate relevant weather and sea state conditions to inform OSTM and response actions;
- Predict sensitivities at risk and fate/behaviour of the spill to inform response actions and scientific monitoring;
- Provide location of slick to O2 (water and oil sampling) monitoring team;
- Provide feedback on the extent, location, appearance and thickness of a dispersed slick (applicable only if dispersants used).

##### 3.1.2. Initiation and termination criteria

Initiation Criteria	O1.1 Weather and sea state; O1.2 Trajectory estimation; and O1.3 Aerial or underwater observation;	✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred
	O1.4 Remote observation;	✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b> ✓ IMT IC (or delegate) confirms the event as a Level 2 or Level 3 hydrocarbon spill.

	O1.5 Satellite imagery;	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ IMT IC (or delegate) confirms the event as a Level 3 hydrocarbon spill;</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has advised that either full or partial implementation of O1 is to commence.</li> </ul>
<b>Termination Criteria</b>	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) considers that continuation of monitoring under O1<sup>1</sup> will not result in a change to the scale or location of active response options; <b>or</b></li> <li>✓ Two consecutive aerial or underwater observations show that oil has weathered and dissipated to &lt;0.3 g/m<sup>2</sup>; or Bonn appearance code 1; or</li> <li>✓ The IMT IC (or delegate) has advised that agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the response; <b>or</b></li> <li>✓ The Principal Investigator through the EUL (or delegate) has advised that continuation of monitoring under O1<sup>1</sup> may increase overall environmental impact.</li> </ul>	

Notes:

1. Decision to terminate monitoring can be made for each individual sub-module independently.

### 3.1.3. Implementation

<b>Implementation time<sup>1</sup></b>	<ul style="list-style-type: none"> <li>✓ O1.1, O1.2 and O1.3 within 4 hours of initiation criteria being met;</li> <li>✓ O1.4 and O1.5 within 24 hours of initiation criteria being met.</li> </ul>
<b>Implementation Plan</b>	<ul style="list-style-type: none"> <li>✓ Refer to <i>Implementation Guide for O1: Oil Spill Surveillance</i></li> </ul>
<b>Reporting</b>	<ul style="list-style-type: none"> <li>✓ Results from data collation, visual/remote surveillance, modelling and/or image analysis reported daily to PSC;</li> <li>✓ Final report prepared within one-week of termination criteria being met; report provided to PSC.</li> </ul>

Notes:

1. A module is considered implemented when Esso have (i) confirmed initiation criteria have been met, (ii) the monitoring providers have been notified, (iii) sampling and analysis plans (where required) have been completed, and (iv) mobilisation has commenced.

### 3.1.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during operational module O1. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- Aerial Observation of Marine Oil Spills (ITOPF 2014);
- SMART Protocols (NOAA 2006).

Sub-module	Sampling technique	Data collection and/or analysis
O1.1 Weather and sea state	<ul style="list-style-type: none"> <li>• Data records collation;</li> <li>• Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>• Data records sourced from Bureau of Meteorology (BoM) or local weather stations;</li> <li>• Sea state observations manually recorded from vessels, offshore platform or shore.</li> </ul>
O1.2 Trajectory estimation	<ul style="list-style-type: none"> <li>• Manual estimation;</li> <li>• OSTM.</li> </ul>	<ul style="list-style-type: none"> <li>• Manual estimation can be completed quickly and with limited data (wind and currents, spill origin and/or present location)</li> <li>• OSTM is generally completed by specialist consultants.</li> </ul>
O1.3	<ul style="list-style-type: none"> <li>• Visual surveillance;</li> <li>• Remote sensing.</li> </ul>	<ul style="list-style-type: none"> <li>• Visual observations of the location, extent, and appearance of the spill.</li> </ul>

Sub-module	Sampling technique	Data collection and/or analysis
Aerial or underwater observation		<ul style="list-style-type: none"> <li>Estimates of volume based on percentage cover and oil thickness.</li> </ul>
O1.4 Remote observation	<ul style="list-style-type: none"> <li>Satellite tracking</li> </ul>	<ul style="list-style-type: none"> <li>Buoys are deployed and position can be tracked via satellite.</li> </ul>
O1.5 Satellite imagery	<ul style="list-style-type: none"> <li>Satellite imagery analysis</li> </ul>	<ul style="list-style-type: none"> <li>Remote sensing and image analysis to determine presence of oil slicks.</li> </ul>

### 3.1.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation and termination of this operational monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for the initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the EP.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement operational module O1. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for O1 in the event of a spill;</li> <li>Implement O1;</li> <li>Review and/or carry out reporting requirements;</li> <li>Compliance with the requirements of O1 and the OSMP;</li> <li>Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP.</li> <li>Level 2/3 – Relevant experience in coordination of operational monitoring</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct visual observations;</li> <li>Completing field data sheets;</li> <li>QA/QC data quality.</li> </ul>	<ul style="list-style-type: none"> <li>Lead observer to be experienced in surveillance techniques;</li> <li>All team members to be familiar with the relevant spill observation, estimation and recording techniques.</li> </ul>

#### Resources

The key resources required for implementation of Module O1 include a fixed wing aircraft and/or helicopter for aerial surveillance. UAVs may be utilised to support aerial surveillance. Vessels may also be required for on-water surveillance of the spill and observations of weather and sea state. Use of a ROV may be required for subsea activities such as detection or tracking of the spill. Access to Oil Spill Trajectory Modelling services and satellite imagery services may be required for spill modelling and remote surveillance. Further information on access to these resources is provided in Section 2.7.6.

## 3.2 O2: Water and Oil Sampling

### 3.2.1. Purpose

The purpose of this module is to provide quantitative measures of water quality and oil (hydrocarbon) characteristics to:

- Determine the physical and chemical characteristics of the spilled oil to validate trajectory forecasts or models (i.e. provide information regarding the spill source characterisation);
- Obtain samples of spilled oil for retention or additional analysis (e.g. fingerprinting);
- Establish background concentrations of total petroleum hydrocarbon (TPH) and polyaromatic hydrocarbons (PAH), and non-hydrocarbon constituents in sea water;
- Determine concentrations of TPH and PAH within the spill plume to validate and enhance OSTM and support assessment of environmental and social impacts;
- Determine the concentrations of non-hydrocarbon constituents (e.g. heavy metals) within the spill plume;
- Determine the effectiveness of dispersants in reducing concentrations of oil in the water column (applicable only if dispersants used);
- To inform scientific monitoring.

### 3.2.2. Initiation and termination criteria

<b>Initiation Criteria</b>	O2.1 Collection of an oil sample	✓	Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred
	O2.2 Fluorometry O2.3 Water samples;	✓ ✓	Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b> IMT IC (or delegate) confirms the event as a Level 2 or Level 3 hydrocarbon spill; <b>or</b> Application of dispersant has been selected as a response option by the IMT IC (or delegate).
	O2.4 Dispersant Monitoring	✓	Application of dispersant has been selected as a response option by the IMT IC (or delegate).
	All sub-modules	✓	The IMT IC (or delegate) has advised that either full or partial implementation of O2 is to commence.
<b>Termination Criteria</b>	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has determined that continuation of monitoring under the module is not necessary to meet the objectives of the response <b>and</b></li> <li>✓ The IMT IC (or delegate) has advised that agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the response; <b>or</b></li> <li>✓ The Principal Investigator through the EUL (or delegate) has advised that continuation of monitoring under O2<sup>1</sup> may increase overall environmental impact.</li> </ul>		

*Notes:*

1. Decision to terminate monitoring can be made for each individual sub-module independently.

### 3.2.3. Implementation

<b>Minimum time to implement<sup>1</sup></b>	<ul style="list-style-type: none"> <li>✓ O2.1: as soon as practicable following initiation criteria being met;</li> <li>✓ O2.2, O2.3, O2.4: within 24 hours of initiation criteria being met.</li> </ul>
<b>Implementation Plan</b>	<ul style="list-style-type: none"> <li>✓ Refer to <i>Implementation Guide for O2: Water and Oil Sampling</i></li> </ul>
<b>Reporting</b>	<ul style="list-style-type: none"> <li>✓ Results from in-situ analysis of samples reported daily to PSC;</li> <li>✓ Results from laboratory analysis of samples reported as available to PSC;</li> <li>✓ Final report prepared within one-week of termination criteria being met; report provided to PSC.</li> </ul>

*Notes:*

1. A module is considered implemented when Esso have (i) confirmed initiation criteria have been met, (ii) the monitoring providers have been notified, (iii) sampling and analysis plans (where required) have been completed, and (iv) mobilisation has commenced.

### 3.2.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during operational module O2. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- SMART Protocols (NOAA 2006);
- ASTM D4489 2017 Standard Practices for Sampling of Waterborne Oils.

Sub-module	Sampling technique	Data collection and/or analysis
O2.1 Collection of an oil sample	<ul style="list-style-type: none"> <li>• Surface oil sample collection<sup>1</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Physical characteristics (e.g. wax content, dynamic viscosity, density, volatiles);</li> <li>• Chemical characteristics (e.g. PAH)</li> </ul>
O2.2 Fluorometry	<ul style="list-style-type: none"> <li>• Water column profiling</li> </ul>	<ul style="list-style-type: none"> <li>• TPH</li> </ul>
O2.3 Water samples	<ul style="list-style-type: none"> <li>• Surface and sub-surface water sample collection</li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. TPH, PAH);</li> <li>• Laboratory analysis for non-hydrocarbon parameters (e.g. heavy metals);</li> <li>• Dispersant (e.g. DOSS).</li> </ul>
O2.4 Dispersant Monitoring	<ul style="list-style-type: none"> <li>• Surface and sub-surface water sample collection</li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. TPH, PAH);</li> <li>• Laboratory analysis for non-hydrocarbon parameters (e.g. heavy metals);</li> <li>• Dispersant (e.g. DOSS).</li> </ul>

*Notes:*

1. The location of Initial response sampling kits has been identified to facilitate the sampling required under O2.1.

### 3.2.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation and termination of this operational monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement operational module O2. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for O2 in the event of a spill;</li> <li>Implement O2;</li> <li>Review and/or carry out reporting requirements;</li> <li>Compliance with the requirements of O2 and the OSMP;</li> <li>Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP.</li> <li>A least 10 years' experience in the collection and analysis of water quality samples.</li> <li>Level 2/3 – Relevant experience or training in coordination of operational monitoring</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>Completing field data sheets</li> <li>QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>Familiarisation with oil and water sampling and recording techniques.</li> </ul>

### Resources

The key resources required for implementation of Module O2 include vessels for on-water sampling and monitoring as well as vehicles for coastal water sampling. A flow-through fluorometer may be required for monitoring oil in water concentrations. Sampling equipment will be required for sampling of the oil slick itself and sampling of water from both inside and outside the spill area. Further information on access to these resources is provided in Section 2.7.6.

Esso has also identified the following NATA accredited laboratories within the region with the capabilities to support the analysis for operational module O2:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	Main Melbourne Laboratory 4 Westall Road, Springvale VIC 3171 Phone: 03 8549 9600
Australian Laboratory Services (Traralgon)	Hazelwood Road, Traralgon VIC 3844 Phone: 03 5176 4170
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Phone: 03 9644 4888
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167

### 3.3 O3: Shoreline Assessment

#### 3.3.1. Purpose

This module outlines a Shoreline Clean-up Assessment Technique (SCAT) to be used to directly inform shoreline clean-up, provide recommendations to operations, and ensure the clean-up is completed. The purpose of this module is to:

- Determine the physical, biological and dynamic properties of shorelines at risk, in order to:
  - Predict the oil behaviour and distribution;
  - Determine the most appropriate clean-up methods;
  - Identify sensitive or vulnerable areas or resources;
  - Determine whether any pre-impact actions are warranted;
- Determine the characteristics and distribution of oil on the shoreline in order to predict the potential for oil persistence and / or natural removal;
- Determine the effectiveness of shoreline response strategies and provide feedback to the IMT.

#### 3.3.2. Initiation and termination criteria

<b>Initiation Criteria</b>	O3.1 Shoreline segmentation	✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred
	O3.2 Shoreline character	
	O3.3 Oil on shorelines	
	O3.4 Shoreline profile	✓ Modification of the shoreline profile is identified as a recommended strategy (e.g. through mechanical construction of pits, berms, or bulk waste removal)
	All sub-modules	✓ The IMT IC (or delegate) has advised that either full or partial implementation of O3 is to commence.
<b>Termination Criteria</b>	✓ The IMT IC (or delegate) has determined that continuation of monitoring under the module is not necessary to meet the objectives of the response <b>and</b> ✓ Results of Module O1 monitoring demonstrate that shorelines will not be impacted; <b>or</b> ✓ The IMT IC (or delegate) has advised that agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the response; <b>or</b> ✓ The Principal Investigator through the EUL (or delegate) has advised that continuation of monitoring under O3 <sup>1</sup> may increase overall environmental impact.	

Notes:

1. Decision to terminate monitoring can be made for each individual sub-module independently.

#### 3.3.3. Implementation

<b>Implementation Time</b> <sup>1</sup>	✓ O3.1, O3.2, O3.3, O3.4: within 24 hours of initiation criteria being met.
<b>Implementation Plan</b>	✓ Refer to <i>Implementation Guide for O3: Shoreline Assessment</i>
<b>Reporting</b>	✓ Results from data collation, visual surveillance, in-situ monitoring reported daily to PSC; ✓ Final report prepared within one-week of termination criteria being met; report provided to PSC.

Notes:

1. A module is considered implemented when Esso have (i) confirmed initiation criteria have been met, (ii) the monitoring providers have been notified, (iii) sampling and analysis plans (where required) have been completed, and (iv) mobilisation has commenced.

### 3.3.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during operational module O3. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- SMART Protocols (NOAA 2006);
- Shoreline Assessment Job Aid (NOAA 2007)
- Shoreline Clean up Assessment Technique (SCAT) Oil Spill Response Limited (updated)
- The Open Water Oil Identification Job Aid for Aerial Observation (NOAA 2016)

Sub-module	Sampling technique	Data collection and/or analysis
O3.1 Shoreline character	<ul style="list-style-type: none"> <li>• Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>• Physical and biological characteristics (e.g. shoreline dimensions, habitat type, substrate type, wind/wave energy etc.).</li> </ul>
O3.2 Oil on shorelines	<ul style="list-style-type: none"> <li>• Visual surveillance;</li> <li>• Surface and sub-surface water sample collection</li> </ul>	<ul style="list-style-type: none"> <li>• Visual assessment of oil extent, percent cover, thickness etc.;</li> <li>• In-situ or laboratory analysis for hydrocarbon content (e.g. TPH).</li> <li>• Assessment of endpoints from clean-up, identification of suggested clean-up techniques</li> </ul>

### 3.3.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation and termination of this operational monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement operational module O3. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Finalise the sampling and analysis design for O3 in the event of a spill;</li> <li>• Implement O3;</li> <li>• Review and/or carry out reporting requirements;</li> <li>• Compliance with the requirements of O3 and the OSMP;</li> <li>• Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>• Familiarisation with relevant requirements of the OSMP and OPEP.</li> <li>• A least 10 years' experience in shoreline survey including the analysis of data.</li> <li>• Relevant experience or training in coordination of operational monitoring</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>• Conduct sampling, record data and arrange transfer of samples to laboratories;</li> <li>• Completing field data sheets;</li> <li>• QA/QC data quality.</li> </ul>	<ul style="list-style-type: none"> <li>• Familiarisation with relevant observation and recording techniques</li> <li>• Zoologist for fauna observations.</li> </ul>

## Resources

Depending on the size and location of the spill, fixed wing aircraft or helicopters may be required for aerial surveys to help cover a broader area and to quickly assess remote or difficult to access locations. Similarly, vessels may be required for shoreline assessment to conduct vessel-based surveys or allow access to the shoreline. Vehicles will be required to support ground surveys. Sampling equipment is required for taking water and sediment samples to support visual observations of oil on shorelines.

Esso has also identified the following NATA accredited laboratories within the region with the capabilities to support the analysis for operational module O3:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	Main Melbourne Laboratory 4 Westall Road, Springvale VIC 3171 Phone: 03 8549 9600
Australian Laboratory Services (Traralgon)	Hazelwood Road, Traralgon VIC 3844 Phone: 03 5176 4170
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Phone: 03 9644 4888
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167

## 3.4 O4: Fauna Observations

### 3.4.1. Purpose

This module is designed to inform responses to spills where there is the potential for exposure to fauna either onshore (e.g. seals or birds on the shoreline) or offshore (e.g. whales or birds either in/on the water). The purpose of this module is to:

- Identify the presence of onshore and offshore fauna, including marine mammals and seabirds, in the response area (i.e. near the oil slick, response vessels or aircraft) in order to implement mitigation strategies, such as reduce vessel speeds, halt operations, move vessels or aircraft from the area, increase flight altitude or consider “hazing” strategies.
- Locate potentially oiled fauna for recovery (i.e. by government agencies (Department of Environment, Land, Water and Planning (DELWP) and Parks Victoria or as directed).

### 3.4.2. Initiation and termination criteria

Initiation Criteria	O4.1 Fauna observation (at sea)	✓	Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred
	O4.2 Fauna observations (onshore)	✓	Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b> ✓ IMT IC (or delegate) confirms that data from Modules O1 and/or O3 predicted/confirmed shoreline exposure.
	All sub-modules	✓	The IMT IC (or delegate) has advised that either full or partial implementation of O4 is to commence.
Termination Criteria	✓ The IMT IC (or delegate) has determined that continuation of monitoring under the module is not necessary to meet the objectives of the response <b>or</b> ✓ Results of Module O1 monitoring demonstrate that shorelines will not be impacted; <b>or</b> ✓ The IMT IC (or delegate) has advised that agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the response; <b>or</b> ✓ The Principal Investigator through the EUL (or delegate) has advised that continuation of monitoring under O4 <sup>1</sup> may increase overall environmental impact.		

Notes:

1. Decision to terminate monitoring can be made for each individual sub-module independently.

### 3.4.3. Implementation

<b>Implementation time <sup>1</sup></b>	<ul style="list-style-type: none"> <li>✓ O4.1: within 4 hours of initiation criteria being met;</li> <li>✓ O4.2: within 24 hours of initiation criteria being met.</li> </ul>
<b>Implementation Plan</b>	✓ Refer to <i>Implementation Guide for O4: Fauna Observations</i>
<b>Reporting</b>	<ul style="list-style-type: none"> <li>✓ Results from visual surveillance reported daily to PSC;</li> <li>✓ Final report prepared within one-week of termination criteria being met; report provided to PSC.</li> </ul>

Notes:

1. A module is considered implemented when Esso have (i) confirmed initiation criteria have been met, (ii) the monitoring providers have been notified, (iii) sampling and analysis plans (where required) have been completed, and (iv) mobilisation has commenced.

### 3.4.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during operational module O4. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- Australian National Guidelines for Whale and Dolphin (DoEE 2017).

Sub-module	Sampling technique	Data collection and/or analysis
O4.1 Fauna observations (at sea)	<ul style="list-style-type: none"> <li>• Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>• Regular observations of the location, species, activity, evidence of oiling etc.</li> </ul>
O4.2 Fauna observations (onshore)	<ul style="list-style-type: none"> <li>• Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>• Regular observations of the location, species, activity, evidence of oiling etc.</li> </ul>

### 3.4.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation and termination of this operational monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for the initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement operational module O4. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Finalise the sampling and analysis design for O4 in the event of a spill;</li> <li>• Implement O4;</li> <li>• Review and/or carry out reporting requirements;</li> <li>• Compliance with the requirements of O4 and the OSMP;</li> <li>• Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>• Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP.</li> <li>• At least 10 years' experience in the collection and analysis of fauna data.</li> <li>• Level 2/3 - Doctorate in environmental science</li> </ul>

Personnel	Responsibilities	Competencies
Field Teams (1 to 2 people)	<ul style="list-style-type: none"> <li>Conduct sampling and record data;</li> <li>Completing field data sheets;</li> <li>QA/QC data quality.</li> </ul>	<ul style="list-style-type: none"> <li>Familiarisation with the fauna identification and recording techniques.</li> </ul>

### Resources

Fixed wing aircraft and/or helicopters may be required for aerial surveillance of fauna with fixed wing aircraft typically utilised for extensive offshore areas and helicopters used for slow speed near shore surveys. This would likely be an extension of surveillance and observation undertaken as part of Module O1. Vessels may also be used to support at sea fauna observations. Vehicles will be required to support onshore fauna observations. UAVs could be used for rapid data collection about faunal colonies via video or photographs.

## 3.5 O5: Air Quality

### 3.5.1. Purpose

In the event of a hydrocarbon spill, people will need to be deployed on site for monitoring and/or response and clean-up operations. Monitoring of air quality is necessary to ensure the protection and safety of human health. The purpose of this module is to:

- Establish a safe perimeter prior to any response operations being conducted where personnel may be exposed to hazards of airborne gases and vapours
- Identify any hazards from airborne gases and vapours;
- Determine the need for respiratory protection for environmental monitoring and clean-up workers; and
- Comply with occupational health regulatory requirements.

### 3.5.2. Initiation and termination criteria

<b>Initiation Criteria</b>	O5.1 Personnel and area monitoring O5.2 Laboratory analysis All sub-modules	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Confirmation by the Safety Officer (SO) (or delegate) a health and safety risk to personnel is present</li> <li>✓ The IMT IC (or delegate) has advised that either full or</li> <li>✓ Partial implementation of O5 is to commence.</li> </ul>
<b>Termination Criteria</b>	<ul style="list-style-type: none"> <li>✓ The SO (or delegate) has determined that there is no longer a health and safety risk; <b>or</b></li> <li>✓ The IMT IC (or delegate) has advised that agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the response.</li> </ul>	

Notes:

- Decision to terminate monitoring can be made for each individual sub-module independently.

### 3.5.3. Implementation

<b>Implementation time</b> <sup>1</sup>	<ul style="list-style-type: none"> <li>✓ O5.1 and O5.2: within 12 hours of initiation criteria being met.</li> </ul>
<b>Implementation Plan</b>	<ul style="list-style-type: none"> <li>✓ Refer to <i>Implementation Guide for O5: Air Quality</i></li> </ul>
<b>Reporting</b>	<ul style="list-style-type: none"> <li>✓ Results from personnel monitoring reported daily to SO;</li> <li>✓ Results from laboratory sampling reported as available to SO;</li> <li>✓ Final report prepared within one-week of termination criteria being met; report provided to SO.</li> </ul>

Notes:

- A module is considered implemented when Esso have (i) confirmed initiation criteria have been met, (ii) the monitoring providers have been notified, (iii) sampling and analysis plans (where required) have been completed, and (iv) mobilisation has commenced.

### 3.5.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during operational module O4. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Occupational Health Monitoring Plan (Centre for Toxicology and Environmental Health 2011);
- Oil Spill Response Field Manual (ExxonMobil 2008).

Sub-module	Sampling technique	Data collection and/or analysis
O5.1 Personnel and area monitoring	<ul style="list-style-type: none"> <li>• Direct-read personal or area gas monitoring</li> </ul>	<ul style="list-style-type: none"> <li>• In-situ data collected and compared against known guideline levels.</li> </ul>
O5.2 Laboratory analysis	<ul style="list-style-type: none"> <li>• Laboratory analysis of vapour monitors</li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. BTEX, TPH).</li> </ul>

### 3.5.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation and termination of this operational monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for the initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement operational module O5. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Finalise the sampling and analysis design for O5 in the event of a spill;</li> <li>• Implement O5;</li> <li>• Review and/or carry out reporting requirements;</li> <li>• Compliance with the requirements of O5 and the OSMP;</li> <li>• Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>• Level 1 – Experience in implementation of safety or industrial hygiene programs in the oil &amp; gas industry</li> <li>• A least 10 years' experience in the collection and analysis of air quality measurements and data.</li> <li>• Level 2/3 - Qualifications in Occupational Health &amp; Safety, or Industrial Hygiene from a recognised institution or equivalent tertiary study in technical area;</li> <li>• Familiarisation with relevant requirements of the OSMP and OPEP.</li> </ul>
Monitoring personnel	<ul style="list-style-type: none"> <li>• To conduct air quality monitoring to determine safe exposure levels in operating environment</li> </ul>	<ul style="list-style-type: none"> <li>• Trained in use of personnel air monitoring equipment</li> </ul>

#### Resources

It is expected that vehicles will be required to support onshore air quality monitoring through both personnel and area monitoring. Laboratory analysis of vapour monitors comprises part of this module. Esso has also identified the following NATA accredited laboratories within the region with the capabilities to support the analysis for operational module O5:

NATA accredited laboratory	Details
Australian Laboratory Services (Traralgon)	Hazelwood Road, Traralgon VIC 3844 Phone: 03 5176 4170
Longford Plants Laboratory	Garretts Road, Longford VIC 3851 Phone: 03 5149 6259

### 3.6 O6: Sediment Sampling

#### 3.6.1. Purpose

The purpose of this module is to provide quantitative measures of sediment quality to:

- Establish background concentrations of TPH and PAH, and non-hydrocarbon constituents in sediment;
- Determine concentrations of TPH, PAH and non-hydrocarbon constituents (e.g. heavy metals) within exposed sediments to inform response strategies;
- Determine the effectiveness of clean-up operations;
- To inform scientific monitoring.

#### 3.6.2. Initiation and termination criteria

Initiation Criteria	O6.1 Sediment samples (intertidal)	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ IMT IC (or delegate) confirms that data from Modules O1, O2 and/or O3 have predicted/confirmed exposure of intertidal benthic substrate.</li> </ul>
	O6.2 Sediment samples (offshore);	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ IMT IC (or delegate) confirms that data from Modules O1 and/or O2 have predicted/confirmed exposure of offshore benthic substrate.</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has advised that either full or partial implementation of O6 is to commence.</li> </ul>
Termination Criteria	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has determined that continuation of monitoring under the module is not necessary to meet the objectives of the response <b>and</b></li> <li>✓ The IMT IC (or delegate) has advised that agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the response; <b>or</b></li> <li>✓ The Principal Investigator through the EUL (or delegate) has advised that continuation of monitoring under O6<sup>1</sup> may increase overall environmental impact.</li> </ul>	

Notes:

1. Decision to terminate monitoring can be made for each individual sub-module independently.

#### 3.6.3. Implementation

Implementation time <sup>1</sup>	<ul style="list-style-type: none"> <li>✓ O6.1 and O6.2: within 24 hours of initiation criteria being met.</li> </ul>
Implementation Plan	<ul style="list-style-type: none"> <li>✓ Refer to <i>Implementation Guide for O6: Sediment Sampling</i></li> </ul>
Reporting	<ul style="list-style-type: none"> <li>✓ Results from in-situ sampling reported daily to EUL;</li> <li>✓ Results from laboratory sampling reported as available to EUL;</li> <li>✓ Final report prepared within one-week of termination criteria being met; report provided to EUL.</li> </ul>

Notes:

1. A module is considered implemented when Esso have (i) confirmed initiation criteria have been met, (ii) the monitoring providers have been notified, (iii) sampling and analysis plans (where required) have been completed, and (iv) mobilisation has commenced.

### 3.6.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during operational module O6. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016).

Sub-module	Sampling technique	Data collection and/or analysis
O6.1 Sediment samples (intertidal)	<ul style="list-style-type: none"> <li>• Surface and sub-surface sediment sample collection</li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. TPH, TRH, PAH, BTEX);</li> <li>• Laboratory analysis for non-hydrocarbon parameters (e.g. TOC, PSD, heavy metals, nutrients).</li> </ul>
O6.2 Sediment samples (offshore)	<ul style="list-style-type: none"> <li>• Surface sediment sample collection</li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. TPH, TRH, PAH, BTEX);</li> <li>• Laboratory analysis for non-hydrocarbon parameters (e.g. TOC, PSD, heavy metals, nutrients).</li> </ul>

### 3.6.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation and termination of this operational monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for the initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement operational module O6. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Finalise the sampling and analysis design for O6 in the event of a spill;</li> <li>• Implement O6;</li> <li>• Review and/or carry out reporting requirements;</li> <li>• Compliance with the requirements of O6 and the OSMP;</li> <li>• Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>• Level 1 - Familiarisation with relevant requirements of the OSMP and OPEP.</li> <li>• A least 10 years' experience in the collection and analysis of sediment quality samples.</li> <li>• Level 2/3 - Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area;</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>• Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>• Completing field data sheets</li> <li>• QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>• Familiarisation with sediment sampling and recording techniques.</li> </ul>

### Resources

Sediment sampling will be conducted on both intertidal and offshore sediments with vehicles required to support the intertidal sediment sampling and vessels required to support the offshore sediment sampling. Sediment sampling equipment such as corers and grab samplers will be required to collect sediment samples. Offshore sediment sampling may utilise ROVs. A NATA accredited laboratory will be required to analyse sediment samples. Esso has identified the following NATA accredited laboratories within the region with the capabilities to support the analysis for operational module O6:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	Main Melbourne Laboratory 4 Westall Road, Springvale VIC 3171 Phone: 03 8549 9600
Australian Laboratory Services (Traralgon)	Hazelwood Road, Traralgon VIC 3844 Phone: 03 5176 4170
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Phone: 03 9644 4888
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167

## 4. Scientific Monitoring

The following sections outline the individual scientific monitoring modules that may be implemented in the event of a hydrocarbon spill to the marine or coastal environment. The sections describe the purpose, initiation and termination criteria, implementation timing, and provide a high-level description of monitoring, reporting and resources required. The modules are presented separately below; however, in practice they may be undertaken simultaneously.

These overviews are supported by internal implementation guides for each of the scientific monitoring modules. The implementation guides have been prepared to provide Esso and their monitoring providers sufficient information to efficiently finalise a monitoring design of an appropriate nature and scale in the event of a hydrocarbon spill.

Scientific monitoring generally has objectives relating to attributing cause-effect interactions of the spill with changes to the surrounding environment. Consequently, such studies are required to account for natural or sampling variation, and study designs must be robust and produce defensible data. Scientific monitoring is typically conducted over a wider study area taking into account the potentially exposed area, extending beyond the spill footprint, and a longer time period, extending beyond the spill response.

Nine scientific monitoring modules have been identified:

- S1: Hydrocarbons in Intertidal Sediments and Water;
- S2: Hydrocarbons in Offshore Sediments and Water;
- S3: Fish and Shellfish Taint and Toxicity for Human Consumption;
- S4: Short-Term Impacts to Oiled Fauna and Flora;
- S5: Recovery of Commercial and Recreational Fisheries;
- S6: Recovery of Fauna;
- S7: Recovery of Subtidal and Intertidal Benthic Habitat;
- S8: Recovery of Coastal Flora;
- S9: Recovery of Ramsar Values.

Guidance on various experimental monitoring approaches for scientific monitoring (e.g. use of baseline data in 'before versus after' analyses, and alternative approaches such as 'control versus impact' and 'gradient approach') is provided in Appendix A. Appendix B describes an approach to utilising baseline data where and when available; and a list of known regional studies and/or data sources. Specific guidance and sampling approaches are described within the implementation guides for each scientific monitoring module.

Guidance documents which provide information such as key locations, receptors and values will be used to inform monitoring design. The management plans for both Commonwealth and State Protected Areas that may be impacted by a spill do not provide guidance as to the levels of acceptable change nor do they state acceptable levels of contaminants including hydrocarbons, however aspects such as key values will be taken into account. Esso will also take into account information from other documents that provide guidance for protected areas such as Corner Inlet and the Gippsland Lakes and in addition will undertake consultation with relevant asset managers of protected areas as well as asset managers responsible for natural assets that are not protected such as commercial and recreational fishery managers. There are also other sources of guidance for the levels of acceptable change such as the Victorian State Environment Protection Policies (Waters) which gives guidance as to levels of change that are considered acceptable for various bodies of water within the state jurisdiction. In addition the conservation advices / recovery plans for Matters of National Environmental Significance (MNES) listed under the EPBC Act also provide guidance on levels of acceptable change and the actions that may be required to ensure protection / recovery of listed species and communities including aspects such as spatial and temporal distribution.

Initiation and/or termination criteria for some of the scientific monitoring modules require the use of 'accepted guidelines and/or benchmark values'. Where available, Australian guidelines (e.g. ANZECC

& ARMCANZ 2000) or regionally relevant data is used. Where these are unavailable or inappropriate for a selected parameter, toxicity screening benchmarks developed by the USEPA in response to the Deepwater Horizon incident (e.g. USEPA 2015), or other international guidelines (e.g. USEPA 2017) may be adopted. Specific guidance on benchmark values are described within the overviews below, and in the implementation guides, for each individual scientific monitoring module.

## 4.1 S1: Hydrocarbons in Intertidal Sediments and Water

### 4.1.1. Purpose

The purpose of this module is to provide quantitative measures of intertidal sediment and water quality. Scientific module S1 will assess and monitor concentrations of hydrocarbons and metals in intertidal sediments and water by:

- Establishing the baseline concentrations of hydrocarbons and metals in water and sediment at identified pre-impact (if practicable) or control (i.e. un-impacted) intertidal sites;
- Monitoring concentrations of hydrocarbons, metals and nutrients (if bioremediation techniques used as part of response operations) in intertidal water and sediments at identified control and impact sites.

### 4.1.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S1.1 Water samples	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) confirms that data from Modules O1 and/or O2 have predicted/confirmed exposure of intertidal waters</li> </ul>
	S1.2 Sediment samples	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) confirms that data from Modules O1 and/or O2 have predicted/confirmed exposure of intertidal or shoreline sediments</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has advised that either full or partial implementation of S1 is to commence.</li> </ul>
<b>Termination Criteria</b>	S1.1 Water samples	<ul style="list-style-type: none"> <li>✓ Ambient hydrocarbon concentrations in intertidal waters have returned to within the expected natural dynamics of baseline state and/or control sites; <b>or</b></li> <li>✓ Ambient hydrocarbon concentrations in intertidal waters are below relevant ANZECC &amp; ARMCANZ (2000) 99% species protection levels; <b>or</b></li> <li>✓ There has been no demonstrable impact on intertidal water quality from hydrocarbons.</li> </ul>
	S1.2 Sediment samples	<ul style="list-style-type: none"> <li>✓ Ambient hydrocarbon concentrations in intertidal sediments have returned to within the expected natural dynamics of baseline state and/or control sites; <b>or</b></li> <li>✓ Ambient hydrocarbon concentrations in intertidal sediments are below relevant ANZECC &amp; ARMCANZ SQGV (Simpson <i>et al.</i> 2013) or NAGD (CoA 2009) trigger levels</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ <b>Or</b> agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.</li> </ul>

### 4.1.3. Implementation

<b>Activation Time<sup>1</sup></b>	✓ S1 to be activated within 24 hours of initiation criteria being met;
<b>Implementation Time</b>	✓ Sampling and analysis plan to be ready within 24 hours of initiation criteria being met; ✓ Mobilisation and monitoring to commence within 24 hours of activation.
<b>Implementation Plan</b>	✓ Refer to <i>Implementation Guide for S1: Hydrocarbons in intertidal sediments and water</i>
<b>Reporting</b>	✓ Summary report to be provided to Esso Environment Unit Lead following completion of each field survey event; ✓ Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

### 4.1.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S1. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC & ARMCANZ 2000)
- Revision of the ANZECC/ARMCANZ Sediment Quality Guidelines (Simpson *et al.* 2013);
- National Assessment Guidelines for Dredging (CoA 2009).

Sub-module	Sampling technique	Data collection and/or analysis
S1.1 Water samples	<ul style="list-style-type: none"> <li>• Surface and sub-surface water sample collection<sup>1</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. TPH, TRH, PAH, BTEX);</li> <li>• Laboratory analysis for non-hydrocarbon parameters (e.g. metals, nutrients).</li> </ul>
S1.2 Sediment samples	<ul style="list-style-type: none"> <li>• Surface and sub-surface sediment sample collection<sup>2</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Laboratory analysis for hydrocarbons (e.g. TPH, TRH, PAH, BTEX);</li> <li>• Laboratory analysis for non-hydrocarbon parameters (e.g. TOC, PSD, metals, nutrients).</li> </ul>

Notes:

1. Sampling techniques as per operational module O2.3.
2. Sampling techniques as per operational module O6.1.

### 4.1.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S1. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for S1 in the event of a spill;</li> <li>Implement S1;</li> <li>Review and/or carry out reporting requirements;</li> <li>Compliance with the requirements of S1 and the OSMP;</li> <li>Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>Doctorate in environmental science,</li> <li>At least 10 years' experience in the collection of environmental samples from water and sediments;</li> <li>Familiarisation with relevant requirements of the OSMP and OPEP.</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories;</li> <li>Completing field data sheets;</li> <li>QA/QC data quality.</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area;</li> <li>Experienced in sediment and water quality sampling and recording techniques.</li> </ul>

### Resources

Vehicles will be required to support sampling of intertidal sediments and water. Sampling equipment for both sediment and water sampling will be required. Some resources for Module S1 can likely be shared with Modules O6 and S2. A NATA accredited laboratory will be required for analysis of the intertidal sediment and water samples. Esso has identified NATA accredited laboratories with the capabilities to support the analysis for scientific module S1, including but not limited to:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	4 Westall Road, Springvale VIC 3171 Ph: 03 8549 9600
Eurofins MGT	25 Kingston Town Close, Oakleigh VIC 3166 Ph: 03 8564 5000
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Ph: 03 9644 4888
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167

## 4.2 S2: Hydrocarbons in Offshore Sediments and Water

### 4.2.1. Purpose

The purpose of this module is to provide quantitative measures of offshore sediment and water quality. Scientific module S2 will assess and monitor concentrations of hydrocarbons and metals in offshore sediments and water by:

- Establishing the baseline concentrations of hydrocarbons and metals in water and sediment at identified pre-impact (if practicable) or control (i.e. un-impacted) offshore sites;
- Monitoring concentrations of hydrocarbons, metals and nutrients (if bioremediation techniques used as part of response operations) in offshore sediments and water at identified control and impact sites.

#### 4.2.2. Initiation and termination criteria

Initiation Criteria	S2.1 Water samples	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) confirms that data from Modules O1 and/or O2 have predicted/confirmed exposure to offshore waters</li> </ul>
	S2.2 Sediment samples	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) has determined that data from operational modules O1, O2 or O6 has confirmed exposure to either benthic substrate or waters within bottom 1 m of seabed</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has advised that either full or partial implementation of S2 is to commence.</li> </ul>
Termination Criteria	S2.1 Water samples	<ul style="list-style-type: none"> <li>✓ Ambient hydrocarbon concentrations in offshore waters have returned to within the expected natural dynamics of baseline state and/or control sites; <b>or</b></li> <li>✓ Ambient hydrocarbon concentrations in offshore waters are below relevant ANZECC/ARMCANZ (2000) 99% species protection levels.</li> </ul>
	S2.2 Sediment samples	<ul style="list-style-type: none"> <li>✓ Hydrocarbon concentrations in offshore sediments have returned to within the expected natural dynamics of baseline state and/or control sites; <b>or</b></li> <li>✓ Hydrocarbon concentrations in offshore sediments are below relevant ANZECC/ARMCANZ SQGV (Simpson <i>et al.</i> 2013) or NAGD (CoA 2009) trigger levels.</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ <b>Or</b>, agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.</li> </ul>

#### 4.2.3. Implementation

Activation Time <sup>1</sup>	<ul style="list-style-type: none"> <li>✓ S2 to be activated within 24 hours of initiation criteria being met</li> </ul>
Implementation Time	<ul style="list-style-type: none"> <li>✓ Sampling and analysis plan to be ready within 24 hours of initiation criteria being met;</li> <li>✓ Mobilisation and monitoring to commence within 24 hours of activation.</li> </ul>
Implementation Plan	<ul style="list-style-type: none"> <li>✓ Refer to <i>Implementation Guide for S2: Hydrocarbons in offshore sediments and water</i></li> </ul>
Reporting	<ul style="list-style-type: none"> <li>✓ Summary report to be provided to Esso Environment Lead following completion of each field survey event;</li> <li>✓ Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.</li> </ul>

##### Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

#### 4.2.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S2. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC & ARMCANZ 2000)
- Revision of the ANZECC/ARMCANZ Sediment Quality Guidelines (Simpson *et al.* 2013);
- National Assessment Guidelines for Dredging (CoA 2009).

Sub-module	Sampling technique	Data collection and/or analysis
S2.1 Water samples	<ul style="list-style-type: none"> <li>Surface and sub-surface water sample collection<sup>1</sup></li> </ul>	<ul style="list-style-type: none"> <li>Laboratory analysis for hydrocarbons (e.g. TPH, TRH, PAH, BTEX);</li> <li>Laboratory analysis for non-hydrocarbon parameters (e.g. metals, nutrients)</li> </ul>
S2.2 Sediment samples	<ul style="list-style-type: none"> <li>Surface sediment sample collection<sup>2</sup></li> </ul>	<ul style="list-style-type: none"> <li>Laboratory analysis for hydrocarbons (e.g. TPH, TRH, PAH, BTEX);</li> <li>Laboratory analysis for non-hydrocarbon parameters (e.g. TOC, PSD, metals, nutrients).</li> </ul>

Notes:

1. Sampling techniques as per operational module O2.3.
2. Sampling techniques as per operational module O6.2.

#### 4.2.5. Responsibilities, competencies, and resources

##### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

##### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

##### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S2. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for S2 in the event of a spill</li> <li>Implement S2</li> <li>Review and/or carry out reporting requirements</li> <li>Compliance with the requirements of S2 and the OSMP</li> <li>Provide advice with respect to environmental issues as required</li> </ul>	<ul style="list-style-type: none"> <li>Doctorate in environmental science,</li> <li>At least 10 years' experience in the collection of environmental samples from water and sediments;</li> <li>Familiarisation with relevant requirements of the OSMP and OPEP</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>Completing field data sheets</li> <li>QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area</li> <li>Experienced in the relevant sampling and/or recording techniques.</li> </ul>

##### Resources

Vessels and ROVs will be required to support sampling of offshore sediments and water. Sampling equipment for both sediment and water sampling will be required. Some resources for Module S2 can likely be shared with Modules O6 and S1. A NATA accredited laboratory will be required for analysis of the offshore sediment and water samples. Esso has identified NATA accredited laboratories with the capabilities to support the analysis for scientific module S2, including but not limited to:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	4 Westall Road, Springvale VIC 3171 Phone: 03 8549 9600

Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167

## 4.3 S3: Fish and Shellfish Taint and Toxicity for Human Consumption

### 4.3.1. Purpose

The purpose of this module is to:

- Provide an understanding of the levels of taint in commercial and recreational fish and/or shellfish species;
- Undertake a chemical analysis of the level of PAH and non-hydrocarbon constituents (e.g. metals) in fish and/or shellfish tissue to assess the level of risk for human consumption;
- Determine if differences exist in concentration of PAH and non-hydrocarbon constituents (e.g. metals) in fish and/or shellfish samples collected from impact and control sites.
- Determine if differences exist in the olfactory status of fish and/or shellfish samples collected from areas exposed to an oil spill (impact) and from control sites;
- Assess possible sources of specific odours via qualitative evaluation;
- Determine the persistence of taint over a specified time period;

### 4.3.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S3 Fish/shellfish tissue samples	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) has determined that data from operational modules O2/O6 or scientific modules S1/S2 has confirmed either: (a) in-water hydrocarbon concentrations are above guideline levels known to cause tainting (Table 4.4.5 in ANZECC &amp; ARMCANZ 2000); or (b) sediment hydrocarbon concentrations are above SQGV levels (Simpson <i>et al.</i> 2013)</li> <li>✓ Principal Investigator through the EUL (or delegate) has determined that data from operational modules O2/O6 or scientific modules S1/S2 has confirmed either: (a) in-water non-hydrocarbon constituent concentrations are above guideline levels known to cause tainting (Table 4.4.5 in ANZECC &amp; ARMCANZ 2000); or (b) sediment hydrocarbon concentrations are above SQGV levels (Simpson <i>et al.</i> 2013) <b>and</b></li> <li>✓ Agreement has been reached with the Jurisdictional Authority relevant to the spill to initiate the monitoring</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has advised that either full or partial implementation of S3 is to commence.</li> </ul>
<b>Termination Criteria</b>	S3 Fish/shellfish tissue samples	<ul style="list-style-type: none"> <li>✓ Two sequential sample sets show ambient hydrocarbon concentrations are below guideline levels for tainting in ANZECC &amp; ARMCANZ 2000); <b>and either</b></li> <li>✓ PAH and non-hydrocarbon constituent levels in fish and shellfish tissue have returned to within the expected natural dynamics of baseline state and/or control sites; <b>or</b></li> <li>✓ PAH and non-hydrocarbon constituent levels in fish and shellfish tissue are at or below levels specified by Food Standards Australia New Zealand (FSANZ).</li> </ul>

All sub-modules	✓	Or, agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.
-----------------	---	---

### 4.3.3. Implementation

Activation Time <sup>1</sup>	✓	S3 to be activated within 24 hours of initiation criteria being met
Implementation Time	✓	Sampling and analysis plan to be ready within 7 days of initiation criteria being met;
Implementation Plan	✓	Refer to <i>Implementation Guide for S3: Fish and shellfish taint and toxicity for human consumption</i>
Reporting	✓	Summary report to be provided to Esso Environment Lead following completion of each field survey event;
	✓	Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

### 4.3.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S3. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016);
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC & ARMCANZ 2000)
- Protocol for Interpretation and Use of Sensory Testing and Analytical Chemistry Results for Re-Opening Oil-Impacted Areas Closed to Seafood Harvesting Due to The Deepwater Horizon Oil Spill (USFDA 2010)

Sub-module	Sampling technique	Data collection and/or analysis
S3 Fish/shellfish tissue samples	<ul style="list-style-type: none"> <li>• Fish and/or shellfish collection;</li> <li>• Biological tissue sampling</li> </ul>	<ul style="list-style-type: none"> <li>• Physical specimen characteristics (e.g. length, sex, visible lesions etc.);</li> <li>• Laboratory analysis of tissue samples for hydrocarbons (e.g. PAH);</li> <li>• Olfactory analysis.</li> </ul>

### 4.3.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S3. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for S3 in the event of a spill;</li> <li>Implement S3;</li> <li>Review and/or carry out reporting requirements;</li> <li>Compliance with the requirements of S3 and the OSMP;</li> <li>Provide advice with respect to environmental issues as required.</li> </ul>	<ul style="list-style-type: none"> <li>Doctorate in environmental science;</li> <li>At least 10 years' experience in the collection of fish and shellfish for laboratory analysis;</li> <li>Familiarisation with relevant requirements of the OSMP and OPEP.</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories;</li> <li>Completing field data sheets;</li> <li>QA/QC data quality.</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area;</li> <li>Experienced in the fish/shellfish collection, sampling and recording techniques.</li> </ul>
Olfactory Analysis Panel (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sensory evaluation of fish and/or shellfish samples.</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in degree environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area;</li> <li>Experienced in olfactory analysis.</li> </ul>

### Resources

Vessels will be required to support collection of fish and shellfish samples. Equipment required for collection of samples may include baited traps and lure lines. A NATA accredited laboratory will be required for analysis of the fish and shellfish samples. Esso has identified NATA accredited laboratories with the capabilities to support the analysis for scientific module S3, including but not limited to:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	4 Westall Road, Springvale VIC 3171 Ph: 03 8549 9600
Intertek Geotechnical	41-45 Furnace Road, Welshpool WA 6106 Ph: 08 9458 8877
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Ph: 03 9644 4888
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167

## 4.4 S4: Short-Term Impacts to Oiled Fauna and Flora

### 4.4.1. Purpose

For the purposes of this module 'fauna' is defined as avifauna (seabirds and shorebirds) and marine megafauna (predominately pinnipeds). 'Flora' is defined as both aquatic flora (e.g. kelp present on subtidal reefs) and coastal flora (e.g. mangroves and saltmarsh).

The purpose of this module is to assess any short-term effects of oiling on marine fauna and flora which may have resulted from an oil spill. Module S5 is designed to conduct:

- Visual inspections of wildlife in the near shore marine environment and assess the number and species of oiled fauna and their health;
- Visual inspections of wildlife on shoreline environments, including at breeding areas and determine the number and species of oiled wildlife, and their general health;
- Surveys of coastal, subtidal and intertidal flora populations to identify the species present and record health condition parameters; and

- Fingerprint analysis of oil samples taken from oiled fauna to provide quantitative measures on the composition, type, estimated age and weathering and degradation of the product.

#### 4.4.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S4.1 Fauna surveys (vessel-based)	✓	Confirmation by the IMT IC (or delegate) that a hydrocarbon spill to marine or coastal waters has occurred; <b>and</b> Principal Investigator through the EUL (or delegate) has determined that data from operational modules O4 has confirmed the presence of oiled fauna.
	S4.2 Fauna surveys (land-based)	✓	
	S4.3 Oiled fauna hydrocarbon testing;		
	S4.4 Flora surveys	✓	Confirmation by the IMT IC (or delegate) that Level 2 or Level 3 hydrocarbon spill to marine or coastal waters has occurred; <b>and</b> Principal Investigator through the EUL (or delegate) has determined that data from operational modules O3 has confirmed the presence of oiled shorelines
	All sub-modules	✓	The IMT IC (or delegate) has advised that either full or partial implementation of S4 is to commence.
<b>Termination Criteria</b>	S4.1 Fauna surveys (vessel-based)	✓	Disturbance parameters (e.g. mortality, percentage oiled fauna/flora) have returned to within the expected natural dynamics of baseline state and/or control sites; and
	S4.2 Fauna surveys (land-based)	✓	
	S4.3 Oiled fauna hydrocarbon testing;		Hydrocarbon concentrations from fauna samples have returned to within the expected natural dynamics of baseline state and/or control sites.
	All sub-modules	✓	Or, agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.

#### 4.4.3. Implementation

<b>Activation Time<sup>1</sup></b>	✓	S4 to be activated within 24 hours of initiation criteria being met
<b>Implementation Time</b>	✓	Sampling and analysis plan to be ready within 24 hours of initiation criteria being met
<b>Implementation Plan</b>	✓	Mobilisation and monitoring to commence within 24 hours of activation.
<b>Reporting</b>	✓	Refer to <i>Implementation Guide for S4: Short-term impacts to oiled fauna and flora</i>
	✓	Summary report to be provided to Esso Environment Lead following completion of each field survey event;
	✓	Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

#### 4.4.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S4. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016).

Sub-module	Sampling technique	Data collection and/or analysis
S4.1 Fauna surveys (vessel-based)	<ul style="list-style-type: none"> <li>• Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>• Quantitative observation records (e.g. presence, abundance, behaviour etc.).</li> </ul>

Sub-module	Sampling technique	Data collection and/or analysis
S4.2 Fauna surveys (land-based)	<ul style="list-style-type: none"> <li>Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>Quantitative observation records (e.g. presence, abundance, behaviour etc.).</li> </ul>
S4.3 Oiled fauna hydrocarbon testing	<ul style="list-style-type: none"> <li>Oil sample collection</li> </ul>	<ul style="list-style-type: none"> <li>Physical characteristics (e.g. wax content, dynamic viscosity, density, volatiles);</li> <li>Chemical characteristics (e.g. PAH)</li> </ul>
S4.4 Flora surveys	<ul style="list-style-type: none"> <li>Coastal vegetation surveys</li> <li>Subtidal and intertidal benthic habitat surveys</li> </ul>	<ul style="list-style-type: none"> <li>Quantitative observation records (e.g. vegetation type, percent cover, health parameters etc.).</li> </ul>

#### 4.4.5. Responsibilities, competencies, and resources

##### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

##### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

##### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S4. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for S4 in the event of a spill</li> <li>Implement S4</li> <li>Review and/or carry out reporting requirements</li> <li>Compliance with the requirements of S4 and the OSMP</li> <li>Provide advice with respect to environmental issues as required</li> </ul>	<ul style="list-style-type: none"> <li>Doctorate in environmental science;</li> <li>At least 10 years' experience in fauna survey including the survey of marine fauna;</li> <li>Familiarisation with relevant requirements of the OSMP and OPEP</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>Completing field data sheets</li> <li>QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area</li> <li>Experienced in the relevant sampling and/or recording techniques.</li> </ul>

## Resources

Vehicles will be required to support land-based fauna surveys and flora surveys. Vessels will be required for implementation of vessel-based fauna surveys and may be supported by the use of UAVs for rapid collection of data via video or photographs of colonies. ROVs may be required for surveys of subtidal flora. Sampling equipment may be used by trained animal handlers to sample oil found on oiled wildlife and will require a NATA accredited laboratory to analyse the oil samples. Esso has identified NATA accredited laboratories with the capabilities to support the analysis for scientific module S4, including but not limited to:

NATA accredited laboratory	Details
Australian Laboratory Services (Melbourne)	4 Westall Road, Springvale VIC 3171 Ph: 03 8549 9600
Intertek Geotechnical	41-45 Furnace Road, Welshpool WA 6106 Ph: 08 9458 8877
Leeder Analytical Pty Ltd	33 Steane St, Fairfield, VIC, 3078 Phone: 03 9481 4167
National Measurement Institute	1/153 Bertie Street, Port Melbourne VIC 3207 Ph: 03 9644 4888

## 4.5 S5: Recovery of Commercial and Recreational Fisheries

### 4.5.1. Purpose

This module provides a semi-quantitative longer-term assessment of whether commercial and recreational fisheries have been impacted by a spill and the level of that impact pertaining to fish catch volume and effort rates. Module S5 will assess changes to fishery stocks due to oil exposure by:

- Determining the catch composition of species in each of the main fisheries following exposure to the spill;
- Summarise commercial catch volume and effort data post-oil spill and compare to pre-existing (baseline) information provided by the Victorian Fisheries Authority (VFA), the New South Wales Department of Primary Industries (NSW DPI), Tasmanian Department of Primary Industries, Parks, Water and Environment (DPIPWE), and/or Australian Fisheries Management Authority (AFMA); and,
- Calculate catch-per-unit effort for fish/shellfish species to determine any change in abundance.

### 4.5.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S5 Desktop review of fishery stock;	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that Level 2 or Level 3 hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) has confirmed that either: (a) data from S3 confirms tainting in fish or shellfish tissue; or (b) in response from government / State IC advice</li> </ul>
	All sub-modules	✓ The IMT IC (or delegate) has advised that either full or partial implementation of S5 is to commence.
<b>Termination Criteria</b>	S5 Desktop review of fishery stock;	✓ Catch per Unit Effort (CPUE) for fishery stock assessments have returned to within the expected natural dynamics of baseline state and/or control sites.
	All sub-modules	✓ <b>Or</b> , agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.

### 4.5.3. Implementation

<b>Activation Time<sup>1</sup></b>	✓ S5 to be activated within 24 hours of initiation criteria being met
<b>Implementation Time</b>	✓ Desktop assessment to commence within 24 hours of activation.
<b>Implementation Plan</b>	✓ Refer to <i>Implementation Guide for S5: Long-term impacts to commercial and recreational fisheries</i>
<b>Reporting</b>	✓ Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

### 4.5.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S5. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Sub-module	Sampling technique	Data collection and/or analysis
S5.1 Desktop review of fishery stock	<ul style="list-style-type: none"> <li>• Desktop review.</li> </ul>	<ul style="list-style-type: none"> <li>• Stakeholder liaison and data collation;</li> <li>• CPUE analyses.</li> </ul>

### 4.5.5. Responsibilities, competencies, and resources

#### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

#### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

#### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S5. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Implement S5;</li> <li>• Review and/or carry out reporting requirements;</li> <li>• Compliance with the requirements of S5 and the OSMP;</li> <li>• Provide advice with respect to environmental issues as required</li> <li>• QA/QC data quality.</li> </ul>	<ul style="list-style-type: none"> <li>• Doctorate in environmental science;</li> <li>• At least 10 years' experience in the collection and analysis of fishery data;</li> <li>• Familiarisation with relevant requirements of the OSMP and OPEP;</li> <li>• Experienced in fisheries data analysis.</li> </ul>

#### Resources

Module S5 is a desktop review and does not require mobilisation of non-personnel resources.

## 4.6 S6: Recovery of Fauna

### 4.6.1. Purpose

The purpose of this module is to provide semi-quantitative measures of changes to population dynamics of indicator fauna to assess long-term environmental effects on these species which may result from a hydrocarbon spill (i.e. assess the extent of damage and measure the degree of recovery, where possible). Module S6 will assess and monitor oil impacts to fauna populations by:

- Monitoring changes in population dynamics (pup counts, breeding success, population changes over time) at identified control and impact sites;
- Assessing the impact of a hydrocarbon spill on indicator fauna by analysing pre and post-impact data on population sizes at control and impact (where existing baseline data is available) sites.

### 4.6.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S6 Fauna surveys	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that Level 2 or Level 3 hydrocarbon spill to marine or coastal waters has occurred, <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) has determined that data from operational module O4 or scientific module S4 has confirmed the exposure of fauna</li> </ul>
	All sub-modules	✓ The IMT IC (or delegate) has advised that either full or partial implementation of S6 is to commence.
<b>Termination Criteria</b>	S6 Fauna surveys	✓ Disturbance parameters (e.g. estimated population) have returned to within the expected natural dynamics of baseline state and/or control sites.
	All sub-modules	✓ <b>Or</b> , agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.

### 4.6.3. Implementation

<b>Activation Time<sup>1</sup></b>	✓ S6 to be activated within 24 hours of initiation criteria being met
<b>Implementation Time</b>	<ul style="list-style-type: none"> <li>✓ Sampling and analysis plan to be ready within 7 days of initiation criteria being met;</li> <li>✓ Mobilisation and monitoring to commence within 7 days of activation</li> </ul>
<b>Implementation Plan</b>	✓ Refer to <i>Implementation Guide for S6: Long-term impacts to fauna</i>
<b>Reporting</b>	<ul style="list-style-type: none"> <li>✓ Summary report to be provided to Esso Environment Lead following completion of each field survey event;</li> <li>✓ Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.</li> </ul>

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

### 4.6.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S6. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016).

Or other related scientific studies (e.g. Kirkwood *et al.* 2005; Goldsworth *et al.* 2000).

Sub-module	Sampling technique	Data collection and/or analysis
S6.1 Fauna surveys	<ul style="list-style-type: none"> <li>Visual surveillance</li> </ul>	<ul style="list-style-type: none"> <li>Quantitative observation records (e.g. population, chicks/pups abundance, behaviour etc.).</li> </ul>

#### 4.6.5. Responsibilities, competencies, and resources

##### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

##### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

##### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S6. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for S6 in the event of a spill</li> <li>Implement S6</li> <li>Review and/or carry out reporting requirements</li> <li>Compliance with the requirements of S6 and the OSMP</li> <li>Provide advice with respect to environmental issues as required</li> </ul>	<ul style="list-style-type: none"> <li>Doctorate in environmental science;</li> <li>At least 10 years' experience in the survey and analysis of fauna data;</li> <li>Familiarisation with relevant requirements of the OSMP and OPEP</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>Completing field data sheets</li> <li>QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area</li> <li>Experienced in the relevant sampling and/or recording techniques.</li> </ul>

##### Resources

Vessels and vehicles will likely be required to access sites for ongoing monitoring of fauna at sea and on land.

## 4.7 S7: Recovery of Subtidal and Intertidal Benthic Habitat

### 4.7.1. Purpose

The purpose of this module is to assess long-term environmental effects on subtidal and intertidal benthic communities which may have resulted from an oil spill or response (i.e. assesses the extent of damage and measure the degree of recovery in benthic communities, where possible). Module S7 will assess and monitor long-term impacts to subtidal and intertidal benthic communities by:

- Undertaking habitat extent analysis to rapidly collect and process real-time data on abiotic and biotic parameters to determine subtidal and intertidal habitat classifications;
- Monitoring seagrass at impact and reference sites to determine extent of change (if any) in biomass and estimated cover due to oil impacts;

- Monitoring macroalgae and sponge at impact and reference sites to determine extent of change (if any) in biomass and estimated cover due to oil impacts;
- Monitoring benthic infauna at impact and reference sites to determine extent of change (if any) to species composition and abundance; and
- Monitoring fish at impact and reference sites to determine extent of change (if any) to species composition and abundance.

#### 4.7.2. Initiation and termination criteria

Initiation Criteria	S7.1 Habitat mapping; S7.2 Macroalgae and sponges S7.3 Benthic infauna monitoring; S7.4 Intertidal and subtidal fish monitoring	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that Level 2 or Level 3 hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) has determined that data from operational module O2/O6 or scientific module S1/S2/S4 has confirmed the exposure of either benthic substrate or waters within bottom 1 m of seabed</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ The IMT IC (or delegate) has advised that either full or partial implementation of S7 is to commence.</li> </ul>
Termination Criteria	S7.1 Habitat mapping; S7.2 Macroalgae and sponges S7.3 Benthic infauna monitoring; S7.4 Intertidal and subtidal fish monitoring	<ul style="list-style-type: none"> <li>✓ Disturbance parameters (e.g. species composition, percent cover) and health parameters (e.g. leaf condition) have returned to within the expected natural dynamics of baseline state and/or control sites.</li> </ul>
	All sub-modules	<ul style="list-style-type: none"> <li>✓ <b>Or</b>, agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring</li> </ul>

#### 4.7.3. Implementation

Activation Time <sup>1</sup>	<ul style="list-style-type: none"> <li>✓ S7 to be activated within 24 hours of initiation criteria being met</li> </ul>
Implementation Time	<ul style="list-style-type: none"> <li>✓ Sampling and analysis plan to be ready within 7 days of initiation criteria being met;</li> <li>✓ Mobilisation and monitoring to commence within 7 days of activation.</li> </ul>
Implementation Plan	<ul style="list-style-type: none"> <li>✓ Refer to <i>Implementation Guide for S7: Long-term impacts to subtidal and intertidal benthic habitat</i></li> </ul>
Reporting	<ul style="list-style-type: none"> <li>✓ Summary report to be provided to Esso Environment Lead following completion of each field survey event;</li> <li>✓ Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.</li> </ul>

*Notes:*

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

#### 4.7.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S7. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016).

Or other related scientific studies (e.g. Anderson *et al.* 2009; English *et al.* 1997; Brown *et al.* 2004; Cappo *et al.* 2006).

Sub-module	Sampling technique	Data collection and/or analysis
S7.1 Habitat mapping	<ul style="list-style-type: none"> <li>Visual and/or remote sensing surveillance (e.g. towed camera, tagging, side-scanning sonar etc.)</li> </ul>	<ul style="list-style-type: none"> <li>Identification of habitat type and composition;</li> <li>Mapping of habitat extent.</li> </ul>
S7.2 Macroalgae and sponge	<ul style="list-style-type: none"> <li>Visual and/or remote sensing surveillance (e.g. towed camera, tagging, side-scanning sonar etc.)</li> </ul>	<ul style="list-style-type: none"> <li>Population and community parameters (composition, cover, abundance, diversity)</li> </ul>
S7.3 Benthic Infauna monitoring	<ul style="list-style-type: none"> <li>Infauna sample collection (e.g. sediment grab sampling)</li> </ul>	<ul style="list-style-type: none"> <li>Population parameters (abundance, composition etc.).</li> </ul>
S7.4 Intertidal and subtidal fish or monitoring	<ul style="list-style-type: none"> <li>Visual and/or remote sensing surveillance (e.g. divers, BRUVS etc.)</li> </ul>	<ul style="list-style-type: none"> <li>Population parameters (abundance, composition etc.).</li> </ul>

#### 4.7.5. Responsibilities, competencies, and resources

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

##### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

##### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S7. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>Finalise the sampling and analysis design for S7 in the event of a spill</li> <li>Implement S7</li> <li>Review and/or carry out reporting requirements</li> <li>Compliance with the requirements of S7 and the OSMP</li> <li>Provide advice with respect to environmental issues as required</li> </ul>	<ul style="list-style-type: none"> <li>Doctorate in environmental science;</li> <li>At least 10 years' experience in the collection and analysis of data relating to marine infauna;</li> <li>Familiarisation with relevant requirements of the OSMP and OPEP</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>Completing field data sheets</li> <li>QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area</li> <li>Experienced in the relevant sampling and/or recording techniques.</li> </ul>

##### Resources

Vehicles and vessels will be required to support monitoring of nearshore and offshore benthic habitats and communities respectively. ROVs may be required for remote surveillance of benthic habitats and communities.

## 4.8 S8: Recovery of Coastal Flora

### 4.8.1. Purpose

The purpose of this module is to assess potential long-term environmental effects on the extent, composition and health of coastal flora communities which may have resulted from an oil spill (i.e. assess the extent of damage and measure the degree of recovery in coastal flora populations, where possible). Module S8 assesses and monitors long-term impacts to coastal flora by:

- Establishing the baseline (background) data on coastal flora community composition, structure and health at identified control and impact sites. Post-spill, pre-impact (reactive baseline) sampling will be undertaken if practicable e.g. if timing permits. This data will augment existing baseline information);
- Monitoring coastal flora communities over time at identified control and impact sites by assessing community extent, composition, structure and health; and
- Assessing the impact of a hydrocarbon spill on coastal flora communities by analysing long-term pre- and post-impact data at control and impact sites.

### 4.8.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S8.1 Habitat mapping;	✓	Confirmation by the IMT IC (or delegate) that Level 2 or Level 3 hydrocarbon spill to marine or coastal waters has occurred; <b>and</b> Principal Investigator through the EUL (or delegate) has determined that data from operational module O3 or scientific module S4 has confirmed the exposure of coastal flora
	S8.2 Condition monitoring	✓	
	All sub-modules	✓	The IMT IC (or delegate) has advised that either full or partial implementation of S8 is to commence.
<b>Termination Criteria</b>	S8.1 Habitat mapping;	✓	Disturbance parameters (e.g. abundance, percent cover) and health parameters (e.g. leaf condition) have returned to within the expected natural dynamics of baseline state and/or control sites.
	S8.2 Condition monitoring	✓	
	All sub-modules	✓	<b>Or</b> , agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.

### 4.8.3. Implementation

<b>Activation Time<sup>1</sup></b>	✓	S8 to be activated within 24 hours of initiation criteria being met
<b>Implementation Time</b>	✓	Sampling and analysis plan to be ready within 7 days of initiation criteria being met;
	✓	Mobilisation and monitoring to commence within 7 days of activation.
<b>Implementation Plan</b>	✓	Refer to <i>Implementation Guide for S8: Long-term impacts to coastal fauna</i>
<b>Reporting</b>	✓	Summary report to be provided to Esso Environment Lead following completion of each field survey event;
	✓	Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

### 4.8.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S8. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, sampling and analysis will be undertaken in line with relevant guidance documents, such as:

- Oil Spill Monitoring Handbook (Hook *et al.* 2016).

Or other related scientific studies (e.g. English *et al.* 1997).

Sub-module	Sampling technique	Data collection and/or analysis
S8.1 Habitat mapping	<ul style="list-style-type: none"> <li>• Remote sensing surveillance (e.g. multispectral imagery)</li> </ul>	<ul style="list-style-type: none"> <li>• Identification of habitat type and composition;</li> <li>• Mapping of habitat extent.</li> </ul>
S8.2 Condition monitoring	<ul style="list-style-type: none"> <li>• Visual (e.g. quadrats, photographs)</li> </ul>	<ul style="list-style-type: none"> <li>• Population parameters (e.g. abundance, percent cover etc.).</li> <li>• Health parameters (e.g. leaf cover, leaf damage, etc.)</li> </ul>

#### 4.8.5. Responsibilities, competencies, and resources

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for the initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

##### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

##### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S8. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Finalise the sampling and analysis design for S8 in the event of a spill</li> <li>• Implement S8</li> <li>• Review and/or carry out reporting requirements</li> <li>• Compliance with the requirements of S8 and the OSMP</li> <li>• Provide advice with respect to environmental issues as required</li> </ul>	<ul style="list-style-type: none"> <li>• Doctorate in environmental science;</li> <li>• At least 10 years' experience in the collection and analysis of data on flora including coastal flora;</li> <li>• Familiarisation with relevant requirements of the OSMP and OPEP</li> </ul>
Field Teams (2 to 3 people)	<ul style="list-style-type: none"> <li>• Conduct sampling, record data and arrange transfer of samples to laboratories</li> <li>• Completing field data sheets</li> <li>• QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>• Bachelor degree in environmental science or an engineering degree from a recognised institution or equivalent tertiary study in technical area</li> <li>• Experienced in the relevant sampling and/or recording techniques.</li> </ul>

##### Resources

Vehicles will be required to support the visual surveys involved in monitoring of coastal flora.

## 4.9 S9: Recovery of Ramsar Values

### 4.9.1. Purpose

This module is aimed at establishing whether oil entering Ramsar wetland has resulted in an alteration to the ecological character of the system. The purpose of this module is to:

- Assess long-term impacts of an oil spill on the ecological character of Ramsar sites.

### 4.9.2. Initiation and termination criteria

<b>Initiation Criteria</b>	S9 Desktop review of wetland values	<ul style="list-style-type: none"> <li>✓ Confirmation by the IMT IC (or delegate) that Level 2 or Level 3 hydrocarbon spill to marine or coastal waters has occurred; <b>and</b></li> <li>✓ Principal Investigator through the EUL (or delegate) has determined that (a) data from operational module O3 has confirmed the exposure of a Ramsar wetland; and (b) data from scientific modules S1, S4, S6, S7 or S8 confirm an impact to water/sediment quality, flora or fauna in the wetland.</li> </ul>
	All sub-modules	✓ The IMT IC (or delegate) has advised that either full or partial implementation of S9 is to commence.
<b>Termination Criteria</b>	S9 Desktop review of wetland values	✓ Wetland values that are important to the ECD* have returned to within the expected natural dynamics of baseline state and/or control sites.
	All sub-modules	✓ <b>Or</b> , agreement has been reached with the Jurisdictional Authority relevant to the spill to terminate the monitoring.

\* as described in relevant Ramsar site documents prepared per the National ECD Framework

### 4.9.3. Implementation

<b>Activation Time<sup>1</sup></b>	✓ S9 to be activated <sup>1</sup> within 24 hours of initiation criteria being met
<b>Implementation Time</b>	✓ Desktop assessment to commence within 24 hours of activation.
<b>Implementation Plan</b>	✓ Refer to <i>Implementation Guide for S9: Long-term impacts to Ramsar values</i>
<b>Reporting</b>	✓ Final report (including all data and associated interpretation and analysis) prepared following the termination criteria for the module being met.

Notes:

1. A module is considered activated when Esso have confirmed initiation criteria have been met and the monitoring providers have been notified to initiate planning and implementation tasks.

### 4.9.4. Monitoring overview

The below table provides an indication of the type of sampling techniques and analysis that may be undertaken during scientific module S9. The final sampling design, including methods and analysis, will be determined by Esso in conjunction with their monitoring providers in the event of a spill.

Where practicable, desktop reviews will be undertaken in line with relevant guidance documents, such as:

- National Framework and Guidance for Describing the Ecological Character of Australian Ramsar Wetlands (DEWHA 2008).

Sub-module	Sampling technique	Data collection and/or analysis
S9 Desktop review of wetland values	<ul style="list-style-type: none"> <li>• Desktop review.</li> </ul>	<ul style="list-style-type: none"> <li>• Data collation (including relevant information from scientific modules S1, S4, S6, S7 and S8 where relevant).</li> <li>• Comparison to known ecological character descriptions of Ramsar wetlands.</li> </ul>

#### 4.9.5. Responsibilities, competencies, and resources

##### Emergency response team

The IMT IC and EUL have responsibilities relating to the initiation of this scientific monitoring module. These roles may delegate responsibilities as appropriate; e.g. the ERT VM/OIM may be responsible for the initiation if the IMT has not yet been established. Roles, responsibilities and competencies of the ERT and IMT teams are as detailed in the OPEP.

##### Esso environmental team

Termination of this scientific monitoring module is the responsibility of Esso Environment Lead.

##### Monitoring team

The below table lists the minimum personnel requirements from the monitoring provider to implement scientific module S9. The numbers of teams and final number of personnel may vary depending on the nature and scale of the spill.

Personnel	Responsibilities	Competencies
Principal Investigator (1 person)	<ul style="list-style-type: none"> <li>• Implement S9</li> <li>• Review and/or carry out reporting requirements</li> <li>• Compliance with the requirements of S9 and the OSMP</li> <li>• Provide advice with respect to environmental issues as required</li> <li>• QA/QC data quality</li> </ul>	<ul style="list-style-type: none"> <li>• Doctorate in environmental science;</li> <li>• At least 10 years' experience in dealing with Ramsar values including the analysis of changes to those values;</li> <li>• Familiarisation with relevant requirements of the OSMP and OPEP</li> <li>• Experienced in wetland ecology.</li> </ul>

##### Resources

Module S9 is a desktop review and will not require mobilisation of non-personnel resources.

## Appendix A: General guidance and approaches for scientific monitoring design

This appendix provides guidance on survey design approaches that are likely to be utilised for the scientific monitoring modules:

- Impact versus Control (IvC);
- Gradient of Impacts;
- Before-After-Control-Impact (BACI);
- Control Chart;
- Lines of Evidence.

The design of monitoring studies should ensure, as far as possible, that the planned monitoring activities are practicable and that the objectives of the study will be met. The design must result in the collection of meaningful data and, where practicable, data that are sufficiently powerful to detect ecologically relevant changes.

The final survey design(s) can depend on a variety of factors, included but not limited to:

- Scale and pattern of potential effects of the spill;
- Availability of baseline data and/or ability to rapidly obtain baseline data;
- Time frame available to gather pre- and post-spill data;
- Availability of operational monitoring data;
- Availability of appropriate control sites;
- Statistical approach proposed for data analysis;
- Range of possible chronic and acute effects on the parameters of concern, based on the characteristics of the spill;
- Monitoring frequency required to ensure short- and long-term impacts are detected;
- Legislative requirements;
- Available resources and equipment to conduct the work in terms of personnel, logistics, and access.

Note: data collection can depend on several constraints (as outlined above) and on access given logistical and safety constraints applicable to a particular spill event. Therefore, the survey designs recommended within the implementation guides for each scientific monitoring module, may not be able to be implemented exactly as intended. For example, there may be inadequate number of control sites because of the size of the spill and therefore data collected from an expected BACI design may need to be analysed as a gradient approach etc.

### Before-After-Control-Impact (BACI) approach

Where appropriate baseline data are available, consideration should be given to developing a beyond BACI monitoring program design (Underwood 1991; 1994) or similar extended BACI design (mBACI), which monitors a range of control and impact sites, and can do so over time (Figure A-1). Where robust, appropriate baseline data for exposure sites are not available, pre-exposure sampling of locations that lie within the hydrocarbon spill trajectory should be prioritised to obtain baseline data prior to hydrocarbon exposure.

Exposure sites should be selected first, encompassing a representative selection of locations within the area affected by hydrocarbons. Where practicable, the monitoring program design may consider stratified sampling along environmental gradients (e.g. level of hydrocarbon exposure etc.). Comparable control sites beyond the area affected by hydrocarbons should then be selected, with monitoring conducted at all sites. Clearly obtaining control sites pre-exposure can be challenging and is heavily reliant on predicting the extent of hydrocarbon movement.

The suggested statistical analysis of data collected using the BACI approach includes a univariate or multi-factorial analysis of variance (ANOVA) and equivalent non-parametric tests, all of which will compare between treatment (impact versus reference) and time (before versus after). Components of variation may help partition a sum of squares into different sources and describe the importance of factors within tests.

**Notes:**

1. A modification to the beyond BACI design, is known as an MBACI design. MBACI designs incorporate multiple impact locations, whereas beyond BACI designs include only one impact location.
2. The above design consists of four reference/control locations and two impact locations, with four nested sites in each. The number of replicates (e.g. quadrats or transects) per site should be set based on resourcing, and /or the results of the power analysis (if applicable).
3. The area affected by the spill is indicated by the grey shaded area, or the area of influence.
4. Design assumes the area of influence has been affected equally.

**Figure A-1: Example of an MBACI design for shoreline and/or intertidal communities**

### Impact versus Control (IvC) approach

For some locations and receptors, baseline data may not exist, may not be recent and applicable, or was collected using methods that are unrepeatable in the current study. If there is a lack of baseline information that can feed into a BACI design, an IvC approach can be used to assess impacts. However, due to the unknown status of the parameter before impact, there is a higher likelihood of encountering Type I error (falsely concluding that an impact has occurred) with this approach. For example, if the status of the parameter to be measured was already naturally lower at impact sites than control sites before the impact occurred, but this was not measured, a conclusion may be reached using the IvC approach that an impact has occurred when it may be natural variation. For this reason, sampling designs should always try to collect or use baseline data (i.e. aim for a BACI design), and if an IvC design is used, it is important to ensure that the control sites are comparable to the impact sites in every way possible except for the presence or absence of the studied effect (hydrocarbon). This may include, but not be limited to: site physical aspect, substrate, current regimes, and community composition.

Because of the higher likelihood of Type I error, it is also useful to collect additional data on relevant physical environmental parameters that are likely to be different at impact and control sites and may affect the conclusion of the assessment. Biological information may also be relevant, such as degree of sub-lethal and lethal impacts to populations. These parameters can be examined later for any potential co-variance with the observed changes in the parameter of interest, to understand whether hydrocarbons or natural variation affected the outcome. The physical and biological information can therefore augment and act as additional evidence to help interpret conclusions from any IvC analyses. As with the BACI approach, when using the IvC approach it is important to understand the scale of natural variation that may affect the outcome of the assessment by replicating sites within sampling locations and replicating samples within each site.

The suggested statistical approach for analysing the data collected using the IvC approach is a multi-factorial ANOVA (to account for nested data), including PERMANOVA and non-parametric tests, to test whether the level of variation among treatments (IvC) is greater than the level of variation within treatments. Components of variation may help partition variance into different sources and help infer whether the effect of hydrocarbons or spatial variation was responsible for any detected change in the receptors.

## Gradient approach

The gradient approach can be used in some instances where a lack of suitable control sites prohibits using a BACI or IvC approach. Sampling should be established along a gradient of predicted effect (based on input of data from operational monitoring, surveillance or modelling), with sites established at various distances from the source of impact or along a gradient of magnitudes of concentrations of hydrocarbons. The gradient approach can also be used in combination with a BACI or IvC approach to help infer the cause of a detected impact and describe thresholds of impacts at which a response appears to have occurred. The gradient approach also provides a 'line of evidence' that the source of potential impact (hydrocarbons) was responsible for the observed effect, rather than natural variation. However, care should be taken to ensure awareness of any natural gradients in the parameter measured and take these into account when interpreting the data.

When designing a study using a gradient approach, relevant Oil Spill monitoring data (e.g. water and sediment quality), and modelling should be considered. Prior knowledge or prediction of the likely gradient of effect will greatly improve the efficiency of the sampling design by minimising the collection of data points that provide no additional information in the analysis (e.g. data points showing similar or no effects that do not help to characterise the gradient of effect), though noting these may aid in statistical power of gradient description so shouldn't necessarily be discouraged.

Typically, the level of observed impact will decline at distance from the source of a hydrocarbon release, with this decline likely to be exponential (i.e. large changes close to a release that quickly decrease in severity); therefore, sampling effort can be distributed along the gradient of effect in a way that best characterises the changes in the parameter measured.

If possible, multiple (> two) sites could be sampled at each distance along the gradient (if logistics and time permit) to provide an understanding of small-scale variation. Sites should also be sampled at distances where no environmental effect is predicted or observed, if possible, to characterise the full extent of the effect's gradient.

The suggested statistical analysis for the gradient approach includes correlation analysis between impact (measurements of hydrocarbon/stress; x-axis) and measurement parameter (biological response; y-axis), and associated regression analyses, may include least-squares regression line and hypotheses testing to determine if the trend is significantly different from zero.

## Control chart approach

The control chart approach is applicable in the following circumstances:

- When long-term (multi-year) datasets exist for the measured parameter;
- When a large amount of natural variation exists in the measured parameter;
- When predicting the expected range of outcomes from an impact.

One of the causal criteria described in the lines of evidence approach is 'strength of association' (Hill 1965), exemplified by a 'larger decline in individuals in areas affected by hydrocarbon than in control areas'. The control chart approach takes this causal criterion a step further and uses rules to establish whether a detected change in a parameter at impact sites is outside what would be expected to occur naturally. This technique requires tracking a parameter over time and determining whether an observed change is within the bounds of what has been observed to occur naturally at that impact site or at control sites.

A control chart has a central line for the mean, an upper control limit (UCL; e.g. typically 3 standard deviations [SD] above the mean), and a lower control limit (LCL; e.g. typically 3SD below the mean), which are typically all determined from historical data (Gotelli and Ellison 2004). The mean line can be constructed using data from i) historical data of an impact site prior to it being affected by hydrocarbons

(i.e. what the mean used to be), or ii) control locations, whereby either historical or recent data is used for comparison to other sites (i.e. a control site historical data compared to impact site). The approach is then based on calculating the mean (ongoing) for an impact site to compare against the control chart. Any observations outside the UCL and LCL suggest that increased variation has been observed that are inconsistent with other data and may post a simple way to detect change in a system (Figure A-2).

In addition, if ongoing data collection is possible following a potential impact, the control chart approach can be used to examine the direction of change and whether this is consistent or inconsistent with other data. These data and interpretation may provide a weight of evidence of a directional change in a given parameter.

The control chart approach is only useful if there is an adequate knowledge of natural variability in a given parameter whether from historical sources or similar sites/locations. Control chart approaches can be a powerful tool for detecting impacts for systems that are naturally highly variable.

Note: The star represents a measurement beyond the likely anticipated variation, which needs to be investigated.

**Figure A-2: Example Control Chart showing Centreline (mean), Upper Control Limit (3 SD above mean), Lower Control Limit (3 SD below mean), and Measurements**

## Lines of evidence approach

The lines of evidence approach is applicable in the following circumstances:

- Can be combined with any of the above monitoring designs to provide inferential evidence of an effect;
- Are useful to support evidence of effect if there are limited (or only one) impact locations;
- Are useful to support evidence of effect if the effect radiates outward from source;
- Are useful to infer cause of change if limited or no baseline data exist;
- Are useful to infer cause of change if limited or no control sites exist.

When a sampling design is suboptimal, or if conclusions from more formal tests are inconclusive, a lines of evidence approach can be used to help infer the cause of an observed change (i.e. attribute change to the hydrocarbon release or to other causes, such as natural variation). Within the lines of evidence approach, inference is developed based on carefully structured arguments. A weakness of this method is that the evidence may be largely circumstantial because it is based on correlations (Downes *et al.* 2002), which does not necessarily imply causation. Each causal argument may be weak when considered independently but combined they may provide strong circumstantial evidence and support for a conclusion (Downes *et al.* 2002).

This approach was originally developed in medicine (Hill 1965) but has been used more recently in ecological studies (e.g. Downes *et al.* 2002; McArdle 1996; Suter 1996; Beyers 1998; Fabricius 2004).

Causal criteria have been developed for categorizing arguments from studies on disease on humans (Hill 1965), and these can be applied to ecological arguments (Hill 1965). With lines of evidence, there is a need to seek evidence not only to support the impact prediction, but evidence to rule out plausible alternative predictions, such as that the observed difference was due to natural processes (Downes *et al.* 2002; Beyers 1998).

In the lines of evidence approach, a set of descriptions should be developed for all or some of the causal criteria listed in Table A-1 before the survey is undertaken (see Downes *et al.* 2002 for further criteria and examples). Data would then be collected that allows each line of evidence to be tested or objectively questioned. The final assessment of whether an impact is likely to have occurred should be based on the 'weight of evidence' from examining multiple lines of evidence.

Example generalised lines of evidence descriptions are provided in Table A-2. These should be modified and tailored to individual scientific monitoring module, as required and each parameter investigated.

**Table A-1: Hills (1965) causal criteria and description in the context of ecological impact Assessment**

Causal Criterion	Description
Strength of association	A large proportion of individuals are affected in the impact area relative to control areas
Consistency of association	The association was observed by other investigators at other times and places
Specificity of association	The effect is diagnostic of exposure
Temporality	Exposure must precede the effect in time
Biological gradient	The risk of effect is a function of magnitude of exposure
Biological plausibility	A plausible mechanism of action links cause and effect
Experimental evidence	A valid experiment provides strong evidence of causation
Coherence	Similar stressors cause similar effects
Analogy	The causal hypothesis does not conflict with existing knowledge of natural history and biology

**Table A-2: Causal criteria and example lines of evidence descriptions that could be used to assess whether a change in a measured parameter was due to the effects of a hydrocarbon release**

Causal Criterion	Evidence Supportive of a Hydrocarbon Release Impact	Evidence Unsupportive of a Hydrocarbon Release Impact
Strength of association	Larger decline in individuals in areas affected by hydrocarbon than in control areas	Similar declines in individuals in areas affected by hydrocarbon and control areas
Consistency of association	Consistent finding of declines in a range of biota in areas affected by hydrocarbon	Inconsistent declines in biota in areas affected by hydrocarbon (e.g. declines in one species but not in other similar species)
Specificity of association	Number of individuals affected correlates with hydrocarbon concentrations	No correlation between number of individuals affected and hydrocarbon concentration
Temporality	Decline in individuals immediately preceded by contact with hydrocarbon	Decline in individuals occurred before or long after hydrocarbon contact
Biological gradient	Changes in individuals aligned with exposure to hydrocarbon spills or concentrations	Decline in individuals occurs with increasing distance from a hydrocarbon spill or hydrocarbon concentrations
Biological plausibility	Evidence from literature of sensitivity to detected hydrocarbon concentration for species where declines are observed	Evidence from literature suggests lack of sensitivity to detected hydrocarbon concentration for species where declines are observed

Causal Criterion	Evidence Supportive of a Hydrocarbon Release Impact	Evidence Unsupportive of a Hydrocarbon Release Impact
Experimental evidence	A valid experiment provides strong evidence of causation	Not applicable (N/A)
Coherence	Evidence of a decline in species abundance, habitat, and food source with increasing hydrocarbon exposure	Evidence of a decline in species abundance, but no other evidence of expected declines associated with exposure
Analogy	Apparent declines in hatchling numbers despite no apparent decline in numbers of adults	Apparent declines in hatchling numbers associated with decreased numbers of adults

## Appendix B: Baseline data

### Rationale and approach

Scientific monitoring provides for the quantitative assessment of the environmental impacts associated with a Level 2 or Level 3 spill. The primary goal of the scientific monitoring program is to document the overall impact (short and long term) of the spill on habitats, species and ecosystems and the subsequent post spill recovery.

In the event of a Level 2 or Level 3 spill, scientific monitoring will be activated and individual modules selected and implemented appropriate to the nature, scale and duration of the spill. Activation of these scientific modules during the spill operational response phase may be required to collect pre-contact baseline data or spill impact data at identified receptors. The appropriate scientific modules will be implemented to assess the extent, severity and persistence of environmental impacts associated with the oil spill event.

Baseline monitoring provides information on the condition of ecological receptors prior to, or spatially independent (e.g. if used in control chart analyses) of, a spill event and is used for comparison with the post-impact scientific monitoring where required. This is particularly important for scientific monitoring where the ability to detect changes between pre-impact and post-impact conditions is necessary.

The design of the scientific monitoring program adopts the following framework:

- Where adequate and appropriate baseline data exists, then scientific modules for species and habitats will commence if and when initiation triggers are reached. In this instance given the adequacy of baseline, the scientific modules will not document the decline of the habitat or species, but will quantify impacts and monitor post-spill recovery;
- Where adequate and appropriate baseline data is not available, the options which will be considered include the following:
  - Collect baseline data prior to hydrocarbon contact and meet the requirements for a Before/After Assessment<sup>1</sup>; or
  - Collect environmental data during the spill event, if practicable, to determine potential impacts<sup>2</sup>;
- In all cases, undertake post-spill scientific monitoring to determine the overall impact of the spill and document post-spill recovery.

An assessment of available baseline data for environmental receptors within the DA is contained in each of the scientific modules. Within each of those modules there is a description of the scientific monitoring approach which respect to baseline, obtaining data and determining impacts.

There are Oil Spill monitoring modules that are suited to pre-impact baseline monitoring. In the event of a spill to marine or coastal waters, reactive pre-impact monitoring should, where practicable, be implemented to gather additional data on the current state of the environment. Note: the collection of ongoing baseline data (i.e. under regular operational conditions) is not planned or considered to be practicable.

Understanding priority areas for reactive pre-impact baseline monitoring is important. Stochastic modelling may be used to determine areas likely to be contacted with fresh hydrocarbons above impact thresholds within a specified timeframe. For example, stochastic modelling may indicate a number of shoreline receptors have a high probability of contact with fresh hydrocarbons; these areas would then

---

<sup>1</sup> Application of the simple BACI sampling design and data analysis programs can be applied to the quantification of oil spill related impacts. See Appendix A

<sup>2</sup> Spill impact and post impact monitoring data will be collected following 'beyond-BACI' principles which is amenable to statistical techniques that can detect significant difference in recorded parameters (i.e. asymmetrical analysis of variance) following procedures described by Underwood (1994).

provide an initial focus for reactive pre-impact monitoring. A summary of activity specific modelling data identifying priority monitoring sites is provided in the OPEP Appendix D Quick Reference Information.

Control sites (i.e. similar to the impact or disturbance location) are sometimes more relevant than reference sites (undisturbed or natural sites) for determining the impact of a hydrocarbon spill as separate from other human or natural stressors (Downes *et al.* 2002). In the event of a spill, existing baseline information should be used to select relevant control sites outside the impact area of a single spill. It is expected that most control sites will be within the predicted environment that may be affected, but outside the impacted area for any given single spill. As all possible permutations or combination of sites cannot be realistically assessed in advance, control sites should be selected post-spill. The number of samples and/or sampling sites for a particular spill should depend on the extent of the spill, and the statistical power necessary to determine whether there is an impact and the ability of the monitoring program to determine recovery and termination criteria.

### **Baseline monitoring**

Baseline information for the environment has been sourced from existing data and is summarised in each scientific monitoring module. In the event of a spill, where insufficient baseline exists information will be augmented with 'reactive' baseline studies at control sites or using pre-impact data at the receptor site where appropriate.

Control sites (i.e. similar to the impact or disturbance location) are often more relevant than reference sites (undisturbed or natural sites) for determining the impact of an oil spill as separate from other human or natural stressors (Downes *et al.* 2002). In the event of a spill existing baseline information will be used to select relevant control sites outside the impact area of a single spill. It is expected that most control sites will be within the DA, but outside the impacted area for any given single spill and will be selected post spill event on the basis of their representativeness to the potentially impacted site and their ability to provide a reliable comparison against which to compare the potentially impacted environmental values that are being measured.

The number of samples and/or sampling locations for a particular spill will depend on the extent of the spill, and the statistical power necessary to determine whether there has been an impact and the ability of the monitoring program to determine recovery and termination criteria.

### **Existing data**

Baseline data characterises the existing environment and its variability both in affected sites and unaffected (control or reference) sites.

The EP contains desk study baseline environmental, social and economic values within the DA at a level deemed suitable for risk assessment and identification of mitigation and contingency planning measures as set out in the EP and OPEP. A summary of known baseline data from the Gippsland region and beyond, including New South Wales is shown in Table B-2.

In the event of a Level 2 or 3 spill relevant specific existing data will be obtained as the starting point to scientific monitoring, by the following process:

- Relevant scientific monitoring studies are catalogued for identified sensitive locations along with the custodian's contact details;
- The monitoring methodology, monitoring sites, and sampling duration and frequency of monitoring studies are provided when appropriate in a tabular format to identify methodological differences, and spatial and temporal gaps in accrued baseline data information;
- In the event of a spill data custodians will be contacted and datasets requested. As a contingency, 'data mining' from publically available information will occur simultaneously for baseline database establishment; and
- Data gaps will be used by the PI to refine the SAP to further optimise the design of the study.

Within each module is a summary of the available baseline information together with implementation strategy to address the assessment of impacts is provided.

The methods used to collect the existing baseline data will be assessed and, where possible, the methods used in the implementation of the monitoring will be consistent with the baseline data methods such that comparisons can be made. The design of the modules has already drawn upon the information contained within the existing baseline studies that were used to inform both the preparation of the EP and the OSMP and its modules, and as such there is already a degree of conformity between the methods proposed in the modules and that used for the collection of the published baseline data.

### **Monitoring survey type**

Establishment of baseline is conducted according to Table B-1.

**Table B-1: Baseline data types**

Type	Description
Baseline field surveys	Field surveys undertaken in advance of the full implementation of the investigations in the modules where baseline information is required. Since the DA is very large and actual spill trajectory dependent on many variables, it is not possible to devise a study programme in advance of a spill that would provide a useful, representative baseline that would cover all spill scenarios.
Reactive baseline surveys	Monitoring surveys mobilised rapidly after a spill to assess baseline conditions at sensitive locations potentially affected by the spill but before spill contact.  Esso recognises that reactive baseline monitoring surveys alone may not be sufficient to serve as a baseline dataset, but can provide an important contribution to augment existing 'baseline' with a 'current pre-exposure' condition.
Baseline studies at control sites	Monitoring at sites chosen from within the DA but where spill trajectory estimation predicts no contact.

### **Impact surveys**

Impact surveys examine the immediate aftermath of a spill on specific receptors.

### **Recovery surveys**

Recovery surveys examine the long term effects on specific receptors following the spill recovery.

### **Use of operational monitoring data**

Findings of operational monitoring will be incorporated into the datasets gathered by scientific monitoring.

### **Monitoring methods**

Survey and analytical methods are specific to the environmental value or receptor to be monitored. Methods selected for each module are set out in the relevant subsection of each module.

### **Monitoring sites**

Reactive baseline monitoring sites may be required where there is insufficient existing baseline data against which to compare data collected following exposure to a hydrocarbon spill.

Selection of reactive baseline survey sites will need to be flexible and will depend on a range of site-specific, scientific criteria depending on the module. However in general sites must be:

- Representative of the area that is potentially impacted by the hydrocarbon spill;
- Coincide in proximity to locations with long-term (or recent) monitoring (notably in Victorian Marine Conservation Areas); and
- Be free from obvious anthropogenic impacts.

### **Reference sites**

Reference sites are those that are representative of undisturbed / natural conditions of similar type, habitat, community etc. to those affected. Although reference sites for most types of affected environment will exist within the DA, control sites may be more representative in many cases.

### **Control sites**

Control sites (i.e. unaffected sites similar to those affected by the spill) are used to determine the impact of an oil spill as separate from other human or natural stressors. In the event of a spill existing baseline information will be used to select relevant control sites outside the impact area of a single spill and must be selected post spill. Control sites will be selected and details of distribution and number of replicates will be decided after detailed appraisal of baseline data such that an understanding of the variability of the data can be obtained.

### **Monitoring indicators**

Indicators are specific species, communities or habitats where changes reflect impacts on the wider environment. Indicators for scientific monitoring were identified and chosen based on the following criteria.

#### Typical – representative of ecological characteristics of the DA

Monitoring of spill impacts is focussed on species that are known to regularly occur within the DA and for which the DA provides vital habitat. This accords with the ecological principle of 'regularly supports' (United Nations 1971).

#### Sensitive – are sensitive to the impacts of oil spills

Species and communities can be impacted by both the oil spill and by associated response actions. The mechanisms and cumulative impacts to species and communities have been explored using a stressor model. This does not cover the entire myriad of complexities and pathways associated with oil and response actions in marine, coastal and estuarine environments but provides an overview of the main linkages (Gross 2003).

### **Determining impacts**

Data on impacted sites will be compared with baseline data from reference or control locations to determine impacts. Multiple reference / control locations will be selected to provide a robust assessment of the impacts.

If there is sufficient statistical power in the data collected then post-impact monitoring will be analysed using statistical models such as Analysis of Variance (ANOVA). The data collected during the monitoring may be too variable to establish statistical trends. Such a situation is not uncommon in monitoring programs where limited 'before' data are available.

Generally determination of an impact involves an experimental approach with sampling before and after the purported impact at both potentially impacted and control (non-impacted) sites – the BACI (Before – After – Control – Impact) approach. The BACI approach allows for the detection of impacts that can be identified as statistically separable from the background natural variation that could be causing the observed phenomenon. The soundness of the approach stems from the ability to combine a range of design elements (an assessment of the before situation, replication, use of controls) to ensure the robustness of the assessment.

In many cases, and this situation pertains to an oil spill is one of them, where there is an inability to be able to collect information about the pre-impact situation. This may be as a result of adverse weather conditions not allowing a reactive baseline survey to be conducted safely. Thus a situation can arise there is insufficient information available as to what the before situation was and indeed what the situation was at any control location either before or after the action. There is also potentially no replication. In such cases an evaluation of the available evidence can be undertaken to see whether there is support for a particular hypothesis or not. Downes *et al.* (2002) in their book on monitoring of aquatic environments present a detailed review of this technique, the Weight (Levels) of Evidence approach. The use of multiple lines of evidence consistent with the integrated assessment philosophy of the revised ANZECC/ARMCANZ (2000a) guidelines as discussed in the CSIRO Handbook for

Sediment Quality Assessment (Simpson *et al.*, 2005). A weight of evidence approach can be taken when there is no definitive experimental evidence available to support or not support a hypothesis.

## Appendix C: Environmental Values and Sensitivities

### Environmental values and sensitivities

The monitoring program responding to a spill is dependent on the types of environmental, social and economic values potentially affected by a spill. Those sensitivities identified by in the Environment Plan (EP) as being present in the Potentially Exposed Area (PEA) are summarised in Table C-1. Linkages between environmental sensitivities, their location, oil spill response options for spill scenarios and OSMP studies are also shown in this table.

### Scope of the monitoring program

The OSMP modules provide for the rapid assessment of the extent of spread of hydrocarbons from a Level 2 or Level 3 spill and effects on the environment of the spilt hydrocarbons as well as any spill response activities that may be used in the clean-up of the spill. The modules provide for the rapid assessment of impacted and potentially affected wildlife including those listed as Matters of National Environmental Significance (MNES) und the EPBC Act (1999). These modules were based on the spill impact assessment in the EP and probable exposure pathways and the likelihood of contact with the identified sensitive receptors.

Table C-1: Sensitivities within Level 3 Hydrocarbon Spill PEA with Monitoring Strategies and Potential OSMP Response Measures to be adopted

## DOCUMENT REVIEW AND UPDATE

The Document Administrator is responsible for maintaining and controlling changes to this document in accordance with the Document Management Manual.

In the course of using this document, users may identify opportunities to improve its content. They are requested to suggest these to the Document Administrator.

This document should be reviewed for accuracy and currency on a 5 yearly basis commencing from the original formal issue date. Major revisions to this manual are to comply with the OIMS System Manual/Process Management of Change procedures.

## DISTRIBUTION

An electronic copy of this document is lodged on U-Docs and a controlled hardcopy is issued to the following recipients:

Copy #	Position	Location
N/A		

Esso Australia Resources Pty Ltd acknowledges Aboriginal and Torres Strait Islander people as the Traditional Custodians of the land and acknowledges and pays respect to their Elders, past and present. Esso Australia Resources Pty Ltd is committed to safe and inclusive workplaces, policies and services for people of LGBTIQ communities and their families.

## 1 Environmental outcomes, standards and measurement criteria

This Section presents the Environmental Performance Outcomes (EPOs), Environmental Performance Standards (EPSs) and measurement criteria required to manage the impacts and risks identified in Volume 2 of this Environment Plan (EP).

The following definitions are used in this Section, as defined in Regulation 4 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (OPGGs (Environment) Regulations):

- EPO – a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level (i.e. a statement of the environmental objective).
- EPS – a statement of the performance required of a control measure.
- Measurement criteria (not defined in the regulations) – defines the measure by which environmental performance used to determine whether the EPSs and EPOs have been met.

**Table 1-1 Environmental performance – Plug and abandonment**

Aspect	Impact	EPO	Control	EPS	Measurement criteria
<b>Aspects of planned activities</b>					
Physical presence – Seabed disturbance	Change in habitat, smothering and change in water quality.	Avoid physical damage to sensitive habitats (i.e. benthic features such as reefs).	<b>CMP1:</b> Site-specific geotechnical assessment	Results of the site-specific geotechnical assessment are used to inform the well locations and confirm the proposed location is free from seabed obstacles, including benthic features.	As the LWIV is on dynamic positioning (DP), no geotechnical assessment is required.
			<b>CMP20:</b> LWIV move procedure	The approved LWIV move procedure details how the LWIV will be moved onto and moved off location. It includes approach path, communication protocols, Permit to Work arrangements and survey criteria to prevent an impact with subsea assets.	Approved procedure is available on site and utilised.  Daily reports confirm that the procedure is followed.
			<b>CM32:</b> NOPSEMA accepted Well Operations Management Plan	The NOPSEMA accepted Well Operations Management Plan (WOMP) describes how the risks to the integrity of the wells will be reduced to ALARP.  This includes: <ul style="list-style-type: none"> <li>• That two barriers have been maintained</li> </ul>	Records confirm a NOPSEMA-accepted WOMP was in place before operations commence.  Records demonstrate that the P&A has been completed in accordance with the WOMP prior to well head removal.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<ul style="list-style-type: none"> <li>That barrier integrity is tested and verified</li> <li>That the wells are plugged and abandoned and left in a safe state.</li> </ul> <p>The well head will not be removed until the P&amp;A program has been completed in accordance with WOMP requirements.</p>	
			CMP38 Remove Wellhead and casing strings at or below mudline	<p>The Casing strings will be cut at or below mudline, followed by casing, wellhead and guide bases removal. The cuts would be made with an internal cutter with at least two attempts.</p> <p>In the event that internal casing cutters are not successful, ROV deployed external cutters will be used to cut at or below mudline.</p> <p>In the event that the Wellhead / Casing / guide bases cannot be successfully removed, the equipment will be left in place and status recorded in accordance with below.</p> <p>Should in-situ storage be required, the items will be maintained in accordance</p>	<p>Well Operations Records confirm depth of cut and as left survey shows seabed clear of subsea equipment.</p> <p>Temporary storage assessment.</p> <p>Subsea material register.</p> <p>NOPSEMA notification records.</p>

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				with the inspection, maintenance and repair processes outlined in the Bass Strait Operations EP (AUGO-EV-EMM-002) Refer to CM6: Temporary storage assessment <ul style="list-style-type: none"> <li>• CM70 The Subsea Material Register</li> </ul> CM1: Maintenance activities for facilities already at CoP are implemented in accordance with s572 (2) Requirements	
Physical interaction – Other marine users	Change to the function, interests or activities of other users.	Marine users are informed prior to commencement of the P&A activities such that they are able to plan their activities and avoid unexpected interference.	<b>CMP2:</b> Petroleum Safety Zone	Petroleum Safety Zones (PSZs) established in accordance with <i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i> (Cmth) (OPGGGS Act).	Government Gazette contains notice of establishment of PSZs.
				Establishment of adequate navigation aids and communication systems on LWIV and supporting facilities (virtual buoy).  Collaboration with AMSA in promulgating adequate warnings and Notices to Mariners.	Records confirm that navigation aids and communication systems were established prior to field activities.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				Implementation of vessel communication procedures for management of vessels.	Records confirm that vessel communication procedures were established prior to field activities.
			<b>CM36:</b> Establishment of temporary fairways	Establishment of temporary fairways and Notice to Mariners buffer zone through AMSA and AHO.	Notice to Mariners records confirm that temporary fairways and buffer zone were established prior to the start of field activities.
			<b>CM36:</b> Pre-start notifications	AMSA Joint Rescue Coordination Centre (JRCC) notified before operations commence to enable AMSA to distribute an AUSCOAST warning.	Records confirm that information to distribute an AUSCOAST warning was provided to the JRCC before operations commenced. Issued AUSCOAST warning dated prior to, or on the date operations commenced.
				AHO notified before operations commence to allow generation of navigation warnings (including Notice to Mariners).	Issued Notice to Mariners dated prior to, or on the date operations commenced.
				Relevant persons are notified of activities approximately four weeks and again one week prior to commencement.	Relevant persons consultation records confirm that information was distributed to relevant persons in the required timeframes.
Planned discharge – Sewage and food waste	Change in water quality and fauna behaviour.	Sewage discharges comply with the International Convention for the Prevention of Pollution from Ships	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex IV as appropriate to vessel class.	Vessels have class certification verified and issued by International Association of Classification Societies (IACS) member.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
		(MARPOL) Annex IV requirements.			
		Food waste discharges comply with MARPOL Annex V requirements.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex V as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.
Sound emissions	Injury to fauna and change in fauna behaviour.	<p>There is no injury (temporary threshold shift and permanent threshold shift) or displacement from foraging, aggregation, calving/breeding or migrating grounds in cetacean Biologically Important Areas from sound emissions</p> <p>No injury, harm or interference to cetaceans from sound emissions during support vessel operations</p>	<b>CMP4:</b> Helicopter Pilot	<p>Interaction between helicopters and cetaceans within the Operational Area (OA) will be consistent with Part 8 Division 8.1 of the <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> (the EPBC Regulations):</p> <p>Helicopters will not fly lower than 1650ft (503m) when within 500m horizontal distance of a cetacean except when landing or taking off and will not approach a cetacean from head on.</p>	Annual refresher memo demonstrates that pilots are aware of flight requirements when in the vicinity of a cetacean.
			<b>CM8:</b> Vessel Master	Vessel masters will implement cetacean interaction management actions consistent with with the <i>Australian National Guidelines for Whale and Dolphin Watching 2017</i> ( Commonwealth of Australia, 2017) (which enact) Part 8	Daily operations reports note when cetaceans were sighted in the caution zone and interaction management actions implemented.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<p>Division 8.1 of the EPBC Regulations, including:</p> <ul style="list-style-type: none"> <li>• Caution zones - vessels will not knowingly travel faster than 6 knots within 300m of an adult whale or 150m of an adult dolphin</li> <li>• No approach zone - vessels will not knowingly get closer than 100m of a whale or 50m of an adult dolphin.</li> </ul> <p>If a cetacean approaches the vessel within the above zones, the vessel will avoid rapid changes in engine speed or direction.</p>	
				<p>Support vessels shall maintain thrust/power limits of no more than 45% during operations alongside the LWIV and as specified in the vessel's Activity Specific Operating Guidelines (ASOG).</p>	<p>Vessel DP setup and watch keeping checklist records verify thrust loads are less than 45%.</p>
				<p>Only one support vessel is to be within the OA at any one time.</p>	<p>Daily operation reports note when supply vessels are alongside.</p>

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CMP35:</b> LWIV Master	Operations will be suspended in the event that LWIV thruster levels are forecast to exceed 75% of their capacity (via weather forecasting).	Well Specific Operations Criteria (WSOG) and Thruster And Generator Operating Strategy (TAGOS) define 75% maximum operating limit.
			<b>CMP26:</b> Fauna observations	Vessel Masters and all crew undertake an awareness induction for managing sound impact to PBW and Southern right whale (SRW),which includes: <ul style="list-style-type: none"> <li>• requirements of the adaptive whale management procedure (CMP33).</li> <li>• whale observation and identification and distance measurement and reporting.</li> </ul>	Induction records.
				<ul style="list-style-type: none"> <li>• Crew members on active duty will report observations of megafauna to bridge watch officers as soon as it is safe to do so.</li> </ul>	Daily reports confirm recordings of cetacean sightings.
			<b>CMP34:</b> Marine Mammal Observer	Two (2) MMOs (with recognised training and experience in whale observation, distance estimation and reporting in	Training records confirm MMOs have the required training and experience per <i>EPBC Act Policy Statement 2.1 1</i> (DEWHA, 2008) and are trained in

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				accordance with Part A.2 and B.1 of the <i>EPBC Act Policy Statement 2.11</i> (DEWHA, 2008) will be onboard the LWIV for the duration of the activity.	the adaptive management requirements (CMP33).
				At least one MMO will be on shift on the LWIV during daylight hours to implement the <i>EPBC Act Policy Statement 2.1</i> (DEWHA, 2008), with the second MMO available to take over the previous shift or assist the MMO on shift as required.	MMO daily reports verify an MMO was on shift during daylight hours.
			<b>CMP33:</b> Adaptive Whale management procedure PBW and SRW	<p>The following adaptive whale management procedure (for PBW and SRW) will be implemented for the activity (regardless of activity timing) see the accompanying decision tree in Volume 2 (Figure 5-5):</p> <ul style="list-style-type: none"> <li>pre-activity vessel-based survey – while en-route to the OA, crew onboard the LWIV and support vessel will maintain watch for PBW and SRW when approaching or in the observation zone (i.e. 9.5km radius behavioural PEA).</li> </ul>	Daily reports contain information on PBW and SRW sightings (and other cetaceans), and actions taken as a result of sightings are consistent with the adaptive management procedure requirements CMP33.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<ul style="list-style-type: none"> <li>• PEA</li> <li>• Pre-activity vessel survey - if PBW or SRW have been observed, this will be communicated to the LWIV. The LWIV and support vessels will not be permitted to commence DP operations on location until such time that there have been no PBW or SRW sightings for 30 minutes or the whale/s have been observed leaving the observation zone</li> <li>• LWIV DP operations (daytime) – MMO’s, LWIV Master and crew maintain observations for PBW and SRW while it is on DP within the observation zone</li> <li>• LWIV DP operations (night-time or low visibility) - support vessel will not come alongside the LWIV using DP (e.g. loading/unloading) unless the whale has not been observed within</li> </ul>	

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<p>the observation zone in the preceding 3 daylight hours.</p> <p>If a PBW or SRW is sighted in the observation zone :</p> <ul style="list-style-type: none"> <li>• support vessel will not come alongside the LWIV under DP (e.g. loading/unloading) unless PBWs/SRWs have not been observed for a continuous 30 minutes within the observable zone.</li> </ul> <p>If a vessel is alongside the LWIV, and if a PBW/SRW is sighted within the observation zone:</p> <ul style="list-style-type: none"> <li>• if loading/unloading can be safely and quickly stopped, any vessel alongside the LWIV will move to a safe position away from the LWIV and away from the direction of the whale until the whale moves out of the observation zone or when 30 mins have lapsed since the last sighting</li> <li>• if loading/unloading operations cannot be</li> </ul>	

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				safely and quickly stopped to allow departure of the vessel, the vessel will adjust heading to reduce thrust to the extent possible for the safe operation of the vessel in accordance with the vessel ASOG, until the whale moves out of the observation zone or has not been sighted for 30 mins.	
Light emissions	Change in fauna behaviour.	Lighting will be limited to that required for safe navigation and work requirements.	<b>CMP30:</b> Lighting will be limited	Lighting will be limited to that required for safe navigation and work requirements, with unnecessary light spill to sea minimised.	Inspection confirms light spill to sea is minimised, except where required for safe work/navigation.
Planned discharge – Treated bilge water and deck drainage	Change in water quality.	Deck drainage discharges comply with MARPOL Annex V requirements.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex V as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.
		Bilge discharges from vessels comply with MARPOL Annex I requirements.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex I as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
Emissions to air	Change in air quality. Contribution to greenhouse gas effect.	Fuel combustion equipment complies with the requirements of MARPOL Annex VI.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex VI as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.
Planned discharge – Cement	Change in water quality.	All cements and additives approved according to chemical discharge assessment process.	<b>CM3:</b> Chemical discharge assessment process	All cement and additives planned for discharge are evaluated as acceptable in accordance with the chemical discharge assessment process.	Chemical assessment records confirm evaluation of each component making up cement as acceptable prior to use/discharge and appropriate approvals documented.  Environmental performance fluid tracking shows cement and additives used.
		No discharge of unmixed cement.	<b>CMP5:</b> Cementing procedures	Detailed cementing procedures developed and implemented including no surface or seabed discharge of unmixed cement.	Cementing procedures developed and implemented. Environmental performance fluid tracking verifies no discharge of unmixed cement.
Planned operational discharge – Subsea	Change in water quality. Change in habitat. Smothering.	All operational discharges approved according to chemical discharge assessment process.	<b>CM3:</b> Chemical discharge assessment process	All chemicals planned for discharge are evaluated as acceptable in accordance with the chemical discharge assessment process.	Chemical assessment records confirm evaluation of all chemicals as acceptable prior to use/discharge and appropriate approvals documented.  Environmental performance fluid tracking shows components of operational subsea discharges.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
Planned operational discharge – Surface	Change in water quality. Change in habitat.	All operational discharges approved according to chemical discharge assessment process.	<b>CM3:</b> Chemical discharge assessment process	All planned chemical discharges are evaluated as acceptable in accordance with the chemical discharge assessment process.	Chemical assessment records confirm evaluation of chemical discharges as acceptable prior to use/discharge and appropriate approvals documented.
					Environmental performance fluid tracking shows components of all planned operational discharges.
		Circulated fluids/tank washings/sodium chloride brine fluids measured for accepted maximum oil content before discharge.	<b>CMP6:</b> Worksite Operations Safety Plan	Test result for circulated fluids/tank washings/sodium chloride brine fluids must be below 5% oil in water by volume to be acceptable for discharge	Test reports document circulated fluids/tank washings/sodium chloride brine fluids oil in water content measured.  Oil in water content of circulated fluids/tank washings/sodium chloride brine fluids is recorded in environmental performance fluid tracking when discharge occurs.
<b>Aspects of unplanned events</b>					
Physical interaction – Marine fauna	Injury/mortality to fauna.	No injury or death of megafauna resulting from vessel strike.	<b>CM8:</b> Vessel Master	Vessel Master is aware of and implements interaction management actions consistent with Part 8 Division 8.1 of the EPBC Regulations, including: <ul style="list-style-type: none"> <li>vessels will not knowingly travel faster than 6 knots within 300m of a whale or 150m of a dolphin</li> </ul>	Daily operations reports note when cetaceans were sighted in the caution zone and interaction management actions implemented.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<ul style="list-style-type: none"> <li>vessels will not knowingly get closer than 100m of a whale or 50m of a dolphin</li> <li>if a cetacean approaches the vessel within the above zones, the vessel will avoid rapid changes in engine speed or direction.</li> </ul>	
Physical presence - Introduction of invasive marine species (IMS)	Change in ecosystem dynamics.	No introduction and establishment of IMS.	<b>CM23:</b> Ballast Water Management Plan	Ballast Water Management Plan approved in accordance with the International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004 (BWM Convention) and guidance (Resolution MEPC.127(53), 2005) (Resolution MEPC.306(73), 2018).	Records show an approved Ballast Water Management Plan which complies with the BWM Convention requirements, including implementation of D-2 standard, in accordance with the agreed timeline per the Class or flag state of the respective vessel.
			<b>CM24:</b> Ballast Water Management Certificate	Ballast Water Management Certificate approved in accordance with the BWM Convention, including implementation of D-2 standard, as per the agreed timeline.	Records show an approved Ballast Water Management Certificate which complies with the BWM Convention requirements, including implementation of D-2 standard, in accordance with the agreed timeline per the Class or flag state of the respective vessel.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CMP7:</b> Ballast water record system	Ballast water record system is maintained in accordance with Regulation B-2 of the Annex to the BWM Convention including: <ul style="list-style-type: none"> <li>• start and finish coordinates</li> <li>• actual pumping times</li> <li>• residual volume remaining in the tank at the end of the empty cycle prior to refill (empty refill method only).</li> </ul>	Ballast water records.
			<b>CM25:</b> Biosecurity clearance when entering Australian territory	Vessel Master to obtain biosecurity clearance to enter Australian territory through pre-arrival information reported through the Maritime Arrivals Reporting System.	Records confirm biosecurity status.
			<b>CM8:</b> Vessel Master	Vessel Master to adhere to Australian ballast water requirements and BWM Convention.	Ballast water records show location of ballast water uptake and discharge.
			<b>CM26:</b> Invasive Marine Species Risk Assessment Procedure	Biofouling risk assessment conducted in accordance with Esso's IMS Risk Assessment Procedure shows low risk.	Biofouling risk assessment record confirms vessel poses low risk of introducing IMS.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CMP8:</b> Immersible retrievable equipment cleaning	All immersible retrievable equipment has been cleaned and/or inspected in accordance with <i>National Biofouling Guidelines for the Petroleum Production and Exploration Industry</i> (Department of Agriculture and Water Resources, 2009) prior to commencement of activities at each location.	Records document cleaning and/or inspection of immersible retrievable equipment.
Accidental release – Dropped objects	Change in habitat.  Change in water quality.	No dropped objects which result in disturbance of benthic habitat.	<b>CMP10:</b> Crane handling and transfer procedures	The crane handling and transfer procedure is in place and implemented by crane operators (and others, such as dogmen).	Completed handling and transfer procedure checklist, Permit to Work and/or risk assessments verify that the procedure is implemented prior to each transfer.
			<b>CM18:</b> Preventative Maintenance System	Visual inspection of lifting gear is undertaken every quarter by a qualified competent person (e.g. maritime officer) and lifting gear is tested regularly in line with the Preventative Maintenance System (PMS).	Inspection of PMS records and lifting register verifies that inspections and testing have been conducted to schedule.
			<b>CM19:</b> Cargo securing manual	All cargo securely fastened to or stored during transport in accordance with approved cargo securing manual to prevent loss to sea.	A completed pre-departure inspection checklist verifies that cargo is securely sea-fastened.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CMP11:</b> LWIV Move Guidance Checklist	All cargo securely fastened to or stored during transport in accordance with cargo securing manual or LWIV move guidance checklist to prevent loss to sea.	LWIV Move Guidance Checklist verifies that cargo is securely sea-fastened.
Accidental release – Waste	Injury/mortality to fauna and change in habitat.	No unplanned overboard release of waste.	<b>CM9:</b> Class certification	<p>Vessel compliant with MARPOL Annex V as appropriate to vessel class which includes measures to prevent loss of waste to the ocean such as:</p> <ul style="list-style-type: none"> <li>• prohibition of discharge of garbage to the sea (other than as permitted for bilge, sewage and food waste)</li> <li>• separation of garbage by recommended types</li> <li>• any receptacles on deck areas, poop decks or areas exposed to the weather should be secured on the ship and have lids that are tight and securely fixed</li> <li>• all garbage receptacles should be secured to prevent loss, spillage.</li> </ul>	Vessels have class certification verified and issued by IACS member.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CMP12:</b> Garbage Management Plan	Vessels have a Garbage Management Plan in accordance with the waste management bridging document which identifies the procedures for collecting, storing and disposing of garbage.	Inspection verifies that waste is segregated, stored and handled in accordance with the Garbage Management Plan.
Accidental Release – Loss of containment: Hazardous or non-hazardous substances	Change in water quality.	No unplanned release of hazardous or non-hazardous substances to the marine environment.	<b>CM14:</b> Procedures for bulk transfer of fluids from support vessels	Bulk transfer of fluids from support vessels undertaken in accordance with relevant procedures.	Permit to Work records for liquid bulk transfers.
			<b>CMP13:</b> Design and certification of hoses	Transfer hoses shall comprise sufficient floating devices and self-sealing weak-link couplings in the mid-section of the hose string, where required, and suitable pressure rating.	Hose certificate confirms suitable fittings and rating.
			<b>CM18:</b> Preventative Maintenance System	The LWIV transfer hoses are inspected and replaced in accordance with the PMS or when they are visibly degraded.	The LWIV hose register and PMS indicate regular inspection and replacement of fuel/chemical/mud hoses.
			<b>CM21:</b> Remotely Operated Vehicle pre-post dive checks	A Remotely Operated Vehicle (ROV) pre- and post-dive inspection visually check for leaks.	Records of ROV pre- and post-dive inspection checklist.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CM22:</b> Remotely Operated Vehicle International Marine Contractors Association Audit	ROV installation inspected against International Marine Contractors Association (IMCA) guidelines.	Audit report developed and corrective action(s) managed in accordance with IMCA category rating.
			<b>CMP14:</b> Bunding	Bulk liquid transfer points and equipment located on deck utilising hydraulic fluids will have primary bunding or sheathing.	Inspection records demonstrate that bulk transfer points and equipment located on deck utilising hydraulic fluids have primary bunding or sheathing.
				Chemicals and oils stored on deck are stored within banded areas.	Inspection records demonstrate that chemicals and oils stored on deck are stored within banded areas.
			<b>CM20:</b> Shipboard Marine Pollution Emergency Plan	MARPOL Annex I specifically requires that a Shipboard Marine Pollution Emergency Plan (or equivalent, according to class) is in place.	Vessels have class certification verified and issued by IACS member.
Accidental release – Loss of containment: Refined oils (collision)	Injury/mortality to fauna.  Change in habitat.  Change to the function, interests or activities of other users.	No unplanned release of marine diesel oil (MDO) to the marine environment from support vessel collision.	<b>CM53:</b> Establishment of temporary fairways	Establishment of temporary fairways during field activities.	Temporary fairways have been established at least 6 months before start of field activities to ensure timely adoption of these measures by maritime traffic.
			<b>CM27:</b> Support vessel approach procedure	LWIV Manager to coordinate with support vessels to avoid a collision (Refer to Helix's Well Operations UK support vessel checklist and Section	Radio operations communications log verifies coordination with approaching vessels have been issued when necessary.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				4.6.3 of <i>Q7000 Safety Case (Australia)</i> (Helix, 2021).	
			<b>CM28:</b> Activity Specific Operating Guidelines/Critical Activity Mode procedures	ASOG (or Well Specific Operations Criteria)/Critical Activity Mode procedures developed to IMCA standards.	Implementation procedures signed by Vessel Master and available.
			<b>CM29:</b> Support vessel dynamic positioning system	All support vessels engaged in DP operations have Class recognised DP2 or 3 systems.	Records of IACS member DP Notation, Failure Mode and Effects Analysis, proving trials and Annual Trials.
				Watchkeepers in charge of watch hold DP certification.	Watchkeepers' DP certificates available.
			<b>CM36:</b> Pre-start notifications	AMSA JRCC notified before operations commence to enable AMSA to distribute an AUSCOAST warning.	Records confirm that information to distribute an AUSCOAST warning was provided to the JRCC before operations commenced. Issued AUSCOAST warning dated prior to, or on the date operations commenced.
				AHO notified before operations commence to allow generation of navigation warnings (including Notice to Mariners).	Issued Notice to Mariners dated prior to, or on the date operations commenced.
				Relevant persons are notified of activities approximately four weeks	Relevant persons consultation records confirm that information was

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				and again one week prior to commencement.	distributed to relevant persons in the required timeframes.
		Minimise the impact on the environment of an MDO spill.	<b>CM20:</b> Shipboard Marine Pollution Emergency Plan	MARPOL Annex I specifically requires that a Shipboard Marine Pollution Emergency Plan (SMPEP) (or equivalent, according to class) is in place.	Vessels have class certification verified and issued by IACS member.
<b>CM12:</b> Oil Pollution Emergency Plan			Capability is maintained to ensure Oil Pollution Emergency Plan (OPEP) can be implemented in response to an incident, as expected.  Emergency response activities will be implemented in accordance with the OPEP.	Test records confirm that emergency response capability has been maintained in accordance with that described in Volume 4 and the OPEP.  Records confirm that emergency response activities have been implemented in accordance with the OPEP.	
<b>CM35:</b> Operational and Scientific Monitoring Plan			Capability is maintained to ensure the Operational and Scientific Monitoring Plan (OSMP) can be implemented in response to an incident, as expected.  Operational and scientific monitoring will be implemented in accordance with the OSMP.	Test records confirm that emergency response capability has been maintained in accordance with that described in the OSMP.  Records confirm that emergency response activities have been implemented in accordance with the OSMP.	

Aspect	Impact	EPO	Control	EPS	Measurement criteria
Accidental release – Reservoir hydrocarbons (loss of well control)	Injury/mortality to fauna.  Change in habitat.  Change to the function, interests or activities of other users.	Maintain well control such that reservoir hydrocarbons are not released to the marine environment.	<b>CM32:</b> NOPSEMA accepted Well Operations Management Plan	The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) accepted Well Operations Management Plan (WOMP) describes how the risks to the integrity of the wells will be reduced to As Low As Reasonably Practicable (ALARP).  This includes: <ul style="list-style-type: none"> <li>• That two barriers have been maintained</li> <li>• That barrier integrity is tested and verified</li> <li>• That the wells are plugged and abandoned and left in a safe state.</li> <li>• The well head will not be removed until the P&amp;A program has been completed in accordance with the WOMP.</li> </ul>	Records confirm a NOPSEMA-accepted WOMP was in place before operations commenced.  Records demonstrate that the P&A has been completed in accordance with the WOMP prior to well head removal..
			<b>CM34:</b> NOPSEMA accepted Safety Case	The NOPSEMA accepted LWIV Safety Case demonstrates how the risks to the integrity of the wells will be reduced to ALARP, including:	Records confirm a NOPSEMA-accepted Safety Case for the LWIV was in place before operations commenced.  Records demonstrate that operations have taken place in accordance with

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<ul style="list-style-type: none"> <li>• planned maintenance of pressure well control equipment</li> <li>• testing of well control equipment</li> <li>• validation of activity specific safety critical equipment.</li> </ul>	processes described in the Safety Case.
			<b>CMP16:</b> Plug and abandonment design	P&A procedures consider well design, fluid selection and formation pressures to ensure that there are two barriers in the well at any time. Procedures signed off at appropriate level of management.	Well-specific P&A procedures have been signed off by the Wells Engineering Supervisor and Wells Operations Superintendent. Changes to the approved procedures are managed by Management of Change (MOC).
			<b>CMP17:</b> Esso approved plug and abandonment procedures	Procedures consider well design, fluid selection and formation pressures to ensure that there are two barriers maintained at any time.	Approved procedures are available onsite and distributed to Esso and LWIV leadership.  Daily reports confirm that these procedures are followed.
			<b>CMP18:</b> Evaluation of reservoir properties	Risk profiling and P&A design are peer reviewed and approved by appropriate levels of management.  Each well is subject to this process and considers reservoir properties for placement of barriers.	P&A program is reviewed and approved by Wells Engineering Supervisor and Wells Operations Superintendent..

Aspect	Impact	EPO	Control	EPS	Measurement criteria
			<b>CM18:</b> Preventative Maintenance System	PMS ensures that Pressure Control Equipment (PCE) and control systems are maintained, to enable reliable performance.	Records show routine completion of maintenance in accordance with PMS.
			<b>CMP19:</b> Pressure Control Equipment testing	PCE is tested before deployment on each well.	Records show that PCE has successfully passed PCE test prior to deployment of the PCE and subsequent tests as per WOMP.
		No loss of containment of hydrocarbons from damage to subsea assets.	<b>CMP20:</b> LWIV move procedure	The approved LWIV move procedure details how the LWIV will be moved onto and moved off location. It includes approach path, communication protocols, Permit to Work arrangements and survey criteria to prevent an impact with subsea assets.	Approved procedure is available on site and utilised.  Daily reports confirm that the procedure is followed.
			<b>CMP21:</b> Rig mover	The LWIV is moved onto and off location under the control of a rig mover.	Daily reports confirm that the rig mover is in control of rig moves.
		Minimise the impact on the environment from a loss of well control.	<b>CM12:</b> Oil Pollution Emergency Plan	Capability is maintained to ensure OPEP can be implemented in response to an incident, as expected.  Emergency response activities will be implemented in accordance with the OPEP.	Test records confirm that emergency response capability has been maintained in accordance with that described in Volume 4 and the OPEP.  Records confirm that emergency response activities have been

Aspect	Impact	EPO	Control	EPS	Measurement criteria
					implemented in accordance with the OPEP.
			<b>CM35:</b> Operational and Scientific Monitoring Plan	Capability is maintained to ensure OSMP can be implemented in response to an incident, as expected.  Operational and scientific monitoring will be implemented in accordance with the OSMP.	Test records confirm that emergency response capability has been maintained in accordance with that described in the OSMP.  Records confirm that emergency response activities have been implemented in accordance with the OPEP.
			<b>CMP22:</b> Source Control Emergency Response Arrangements included in the Australia Wells Tier II/III Emergency Response Plan	Source control emergency response arrangements consistent with <i>IOGP Report 594</i> (IOGP, 2019) and The Australian Petroleum Production and Exploration Association (APPEA) <i>Australian Offshore Titleholders Source Control Guideline</i> (APPEA, 2021) will be in place prior to commencement of P&A activities.  Source control emergency response arrangements includes: <ul style="list-style-type: none"> <li>• SFRT</li> <li>• installation of capping stack (including logistics plan)</li> </ul>	Check/gap analysis against the requirements of <i>IOGP Report 594</i> (IOGP, 2019) and <i>Australian Offshore Titleholders Source Control Guideline</i> (APPEA, 2021) on file.  Contracts with third-party provider for well construction material, as well as logistics contracts are in place for this campaign.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				<ul style="list-style-type: none"> <li>drilling a relief well (if required).</li> </ul>	
			<b>CMP23:</b> Availability of suitable Mobile Offshore Drilling Unit to drill relief well	Availability of Mobile Offshore Drilling Unit (MODU) to meet minimum requirements/ specifications for the MODU (to drill relief well).	Status and location of suitable MODU to drill relief well identified 30 days prior to P&A activity commencing on first well and on a monthly basis throughout the P&A campaign.
			<b>CMP24:</b> Availability of resources to meet relief well timeframe commitments	In the unlikely event that there is no suitable MODU available, or information becomes available to Esso or its rig contractor to indicate that resources may be required beyond those identified in the SCERP to allow a relief well to be drilled in the committed 98-day timeframe, the well activities will be made safe and any further activities will be suspended until such time as the activity can comply with this EP or the EP is resubmitted and accepted.	Records of tracking process indicate that a suitable MODU were available/identified throughout the activity.
		Minimise the impact on commercial fisheries from a loss of well control.	<b>CM51:</b> Utilisation of idle fishing vessels	Opportunities to utilise idle fishing vessels for oil spill response and monitoring activities will be taken where there is agreement of the vessel owner and where a risk assessment shows that	Esso Incident Management Team (IMT) records reflect communications with fishing industry looking for opportunities to utilise idle fishing vessels.

Aspect	Impact	EPO	Control	EPS	Measurement criteria
				there are no additional risks to vessels and crew.	
			<b>CM52:</b> Communication with fisheries	Should a spill occur, then updates on oil spill response and monitoring will be provided to fishery representative bodies (through South Eastern Trawl Fishing Industry Association (SETFIA)) to enable accurate information on spill status, impacts and effects of spilled hydrocarbons on seafood safety to be provided to fishing industry members and the public. Daily updates provided in the first week until the modelling is completed and then as needed, until relief well completed (and beyond if there is ongoing concern).	Relevant persons consultation records show communication with SETFIA per the performance standard.

**Table 1-2 Environmental performance – Emergency response capability**

EPO	Control	EPS	Measurement criteria
Esso IMT is available to respond as required to coordinate spill response operations in a timely manner to minimise impact to the environment.	Esso IMT.	Trained personnel are available to fulfil Incident Commander, Operations Section Chief, Planning Section Chief, Logistics Section Chief, Safety Officer and Environmental Unit Lead roles with 1 hour of Esso IMT activation.	Capability is demonstrated during test/drill and is documented in test/drill report.  Training records.
		Regional Response Team (RRT) support is available for a Tier III response in: <ul style="list-style-type: none"> <li>• &lt;12 hours from notification for remote support</li> <li>• &lt;72 hours for in country support.</li> </ul>	Capability is demonstrated during test/drill and is documented in test/drill report.
		Emergency response capability is maintained for the duration of the activities.	Esso IMT call out tests conducted and recorded per test schedule.
Source control equipment is available when required to prevent further uncontrolled release of hydrocarbons into the marine environment.	Agreements in place with ROV specialist.	Current global agreements state that a ROV appropriate to the task will be available. Estimated 5 days from call out request to arrive in Victoria.	Current global agreement document.
	Support vessel identification process.	Suitable support vessels and their location during the activity will be identified prior to rig activities.	Completed register in the Tier II/III Emergency Response Plan (ERP).
	Agreements in place for access to capping stack	Agreements with OSRLand Wild Well Control for access to capping stack	Current Agreements in place.
	Agreements with the Australian Marine Oil Spill Centre (AMOSC) for SFRT.	Agreements with AMOSC for SFRT.	Annual review of agreement document.

EPO	Control	EPS	Measurement criteria
	Memorandum of Understanding with APPEA.	Current APPEA Memorandum of Understanding states that signatories will make best endeavours to make drilling units available for transfer between operators when requested for emergency response.	Memorandum of Understanding document.
Equipment and third-party services are available to complete oil spill surveillance and monitoring when required to gather information on the extent, severity and persistence of the oil and potential sensitivities at risk.	Helicopter fleet.	A helicopter is available to complete surveillance and monitoring in <4 hours of request, subject to safe flying conditions.  (Note: Assumes good visibility, daylight hours and suitable flying conditions).	Capability is demonstrated during test/drill and is documented in test/drill report.
	Arrangements with third-party for provision of fixed wing aircraft.	Third-party fixed wing aircraft will be available <24 hours from request of service.	Capability is demonstrated during test/drill and is documented in test/drill report.
	Support vessel.	Support vessel is available to complete surveillance and monitoring in <24 hours from request of service.	Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement with third-party suppliers for provision of additional vessels.	Current agreement states additional vessels will be available when requested.	Agreement document.
	Agreement with AMOSC for trajectory modelling.	Trajectory modelling is through AMOSC within <4 hours of service request.	Agreement document.
	Tracking buoys.	Tracking buoy is available to complete surveillance and monitoring within 12 hours of spill occurring subject to safe conditions.	Functionality is demonstrated during test/drill and is documented in test/drill report.
	Contract with satellite imagery provider.	Current agreement with satellite imagery provides 24/7 emergency response support.	Agreement document.

EPO	Control	EPS	Measurement criteria
	Esso initial response sampling kits.	Esso initial response sampling kit with required equipment is available when required.  Samples obtained <24 hours of spill occurring subject to safe conditions.	Functionality is demonstrated during test/drill and is documented in test/drill report.
	Agreement with service provider for monitoring and sampling.	Monitoring and sampling service provider has capability to implement OSMP.	Annual capability review.
Dispersant and equipment for applying dispersant is available when required to reduce consequences to surface and shoreline values and sensitivities.	Esso-owned dispersant stocks.	Sufficient dispersant volume (estimated 12m <sup>3</sup> ) is available to mobilise for the first 24 hours of the response.	Annual dispersant testing report.
	Dispersant application equipment.	Equipment is maintained in response ready condition.	Annual equipment inspection report.
	Agreement with AMOSC for dispersant capabilities.	Response capabilities maintained per service level statement including access to mutual aid and the National Plan (which provides dispersant stockpiles within 24 hours of request).	Annual assurance assessment report.
	Agreement with Oil Spill Response Limited (OSRL) for dispersant capabilities	Response capabilities maintained per service level statement including access to OSRL Global Dispersant Stockpile within 48 hours.	Annual assurance assessment report.
	Support vessel.	Support vessel is available to complete surface dispersant application in <24 hours from request of service.	Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement with third-party suppliers for provision of additional vessels.	Current agreement states additional vessels will be available when requested.	Agreement document.

EPO	Control	EPS	Measurement criteria
Containment and recovery equipment is available when required to recover spilt oil before shoreline or other sensitivity contact.	Containment and recovery vessels.	Esso will have access to containment and recovery vessels per Volume 3 Table 6-5.	Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement in place with AMOSC.	Esso will have required contracts, agreements and memberships with AMOSC in place to provide oil spill response equipment and personnel per Volume 3 Table 6-5 within 72 hours.	Contracts, agreements or memberships that demonstrate access to spill response equipment and personnel.
	Annual assurance assessment of AMOSC capabilities.	Response capabilities maintained per AMOSC Service Level Statement.	Annual assurance assessment report.
	Personnel trained for containment and recovery activities.	Personnel trained in oil spill response equipment operation per Volume 3 Table 6-5 within <24 hour of request of service.	Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement with waste management contractor.	Current contract in place for onshore waste management in timeframe described in Volume 3 Table 9-6.	Agreement document.
Equipment and personnel available to support shoreline protection and clean-up when requested to reduce oil impact on shoreline environmental sensitivities.	Agreement with third-party OSMP consultant.	Esso will have required contract in place to enable access to personnel and resources required for implementation of OSMP in the timeframe described in Volume 3 Table 7-10.	Current agreement in place for OSMP consultant.  Capability testing conducted and recorded.
	Annual review of agreement with third-party suppliers for provision of vessels.	Esso will have required contracts in place to enable access to vessels needed for shoreline protection in the timeframe described in Volume 3 Table 7-10.	Current agreement in place for vessels which meets standard.  Capability testing conducted and recorded.
	Esso/AMOSC response equipment.	Equipment is maintained in accordance with maintenance strategy.	Monthly exception reports show any overdue maintenance, inspection, and/or testing tasks with actions signed-off by

EPO	Control	EPS	Measurement criteria
		Equipment is available for deployment within 24 hours.	the appropriate level of operations management.  Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement in place with AMOSC.	Esso will have required contracts, agreements and memberships with AMOSC in place to provide oil spill response equipment and personnel in timeframe described in Volume 3 Table 7-10.	Contracts, agreements or memberships that demonstrate access to spill response equipment and personnel.
	Annual assurance assessment of AMOSC capabilities.	Response capabilities maintained per AMOSC Service Level Statement.	Annual assurance assessment report.
	Personnel hiring agreements.	Current agreements in place with labour hiring companies.	Agreement documents.
	Agreement with waste management contractor.	Current contract in place for onshore waste management in timeframe described in Volume 3 Table 9-6.	Agreement contract.  Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement with contractor for heavy plant equipment.	Current agreement in place with contractor for heavy plant equipment.  Equipment is available for deployment within 48 hours.	Agreement documents.  Capability is demonstrated during test/drill and is documented in test/drill report.
Equipment and personnel to support oiled wildlife response are available when requested to monitor,	Agreement in place with AMOSC.	Esso will have required contracts, agreements and memberships with AMOSC in place to provide oiled wildlife response equipment and personnel per Volume 3 Table 8-6 for deployment within 24 hours.	Contracts, agreements or memberships that demonstrate access to oiled wildlife response equipment and personnel.

EPO	Control	EPS	Measurement criteria
evaluate and reduce environmental impact on fauna.	Annual assurance assessment of AMOSC capabilities.	Response capabilities maintained per AMOSC Service Level Statement.	Annual assurance assessment report.
	Agreement in place with OSRL.	Esso will have required contracts, agreements and memberships with OSRL in place to provide oiled wildlife response equipment per Volume 3 Table 8-6 for mobilisation to Melbourne within 72 hours.	Contracts, agreements or memberships that demonstrate access to oiled wildlife response equipment and personnel.
	ExxonMobil RRT.	ExxonMobil RRT Oiled Wildlife Response Core team personnel are available for remote support within 12 hours and in country support within 72 hours.	Capability is demonstrated during test/drill and is documented in test/drill report.
	Agreement with waste management contractor.	Current contract in place for onshore waste management. Equipment is available for deployment within 48 hours.	Contract agreement. Capability is demonstrated during test/drill and is documented in test/drill report.
Equipment and personnel to manage waste are available when requested to reduce secondary contamination impacts on shoreline environmental sensitivities.	Annual review of agreement with third-party suppliers for provision of vessels.	Esso will have required contracts in place to enable access to vessels needed for waste management in the timeframe described in Volume 3 Table 7-10.	Current agreement in place for vessels which meets standard. Capability testing conducted and recorded.
	Agreement in place with AMOSC.	Esso will have required contracts, agreements and memberships with AMOSC in place to provide oil spill response equipment and personnel, and waste management resources in timeframe described in Volume 3 Table 9-8.	Contracts, agreements or memberships that demonstrate access to spill response equipment and personnel.
	Annual assurance assessment of AMOSC capabilities.	Response capabilities maintained per AMOSC Service Level Statement.	Annual assurance assessment report.

EPO	Control	EPS	Measurement criteria
	Agreement with waste management contractor.	Current contract in place for onshore waste management in timeframe described in Volume 3 Section 9.3.1.	Agreement contract. Capability is demonstrated during test/drill and is documented in test/drill report.
	Personnel hiring agreements.	Current agreements in place with labour hiring companies.	Agreement documents.
	Agreement with contractor for heavy plant equipment.	Current agreement in place with contractor for heavy plant equipment. Equipment is available for deployment within 48 hours.	

Note: Capability and functionality testing is conducted in accordance with Section 2.8.3 and the schedule outlined in Table 2-7. These tests are also further detailed in the annual Emergency Preparedness and Response Activity Plan.

## 2 Implementation strategy

The OPGGS (Environment) Regulations 14(1) requires that an implementation strategy must be included in an EP. The implementation strategy identifies systems, practices and procedures to be used to ensure that the environmental impacts and risks of the activity are reduced to ALARP and an acceptable level, and that the EPOs and EPSs in the EP are met.

### 2.1 Environmental Management System overview

The OPGGS (Environment) Regulations 14(3) requires that the implementation strategy must contain a description of the Environmental Management System (EMS) for the activity, including specific measures to be used to ensure that:

- the environmental impacts and risks of the activity continue to be identified and reduced to a level that is ALARP
- control measures detailed in the EP are effective in reducing the environmental impacts and risks of the activity to ALARP and an acceptable level
- EPO and standards set out in the EP are being met.

The EMS is the method by which the environmental impacts and risks outlined in this EP are managed to ensure they are reduced to ALARP and an acceptable level, for the duration of this EP, and until such time as the relevant petroleum titles are surrendered. The Esso EMS is called Operations Integrity Management System (OIMS). Lloyd's Register Quality Assurance Inc. has assessed OIMS and concluded that it is consistent with the intent and meets the requirements of *ISO 14001 Environmental Management Systems*.

OIMS comprises of a number of separate systems each designed to meet specific expectations, which are set out within a framework of 11 separate elements. ExxonMobil's OIMS Framework (Figure 2-1) establishes common worldwide expectations for addressing risks inherent in the business. The term Operations Integrity is used by ExxonMobil to address all aspects of its business that can impact personnel and process Safety, Security, Health and Environment (SSHE) performance.

The 11 elements of OIMS interact within a hierarchy as shown in Figure 2-1. The visible leadership and commitment of management required by Element 1 is the driver for the effective implementation of OIMS. Elements 2 to 10 provide the operations of OIMS to control the hazards associated with Esso's activities. Element 11 provides evaluation of the effective implementation of Elements 1 to 10 through a process of periodic audits and assessments. Element 11 also drives the continuous improvement feedback loop within OIMS.

The aspects of OIMS that are relevant to the scope of this EP are described in further detail in the following sections.

**Figure 2-1 Operations Integrity Management System Framework**

### 2.1.1 Management Leadership, Commitment and Accountability (OIMS System 1-1)

The purpose of OIMS System 1-1 is to provide a mechanism for management to:

- guide management system implementation, execution and improvement of OIMS
- demonstrate visible commitment to OIMS.

The System objectives are:

- management Systems for Operations Integrity are established, and managers and supervisors demonstrate commitment and personal accountability to them through active and visible participation
- ensure processes are in place for sharing lessons learned
- OIMS roles and responsibilities are established, accepted and exercised
- programs are in place to ensure active participation from the workforce relevant to Operations Integrity
- interfaces between organisations are defined
- achievement of established targets and ongoing improvement with respect to Operations Integrity performance is evaluated and stewarded.

### 2.1.2 Information Management (OIMS System 4-1)

The purpose of OIMS System 4-1 is to ensure that actions taken and decisions made that impact Operations Integrity are based on correct information. In the context of this System integrity critical information is the general term used to refer to both integrity critical documentation and pertinent records.

The System objectives are:

- to ensure that integrity critical documents and drawings are identified, accessible, accurate and appropriately safeguarded
- to ensure that pertinent records are defined and appropriately maintained.

### 2.1.3 Compliance with Laws, Regulations and Permits (OIMS System 4-2)

OIMS System 4-2 addresses regulatory compliance activities during all phases of operations. Several mechanisms are in place to identify new or amended requirements that may or may not have an impact on this EP:

- engagement with government agencies and review of government publications of laws and regulations
- participation in government-sanctioned working committees
- active participation in industry organisations or cooperatives (e.g. APPEA)
- active participation in local or international trade organisations
- subscriptions to specialist consultants, commercial publications and government provided subscriptions (e.g. SAI Global, Environment Essentials, COMLAW).

If new, amended or existing requirements are identified, an assessment is made as to their applicability and possible impact on Esso operations and the environment. Environmentally relevant changes could include:

- changes to existing legislation or introduction of new legislation
- changes to the existing environment including (but not limited to) fisheries, tourism and other commercial and recreational uses, and any changes to protective matter requirements
- changes to the requirements of an existing external approval (e.g. changes to conditions of environmental licences)
- new information or changes in information from research, stakeholders, legal and other requirements, and any other sources used to inform the EP
- changes or updates identified from incident investigations, emergency response activities or emergency response exercises.

Changes to legislation are screened by the Environmental Advisor before being forwarded to an appropriate subject matter contact for their determination on applicability. A tracking list of emerging/amending regulations and associated current review status is maintained by Esso's SSHE Group.

Relevant changes to protected matter management are assessed on a periodic basis by the Environmental Advisor, and incorporated into the risk assessments, control measures, EPOs and EPSs and implementation strategy in the EP where required.

Changes assessed by the Environmental Advisor are reviewed and assessed in accordance with the process outlined in OIMS System 7-1.

### 2.1.4 Personnel Selection, Training and Competency Verification (OIMS System 5-1)

The purpose of OIMS System 5-1 is to ensure that Esso personnel are trained in the knowledge and skills necessary to meet the requirements of their specific positions and roles.

The System objectives are:

- personnel are trained to perform their assigned tasks, and the training includes Operations Integrity risks and regulatory requirements
- key positions are identified with competency requirements specified and documented
- personnel placements meet criteria defined in the System
- personnel resources are available and qualified to meet the manning criteria as needed by the Function
- training and competencies for key positions are reviewed and assessed periodically.

### 2.1.5 Facility Integrity Management (OIMS System 6-2)

The purpose of OIMS System 6-2 is to ensure that the Operations Integrity of all Esso-owned or controlled critical equipment is maintained over the operating life of the equipment preventing or mitigating a significant event that could result in significant SSHE consequences.

The System objectives are:

- a systematic, risk-based approach is used to identify critical equipment and develop equipment strategies
- integrity programs for the operational integrity of critical equipment are developed, approved, and executed at all locations
- critical equipment undergoes programmatic condition monitoring, preventive maintenance, inspection, and/or testing, or other measures are in place to minimise the impact of failure.

### 2.1.6 Well Management (OIMS System 6-3)

The purpose of OIMS System 6-3 is to provide the structure for well work planning and operations as well as ongoing well integrity activities. This System addresses the Operations integrity aspects of well work and well integrity activities.

The System objectives are:

- well work programs are documented, understood, and effectively executed
- well integrity activities are in place to effectively address Operations Integrity for all well types and well status.

### 2.1.7 Work Management (OIMS System 6-4)

The purpose of OIMS System 6-4 is to ensure that the work activities at Esso-owned, managed or controlled sites are undertaken in a structured and controlled manner to reduce the risk of incidents. This System provides a structure for managing the risks associated with the work to be performed and confirming that interfaces with the work activities are appropriately considered.

The System objectives are:

- work permits are executed to protect personnel, equipment, and the environment from mechanical and operational risks
- controls are in place for the temporary disarming, deactivation, or unavailability of integrity critical equipment

- work interfaces are evaluated and procedures are in place to manage identified risks, including hand-over and simultaneous operations.

### 2.1.8 Environmental Management (OIMS System 6-5)

OIMS System 6-5 specifically addresses corporate requirements for environmental management, including socioeconomic and community health aspects. This includes the fundamental requirement to develop Environmental Management Plans which identify and assess all environmental aspects, impacts and risks associated with Esso's activities, facilities and ongoing operations. The Environmental Management Plans must also describe how the impacts and risks are addressed and controlled. As such, this EP meets the OIMS System 6-5 requirement for an Environmental Management Plan for the Gudgeon-1 and Terakihi-1 P&A activities.

In addition, OIMS System 6-5 includes processes and procedures for managing environmental impacts. Processes which have been developed include chemical discharge assessment and IMS Risk Assessment Procedure.

#### 2.1.8.1 Chemical discharge assessment process

Esso assesses all chemicals that are likely to be discharged during the activities described in this EP. The chemical discharge assessment process is triggered by the MOC process. The introduction of a new chemical to Esso's facilities requires assessment for environmental and safety suitability in accordance with the Workplace Substances Manual (AUGO-PO-WSM-MOHLINK).

Chemicals that have the potential to be discharged into the marine environment must be screened against international standards to identify if the chemical is considered to be environmentally hazardous in the marine environment. These international standards include the:

- Offshore Chemical Notification Scheme (OCNS)
- Convention for the Protection of the Marine Environment of the North-East Atlantic (the 'OSPAR Convention')
- Centre for Environment, Fisheries and Aquaculture Science (CEFAS).

In the absence of Australian standards regarding the suitability of well operations fluid chemical additives, the OCNS is generally used as a basis for selecting environmentally acceptable chemicals in the Australian offshore petroleum industry. The OCNS manages chemical use and discharge by the United Kingdom (UK) and Netherlands offshore petroleum industries. The scheme is regulated in the UK by the Department of Energy and Climate Change using scientific and environmental advice from the UK's CEFAS and Marine Scotland.

The OCNS uses the Harmonised Mandatory Control Scheme developed through the OSPAR Convention. This ranks chemical products according to Hazard Quotient, calculated using the Chemical Hazard and Risk Management (CHARM) model. The CHARM model requires the biodegradation, bioaccumulation and toxicity data of the product to be provided.

Under the OSPAR Convention, organic-based compounds used in production, completion and workovers, drilling and cementing are subject to the CHARM model. The CHARM model calculates the ratio of the 'Predicted Effect Concentration' against the 'No Effect Concentration' expressed as a Hazard Quotient, which is then used to rank the product. The Hazard Quotient is converted to a colour banding to denote its environmental hazard, which is then published on the *Definitive ranked lists of registered products* (OCNS, 2022). Gold has

the lowest hazard, followed by silver, white, blue, orange and purple (having the highest hazard).

Products not amenable to assessment under the CHARM model (i.e. inorganic substances, synthetic based muds, hydraulic fluids or chemicals used only in pipelines) are assigned an OCNS grouping A – E, with 'A' having the greatest potential environmental hazard and 'E' having the least. Products that only contain substances that pose little or no risk to the environment (termed PLONORs) are given the OCNS 'E' grouping. Data used for the assessment includes toxicity, biodegradation and bioaccumulation.

Chemicals that are hazardous to the marine environment are subject to substitution warnings under the Harmonised Mandatory Control Scheme. The UK follows and applies the OSPAR harmonised pre-screening scheme and complies with the recommendation of Regulation (EC) No 1907/2006 of the European Parliament and of the Council of 18 December 2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH), to replace chemical substances identified as candidates for substitution. These substances are flagged with a substitution warning on the product template and CEFAS encourages operators to select products without a substitution warning.

Only chemicals ranked under the OCNS rating system as 'Gold' or 'Silver' (CHARM) and 'E' or 'D' (non-CHARM) with no substitution warning will be approved for discharge without further assessment.

Where no OCNS ranking is available for a chemical but ecotoxicity data is available, an equivalence check can be completed to establish if it would have a substitution warning. The equivalence check will be completed in accordance with the assessment process outlined by CEFAS for the OCNS scheme. A chemical will be considered to be 'equivalent' if it is assessed to *not* have a substitution warning according to the criteria defined by OCNS (<https://www.cefas.co.uk/cefas-data-hub/offshore-chemical-notification-scheme/substitution-warning/>).

If a chemical is not on the OCNS list, has a substitution warning (or equivalent) or has limited ecotoxicity data available, then further assessment is required to determine if the chemical is suitable for discharge to the marine environment. This assessment can include:

- calculation of CHARM ranking in accordance with *User Guide Version 1.5* (CHARM Implementation Network, 2017)
- details of the technical requirement for this product and review of any possible alternative chemicals
- assessment of impacts to the receiving environment from discharge in the relevant scenario
- consideration of additional restrictions or controls to the approval e.g. timeframes for use, periodic reassessment.

#### 2.1.8.2 *Invasive marine species risk assessment process*

Esso's IMS Risk Assessment Procedure was developed to complement Australian IMS prevention efforts in the context of Esso's operations offshore in Bass Strait. The assessment is undertaken prior to the mobilisation of a vessel (inclusive of MODUs) to an Esso OA (as defined under the EP for the activity). The IMS Risk Assessment Procedure incorporates key considerations from other established risk assessment processes.

### 2.1.8.3 Wet storage assessment

Environmental assessment conducted under the MOC process includes assessment against OPGGS Act Section 572. In the event that a change results in out-of-service equipment and/or structures or pieces of equipment being left on the seabed until they are able to safely be removed, an assessment is completed to ensure:

- impacts and risks continue to be reduced to ALARP and acceptable levels
- requirements under OPGGS Act Section 572 continue to be met
- that a plan is in place to safely remove structures or equipment when reasonably practicable.

This assessment must include the following considerations, where applicable:

- management of NORM
- management of any potential leaks/seeps of chemicals and hydrocarbons
- equipment or infrastructure wet stored on the seabed within the PSZ or 200-metre operational zone around pipelines
- impact to benthic communities through smothering
- integrity status
- the size, configuration, weight and height above seabed where relevant.

### 2.1.9 Management of Change (OIMS System 7-1)

Esso's MOC process is documented in the Management of Change Manual (MOC-000) which sits under OIMS System 7-1. The objective of System 7-1 is to manage permanent or temporary changes that arise during the duration of activities under this EP and ensure that additional impacts and risks are not introduced by changes that could increase the risk of harm to people, assets or the environment.

Environmentally relevant changes which could trigger the MOC process include:

- new activities, assets, equipment, processes or procedures proposed to be undertaken or implemented that have the potential to impact on the environment and have not been:
  - assessed for environmental impact previously, in accordance with the relevant standard, or
  - authorised in the existing management plans, procedures, work instructions or maintenance plans.
- proposed changes to activities, assets, equipment (including change of status), processes or procedures that have the potential to impact on the environment or interface with an environmental receptor
- changes to the existing environment including (but not limited to) fisheries, tourism and other commercial and recreational uses, and any changes to protected areas, plans or requirements for protected species
- changes to the requirements of an existing external approval (e.g. changes to conditions of environmental licences)
- new information or changes in information from research, stakeholders, legal and other requirements, and any other sources used to inform the EP

- changes or updates identified from audits, inspections and assessments, incident investigations, emergency response activities or emergency response exercises.

OIMS System 7-1 is a structured process, involving relevant engineers, technicians, operations and maintenance personnel and SSHE specialists to evaluate the potential positive and negative consequences of the proposed change, and to seek the endorsement of all potentially impacted parties.

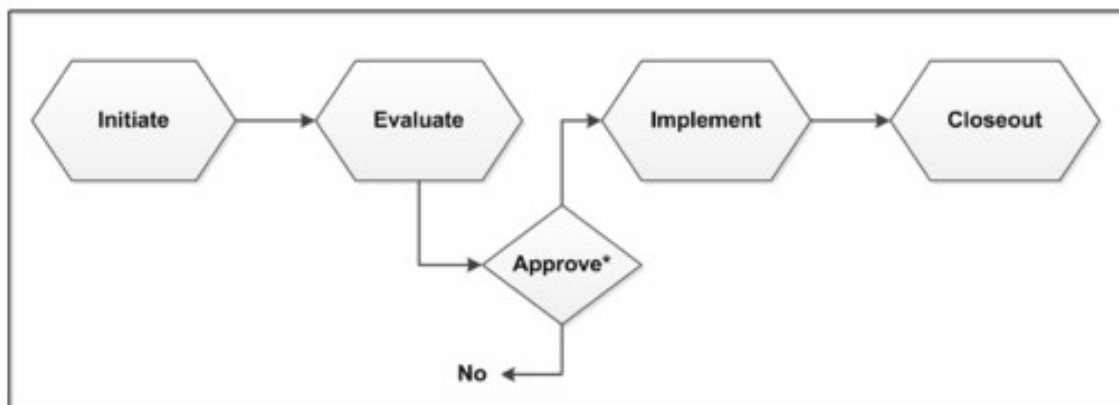

The MOC process is implemented electronically and requires a number of assessments which include technical, regulatory, safety and environmental assessments. A mandatory screening checklist is undertaken for all work being assessed under the MOC process to identify the potential for a change to, or increase in, environmental impacts. MOCs which identify potential change to or increase in environmental impacts during screening require completion of an environmental checklist. A mandatory regulatory checklist is also completed to identify if proposed activities will result in a change to the EP. Environmental and regulatory checklists are reviewed and approved by an Environmental and Regulatory Advisor.

The Environmental and Regulatory Advisor reviews the MOC in accordance with OPGGS (Environment) Regulation 17. A revision of the EP will be required under OPGGS (Environment) Regulation 17 in the event that a proposed change:

- constitutes a new stage or significant modification, or
- introduces a significant new environmental impact or risk, or
- significantly increases an existing environmental impact or risk.

Minor changes, which do not trigger a resubmission under OPGGS (Environment) Regulation 17, may result in administrative updates to this EP which are documented in a change register.

Esso also has a comprehensive process to identify amended and new regulations which is described in OIMS System 4-2.

Note: Changes are approved before they are implemented; other reviews/endorsements/approvals may occur between other process steps.

## Figure 2-2 Management of Change system cycle

### 2.1.10 Third-Party Services (OIMS System 8-1)

OIMS System 8-1 provides a systematic approach for the selection of contractors and subsequent management of interfaces between Esso and contractors to ensure work is

performed in a safe, secure, and environmentally sound manner. This System applies to all service contractors (including marine operations, wireline and workover operations, crane services, provision of lifting equipment and aviation services) and suppliers of critical equipment (such as valves, seals, gaskets, lifting equipment and cranes).

The contractor selection and management processes are established to support two different phases of a contract life cycle:

- the first phase includes requisitioning for contractor services, pre-qualifying contractors, selecting the contractor, and conducting pre-mobilisation activities associated with subsequent contractor interface management
- the second phase occurs during contract work execution and involves ongoing interface management between Esso and the contractor, as well as monitoring and stewardship activities to confirm that the contractor is meeting the Operations Integrity requirements of the agreement.

The pre-qualification process includes review of recent contractor performance results, reviews of contractor SSHE programs, and site visits to the contractor's facilities to validate reported performance results and evaluate a contractor's capability for effective work execution. Esso's SSHE Group participates in the pre-qualification screening and bid evaluation process including contractor site assessments, as required. OIMS System 8-1 specifies that all contractors conducting activities with potential high SSHE impact must submit a SSHE execution plan or a bridging document for the scope of work. High SSHE impacts are activities which, if poorly executed, could cause significant safety or environmental impacts. These may include aviation, construction, well work, subsea activities and vessels.

The contractor's SSHE execution plan is required to address:

- communication of SSHE expectations and requirements to contractor crews and subcontractors
- compliance with relevant regulatory obligations (including Environmental Management Plans, Safety Cases, relevant laws and regulations)
- reporting of leading and lagging indicators
- incident investigation and management processes
- other specific requirements as dictated by the scope of the assignment or local site characteristics.

#### 2.1.11 Incident Management (OIMS System 9-1)

The purpose of OIMS System 9-1 is to provide the requirements for proper management of SSHE incidents including initial response and notifications, investigation and analysis, documentation, communication of lessons learned, corrective actions management and the analysis of trends. In the context of this System, incidents (including near misses) are related to:

- personnel safety
- process safety
- security
- occupational health
- regulatory compliance
- equipment reliability (with SSHE consequences).

System 9-1 requires that:

- the incident is reported in the IMPACT database
- an investigation occurs, if triggered by an evaluation of actual or potential incident severity, and
- the incident is correctly documented, lessons learned are communicated, and corrective actions are followed up and tracked in the IMPACT database.

The triggers and expected deliverables for incident investigations are based on incident severity (actual and potential) and are documented in the Incident Investigation and Sharing Guideline. The triggers for an investigation of an environmental incident are a significant spill to the environment, a community complaint or a regulatory reportable incident (see Table 2-6) (or other incident at the discretion of management).

Corrective actions that address the root cause(s) of the incident are identified and implemented to prevent the recurrence of similar incidents. Corrective actions can be improvements to facilities, programs, processes or procedures that are identified to reduce the impact or risk, and enhance the integrity of operations. Once corrective actions have been identified from incident reports (including audit and inspection reports), the implementation process is systematically managed to completion via IMPACT. This ensures results are achieved and that the improvement is documented and sustained.

Esso utilises the IMPACT incident database as the single, centralised tool for capturing data, tracking, sharing and analysing incidents, assessment findings, lessons learned and follow-up actions.

#### 2.1.12 Community Awareness and Public Affairs (OIMS System 10-1)

The purpose of OIMS System 10-1 is to establish and maintain community confidence and trust in Esso activities through consultative and collaborative interactions and relationships that establish Esso as a responsible corporate citizen and good neighbour. This System addresses all forms of communication and interaction with employees, contractors, government and law enforcement officials, non-governmental organisations, the media and local communities where Esso's offices and operations could have an impact on the communities.

The System objectives are:

- recognise and respond to community concerns and impacts so as to establish and maintain public trust and confidence in the Operations Integrity of Esso operations and facilities; and
- anticipate community concerns and develop response plans, as appropriate.

#### 2.1.13 Emergency Preparedness and Response (OIMS System 10-2)

The purpose of OIMS System 10-2 is to ensure that Esso establishes effective responses to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations. This System addresses all sites for which Esso has responsibility and includes emergencies, disruptions to critical business operations, and security threats that could occur throughout the business line's sphere of influence (e.g., processing, drilling, transportation, office).

The System objectives are as follows:

- ERPs and Business Continuity Plan(s) are documented, resourced with qualified personnel, accessible, current, and clearly communicated
- required training, exercises, simulations, and/or drills are conducted to determine the adequacy of the emergency response and Business Continuity Plans.

## 2.2 LWIV Environmental Management System

The LWIV that will be used to conduct the activities within this EP is the Q7000, operated by Helix Energy Solutions Group, Inc. (Helix). LWIV operations will be conducted in accordance with the Q7000 operating procedures. These are complemented by the Q7000 Safety Case (Australia) (Helix, 2021). The Safety Case outlines:

- management system description:
  - Helix's Well Operations UK primary business policies
  - Helix's master training matrix
  - Helix's Well Operations UK risk assessment matrix
- facility description:
  - medical equipment and pharmaceuticals
  - safety critical element codes and standards
- risk management:
  - hazard register
  - bow tie diagrams
  - summary of operational boundaries matrix
  - recommendations register
  - emergency response
  - performance monitoring.

In addition to these policies and procedures, there will also be operations/location specific working practices which will be incorporated into the operation of the LWIV by project specific Health Safety and Environment (HSE) Management System bridging documents, developed where required.

## 2.3 Roles and responsibilities

As required by OPGGS (Environment) Regulation 14(4), this Section sets out the roles and responsibilities of personnel in relation to the implementation, management and review of this EP.

The organisation structure for the activities described in this EP is shown in Figure 2-3. The key roles with environmental responsibilities relevant to the LWIV P&A campaign are described in Table 2-1. This is aligned with OIMS System 5-1. Each key position within the Esso organisation which could have a significant impact on Operations Integrity has a clearly defined and documented position description outlining their role, responsibilities, accountabilities and authorities.

The key roles relevant to the LWIV campaign activities are:

- Wells Operations Superintendent (Esso)
- Wells Engineering Manager (Esso)
- Wells Operations Supervisor (Esso)

- Offshore Risk, Environment and Regulatory Supervisor (Esso)
- Environmental Advisor (Esso)
- Offshore Installation Manager (OIM) (Helix)
- Rig Superintendent (Helix)
- Chief Officer (Helix)
- Chief Officer Safety (Helix).

The key roles relevant to support operations are:

- Vessel Masters (Vessel contractors)
- Helicopter Pilots (Esso).

### 2.3.1 OIMS Management Committee

The OIMS Management Committee has overall accountability for the implementation, execution, and continuous improvement of OIMS within Esso.

Key responsibilities of the OIMS Management Committee include:

- demonstrate commitment to OIMS through active and visible participation in OIMS implementation, execution and improvement
- ensure that Annual System Reviews are conducted
- review key Operations Integrity performance indicators that show the status and effectiveness of OIMS implementation and execution
- periodically review Operations Integrity incidents for learning and continuous improvements to OIMS.

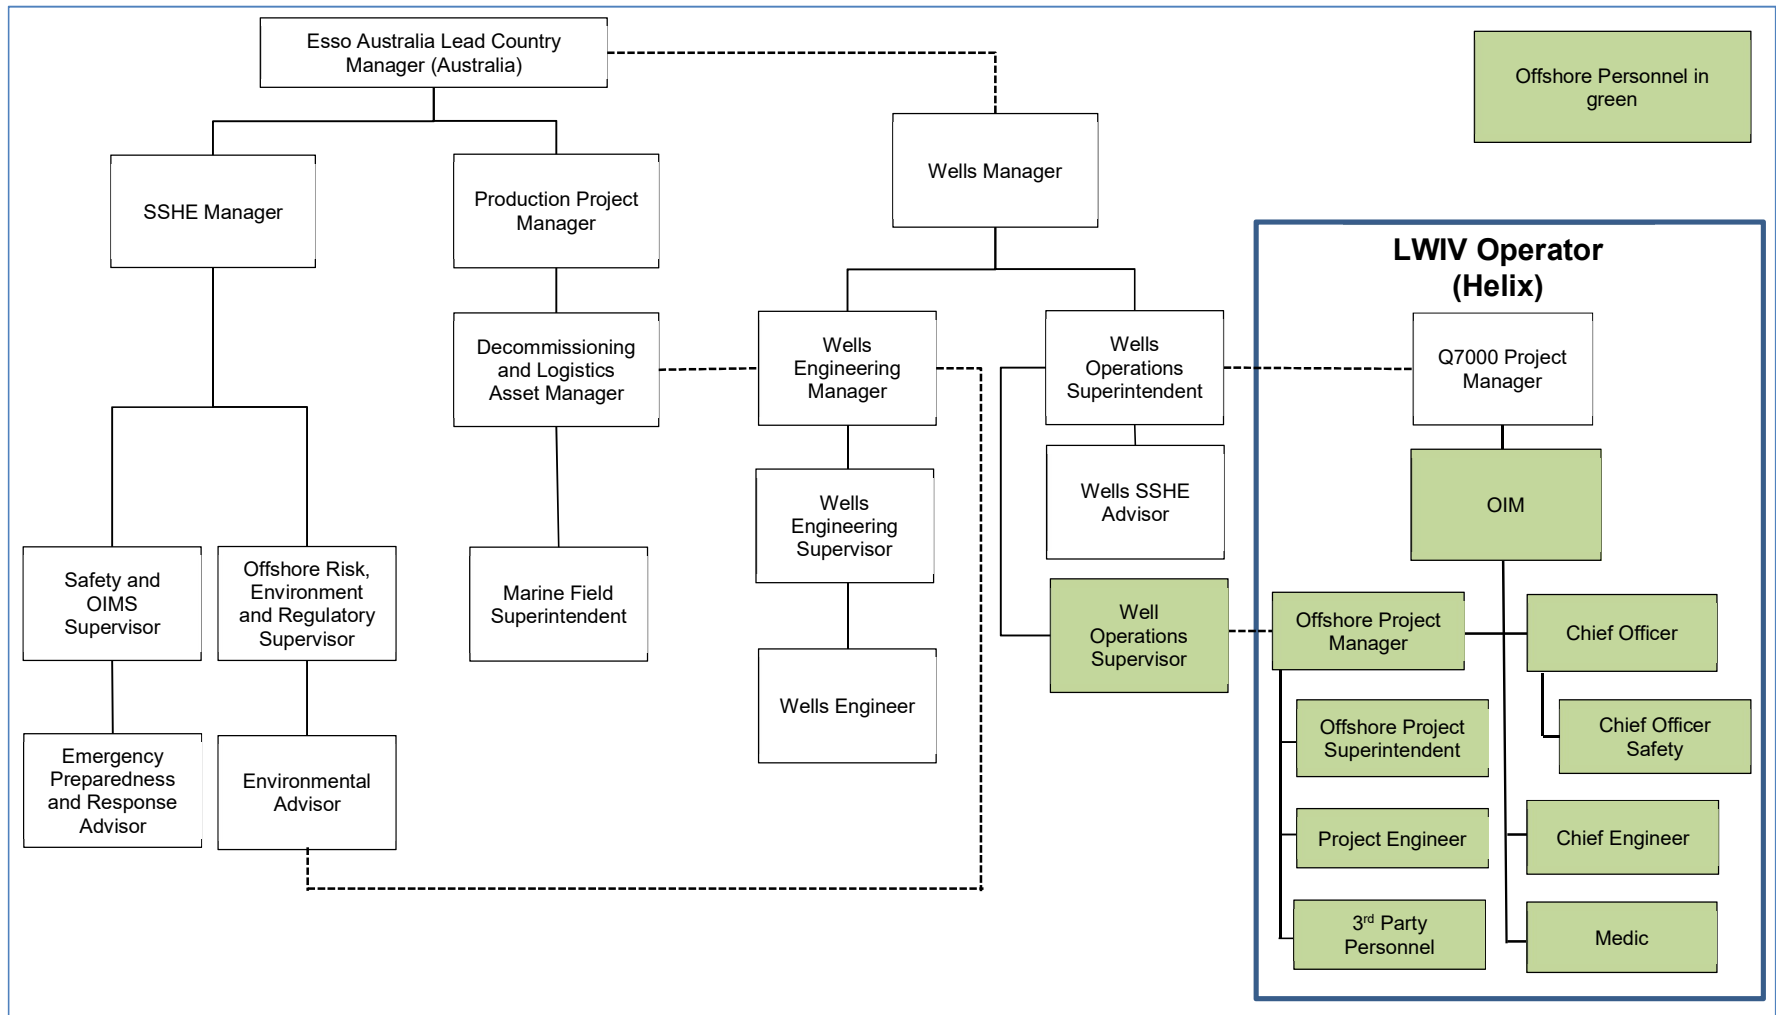

Figure 2-3 Indicative organisation chart

Table 2-1 Key roles and responsibilities

Role	Responsibilities
Wells Operations Superintendent (Esso)	<ul style="list-style-type: none"> <li>• Oversees day-to-day operations to ensure compliance with relevant environmental legislative requirements, commitments, conditions and procedures as provided in this EP.</li> <li>• Primary point of contact between shore-based Wells team and LWIV.</li> <li>• Ensures campaign-related induction is delivered.</li> <li>• Ensures procedures are in place and used effectively for the safe and efficient work management during wells operations.</li> <li>• Ensures prompt follow-up action is initiated and completed after inspections/audits, incidents, and emergency drills.</li> <li>• Member of the Esso IMT.</li> </ul>
Wells Engineering Manager (Esso)	<ul style="list-style-type: none"> <li>• Ensures an effective organisational structure is in place, with defined roles and responsibilities to ensure implementation of OIMS for wells operations.</li> <li>• Ensures sufficient competent staff to execute wells operations.</li> <li>• Ensures systems are in place to provide technical support and competent field personnel to maintain facility integrity during wells operations.</li> <li>• Ensures that arrangements are in place to respond to a well control incident.</li> <li>• Member of the Esso IMT.</li> <li>• Facilitates lessons learnt review at completion of P&amp;A campaign.</li> </ul>
Wells Operations Supervisor (Esso)	<ul style="list-style-type: none"> <li>• Monitors wells activities to ensure that the relevant environmental legislative requirements, commitments, conditions and procedures as detailed in this EP are being followed.</li> <li>• Maintains clear communication between Esso and LWIV personnel.</li> <li>• Facilitates environmental inspections and/or audits.</li> <li>• Ensures follow up actions identified during environmental inspections/audits, incidents and emergency drills are implemented.</li> <li>• Notifies Esso Wells Operations Superintendent of any incidents.</li> <li>• Prepares daily operations reports.</li> <li>• Maintains chemical assessment records and approvals.</li> <li>• Maintains retort test reports.</li> <li>• Maintains records of all operational discharges.</li> <li>• Reports to regulatory authorities as appropriate, including the reporting of environmental incidents.</li> <li>• Reports reportable incidents to NOPSEMA within 2 hours.</li> </ul>

Role	Responsibilities
	<ul style="list-style-type: none"> <li>• Reports recordable incidents to Environmental Advisor (Esso) for monthly reporting to NOPSEMA.</li> <li>• Provide input for annual and/or end of activity environmental performance reporting.</li> </ul>
Q7000 Project Manager	<ul style="list-style-type: none"> <li>• Main Client focal point for Helix</li> <li>• Reviews and approves all engineering procedures</li> <li>• Reviews and approves all safety and interface documentation</li> <li>• Management of change approval</li> <li>• Reviews and approves procurement of engineering materials</li> <li>• Ensures actions raised from HAZID are closed out</li> <li>• Management of client audit findings close-out</li> </ul>
OIM (Helix)	<ul style="list-style-type: none"> <li>• Ensures rules of the accreditations are implemented and maintained on board.</li> <li>• Responsible for the overall safe and efficient operation of the Q7000 and must ensure day-to-day activities are carried out in accordance with offshore and maritime legal requirements</li> <li>• Maintains clear communication with workforce.</li> <li>• Assumes a command and control function (On Scene Commander) in the case of an emergency.</li> <li>• Ensures that HSE incidents are reported in line with regulations and the Helix's Work Management System (WMS)</li> <li>• Ensures that all personnel joining the vessel are inducted in accordance with Helix's WMS</li> <li>• Monitors and reports on the performance of all personnel on board</li> <li>• Periodically reviews the Helix's WMS to ensure that any non-compliance or improvement is addressed and revision actioned</li> <li>• Ensures vessel's marine and related operations (i.e helicopter operations) are conducted in accordance with Helix's WMS, Flag State and Coast requirements, and Esso's requirements.</li> <li>•</li> </ul>
Chief Officer (Helix)	<ul style="list-style-type: none"> <li>• Deputy OIM.</li> <li>• Responsible for the upkeep of all deck machinery and equipment, including supervision of planned maintenance program.</li> <li>• Maintains vessel stability with reference to the stability, trim, stress and bending moments, to ensure compliance with statutory stability criteria as described in approved documentation</li> <li>• Supervises all maintenance required for the safe upkeep of all lifesaving appliances and watertight integrity, as required by the International Convention for Safety of Life at Sea.</li> </ul>

Role	Responsibilities
Chief Officer Safety (Helix)	<ul style="list-style-type: none"> <li>• Undertakes inspections, monitoring and reporting in accordance with approved procedures, including this EP.</li> <li>• Coordinates environmental inductions onboard the LWIV.</li> <li>• Provides input into incident reporting.</li> <li>• Undertakes incident investigation in collaboration with Environment and Regulatory Advisor.</li> <li>• Ensures compliance with the provisions of the Code of Safe Working Practices for Merchant Seamen, statutory requirements and Helix WOUK Safety and Environmental Management System policies and procedures.</li> <li>• Designated as Security Officer under the International Ship and Port Security code.</li> </ul>
Chief Engineer (Helix)	<ul style="list-style-type: none"> <li>• Responsible for the safe and effective management of the vessel's plant and machinery, and must ensure all measures are taken to prevent the pollution of the marine environment.</li> <li>• Ensures that vessel retains its certification / Class.</li> <li>• Maintains accurate records and conform to Helix's WMS.</li> <li>• Checks all third party equipment certificates of conformity including maintenance records and histories.</li> </ul>
Offshore Project Manager (Helix)	<ul style="list-style-type: none"> <li>• Responsible for all project operations under the overall control of Helix OIM and for coordinating onsite well operations activities. Ensures operations are completed in accordance to policies and procedures.</li> <li>• Supervises all wells activities to ensure these are undertaken in accordance with the Helix Environmental Management System.</li> <li>• Communicates environmental hazards and risks to the workforce and the importance of following good work practices.</li> <li>• Responsible for ensuring that all personnel directly or indirectly involved with well operations conform to instructions.</li> <li>• In a LOWC event, assumes overall control and responsibility.</li> <li>• Prepares contractor daily operations reports.</li> <li>• Liaise with Esso regarding any changes to the approved program and communicate these changes to the OIM and onshore Project Manager.</li> <li>• Liaison function between Helix OIM and Chief Engineer to ensure compliance with all appropriate Helix's WMS policies.</li> <li>• Responsible for the interface between marine, Esso and project activities.</li> <li>• Participates in environmental inspections and/or audits.</li> <li>• Ensures follow-up actions identified during environmental inspections/audits and emergency drills are implemented.</li> </ul>
Offshore Risk, Environment and	<ul style="list-style-type: none"> <li>• Ensures all regulatory reporting requirements are met.</li> </ul>

Role	Responsibilities
Regulatory Supervisor (Esso)	<ul style="list-style-type: none"> <li>• Reports to regulatory authorities as appropriate, including the reporting of environmental incidents.</li> <li>• Coordinates EP compliance audits.</li> <li>• Maintains communication with government agencies.</li> </ul>
Environmental Advisor (Esso)	<ul style="list-style-type: none"> <li>• Undertakes duties as delegated by Offshore Risk, Environment and Regulatory Supervisor.</li> <li>• Interfaces between Esso Wells SSHE Advisor and Rig Safety Supervisor.</li> <li>• Prepares pre-start notifications.</li> <li>• Prepares environmental/regulatory content for inductions and ensures personnel receive the induction and that attendance records are maintained.</li> <li>• Completes/coordinates EP compliance audits, as delegated by Offshore Risk, Environment and Regulatory Supervisor.</li> <li>• Undertakes incident investigations.</li> <li>• Completes monthly incident reporting to NOPSEMA.</li> <li>• Completes annual and/or end of activity environmental performance reporting (if delegated by Esso Wells Operations Supervisor).</li> </ul>
Support Vessel Masters (Vessel Contractors)	<ul style="list-style-type: none"> <li>• Implements and ensures adherence to relevant environmental legislative requirements, commitments, conditions and procedures on-board.</li> <li>• Overall responsibility for meeting requirements and standards of environmental performance.</li> <li>• Maintains clear communication with the crew.</li> <li>• Communicates environmental hazards and risks to the crew.</li> <li>• Maintains vessel in a state of preparedness for emergency response.</li> <li>• Reports environmental incidents to the Esso Wells Operations Supervisor and ensures follow-up actions are carried out.</li> <li>• Ensures that personnel are competent and trained for their roles.</li> <li>• Maintains records of DP notation, Failure Mode and Effects Analysis and proving trials.</li> <li>• Maintains records of watchkeeper-in-charge DP certification.</li> <li>• Complies with Cargo Securing Manual and completes pre-departure inspection checklist.</li> <li>• Implements ASOG/Critical Activity Mode procedures.</li> <li>• Implements cetacean interaction management actions consistent with Part 8 Division 8.1 of the EPBC Regulations.</li> <li>• Prepares daily operations reports including cetacean sightings and management actions implemented.</li> </ul>

Role	Responsibilities
Helicopter Pilots (Esso)	<ul style="list-style-type: none"><li data-bbox="516 342 1369 401">• Implements cetacean interaction management actions consistent with Part 8 Division 8.1 of the EPBC Regulations.</li><li data-bbox="516 422 532 443">•</li></ul>

## 2.4 Training and awareness

OPGGS (Environment) Regulation 14(5) requires that the implementation strategy details measures for ensuring that employee and contractors working on, or in connection with, the activity are aware of their responsibilities in relation to the EP, including during emergencies or potential emergencies, and have the appropriate competencies and training.

### 2.4.1 Requirements

#### 2.4.1.1 Esso personnel

OIMS System 5-1 addresses the selection, placement, training and ongoing verification of competency of employees and contractors to meet specific job requirements.

Position descriptions for key positions, which could have a significant impact on Operations Integrity (personnel and process SSHE), document the required Operations Integrity-related competencies and/or experience. This provides the basis for ensuring personnel selection and placement decisions meet specific job requirements. Personnel performing tasks with environmental aspects and impacts/risks will have the knowledge and skills necessary to perform their work in a manner consistent with the environmental policy and the requirements of OIMS System 6-5: Environmental Management.

The placement of personnel is subject to verification of completion of any needed training and/or experience, and demonstration of the required competencies for the performance of the job. The extent of initial, ongoing and refresher training provided is based on established requirements for Operations Integrity-related training and an individual's competency and/or experience gaps. These training requirements are documented in a training plan. The requirements may be met through training and/or developmental activities (i.e. training assignments).

Learning management systems are used for competency tracking, e-learning, training, scheduling and tracking of re-qualification requirements. Training progress is reviewed periodically by an individual's Supervisor. Any new training requirements are completed per the training plan.

In addition to the process of assuring that a person is competent in the knowledge and skills necessary to perform in a position, an assessment of the individual's performance and behaviours in that position is conducted annually. The performance assessment process includes Operations Integrity aspects and behaviours such as compliance with OIMS Systems and associated procedures.

#### 2.4.1.2 Third-party service providers

Third-party requirements for competency assurance of workers are addressed in OIMS System 8-1. Job specific Operations Integrity requirements are defined and communicated to third parties during the contracting process and included in third-party contracts.

Each third-party service provider is required to maintain training files for their personnel. Selected providers undergo a validation process in which Esso verifies these records as part of the initial contracting process and at a minimum annually for Operations Integrity critical contractors.

#### 2.4.2 Competency and training

This Section describes the competency and training programs in place for Esso personnel and contractors.

#### 2.4.3 Environmental induction

All Gudgeon-1 and Terakihi-1 P&A personnel involved in the LWIV campaign will undergo environmental awareness training prior to the activities commencing as part of their induction. The environmental awareness component of the induction will include:

- environmental regulatory requirements
- description of the environmental sensitivities and conservation values of the OA and surrounding waters
- roles and environmental responsibilities of key positions as defined in the EP
- overview of cetacean interaction management actions consistent with Part 8 Division 8.1 of the EPBC Regulations
- overview of waste management requirements
- chemical discharge assessment and approval process requirements
- overview of housekeeping and spill prevention
- procedures for reporting reportable and recordable environmental incidents
- overview of emergency response and spill management procedures.

The Esso Wells Operations Superintendent and Esso Environmental Advisor are responsible for ensuring personnel receive this induction prior to the commencement of LWIV campaign activities. All induction attendees will sign an attendance sheet to confirm their participation in, and understanding of, the induction which will be retained by the Esso Environmental Advisor.

Vessel personnel receive Esso environmental familiarisation. The familiarisation material includes specific EP vessel requirements and definition of an environmental incident.

##### 2.4.3.1 Marine Mammal Observers

Where MMOs are required for the activity they will need to be trained and experienced in whale identification and behaviour, distance estimation, and be capable of making accurate identifications and observations of whales in Australian waters per *EPBC Act Policy Statement 2.1* (DEWHA, 2008). This standard is applied in the absence of there being any definitive qualifications stipulated in Australia for MMOs.

#### 2.4.4 Oil spill response competency and training

In accordance with OPGGS (Environment) Regulation 14(5), the implementation strategy must ensure personnel have the appropriate competencies and training to undertake their roles and responsibilities in emergency situations.

Oil spill response training will be made available to specific personnel required to undertake a role in oil spill response.

**Table 2-2 Oil spill response competency and training**

Section	Role	Training and competency
Command	Incident Commander	<ul style="list-style-type: none"> <li>Incident Management training (PMAOMIR418).</li> <li>Oil Spill Response training.</li> <li>International Maritime Organisation (IMO) III - Command and Control training (for Level II/III incidents).</li> </ul>
	Safety Officer	<ul style="list-style-type: none"> <li>Incident Management training (PMAOMIR320).</li> <li>Experience in implementing safety management systems.</li> </ul>
	Liaison Officer	<ul style="list-style-type: none"> <li>Incident Management training (PMAOMIR320).</li> </ul>

	All other roles	<ul style="list-style-type: none"> <li>ICS 200.</li> </ul>

\* When the Esso IMT is activated, the Environmental Unit Lead becomes responsible for managing implementation of the OSMP modules, as directed by the Planning Section Chief.

Esso IMT members are selected by the supervisors based on skills and experience. Nominations are reviewed by the OIMS System 10-2 System Owner (to ensure training and competency requirements have been met or appropriate management measures have been put in place) and approved by the asset manager. Emergency Preparedness and Response required competency road map is assigned to the new incumbent. A training plan is put in place and the OIMS System 5-1 mitigation approval process applies.

The selection of the Environmental Unit Lead is based on relevant experience as an Environmental Advisor, with experience and/or training in the implementation of scientific monitoring. Minimum requirements include involvement in drills and spill exercises, management of marine monitoring programmes, such as produced formation water monitoring, and monitoring of parameters relating to offshore drilling and operations activities.

In addition, the minimum requirement includes a relevant tertiary degree in engineering, environmental science, environmental management or similar.

Esso implements incident management based on the ICS. The ICS is a system designed to provide a consistent organisation to respond to emergency situations. Positions within the ICS are fixed and have specific functions, ensuring that all responders know what to do and where they report in the organisation structure. The ICS is based on the US National Incident Management System 2006 ICS Structure, with slight modifications for industry. ICS is the primary emergency response framework for an oil spill response from all offshore activities. Typical incident management roles and training requirements are outlined in Table 2-2 and discussed further below.

#### *2.4.4.1 Incident management training*

The training program has been designed to meet the PMA08 Chemical, Hydrocarbons and Refining training standard. Personnel with an oil spill response role undertake incident management training including ICS and oil spill response specific training, as defined by their role and in accordance with the Emergency Response Training Plan.

##### **2.4.4.1.1 ICS 100 and 200 training**

ICS 100 and 200 training consists of computer-based training which addresses fundamental principles of the ICS including key roles and functions.

##### **2.4.4.1.2 ICS 300**

ICS 300 training is instructor led training that expands upon the information covered in the ICS 200 course. ICS 300 training may be obtained through completion of the ExxonMobil University of Spill Management course where the training provider is accredited to provide the certification.

#### *2.4.4.2 Oil spill response training*

To supplement incident management training, identified Esso IMT members must also complete oil spill response training. Oil spill response training may be completed through participation in a bespoke training program for Esso, completion of training delivered by AMOSC (or another training provider) or ExxonMobil University of Spill Management. Key aspects that must be addressed in this training include:

- understanding different oil spill response objectives and strategies
- understanding the different environmental, sociological and economic considerations of oil spill response
- learning and undertaking an oil spill incident action planning process
- understanding how to effectively monitor and evaluate oil spill strategies
- understanding jurisdictional control arrangements.

#### *2.4.4.3 Oil spill response equipment operation*

Selected operations and maintenance personnel at Esso's onshore facilities are familiarised with oil spill equipment operation, deployment and shoreline clean up techniques through dedicated training sessions and/or through participation in exercises. Training and exercises

may be supported by AMOSC, Oil Response Company of Australia or another training provider. Selected personnel may also be nominated to attend IMO I – Oil Spill Response Operations.

#### 2.4.4.4 Additional specialist training

Additional specialist training may be made available to specific personnel required to undertake a role in oil spill response. This training has been summarised in Table 2-3 and discussed further below.

**Table 2-3 Specialist training**

Typical Attendees	Course
Members of the AMOSC Core Group	IMO I – Oil Spill Response Operations. AMOSC Core Group workshop.
Select Esso IMT members	IMO II – Oil Spill Response Management or IMO III – Command and Control.
Aerial Observers	Aerial surveillance course.
RRT members and select Esso IMT members	ExxonMobil University of Spill Management (or equivalent). RRT training workshop.
Emergency Support Group (ESG) members and select Esso IMT members	ESG training.

##### 2.4.4.4.1 AMOSC Core Group

Selected ExxonMobil personnel have been identified as members of the AMOSC Core Group and may be called upon to respond under the AMOSC Plan and National Plan arrangements. These personnel receive training through AMOSC in accordance with the AMOSC Core Group agreement. They also participate in bi-annual training, exercise or response activities in order to maintain their competency.

##### 2.4.4.4.2 ExxonMobil University of Spill Management

ExxonMobil has developed an oil spill response training program which presents the fundamentals of oil spill response and provides a broad overview of response activities with a focus on the practicality and limits when responding to an oil spill. This course is aimed at personnel who fulfil a role within the Esso IMT. The course combines theory, desktop exercises and field deployment of response equipment. The course is jointly run by ExxonMobil personnel along with specialist contractors and the local oil spill response organisation. The course is generally run over four days. The course content covers:

- oil spill response concepts
- decision processes
- corporate policies and preferences

- fate, behaviour, tracking and surveillance
- response options: mechanical, in-situ burning, dispersants, monitoring and surveillance
- response components
- practical realities
- common misconceptions
- hands-on equipment deployment.

On completion of the course participants are certified in ICS 100-200.

#### **2.4.4.4.3 IMO II - Oil Spill Response Management**

As an alternative to the ExxonMobil University of Spill Management, Esso IMT personnel may attend the IMO II - Oil Spill Response Management course.

#### **2.4.4.4.4 IMO III - Command and Control**

Personnel identified to fulfil a Tier 2/3 Incident Commander role attend the IMO III - Command and Control course, or equivalent.

#### **2.4.4.4.5 Regional Response Team**

Esso, along with other ExxonMobil Business Units, contribute personnel to ExxonMobil's RRT. All RRT members complete University of Spill Management training (or equivalent) as base training. Selected RRT members also participate in additional role specific training. The RRT conducts annual RRT training workshops which are typically combined with a response exercise.

The ExxonMobil RRT includes personnel (currently 12) with experience and/or training in oiled wildlife response. These personnel are able to provide above-field support to an oiled wildlife response through development of response plans and coordination of specialist resources.

#### **2.4.4.4.6 Emergency Support Group**

Members of the ESG provide strategic support in the event of an oil spill or other emergency event. ExxonMobil's ESG course is used to train ESG members in the ESG process as well as provide an overview of ExxonMobil's emergency response structure. This is an internally run course which combines theory and a number of simulation exercises. The course is typically run over 2.5 days.

Course objectives are to:

- increase awareness of the ExxonMobil emergency response system and the underpinning principles
- assist in achieving a consistent approach to the ESG response process across the Corporation
- familiarise participants with roles and responsibilities within the ESG and the interface with other responders and relevant persons
- provide an opportunity for participants to practice roles
- improve ESG leadership and communication skills

- build the confidence of participants in responding as a team and individually
- enhance ExxonMobil's commitment to a consistent approach to emergency response.

### **Aerial surveillance course**

Aerial Observers complete an aerial surveillance course, which is provided by AMOSC and OSRL. The course is typically run over two days and includes theory and practical activities including:

- basic hydrocarbon theory and its relevance to aerial surveillance
- basic understanding of how to work in an aviation crew environment
- how to effectively plan and coordinate an aerial surveillance flight
- how to carry out the plotting and recording of oil spill information
- how to present oil spill information back through the Esso IMT in a clear and coherent manner.

#### *2.4.4.5 Source Control Branch*

Esso have a Source Control Branch (SCB) who specialise in source control in relation to a controlled or uncontrolled well control scenario. Personnel involved in SCB management (i.e. Branch Director/Deputy Branch Director) will have the minimum competencies and training or meet requirements recognition of prior learning and experience.

## **2.5 Monitoring of environmental performance**

In accordance with OPGGS (Environment) Regulation 14(6) the implementation strategy must provide for sufficient arrangements for monitoring, recording, audit, management of non-conformance and review of environmental performance and the implementation strategy to ensure that the EPOs and EPSs in the EP are being met.

### *2.5.1 Audits, assessments and inspections*

Environmental performance assurance of the activity will be undertaken in a number of ways. Performance assurance is undertaken to ensure that:

- controls are implemented in accordance with EPSs to achieve the EPOs
- non-compliances and opportunities for improvement are identified
- environmental monitoring and reporting requirements are met.

#### *2.5.1.1 LWIV activities*

A due-diligence pre-activity inspection/audit of the LWIV will be carried out after contract award and prior to the work commencing to ensure all controls listed in the EP to achieve the EPSs are ready to be implemented prior to the P&A activities commencing and to verify that procedures and equipment for managing routine discharges and emissions are in place (as described in pre-qualification material) to enable compliance with the EP.

A LWIV inspection checklist will be completed at commencement of the P&A campaign and quarterly thereafter by the Esso Wells Operations Supervisor, in conjunction with the Helix Rig Superintendent, and issued to the Esso Environmental Advisor for review.

Throughout the campaign a monthly EP compliance check of EPSs will be conducted and issued to the Esso Environmental Advisor for review and as the basis for the monthly recordable incident report (Section 2.7.2).

#### *2.5.1.2 Vessel activities*

In addition to the third-party services OIMS evaluation under System 8-1 a pre-mobilisation inspection is undertaken for all vessels to communicate specific EP requirements and to ensure that procedures and equipment for managing routine discharges and emissions are in place to enable compliance with this EP.

Vessels will conduct their own HSE inspections, which will be provided to Esso for ongoing compliance monitoring. These will be discussed in the quarterly review.

#### *2.5.1.3 Environment Plan compliance*

Independent of LWIV/support vessel-based inspection and audit activities, Esso will undertake a compliance audit of the commitments contained in this EP and assess the effectiveness of the implementation strategy.

Any non-compliance with this EP will be subject to investigation and follow-up action as detailed in Section 2.5.2.

Any opportunities for improvement or non-compliances noted will be communicated to all relevant personnel at the time of the audit to ensure adequate time to implement corrective actions. The findings and recommendations of inspections and audits will be documented and distributed to relevant personnel for comments, and any actions tracked until closed out

Results from the environmental inspections and audits will be summarised in the campaign specific EP environmental performance report(s) submitted to NOPSEMA.

#### *2.5.1.4 Contractor performance monitoring*

In accordance with Esso's Third-Party Services Management Manual (AUGO-PO-TPS-010) (see Section 2.1.10 for further information on OIMS System 8-1) third parties performance monitoring plans will be established prior to a contractor mobilising to a work site location.

The Contract Administrator is engaged in the contract life cycle management and the SSHE Group assists in the assessment and monitoring of contractor performance, as required. Providers of OIMS-critical services such as aviation, vessels, construction and well work are subject to a Quarterly Performance Review and Annual Performance Assessment.

Performance reporting consists of documented reports and verbal communications appropriate to the impacts and risks involved with the services provided. Written reports can include:

- non-conformance reports
- SSHE performance statistics, including environmental incidents

- assessments on the adequacy of actions taken from performance gaps/incidents
- deficiencies with HSE and security requirements and recommended corrective actions
- review of contractor HSE inspections and findings.

Report findings and recommendations are reviewed with contractor management and follow-up actions implemented to address deficiencies.

### 2.5.2 Management of non-conformance

Investigations into environmental incidents (including EP non-compliances) are conducted in accordance with the Esso incident management system, as described in detail in OIMS System 9.1: Incident Management.

Notification, reporting and investigation of incidents achieves the following:

- ensures management, regulatory authorities and other appropriate personnel are notified of incidents and near misses on a timely basis
- enables sharing of learnings throughout the organisation to continuously improve HSE systems
- identifies corrective actions to prevent re-occurrence including (if applicable) actions to re-establish the stated control measures in the EP in order to continue to reduce impacts and risks to ALARP and an acceptable level; and
- enables the analysis and trending of incident data to ensure appropriate focus on emerging issues.

Incidents are managed in accordance with the Incident Management Guideline (AUGO-PO-IMG-015) which describes the responsibilities and processes for all stages of incident management. Esso utilises the IMPACT incident database as the single, centralised tool for capturing data: tracking, sharing and analysing incidents, assessment findings, lessons learned and follow-up actions.

All Esso personnel are responsible for notifying their immediate supervisor of incidents, near misses and identified hazards, and for taking appropriate responses as part of their regular duties. Accountability for investigation lies with business line management. The SSHE Group is responsible for maintaining the reporting system, subject matter expert advice and investigation support.

The triggers and expected deliverables for investigations are based on incident severity (actual and potential) and are documented in the Incident Investigation and Sharing Guideline. The triggers for an investigation into an environmental incident are a significant spill to the environment, community complaint or regulatory reportable incident (see Table 2-6).

Corrective actions that address the root cause(s) of the incident are identified and implemented to prevent the recurrence of similar incidents. Corrective actions can be improvements to facilities, programs, processes or procedures that are identified to reduce the impact or risk, and enhance the integrity of operations. Once corrective actions have been identified from incident reports (including audit and inspection reports), the implementation process is systematically managed to completion via IMPACT. This ensures results are achieved and that the improvement is documented and sustained.

Helix will also, when relevant, undertake an investigation as per their HSE Management System.

### 2.5.3 Environmental performance review

#### 2.5.3.1 Daily rig calls

Daily rig calls are undertaken to keep all personnel involved up to date with the activities that are planned for the day and allows for input from the management team to assist with work planning.

#### 2.5.3.2 Toolbox meetings

Toolbox meetings are conducted twice daily to plan for any events that are occurring during the shift. This allows for relevant permits and risk assessments to be undertaken and to make sure that personnel completing the tasks understand all the associated safety and environmental risks.

Environmental matters will be included in daily toolbox talks as required for the specific work task being risk assessed.

Environmental issues will also be addressed in daily or weekly HSE meetings. All LWIV crew will participate in these meetings with the Helix OIM and Helix Rig Superintendent in discussing HSE matters that have arisen during that day or week's operations, and upcoming issues to consider. Outcomes will be documented in HSE meeting minutes.

### 2.5.4 Completion of activity

The Wells team conducts regular reviews of key performance indicators such as incident reports (including spills), regulatory compliance and types/volumes of waste disposed. In addition, the Wells team operations stewardship review is conducted yearly with senior management covering the environmental performance of recently completed wells operations campaigns.

The HSE team on board the LWIV meets on a monthly basis specifically to review environmental issues and initiatives. Personnel from Helix, Esso and other contractors attend where possible.

At the completion of the P&A campaign, a lessons learned review will be conducted to determine:

- the effectiveness of control measures
- improvements in procedures or processes for future campaigns.

### 2.5.5 Annual OIMS review

Formal assessment is regularly undertaken on the performance of the OIMS Systems to ensure that the Systems continue to be suitable, effective and are continuously improved. This is undertaken, at a minimum, on an annual basis in accordance with OIMS System 1-1.

## 2.6 Monitoring of emissions and discharges

In accordance with OPGGS (Environment) Regulation 14(7) the implementation strategy must provide for sufficient monitoring of, and maintain quantitative records of, emissions and discharges (whether occurring during normal operations or otherwise), such that the record can be used to assess whether the EPOs and EPSs in the EP are being met.

For LWIV/support vessel-based activities, the Esso Wells Operations Supervisor is responsible for collecting emissions and discharges data and reporting to the Esso Environmental Advisor.

A summary of these results will be reported in the EP environmental performance report submitted to NOPSEMA. Table 2-4 summarises the monitoring requirements for routine operations.

The process for managing environmental monitoring records is addressed through OIMS System 4-1.

**Table 2-4 Summary of monitoring of emissions and discharges**

Aspect	Monitoring	Frequency	Reporting
Ballast water uptake/discharge	Volume Location	Per event	Annual/end of activity environmental performance report.
Planned cement discharge	Cement additives used	Daily	Annual/end of activity environmental performance report.
Planned operational discharges – surface (i.e. circulation fluids, interface fluids, tank washings, new sodium chloride brine)	Components of fluids discharged at surface	Per event	Annual/end of activity environmental performance report.
	OIW content of interface fluids/tank washings	Daily	
Spill to sea	Chemical/oil type Volume	By incident event	Incident report. Annual/end of activity environmental performance report.
Release of waste to sea	Waste type	By incident event	Incident report. Annual/end of activity environmental performance report.
Dropped object to sea	Object type	By incident event	Incident report. Annual/end of activity environmental performance report.

## 2.7 Reporting

This Section details the external (routine) notifications and reporting requirements to statutory authorities, together with the (non-routine) incident notifications and reporting requirements.

Relevant regulatory references are provided in Table 2-5.

### 2.7.1 Routine notification and reporting

Regulation 26C of the OPGGS (Environment) Regulations requires the reporting of environmental performance of this EP.

The OPGGS (Environment) Regulation 14(2) states that the implementation strategy must:

- state when the titleholder will report to the Regulator in relation to the titleholder's environmental performance for the activity
- provide that the interval between reports will not be more than one year.

In addition to environmental performance reporting, OPGGS (Environment) Regulation 29 requires notifying NOPSEMA of the start and end of activity and Regulation 25A requires notifications that all of the obligations under the EP have been completed.

The routine reporting requirements required for this EP are described in Table 2-5.

**Table 2-5 Routine Environment Plan reporting requirements**

Requirement	Timing	Contact
Submit an annual EP environmental performance report to NOPSEMA	The annual EP environmental performance report will be submitted to NOPSEMA within 3 months of the completion of the P&A campaign.  Should the duration of the P&A campaign exceed one year, interim environmental performance reports will be submitted to NOPSEMA within three months of each anniversary of the commencement of the campaign to ensure that the interval between reports will not exceed one year.	NOPSEMA – submissions@nopsema.gov.au
Notify NOPSEMA of the commencement date	At least 10 days prior to activity.	
Notify NOPSEMA of the completion date	Within 10 days of activity completion.	
Notification of EP completion	Within 10 days of activity finalisation and obligation completion.	

### 2.7.2 Incident notification and reporting

The OPGGS (Environment) Regulations define ‘recordable incidents’ and ‘reportable incidents’, and also describe reporting requirements for each type of incident.

The requirements for reporting environmental incidents to external agencies are listed in Table 2-6. These will be reported to the regulator by the Esso Wells Operations Supervisor (or SSHE Group delegate).

**Table 2-6 External incident notification and reporting requirements**

Requirement	Timing	Contact
<b>Recordable incidents</b>		
<p>Recordable incident, for an activity, means a breach of an EPO or EPS, in the EP that applies to the activity that is not a reportable incident.</p> <p>As a minimum, the written monthly recordable incident report must include a description of:</p> <ul style="list-style-type: none"> <li>• all recordable incidents which occurred during the calendar month</li> <li>• all material facts and circumstances concerning the incidents that the titleholder knows or is able, by reasonable search or enquiry, to find out</li> <li>• any action taken to avoid or mitigate any adverse environmental impacts of the recordable incidents</li> <li>• the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring in the future</li> </ul> <p>Monthly reports will utilise the <i>Recordable Environmental Incident Monthly Report</i> (NOPSEMA, 2020). If there are no recordable incidents a ‘nil’ report will be submitted.</p>	<p>As soon as possible but before the 15<sup>th</sup> day of the following calendar month.</p>	<p>NOPSEMA – <a href="mailto:submissions@nopsema.gov.au">submissions@nopsema.gov.au</a></p>
<b>Reportable incidents</b>		

Requirement	Timing	Contact
<p>Reportable incidents are those that have caused, or have the potential to cause, moderate to significant environmental damage. This includes, but is not limited to, those identified through the risk assessment process as having a consequence ranking of I or II, or at a minimum the following incidents:</p> <ul style="list-style-type: none"> <li>• unplanned release of hydrocarbon liquid or chemicals exceeding 80L into the marine environment caused by, or suspected to have been caused by, petroleum activities</li> <li>• unplanned injury or death of a cetacean or listed threatened/migratory/marine species caused by, or suspected to have been caused by, petroleum activities.</li> </ul> <p>The notification must contain:</p> <ul style="list-style-type: none"> <li>• all material facts and circumstances concerning the reportable incident that the titleholder knows or is able, by reasonable search or enquiry, to find out</li> <li>• any action taken to avoid or mitigate the adverse environmental impact of the reportable incident</li> <li>• the corrective action that has been taken or is proposed to be taken to stop, control or remedy the reportable incident.</li> </ul>	<ul style="list-style-type: none"> <li>• Verbally as soon as possible but within 2 hours of incident, or, if the reportable incident was not detected by the titleholder at the time of the first occurrence – the time the titleholder becomes aware of the reportable incident, then.</li> <li>• Written notification as soon as practicable (copy to National Offshore Petroleum Titles Authority and Department of Jobs, Precincts and Regions (DJPR)).</li> <li>• Written report as soon as practicable but within 3 days including specifying if a further written report will be provided (then copy to National Offshore Petroleum Titles Authority and DJPR within 7 days).</li> <li>• If formal investigation is triggered, a further written report within 30 days.</li> </ul>	<p>NOPSEMA – 1300 674 472</p> <p>DJPR – Earth Resources Regulation Compliance Duty Officer - 0419 597 010 (24-hour)</p> <p>Department State Duty Officer – 0428863564 <a href="mailto:licensing.err@ecodev.vic.gov.au">licensing.err@ecodev.vic.gov.au</a></p> <p>National Offshore Petroleum Titles Authority – <a href="mailto:reporting@nopta.gov.au">reporting@nopta.gov.au</a></p>
<b>Other reporting requirements</b>		

Requirement	Timing	Contact
<p>Mandatory MARPOL report about a pollution incident involving:</p> <ul style="list-style-type: none"> <li>a discharge (or probable discharge) of oil or noxious liquid substances in excess of permitted MARPOL discharge levels, quantities or rates, for whatever reason, including those for the purpose of securing the safety of the ship or for saving life at sea</li> <li>a discharge (or probable discharge) of harmful substances in packaged form, including those in freight containers, portable tanks, road and rail vehicles and shipborne barges.</li> </ul> <p>Report to include:</p> <ul style="list-style-type: none"> <li>name of ship/s involved</li> <li>time, type and location of incident</li> <li>quantity and type of harmful substance</li> <li>assistance and salvage measures</li> <li>any other relevant information.</li> </ul>	<p>Vessel Master to notify AMSA verbally without delay. If AMSA asks for a written MARPOL report this must be provided within 24 hours after AMSA asks for the report.</p>	<p>AMSA +61 02 6230 6811 or 1800 641 792 rccaus@amsa.gov.au</p>
<p>Suspected or known IMS introduction</p>	<p>Immediately</p>	<p>Report a pest – <a href="https://www.marinepests.gov.au/">https://www.marinepests.gov.au/</a> Department of Environment, Land, Water and Planning Victoria – 136 186</p>
<p>Oiled wildlife</p>	<p>Immediately</p>	<p>Department of Environment, Land, Water and Planning Victoria State Agency Commander – 1300 134 444</p>
<p>Wildlife emergency</p>	<p>Immediately</p>	<p>Department of Environment, Land, Water and Planning Victoria</p> <ul style="list-style-type: none"> <li>Whale and Dolphin Emergency Hotline – 1300 136 017</li> </ul>

Requirement	Timing	Contact
		<ul style="list-style-type: none"> <li>Seals, Penguins or Marine Turtles 136 186 (Mon-Fri 8am to 6pm)</li> <li>Marine Response Unit – 1300 245 678</li> </ul>
Notification of activities affecting listed species or ecological communities in or on a Commonwealth area (specifically unintentional injury or death of a cetacean or listed threatened/migratory/marine species caused by, or suspected to have been caused by petroleum activity)	Within 7 days	Department of Climate Change, Energy, the Environment and Water 1800 803 772 <a href="mailto:EPBC.Permits@environment.gov.au">EPBC.Permits@environment.gov.au</a>
Cetacean vessel strike	Within 3 days	Department of Climate Change, Energy, the Environment and Water <a href="https://data.marinemammals.gov.au/report/shipstrike">https://data.marinemammals.gov.au/report/shipstrike</a>

## 2.8 Emergency response

The process to prepare emergency preparedness and response plans, including procedures to prevent and mitigate potential environmental impacts associated with accidents and emergency situations, is addressed through OIMS System 10-2: Emergency Preparedness and Response.

Emergency planning and preparedness are essential to ensure that, in the event of an incident, all necessary actions are taken for the protection of the public, the environment, and company personnel, assets and reputation.

Responsibilities for the purposes of emergency response are outlined as follows:

- Helix is the 'Operator' of the facility and has legislative responsibilities for all operations on the LWIV, including response to emergencies
- Esso's role in dealing with emergencies is to provide the necessary resources to support a Helix emergency response. Esso's Wells team will operate from the EAPL Melbourne office. Additional management, technical and emergency response support will be provided from the Melbourne office and, if required, Houston offices.

### 2.8.1 Emergency response documentation

A campaign specific bridging ERP will be developed to support the existing LWIV emergency response documentation. It will describe the location specific arrangements for responding to emergencies including the role of helicopter and vessel support functions, extreme weather evacuation planning, medivac, regulatory liaison and reporting.

In the event of an emergency on the LWIV, Helix's Emergency Response Plan, as per the requirements of the *Q7000 Safety Case (Australia)* (Helix, 2021), is the primary document that details how emergencies are managed.

The bridging ERP will address local responses for Esso Bass Strait operations including appropriate support linkages to Esso's Australian and corporate-wide emergency preparedness and response network including in-country, regional and global ESGs. The Bridging ERP also details how Helix and Esso will interact in the event of an emergency. A campaign specific Contacts Directory listing all contact numbers will also be developed.

### 2.8.2 Oil Pollution Emergency Plan

In accordance with OPGGS (Environment) Regulation 14(8), 14(8AA) and 14(8A), the implementation strategy must include an OPEP and arrangements for testing the response arrangements within this plan.

In all cases Esso, as nominated operator under the OPGGS (Environment) Regulations, will retain control and responsibility for managing spill response.

Esso has in place the Bass Strait OPEP for all its offshore assets and operations in Bass Strait that outlines how Level 1, 2 and 3 spills will be managed. The Bass Strait OPEP includes as Appendix D Quick Reference Information specific to Gudgeon-1 and Terakihi-1 P&A activities which summarises hydrocarbon properties, worst case deterministic modelling, receptors at risk, relevant shoreline Tactical Response Plans (TRPs), and recommended spill response strategies.

Level 1 spills are defined in the Bass Strait OPEP as 'Located within a 3 nautical mile radius of the spill location'. As described in Section 3, Helix as the 'Operator' of the facility', has the responsibility to respond to emergencies. Therefore, for a Level 1 spill which is contained inside the 500-metre PSZ the LWIV Shipboard Marine Pollution Emergency Plan is the primary response plan and Helix will use its shipboard resources to immediately respond.

As described above, as Esso is the nominated operator under the OPGGS (Environment) Regulations, it will support Helix with the Bass Strait OPEP and provide additional resourcing as needed. All actions described under Level 1 incidents in the Bass Strait OPEP will still be undertaken by Esso who will work with Helix throughout the response process per the campaign specific Bridging ERP. Where the spill extends beyond the 500-metre PSZ, Esso with its additional capabilities will continue with the response.

For a Level 2 or 3 spill the Bass Strait OPEP is the primary document and this will outline the resources and response strategies to be implemented depending on the size and nature of the spill.

#### 2.8.2.1 Oil spill response needs and capability

In order to determine appropriate oil spill response strategies and capabilities, Esso has assessed spill risk, fate and weathering as detailed in Volume 2. Deterministic modelling was utilised to identify potentially impacted receptors and anticipated oil loadings. Where modelling indicates surface or shoreline exposure above moderate thresholds, i.e. actionable quantities of oil, an assessment has been carried out to determine resource needs and availability. This information is summarised in the Bass Strait OPEP Appendix D Quick Reference Information.

MDO is a Group II oil (ITOPF, 2015) which has low viscosity and spreads rapidly on the sea surface to form thin sheens. Due to the rapid spread and weathering of MDO in an open water environment, on-water containment and recovery may be viable but is unlikely to be effective. Use of chemical dispersants is not recommended practice for MDO. No shoreline contact was predicted above the low threshold from a MDO spill at Gudgeon-1 and Terakihi-1 (as modelled from West Kingfish, refer to Volume 2 Section 6.6).

The Gudgeon-1 and Terakihi-1 crude oils (using West Kingfish and Flounder crude as an analogue) are Group IV persistent oils according to the International Tanker Owners Pollution Federation classifications (ITOPF, 2015).

Use of a Capping Stack for well source control has been assessed and is feasible. The evaluation of source control options is further discussed in Volume 2 Section 6.7.

There is a moderate probability of shoreline contact at the moderate exposure threshold for both modelled scenarios at 14 percent for the Gudgeon-1 scenario and 56 percent for the Terakihi-1 scenario. The length of shoreline exposed is up to 58.3 kilometres and 140 kilometres for the Gudgeon-1 and Terakihi-1 scenarios respectively at 10 grams per square metre. The minimum time before shoreline accumulation at this threshold is 10.9 days (at East Gippsland) and 6.5 days (at East Gippsland) for the Gudgeon-1 and Terakihi-1 scenarios respectively. The applicable TRPs are listed in the Quick Reference Guide (AUGO-DC-EMP-001).

Given the properties of these oils and predicted weathering and fate, based on the Net Environmental Benefit Analysis the recommended response strategies will include a combination of surveillance and monitoring, dispersant application, containment and recovery, protection of sensitive shoreline resources, shoreline clean-up and oiled wildlife response. All required resources for implementation of these strategies are available per the Bass Strait OPEP.

### 2.8.3 Testing of oil spill response arrangements

In accordance with OPGGS (Environment) Regulation 14(8C) and requirements of OIMS System 10-2: Emergency Preparedness and Response, the response arrangements within the OPEP will be tested:

- prior to the commencement of the activity
- when they are significantly amended
- not later than 12 months after the most recent test
- in accordance with the schedule outlined in Volume 4 Table 9-1 of Bass Strait Operations EP (AUGO-EV-EMM-002) and in addition the schedule outlined in Table 2-6, and as further detailed in the annual Emergency Preparedness and Response Activity Plan.

The Emergency Preparedness and Response Activity Plan includes additional detail on the type of test, frequency, duration, and participants and is cross-referenced to preparedness and response performance standards which are to be tested, as detailed in Volume 3 and Section 2.8.

Testing may be externally or internally facilitated. Tests will be documented, assessed against objectives and applicable performance standards and any corrective actions/recommendations arising from the tests will be managed in accordance with the

Emergency Preparedness and Response Programs Guide (AUGO-PO-SRT-337). Emergency response training records will be maintained in accordance with OIMS System 10-2.

Where changes are required to the Bass Strait OPEP, resulting from testing/exercise outcomes, altered contractual arrangements, corrective actions, routine information updates (e.g. contact detail change), or other items; the OIMS System 10-2 Administrator is responsible for ensuring changes are assessed against OPGGS (Environment) Regulation 17 revision criteria and where necessary, the EP and/or OPEP is submitted to NOPSEMA as a formal revision, in accordance with the MOC process (OIMS System 7-1). For changes which do not trigger a formal revision, internal revisions to the OPEP will also be in accordance with the MOC process with any change justified.

**Table 2-7 Testing of oil spill response arrangements**

Test	Objective	Parties Involved	Scheduled Frequency
Relief well	To assess the availability of suitable* drill rigs capable of meeting the timelines defined in the SCERP (in total well completed in 98 days) for relief well drilling.	Wells team Third-party service providers Rig operator	Status and location of suitable relief well rigs is confirmed 30 days prior to P&A activities commencing on first well and subsequently each month throughout the campaign.
Desk top exercise - Source control	To familiarise the Offshore IMT and SCB with their roles and responsibilities detailed in the Bass Strait OPEP and Australia Well Tier II/III ERP;  To validate contact information and resource activation protocols as detailed in the Bass Strait OPEP and Australia Well Tier II/III ERP to assess the availability of logistical resources to mobilise the following; <ul style="list-style-type: none"> <li>• Wild Well Control/OSRL capping stack and supporting equipment to the Bass Strait from Singapore</li> <li>• the specific aspect of the logistical resources to be assessed will be the availability of suitable</li> </ul>		Shortly after arrival of the LWIV and before start of P&A activities.

	<p>construction support vessels.</p> <ul style="list-style-type: none"><li>• to notionally test identifying and mobilising a relief rig to drill a relief well as outlined in the Australia Well Tier II/III ERP .</li></ul>		
--	--	--	--

\* Parameters assessed include current Australian Safety Case, current working location (preferably in Australian waters, otherwise nearest location), compatibility with well location (depth, working pressures etc.), contractual arrangements and time to mobilise to site. A check is also conducted to see if identified rigs have been contracted through members party to the Mutual Aid Agreement, for the purposes of rendering assistance where needed in case of a catastrophic event.

\*\* This test is only applicable when Subsea Well Control is a response option.

### 3 Relevant persons consultation

Esso has undertaken consultation in the course of preparing this EP in accordance with regulation 11A of the OPGGS (Environment) Regulations.

The judgements of the Federal Court of Australia Decision (Tipakalippa v National Offshore Petroleum Safety and Environmental Management Authority (No 2), 2022) and Appeal (Santos NA Barossa Pty Ltd v Tipakalippa, 2022) represents the law regarding requirements for consultation in accordance with the OPGGS (Environment) Regulations. At the time of the Decision, this EP was under assessment by NOPSEMA based on the previous consultation methodology.

Following the Appeal and the Federal Court of Australia Decision on 28 September 2023 (Cooper v National Offshore Petroleum Safety and Environmental Management Authority (No 2), 2023), Esso revised its methodology (refer to Section 3.1.2) to better reflect the intent of the judgements.

This Chapter provides the outcomes of consultation conducted up to and including information received by 4 November 2023. During the consultation process, no objections or claims were received.

Over the past 50 years of operations in Bass Strait, Esso has established relationships with relevant persons identified in the *Bass Strait Operations EP* (AUGO-EV-EMM-002) and activity-specific EP submissions, as well as the broader public and other interested parties.

Esso recognises and respects the important contribution of relevant persons, including First Nations people, throughout offshore petroleum activities. Esso is committed to ensuring that relevant persons are identified and given sufficient information and reasonable time for consultation to allow them to make an informed assessment of the possible consequences of a proposed petroleum or greenhouse gas activity on them.

The consultation process outlined in this EP allows Esso to ascertain, understand and address all the environmental impacts and risks that might arise from its proposed activity. The consultation process also allows Esso to receive information that the Company might not otherwise receive, and to use this information to enhance understanding of the environment, people, communities, heritage values, and social and cultural features that may be affected by the proposed activities and to inform decision-making.

For the purposes of this EP, Esso defines consultation as a process of communication that leads to a decision where the views of relevant persons have been taken into account. Whereas engagement aims to build long term relationships by exchanging information. While Esso is required by legislation to consult with relevant persons, Esso is also committed to engaging with relevant persons and continuing to further develop relationships already established.

Esso will consider and adopt appropriate measures, in response to the matters raised by relevant persons, in the management of environmental impacts and risks as part of the EP development process.

This Chapter describes Esso's approach to consultation and engagement, and the steps taken to develop and maintain consistent, constructive and effective relationships with relevant persons associated with this EP.

More specifically, this Chapter outlines in detail:

- Section 3.1 Consultation requirements – the applicable consultation and engagement standards and legislative requirements, including Esso’s definition of relevant persons.
- Section 3.2 Esso’s consultation methodology – the methodology used to identify and consult with relevant persons for any EP.
- Section 3.3 Esso’s consultation methodology as applied to the scope of this environment plan – how Esso has applied the methodology (as described in Section 3.1.2) for this specific EP and the activities it proposes. This includes:
  - the relevant persons identified under the scope of this EP and the verification process applied
  - communication and consultation methods used to ensure sufficient information is provided in relation to the scope of this EP
  - how the consultation process is planned and tailored as appropriate to the nature and scope of this EP
  - a description of consultations undertaken
  - a summary of how feedback received to-date have been considered, addressed and communicated.

### 3.1 Consultation requirements

Esso is committed to undertaking all consultation and engagement activities in accordance with applicable Australian legislation and ExxonMobil standards.

#### 3.1.1 Legislative requirements

For each EP, Esso undertakes consultation in accordance with legislative requirements, including case law. As such, Esso’s consultation processes are designed to meet obligations specified in Section 280 and Section 460 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (the Act) and in the context of the objects of Regulation 3 of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (OPGGS (Environment) Regulations).

Consultation-specific requirements are covered in several of the OPGGS (Environment) Regulations, as discussed in the following sections.

##### 3.1.1.1 Regulation 11A

In accordance with Regulation 11A (1), Esso categorises relevant persons into five categories aligned to Regulation 11A (1)(a)-(e).

For the purpose of the consultation, the titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person.

Per Regulation 11A (2), Esso defines ‘sufficient information’ to include:

- sharing information that is tailored to a relevant persons’ needs
- detailing the proposed activity and any impacts and risks that may be relevant to them

- describing the control measures proposed to manage the potential impacts to them.

Esso considers the functions, interests or activities of relevant persons and the potential impacts and risks that affect them when determining information requirements and acknowledges that information may need to be provided in an iterative manner.

Following guidance provided in *Consultation in the course of preparing an environment plan* (NOPSEMA, 2023), Esso acknowledges that:

*“The phrase ‘functions, interests or activities’ in reg 11A(1)(d) should be broadly construed as this approach best promotes the objects of the Regulations, including that offshore petroleum and greenhouse gas activities are carried out in a manner consistent with the principles of ESD14.*

*Functions: Refers to ‘a power or duty to do something’.*

*Activities: To be read broadly and is broader than the definition of ‘activity’ in regulation 4 of the Environment Regulations and is likely directed to what the relevant person is already doing.*

*Interests: To be construed as conforming with the accepted concept of ‘interest’ in other areas of public administrative law. Includes ‘any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation’.*”

In accordance with Regulation 11A (3), Esso determines a reasonable period for consultation in relation to this EP, as discussed in Section 3.2.7.1.

In accordance with Regulation 11A (4), Esso will inform each relevant person that they may request that particular information they provide in the consultation not be published. Esso is committed to honouring this request and will not publish information subject to such a request.

#### 3.1.1.2 Regulation 9

In accordance with Regulation 9 (8), sensitive information relating to relevant persons and the full text of any response by a relevant person to consultation under Regulation 11A in the course of preparation of the EP, will only be included in the ‘sensitive information part’ and not anywhere else in the EP. The ‘sensitive information part’ is removed prior to publication in accordance with Regulation 9AB.

#### 3.1.1.3 Regulation 10A

In accordance with Regulation 10A (g), this whole Chapter is intended to demonstrate how Esso has carried out the consultations required by Division 2.2A. In developing this EP, Esso has also considered the guidance provided in *Environment Plan Assessment* (NOPSEMA, 2020), *Environment Plan decision making* (NOPSEMA, 2021) and *Environment plan content requirement* (NOPSEMA, 2020).

#### 3.1.1.4 Regulation 14

In accordance with Regulation 14 (9), Esso ensures appropriate consultation is conducted with relevant departments, authorities and ministers through their identification as relevant persons under Categories 11A (1)(a), (b) and (c) (Refer to Section 3.2.4.1).

Other persons or organisations with functions, interests or activities are identified as relevant persons under Category 11A (1)(d) (Refer to Section 3.2.4.2).

In addition, Esso may categorise any other person or organisation as a relevant person under 11A (1)(e) (Refer to Section 3.2.4.3).

Esso also conducts broad-based information sharing activities as outlined in Section 3.2.4.4.

#### 3.1.1.5 Regulation 16

In accordance with Regulation 16 (b), Esso provides a report on all consultations undertaken with any relevant person in accordance with Regulation 11A (see Section 3.2.10). The report contains:

- a summary of each response made by a relevant person
- an assessment of the merits of any objection or claim about the adverse impact of each activity to which the environment plan relates
- a statement of the titleholder's response, or proposed response, if any, to each objection or claim
- a copy of the full text of any response by a relevant person.

#### 3.1.1.6 Case law

The judgements from the Federal Court of Australia Decision (Tipakalippa v National Offshore Petroleum Safety and Environmental Management Authority (No 2), 2022), Appeal (Santos NA Barossa Pty Ltd v Tipakalippa, 2022) and Decision on 28 September 2023 (Cooper v National Offshore Petroleum Safety and Environmental Management Authority (No 2), 2023) represents the law and constitute the legal requirements of consulting with relevant persons in accordance with the OPGGS (Environment) Regulations.

In the Appeal (Paragraphs 96 & 104), The Federal Court of Australia has noted that there is no shortage of guidance in decisions on consultation processes under *the Native Title Act 1993*, which is illustrative of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner. The *Native Title Act 1993* requires reasonable notice to group members, but not exhaustive communications with each and every person.

Esso also implements the guidance outlined in *Consultation in the course of preparing an environment plan* (NOPSEMA, 2023), which was revised to incorporate the judgements.

#### 3.1.2 ExxonMobil standards

In accordance with OIMS 10-1, Esso has developed a consultation and engagement methodology that enables Esso to:

- ensure every effort is made to identify relevant persons to this activity
- undertake a verification process to ensure all representatives of relevant persons are a true representation/advocate of the views of their constituents and can be relied upon to faithfully communicate the results of engagements back to their constituents
- ensure relevant persons, especially those who are directly impacted, are consulted on matters that may affect them

- ensure that consultation is genuine and provides a meaningful dialogue to develop and maintain consistent and constructive relationships with relevant persons to further understand potential environmental, social and economic impacts
- pursue engagement with relevant persons using a level of effort commensurate with the nature and scale of the activity
- keep relevant persons informed with respect to their specific interests, functions or activities
- encourage relevant persons to assess the information provided to them and respond to Esso with any feedback including questions, issues, concerns, suggestions, objections and/or claims
- provide relevant persons with feedback regarding matters they have raised with Esso
- maintain confidence of relevant persons in Esso and its activities through ongoing open, informative, inclusive and timely communications, wherever possible.

Implementation of the consultation methodology provides a mechanism by which Esso can:

- meet regulatory and other obligations and align with industry best practice consultation and engagement methods
- review and update the consultation methodology to reflect any changes to applicable laws, best practices or standards
- provide meaningful information in a format, language and style that is readily understood and tailored to the needs of relevant persons and groups
- provide information so that sufficient time and opportunity to inform decision-making
- ensure consultations are based on open communication that is transparent, collaborative, inclusive and are conducted with integrity to foster respect and trust
- disseminate information in formats, methods and locations that make it easy for relevant persons to access and understand
- respect local traditions and the relevant person's preferred ways of doing things
- establish a dialogue that gives all relevant persons the opportunity to exchange views and information, to listen, and to have their feedback heard and addressed
- seek inclusiveness in representation of views, including minority and special interest groups
- develop clear mechanisms for receiving, documenting, evaluating and responding to feedback
- incorporate feedback from relevant persons into the program design and provide clear and transparent reporting back to relevant persons in a reasonable timeframe.

Esso recognises First Nations people as the Traditional Custodians of the land and waters in which the company operates and acknowledges and pays respect to their Elders – past, present and emerging.

Esso understands that First Nations people see no distinction between the land and the sea, considering it all as a part of their Country. This understanding aligns with the regulatory guidance (NOPSEMA, 2023), which states “A connection of traditional owners with sea country may constitute an interest for the purposes of reg 11A (1)(d).”.

Esso continues to identify and attempt consultations with environmentally focused non-government organisations (eNGOs) and other environmental protection and advocacy groups.

### 3.2 Esso's consultation methodology

This Section provides a detailed methodology for identifying and consulting with relevant persons, which is to be followed when developing a new EP or a revision to an EP for an offshore activity. It covers the:

- process for identifying relevant persons applicable to an offshore activity that requires a new EP or a revision to an EP under the OPGGS (Environment) Regulations
- the process for classification of relevant persons based on their functions, interests or activities
- preparation of appropriate consultation materials and forms of consultation for each relevant person identified
- process of consultation including assessment of information and feedback received.

For specific information on how this process was undertaken in relation to this EP, refer to Section 3.3.

#### 3.2.1 Definition

To ensure a consistent approach to identifying and consulting with relevant persons in relation to offshore EPs, the definitions included in Table 3-1 have been used as the basis for this methodology.

**Table 3-1 Definitions**

Term	Definition
Activities	In relation to Regulation 11A (1)(d), activities are considered to be what other persons or organisations are already doing.
Area To Be Avoided (ATBA)	The boundary of which commences at the most easterly intersection of the coastline of the State of Victoria at mean low water by the parallel of Latitude 38° 14' 54.50" South and runs thence south-easterly along the geodesic to the point of Latitude 38° 34' 54.49" South, Longitude 147° 44' 04.61" East thence along the coastline of the State of Victoria at mean low water to the point of commencement.
Claims	Evidence provided that suggests there are potential adverse impacts from the petroleum or greenhouse gas activities to which the EP relates.
Consultation	Targeted and tailored information provided to enable effective consultation on a specific planned activity within a defined timeframe.
Consultation period	Esso generally defines the consultation period during the development of an EP as being 30 business days, subject to the nature and scale of the proposed activity.
Engagement	Ongoing relationship building or general engagement not related to a specific activity or defined timeframe.
Environment	OPGGS (Environment) Regulations defines this as:

Term	Definition
	<p>(a) ecosystems and their constituent parts, including people and communities; and</p> <p>(b) natural and physical resources; and</p> <p>(c) the qualities and characteristics of locations, places and areas; and</p> <p>(d) the heritage value of places; and includes</p> <p>(e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d).</p>
Functions	In relation to Regulation 11A (1)(d), functions refer to a power or duty to do something.
Geographical boundary	The geographical areas (OA, ATBA and PEA) used as the basis for identifying relevant persons.
Information sharing	Broad, high level information such as information bulletins and information regarding PEA and oil spill modelling.
Interests	<p>In relation to Regulation 11A (1)(d), interests represent a connection to the values described in the EP. Any interest possessed by an individual, whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.</p> <p>An interest does not extend to general public interest in an activity.</p>
Objection	A reason or argument that asserts that there are potential adverse impacts arising from the petroleum or greenhouse gas activities to which the EP relates.
Operational Area (OA)	The 500-metre PSZ around platforms and subsea installations.
Petroleum/greenhouse gas activity	A planned offshore petroleum or greenhouse gas storage activity for which an EP is required. This also includes activities undertaken in the event of an emergency condition such as oil spill response.
Planned activity	The activity as described in Volume 2 Section 2.1.
Potentially Exposed Area (PEA)	Oil spill modelling is used to determine the total area that could be exposed to hydrocarbon, including trace concentrations of oil in the water column, as a result of any spill and is used for planning purposes to ensure that all social and environmental sensitivities are acknowledged, described and considered in the development of the EP.
Reasonable period	<p>The amount of time for relevant persons to identify the effect of a proposed activity on their functions, interests or activities and make a response detailing their objections or claims.</p> <p>Esso generally defines a reasonable period for a relevant person to review and provide an initial response (i.e. the consultation period) as being 30 business days, subject to the nature and scale of the proposed activity.</p> <p>Where engagement with relevant persons is ongoing after this period, Esso will continue to engage with these persons until Esso believes that it has provided sufficient evidence/justification to close the consultation</p>

Term	Definition
	(i.e. they have been provided sufficient information and reasonable time).
Relevant person	Can be a person, organisation, department or agency that falls within one of the classifications defined by subregulation 11A (1) of the OPGGS (Environment) Regulations.
Stakeholder	Stakeholder is a general use term and includes any person, group or organisation with a interest or concern in something. It includes those that may be affected in an immaterial or negligible way. Esso uses this terminology in general terms when describing those persons/organisations that we have chosen to engage with even though they may not be deemed to be relevant persons pursuant to Regulation 11A for the scope of the EP.
Unplanned activity/event	Accidental release e.g. loss of containment refined oils (collision) or loss of containment reservoir hydrocarbons Covered by OPEP.

### 3.2.1.1 *Petroleum activity (planned activity)*

The OPGGS (Environment) Regulations require that consultation be undertaken to ensure that persons who may be affected by a petroleum activity are given the opportunity to inform the titleholder how they may be affected and to allow the titleholder to assess and address any objections or claims about that activity in the preparation of environment plans.

Regulation 4 of the OPGGS (Environment) Regulations defines a petroleum activity as “any operations or works in an offshore area carried out for the purpose of:

- a. exercising a right conferred on a petroleum titleholder under the Act by a petroleum title; or
- b. discharging an obligation imposed on a petroleum titleholder by the Act or a legislative instrument under the Act.”

When identifying relevant persons, Esso considers which stakeholders perform a function in relation to – or have a function, interest or activity that may be affected by – the planned activity.

### 3.2.1.2 *Unplanned event/activity (emergency conditions)*

Relevant persons who may perform a function in Esso’s planning for, or management of an unplanned activity, and whose information is integral to the development of emergency management plans, are engaged during the development of this EP and the OPEP.

Persons whose functions, interests or activities are within the PEA for the unplanned activity are provided with broad, high level information such as activity information bulletins and information regarding PEA and oil spill modelling.

If requested, consultation may include face-to-face engagements, phone calls, community meetings, specialist group meetings, community drop-in sessions. If no response is received no further consultation is required.

### 3.2.1.3 *Geographical boundaries*

Esso uses the following geographical boundaries to define EP consultation:

- Operational Area (OA): 500-metre PSZ around platforms and subsea installations (as described in Volume 2 Section 2.1).
- Area To Be Avoided (ATBA): As described in Schedule 2 of the OPGGS Act.
- Potentially Exposed Area (PEA): As described in Volume 2 Section 3.4.

### 3.2.2 *Esso's Approach to consultation*

Esso's approach to consultation with relevant persons involves steps undertaken across three consultation Levels, as shown in Figure 3-1.

If Esso identifies a group of relevant persons that may be potentially affected, but is unable to confirm individual contact details as these are not ascertainable through normal mechanisms (e.g. website, associated government agencies, organisations or groups who hold these details or who can advise who these individuals are), the opportunity exists for such persons to contact Esso via the publicly accessible Esso Consultation Hub, consultation email or phone. Newspaper advertisements are also used to highlight activities so that individuals or groups can self-identify to Esso.

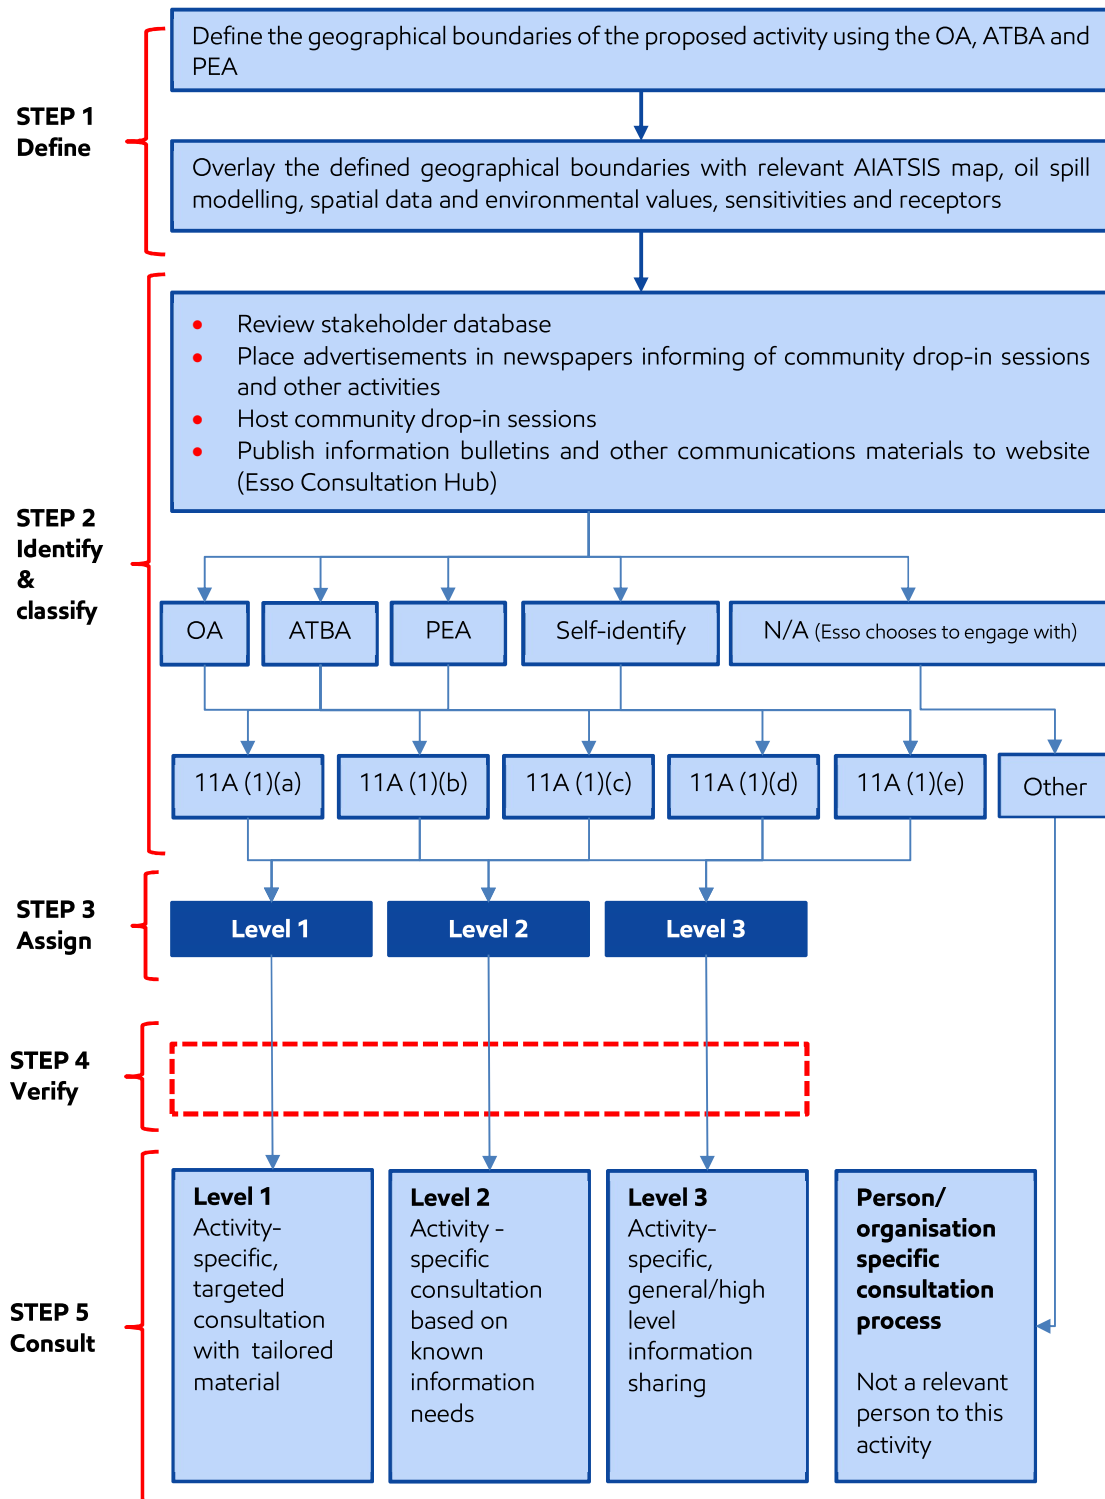

Figure 3-1 Esso's approach to consultation

### 3.2.3 Step 1 – Define

When preparing for consultation for each new petroleum activity, Esso first identifies the geographical boundaries of the EP. As defined in Section 3.2.1.3, these geographical boundaries are the:

- OA
- ATBA
- PEA.

Each of the defined geographical boundaries are then overlaid with relevant Australian Institute of Aboriginal and Torres Strait Islander Studies (AIATSIS) map, oil spill modelling, spatial data and environmental values, sensitivities and receptors.

Esso will also outline the EP specifications for:

- activity description, which is compared to previous consultations undertaken for other Esso activities and/or facilities.
- scope of the EP, taking into consideration factors such as planned and unplanned impacts to environmental factors including air and water emissions, culturally sensitive areas, sea country and marine environments; and potential socioeconomic impacts including job creation throughout the supply chain
- environmental values and sensitivities of the proposed activity, including cultural heritage (world, national and local), sea country, wetlands of international significance (Ramsar), listed threatened species and listed migratory species, listed threatened ecological communities and Commonwealth marine areas
- timing of the proposed activity, including any seasonal changes.

After considering these specifications, Esso then identifies the anticipated key functions, interests and activities of relevant persons.

### 3.2.4 Step 2 – Identify and classify

Esso acknowledges that factors such as the nature and scale of the activity, the environment in which the activity is being undertaken and the possible impacts and risks of the activity should be taken into account when determining whether the activity may be relevant to authorities, or in determining who has functions, interests or activities that may be affected (NOPSEMA, 2023).

Using the defined OA, ATBA and PEA, relevant persons/organisations are then identified by geographical boundary. Following this, they are then classified in accordance with the regulatory definitions in Regulation 11A (1)(a)-(e), which includes five relevant persons categories as follows:

- 11A (1)(a) – Each Department or agency of the Commonwealth to which the activities to be carried out under the EP or revision of the EP may be relevant. For Esso's operations in Bass Strait, this includes any Commonwealth department or agency that has responsibility for managing or protecting the marine environment from pollution. It may also include those with responsibilities for environmental and fisheries management, defence and communications, maritime/navigational safety, marine parks, and native title.

- 11A (1)(b) – Each Department or agency of a State or the Northern Territory to which the activities to be carried out under the EP or revision of the EP may be relevant. For Esso’s operations in Bass Strait, this includes any Victorian government department or agency that has responsibility for managing or protecting the marine environment from pollution. It may include those with responsibilities for environmental and fisheries management, defence and communications, maritime/navigational safety, marine parks, and native title.
- 11A (1)(c) – The Department of the responsible State Minister, meaning the Victorian Government department that has responsibilities for offshore petroleum or energy resources in Victoria. For Esso’s operations in Bass Strait, this is Victoria’s Department of Energy, Environment and Climate Action (DEECA), formerly the Department of Jobs Precincts and Regions - Earth Resources.
- 11A (1)(d) – A person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. A connection of traditional owners with sea country may constitute an interest for the purposes of Regulation 11A (1)(d) classification. For Esso’s operations in Bass Strait this may include First Nations groups, non-government organisations, worker unions and fishing groups, community groups and individuals.
- 11A (1)(e) – Any other person or organisation that the Esso considers relevant.

Specific processes for the identification of relevant persons are outlined in the following sections.

#### *3.2.4.1 Methodology for identification of Regulation 11A (1) (a)-(c) relevant persons*

The OPGGS (Environment) Regulations, Regulation 11A (1)(a)-(b) requires the identification of relevant persons in Commonwealth or State government departments or agencies who may have responsibilities either related to or impacted by the activities to be carried out under the EP.

Regulation 11A (1)(c) requires Esso to identify the department of the responsible State Minister.

Esso has a history of extensive and ongoing consultation for offshore activities in the Bass Strait spanning more than 50 years, meaning that most, if not all, Regulation 11A (1)(a)-(c) relevant persons are known to Esso.

The first step in identification is to review Esso’s existing Stakeholder Database. This review involves comparing the ‘activity description’ to previous Esso activities and/or facilities to identify past consultations of a similar nature. This is then used to filter Esso’s Stakeholder Database, providing a list of relevant persons for all past activities of a similar nature.

If Commonwealth or State departments, agencies or ministers change, Esso leverages existing relationships to ensure consistency of consultation.

#### *3.2.4.2 Methodology for identification of Regulation 11A (1)(d) relevant persons*

Identification of relevant persons consistent with Regulation 11A (1)(d) requires their functions, interests or activities to be understood and applied broadly taking into account how potential risks and impacts of the EP activity may affect them. This is achieved via several methods as outlined in the following sections.

### 3.2.4.2.1 Review of relevant persons previously identified for other activities

Given Esso's extensive history of consultation in the area, identification of relevant persons starts with a review of Esso's existing Stakeholder Database to generate a list of any persons, groups, and organisations with functions, interests or activities matching those defined for the EP.

### 3.2.4.2.2 Actively seek out new relevant persons

To ensure the broad capture of ascertainable persons and organisations who may have their functions, interests or activities affected by the activity (Santos NA Barossa Pty Ltd v Tipakalippa, 2022), Esso seeks to identify any new relevant persons through:

- using local knowledge of existing relationships to identify marine users and interest groups active in the area (e.g. indigenous groups, commercial fisheries, recreational fishers, other energy producers, local business, etc.)
- providing a link to the Esso Consultation Hub and Esso Consultation Questionnaire with existing relevant persons and asking them to share it with anyone who may be interested in Esso's activities
- seeking the advice of First Nations groups such as land councils and prescribed body corporates in relation to who and how other First Nations groups or individuals should be consulted as relevant persons whose interests may be affected by the activities
- searches of internet sources, including google, social media platforms etc.
- members of the Company's local workforce providing suggestions of other potentially impacted relevant persons
- identified relevant persons providing recommendations of other potentially impacted relevant persons, through direct engagement and/or the Esso Consultation Questionnaire
- guidance from the Regulator, other government agency/department, industry associations or bodies about other potentially relevant persons
- advertisements in newspapers and other relevant news sources (e.g. *Koori Mail*, local papers)
- hosting community drop-in sessions where members of the public can attend and review materials relevant to Esso's activities and ask questions of staff
- a review of legislation applicable to petroleum and marine activities
- active participation in industry bodies and collaborations e.g. Australian Energy Producers, Centre for Decommissioning Australia, National Energy Resources Australia, and the National Decommissioning Research Initiative
- leveraging existing relationships with relevant Commonwealth and state departments and agencies to identify other relevant stakeholders
- reviewing the relevant persons identified for other oil and gas EPs in the area.

Relevant persons identified through these means are added to the list generated by the review of the Stakeholder Database (per per Section 3.2.4.2.1).

### 3.2.4.2.3 Specific identification processes for certain groups

#### 3.2.4.2.3.1 First Nations peoples

Esso's consultation approach is consistent with Regulation 11A, incorporating guidance provided by the Appeal ruling (*Santos NA Barossa Pty Ltd v Tipakalippa*, 2022). The consultation methodology includes sufficient time for each stage of the consultation process, including identification of First Nations groups as well individuals within the community, information sharing, receipt of feedback and assessment of merit.

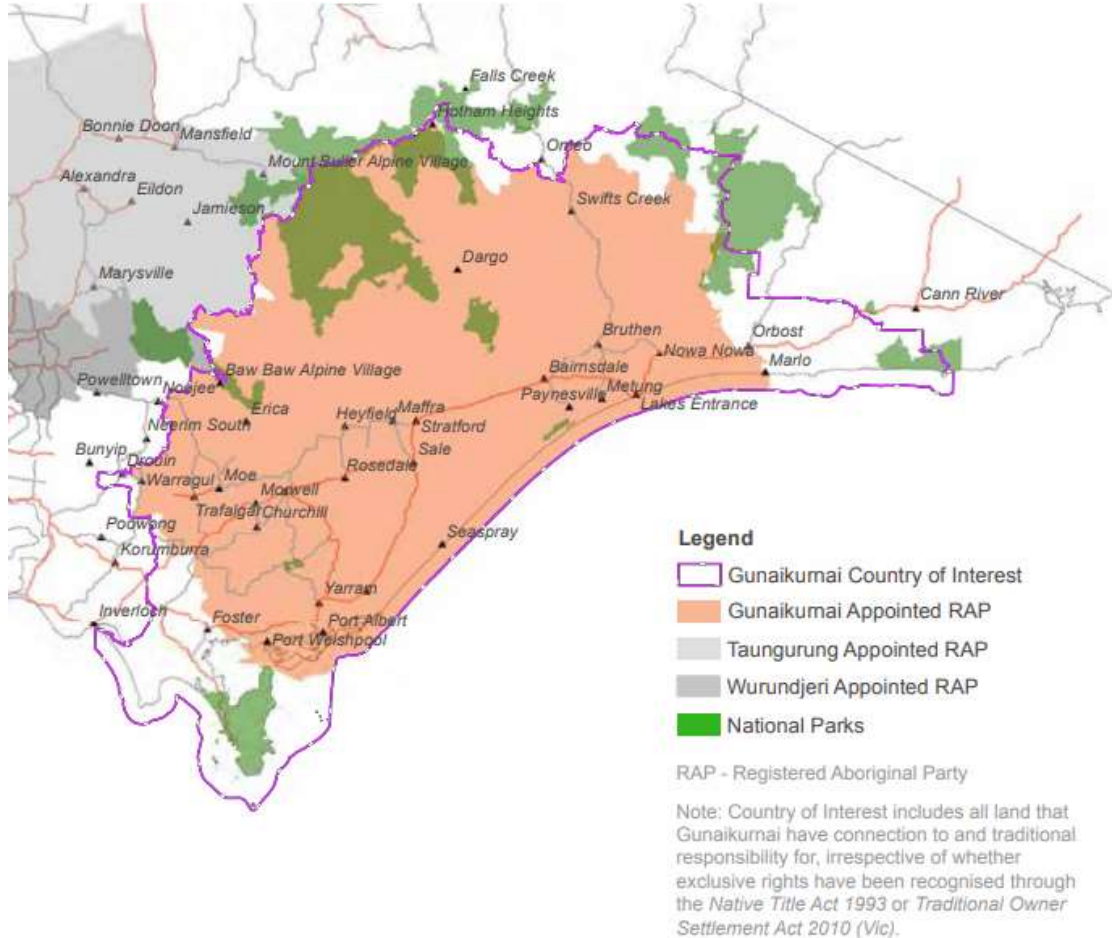

Identification commences with a review of the Stakeholder Database (as described in Section 3.2.4.2.1). Additional potentially relevant First Nations peoples are identified using the AIATSIS map of indigenous Australia, overlaid with the geographical information of the OA, ATBA and PEA, followed by an assessment of whether there will be any impacts from Esso's planned or unplanned activities affecting the functions, interests or activities of relevant persons. Government resources such as State Government spatial data sets are also utilised to identify potentially relevant Aboriginal Land Councils, Registered Aboriginal Parties and Registered Aboriginal Community Organisations.

The Commonwealth Heritage List (DCCEEW, 2021) is a list of Indigenous, historic and natural heritage places owned or controlled by the Australian Government which have a significant heritage value to the nation. This list has been reviewed as described in Volume 1, Section 2.5.

The Nanjit to Mallacoota Sea Country IPA consultation project, which extends from Corner Inlet to the Victoria/New South Wales border has also been reviewed as described in Volume 1, Section 2.5.1.

Esso reviewed the *Gunaikurnai Whole-of-Country Plan* (GLaWAC, 2015) and the *Position Statement: Offshore Renewable Energy Infrastructure Area* (GLaWAC, 2022) with particular regard to Sea Country mapping.

Currently, there is no Sea Country mapping in the ATBA, as illustrated in Figure 3-2. Esso will continue consulting with the Gunaikurnai Land and Waters Aboriginal Council (GLaWAC) as a Level 1 relevant person and will seek to discuss Sea Country for the development of future EPs.

**Figure 3-2 Gunaikurnai Country of Interest**

**3.2.4.2.3.2 Local Councils**

Identification commences with a review of the Stakeholder Database (as described in Section 3.2.4.2.1). Additional potentially relevant local government/councils are identified using government resources such as State Government spatial data overlaid with the geographical information of the OA, ATBA and PEA.

**3.2.4.2.3.3 Commercial fishing**

Esso has a long-standing relationship with Bass Strait commercial fishing operators representative bodies and their members. Esso meets with SETFIA, Lakes Entrance Fishermen Limited (LEFL) and Seafood Industry Victoria (SIV) on a quarterly basis to discuss all upcoming and current offshore activities including any potential risks and how/if an activity may impact their members.

Where it is identified that an activity may affect their members, various strategies can be implemented including:

- distribution of SMS updates to the eastern fishing fleet advising of vessel movements, activities being performed outside the PSZ, coordinates of survey work, etc. Messages may be sent as often as daily during an activity, if appropriate
- updating Esso vessels plotters to show where commercial fishing equipment is to avoid that area
- commercial fishers may choose to relocate their equipment for the duration of the activity.

Esso also attends representative board meetings and any members meetings to consult directly with members on any proposed activities as requested.

While fishing is prohibited in any PSZ, reminders about PSZs are provided to all local fishing groups annually.

#### *3.2.4.3 Methodology for identification of Regulation 11A (1)(e) relevant persons*

Regulation 11A (1)(e) makes provision for “any other person or organisation that the titleholder considers relevant”. This allows Esso to nominate persons/organisations as relevant persons, at their discretion.

#### *3.2.4.4 Persons or organisations who self identify*

As part of the Company’s own commitments to consultation and engagement, Esso regularly conducts broad-based information sharing designed to reach both relevant persons identified for any EP and a broad range of other interested parties. This broad-based information sharing allows Esso to create awareness of its activities and encourages potentially relevant persons to make themselves known to the Company (NOPSEMA, 2023). Any persons or organisations who self-identify are added to the list generated by the ongoing review of the Stakeholder Database (per Section 3.2.4.2.1).

Esso will undertake advertising and publish information on a proposed activity to help identify any other relevant persons that may not have been identified by the process.

Esso will place advertisements in newspapers informing people of community drop-in sessions and directing them to the Esso Consultation Hub to seek out anyone else who may be relevant based on the defined geographical area of the activity.

Where a person, organisation, department or agency identifies themselves to Esso via these campaigns, Esso will apply the methodology as defined in Figure 3-1 to assess if the person, organisation, department or agency is a relevant person, for the purposes of the EP and assign the relevant consultation Level.

The advertisements will also act as a means for sharing information to identified relevant persons and providing an ongoing mechanism for feedback.

#### *3.2.4.5 Persons or organisations Esso chooses to contact*

Over the past 50 years of operations in Bass Strait, Esso has established relationships with relevant persons identified in the *Bass Strait Operations EP* (AUGO-EV-EMM-002) and activity-specific EP submissions, as well as the broader public and other interested parties.

Esso recognises and respects the important contribution of stakeholders and is committed to maintaining and developing further these important relationships.

In addition to consulting with relevant persons under Regulation 11A (1), there may be persons or organisations that Esso chooses to contact in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to Regulation 11A (1), but that Esso has chosen to contact potentially for additional guidance, for example to update contact information or obtain the correct contacts
- that are 'not relevant' pursuant to Regulation 11A (1), but that Esso have contacted as a result of consultation requirements changing or updated guidance from the Regulator
- where it is unclear what their functions, interests and activities are, or whether they may be affected. In this circumstance, engagement is required to inform relevance under Esso's consultation methodology
- Esso wishes to maintain and continue to develop a relationship with.

### 3.2.5 Step 3 – Assign

Once each relevant person has been identified and classified as per Regulation 11A (1)(a)-(e), the consultation Level is assigned during workshop(s) held with Esso consultation advisors and relevant subject matter experts. The more complex the activity, the more discussions are needed to ensure all matters are considered appropriately.

In assigning a consultation Level, the following considerations are taken into account:

- the location of the activity (OA, ATBA or PEA) and whether or not their functions, interests and activities are impacted by the planned or unplanned activity
- if any impact, the degree of that impact, for example – level of PEA overlap with a known fishery
- the functions, interests and activities of the person(s) or organisation
- persons or organisations known to Esso and previously recorded in the Stakeholder Database
- relevant persons/organisations known preferred methods of communication and any specific information needs
- Esso's relationship with the relevant person/organisation e.g. when did Esso last engage with them? On what topic? What is their level of interest? Is Esso currently consulting with them on other activities?
- the environmental values and sensitivities and whether or not the persons functions, interests and activities are impacted by the activity; if any impact, the degree of that impact
- if the relevant person/organisation can provide any information that will assist the design or management of the planned activities
- the duration of the activity.

The output of the workshop is recorded in a register of all relevant persons related to the activity including the justifications and reasons for the assigned consultation Level, this information is then provided in the relevant EP.

Esso notes that throughout the consultation process the assigned Level of consultation may be adjusted based on feedback received from the relevant persons, for example a relevant person may request more or less information and may therefore move to a higher or lower Level of consultation.

### 3.2.6 Step 4 – Verify

For Regulation 11A (1)(a)-(c) relevant persons, the verification process confirms the details of the department/agency are correct. This involves checking for departmental restructures, name changes, staff/contact person changes, contact information changes etc.

For Regulation 11A (1)(d)-(e) relevant persons, verification aims to ensure that:

- the functions, interests and activities used to evaluate and categorise the person or organisation as a relevant person are confirmed
- identified representatives are a true representation/advocate of the views of their constituents and can be relied upon to faithfully communicate the results of engagements back to their constituents
- relevant persons have been provided with the Esso Consultation Questionnaire to confirm they are willing to participate in the consultation process.

Verification processes for Regulation 11A (1)(d)-(e) relevant persons are further detailed in the following sections.

#### 3.2.6.1 *Verifying functions, interests and activities*

In order to verify functions, interests and activities, Regulation 11A (1)(d)-(e) relevant persons (or their verified representative) will be provided with:

- an information bulletin (or similar) providing sufficient information on the activity proposed in the EP
- Esso Consultation Questionnaire to verify functions, interests and activities.

The information bulletin aims to ensure all relevant persons are provided with sufficient information at the outset of the consultation process so they can make informed decisions about their participation or otherwise. This information bulletin will be in the form of a brochure or link to a specific webpage.

One aim of the Esso Consultation Questionnaire is to verify the functions, interests and activities of each relevant person. This is achieved through providing a tailored list of functions, interests and activities (relevant to the EP) so that the relevant person can select one or more items. Esso updates the Stakeholder Database and may re-evaluate the person's/group's status as a relevant person.

In some cases, relevant persons have developed guidance detailing their own functions, interests or activities and how and when they wish to be consulted on activities (NOPSEMA, 2023), which will be considered throughout the process. This includes, for example:

- *Consultation with Commonwealth agencies with responsibilities in the marine area* (NOPSEMA, 2022)

- *Engage Early: Guidance for proponents on best practice Indigenous engagement for environmental assessments under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)* (Department of Environment, 2016).

If the functions, interests or activities of a person/s have not been advised directly to Esso via the above methods, an assessment is made based on available information relating to the person(s) or organisation(s), as per NOPSEMA function, interests and activities definitions.

#### 3.2.6.2 *Verifying true representation*

The Esso Consultation Questionnaire is also used to determine the group participation of individual relevant persons. This information is used to develop a list of group members that Esso can engage with directly to seek verification that the right group representatives have been identified. This ground-truthing of views of the designated representatives is essential to confirm they will provide a comprehensive and accurate representation. The Esso Consultation Questionnaire also allows for individual relevant persons to choose whether they want to be consulted with directly or if their preference is for Esso to consult with the group representative on their behalf.

#### 3.2.6.3 *Confirming participation*

Provision is made in the Esso Consultation Questionnaire to allow for a relevant person to 'opt out' of the consultation process for a specific activity. Esso will respect the wishes of the relevant person should they choose to 'opt out'.

Where the Esso Consultation Questionnaire has not been completed, this will not be considered 'opting out' and Esso representatives will seek to make further contact with the relevant person to obtain a response, as appropriate. Should Esso still be unable to confirm participation, consultation materials will continue to be provided.

Relevant persons can also notify Esso via the Consultation email to opt out of communications on specific activities.

It is recognised that in any community consultation there will inevitably be persons who cannot participate for various reasons, however the absence of their participation would not invalidate the process provided reasonable efforts are made to identify the relevant persons and to consult with them (NOPSEMA, 2023).

#### 3.2.7 *Step 5 – Consult*

Esso seeks to consult with relevant persons so that each relevant person has sufficient information to understand the planned activity and to help them make an informed assessment of possible consequences associated with the EP pursuant to their own functions, interests or activities. Esso acknowledges that what constitutes sufficient information as part of a consultation process may differ depending on the relevant person/s (NOPSEMA, 2023). As such, Esso seeks to consult in a way that is appropriate for each relevant person and adapted to the nature of the relevant persons to be consulted.

To achieve this, Esso consults with relevant persons in accordance with their consultation Level assigned during the workshop outlined in Section 3.2.5. The consultation methods for each Level are outlined in Sections 3.2.7.1 to 3.2.7.3.

Each consultation has the overarching goals of:

- further strengthening foundation relationships with existing relevant persons
- developing relationships with new relevant persons
- facilitating genuine two-way dialogue between Esso and relevant persons
- building upon preceding consultations (where applicable) to further a relevant person's understanding of the activity.

Throughout the consultation process, relevant persons are invited to correspond with Esso if they have concerns or require clarifications. Follow-up verbal discussions occur where required or if requested.

Esso also provides avenues for relevant persons to contact Esso outside of formal engagement activities if they have any questions or concerns. If needed, Esso will provide support or assistance to relevant persons in relation to understanding the technical data.

All relevant persons are given the opportunity to nominate how they would like to be consulted. As appropriate, direct engagement with relevant persons e.g. First Nations groups, will be done to co-design their consultation methodology. This may require consultation over an extended period of time.

Relevant persons are not obligated to respond to a titleholder's requests to participate in the consultation process. In cases where no response has been received from a relevant person, and where sufficient information and reasonable period has been afforded to the relevant person, Esso will consider consultation closed for the purposes of the preparation of the EP.

The assigned consultation Levels and associated rationale for each relevant person are included in the relevant EP.

#### *3.2.7.1 Consultation Level 1*

Relevant persons assigned with consultation Level 1 will be provided with targeted and tailored activity-specific information to enable an effective consultation process. This can include meetings, presentations, workshops, forums, phone calls and specific information such as mapping. Consultation Level 1 is the highest level of engagement with relevant persons and may require consultation over an extended period of time.

Consultation Level 1 is generally applied to relevant persons whose functions, interests or activities are located in the OA of the planned activity or if the relevant person has indicated that this is the level of consultation they prefer.

Relevant persons will be provided with sufficient information (in a variety of formats, i.e. written, face to face, telephone etc.) and a reasonable period (generally 30 days, but can be more according to the activity complexity) to respond. If no response is received, Esso will make a second attempt to contact the relevant person.

#### *3.2.7.2 Consultation Level 2*

Relevant persons assigned with consultation Level 2 will be provided with specific information based on known information needs (e.g. published industry guidance notes or proformas outlining what information a relevant person wishes to receive).

This may include meetings, presentations, workshops, forums, phone calls and specific information such as mapping. May require consultation over an extended period of time.

Consultation Level 2 is generally applied to relevant persons whose functions, interests or activities are located in the ATBA of the planned activity or if the relevant person has indicated that this is the level of consultation they prefer.

Relevant persons will be provided with sufficient information (in a variety of formats, i.e. written, face to face, telephone etc.) and a reasonable period (generally 30 days, but can be more according to the activity complexity) to respond. If no response is received, Esso will make a second attempt to contact the relevant person.

### 3.2.7.3 Consultation Level 3

Relevant persons assigned with consultation Level 3 will be provided with activity-specific information but at a broader, level. This can include: activity-specific information bulletins including the impacts, risks and the mitigative controls in place, information regarding PEA and oil spill modelling, and/or links to the Esso Consultation Hub and Esso Consultation Questionnaire.

If requested, consultation can include face-to-face engagements, phone calls, community meetings, specialist group meetings or community drop-in sessions.

Consultation Level 3 is generally applied to relevant persons whose functions, interests or activities are located in the PEA and may be affected by unplanned activities associated with the planned activity or if the relevant person has indicated that this is the level of consultation they prefer.

Relevant persons will be provided with sufficient information (in a variety of formats, i.e. written, face to face, telephone etc.) and a reasonable period to respond (generally 30 days, but can be more according to the activity complexity). If no response is received, no further consultation will be undertaken but Esso will continue to provide broader, high level information.

### 3.2.8 Relevant persons responses

Esso makes ongoing efforts to obtain responses through consultation. Esso is committed to considering all input and/or responses received from relevant persons in the development of EPs. Relevant Person responses may be received in various ways.

Esso accepts responses and engages in consultation in order to understand the responses. Esso clearly identifies and addresses each matter raised by relevant persons, and if applicable to the activity to which the EP relates:

- demonstrates that the risk or impact in question has been reduced to ALARP and will be of an acceptable level
- provides a statement that addresses each element of the objection or claim made by a relevant person and where control measures are implemented to resolve objections and claims, will clearly communicate this to the relevant person
- provides copies of all written responses provided by a relevant person to NOPSEMA.

Responses received from relevant persons, throughout the development of an EP and its subsequent revisions, is considered and addressed as appropriate. A summary of responses, objection and/or claim, as well as Esso's assessment of the merits of feedback, objections and/or claim, and Esso's response, are provided in the EP.

### 3.2.9 Ongoing engagement (as opposed to activity-specific consultation)

Esso recognises the importance of ongoing engagement with stakeholders as it is an opportunity to review and update Esso's current relevant persons functions, interests and activities, and as a forum for enquiry, objections or claims to be raised during an EPs activity.

#### 3.2.10 Consultation reporting

Esso maintains a Stakeholder Database for all its Bass Strait operations-related consultation. Communications, including meetings, calls, distribution of communications materials, emails etc. with relevant persons are logged in the Database, detailing any feedback received, including questions, issues, concerns, suggestions, objections and/or claims, and any actions/responses. Actions are tracked and feedback is provided to relevant persons as required.

During all communications, Esso encourages relevant persons to provide feedback through:

- emailing the [consultation@exxonmobil.com](mailto:consultation@exxonmobil.com) email address
- accessing the Esso Consultation Hub
- completing the Esso Consultation Questionnaire
- calling +61 3 9261 0000
- or writing to GPO Box 400 Melbourne VIC 3001.

A report on all consultations between the Company and any relevant person is included in the relevant EP.

### 3.3 Esso's consultation methodology as applied to the scope of this environment plan

In response to the instructive reasons given by the Full Federal Court of Australia in the Appeal on 2 December 2022 (*Santos NA Barossa Pty Ltd v Tipakalippa*, 2022) and subsequent NOPSEMA guidance on *Consultation in the course of preparing an environment plan* (NOPSEMA, 2023), Esso revised its consultation methodology in January 2023 and recommenced the consultation process in accordance with the revised methodology.

Following the Federal Court of Australia Decision on 28 September 2023 (*Cooper v National Offshore Petroleum Safety and Environmental Management Authority (No 2)*, 2023), Esso made further revisions to its methodology to reflect the reasoning in these judgements.

This Section provides the outcomes of consultation conducted up to and including information received by 4 November 2023.

The revised methodology (as outlined in Section 3.1.2) means that persons who have previously been identified and consulted with throughout the course of the preparation of this EP may now have been re-classified as can be seen in Appendix A.

This section demonstrates how Esso applied the updated consultation methodology specifically to this EP and how the Company ensured the consultations were appropriate and adapted to the nature of the interests of the relevant persons.

Throughout the entirety of the consultation process for this EP, it is important to note that no objections or claims were received.

### 3.3.1 Step 1 – Define

For Gudgeon-1 and Terakihi-1 plug and abandonment activities, Esso has outlined the following specifications, which were the basis for determining the anticipated key functions, interests and activities of relevant persons and classifying them in accordance with Regulation 11A (1):

- **Activity description:** Refer to Volume 2 Section 2
- **Scope:** Refer to Volume 2 Section 1.2
- **Timing:** Refer to Volume 2 Section 2.2
- **Values and sensitivities:** Refer to Volume 2 Section 4
- **Geographical boundary:** For the purposes of consultation, the geographical boundary used to determine relevant persons includes the OA, ATBA and PEA as shown in Volume 2, Figure 2-1 and Volume 2, Figure 4-1.

The planned activity for this EP is the P&A of the Gudgeon-1 and Terakihi-1 subsea wells in Commonwealth waters. Therefore, in determining who is a relevant person for consultation, Esso sought to identify and consult with persons whose functions, interests or activities could be affected by the activity.

The defined geographical boundaries were then overlaid with the relevant AIATSIS map, oil spill modelling, spatial data and environmental values, sensitivities and receptors.

### 3.3.2 Step 2 – Identify and classify

A complete list of all relevant persons that may be affected from either the planned activities or the unplanned activities, was developed based on the identification methods outlined Sections 3.3.2.1 to 3.3.2.5.

#### 3.3.2.1 Regulation 11A (1)(a)-(c) relevant persons

To identify relevant persons in accordance with Regulation 11A (1)(a)-(c), Esso used the methods as outlined in Table 3-2. The full list of Regulation 11A (1)(a)-(c) relevant persons is shown in Appendix A-1.

**Table 3-2 Relevant persons identification methods (Regulation 11A (1)(a)-(c))**

Method	Description
<b>Relevant persons previously identified for other activities</b>	
Review of Esso's existing Stakeholder Database	Identify existing relevant persons based on Regulation 11A (1)(a)-(c) and the: <ul style="list-style-type: none"> <li>• activity description</li> <li>• scope</li> <li>• geographic location</li> </ul>

Method	Description
<b>Actively seek out new relevant persons</b>	
Regulation 11A (1)(a)-(c)	Search for any Commonwealth or State departments, agencies or ministers related to any of the values and sensitivities listed in Volume 2 Section 4 and located in either the OA, ATBA or PEA.

### 3.3.2.2 Regulation 11A (1)(d) relevant persons

To identify relevant persons in accordance with Regulation 11A (1)(d), Esso used the methods as outlined in Table 3-3. The full list of Regulation 11A (1)(d) relevant persons is shown in Appendix A-1.

**Table 3-3 Relevant persons identification methods (Regulation 11A (1)(d))**

Method	Description
<b>Relevant persons previously identified for other activities</b>	
Review of Esso's existing Stakeholder Database	Identify existing relevant persons based on Regulation 11A (1)(d) and: <ul style="list-style-type: none"> <li>• Area of planned activities and geographic location of potentially affected areas from unplanned activities.</li> <li>• reasonably ascertainable functions, interests or activities</li> <li>• provide information bulletins, Consultation Hub and Esso Consultation Questionnaire.</li> </ul>
<b>Actively seek out new relevant persons</b>	
Local knowledge	Use local knowledge of existing relationships to identify marine users and interest groups active in the area.
Existing relevant persons	Ask existing relevant persons to share information bulletins, Esso Consultation Hub and Esso Consultation Questionnaire with anyone they consider may be interested.
Seek advice of First Nations groups	Met with Koorie Heritage Trust to discuss cultural heritage and sea country. Consultation Hub including information bulletin and Esso Consultation Questionnaire provided to all First Nations identified in the PEA. Potentially relevant First Nations peoples are identified using the AIATSIS map of indigenous Australia, overlaid with the geographical information of the OA (and PEA if applicable). Government resources such as State Government spatial data sets are also utilised to identify potentially relevant Aboriginal Land Councils, Registered Aboriginal Parties and Registered Aboriginal Community Organisations.

Method	Description
Community drop-in sessions	Consider the attendees of community drop-in sessions.
Recommendations	Consider recommendations received from relevant persons via responses provided in the Esso Consultation Questionnaire or through consultation with them.
Searches of internet sources	Google, social media platforms using the geographical boundaries of the PEA. Search for any potentially relevant persons related to any of the values and sensitivities listed Volume 2 Section 4. Search using methodology in Section 3.2.4.1.
Advertisements in newspapers and other relevant news sources	Advertised in national, state, regional and local papers using the geographical boundaries of the PEA including <i>Koori Mail</i> .
Review of legislation applicable to petroleum and marine activities	Following on from (Santos NA Barossa Pty Ltd v Tipakalippa, 2022) Esso conducted a further review of worker unions, eNGOs, First Nations groups and communities within the geographical boundary of the PEA.

### 3.3.2.3 Regulation 11A (1)(e) relevant persons

To identify relevant persons in accordance with Regulation 11A (1)(e), Esso has reviewed the existing Stakeholder Database to see if there are any other persons or organisations that Esso believes are relevant. These persons were added to the list of relevant persons and assigned an appropriate consultation Level. The full list of Regulation 11A (1)(e) relevant persons is shown in Appendix A-1.

### 3.3.2.4 Self-identifying relevant persons

Esso's broad-based information sharing mechanisms are outlined in Table 3-4.

**Table 3-4 Broad-based information sharing mechanisms**

Mechanism	Description
Periodic updates	Esso uses email distribution to provide updates about Esso's offshore operations and activities, reports or information bulletins to relevant persons as appropriate.
Advertisements in newspapers and other relevant news sources	Advertised in national, state, regional and local papers using the geographical boundaries of the PEA including <i>Koori Mail</i> .
Esso Consultation Hub	A Consultation Hub has been developed and shared with all relevant persons to provide access to information on all offshore activities and the opportunity to request further information and consultation preferences.

Mechanism	Description
Esso Consultation Questionnaire	<p>The Esso Consultation Questionnaire has been developed and shared with all relevant persons to allow Esso to consult with relevant persons based on their preferences:</p> <ul style="list-style-type: none"> <li>• Which of the following Esso activities would you like to be consulted on?</li> <li>• How would you prefer Esso communicates with you?</li> <li>• Please select any functions, interests or activities that may apply to you</li> <li>• Please select any group(s) you are represented by a member of, or participate in</li> <li>• Do you wish to be consulted through your representative?</li> <li>• How did you hear about our activities?</li> </ul>
<i>Connection</i> magazine	Esso's monthly newsletter, which is distributed via email and accessible on the Company website. The magazine provides relevant persons with regular updates on Esso's activities.
Esso website	<p>Esso's website is an online portal that gives broader groups of relevant persons up-to-date information on various facets of our business and provides an opportunity for relevant persons to make enquiries about our offshore activities and projects.</p> <p>The website is updated periodically to reflect new information and activity progress.</p>
Annual Decommissioning Report	Accessible from Esso's website, this Report provides technical, yet accessible, insight into Esso's decommissioning plans and yearly progress. The Report is emailed directly to all Relevant Persons and shared more broadly with other interested relevant persons.

Various people/organisations identified themselves for Esso activities, but for this campaign, no persons or organisations self-identified for the activities of this EP.

### 3.3.2.5 *Persons or organisations Esso chooses to contact*

As part of Esso's ongoing stakeholder relationship management activities, Esso may choose to contact other persons and organisations that did not meet the Regulation 11A (1) categories. If so, each will be assessed and added to Appendix A-1, under the category of 'other'. For the purposes of consultation, they may not be relevant persons.

The persons and organisations in this category may include those who:

- do not have a function, interest or activity that overlapped with either the OA, ATBA or the PEA and were not going to be impacted by the activities outlined in this EP
- have an interest in Esso's other activities (e.g. onshore facilities in Longford or Hastings) and were notified as part of our ongoing communications with them
- have a broader industry interest and are included in our broader communications
- Esso approached to clarify what their functions, interests and activities are, or whether they may be affected.

### 3.3.3 Step 3 – Assign

In order to confirm the appropriate Regulation 11A (1) category and assign the appropriate consultation Level to each identified relevant person, a number of consultation workshops were held with Esso consultation advisors and relevant subject matter experts as per Section 3.2.5.

Factors considered in the workshops, specific to the Gudgeon-1 and Terakihi-1 activity, include:

- the OA of the activity is 85 kilometres off the Gippsland coastline at 300-400 metres water depth
- the OA is outside the ATBA and the OA borders the Traffic Separation Scheme
- the OA is located fully within the 500-metre PSZ
- the well sites are located within existing Commonwealth fisheries that may be used by commercial fishers
- the 500-metre PSZ will be communicated to the commercial fishing organisations
- there may be recreational fishing in the area but unlikely to be significant given the closeness of the Traffic Separation Scheme
- the duration of the work is short term, estimated to be 30 days per well
- there is no known Sea Country mapping currently available
- relevant government departments are known
- the functions, interests and activities of the relevant person(s) or organisations identified in Step 2 (refer to Section 3.2.4) and their known preferred methods of communication
- Esso's relationship with the relevant person or organisation e.g. when did Esso last engage with them? On what topic? What are their levels of interest? Is Esso currently consulting with them on other activities?
- the environmental values and sensitivities have been assessed in the impact and risk assessment as risk category 3 or 4 per Section 5 and 6 of Volume 2 of this EP
- if the relevant person/organisation can provide input to the design of the or management of the planned activities have been identified

A complete list of all identified relevant persons, their assigned consultation Level and the justification for the consultation Level, as per the process outlined in Section 3.2.5) is provided in Appendix A-2.

### 3.3.4 Step 4 – Verify

A link to the Esso Consultation Questionnaire was emailed to every person in the Stakeholder Database to verify:

- which Esso activities they wish to be consulted on
- how they would prefer Esso to communicate with them
- which functions, interests or activities that may apply to them
- any group(s) they are represented by, a member of, or participate in
- if they wish to be consulted through their representative.

No person or organisation elected to be consulted on the Gudgeon-1 and Terakihi-1 plug and abandonment activity.

Esso confirmed representation for the groups outlined in Table 3-5 via the regular engagements that occur as part of Esso's ongoing relationship management activities.

**Table 3-5 Relevant person representatives**

Relevant person	Representative for
SETFIA	Incorporated association representing commercial fishers in Commonwealth South East Trawl Sector; Scalefish Hook Sector; Shark Hook, Shark Gillnet Sectors; small pelagic fishery.
SIV	Representative peak body for the Victorian seafood industry, from professional fishers, through to wholesalers, processors and retailers
LEFL (formerly Lakes Entrance Fishing Cooperative)	Represents Lakes Entrance commercial fishing by providing a full-service unloading facility to the local fishing fleet. From here, fresh seafood is distributed to local shops.

### 3.3.5 Step 5 – Consult

Gudgeon-1 and Terakihi-1 consultations began in January 2022 using various methods and levels of consultation. Consultation for this EP closed on 4 November 2023.

#### 3.3.5.1 Consultation timing

For the nature and scale of the activity described in this EP (being of short duration and relatively low impact), and in accordance with the methodology described in this EP, Esso determined the minimum 30 business days would provide a reasonable period for relevant persons to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person.

All relevant persons have been consulted with for a minimum of 120 days and some up to a maximum of 23 months, as shown in Appendix A-1. On this basis, Esso has met the requirement to provide a reasonable period for consultation.

#### 3.3.5.2 Provision of sufficient materials

Esso developed an information bulletin to provide each relevant person with sufficient information, in accordance with Regulation 11A (2), by providing an overview of the proposed activity including information on the activity description, scope, timing, location, risks, impacts, and mitigation measures.

The first version of the information bulletin was issued in September 2022 (refer to Appendix B). In 2023, the consultation process continued with development and distribution of further revisions to the information bulletin updated to respond to feedback obtained throughout consultation (regarding the format of the consultation materials, not regarding the activity itself), including feedback from NOPSEMA. A second revision was issued in March 2023 followed by the third revision in May 2023 (refer to Appendix C).

These bulletins included additional information on the potential risk for a loss of well control that may potentially impact the environment, including people and communities, the heritage value of places and their social and cultural features.

Following the implementation of the revised methodology, a fourth bulletin was provided in September 2023 (refer to Appendix C).

Esso acknowledges that what is considered ‘sufficient information/materials’ may vary from relevant person to relevant person. As such, the information bulletin was accompanied with the Esso Consultation Questionnaire, which provides relevant persons with a mechanism to communicate what they consider ‘sufficient information/materials’. On the basis of the provision of four information bulletins, the Esso Consultation Questionnaire requesting feedback, providing access to the consultation hub, regular newspaper advertisements and the numerous written and verbal communications, Esso has met the requirement for the provision of sufficient materials.

### 3.3.5.3 Consultations undertaken

Records of all consultations undertaken are recorded in the Stakeholder Database and provided in Appendix A-3. This includes individual consultations as well as regular meetings with representatives of Regulation 11A (1)(a)-(c) departments, agencies and/or ministers and with groups and/or group representatives identified under Regulation 11A (1)(d).

As part of Esso’s own commitments to consultation and engagement, the Company regularly hosts community drop-in sessions. Over the course of the Gudgeon-1 and Terakihi-1 consultation, Esso hosted four community drop-in sessions in the local area:

- Session 1: 15 February 2023, 12pm-1pm at 90 Macalister Street, Sale, VIC, 3850
- Session 2: 15 February 2023, 5:30pm-6:30pm at 90 Macalister Street, Sale, VIC, 3850.
- Session 3: 29 August 2023, 5.30pm-6.30pm at 201 Esplanade, Lakes Entrance VIC 3909
- Session 4: 30 August 2023, 5.30pm-6.30pm at 90 Macalister Street, Sale, VIC, 3850

To ensure every effort was made to reach as many stakeholders as possible, the community drop-in sessions were advertised in various news outlets from 23 January to 8 February 2023, and 16 to 23 August 2023 as shown in Table 3-6. Three advertisements were used to tailor information to the news outlets target audience. These are referred to as Advertisement A, B and C in Table 3-6, and are provided in Appendix D. All advertisements:

- advised commencement of the 2023 consultation process
- provided a summary of the activities
- provided a link to the information bulletin (via Esso’s webpage).

A total of seven people attended the community drop-in sessions. The Esso Consultation Questionnaire was trialled with attendees of the sessions. None of the attendees nominated Gudgeon-1 and Terakihi-1 activity as an activity they wished to continue to be consulted on.

#### 3.3.5.4 Consultation with First Nations people

Esso commenced Gudgeon-1 and Terakihi-1 activity-specific consultation with GLaWAC in September 2022, providing an activity overview (description, location, impacts and risks) and seeking feedback. Engagement with GLaWAC continued through October 2022 to March 2023 via email and phone, and included discussions on Esso's offshore activities and sharing of information related to decommissioning. Additional information on Gudgeon-1 and Terakihi-1 Oil Spill Modelling Information (PEA) was provided to GLaWAC in July 2023.

The Esso Consultation Hub and Esso Consultation Questionnaire, which provides activity-specific information to the public, was launched and communicated to GLaWAC in July 2023. GLaWAC provided a response to the Esso Consultation Questionnaire nominating to be consulted on specific activities including the South East Australia Carbon Capture and Storage (SEA CCS) Project and decommissioning activities (not including the scope of this EP).

GLaWAC were provided an opportunity to nominate to be consulted on Gudgeon-1 and Terakihi-1 plug and abandonment activities, but did not make this nomination. The Gudgeon-1 and Terakihi-1 consultation closing date was communicated publicly in October 2023.

In relation to Traditional Custodian relevant persons, Esso has discharged its duty under regulation 11A. Esso considers that consultation under Regulation 11A is complete. This is on the basis that despite the provision of detailed information, GLaWAC did not nominate to be consulted on the Gudgeon-1 and Terakihi-1 plug and abandonment activity, nor has GLaWAC requested any further information in relation to the Gudgeon-1 and Terakihi activity since discussions commenced in September 2022 .

General engagement (beyond the Gudgeon-1 and Terakihi-1 activity) with GLaWAC continued throughout 2023 and are ongoing:

- Esso's discussions (via phone, email and in person) with GLaWAC have included Sea Country mapping, with an offer from Esso to share geospatial and other information which may assist GLaWAC in mapping sea country for their Indigenous Protected Area (IPA) application.
- Esso requested information on Gunaikurnai Sea Country to further understand how offshore activities might impact on cultural heritage (January 2023). A meeting was conducted in GLaWAC offices in December 2023 to further discuss GLaWAC's IPA application, and identify potential opportunities for Esso to share information that might support this application.
- Esso representatives attended the NOPSEMA facilitated National Summit on Consultation on Offshore Petroleum Activities with First Nations Peoples (Perth, 21-22 June 2023); and
- the Australian Energy Producers facilitated National Sea Country Alliance Summit (NSCAS) (Perth, 6-7 November 2023), which were also attended by GLaWAC representatives.

Esso considers these activities as valuable relationship building, as well as facilitating information sharing.

#### 3.3.5.5 Application of revised methodology

As consultations for this EP were well advanced at the time of the methodology revision, Esso reviewed the consultations undertaken with the relevant persons identified under the new

methodology to determine if the requirements of the new methodology were satisfied by the consultations already conducted. The outcomes of this review confirmed the relevant persons categories and the corresponding consultation Levels and that sufficient information and time had been provided across all Levels.

No additional consultation was required following this review.

### 3.4 Relevant persons feedback

Throughout the consultation process, all relevant persons had the opportunity to contact Esso's consultation and engagement team by emailing [consultation@exxonmobil.com](mailto:consultation@exxonmobil.com), completing the Esso Consultation Questionnaire, calling Esso's Head Office on +61 3 9261 0000 or writing to GPO Box 400 Melbourne VIC 3001.

Esso provides a summary of all feedback, objections and/or claims, as well as Esso's assessment of the merits of these and Esso's response in Appendix A-3.

No objections or claims were received from relevant persons, either through face-to-face, email or phone requests, or through responses provided in the Esso Consultation Questionnaire for the scope of this EP.

During the February 2023 community drop-in session, Esso did receive feedback from an attendee relating to the advertisement campaign for this activity. They advised that the content of the advertisement was difficult to read at the size in which it was printed. Esso took steps to improve the legibility of further advertisements in August 2023.

During the August 2023 community drop-in session, Esso received and responded to questions in relation to well abandonment philosophy including explaining the environment controls for this activity. No further follow-up or action was required.

It was also noted that attendees at community drop-in sessions had attended because they saw the advertisement in a national newspaper. This demonstrates that the broader range of news outlets used in the 2023 advertising campaign is effective in reaching additional stakeholders.

Esso considers it has discharged its obligations for consultation under Regulation 11A (1) having provided a reasonable period, sufficient information and opportunity for relevant persons to provide feedback, objections and/or claims.

### 3.5 Ongoing Consultation

Following the submission of this EP, Esso will continue communicating with relevant persons to provide activity updates. Updates will include activities within the scope of this EP as well as broader Esso operations. Table 3-7 outlines the ongoing engagement and consultation plans for this EP.

Table 3-7 Ongoing consultation and engagement plan

Relevant person(s)	Planned ongoing engagement mechanism	Timing
All	Information-sharing materials regarding the outcome of this submission. Continuing to respond to specific feedback received via email, phone or meetings. Ensuring the Esso website is maintained and kept up to date. Continuing to develop and distribute regular newsletters and issues of <i>Connection</i> magazine.	As required
Regulation 11A (1)(a)-(c)	Conducting regularly scheduled meetings with Commonwealth and State government departments and agencies.	As scheduled
Commercial Fishing Representatives	Meetings to provide updates on all activities	Quarterly
Relevant Persons identified as marine users and relevant government departments and agencies	Notifications of commencement of activities as appropriate.	2 weeks prior to activity commencing
	Notifications of vessel activities via text message or email where appropriate.	During activity
NOPSEMA	Regulatory notification of start of activity.	10 days prior to activity commencing
	Regulatory notification of cessation of activity.	Within 10 days of activity completion

### 3.6 Reporting

In accordance with OPGGS (Environment) Regulations, Regulation 16, Esso has included within this EP submission, reports on all consultations under Regulation 11A undertaken with any relevant person identified in this EP.

A summary report on all Gudgeon-1 and Terakihi-1 plug and abandonment activity-specific consultations undertaken up to the date of submission of this EP is included as Appendix A-3. The summary report is intended to be made public with this EP and does not contain any sensitive information.

Sensitive information relating to relevant persons and the full text of any response by a relevant person to consultation under Regulation 11A in the course of preparation of the EP, also referred to as the 'sensitive information part', is also provided to NOPSEMA. However,

in accordance with Regulation 9AB, the 'sensitive information part' is removed prior to publication.

## Appendix A – Consultation report (Summary)

### Appendix A-1 Relevant persons (Regulation 11A (1)(a)-(e))

Person/Organisation	Geo. Area	Category	Function, Interest or Activity
<b>Regulation 11A (1)(a)</b>			
Australian Fisheries Management Authority (AFMA)	OA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for management of Commonwealth commercial fisheries from 3-200nm. The OAs overlap with local fisheries.
Australian Hydrographic Office (AHO)	OA	11A (1)(a)	Function as department or agency of the Commonwealth as office responsible for publication of nautical charts and other information for safety of ships navigating in Australian waters (including Notices to Mariners).
Australian Maritime Safety Authority (AMSA)	OA	11A (1)(a)	Function as department or agency of the Commonwealth as authority responsible for maritime safety, protection of the marine environment including marine pollution and maritime aviation search and rescue.
Department of Agriculture, Fisheries and Forestry (DAFF)	OA	11A (1)(a)	Function as department or agency of the Commonwealth that manages biosecurity risks to Australia
Department of Agriculture, Fisheries and Forestry (DAFF) - fisheries, biosecurity and marine pests	OA	11A (1)(a)	Function as department or agency of the Commonwealth to enhance our agricultural, fisheries and forestry industries.
Department of Climate Change, Energy, the Environment and Water (DCCEEW)	OA	11A (1)(a)	Function as department or agency of the Commonwealth to help Australia respond to climate change and manage water and energy resources.
Department of Defence	OA	11A (1)(a)	Function as department or agency of the Commonwealth for national defence.
Department of Industry, Science, Energy and Resources (DISER)	ATBA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for consolidating the Government's efforts to drive economic growth, productivity and competitiveness by bringing together industry, energy, resources and science.
Director of National Parks	ATBA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for the management of a portfolio of terrestrial and marine protected areas.
Indigenous Land and Sea Corporation	PEA	11A (1)(a)	Function as department or agency of the Commonwealth with national responsibilities to assist Aboriginal and Torres Strait Islander people to acquire land and to manage assets to achieve cultural, social, environmental and economic benefits for Indigenous peoples.
National Offshore Petroleum Titles Administrator (NOPTA)	OA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for the day-to-day administration of petroleum & greenhouse gas titles in Commonwealth waters in Australia.
Parks Australia	ATBA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for managing Commonwealth reserves and conservation zones.
State Emergency Service	ATBA	11A (1)(a)	Activity as department or agency of the Commonwealth for flood, storm, tsunami, earthquake and landslide throughout Australia.

Person/Organisation	Geo. Area	Category	Function, Interest or Activity
<b>Regulation 11A (1)(b)</b>			
Aboriginal Heritage Tasmania (Part of the Department Premier and Cabinet)	PEA	11A (1)(b)	Function as department or agency of Tasmania that aims to protect and promote Tasmania's unique Aboriginal heritage and facilitate the return of land to Tasmania's Aboriginal people. Aboriginal Heritage Tasmania administers the Aboriginal Heritage Act 1975, which establishes the Aboriginal Heritage Council of Tasmania, the Aboriginal Lands Act 1995, which establishes the Aboriginal Land Council of Tasmania, and the Native Title (Tasmania) Act 1994.
Bass Coast Shire Council	PEA	11A (1)(b)	Function as department or agency of Victoria as Local Council
CarbonNet	ATBA	11A (1)(b)	Function as department or agency of Victoria to establish a commercial scale Carbon Capture and Storage network in Gippsland, Victoria.
Department of Energy, Environment and Climate Action (DEECA) (Agriculture)	N/A	11A (1)(b)	Function as Department that administers legislation related to agriculture and biosecurity.
Department of Energy, Environment and Climate Action (DEECA) (Resources)	N/A	11A (1)(b)	Function as Victoria's lead agency for economic recovery and business and industry engagement
Department of Jobs, Skills, Industry and Regions (DJPR)	ATBA	11A (1)(b)	Function as department or agency of Victoria for economic recovery and business and industry engagement
Department of Jobs, Skills, Industry and Regions (DJPR) (Marine Pollution)	ATBA	11A (1)(b)	Function as department or agency of Victoria responsible for wildlife affected by marine pollution.
Department of Natural Resources and Environment Tasmania	PEA	11A (1)(b)	Function as government department responsible for supporting primary industry development, the protection of Tasmania's natural environment, effective land and water management.
Department of Transport and Planning	N/A	11A (1)(b)	Function as department is responsible for ongoing operation and coordination of the state's transport networks, as well as the delivery of new and upgraded transport infrastructure.
East Gippsland Catchment Management Authority	PEA	11A (1)(b)	Function as department or agency of Victoria for the integrated management of land, biodiversity and water resources in the region. The Authority also has responsibility for the planning and delivery of river health works, and several statutory activities.
East Gippsland Shire Council	ATBA	11A (1)(b)	Function as department or agency of Victoria as local council.
East Gippsland Water	N/A	11A (1)(b)	Function as state agency that serves an area of 21,000 square kilometres in the far southeast of Victoria,
Environment Protection Authority Victoria	ATBA	11A (1)(b)	Function as department or agency of Victoria relevant for oil spill response as they have jurisdiction over environmental matters in Victoria, including environmental protection and may advise on pollution and waste management in a response scenario.
Environmental Protection Agency (Tas)	PEA	11A (1)(b)	Function as department or agency of Tasmania responsible for the environmental protection and management in the state of Tasmania
Fire Rescue Victoria	N/A	11A (1)(b)	Function as fire and rescue service for the state of Victoria.

Person/Organisation	Geo. Area	Category	Function, Interest or Activity
Gippsland Ports	ATBA	11A (1)(b)	Function as department or agency of Victoria responsible for the application of the Marine Act and other related legislation
Gippsland Water	ATBA	11A (1)(b)	Function as department or agency of Victoria as Central Gippsland Region Water Corporation a regional Victorian water corporation established under the Water Act 1989 (Vic)
Maritime Border Command	OA	11A (1)(b)	Function as department or agency of Victoria as principal civil maritime security agency, a de facto coast guard, operating in the maritime domain to ensure compliance with Australia's maritime legislation by foreign and domestic non-state actors.
Mornington Peninsula Shire	PEA	11A (1)(b)	Function as department or agency of Victoria as local council.
Parks Victoria	ATBA	11A (1)(b)	Function as department or agency of Victoria relevant for oil spill response. They manage significant stretches of land along the Gippsland coastline and some maritime infrastructure in the Gippsland area (e.g. some piers, jetties, berths).
Ports Victoria	PEA	11A (1)(b)	Function as department or agency of Victoria that manages the safe transit of vessels into and out of Victoria's commercial ports. It provides maritime expertise, informing the strategic development and operations within Victoria's commercial ports and waterways.
Relevant Person #323	N/A	11A (1)(b)	Activities as Member of Parliament - State
Safe Transport Victoria - Maritime (previously known as Transport Safety Victoria – Maritime Safety)	ATBA	11A (1)(b)	Function as department or agency of Victoria responsible for conducting audits of Victoria's ports and waterways and work with the entities that manage them to ensure they are safe for all waterway users.
South Gippsland Shire Council	ATBA	11A (1)(b)	Function as department or agency of Victoria as local council.
Tasmania Parks and Wildlife Service	PEA	11A (1)(b)	Function as State Government agency working to conserve the State's natural and cultural heritage while providing for sustainable use and economic opportunities for the Tasmanian community.
Transport for NSW	N/A	11A (1)(b)	Function as department responsible for evidence-based strategy, policy, and awareness campaigns for the NSW Government's maritime program
Victorian Fisheries Authority	ATBA	11A (1)(b)	Function as department or agency of Victoria established to effectively manage Victoria's fisheries resources.
Victorian State Emergency Service	ATBA	11A (1)(b)	Function as department or agency of Victoria as a control agency for flood, storm, tsunami, earthquake and landslide throughout Victoria
Wellington Shire Council	ATBA	11A (1)(b)	Function as department or agency of Victoria as a local council.
West Gippsland Catchment Management Authority	PEA	11A (1)(b)	Function as department or agency of Victoria to manage land and water resources in the West Gippsland region.

Person/Organisation	Geo. Area	Category	Function, Interest or Activity
<b>Regulation 11A (1)(c)</b>			
Department of Energy, Environment and Climate Action (DEECA)	ATBA	11A (1)(c)	Function as as department of the Victorian Government working with industry and the community to develop Victoria's secure and sustainable energy future
<b>Regulation 11A (1)(d)</b>			
3D Oil	PEA	11A (1)(d)	Person or organisation with activities as oil and gas company with licenses offshore from Gippsland.
Aboriginal Heritage Council Tasmania (Report to AHT) (TAS)	PEA	11A (1)(d)	Statutory council established in 2017 under the Aboriginal Heritage Act 1975. An independent body who advise the Tasmanian Government, land managers and owners on the protection and management of Aboriginal cultural heritage in Tasmania.
Aboriginal Land Council of Tasmania (now directs to TAC)	PEA	11A (1)(d)	Organisation representing the political and community development aspirations of the Tasmanian Aboriginal community.
Aboriginal Launceston (TAS)	PEA	11A (1)(d)	Organisation representing Traditional Owners
Aquila Fishing Charters	PEA	11A (1)(d)	Person or organisation with activities as local fishing charter business.
Australian Conservation Foundation	PEA	11A (1)(d)	Australian independent, non-profit organisation, working to conserve threatened wildlife and ecosystems.
Australian Oceanographic Services	PEA	11A (1)(d)	Organisation providing access to underwater research vehicles, technology and equipment.
Australian Southern Bluefin Tuna Industry Association	PEA	11A (1)(d)	Organisation representing the Australian Southern Bluefin Tuna Industry working to maintain a high level of quality and training.
Australian Volunteer Coastguard	PEA	11A (1)(d)	Organisation responding to a variety of marine incident types and supporting other agencies in events such as marine fire and medical evacuation from vessels.
Australian WildCatch Fishing	ATBA	11A (1)(d)	Activities as business operating five fishing vessels in Gippsland and supports a variety of other Vessels, with the design and construction of Fishing Gear, Crew placement, Quota, licence management and associated administration.
Australian Wildlife Conservancy	PEA	11A (1)(d)	Interest as Australian independent, non-profit organisation, working to conserve threatened wildlife and ecosystems.
Australian Workers' Union	PEA	11A (1)(d)	Activities as negotiating workplace enterprise agreements. The Offshore Alliance brings together workers under the banners of the Maritime Union of Australia and the Australian Workers' Union.
Bass Oil	PEA	11A (1)(d)	Organisation with activities as oil and gas company with licenses offshore from Gippsland.
Bass Strait Bait & Tackle Lakes Entrance	PEA	11A (1)(d)	Organisation as Lakes Entrance based business servicing the recreational fishing industry.
Beach Energy	PEA	11A (1)(d)	Organisation with activities as oil and gas company with licenses offshore from Gippsland.
Boating Industry Association of Victoria	PEA	11A (1)(d)	Not-for-profit organisation and the peak body representing the recreational and light commercial marine industry.

Person/Organisation	Geo. Area	Category	Function, Interest or Activity
Bodalla Local Aboriginal Land Council (NSW)	PEA	11A (1)(d)	Organisation representing Traditional Owners
Bunurong Land Council Aboriginal Corporation	PEA	11A (1)(d)	Organisation representing Traditional Owners
Bush Heritage	PEA	11A (1)(d)	Interest as a leading not-for-profit conservation organisation that protects ecosystems and wildlife across Australia.
Cape Barren Island Aboriginal Association Incorporated (TAS)	PEA	11A (1)(d)	Organisation representing Traditional Owners
Catchers Trust (Chairman) (NSW)	PEA	11A (1)(d)	Activities as Chairman of Catchers Trust in NSW, a sounding board for licensed fishermen and a mechanism to distribute profits from Sydney Fish Markets
Circular Head Aboriginal Corporation (TAS)	PEA	11A (1)(d)	Organisation representing Traditional Owners
Committee for Gippsland	PEA	11A (1)(d)	Interests as independent group established to represent all sectors of business, industry and community views to collaboration on regional priorities to benefit Gippsland communities.
Commonwealth Fisheries Association	PEA	11A (1)(d)	Organisation contributing to the formulation of effective and responsible fisheries policies.
Community Over Mining	PEA	11A (1)(d)	Interest as non-government organisation covering many topics in Gippsland and around Australia including pollution to air, land and water.
Construction, Forestry, Maritime, Mining and Energy Union	PEA	11A (1)(d)	Activities as trade union in building and construction, forestry and furnishing products, maritime and mining and energy production.
Cooper Energy	PEA	11A (1)(d)	Organisation with activities as oil and gas company with licenses offshore from Gippsland.
Corner Inlet Fisheries Habitat Association	PEA	11A (1)(d)	Person or organisation to facilitate and encourage better habitat protection and stewardship of the local marine resource.
Country Fire Authority (Region 10)	PEA	11A (1)(d)	Volunteer organisation fire service responsible for fire suppression, rescues, and response to other accidents and hazards across most of the state Victoria, Australia
Delta Group	N/A	11A (1)(d)	Activities as contractors - services include closure studies and decommissioning, deconstruction and demolition, civil engineering and construction, landscaping and external works, resource recovery and waste management, asbestos removal and disposal, site remediation, rehabilitation and revegetation, and heavy plant rental.
East Gippsland Estuarine Fishermen's Association	PEA	11A (1)(d)	Person or organisation representing the interests of the Gippsland Lakes Estuarine fishers.
Eastern Victorian Sea Urchin Divers Association	PEA	11A (1)(d)	Organisation representing Sea Urchin Divers.
Eastern Zone Abalone Industry Association	ATBA	11A (1)(d)	Activities as the wild catch abalone industry sector that operates in the Mallacoota regions of Victoria.
Elders Council of Tasmania Aboriginal Corporation	PEA	11A (1)(d)	Organisation representing Traditional Owners
Electrical Trades Union	PEA	11A (1)(d)	Activities as division of the Communications, Electrical and Plumbing Union

Person/Organisation	Geo. Area	Category	Function, Interest or Activity
Emperor Energy	PEA	11A (1)(d)	Organisation with activities as oil and gas company with licenses offshore from Gippsland.
Environment Victoria	PEA	11A (1)(d)	Interest as an independent and not-for-profit group campaigning for a safe climate, healthy rivers and sustainable living.
Far Out Charters	PEA	11A (1)(d)	Organisation operating offshore fishing charters based out of Lakes Entrance.
First Tasmanians Aboriginal Corporation (TAS)	PEA	11A (1)(d)	Organisation representing Traditional Owners
Fishing Tribunal	ATBA	11A (1)(d)	Activities as independent group established to consider commercial fishing vessel damage claims resulting from interaction with Esso equipment/facilities.
Flinders Island Aboriginal Association Inc (TAS)	PEA	11A (1)(d)	Organisation representing Traditional Owners
Game Fishing Association of Victoria	ATBA	11A (1)(d)	Activities as the governing body for Game Fishing in Victoria.
Gippsland Lakes Fishing Club	ATBA	11A (1)(d)	Activities as a recreational fishing club based in Lakes Entrance.
Gippsland Lakes Yacht Club	PEA	11A (1)(d)	Organisation sailing club in East Gippsland
GreenPeace	PEA	11A (1)(d)	Interest as eNGO campaigning for a green and peaceful future.
Gulaga and Biamanga Joint Authority (NSW)	PEA	11A (1)(d)	Organisation representing Traditional Owners
GunaiKurnai Land and Waters Aboriginal Corporation	OA	11A (1)(d)	Function, interests and activities as Registered Aboriginal Party that represents the GunaiKurnai people, the Traditional Owners of our Country, as determined by the Victorian Aboriginal Heritage Council under the Aboriginal Heritage Act 2006.

## Appendix A-2 Relevant persons consultation Levels

Person/Organisation	Geo. Area	Category	Function, Interest or Activity	Classification Level	Classification Justification
<b>Regulation 11A (1)(a)</b>					
Australian Fisheries Management Authority (AFMA)	OA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for management of Commonwealth commercial fisheries from 3-200nm. The OAs overlap with local fisheries.	L2	Esso has applied its methodology and initially assessed AFMA as Level 1 consultation but moved to Level 2 as a result of AFMA advising they have no comments on the G&T EP activity.
Australian Hydrographic Office (AHO)	OA	11A (1)(a)	Function as department or agency of the Commonwealth as office responsible for publication of nautical charts and other information for safety of ships navigating in Australian waters (including Notices to Mariners).	L1	Esso has applied its methodology and assessed AHO as a Level 1 consultation as they provide Notice to Mariners and therefore have a function in the OA of the planned activity
Australian Maritime Safety Authority (AMSA)	OA	11A (1)(a)	Function as department or agency of the Commonwealth as authority responsible for maritime safety, protection of the marine environment including marine pollution and maritime aviation search and rescue.	L1	Esso has applied its methodology and assessed AMSA as a Level 1 consultation as their function is in the OA of the planned activity
Department of Agriculture, Fisheries and Forestry (DAFF)	OA	11A (1)(a)	Function as department or agency of the Commonwealth that manages biosecurity risks to Australia	L1	Esso has applied its methodology and assessed DAFF as a Level 1 consultation as their function is in the OA of the planned activity
Department of Agriculture, Fisheries and Forestry (DAFF) - fisheries, biosecurity and marine pests	OA	11A (1)(a)	Function as department or agency of the Commonwealth to enhance our agricultural, fisheries and forestry industries.	L1	Esso has applied its methodology and assessed DAFF as a Level 1 consultation as their function is in the OA of the planned activity.
Department of Climate Change, Energy, the Environment and Water (DCCEEW)	OA	11A (1)(a)	Function as department or agency of the Commonwealth to help Australia respond to climate change and manage water and energy resources.	L1	Esso has applied its methodology and assessed DCCEEW as a Level 1 consultation as their function is in the OA of the planned activity.
Department of Defence	OA	11A (1)(a)	Function as department or agency of the Commonwealth for national defence.	L1	Esso has applied its methodology and assessed DoD as a Level 1 consultation as their function is in the OA of the planned activity.
Department of Industry, Science, Energy and Resources (DISER)	ATBA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for consolidating the Government's efforts to drive economic growth, productivity and competitiveness by bringing together industry, energy, resources and science.	L2	Esso has applied its methodology and assessed DISER as a Level 2 consultation as there are no impacts to their function in the OA of the planned activity.
Director of National Parks	ATBA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for the management of a portfolio of terrestrial and marine protected areas.	L2	Esso has applied its methodology and assessed DoNP as a Level 2 consultation as there are no terrestrial or marine protected areas in OA of planned activity.
Indigenous Land and Sea Corporation	PEA	11A (1)(a)	Function as department or agency of the Commonwealth with national responsibilities to assist Aboriginal and Torres Strait Islander people to acquire land and to manage assets to achieve cultural, social, environmental and economic benefits for Indigenous peoples.	L3	Esso has applied its methodology and assessed department or agency as a Level 3 consultation as their function is in the PEA and no impact from planned activity.
National Offshore Petroleum Titles Administrator (NOPTA)	OA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for the day-to-day administration of petroleum & greenhouse gas titles in Commonwealth waters in Australia.	L1	Esso has applied its methodology and assessed NOPTA as a Level 1 consultation as their function is in the OA of the planned activity.
Parks Australia	ATBA	11A (1)(a)	Function as department or agency of the Commonwealth responsible for managing Commonwealth reserves and conservation zones.	L2	Esso has applied its methodology and assessed PA as a Level 2 consultation as there are no Commonwealth reserves or conservation zones in OA of planned activity.
State Emergency Service	ATBA	11A (1)(a)	Activity as department or agency of the Commonwealth for flood, storm, tsunami, earthquake and landslide throughout Australia.	L3	Esso has applied its methodology and assessed SES as a Level 3 consultation as their function is to provide response in the event of an unplanned activity (refer to section 3.2.1.2).
<b>Regulation 11A (1)(b)</b>					
Aboriginal Heritage Tasmania (Part of the Department Premier and Cabinet)	PEA	11A (1)(b)	Function as department or agency of Tasmania that aims to protect and promote Tasmania's unique Aboriginal heritage and facilitate the return of land to Tasmania's Aboriginal people. Aboriginal Heritage Tasmania administers the Aboriginal Heritage Act 1975, which establishes the Aboriginal Heritage Council of Tasmania, the Aboriginal Lands Act 1995, which establishes the Aboriginal Land Council of Tasmania, and the Native Title (Tasmania) Act 1994.	L3	Esso has applied its methodology and assessed department or agency as a Level 3 consultation as their function is in the PEA and no impact from planned activity.
Bass Coast Shire Council	PEA	11A (1)(b)	Function as department or agency of Victoria as Local Council	L3	Esso has applied its methodology and assessed department or agency as a Level 3 consultation as their function is in the PEA and no impact from planned activity.
CarbonNet	ATBA	11A (1)(b)	Function as department or agency of Victoria to establish a commercial scale Carbon Capture and Storage network in Gippsland, Victoria.	L2	Esso has applied its methodology and assessed CarbonNet as a Level 2 consultation as their function is in the ATBA of the planned activity.
Department of Energy, Environment and Climate Action (DEECA) (Agriculture)	N/A	11A (1)(b)	Function as Department that administers legislation related to agriculture and biosecurity.	L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their interest may be relevant in the event of an unplanned activity.
Department of Energy, Environment and Climate Action (DEECA) (Resources)	N/A	11A (1)(b)	Function as Victoria's lead agency for economic recovery and business and industry engagement	L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their interest may be relevant in the event of an unplanned activity.

Person/Organisation	Geo. Area	Category	Function, Interest or Activity	Classification Level	Classification Justification
Department of Jobs, Skills, Industry and Regions (DJPR)	ATBA	11A (1)(b)	Function as department or agency of Victoria for economic recovery and business and industry engagement	L2	Esso has applied its methodology and assessed DJSIR as a Level 2 consultation as their function is in the ATBA of the planned activity.
Department of Jobs, Skills, Industry and Regions (DJPR) (Marine Pollution)	ATBA	11A (1)(b)	Function as department or agency of Victoria responsible for wildlife affected by marine pollution.	L3	Esso has applied its methodology and assessed DJSIR - marine pollution as a Level 3 consultation as their function is to provide response in the event of an unplanned activity (refer to section 3.2.1.2).
Department of Natural Resources and Environment Tasmania	PEA	11A (1)(b)	Function as government department responsible for supporting primary industry development, the protection of Tasmania's natural environment, effective land and water management.	L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their interest may be relevant in the event of an unplanned activity.
Department of Transport and Planning	N/A	11A (1)(b)	Function as department is responsible for ongoing operation and coordination of the state's transport networks, as well as the delivery of new and upgraded transport infrastructure.	L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their interest may be relevant in the event of an unplanned activity.
East Gippsland Catchment Management Authority	PEA	11A (1)(b)	Function as department or agency of Victoria for the integrated management of land, biodiversity and water resources in the region. The Authority also has responsibility for the planning and delivery of river health works, and several statutory activities.	L3	Esso has applied its methodology and assessed department or agency as a Level 3 consultation as their function is in the PEA and no impact from planned activity.
East Gippsland Shire Council	ATBA	11A (1)(b)	Function as department or agency of Victoria as local council.	L2	Esso has applied its methodology and assessed person or organisation as a Level 2 consultation as their function may occur in the ATBA of the planned activity.

Relevant Person #534	N/A	11A (1)(e)	Interests as community member.	L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their interest may be relevant in the event of an unplanned activity.
RMIT	N/A	11A (1)(e)	Activities as Victorian tertiary institution.	L3	Esso has applied its methodology and although person or organisation will not be impacted from planned or unplanned activities, Esso chose to share information at its discretion.

Person/Organisation	Geo. Area	Category	Function, Interest or Activity	Classification Level	Classification Justification
University of Melbourne	N/A	11A (1)(e)	Activities as Victorian tertiary institution.	L3	Esso has applied its methodology and although person or organisation will not be impacted from planned or unplanned activities, Esso chose to share information at its discretion.
Victorian Regional Channels Authority	N/A	11A (1)(e)	Function as Victorian State government agency/authority managing commercial navigation in the port waters of Geelong and Hastings.	L3	Esso has applied its methodology and although person or organisation will not be impacted from planned or unplanned activities, Esso chose to share information at its discretion.
Women in Seafood Australasia	N/A	11A (1)(e)	Interest as national organisation representing women working in the seafood industry.	L3	Esso has applied its methodology and although person or organisation will not be impacted from planned or unplanned activities, Esso chose to share information at its discretion.
Yachting Victoria	N/A	11A (1)(e)	Interest as organisation providing sailing advice for the South East of Australia.	L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their interest may be relevant in the event of an unplanned activity.

Appendix A- 3 Consultation report (Summary)

Consultation report (Summary) for Regulation 11A (1)(a) relevant persons

Reg 11A (1)			Reg 11A (2) Sufficient Information	Reg 11A (3) Sufficient Time	Summary of responses received and Esso's consideration and response	Summary of Objection or Claim	Reg 16 (b) (ii) & (iii) Esso's Assessment of Merits of Objection or Claim and its Response	Reg 10A (g) (ii) Environment Plan Controls	Reg 16 (b) (i) Summary of each response			
Person/ Organisation	Geo. Area	Function, Interest or Activity							To/ From	Date	Method	Correspondence Summary
Australian Fisheries Management Authority (AFMA)	OA	Function as department or agency of the Commonwealth responsible for management of Commonwealth commercial fisheries from 3-200nm. The OAs overlap with local fisheries.	Esso considers it has discharged its obligations for consultation under Regulation 11A (2).	Esso considers it has discharged its obligations for consultation under Regulation 11A (3).	In July 2023 AFMA responded to Esso's consultation email providing information on the activity and encouraged Esso to engage directly with relevant industry associations for this area of operation.  AFMA also responded confirming receipt of consultation emails providing information on the activity in September 2022, June 2023 and July 2023.  Esso has addressed AFMA's feedback confirming that Esso has engaged directly with relevant industry associations.  Esso has consulted Bass Strait Central Zone Scallop Fishery, Bass Strait Scallop Industry Association, Commonwealth Fisheries Association (CFA), Tasmanian Seafood Industry Council (TSIC), Seafood Industry Victoria, Commonwealth Fisheries Association (CFA), South East Trawl Fishing Industry Association (SETFIA), Southern and Eastern	No objections or claims on this activity	Not applicable as no objections or claims were made	Esso will provide notifications to AFMA and relevant Fishery Licence Holders that have the potential to be directly impacted by planned activities in the Operational Area at the commencement, duration and/or end of the activity as necessary.  No additional measures or controls are required.	To	01-Sep-22	Email	Relevant Person provided with Gudgeon-1 and Terakihi-1 fact sheet with the activity description, location and potential impacts and mitigation measures.
			To	23-Jun-23					Email	Email sent inviting feedback on offshore activities: - Gudgeon-1 and Terakihi-1 P&A - Jack up rig - Geotechnical and geophysical EP - SEA CCS - Decommissioning - Bass Strait State Waters EP  Link and QR code provided to an Esso Consultation Questionnaire to better understand relevant person consultation wishes and link to NOPSEMA's Consultation on offshore petroleum environment plans brochure.		
			From	07-Jul-23					Email	Relevant person encouraging Esso to engage directly with relevant industry associations.		
			To	11-Jul-23					Email	Responded to relevant person thanking them for the information provided.		
			To	11-Jul-23					Email	Sharing new Consultation Hub which allows easy access to information on Esso offshore activities.  Included within the Consultation Hub a link provided to 'Esso Consultation Questionnaire' to better understand what activities you're interested in, how you want to be consulted and any questions or feedback you may have.  If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.		
			From	11-Jul-23					Email	Acknowledgement of receipt.		
			To	08-Oct-23					Email	Esso provided an update on current activities including Gudgeon-1 and Terakihi-1: Exploration Well Plug and Abandonment with links to the proposed activity information		

Reg 11A (1)			Reg 11A (2) Sufficient Information	Reg 11A (3) Sufficient Time	Summary of responses received and Esso's consideration and response	Summary of Objection or Claim	Reg 16 (b) (ii) & (iii) Esso's Assessment of Merits of Objection or Claim and its Response	Reg 10A (g) (ii) Environment Plan Controls	Reg 16 (b) (i) Summary of each response			
Person/ Organisation	Geo. Area	Function, Interest or Activity							To/ From	Date	Method	Correspondence Summary
					Scalefish and Shark Fishery, Southern Shark Industry Alliance Inc., Great Australian Bight Fishing Industry Association Inc. (GABIA), Tuna Australia (ETBF Industry Association), Australian Southern Bluefin Tuna Industry Association (ASBTIA).  No further follow up or action required.							available via Esso's Consultation hub  Communication included Information bulletin and consultation closing dates.
Australian Hydrographic Office (AHO)	OA	Function as department or agency of the Commonwealth as office responsible for publication of nautical charts and other information for safety of ships navigating in Australian waters (including Notices to Mariners).	Esso considers it has discharged its obligations for consultation under Regulation 11A (2).  Sufficient information has been provided as summarised below:  - Consultation fact sheet with activity description, location and potential impacts and seeking feedback provided to AHO on 1 September 2022 based on their function, interest and activities.  - Esso sent multiple follow up emails seeking feedback on the proposed activity.  - Esso sent additional emails with links to the Esso Consultation Hub on the public website with proposed activity information, the Esso Consultation Questionnaire to better understand relevant person consultation wishes, NOPSEMA's "Consultation on offshore petroleum environment plans brochure" and reminder of consultation closing date. - Esso published advertisements in national, state and relevant local newspapers from January 2023 to August 2023 advising of the proposed activities and requesting feedback.  - Esso published advertisements in a national, state and relevant local newspapers from January 2023 to August 2023 advising of the proposed activities and requesting feedback.	Esso considers it has discharged its obligations for consultation under Regulation 11A (3).  Esso considers that for the nature and scale of the activity as described in this EP, the minimum 30 business days would provide a reasonable period for relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities.  Sufficient time has been provided as consultation commenced on 1 September 2022 and continued until October 2023.  Esso has provided AHO with the opportunity to provide feedback over a 13 -month period.  Refer to columns headed 'Reg 16 (b) (i) Summary of each response' to the right of this table for further details.	AHO responded confirming receipt of consultation emails providing information on the activity in September 2022, June 2023 and July 2023.  No further follow up or action required.	There were no objections or claims on this activity.	Not applicable as no objections or claims were made.	Esso will provide notifications to AHO at the commencement, duration and/or end of the activity as necessary.  No additional measures or controls are required.	To	01-Sep-22	Email	Relevant Person provided with Gudgeon-1 and Terakihi-1 fact sheet with the activity description, location and potential impacts and mitigation measures.
			From	02-Sep-22	Email	RP acknowledged G&T fact sheet						
			From	02-Sep-22	Email	Relevant Person acknowledged receipt of email						
			To	23-Jun-23	Email	Email sent inviting feedback on offshore activities: - Gudgeon-1 and Terakihi-1 P&A - Jack up rig - Geotechnical and geophysical EP - SEA CCS - Decommissioning - Bass Strait State Waters EP  Link and QR code provided to an Esso Consultation Questionnaire to better understand relevant person consultation wishes and link to NOPSEMA's Consultation on offshore petroleum environment plans brochure.						
			To	11-Jul-23	Email	Sharing new Consultation Hub which allows easy access to information on Esso offshore activities.  Included within the Consultation Hub a link provided to 'Esso Consultation Questionnaire' to better understand what activities you're interested in, how you want to be consulted and any questions or feedback you may have.

			activity.  - Esso sent additional emails with links to the Esso Consultation Hub on the public website with proposed activity information, the Esso Consultation Questionnaire to better understand relevant person consultation wishes, NOPSEMA's "Consultation on offshore petroleum environment plans brochure" and reminder of consultation closing date. - Esso published advertisements in national, state and relevant local newspapers from January 2023 to August 2023 advising of the proposed activities and requesting feedback.  - Esso published advertisements in a national, state and relevant local newspapers from January 2023 to August 2023 advising of the proposed activities and requesting feedback.	Refer to columns headed 'Reg 16 (b) (i) Summary of each response' to the right of this table for further details.	responded and provided the requested information to AMSA with regards to the location coordinates of the G&T activity area.  Esso continues to keep AMSA informed of its activities and continues to work with AMSA to ensure shipping lanes are effective in and around Esso Operational Areas. Regular meetings held to ensure the existing TSS are working effectively and will continue to do so throughout the G&T Campaign.				To	02-Mar-22	Email	Provided Relevant Person with Blackback coordinates and sought further meeting time to discuss the Gudgeon-1 and Terakihi-1 P&A .
									To	07-Mar-22	Phone	Discussion re Esso Decommissioning Marine Operations include MPSV scope and operational aspects related to avoiding marine collision with passing traffic including: - risk controls utilised in past campaigns - traffic patterns as shared by AMSA - general standard of applying 2.5NM clearance in AMSA/RCC navigation warnings  Discussed Gudgeon-1 and Terakihi-1 P&A campaign comparing rig differences and the operational footprint and vessel traffic patterns in the area – resulting in an agreed approach to vessel traffic management in the Operation Area.
									From	28-Mar-22	Email	AMSA email to Esso providing provisional traffic plan for traffic management around Blackback, Gudgeon and Terakihi well location during the planned decommissioning work. Requested additional meeting to confirm details and mitigation measures.
									To	05-Apr-22	In Person	Meeting between Esso and AMSA to discuss implementation of Temporary Fairways at the Gippsland TSS.  Esso and AMSA agreed the Temporary Shipping Fairway as proposed by AMSA were suitable to be established, and a proposed start date for the scheme of 1 July 2022 00UTC would be suitable.  AMSA agreed to engage directly with the Australian Hydrographic Office (AHO) to establish the Fairways, ensure notice to mariners were issued and seek AHO assistance for wider promulgation via notices to mariners issued by the UK Hydrographic Office (UKHO).  Esso explained the risk

												assessment/HAZID process that would be conducted prior to operations in the area, and agreed to share details including adopted risk controls related to vessel collision risk in good time prior to activity commencing.
									From	06-Apr-22	Email	AMSA Advisor confirmed via email that there are no issues with the coordinates and that there is no issue or impingement on the proposed temporary shipping fairways
									From	07-Apr-22	Email	AMSA confirmed minutes of discussion on 5 April with minor amendments. AMSA advised a concern regarding start time of the new temporary shipping fairway pushing the date back to 1 August 2022 in order to allow more time for the Notice to Mariners to reach all commercial traffic.
									From	07-Apr-22	Email	AMSA sent email with draft text for Notice to Mariners regarding diverting traffic in Bass Strait temporarily whilst decommissioning of Blackback, Gudgeon and Terakihi wells takes place
									To	07-Apr-22	Email	Esso emailed AMSA to confirm no issues with commenced date of 1 August 2022 for temporary changes to the Traffic Scheme. Also confirmed coordinates and noted slight difference due to systems used.
									To	29-Apr-22	Email	Meeting invitation sent to AMSA for 3rd May,
									From	3-May-22	Phone	Meeting was requested by AMSA to continue engagement on changes to the temporary fairway required for decomm activities.  Only item 1 – Virtual Aids to Nav was discussed. Discussion was technical based around how the AIS Base Station functionality worked. The placement of the base station was discussed and Esso and AMSA aligned that Cobia was the preferred location. Esso and AMSA agreed that the unit needed to be installed ahead of the date of effect of modified scheme (1 Aug). With intention to

L3	Esso has applied its methodology and assessed person or organisation as a Level 3 consultation as their activity may occur in the PEA and no impact from planned activity.	Esso considers it has discharged its obligations for consultation under Regulation 11A (2).  Sufficient information has been provided as summarised below:  - Consultation fact sheet with activity description, location and potential impacts and seeking feedback provided to East Gippsland Estuarine Fishermen's Association on 1 September 2022 based on their function, interest and activities.  - Esso sent additional emails with links to the Esso Consultation Hub on the public website with proposed activity information, the Esso Consultation Questionnaire to better understand relevant person consultation wishes, NOPSEMA's "Consultation on offshore petroleum environment plans brochure" and reminder of consultation closing date.  - Esso sent multiple follow up emails seeking feedback on the proposed activity.	Esso considers it has discharged its obligations for consultation under Regulation 11A (3).  Esso considers that for the nature and scale of the activity as described in this EP, the minimum 30 business days would provide a reasonable period for relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities.  Sufficient time has been provided as consultation commenced on 1 September 2022 and continued until October 2023.  Esso has provided East Gippsland Estuarine Fishermen's Association with the opportunity to provide feedback over a 13 month period.	Not applicable as no responses were received.	There were no objections or claims on this activity.	Not applicable as no objections or claims were made.	No additional measures or controls are required	To	01-Sep-22	Email	Relevant Person provided with Gudgeon-1 and Terakihi-1 fact sheet with the activity description, location and potential impacts and mitigation measures.				
														To	23-Jun-23	Email	Email sent inviting feedback on offshore activities: - Gudgeon-1 and Terakihi-1 P&A - Jack up rig - Geotechnical and geophysical EP - SEA CCS - Decommissioning - Bass Strait State Waters EP  Link and QR code provided to an Esso Consultation Questionnaire to better understand relevant person consultation wishes and link to NOPSEMA's Consultation on offshore petroleum environment plans brochure.	
															To	11-Jul-23	Email	Sharing new Consultation Hub which allows easy access to information on Esso offshore activities.  Included within the Consultation Hub a link provided to 'Esso Consultation Questionnaire' to better understand what activities you're interested in, how you want to be consulted and any questions or feedback you may have.  If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.
															To	08-Oct-23	Email	Update on current activities including Gudgeon-1 and Terakihi-1 P&A - links to proposed activity

					From	21-Jul-23	Email	Relevant person enquired if this project will impact their local government area							
					To	29-Jul-23	Email	Esso responded to relevant person							
								<p>In the course of preparing an EP, Esso Australia must consult with relevant authorities, persons and organisations whose functions, interests or activities may be affected by the proposed activities (i.e. a relevant person) and provide the opportunity for any issues or concerns to be raised. In relation to the Gudgeon and Terakihi activity, we've contacted you because Shellharbour City Council is within the environment that may be affected (EMBA).</p> <p>Well plug and abandonment is a safe and long-standing practice, and we also conduct stochastic oil spill modelling which is created by overlaying a great number (often hundreds) of individual, computer-simulated, hypothetical oil spills. Considering many spill events and the different spill trajectories is an integral part of modern spill risk assessment and is often used to identify the range of environments that may be affected in various conditions and identify the priorities for protection.</p> <p>We don't anticipate the Gudgeon and Terakihi activity will have any impact on your local government area.</p>

					- Esso published advertisements in a national, state and relevant local newspapers from January 2023 to August 2023 advising of the proposed activities and requesting feedback.	Sufficient time has been provided as consultation commenced on 8 October 2023.  Esso has provided Sea Shepherd Australia with the opportunity to provide feedback over a 1 month period.  Refer to columns headed 'Reg 16 (b) (i) Summary of each response' to the right of this table for further details.												
Seafood Industry Victoria	ATBA	Activities as a not-for-profit, non-government organisation. SIV is the representative peak body for the Victorian seafood industry, from professional fishers through to wholesale, processors and retail.	L2	Esso has applied its methodology and assessed person or organisation as a Level 2 consultation as their activity may occur in the ATBA of the planned activity.	Esso considers it has discharged its obligations for consultation under Regulation 11A (2).  Sufficient information has been provided as summarised below:  - Consultation fact sheet with activity description, location and potential impacts and seeking feedback provided to Seafood Industry Victoria on 1 September 2022 based on their function, interest and activities.  - Esso sent additional emails with links to the Esso Consultation Hub on the public website with proposed activity information, the Esso Consultation Questionnaire to better understand relevant person consultation wishes, NOPSEMA's "Consultation on offshore petroleum environment plans brochure" and reminder of consultation closing date.	Esso considers it has discharged its obligations for consultation under Regulation 11A (3).  Esso considers that for the nature and scale of the activity as described in this EP, the minimum 30 business days would provide a reasonable period for relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities.  Sufficient time has been provided as consultation commenced on 1 September 2022 and continued until October 2023.  Esso has provided Seafood Industry Victoria with the opportunity to	Two meetings were held with Seafood Industry Victoria in June 2023 and October 2023 and Gudgeon and Terakihi activity discussed including location, activity, timing and Seafood Industry Victoria said there would be little to no impact on commercial fishing activity, particularly in State Waters.	There were no objections or claims on this activity.	Not applicable as no objections or claims were made.	No additional measures or controls are required	To	01-Sep-22	Email	Relevant Person provided with Gudgeon-1 and Terakihi-1 fact sheet with the activity description, location and potential impacts and mitigation measures.				
														To	23-Jun-23	Email	Email sent inviting feedback on offshore activities: - Gudgeon-1 and Terakihi-1 P&A - Jack up rig - Geotechnical and geophysical EP - SEA CCS - Decommissioning - Bass Strait State Waters EP  Link and QR code provided to an Esso Consultation Questionnaire to better understand relevant person consultation wishes and link to NOPSEMA's Consultation on offshore petroleum environment plans brochure.	
															To	26-Jun-23	Phone	Esso meet with relevant person on zoom and discussed all offshore activities,
															To	11-Jul-23	Email	Sharing new Consultation Hub which allows easy access to information on Esso offshore activities.  Included within the Consultation Hub a link provided to 'Esso Consultation Questionnaire' to better understand what activities you're interested in, how you want to be consulted and any questions or feedback you may have.

## Appendix B – Information bulletin version 1 (2022 consultations)

The ExxonMobil logo is displayed in red text on the left side of the image. The word "Exxon" is in a bold, sans-serif font, and "Mobil" is in a slightly lighter, sans-serif font, with a red chevron symbol above the letter 'i'.

Exploration well  
plug and abandonment

Gudgeon-1 and  
Terakihi-1

Esso Australia is planning to undertake an offshore activity to plug and abandon (P&A) two exploration wells – Gudgeon-1 and Terakihi-1 in Gippsland Basin off the Victorian coastline. There will be no seismic activity as part of this campaign.

All well P&A activities will be undertaken by the Q7000 Helix rig. The Q7000 was built in 2017 and operates in accordance with current international safety and environmental standards.

### Activity description

The Gudgeon-1 and Terakihi-1 exploration wells were originally suspended for potential future use which is no longer viable, so permanent barriers will be installed to enable the wells to be safely P&A'd in accordance with regulatory requirements. Well P&A is a safe and long-standing practice.

For all wells, a blowout preventer (BOP) will be used to prevent the release of hydrocarbons during the plugging of the wells. Tubing and associated instruments and control valves will be removed, and permanent cement plugs/barriers installed to provide multiple physical barriers to prevent the release of any hydrocarbons that remain in the reservoir. The Gudgeon-1 and Terakihi-1 wellheads will be cut at below the seabed and removed.

### Activity location

The Gudgeon-1 and Terakihi-1 wells are located approximately 85 kilometres off the Gippsland coastline, south-east of Lakes Entrance in water depths of approximately 300-400 metres.

The wells are not located within any established or proposed Commonwealth or State Marine Protected Areas, Critical Habitats or Threatened Ecological Communities. It is recognised that the activities will overlap with existing fisheries.

### Potential impacts and mitigation measures

Provided in the following pages are the key potential impacts and mitigation measures relating to the P&A activity to assist stakeholders in making an informed assessment of possible impacts to their activities, functions or interests in the area.

#### ACTIVITY TIMING

EARLIEST DATE OF COMMENCEMENT

**Q3 2023**

ALL P&A ACTIVITY COMPLETED WITHIN

**3 months**

FIELD ACTIVITIES ESTIMATED TO TAKE

**~30 days**

PER WELL

P&A ACTIVITIES WILL BE CONDUCTED

**24/7**

THE TIMING AND ORDER OF ACTIVITY MAY VARY AND IS CONTINGENT ON REGULATORY APPROVALS, JOINT VENTURE APPROVALS, WEATHER AND RIG/VESSEL SCHEDULES

## LIGHT WELL INTERVENTION VESSEL AND VESSEL-BASED POTENTIAL IMPACTS AND MITIGATION MEASURES

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCE	IMPACT/RISK REDUCTION AND MITIGATION MEASURES
Light well intervention (LWI) vessel mooring	Temporary and localised seabed disturbance	<ul style="list-style-type: none"> <li>As the LWI is self-propelled and will be holding position by means of dynamic positioning, no anchoring will be required under normal circumstances.</li> </ul>
Planned discharges to the marine environment including: sewage and food waste; treated bilge and deck wash; and cooling water and brine	Temporary and localised reduction in water quality; temporary change to predator/prey dynamics	<ul style="list-style-type: none"> <li>Routine discharges and vessel waste treatment systems will meet International Convention for the Prevention of Pollution from Ships (MARPOL) requirements and are routinely maintained.</li> <li>Food scraps will be macerated prior to discharge.</li> <li>Discharged bilge water will have less than 15 parts per million oil in water content.</li> <li>Any chemicals planned for discharge will undergo an environmental assessment to confirm suitability for discharge prior to use.</li> </ul>
Sound emissions	Temporary displacement of sound sensitive fauna around active vessels	<ul style="list-style-type: none"> <li>Support vessels and helicopters will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans.</li> </ul>
Light emissions	Attraction of light sensitive species; change in fauna behaviour	<ul style="list-style-type: none"> <li>Lighting will be kept to a minimum while still meeting navigational and workplace safety requirements.</li> </ul>
Air emissions	Temporary and localised reduction in air quality	<ul style="list-style-type: none"> <li>Marine engines are routinely maintained and air emissions will meet MARPOL requirements.</li> <li>There will be no requirement for flaring or venting during P&amp;A activities.</li> </ul>
Unplanned interaction with marine fauna (vessel strike)	Injury or death of marine fauna	<ul style="list-style-type: none"> <li>Support vessels will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans.</li> <li>LWI will be stationary during well intervention. Normal speed when relocating is less than 10 knots. Watchkeeping will be maintained during vessel relocations.</li> <li>Any injury/mortality of <i>Environment Protection and Biodiversity Conservation Act 1999</i>-listed fauna will be reported to the Department of Climate Change, Energy, the Environment and Water.</li> </ul>
Unplanned introduction of Invasive Marine Species (IMS)	Displacement of native species and habitat domination	<ul style="list-style-type: none"> <li>LWI and all support vessels will have a Ballast Water Management Plan and associated certificate.</li> <li>LWI and all support vessels will comply with Australian Ballast Water Management requirements.</li> <li>A Biofouling Risk Assessment process will be completed.</li> <li>Submersible equipment (Remotely Operated Vehicle, BOP) will be rinsed on completion of each activity and is normally stored on deck, thereby minimising IMS risk.</li> </ul>

## PLUG AND ABANDONMENT ACTIVITY POTENTIAL IMPACTS AND MITIGATION MEASURES

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCE	IMPACT/RISK REDUCTION AND MITIGATION MEASURES
Discharge of cement	Localised and temporary: reduction in water quality; smothering of benthic habitat	<ul style="list-style-type: none"> <li>• Low toxicity cement additives have been selected for use.</li> <li>• Cement hose flushing and slurry releases will be rapidly diluted and dispersed by the dynamic marine environment.</li> </ul>
Drilling fluid and cuttings discharges	Localised and temporary: increase in turbidity; burial of benthic habitat in immediate seabed area; potential toxicity impacts	<ul style="list-style-type: none"> <li>• Seawater-based fluids will be used where practicable.</li> <li>• Low toxicity non-aqueous fluids and additives will be used when required.</li> <li>• Solids control equipment will be used to remove non-aqueous fluids on cuttings to minimal residues prior to discharge overboard.</li> <li>• Dynamic seabed and marine environment will rapidly disperse discharged cuttings and drilling fluids.</li> </ul>
Well fluid discharges	Increased salinity; potential toxicity effects	<ul style="list-style-type: none"> <li>• Low toxicity chemical additives will be selected for use in abandonment and completion fluids.</li> <li>• Chemicals used in well fluids will undergo environmental assessment to confirm suitability for discharge prior to use.</li> <li>• Dynamic seabed and marine environment will rapidly disperse discharged well fluids.</li> </ul>
Disconnection/cutting discharges	Localised and temporary: reduction in water quality; smothering of benthic habitats	<ul style="list-style-type: none"> <li>• Chemicals planned for discharge will undergo environmental assessment to confirm suitability for discharge.</li> <li>• Discharges will rapidly disperse in dynamic seabed and marine environment.</li> </ul>
Naturally Occurring Radioactive Materials (NORM)	Temporary exposure of marine fauna to radioactive materials	<ul style="list-style-type: none"> <li>• As these wells have never been producing there is no credible risk for NORM.</li> <li>• Wellheads will be removed on completion of P&amp;A activities and disposed in accordance with legal requirements.</li> </ul>
Vessel collisions	Vessel impacts; injury or death; spill risk; interruption to plug and abandonment activities	<ul style="list-style-type: none"> <li>• Marine users will be informed (including NtMs) prior to commencement of the P&amp;A activities so they will be able to plan their activities and avoid unexpected interference.</li> <li>• Establishment of temporary fairways and 2-nautical mile buffer zone through AMSA/AHS.</li> <li>• Petroleum Safety Zone (PSZ) established in accordance with the <i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i>.</li> <li>• Establishment of adequate navigation aids and communication systems on LWI and supporting facilities (virtual buoy).</li> <li>• Collaboration with AMSA in promulgating adequate warnings and notifications to mariners.</li> <li>• Implementation of vessel communication procedures.</li> <li>• Relevant stakeholders will be notified of activities approximately four weeks and again one week prior to commencement.</li> </ul>

### Petroleum Safety Zones and Notice to Mariners

A 500-metre PSZ around the Gudgeon-1 and Terakihi-1 subsea wells will be established by NOPSEMA for the duration of the campaign, in accordance with Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*.

The exact location of the rig while at each location will be communicated to other marine vessels via a Notice to Mariners (NtM) issued by the Australian Hydrographic Service (AHS) and AUSCOAST warnings issued by the Australian Maritime Safety Authority (AMSA).

Since the wells are located in close proximity to the main shipping route (Gippsland Basin Traffic Separation Scheme; TSS) AMSA has established temporary fairways adjacent to the TSS, to divert maritime traffic away from the rig location (Notice to Mariners 369(P)/2022, issued on 29 April 2022).

The date of effect is 1 August 2022, to allow adequate time for international vessels to adopt this deviation. AMSA has allowed for a 2-nautical mile buffer zone around each of the well locations. In addition, a 'virtual buoy' or Automatic Identification System (AIS) Base Station will transmit a signal to 'mark' the change on the electronic chart display and information system of passing vessels, in addition to AMSA navigation warnings to passing ships, from its AIS stations, for the northern and southern approaches.

### Interaction with commercial fishing

The well sites are located within existing designated Commonwealth fisheries that may be used by commercial fishers.

The 500-metre PSZ will be communicated to the Lakes Entrance Fishermen's Co-op (LEFCOL), South East Trawl Fishing Industry Association (SETFIA) and Seafood Industry Victoria (SIV) as it is a legal requirement that the area should be avoided during petroleum-related activities.

### Environment Plans

Under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*, before any petroleum-related activities in Commonwealth waters can commence, an Environment Plan (EP) must be accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

In the course of preparing an EP, Esso Australia must consult with relevant authorities, persons and organisations whose functions, interests or activities may be affected by the proposed activities (i.e. a relevant person) and provide the opportunity for any issues or concerns to be raised.

A single EP is proposed to be developed for these two well P&As.

The EP is a comprehensive document that describes the existing environment, including stakeholders, and how Esso Australia will undertake the P&A activities to avoid, minimise or manage potential environmental impacts to the As Low As Reasonable Practicable (ALARP) standard and meet regulatory acceptability criteria.

### OIL POLLUTION EMERGENCY PLAN

Under Commonwealth environment legislation, Esso Australia must demonstrate and document oil spill response arrangements. The Oil Pollution Emergency Plan (OPEP) forms part of an EP submission and demonstrates our capability to respond in the unlikely event of an oil spill.

Esso Australia is a member of the Australian Marine Oil Spill Centre (AMOSOC), a co-operative national oil spill response organisation, which provides access to additional oil spill response resources if required.

Esso Australia's OPEP interfaces with national, state and industry response plans prepared and implemented by the Australian Government via AMSA (NATPLAN), the Victorian Government (Maritime Emergencies (non-search and rescue) Plan), the Tasmanian Government (TASPLAN), the NSW Government (NSW Marine Oil and Chemical Spill Contingency Plan) and the Australian Oil industry's Australian Marine Oil Spill Plan (AMOSPLAN) administered by AMOSOC.

The OPEP defines spill response options which may be applied to a spill event. The selected spill response option(s) would depend upon the size and type of spill; environmental sensitivities within the spill path; prevailing weather conditions; access restrictions and available resources. In all instances, a Net Environmental Benefits Assessment is undertaken, in consultation with relevant government agencies, to consider the advantages and disadvantages of the available spill response options.

Esso Australia Resources Pty Ltd ("EARPL") and Woodside Energy (Bass Strait) Pty Ltd are 50:50 co-venturers in a joint venture for the exploration, development and production of oil and gas from Bass Strait and are the owners of the Longford Facility. EARPL is the designated Operator of the joint venture under the Gippsland Basin Joint Venture Operating Agreement. EARPL receives services, including personnel, from its wholly owned subsidiary, Esso Australia Pty Ltd ("Esso Australia"). Esso Australia is "operator" as defined in the *Occupational Health and Safety Regulations 2007*.

The ExxonMobil logo is displayed in red text. The word "Exxon" is in a bold, sans-serif font, and "Mobil" is in a similar font with a distinctive slanted 'i'. The background of the entire page is a photograph of a blue fishing boat with white superstructure, featuring various pieces of equipment like buoys and a large spool of green rope.

Esso Australia is committed to ongoing engagement with the communities where we operate. Esso has been consulting with stakeholders potentially affected by this campaign through a number of different channels. We will continue address questions and consider feedback from stakeholders throughout this campaign.

Esso welcomes the opportunity for more face-to-face meetings and will continue to keep interested stakeholders informed of the proposed activities throughout the planning phase and into the execution phase.

If you have any specific questions or feedback about any of these activities please contact Esso at:

## **Appendix C – Information bulletins version 2, 3 and 4 (2023 consultations)**

The ExxonMobil logo is displayed in red text on the left side of the image. The word "Exxon" is in a bold, sans-serif font, and "Mobil" is in a slightly lighter, sans-serif font. The background of the entire image is a photograph of an offshore oil rig at sea. The rig has a red hull and a white superstructure. A large crane is visible on the left side of the rig. The rig is positioned in the center-right of the frame, with the ocean extending to the horizon under a blue sky with scattered white clouds. The rig's name "HELIIX" is visible on a tall structure. The rig is supported by several legs in the water. The overall scene is a clear, bright day at sea.

Exploration well  
plug and abandonment

Gudgeon-1 and  
Terakihi-1

Esso Australia is planning to undertake an offshore activity to plug and abandon (P&A) two exploration wells – Gudgeon-1 and Terakihi-1 in Gippsland Basin off the Victorian coastline.

All well P&A activities will be undertaken by the Helix Q7000 Light Well Intervention Vessel (LWIV), as pictured on cover. The Q7000 was built in 2017 and operates in accordance with current international safety and environmental standards, such as those set by the International Convention for the Prevention of Pollution from Ships (MARPOL) and Australian Maritime Safety Authority (AMSA). No seismic activity is required.

### Activity description

The Gudgeon-1 and Terakihi-1 exploration wells were originally suspended for potential future use which is no longer viable, so permanent barriers will be installed to enable the wells to be safely P&A'd in accordance with regulatory requirements. Well P&A is a safe and long-standing practice.

For all wells, a blowout preventer will be used to prevent the release of hydrocarbons during the plugging of the wells. Tubing and associated instruments and control valves will be removed, and permanent cement plugs/barriers installed to provide multiple physical barriers to prevent the release of any hydrocarbons that remain in the reservoir. The Gudgeon-1 and Terakihi-1 wellheads will then be cut at or below the seabed and removed.

### Potential impacts and control measures

Provided in the following pages are the key potential impacts and control measures relating to the P&A activity to assist relevant persons in making an informed assessment of possible impacts to their functions, interests or activities in the area.

### Activity location

The Gudgeon-1 and Terakihi-1 wells are located approximately 85 kilometres off the Gippsland coastline, south-east of Lakes Entrance in water depths of approximately 300-400 metres.

The wells are not located within any established or proposed Commonwealth or State Marine Protected Areas, Critical Habitats or Threatened Ecological Communities. It is recognised that the activities will overlap with existing fisheries with the establishment of a 500-metre Petroleum Safety Zone (PSZ) around both Gudgeon-1 and Terakihi-1 subsea wells while the activity is being undertaken.

Once completed this activity will ultimately eliminate the risk of any loss of hydrocarbon containment and will remove obstructions and snag points for commercial fishing.

### ACTIVITY TIMING

#### EARLIEST DATE OF COMMENCEMENT

# Q3 2023

#### ALL P&A ACTIVITY COMPLETED WITHIN

# 3 months

#### FIELD ACTIVITIES ESTIMATED TO TAKE

# ~30 days

#### PER WELL

#### P&A ACTIVITIES WILL BE CONDUCTED

# 24/7

THE TIMING AND ORDER OF ACTIVITY MAY VARY AND IS CONTINGENT ON REGULATORY APPROVALS, JOINT VENTURE APPROVALS, WEATHER AND RIG/VESSEL SCHEDULES

## LIGHT WELL INTERVENTION VESSEL AND VESSEL-BASED POTENTIAL IMPACTS AND CONTROL MEASURES

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCE	CONTROL MEASURES
LWIV mooring	Temporary and localised seabed disturbance	<ul style="list-style-type: none"> <li>As the LWIV is self-propelled and will be holding position by means of dynamic positioning, no anchoring will be required under normal circumstances, therefore no impact on the seabed.</li> </ul>
Planned discharges to the marine environment <sup>1</sup>	Temporary and localised reduction in water quality; temporary change to predator/prey dynamics	<ul style="list-style-type: none"> <li>Routine discharges and vessel waste treatment systems will meet MARPOL requirements and are routinely maintained.</li> <li>Food scraps will be macerated prior to discharge.</li> <li>Discharged bilge water will have less than 15 parts per million oil in water content.</li> <li>Chemicals planned for discharge will undergo an environmental assessment to confirm suitability for discharge prior to use.</li> </ul>
Sound emissions	Temporary displacement of sound sensitive fauna around active vessels	<ul style="list-style-type: none"> <li>Support vessels and helicopters will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans, for example helicopters adhering to strict distances from cetaceans when sighted.</li> <li>During specific months a Marine Mammal Observer will be placed on the LWIV to aid in sighting and reporting of whales and there will be no more than two attendant vessels alongside the LWIV at any one time to reduce the cumulative sound emissions.</li> <li>If certain listed species of whales are spotted additional controls are in place to help protect and minimise noise disturbance to these species.</li> </ul>
Light emissions	Attraction of light sensitive species; change in fauna behaviour	<ul style="list-style-type: none"> <li>Lighting will be used in accordance with the National Light Pollution Guidelines for Wildlife.</li> <li>Lighting will be kept to a minimum while still meeting navigational and workplace safety requirements.</li> </ul>
Air emissions	Temporary and localised reduction in air quality	<ul style="list-style-type: none"> <li>Marine engines are routinely maintained and air emissions will meet MARPOL requirements.</li> <li>There will be no requirement for flaring or venting during P&amp;A activities.</li> </ul>
Unplanned interaction with marine fauna (vessel strike)	Injury or death of marine fauna	<ul style="list-style-type: none"> <li>Support vessels will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans.</li> <li>LWIV will be stationary during well intervention. Normal speed when relocating is less than 10 knots. Watchkeeping will be maintained during vessel relocations.</li> <li>Any injury/mortality of <i>Environment Protection and Biodiversity Conservation Act 1999</i>-listed fauna will be reported to the Department of Climate Change, Energy, the Environment and Water.</li> </ul>
Unplanned introduction of Invasive Marine Species	Displacement of native species and habitat domination	<ul style="list-style-type: none"> <li>LWIV and all support vessels will have a Ballast Water Management Plan and associated certificate.</li> <li>LWIV and all support vessels will comply with Australian Ballast Water Management requirements.</li> <li>A Biofouling Risk Assessment process will be completed.</li> <li>Submersible equipment (Remotely Operated Vehicle, blowout preventer) will be rinsed on completion of each activity and is normally stored on deck, thereby minimising Invasive Marine Species risk.</li> </ul>

<sup>1</sup> Including sewage and food waste, treated bilge and deck wash, and cooling water and brine.

## PLUG AND ABANDONMENT ACTIVITY POTENTIAL IMPACTS AND CONTROL MEASURES

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCE	CONTROL MEASURES
Discharge of cement	Localised and temporary: reduction in water quality; smothering of benthic habitat	<ul style="list-style-type: none"> <li>• Low toxicity cement additives have been selected for use.</li> <li>• Cement hose flushing and slurry releases will be rapidly diluted and dispersed by the dynamic marine environment.</li> </ul>
Drilling fluid and cuttings discharges	Localised and temporary: increase in turbidity; burial of benthic habitat in immediate seabed area; potential toxicity impacts	<ul style="list-style-type: none"> <li>• Seawater-based fluids will be used where practicable.</li> <li>• Low toxicity non-aqueous fluids and additives will be used when required.</li> <li>• Non-aqueous fluids will be removed as much as possible from the cutting fluids using 'solids control equipment' prior to discharge overboard.</li> <li>• Dynamic seabed and marine environment will rapidly disperse discharged cuttings and drilling fluids.</li> </ul>
Well fluid discharges	Increased salinity; potential toxicity effects	<ul style="list-style-type: none"> <li>• Low toxicity chemical additives will be selected for use in abandonment and completion fluids.</li> <li>• Chemicals used in well fluids will undergo environmental assessment to confirm suitability for discharge prior to use.</li> <li>• Dynamic seabed and marine environment will rapidly disperse discharged well fluids.</li> </ul>
Disconnection/cutting discharges	Localised and temporary: reduction in water quality; smothering of benthic habitats	<ul style="list-style-type: none"> <li>• Chemicals planned for discharge will undergo environmental assessment to confirm suitability for discharge.</li> <li>• Discharges will rapidly disperse in dynamic seabed and marine environment.</li> </ul>
Naturally Occurring Radioactive Materials	Temporary exposure of marine fauna to radioactive materials	<ul style="list-style-type: none"> <li>• As these wells have never been producing there is no credible risk for Naturally Occurring Radioactive Materials.</li> <li>• It is the aim that wellheads will be removed on completion of P&amp;A activities and disposed in accordance with the <i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i>.</li> </ul>
Vessel collisions	Vessel impacts; injury or death; spill risk; interruption to plug and abandonment activities	<ul style="list-style-type: none"> <li>• Marine users will be informed (including Notices to Mariners) prior to commencement of the P&amp;A activities so they will be able to plan their activities and avoid unexpected interference.</li> <li>• Establishment of temporary fairways and 2-nautical mile buffer zone through AMSA/Australian Hydrographic Service.</li> <li>• PSZ established in accordance with the <i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i> at least one month before start of field activities.</li> <li>• Establishment of adequate navigation aids and communication systems on LWIV and supporting facilities (virtual buoy).</li> <li>• Collaboration with AMSA in ensuring adequate warnings and notifications to mariners.</li> <li>• Implementation of vessel communication procedures.</li> <li>• Relevant persons whose activities are within the activity location will be notified of activities approximately four weeks and again one week prior to commencement.</li> </ul>

## Petroleum Safety Zones and Notice to Mariners

A 500-metre PSZ around the Gudgeon-1 and Terakihi-1 subsea wells will be established by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for the duration of the activity, in accordance with Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*.

The exact location of the rig will be communicated to other marine vessels via a Notice to Mariners issued by the Australian Hydrographic Service and AUSCOAST warnings issued by the AMSA.

Since the wells are located in close proximity to the main shipping route, AMSA has established temporary fairways adjacent to the Gippsland Basin Traffic Separation Scheme, to divert maritime traffic away from the rig location (Notice to Mariners 369(P)/2022, issued on 29 April 2022).

The date of effect was 1 August 2022, to allow adequate time for international vessels to adopt this deviation. AMSA has allowed for a 2-nautical mile buffer zone around each of the well locations. In addition, a 'virtual buoy' or Automatic Identification System Base Station will transmit a signal to 'mark' the change on the electronic chart display and information system of passing vessels, as well as AMSA navigation warnings to passing ships, from its virtual buoys, for the northern and southern approaches.

## Interaction with commercial fishing

The well sites are located within existing designated Commonwealth fisheries that may be used by commercial fishers.

The 500-metre PSZ will be communicated to the Lakes Entrance Fishermen's Co-op, South East Trawl Fishing Industry Association and Seafood Industry Victoria as it is a legal requirement that the area should be avoided during petroleum-related activities.

## Environment Plans

Under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*, before any petroleum-related activities in Commonwealth waters can commence, an Environment Plan (EP) must be accepted by NOPSEMA.

A single EP is proposed to be developed for these two well P&As.

The EP is a comprehensive document that describes the existing environment, including relevant persons, and how Esso Australia will undertake the P&A activities to avoid, minimise or manage potential environmental impacts to As Low As Reasonable Practicable (ALARP) and meet regulatory acceptability criteria. Achieving ALARP requires a titleholder to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure.

In the course of preparing an EP, Esso Australia must consult with relevant authorities, persons and organisations whose functions, interests or activities may be affected by the proposed activities (i.e. a relevant person) and provide the opportunity for any issues or concerns to be raised.

## OIL POLLUTION EMERGENCY PLAN

Under Commonwealth environment legislation, Esso Australia must demonstrate and document oil spill response arrangements. The Oil Pollution Emergency Plan (OPEP) forms part of an EP submission and demonstrates our capability to respond in the unlikely event of an oil spill.

Esso Australia is a member of the Australian Marine Oil Spill Centre (AMOSOC), a co-operative national oil spill response organisation, which provides access to additional oil spill response resources if required.

Esso Australia's OPEP interfaces with national, state and industry response plans prepared and implemented by the Australian Government via AMSA (NATPLAN), the Victorian Government (Maritime Emergencies (non-search and rescue) Plan), the Tasmanian Government (TASPLAN), the NSW Government (NSW Marine Oil and Chemical Spill Contingency Plan) and the Australian Oil industry's Australian Marine Oil Spill Plan (AMOSPLAN) administered by AMOSOC.

The OPEP defines spill response options which may be applied to a spill event. The selected spill response option(s) would depend upon the size and type of spill; environmental sensitivities within the spill path; prevailing weather conditions; access restrictions and available resources. In all instances, a Net Environmental Benefits Assessment is undertaken, in consultation with relevant government agencies, to consider the advantages and disadvantages of the available spill response options.

Esso Australia Resources Pty Ltd ("EARPL") and Woodside Energy (Bass Strait) Pty Ltd are 50:50 co-venturers in a joint venture for the exploration, development and production of oil and gas from Bass Strait and are the owners of the Longford Facility. EARPL is the designated Operator of the joint venture under the Gippsland Basin Joint Venture Operating Agreement. EARPL receives services, including personnel, from its wholly owned subsidiary, Esso Australia Pty Ltd ("Esso Australia"). Esso Australia is "operator" as defined in the *Occupational Health and Safety Regulations 2007*.

The ExxonMobil logo is displayed in red text. The word "Exxon" is in a bold, sans-serif font, and "Mobil" is in a similar font with a distinctive slanted 'i'. The background of the entire page is a photograph of a blue fishing boat with white superstructure, featuring various pieces of equipment like winches and buoys.

Esso Australia is committed to ongoing engagement with the communities where we operate. Esso has been consulting with relevant persons potentially affected by this activity through a number of different channels. We will continue to address questions and consider feedback from relevant persons throughout this activity.

Esso welcomes the opportunity for more face-to-face meetings and will continue to keep relevant persons informed of the proposed activities throughout the planning phase and into the execution phase.

# Exploration well plug and abandonment

Gudgeon-1 and Terakihi-1

Esso is planning to undertake an offshore activity to plug and abandon (P&A) two exploration wells – Gudgeon-1 and Terakihi-1 in the Gippsland Basin off the Victorian coastline. P&A is the industry term for the permanent closure of a well. Well P&A is a safe and long-standing practice.

All well P&A activities will be undertaken by the Helix-owned and operated Q7000 Light Well Intervention Vessel (LWIV), as pictured on the cover. The Q7000 was built in 2017 and operates in accordance with current international safety and environmental standards, such as those set by the International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978, (MARPOL 73/78) and Australian Maritime Safety Authority (AMSA). The Q7000 also holds a Safety Case accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA), the Australian regulator.

This information bulletin has been developed as part of Esso's commitment to keep relevant persons and other stakeholders informed of planned activities in Bass Strait and to provide relevant persons with sufficient information about the nature and scale of the activity, as well as its potential risks and impacts, so that they can make an informed decision as to whether their functions, interests or activities are affected.

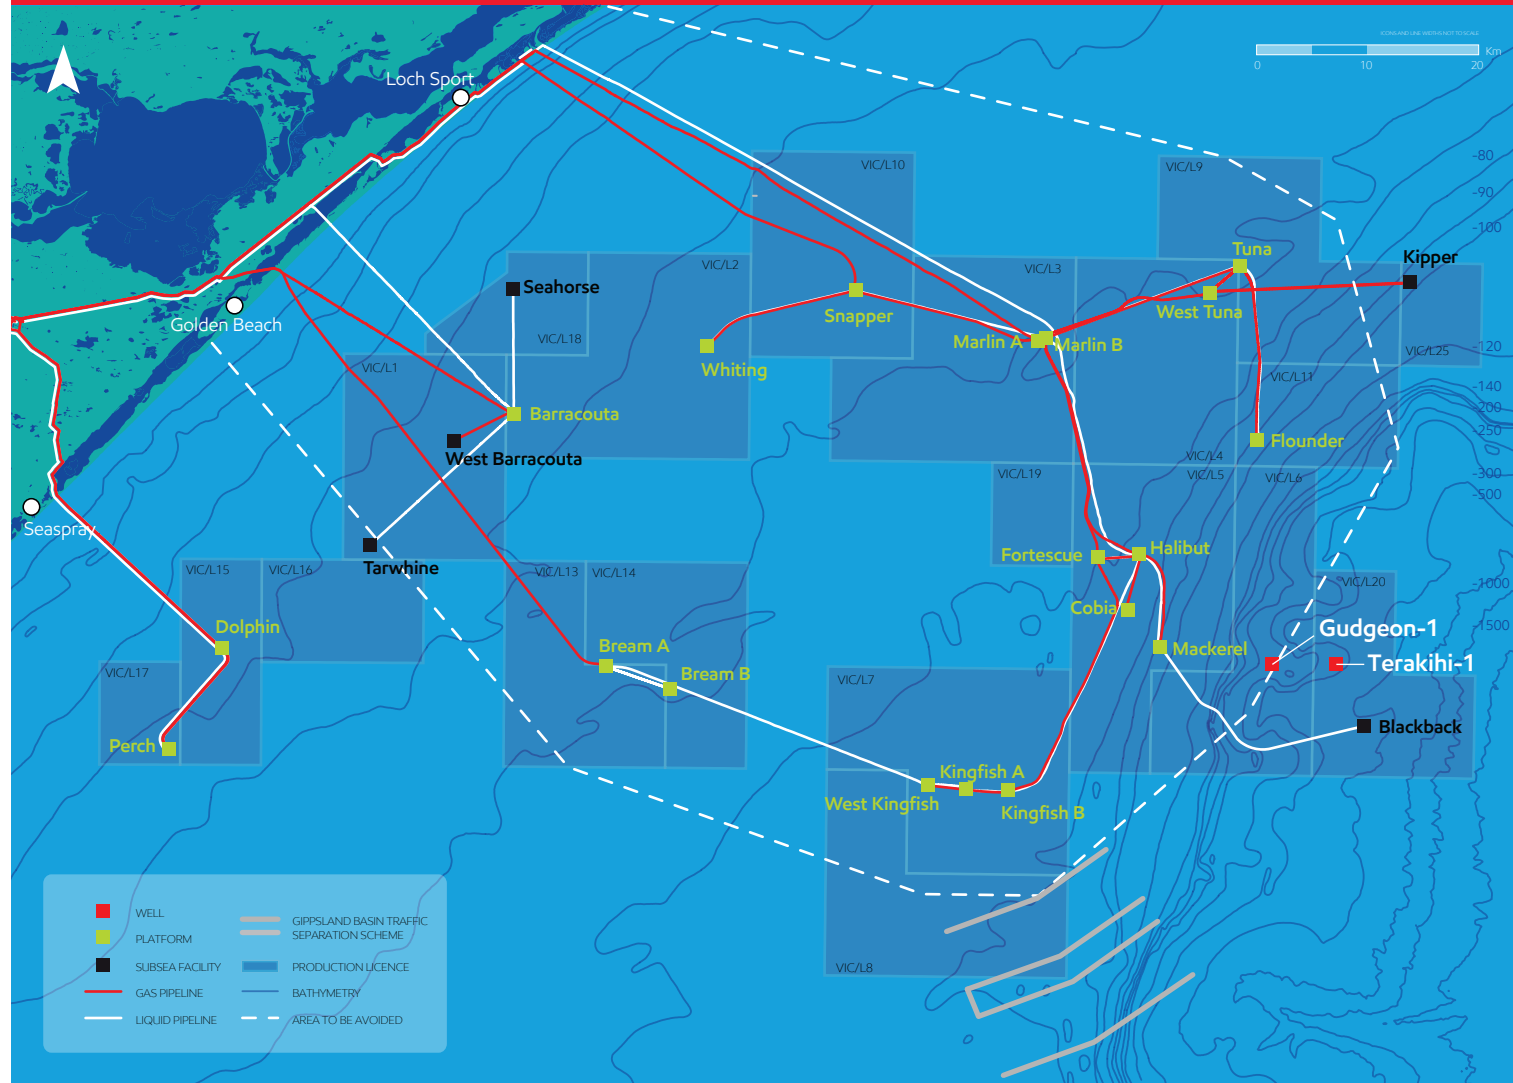

### Activity description

The Gudgeon-1 and Terakihi-1 exploration wells were originally cased and cemented safety, followed by suspending these wells for potential future development which is no longer viable, so permanent barriers will be installed to enable the wells to be safely P&A'd in accordance with regulatory requirements.

For all wells, a pressure control equipment system will be used during the plugging activity and permanent cement plugs/barriers will be installed, to provide sufficient physical barriers to prevent the potential release of any hydrocarbons. The Gudgeon-1 and Terakihi-1 wellheads will then be cut at or below the seabed and removed.

No seismic activity is required.

## ACTIVITY LOCATIONS

### Activity location

The Gudgeon-1 and Terakihi-1 wells are located approximately 85 kilometres off the Gippsland coastline, south-east of Lakes Entrance in water depths of approximately 300-400 metres.

The wells are not located within any established or proposed Commonwealth or State Marine Protected Areas, Critical Habitats or Threatened Ecological Communities.

### Potential impacts and control measures

Provided in the following pages are the key potential impacts and control measures relating to the activities to assist relevant persons in making an informed assessment of possible impacts to their functions, interests or activities in the area.

Once completed this activity will ultimately eliminate the risk of any loss of hydrocarbon containment and will remove obstructions and snag points for commercial fishing.

### Petroleum Safety Zones and Notice to Mariners

A 500-metre PSZ around the Gudgeon-1 and Terakihi-1 subsea wells will be established by NOPSEMA for the duration of the activity, in accordance with Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*. The exact location of the rig will be communicated to other marine vessels via a Notice to Mariners issued by the Australian Hydrographic Service and AUSCOAST warnings issued by the AMSA.

Since the wells are located in close proximity to the main shipping route, AMSA has established temporary fairways adjacent to the Gippsland Basin Traffic Separation Scheme, to divert maritime traffic away from the rig location (Notice to Mariners 369(P)/2022, issued on 29 April 2022).

The date of effect was 1 August 2022, to allow adequate time for international vessels to adopt this deviation. AMSA has allowed for a 2-nautical mile buffer zone around each of the well locations. In addition, a 'virtual buoy' or Automatic Identification System Base Station will transmit a signal to 'mark' the change on the electronic chart display and information system of passing vessels, as well as AMSA navigation warnings to passing ships, from its virtual buoys, for the northern and southern approaches.

### Interaction with commercial fishing

The well sites are located within existing designated Commonwealth fisheries that may be used by commercial fishers. The 500-metre PSZ will be communicated to the Lakes Entrance Fishermen's Co-op, South East Trawl Fishing Industry Association and Seafood Industry Victoria as it is a legal requirement that the area should be avoided during petroleum-related activities.

### Environment Plans

Under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006*, before any petroleum-related activities in Commonwealth waters can commence, an Environment Plan (EP) must be accepted by NOPSEMA. A single EP is proposed to be developed for these two well P&As.

The EP is a comprehensive document that describes the existing environment, including relevant persons, and how Esso will undertake the P&A activities to avoid, minimise or manage potential environmental impacts to As Low As Reasonable Practicable (ALARP) and meet regulatory acceptability criteria. Achieving ALARP requires a titleholder to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure.

In the course of preparing an EP, Esso must consult with relevant authorities, persons and organisations whose functions, interests or activities may be affected by the proposed activities (i.e. a relevant person) and provide the opportunity for any concerns, objections or claims to be raised.

### OIL POLLUTION EMERGENCY PLAN

Under Commonwealth environment legislation, Esso must demonstrate and document oil spill response arrangements. The Oil Pollution Emergency Plan (OPEP) forms part of an EP submission and demonstrates Esso's capability to respond in the unlikely event of an oil spill.

Esso is a member of the Australian Marine Oil Spill Centre, a co-operative national oil spill response organisation, which provides access to additional oil spill response resources if required.

Esso's OPEP interfaces with national, state and industry response plans prepared and implemented by the Australian Government via the Australian Maritime Safety Authority (NATPLAN), the Victorian Government (Maritime Emergencies (non-search and rescue) Plan), the Tasmanian Government (TASPLAN), the NSW Government (NSW Marine Oil and Chemical Spill Contingency Plan) and the Australian Oil industry's Australian Marine Oil Spill Plan (AMOSPLAN) administered by the Australian Marine Oil Spill Centre.

The OPEP defines spill response options which may be applied to a spill event. The selected spill response option(s) would depend upon the size and type of spill; environmental sensitivities within the spill path; prevailing weather conditions; access restrictions and available resources. In all instances, a Net Environmental Benefits Assessment is undertaken, in consultation with relevant government agencies, to determine the most appropriate spill response option.

### ACTIVITY TIMING

Earliest date of commencement

**Q4 2023**

All activities completed within

**3 months**

Field activities estimated to take

**~30 days per well**

Activities will be conducted

**24/7**

*The timing and order of activity may vary and is contingent on regulatory approvals, joint venture approvals, weather and rig/vessel schedules.*

## POTENTIAL IMPACTS, CONSEQUENCES AND CONTROL MEASURES

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCES	CONTROL MEASURES
LWIV mooring	Temporary and localised seabed disturbance	<ul style="list-style-type: none"> <li>As the LWIV is self-propelled and will be holding position by means of dynamic positioning, no anchoring will be required under normal circumstances, therefore no impact on the seabed.</li> </ul>
Planned discharges to the marine environment <sup>1</sup>	Temporary and localised reduction in water quality; temporary change to predator/prey dynamics	<ul style="list-style-type: none"> <li>Routine discharges and vessel waste treatment systems are maintained to meet the requirements of MARPOL 73/78.</li> <li>Food scraps will be macerated prior to discharge.</li> <li>Discharged bilge water will have less than 15 parts per million oil in water content.</li> <li>Chemicals planned for discharge will undergo environmental assessment to confirm suitability for discharge prior to use.</li> </ul>
Sound emissions	Temporary displacement of sound sensitive fauna around active vessels	<ul style="list-style-type: none"> <li>Support vessels and helicopters will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans, for example helicopters adhering to strict distances from cetaceans when sighted.</li> <li>A Marine Mammal Observer will be placed on the LWIV to aid in sighting and reporting of whales and there will be no more than one vessel alongside the LWIV at any one time to reduce the cumulative sound emissions.</li> <li>If certain listed species of whales are spotted additional controls are in place to help protect and minimise noise disturbance to these species.</li> </ul>

# Bass Strait Operations

Gudgeon-1 and Terakihi-1 - Well Plug and Abandonment

INFORMATION BULLETIN  
September 2023

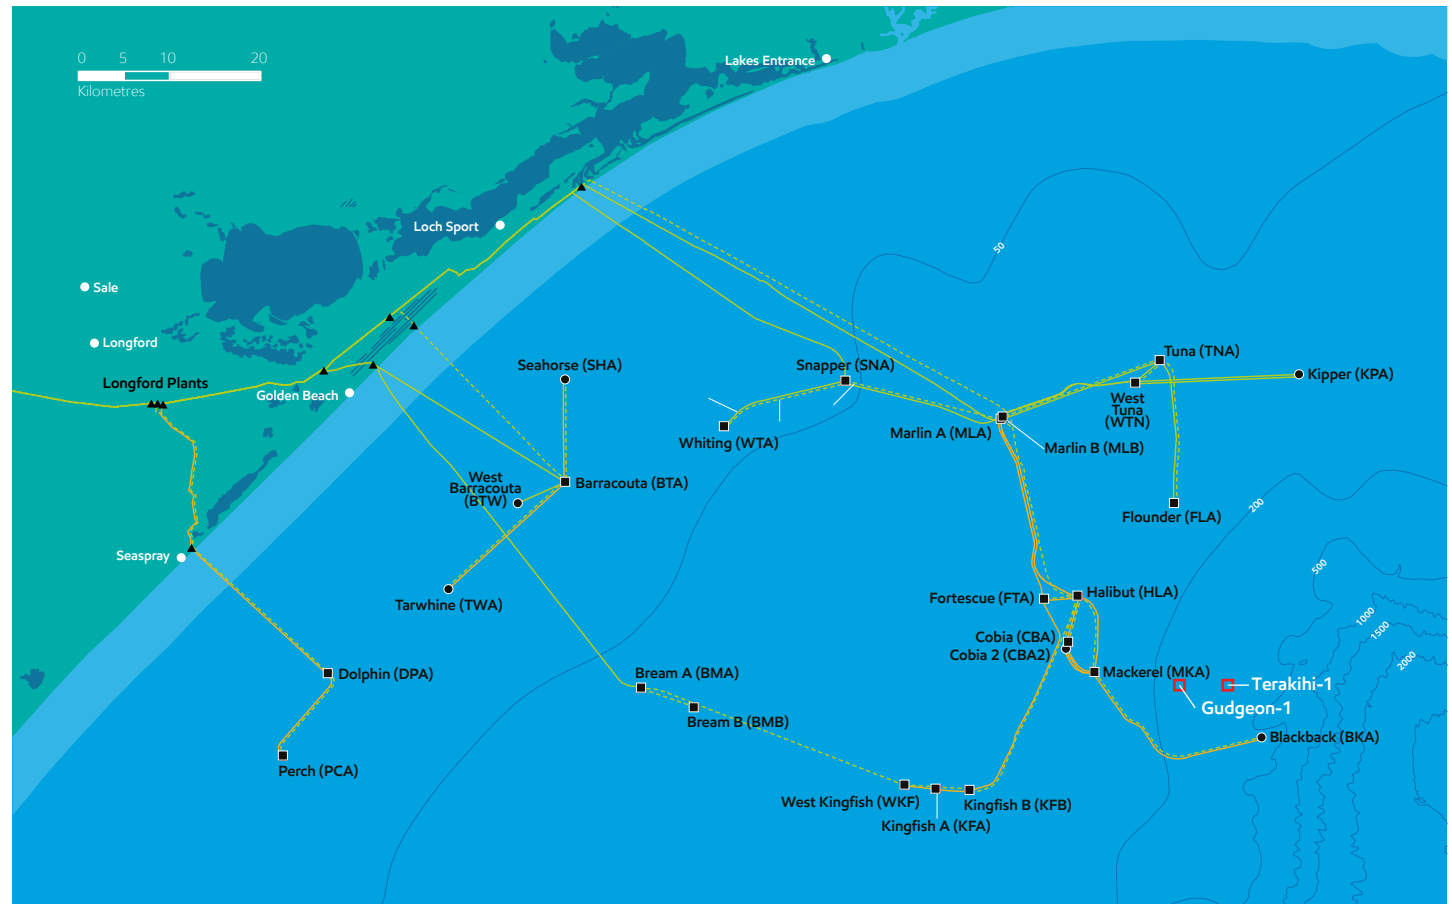

Esso is committed to engaging with the communities where we operate and helping our stakeholders to understand our business.

This information bulletin has been developed as part of Esso's commitment to keep relevant persons and other stakeholders informed of planned activities in Bass Strait and to provide them with sufficient information about the nature and scale of the activity, as well as its potential risks and impacts, so that they can make an informed decision as to whether their functions, interests or activities are affected.

### Overview

Esso Australia Resources Pty Ltd (Esso) is a wholly owned subsidiary of ExxonMobil Australia Pty Ltd. Esso is the operator of the assets in Bass Strait that are part of the Gippsland Basin Joint Venture between Esso and Woodside Energy (Bass Strait) Pty Ltd (Woodside Energy) and the Kipper Unit Joint Venture (Esso, Woodside Energy, and MEPAU A Pty Ltd). These assets comprise 19 platforms with approximately 400 wells, six subsea facilities and more than 800 kilometres of subsea pipelines.

Esso is planning to undertake an offshore activity to plug and abandon (P&A) two exploration wells – Gudgeon-1 and Terakihi-1 in the Gippsland Basin off the Victorian coastline. P&A is the industry term for the permanent closure of a well. Well P&A is a safe and long-standing practice. All well P&A activities will be undertaken by the Helix-owned and operated Q7000 Light Well Intervention Vessel (LWIV), as pictured on the cover. The Q7000 was built in 2017 and operates in accordance with current international safety and environmental standards, such as those set by the International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978, (MARPOL 73/78) and Australian Maritime Safety Authority (AMSA). The Q7000 also holds a Safety Case accepted by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA), the Australian regulator.

- PLATFORM
- SUBSEA FACILITY
- ▲ VALVE SITE

NOTE: Some changes made to improve visibility of pipelines. Facility icons do not indicate facility size.

### Activity timing

Earliest date of commencement

**4Q 2023**

Field activities estimated to take

**~30 days per well**

Activities will be conducted

**24/7**

The timing and order of activity may vary and is contingent on regulatory approvals, joint venture approvals, weather and rig/vessel schedules.

Consultation will be conducted with relevant persons prior to the commencement of plug and abandonment activities.

### Activity description

The Gudgeon-1 and Terakihi-1 exploration wells were originally cased and cemented safely, then suspended for potential future development, which is no longer viable. As such, permanent barriers will be installed to enable the wells to be safely P&A'd in accordance with regulatory requirements.

For all wells, a pressure control equipment system will be used during the plugging activity and permanent cement plugs/barriers will be installed, to provide sufficient physical barriers to prevent the potential release of any hydrocarbons.

The Gudgeon-1 and Terakihi-1 wellheads will then be cut at or below the seabed and removed. No seismic activity is required.

### Activity location

The Gudgeon-1 and Terakihi-1 wells are located approximately 85 kilometres off the Gippsland coastline, south-east of Lakes Entrance in water depths of approximately 300-400 metres.

The wells are not located within any established or proposed Commonwealth or State Marine Protected Areas, Critical Habitats or Threatened Ecological Communities.

### Petroleum Safety Zones and Notice to Mariners

A 500-metre Petroleum Safety Zone (PSZ) around the Gudgeon-1 and Terakihi-1 subsea wells will be established by NOPSEMA for the duration of the activity, in accordance with Section 616 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGGS Act).

The exact location of the rig will be communicated to other marine vessels via a Notice to Mariners issued by the Australian Hydrographic Service and AUSCOAST warnings issued by the AMSA.

Since the wells are located in close proximity to the main shipping route, AMSA has established temporary fairways adjacent to the Gippsland Basin Traffic Separation Scheme, to divert maritime traffic away from the rig location (Notice to Mariners 369(P)/2022, issued on 29 April 2022). The date of effect was 1 August 2022, to allow adequate time for international vessels to adopt this deviation.

## ENVIRONMENT PLAN

Under the OPGGS Act, before any petroleum-related activities in Commonwealth waters can commence, an Environment Plan (EP) must be accepted by NOPSEMA. A single EP is proposed to be developed for these two well P&As.

The EP is a comprehensive document that describes the existing environment, including relevant persons, and how Esso will undertake the drilling activities to avoid, minimise or manage potential environmental impacts to As Low As Reasonably Practicable (ALARP) and meet regulatory acceptability criteria. Demonstrating ALARP requires a titleholder to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure.

In the course of preparing an EP, Esso must consult with relevant authorities, persons and organisations whose functions, interests or activities may be affected by the proposed activities (i.e. a relevant person) and provide the opportunity for any feedback.

AMSA has allowed for a 2-nautical mile buffer zone around each of the well locations. In addition, a 'virtual buoy' or Automatic Identification System Base Station will transmit a signal to 'mark' the change on the electronic chart display and information system of passing vessels, as well as AMSA navigation warnings to passing ships, from its virtual buoys, for the northern and southern approaches.

### Interaction with commercial fishing

The well sites are located within existing Commonwealth fisheries that may be used by commercial fishers.

The 500-metre PSZ will be communicated to the Lakes Entrance Fishermen's Co-op, South East Trawl Fishing Industry Association and Seafood Industry Victoria as it is a legal requirement that the area should be avoided during petroleum-related activities.

### Potential impacts, consequences and control measures

Esso's aim is to minimise environmental and social impacts associated with the proposed activities. As such, Esso has undertaken an assessment to identify potential impacts and consequences to the environment resulting from the proposed activities, considering timing, duration, location, values and sensitivities.

For each potential impact, Esso has developed the control measures outlined on the following pages to assist relevant persons in making an informed assessment of possible impacts to their functions, interests or activities.

Once completed, the activities will eliminate the risk of any loss of hydrocarbon containment and will remove obstructions and snag points for commercial fishing.

↑ Fishing vessels at Lakes Entrance

## → OIL POLLUTION EMERGENCY PLAN

In accordance with the OPGGS Act, Esso must demonstrate and document oil spill response arrangements. The Oil Pollution Emergency Plan (OPEP) forms part of an EP submission and demonstrates Esso's capability to respond in the unlikely event of an oil spill.

Esso is a member of the Australian Marine Oil Spill Centre, a co-operative national oil spill response organisation, which provides access to additional oil spill response resources if required.

Esso's OPEP interfaces with national, state and industry response plans prepared and implemented by the Australian Government via the Australian Maritime Safety Authority (NatPlan), the Victorian Government (Maritime Emergencies (non-search and rescue) Plan), the Tasmanian Government (TasPlan), the NSW Government (NSW Marine Oil and Chemical Spill Contingency Plan) and the Australian Oil industry's Australian Marine Oil Spill Plan (AMOSPlan) administered by the Australian Marine Oil Spill Centre.

The OPEP defines spill response options which may be applied to a spill event. The selected spill response option(s) would depend upon the size and type of spill; environmental sensitivities within the spill path; prevailing weather conditions; access restrictions and available resources. In all instances, a Net Environmental Benefits Assessment is undertaken, in consultation with relevant government agencies, to determine the most appropriate spill response option.

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCES	CONTROL MEASURES
LWIV mooring	Temporary and localised seabed disturbance	<ul style="list-style-type: none"> <li>As the LWIV is self-propelled and will be holding position by means of dynamic positioning, no anchoring will be required under normal circumstances, therefore no impact on the seabed.</li> </ul>
Planned discharges to the marine environment <sup>1</sup>	Temporary and localised reduction in water quality; temporary change to predator/prey dynamics	<ul style="list-style-type: none"> <li>Routine discharges and vessel waste treatment systems are maintained to meet the requirements of MARPOL 73/78.</li> <li>Food scraps will be macerated prior to discharge.</li> <li>Discharged bilge water will have less than 15 parts per million oil in water content.</li> <li>Chemicals planned for discharge will undergo environmental assessment to confirm suitability for discharge prior to use.</li> </ul>
Sound emissions	Temporary displacement of sound sensitive fauna around active vessels	<ul style="list-style-type: none"> <li>Support vessels and helicopters will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans, for example helicopters adhering to strict distances from cetaceans when sighted.</li> <li>A Marine Mammal Observer will be placed on the LWIV to aid in sighting and reporting of whales and there will be no more than one vessel alongside the LWIV at any one time to reduce the cumulative sound emissions.</li> <li>If certain listed species of whales are spotted additional controls are in place to help protect and minimise noise disturbance to these species.</li> </ul>
Light emissions	Attraction of light sensitive species; change in fauna behaviour	<ul style="list-style-type: none"> <li>Lighting will be used in accordance with the National Light Pollution Guidelines for Wildlife.</li> <li>Lighting will be kept to a minimum while still meeting navigational and workplace safety requirements.</li> </ul>
Air emissions	Temporary and localised reduction in air quality	<ul style="list-style-type: none"> <li>Marine engines are routinely maintained and air emissions will meet MARPOL 73/78 requirements.</li> <li>There will be no requirement for planned flaring or venting during P&amp;A activities.</li> </ul>
Unplanned interaction with marine fauna (vessel strike)	Injury or death of marine fauna	<ul style="list-style-type: none"> <li>Support vessels will comply with <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> Part 8 Division 8.1 interacting with cetaceans.</li> <li>LWIV will be stationary during well intervention. Normal speed when relocating is less than 10 knots. Watchkeeping will be maintained during vessel relocations.</li> <li>Any injury/mortality of <i>Environment Protection and Biodiversity Conservation Act 1999</i>-listed fauna will be reported to the Department of Climate Change, Energy, the Environment and Water.</li> </ul>
Unplanned introduction of invasive marine species	Displacement of native species and habitat domination	<ul style="list-style-type: none"> <li>LWIV and all support vessels will have a Ballast Water Management Plan and associated certificate.</li> <li>LWIV and all support vessels will comply with Australian Ballast Water Management requirements.</li> <li>A Biofouling Risk Assessment process will be completed.</li> <li>Submersible equipment (Remotely Operated Vehicle, blowout preventer) will be rinsed on completion of each activity and is normally stored on deck, thereby minimising invasive marine species risk.</li> </ul>
Discharge of cement	Temporary and localised reduction in water quality; smothering	<ul style="list-style-type: none"> <li>Low toxicity cement additives have been selected for use.</li> <li>Cement hose flushing and slurry releases will be rapidly diluted and dispersed by the dynamic marine environment.</li> </ul>

<sup>1</sup> Including treated sewage and food waste, treated bilge and deck wash, and cooling water and brine.

POTENTIAL IMPACTS	POTENTIAL CONSEQUENCES	CONTROL MEASURES
Drilling fluid and cuttings discharges	Temporary and localised increase in turbidity; burial of benthic habitat in immediate seabed area; potential toxicity impacts	<ul style="list-style-type: none"> <li>Seawater-based fluids will be used where practicable.</li> <li>Low toxicity non-aqueous fluids and additives will be used when required.</li> <li>Non-aqueous fluids will be removed as much as possible from the cutting fluids using 'solids control equipment' prior to discharge overboard.</li> <li>Dynamic seabed and marine environment will rapidly disperse discharged cuttings and drilling fluids.</li> </ul>
Well fluid discharges	Increased salinity; potential toxicity effects	<ul style="list-style-type: none"> <li>Low toxicity chemical additives will be selected for use in abandonment and completion fluids.</li> <li>Chemicals used in well fluids will undergo environmental assessment to confirm suitability for discharge prior to use.</li> <li>Dynamic seabed and marine environment will rapidly disperse discharged well fluids.</li> </ul>
Disconnection/cutting discharges	Temporary and localised reduction in water quality; smothering	<ul style="list-style-type: none"> <li>Chemicals planned for discharge will undergo environmental assessment to confirm suitability for discharge.</li> <li>Discharges will rapidly disperse in dynamic seabed and marine environment.</li> </ul>
Naturally Occurring Radioactive Material	Temporary exposure of marine fauna to radioactive material	<ul style="list-style-type: none"> <li>As these wells have never been producing there is no credible risk for Naturally Occurring Radioactive Material.</li> <li>It is the aim that wellheads will be removed on completion of P&amp;A activities and disposed in accordance with the OPGGS Act.</li> </ul>
Vessel collisions	Vessel impacts; injury or death; spill risk; interruption to plug and abandonment activities	<ul style="list-style-type: none"> <li>Marine users will be informed (including Notices to Mariners) prior to commencement of the P&amp;A activities so they will be able to plan their activities and avoid unexpected interactions.</li> <li>Establishment of temporary fairways and 2-nautical mile buffer zone through AMSA/Australian Hydrographic Service.</li> <li>PSZ established in accordance with the OPGGS Act at least one month before start of field activities.</li> <li>Establishment of adequate navigation aids and communication systems on LWIV and supporting facilities (virtual buoy).</li> <li>Collaboration with AMSA in ensuring adequate warnings and notifications to mariners.</li> <li>Implementation of vessel communication procedures.</li> <li>Relevant persons whose activities are within the activity location will be notified of activities approximately four weeks and again one week prior to commencement.</li> </ul>
Loss of well control	Potential toxicity; oiling of fauna; reduction in visual aesthetic; socioeconomic impacts to the fishing and tourism industries	<ul style="list-style-type: none"> <li>NOPSEMA-accepted Well Operation Management Plan prior to commencement.</li> <li>NOPSEMA-accepted Safety Case prior to commencement of activity.</li> <li>Esso-approved P&amp;A procedures.</li> <li>Preventative maintenance systems in place.</li> <li>Well control equipment testing.</li> <li>Emergency response preparedness including: OPEP; Operational and Scientific Monitoring Plan; Source Control Plan; availability of suitable Mobile Offshore Drilling Unit to drill a relief well; and P&amp;A Bridging Emergency Response Plan.</li> </ul>

## Environment that may be affected

The environment that may be affected (EMBA) is the largest spatial extent where the activities could potentially have an environmental consequence (direct or indirect impact). The EMBA is also known as the Potentially Exposed Area (PEA). For this activity, the broadest extent of the PEA/EMBA is determined by a highly unlikely release of hydrocarbons from a loss of well containment.

The EMBA represents the area that could be exposed to hydrocarbons, including trace concentrations of oil in the water column, as a result of a loss of well containment from this activity. Each spill simulation is subject to different wind and ocean currents at different times of the year. The 100 individual spill simulations for each scenario are then combined to identify the largest envelope in which a single spill could occur. The PEA/EMBA is not representative of a single spill; an individual spill would affect a significantly smaller area.

For this activity, Esso has defined the PEA/EMBA by combining the potential spatial extent of surface and in-water (dissolved and entrained) hydrocarbons, resulting from a loss of well containment.

## Consultation

Esso is committed to ongoing engagement with the communities where we operate. Your functions, interests and activities may mean you, your business or your organisation are a relevant person for these activities. Your participation will help Esso to better understand the impacts and risks that may arise from the activities. As such, we're seeking your feedback as we develop the EP.

Please note that your feedback and our response will be included in our EP for the proposed activities, which will be submitted to NOPSEMA for acceptance in accordance with the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009*. Please let us know if your feedback is sensitive and we will make this known to NOPSEMA upon submission of the EP in order for this information to remain confidential to NOPSEMA. Esso will communicate any material changes to the proposed activity to relevant persons as they arise.

If you would like to comment on the proposed activities outlined in this information bulletin, or would like additional information, please contact us.

# Progress update on the abandonment plans for Esso Australia’s Gudgeon-1 and Terakihi-1 exploration wells in the Gippsland Basin

## Community Consultation Session

As operator of some of Australia’s oldest oil and gas fields, Esso Australia is committed to decommissioning our Bass Strait offshore facilities safely and effectively.

We have substantial experience in safely and effectively decommissioning facilities to achieve positive outcomes across the globe, and we are excited to be part of Australia’s growing decommissioning industry.

As part of our decommissioning activities, Esso Australia is planning to undertake offshore work to plug and abandon (P&A) two exploration wells, Gudgeon-1 and Terakihi-1, which are located approximately 85 kilometres off the Gippsland coastline in water depths of approximately 300-400 metres.

The proposed plan will see P&A well activities undertaken by the Helix Q7000 Light Well Intervention Vessel, which operates in accordance with current international safety and environmental standard. No seismic activity will be required.

The wells are not located within any established or proposed Commonwealth or State Marine Protected Areas, Critical Habitats or Threatened Ecological Communities.

It is recognised that the proposed activities will overlap with existing fisheries with the establishment of a 500-metre

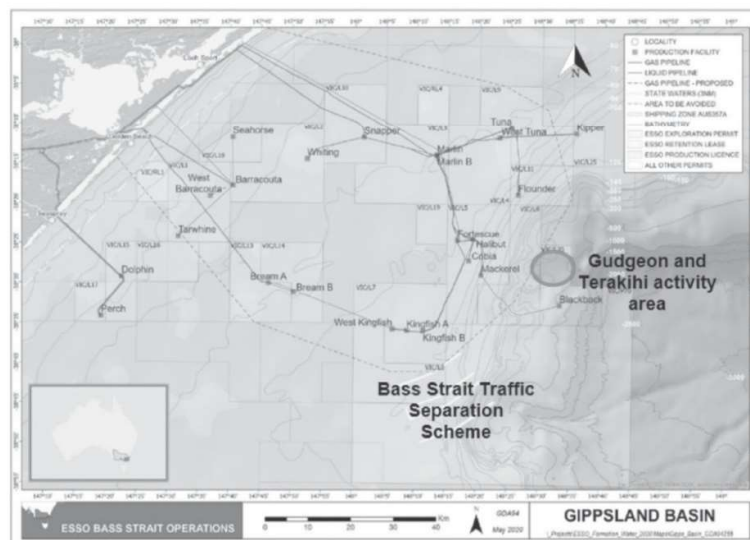

Petroleum Safety Zone (PSZ) around both Gudgeon-1 and Terakihi-1 subsea wells.

This work is imperative to our decommissioning efforts, as it will eliminate the potential risk of loss of hydrocarbon containment and will remove obstructions and snag points for fishing and future users of the sea.

Esso Australia has evaluated potential impacts and risks to the marine environment occurring from proposed activities. You can read our control measures in our Exploration Well Plug and Abandonment bulletin, which can be found here: <https://www.exxonmobil.com.au/-/media/australia/files/energy-and-environment/upstream-operations/gudgeon-1-and-terakihi-1-fact-sheet.pdf>

Prior to commencing and throughout our decommissioning activities, we have continued to identify and actively engage with key stakeholders across the Gippsland region. This ongoing consultation has played an essential role in how we align our approach and ensure the essential work that we are undertaking meets the community’s needs and expectations.

If you would like to learn more about our decommissioning process and the approach we are considering for the plug and abandonment of Gudgeon-1 and Terakihi-1, we welcome you to come along to one of our two community information sessions we are hosting in Sale, Victoria. Please see details below.

### Session 1

**Date:** Wednesday  
February 15, 2023,

**Time:** 12pm – 1pm

**Location:** The Drawing Room  
at The Criterion (90 Macalister  
Street, Sale Victoria 3850)

### Session 2

**Date:** Wednesday  
February 15, 2023

**Time:** 5:30pm – 6:30pm

**Location:** The Drawing Room  
at The Criterion (90 Macalister  
Street, Sale Victoria 3850)

An ExxonMobil Brand

Please register your interest in attending at [consultation@exxonmobil.com](mailto:consultation@exxonmobil.com) by Monday February 13, 2023. If you cannot attend the sessions but would like further information, you can also reach out to the aforementioned email address with your queries.

# Progress update on the abandonment plans for Esso Australia’s Gudgeon-1 and Terakihi-1 exploration wells in the Gippsland Basin

As operator of some of Australia’s oldest oil and gas fields, Esso Australia is committed to decommissioning our Bass Strait offshore facilities safely and effectively.

We have substantial experience in safely and effectively decommissioning facilities to achieve positive outcomes across the globe, and we are excited to be part of Australia’s growing decommissioning industry.

As part of our decommissioning activities, Esso Australia is planning to undertake offshore work to plug and abandon (P&A) two exploration wells, Gudgeon-1 and Terakihi-1, which are located approximately 85 kilometres off the Gippsland coastline in water depths of approximately 300-400 metres.

The proposed plan will see P&A well activities undertaken by the Helix Q7000 Light Well Intervention Vessel, which operates in accordance with current international safety and environmental standards. No seismic activity will be required.

The wells are not located within any established or proposed Commonwealth or State Marine Protected Areas, Critical Habitats or Threatened Ecological Communities.

It is recognised that the proposed activities will overlap with existing fisheries with the establishment of a 500-metre

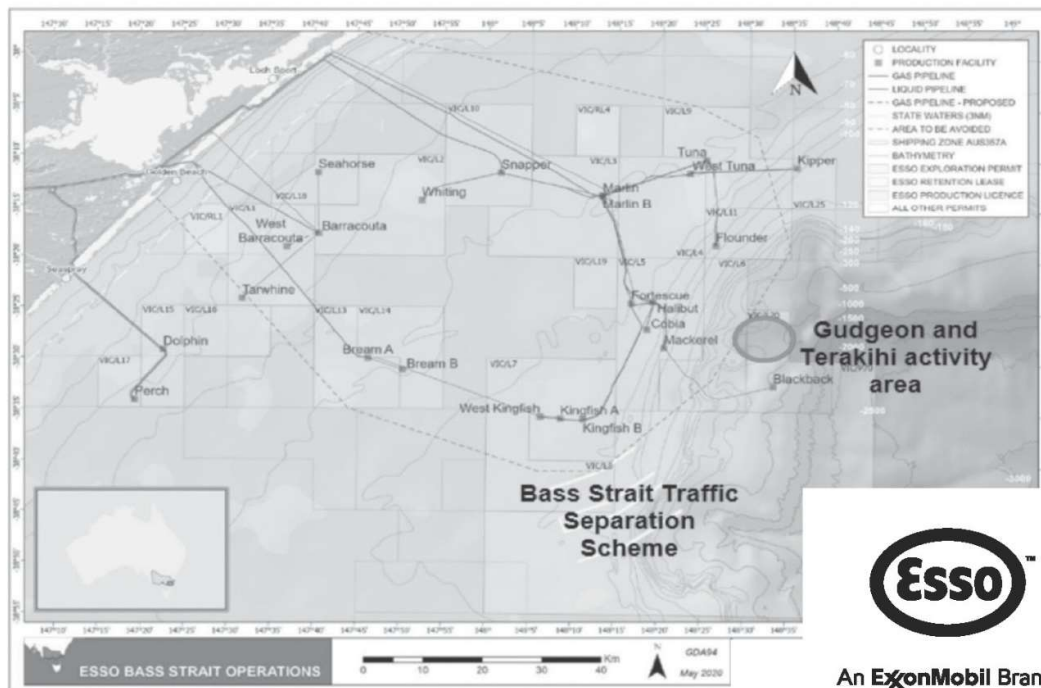

Petroleum Safety Zone (PSZ) around both Gudgeon-1 and Terakihi-1 subsea wells.

This work is imperative to our decommissioning efforts, as it will eliminate the potential risk of loss of hydrocarbon containment and will remove obstructions and snag points for fishing and future users of the sea.

Esso Australia has evaluated potential impacts and risks to the marine environment occurring from proposed activities. You can read our control measures in our Exploration Well Plug and Abandonment bulletin, which can be found here: <https://exxonmobil.co/3R1H5Ec>

Prior to commencing and throughout our decommissioning activities, we have continued to identify and actively engage with key stakeholders across the Gippsland region. This ongoing consultation has played an essential role in how we align our approach and ensure the essential work that we are undertaking meets the community’s needs and expectations.

If you have any queries or would like to learn more about our decommissioning process and the approach we are considering for the plug and abandonment of Gudgeon-1 and Terakihi-1, please reach out to [consultation@exxonmobil.com](mailto:consultation@exxonmobil.com).

Esso's Bass Strait activities

# Progress update

An ExxonMobil Brand

Esso actively engages with relevant people across the Gippsland region and consults them as we work through our offshore activities.

This ongoing communication has played an essential role in how we align our approach and ensure the work that we are undertaking meets the community's needs and expectations.

Scan the QR code for more information on our offshore activities on our Consultation Hub.

<https://www.exxonmobil.com.au/community-engagement/local-outreach/consultation-hub>

## Community Sessions

If you would like to learn more about our offshore activities including Decommissioning, Carbon Capture and Storage and Jack Up Rig Drilling Kipper Environment Plan we invite you to one of our community information sessions.

When: Tuesday 29 August 2023  
Where: Bellevue on the Lakes Hotel, Lakes Entrance  
Time: Any time between 5.30 pm - 6.30 pm

When: Wednesday 30 August 2023  
Where: Drawing Room at the Criterion Hotel, Sale  
Time: Any time between 5.30 pm - 6.30 pm

Please register your interest in attending by emailing [consultation@exxonmobil.com](mailto:consultation@exxonmobil.com) by Friday 25 August 2023.

## Pipelines Decommissioning Stakeholder Forum

Would you like to be more involved in the discussion about options and criteria being considered for decommissioning the pipeline network?

Please contact us by phone or email to register your interest in attending one of the following half-day stakeholder forums:

When: Tuesday 26 September 2023  
Where: Sale

When: Tuesday 3 October 2023  
Where: Melbourne

When: Wednesday 4 October 2023  
Where: Online

## Appendix E – Key Additional Consultation Materials

NOPSEMA

# AT A GLANCE OIL SPILL MODELLING

August 2018

**While offshore oil spills are extremely rare events, it is important that oil and gas companies are ready to respond given the potentially significant consequences.**

Oil spill modelling is a tool used to support oil spill preparedness and response planning. It can also be used to support response operations in the event of an actual oil spill. There are a number of different approaches to modelling, which are generally used in combination to inform risk assessment, and response and preparedness planning. Two types of oil spill modelling often used are stochastic and deterministic modelling.

## Stochastic modelling

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated, hypothetical oil spills.

The simulated oil spills for a stochastic model will all start from the same location (e.g. a drilling location or production platform) but each oil spill scenario will be subject to a different set of wind and weather conditions drawn from historical records.

Sophisticated modelling software will count how often oil may be observed in each area of the environment in all of the discrete spill events. This is often presented as a probability of

exposure and can be useful for informing preparedness and response arrangements as it shows which areas are more or less likely to be impacted in the remote chance a spill occurs.

Considering many spill events and the different spill trajectories is an integral part of modern spill risk assessment and is often used to identify the range of environments that may be affected in various conditions and identify the priorities for protection.

Image courtesy of RPS, Ocean Science, RI, USA.

Stochastic modeling is generally used for risk assessment and preparedness planning. By overlaying hundreds of oil spills into a single map, stochastic modeling shows all the areas that could be affected rather than just assuming one spill scenario. It is misleading to imply that stochastic modelling represents what a single spill would look like or the area it would affect.

## Deterministic modelling

Deterministic modelling creates a computer simulation of a single hypothetical oil spill subject to a single set of wind and weather conditions. Deterministic modelling is used to forecast the fate and behaviour of oil from a single model run.

Deterministic modelling is commonly used to consider the fate and effects of representative 'worst-case' oil spill scenarios. Often, one or more model runs are generated and each run will be carefully selected in consideration of the nature and scale of

the offshore petroleum activity and the local environment. The information produced by deterministic modelling is very useful for informing upper limits for oil spill preparedness and response arrangements, which assumes that no other action is taken, which can then be adapted and scaled to match the particulars of different oil spills.

Deterministic modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill. The map produced by deterministic modelling provides a more realistic representation of what a single oil spill would look like and the area it may affect.

**While it is impossible to prepare for an infinite number of possible oil spills it is also insufficient to only prepare to respond to a single representative worst-case oil spill, therefore, appropriate preparedness and response planning tends to be informed by both deterministic and stochastic modelling.**

## For more information

For further information refer to the Oil pollution risks page at [nopsema.gov.au](http://nopsema.gov.au) or email [communications@nopsema.gov.au](mailto:communications@nopsema.gov.au).

**NOPSEMA**

Australia's offshore  
energy regulator

# Consultation on offshore petroleum environment plans

---

**Information for the community**

The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) is Australia's independent expert regulator for health and safety, structural and well integrity, and environmental management for offshore petroleum and greenhouse gas storage activities in Commonwealth waters.

The protection and preservation of the marine environment is best achieved when there are opportunities for the community to participate in the environmental approvals process through consultation.

---

## Who can participate?

Under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (the regulations) there are several ways the community can participate in the environmental approvals process for offshore petroleum activities in Commonwealth waters.

### Public comment for new projects and exploration activities

Offshore project proposals (OPPs) for new offshore petroleum projects and environment plans for offshore petroleum exploration activities are subject to a mandatory public comment period. Public comment must be done before the OPP or environment plan is submitted to NOPSEMA for assessment. Further information about public comment can be found at [nopsema.gov.au](http://nopsema.gov.au).

### Relevant persons consultation

Titleholders must consult with a specific category of people or organisations referred to as 'relevant persons' while preparing an environment plan for any offshore petroleum activity. This consultation must be done before the environment plan is submitted to NOPSEMA.

Some categories of relevant persons are specified in the regulations, such as government departments, however the information in this brochure is for the category of relevant persons who are not specified but who have 'functions, interests or activities' that may be affected by the offshore activity.

### Correspondence directly to the regulator (NOPSEMA)

You can send correspondence directly to NOPSEMA; however, this generally cannot be considered until after the environment plan has been submitted. It is always better to use the public comment and relevant persons consultation processes in the first instance.

## What is 'relevant persons' consultation?

Consultation on offshore petroleum activities is a two-way process where information is shared between titleholders and relevant persons. It is a requirement for titleholders when preparing an environment plan and is an important part of good environmental management.

Consultation provides an opportunity for people or organisations who may be affected by an offshore petroleum activity to raise concerns, including objections or claims, about the potential impacts of the activity, to seek information about how they may be affected, and how the titleholder intends to manage the activity to ensure the associated impacts are as low as reasonably practicable and are acceptable.

Information provided by relevant persons in consultation may also help titleholders better understand the values and sensitivities of the environment and inform the evaluation of the potential impacts and risks associated with the activity and how to manage them appropriately.

## Am I a relevant person?

You may be a relevant person if you or your organisation have functions, interests, or activities that may be affected by an offshore petroleum activity proposed under an environment plan being prepared or already underway under an environment plan being revised.

The terms 'functions' 'interests' and 'activities' should be read broadly. You do not have to have a legal or financial interest that may be affected by an offshore petroleum activity to be a relevant person.

Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species. However, to be a relevant person your interests should be more than a general interest in the environment and/or offshore petroleum activities.

## If I am a representative body, can I consult on behalf of all my members?

The law recognises that interests may be held communally. In some cases, all members of a community may agree that their representative body can consult on their behalf. However, this may not always be the case. Representative bodies should inform titleholders whether or not they have the authority to consult with titleholders on behalf of all their members.

Representative bodies, such as peak bodies and prescribed body corporates, may be relevant persons in their own right. They may also be an initial point of contact for titleholders to seek information about who else they should approach for consultation.

It is the titleholder's responsibility to provide all members of a community who have a shared interest opportunities to participate in consultation. In some circumstances, representative bodies may offer to assist titleholders with this.

## Do I have to participate?

If you are a relevant person, you have the right to be consulted by titleholders of offshore petroleum activities when they are preparing an environment plan to submit to NOPSEMA.

Titleholders have a duty to provide you an opportunity to be consulted, however there is no obligation on you to participate in consultation. If you do not wish to be consulted, you should advise titleholders of this when they first contact you.

Titleholders must make reasonable efforts to consult with relevant persons, but the regulations do not require them to get a response to their requests. If you want to participate in consultation but need more information or time then it is best to communicate this to titleholders when they contact you. If you do not respond, they might assume you do not wish to be consulted.

If you are an organisation or representative body that is regularly approached for consultation you may consider developing guidance outlining how and when you want to be consulted. You could also consider documenting your functions, interests and activities. Both measures may help with managing regular requests for consultation.

In some instances, the likelihood of you being affected by an activity is very low and/or the impact on your functions, interests or activities may be minor. For example, if you are only going to be affected by the activity in the very unlikely event of an oil spill you may wish to inform titleholders you only want to be consulted if a spill occurs as part of the requirement for ongoing consultation set out in the regulations.

## What if I want to be consulted but the titleholder hasn't contacted me?

Titleholders have a duty to identify who may be a relevant person and provide them opportunities to participate in consultation. However, even with best endeavors, titleholders may miss people or organisations who may be relevant.

If you believe you are a relevant person and you want to be consulted on offshore petroleum activities, then you should contact titleholders directly and identify yourself as a relevant person.

If a titleholder refuses to consult with you, and you believe you are a relevant person, you can write to NOPSEMA. Once an environment plan is submitted to NOPSEMA, this information can be considered in the assessment of whether or not the titleholder has met the requirements for consultation.

It is always better to attempt to resolve issues with the titleholder in the first instance. Relevant persons consultation is carried out before an environment plan is submitted, so NOPSEMA is limited in its ability to require titleholders to consult with a particular person or organisation.

## What is the process for consultation?

There is no detailed process set out for how consultation should be carried out, however there are requirements that must be met under the regulations. These include:

- That you are given sufficient information to make an informed assessment about whether you are likely to be affected by the activity, how you may be affected, and to raise any concerns, including objections or claims, about the potential impacts of the activity.
- That you are given a reasonable period of time to consider the information provided to you and give feedback to the titleholder on the potential impacts of the activity on your functions, interests or activities.

What constitutes sufficient information and a reasonable period of time depends on several factors including the nature of your functions, interests and activities. You should communicate as early as possible in consultation with titleholders about what information and how much time you may need so that they can consider, respond and address these in their planning.

The information provided to you should be in a form that is appropriate and readily accessible to you. Consultation is generally a two-way process where information is shared between titleholders and relevant persons rather than a one-way process of seeking feedback to a fact sheet or high-level information.

## What if I don't have the resources to participate?

If you are a relevant person and you believe you have information that is important to the understanding of the potential impacts of an offshore petroleum activity or you want to raise concerns, including objections or claims, then you should discuss with the titleholder how you can participate in consultation.

This might include requesting information in a different format, asking for more time to consider information or help to understand the information to provide an informed response.

There is no requirement in the law for titleholders to pay the costs incurred by relevant persons to be consulted, however they may choose to provide assistance to relevant persons to ensure consultation is carried out efficiently and is robust. This is a matter between the titleholder and relevant persons.

## How do I make sure my views are considered?

It is important to communicate clearly when participating in consultation with titleholders. You may provide information to titleholders that helps them understand the environment and raise specific concerns, objections or claims about the potential impacts of the activity or the way the titleholder proposes to manage the activity to ensure the associated impacts are as low as reasonably practicable and are acceptable.

The information you provide to a titleholder during consultation must be considered by that titleholder and addressed in their environment plan for NOPSEMA to consider in its assessment and decision-making.

NOPSEMA publishes environment plans on its website when they are submitted for public comment, for assessment and when they are approved. Relevant persons have the right to request that the information they have provided in consultation is not published and titleholders must ensure they communicate this right to relevant persons.

Relevant persons should be aware that while you are free to respond on any matter and raise any concern, this may not be able to be considered if it is outside the scope or purpose of the environment plan and approval process. Examples of issues that may not be considered under the regulations include statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities.

## Do titleholders need my consent?

Titleholders are not required by law to obtain agreement or consent from relevant persons for their offshore petroleum activities to proceed; however, they are required to demonstrate in their environment plan how the concerns, objections or claims raised by relevant persons were considered and demonstrate that their response to that information was appropriate.

NOPSEMA's assessment and decision-making will consider if titleholders have adequately demonstrated in the environment plan that genuine consultation has taken place with relevant persons in accordance with regulations.

## Do I need to respond to a request for consultation?

There is no obligation for relevant persons to respond to a request for consultation from a titleholder. However, if you are provided an opportunity to participate in consultation and you do not want to be consulted, or you only want to be consulted on specific offshore petroleum activities or environmental matters, then it is best that you communicate this to titleholders as soon as they contact you. If you do not respond to requests for consultation, titleholders may make many repeated attempts to contact you.

**NOPSEMA can help you understand the requirements for consultation and how to effectively participate in the process. Please contact [communications@nopsema.gov.au](mailto:communications@nopsema.gov.au) for assistance.**
