## 1 Preface

### 1.1 Purpose of this document

This preface document provides an overview of the Gudgeon and Terakihi (G&T) Environment Plan (EP) and incorporates the summary table required by regulation 11(4). It is designed to assist the reader to navigate the four volumes which make up the G&T EP.

### 1.2 Overview of the Environment Plan Structure

#### 1.2.1 Structure of the Environment Plan

All offshore activities as defined by the Offshore Petroleum and Greenhouse Gas Storage Act, 2006 (OPGGGS Act) and the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations, 2009 (OPGGGS(E)R), require an accepted Environment Plan to enable them to proceed. All of these activities take place in the Bass Strait and are operated by Esso using the same management systems and processes. Therefore there is direct replication of processes, information and systems across facilities and within facility specific Environment Plans. In an effort to minimise replication and streamline the administrative process, Esso has standardised the sections of the Environment Plans that are identical between activities. The Environment Plan is now presented in four separate volumes which should be read as one volume however can be maintained individually as necessary.

#### 1.2.2 Standardised information across all activities

The standardised sections of the Environment Plans that are identical between activities are described below:

##### **Volume 1 - Description of the Environment**

Volume 1 describes the environment within a geographic area which encompasses the combined breadth of all credibly conceivable worst case discharge scenarios (WCDS) that could arise from any activity undertaken by Esso.

Each project will have a different WCDS. Project specific stochastic oil spill modelling will be used to determine the geographic area potentially impacted by that particular project.

Volume 1 uses the combined geographic area from all the conceivable individual activities and is then used to determine the total potentially affected area (PEA).

Note that by definition, no single credible spill scenario could potentially impact the whole of the PEA. Information contained in Volume 1 includes:

- Description of the Environment (Reg 13(2) and Reg 13(3))
- Legislative and other requirements (Reg 13(4))
- Describes the total combined geographic area which may be affected by all and any of the activities undertaken by Esso
- Esso's Corporate environmental policy (Reg 16(a))

##### **Volume 3 - Emergency Preparedness and Response**

Esso prepares for and manages emergency situations, including oil spills, under its safety management system, OIMS System 10-2 (refer Implementation Strategy). The purpose of OIMS System 10-2 is to ensure that Esso establishes effective response to emergencies and business disruptions that threaten the safety, security and health of the public, contractors and employees, the environment, asset integrity, and critical business operations. The system and its processes address all sites for which Esso has responsibility and are designed to respond to all emergency situations, regardless of the specific activity and is therefore applied consistently across all activities.

Information contained in Volume 3 includes:

- Description of the activities that may be undertaken in response to an oil spill, should one occur (Reg 13(1));
- Impact and Risk Assessment of the oil spill response activities (Reg 13(5) & Reg 13(6));
- A description of Esso's capability to respond to an oil spill, including arrangements with other organisations that can provide additional resources (Reg 14(8AA));
- An assessment of the adequacy of Esso's capability to respond in a timely manner to any oil spill arising from any and all of Esso's offshore petroleum activities (Reg 14(8AA)).

The Oil Pollution Emergency Plan (OPEP) is included in Appendix A of Volume 3 and includes:

- Description of the specific arrangements in place for responding to and monitoring oil pollution arising from any of Esso's offshore petroleum activities (Reg 14(8AA)).
- The Oil Spill Monitoring Plan (OSMP) is included in Appendix B of Volume 3 and includes:
- Description of the specific arrangements for monitoring oil pollution which also informs response activities (Reg 14(8AA) & Reg 14(8D)).

### 1.2.3 Activity specific information

The information which will vary between activities is the specific scope of work that will be undertaken, defined by the OPGGS(E)R as the description of the Activity (R13(1)), and its associated impacts and potential risks (R13(5), R13(6) and R13(7)). For each work scope, all activity specific information relating to these regulations is provided in Volume 2, Description of the Activity, Impacts and Risks.

#### Volume 2 - Description of the Activity, Impacts and Risks

Information contained in Volume 2 includes:

- Details of Titleholder (Reg 15)
- Description of Activity (Reg 13(1))
- Description of the activity specific environment that may be affected (R13(2)a)
- Impact and Risk Assessment (Reg 13(5), Reg 6(a) & Reg 6(b))

#### Volume 4 - Implementation Strategy

Esso operates in accordance with the proprietary ExxonMobil Operations Integrity Management System (OIMS). OIMS consists of 11 Elements, each of which has globally defined corporate expectations. These are implemented through formally documented Management Systems. OIMS provides for all the standard recognised requirements of safety management systems, beginning with Management Leadership, Commitment and Accountability (Element 1) and incorporating a continuous cycle of assessment and improvement (Element 11). Regardless of the specific activity, Esso will consistently use OIMS to implement all activities. However the activity specific organisation structure and roles and responsibilities of personnel in relation to the implementation, management and review of the environment plan defined by the OPGGS(E)R as the Implementation Strategy for the environment plan (R14), will vary for each project. This information is provided in Volume 4, Implementation Strategy.

Information contained in Volume 4 includes:

- Environmental Performance (Reg 13(7))
- Monitoring of performance outcomes and standards (Reg 14(3))
- Implementation Plan (Reg 14(1), Reg 10A(e) and Reg 14(8A, 8B & 8C))
- Environmental Management System (Reg 14(3))
- Roles and Responsibilities & Training (Reg 14(5))
- Incident reporting and recording requirements (Reg 26, 26A, 26AA & 26B) and Reporting (Reg 14(2) & 26C)
- Consultation (Reg 11 & Reg 16b)

### 1.3 EP Summary Requirement

This Bass Strait EP summary has been prepared from material provided in the EP. The summary consists of the following as required by regulation 11(4):

<b>EP Summary material requirement</b>	<b>Relevant section of EP containing EP Summary material</b>
<b>The location of the activity</b>	Volume 2 Section 2
<b>A description of the receiving environment</b>	Volume 1 Volume 2 Section 5
<b>A description of the activity</b>	Volume 2 Section 2 Volume 2 Section 4
<b>Details of the environmental impacts and risks</b>	Volume 2 Section 5 Volume 2 Section 6
<b>The control measures for the activity</b>	Volume 2 Section 5 Volume 2 Section 6 Volume 4 Section 1
<b>The arrangements for ongoing monitoring of the titleholder's environmental performance</b>	Volume 4
<b>Response arrangements in the oil pollution emergency plan</b>	Volume 3, including appendices
<b>Consultation already undertaken and plans for ongoing consultation</b>	Volume 4 Section 3 Volume 4 Appendix A
<b>Details of the titleholders nominated liaison person for the activity</b>	Volume 2 Section 1

# 1 Introduction

## 1.1 Overview

This Description of the Environment has been prepared in accordance with the requirements of the Commonwealth Offshore Petroleum and Greenhouse Gas Storage Act 2006 and the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations, 2009 (OPGGS(E)R) per the amended Act and Regulations as at 01 January 2015. The Environment Plan development has been guided by N04750-GN1344 Environment Plan Content Requirements (NOPSEMA 2016).

## 1.2 Regulatory Context

The OPGGS(E)R have prescribed requirements for the description of the environment. Table 1-1 lists the requirements of the regulations and identifies the sections in this description of the environment where the requirements are addressed.

**Table 1-1 OPGGS(E)R requirements for the description of the activity with references to where these items are addressed**

Regulation	Requirement	Relevant section where this is addressed
13(2)	The Environment plan must:	
13(2)(a)	Describe the existing environment that may be affected by the activity	1.4 Definition of Described Area 2 Description of the Environment
13(2)(b)	Include details of the particular relevant values and sensitivities (if any) of that environment'	2.2 Values and Sensitivities
13(3)	Particular relevant values and sensitivities may include	
13(3)(a)	the world heritage values of a declared World Heritage property within the meaning of the EPBC Act	2.2.1 World Heritage
13(2)(b)	the national heritage values of a National Heritage place within the meaning of that Act	2.2.2 National Heritage
13(2)(c)	the ecological character of a declared Ramsar wetland within the meaning of that Act	2.2.3 Wetlands of International Importance
13(2)(d)	the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act	2.3.1 Fauna 2.2.4 Threatened Ecological Communities
13(2)(e)	the presence of a listed migratory species within the meaning of that Act	2.3.1 Fauna
13(2)(f)	any values and sensitivities that exist in, or in relation to, part or all of:	
13(2)(f)(i)	a Commonwealth marine area within the meaning of that Act; or	2.2.5 Commonwealth Marine Areas 2.2.6 Australian Marine Parks
13(2)(f)(ii)	(ii) Commonwealth land within the meaning of that Act	2.2.8 National Parks and Reserves

The OPGGS(E)R define 'environment' as 'the ecosystems and their constituent parts, natural and physical resources, qualities and characteristics of areas, the heritage value of places and includes the

social, economic and cultural features of those matters'. In accordance with Regulation 13(2) of the OPGGS(E)R, this document describes the physical setting, ecological receptors, and social receptors, of the receiving environment.

A greater level of detail is provided for those particular receptors as defined by Regulation 13(3) of the OPGGS(E)R which states that particular relevant values and sensitivities may include any of the following:

- (a) the world heritage values of a declared World Heritage property within the meaning of the EPBC Act;
- (b) the national heritage values of a National Heritage place within the meaning of that Act;
- (c) the ecological character of a declared Ramsar wetland within the meaning of that Act;
- (d) the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act;
- (e) the presence of a listed migratory species within the meaning of that Act;
- (f) any values and sensitivities that exist in, or in relation to, part or all of:
  - (1) a Commonwealth marine area within the meaning of that Act; or
  - (2) Commonwealth land within the meaning of that Act.

### 1.3 Environmental Policy

It is Esso's policy to conduct its business in a manner that is compatible with the balanced environmental and economic needs of the communities in which it operates. Esso is committed to continuous efforts to improve environmental performance throughout its operations.

Accordingly, Esso's policy is to:

- Comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist;
- Encourage concern and respect for the environment, emphasize every employee's responsibility in environmental performance, and ensure appropriate operating practices and training;
- Work with government and industry groups to foster timely development of effective environmental laws and regulations based on sound science and considering risks, costs and benefits, including effects on energy and product supply;
- Manage its business with the goal of preventing incidents and of controlling emissions and wastes to below harmful levels and design, operate, and maintain facilities to this end;
- Respond quickly and effectively to incidents resulting from its operations, cooperating with industry organizations and authorized government agencies;
- Conduct and support research to improve understanding of the impact of its business on the environment, to improve methods of environmental protection, and to enhance its capability to make operations and products compatible with the environment;
- Communicate with the public on environmental matters and share its experience with others to facilitate improvements in industry performance; and
- Undertake appropriate reviews and evaluations of its operations to measure progress and to ensure compliance with this environmental policy.

A copy of Esso's Environmental Policy is provided in Appendix A.

### 1.4 Definition of Described Area

In accordance with Regulation 13(2)a of the OPGGS(E)R and NOPSEMA A652993 (NOPSEMA, 2019), the Potentially Exposed Area (PEA) is defined as the outer edge of all simulations in stochastic modelling, using the worst case discharge scenario (WCDS) and the lowest relevant threshold for the

furthest reaching fate of hydrocarbons. While modelling carries some inherent uncertainty, the Potentially Exposed Area (PEA) as defined:

- Represents the area that could be affected by any oil spill; and
- Is conservative, as the lowest threshold relevant to any receptor is used.

Each specific activity will define its own PEA in Volume 2 of the Environment Plan. The Described Area (DA) is the *combined* breadth of *all* credibly conceivable PEAs for specific operational activities and project activities to be undertaken by Esso. By definition:

- the limits of each specific PEA is expected to fall within the DA and therefore, all information required to describe the environment will be contained in this Volume 1; and
- no single activity is expected to potentially impact the entire DA.

In the event that the PEA for a future activity is found to reach beyond the edge of the DA, the DA will be expanded and the Description of Environment (this Volume 1) will be revised.

Using the criteria described above, the DA is shown in Figure 1-1. The DA encompasses the Southeast Marine Bioregion, the Temperate East Marine Bioregion and the Coral Sea Marine Bioregion. The IMCRA provincial bioregions encompassed by the DA are also shown in Figure 1-1.

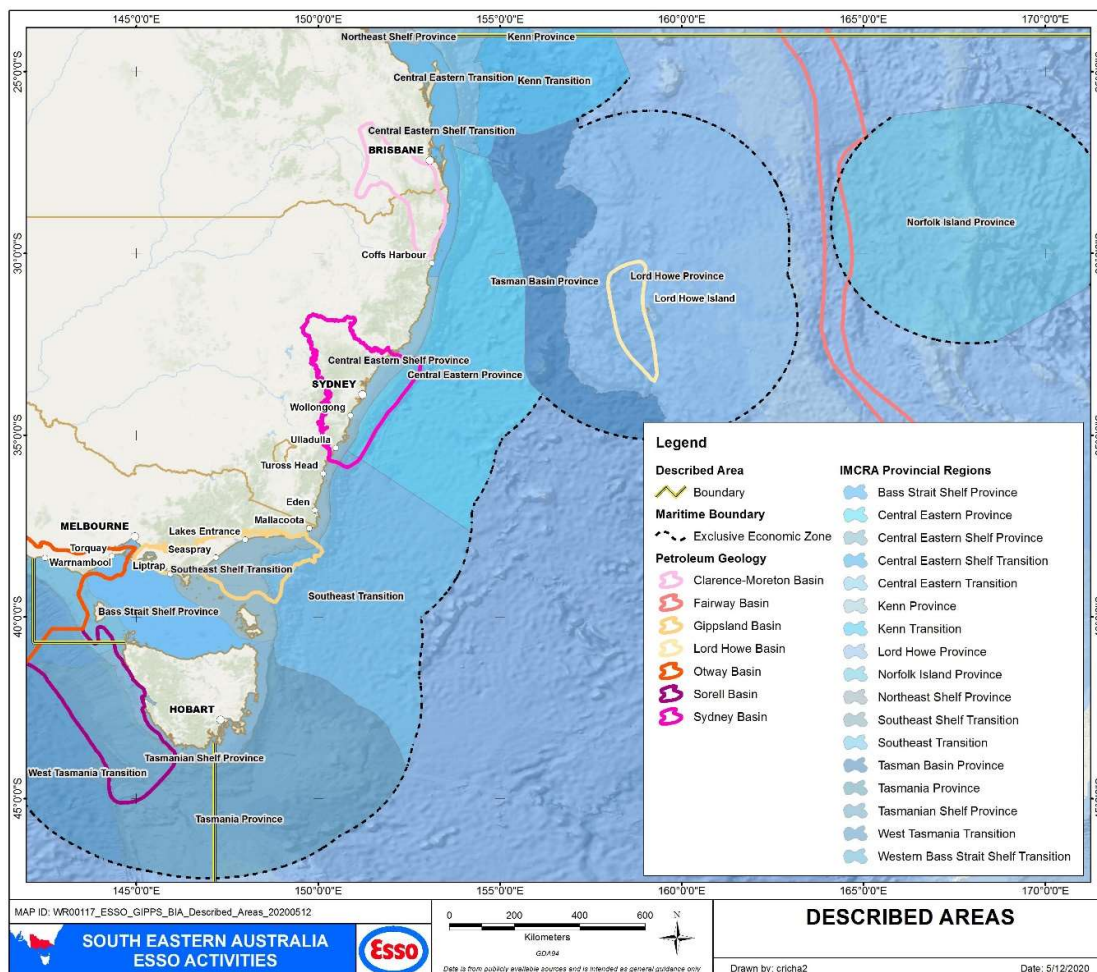

Figure 1-1 Described Area (DA)

### 1.5 Esso Bass Strait Permit Area

Esso's operations and project activities are undertaken within its permit areas in the Gippsland Basin in Bass Strait. Figure 1-2 shows the Esso Gippsland Basin Permit Areas (EGBPA) and Table 1-2 lists the location of the existing facilities and pipelines.

VIC/L20	Blackback subsea facility	BKA	~87	~402	38° 32' 21" S	148° 33' 20" E
VIC/L25	Kipper subsea facility	KPA <sup>5</sup>	-	95	38° 10' 52" S	148° 35' 37" E

<sup>1</sup> TWA subsea facility is located approximately 17 km to the south west of the BTA platform

<sup>2</sup> The KFA platform is located approximately 3.5 km from the WKF platform and 4 km from the KFB platform.

<sup>3</sup> The BMB platform is located approximately 7 km east of BMA

<sup>4</sup> The SHA subsea facility is located approximately 11 km to the north of the BTA platform

<sup>5</sup> KPA subsea facility is located approximately 18 km to the east of the WTN platform

<sup>6</sup> The PCA and DPA platforms are 9 km apart, and approximately 40 km and 33 km west of BMA respectively

<sup>7</sup> The BTW subsea facility is located approximately 6 km to the west of BTA platform

## 2 Description of the Environment

### 2.1 Physical Environment

Esso's operations are located in Bass Strait, the region of the continental shelf that separates mainland Australia from Tasmania. The physical environment of the Described Area (DA) is described in this section.

#### 2.1.1 Climate and Meteorology

Average summer air temperatures in coastal Victoria (Yarram Airport) range from early morning lows of 11 to 13°C, to afternoon highs of 23 to 26°C (BOM, 2017). Average winter temperatures range from minimums of 5°C to maximums of 15°C in the afternoons. Offshore (on Deal Island in central Bass Strait), milder conditions occur with an average summer range of 13 to 21°C and an average winter range of 9 to 14°C (BOM, 2017).

Average monthly rainfall along the Gippsland coast (Yarram Airport) ranges from 36 mm in January (highest 112 mm) to 60 mm in June (highest 174 mm). Offshore (on Deal Island in central Bass Strait) monthly rainfall ranges from 41 mm in January (highest 162 mm) to 78 mm in June (highest 247 mm)

and shows a similar pattern to the coastal region (Lakes Entrance) with slightly higher winter rainfall: 38 mm in January (highest 90 mm) to 101 mm in June (highest 298 mm) (BOM, 2017).

Wind speeds are in the range of 10 to 30 km per hour, with maximum gusts reaching 100 km per hour. The wind direction is predominately westerly during winter, westerly and easterly during spring and autumn (when wind speeds are highest) and easterly during summer. Strong south-easterly winds can be generated by low pressure systems known as 'east coast lows'. Although these occur relatively infrequently (once or twice per year), the longer fetch of these winds increases their potential for generating extreme wave conditions (BOM, 2017).

There are three main and one minor types of storm which can generate severe wave conditions in the study area of Bass Strait. These are (Esso, 1989 and Cardno, 2017):

**South-east storms:** are generally associated with what has become known as an "east-coast low". East-coast lows are generally associated with very strong east to south-east winds (speeds in excess of 80 knots have been measured off the New South Wales coastline) and high rainfall. South-east storms resulting from east-coast lows occur relatively infrequently (on average 1 to 2 per year), and not all travel far enough south to cause concern in Bass Strait. The waves they generate are however, unrestricted by fetch or water depth. As such they have the greatest potential for generating extreme wave conditions in eastern Bass Strait.

**South-west storms:** occur relatively frequently (typically several severe storms per year). Due to fetch and depth limitation, it is unlikely that extreme design-wave conditions will occur during a south-west storm.

**South storms:** are generally associated with low-pressure systems in the western part of the Tasman Sea. During the peak of the storm the Tasman Sea lows generate very strong south south-east through to south south-west winds in Bass Strait. During storm development however, the wind can have a significant south-east or south-west component, depending on the origin of the low. Southerly storms occur at about the same frequency as south-east storms. Southerly storms are considered to have a greater potential than the south-west storms for generating extreme wave conditions.

**Small-scale Bass Strait Lows:** can generate south east, south or south west waves, depending on their origin and location. These storms can be quite severe (e.g., the January 1986 storm), but due to fetch limitations are unlikely to be the cause of extreme design-wave conditions.

## 2.1.2 Oceanography

### 2.1.2.1 Currents and Tides

Currents in the Gippsland Basin are tide and wind driven. Tidal movements predominantly have a northeast–southwest orientation. Tidal flows come from the east and west during a rising (flood) tide, and flow out to the east and west during a falling (ebb) tide. Tidal streams are dominated by the lunar tidal constituent, which has a period of 12.4 hours. The main tidal components vary in phase by about three to four hours from east to west. Most of this phase change occurs between Lakes Entrance and Wilsons Promontory. Timing of the high tide, for example, can vary by up to three hours across this region. Tides in the area from Lakes Entrance to Gabo Island are, however, relatively weak in comparison to other areas of Bass Strait (GEMS, 2005).

Bass Strait is characterised by shallow water and tidal currents. While there is a slow easterly flow of waters in Bass Strait, there is also a large anticlockwise circulation. The shallowness of the water means that these waters more rapidly warm in summer and cool in winter than other waters of the Region.

Wind driven currents in Gippsland Basin can be caused by the direct influence of weather systems passing over Bass Strait (wind and pressure driven currents) and the indirect effects of weather systems passing over the Great Australian Bight (GEMS, 2005). Appendix D provides the current roses from six platforms in Bass Strait (SNA, TNA, FTA, HLA, CBA and MKA) (RPS, 2016). They show the monthly average ocean current rose plot derived from five-year current dataset at each location.

The colour keys shows the current speeds (m/s), the compass direction provides the current direction flowing *towards* and the length of the wedge gives the percentage of the record for a particular speed and direction combination.

The eastern parts of the Region are strongly influenced by the East Australian Current (EAC) that flows southward adjacent to the east coast of New South Wales, Victoria and Tasmania, carrying warm equatorial waters (Refer Figure 2-1 and Figure 2-2). The EAC is up to 500 m deep and 100 km wide, and is strongest in summer when it can flow at up to 5 knots. In winter it flows at 2–3 knots as the oceanographic and climatic drivers in the Coral Sea diminish. The EAC tends to form ocean eddies that rotate around warm, central cores that can be up to 200 km across, and may persist for months. Eddies form more frequently off the south coast of New South Wales than other areas, but are also common along the east coast of Tasmania. The eddies can cross the continental shelf, and when mixing with shelf break waters, create upwellings that form isolated areas of enhanced productivity 200–300 km in diameter. Seasonal and transient upwellings are important ecological features of the Region. The closest to the Bass Strait operations is the Upwelling East of Eden, a key ecological feature for the high productivity and aggregations of marine life (refer Section 4.6.2 for further details). The EAC also affects sea surface temperatures on the eastern Tasmanian shelf, which can vary substantially among years depending on the relative influence of subtropical waters.

At the shelf break east of Bass Strait, nutrient-rich waters rise to the surface in winter as part of the processes of the Bass Strait Water Cascade, where the eastward flushing of the shallow waters that are more saline and slightly warmer than surrounding Tasman Sea waters form an undercurrent that cascades down the continental slope (refer Section 4.6.4 for further details). The cascading water has a displacing effect causing nutrient rich waters to rise which in turn leads to increased primary productivity in those areas. The cascading water also concentrates nutrients and some fish and whales are known to aggregate along its leading edge.

Further offshore, in the south east part of the operational area, currents are driven by two parameters, the Sub-Antarctic Water movement, coming from the south, and the Bass Strait Water movement from the west (Tomczak, 1985; Rochford, 1975; in Gibbs et al, 1991). The presence of deepwater currents is documented in the Blackback Oceanographic Study (Lawson & Treloar 1996), Kingfish B Wave, Current and Wind data (Lawson & Treloar 1987 1990) and Metocean Design Criteria for Bass Strait Fixed Platforms (Esso 1990).

Esso undertook a comprehensive current measurement program in the Blackback study area using seven current meters moored three metres above the seabed over a 12 month period (Lawson & Treloar 1996) to provide an understanding of the regional oceanography of the Bass Strait shelf and continental slope, particularly the relative importance of tidal, wind-driven and density-generated currents and the influence of regional topography on currents in the study area.

Tidal current analysis indicated general seabed current alignment normal to the bathymetry, at speeds of around 0.2 to 0.3 m/s. The dominance of the bathymetry was most evident at the current meter sites located within a clearly defined valley.

Analysis of residual, non-tidal current vectors during significant storm periods has confirmed that wind driven currents are the strongest currents in the continental shelf areas but are of progressively lesser significance lower down the continental slope. The study has also provided evidence of flow of water from the continental shelf down the continental slope, conforming to the Bass Strait Cascade, as evidenced by high easterly currents and minimum vertical variation in temperature from the shelf to depths of 500 m (Refer to Section 2.2.7.4 for detail on the Bass Cascade). Currents during these cascade flows were stronger than background tidal currents and were the strongest currents recorded lower down the continental slope.

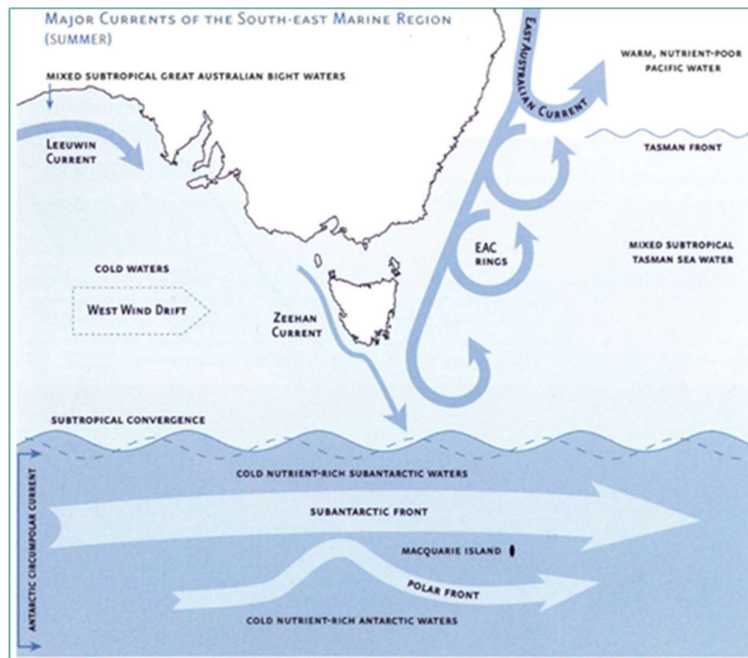

Figure 2-1 Major ocean currents in south-eastern Australian waters summer

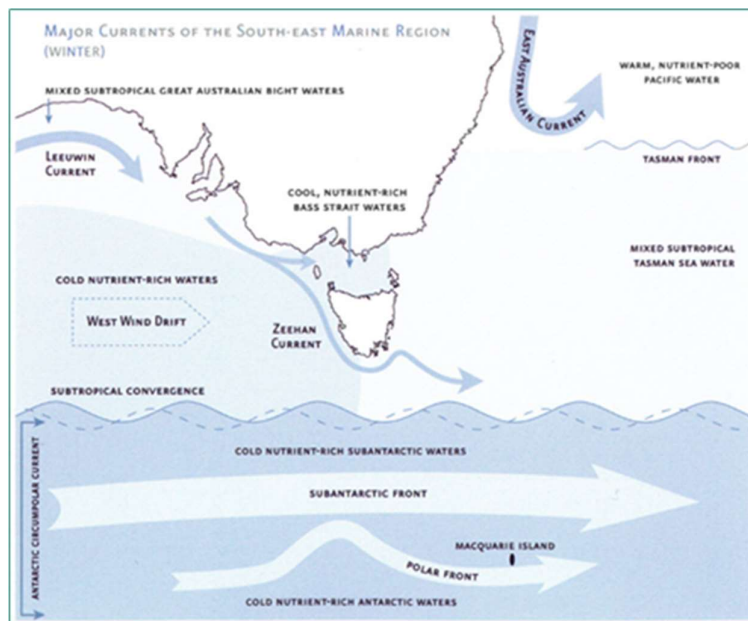

Figure 2-2 Major ocean currents in south-eastern Australian waters winter

### 2.1.2.2 Water Temperatures and Density Stratification

Temperatures in the subsurface waters of Bass Strait range from about 13°C in August/September to 16°C in February/March. Surface temperatures can exceed 20°C at times in late summer due to the warmer waters of the East Australia Current entering the strait. Water temperatures in the operational area are expected to follow this pattern (Jones 1980). Table 2-1 shows the monthly average sea surface temperatures and salinity as obtained from the World Ocean Atlas 2013 database which shows the same range of temperatures as those previously recorded. Monthly average sea surface temperatures were shown to range from 14°C (August, September) and 20°C (March). Salinity remained consistent throughout the year ranging from 35 to 36 psu (RPS, 2018a).

**Table 2-1 Average monthly sea surface temperature and salinity nearby Blackback well location within the 0-5m water depth.**

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (°C)	19	20	20	19	18	16	15	15	14	15	16	18
Salinity (psu)	35	35	36	36	35	36	36	36	35	36	36	36

Waters are generally well mixed, but surface warming sometimes causes weak stratification in calm summer conditions. During these times, mixing and interaction between varying water masses leads to variations in horizontal water temperature and a thermocline (temperature profile) develops. The thermocline acts as a low friction layer separating the wind driven motions of the upper well mixed layer from the bottom well mixed layer. As a result, upwelling of cold water on the northern shores of Bass Strait can occur (Jones 1980).

Information on density and temperature profiles of the deeper area of the Blackback field has been obtained by Lawson and Treloar (1996a). Temperatures measured at the seabed confirmed a decrease in temperature with depth of measurement. The survey also showed a period (July to September) of uniformity of temperature at all measured depths, indicating flow down the continental slope (Bass Strait Cascade). The range of water temperatures observed at the seabed is from a maximum of 17°C at 93 m to a minimum of 7°C at 480 m. The minimum temperatures at depth were recorded in summer, possibly because of stronger stabilising stratification and absence of the cascade of relatively warmer water during winter.

### 2.1.2.3 Waves

Bass Strait is a high energy environment exposed to frequent storms and significant wave heights. High wave conditions are generally associated with strong west to southwest winds caused by the eastward passage of low pressure systems across Bass Strait. Storms may occur several times a month resulting in wave heights of 3 to 4 m or more. In severe cases, southwest storms can result in significant wave heights of greater than 6 m (Jones 1980).

Wave data have been analysed for the ten year period from 1977 to 1987 (Lawson & Treloar 1987). Wave conditions at Blackback exhibit an increased wave climate, in excess of those experienced at further inshore facilities due to the increased fetch length of waves approaching from the south west. Higher wave conditions are generally associated with strong west to south west winds caused by the eastward passage of low pressure systems across Bass Strait. These may occur several times per month and can result in significant wave heights of three to four metres or more. In severe cases, south west storms can result in significant wave heights of up to six to seven metres.

Extreme design wave conditions are associated with east coast low pressure systems. These can result in very strong east to south east winds in eastern Bass Strait. The 1989 Metocean Design Criteria Report (Esso 1990) gives a design significant wave height of 9.0 m and a corresponding maximum wave height of 17.5 m.

### 2.1.2.4 Bathymetry

The EGBPA is located in Bass Strait, the region of the continental shelf that separates mainland Australia from Tasmania. The bathymetry in the EGBPA is concave shaped, with a shallower rim on the eastern and western end of the EGBPA and a deeper centre. The seabed bathymetry across the region is highly variable. A steep nearshore profile (0 to 20 m water depth) extends to a less steep inner (20 to 60 m water depth) and moderate profile (60 to 120 m water depth), concluding with a flat outer shelf plain (greater than 120 m water depth) in the western part (central Bass Strait) and a steep slope into the Bass Canyon in the east. The Esso Bass Strait Operations are distributed across this area from the Dolphin platform located closest to the coast at approximately 21 km and in approximately 38 m water depth out to the VIC/P70 permit area that extends out to 90-100 km offshore in water depths of approximately 2,300m. Refer to Figure 1-2 which shows the bathymetry in the EGBPA.

## 2.2 Values and Sensitivities in the DA

This sections summarises the relevant values and sensitivities in the DA as required by regulation 13(2)(b) of the OPGGS(E)R.

The OPGGS(E)R require petroleum activities to be carried out in a manner; consistent with the principles of ecologically sustainable development as set out in section 3A of the Environment Protection and Biodiversity Conservation Act (EPBC Act). Protected matters, or matters of national environmental significance (MNES) must be described and considered.

Table 2-2 provides a summary of the relevant MNES that have been identified as existing in the DA, or in the case of floral and faunal species, may exist within the DA. Additional detail of each MNES is provided in other parts of this volume as indicated in the table. Table 2-3 summarises the values and sensitivities of other protected matters within the DA.

**Table 2-2 Relevant Matters of National Environmental Significance in the DA**

Matters of National Environmental Significance Value/sensitivity	Receptor Type	Features present within the Described Area
World Heritage	Cultural feature - Historic site	Tasmania Darlington Probation Station (2.2.1.1.1) Port Arthur Historic (2.2.1.1.1) Norfolk Island Kingston and Arthurs Vale Historic Area (2.2.1.1.1)

## 2.2.1 World Heritage

There are three relevant World Heritage listings which occur in or near the DA. Darlington Probation Station and Port Arthur Historic Site are also on the Australian Convict Sites World Heritage list.

### 2.2.1.1 Australian Convict Sites

#### 2.2.1.1.1 Darlington Probation Station

Darlington Probation Station, located on Maria Island National Park (Section 2.2.8.35) off the east coast of Tasmania is the only declared World Heritage place in the DA. It offers a glimpse into our convict past and the probation system that was unique to Tasmania. The precinct has 13 intact structures that remain and are set amongst a relatively unchanged landscape along the cove, uniquely demonstrating the philosophy behind the probation system (DoEE, 2019d).

#### 2.2.1.1.1 Port Arthur Historic Site

Located in the south-west on the Tasman Peninsula is the Port Arthur Historic Site. Port Arthur was inscribed on the Australian Convict Sites World Heritage serial listing on 31 July 2010. Port Arthur was established in the 1830s as a penal settlement. It remains a physical chronicle of a dramatic part of Australia's history and together with its 60 or so buildings and picturesque landscape has become Tasmania's most popular tourist destination (DoEE, 2019c).

#### 2.2.1.1.1 Kingston and Arthur's Vale Historic Area

The Kingston and Arthur's Vale Historic Area (KAVHA), on Norfolk Island, is of outstanding significance to the nation as a convict settlement spanning the era of transportation to eastern Australia from 1788 to 1855. The punishment, living and working conditions for the convicts were extremely harsh and brutal

making it infamous as a 'hell on earth' with 'no hope of return'. KAVHA includes more than 40 buildings, groups of buildings, ruins and archaeological remains within 225 hectares of relatively undisturbed land. All structures were built by convicts from limestone quarried on the island or with local timber. There was an exceptional phase of penal reform to rehabilitate convicts under Commandant Maconochie between 1840 and 1844. His penal regime had an impact and was partly adopted in Fremantle Prison, Britain and America (DAWE, 2020g).

#### 2.2.1.2 Lord Howe Island Group

Located 700 kilometres north-east of Sydney and covering an area of 1,463 km<sup>2</sup>, the Lord Howe Island Group comprises Lord Howe Island, Admiralty Islands, Mutton Bird Islands, Ball's Pyramid, and associated coral reefs and marine environments. The justification criteria for its World Heritage listing are its exceptional diversity of spectacular and scenic landscapes within a small area, including sheer mountain slopes, a broad arc of hills enclosing the lagoon and Balls Pyramid rising abruptly from the ocean. It is considered to be an outstanding example of an island system developed from submarine volcanic activity and demonstrates the nearly complete stage in the destruction of a large shield volcano. Having the most southerly coral reef in the world, it demonstrates a rare example of a zone of transition between algal and coral reefs. Many species are at their ecological limits, endemism is high, and unique assemblages of temperate and tropical forms cohabit. The second criteria is it's an outstanding example of the development of a characteristic insular biota that has adapted to the island environment through speciation. A significant number of endemic species or subspecies of plants and animals have evolved in a very limited area. The diversity of landscapes and biota and the high number of threatened and endemic species make these islands an outstanding example of independent evolutionary processes (DoEE, 2019s). Endemic species occur in the flora and invertebrate fauna; 60% of invertebrate fauna are endemic with discovery of new species still occurring. Of the endemic flora, more is known about the vascular plants of which 113 of the 239 species are endemic. Whilst less is known about the non-vascular plants, they are also thought to be highly diverse and include endemic species (DECCW, 2007). Lord Howe Island Group is within the Lord Howe Marine Park, refer Section 2.2.6.11 for information on this park.

#### 2.2.1.3 Gondwana Rainforests of Australia

Gondwana Rainforests of Australia, comprising eight blocks of protected areas (366,703 ha), is situated predominantly along the Great Escarpment on Australia's east coast. The outstanding geological features displayed around shield volcanic craters and the high number of rare and threatened rainforest species are of international significance for science and conservation. One of the protected areas (136 ha) is within the Iluka Nature Reserve (refer Section 2.2.8.38). The reserve is located on the north coast of NSW, approximately 750 km north of Sydney and 150 km south of the NSW/QLD border. The coastal reserve contains the largest single stand in New South Wales of littoral rainforest, a distinctive coastal variant of sub-tropical rainforest, and the least extensive of all New South Wales rainforest types (DoEE, 2019an).

#### 2.2.1.4 Fraser Island

Fraser Island World Heritage site covers 181,851 hectares and includes all of Fraser Island and several small islands off the island's west coast. It is the world's largest sand island, with long sweeps of ocean beach, 40 kms of sand cliffs and inland remnants of tall rainforest growing on sand dunes, a phenomenon believed to be unique in the world because it requires significant biological adaptation. Fraser Island also represents significant biological evolution (such as the development of rare and biogeographically significant species of plants and animals). Vegetation associations and succession display an unusual level of complexity, with major changes in floristic and structural composition occurring over very short distances. Evolution and specialised adaptation to low fertility, fire, waterlogging and aridity is continuing in the ancient angiosperm flora of the heathlands and the associated vertebrate and invertebrate fauna. The site also represents an outstanding example of significant ongoing geological processes including longshore drift. Fraser Island also has a variety of freshwater dune lakes which are exceptional in terms of number (half of the all the world's perched lakes), diversity and age (DAWE, 2020d).

## 2.2.2 National Heritage

The National Heritage List is Australia's list of natural, historic and Indigenous places which are classified to have outstanding heritage value to the nation. There are three classes for National Heritage listings; natural, historic and indigenous. The declared World Heritage properties noted in Section 0 above are also listed on Australia's National Heritage list. Other relevant National Heritage places occurring in the DA are described below.

### 2.2.2.1 The Great Ocean Road and Scenic Environs – Historic Heritage

The Great Ocean Road and Scenic Environs is a 242 km road located on the west coast of Victoria, commencing at Torquay and ending in Allansford, just east of Warrnambool which as well as following the spectacular coast, passes inland through the forests of the Great Otway National Park and the rural landscape west of the Otway Ranges. The site includes all the coastline between the two towns where coastline abuts the dynamic ocean swells of Bass Strait, and the hinterland displays a diverse natural environment including temperate rainforest, heathlands, wetlands, sheer cliffs, ancient rock stacks and stunning beaches, which combined, provide a magnificent aesthetic landscape and seascape which support a diverse range of flora and fauna, including threatened coastal and migratory birds.

The project to build the road was created to provide work and continuing welfare for First World War returned servicemen over the 13 years it took to build, and also to provide a utilitarian memorial to all Australian First World War servicemen. This accounts for its listing under the historic classification on the database. It also provided the residents and tourists a means of accessing the spectacular coastal landscape, for which it is most well-known now. The limestone at Port Campbell is significant for the diversity of geomorphical features found in a single lithological unit giving rise to the distinctive rock formations of the twelve Apostles, Bay of Islands and Bay of Martyrs. The Otway Ranges Coastal Cretaceous site is one of only two places in Australia where polar dinosaur fossils are found and illustrates the environment prior to the separation of Australia from Antarctica. These features contribute to the scientific and educational values of the place. The place includes a large part of the Great Otway National Park (refer Section 2.2.8.21) where a diverse range of ecosystems including wet and dry sclerophyll forests, cool temperate rainforest and near the coast, shrublands and coastal heaths (DoEE, 2019p).

### 2.2.2.2 Ku-ring-gai Chase National Park, Lion, Long and Spectacle Island Nature Reserves – Natural Heritage

Located at the entry to Broken Bay and the mouth of the Hawksbury River, Ku-ring-gai Chase National Park, Lion, Long and Spectacle Island Nature Reserves span 15,000 ha, approximately 20 km north of Sydney. The park and reserves contain an outstanding representation of the species that contribute to the high endemism value of the Sydney region with high species richness across many groups and a representative range of ecosystems. The complex pattern of 24 plant communities contribute species richness with over 1000 native plant species present and an outstanding array of birds and other plant species. Rock art can be seen across the entire sandstone landscape and a small number of engravings found on vertical boulders in close proximity to major waterways. Section 2.2.8.52 provides additional information on the National Park (DoEE, 2019).

### 2.2.2.3 North Head – Historic Heritage

The northern, seaward entrance to Port Jackson, more commonly known as Sydney Harbour, is important as it played a major role in the cultural and military life of the colony of New South Wales, following the arrival of the First Fleet in 1788. The 'Heads', have signified arrival and departure at Port Jackson since 1788 and are recognised as important, iconic, national landmarks. The North Head Quarantine Station is important for its association with the establishment of the colony of NSW and with Australia's development as an island-nation, susceptible to ship-borne disease. The quarantine station has the longest history (1828-1977) of quarantine use in Australia. Existing structures at the North Head Quarantine Station include hospital and isolation ward, cemeteries and memorials, wharf area, separation facilities for first, second and third class passengers and an administration area. The area comprises the entire headland of approximately 277 ha at Manly (DoEE, 2019i).

#### **2.2.2.4 Bondi Beach – Historic Heritage**

Bondi Beach is significant in the course of Australia's cultural history as the site of the foundation of Australia's first recognised surf lifesaving club in 1907. It is also has significant social value for being having a central place in the development of Australia's beach culture and it's way of life and leisure (DoEE, 2019j).

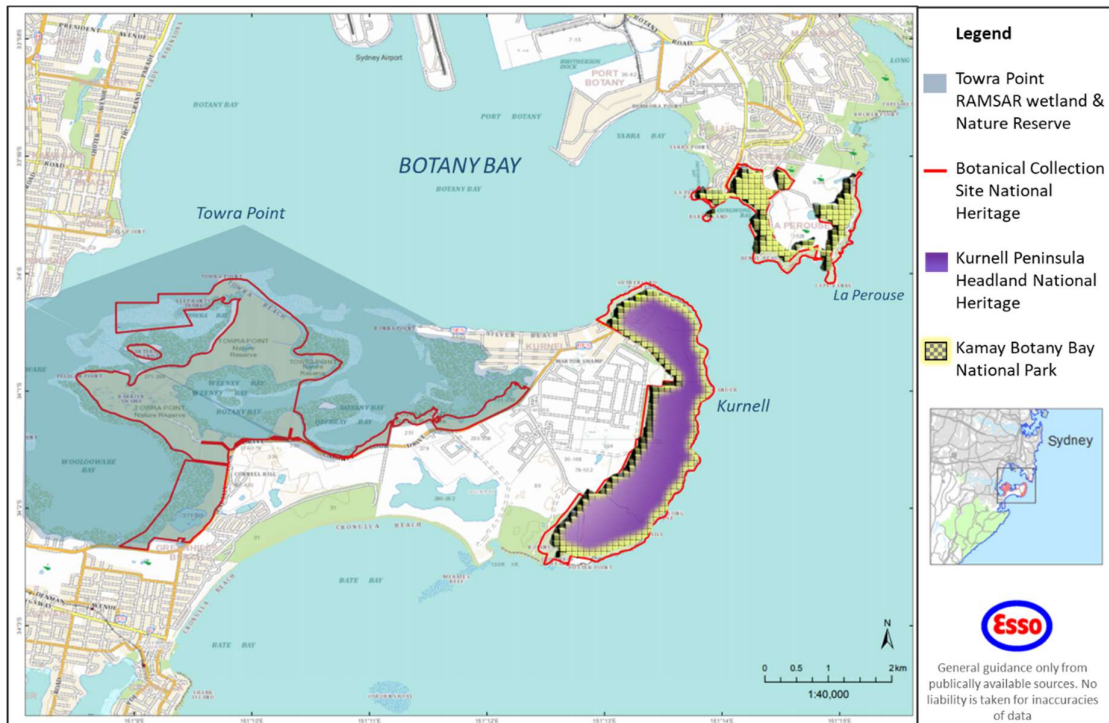

#### **2.2.2.5 Kurnell Peninsula Headland – Historic Heritage**

The site of first recorded contact between Indigenous people and Britain in eastern Australia (The Meeting Place) representing the birthplace of a nation and the dispossession of Indigenous people is on Kurnell Peninsula. The first landfall on continental Australia made by Captain James Cook, Commander of the Endeavour at Kurnell Peninsula was a precursor of the colonisation of Australia by Britain. On this voyage in 1770, Cook mapped Australia's eastern coastline. The listed place occupies approximately 325 hectares on the southern headland at the entrance to Botany Bay. It includes the Meeting Place Precinct, including Captain Cook's Landing Place, the coastal, landmark, sandstone, areas of Kurnell Headland between Sutherland Point in the north and Doughboy Head in the south, Endeavour Heights and sand dunes, including Botany Cone, in the south-west. The boundaries are defined by Botany Bay National Park (Kurnell Section) and a small Sydney Water inholding at Potter Point (DoEE, 2019f).

#### **2.2.2.6 Kamay Botany Bay: botanical collection sites – Historic Heritage**

Accompanying Captain James Cook on the 1770 voyage to Australia (refer 2.2.2.5 above) were botanist Sir Joseph Banks and naturalist Dr Daniel Solander. Upon the first landing plants collected by Banks and Solander included a large number of iconic Australian plant species, including some that later became type-specimens which have important scientific and research value. The plant collection sites at Kamay Botany Bay, together with the collected plant material, represent the symbolic and actual integration of Australian flora into western science. Banks and Solander used ideas from Swedish scientist Carl Linnaeus newly developed and revolutionary biological classification system (known as the Linnaean System) to collect the plants for scientific study. This plant collection made a significant contribution in revolutionising the international systematic biology discipline, shaped European perceptions of Australia and provided a benchmark for the Australian environment as well as catalysing and informing subsequent botanical studies of Australia (DoEE, 2019h). The place is broadly comprised of three areas: the Kurnell Peninsula and La Perouse Headland which are located within Kamay Botany Bay National Park (refer Section 2.2.8.68) and the Towra Point Nature Reserve (refer Section 2.2.8.67).

Figure 2-3 shows the location of the National Heritage places and Ramsar Wetland in Botany Bay.

**Figure 2-3 National Heritage Places, RAMSAR wetland, National Parks and Reserves in Botany Bay**

**2.2.2.7 Royal National Park and Garawarra State Conservation Area – Natural Heritage**

Bounded by the Pacific Ocean to the east, Port Hacking to the north, the 15,968 ha area of the Royal National Park (15068 ha) and Garawarra State Conservation Area (900 ha) in NSW (south of Cronulla) was the second National Park to be established in the world after Yellowstone. Its declaration in 1879 marked the beginning of the development of Australia’s National Park system of protected areas. With greater access to and use of natural areas for recreation, the public’s concern for the natural environment and its conservation grew. The establishment of Royal NP is considered to be the beginning of the Australian conservation movement (DoEE, 2019e).

Royal National Park (Royal NP) and Garawarra State Conservation Area (Garawarra SCA) constitute a major centre of temperate plant species richness in Australia, with more than 1000 species recorded. The place is also extremely rich in perching birds, reptiles and butterflies and can be regarded as exemplifying the biodiverse Hawkesbury Sandstone environment.

The park’s historical significance and species richness account for the official values of its National Heritage listing. However this area has many other values which are described in the National Parks and Reserves, Section 2.2.8.69.

**2.2.2.8 Nepean Island Reserve and Phillip Island**

Nepean Island Reserve and Phillip Island are part of the Norfolk Island group protected area system located in the External Territories of Australia. Nepean Island Reserve is listed for its natural values and is the main breeding site within the Norfolk Island Group for the masked booby *Sula dactylatra*. The masked booby is one of eight seabird species known to breed on the island. Seven of these are protected under Commonwealth legislation, and three are also protected under International treaties. The reserve supports populations of the nationally vulnerable nocturnal marbled gecko, *Christinus guentheri*. This species is no longer found on Norfolk Island but remains on Nepean Island mainly due to the absence of predation pressure from black rats. Nepean Island is historically significant for its association with quarrying and timber-getting during the Second Settlement period (1825-55) (refer Section 2.2.6.18) (DAWE, 2020h).

Phillip Island is important as several vascular plant species have survived there and are re-establishing what were thought to be extinct including the endemic Norfolk Island abutilon *Abutilon julianae*, Phillip Island wheat grass *Elymus multiflorus* var. *kingianus* and the endemic Phillip Island hibiscus *Hibiscus insularis*. Phillip Island is the northern most breeding habitat for the Australasian gannet *Morus serrator* and also supports one of the largest breeding populations of the red-tailed tropicbird *Phaethon rubricauda roseotincta* (DAWE, 2020i).

**2.2.2.9 HMAS Sirius Shipwreck**

The shipwreck site of HMS Sirius has outstanding heritage value to the nation because of its importance in defining events in Australia’s cultural history and for its part in development of the processes of Australian migration and defence. It also possesses rare and uncommon aspects of Australia’s cultural history relating to early European settlement. The archaeological remains of HMS Sirius are the only known remains of a vessel of the first fleet that sailed to Australia. The primary shipwreck site of HMS Sirius is located east of Kingston Pier in Slaughter Bay, Norfolk Island (COA, 2011).

**2.2.3 Wetlands of International Importance**

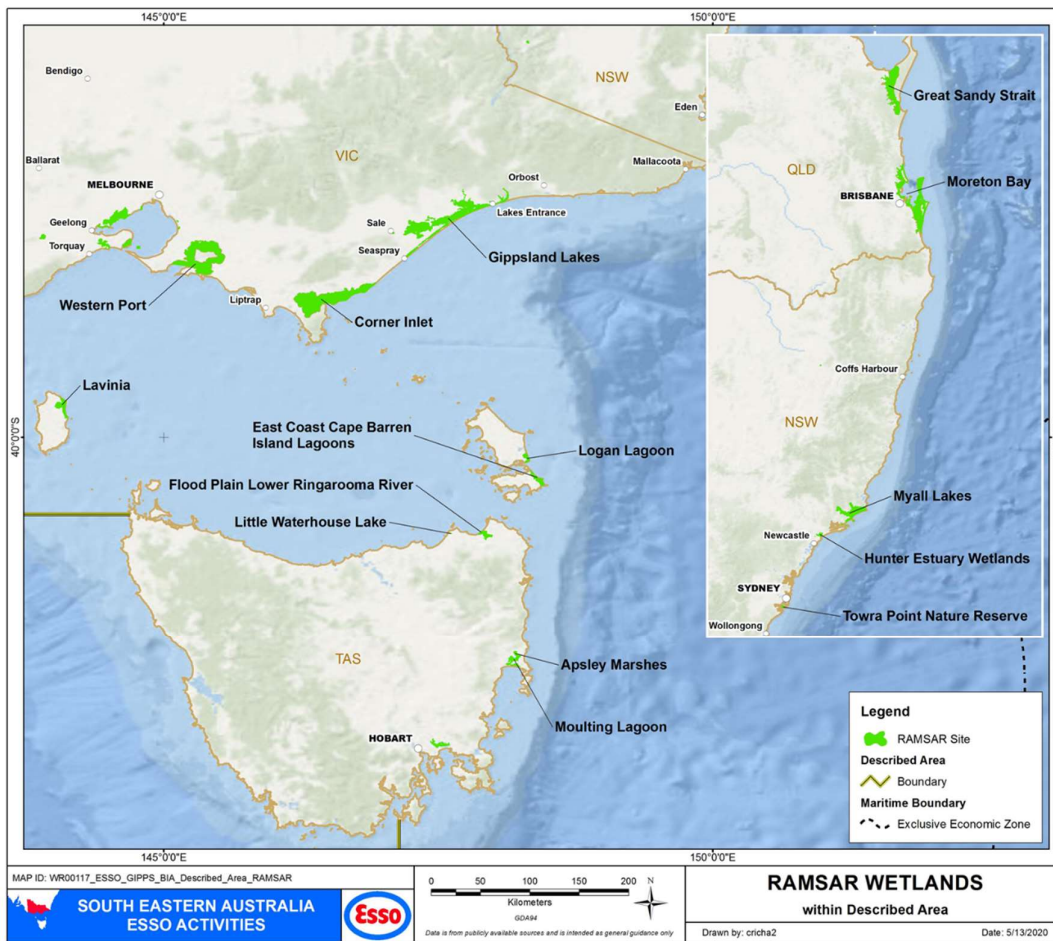

Under the Ramsar Convention, wetland types have been defined to identify the main wetland habitats represented at each site. The classification system uses three categories (with a number of wetland types within each): (i) Marine/Coastal Wetlands; (ii) Inland Wetlands; and (iii) Human-made Wetlands. The wetlands are selected on account of their international significance in terms of the biodiversity and uniqueness of their ecology, botany, zoology or other natural process. A set of nine criteria have been developed to identify and classify wetlands, these are shown in Table 2-5 below. Two Ramsar wetlands are located inshore of Esso’s permit areas and several others occur in the DA (Figure 2-4).

**Table 2-5 Criteria for identifying Wetlands of International Importance (DoEE, 2019u)**

Group	Ramsar Criteria
<b>A</b> Sites containing representative, rare or unique wetland types	<b>Criterion 1:</b> A wetland should be considered internationally important if it contains a representative, rare, or unique example of a natural or near-natural wetland type found within the appropriate biogeographic region.
<b>B</b> Sites of international importance for conserving biological diversity	Criteria based on species and ecological communities  <b>Criterion 2:</b> A wetland should be considered internationally important if it supports vulnerable, endangered, or critically endangered species or threatened ecological communities.  <b>Criterion 3:</b> A wetland should be considered internationally important if it supports populations of plant and/or animal species important for maintaining the biological diversity of a particular biogeographic region.  <b>Criterion 4:</b> A wetland should be considered internationally important if it supports plant and/or animal species at a critical stage in their life cycles, or provides refuge during adverse conditions.
	Specific criteria based on waterbirds  <b>Criterion 5:</b> A wetland should be considered internationally important if it regularly supports 20,000 or more waterbirds.  <b>Criterion 6:</b> A wetland should be considered internationally important if it regularly supports 1% of the individuals in a population of one species or subspecies of waterbird.
	Specific criteria based on fish  <b>Criterion 7:</b> A wetland should be considered internationally important if it supports a significant proportion of indigenous fish subspecies, species or families, life-history stages, species interactions and/or populations that are representative of wetland benefits and/or values and thereby contributes to global biological diversity.  <b>Criterion 8:</b> A wetland should be considered internationally important if it is an important source of food for fishes, spawning ground, nursery

Group	Ramsar Criteria
	and/or migration path on which fish stocks, either within the wetland or elsewhere, depend.
	Specific criteria based on other taxa
	<p><b>Criterion 9:</b> A wetland should be considered internationally important if it regularly supports 1% of the individuals in a population of one species or subspecies of wetland-dependent non-avian animal species.</p>

**Figure 2-4 Wetlands of International Importance within the DA**

### 2.2.3.1 Gippsland Lakes Ramsar Site

The Gippsland Lakes Ramsar Site is located in Victoria, south of the Eastern Highlands and to the east of the La Trobe Valley. Covering a vast area, the lakes are a series of large, shallow, coastal lagoons approximately 70 km in length and 10 km wide, separated from the sea by sand dunes. The surface area of the lakes is approximately 364 km<sup>2</sup> and the three main water bodies are Lakes Wellington, Victoria and King.

The Gippsland Lakes Ramsar Site meets six of the Ramsar criteria: 1, 2, 4, 6 & 8 (DoEE 2017s).

The Gippsland Lakes is a particularly good representative example of a natural or near-natural wetland, characteristic of the biogeographical region. It forms one of the largest coastal lagoon systems in the Drainage Division and contains a distinctive landscape of wetlands and flat coastal plains. The site supports a broad range of wetland types in close proximity to each other, including periodically

inundated palustrine marshes, permanently inundated palustrine marshes, shallow lacustrine (lake) features, deep lacustrine features, lagoons with narrow inlets, and broad embayments.

The site supports several nationally threatened wetland fauna species at various stages of their life-cycle including two nationally threatened frog species (green and golden bell frogs and growling grass frogs), the vulnerable Australian painted snipe, a vulnerable fish species (the Australian grayling) and three nationally vulnerable and endangered wetland-associated flora species (dwarf kerrawang, swamp everlasting and metallic sun-orchid).

The site supports habitat and conditions that are important for critical life cycle stages of a variety of wetland-dependent fauna species. The permanence of the main lakes and the relatively regular flooding of the adjacent wetlands mean that this wetland is an important drought refuge for many water birds and other aquatic species, including as permanent refuges and breeding sites for two threatened frog species.

The Gippsland Lakes have been identified as being of outstanding importance for waterbirds, regularly supporting more than 20,000 waterfowl. Waterbird species which are considered to have met the one per cent population threshold are: Red-necked stint, Black swan, Sharp-tailed sandpiper, Chestnut teal, Musk duck, Fairy tern and Little tern.

Gippsland Lakes provides important habitats, feeding areas, dispersal and migratory pathways, and spawning sites for numerous fish species of direct and indirect fisheries significance. These fish have important fisheries resource values both within and external to the site.

Currently, parts of the Lakes system are heavily used for commercial and recreational fisheries and boating activities, while the immediate hinterland has been developed for agricultural use, and limited residential and tourism purposes (DoEE, 2017q).

The Lakes are protected as a Ramsar site by the Lakes National Park and the Gippsland Lakes Coastal Park (Refer Section 2.2.8.9). The locality of the Ramsar site is shown in Figure 2-5.

The ecological character description (ECD) of the Gippsland Lakes Ramsar Site as developed under the requirements of the National Framework and Guidance for Describing the Ecological Character of Australia's Ramsar Wetlands (DEWHA, 2008), is summarised in Table 2-6. The information on the limits of acceptable change, also required by the National Framework for describing the wetlands, are summarised in Table 2-7 (DSEWPAC 2010).

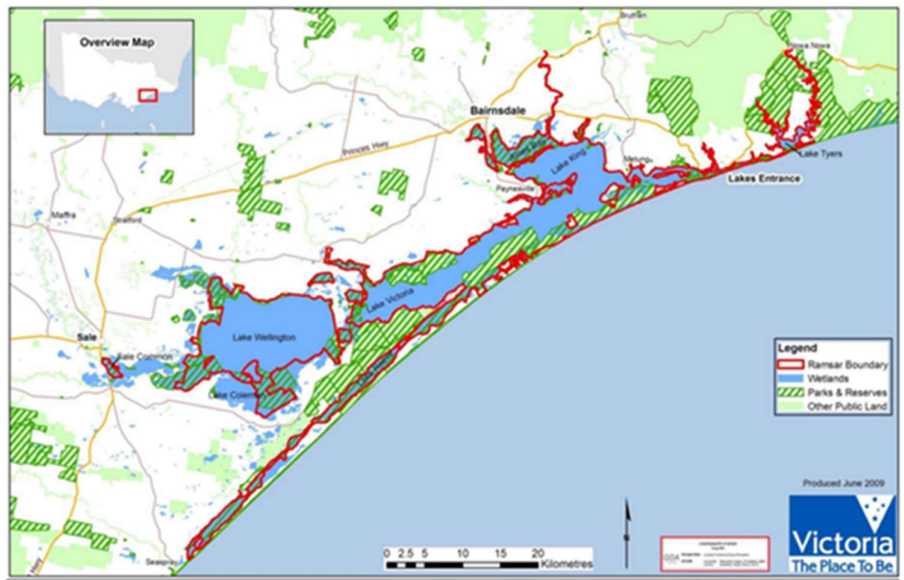

Figure 2-5 Locality of Gippsland lakes Ramsar Site (DSEWPAC, 2010)

Critical components	Critical processes	Critical services/benefits
<p><b>Wetland habitats:</b> grouped as follows</p> <ul style="list-style-type: none"> <li>• (C1) marine subtidal aquatic beds (seagrass/aquatic plants).</li> <li>• (C2) coastal brackish or saline lagoons (open water phytoplankton-dominated habitats).</li> <li>• fringing wetlands that can occur within the site as–</li> <li>• (C3) predominantly freshwater wetlands</li> <li>• (C4) brackish wetlands</li> <li>• (C5) saltmarsh/ hypersaline wetlands.</li> </ul> <p><b>Wetland flora and fauna:</b></p> <ul style="list-style-type: none"> <li>• (C6) abundance and diversity of waterbirds.</li> <li>• (C7) presence of threatened frog species (green and golden bell frog; growling grass frog).</li> <li>• (C8) presence of threatened wetland flora species.</li> </ul>	<p>Hydrological regime: (P1) patterns of inundation and freshwater flows into the wetland system, groundwater influences and marine inflows that affect habitat structure and condition.</p> <p>Waterbird breeding functions: (P2) critical breeding habitats for a variety of waterbird species.</p>	<p>Threatened species: (S1) the site supports an assemblage of vulnerable or endangered wetland flora and fauna that contribute to biodiversity.</p> <p>Fisheries resource values: (S2) the site supports key fisheries habitats and stocks of commercial and recreational significance.</p>
Supporting Components	Supporting Processes	Supporting services/benefits
<p>Other wetland habitats: supported by the site (sand/pebble shores, estuarine waters, etc.).</p> <p>Other wetland fauna: supported by the site (for example, fish, aquatic invertebrates).</p>	<p>Climate: patterns of temperature, rainfall and evaporation.</p> <p>Geomorphology: key geomorphologic/topographic features of the site.</p> <p>Coastal and shoreline processes: hydrodynamic controls on coasts and shorelines through tides, currents, wind, erosion and accretion.</p> <p>Water quality: water quality influences aquatic ecosystem values, noting the key water quality variables for Gippsland Lakes are salinity, dissolved oxygen, nutrients and sediments.</p> <p>Nutrient cycling, sediment processes and algal blooms: primary productivity and the natural functioning of nutrient cycling/flux processes in waterbodies.</p> <p>Biological processes: important biological processes such as primary productivity.</p>	<p>Tourism and recreation: the site provides and supports a range of tourism and recreational activities that are significant to the regional economy.</p> <p>Scientific research: the site supports and contains features important for scientific research.</p>

**Table 2-7 Limits of acceptable change (LAC) – Gippsland Lakes Ramsar site (DSEWPAC 2010)**

Number	Indicator for Critical Component / Process/Service for the LAC	Relevant timescale <sup>1</sup>	Limit(s) of Acceptable Change	Spatial scale/temporal scale of measurements	Underpinning baseline data	Secondary critical C,P,S addressed through LAC
<b>Critical components</b>						
C1	Marine sub-tidal aquatic beds (for example, within Lake King, Lake Victoria, Lake Tyers, Bunga Arm and Lake Bunga)	Long Term	Total seagrass extent will not decline by greater than 50 per cent of the baseline value of Roob and Ball 1997 (that is, 50 per cent of 4330 hectares = 2165 hectares) in two successive decades at a whole of site scale.  Total mapped extent of dense and moderate <i>Zostera</i> will not decline by greater than 80 per cent of the baseline values determined by Roob and Ball (1997) in two successive decades at any of the following locations:  Fraser Island Point Fullerton, Lake King Point King, Raymond Island, Lake King Gorcrow Point – Steel Bay, Lake Victoria Waddy Island, Lake Victoria	Sampling to occur at least twice within the decade under consideration.  Baseline mapping against which this LAC can be tested is within Roob and Ball 1997.  Note that the seagrass assessment by Hindell (2008) did not produce mapping but did use similar sampling sites to Roob and Ball.	Level B – Recent quantitative data describes seagrass condition at various sites but over a limited timeframe. There is no available seagrass condition data prior to listing.	P1
C2	Coastal brackish or saline lagoons (for example, Lake King, Lake Victoria, Lake Wellington, Lake Tyers)	Long Term	No change in wetland typology from the 1980 classification of Corrick and Norman (1980), as presented in Figure 2-3.	To be determined based on expert review.	Level B – VMCS mapping data describes wetland extent. This is coarse scale mapping and should be considered as indicative only.	P1, S2
		Long Term	A long-term change in ecosystem state at Lake King, Lake Victoria or Lake Tyers from relatively clear, seagrass- dominated estuarine lagoons to turbid, algae dominated system (characteristic of Lake Wellington) will represent a change in ecological character.	To be determined based on expert review.		

		Short Term	No single cyanobacteria algal bloom event will cover greater than 10 per cent of the combined area of coastal brackish/saline lagoons (that is, Lake King, Victoria, Wellington and Tyers) in two successive years.	Algal bloom extent (per cent lakes area and location) and number should be reported annually, but assessed on an ongoing basis.	Level A – The occurrence of cyanobacteria algal blooms are well documented. The extent of algal blooms historically has not been assessed, including at the time of site declaration.	
C3	Fringing wetlands – predominantly freshwater marsh at Macleod Morass and Sale Common	Long Term	No change in wetland typology from the 1980 classification (Corrick and Norman 1980; See Figure 2-3). In this regard, the conversion of vegetation communities at Sale Common and Macleod Morass from a predominantly freshwater character (for example, giant rush, common reed, cumbungi) to those of a brackish water character (brackish or swamp scrub/saltmarsh species) will represent a change in ecological character.	To be determined based on expert review.	Level B – VMCS mapping data describes wetland extent during 1980. This is coarse scale mapping and should be considered as indicative only. There is no available community data prior to listing.	P1, P2, C6, C7, C8
			The total mapped area of freshwater marshes (shrubs and reed wetland types) at Sale Common and Macleod Morass will not decline by greater than 50 per cent of the baseline value outlined in VMCS for 1980 (that is, 50 per cent of 402 hectares = 201 hectares) in two successive decades.	Sampling to occur at least twice within the decade under consideration.		
		Short Term	In existing freshwater wetland areas, the annual median salinity should not be greater than one grams per litre in two successive years. Note that where ambient water quality characteristics fall outside the range of these baseline levels, and ecosystem health indicators shows no signs of impairment, the LAC may need to be adjusted accordingly.	Annual median based on at least eight sampling periods per year, encompassing wet and dry periods.	Level C – No available baseline data. Value based on species salinity tolerances.	
C4	Fringing wetlands – brackish marsh (for example, Dowd	Long Term	For all fringing brackish wetlands: No change in wetland typology from the 1980 classification (Corrick and Norman 1980).	To be determined based on expert review.	As for C3.	P1, P2, C6, C7, C8

	Morass; The Heart Morass; Clydebank Morass, Lake Coleman {Tucker Swamp}	Medium Term	For Dowd Morass and the Heart Morass: The annual median salinity will be less than four grams per litre in five successive years. Note that where ambient water quality characteristics fall outside the range of these baseline levels, and ecosystem health indicators shows no signs of impairment, LAC may need to be adjusted accordingly.	Annual median based on at least eight sampling periods per year, encompassing wet and dry periods.	Level C – No available baseline data. This value is based on species tolerances and requirement for salinity to be less than four grams per litre to allow reproduction (refer Tilleard and Ladson 2010).	
		Long Term	The total area of common reed at Dowd Morass will not decline by greater than 50 per cent of the 1982 baseline value (that is, 50 per cent of 480 hectares = 245 hectares) outlined in Boon et al. (2007) in two successive decades.	Sampling to occur at least twice within the decade under consideration.	Level A – Boon et al. (2007) provides good quality mapping data relevant to time of listing.	
C5	Fringing wetlands – saltmarsh/hypersaline marsh (for example, Lake Reeve)	Medium Term	No change in wetland typology from the 1980 classification (Corrick and Norman 1980). The total mapped area of salt flat, saltpan and salt meadow habitat at Lake Reeve Reserve will not decline by greater than 50 per cent of the baseline value outlined in VMCS for 1980 (that is, 50 per cent of 5035 hectares = 2517 hectares) in two successive decades.	To be determined based on expert review. Sampling to occur at least twice within the decade under consideration.	As for C3.	P1, C6

C6	Abundance and diversity of waterbirds	Medium Term	<p>The number of standard 20 minute searches (within any ten year period) where waterbird abundance is less than 50 individuals will not fall below 50 per cent of the 'baseline' value (based on Birds Australia count data – 1987-2010), for the following species:</p> <p>black swan = 15 per cent of surveys          chestnut teal = 10 per cent of surveys          Eurasian coot = 11 per cent of surveys.</p> <p>The absence of records in any of the following species in five successive years will represent a change in character: red-necked stint, sharp-tailed sandpiper, black swan, chestnut teal, fairy tern, little tern, musk duck, Australasian grebe, grey teal, Eurasian coot, great cormorant, red knot, curlew sandpiper.</p> <p>Median abundance (derived from at least three annual surveys {summer counts} over a 10-year period) falls below the 20<sup>th</sup> percentile baseline value. <i>Note: An adequate baseline will need to be established to assess this LAC (for example, at least three annual surveys (summer counts) over a 10-year period).</i></p>	<p>Sampling to be undertaken at least twice a year over any 10 year period at stations containing favourable habitat for these species (see Table E8 for locations). Surveys should consist of standardised 20 minute counts.</p> <p>Sampling to be undertaken at least twice a year (during summer) at stations containing favourable habitat for these species (see section 3.4.1 for important locations).</p> <p>Recommended baseline monitoring program should include:</p> <p>A combination of aerial and ground surveys.</p> <p>Representative coverage of primary habitats within the site.</p>	<p>Level A – Birds Australia data, while standardised in terms of sampling effort per site, is not standardised in terms of frequency of sampling events at any given sampling location. Data should be considered indicative only.</p> <p>Level A – Records for these species are reliable. Birds Australia and DSE data can be used to assess this qualitative LAC.</p> <p>There are no baseline data available for this LAC.</p>	P1, P2
----	---------------------------------------	-------------	---	---	---	--------

C7	Presence of threatened frogs	Medium Term	<p>The site will continue to support suitable habitat for growling grass frog and green and golden bell frog. In this regard, the LAC for Component 3 applies.</p> <p>There is insufficient data to develop a LAC relating directly to site usage by these species, which represents a critical information gap. Should baseline data become available in the future, the following LAC will apply: a significant reduction (greater than 25 per cent over a period of 5 years) in the local adult population within the site, especially for important local populations (for example, within Macleod Morass, Sale Common, Ewings Marsh, Roseneath wetlands (Morley Swamp and Victoria Lagoon), the Heart Morass and freshwater pools on Rotamah Island).</p>	<p>Refer to C3.</p> <p>Recommended baseline monitoring program should comprise a minimum two annual sampling periods separated by at least one year (and within a 5 year period).</p>	<p>Level C – Surveys for these species have been opportunistic. The most recent record for growling grass frog is 2007, whereas the green and golden bell frog was recorded at the site in 1998. There are no empirical data describing abundances at the site.</p>	P1
C8	Presence of threatened wetland flora species	Long Term	<p>The three threatened flora species (<i>Rulingia prostrata</i>, <i>Thelymitra epipactoides</i> and <i>Xerochrysum palustre</i>) continue to be supported within the boundaries of the Gippsland Lakes Ramsar site.</p>	<p>Based on opportunistic searches.</p>	<p>Level C – Setting of empirical limits of acceptable change is not possible at present, given the absence of quantitative estimates of population size of threatened species within the site, and more importantly the viability of populations (and their key controls) within the site.</p>	P1

Critical processes																						
P1	Hydrological regime	Short Term – Medium Term	<p>Wetland wetting frequency, flushing frequency and flushing volume are maintained as follows:</p> <table border="1"> <thead> <tr> <th>Wetland</th> <th>Wetting Frequency</th> <th>Flushing Frequency</th> <th>Required Flushing Volume</th> </tr> </thead> <tbody> <tr> <td>Sale Common</td> <td>Annual with 100 per cent reliability</td> <td>2-3 times/decade</td> <td>4 GL</td> </tr> <tr> <td>Dowd Morass</td> <td>5-7 times/decade</td> <td>2-3 times/decade</td> <td>15GL</td> </tr> <tr> <td>The Heart Morass</td> <td>5-7 times/decade</td> <td>2-3 times/decade</td> <td>15GL</td> </tr> </tbody> </table> <p>From Tilleard and Ladson (2010); note that larger flushing volumes (~20GL) are identified as being needed for Dowd and the Heart Morasses following saline flood events in the Lake Wellington system (for example, when the wetlands are filled with saline water from Lake Wellington and this corresponds with low flows in the Latrobe River).</p>	Wetland	Wetting Frequency	Flushing Frequency	Required Flushing Volume	Sale Common	Annual with 100 per cent reliability	2-3 times/decade	4 GL	Dowd Morass	5-7 times/decade	2-3 times/decade	15GL	The Heart Morass	5-7 times/decade	2-3 times/decade	15GL	<p>Refer to LAC for details. Values measured at existing gauging stations in the lower reaches of the Rivers or otherwise in the wetlands themselves.</p>	<p>LAC have been identified for these wetlands on the basis that they are the best indicators of freshwater flows into the broader Gippsland Lakes system.</p> <p>Level C – LAC based on Tilleard and Ladson (2010) 'Hydrological Analyses to Support Determination of Environmental Water Requirements in the Gippsland Lakes'. This is a threshold-based LAC that is based on modelling and ecological assessments.</p> <p>Note that these values should be considered as indicative only at this stage, and should be constantly reviewed.</p> <p>Tilleard and Ladson (2010) indicate no work has been done for wetlands on the Mitchell (Macleod Morass); McLennan Straits (Morley Swamp, Lake Betsy); or Jones Bay.</p>	C1 – C8 S1, S2
Wetland	Wetting Frequency	Flushing Frequency	Required Flushing Volume																			
Sale Common	Annual with 100 per cent reliability	2-3 times/decade	4 GL																			
Dowd Morass	5-7 times/decade	2-3 times/decade	15GL																			
The Heart Morass	5-7 times/decade	2-3 times/decade	15GL																			

P2	Waterbird breeding	Short Term	Abandonment or significant decline (greater than 50 per cent) in the productivity of two or more representative breeding sites (based on two sampling episodes over a five year period) within any of the following site groupings: Lake Coleman, Tucker Swamp and Albifrons Island – Australian pelican. Bunga Arm and Lake Tyers – little tern and fairy tern. Macleod Morass, Sale Common and Dowd Morass – black swan, Australian white ibis, straw-necked ibis, and little black cormorant.	Recommended baseline monitoring program should comprise a minimum two annual sampling periods separated by at least one year (and within a 5 year period).	Level C – The use of the site by these species is well documented. However, there are no empirical data describing breeding rates. Baseline data will need to be collected to assess this LAC.	C6
<b>Critical services/benefits</b>						
S1	Threatened species	N/A	No LAC are proposed for painted snipe and Australasian bittern at the current time until greater information is available about patterns of usage and populations in the Ramsar site. Other threatened species are dealt with in the critical components above.	N/A	Level C – Site records are not recent, uncommon and the location within the Ramsar boundary not known.	P1, C3
		Long Term	Australian grayling continues to be supported in one or more of the catchments draining into the Gippsland Lakes.	Setting of more empirical limits of acceptable change not possible at present, given the absence of quantitative population data for this species for any of the rivers and creeks that drain into the site.	Level C – This species has been recorded in the major drainages that drain into the site. Juveniles have an apparent obligate estuarine phase, and therefore must use the site in order for this species to persist in these drainages. There are no data describing the population status of this species in these drainages.	P1, C1, C2
S2	Fisheries resource values	Medium Term	Total annual black bream commercial fishing catch per unit effort will not fall below the 10 <sup>th</sup> percentile historical baseline value of 6.1 (see Section 3.8.2) in a five successive year period.	Median measured over five years.	Level B – While some commercial fish data has been accessed and	C1, C2, C3, C4, C5

			Sub-optimal black bream spawning conditions should not occur in any successive five year period within key spawning grounds (that is, mid-lower estuaries and adjacent waters of main lakes) during the peak spawning period (October to December). Based on Tilleard (2009), optimal conditions are as follows:	Annual median value for the period October to December.	reviewed as part of the current study, the abundance and usage of the Gippsland Lakes by key fish species of commercial and recreational significance is not well quantified. The baseline data used in this LAC has limited duration (five years), and is unlikely to be representative of patterns in abundance over longer timeframes. This LAC will need to reviewed and refined.  Level C – based on conditions outlined in Tilleard (2009).
			Water column salinity is maintained in brackish condition (for example, between 17-21 grams per litre median value) in the middle of the water column in the mid-lower estuaries and adjacent waters of the main lakes	As above.	
			The salt wedge is located within the mid-lower section of the estuarine river reaches or just out into the main lakes as opposed to far upstream or well-out into the Lakes.		

C – component, P – process , S/B – service/benefit

### 2.2.3.2 Corner Inlet Ramsar Site

The Corner Inlet Ramsar Site is located on the south-east coast of Victoria. It is bounded to the west and north by the South Gippsland coastline, in the south-east by a series of barrier islands and sandy spits lying end to end and separated by narrow entrances, and to the south by the hills of Wilsons Promontory.

The Corner Inlet Ramsar Site also meets six of the Ramsar criteria (DoEE 2017o): 1, 2, 4, 5, 6 and 8 (as described above).

Corner Inlet is a very good example of a wetland enclosed by barrier islands in Victoria and contains the most extensive intertidal mudflats in Victoria. The area contains the only extensive bed of the Broad-leaved seagrass in Victoria. The islands of Corner Inlet, although not rich in plant diversity, are of high biogeographical significance as a result of their geological history and connectivity to the mainland during ice ages. The islands also contain significant areas of saltmarsh and mangroves, both of which are communities of very limited distribution. These communities filter pollutants, stabilize sediments and protect the shoreline from erosion.

Corner Inlet provides breeding habitat for a variety of waterbirds, including several species listed as threatened at the State level and/or occurring in significant numbers and habitat for significant aggregations of waterbirds during post-breeding, and as a refuge during adverse environmental conditions. Corner Inlet regularly supports well over 20,000 waterbirds including species such as the Eastern curlew, Curlew sandpiper, Bar-tailed godwit, and Double-banded plover.

The Corner Inlet Ramsar Site has regularly supported more than one per cent of the population of the Pied oystercatcher, Sooty oystercatcher, Pacific gull, Fairy tern, Red knot, Red necked stint and Chestnut teal.

Corner Inlet supports the nationally critically endangered Orange bellied parrot as well as several other vulnerable and endangered species, including the growling grass frog and Australian grayling. The Southern right whale, Leathery turtle, Swift parrot and Shy albatross have all also been recorded at the site.

Corner Inlet provides important habitats, feeding areas, dispersal and migratory pathways, and spawning sites for numerous fish species. Some of these include King George whiting, Australian salmon, greenback flounder, southern garfish, leatherjackets (several species), short-finned eel and gummy shark.

Corner Inlet was used traditionally by Indigenous people and many archaeological sites including scarred trees, burial sites, artefact scatters, shell middens and camps have been found. Currently, the Ramsar site is used for biological conservation, ports with servicing facilities for off-shore oil and natural gas exploration, commercial fishing, recreational fishing, and other recreational activities. Diving is popular around the numerous shipwreck sites in Corner Inlet and around the barrier islands (DoEE, 2017o).

The site is protected as a Ramsar site by the Nooramunga and Corner Inlet Marine and Coastal Parks, and by part of it lying within the Corner Inlet Marine National Park (Section 2.2.8.11). The locality of the Ramsar site is shown in Figure 2-6.

The ecological character description (ECD) of the Corner Inlet Ramsar Site is summarised in Table 2-8 with limits of acceptable change summarised in Table 2-9 (DSEWPAC, 2011b).

In the context of the Bass Strait Operations and predicted extent of the DA, critical components that may be affected by a major spill event include Seagrass, mangroves, saltmarshes and intertidal and subtidal waters (C1), Waterbird breeding (P1), Threatened species (S1) and Fish abundance (S2).

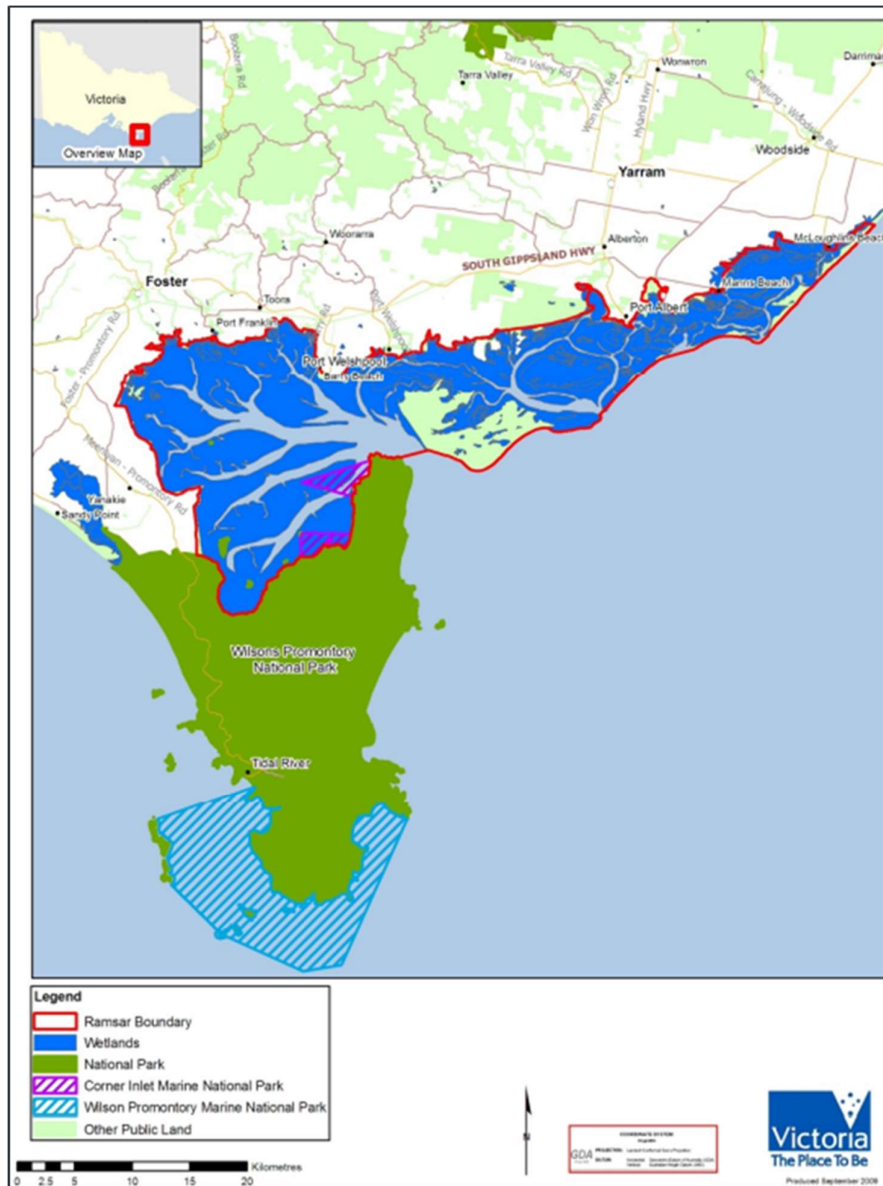

Figure 2-6 Locality of Corner Inlet Ramsar Site (DSEWPAC, 2011b)

Table 2-9 Limits of acceptable change (LAC) – Corner Inlet Ramsar site (DSEWPAC, 2011b)

Number	Indicator for Critical Component / Process/Service for the LAC	Relevant timescale <sup>1</sup>	Limit(s) of Acceptable Change	Spatial scale/temporal scale of measurements	Underpinning baseline data	Secondary critical C,P,S addressed through LAC
<b>Critical Components</b>						
C1	Seagrass extent	Long Term	<ul style="list-style-type: none"> <li>Total mapped extent of dense <i>Posidonia</i> will not decline by greater than 10 percent of the baseline value outlined by Roob <i>et al.</i> (1998) at a whole of site scale (baseline = 3050 hectares; LAC = mapped area less than 2745 hectares) on any occasion. (Note: the small degree of allowable change recognises that this seagrass species is a critical habitat resource and generally shows low natural variability.)</li> <li>Total mapped extent of the dense and medium density <i>Zosteraceae</i> will not decline by greater than 25 percent of the baseline values outlined by Roob <i>et al.</i> (1998) at a whole of site scale on two sampling occasions within any decade.</li> <li>Dense <i>Zostera</i> - Baseline = 5743 hectares (LAC = mapped area less than 4307 hectares)</li> <li>Medium <i>Zostera</i> - Baseline = 1077 hectares (LAC = mapped area less than 807 hectares)</li> </ul> <p>(Note: the moderate degree of allowable change recognises that these seagrass species generally show moderate degrees of natural variability)</p>	<p>Sampling to occur at least twice within the decade under consideration.</p> <p>Note that the seagrass assessment by Hindell (2008) did not produce mapping but did use similar sampling sites to Roob <i>et al.</i></p>	<p>Recent quantitative data describes seagrass condition at various sites but over a limited timeframe. It is thought that the Roob <i>et al.</i> (1998) study under-estimated the total available seagrass habitat (J. Stevenson, Parks Victoria, pers. comm. February 2011), hence a 10 per cent change from this baseline value would represent a larger actual change from the true baseline.</p> <p><b>Note:</b> Prior to declaration, <i>Posidonia</i> covered approximately 44 per cent (11,900 hectares) of the site (Poore 1978). Morgan (1986) estimated that <i>Posidonia</i> meadows covered 11,900 hectares in 1965 and 9,000 to 9,500 square kilometres in 1983–84. There is uncertainty regarding these mapping data and therefore empirical LACs</p>	S2

<sup>1</sup> Short Term – measured in years; Medium Term – five to 10 year intervals; Long term – 10+ year intervals.

### 2.2.3.3 Logan Lagoon Ramsar Site

The site is an excellent, regionally representative example of a coastal estuarine wetland system and includes Logan, Syndicate and Wilsons Lagoons, Pot Boil Point and part of Planters Beach.

The Logan Lagoon Ramsar site is enclosed within the Logan Lagoon Conservation Area and is located on the south-east corner of Flinders Island in Bass Strait, Tasmania.

Logan Lagoon meets five of the Ramsar Criteria: 1, 2, 3, 4 and 6.

The Logan Lagoon Ramsar site is in the Tasmanian Australian Drainage Division. It contains two sites listed on the Tasmanian Geoconservation Database; Logan Lagoon Holocene Shorelines and Planter Beach Coastal Barrier System. Logan Lagoon, with other lagoons and dunes in the area, provides a representative and outstanding example of the development of Holocene shorelines for the local region. Planter Beach Coastal Barrier System, partly within the site, is a representative and outstanding example of how offshore bars formed with Holocene sea level rise and barrier growth has enclosed the coast, forming large lagoons. Logan Lagoon is recognised as a wetland in near pristine condition.

The nationally threatened Northern leek orchid occurs within the Logan Lagoon Ramsar site (DoEE, 2017v). The nationally threatened subspecies of the Common wombat (Bass Strait) also occurs on the site and is restricted to Flinders Island.

Logan Lagoon supports species and communities threatened in the Tasmania Drainage Division, particularly *Callitris rhomboidea* forest and the rayless starwort. The site provides breeding habitat for two beach nesting shorebirds that are threatened in the region, the Fairy tern and Little tern.

The Logan Lagoon Ramsar site is an important area for birds migrating between south-eastern Australia and Tasmania. The lagoon supports five migratory bird species, the Red-necked stint, Curlew sandpiper, Sharp-tailed sandpiper, Common greenshank, and Little tern. The site also regularly supports one percent of the global or regional populations of: Hooded plover, Fairy tern, Musk duck, and Chestnut teal (DoEE 2017v).

In the context of the Bass Strait Operations and predicted geographical extent of the DA, critical components that may be affected by a major spill event include water quality (should tidal exchange occur), threatened wetland-dependent plant species, threatened saline plant communities and shorebird and waterbird species.

The locality of the Ramsar site is shown in Figure 2-7. The critical components and processes of the Logan Lagoon Ramsar site and its limits of acceptable change are shown in Table 2-10.

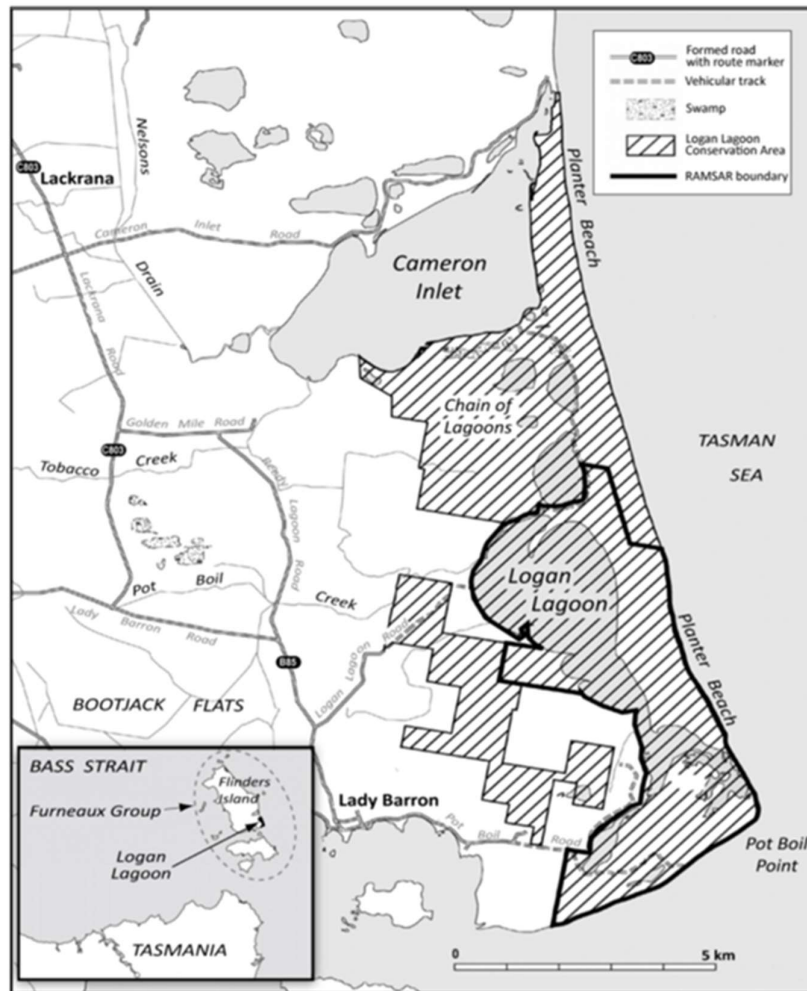

Figure 2-7 Locality Logan Lagoon Ramsar Site (Finley and Roberts, 2010)

**Table 2-10 Limits of acceptable change for critical components and processes of the Logan Lagoon Ramsar site (Finley and Roberts, 2010).**

Critical Component/Process / Service	Baseline / supporting evidence	Limit of acceptable change
<p>Climate: Understanding the interactions between the physical conditions at the site and its subsequent use by flora and fauna is important. For example, waterbirds may use the site for breeding only in years when water levels are moderate and there is adequate area for nesting on the shores.</p>		
<p>Climate</p>	<p>The particular attributes of climate that are important in maintaining the ecological character of the site are rainfall, temperature, wind and evaporation.</p> <p>Climate predictions for north-eastern Tasmania suggest a generally warmer climate which is wetter in all seasons. Mean daily temperatures are projected to be warmer (both minimum and maximum temperatures) with increased solar radiation, relative humidity in summer, and increased evaporation (ACE CRC 2010).</p>	<p>The links between climatic conditions, the hydrological responses to such conditions, and their impact on the biological components are poorly understood and should be further investigated.</p> <p>No LAC can be determined due to a lack of understanding of the impact of climatic processes on other critical components, processes and services, such as, hydrology, geomorphology, flora and fauna.</p>
<p>Geomorphology: Protecting the geological features, including the integrity and structure of the dunes, is important for the purposes of geoconservation and maintaining the ecological character which contributes to the site's listing under Criterion 1.</p>		
<p>Holocene Shorelines and dune systems</p>	<p>There are approximately 54 hectares of shorelines, spits and dune systems that are important for maintaining the geoconservation value of the site under Criterion 1.</p> <p>The area of shorelines, spits and dunes defined in the TASVEG mapping layers require ground-truthing.</p>	<p>Currently there are 54 hectares of high quality shorelines, dune systems and spits mapped within the site. In the absence of studies detailing impacts from human disturbance, a common-sense approach has been adopted, setting a limit of acceptable change at not more than 3 hectares (2 percent) of the area of the Holocene shoreline and dune systems showing evidence of human disturbance through vehicle use or foot traffic. Because the wetland map was made without proper ground-truthing, verification of areas will be required.</p>
<p>Hydrology: The hydrological regime is a major driver in the vegetation communities at the site, particularly for wetland-dependent communities. The availability of water plays a key role in the attractiveness of the site for resting and breeding of resident and migratory fauna, especially birds.</p>		
<p>Surface water flow</p>	<p>Flow regimes are poorly understood: Historically, the lagoon mouth has been artificially breached by local landowners. Alterations to the natural hydrological regime impacts on other components such as geomorphology, water quality, vegetation and fauna.</p> <p>Surrounding farmland drains into the lagoon via a series of channels. High water levels in the lagoon have previously been blamed for inundated pasture on surrounding farms. The link between climate and hydrology is poorly understood. For example, the amount of rainfall required to maintain the natural hydrology.</p>	<p>No unnatural opening of the lagoon mouth.</p> <p>Site observations indicate that fluvial inflows are a significant input of surface water to the lagoon. Whilst this inflow is beneficial in maintaining water in the lagoon, poor water quality in inflow waters could offset this benefit. Site specific hydrology data and further water quality data is therefore required before LAC can be set that takes into account these factors.</p>

Critical Component/Process / Service	Baseline / supporting evidence	Limit of acceptable change
Tidal exchange	Historical information on lagoon mouth opening is anecdotal. Future monitoring should include the status of the lagoon entrance (open/closed) because parameters such as salinity may be highly variable when the lagoon is open to the ocean.	No unnatural opening of the lagoon mouth. The lagoon is rarely open to the ocean. However, when the hydrological regime shifts to a marine system, advice on appropriate parameters should be sought.
Water Quality: provides suitable water quality to support the persistence of wetland dependent flora and fauna. The ecological character of the site currently depends on the quality of water entering and being retained within the lagoon. Baselines need to be set before LAC can be set.		
Water quality	Only two water samples recorded from the site. <u>pH</u> : Limited data indicates pH of 7.2-7.7 in Logan Lagoon waters. Potential for acid sulphate soils to impact on pH of lagoon waters. <u>Salinity</u> : Limited data indicates salinity (as Total Dissolved Solids) ranging between 2,600-35,700 mg/L: Salinity highly variable depending on seasonal climatic and hydrological processes. <u>Dissolved Oxygen</u> : No data available. <u>Turbidity</u> : Limited data indicates range between 0.5 and 4.9 NTU: Turbidity varies with freshwater inflows, wind and tidal influences. <u>Nutrients</u> : Limited site data indicates Total P (0.09 – 0.2 mg/L and Total N (1.4-1.5 mg/L).	Cannot determine LAC due to insufficient data.
Vegetation: the hydrology, climate, water quality and soil quality of Logan Lagoon influence the vegetation that is supported at the site. The threatened wetland-dependent vegetation communities contribute to the regional biodiversity and selection of Criterion 1 and 3.		
Holocene Shorelines and dune systems	There are currently three threatened wetland-dependent plant species mapped at the site.	In the absence of accurate mapping, a common sense approach has been adopted, setting a limit of acceptable change as the persistence of the following threatened species within the Logan Lagoon boundary: Swamp fireweed ( <i>Senecio psilocarpus</i> ) Large-fruit seatassel ( <i>Ruppia megacarpa</i> ) Northern leek orchid ( <i>Prasophyllum secutum</i> ) These three species are cryptic and therefore seasonally specific surveying will be required to identify them. Species should be observed during two out of every three surveys.
Threatened plant communities	Poor quality information on the current distribution and abundance of threatened plant communities because maps based on TASVEG	There are 14.22 hectares of threatened wetland-dependent vegetation communities at the site. Common sense would suggest no loss greater than 10 percent for each wetland type

Critical Component/Process / Service	Baseline / supporting evidence	Limit of acceptable change
	<p>Mapping Layers have not been ground-truthed. The areas of threatened wetland-dependent vegetation communities are:</p> <p>Saline aquatic herbland = 9.23 hectares</p> <p>Freshwater aquatic herbland = 1.28 hectares</p> <p>Lacustrine herbland = 3.71 hectares.</p>	<p>based on TASVEG mapping layers. Because the wetland map was made without proper ground-truthing, verification of areas will be required. Based on current estimates made for this ECD, the maximum areas of threatened wetland vegetation that could be lost before causing unacceptable change to the site are:</p> <p>Saline aquatic herbland: 0.9 hectares</p> <p>Freshwater aquatic herbland: 0.5 hectares</p> <p>Lacustrine herbland: 4 hectares.</p>
<p>Fauna: Logan Lagoon supports and large number of birds, many with conservation significance locally, nationally, and internationally which justifies the selection of Ramsar criteria 3, 4 and 6.</p>		
<p>Number of waterbird species counted at the site annually</p>	<p>Annual counts of waterfowl carried out at Logan Lagoon during February 1985 - 2009, excluding 1987, 1989, 1994 and 2008. The area counted varied among years and data are not comparable, making it difficult to detect population trends.</p>	<p>No LAC can be determined due to insufficient data. To be defined once population trends for waterfowl are clear from systematic annual counts.</p>
<p>Number of shorebirds recorded in annual surveys</p>	<p>There has been no systematic, long term monitoring of shorebirds within the Ramsar site to enable a numerical baseline to be set, although Birds Tasmania conducted counts along the ocean coastline of the site in 2008 and 2010, and is planning future work.</p>	<p>No LAC can be determined due to insufficient data. To be defined once population trends for shorebirds are clear from systematic annual counts.</p>
<p>Threatened mammals, reptiles, amphibians</p>	<p>Very little systematic data. Poor information on the current distribution and abundance of threatened species.</p>	<p>No LAC can be determined due to insufficient data. To be defined once systematic surveys undertaken for a range of species.</p>

#### 2.2.3.4 East Coast Cape Barren Islands Lagoons Ramsar Site

The East Coast Cape Barren Island Lagoons Ramsar site is located on the east coast of Cape Barren Island, one of the Furneaux Group of islands which lie in Bass Strait to the north-east of Tasmania. The site extends from just north of Tar Point down to Jamieson's Bay and extends westwards from the coast for a distance varying from one to four kilometres. The site meets two of the Ramsar Criteria: 1 and 3.

The East Coast Cape Barren Island Lagoons site is significant as it forms a representative sample of coastal lagoons in the Flinders Biogeographic Region and is relatively undisturbed. The Cape Barren Dunes, within the site, are a geoconservation site in Tasmania. Thirsty Lagoon is a hypersaline lagoon and is a Tasmanian estuary of critical conservation significance. Three of the lagoons within the site, Flyover Lagoon 1, Flyover Lagoon 2 and Little Thirsty Lagoon, have been assessed as near pristine wetlands for Tasmania, and are recognised Nationally Important Wetlands.

The critical components and processes for the site at the time of listing in 1982 have been determined to be geomorphology, hydrology and vegetation types. While there is some anecdotal evidence that this site is important for shorebirds, there is insufficient data to evaluate whether they are a critical component (DSEWPAC, 2008).

The Ramsar site is an important habitat for a number of plant species and vegetation communities. Thirteen threatened species listed in Tasmania occur on the site, including the Furze hakea and horny cone bush. The site represents the only known reserve in Tasmania for the threatened pink bladderwort. The White-bellied sea eagle, listed as vulnerable in Tasmania, and the Ruddy turnstone, listed under international migratory conservation agreements, also occur within the site.

This area is of cultural importance to the local Indigenous community, who manage the freehold title to part of Cape Barren Island, including the Ramsar site. Access is currently restricted, keeping the site largely undisturbed (DSEWPAC, 2008).

In the context of the Bass Strait Operations and predicted geographical extent of the DA, critical components that may be affected by a major spill event include estuarine waters, coastal brackish or saline lagoons, intertidal marshes, intertidal mud sand or salt flat and, threatened flora species.

The locality of the Ramsar site is shown in Figure 2-8. The critical components and processes of the East Coast Cape Barren Island Lagoons Ramsar and its limits of acceptable change are shown in Table 2-11.

Figure 2-8 Locality of East Coast Cape Barren Island Lagoons Ramsar site (DSEWPAC, 2008)

**Table 2-11 Summary of limits of acceptable change for the East Coast Cape Barren Island Lagoons Ramsar site (DSEWPAC, 2008)**

Critical ecological components, processes and services	Baseline condition and range of natural variation where known	Limit(s) of Acceptable Change* (based on baseline and natural variability)	Basis of LAC	Level of confidence
<p><i>Critical component</i> and process: Geomorphology and Hydrology</p> <p><i>Critical service:</i> Natural or near-natural wetland ecosystem</p>	<p>There is a diversity and range of Ramsar wetland types which are defined by their geomorphology and hydrology.</p> <p>There is an absence of information relating to the variability in extent and types of wetland around the time of listing</p>	<p>The areal extent of Ramsar wetland types does not change by <math>\pm 20\%</math>, i.e.</p> <ul style="list-style-type: none"> <li>• estuarine waters <math>\pm 20\%</math> from 200 hectares</li> <li>• intertidal marshes <math>\pm 20\%</math> from 44 hectares</li> <li>• coastal brackish/saline lagoons <math>\pm 20\%</math> from 375 hectares</li> <li>• intertidal mud sand or salt flats <math>\pm 20\%</math> from 55 hectares.</li> </ul>	<p>Based on aerial photograph interpretation and geomorphological mapping by Mowling (2007).</p>	<p>Low: Limited confidence in estimates of aerial extent. Limited data on changes to geomorphology, hydrology and vegetation types since time of listing (refer to Chapter 7 of ECD).</p>
<p><i>Critical component</i> and process: Hydrology</p> <p><i>Critical service:</i> Natural or near-natural wetland ecosystem</p>	<p>Hydrology as a critical component and service is linked to the geomorphology of the wetland.</p>	<p>As above, this LAC is linked to the geomorphology of the wetland.</p>	<p>As above</p>	<p>As above</p>
<p><i>Critical component</i> Vegetation types</p> <p><i>Critical service:</i> Natural or near-natural wetland ecosystem</p>	<p>Thirteen different Tasmanian wetland vegetation communities were identified within site which corresponds to six TASVEG communities.</p> <p>Sixteen flora species have been recorded on site that are threatened in Tasmania.</p> <p>Vegetation succession is an integral component of the ECCBIL wetlands such that some changes in vegetation communities are normal.</p>	<p>Maintenance of the extant TASVEG vegetation communities on site at time of listing i.e.</p> <ul style="list-style-type: none"> <li>• lacustrine herbland (AHL)</li> <li>• freshwater aquatic sedgeland and rushland (ASF)</li> <li>• freshwater aquatic herbland (AHF)</li> <li>• saline aquatic herbland (AHS)</li> <li>• saline sedgeland/rushland (ARS)</li> <li>• succulent saline herbland (ASS).</li> </ul>	<p>Based on the limited available vegetation data i.e. TASVEG mapping, the Kirkpatrick and Harwood (1981) survey and expert opinion.</p>	<p>Low: Not confident in the data and not confident that this will represent a change in ecological character. Limited information about the variability in extent and condition of the vegetation types since the time of listing is available. Difficult to describe baseline condition and variability (refer to Chapter 7 of ECD).</p>

\*Exceeding or not meeting a LAC does not automatically indicate that there has been a change in ecological character

### 2.2.3.5 Flood Plain Lower Ringarooma

The Flood Plain Lower Ringarooma River Ramsar site is located on the far north-east coast of Tasmania, between Cape Portland and Waterhouse Point and covers an area of 3519 hectares.

The Flood Plain Lower Ringarooma River Ramsar site is rare within the Drainage Division, as it is rare for large rivers in Tasmania to be flowing through flood plains and forming the mosaic of wetlands that the Ringarooma River does. The site contains good condition, regionally representative examples of wetland systems within a flood plain, with a mosaic of permanent and seasonal marshlands and a large river estuary (Boobyalla Inlet). Boobyalla Inlet is recognised as a Tasmanian estuary with high conservation significance.

The site meets Ramsar Criteria 1, 2, 3 and 4. It supports six fauna species listed as nationally threatened including four wetland dependant species. : green and gold frog (*Litoria raniformis*-Vulnerable) , dwarf galaxias (*Galaxiella pusilla* - Vulnerable), fairy tern (*Sterna nereis*- Vulnerable), Australian grayling (*Prototroctes maraena* - Vulnerable), Australasian bittern (*Botaurus poiciloptilus* - Endangered) and shiny grasstree (*Xanthorrhoea bracteata* - Endangered) (Newall and Lloyd, 2012a). The series of shallow freshwater lagoons at the site are an important feeding and nesting place for many species of waterbirds. A number of migratory birds have been recorded from the site, including eleven listed species.

The locality of the Ramsar site is shown in Figure 2-9. The critical components and processes of the Flood Plain Lower Ringarooma River site and its limits of acceptable change are shown in Table 2-12.

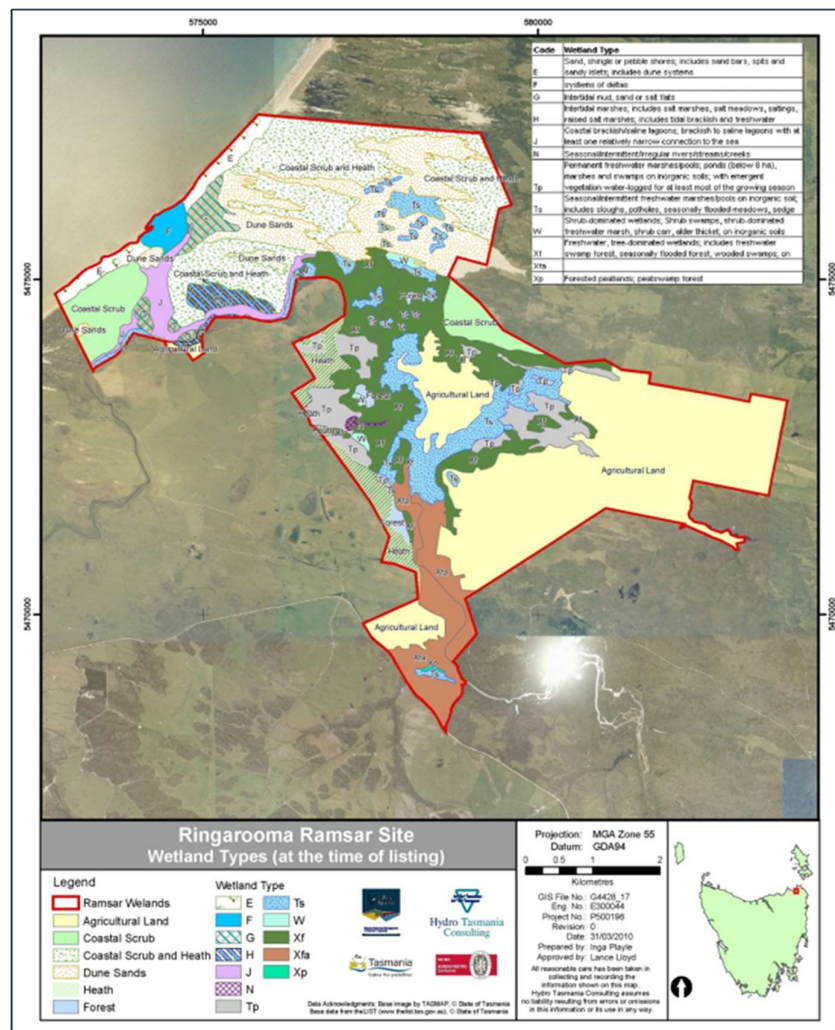

Figure 2-9 Locality and wetland type of Ringarooma Ramsar Site

**Table 2-12 Critical Components and Limits of Acceptable Change for the Flood Plain Lower Ringarooma River Ramsar Site.**

Critical Component, Process or Service	Baseline Information	Limits of acceptable change*	Confidence level	Justification and Comments
All Ramsar wetland types identified as being present at time of listing except Freshwater aquatic sedgeland and rushland (Ts) (service = supports Ramsar wetland types).	Using a vegetation survey (DPIW 2006), aerial photographs, and a site inspection, the following areas were identified for each wetland type (hectares): E = 74, F = 33 G = 58, H = 44 J = 74, N = 5 Tp= 169, W = 13 Xf = 614, Xp = 1	Not more than a 20 percent loss in area of any wetland type in nine out of 10 years. So that is, no more than: <ul style="list-style-type: none"> <li>• 15 hectares for E</li> <li>• 6.5 hectares for F o 12 hectares for G</li> <li>• 9 hectares for H</li> <li>• 15 hectares for J</li> <li>• 1 hectare for N</li> <li>• 34 hectares for xp</li> <li>• 2.5 hectares for W</li> <li>• 123 hectares for Xf</li> <li>• 0.2 hectares for Xp</li> </ul>	Medium – site specific measures of area are used: however, the 20 percent change is not quantitatively derived.	There are no data on the variability of the wetland habitat types and, until this ECD, there was no mapping of the wetland types. These limits have been set as a common sense approach to defining a significant change in the area of each wetland type. Monitoring into the future should incorporate changes to wetland type over time to refine this LAC.
Freshwater aquatic sedgeland and rushland (Ts) (service = supports Ramsar wetland types).	Using a vegetation survey (DPIW 2006), aerial photographs and a site inspection, an area of 257 hectares was identified as freshwater aquatic sedgeland and rushland at the time of listing.	No less than 298 hectares of freshwater aquatic sedgeland and rushland should be present at the site in nine out of 10 years. This represents 80 percent (for example a 20 percent loss) of the current area of this wetland type (373 hectares).	Medium – site specific measures of area are used: however, the 20 percent change is not quantitatively derived.	At listing, the site contained a large area of agricultural land (rough grazing) in Fosters Swamp. Grazing has subsequently ceased and the area allowed to regenerate into sedgeland and rushland, increasing the total area of this vegetation type to 373 hectares. There are no data on the variability of the wetland habitat type at the site and, until this ECD, there was no mapping of the wetland types. A limit of 20 percent has been set as a common sense approach to defining a significant change in the area of each wetland type. Monitoring into the future will refine this LAC.
Rare plant species (service = supporting populations important for regional biodiversity).	The only baseline information available is that four rare wetland dependent species were recorded as being at the site at the time of designation.	Presence in nine out of 10 years of: <ul style="list-style-type: none"> <li>• native gypsywort</li> <li>• erect marshflower</li> <li>• purple loosestrife</li> <li>• ribbon weed</li> </ul>	Low	There is no quantitative information on these species within the site. Therefore quantitative limits of acceptable change cannot be set and a qualitative LAC based on presence / absence of these four species is provided. Based on lack of data for the site, confidence in the LAC representing

rare bird species (service = support for rare or threatened species).	tern) is listed on the IUCN redlist.	<ul style="list-style-type: none"><li>• fairy tern</li><li>• pied oystercatcher</li><li>• red-capped plover</li></ul>		confidence in the LAC representing good indicator of change in ecological character is low.
Migratory fish species (service = support for a population at a critical stage of its life cycle).	The only baseline information available is that three migratory fish species occur at the site, one of which is the rare Australian grayling.	Presence in 2 out of 3 years of: <ul style="list-style-type: none"><li>• Tasmanian mudfish</li><li>• Tasmanian whitebait</li><li>• Australian grayling</li></ul>	Low	Again, no quantitative information on these species at the site. Therefore quantitative limits of acceptable change cannot be set and a qualitative LAC based on presence / absence of the species is provided. Based on lack of data for the site, confidence in the LAC representing good indicator of change in ecological character is low.

### 2.2.3.6 Moulting Lagoon Ramsar Site

Moulting Lagoon Ramsar site comprises of an estuarine and marine waters system and is influenced by freshwater inflows from two permanent fresh water rivers which are not within the site boundary. Moulting Lagoon is located on the east coast of Tasmania, between the townships of Bicheno and Swansea and 6 kilometres north-west of Coles Bay and the Freycinet Peninsular (both listed state reserves). The site covers approximately 4507 hectares and lies within the municipality of Glamorgan-Spring Bay. The entire area of the site is Crown Land and is contiguous with the Apsley Marshes Ramsar site. The site, plus several sections of coastal reserve surrounding it and an additional area of land to the north, is located within the Moulting Lagoon Game Reserve, under the management of the Tasmanian Parks and Wildlife Service. Moulting Lagoon discharges into Great Oyster Bay via a narrow entrance at the end of a long sand spit (DoEE, 2019a).

Moulting Lagoon meets Ramsar Criteria 1, 2, 3, 4 & 8. It supports large numbers and a high diversity of waterbirds including shorebirds and waders. Twenty-two species of resident and migratory waders have been recorded onsite, with nine species regularly using the area. The site supports a number of threatened species listed under the Tasmanian Threatened Species Protection Act 1995 (TSPA) including the white-bellied sea eagle (*Haliaeetus leucogaster*; vulnerable); eastern curlew (*Numenius madagascariensis*, endangered); and great-crested grebe (*Podiceps cristatus* vulnerable); 13 plant species and a number of saltmarsh communities. The estuary also supports substantial populations of fish and diverse floristic communities. Wetland vegetation is dominated by two key types: saltmarsh and seagrass. These vegetation associations are critical components of the site's ecological character playing central roles in the provision of physical habitat for aquatic species as well providing key food resources, particularly for the waterbirds including migratory species. Moulting Lagoon and the Apsley Marshes provide a linkage between the inland waters of the Apsley River and the Southern Ocean. Regular migrations of short-finned eels (*Anguilla australis*), both on their seaward migration to breed as well as returning juveniles, are reported (Hale and Butcher 2011). In addition, black bream (*Acanthopagrus butcheri*) are known to travel up the drains, via Moulting Lagoon into the Apsley Marshes Ramsar site in order to spawn. Australian grayling (vulnerable, EPBC Act and TSPA) have also been recorded in the river upstream and presumably would use the site as a migratory route during breeding (DoSEWPaC, 2011).

Moulting Lagoon has indigenous cultural significance as part of the lands were occupied by the Oyster Bay Tribe, which included most of the east coast from the Derwent estuary to the Fingal Valley and west inland to the Midlands. Currently only eight sites have been registered on the Tasmanian Aboriginal Site Index.

The locality of the Ramsar site is shown in Figure 2-10. The critical components and processes of the Moulting Lagoon site and its limits of acceptable change are shown in Table 2-13.

Figure 2-10 Locality of Moulting Lagoon and Apsley Marshes Ramsar Sites (Hale &Butcher, 2011).

**Table 2-13 Limits of Acceptable Change for the Moulting Lagoon Ramsar site**

Critical Component/ Process / Service	Baseline Information and Justification	Limit of acceptable change*	Confidence level
Hydrology	Moulting Lagoon receives freshwater inflows from the Swan and Apsley Rivers. The Department of Primary Industries, Parks, Water and Environment, Tasmania monitor flow events into Moulting Lagoon at stream gauges located at Swansea Grange and Apsley upstream at Coles Bay Road. This information is stored and accessible via WIST (The Water Information System of Tasmania). There is a relatively high degree of inter annual variability in inflows. For example, from 1968 to 1992 average daily flow during winter ranged from less than 10 megalitres a day to over 5000 megalitres a day (data from State of Tasmania 2010). The tidal influence and estuarine conditions that prevail in the site are critical to the character of the site. However, there is limited information other than tide heights for this source of water. The site supports a range of estuarine wetland types including intertidal mud and sand flats, and sea grass beds. However mapping and other information is insufficient to determine extent and variability at the time of listing. In the absence of sufficient data LAC are based on no change in hydrological wetland types.	No change in wetland hydrological types present within the site. That is, the following hydrological wetland types are maintained: <ul style="list-style-type: none"> <li>• Dominance of estuarine waters;</li> <li>• Presence of marine subtidal aquatic beds - seagrass beds;</li> <li>• Presence of sand bars, spits, dune systems;</li> <li>• Presence of intertidal mud, sand and salt flats;</li> <li>• Presence of intertidal saltmarsh and salt meadows; and</li> <li>• Presence of brackish to saline lagoons.</li> </ul>	M
Wetland vegetation- saltmarsh	Some mapping of plant communities has been undertaken as part of the TASVEG program; however extent of saltmarsh vegetation within the Ramsar site is considered a knowledge gap. As such a quantitative LAC for this component cannot be set and will require revision should such information become available.	No less than 90 percent of the extent of saltmarsh communities within the Ramsar site.	L
Wetland vegetation – seagrass	Detailed mapping of seagrass was completed by Mount et al. (2005) (for the Great Swanport estuary part of the site) and Lucieer et al. (2009) for Moulting Lagoon. The combined figures from these studies indicate 2200 hectares of Ruppia; 940 hectares of seagrass (mixed <i>Heterozostera tasmanica</i> and <i>Zostera muelleri</i> ) and 50 hectares of macroalgae.  The mapping is a single snap shot in time and does not provide an indication in variability. The LAC has therefore been based on an arbitrary figure of 25 percent reduction from baseline mapping.	No less than 1650 hectares of <i>Ruppia</i> and 700 hectares of seagrass ( <i>Heterozostera tasmanica</i> and <i>Zostera muelleri</i> ).	H
Wetland vegetation – threatened species	The Management Plan for the Moulting Lagoon Game Reserve (PWS 2007), which covers a larger area than the Ramsar site, indicates that 13 plant species listed under the Tasmanian Threatened Species Protection Act 1995 occur “in and around” the game reserve (Appendix 2). Moulting Lagoon is recognised as being important for the conservation of some of these species such as: large fruit sea tassel <i>Ruppia megacarpa</i> (rare) and the spreading watermat <i>Lepilaena patentifolia</i> (rare) both of which are marine angiosperms; southern swampgrass <i>Amphibromus neesii</i> (rare), which is found at Charlie Diglers Hole; and native broom <i>Viminaria juncea</i> , for which Moulting Lagoon is the only known Tasmanian population.	Continued presence of the following species within the Ramsar site: <i>Ruppia megacarpa</i> ; <i>Lepilaena patentifolia</i> <i>Amphibromus neesii</i> and <i>Viminaria juncea</i>	M

Critical Component/ Process / Service	Baseline Information and Justification	Limit of acceptable change*	Confidence level
	<p>However, how many of the 13 species occur within the Ramsar site and are important to the ecological character of the site remains unknown.</p> <p>The LAC is based on continued presence of those species currently known to occur in the site and for which the site has been recognised as important for their conservation.</p>		
Fish	Last (1993) recorded 36 fish species from Great Swanport estuary. Last also described habitat preferences for these species.	No less than 28 of recorded fish species (Last 1983) are present at least once every 10 years.	H
Waterbirds – abundance	<p>Three waterbird species have greater than one percent of their population occurring at the site on a regular basis. These species are a major reason for the site's Ramsar listing. Further reductions in population numbers may be beyond site management control, but it is vital to the site's ecological character that it still retains the quality and quantity of habitat required by waterbirds for foraging and breeding.</p> <p>Long-term regional trends for these species can be used to underpin the LAC. If trends in species counts move opposite to regional trends, this may indicate issues at the site, and might be used as a management trigger for these LAC.</p> <p>The LAC for individual species are provided for the intrinsic value of the species but also in part as a surrogate for the waterbird community as a whole.</p> <p>For black swan the 20th percentile+ as a minima of the current data (1992 to 2009, S. Blackhall data) has been used to derive the LAC as the species move into and out of the site on a seasonal basis.</p> <p>For pied oystercatcher and Pacific gull the 80th percentile+ of the current data (1992 to 2009, S. Blackhall data) has been used to derive the LAC.</p>	No less than 7000 black swan ( <i>Cygnus atratus</i> ) in eight out of 10 years.	H
		No less than 200 pied oystercatcher ( <i>Haematopus longirostris</i> ) in five out of 10 years.	H
		No less than 80 Pacific gull ( <i>Larus pacificus</i> ) in five out of 10 years	H
Waterbirds - breeding	Of the waterbirds which breed at the site, the most significant in terms of occurrence and abundance is the black swan, which breeds annually within the site.	Presence of black swan ( <i>Cygnus atratus</i> ) breeding within the site on an annual basis.	H
Supports near natural wetland types	Wetland types are maintained by hydrology and vegetation.	See LAC for hydrology and vegetation communities.	N/A
Physical habitat for waterbird (breeding, roosting and feeding).	Physical habitat for waterbirds is maintained through wetland types and can be indicated by the numbers of waterbirds supported by the site.	See LAC for hydrology, vegetation and waterbirds.	N/A
Provides drought refuge	Drought refuge is maintained by hydrology.	See LAC for hydrology.	N/A

<b>Critical Component/ Process / Service</b>	<b>Baseline Information and Justification</b>	<b>Limit of acceptable change*</b>	<b>Confidence level</b>
Supports biodiversity including threatened species	Biodiversity values of the site lie predominantly with the high diversity of wetland flora, waterbirds and fish and can be indicated by the species richness of these groups.	See LAC for vegetation, fish and waterbirds.	N/A
Ecological connectivity	Connectivity for fish migration is maintained through hydrological connections from Moulting Lagoon to inland freshwater wetlands via the Aspley River. While the LAC for hydrology partially addresses this service, it is important that physical connectivity is also retained and that obstructions to water flow are not introduced to the site	No barriers to hydrological connectivity between Moulting Lagoon and the Aspley River.	H

### 2.2.3.7 Apsley Marshes Ramsar Site

The Apsley Marshes Ramsar site is located on the east coast of Tasmania, within the Tasmanian Drainage Division (bioregion), 14 kilometres south west of the town of Bicheno (population in 2007; 640). The site covers approximately 880 hectares and lies within the municipality of Glamorgan-Spring Bay. The site is situated almost entirely within private (freehold) land and is contiguous with and inland of Moulting Lagoon Ramsar site (Refer Section 2.2.3.6, [Figure 2-10](#) above). It meets Ramsar Criteria 1, 2, 3, 4 & 8. The wetland has 82 native species of wetland plant; including six species that are considered rare or threatened within the bioregion and the nationally vulnerable swamp everlasting (*Xerochrysum palustre*) and ten wetland vegetation associations. There are 26 species of waterbird recorded including the internationally endangered Australasian bittern (*Botaurus poiciloptilus*). It is also a significant breeding site for black swans (*Cygnus atratus*); confirmed breeding of three additional species including the white-bellied sea-eagle and potential breeding of three more waterbird species (Hale & Butcher, 2011).

### 2.2.3.8 Western Port Ramsar Site

The Western Port Ramsar site situated in south-eastern Australia, approximately 60 km south-east of Melbourne, Victoria, occupies approximately 59,950 ha and consists of large shallow intertidal areas dissected by deeper channels, and a narrow strip of adjacent coastal land in some areas. The Ramsar site has long been recognised for its diversity of native flora and fauna, particularly for its ability to support diverse assemblages of waterbirds and wetland vegetation, including seagrass, saltmarsh and mangroves. As such, the site as listed in 1982 satisfies criteria 1a, 1b, 2, 3a, 3b, 3c, 4 and 8.

### 2.2.3.9 Little Waterhouse Lake Ramsar Site

Little Waterhouse Lake, part of the Waterhouse Point wetlands complex, is located seven kilometres south-west of Waterhouse Point, and lies between the towns of Bridport and Tomahawk on the north-east coast of Tasmania.

Little Waterhouse Lake is a good example of a coastal freshwater body in good condition in the Flinders Biogeographic Region. The site forms part of the Waterhouse Dunefield Geoconservation site, a system of current, active dunes moving over the top of much older longitudinal dunes, which developed at the height of the last glacial stage when Bass Strait was dry and arid.

### 2.2.3.10 Lavinia Ramsar Site

Lavinia Ramsar Site (7,034 ha) is situated on the northeast coast of King Island in Bass Strait. King Island lies between the north-west tip of Tasmania and Cape Otway in Victoria. The site is listed under Ramsar criteria 1, 2, 3 and 4 (Newall and Lloyd, 2012b). The site has 4 ecosystem units and the coastal components include estuarine waters, intertidal mud and marshes, saline/brackish lagoons and rocky/sand/shingle shores. The site is important for supporting regionally rare flora and fauna and providing habitat for ten migratory bird species listed under international agreements. It provides nesting habitat for waterbirds and seabirds including the threatened fairy tern and orange-bellied parrot. The vulnerable green and gold frog are also found at the site (Newall and Lloyd, 2012b).

### 2.2.3.11 Myall Lakes Ramsar site

The large area of 44,612 ha making up the Myall Lakes Ramsar site is entirely within the Port Stephens Great Lakes Marine Park (NSW) just to the north of Newcastle city on the NSW central coast. It supports a rich biodiversity, containing a range of undisturbed terrestrial and wetland vegetation communities with a large number of plant and animal species. The site's vegetation is particularly diverse, with 968 species of terrestrial and aquatic plants recorded, and vegetation communities ranging from littoral rainforest to forest, heath, grassland, swamp, mangrove, seagrass, submerged aquatic vegetation and emergent freshwater vegetation. It is listed under Ramsar criterion 1a, 1c, 2a and 3b. There are 22 species of shorebirds listed under migratory bird agreements (JAMBA, CAMBA and ROKAMBA) which use the site as roosting, feeding, nesting and breeding habitat. The lakes support 5 wetland dependent threatened species including the endangered, Australasian bittern, 3 vulnerable frog species and 1 endangered frog species (NSW OEH, 2012a).

#### 2.2.3.12 Hunter Estuary Wetlands Ramsar site

The Hunter Estuary Wetlands Ramsar site is comprised of two components, Kooragang is located in the estuary of the Hunter River, 7km north of Newcastle comprising of 3,388 ha and Hunter Wetlands Centre is a small, 42 ha complex approximately 2.5 km south west of the Kooragang (NSW OEH, 2012b). The site meets Ramsar criteria 2, 4 and 6. The site is extremely important as both a feeding and roosting site for a large seasonal population of shorebirds and as a waylay site for transient migrants. Over 250 species of birds have been recorded within the Ramsar site, including 45 species listed under international migratory conservation agreements. In addition, the Ramsar site provides habitat for the nationally threatened Green and Golden Bell Frog, Red Goshawk and Australasian Bittern (Brereton et al., 2010).

#### 2.2.3.13 Towra Point Nature Reserve Ramsar Site

Towra Point Nature Reserve Ramsar site consists of 386.5 hectares of wetlands that lie on the southern shore of Botany Bay, approximately 16 kilometres from Sydney city centre. The entire Ramsar site lies within Towra Point Nature Reserve (Refer Section 2.2.8.67). The site meets Ramsar criteria 2, 3, 4 & 8. Towra Point is a critical roosting and feeding habitat for large numbers of migratory shorebird species and a significant nesting site for the endangered little tern (*Sterna albifrons*). The mangroves and seagrass provide protection and food for juvenile fish species. Studies have shown that a higher abundance and diversity of fish species are found in areas of mangrove and saltmarsh which are adjacent to seagrass than are found in isolated communities. The release of crab larvae from saltmarsh areas during spring ebb tides provides a reliable source of food for a variety of fish species and a critical link in the estuary's food web. Towra Point is important in providing ecological connectivity for itinerant species, and is important for maintaining biodiversity in the greater Sydney region. Threats to the site include its proximity to one of the largest ports in eastern Australia; alterations to the shoreline, hydrology and bathymetry of Botany Bay causing increased wave energy on the southern side of the bay; residential and industrial development within the catchment; invasive species; and the impacts of climate change including sea level rise (DECCW, 2010).

#### 2.2.3.14 Elizabeth and Middleton Reefs Ramsar Site

Elizabeth and Middleton Reefs are located in the northern Tasman Sea, 630 km east of Coffs Harbour (NSW); 690 km east-southeast of Brisbane (Queensland); and 150 km north of Lord Howe Island. Elizabeth and Middleton Reefs are a pair of isolated oceanic platform reefs separated from one another by 45 km of deep oceanic waters and together they represent the southern-most platform reefs in the world. Elizabeth Reef measures 8.2 km by 5.5 km and Middleton Reef, slightly larger but of a similar shape, at 8.9 km by 6.3 km. The site is listed under Ramsar criteria 1, 2, 3, 4 and 8.

Critical Services provided by this site are:

- It is representative of a unique ecosystem in the bioregion: southern-most open ocean coral reef platform in the world;
- It supports threatened species: Green turtle (*Chelonia mydas*) (feeding habitat only, no nesting);
- It supports regionally high species diversity: fish; coral communities; molluscs; and sea cucumbers (beche-de-mer).
- It supports animal taxa at a vulnerable or critical stage of their lifecycle, particularly the Galapagos Shark (*Carcharinus galapagensis*)(likely nursery ground); and,
- It supports the last known large population of Black Cod (*Epinephelus daemeli*).

The threats to this site are the Crown of Thorns starfish which is present at the reefs however its distribution and abundance is not well known. Other threats are illegal fishing of Black Cod and other species (including for the aquarium trade), coral bleaching due to thermal changes in temperature and also water quality changes from pollution (DEWHA, 2006).

#### 2.2.3.15 Moreton Bay Ramsar Site

The Moreton Bay Ramsar site is located in and around Moreton Bay, north-east, east and south-east of the city of Brisbane, in the state of Queensland. The site is 1,206 km<sup>2</sup> and includes most of Moreton Island, and parts of North and South Stradbroke Islands, Bribie Island, the southern Bay Islands, inclusive of the National Parks and Marine Parks in those areas. It is notable for its large size, diversity of wetland habitats, connectivity between wetland types, as well as diverse flora and fauna that includes

threatened species and ecological communities. It contains seagrass, sandy and muddy tidal flats and subtidal areas, saltmarsh, mangroves and coral communities, freshwater wetlands, as well as ocean beaches and dunes. The site is listed under all nine of the Ramsar criteria (RSIS, 2019).

Critical Services provided by this site are:

- It includes one of the most extensive intertidal areas of seagrass, mangrove and saltmarsh communities on the eastern coast of Australia, and is valuable for supporting fisheries resources, waterbirds and marine megafauna of conservation significance.
- It regularly supports more than 50,000 waterbirds, representing at least 43 species of shorebirds and at least 28 migratory shorebird species. The site is recognised as a network site under the East Asian Australasian Flyway Partnership and supports at least nine migratory shorebird species, including the critically endangered eastern curlew (*Numenius madagascariensis*) and curlew sandpiper (*Calidris ferruginea*).
- It supports a range of internationally, nationally, state and locally significant species including the Oxleyan pygmy perch fish, four species of acid frogs, the water mouse, Illidge's ant-blue butterfly, and several freshwater invertebrates.
- The site provides important cultural, social, economic and recreational values

Conservation measures focus on managing water quality from human, agricultural, industrial and commercial threats.

#### 2.2.3.16 Great Sandy Strait Ramsar Site

Great Sandy Strait (including Great Sandy Strait, Tin Can Bay and Tin Can Inlet) is a sand passage estuary between the mainland and the World Heritage-listed Fraser Island. It covers an area of approximately 837 km<sup>2</sup>. The site is listed under Ramsar criteria 1, 2, 3, 5, 6 and 8 (RIS, 1999).

Critical Services provided by this site are (DAWE, 2020a):

- It is an outstanding example of a sand passage estuary and is in a relatively undisturbed state. Large, well developed expanses of sand and mud flats, salt flats, mangroves and seagrass beds are widespread along the Strait.
- It provides feeding grounds that are frequently or occasionally used by six species of threatened marine turtle, the Green Turtle, Loggerhead Turtle, Hawksbill Turtle, Flatback Turtle, Leatherback Turtle and Pacific Ridley Turtle. Other threatened species that occur in the site include the Dugong, Humpback Whale, Water Mouse, Illidge's Ant Blue Butterfly, and the Oxleyan Pygmy Perch
- It supports at least 38 species of shorebirds, 104 species of fish, 27 species of molluscs, hard & soft coral species, 11 species of mangrove, and seven species of seagrass. The mangrove communities within the Strait represent a transition between essentially temperate and tropical species
- Wetlands along Great Sandy Strait regularly support in excess of 20,000 migratory shorebirds and support more than 1% the total world population of the Eastern Curlews, Grey-tailed Tattlers, Lesser Sand Plovers, Terek Sandpipers, Whimbrels, Bar-tailed Godwits, Pied Oystercatchers, Greenshanks, and Grey Plovers
- The tidal wetlands are extremely important for protection of, and source of food for, juvenile and adult fish, prawns and other crustaceans. It is highly valued for commercial and recreational fishing.

Great Sandy Strait is located close to regional population centres (Maryborough and Hervey Bay) that are rapidly growing and causing development pressures to the site including increased water extraction, clearing of land and seagrass disturbance, landfill and dredging and pressures from expanding agriculture (RIS, 1999).

#### 2.2.4 Threatened Ecological Communities

Ecological communities are a group of native flora, fauna and other organisms that naturally occur together and interact in a unique habitat. Their structure, composition and distribution are determined by environmental factors such as soil type, location (e.g. altitude/depth), climate, and water availability, chemistry and movement (e.g. oceanic currents) and thereby changes to any one or a combination of these factors threatens the viability of the community. Species within each ecological community

interact with and depend on each other for survival. Ecological communities are important because of their unique combination of native biodiversity, distinctive landscape/seascape values, vital habitat qualities and for the ecosystem services they provide. There are eight types of listed threatened ecological communities (TECs) within the DA.

#### **2.2.4.1 Giant Kelp Marine Forests of South East Australia**

The 'Giant Kelp Marine Forests of South East Australia' is listed as an endangered TEC under the EPBC Act. Kelps are very large brown algae that grow on hard sub tidal substrates in cold temperate regions. Kelps have a holdfast that attaches to the substrate, a stem-like or trunk-like stipe, and large, flattened, leaf-like blades called fronds. Because kelps require constant water motion to provide nutrients, they are located in relatively high-energy settings. Kelp forests support a diverse animal community of fish, invertebrates, and marine mammals as well as important algal communities (NOAA 2010). The ecological community is characterised by a closed to semi-closed surface or subsurface canopy of *Macrocystis pyrifera*, and extends between the ocean floor and ocean surface, exhibiting a 'forest-like' structure with a diverse range of organisms occupying its benthic, pelagic and upper-canopy layers (TSSC 2012). *M. pyrifera* is the only species of kelp to provide this three-dimensional structure from the sea floor to the sea surface (TSSC 2012). This ecological community occurs on rocky substrate along the east and south coastlines of Tasmania; some patches may also occur in the coastal waters of western and northern Tasmania, south eastern South Australia, and Victoria (TSSC 2012).

The high primary and secondary productivity of the giant kelp forests create and provide a number of ecosystem services to the local environment including settlement habitat for juvenile life stages of commercially important fisheries, improvements in local water quality conditions and coastal protection via buffering strong wave conditions from reaching the shore (TSSC 2012).

The key threats affecting the ecological community include increasing sea surface temperatures, changes in nutrient availability in warmer waters, changes in weather patterns and large scale oceanographic conditions, and associated range expansion of invasive species (TSSC 2012). Other threats include impacts on water quality from land-based activities and aquaculture and potential loss from catastrophic storm events (TSSC 2012). Figure 2-11 shows the distribution of the Giant Kelp Marine Forests of south east Australia.

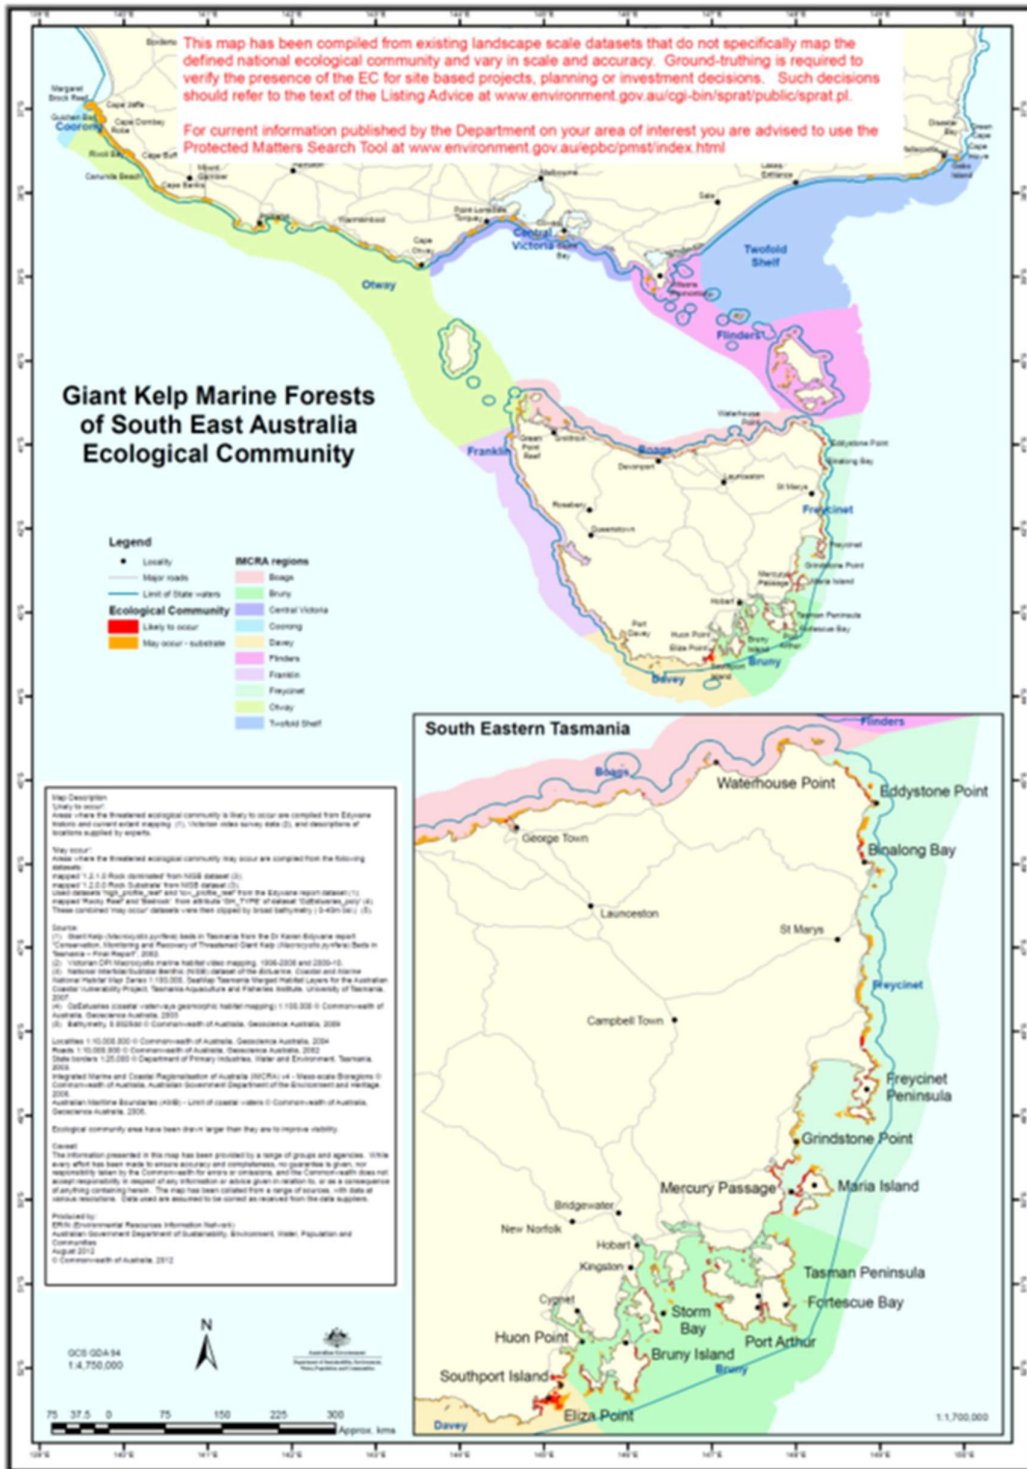

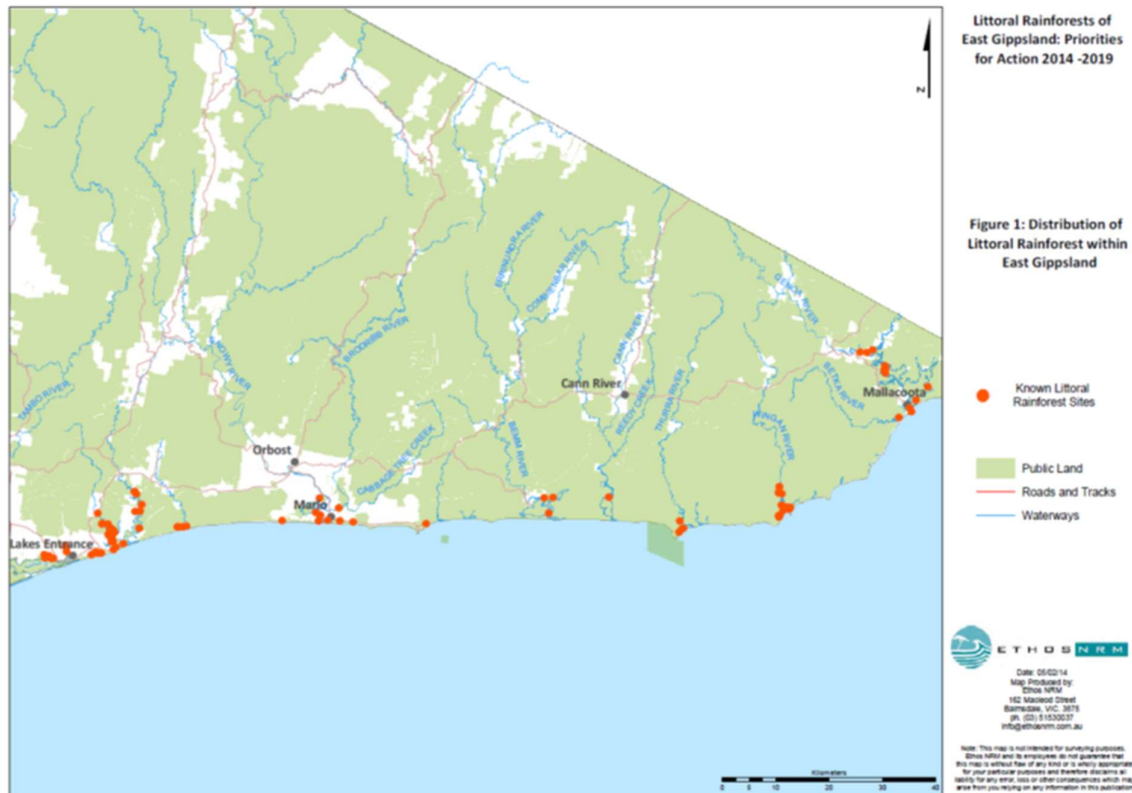

Figure 2-11 Distribution of Threatened Ecological Communities - Giant Kelp Marine Forests of South East Australia

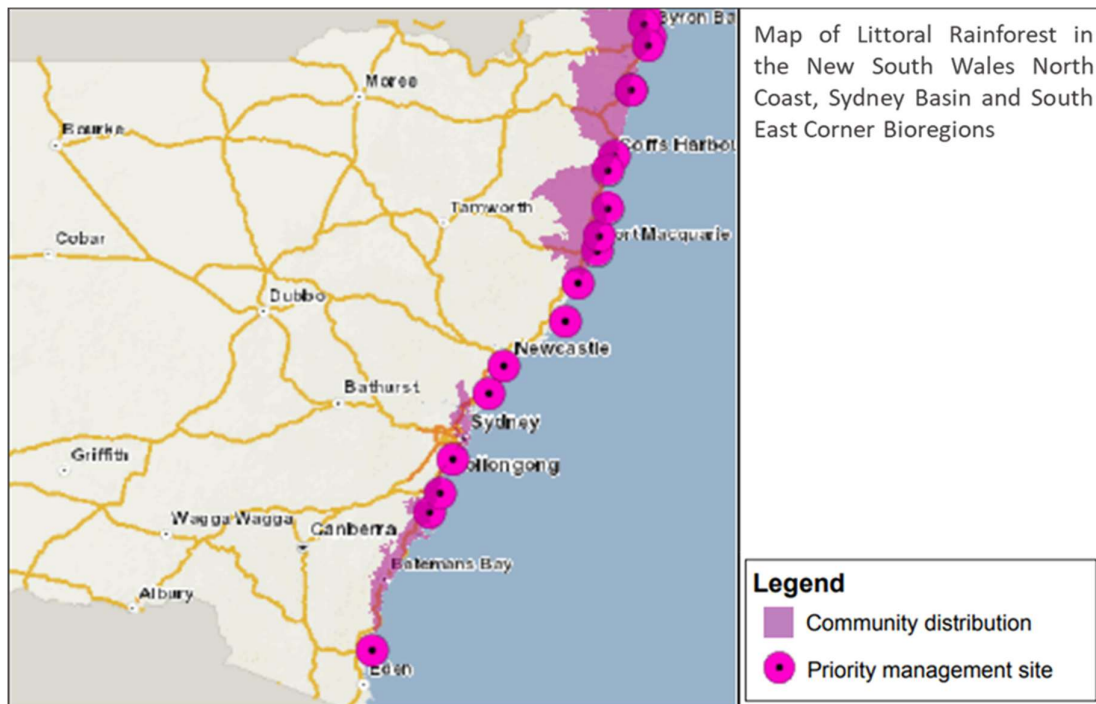

### 2.2.4.2 Littoral Rainforest and Coastal Vine Thicket

The 'Littoral Rainforest and Coastal Vine Thickets of Eastern Australia' is listed as a critically endangered TEC under the EPBC Act. The ecological community is a complex of rainforest and coastal vine thickets on the east coast of Australia influenced by its proximity to the sea; and provides habitat for over 70 threatened plants and animals and provides important stepping stones along the eastern Australian coast for various migratory and marine birds (DoE&PI, 2014). It also provides an important buffer to coastal erosion and wind damage (TSSC, 2015a; DoEE, 2017s).

The ecological community occurs as a series of naturally disjunct and localised stands within two kilometres of the eastern coastline of Australia or adjacent to a large saltwater body, such as an estuary on a range of landforms including dunes and flats, headlands and sea-cliffs, including offshore islands, from Princess Charlotte Bay, Cape York Peninsula to the Gippsland Lakes in Victoria (TSSC, 2015a). Figure 2-12 shows the detailed distribution of Littoral Rainforest within East Gippsland. Figure 2-13 shows the distribution of Littoral Rainforest in New South Wales.

**Figure 2-12 Distribution of Threatened Ecological Communities - Littoral Rainforest within East Gippsland (Vic DoE&PI, 2014 Littoral Rainforests of East Gippsland: Priorities for Action 2014-2019)**

**Figure 2-13 Distribution of Threatened Ecological Communities - Littoral Rainforest in NSW (NSW OEH, 2017)**

### 2.2.4.3 Subtropical and Temperate Coastal Saltmarsh

The 'Subtropical and Temperate Coastal Saltmarsh' is listed as a vulnerable Threatened Ecological Community (TEC) under the EPBC Act, and its known distribution includes the southern and eastern coasts of Australia (Figure 2-14). The Subtropical and Temperate Coastal Saltmarsh ecological community occurs within a relatively narrow margin along the Australian coast, within the subtropical and temperate climatic zones; and includes coastal saltmarsh occurring on islands within these climatic zones (TSSC, 2013a). The physical environment for the ecological community is coastal areas under regular or intermittent tidal influence (TSSC, 2013a).

The ecological community consists mainly of salt-tolerant vegetation (halophytes) including: grasses, herbs, sedges, rushes and shrubs (TSSC, 2013a). Many species of non-vascular plants are also found in saltmarsh, including epiphytic algae, diatoms and cyanobacterial mats (TSSC, 2013a). The ecological community is inhabited by a wide range of infaunal and epifaunal invertebrates, and temporary inhabitants such as prawns, fish and birds (and can often constitute important nursery habitat for fish and prawn species) (TSSC, 2013a). Insects are also abundant and an important food source for other fauna, with some species being important pollinators (TSSC, 2013a). The dominant marine residents are benthic invertebrates, including molluscs and crabs that rely on the sediments, vascular plants, and algae, as providers of food and habitat across the intertidal landscape (TSSC, 2013a).

The key threats affecting the ecological community include: clearing and fragmentation, infilling, altered hydrology/tidal restriction, invasive species, climate change, mangrove encroachment, damage from recreational activities, pollution (including oil spills), eutrophication, acid sulphate soils, grazing, insect control, salt and other mining activities, and inappropriate fire regimes (TSSC, 2013a).

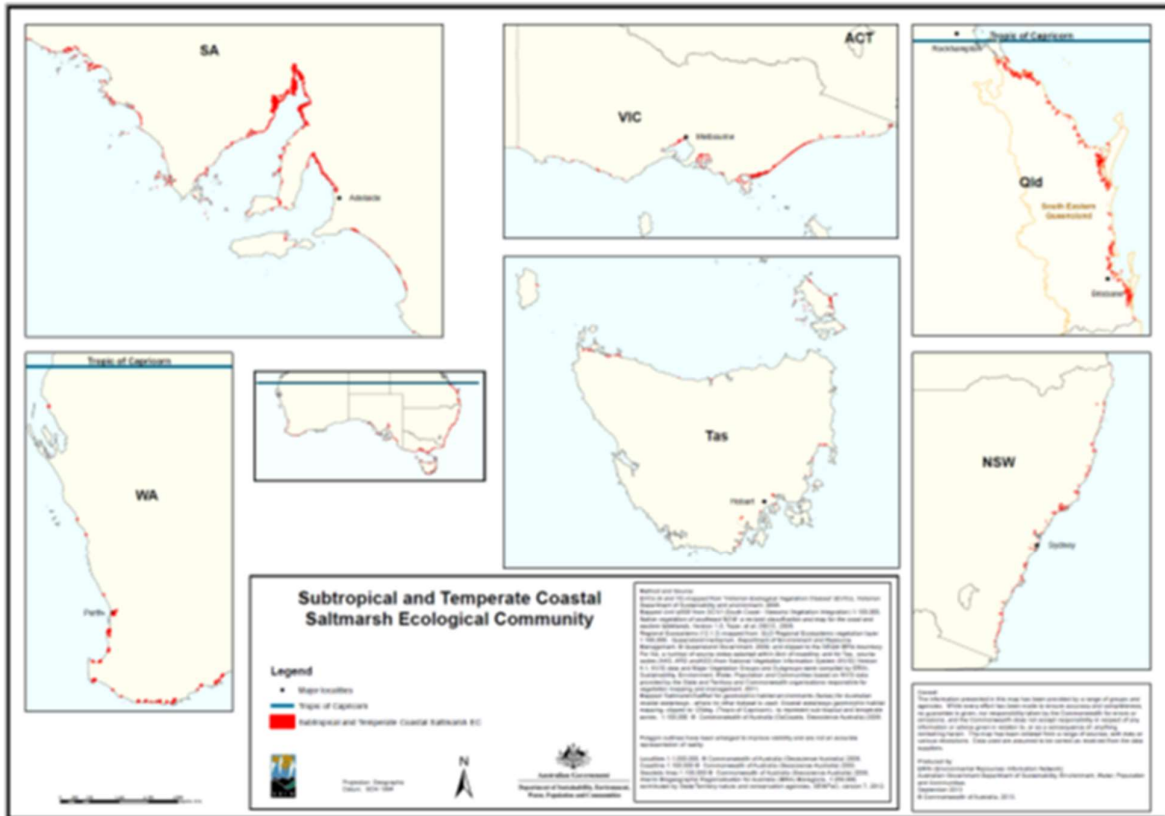

Figure 2-14 Distribution of the TEC Subtropical and Temperate Coastal Saltmarsh

#### 2.2.4.4 Assemblages of Species Associated with Open-coast Salt-wedge Estuaries of Western and Central Victoria Ecological Community

This ecological community is the assemblage of native plants, animals and micro-organisms associated with the dynamic salt-wedge estuary systems that occur within the temperate climate, microtidal regime (<2 m), high wave energy coastline of western and central Victoria. The ecological community currently encompasses 25 estuaries in the region defined by the border between South Australia and Victoria and the most southerly point of Wilsons Promontory (DoEE, 2018). Some assemblages of biota are dependent on the dynamics of salt-wedge estuaries for their existence, refuge, increased productivity and reproductive success.

The ecological community is characterised by a core component of obligate estuarine taxa, with associated components of coastal, estuarine, brackish and freshwater taxa that may reside in the estuary for periods of time and/or utilise the estuary for specific purposes (e.g. reproduction, feeding, refuge, migration) (DoEE, 2018).

Salt-wedge estuaries are typically ecosystems of high ecological value which are increasingly under threat. They contribute high levels of productivity to coastal and nearshore marine environments, and provide important refuge, nursery or breeding habitat for a wide range of invertebrates, fish and birds. Many Victorian estuaries also support rare and threatened flora and fauna, in addition to internationally significant bird species, such as the hooded plover and eastern curlew.

Although the adjacent marine waters outside the estuary mouth are considered a buffer zone and not part of the TEC, they are considered critical to the survival of the TEC.

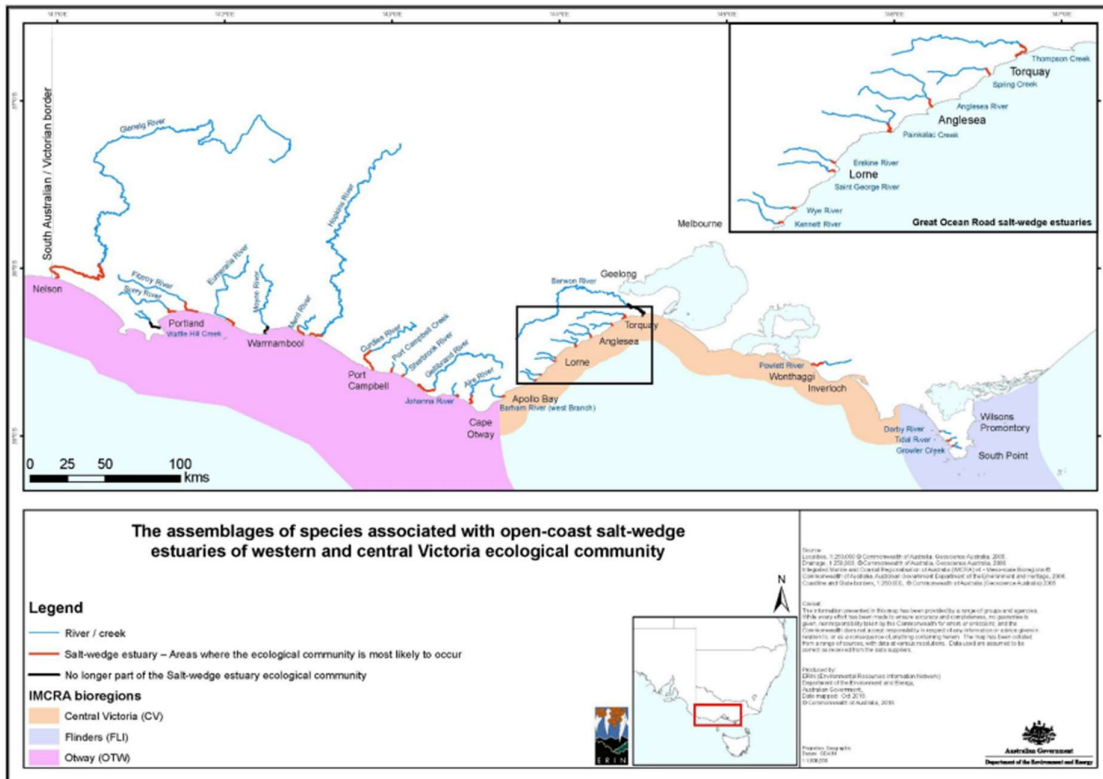

Figure 2-15 Distribution of the TEC open-coast salt-wedge communities

### 2.2.4.5 Coastal Swamp Oak (*casuarina glauca*) Forest of New South Wales and South East Queensland Ecological Community

This TEC occurs along South East Corner bioregions of NSW in coastal catchments at elevations up to 50 m ASL, typically less than 20 m ASL, on coastal flats, floodplains, drainage lines, lake margins, wetlands and estuarine fringes where soils are at least occasionally saturated, water-logged or inundated. It does not occur on rocky headlands, sea cliffs or other consolidated sediments. Coastal Swamp Oak Forest is often found in association with other vegetation types such as coastal saltmarsh and mangroves.

The vegetation of the Coastal Swamp Oak Forest provides diverse habitat values and is a source of food for a wide range of fauna, particularly the crevices and hollows within older trees. Most fauna species that form a part of the Coastal Swamp Oak Forest also inhabit adjacent wetlands, grasslands, woodlands and forests. Many fauna species within the ecological community are listed as threatened under State and/or Commonwealth legislation and include small mammals, reptiles, invertebrates, amphibians and birds. Coastal Swamp Oak Forest is not a primary habitat for waterbirds. (DoEE 2018).

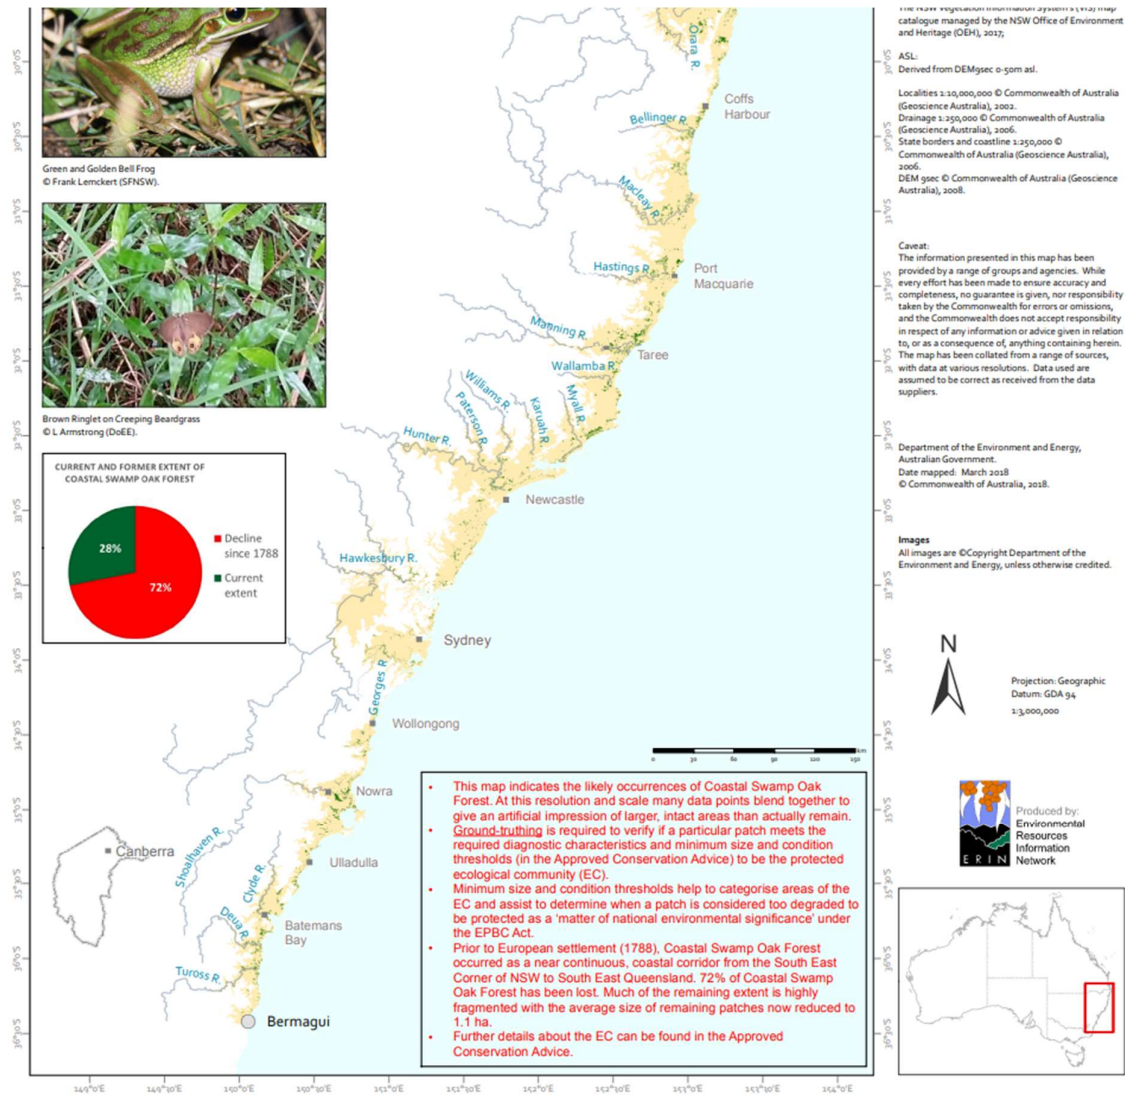

Figure 2-16 Distribution of the TEC Coastal swamp oak forest of NSW (extract only)

### 2.2.4.6 Coastal Upland Swamps in the Sydney Basin Bioregion

This TEC includes a range of vegetation and fauna associated with periodically waterlogged soils on the Hawkesbury sandstone plateaux (DoE 2014). This TEC is endemic to NSW, present in the eastern part of the Sydney Basin, occurring primarily on poorly permeable sandstone plateaux in low relief headwater valleys of streams and on sandstone benches with abundant seepage moisture. Majority of the swamps exist at elevations of 200-450 metres ASL. However, the elevation of some swamps in the region can vary from as low as 20 metres to around 600 metres ASL (DoE, 2014).

The TEC is characterised by highly diverse and variable mosaics of vegetation depending on soil conditions, size of the site, recent rainfall conditions, fire regimes and disturbance history. The swamps also provide habitat for a wide range of fauna permanently or as transients (DoE, 2014).

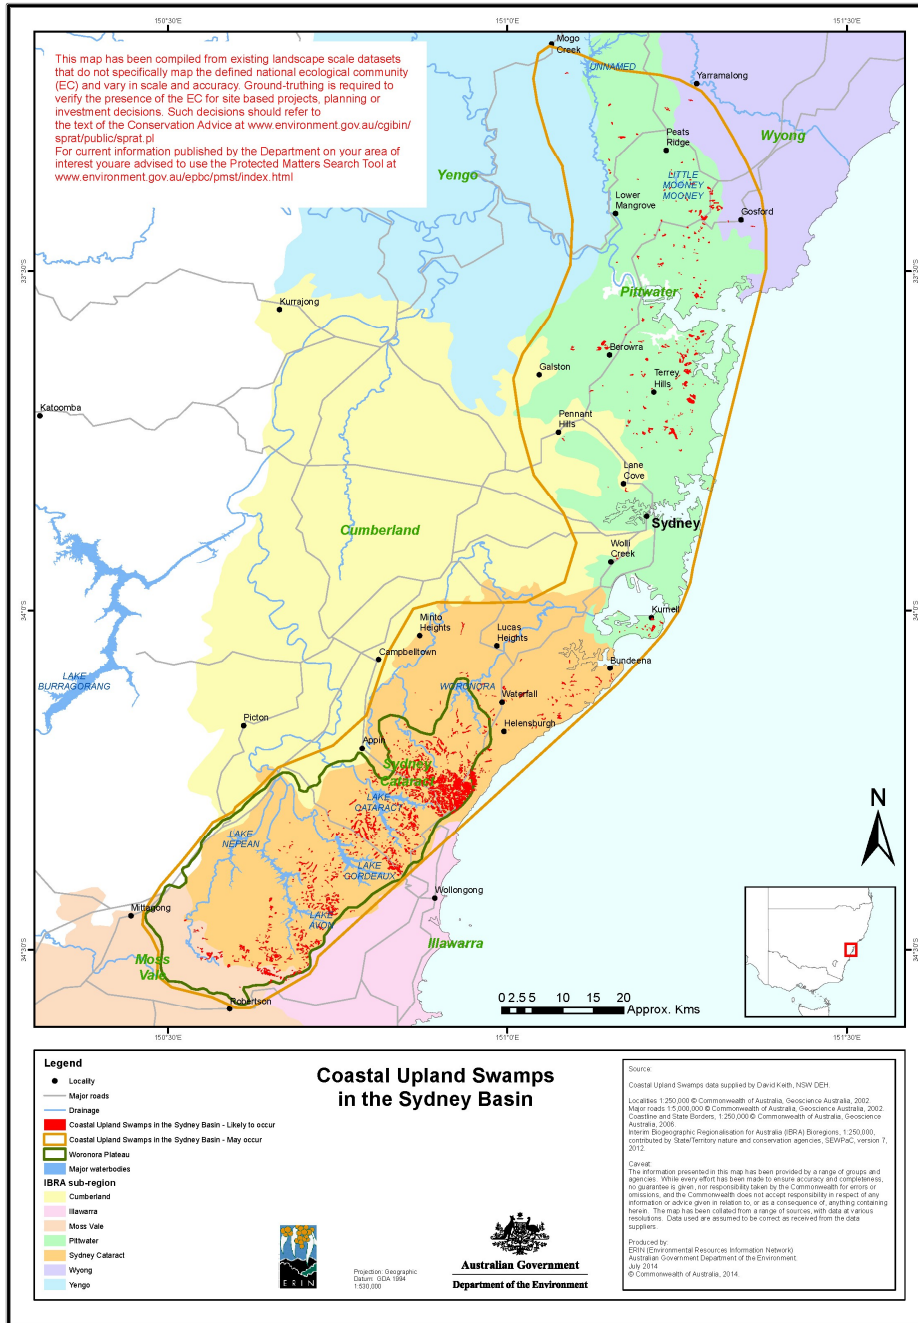

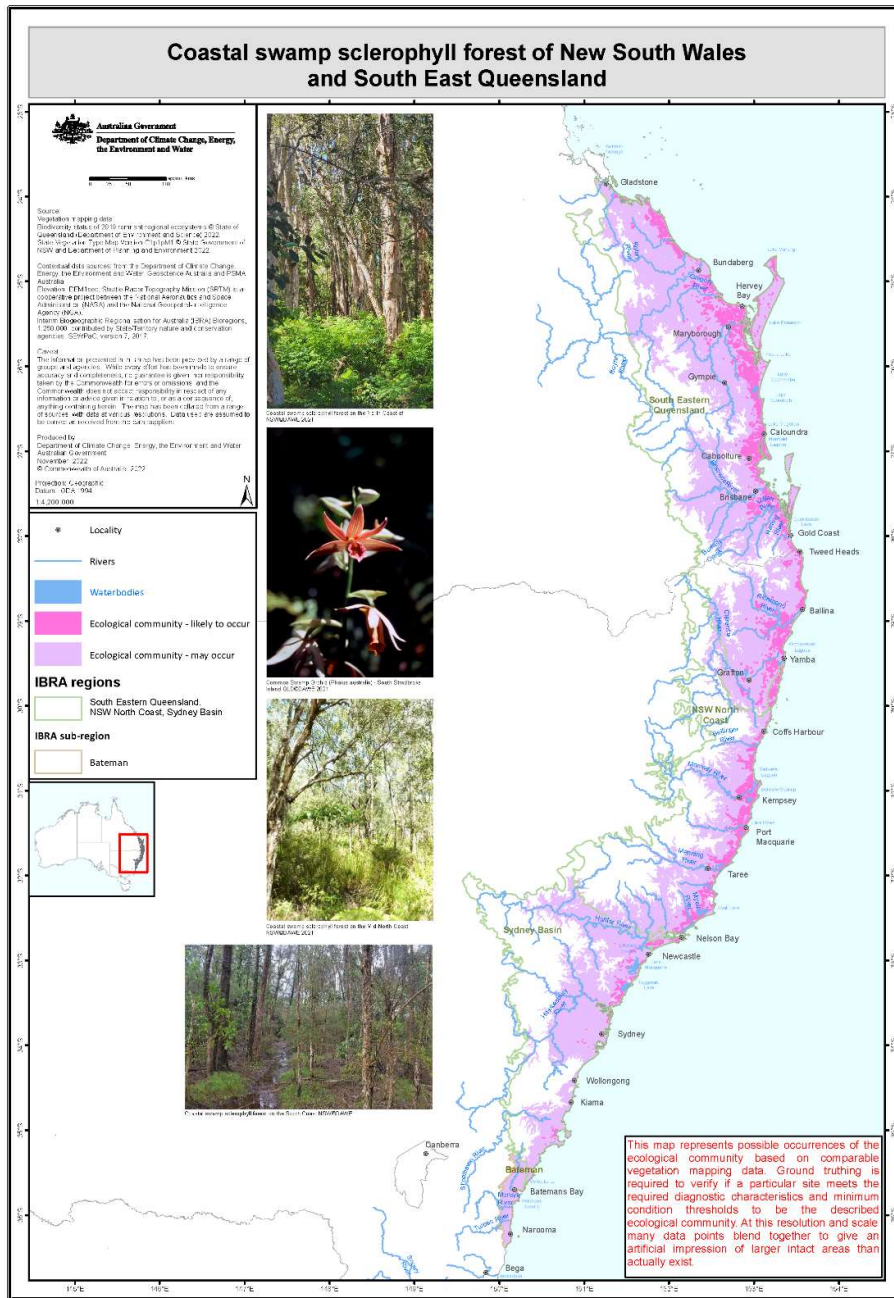

Figure 2-17 Distribution of the TEC Coastal Upland Swamps in the Sydney Basin Bioregion

### 2.2.4.7 Coastal Swamp Sclerophyll Forest of New South Wales and South East Queensland

This TEC includes the plants, animals and other organisms typically associated with forested palustrine wetlands, or swamp forests. This TEC is found in the temperate to subtropical coastal valleys between the Great Dividing Range and the coastline from near Gladstone in QLD, through to the south coast of NSW (DCCEE, 2021). Present in low-lying coastal alluvial areas with minimal relief at elevations below 20m ASL but may occur occasionally up to 220m ASL (DCCEE, 2021).

This TEC often has a layered canopy, dominated by melaleucas and/or *Eucalyptus robusta*. This TEC supports a range of aquatic, ground dwelling and arboreal species.

**Figure 2-18 Distribution of the TEC Coastal Swamp Sclerophyll Forest of New South Wales and South East Queensland**

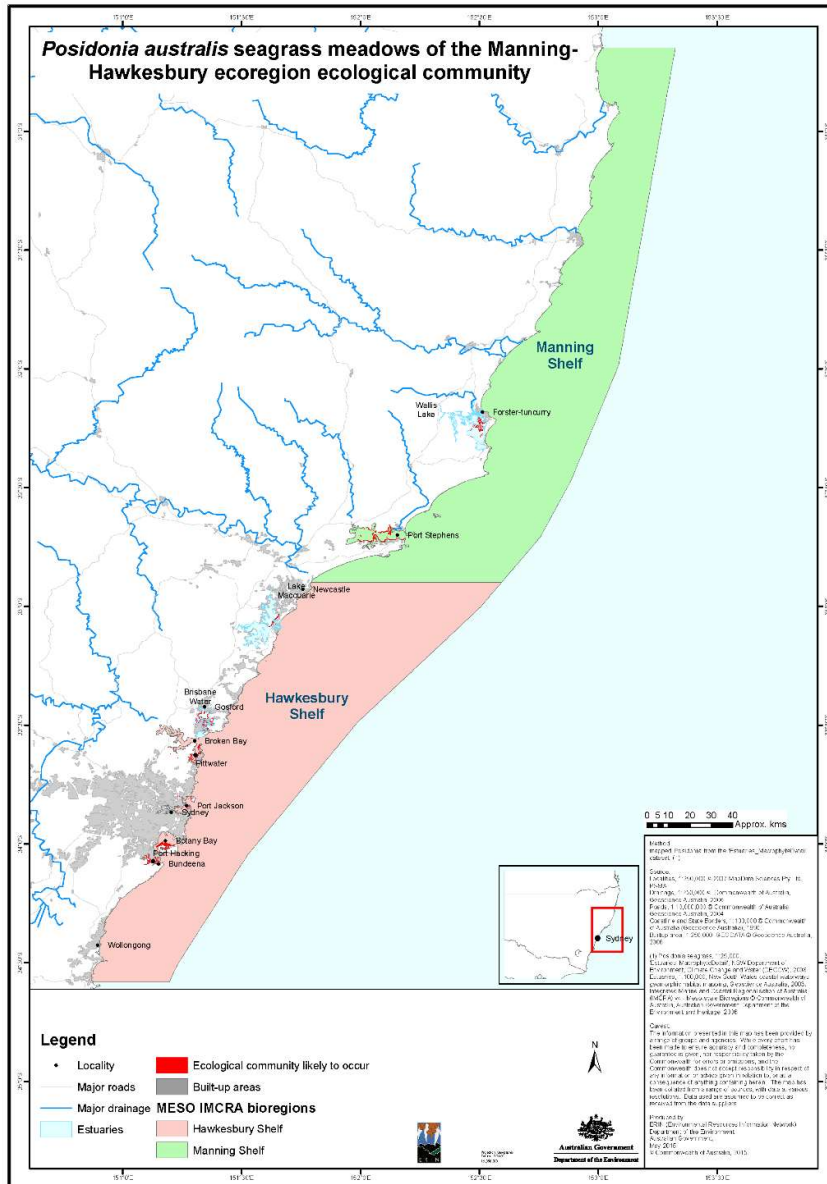

**2.2.4.8 Posidonia australis seagrass meadows of the Manning-Hawkesbury ecoregion**

This TEC comprises of plants, animals and micro-organisms associated with seagrass meadows dominated by *Posidonia australis* occurring in the warm temperate Manning Shelf and Hawkesbury Shelf bioregions (NSW) from Wallis Lake to Port Hacking (DoE, 2015). This TEC mainly occurs within

sheltered environments of permanently open estuaries, typically in subtidal waters at depths ranging less than 1m to 10 m on sand and silty mud substrate (DoE,2015).

The wide strap-like leaves of *Posidonia australis* provides substrate for a diverse collection of benthic flora. *Posidonia australis* is believed to provide the greatest habitat structure of any of the seagrass species found in NSW, supporting an abundance of fauna.

**Figure 2-19 Distribution of the TEC *Posidonia australis* seagrass meadows of the Manning-Hawkesbury ecoregion**

### 2.2.5 Commonwealth Marine Areas

Six marine regions have been identified in Commonwealth waters around Australia. Marine bioregional planning is designed to better protect marine environments, conserve biodiversity and deliver greater certainty to resource users and decision-makers about the marine conservation priorities of the Australian Government. The majority of the DA lies within the South-east Marine Region. A portion of

the north-eastern section of the DA overlaps with the Temperate East Marine Region (Refer Figure 2-20 in Section 2.2.6 below).

The key conservation values of the South-east Marine Region are:

- Features with high biodiversity and productivity, such as the east Tasmania subtropical convergence zone, Bass Cascade, Upwelling east of Eden, Seamounts south and east of Tasmania and Bonney coast upwelling.
- Breeding and resting areas for Southern right whale.
- Migration areas for Blue, Fin, Sei, Southern right and Humpback whales.
- Foraging areas for Australian sea-lion, White shark, Harrison's dogfish, Killer and Sei whales, Australasian gannet, Fairy prion, Black-faced cormorant, Little penguin, Crested tern, and several species of seal, penguin, albatross, petrel, shearwater and gulls.
- Wrecks of MV City of Rayville, SS Cambridge and ketch Eliza Davies.
- 10 provincial bioregions and 17 seafloor types are represented in the network (DoEE, 2015a)

The Temperate East Marine Region spans an area of approximately 1.4 million square kilometres from the southern boundary of the Great Barrier Reef in Queensland to Bermagui in Southern New South Wales. The key conservation values of the Temperate East Marine Region relevant to the DA are:

- Features with high biodiversity and productivity such as the Canyons of the Eastern Continental Slope and Shelf rocky reefs
- Nesting sites for listed seabirds on islands along the NSW coast, including Montague Island (Short-tailed shearwater, Sooty shearwater)
- Breeding sites for Little penguin, shearwater, Wilson's storm petrel, Crested tern
- Migration areas for Humpback whale
- Breeding sites for Indo-Pacific Bottlenose Dolphin
- Foraging sites for several species of petrel, albatross, shearwater
- 3 provincial bioregions

### 2.2.6 Australian Marine Parks

Australian Marine Parks have been established in Commonwealth waters for to contribute to the long term conservation of marine ecosystems and protect marine biodiversity found in them, while also allowing for sustainable use of natural resources. The Australian Marine Parks are protected areas.

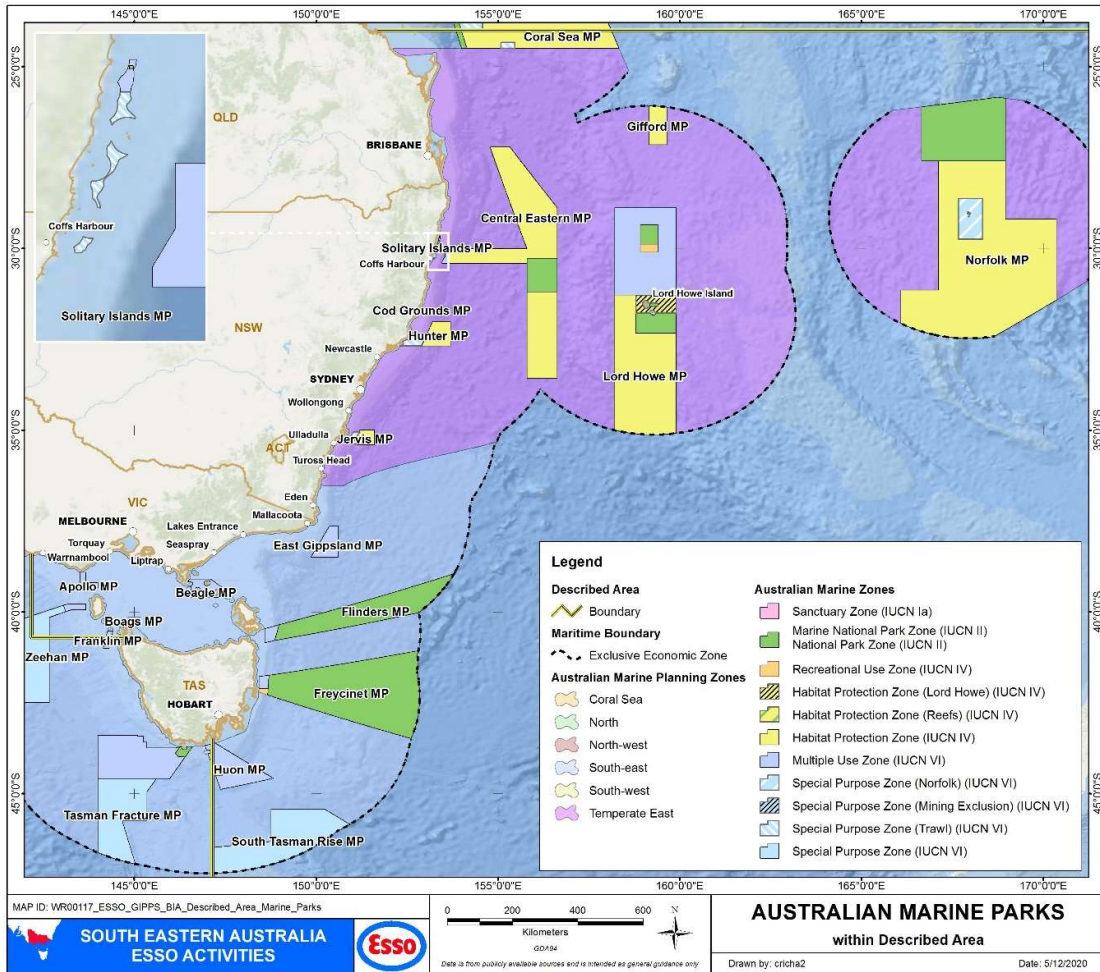

Figure 2-20 Australian Marine Parks within the DA

### 2.2.6.1 East Gippsland Marine Park

The East Gippsland Marine Park (4,137 km<sup>2</sup>) is off the north-east corner of Victoria, on the continental slope and escarpment and the closest of the Marine Parks to the EGBPA. The full area of the Marine Park is designated as a multiple use zone (IUCN VI).

The East Australian Current funnels warm waters through the marine park over the complex seafloor features causing eddies to form off Cape Howe. This results in conditions in which phytoplankton flourish, thereby attracting and supporting an abundance of marine life. The main features of the seafloor are the continental shelf, the steep escarpments and deep canyons.

Details of the East Gippsland Marine Park are listed in Table 2-14 (DNP, 2013). The full extent of the East Gippsland Marine Park occurs within the DA (Figure 2-20); as such all conservation values identified above are considered applicable to this region.

**Table 2-14 East Gippsland CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (DNP, 2013)**

<b>Proclaimed</b>	28 June 2007			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN VI—Multiple Use Zone			
<b>Assigned zones in reserve:</b>	IUCN Ia	IUCN II	IUCN IV	IUCN VI Multiple Use Zone
<b>Depth of reserve below seabed</b>	100 m			
<b>Total area</b>	4,137 km <sup>2</sup> (413 700 ha).			
<b>Major conservation values</b>	<p>Examples of ecosystems, habitats and communities associated with:</p> <ul style="list-style-type: none"> <li>• the Southeast Transition</li> </ul> <p>and associated with sea-floor features:</p> <ul style="list-style-type: none"> <li>• abyssal plain/deep ocean floor</li> <li>• canyon</li> <li>• escarpment</li> <li>• knoll/abyssal hill</li> <li>• slope</li> </ul> <p>Features with high biodiversity and productivity:</p> <ul style="list-style-type: none"> <li>• Bass Cascade</li> <li>• upwelling east of Eden</li> </ul> <p>Important foraging area for:</p> <ul style="list-style-type: none"> <li>• Wandering, Black-browed, Yellow-nosed and Shy albatrosses; Great-winged petrel; Wedge-tailed shearwater; and Cape petrel</li> </ul> <p>Important migration area for:</p> <ul style="list-style-type: none"> <li>• Humpback whale</li> </ul>			
<b>Location</b>	The East Gippsland Commonwealth Marine Reserve is off the north-east corner of Victoria, on the continental slope and escarpment.			
<b>General description of the reserve</b>	<p>The East Gippsland Commonwealth Marine Reserve contains representative samples of an extensive network of canyons, continental slope and escarpment at depths from 600 m to more than 4000 m.</p> <p>The geomorphic features of this reserve include rocky-substrate habitat, submarine canyons, escarpments and a knoll, which juts out from the base of the continental slope.</p> <p>The reserve includes both warm and temperate waters, which create habitat for free-floating aquatic plants or microscopic plants (i.e. phytoplankton) communities. Complex seasonality in oceanographic patterns influences the biodiversity and local productivity.</p> <p>The East Australian Current brings subtropical water from the north, and around Cape Howe the current forms large eddies, with a central core of warm water. Around the outside of the eddies, cooler, nutrient-rich waters mix with the warm water creating conditions for highly productive phytoplankton growth, which supports a rich abundance of marine life. During winter, upwellings of cold water may occur and bring nutrient-rich waters to the surface, boosting productivity.</p> <p>Many oceanic seabirds forage in these waters, including albatrosses (e.g. Wandering, Black-browed, Yellow-nosed and Shy albatrosses), the Great-winged petrel, Wedge-tailed shearwater and Cape petrel.</p> <p>Humpback whales pass by during their migrations north and south along the eastern seaboard.</p>			

### 2.2.6.2 Beagle Marine Park

The Beagle Marine Park (2,928 km<sup>2</sup>) lies entirely within Bass Strait, encompassing Tasmania's Kent Group Marine Reserve and the Hogan and Curtis Island groups; and is nearby to the north-east is Victoria's Wilsons Promontory Marine National Park. The full area of the Marine Park is designated as a multiple use zone (IUCN VI).

The Beagle Marine Park was once dry land which connected mainland Australia to Tasmania. After the ending of the last ice-age, the melting glaciers caused sea levels to rise and the connection to Tasmania was lost leaving the Bass Strait islands and an area of shallow waters 50-70m depth. Further information on the Hogan Group of islands, the Kent Group and other protected areas is described in Section 2.2.8, National Parks and Reserves. Detailed information on the Beagle Marine Park is presented in Table 2-15 (DNP, 2013).

The full extent of the Beagle Marine Park occurs within the DA (Figure 2-20); as such all conservation values identified in the park are considered applicable to this region.

**Table 2-15 Beagle CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (DNP, 2013)**

<b>Depth of reserve below seabed</b>	100 m			
<b>Total area</b>	2,928 km <sup>2</sup> (292 800 ha)			
<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with:</p> <ul style="list-style-type: none"> <li>• the Southeast Shelf Transition.</li> </ul> <p>and associated with sea-floor features:</p> <ul style="list-style-type: none"> <li>• basin</li> <li>• plateau</li> <li>• shelf</li> <li>• sill</li> </ul> <p>Important migration and resting on migration area for:</p> <ul style="list-style-type: none"> <li>• southern right whale</li> </ul> <p>Important foraging area for:</p> <ul style="list-style-type: none"> <li>• Australian fur seal</li> <li>• Killer whale</li> <li>• Shy albatross, Australasian gannet, Short-tailed shearwater, Pacific and Silver gulls,</li> <li>• Crested tern, Common diving petrel, Fairy prion, Black-faced cormorant and Little penguin</li> <li>• White shark</li> </ul> <p>Cultural and heritage sites:</p> <ul style="list-style-type: none"> <li>• the wreck of the steamship SS Cambridge</li> <li>• the wreck of the ketch Eliza Davies</li> </ul>			
<b>Location</b>	The Beagle Commonwealth Marine Reserve lies entirely within Bass Strait, with its north-western edge abutting Victorian waters south-east of Wilson's Promontory. It is a shallow-water reserve surrounding a collection of Bass Strait islands.			

<b>General description of the reserve</b>	<p>The Beagle Commonwealth Marine Reserve represents an area of shallow continental shelf ecosystems in depths of about 50–70 m that extends around south-eastern Australia to the east of Tasmania. The sea floor that it covers formed a land bridge between Tasmania and Victoria during the last ice age 10 000 years ago.</p> <p>Its boundary encloses Tasmania’s Kent Group Marine Reserve and the Hogan and Curtis Island groups. Nearby to the north-east is Victoria’s Wilsons Promontory Marine National Park.</p> <p>The reserve encompasses the fauna of central Bass Strait, which is expected to be especially rich based on studies of several sea floor–dwelling animal groups. Its ecosystems are similar to those documented for the deeper sections of the Kent Group Marine Reserve, especially those based around habitats of rocky reefs supporting beds of encrusting, erect and branching sponges, and sediment composed of shell grit with patches of large sponges and sparse sponge habitats.</p> <p>Islands encompassed by the reserve and nearby islands support important breeding colonies for many seabirds and for the Australian fur seal. The waters of the reserve provide an important foraging area for those species breeding nearby. The rich marine life also attracts top predators, such as the great white shark and killer whales.</p> <p>The SS Cambridge, a British freighter, which lies in the reserve to the east of Wilson’s Promontory, was sunk in 1940 by a WWII mine.</p> <p>The trading ketch Eliza Davies, which lies in the reserve to the east of Wilson’s Promontory, sunk under tow in 1924.</p>
---	---

**2.2.6.3 Flinders Marine Park**

The Flinders Marine Park (27,043 km<sup>2</sup>) is east of the north-east tip of Tasmania and Flinders Island, and extends over 400 km eastward. The Marine Park has two management zones: Marine National Park (IUCN II), and a multiple use zone (IUCN VI).

Seafloor habitats found in this marine park are the continental shelf, and a long section of steep continental slope cut through by a series of deep canyons, a large seamount and areas of sandy and muddy sediments. As per the East Gippsland Marine Park, Flinders Marine Park is influenced by the East Australian Current forming large-scale eddies which ultimately result in an abundance of marine fauna. Detailed information on the Beagle Marine Park is presented in Table 2-16 ((DNP, 2013)).

The full extent of the Flinders Marine Park occurs within the DA (Figure 2-20); as such all conservation values identified above are considered applicable to this region.

**Table 2-16 Flinders CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (DNP, 2013)**

<b>Location</b>	The Flinders Commonwealth Marine Reserve is east of the north-east tip of Tasmania and Flinders Island, and extends over 400 km eastward.
<b>General description of the reserve</b>	<p>The Flinders Commonwealth Marine Reserve covers a depth range from about 40 m on the shallow continental shelf to abyssal depths of 3000 m or more near the edge of Australia's exclusive economic zone.</p> <p>Key features of this area are the continental shelf, and a long section of steep continental slope, incised by a series of deep submarine canyons. Sea bottom habitats include sheer rocky walls and large rocky outcrops that support a rich diversity of small seabed animals, such as lace corals and sponges. These and the large expanses of sandy and muddy sediments are habitats to a wide variety of fishes and to populations of the giant crab. Areas between 400 m and 600 m of the continental slope sea floor are habitat for dogfish and gulper sharks, and Harrison's dogfish has been recently recorded in the reserve.</p> <p>The biodiversity of the reserve is influenced by summer incursions of the warm East Australian Current and associated large-scale eddies.</p> <p>Another prominent feature is a large offshore seamount believed to be too deep to have been fished. Seamounts are generally considered to be important centres of deep ocean biodiversity, offering a wide range of habitats at different depths and orientations to currents. The large seamounts to the east of Tasmania are believed to be individually important, providing habitat to species that may be unique to each seamount and to a range of more widely occurring species that make their homes only on their rocky slopes. Presently, little is known about the fauna of these seamounts, but based on information from other better known offshore seamounts, seabed animals are expected to include endemic species.</p>

### 2.2.6.4 Freycinet Marine Park

The Freycinet Commonwealth Marine Park (57,942 km<sup>2</sup>) is east of Tasmania, offshore from the Freycinet Peninsula. The Marine Park has three management zones: Marine National Park (IUCN II), recreational use zone (IUCN IV) and a multiple use zone (IUCN VI).

The Freycinet Marine Park begins offshore from Bicheno and Freycinet National Park on the east coast of Tasmania and extends out to over 3,000 m depth covering seafloor features such as seamounts, deep sea (abyssal) plains, canyons and deep granite reefs. Detailed information on the Freycinet Marine Park is presented in Table 2-17 (DNP, 2013).

The offshore region of the Freycinet Marine Park occurs within the DA (Figure 2-20); as such all conservation values relevant to the deeper offshore waters are considered applicable to this region.

**Table 2-17 Freycinet CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (DNP, 2013)**

<b>Location</b>	The Freycinet Commonwealth Marine Reserve is east of Tasmania, offshore from the Freycinet Peninsula.
<b>General description of the reserve</b>	<p>The Freycinet Commonwealth Marine Reserve covers a depth range from about 40 m on the shallow continental shelf, to abyssal depths of 3000 m or more at the edge of Australia's exclusive economic zone.</p> <p>The reserve spans the continental shelf and deeper water ecosystems that extend around south-eastern Australia to the east of Tasmania. The shelf is adjoined to a large offshore saddle.</p> <p>The reserve also includes large offshore seamounts, which are believed to be too deep to have been fished. Seamounts are generally considered to be important centres of biodiversity. They offer a wide range of habitats at different depths and orientations to currents. The seamounts east of Tasmania are also believed to be individually important, providing habitat to species that may be unique to each seamount.</p> <p>The shallower part of the reserve includes habitat important to seabirds.</p> <p>White shark also forage in the reserve.</p>

### 2.2.6.5 Boags Marine Park

The Boags Marine Park is north of Three Hummock Island off Tasmania's north-west coast. It covers 537 square kilometres, with depths mostly between 40 metres and 80 metres.

The shallow waters of central Bass Strait are home to rich arrays of animals that live on the seafloor and in the sediment, including crustaceans, molluscs and polychaete worms. Seabirds from colonies on nearby islands forage also in the area (DNP, 2013).

The marine park is a Multiple Use Zone.

**Table 2-18 Boags CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (DNP, 2013)**

<b>Proclaimed</b>	28 June 2007

<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with::</p> <ul style="list-style-type: none"> <li>the Bass Strait Shelf Province</li> </ul> <p>And associated with sea-floor features:</p> <ul style="list-style-type: none"> <li>plateau</li> </ul>			

	<ul style="list-style-type: none"> <li>tidal sandwave/sandbank</li> </ul> <p>Important foraging area for:</p> <ul style="list-style-type: none"> <li>shy albatross, Australasian gannet, short-tailed shearwater, fairy prion, black-faced cormorant, common diving petrel and little penguin</li> </ul>
<b>Location</b>	The Boags Commonwealth Marine Reserve is off the north-west tip of Tasmania, north of Three Hummock Island. The reserve is wholly contained within western Bass Strait.
<b>General description of the reserve</b>	<p>The Boags Commonwealth Marine Reserve represents an area of shallow ecosystems that has a depth range mostly between 40m and 80 m. It encompasses the fauna of central Bass Strait, which is expected to be especially rich based on studies of several sea floor-dwelling animal groups.</p> <p>The Boags Marine Reserve contains a rich array of life, particularly bottom-dwelling animals and animals living in the sea-floor sediments and muds, such as crustaceans, polychaete worms and molluscs, as is common for the Bass Strait seabed.</p> <p>The reserve is adjacent to the important seabird breeding colonies of Tasmania's north-west, particularly the Hunter group of islands (Three Hummock Island, Hunter Island, Steep Island, Bird Island, Stack Island and Penguin Islet), and so is an important foraging area for a variety of seabirds.</p> <p>White shark also forage in the reserve.</p>

#### 2.2.6.6 Apollo Marine Park

The Apollo Commonwealth Marine Reserve (118,400 ha) is representative of the continental shelf that extends from South Australia to the west of Tasmania. The park is located off the southern tip of Cape Otway just beyond the Victorian state boundary down to the north of King Island in Tasmania. The waters of the reserve are exposed to large swell waves generated from the south-west and strong tidal flows. Detailed information on the Apollo Marine Park is presented in Table 2-19 (PA, 2019c).

**Table 2-19 Apollo CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (PA, 2019c)**

<b>Proclaimed</b>	28 June 2007			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN VI—Multiple Use Zone			
<b>Assigned zones in reserve:</b>	IUCN Ia	IUCN II	IUCN IV	IUCN VI
				Multiple Use Zone
<b>Depth of reserve below seabed</b>	100 m			
<b>Total area</b>	1184 km <sup>2</sup> (118 400 ha).			
<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with:</p> <ul style="list-style-type: none"> <li>the Western Bass Strait Shelf Transition</li> <li>Bass Strait Shelf Province</li> </ul> <p>And associated with sea-floor features:</p> <ul style="list-style-type: none"> <li>deep hole valley</li> <li>shelf</li> </ul> <p>Important migration area for:</p> <ul style="list-style-type: none"> <li>blue, fin, sei and humpback whales</li> </ul> <p>Important foraging area for:</p> <ul style="list-style-type: none"> <li>black-browed and shy albatross, Australasian gannet, short-tailed shearwater, and crested tern</li> </ul>			
<b>Location</b>	The Apollo Commonwealth Marine Reserve is in Bass Strait south of Cape Otway and Apollo Bay in western Victoria, and north-west of King Island.			

<b>General description of the reserve</b>	<p>The Apollo Commonwealth Marine Reserve represents the continental shelf that extends from South Australia to the west of Tasmania.</p> <p>The cool waters of the reserve are less than 50 m deep near Cape Otway. The reserve includes the Otway Depression, a 100 m deep undersea valley joining the Bass Basin to the open ocean. This valley was an outlet channel for the ancient Bass Lake and mainland river systems, which existed during the last ice age.</p> <p>The waters of the reserve are exposed to large swell waves generated from the southwest and strong tidal flows. The sea floor has many rocky reef patches interspersed with areas of sediment and, in places, has rich, benthic fauna dominated by sponges.</p> <p>Seabirds, dolphins, seals and white shark forage in the reserve, and blue whales migrate through Bass Strait.</p> <p>The MV City of Rayville, a United States of America freighter, which lies in the reserve south of Cape Otway, was sunk in 1940 by a mine.</p>
---	--

**2.2.6.7 Zeehan Marine Park**

The Zeehan marine park is south-west of King Island. It covers 19,897 km<sup>2</sup> with depths from about 50 metres to over 3000 metres. The park has four undersea canyons cutting into the continental shelf. The Zeehan current, an extension of the Leeuwin current from the west runs along the west coast of Tasmania and reaches the southern tip at its strongest point in winter. Zeehan Marine Park is a nursery ground for blue warehou and ocean perch. Concentrations of larval fish of these species are found in the marine park as well as the commercially fished species of Tasmanian giant (PA, 2019e).

<b>Location</b>	The Zeehan Commonwealth Marine Reserve is north-west of Tasmania.
<b>General description of the reserve</b>	<p>The Zeehan Commonwealth Marine Reserve covers a broad depth range, from the shallow continental shelf at a depth of about 50 m to the abyssal plain, which is over 3000 m deep. A significant feature of this reserve is a series of four submarine canyons that incise the continental slope, extending from the shelf edge to the abyssal plain. Biodiversity and productivity on the outer shelf and upper slope in this reserve are influenced by the Zeehan Current and its interactions with the canyons.</p> <p>The reserve includes a variety of seabed habitats, including exposed limestone, that support rich animal communities of large sponges and other, permanently fixed, invertebrates on the continental shelf.</p> <p>There are also extensive ‘thickets’ of low invertebrate animals, such as lace corals and sponges, on the continental slope. These communities are exceptionally diverse and include species new to science. The rocky limestone provides important habitats for a variety of commercial fish species, including Australia’s giant crab. Concentrations of larval blue warehou and ocean perch indicate the area is a nursery ground. It is also a foraging area for a variety of seabirds and white shark.</p>

### 2.2.6.8 Franklin Marine Park

The Franklin Marine Park is located off the north-western point of Tasmania, south of King Island. It mostly comprises of water depths of approximately 40 m except for a deep valley in the southern end of the reserve which drops to 150m depth. Seabirds from the numerous breeding colonies on nearby islands including Albatross Island, Black Pyramid Rock and other Hunter Group islands forage in the park (PA, 2019d). Detailed information on the Franklin Marine Park is presented in Table 2-21 (PA, 2019d).

**Table 2-21 Franklin CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (PA, 2019d))**

<b>Depth of reserve below seabed</b>	100 m			
<b>Total area</b>	671 km <sup>2</sup> (67 100 ha).			
<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with::</p> <ul style="list-style-type: none"> <li>• The Tasmanian Shelf province</li> <li>• the Western Bass Strait Shelf Transition</li> </ul> <p>And associated with sea-floor features:</p> <ul style="list-style-type: none"> <li>• shelf</li> <li>• deep hole valley</li> <li>• escarpment</li> <li>• plateau</li> </ul> <p>Important foraging area for:</p> <ul style="list-style-type: none"> <li>• shy albatross, short-tailed shearwater, Australasian gannet, fairy prion, little penguin, common diving petrel, black-faced cormorant and silver gull</li> </ul>			

<b>Location</b>	The Franklin Commonwealth Marine Reserve is west of the north-western corner of Tasmania and south-east of King Island.
<b>General description of the reserve</b>	<p>The Franklin Commonwealth Marine Reserve represents an area of shallow continental shelf ecosystems and incorporates areas of two major bioregions: western Bass Strait and the Tasmanian shelf. Its cool temperate waters are exposed to large swells driven by westerly gales. At its northern end, the waters are only 40 m deep, and in much of the reserve the sea floor slopes gently and is covered by fine and coarse sediments. At the southern end of the reserve there is a valley where the water is up to 150 m deep.</p> <p>The reserve provides a feeding ground for a variety of seabirds, such as the fairy prion, shy albatross, silver gull, short-tailed shearwater, black-faced cormorant and common diving petrel that have breeding colonies on the nearby Hunter group of islands.</p> <p>Black Pyramid Rock, 6 km north of the reserve supports the largest breeding colony of the Australasian gannet in Tasmania, and one of only eight breeding sites for this species in Australia.</p> <p>White shark also forage in the reserve</p>

### 2.2.6.9 Huon Marine Park

The Huon Commonwealth Marine Park off Southern Tasmania covers approximately 991 square kilometres of outer continental shelf, continental slope and deeper seabed, ranging from 70 metres to over 3000 metres. It has more than 120 seamounts within the marine park, the largest cluster in Australia. The seamounts are cone-shaped remnants of extinct volcanoes rising from the seafloor, up to 25km across at the base and rising 200 to 500 m from the seabed. Some 'summits' are over 1000 metres below the surface. In an otherwise bare substrate, seamounts provide hard, elevated and current swept attachment sites for communities of filter feeding fauna such as corals, sponges, sea stars and anemones (CSIRO, 2007). Their structural form made of massive accumulations of the reef building stony coral also provides habitat for a smaller mobile fauna such as crustaceans, brittle stars, urchins and molluscs. The marine park protects spawning grounds for basketwork eels and commercial fish species, including ocean perch. Details of the Huon Marine Park are listed in Table 2-22 (PA, 2019a).

The marine park has Habitat Protection and Multiple Use zones. The Tasmanian seamounts are also on the *Commonwealth Heritage List* (DCCEEW, 2021) and are also listed as a key ecological feature (refer Section 2.2.7.5).

<p><b>Location</b></p>	<p>The Huon Commonwealth Marine Reserve is south-east of Tasmania.</p>
<p><b>General description</b></p>	<p>The Huon Commonwealth Marine Reserve covers a broad depth range from the inner continental shelf at about 70 m, to abyssal depths of more than 3000 m. The majority of the area is in deep water. The Tasman Seamounts Marine Reserve that was proclaimed in 1999 has been wholly incorporated into the Huon Commonwealth marine reserve.</p> <p>The reserve contains a cluster of seamounts that appear as cone-shaped submerged mountains, which provide a range of depths for a diversity of plants and animals.</p> <p>The peaks of many of the reserve’s seamounts are between 750 m and 1000m below the sea surface and support endemic species, including large erect corals and sponges. Some of the flora and fauna are hundreds and possibly thousands of years old, making them some of the longest-lived animals on Earth. The reserve also provides an important connection between seamounts of the Indian Ocean and the Tasman Sea.</p> <p>Seamounts are regarded as areas of increased productivity in the otherwise nutrient-poor open ocean. Their topography accelerates water currents to provide a consistent and relatively rich food source for filter feeders, and which sweeps the seamounts clear of fine sediments, exposing rocks for animals, such as corals, to attach to. Seamounts are generally considered to be important stepping stones in the transoceanic dispersal of larvae of bottom-dwelling species. The habitat protection zone was established to protect the unique and vulnerable benthic communities of the reserve’s seamounts. The zone includes seamounts rising 650–1000 m above the sea floor, which have been subject to commercial fishing. Deeper seamounts, peaking at 1150–1700 m above the sea floor, have not been fished, and are in pristine condition. Benthic communities include coral dominated communities found at depths less than 1400 m. The hard coral <i>Solenastrea variabilis</i> forms a dense matrix that provides a platform for hydroids and sponges; stone corals; and black, gold and bamboo corals. Benthic communities deeper than 1400 m are urchin dominated. The reserve is a foraging area for white shark and seabirds and a spawning or nursery area for important commercial fish, including ocean perch and blue warehou.</p>

**2.2.6.10 Solitary Islands Marine Park**

Solitary Islands Marine Park offshore northern NSW is a place where many species occur at the limits of their range as the East Australian Current meets cooler waters from the south. The marine park includes Pimpernel Rock, a submerged pinnacle rising to within a few metres of the surface. Also, the critically endangered grey nurse sharks gather here, making it a popular dive spot. Details of the park are described in Table 2-23 (DNP, 2018).

### 2.2.6.11 Lord Howe Marine Park

The Lord Howe Marine Park surrounds the NSW Lord Howe Island Marine Park (refer Section 2.2.8.37) and extends further seaward to 12 nautical miles. The waters – a unique mix of warm tropical and cool temperate ocean currents – are home to over 500 fish species, more than 90 coral species and countless other marine species, many only found in the immediate area. A wide range of habitats include a barrier coral reef and lagoon, and fringing reefs dominated either by coral or macroalgal communities. Details of the park are described in Table 2-24 (DNP, 2018).

**Table 2-24 Lord Howe Marine Park CMR: Temperate East Marine Parks Network Management Plan 2018 (DNP, 2018)**

<b>Proclaimed</b>	14 December 2013

<b>Depth of reserve below seabed</b>	between 15 m and 6000 m.			
<b>Total area</b>	110,126 km <sup>2</sup>			
<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with::</p> <ul style="list-style-type: none"> <li>Lord Howe Province—due to the convergence of warm, tropical and cooler temperate waters in the area, the Marine Park supports a unique mix of tropical, subtropical and temperate species, many found at the northern or southern extent of their range.</li> <li>Tasman Basin Province—interactions between currents, eddies and seamounts and the movements of the deep sub-Antarctic water mass influence biological productivity in this area.</li> </ul> <p>Important area for:</p> <ul style="list-style-type: none"> <li>Foraging and breeding of seabirds</li> <li>Migrating humpback whales</li> </ul> <p>Key ecological features of the Marine Park are:</p> <ul style="list-style-type: none"> <li>Lord Howe Seamount Chain—a chain of submerged volcanoes running 1000 km north–south, the seamount chain includes Lord Howe Island and Elizabeth and Middleton Reefs. These isolated, oceanic reefs support a diverse range of tropical and temperate marine life, including both warm-water and cold-water corals and an abundance of fish species. This diversity is a result of the effect of the East Australian Current on the reefs as it exposes the area to its warm waters, in contrast to the surrounding cooler ocean.</li> <li>Elizabeth and Middleton Reefs—small, isolated, oceanic platforms reefs that occur on top of the volcanic seamounts of the Lord Howe seamount chain. The</li> </ul>			

	<p>lagoons of both reefs are important areas for populations of black cod and the Galapagos shark.</p> <ul style="list-style-type: none"> <li>Tasman Front and eddy field—a region that separates the warm, nutrient-poor waters of the Coral Sea from the cold, nutrient-rich waters of the Tasman Sea, providing increased nutrients and plankton aggregations, and enhanced productivity that attracts mobile species such as turtles, cetaceans, tuna and billfish.</li> </ul> <p><b>Culture</b></p> <ul style="list-style-type: none"> <li>The marine environment around Lord Howe Island has long held significance among Lord Howe Islanders. A unique community and culture has developed by those who have visited and settled the island over time Sea country is valued for Indigenous cultural identity, health and wellbeing.</li> <li>Across Australia, Indigenous people have been sustainably managing their sea country for tens of thousands of years. At the commencement of this plan, there is limited information about the cultural significance of this Marine Park due to its remote location</li> </ul> <p><b>World Heritage</b></p> <ul style="list-style-type: none"> <li>Parts of the Marine Park are within the world heritage-listed Lord Howe Island Group, which was listed as an area of outstanding universal value under the World Heritage Convention in 1982. The Lord Howe Island Group comprises Lord Howe Island, Admiralty Islands, Mutton Bird Islands, Ball’s Pyramid, and associated coral reefs and marine environments. It includes spectacular landscapes, volcanic mountains, and diverse low-lying rainforests, palm forests and grasslands. There are a large number of species of native plants, of which many are endemic to Lord Howe Island, and colonies of endangered seabirds.</li> </ul> <p><b>National Heritage</b></p> <ul style="list-style-type: none"> <li>The Lord Howe Island Group was included in the National Heritage List in 2007.</li> </ul> <p><b>Historic shipwrecks</b></p> <ul style="list-style-type: none"> <li>The Marine Park contains over 25 known shipwrecks listed under the Historic Shipwrecks Act 1976.</li> </ul> <p><b>Social and economic values</b></p> <ul style="list-style-type: none"> <li>Tourism, commercial fishing, recreation, including fishing, and scientific research, are important activities in the Marine Park. These activities contribute to the wellbeing of regional communities and the prosperity of the nation.</li> </ul>
<b>Location</b>	The Lord Howe Marine Park is located approximately 550 km offshore of New South Wales, adjacent to the New South Wales Lord Howe Island Marine Park and World Heritage Area.
<b>General description of the reserve</b>	<p>The Lord Howe Marine Park is significant because it includes habitats, species and ecological communities associated with the Lord Howe Province and the Tasman Basin Province. It includes three key ecological features: the Lord Howe Seamount Chain; Elizabeth and Middleton Reefs (the southernmost coral reefs in the world); and the Tasman Front and eddy field, all valued for high productivity, aggregations of marine life, biodiversity and endemism.</p> <p>The Elizabeth and Middleton Reefs Ramsar site is located within the Marine Park. The site was listed under the Ramsar Convention in 2002 and is a wetland of international importance under the EPBC Act, due to its unique nature as the southernmost open-ocean coral-reef platform in the world.</p> <p>The Marine Park includes habitats connecting to and complementing the adjacent New South Wales Lord Howe Island Marine Park.</p>

**2.2.6.12 Central Eastern Marine Park**

Central Eastern Marine Park begins 30 kilometres east of Coffs Harbour. It covers 70,054 km<sup>2</sup>, with depths from 120 m to 6000 m. It has National Park, Habitat Protection and Multiple Use zones. And is

located between the Hunter and the Lord Howe Commonwealth Marine Parks. Details of the park are described in Table 2-25 (DNP, 2018).

**Table 2-25 Central Eastern Marine Park CMR: Temperate East Marine Parks Network Management Plan 2018 (DNP, 2018)**

<b>Proclaimed</b>	14 December 2013			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN category IV - Habitat Protection Zone

These activities contribute to the wellbeing of regional communities and the prosperity of the nation</li> </ul>			
<b>Location</b>	The Cod Grounds Marine Park is 5.5 km offshore, NSW (south of Port Macquarie).			
<b>General description of the reserve</b>	The Cod Grounds Marine Park is significant because it contains habitats, species and ecological communities representative of the Central Eastern Shelf Transition. It provides habitat for grey nurse sharks.			

#### 2.2.6.15 Jervis Marine Park

Jervis Marine Park comprises an area of 2473 square kilometres and covers a depth range from 120 m to 5000 m approximately.

Seafloor features represented in the reserve include abyssal-plain/deep ocean floor, canyons, shelf and slope. The reserve include two key ecological features, it is one of three shelf incising canyons occurring within the region (unique sea-floor feature with ecological properties of regional significance) and shelf rocky reefs. Details of the Jervis Marine Park are described in Table 2-28 (DNP, 2018).

At the commencement of this plan (Temperate East Management Plan), there was limited information about the cultural significance of this Marine Park. The Native Title Services Corporation is the Native Title Service Provider for the New South Wales region.</p>			

### 2.2.6.16 South Tasman Rise Marine Park

The South Tasman Rise is an area of seafloor that lies 550 km south of Hobart, Tasmania in the Southern Ocean where water depths are about 1,500 metres. This deep ocean park covers 27,704 square kilometres. It is designated as a Special Purpose zone.

The reserve supports unique environments for marine life and is an area of significant scientific interest. The seamounts here have flat tops, evidence they were once above the ocean's surface where they were shaped by wind and wave erosion. The rise most probably originates from subsided continental crust that fragmented as Australia and Antarctica separated (AMP, 2019). Australia and New Zealand agreed that there would be no fishing in 2007-08 and indefinitely thereafter. No permits have been issued for this fishery since 2007 (AFMA, 2019). Details of the South Tasman Rise Marine Park are listed in Table 2-29 (DNP, 2013).

**Table 2-29 South Tasman Rise CMR: SE Commonwealth Marine Reserves Network Management Plan 2013-2023 (DNP, 2013)**

<b>Proclaimed</b>	28 June 2007			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN VI—Special Purpose Zone			
<b>Assigned zones in reserve:</b>	IUCN Ia	IUCN II	IUCN IV	IUCN VI
				Special Purpose Zone
<b>Depth of reserve below seabed</b>	100 m			
<b>Total area</b>	27,704 km <sup>2</sup> (27 704 00 ha)			
<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with:</p> <ul style="list-style-type: none"> <li>• Tasman Province and associated with sea-floor features:</li> <li>• Abyssal plain/deep ocean floor</li> <li>• canyon</li> <li>• plateau</li> <li>• seamount/guyot</li> <li>• slope</li> </ul> <p>Important foraging area for:</p> <ul style="list-style-type: none"> <li>• wandering and black-browed albatrosses, Short-tailed shearwater</li> <li>• white-headed and white-chinned petrels</li> </ul>			
<b>Location</b>	The South Tasman Rise Commonwealth Marine Reserve is south-east of Tasmania, with its southern edge following the boundary of the Australian exclusive economic zone, 200 nm from land.			
<b>General description of the reserve</b>	The South Tasman Rise Commonwealth Marine Reserve occurs in the deep ocean and includes a section of the mid-continental slope at depths of 1200–3000 m. It encloses a submerged plateau of continental rock that stands as the last remnant of the link between Australia and Antarctica. The sea floor in this reserve was deformed by the massive rifting process when the Australian continental block moved north. The reserve supports unique environments for marine life and is an area of significant scientific interest. It contains several seamounts, some of which have flat summits, which indicates that they were exposed above the surface at some time.			

### 2.2.6.17 Gifford Marine Park

Gifford Marine Park is located in the norther region of the Temperate East Marine Region. Details of the Gifford Marine Park are listed in Table 2-30 (DNP, 2018)

**Table 2-30 Gifford CMR: Temperate East Marine Parks Network Management Plan 2018 (DNP, 2018)**

<b>Proclaimed</b>	14 December 2014, renamed Gifford Marine Park on 9 October 2017			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN IV—Special Purpose Zone			
<b>Assigned zones in reserve:</b>	IUCN Ia	IUCN II	IUCN IV	IUCN VI
			Habitat Protection Zone	
<b>Depth of reserve below seabed</b>	Depth range of 220 and 4000 m			
<b>Total area</b>	5,828 km <sup>2</sup>			
<b>Major conservation values</b>	<p>Ecosystems, habitats and communities associated with:</p> <ul style="list-style-type: none"> <li>• Ecosystems representative of Lord Howe Province</li> <li>• Abyssal plain/deep ocean floor</li> <li>• canyon</li> <li>• plateau</li> <li>• Lord Howe Seamount Chain</li> <li>• slope</li> </ul> <p>Important area for:</p> <ul style="list-style-type: none"> <li>• a range of threatened species including migratory, marine and cetacean species</li> <li>• foraging habitat for seabirds</li> <li>• migratory pathway for humpback whales</li> </ul> <p>Commercial fishing is an important activity in the marine park</p>			
<b>Location</b>	The Gifford Marine Park located approximately 480 km north of Lord Howe Island and borders on the limit of Australia’s exclusive economic zone.			
<b>General description of the reserve</b>	The Gifford Marine Park is significant because it contains habitats, species and ecological communities associated with the Lord Howe Province. It includes one key ecological feature: the Lord Howe Seamount Chain, valued for high productivity, aggregations of marine life, biodiversity and endemism.			

### 2.2.6.18 Norfolk Marine Park

Norfolk Island Marine Park is around Norfolk Island in the External Territories, over 1500 km from mainland Australia. Details of the Norfolk Marine Park are listed in Table 2-31 (DNP, 2018)

**Table 2-31 Norfolk Island CMR: Temperate East Marine Parks Network Management Plan 2018 (DNP, 2018)**

<b>Proclaimed</b>	14 December 2013, renamed Norfolk Marine Park on 9 October 2017.			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN IV			
	IUCN I	IUCN II	IUCN IV	IUCN VI

Assigned zones in reserve:	National Park Zone	Habitat Protection Zone	Special Purpose Zone (Norfolk)

<b>Location</b>	The Norfolk Marine Park is around Norfolk Island, including Nepean Island Reserve and Phillip Island, approximately 1400 km offshore from Evans Head in New South Wales.		
<b>General description of the reserve</b>	The Norfolk Marine Park is significant because it contains habitats, species and ecological communities associated with the Norfolk Island Province. It includes two key ecological features: Norfolk Ridge, and the Tasman Front and eddy field, both valued for high productivity, aggregations of marine life, biodiversity and endemism.		

### 2.2.6.19 Coral Sea Marine Park

The Coral Sea Marine Park southern boundary commences at latitude 24° 30' 00" and extends north for over 1400 kms. The southern end of the park intersects with the limits of the DA by approximately 75 kms. Details of the Coral Sea Marine Park are listed in Table 2-32 (DNP, 2018b)

**Table 2-32 Coral Sea CMR: Coral Sea Marine Park Management Plan 2018 (DNP, 2018b)**

<b>Proclaimed</b>	14 December 2013, renamed on 9 October 2017			
<b>IUCN category assigned by this Management Plan and reserve management zone name</b>	IUCN IV—Habitat Protection Zone			
<b>Assigned zones in reserve:</b>	IUCN II	IUCN IV	IUCN IV	IUCN VI
	National Park Zone	Habitat Protection Zone	Habitat Protection Zone (reefs)	Special Purpose Zone
<b>Depth of reserve below seabed</b>	From 15 m to depths of 6,000 m			
<b>Total area</b>	989,836 km <sup>2</sup>			
<b>Major conservation values</b>	<p>Ecosystems representative of:</p> <ul style="list-style-type: none"> <li>Cape Province, Northern Transition and Province, Central Eastern Transition, Kenn Province and Transition</li> </ul> <p>KEFs:</p> <ul style="list-style-type: none"> <li>Tasmanid Seamount Chain</li> <li>Reefs, cays and herbivorous fish of the Queensland and Marion Plateau</li> </ul> <p>Important area for:</p> <ul style="list-style-type: none"> <li>the only known spawning aggregation of black marlin in the Pacific Ocean (occurs near Osprey Reef)</li> <li>breeding and or foraging habitat for seabirds, interesting habitat for marine turtles, and a migratory pathway for humpback whales</li> <li>Supporting migratory birds</li> <li>Coringa-Herald and Lihou Reefs and Cays Ramsar site (beyond the DA)</li> </ul> <p>Historic, social and economic values</p> <ul style="list-style-type: none"> <li>Tourism, commercial fishing, and recreation, including fishing contribute to the wellbeing of regional communities and the prosperity of the nation</li> <li>45 historic shipwrecks are found in the park</li> </ul>			
<b>Location</b>	The Coral Sea Marine Park extends from Cape York Peninsula to an east–west line approximately 40 km north of Bundaberg in Queensland. The nearest point of the Marine Park to mainland Australia is approximately 60 km and it extends to approximately 1100 km from the coast. It lies immediately to the east of the Great Barrier Reef Marine Park.			
<b>General description of the reserve</b>	The marine environment of the Coral Sea Marine Park is characterised by shallow-water tropical marine ecosystems, a large area of continental shelf and continental slope, two areas of abyssal plain with depths to 6000 m, high incidence of cyclones, high, mostly tropical species diversity and globally significant populations of internationally threatened species. There are approximately 34 reefs, and 56 cays and islets in the Marine Park, with a total reef area of approximately 15,024 km <sup>2</sup> . It is influenced by a complex system of ocean currents that change seasonally and between years. Currents have also influenced the composition of reef species. The east–west-flowing South Equatorial Current cuts through the centre of the Marine Park before dividing to form the north-flowing Hiri Current and the south-flowing East Australian Current. These currents create a barrier reducing the mixing of species between the north and south of the Marine Park, forming distinct communities. The southern part of the Marine Park transitions between tropical and temperate waters and includes the northern extent of the range of some temperate species typical of the Temperate East Marine Region.			

### 2.2.7 Key Ecological Features (KEF)

Key Ecological Features (KEF) are elements of the Commonwealth marine environment that are considered to be of regional importance for either a region's biodiversity or its ecosystem function and integrity. KEFs are not matters of national environmental significance and have no legal status in their own right. However, they are components of the Commonwealth marine area. Fourteen KEFs occur in the DA as identified in the Conservation Values Atlas (DoEE 2015b). The eleven KEFs that have been spatially defined are shown in Figure 2-21.

The location of the three KEFs that are not spatially defined (Bass Cascade, shelf rocky reefs and hard substrates (South East Marine Region) and the East Tasmania subtropical convergence zone) are described below.

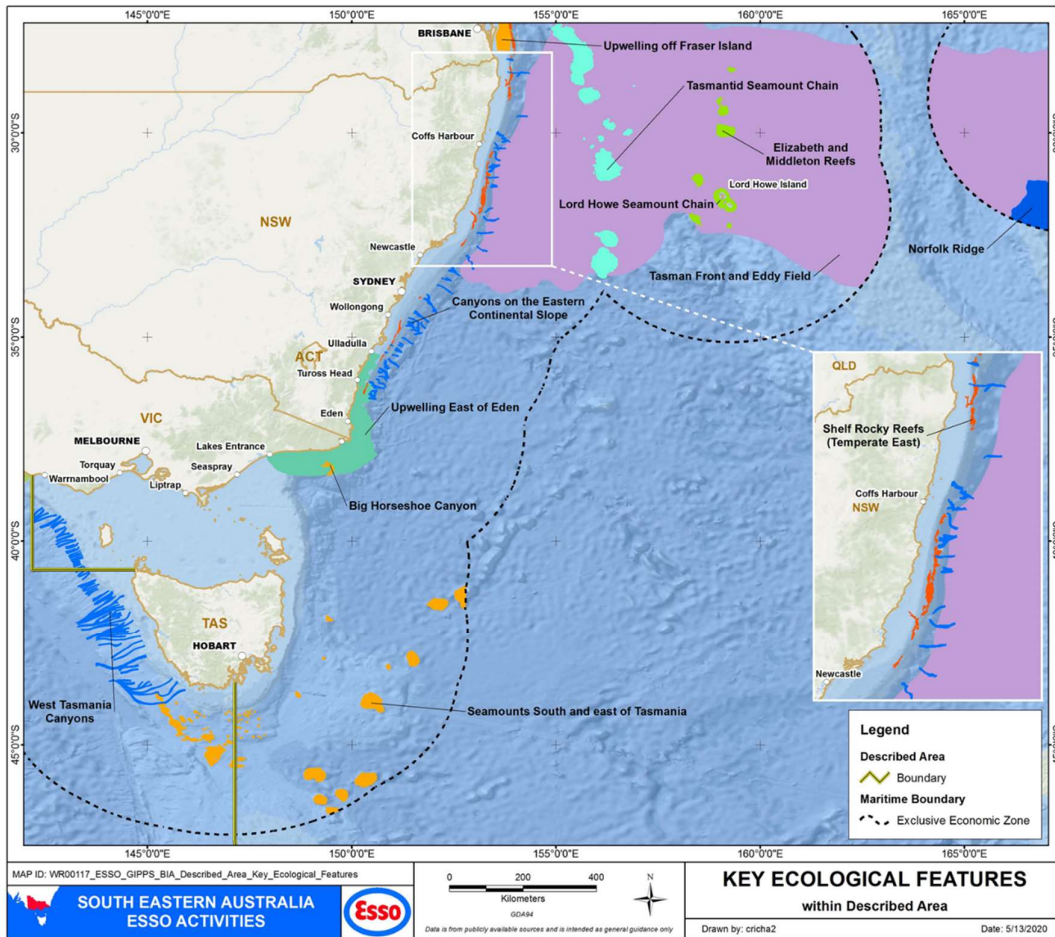

Figure 2-21 Spatially defined Key Ecological Features within the DA

#### 2.2.7.1 Big Horseshoe Canyon

Big Horseshoe Canyon is defined as a key ecological feature as it is an area of high productivity and aggregations of marine life.

The steep, rocky slopes of the Big Horseshoe Canyon provide hard substrate habitat for attached large epifauna. Sponges and other habitat forming species provide structural refuges for benthic fishes, including the commercially important pink ling.

The Big Horseshoe Canyon is the largest south eastern canyon sampled for benthic biodiversity (Williams et al., 2009). It has a total area of 319 km<sup>2</sup> in 1500-m depth that supports a rich, abundant, filter-feeding benthic megafauna, including large sponges in dense beds of large individuals at 120 m and at 300–400 m, dense stands of the stalked crinoid *Metacrinus cyaneus* in 200–300 m, and many

species of octocoral (especially gold corals) at depths >700 m (Kloser et al., 2001). It is the only known temperate location of the stalked crinoid *Metacrinus cyaneus*.

Big Horseshoe Canyon lies south of the coast of eastern Victoria. This feature is the eastern most arm of the Bass Canyon system (DoEE 2015a).

#### **2.2.7.2 Upwelling East of Eden:**

The Upwelling east of Eden is defined as a key ecological feature as it is an area of high productivity and aggregations of marine life.

Dynamic eddies of the East Australian Current cause episodic productivity events when they interact with the continental shelf and headlands. The episodic mixing and nutrient enrichment events drive phytoplankton blooms that are the basis of productive food chains including zooplankton, copepods, krill and small pelagic fish.

The upwelling supports regionally high primary productivity that supports fisheries and biodiversity, including top order predators, marine mammals and seabirds. This area is one of two feeding areas for blue whales and humpback whales, known to arrive when significant krill aggregations form. The area is also important for seals, other cetaceans, sharks and seabirds.

This feature displays seasonal and annual variation, and is present along the eastern Victorian and southern NSW coasts.

#### **2.2.7.3 East Tasmania subtropical convergence zone (East coast of Tasmania):**

A zone of enhanced pelagic productivity where eddies of the East Australian Current interact with subantarctic waters driven by westerly winds. This is a complex feature that is characterised by autumn and spring phytoplankton blooms that form the basis of a productive food chain which supports cetaceans, seals, sharks and seabirds. The phytoplankton blooms attract migratory commercial fish stocks such as Southern bluefin tuna, barracouta, and jack mackerel, and are also important for krill, which in turn form an important component of the diet of many pelagic species. This KEF has not been spatially defined and hence is not shown in Figure 2-21 however it is not expected to occur within the DA. The northern and southern extent of the feature are approximately level with the north-east tip of Tasmania and the Tasman Peninsula.

#### **2.2.7.4 The Bass Cascade (along the Bass Canyon System)**

The Bass Cascade refers to the "underwater waterfall" effect brought about by the northward flow of Bass Strait waters in winter which are more saline and slightly warmer than surrounding Tasman Sea waters. As the water approaches the mainland in the area of the Bass Canyon group it forms an undercurrent that flows down the continental slope. The cascading water has a displacing effect causing nutrient rich waters to rise, which in turn leads to increased primary productivity in those areas. The cascading water also concentrates nutrients and some fish and whales are known to aggregate along its leading edge. The Bass Cascade occurs during winter months only.

This KEF has not been spatially defined and hence is not shown in Figure 2-21, however it is expected to occur within the DA.

#### **2.2.7.5 Seamounts south and east of Tasmania (south and east of Tasmania):**

The Seamounts south and east of Tasmania are defined as a key ecological feature as they are an area of high productivity and aggregations of marine life.

These seamounts are a chain or cluster of seamounts rising from the abyssal plain, continental rise or plateau situated 200 km or more from shore (east of Flinders Island to south east of southern Tasmania). Seamounts with hard substrate summits and slopes provide attachment points for sessile invertebrates, while the soft sediments can be habitat for species that burrow into the sediments.

The Seamounts south and east of Tasmania extend into the southern offshore waters of the DA (Figure 2-21). These seamounts create localised upwellings of nutrient rich waters from the seafloor. The hard substrate support sessile invertebrates.

#### **2.2.7.6 Shelf rocky reefs and hard substrates (Southeast Marine Region)**

Rocky reefs and hard grounds are located in all areas of the South-east Marine Region continental shelf including Bass Strait, in 50 m to 150–220 m water depth. They support macroalgae and sessile invertebrates and provide habitat and shelter for fish and are important for aggregations of biodiversity and enhanced productivity. This KEF has not been spatially defined and hence do not appear on Figure 2-21 however it is expected to occur along the continental shelf of Bass Strait within the DA.

#### **2.2.7.7 West Tasmania Canyons**

The West Tasmania Canyons are located in the Southeast Marine Bioregion on the edge of the continental shelf offshore of the north-west corner of Tasmania and they extend down as far south as Macquarie Harbour. The northern section of the canyons intersect the DA. These canyons can influence currents, act as sinks for rich organic sediments and debris, and can trap waters or create upwellings that result in productivity and biodiversity hotspots. For example, plumes of sediment and nutrient-rich water can be seen at or near the heads of canyons. Sponges are concentrated near the canyon heads, with the greatest diversity between 200 m and 350 m depth. Sponges are associated with abundance of fishes and the canyons support a diversity of sponges comparable to that of seamounts (refer Section 2.2.7.5 above) (DoEE, 2015a).

#### **2.2.7.8 Tasmantid Seamount Chain**

Just 150-600 km east of the Australian mainland is a 2000 km long chain of submerged volcanoes (from approximately Latitude 19°deg south to 33° deg south) are the Tasmantid Seamount Chain that rise over 4000 m above the seafloor - nearly twice the height of the highest mountain on the mainland. These undersea mountains, the Tasmantid Seamounts, are extinct volcanoes formed from around 40 to 6 million years ago above a mantle hotspot, similar to the Hawaiian Islands. The seamount chain includes Lord Howe Island and Elizabeth and Middleton Reefs. These isolated, oceanic reefs are thought to support a diverse range of tropical and temperate marine life, including both warm-water and cold-water corals and an abundance of fish species. This diversity is a result of the effect of the East Australian Current on the reefs as it exposes the area to its warm waters, in contrast to the surrounding cooler ocean. The information on the Tasmantid Seamounts has been based on observations from some seamounts in other locations, however for benthic ecosystems, the data for the Tasmantid seamount chain is poor (CSIRO, 2012). Thus the seamount chain's conservation values are defined in terms of containing feature scale geomorphic surrogates for biodiversity (basin, plateau, seamount and abyssal plain/deep ocean floor). In general what is known is that Taupo seamount supports a diverse and dense invertebrate megafauna and abundant sharks; a high diversity of demersal fishes is recorded in commercial fishery logbooks and fishery observers; individual seamounts vary greatly in size in shelf and upper/mid slope depths where benthic biodiversity is expected to be greatest (CSIRO, 2012).

#### **2.2.7.9 Lord Howe Seamount Chain**

Lord Howe Seamount Chain is a chain of submerged volcanoes running 1000 km north–south, the seamount chain includes Lord Howe Island and Elizabeth and Middleton Reefs. This seamount chain runs east of the Tasmantid Seamount discussed above (refer Section 2.2.7.8). These isolated, oceanic reefs support a diverse range of tropical and temperate marine life, including both warm-water and cold-water corals and an abundance of fish species. This diversity is a result of the effect of the East Australian Current on the reefs as it exposes the area to its warm waters, in contrast to the surrounding cooler ocean (DSEWPAC, 2012a).

#### **2.2.7.10 Tasman Front and eddy field**

The Tasman Front and eddy field occurs in the Temperate East Marine Region and is defined as a key ecological feature formed by complex and dynamic oceanographic processes supporting transient patches of enhanced productivity that, in turn, attract aggregations of species across trophic levels, including top predators such as tuna and sharks. This feature also supports biological connectivity with seamount habitats (Tasmantid Seamount Chain – refer Section 2.2.7.8 above) further offshore. The Tasman Front is formed by a current that moves to the north in winter and to the south in summer. The Front separates the warm, nutrient-poor waters of the Coral Sea from the nutrient-rich waters of the Tasman Sea and its boundary can and associated eddies vary in shape, strength and location. The front is formed between 27° S and 33° S. In the southern portion of the Temperate East Marine Region, the Tasman Front creates a complex oceanographic environment with vertical mixing causing enhanced

productivity. Patches of productivity are important for mid-level consumers including turtles and top fish predators. This is supported by Fisheries oceanography studies that describe a positive relationship between fish catch rates and proximity to frontal features, and a predominance of bigeye tuna and swordfish associated with the Tasman Front (DoEE, 2019t).

#### **2.2.7.11 Shelf rocky reefs (Temperate East Marine Region)**

The Shelf Rocky Reefs habitat has been identified as a key ecological feature as it is considered a unique sea-floor feature which is associated with ecological properties of regional significance.

Shelf rocky reefs feature support a range of complex benthic habitats that, in turn, support diverse benthic communities. Along the continental shelf, south of the Great Barrier Reef, benthic communities on rock outcrops and boulder substrates shift from algae-dominated communities to those dominated by attached invertebrates, including dense populations of large sponges, with a mixed assemblage of moss animals and soft corals; this shift generally occurs at a depth of 45 m. Below wave-influenced areas, massive and branched growth forms of sponges are more prevalent, and sponge species richness and density generally increases with depth along the New South Wales coast.

Collectively, these invertebrates create a complex habitat-forming community that supports microorganisms and other invertebrates, such as crustaceans, molluscs, annelids and echinoderms. These habitats also contribute to increased survival of juvenile fish by providing refuge from predation. Rocky reef habitats on Australia's east coast support a diverse assemblage of demersal fish, which show distinct patterns of association with shelf-reef habitats; e.g. jackass morwong, barracouta, orange-spotted catshark, eastern orange perch, butterfly perch and warehou are species that distinguish rocky-reef habitats at depths greater than 45 m from those of soft sediments. Unlike the shelf rocky reef and hard substrate of the South East Marine Region, this KEF has been spatially defined and is shown in Figure 2-21.

#### **2.2.7.12 Canyons on the eastern continental slope**

The Canyons on the eastern continental slope are defined as a key ecological feature as they are a unique seafloor feature with enhanced ecological functioning and integrity, and biodiversity, which apply to both its benthic and pelagic habitats.

Canyon systems have a marked influence on diversity and abundance of species through their combined effects of topography, geology and localised currents, all of which act to funnel nutrients and sediments into the canyon. As such, these features are valued for their enhanced productivity and biological diversity properties. Canyons contribute to habitat diversity by providing a hard surface that offers anchoring points and vertical relief for filter feeder benthic species. Hard substrata support different species assemblages; particularly favouring large filter feeder-dominated benthic species (e.g. attached sponges and crinoids) that thrive in abundance in the enhanced current flow conditions. Large benthic animals such as sponges and feather stars are abundant, with particularly high diversity found in the upper slope regions (150–700 m). A range of higher trophic level species, including crustaceans, echinoderms, bivalves, cephalopods and fish are then attracted to these regions. Canyons are therefore significant contributors to overall biodiversity, particularly in terms of benthic organisms. Due to isolation, restricted dispersal and connectivity, it is also expected this diversity encompasses a high degree of endemism, further contributing to the social and biological values of these communities.

The Canyons on the eastern continental slope lie off the coast of NSW (Figure 2-21).

#### **2.2.7.13 Upwelling off Fraser Island**

In two areas near Fraser Island, upwellings of cold, deep waters mix with surface waters. Tides, wind and currents draw these nutrient-rich waters onto the shelf, where they generate blooms of phytoplankton that support animals higher in the food chain, including a number of commercially valuable and threatened species (DSEWPAC, 2012a). The spatial boundary for this KEF is an area of enhanced productivity (identified through areas of enhanced chlorophyll levels) spanning shelf-edge, slope and off-shelf areas running from the northwest to the southeast of Fraser Island. The feature also appears to be an important area of connectivity in migrations of small pelagic fish and top predators. The subtropical waters off Fraser Island are an important spawning area for temperate small pelagic fish (i.e. the sardine, round herring and Australian anchovy), the adults of which appear to migrate from

the south and whose larvae are subsequently transported back into temperate nursery areas by the East Australian Current (DAWE, 2020b).

#### **2.2.7.14 Norfolk Ridge**

The Norfolk Ridge occurs in a region of remnant volcanic arcs, plateaux, troughs and basins (ranging from 50 m to 3,900 m). The ridge runs southward from New Caledonia to New Zealand, between the New Caledonia Trough to the west and the Norfolk Basin to the east (DSEWPAC, 2012a). There are likely to be high levels of diversity in seamount communities (1.24% is classed as pinnacles or seamount/guyot) including endemic species, caused by relatively productive seafloor habitats that support population densities far higher than surrounding areas. Benthic habitats along the Norfolk Ridge are also thought to act as 'stepping stones' for animal dispersal, connecting deep water species from New Caledonia to New Zealand (DSEWPAC, 2012a). Similar to the Lord Howe chain, the ridge also generates localised oceanographic changes which create sites of enhanced productivity and aggregate marine species (DAWE, 2020c).

#### **2.2.8 National Parks and Reserves**

The National Reserve System is Australia's network of protected areas and is made up of Commonwealth, state and territory reserves; Indigenous lands and protected areas.

National parks and reserves which include marine protected areas and terrestrial protected areas are declared under each individual state's legislation and are managed by state authorities.

A number of state marine protected areas occur within the DA. The parks which are located within approximately 100 kms of the EGBPA are all on the Victorian coastline between Point Hicks National Park and Corner Inlet and Nooramunga Marine and Coastal Parks.

Figure 2-22 shows National Parks and Reserves in the DA in Victoria. Figure 2-23 shows the Parks and Reserves in the DA in the islands of Tasmania in northern Bass Strait, Figure 2-24 shows the Parks and Reserves in the DA in Tasmania and Figure 2-25 shows the Parks and Reserves in the DA in NSW.

In addition to National parks and reserves, numerous state and territory reserves are present within the DA; these are identified in the following sections and grouped where applicable.

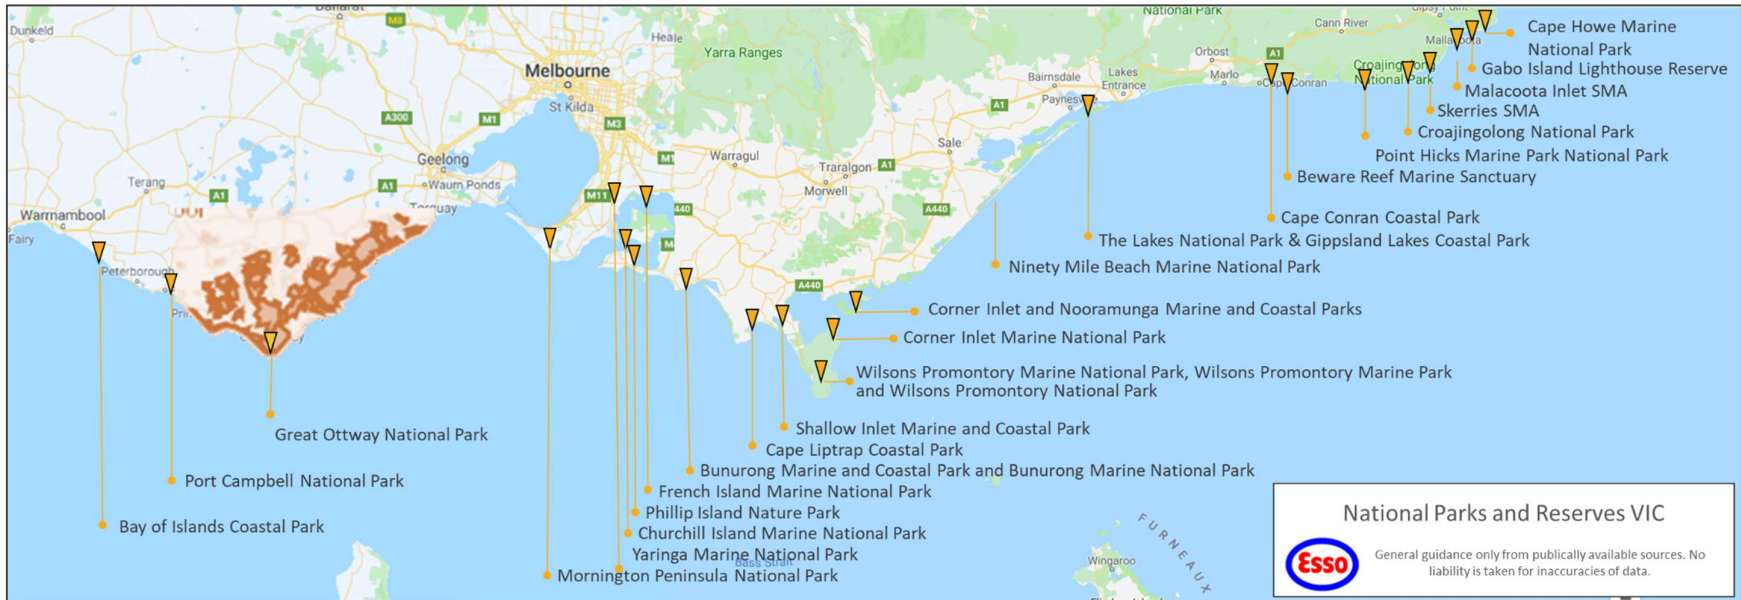

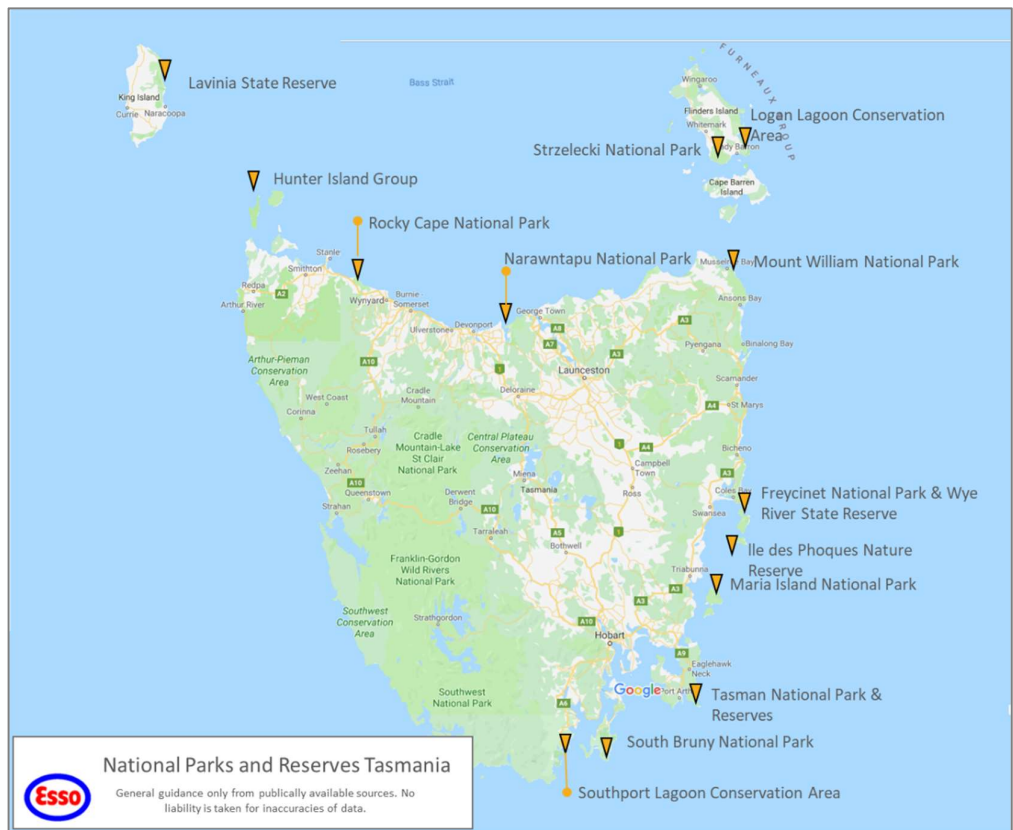

Figure 2-22 National Parks and reserves in the DA in Victoria

**Figure 2-23 National Parks and reserves in the DA on the islands of Tasmania in northern Bass Strait**

**Figure 2-24 National Parks and Reserves in the DA on and around mainland Tasmania**

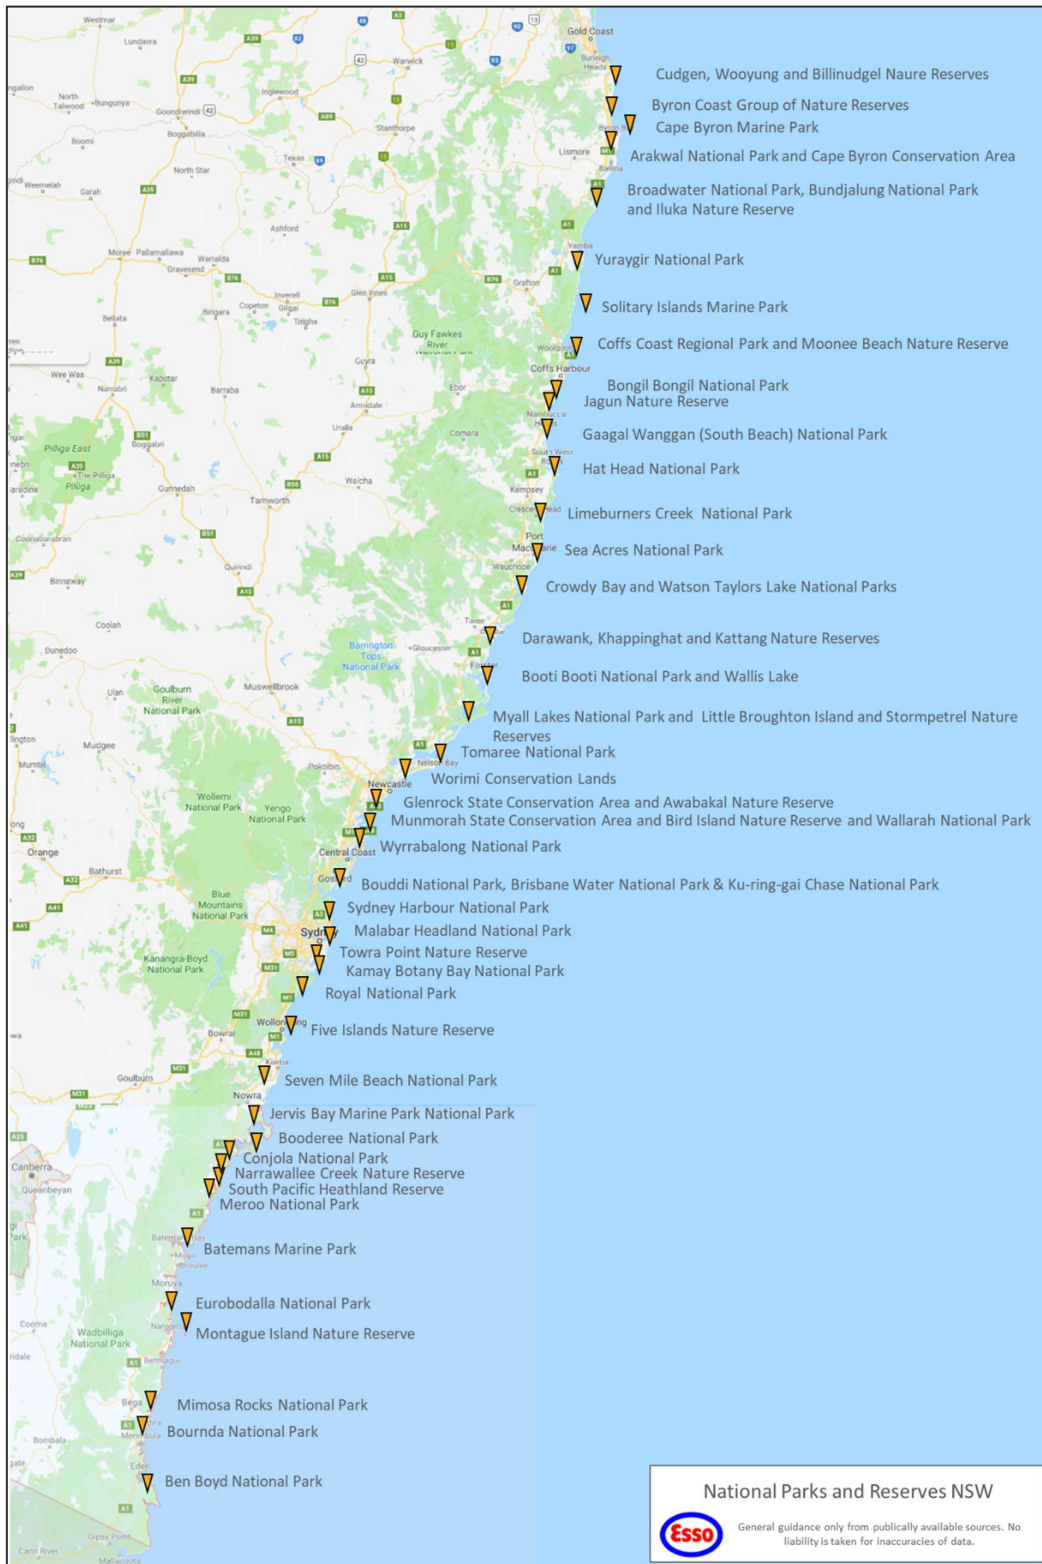

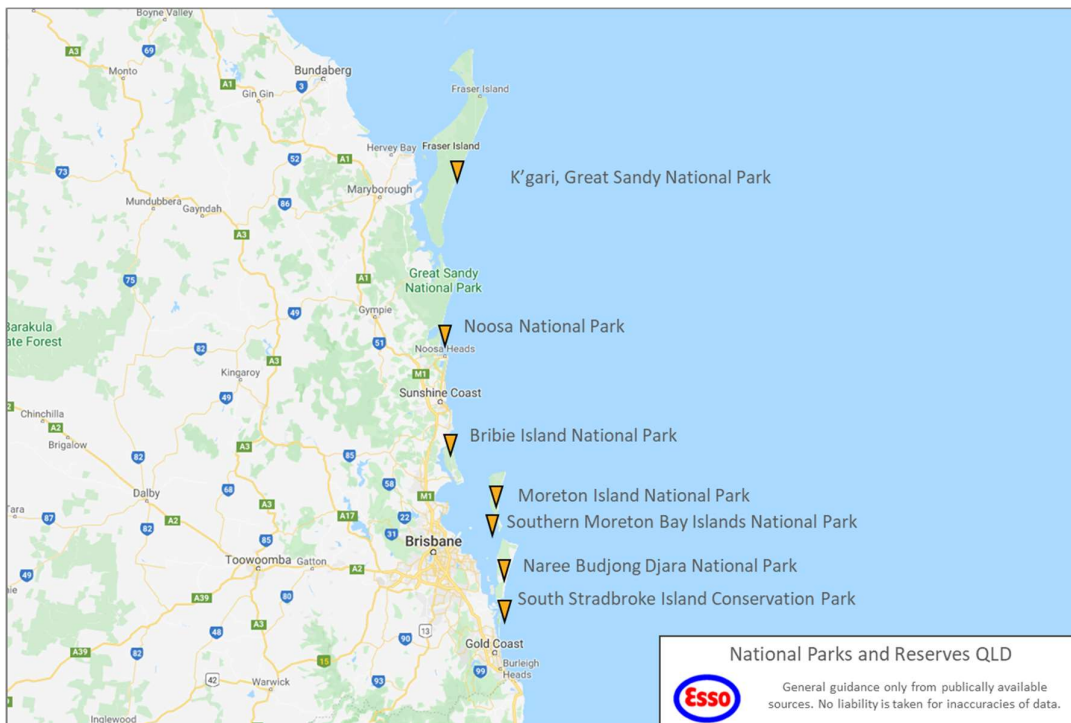

Figure 2-25 National Parks and reserves in the DA in New South Wales

**Figure 2-26 National Parks and reserves in the DA in Queensland**

**2.2.8.1 Cape Howe Marine National Park - VIC**

The Cape Howe Marine National Park is situated in the far east of Victoria alongside the border with New South Wales. The habitats found in the park include kelp forests, granite and sandstone reefs, sandy beaches and soft sediments. The marine life of the area is particularly diverse because species of both warm and cool areas can reside here. Whales pass by Cape Howe on their migration from Antarctica and are sometimes followed by a pod of orcas. Little penguins also forage at the rook on Gabo Island. (ParksVic 2017i).

**2.2.8.2 Gabo Island Lighthouse Reserve - VIC**

Gabo Island is considered to be of State zoological significance due to the presence of one of the largest breeding colonies of Little penguins in the world. Short-tailed shearwaters also breed on Gabo Island.

Common species of whale sighted from the island include Southern right whales, Humpback whales and Killer whales. Whales pass Gabo Island on their annual migration south to feed in Antarctic waters from late winter to early spring and then again during autumn on their northern migration to calve in tropical areas. Pods of dolphins are also regularly sighted from Gabo Island. Species include Common dolphins and Bottlenose dolphins. Australian and New Zealand Fur Seals are also often seen on the rocks surrounding the island.

The lighthouse was constructed from 1858 to 1862 and is the only operating island lighthouse in Victoria (ParksVic, 2017f).

**2.2.8.3 Mallacoota Inlet Special Management Area (Victoria)**

The Mallacoota Inlet Special Management Area is a special management area. Flora, fauna and areas of geomorphological significance are protected in this area. The associated Mallacoota Inlet Wetlands are a recognised Nationally Important Wetland.

#### 2.2.8.4 The Skerries Special Management Area (Victoria)

The Skerries Special Management Area is a special management area. The Skerries is home to a major seal breeding colony with an estimated population of 11,500 representing approximately 12% of the national population.

#### 2.2.8.5 Croajingolong National Park & Nadgee Nature Reserve - VIC

The Croajingolong National Park follows the far-eastern coastline of Victoria for 100 km and together with the adjoining Nadgee Nature Reserve in New South Wales is classified as a UNESCO World Biosphere Reserve. Over 1000 species of native plants have been recorded in the park including 90 species of orchids. The park also contains areas of cool temperate and warm temperate rainforest, eucalypt forest and coastal heathland.

Of the 52 mammal species recorded in the park, arboreal mammals, such as possums, gliders and bats are common. Seals, whales and dolphins occur in coastal waters adjacent to the park. The islands and ocean beaches attract migratory seabirds and waders, the wetlands are habitat for a diversity of waterfowl and the coastal woodlands are favoured habitat for birds of prey; the Nadgee Lake and tributary wetlands are a recognised Nationally Important Wetland. Significant populations of reptiles and amphibians also occur within the park.

The park's secluded coastal camping locations make it popular for beach walks, bird watching, boating and fishing (ParksVic 2017h).

The Skerries, offshore from Wingan Inlet, is home to a major seal breeding colony with an estimated population of 11,500 representing approximately 12% of the national population.

Dry open forest areas occur widely throughout Nadgee Nature Reserve with patches of rainforest occurring in creek catchments and low shrubby heaths being encountered at Mt Nadgee and along the coast. Nadgee Nature Reserve also contains examples of both fresh and salt water wetlands.

The near-coastal areas are significant breeding and foraging habitat for the Eastern bristlebird and seabirds such as the Short-tailed shearwater, Crested tern and Gannet. Most of the park's beaches support a breeding pair of Hooded plovers. Sea caves support important invertebrate 'guano' communities.

The reserve is largely undisturbed by recreational development and contains the only coastal Wilderness Area in NSW (NPWS 2017a).

#### 2.2.8.6 Point Hicks Marine National Park - VIC

The Point Hicks Marine National Park is located alongside Croajingolong National Park, East Gippsland. Many creatures found here are not found further west because the water is too cold, for example the large black sea urchin. The National Park is approximately 4,000 ha in area, with fauna including intertidal and shallow subtidal invertebrates, diverse sessile invertebrates living on subtidal reefs, kelps and small algae, and a high diversity of reef fish. In addition to the subtidal reef, the marine environment around Point Hicks includes intertidal rock operational areas and offshore sands (ParksVic 2017a). Point Hicks Marine National Park is also a popular location for recreational divers. Remains of two shipwrecks can be encountered in the National Park.

#### 2.2.8.7 Beware Reef Marine Sanctuary - VIC

The Beware Reef Marine Sanctuary is a State marine protected area, IUCN Category II, located approximately 5 km southeast of Cape Conran and to the north-east of the operational area, comprises a granite outcrop covering an area of 220 ha and extending for a distance of approximately 500 m from the edge of the exposed reef. It rises from a depth of approximately 30 m and is exposed at low tide, providing a resting area for Australian fur seals. The reef is covered by outcrops of Bull kelp (*Durvillaea* sp.) and supports a range of marine life, including seahorses and leafy seadragons (ParksVic, 2017b). Beware Reef is a popular location for recreational divers and the remains of numerous shipwrecks can be encountered in the sanctuary.

#### 2.2.8.8 Cape Conran Coastal Park - VIC

The Cape Conran Coastal Park extends from Sydenham Inlet in the east to Point Ricardo near Marlo. The park includes ocean beaches and is a popular park for water activities - swimming, diving, boating, fishing and rock pooling.

Many birds feed on the nectar rich plants of the heathlands and banksia woodlands including the threatened Ground parrot (*Pezoporus wallicus wallicus*). Lizards and large lace monitors are common around Cape Conran (Parks Victoria 2017i).

#### 2.2.8.9 The Lakes National Park and Gippsland Lakes Coastal Park - VIC

The Gippsland Lakes are a group of large coastal lagoons in eastern Victoria, separated from the sea by sand dunes and fringed on the seaward side by Ninety Mile Beach. The main lakes - Wellington, Victoria and King cover an area of 340 km<sup>2</sup> and have a shoreline of 320 km. The lakes are fed by a number of river systems. The largest of the rivers are the Latrobe River and the Avon River (flowing into Lake Wellington), and the Mitchell River, Nicholson River and Tambo River (flowing into Lake King). The system is linked to the sea by an artificial entrance near the eastern end, opened in 1889, where the town of Lakes Entrance is now situated (ParksVic, 2017j, ParksVic, 2017k).

The Lakes National Park covers 2390 ha bounded by Lake Victoria, Lake Reeve and the township of Loch Sport. Gippsland Lakes Coastal Park is a narrow coastal reserve covering 17,600 ha along approximately 90km of Ninety Mile Beach from Seaspray to Lakes Entrance, including Rigby Island. The Lakes National Park contains large areas of diverse and relatively undisturbed flora and fauna communities representative of the inner barrier of the Gippsland Lakes system. Gippsland Lakes Coastal Park takes in extensive coastal dune systems, woodlands and heathlands, as well as water bodies such as Lake Reeve and Bunga Arm (ParksVic 2017k).

The Gippsland Lakes system is listed under the Convention on Wetlands of International Importance (Ramsar). The Gippsland Lakes provide important feeding, resting and breeding habitat for approximately 80 waterbird species (ParksVic 2003, 2017j,k), and the lakes, and associated swamps and morasses, regularly support approximately 40,000 to 50,000 waterbirds.

Clydebank Morass, Macleod Morass and Jones Bay (within Lake King) support many species of migratory waders. Lake Wellington, Lake Victoria and Lake King support migratory seabirds, including the little tern and fairy tern, as well as a range of other waterfowl. Lake Reeve provides significant habitat for a large number of migratory waders, and is listed as one of the five most important areas for shorebirds in Victoria (Parks Victoria, 2003). Bunga Arm supports breeding populations of threatened species e.g. Little tern, Fairy tern, Hooded plover and White-bellied sea-eagle (ParksVic 2003, 2017k). Many of lakes and waterbodies (e.g. Lake King, Lake Bunga) within the area are recognised Nationally Important Wetlands.

#### 2.2.8.10 Ninety Mile Beach Marine National Park - VIC

Located 30 km south of Sale and adjacent to Gippsland Lakes Coastal Park, the Ninety Mile Beach Marine National Park covers 5 km of coastline. The huge subtidal sandy expanses characteristic of the area exhibit particularly high species diversity including tube building worms, small molluscs and many tiny crustaceans. Many pelagic fish species feed on the benthos, and young Great white sharks have also been observed feeding in the area (ParksVic 2017c).

#### 2.2.8.11 Corner Inlet and Nooramunga Marine and Coastal Park - VIC

The Corner Inlet and Nooramunga Marine and Coastal Parks are protected from Bass Strait by sand barrier islands and Wilsons Promontory. Corner Inlet and Nooramunga consist of shallow marine waters, intertidal mudflats and a series of sand islands. Corner Inlet and Nooramunga Marine and Coastal Parks contain a diverse range of habitats including large stands of white mangrove and saltmarsh areas. Seaward of the mangroves are extensive areas of intertidal mud and sand flats which provide food for thousands of migratory wading birds each year.

Thirty two species of migratory waders have been recorded, including the largest concentrations of Bar tailed godwit and Great knot in south eastern Australia. In summer, the ocean beaches and sand spits are also used as nesting sites by shorebirds like the Pied oyster catcher, Crested tern, Caspian tern, Fairy tern, Hooded plover and the endangered Little tern. Fringing the saltmarshes and mangroves on the mainland and islands are stands of swamp paperbark and coast tea-tree, and further inland

woodlands of coast banksia and manna gum. These are home for a variety of animals including the New Holland mouse, swamp antechinus, Orange-bellied parrot, Ground parrot and White-bellied sea eagle. The parks are recognised as wetlands of international importance under the Ramsar convention (Parks Victoria 2017d and 2017e).

#### **2.2.8.12 Corner Inlet Marine National Park - VIC**

Corner Inlet Marine National Park is located north and east of Wilson's Promontory adjacent to the southern shores of Corner Inlet. The National Park protects large areas of seagrass including the only extensive *Posidonia australis* meadow in southern Australia. Amongst the seagrass live over 300 marine invertebrates including crabs, seastars, sea snails, squid and many fish including pipefish, stingrays, flathead, whiting and flounder. The seagrass and surrounding marshes are particularly important for international migratory birds such as the Eastern curlew (Parks Victoria 2017e). The area has been listed as part of the Corner Inlet Ramsar Site.

#### **2.2.8.13 Wilsons Promontory Marine National Park - VIC**

Wilsons Promontory Marine National Park is Victoria's largest Marine Protected Area (MPA) at 15,550 ha and is located around the southern tip of Wilsons Promontory. There is a diversity of marine life including octopus, sharks and rays. It is a popular location for recreational divers particularly around the sponge gardens. The offshore islands, including Anser Island, support many colonies of fur seals and oceanic birds such as Little penguins, Fairy prions, Silver gulls and Pacific gulls (Parks Victoria 2017g).

Wilsons Promontory National Park is a popular tourist destination due to its coastal scenery and diverse natural environments. Tourist activities include walking, camping, sightseeing, viewing wildlife, fishing, boating, diving, sea kayaking and surfing.

The park is important for its range of plants and animals, including many threatened species including the New Holland mouse, Ground parrot and White-bellied sea eagle. Coastal features include expansive intertidal mudflats, sandy beaches and sheltered coves interrupted by prominent headlands and granite cliffs in the south, backed by coastal dunes and swamps.

The avifauna recorded for Wilsons Promontory includes around half of all Victorian bird species. Significant species of migratory wading birds feed on the tidal mudflats of Corner Inlet within and adjoining the park. The offshore islands have breeding and roosting sites for sea birds, including a large number of Short-tailed shearwaters (Parks Victoria 2017g).

#### **2.2.8.14 Cape Liptrap Coastal Park - VIC**

Cape Liptrap is a narrow peninsula formed by the spine of the Hoddle Range running out to sea. It consists of steep cliffs flanked by rock pinnacles and wave cut platforms. Between Venus Bay and Cape Liptrap the coast varies between cliffs of dune limestone and rock stacks and pebble beaches to broad sandy beaches backed by high dunes.

The Gunai/Kurnai and Boonwurry people have inhabited this area for over 6000 years. Middens mark the location of camps along the coast.

Along the coast Pacific Gulls, Silver gulls, Sooty oystercatchers and herons feed on the beach and rock platforms, and cormorants and Australian gannets forage for fish (ParksVic, 2018).

#### **2.2.8.15 Bunurong Marine and Coastal Park and Bunurong Wilsons Promontory Marine National Park - VIC**

The Bunurong group of parks stretches along 17 km of coastline. The Bunurong Marine National Park is 2,100 ha in size and adjoins the Bunurong Marine Park and Bunurong Coastal Reserve.

The coastal waters protect a remarkable range of habitats including intertidal reefs, subtidal rocky reefs, algal gardens and seagrass beds. The coastal waters share the cool waters of Victoria's central and western coasts but, unlike those shores, are relatively protected from the oceanic south-westerly swell by the position of distant King Island. The gently sloping rocky seafloor is also unusual in Victoria.

The marine life of the region is considered special due to the unusual set of environmental conditions. The intertidal sandstone reefs of the area boast the highest recorded diversity of intertidal and subtidal invertebrates in eastern Victoria. The range of seaweed species is also large and includes greens, blue-greens, browns and encrusting, coralline reds.

Seagrass meadows and sandy bays are also important habitats within the area. The diversity of habitats supports many marine animals including seastars, featherstars, crabs, snails, Port Jackson Sharks and up to 87 species of fish.

The coastal area is home to the Hooded plover which breeds on the beaches (ParksVic, 2018).

#### **2.2.8.16 Phillip Island Nature Park - VIC**

Phillip Island Nature Parks is part of the United Nations Scientific and Cultural Organisation (UNESCO) Western Port Biosphere Reserve, and abuts the Western Port Ramsar wetland. Phillip Island is part of Bunurong and Boonwurrung country, and the Nature Parks conserves important elements of the area's indigenous heritage, as well as historical sites of European settlement and agriculture. It is an important ecotourism site for Victoria and protects threatened flora and fauna and is a known breeding site for threatened marine species of Little Penguin and Short-Tailed Shearwaters, Hooded Plovers and has a population of Australian Fur Seals (PoV, 2013).

#### **2.2.8.17 French Island Marine National Park - VIC**

The park is 2,978 hectares in size and approximately 10 kilometres south of the township of Tooradin on the Victorian coast. The main ecological communities protected by the park include subtidal and intertidal soft sediments (including seagrasses, mangroves and a small area of saltmarsh), and the water column. Over 73 per cent of the park is intertidal. French Island Marine National Park provides important feeding and roosting habitat for forty listed bird species such as the grey-tailed tattler *Heteroscelus brevipes* and the intermediate egret *Ardea intermedia* and the critically endangered orange-bellied parrot *Neophema chrysogaster*. The park is also feeding habitat for twenty-seven internationally important migratory bird species. Syngnathids, the group that includes seahorses and pipefish, are protected and are found in the park (ParksVic, 2019c).

#### **2.2.8.18 Churchill Island Marine National Park - VIC**

Churchill Island Marine National Park covers 670 hectares and is located south of Rhyll on the eastern shore of Phillip Island. The main habitats protected by the park include intertidal and subtidal soft sediments (including small areas of mangroves and saltmarsh, and seagrasses), some shingle-cobble rock areas, and the water column. The park provides important feeding and roosting habitat for forty-one listed bird species including the critically endangered orange-bellied parrot *Neophema chrysogaster*. The park and surrounds is a feeding area for twenty-nine internationally important migratory bird species (ParksVic, 2019 a).

#### **2.2.8.19 Yaringa Marine National Park - VIC**

Yaringa Marine National Park covers 970 ha along the north of Western Port Bay in Victoria. It is typified by saltmarsh communities, coastal heaths and open woodlands and forms part of the Western Port Ramsar Site. The areas above high water mark are protected within Western Port Nature Conservation Reserve. The natural values include the seagrass, mangrove and saltmarsh communities that provide habitat for migratory wader and shorebird species. Extensive intertidal mudflats support a diverse range of invertebrate and fish species. The areas are also a place of Indigenous cultural significance. Boating, birdwatching and marine education are elements of its social value (ParksVic, 2007).

#### **2.2.8.20 Mornington Peninsula National Park - VIC**

Mornington Peninsula National Park covers 2,686-hectares along the coastline of the Mornington Peninsula situated approximately 90 km south of Melbourne. It contains important areas of native vegetation remaining on the Mornington Peninsula following depletion since European settlement. Of particular note are communities of coastal grassy forests, banksia woodlands and sand heathlands. The park has known breeding habitat in Victoria for the threatened Hooded Plover. The park's tourism values are important to Victoria (ParksVic, 2019 b).

#### **2.2.8.21 Great Otway National Park - VIC**

Great Otway National Park (103,185 ha) includes extensive forests and heathlands on much of the southern fall and many northern areas of the Otway Ranges, and much of the coastline between Torquay in the east and Princetown in the west. The area of the park is not continuous but contains large areas of public land, private and rural communities with larger towns nearby such as Anglesea,

Lorne and Apollo Bay. The park is an integral element of Victoria's most popular regional tourism destination. The Great Ocean Road and Scenic Environs, also on Australia's National Heritage list (refer Section 2.2.2.1) intersects the park in many places. Covering a large area both on the coast and inland, the park has many values from European and Indigenous historic significance to educational and scientific significance for its geomorphic and geological forms. Its proximity to Melbourne and its past (logging) and present uses for rural and forestry are managed with the high demand for its scenic and recreational values including fishing, hunting and touring. Relevant to this plan are the conservation values of the park in the coastal regions and the numerous tourist and recreational values the coastline and beaches offer, primarily due to their natural beauty. The park supports several species of migratory birds and listed threatened species include the Shy Albatross, Wandering Albatross and Fairy Prion (ParksVic and DSE, 2009).

#### **2.2.8.22 Port Campbell National Park and Bay of Islands Coastal Park - VIC**

Port Campbell National Park and Bay of Islands Coastal Park combine to form a linear reserve along 65 km of Victoria's southern ocean coastline extending past the limits of the Great Otway National Park and covering a total area of 2,700 ha. The park extends to the limits of the National Heritage Great Ocean Road and Scenic Environs place (refer Section 2.2.2.1). The Parks' geomorphical features including sheer cliffs and gorges, the arches and the off-shore stacks draw over five million visitors to the Great Ocean Road region each year. The park contains a wide range of remnant coastal vegetation types, including important coastal heathlands, which provide a valuable link between other patches of remnant vegetation in the area and contains a high diversity of plants. The area supports the endangered Australasian Bittern and listed marine species like the Great Egret and White-bellied sea-eagle (ParksVic, 1998).

#### **2.2.8.23 Hogan Group - TAS**

Hogan Island, the largest island in the Hogan Group, is a 232 ha granite island located in northern Bass Strait between the Furneaux Group and Wilsons Promontory. Recorded breeding seabird and wader species include Little penguin, Short-tailed shearwater, Pacific gull, Silver gull and Sooty oystercatcher (Brothers et al., 2001). Other islets of the Group include: Twin, Long, Round, East, Boundary (or North East) islets, and Seal Rock.

#### **2.2.8.24 West Moncoeur Island and East Moncoeur Island - TAS**

West Moncoeur Island and East Moncoeur Island are part of Tasmania's Rodondo Group lying in northern Bass Strait south of Wilsons Promontory. The islands are granite islands ringed by steep cliffs. Recorded breeding seabird and wader species include Little penguin, Short-tailed shearwater, Fairy prion, Common diving petrel, Pacific gull and Sooty oystercatcher. Both islands are considered important breeding sites for seabirds (Brothers et al., 2001). West Moncoeur Island holds an important breeding colony of Australian fur seals and is a nature reserve (DPIPWE, 2000).

#### **2.2.8.25 Curtis Island Nature Reserve and Devils Tower Nature Reserve - TAS**

Curtis Island, part of the Curtis Group, is a granite island with an area of 150 ha lying in northern Bass Strait between the Furneaux Group and Wilsons Promontory. It is a nature reserve and supports up to 390,000 breeding pairs of Short-tailed shearwaters. Other recorded breeding seabird and wader species include Little penguin, Fairy prion, Pacific gull and Sooty oystercatcher.

Other islands in the Curtis Group are Cone Islet, Sugarloaf Rock and Devils Tower. Devils Tower comprises two small granite islands with a combined area of 4.77 ha. It is a nature reserve and recorded breeding seabird species include Short-tailed shearwater, Fairy prion and Common diving-petrel. The island is also used as a regular haul-out site for Australian fur seals (Brothers et al., 2001)

#### **2.2.8.26 Kent Group National Park and Kent Group Marine Reserve - TAS**

The six islands and islets of the Kent Group (Erith, Dover, Deal, North East Isle, South West Isle and Judgement Rocks) comprise Tasmania's northernmost National Park. Surrounding the largest of the islands, the Kent Group Marine Reserve covers 29,000 ha of marine habitat including deep and shallow reefs as well as extensive sponge beds (TPWS 2017). The waters around the Kent Group include the southernmost strongholds of several fish species including the violet roughy, mosaic leatherjacket and Wilson's weedfish, and the southern limit of distribution of Maori wrasse, one spot puller and Bank's

shovelnose. The Marine Protected Area (MPA) is made up of a sanctuary zone which is a 'no take' zone, and a habitat protection zone which allows for lower impact fishing (e.g. abalone and rock lobster fishing, hand line fishing).

The North East Isle is a 32.62 ha unpopulated granite island with a peak elevation of 125 m above sea level. Recorded breeding seabird and wader species include Little penguin, Short-tailed shearwater, Fairy prior, Common diving petrel, Pacific gull and Sooty oystercatcher (Brothers et al., 2001).

#### **2.2.8.27 Logan Lagoon Conservation Area - TAS**

Logan Lagoon Conservation Area is also a Ramsar wetland of international significance. Refer to Section 2.2.3.3 Logan Lagoon Ramsar Site for further information.

#### **2.2.8.28 Strzelecki National Park - TAS**

Strzelecki National Park covers 4216 hectares in the south-western corner of Flinders Island. Flinders is the main island in the Furneaux Group, a group of 54 islands in Bass Strait off the north-east coast of mainland Tasmania.

The national park protects rich and varied ecosystems as well as spectacular coastal and granite mountain landscapes. Strzelecki forms an area where plant and animal species found on mainland Australia and Tasmania overlap, making the park of important biogeographic significance. The park is also home to a high number of endemic species, rare flora and fauna and significant vegetation communities.

Flinders Island has particular significance as an important stop-over point for bird species migrating between the Australian mainland and Tasmania. A number of rare and threatened species occur in the park, including the Swift parrot, Forty-spotted pardalote, Grey-tailed tattler, and the Hooded plover (Tas Parks, 2018).

#### **2.2.8.29 Lavinia State Reserve – TAS**

Lavinia State Reserve located on the north-eastern side of King Island contains the Lavinia Ramsar wetland site which accounts for its primary values. Refer to Section 2.2.3.10 for information on this reserve.

#### **2.2.8.30 Hunter Island Group – TAS**

The Hunter Group of Islands is a group of 13 islands which lay off the north-west tip of Tasmania in Bass Strait. The two largest islands are Hunter Island and Three Hummock Island and they are surrounded by many smaller islands including Albatross Island, Kangaroo Island (Tasmania), Bird Island and Stack Island. The group supports large numbers of migratory and seabirds. The endangered Northern Royal Albatross, southern Giant Petrel and Grey-headed Albatross are only some of the listed migratory species. The Critically endangered Great Knot and endangered Sand Plover are known to roost on the islands. The Critically endangered Curlew Sandpiper and Eastern Curlew are known to occur in the area and the islands are breeding and feeding or foraging areas for many other threatened bird species (DoEE, 2019r). The Hunter Group of Island is listed as an Important Bird Area by Birdlife International, formerly the International Council for Bird Preservation.

#### **2.2.8.31 Rocky Cape National Park - TAS**

Rocky Cape National park has an area of about 3064 ha on the north coast of Tasmania. As the name suggests the park is valued for its geoheritage where the age of the rocks and the geomorphosis, movement and erosion over time has created a spectacular coastline, including caves which are now 20M above the waterline. Threatened species habitat for critically endangered Curlew Sandpiper, Swift Parrot, Bar-tailed Godwit, Far Eastern Curlew and a migration route for the critically endangered Orange-Bellied Parrot (TSSC, 2006).

#### **2.2.8.32 Narawntapu National Park - TAS**

The Park has a total area of about 4,500 hectares and stretches on the north coast of Tasmania along the coast of Bass Strait from the Port Sorell estuary in the west to the mouth of the Tamar River in the east. The Park includes the adjacent islands in the Port Sorell estuary and The Carbuncle, covers primarily land mass extending to the low water mark and the tidal flats but does not include marine or

estuarine waters. Threatened ecological communities of saltmarsh occur in the area. Endemic flora species such as velvet bush, threatened species such as the grass tree, and several plant communities which are unreserved or poorly reserved elsewhere in the State reserve system make this park an area of high conservation value for Tasmania. Threatened fauna species recorded are the Green and Gold frog, Swift Parrot, Wedge Tail Eagle and Great Crested Grebe. Endemic species found here are the Tasmanian Pademelon and the Bettong (TPWS, 2016).

#### **2.2.8.33 Mt William National Park - TAS**

Mt William National Park located in the far north-east corner of Tasmania is an important area for the conservation of Tasmania's coastal heathlands and dry sclerophyll plants. Being a coastal park, Mt. William is an excellent area for observing sea birds. Gulls, terns, gannets, and albatrosses can be seen, as well as both the Pied and Sooty oystercatcher. Although not common, both the White-bellied sea eagle and the Wedge-tailed eagle can sometimes be spotted soaring overhead. Mt William is also the first and last stop off point for some migratory birds such as shearwaters (TPWS, 2014).

#### **2.2.8.34 Freycinet National Park and Wye River State Reserve - TAS**

Freycinet National Park on the east coast of Tasmania comprises a total area of some 16,803 hectares and includes Freycinet Peninsula, Schouten Island and nearby offshore islets and rocks extending in each case to the low water mark. The park has visitor, recreation and conservation zones which also include cultural and historical values. Freycinet National Park is important for the conservation of Tasmania's dry sclerophyll plant communities on granite and dolerite, and the conservation of a range of rare and endemic plant species, including several threatened species. The Park is important for wading birds due to its proximity to Moulting Lagoon, a wetland of international importance. All of the Park's offshore islands, islets and rocks are important breeding and resting sites for seabirds. Australian Fur Seals and Leopard Seals haul out to rest on the Islands. Vulnerable species include the Hooded Plover, Swift Parrot, Wedge Tail Eagle, White-bellied Sea Eagle, Shy Albatross and Black-browed Albatross, White-fronted Tern and Fairy Tern. With the wide diversity in habitats, the park is important for conservation of numerous native and endemic species of flora and fauna and together with its social values is a renowned Tasmanian recreation and tourist destination (TPWS, 2000).

#### **2.2.8.35 Maria Island National Park and Ile des Phoques Nature Reserve - TAS**

Maria Island lies off the south-east coast of Tasmania and has a total area of about 11,550 hectares which includes a marine area of 1878 hectares. Except for Lachlan Island in Mercury Passage, the Park includes all the islands, rocks, and reefs adjacent to the coastline, most notably Ile du Nord (Rabbit Island) and Ile des Phoques Nature Reserve located midpoint between Maria Island and Schouten Island (TPWS, 1998). Threatened ecological communities include Giant Kelp Marine Forests and subtropical and temperate coastal saltmarsh (EPBC, 2019a). The area includes 53 threatened species including the critically endangered Swift Parrot, Curlew Sandpiper, Eastern Curlew and Bar-tailed Godwit. The waters around Maria Island are known foraging and feeding areas for vulnerable Humpback Whales and other marine mammals may also feed in the area. The park is rich in poorly reserved flora species. The Australian Convict Site, Darlington Probation Station is listed in the world Heritage list and was a penal colony established by Governor Arthur.

The Maria Island Marine Reserve on the north and north-west coast of the island covers 1250 ha and extend out to 1km from shore (or 20m depth) and include a sanctuary zone for the protection of kelp species (TPWS, 2019).

#### **2.2.8.36 Tasman National Park and Reserves - TAS**

Tasman National Park in the south-east of Tasmania has an area of 10,755 hectares and includes the adjacent offshore rocks and islands and includes several reserves. As many of the national parks on the east coast, the Tasman Park has geoheritage significance. Due to the substantially undisturbed landscape it is significant for flora and fauna conservation. Threatened fauna include the endangered Wedge-Tailed Eagle, Shy Albatross, Swift Parrot, Live-Bearing Sea Star. Several threatened flora species also occur in the Park. Several historic sites have been recorded in the park and reserves, and include examples of historic heritage from the convict era, through to maritime history and timber harvesting (TPWS, 2011). Whilst it does not include the world heritage Port Arthur site, the park spans either side of the entry to the port.

#### 2.2.8.37 South Bruny National Park - TAS

South Bruny National Park (5,059 ha) provides key habitat for a number of threatened species, particularly bird life. The hooded plover uses the sandy beaches and dunes to nest, and the critically endangered swift parrot depends on blue gums for its specialised diet. The marine environment surrounding the park is home to seals and whales. The Australian fur seal, the most common seal in Tasmanian waters, can be seen around The Friars. Bruny Island was home to the Nuenonne clan of the South East nation of Tasmanian Aboriginal people and the park contains a number of important Aboriginal sites, including middens, quarries and artefact scatters (TPWS, 2020a).

#### 2.2.8.38 Southport Lagoon Conservation Area – TAS

Lying approximately 80 kms south of Hobart the 4,280 hectare Southport Lagoon Conservation Area possesses a wide diversity of significant natural, cultural and recreational values. The lagoons and fringing vegetation support many bird species and fish nurseries. The historically significant Bruni D'Entrecasteaux's 1792 expedition documented plants found at the time, all of which still remain, including the 25 species that were thought to be extinct. Whaling stations operated to the north of the lagoon in the early 1900's but became unviable by the late 1840s due to overfishing (TPWS, 2020b).

#### 2.2.8.39 Lord Howe Island Permanent Park Preserve - NSW

Lord Howe Island Permanent Park Preserve includes a major part of the Lord Howe Island Group but excludes the settlement areas of the island (residential and tourist accommodation and agricultural lands). Whereas a National Park does not allow any harvesting, the management of the *Preserve* allows for sustainable harvesting of some natural resources, in this case mainly palm seeds. Lord Howe is listed as World Heritage (refer to Section 2.2.1.2) for its exceptional natural beauty and for a place which has habitats where populations of rare or endangered species of plants and animals still survive. The Lord Howe Island Group forms one of the major seabird breeding sites in the Tasman Sea and is thought to be home to the most diverse and largest number of seabirds in Australia, 34 bird species regularly breed on the island. The summit and slopes of Mt Lidgbird and Mt Gower support almost the entire breeding population of the marine bird, providence petrel (*Pterodroma solandri*); the only known breeding locality in Australasia of the grey ternlet (*Procelsterna cerulea*) and vulnerable Kermadec petrel (*Pterodroma neglecta neglecta*); and the southernmost breeding locality in the world for the threatened masked booby (*Sula dactylatra tasmani*), sooty tern (*Sterna fuscata*) and common noddly (*Anous stolidus*) (DECCW, 2010a).

#### 2.2.8.40 Cudgen, Wooyung and Billinudgel Nature Reserves - NSW

Cudgen, Wooyung and Billinudgel Nature Reserves are located just south of the QLD/NSW border and collectively cover approximately 7km of coastline. All are characterised by high species diversity and contain an overlap of the tropical and subtropical species close to the extent of their range. The three reserves conserve important coastal landscapes, remnant vegetation, and wildlife habitat in a region subject to considerable pressures from agricultural, residential, infrastructure and tourism development (DECC, 2007).

Cudgen Nature Reserve is also significant for wetland conservation in a local, regional and state context (NPWS, 1998d).

#### 2.2.8.41 Cape Byron Marine Park - NSW

The Cape Byron Marine (State) Park is situated off the far north coast of NSW, wrapping around Cape Byron headland at Byron Bay and covers approximately 220 km<sup>2</sup> of NSW waters from the mean high water mark to 3 nautical miles offshore. It includes the tidal waters of the Brunswick River and its tributaries and Belongil and Tallow Creeks. It has multiple zones including Sanctuary, Habitat Protection and General Use.

The marine park conserves many subtropical marine habitats which support high levels of biodiversity including some threatened and protected species. It is strongly influenced by the East Australian Current (EAC) as warm waters from the north come together with cooler waters from the south. Julian Rocks within the park is an aggregation site for the endangered Grey Nurse Sharks, *Carcharias taurus*, who visit in winter (DPI, 2019a).

#### **2.2.8.42 Byron Coast Group of Nature Reserves - NSW**

The Brunswick Heads, Tyagarah and Broken Head nature reserves, together form the Byron Coast Group of Nature Reserves and cover about 922 hectares to the north and south of Byron Bay, a major tourist location. Like many of the parks and reserves described in this region, their importance as a group of protected areas is greater than their importance individually for nature conservation. These reserves, together with the surrounding parks and reserves form a discontinuous chain that protect habitats which support a diverse range of wildlife and plant communities including refuges for animals of ecological significance and important links in the north-south migration of certain animal species. Protection of these reserves becomes increasingly important in the face of growing population and recreational use (NPWS, 1998c).

#### **2.2.8.43 Arakwal National Park and Cape Byron Conservation Area- NSW**

Arakwal National Park is a 185.2 ha area created under an Indigenous Land Use Agreement (ILUA) with the Arakwal people as part of resolving a native title claim. It is situated 2km south of Byron Bay which is a regional and international tourist destination. It is a core component of the protected areas in the Byron Coast Group of reserves discussed above and also has significant values to its aboriginal people, the Arakwal people, who have been associated with the coastal landscape for over 22,000 years. The Park protects significant coastal habitat including a large area of honeysuckle country (Banksia heathland) that is home to a range of native plants and animals including threatened ecological communities and species (DEC, 2007).

Situated on the most easterly point of the Australian mainland on the far north coast of NSW, Cape Byron Headland Reserve is a State Conservation Area of 98.5 ha. It adjoins the Arakwal National Park and is equally important to the Arakwal people. It has rich historical heritage symbolised by the Cape Byron Lighthouse and is a major tourist attraction in walking distance to the Byron Bay township, providing various recreational activities including hiking, hang-gliding and whale watching (CBT, 2002).

#### **2.2.8.44 Broadwater National Park, Bundjalung National Park and Iluka Nature Reserve - NSW**

Broadwater National Park, Bundjalung National Park and Iluka Nature Reserve collectively form part of a major conservation system covering much of the subtropical coast of northern NSW. They protect most of the coastline (over 20,000 ha of coastal land) from Ballina on the Richmond River to the north and Iluka on the Clarence River to the south. The parks are significant as they exhibit high levels of biodiversity and a range of faunal species, which reflects the diverse vegetation communities and climatic conditions within the three areas. They contain subtropical communities, being at the end of the southern range of the subtropics, as well as coastal communities and also support temperate species. The parks protect more than 280 species of reptiles, birds and mammals. Twenty-six species of birds are recognised as being either endangered or vulnerable and therefore of high conservation status. (NPWS, 1997). The coastal wetlands, dunes and ocean foreshores are important feeding and roosting sites for a number of migratory and resident shorebirds. The Iluka Nature Reserve also protects a significant remnant area of sub-tropical littoral rainforest as part of a system of rainforest parks which are World Heritage listed (refer 2.2.1.3) (NPWS, 1997).

#### **2.2.8.45 Yuraygir National Park - NSW**

Yuraygir National Park on the north coast of NSW covers an area of 32,898 ha including over 80 kms of coastline. The park protects a wide range of vegetation communities and protects habitats which support a diverse range of wildlife communities including animals of ecological significance and species at the limit of their distribution (tropical and subtropical overlap). The park is also an important link in the north-south migration of certain animal species including the little tern, ruddy turnstone, Mongolian plover, pied oyster-catcher, sooty oyster-catcher, white-bellied sea eagle, eastern curlew, red-necked stint and the common sandpiper (NPWS, 2003).

#### **2.2.8.46 Solitary Islands (State) Marine Park - NSW**

Adjacent to the Yuraygir National Park and continuing south to Coffs Harbour is the Solitary Islands Marine Park which covers the area between the coast and the Commonwealth Solitary Islands Marine Park (refer Section 2.2.6.10). It has multiple zones including Sanctuary, Habitat Protection and General Use. It is approximately 710 km<sup>2</sup> from the mean high water mark to three nautical miles offshore, including estuaries to their tidal limit. The marine park is unique in that it contains diverse habitats

(estuaries, sandy beaches, intertidal rocky shores, sub-tidal reefs, submerged solitary islands and open oceans) that support a diverse range of fish species including large pelagic fish. Turtles, shelled animals and many marine snails and slugs are also present, especially on the western side. In Anemone Bay in the north of the park the wildlife is particularly diverse and supports the dense coverage of anemone and anemone fish. The park is also the northern most breeding site recorded for the giant cuttlefish (DPI, 2019b).

#### **2.2.8.47 Coffs Coast Regional Park and Moonee Beach Nature Reserve - NSW**

Coffs Coast Regional Park covers a narrow, disjunct strip of coastal land stretching from near Corindi to the northern end of Park Beach, Coffs Harbour, covering an area of 562ha. The position of the park adjacent to a major regional city, a number of coastal villages and a wide range of tourism accommodation (including resorts and caravan parks) leads to pressure on the park from high visitation rates and varied land uses next to the park (NSW OEH, 2017c).

Moonee Beach Nature Reserve covers 336 ha and is located between areas covered by the Coffs Coast Regional Park. Many threatened species of fauna are found in the reserve, many of which are migratory bird species such as the wedge-tailed shearwater and the little tern. They too are threatened by increasing visitation rates (NSW OEH, 2012d).

#### **2.2.8.48 Muttonbird Island Nature Reserve - NSW**

Muttonbird Island Nature Reserve covers an area of around 9 hectares and is located adjacent to the coastline at Coffs Harbour on the mid north coast of NSW. It consists of two islands: Muttonbird Island and Little Muttonbird Island. As the name suggests, the reserve is a significant breeding site for the listed migratory wedge-tailed shearwaters (*Puffinus pacificus*) which migrate from Asia every year in August to breed on the island. As well as the migratory birds a number of threatened species have been recorded on the island including the vulnerable black-winged petrel (*Pterodroma nigripennis*), osprey (*Pandion haliaetus*) and sooty oystercatcher (*Haematopus fuliginosus*) (NPWS, 2009b)

#### **2.2.8.49 Bongil Bongil National Park - NSW**

Located 10km south of Coffs Harbour on the north coast of NSW is the 4,316 ha Bongil Bongil National Park. The park has over 10 km of coastline and is important as it protects coastal wetlands, creeks and estuaries that are crucial habitat for many native plant and animal species. The park contains diverse range of vegetation including threatened ecological communities such as Littoral Rainforest and Swamp Sclerophyll Forest on Coastal Floodplains. The park supports many species of shorebirds including the endangered Curlew sandpiper and Little Tern. With its close proximity to Coffs Harbour city and other smaller town, visitation to the park and enjoyment of the coastal areas is high (NSW OEH, 2017b)

#### **2.2.8.50 Jagun Nature Reserve - NSW**

Jagun reserve is located adjacent to the township of Valla Beach on the mid north coast of NSW. Although it is only 103 ha, the reserve is a critical part of a regional habitat corridor known as the

Oyster Creek Urunga Corridor linking large areas of coastal vegetation from Deep Creek in the south to the Bellinger River in the north, providing potential key linkages for threatened forest fauna. Jagun Nature Reserve has a number of small drainage lines which flow into Oyster Creek, which intermittently opens and closes to the ocean thereby having a short distance of transition between marine and freshwater vegetation, and variations in salinity dependent upon contact with the ocean. The entrance to Oyster Creek is highly significant to the Aboriginal Gumbaynggir people (NPWS, 2008).

#### **2.2.8.51 Gaagal Wanggaan (South Beach) National Park- NSW**

Gaagal Wanggaan (South Beach) National Park (637ha) is owned by the Aboriginal Gumbaynggir people and leased back to and jointly managed with the NSW Parks and Wildlife Service. Encompassing Warrell Creek, Gaagal Wanggaan (South Beach) National Park covers an undisturbed coastal dune system, littoral rainforest, shrubland, and estuarine mangroves which support a diverse range of coastal fauna and flora. The park contains significant Aboriginal cultural values including sites that show the continuous use of the area by Aboriginal people, as they have for thousands of years (NSW OEH, 2019b).

#### **2.2.8.52 Hat Head National Park- NSW**

Together with Limeburners Creek Nature Reserve, Sea Acres Nature Reserve and Crowdy Bay National Park, Hat Head National Park (7,220 ha) forms a system of protected areas between Harrington in the south and South West Rocks in the north which is broken only by the coastal towns and villages. Extensive wetlands of the Limeburners Creek Nature Reserve discussed below (refer Section 2.2.8.53) parallel the beaches of Hat Head National Park although these are being invaded by huge mobile dunes. Hat Head National Park contains the northern range limit of a number of temperate species of flora and fauna as well as the southern limit of many tropical and sub-tropical species as it is located at the Macleay-Mcpherson Overlap; an ecological transition zone between the temperate southern areas of eastern Australia and the tropical north. The zone of overlap has significance for the number and diversity of both plant and animal species (NPWS, 1998a).

#### **2.2.8.53 Limeburners Creek National Park - NSW**

Limeburners Creek National Park covers 9,123 ha of coastal land north of Port Macquarie on the NSW mid-north coast. It incorporates large portion of Limeburners Creek Nature Reserve which is nationally significant freshwater and estuarine wetland. These provide habitat for many threatened and migratory bird species. Other natural values include wet and dry heathland, littoral rainforest, eucalypt forest and woodland. The park contains a high concentration of indigenous relics including what may be fish trap, one of only three in the north coast of New South Wales (NPWS, 1998b).

#### **2.2.8.54 Sea Acres National Park - NSW**

Sea Acres National Park is located near Port Macquarie on the mid-north coast region of New South Wales. It is famous for its 1.3 km rainforest walk however has a coastal region also where evidence of its indigenous heritage and the way that the Birpai People likely used the area for fishing, hunting and gathering (NPWS, 2019c).

#### **2.2.8.55 Crowdy Bay National Park and Watson Taylors Lake - NSW**

Located on the mid-north coast of New South Wales, 25 km north-east of Taree is the 8,022 ha Crowdy Bay National Park which has within it the nationally significant, freshwater Watson Taylors Lake wetland. Part of the wetland is Blackfellows Bog, which is of high scientific value as it contains a wealth of palynological material which will allow scientists to reconstruct the many vegetative and climatic changes that have occurred over the last several thousand years in the Crowdy Bay area. Other significant natural values of the park include remnant stands of littoral rainforest at Crowdy Gap and Diamond Head and both wet and dry heath communities. The heath contributes to the park's attraction as a place for spring wildflower display, being renowned for many scenic features of the park together with beaches, headlands and sand plains. The park also contains undisturbed indigenous middens dating back approximately 6,000 years (NPWS, 1987). Crowdy Bay National Park is a listed Nationally Important Wetland.

#### **2.2.8.56 Darawank, Khappinghat and Kattang Nature Reserves - NSW**

Along the coast between Forster and Camden Haven are the Darawank (1191 ha), Khappinghat and Kattang (68 ha) Nature Reserves. Darawank Nature Reserve, occupies the largest area along the coast and supports a diversity of wetland and coastal vegetation communities providing habitat for threatened shorebird species including the Australian pied oystercatcher (*Haematopus longirostris*) and little tern (*Sternula albifrons*) and nesting site for the endangered black-necked stork (*Ephippiorhynchus asiaticus*). Consistent with the adjacent parks, these reserves have important ecological communities of littoral rainforest and subtropical rainforest (NSW OEH, 2014). Khappinghat is mainly inland but includes the approximately 3.45km of beach and Kattang is a dramatic cliffed headland which is a popular spot for fishing, viewing wildflowers and whale hatching (NPWS, 2019b).

#### **2.2.8.57 Booti Booti National Park and Wallis Lake - NSW**

Booti Booti National Park is 1566 ha park, approximately 10km long, 3.25 km wide at its widest point and 400m wide at its narrowest. It's a peninsula which runs between the Forster town in the North and Charlotte Head in the south and separates the ocean from Wallis Lake, which is a nationally important wetland. The park consists of what was 3 hill, island complexes that have been joined to the mainland through deposited sand. The dominant plant community is dry, subtropical rainforest and also includes

Littoral rainforest as well as other plant communities (Griffith et al., 2014). Its estuarine waters provide habitat to over 200 bird species including the endangered little tern (NPWS, 2019d).

Wallis Lake is a nationally significant wetland and one of the lakes which form The Great Lakes of NSW (including Myall Lakes see Section 2.2.8.58 below). Wallis Lake supports the northern-most limit of the seagrass *Posidonia australis* and 20 per cent of the total seagrass communities in New South Wales (DoEE, 2006).

#### **2.2.8.58 Myall Lakes National Park Little Broughton Island and Stormpetrel Nature Reserves-NSW**

The extensive waterways including Bombah Broadwater, Boolambayte Lake and Myall Lake are the dominant feature of this park. The Myall Lakes Ramsar site also overlaps with the park (refer Section 2.2.3.10). Its proximity to Newcastle and Forster on the central coast of NSW and the dunes, waterways and 40kms of beach make Myall National Park the most frequently visited National Park in northern NSW.

The Myall Coast Reserves include Little Broughton Island (36 ha) and two islands known as Inner Rock and North Rock which together form Stormpetrel Nature Reserve (8 ha). They are located about 3 km offshore near Broughton Island. The three islands are important breeding sites for seabirds, of particular note are the White-bellied Sea Eagle and the Wedge-tailed Shearwater. Little Broughton Island is also recognised as the northern most breeding site for the short-tailed Shearwater (NPWS, 2002).

#### **2.2.8.59 Tomaree National Park - NSW**

Tomaree National Park is located in the Port Stephens area of NSW, approximately 45km north of Newcastle and covers an area of approximately 2,310 ha. The park is one of a group of conservation reserves in the Port Stephens area which protect a coastal landscape of regional and state importance. Nearby Nelson Bay is a popular holiday destination for people in Sydney and the park has over 100,000 visitors per year. The park's important values include evidence of important geological events, essential wintering habitat for a variety of birds, conservation of heath communities on volcanic rock (rhyodacite) which have restricted distribution in NSW (NPWS, 2006).

#### **2.2.8.60 Worimi Conservation Lands - NSW**

The Worimi Conservation Lands covers a total area of 4029 ha comprising the Worimi National Park (1812 ha), 881 ha of state conservation area and 1336 ha of regional park. It is located north of the Hunter River, Newcastle and covers approximately 25km of coastline including the intertidal zone down to the low water mark. Ownership of the land is by the Aboriginal Worimi people and it is leased back to the New South Wales government. It is managed under a jointly between the government and the Worimi people. It has significant indigenous heritage values with burial sites, ceremonial sites, middens extensive archaeological material. Worimi is an important habitat link within a broader wildlife corridor comprising the Wetlands National Park in the south-east and Tomaree National Park in the north-east (refer Section 2.2.8.59), linking Port Stephens to the Watagans, south-east of Newcastle. Many listed bird species are known to occur there including the endangered curlew sandpiper, little tern and pied oystercatcher (NSW, OEH, 2015).

#### **2.2.8.61 Glenrock State Conservation Area and Awabakal Nature Reserve - NSW**

Glenrock State Conservation Area of 534 ha is significant as it contains ten nationally significant vegetation communities, including lagoon (Glenrock Lagoon) and the threatened ecological community of littoral rainforest. The conservation area contains many cultural records, both Aboriginal and European, and is located within the Awabakal Local Aboriginal Land Council area (NPWS, 2010).

Awabakal Nature Reserve to the south of Glenrock State Conservation Area has similar values to Glenrock. The Redhead Lagoon provides one of the most important sources of information on the vegetation history of eastern Australia through the last full glacial–interglacial cycle.

Both areas are important habitat for the threatened terrestrial birds and mammal species. The proximity of these areas (8km and 15km to Newcastle city respectively) makes these highly used areas for educational and recreational purposes (NPWS, 2014c).

#### **2.2.8.62 Munmorah State Conservation Area and Bird Island Nature Reserve and Wallarah National Park - NSW**

Munmorah State Conservation Area is on the coast of NSW, approx. 40 km north of Gosford and has an area of 1,515 ha, including 12km of coastline. A range of vegetation communities including woodlands, open forests, wetlands, coastal tea tree shrubland and coastal heath support diverse fauna including the listed osprey (*Pandion haliaetus*) and sooty oystercatcher (*Haematopus fuliginosus*). The 7.3 ha Bird Island with its steep vertical cliffs is an important nesting and roosting area for seabirds including listed and migratory species including species of shearwater, godwit, curlew, terns and the arctic jaeger (also known as arctic skua) (*Stercorarius parasiticus*) (DoEE, 2019o) (NPWS, 2009a).

To the north of the park is the Wallarah National Park, primarily an inland park of 178 ha with approximately 2km of coastline. Seabirds and migratory birds found in the Munmorah State Conservation Area may also occur here (NPWS, 2014b)

#### **2.2.8.63 Wyrabalong National Park - NSW**

Wyrabalong National Park is located on the Central Coast of New South Wales approximately 105 km north of Sydney. The 620 ha park conserves the largest stands of littoral rainforest and Sydney red gums on the NSW Central Coast as well as significant freshwater wetlands. It also contains six endangered ecological communities (coastal saltmarsh, Littoral rainforest, swap oak and swap sclerophyll forest, freshwater wetlands and themed grassland), significant habitat for a number of threatened animal species and a variety of Aboriginal sites, including an extensive midden at Pelican Point. The protected lake and foreshore and island provide important habitat for migratory birds and seabirds (NPWS, 2013).

#### **2.2.8.64 Bouddi National Park, Brisbane Water National Park & Ku-ring-gai Chase National Park - NSW**

Broken Bay, 46 km north of Sydney has three national parks at its entrance and is also the mouth of the Hawksbury River. Bouddi is at the north headland and comprises approximately 1,532 ha (NPWS, 2019a) and one of the first marine parks to extend down to the low water mark and therefore one of the first marine protected areas. Brisbane Waters National Park comprises approximately 11,506 ha. Both parks are significant in their representation of sandstone parks, coastal habitats and communities typical of the Sydney region. They are important in that together with the Ku-ring-gai Chase National Park on the south of the bay, also a National Heritage listed place (refer Section 2.2.2.2), they are a part of a system of reserves which protects the State and regionally significant waterways of the lower Hawksbury River, Broken Bay, Pittwater and Brisbane Waters. The extensive areas covered by the three parks support a diverse range of communities which support native floral and faunal species. The parks also contain a large number of significant indigenous sites and representations of Sydney rock art (NPWS, 1992). With their proximity to suburban Sydney they are popular tourist and recreational locations.

#### **2.2.8.65 Sydney Harbour National Park - NSW**

Sydney Harbour National Park covers 393 ha of headlands, beaches and islands in and around Sydney Harbour. The park includes six headlands including North Head on the northern side and South Head on the south side. The five islands within the park are Shark Island, Clark Island, Fort Denison, Goat Island and Rodd Island, extending well into the harbour past the Sydney Harbour Bridge. All parts of the park are within suburban Sydney city. Its list of values include historic, conservation values for the protection of native flora and fauna, indigenous heritage, landscape and recreation and tourism (NPWS, 2012),

#### **2.2.8.66 Malabar Headland National Park - NSW**

The Malabar headland, located in Malabar, 12 km south of Sydney, is a 177 ha park which has dramatic sandstone cliffs and provides spectacular coastal views. The western and eastern sections of the headland contain rare examples of the once extensive Port Jackson mallee scrub (*Eucalyptus obstans*, formerly *Obtusiflora*). Malabar headland also contains one of the largest, continuous remnants of the endangered ecological community listed as Eastern Suburbs Banksia Scrub. The site is a renowned site for viewing seabirds and marine mammals, in particular the white bellied sea eagle and the

humpback whale (NPWS, 2014a). The headland also has indigenous heritage significance and includes shell middens that can be seen today.

#### **2.2.8.67 Towra Point Nature Reserve - NSW**

Located at Kurnell, Botany Bay, in Southern Sydney, Towra Point Nature Reserve is a 603 ha reserve. The site is one of the first contacts between European and Aboriginal peoples, Towra Point is a hugely important place for Australia as we know it today. In April 1770, the Cook expedition explored the area and mapped Towra Lagoon as a source of fresh water. Its fresh drinking water and historical richness in seafood provided an abundant source of food to the indigenous people and the nature reserve is now a dedicated Aboriginal Place. Towra Point Nature reserve forms the largest and most diverse estuarine wetland complex in NSW. Representing around half of the remaining mangrove area near Sydney, and most of the saltmarshes remaining in the region. The abundance of mudflat, fresh water wetlands and sea grass beds, it provides breeding, feeding and roosting sites for many threatened and migratory bird species; Towra Point Estuarine Wetlands are a recognised Nationally Important Wetland. Towra Point can only be accessed by boat or kayak (DECCW, 2010b).

#### **2.2.8.68 Kamay Botany Bay National Park - NSW**

Located within the Sydney metropolitan area, Kamay Botany Bay National Park (or Botany Bay National Park) covers approximately 456 ha of the northern and southern headlands of the entrance to Botany Bay and includes over 13 km of coastline. As discussed in the section on National Heritage (Section 2.2.2) the park includes the Kurnell Peninsula and Botany Bay botanical sites, listed National Heritage Places. It is also renowned for the place of arrival of the French expedition under the command of Jean-Francois de Galaup, Comte de Laperouse in 1788 before the departure of the first fleet. Laperouse stayed in Botany Bay for six weeks and built a stockade, observatory and a garden for fresh produce on the La Perouse peninsula before leaving and not seen again. The association of the park with the history of the European exploration and the botanical collection of native plants by Banks and Solander are the two most prominent values, however, together with those is the symbolism of the meeting of the Indigenous and European cultures and the historical social issues that have developed from that and the opportunity to further explore current social issues such as reconciliation (NPWS, 2016). The retention of the largest remnants of the original vegetation communities of the Kurnell Peninsula and Eastern Suburbs and prominent scenic coastal headlands at the entrance to Botany Bay are also defined as core values of the park. The park is also part of a broader network of conservation areas in the region that provide secure protection for native plants and animals, sites of Aboriginal and historic heritage value and recreational opportunities for a growing population. On the southern Headland, the park abuts the Caltex fuel import terminal on the inland side of the park (NPWS, 2018).

#### **2.2.8.69 Royal National Park - NSW**

Royal National Park is a 15,068 ha park situated on the coast of NSW, adjacent to the southern fringe of metropolitan Sydney and about 30 km north of Wollongong. Royal National Park adjoins Heathcote National Park (2,251 ha) to the west and Garawarra State Recreation Area (900ha) to the southwest. These adjoining parks do not include coastal areas. The parks are significant for many reasons and these can be partially attributed to their accessibility to suburban Sydney combined with the parks' diversity of natural and cultural heritage which makes for high public profile and visitation rates for recreation, scientific and educational purposes (NPWS, 2000)

The park is amongst the most floristically diverse areas of its size in the temperate parts of the world. Well over 1000 plant species have been recorded, including 26 species which are listed as nationally rare or threatened. The place is important for its richness in a wide array of species including heaths (Epacridaceae), peas and wattles (Mimosaceae and Fabaceae), orchids (Orchidaceae), grevilleas and banksias (Proteaceae) and members of the eucalypt family (Myrtaceae) (DoEE, 2019).

Royal National Park is also recognised for its rich invertebrate fauna. The place is also extremely important as a centre of temperate animal species richness for a range of groups including perching birds (Passeriformes) especially honeyeaters (Meliphagidae), tree-frogs (Hylidae), reptiles (Reptilia) and butterflies (Lepidoptera). The place can be regarded as exemplifying the biodiverse Hawkesbury Sandstone environment.

Royal NP is one of only four coastal national parks in NSW that protect land below high water mark and associated estuarine habitats. The submerged and intertidal lands of South West Arm and Cabbage

Tree Basin, both in Port Hacking, are part of Royal NP. Both areas are sheltered bodies of water which support nursery grounds for juvenile fish and invertebrates, seagrass beds and a diverse benthic fauna. Cabbage Tree Basin also supports a mangrove community and is an area frequented by migratory birds (NPWS 2000).

The Royal National Park and Garawarra State Conservation Area are listed on the National Heritage list, recognised for its importance as Australia's first National Park and the diverse and fascinating nature environments protected in the area (refer Section 2.2.2).

Other values of the park include:

#### Indigenous Heritage

- Aboriginal sites in the parks are of importance to the present day Aboriginal community for cultural revival, educational and historical reasons.
- Provides protection for a large number of Aboriginal sites, particularly rock engravings stylistically distinct from those north of the Georges River.
- Royal National Park protects several cultural landscapes, including the Audley precinct and the Bulgo and South Era cabins.

#### Natural Heritage

- The three reserves comprise a moderately large area of land protecting important landforms and plant and animal communities which are typical of the coastal and sub-coastal parts of the Sydney Basin.
- The three reserves are an important link in a corridor of natural lands extending from southern and south-western Sydney southwards to the Illawarra escarpment, the water catchment areas and beyond.

#### Historic

- Royal National Park protects several cultural landscapes, including the Audley precinct and the Bulgo and South Era cabins.

#### 2.2.8.70 Five Islands Nature Reserve - NSW

Five Islands Nature Reserve includes five small islands clustered off the coast of Port Kembla, immediately south of the city of Wollongong within the Wollongong Local Government Area. The islands are clustered between approximately 0.5 kilometres and 3.5 kilometres off the coast. The main values of the islands include (NPWS, 2005):

- Evidence of geological and geomorphologic processes related to the formation of the Sydney Basin and subsequent landscape evolution
- Habitat and breeding sites for the sooty oystercatcher (*Haematopus fuliginosus*), classified as vulnerable
- Breeding sites for the wedge-tailed shearwater (*Puffinus pacificus*), the shorttailed shearwater (*Puffinus tenuirostris*) and habitat for the white-bellied sea-eagle (*Haliaeetus leucogaster*), all of which are listed migratory species
- Importance to the Aboriginal community due to continuing cultural associations and past occupation of the area
- Listed Nationally Important Wetland.

#### 2.2.8.71 Seven Mile Beach National Park and Comerong Island Nature Reserve - NSW

Seven Mile Beach National Park and Comerong Island Nature Reserve are located on the south coast of NSW, approximately 50 km south of Wollongong. The national park covers much of the sand dune barrier along Seven Mile Beach and part of adjacent Coomonderry Swamp (NPWS, 2019). It was reserved in 1971 and has a current area of 898 ha. The nature reserve comprises several islands in the Shoalhaven delta and the beds of Comerong Bay, Comerong Lagoon and the channels between the islands. It was reserved in 1986 and has an area of 660 ha. Seven Mile Beach National Park contains one of the largest areas of natural coastal dune vegetation on the central part of the NSW coastline and the uncommon orchid *Dipodium hamiltonianum* occurs there.

Coomonderry Swamp is the only large semi-permanent freshwater wetland on the south coast and protects approximately one third of this type of habitat within NSW. It is an important drought refuge when smaller coastal wetlands and inland wetlands are dry and supports a diverse range of bird species. The swamp has a large population of the threatened green and golden bell frog *Litoria aurea*. Other threatened fauna recorded at Coomonderry Swamp include the Australasian bittern *Botaurus poiciloptilus* and black-necked stork *Ephippiorhynchus asiaticus*. Threatened species recorded elsewhere in the national park include the tiger quoll *Dasyurus maculatus*, yellow-bellied sheath-tail-bat *Saccolaimus flaviventris*, greater broad-nosed bat *Scoteanax rueppellii*, swift parrot *Lathamus discolor*, olive whistler *Pachycephala olivacea*, regent honeyeater *Xanthomyza phrygia*, masked owl *Tyto novaehollandiae* and powerful owl *Ninox strenua*.

The Comerong Island nature reserve protects one of the few large naturally vegetated delta systems in NSW. It contains an important sample of three major habitat types - tidal shallows, mangrove swamp and has the largest remaining area of littoral forest on the south coast of NSW. It provides habitat for a large number of threatened waterbirds and shorebirds including two species of oystercatchers and sandpipers and is an important estuarine system for waders. The park and reserve are important recreational resources for sightseeing and fishing (NPWS 1998).

#### 2.2.8.72 Jervis Bay Marine Park - NSW

Jervis Bay Marine Park on the NSW South coast covers approximately 215 km<sup>2</sup> and spans over 100 km of coastline and adjacent oceanic and estuarine waters. It extends from Kinghorn Point south to Sussex Inlet. It includes most of the waters of Jervis Bay, with the remainder forming part of the Booderee National Park on Bherwerre Peninsula. It contains the tidal waters of Currumbene Creek, Moona Creek, Carama Inlet, Wowly Gully, Callala Creek and Currarong Creek, and the mean high water mark along the shores. The marine park has six estuaries, excluding Jervis Bay, four small coastal creeks and two larger, wave-dominated estuaries. Four seagrass species are abundant making it an important nursery for fish and providing food and shelter for recreationally and commercially valuable species such as snapper, bream, luderick, whiting and flathead. The rocky shores are important roosting and feeding grounds for shorebirds including the threatened sooty oystercatcher. Shallow and intermediate reefs support a wide range of biodiversity, including habitat for commercially and recreationally valuable fish and for invertebrates such as cuttlefish, crabs and rock lobsters (NSW DPI, 2019).

The park was established in 1998. The park contains important habitat for the endangered grey nurse shark. Protected species known to occur in the park include the eastern blue devilfish, elegant wrasse, black rockcod, some hard and soft corals, sea anemones, zooanthids, and all pipefishes and seahorses. Pied and sooty oystercatchers, hooded plovers and ospreys are among the threatened bird species known to nest, roost and/or feed on the rocky shores. Humpback and southern right whales are often spotted during migration and are an important tourist attraction.

Indigenous people have strong ties to the land with midden sites located in areas around the marine park. Nine shipwrecks have been found in Jervis Bay, including the Hive which was the only convict transport ship to be wrecked on mainland Australia.

#### 2.2.8.73 Booderee National Park - NSW

Booderee National Park stretches across 6,379 hectares at the southern section of Jervis Bay on the south coast of New South Wales and includes 875 hectares of marine environment with values similar to those in Jervis Bay Marine Park. Booderee National Park is owned by the Wreck Bay Aboriginal Community and is jointly managed with Parks Australia. The Yuinpeople have a strong and continuing connection to the Jervis Bay area. The park includes Bowen Island which has a sanctuary zone on the west coast to protect nesting seabirds and their habitat from disturbance. The marine environment has a habitat protection zoning designed to safeguard sensitive, rare and endangered habitats, including littoral areas and seagrass beds (PA, 2019 b).

The Jervis Bay Territory occupies the Bherwerre Peninsula and is a listed Commonwealth Heritage place under the EPBC Act. The Territory is comprised of both marine reserve and 6312 hectares of the Booderee National Park

The traditional landowners of Wreck Bay were granted freehold title over 403 hectares of land in 1986. A further grant of the Commonwealth's Jervis Bay National Park was made to the Wreck Bay Aboriginal Community in December 1995. The park was renamed Booderee in 1998.

The Jervis Bay Territory is listed on the Commonwealth Heritage Register under a number of entries:

- Cape St George Lighthouse Ruins & Curtilage Stony Creek Rd
- Christians Minde Settlement Ellmoos Rd
- Jervis Bay Botanic Gardens Caves Beach Rd
- Jervis Bay Territory Jervis Bay Rd
- Royal Australian Naval College College Rd

#### **2.2.8.74 Conjola National Park - NSW**

Located in the mid coast of NSW the Conjola National Park covers 11,060 ha including forests, woodlands, rainforest, coastal scrub and wetlands and four endangered ecological communities: Coastal Saltmarsh; Swamp Sclerophyll Forest (important feeding; Swamp Oak Floodplain Forest and Bangalay Sand Forest. 429 plant species are represented, five of which are threatened. Twenty five species of threatened fauna occur in the park. Of these the regent honeyeater (*Xanthomyza phrygia*), swift parrot (*Lathamus discolor*), little tern (*Sterna albifrons*), hooded plover (*Thinornis rubricollis*) and green and golden bell frog (*Litoria aurea*) are endangered. High diversity and occurrence of Aboriginal sites including middens, campsites, rock shelters and grinding grooves. A number of heritage features are located in the park including a burial and monument for the 1870 shipwreck of the Walter Hood (NPWS, 2009).

#### **2.2.8.75 Narrawallee Creek Nature Reserve - NSW**

Narrawallee Creek Nature Reserve is located on the mid south coast of New South Wales approximately 7km north of Ulladulla and covers an area of 878 ha. It includes five endangered ecological communities being Coastal Saltmarsh, Swamp Sclerophyll Forest (dominated by swamp mahogany, an important food source for several threatened fauna including the yellow-bellied glider and grey-headed flying fox), Swamp Oak Floodplain Forest, Littoral Rainforest and Bangalay Sand Forest). Eleven species of threatened fauna recorded, including breeding sites for the little tern, hooded plover and pied oystercatcher. Both indigenous and historical values are placed on the reserve (NPWS, 2006).

#### **2.2.8.76 South Pacific Heathland Reserve - NSW**

The South Pacific Heathland Reserve is a 14 hectare flora and fauna reserve on the cliffs above the rock platform between Rennies Beach and Racecourse Beach at the southern end of Ulladulla. Its value is based on its diversity of local flora, birdlife, and spectacular heathland and panoramic coastal views and is a popular nature walking track. Whales may be seen from the viewing platforms during their migration seasons (DNSW, 2019).

#### **2.2.8.77 Parks & Reserves – Meroo National Park - NSW**

Meroo National Park is 3,731 ha of coastline, coastal lakes and inland forested areas located 5 km south of Ulladulla on the NSW south coast. High conservation values are attributed to the coastal lakes included in the park (Termeil, Tabourie and Wairo Beach Lagoon) and the foreshores and fringing wetlands of the adjoining lakes (Meroo, Burrill and Willinga Lakes). As per the Narrawallee Creek Nature Reserve it includes endangered ecological communities Swamp Oak Floodplain Forest (*Casuarina glauca* – *Melaleuca ericifolia*), Coastal Saltmarsh, Littoral Rainforest, Bangalay Sand Forest (*E. botryoides* – *Banksia serrata*) and Themeda Grassland on Seacliffs and Coastal Headlands. At least 12 threatened fauna species including significant populations of the nationally endangered green and golden bell frog (*Litoria aurea*) have been recorded here. The park also has indigenous and recreational values due to mythological sites and a range of bush camping locations (NPWS, 2010).

#### **2.2.8.78 Murrumurung National Park - NSW**

Murrumurung National Park spans 44 km of coastline on the NSW south coast and supports more than 90 species of bird including gannets, shearwaters, White-faced storm petrels, Sooty oystercatchers and Little penguins. The forest of spotted gums stretches right to the ocean (NPWS, 2018). The National

Park includes four offshore Islands and encompasses Brush Island Nature Reserve, Belowla Island Nature Reserve and Tollgate Islands Nature Reserve.

#### **2.2.8.79 Batemans Marine Park - NSW**

The Batemans Marine Park was established in 2006 and covers approximately 85,000 hectares, extending from the north end of Murramarang Beach near Bawley Point to Wallaga Lake in the south. It includes all of the seabed and waters from the mean high water mark on the coast to three nautical miles offshore. It includes all estuaries, creeks, rivers and lakes (except Nargal Lake) to the limit of tidal influence. Scuba diving, snorkelling, beach going, whale, seal and other wildlife watching, fishing, swimming, surfing and boating are all popular pastimes.

The park covers a range of habitats, including continental shelf sea floor along with sponge gardens, beaches, rocky shores, kelp beds, coralline algal banks, rocky reefs, islands, seagrass, mangroves and estuarine habitats.

The Montague Island Nature Reserve, within the Marine Park, is a breeding and nesting place for over 40,000 sea birds including Shearwaters, Little penguins, Crested terns and Silver gulls and is a haul out site for Australian and New Zealand fur seals. Both Montague Island and the Tollgate Islands (also within the park) are aggregation sites for Grey nurse sharks.

Local Aboriginal communities have strong links to the area within and adjoining the Marine Park. The local Aboriginal communities within the Yuin Nation are actively involved in consultation on park issues affecting traditional use (DPI, 2018).

#### **2.2.8.80 Eurobodalla National Park - NSW**

Eurobodalla National Park contains a range of aquatic environments including lagoons, lakes, estuaries, sheltered and wild beaches that protect a wide variety of plants and animals. The National Park provides an important habitat for a wide variety of birds with 131 bird species having been recorded in the park. Estuaries and headlands are important over-wintering areas for migratory birds, including 17 species of waders, and the Hooded plover and Little tern nest on the sand islands, sand spits and dunes.

Water based activities such as boating, fishing and swimming are all popular in the park (NPWS, 2018).

#### **2.2.8.81 Mimosa Rocks National Park - NSW**

Mimosa Rocks National Park takes its name from the Paddle Steamer Mimosa that wrecked in 1863 after running aground on rocks at the northern end of the park. The rocks of the park have distinctive castle-like features that are the result of geological folds, faults and intrusions.

The park provides important habitat for many migratory birds, including Hooded plovers and Pied oystercatchers that nest along the coastline. The Bar tailed godwit rests briefly here in summer months during its migration from Alaska to New Zealand.

The park is popular for fishing, surfing, snorkelling and birdwatching. From May to November, the headlands are excellent whale watching vantage points (NPWS, 2018).

#### **2.2.8.82 Bournda National Park - NSW**

Bournda has been a special place for the Dhurga and Yuin people for thousands of years and its name means 'place of tea tree and kangaroos'. The estuarine wetlands provide roosting and feeding areas for a large variety of waders and waterfowl including threatened species such as Little tern, Hooded plover and Pied oystercatcher (NPWS, 2018).

#### **2.2.8.83 Ben Boyd National Park - NSW**

The Ben Boyd National Park is comprised of three sections, extending approximately 45 km along the coast north and south of Twofold Bay near Eden. The park's vegetation reflects its location in the driest, windiest part of the state's coastline. Open forest and woodland cover most of the park. The park's varied habitat supports a highly diverse bird population and about 50 species of mammal including a number of threatened species. Migrating whales can often be seen from the coast between late May and December and the former Davidson Whaling Station located on Twofold Bay is a tourist attraction (NPWS 2017b).

#### 2.2.8.84 Broulee Island Nature Reserve

Broulee Island Nature Reserve is located on the South Coast of NSW and covers the entire 43 hectares of Broulee Island to mean high water mark. Broulee Island Nature Reserve contains a vegetation succession from mangroves on the shoreline rock platforms to an open forest dominated by southern mahogany on the plateau. The shoreline and adjacent waters are utilised by a number of seabird species, none of which are known to breed on Broulee Island; these include shearwaters, cormorants, gulls. (*Broulee Island Nature Reserve Plan of Management, NSW OEH 2008*)

#### 2.2.8.85 The Bull Island Nature Reserve

The Bull Island Nature Reserve is situated within Smiths Lake, an intermittently closed saline lagoon separated from the ocean by a large sandbar. The island supports mangrove stands and intertidal areas (when the lake is open to the ocean) and provides habitat for the endangered pied oystercatcher (*Haematopus longirostris*) and the vulnerable eastern osprey (*Pandion cristatus*). (*Statement of Management Intent: Bull Island and Smiths Lake Nature Reserve, NSW OEH 2014*)

#### 2.2.8.86 Seal Rocks Nature Reserve

Seal Rocks Nature Reserve consists of two exposed low-lying rocks, less than 1 hectare in size. It is situated 3 km offshore from Myall Lakes National Park and once supported the most northern rookery of the Australian fur seal in NSW. There are still occasional sightings of Australian fur seals, and suitable habitat also exists for the New Zealand fur seal. Seal Rocks may be used occasionally by little penguins and sea birds. The waters surrounding the reserve are within the Sanctuary Zone of the Port Stephens – Great Lakes Marine Park and the waters around Seal Rocks form a key aggregation site for the endangered grey nurse shark. (*Plan of Management Seal Rocks Nature Reserve, NSW OEH 2014*)

#### 2.2.8.87 K'gari, Great Sandy National Park – QLD

Fraser Island, Cooloola, Hervey Bay and some adjacent areas in south-east Queensland form the K'gari, Great Sandy Region National Park of about 840,000ha and is listed on the World Heritage list (refer Section 2.2.1.4). The habitats of a number of internationally and nationally threatened terrestrial and marine animals and plants occur within the Region. The marine areas and associated tidal wetlands of Hervey Bay, and the Great Sandy Strait and adjacent beaches support and harbour a diversity of marine life. Species include seasonal populations of humpback whales, dugong, dolphins, turtles, and trans-equatorial migratory wading birds which depend upon the Region for roosting and staging during their annual migrations. The Great Sandy Strait is recognised as a Ramsar Wetland of International Importance (refer Section 2.2.3.16) (QEPA, 2005).

#### 2.2.8.88 Noosa National Park – QLD

Noosa National Park (2,280 ha) is situated on the Sunshine Coast about 150 km north of Brisbane. The Sunshine Coast has strong links to the adjacent Great Sandy Region in terms of geology, landscape components, climate, soils and vegetation. More than 181 bird species have been recorded in the park and adjacent intertidal areas. The Noosa Heads area provides habitat for 28 birds of conservation significance, including 20 migratory birds covered under agreements between Australia and Japan (JAMBA) and Australia and China (CAMBA) (QPWS, 1999).

#### 2.2.8.89 Bribie Island National Park – QLD

Bribie Island is part of a network of coastal sand landscapes stretching from Stradbroke Island to Woodgate. The island is low-lying, with a maximum elevation of less than 10 metres, and the coastal environments including the salt marsh, tidal flats, mangroves, sandy beaches, wetlands and freshwater lakes, provide habitat for diversity of native animals including internationally protected resident and migratory shorebirds. The critically endangered eastern curlew is known to roost there. Shorebirds are threatened by human disturbance and destruction of nest sites (QPWS, 2013a).

#### 2.2.8.90 Moreton Island, Southern Moreton Bay Islands South Stradbroke Island National Park – QLD

Moreton Island National Park (16,900ha), Southern Moreton Bay Islands National Park (1,646 ha) and North and South Stradbroke Island Conservation Park (1,440 ha) are located on the eastern edge of Moreton Bay, Queensland. Like the surrounding sand islands, these are ecologically significant with

forest woodland, heathland, mangrove and grassland communities. The Southern Moreton Bay Islands National Park contains the most southern distribution of black mangrove *Lumnitzera racemosa* in Queensland (QPWS, 2013b). Moreton Bay and the sand islands provide a vital feeding and resting point for over 50,000 migratory waders and parts of Moreton Bay are listed as a wetland of international importance (refer Section 2.2.3.15) (QPWS, 2007), each area representing different extents of the various wetland systems.

#### **2.2.8.91 Naree Budjong Djara National Park – QLD**

Naree Budjong Djara National Park (132 km<sup>2</sup>, forming approximately 50% of North Stradbroke Island) features places of incredible conservation value and a variety of special habitats, including endangered heathlands, freshwater lakes and woodlands, similar to the other islands in Moreton Bay. Its cultural significance to the traditional owners, the Quandamooka people, dates back thousands of years and the park is jointly managed by the Quandamooka people and Queensland Parks and Wildlife Service (QPWS) (QPWS, 2020).

#### **2.2.8.92 Special Management Areas**

##### **Skerries**

The Skerries, offshore from Wingan Inlet, near Croajingolong National Park is home to a major seal breeding colony with an estimated population of 11,500 representing approximately 12% of the national population.

##### **Montague Island**

The Montague Island Nature Reserve, within the Batemans Marine Park (Refer Section 2.2.8.79), is a breeding and nesting place for over 40,000 sea birds including Shearwaters, Little penguins, Crested terns and Silver gulls and is a haul out site for Australian and New Zealand fur seals. Both Montague Island and the Tollgate Islands (also within the park) are aggregation sites for Grey nurse sharks.

#### **2.2.8.93 Other State and Territory Reserves**

The National Reserve System is a network of protected areas and is made up of Commonwealth, state and territory reserves; Indigenous lands and protected areas. Some of those not already identified within National National Parks or reserves are presented in this section. It should be noted that many places are terrestrial or within already discussed Reserves and National Parks.

##### **Tasmania**

The Furneaux Group is a group of approximately 100 islands located at the eastern end of Bass Strait, between Victoria and Tasmania, Australia. The islands contain granite from the Devonian period, as well as unconsolidated limestone and sand from Cenozoic periods and are generally mountainous with rugged coastlines. The islands are home to numerous seabirds including albatross, petrels, cormorants and curlews. It contains the Franklin Sound Islands Important Bird Area and the islands support breeding seabird and wader species such as the little penguin, black cormorants, Pacific gull, Caspian terns, sooty oystercatcher and pied oystercatcher. Some of the islands are known to be haul out sites for Australian fur seals.

The largest islands in the group are Flinders Island, Cape Barren Island, Clarke Island and Chappell Island. Other islands include: Anderson Island, Babel Island, Badger Island, Bass Pyramid, Battery Island, Billy Goat Reefs, Big Green Island, Boxen Island, Briggs Islet, Cat Island, Chalky Island, Cooties Reef, Doughboy Island, East Kangaroo Island, Fisher Island, Fisher Island Reef, Forsyth Island, Great Dog Island, Inner Sister Island, Outer Sister Island, Isabella Island, Little Anderson Island, Little Chalky Island, Little Dog Island, Little Green Island, Long Island, Low Islets, and another of the same name Low Islets, Middle Pasco Island, Mile Island, Moriarty Rocks, Mount Chappell Island, Neds Reef, Night Island, North Pasco Island, Passage Island (Tasmania), Pelican Island, Prime Seal Island, Puncheon Island, Puncheon Islets, Roydon Island, Rum Island, Samphire Island, Sentinel Island, South Pasco Island, Spences Reefs, Spike Island, Storehouse Island, Swan Island, Tin Kettle Island, Vansittart Island.

The islands themselves support numerous listed state reserves such as Blythe Point and Bun Beetons Point on Flinders Island and Badger Point on Badger Island.

**Figure 2-27 Furneaux Group**

Bay of Fires area is part of the Bay of Fires Conservation area and extends along the coast from Binalong Bay in the south to Eddystone Point in the north. The area contains indigenous middens and contains rock gullies, long beaches and granite boulders. The area supports numerous bird species including hooded plovers, sooty and pied oyster catchers, and a variety of gulls. The critically endangered swift parrot breeds in the forests of the Bay of Fires hinterland.

The Waterhouse Island Group are located on the north-east coast of Tasmania and are comprised of the following islands: Baynes, Ninth, Tenth, Waterhouse, Little Waterhouse, Maclean, St Helens, Foster, Swan, Little Swan, Cygnet and Paddys islands; and Bird Rock and George Rocks islets. The islands support breeding seabird and wader species such as little penguin, Pacific gull, silver gull, sooty oystercatcher, black-faced cormorant and Caspian tern.

**Victoria**

Ewing Morass Wildlife Reserve and Lake Tyers State Park are located along Pettmans Beach, approximately 20 km east of Lakes Entrance. It is an extensive sandy beach, frequented by campers and fishers. The area is highly significant to Gunaikurnai Traditional Owners due to its Aboriginal cultural heritage. Ewings Marsh is a recognised Nationally Important Wetland which provides an important habitat for water birds such as curlews, little egret and White-bellied Sea-eagle (DAWE website, accessed May 2022).

### 2.2.9 Wetlands of National Importance

Australia currently has 66 Ramsar wetlands listed as Wetlands of International Importance under the Ramsar Convention on Wetlands; those within the DA are presented in Section 2.2.3.

In addition to those listed internationally, Australia maintains a Directory of over 900 nationally important wetlands. The Directory provides information on each wetland, the species associated with them, information about their social and cultural values, and some of the ecosystem services and benefits they provide. The Directory is available through the Department of Agriculture, Water and The Environment website and should be referenced for further information.

The criteria for determining nationally important wetlands in Australia, and hence their eligibility for inclusion in the Directory, are those agreed to by the ANZECC Wetlands Network in 1994.

A wetland may be considered nationally important if it meets at least one of the following criteria:

- It is a good example of a wetland type occurring within a biogeographic region in Australia.
- It is a wetland which plays an important ecological or hydrological role in the natural functioning of a major wetland system/complex.
- It is a wetland which is important as the habitat for animal taxa at a vulnerable stage in their life cycles, or provides a refuge when adverse conditions such as drought prevail.
- The wetland supports 1% or more of the national populations of any native plant or animal taxa.
- The wetland supports native plant or animal taxa or communities which are considered endangered or vulnerable at the national level.
- The wetland is of outstanding historical or cultural significance.

The wetland classification system identifies 40 different wetland types in three categories:

- A. Marine and Coastal Zone wetlands
- B. Inland wetlands, and
- C. Human-made wetlands.

Those applicable to wetlands that may be present in the DA are associated with (A) marine and coastal zone wetlands and include:

- Marine waters - permanent shallow waters less than six metres deep at low tide; includes sea bays, straits.
- Subtidal aquatic beds; includes kelp beds, seagrasses, tropical marine meadows.
- Coral reefs.
- Rocky marine shores; includes rocky offshore islands, sea cliffs.
- Sand, shingle or pebble beaches; includes sand bars, spits, sandy islets.
- Estuarine waters; permanent waters of estuaries and estuarine systems of deltas.
- Intertidal mud, sand or salt flats.
- Intertidal marshes; includes salt-marshes, salt meadows, saltings, raised salt marshes, tidal brackish and freshwater marshes.
- Intertidal forested wetlands; includes mangrove swamps, nipa swamps, tidal freshwater swamp forests.
- Brackish to saline lagoons and marshes with one or more relatively narrow connections with the sea.
- Freshwater lagoons and marshes in the coastal zone.
- Non-tidal freshwater forested wetlands.

Many of the nationally important wetlands are recognised under the Ramsar Convention (see Section 2.2.3) or associated with State and National Parks. The wetlands are generally associated with certain coastal habitats (see Section 2.3.4) such as saltmarshes and intertidal flats.

## 2.3 Ecological Environment

### 2.3.1 Fauna

The EPBC Act Protected Matters search tool on the Department of Environment and Energy site was used to inform the listed marine, migratory and threatened faunal species (or species habitat) that occur,

or may occur in the DA (DoEE 2019b, DoEE 2019l, DoEE 2019m, DoEE 2019r, DoEE 2019at, DoEE 2019au).

### 2.3.1.1 Fish

#### 2.3.1.2 Fish (bony)

Bony fish are a diverse group of fish that have skeletons primarily composed of bone tissue, as opposed to cartilage; most living species of fish are bony fish. The vast majority of fish are members of Osteichthyes, which is an extremely diverse and abundant group consisting of 45 orders, and over 435 families and 28,000 species.

Syngnathidae is a group of bony fishes that includes seahorses, pipefishes, pipehorses and sea dragons; the closely related Solenostomidae family includes ghost pipefish. These species occupy a range of habitats, however generally display a preference for seagrass and macroalgal beds, coral reefs, mangroves or sponge gardens (i.e. a habitat offering a protective environment. Habitat that supports syngnathid populations is generally patchy, so populations of syngnathid species may be dispersed and fragmented (DSEWPaC, 2012f). Syngnathids are typically carnivorous, feeding in the water column on or near the sea floor; their diet including small crustaceans, invertebrates, and zooplankton. Generally, the pipefishes, seahorses and seadragons are associated with vegetation in sheltered to moderately exposed reef areas at a range of depths from 0 to 50 m, depending on the species (Edgar, 1997), but usually at depths of between 5 and 25 m. Given that these species normally inhabit shallow reefs and kelp beds (Kuitert 2000).

It is estimated that there are over 500 species of fish found in the Gippsland Basin, including a number of species of importance to commercial and recreational fisheries (LCC, 1993). Species of commercial importance are covered in Section 2.4.1.

Fish species listed under the EPBC Act that may occur in the DA are given in Table 2-33 (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). Two species listed as 'critically endangered', the Spotted handfish and the Red handfish, may occur within the DA. There are less than forty Red handfish known to exist with a second (secret) location only recently discovered along the east coast of Tasmania (ABC 2018). Ziebell's Handfish, also may occur in the DA and is listed as vulnerable. Handfish have a depth distribution of 3-20 metres and use their hand-like fins to crawl across the sea floor. The species' diet includes small crustaceans and polychaete worms and the species is endemic to Tasmania (DoEE, 2015).

Two other fish species potentially occurring within the DA were listed as 'vulnerable' under the EPBC Act; the Australian grayling (*Prototroctes maraena*) and the Black rockcod (*Epinephelus daemeli*) (DoEE 2017a). The Australian grayling is a small to medium-sized, slender, silvery fish with soft-rayed fins. It is endemic to south-eastern Australia, including Victoria, Tasmania and New South Wales, and is a migratory species that inhabits estuarine waters and coastal seas as larvae/juveniles, but spend most of their lives in freshwater, inhabiting rivers and streams as adults (DSE, 2008). The Black cod's range includes warm temperate and subtropical waters of the southwestern Pacific, including south-eastern Australia and the North Island, Kermadec Islands and Poor Knights Islands of New Zealand. The last known significant population of Black cod is at Elizabeth and Middleton Reefs (refer 2.2.3.14). Black cod generally inhabit near-shore rocky and offshore coral reefs at depths down to 50 m. In coastal waters juveniles are often found in estuary systems with adults moving into rock caves, rock gutters and on rock reefs (DoEE, 2012a).

Pipefishes, seahorses and seadragons, as listed under the EPBC Act, require a permit to remove them from the area. Generally, the pipefishes, seahorses and seadragons are associated with vegetation in sheltered to moderately exposed reef areas at a range of depths from 0 to 50 m, depending on the species (Edgar, 1997), but usually at depths of between 5 and 25 m. These species normally inhabit shallow reefs and kelp beds, they are not commonly found within the operational area itself but occur around adjacent shorelines in the DA (Kuitert 2000). Four additional species of pipefish and seadragon are listed as may occur within the DA.

A review of data collected in 1998 and 1999 by Neira (2005) suggested that the presence of Bass Strait offshore production facilities (and subsea infrastructure) within and near the Gippsland Basin Exclusion Zone provides additional habitat for early life stages of a large suite of teleost fish families. However, it is likely that both species composition and abundance around the operational area are closely linked to

the ichthyofauna inhabiting hard/soft megahabitats off the Gippsland coastline and, to a lesser extent, those at the south-east corner of mainland Australia (e.g. Howe/Gabo complex).

**Table 2-33 EPBC Act listed fish species or species habitat that may occur within the DA (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m)**

Scientific Name	Common Name	Threatened Species	Migratory Species	Listed Marine Species	Type of Presence
<b>Fish</b>					
<i>Acentronura tentaculata</i>	Shortpouch pygmy pipehorse			✓	MO
<i>Brachionichthys hirsutus</i>	Spotted Handfish	CE			MO

### 2.3.1.3 Fish (cartilaginous)

Cartilaginous fish are jawed vertebrates with skeletons made of cartilage rather than bone. This group includes two subclasses:

- Elasmobranchii (sharks, rays, skates and sawfish); and
- Holocephali (chimaeras or ghost sharks).

There are six shark and three ray species (or species habitat) that may occur within the DA; this includes species classified as threatened and migratory (Table 2-33) (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). Only one species (Great White Shark) has an important behaviour (breeding) identified for the DA.

A list of the conservation advice and/or recovery plans, with relevant management actions, is shown in Table 2-36.

#### Sharks and Rays

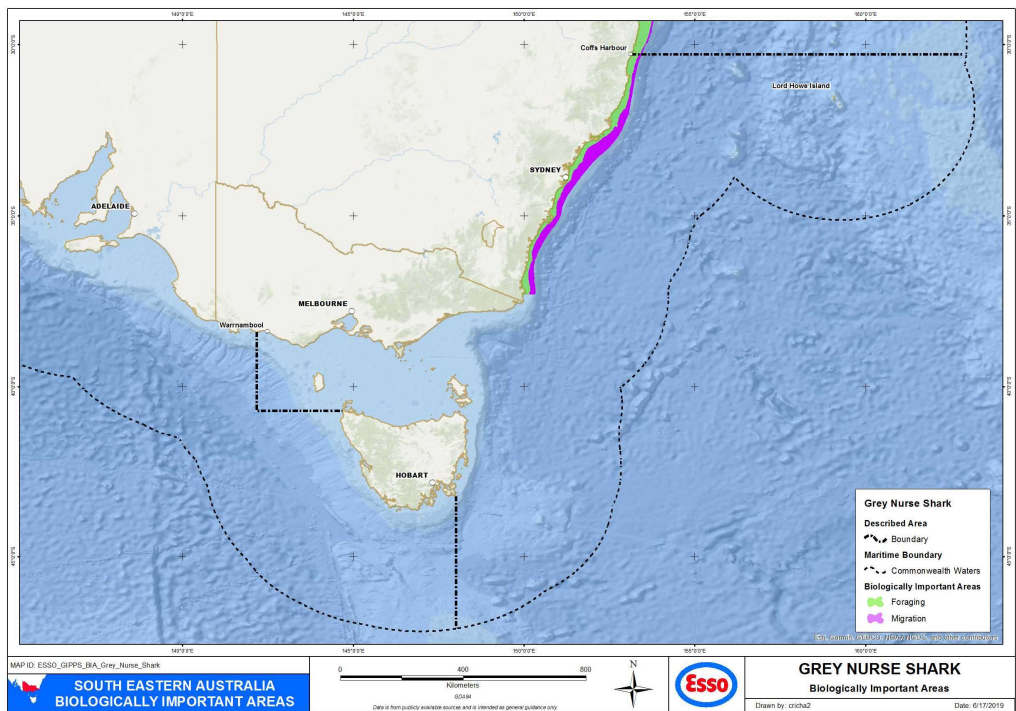

In Australia, the Grey Nurse Shark primarily has an inshore coastal distribution in sub-tropical to cool temperate waters on the continental shelf (DoE, 2014). The east coast population covers a range extending from the Capricornia coast (central Queensland) to Narooma in southern New South Wales (DoE, 2014), and is listed as critically endangered (TSSC, 2001). The species is rarely found travelling in the northern section of the Commonwealth south-east marine bioregion (DoEE 2015a and is uncommon in Victorian, South Australian and Tasmanian waters. The Grey Nurse Shark generally occurs as solitary individuals or in small schools; larger aggregations of individuals may occur for courtship and mating (DoE, 2014). A number of key aggregation sites<sup>2</sup> and habitat critical for the survival of the Grey Nurse Shark have been identified; the following two areas occur within the DA: Tollgate Islands (near Batemans Bay), and Montague Island (near Narooma). The Grey Nurse Shark migrates within its range, making seasonal north-south movements to form aggregations at critical habitat sites, thought to be related to breeding (DoEE, 2017f). The precise timing of mating and pupping in Australian waters is unknown; however, in South Africa mating occurs between late-October and late-November (DoEE, 2017f). A BIA for foraging and migration has been identified for the Grey Nurse Shark along the east coast of Australia (Figure 2-28).

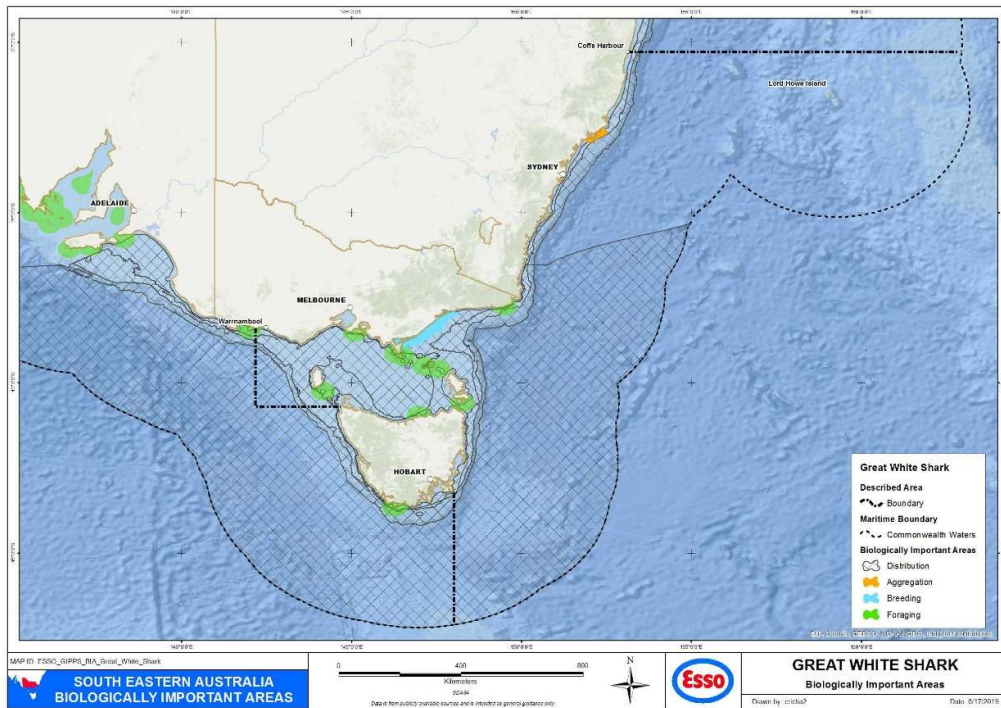

The shortfin mako shark (*Isurus oxyrinchus*) has been recorded in offshore waters all around the Australian coastline except for the Arafura Sea, Gulf of Carpentaria and Torres Strait in the north (TSSC, 2014b). It is a pelagic species, primarily occurring in offshore, oceanic waters (Last and Stevens, 2009). The shortfin mako is highly migratory and can cover large distances, migrating from Australian waters to areas well beyond the Australian Exclusive Economic Zone (Rogers et al., 2009). The shortfin mako inhabits depths down to 600 m, with a slight trend indicating the species spend the majority of the night in shallow water, and the majority of daylight hours in deeper waters (Rogers et al., 2009). It is not

<sup>2</sup> 'Key Aggregation Sites' defined as being locations where five or more Grey Nurse Sharks were consistently found throughout the year (DoEE, 2014).

normally found in waters below 16°C (RPS, 2015). Satellite tracking data for shortfin mako showed a potential for year round occupation of the Otway, Bass Strait and Gippsland Basins (Rogers and Bailleul, 2015). The longfin mako (*Isurus paucus*), often mistaken for the shortfin mako, is an epipelagic species with a usual depth range between 120 and 240 metres. Its exact range is not known however it known to have a worldwide distribution in tropical and temperate seas. Within Australia it is known to occur in the north and to the south to at least Port Stephens in NSW. It is thought to feed on pelagic fish and cephalopods (DSEWPAC, 2012g).

The Great White Shark has a range extending from central Queensland, around the south coast, to north-west Western Australia (DSEWPac, 2013a). The shark is primarily found on the continental shelf and coastal waters, including inshore waters around oceanic islands. The Great White Shark is not evenly distributed throughout its range, with observations more frequent in some areas, including those around fur-seal or sea-lion colonies (DSEWPac, 2013a). Juveniles appear to aggregate seasonally in key areas, including Wilsons Promontory (Victoria), and the Skerries (DSEWPac, 2013a). Recent studies have found that juvenile white sharks (<3m) occupy estuaries Corner Inlet, Victoria during October to January (Harasti *et al.*, 2017). A BIA for breeding (nursery ground) has been established in the coastal region extending east from Wilsons Promontory (Figure 2-28). The Great White Shark moves seasonally along the south and east Australian coasts, moving northerly along the coast during autumn and winter, and returning to southern Australian waters by early summer. The Great White Shark is not known to form and defend territories, however, its ability to return on a seasonal basis implies a degree of site fidelity (DSEWPac, 2013a).

**Figure 2-28 Biologically important areas for shark species**

Whale sharks (*Rhincodon typus*) are generally found in warmer oceanic waters (where temperatures range from 21 to 25°C) and mainly occur in waters off the Northern Territory, Queensland and northern Western Australia. However, there have been a few isolated reports of immature male whale sharks in New South Wales and Victoria (Last & Stevens 1994). The Whale sharks are not likely to occur in the EGBPA.

The Porbeagle or Mackerel Shark (*Lamna nasus*) is listed as a migratory marine species under the EPBC Act, likely to occur in the DA. The timing and details of these migratory movements are not well-understood for the Porbeagle however it primarily inhabits oceanic waters and areas around the edge of the continental shelf. They occasionally move into coastal waters, but these movements are temporary. The Porbeagle utilises a broad vertical range of the water column and is known to dive to depths exceeding 1300 m. The Porbeagle is thought to be reasonably flexible in the types of habitat used for foraging. Whilst protected from targeted fishing, bycatch remains its greatest threat.

The Giant manta ray (*Manta birostris*) (Australian Museum, 2014) is the largest species of ray in the world. The Manta ray lives in tropical waters but is also found occasionally in temperate seas. In Australia it is recorded from south-western Western Australia, around the tropical north of the country and south to the southern coast of NSW, where it may overlap with the DA. The Manta ray feeds on plankton which are filtered from the water through the gills (DoEE, 2018c).

Another species of the Manta found in the DA is the Reef manta ray (*Manta alfredi*), distinguishable from the Giant manta ray as it has dark spots on the ventral surface between the gills (Australian Museum, 2019). It is a listed migratory species and has similar distribution and feeding habits as the Giant Manta ray. No specific conservation advice exists for either species of the ray (DoEE, 2019x).

The Green Sawfish, is a species of ray listed as vulnerable, with a body of a shark and a flattened head and an elongated snout with 24–28 pairs of unevenly-spaced rostral (saw-like) teeth. The species was last recorded in waters of NSW in 1926 but appears to have contracted its range and has not been detected in NSW or southern Queensland waters since then. It is currently distributed from the Whitsundays in Queensland across northern Australian waters to Shark Bay in Western Australia. The fins are highly sought after in the international market and anecdotal reports suggest sawfish populations have declined significantly as a result (DoEE, 2019ap).

**Table 2-35 Fish species or species habitat that may occur within the DA (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m)**

#### 2.3.1.4 Birds

Birds in the marine environment can include both seabirds and shorebirds:

- Seabirds refers to those species of bird whose normal habitat and food sources are derived from the ocean (both coastal and pelagic); seabirds include such species as pelicans, gannets, cormorants, albatrosses and petrels.
- Shorebirds (sometimes referred to as wading birds) refers to those species of bird commonly found along sandy or rocky shorelines, mudflats, and shallow waters; shorebirds include such species as plovers and sandpipers.

There are 121 seabird and shorebird species (or species habitat) that may occur within the DA; this includes species classified as threatened and migratory (Table 2-37) (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). The type of presence varies between species, and includes important behaviours (e.g. foraging, roosting, breeding) for some species.

The coast and neighbouring islands within the DA provide feeding and nesting habitats for many coastal and migratory bird species. Seabirds spend much of their lives at sea in search of prey only to return for a short time to breed and raise chicks. Most species tend to forage on their own, though large feeding flocks will gather at rich or passing food sources. Squid, fish and krill are common sources of food. Islands in the Gippsland Basin are nesting sites for many seabird species, many of which migrate to these islands each year. Colonies of seabirds occur in Corner Inlet and on the islands around Wilsons Promontory, to the east at The Skerries, Tullaberga Island and Gabo Island and to the south on Curtis Island and the Hogan Island Group (Harris & Norman 1981). Species that nest and breed on these islands include the listed marine species, Little penguin (*Eudyptula minor*), White-faced storm petrel (*Pelagodroma marina*), Short-tailed shearwater (*Puffinus tenuirostris*) and the Fairy prion (*Pachyptila turtur*).

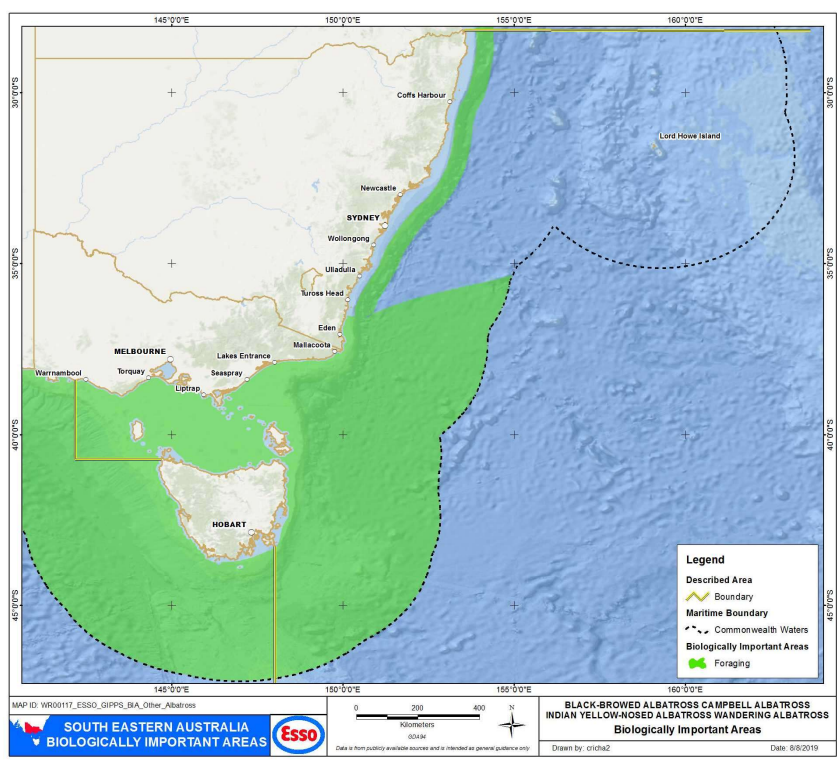

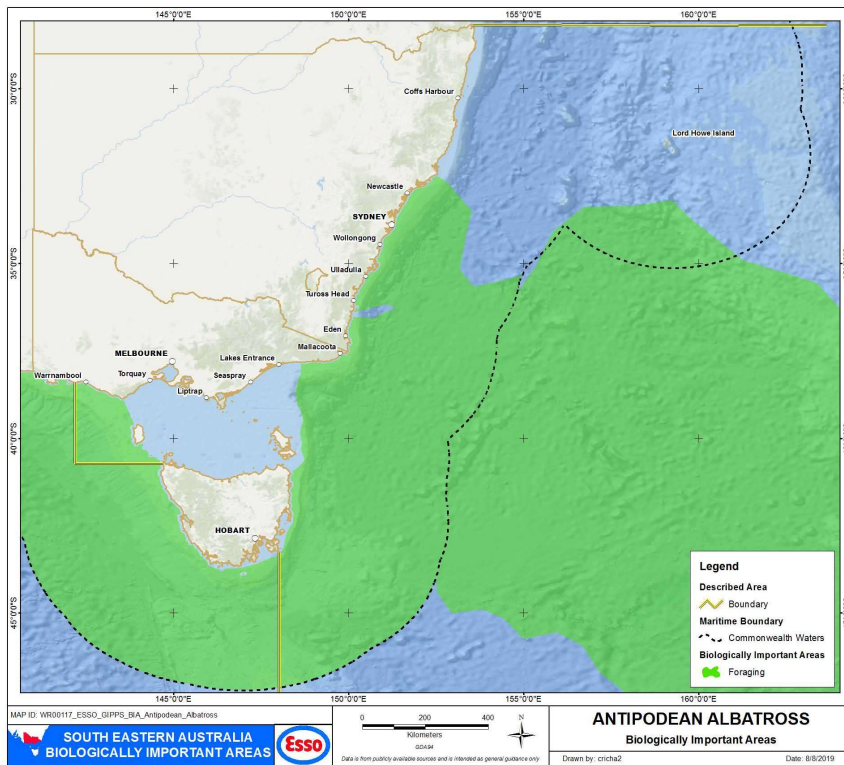

A list of the conservation advice and/or recovery plans, with relevant management actions for petroleum activities, is shown in Table 2-38.

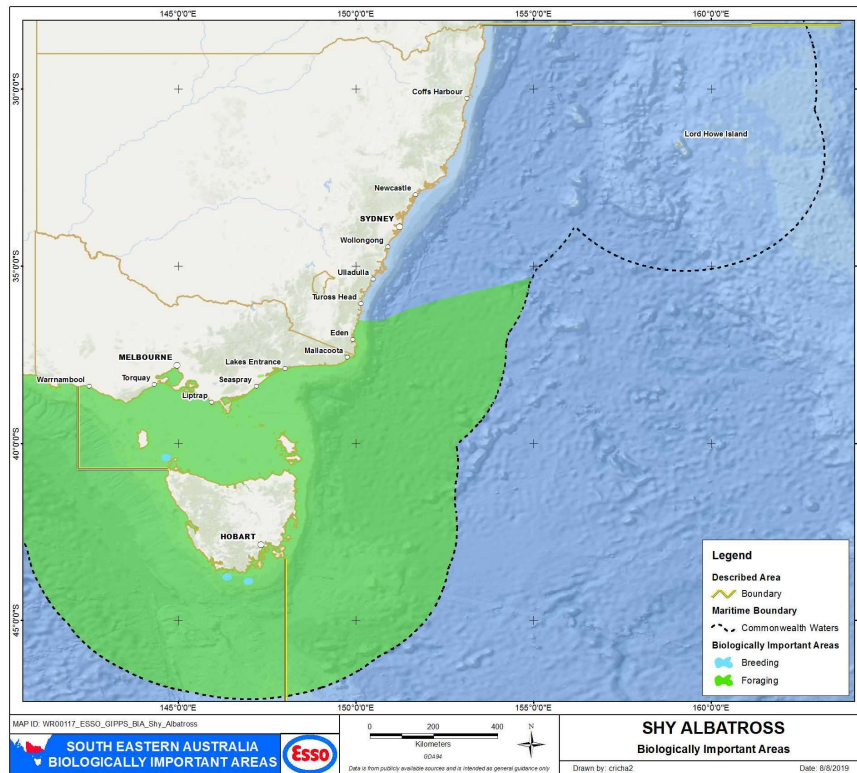

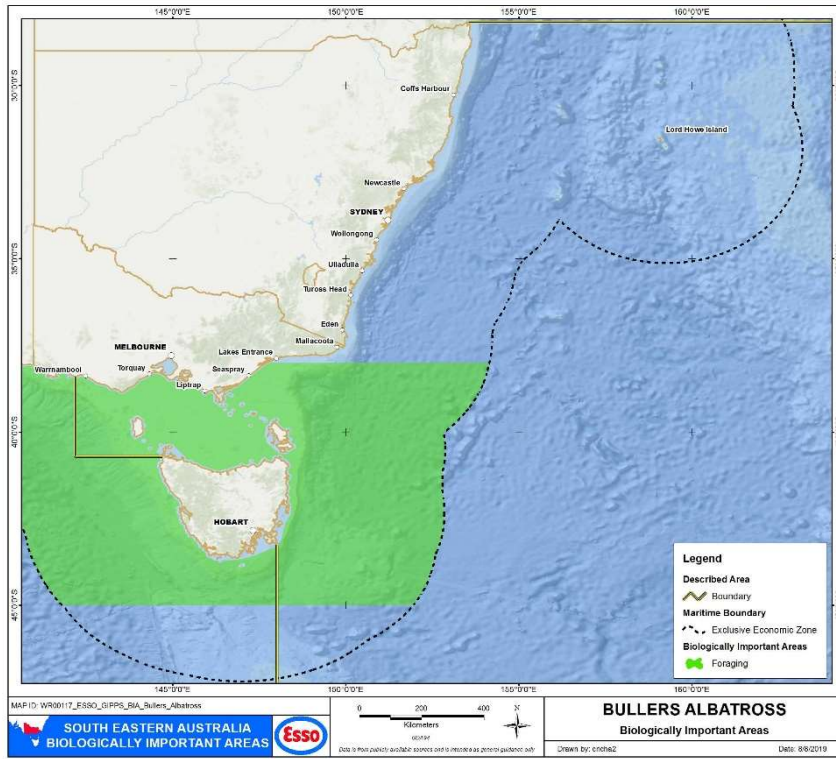

#### Albatross

There are 15 species of albatross that may occur within the DA, and all except two (Sooty Albatross and Grey-headed Albatross) has been identified as using the area for foraging (Table 2-37). Albatross species exhibit a broad range of diets and foraging behaviours; this combined with their ability to cover vast oceanic distances, means all waters within Australian jurisdiction can be considered foraging habitat for this species (DSEWPaC, 2011a). However, the most critical foraging habitat is considered to be in waters south of 25°S where most species spend the majority of their foraging time (DSEWPaC, 2011a).

Albatross' typically feed offshore, mainly along the edge of the continental shelf and over open waters, where they catch fish and cephalopods (e.g. squid, cuttlefish) by diving into the water (DSEWPaC, 2011a). A BIA for foraging, has been identified for the following albatross species: Antipodean, Buller's, Shy, Black-browed, Campbell, Wandering, Indian Yellow-nosed and White-capped (Figure 2-29) (DoEE, 2015h). There is only one species, the Shy Albatross, that is known to breed within the waters off mainland Australia, and this occurs outside of the DA.

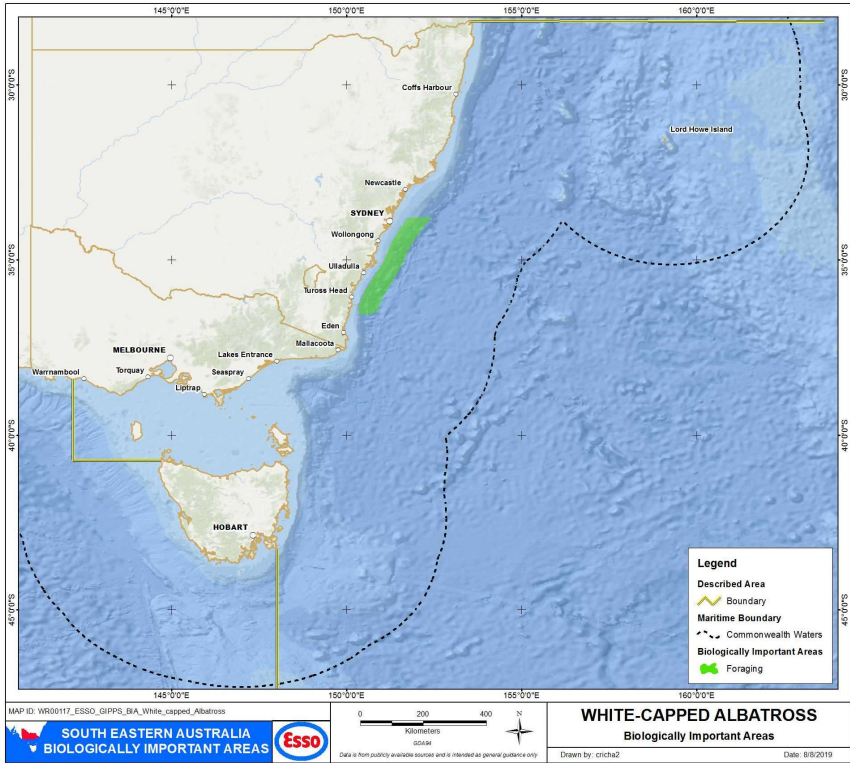

Figure 2-29 Biologically Important Areas for albatross species

**Petrels**

There are 13 species of petrel that may occur within the DA, with most either foraging and/or breeding within the area (Table 2-37). Similar to albatrosses, the petrels have a diverse foraging range, and all waters within Australian jurisdiction can be considered foraging habitat for this species. Typical diet for petrels includes cephalopods (e.g. squid) and fish, and prey is predominately caught by surface-seizing (DSEWPac, 2011a).

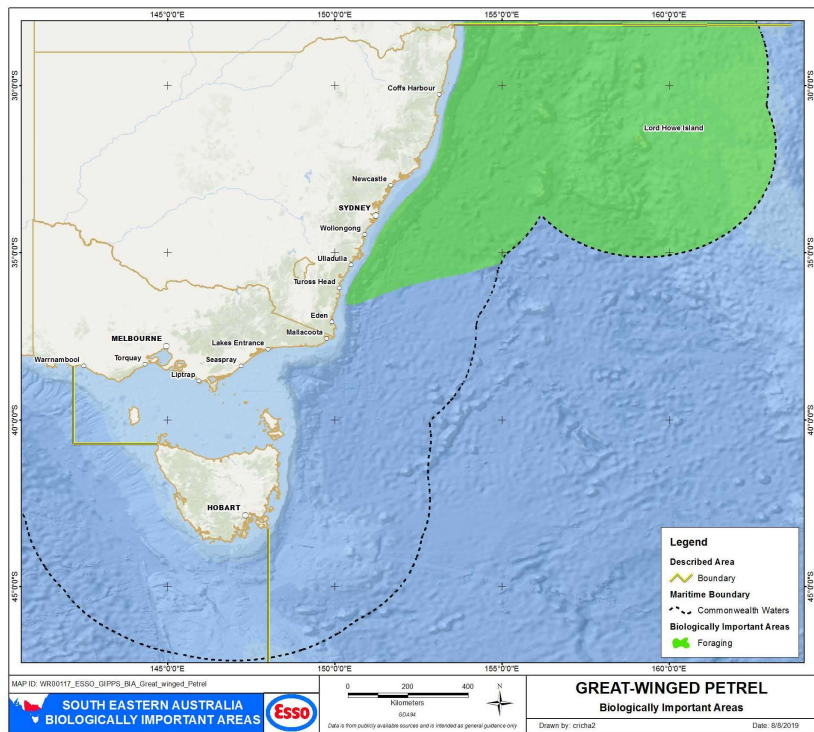

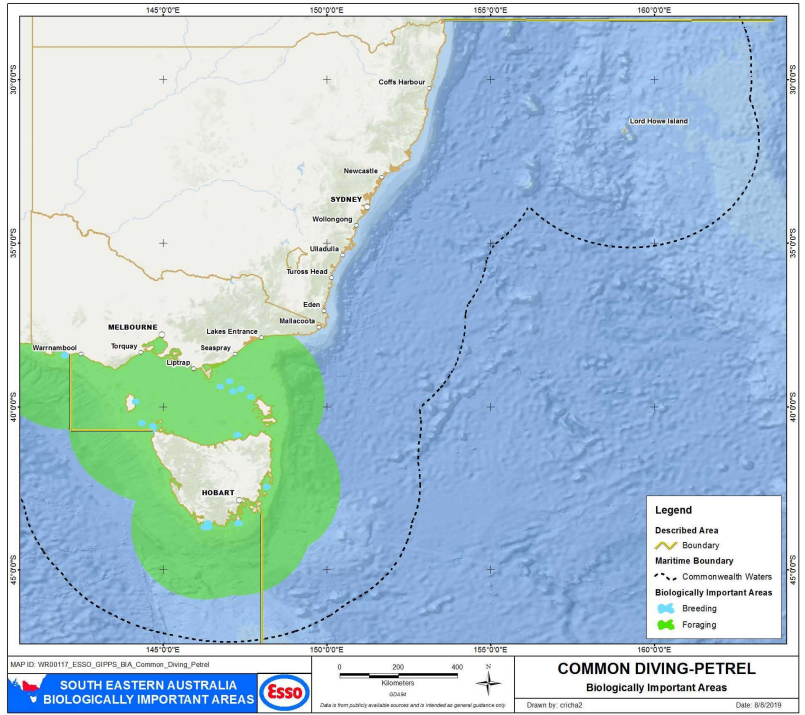

BIAs, for foraging and breeding, have been identified for the White-faced Storm Petrel, Common Diving-Petrel, Black-winged Petrel and Providence Petrel. BIAs for foraging have also been defined for the Northern and Southern Giant Petrel and the Great-winged Petrel (Figure 2-30) (DoEE, 2015h).

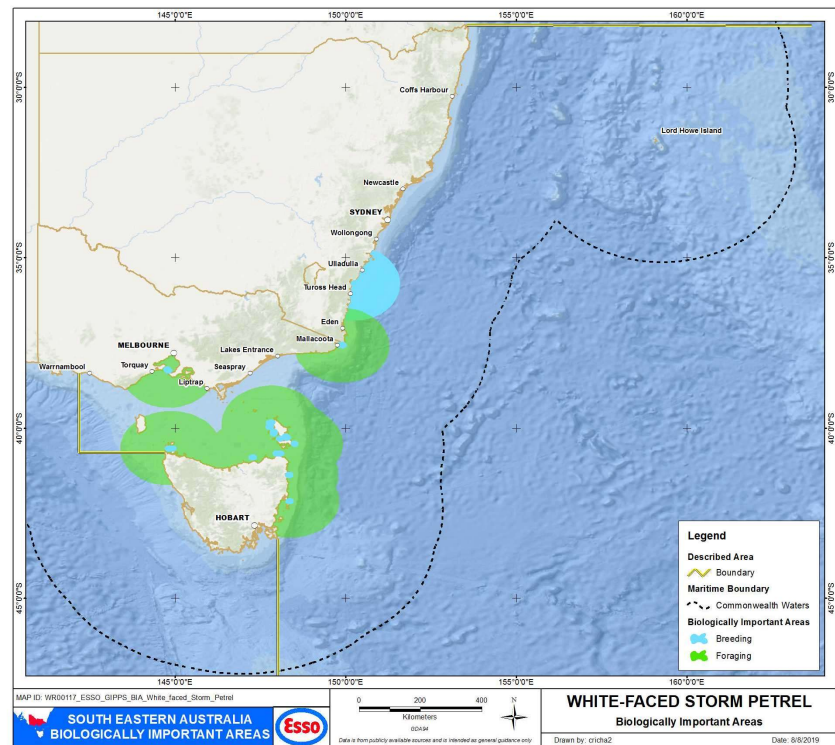

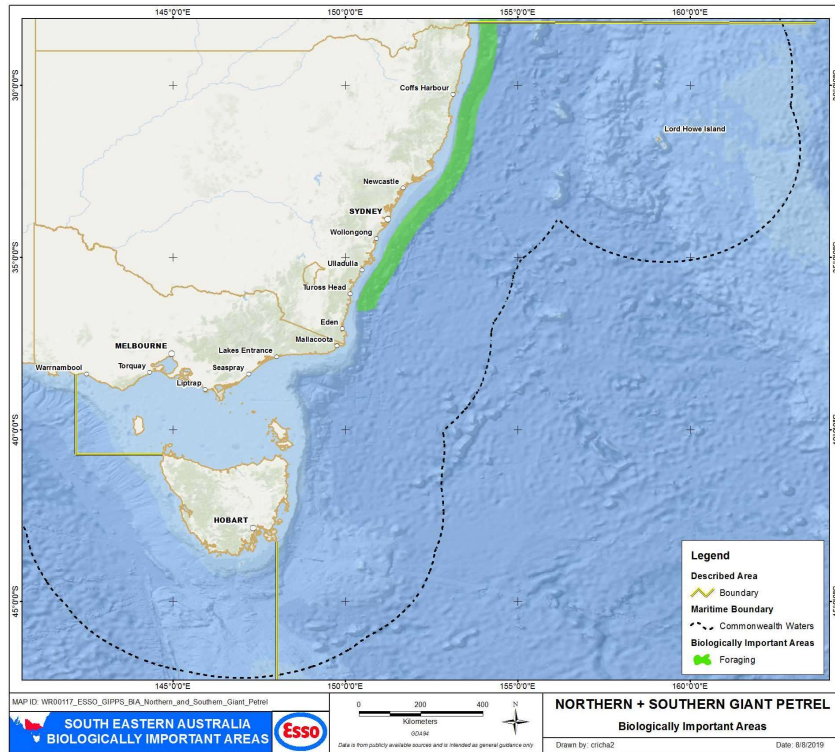

Both the Common Diving-Petrel and the White-faced Storm Petrel are listed as marine species under the EPBC Act, and have large populations within Australia, accounting for 5% and 25% respectively of the global population (DoEE, 2015a). The Common Diving-Petrel breeds on islands off south-east Australia and Tasmania; there are 30 sites with significant breeding colonies (defined as more than 1,000 breeding pairs) known in Tasmania, and 12 sites in Victoria (including Seal Island, Wilson’s Promontory and Lady Julia Percy Island) (DoEE, 2015a). There are 15 sites with significant breeding colonies in Tasmania, and three sites with Victoria, for the White-faced Storm Petrel (DoEE, 2015a). One critically endangered species, the Herald Petrel has been estimated to only have about 10-25 breeding birds in Australia. Although they are known to breed on Raine Island in North Queensland waters, they are highly oceanic birds that are listed as likely to occur in the DA (TSSC 2015).

The Black-winged Petrel (*Pterodroma nigripennis*) and Providence Petrel (*Pterodroma solandri*) are listed marine species whose only known breeding sites in Australia are on Lord Howe Island, and for the Providence Petrel, Philip Island (in NSW off Norfolk island). Both have been identified as a conservation value in the Temperate East Marine Region (DoEE, 2019af). The Black-winged Petrel forms a burrow of up to 1m long in sandy soil to nest and is prone to predation by the Masked Owl and introduced rodents. The Black-winged Petrel is also known to occur in other parts of the Pacific (NSW OEH, 2019c). The distribution of the Providence Petrel is far more restricted with breeding sites only

known to occur in Lord Howe and Philip Island. Their main known threats are from predation and disturbance of nests by tourists on the island. They nest on the tops of Mount Gower and Mount Lidgbird and to a less extent, on the lower slopes of the mountains (NSW OEH, 2019d).

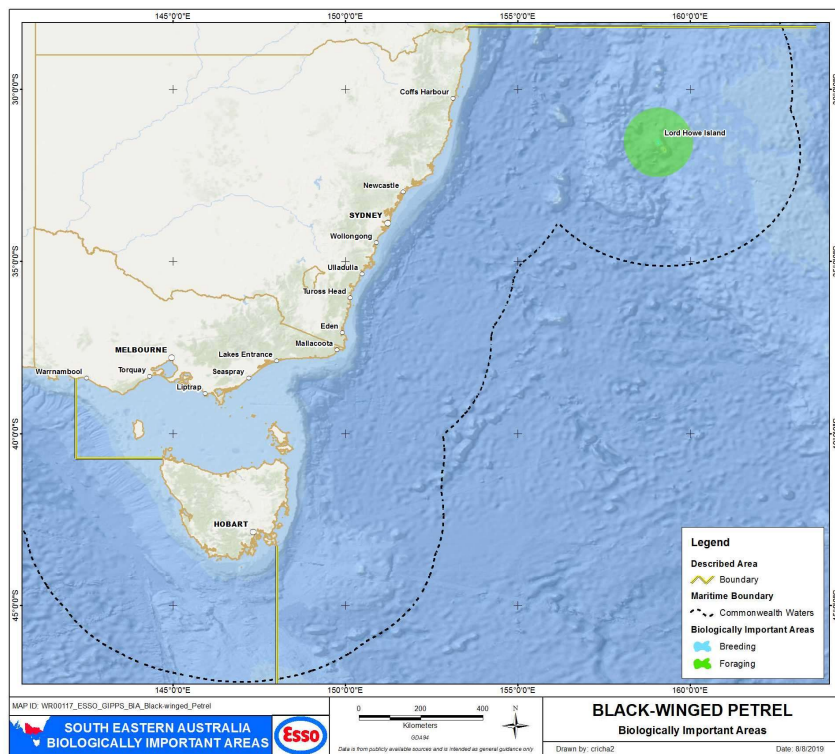

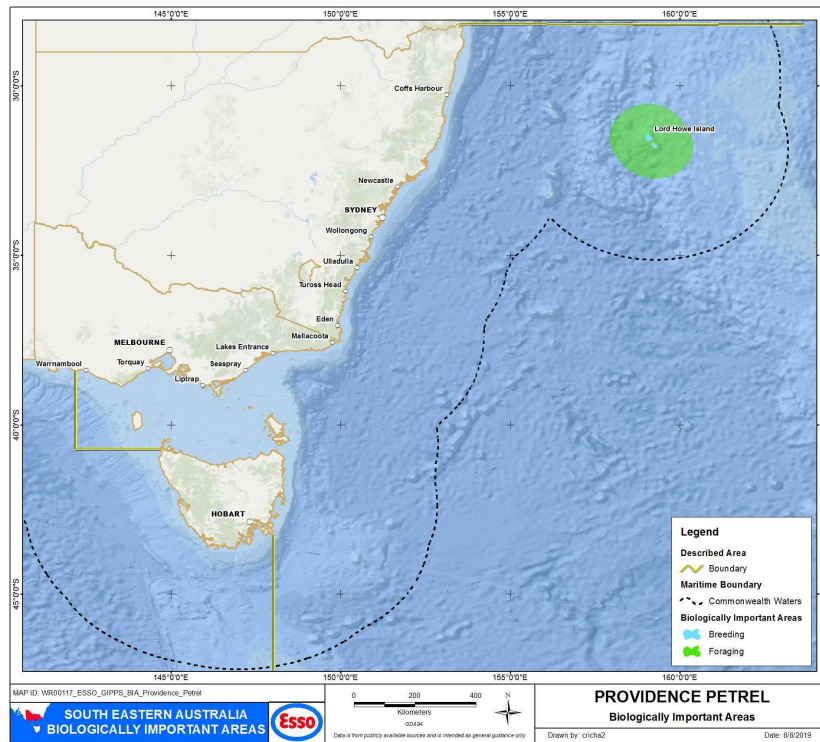

Figure 2-30 Biologically Important Areas for Petrel species.

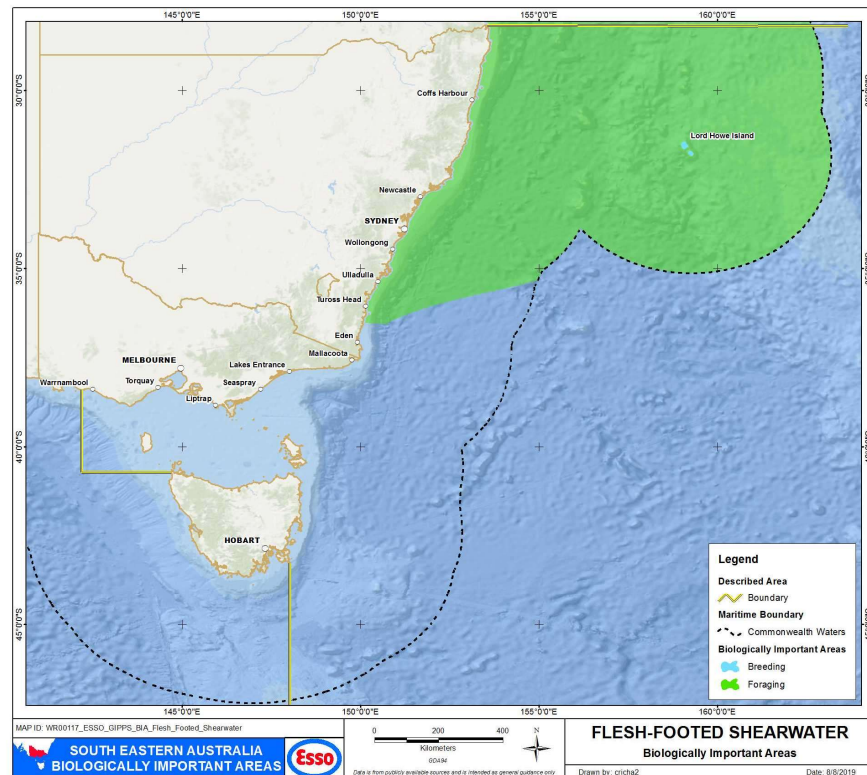

## Shearwaters

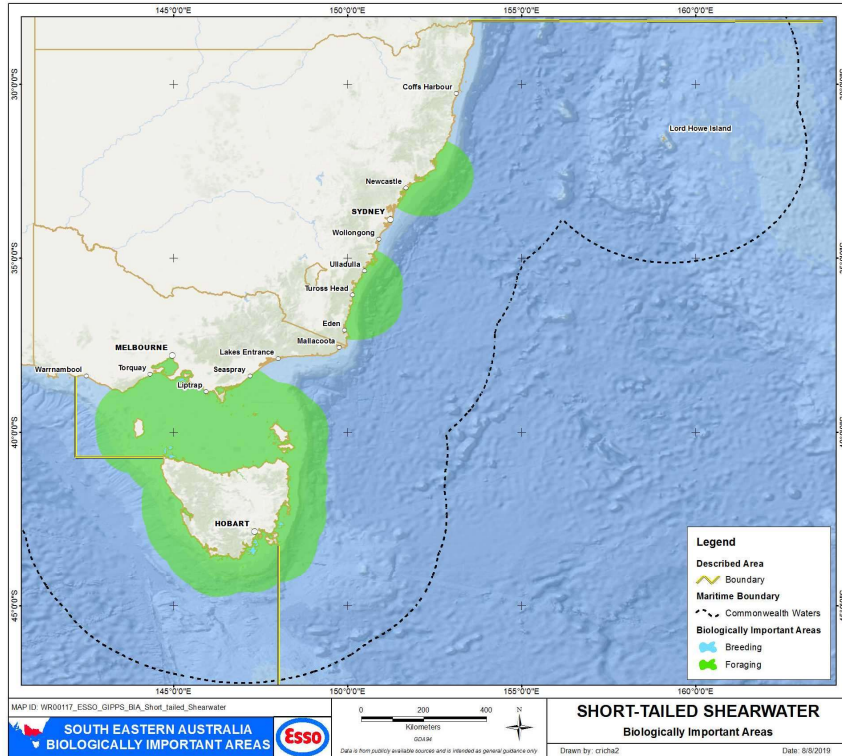

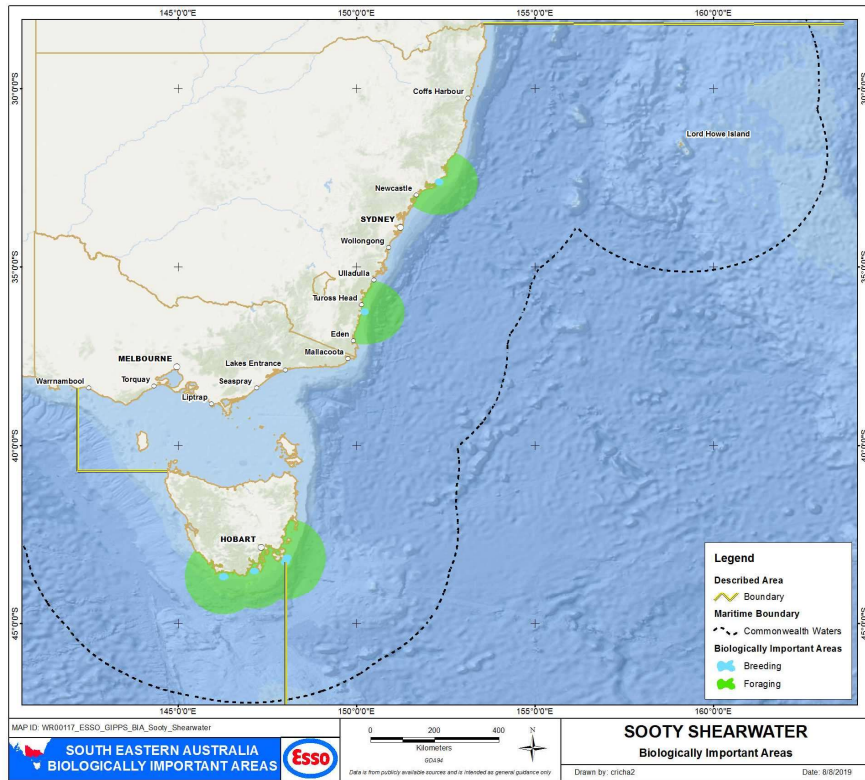

The shearwaters represent the most abundant seabird in Australia. There are five species of shearwater that may occur within the DA, and all have been identified as using the area for foraging and breeding (Table 2-37). BIAs, for foraging and breeding, have been identified for the following species: Sooty, Wedge-tailed, and Short-tailed shearwaters; and a BIA for foraging for the Flesh-footed Shearwater (Figure 2-31) (DoEE, 2015h).

Shearwaters are typically pelagic species, except during breeding seasons where they are found on remote islands or coastal headlands. Known breeding locations include New South Wales oceanic islands (e.g. Solitary Island, Cabbage Tree Island, Muttonbird Island, Bird Island) (Sooty Shearwater, Wedge-tailed Shearwater). Breeding season in south-eastern Australia for shearwaters is typically over summer; late-August/early-September to May (DoEE 2017a, 2017b, 2017d, 2017e). Shearwater nests are usually in burrows or rock crevices.

Shearwaters are known to forage for a variety of pelagic prey, including krill, cephalopods, fish and crustaceans. Food is usually taken by pursuit-plunging, surface plunging or surface-seizing; however other methods (e.g. hydroplaning, deep plunging) may be used.

The Short-tailed Shearwater is one of few native birds that is commercially harvested (Tasmania Parks & Wildlife Service, 2014).

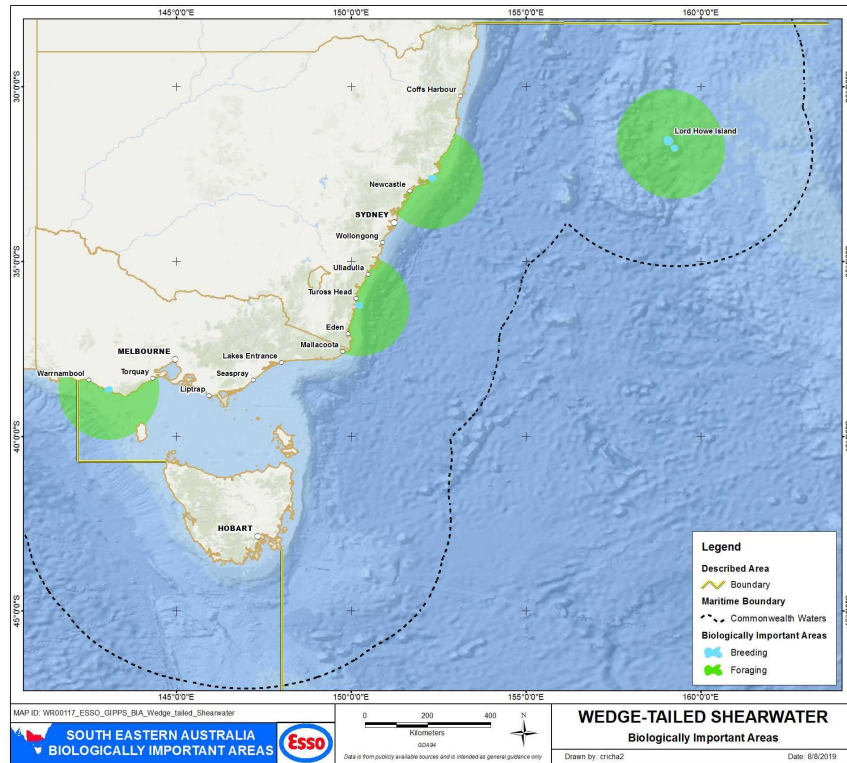

Figure 2-31 Biologically Important Areas for Shearwater species

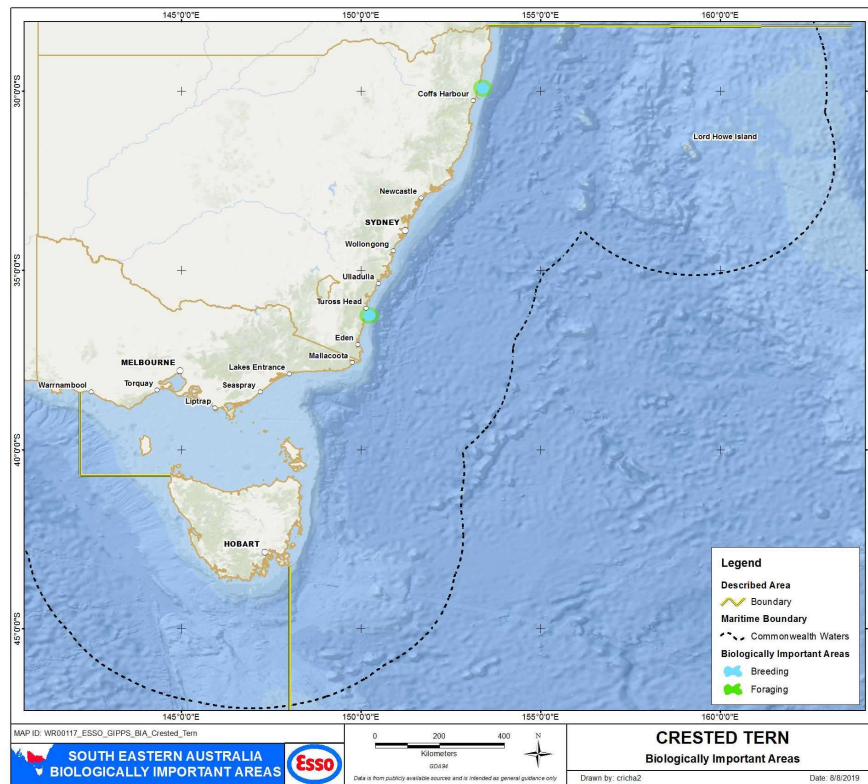

### Terns

There are eight species of tern that may occur within the DA, and all have been identified as using the area for breeding (Table 2-37). A BIA, for foraging and breeding, has been identified for the Crested Tern (Figure 2-32) (DoEE, 2015h).

Many of the tern species are widespread and occupy beach, wetland, grassland and beach habitats. Terns rarely swim; they hunt for prey in flight, dipping to the water surface or plunge-diving for prey (Flegg, 2002) usually within sight of land, for fish, squid, jellyfish and sometimes crustaceans (DEHWA, 2007).

Terns breed in colonies on small offshore islands, including those of the Furneaux Group in eastern Bass Strait. Nests are typically in sand or coral scrapes (Birdlife Australia, 2017a, 2017b; NSW OEH, 2017a).

**Figure 2-32 Biologically Important Areas for Crested Tern**

**Migratory Waterbirds**

Migratory birds are species where a substantial proportion of the global or a regional population makes regular cyclical movements beyond the breeding range, with predictable timing and destinations. Many species of migratory waterbirds occur in the DA including eight species of sandpipers

**Plovers**

There are nine species of plover that are known to occur in the DA, six of which are wetland migratory species and most of which have a known to feed or form rookeries in the DA. Many plovers feed by running along wet sand, mud or beaches and shorelines, snapping up small, aquatic, molluscs and insects for food. The nest is in a slight hollow in the ground where two to five (usually four) spotted eggs are laid and both parents incubate and care for the young. Some of the species here including the vulnerable Greater Sand Plover and the endangered Lesser Sand Plover are strongly migratory, birds breeding in the northern hemisphere and wintering in sandy beaches of Asia and Australasia. These are part of the East Asian – Australasian Flyway (EAAF) (DoEE, 2019ah) which stretches from the Russian Far East and Alaska, southwards through East Asia and South-east Asia, to Australia and New Zealand and encompasses 22 countries. During migration, waterbirds rely on a system of highly productive wetlands to rest and feed, building up sufficient energy to fuel the next phase of their journey. Whilst wintering in Australia, they occur in coastal areas of all states though the greatest numbers occur in northern Australia. Of the three non-migratory species, the eastern form of the Hooded Plover (*Thinornis cucullatus cucullatus*) is listed as vulnerable. It is a small bird that nests on the back of usually wide beaches above the high water mark. Its main threat is human disturbance from unleashed domestic dogs (DoEE, 2019ai).

**Sandpipers**

Eight sandpiper species are known to occur within the DA. Sandpiper refers to the small to middle sized shorebirds (15-30sm) in the family Scolopacidae which are seen at beaches and inland mudflats during migration and wintering. They are all migratory breeding in the northern hemisphere Arctic and sub-Arctic regions and travel in large flocks when migrating. The majority of these species eat small

invertebrates probed out of the mud or soil or sand with their sensitive bills which distinguishes them from the plovers that are darting across the surface feeding by sight. The critically endangered Curlew Sandpiper's (*Calidris ferruginea*) sighted population in Australia has significantly declined. Breeding does not occur in Australia, it is part of the EAAF and breeding occurs in Siberia, however its wetland resting habitat on its winter migration, particularly in East Asia, is being threatened by degradation through habitat loss, pollution and other human disturbance resulting in an estimated reduction in population size in Australia by >80% (DoEE, 2015b). In Australia the main threat for all sandpipers is from disturbance from humans and their domestic animals.

Also in the Scolopacidae family are all of the other listed wetland migratory species found in the DA (other than the Osprey) including the snipes, knots, godwits, dowitchers, sanderlings, turnstones, shanks, curlews, phalarope, whimbrel and tatters. These have similar breeding habits as the Sandpipers. Their feeding habitat is generally coastal with large intertidal mudflats or sandflats and they roost on sandy beaches, sandbars, and spits. There are three critically endangered species, the Great Knot, the Northern Siberian Bar-tailed Godwit and the Eastern Curlew. The Red Knot is listed as endangered and the Bar-tailed Godwit (auera) is listed as vulnerable (note the Bar-tailed Godwit is a subspecies of the Siberian Bar-tailed Godwit (TSSC, 2016a)). These species are all migratory birds breeding in the northern hemisphere (e.g., Siberia/Alaska) and migrating south during their winter. Recorded numbers are in decline in Australia and, like the Sandpipers, this is largely attributed to the decline in wetlands in Asia used as staging areas for resting and feeding during migration. In Australia threats include human disturbance as well as habitat loss and degradation from pollution, changes to the water regime and invasive plants (DoEE, 2015c).

#### Other

Many other species also occur within areas of the DA (Table 2-37), those that are critically endangered, endangered or vulnerable are discussed below.

The Swift Parrot and Orange-bellied Parrot are both critically endangered, they both breed in Tasmania and migrate to the mainland for the non-breeding season. The Swift parrot's habitat is mainly forest and it's threatened mainly by native predators and also loss of forest habitat (TSSC, 2016b). The orange bellied parrot is ground feeding and inhabits salt marshes, coastal dunes, pastures, shrub lands, estuaries, islands, beaches and moorlands generally within 10 km of the coast. As with many of the migratory species, it is threatened by the loss of wetland habitat, in this case through changes to land use practices such as drainage of wetlands for grazing, alteration and destruction of saltmarsh for industrial and urban development, vegetation clearance for agricultural purposes (TSSC, 2006).

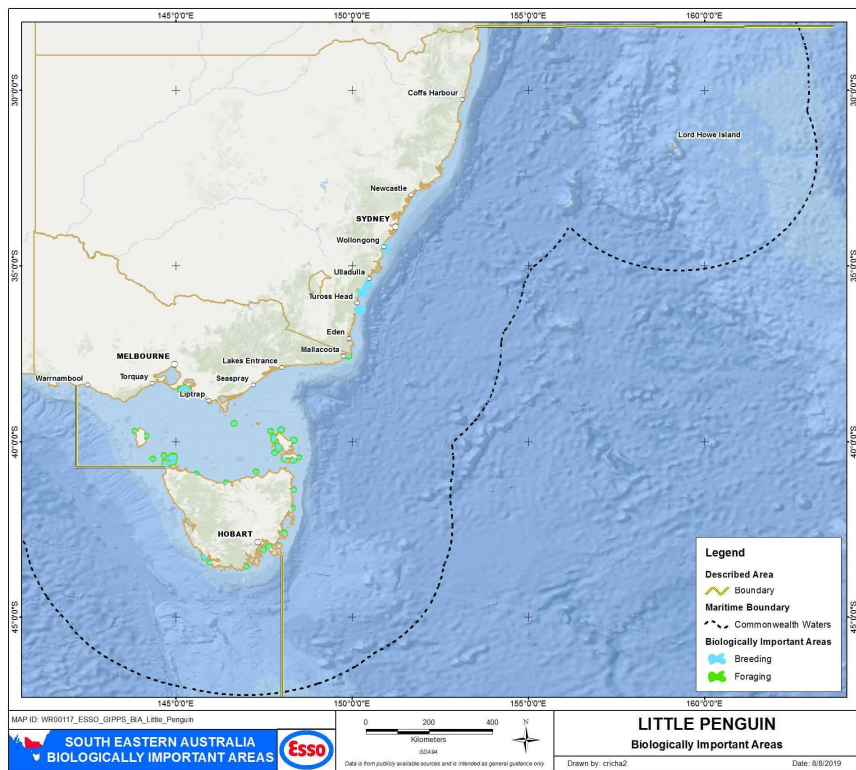

The Australian Painted snipe, a listed endangered species has been recorded at wetlands in all states of Australia and whilst called a snipe it is in the family Rostratulidae. It is known to nest in Australia and generally inhabits shallow terrestrial freshwater but also brackish wetland and also seen in saltmarshes. Its decline has been attributed to the loss of wetland habitat since European settlement in Australia (DoEE, 2019aj).

The endangered Australasian Bittern is mainly a freshwater wetland species and rarely occurs in estuaries or tidal wetlands, favouring tall dense vegetation where it forages on small aquatic animals including frogs, fish, freshwater crayfish, reptiles and insects. These birds are also culturally significant to Aboriginal people. This species is capable of moving between habitats from south-east Queensland to south-east South Australia as suitability changes. Wetland habitat loss and degradation is a threat to the Australasian Bittern (TSSC, 2019).

The endangered Eastern Bristlebird is a small, well-camouflaged, ground-dwelling bird spending most of its time in low, dense vegetation in coastal, subcoastal and coastal escarpment scrubland / grassland / sedgeland and in open grassy forest on inland ranges. The species has contracted to four genetically isolated populations in three disjunct areas of south-eastern Australia. Within the DA these are the Illawarra and Jervis Bay regions of eastern NSW (central populations) and the NSW/Victorian border coastal region (southern population) near Nadgee Mallacoota. They feed mainly on invertebrates but also on seeds and grasses. Habitat loss through clearing of coastal heath and escarpment forest is recognised as the main process that has reduced the distribution and abundance of the Eastern Bristlebird in the last 150 years. Another potential threat to the species is predation, particularly by feral predators and particularly after fire (NSW OEH, 2012c).

Within Australia, the vulnerable Fairy Prion (southern) breeds only on Maquarie Island (outside of the DA) and outside Australia is also known to breed in other subantarctic islands including New Zealand and Falklands. During the non-breeding season it frequents sub-tropical waters and it feeds by plucking food off the ocean surface. Its main threat in Australia was predation from introduced black rats which have now been eradicated on Macquarie Island (TSSC, 2015e).

The Little Penguin is the smallest species of penguin in the world and are permanent residents on a number of inshore and offshore islands. The Australian population is large but not thought to exceed one million birds (DoEE, 2015a). Bass Strait has the largest proportion (approximately 60%) of the known breeding colonies in Australia; however, breeding populations are also found on the New South Wales coast. Individuals exhibit strong site fidelity, returning to the same breeding colony each year to breed in the winter and spring months (Gillanders *et al.*, 2013). The diet of a Little Penguin includes small school fish, squid and krill. Prey is typically caught with rapid jabs of the beak and swallowed whole. A BIA for breeding and foraging, has been identified for the Little Penguin (Figure 2-33) (DoEE, 2015h). Little penguins are also an important component of the Australian and New Zealand fur-seals' diet (PoSA, 2011).

**Figure 2-33 Biologically Important Area for Little Penguin**

The Australasian Gannet generally feeds over the continental shelf or inshore waters. Their diet is comprised mainly of pelagic fish, but also squid and garfish. Prey is caught mainly by plunge-diving, but it is also seen regularly attending trawlers. Breeding is highly seasonal (October–May), nesting on the ground in small but dense colonies (DoEE, 2015a). While breeding behaviour has been identified (Table 1), known important breeding locations for the Australian Gannet occur outside the DA at Pedra Branca, Eddystone Rocks, Sidmouth Rocks, and Black Pyramid (Tasmania) and Lawrence Rocks (Victoria).

The Black-faced Cormorant is endemic to southern Australia (DoEE, 2015a); and favours rocky coasts. The species feeds in coastal waters on a variety of fish, typically catching prey by pursuit-diving. There are 40 significant breeding sites (defined as more than 10 breeding pairs) known for the species in southern Australia. Breeding usually occurs on rocky islands, but also on stacks, slopes and sea cliffs in colonies of up to 2500 individuals (DoEE, 2015a).

The Red-tailed Tropicbird is a medium sized (45-55cm) seabird and listed marine and migratory species that exists in tropical Pacific and Indian oceans (DoEE, 2019v). It nests on cliffs by the water's edge, and less so inland on smaller islands and has been identified as a conservation value in the Temperate East Marine Region. The red-tailed tropicbird is mostly a plunge-diver, diving anywhere from an above-water height 6 to 50 metres to a depth of about 4.5 metres (AOLA, 2019a). No specific conservation plans exist for this species.

The Masked Booby is a large listed marine and migratory species that has a breeding population on Lord Howe Island (Mutton Bird Point, King Point, Roach Island, South Island, Sugarloaf Island, Mutton Bird Island, Gower Island, Sail Rocks and Ball's Pyramid) that is the most southerly known breeding colony in the world (DoEE, 2019w). The masked Booby nests in small colonies, laying on sandy beaches and feeds by plunge diving on the ocean (AOLA, 2019b).

The Red-necked Phalarope (*Phalaropus lobatus*) is a listed migratory and marine wader and the smallest of the Phalarope species (18-19 cm). This is one of only two Phalaropes that occurs regularly at sea where feeding is expected to occur. In Australia it is recorded in both coastal and inland lakes/swamps including highly saline waters and saltfields. In Victoria it has been seen in near coastal lakes such as Lake Cooewarre and Lake Victoria near the entrance to Port Phillip Bay. Sightings occur from Mid October to early April. From a global perspective there are no important sites for this species in Australia (i.e. a site is considered important if it is occupied by more than 1% of the bird's total population). It breeds in the Arctic and sub-Arctic North America and spends its non-breeding winter season at sea (DoEE, 2019ag).

The Magpie Goose is widespread in northern Australia, where it may congregate in huge flocks, often comprising thousands of birds. They were also commonly found in the southern parts of Australia but are now not seen in Tasmania, endangered in Victoria and vulnerable in NSW. They are a listed marine species, a waterfowl which nests near wetlands on floating reeds or tree-tops. They feed on aquatic vegetation (Birdlife Australia, 2019).

Some listed bird species, whilst not seabirds or shorebirds, inhabit islands and nearshore habitats such as forests and freshwater wetlands and include the critically endangered Regent Honeyeater, endangered Wedge-tailed Eagle (Tasmanian), Forty-spotted Pardalote, and the vulnerable Masked Owl and Painted Honeyeater. These are terrestrial/freshwater species and though they occur in or near the DA they are not expected to be impacted by petroleum activities.

The Regent Honeyeater is most commonly associated with box-ironbark eucalypt woodland and dry sclerophyll forest. Its utilisation of lowland coastal forest occurs when its usual habitat is affected by drought and coastal regions become a refuge. Its diet primarily consists of nectar, but also includes invertebrates (mostly insects) and their exudates. Loss of habitat is its primary threat (TSSC, 2015d).

The Wedge-tailed Eagle (Tasmanian) is found only in Tasmania and nearby islands. The subspecies is widespread on mainland Tasmania, where it inhabits coastal, lowland and highland regions. It is carnivorous, and feeds on both live prey and carrion, capable of killing prey several times its own body weight with birds being approximately 10% of items consumed. The major threats to the Wedge-tailed Eagle (Tasmanian) are loss of nesting habitat (old growth Eucalyptus forest) and disturbance of nesting birds and, to a lesser degree, persecution by humans. The loss of suitable habitat has also increased conflict between the Wedge-tailed Eagle (Tasmanian) and the White-bellied Sea-Eagle *Haliaeetus leucogaster* for nest sites, and this is known to have caused breeding failures in both species (DoEE, 2019ak)

The Masked Owl (Tasmanian) is endemic to Tasmania, including several near-shore islands. It is the second largest nocturnal raptor in Australia with a wingspan up to 128cm. It feeds predominately on introduced rodents and Rabbits and other native fauna in less disturbed habitats. Its greatest threat is loss of habitat through clearing and fragmentation (DEWHA, 2010a).

The Forty-spotted Pardalote is confined to south-eastern Tasmania including the offshore islands. It inhabits sclerophyll forests and open woodlands where White Gum is present and feeds on invertebrates, manna from Eucalyptus trees (including *E. dalrympleana* and White Gum) and lerps (sugary secretions produced by psyllid insects) (TSSC, 2016c). Its primary threat is of habitat through clearing and fragmentation. Similar to the Pardalote, the Regent Honeyeater also occurs in woodland, mostly box ironbark, and feeds on nectars, insects and their lerps. Its distribution is patchy but extends from south east Queensland to through to Victoria (DoEE, 2015 f). The Painted Honeyeater is the most

specialized of Australia's honeyeaters and inhabits eucalypt forests/woodlands but its diet consists mainly of mistletoe fruits and therefore its primary threat is loss of habitat through clearing (DoEE, 2015g).

The endangered Tasmanian Azure Kingfisher is endemic to Tasmania and occurs along several river systems on the south, west and north-west coast with outlying occurrences in the north-east, east, centre and Bass Strait islands. It utilizes a wide range of forest types but mainly wet sclerophyll eucalypt forests. It feeds on small fish, freshwater crayfish, aquatic insects and occasionally amphibians. Its primary threat is habitat clearing and acidic runoff from mining activities (DEWHA, 2010b).

Painted Honeyeater	Conservation Advice Grantiella picta painted honeyeater. Canberra: Department of the Environment (DoEE, 2015 g).	None Identified

### 2.3.1.5 Marine Mammals

#### 2.3.1.6 Cetaceans

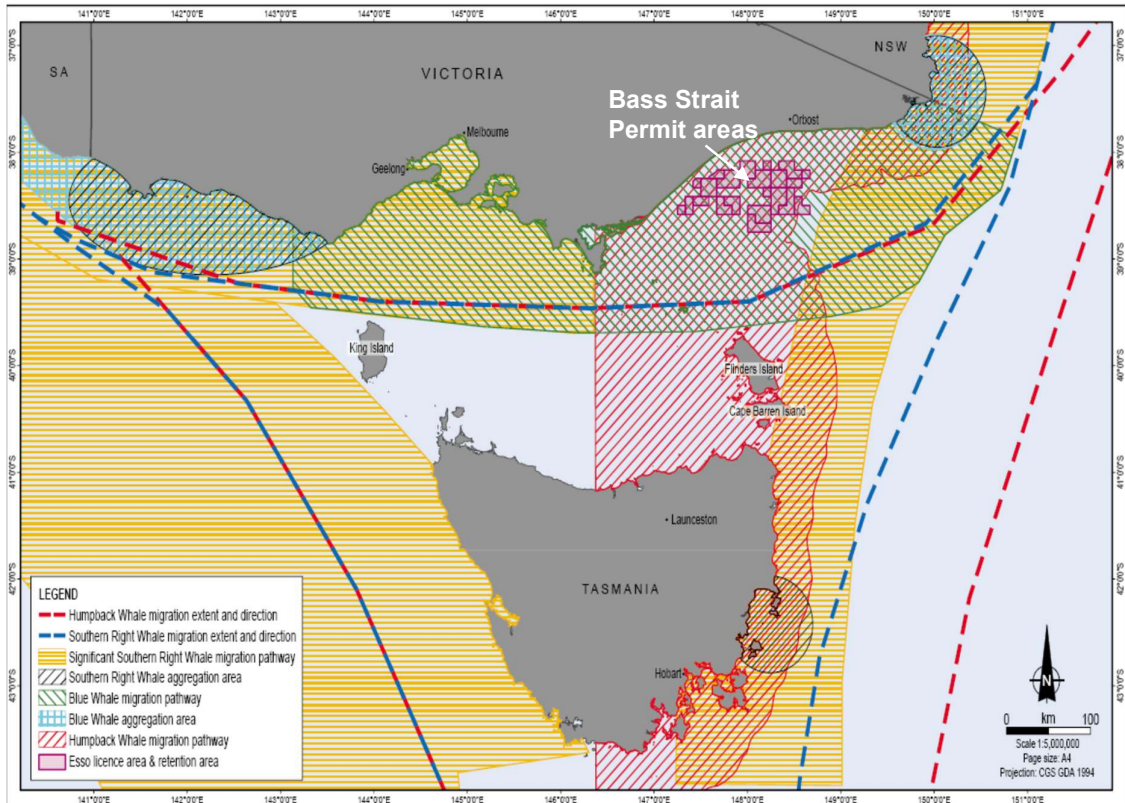

Cetaceans are a widely distributed and diverse group of carnivorous, finned, aquatic marine mammals. They comprise whales, dolphins and porpoises. Cetaceans are generally found in the ocean, but can also inhabit river systems.

There are 25 whale, and 18 dolphin species (or species habitat) that may occur within the DA; this includes species classified as threatened and migratory (Table 2-39) (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). A list of the conservation advice and/or recovery plans, with relevant key threats and management actions, is shown in Table 2-40. The type of presence varies between species, and includes important behaviours (e.g. foraging, breeding) for some species.

#### Whales

Southern Right Whales generally occur along the southern coast of Australia; they migrate annually along the eastern coastline from high latitude feeding grounds to lower latitudes for calving between mid-May and October (DoEE, 2017h). Known calving and aggregation grounds in the south-east region are Warrnambool, Port Fairy, Port Campbell and Portland in Victoria, and Encounter Bay in South Australia (DSEWPaC, 2012d; DoEE, 2015a). Nursery grounds are occupied from May to October, with female-calf pairs generally staying in the area for two to three months (Charlton, 2017). Calving itself usually occurs in very shallow (<10 m depth) waters. Other population classes stay in the nursery grounds for shorter and variable periods of time; there is typically a lot of movement along the coast, and thus habitat connectivity is important for this species. The summer offshore distribution and migration routes of SRW largely is unknown, but is known to include directly southern and western migration pathways, but may include offshore habitat where mating (Burnell, 2001; Mackay et al., 2015). Figure 2-34 shows whale migration pathways and aggregation around the Bass Strait petroleum permit areas, including those for the SRW.

In mid-2023, the NCVA updated the BIA data for the SRW, which now identifies two BIAs; reproduction (May – September) and migration (April -October), both of which are overlapped by the DA (Figure 2-37). Reproduction is spatially defined along the entire coast of Victoria including Port Phillip Bay and Western Port Bay and along the entire coastline of Tasmania as well as majority of the NSW coastline up to Burnett Heads in Queensland. Reproduction also occurs in areas along the SA and WA coast. Migration for the SRW covers all Commonwealth waters in southern Australia from Naturaliste, WA to the Victorian/NSW border, including the Great Australian Bight and all of Bass Strait. Migration also mirrors the reproduction BIA along the coast in NSW and Queensland and exists along the west coast of WA. According to the BIA Protocol (DCCCEEW, 2023b) category definitions, reproduction BIAs are areas known or likely to be regularly or repeatedly used by individuals or aggregations of a species for reproduction or to provide refuge, or other advantage to young. Migration BIAs are areas known or likely to be regularly or repeatedly used by individuals or aggregations of a species for undertaking seasonal or other temporal movements which contribute to connectivity with other functionally important areas (DCCCEEW, 2023b).

**Figure 2-34 Whale migration pathways and aggregation around the Bass Strait petroleum permit areas**

Humpback whales migrate annually along the eastern coast of Australia heading north to tropical calving grounds from June to August, and south to Southern Ocean feeding areas from September to November (Figure 2-35). While the main migration route of this species is along the east coast of Australia along the continental shelf to the east of Bass Strait, some animals migrate through Bass Strait. Humpback whales do not feed, breed or rest in Bass Strait and the Victorian coastal waters are not a key location for this whale species (Bannister et al., 1996). Most feeding grounds are south of Australian waters (TSSC, 2015c). A BIA for the Humpback Whale, for migration and breeding, has been identified along the east coast of Australia (Figure 2-37) (DoEE, 2015h). Humpback whales in the southern Hemisphere primarily feed on Antarctic krill (*Euphausia superba*). While most feeding grounds are south of Australian waters, there are some feeding grounds that are regularly used on the southern migration in Australian coastal waters: off the coast of Eden in New South Wales, and east coast of Tasmania (TSSC, 2015c).

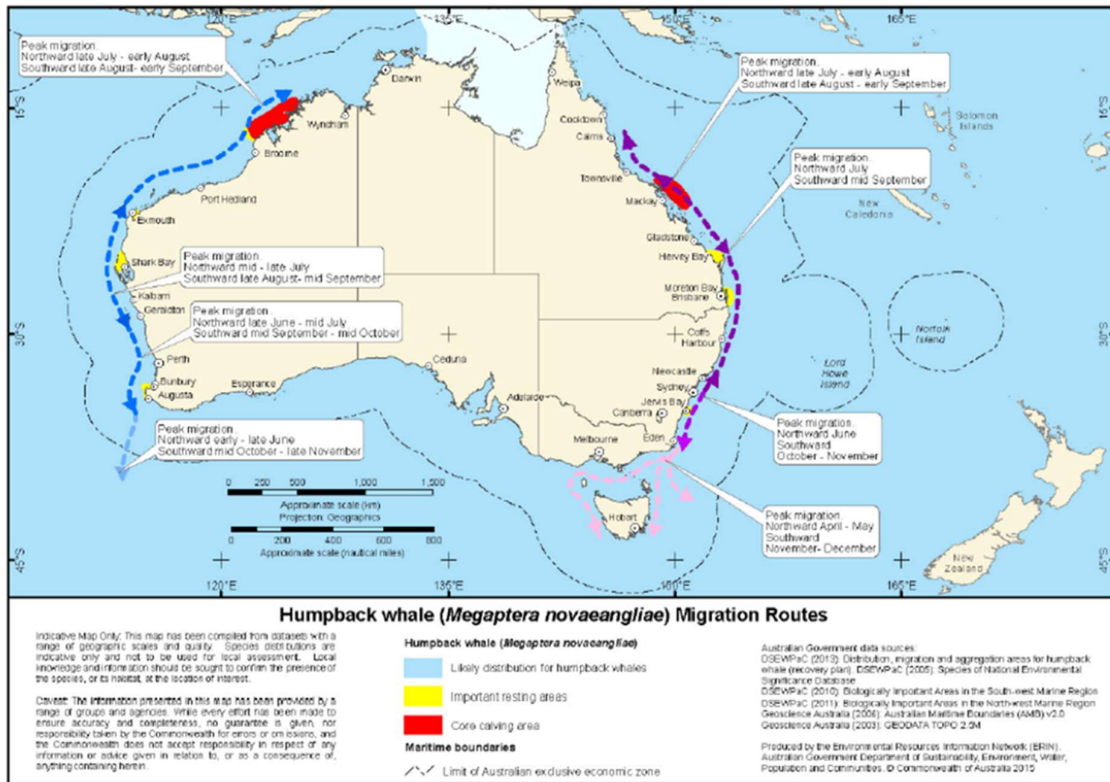

Figure 2-35 Migration routes for Humpback Whales around Australia (TSSC, 2015c)

There are two subspecies of Blue Whale that occur within Australian waters: Antarctic Blue Whale, and the Pygmy Blue Whale. Blue Whales have the highest known prey requirements, consuming up to two tonnes of krill per day (DoEE, 2015d).

Blue whale sightings in Australia are widespread, and much of the shelf and coastal waters are unlikely to hold significance for this species with the exception of some foraging locations. Australia has two known seasonal feeding aggregations of Blue Whales; one occurs adjacent to the Bonney Upwelling system off South Australia and Victoria (Figure 2-36) (Gill 2002; Gill & Morrice 2003; McCauley et al 2018). Pygmy Blue Whales are typically foraging in this area between January and April (DoEE, 2015d). The abundance of whales in the area varies within and between seasons (DoEE, 2015d). Outside these main feeding areas, foraging areas for the Pygmy Blue Whale also include in Bass Strait, and diving and presumably feeding at depth off the west coast of Tasmania (DoEE, 2015d). A BIA for the Pygmy Blue Whale for foraging and distribution has been identified in the DA (Figure 2-37) (DoEE, 2015h). Acoustic detections of blue whales indicates that New Zealand pygmy blue whales occur predominantly eastward of Bass Strait, Australian pygmy blue whales occur west of Bass Strait, and Antarctic blue whales occur along the entire southern coastline (McCauley et al., 2018). Sightings of Blue whales in the Gippsland Basin are reasonably rare (Bannister et al. 1996).

Movements and behaviour identified by Moller et al 2020 corroborate previous suggestions that blue whales aggregate to feed in the Australian Southern waters (between the Great Australian Bight to Bass Strait) from late spring to autumn (November to May) each year. Sighting data from aerial surveys (as presented in Moller *et al* 2020) suggests that between November and December blue whales utilise mainly slope waters south of Kangaroo Island and Eyre Peninsula, while from January to April they are usually found in shelf waters between Cape Jaffa and Cape Otway (the Bonney Upwelling).

Transiting behaviour was mainly observed between April and June, and then between November and December, suggesting that the pygmy blue whales were mainly migrating during those times (Moller *et al* 2020). This is supported by McCauley *et al* (2018) who state " Individuals head east as far as Bass Strait and can be found feeding along the south eastern Australian continental shelf during upwelling

conditions (Gill, 2002; Gill et al., 2011). The animals remain in southern waters, feeding, until April to June of the following year, before heading northwards to tropical waters from April to July onwards".

Dates associated with the Upwelling are variable and different reports and authors have it anywhere between November to April. These variations in timings are a result of environmental factors affecting the upwelling and krill numbers.

This variability also extends into Bass Strait. McCauley et al (2018) note that in 2004 the peak Pygmy Blue whale calling in Bass Strait was in May which is late in the season. Gill et al. (2011) has suggested that in some years westerly water flows, driven by a change in wind regime to pre-dominant westerly's in autumn, may move krill swarms generated along the Bonney coast into the eastern edges of Bass Strait. In 2004 it is possible these krill swarms were pushed well into Bass Strait giving rise to the spike of pygmy blue whale calling in May. On at least one occasion all three blue whale call types were present within a short time frame (over April-June) and commonly two call types present over this period during other years (McCauley et al 2018).

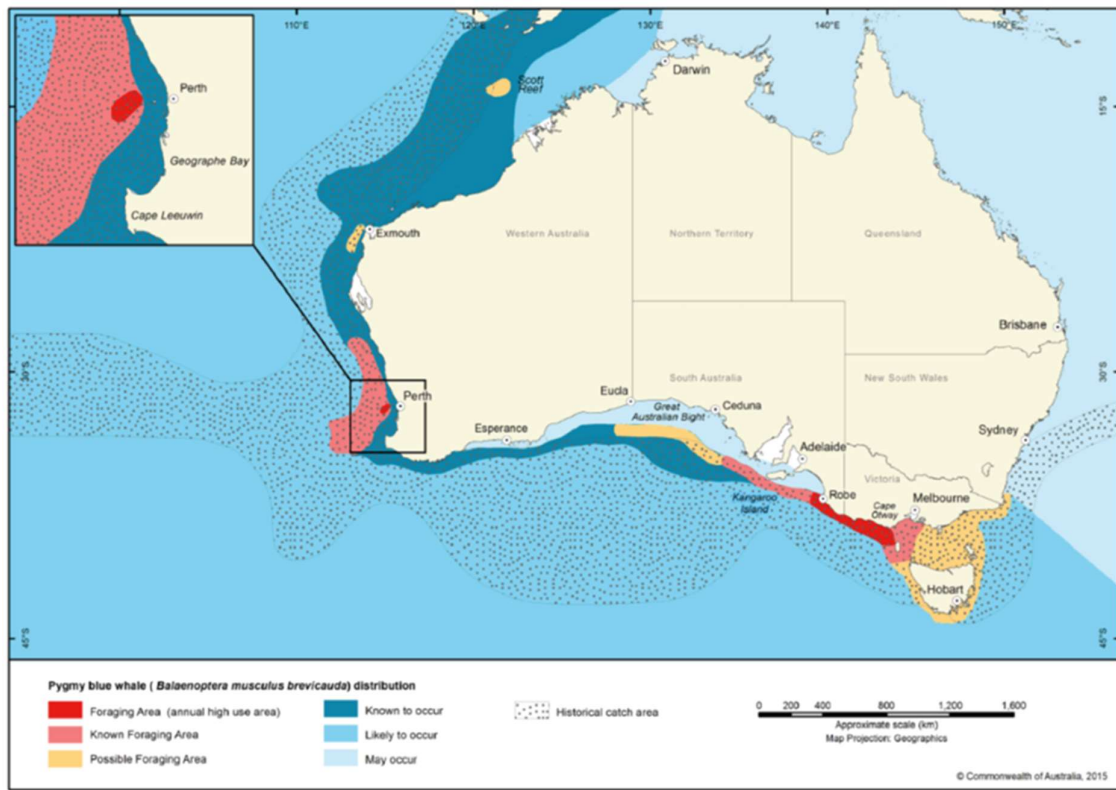

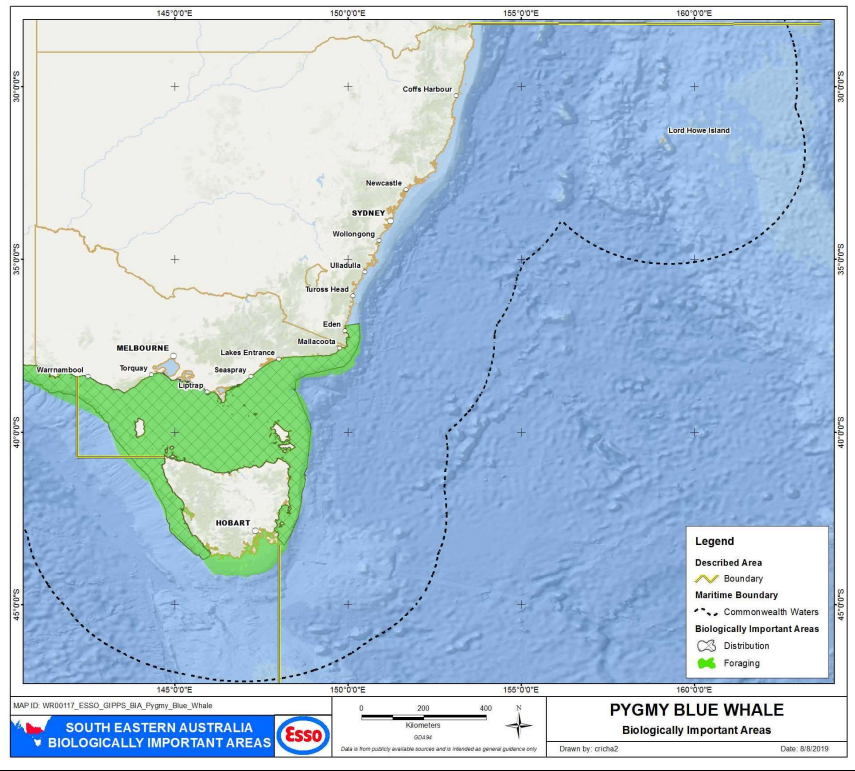

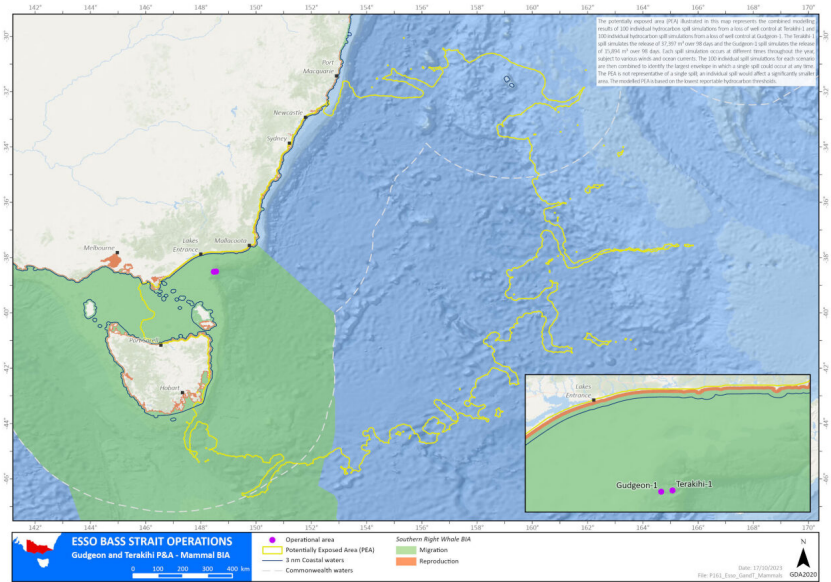

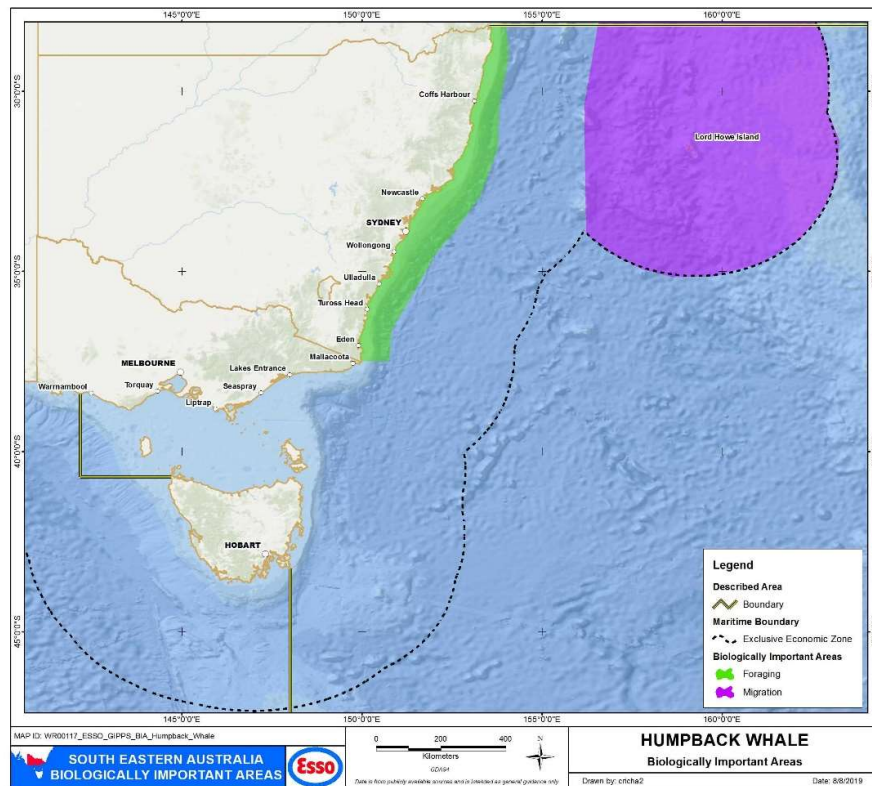

Figure 2-36 Distribution and foraging areas for the Pygmy Blue Whale (DoE, 2015d)

Sei Whales have been infrequently recorded in Australian waters; however occasional sightings have been recorded off Tasmania, New South Wales, Queensland and within the Great Australian Bight (DoEE, 2017p). Sei Whales typically feed between the Antarctic and Subtropical convergences, and their diet is planktonic crustacea, in particular copepods and amphipods. However, Sei Whales have also been observed feeding on the continental shelf in the Bonney Upwelling region during November and May, suggesting the area may be used for opportunistic feeding (DoEE, 2018a).

The distribution of Fin Whales in Australian waters is uncertain, but they have been recorded in Commonwealth waters off most States (the species is rarely found in inshore waters) (DoEE, 2017r). Fin Whales frequently lunge or skim feed, at or near the surface, feeding on planktonic crustacea, some fish and cephalopods (DoEE, 2017r). Fin Whales generally feed in high latitudes, however depending upon prey availability and locality, it may also feed in lower latitudes. Fin whales have been observed in waters off the Bonney Upwelling during November and May, suggesting the region may be used for opportunistic feeding (DoEE 2018b). Fin whales have also been detected acoustically south of Portland, Victoria (Erbe et al., 2016).

Records of Pygmy Right Whales in Australian waters are distributed between 32°S and 47°S, but are not uniformly spread around the coast (DoEE, 2017t). Areas of coastal upwelling events appear to be an important component regulating Pygmy Right Whale distribution. Pygmy right whales (*Caperea truncates*) have primarily been recorded in areas associated with upwellings and with high zooplankton abundance, which constitute their main prey. There is some evidence to indicate that the area south of 41°S is important for weaned Pygmy Right Whales, possibly because of the higher prey abundance in these waters (DoEE, 2017t).

**Figure 2-37 Biologically Important Areas for whale species**

### Dolphins

All dolphins are a protected species in Australian waters. None that are listed as occurring in the DA are listed as vulnerable, endangered or critically endangered. They are found in a variety of marine habitats, from the open ocean to coastal bays and inlets. Dolphins are migratory animals and their habits vary. Species that live in coastal areas are less likely to travel compared to species that live in open water.

The Indian Ocean Bottlenose Dolphin is distributed continuously around Australia (DoEE, 2017u). The Indian Ocean Bottlenose Dolphin occurs mainly in riverine and shallow coastal waters (on the shelf or around oceanic islands) (DSEWPac, 2012e). Known populations include: Jervis Bay, Twofold Bay, and Phillip Bay (DSEWPac, 2012e). Calving peaks occur in spring and summer or spring and autumn (DoEE, 2017u). Gestation lasts approximately 12 months, so peak mating period coincides with peak calving period in each location (DoEE, 2017u). A BIA for breeding for the Indian Ocean Bottlenose Dolphin has been identified within New South Wales coastal waters (Figure 2-38) (DoEE, 2015h).

The Indo-Pacific Humpback dolphin (*Sousa chensis*) has similar habitat type as the Indian Ocean Bottlenose and occurs in tropical/subtropical waters from approximately the Queensland–New South Wales border to western Shark Bay, Western Australia. Humpback dolphins have been observed feeding mainly in near-shore habitats and in a wide range of inshore-estuarine coastal habitats including rivers and creeks, exposed banks, shallow flats, rock and coral reefs as well as over submerged reefs in waters at least up to 40 m deep. Although listed as a migratory species, they do not appear to undergo large scale seasonal migrations (DoEE, 2019y). BIA for this species occur in northern Queensland, outside of this DA (NCVA, 2019).

The Bottle-nosed dolphin (*Tursiops truncatus*) and the Common dolphin (*Delphinus delphis*) are commonly sighted in near-shore Victorian waters.

Dusky dolphins are listed as a migratory marine species likely to be present in the vicinity of the EGBPA. Although they have been sighted off Tasmania, there is no known calving locality for this species in Australian waters (Gill et al. 2000). Of the same genus as the Dusky dolphins are the Hourglass dolphins which may occur in the area. These are circumpolar in pelagic waters of the Subantarctic and Antarctic zones. Little information is known about species feeding or breeding habitats (DoEE, 2019am).

There are a number of pelagic dolphins that may occur in the DA. The population size of these species is not known however none are considered to be rare. No specific conservation or listing advice exists and their distribution has not been specifically defined. All species feed on pelagic fish, squids, octopus, shrimps and other marine fauna taken at depths exceeding 250 m. The extent of occurrence is large in all cases, estimated to be greater than 20,000 km<sup>2</sup>. All are tropical to subtropical species (occasionally temperate) with distribution varying depending on water temperature and flow of warm currents.

The Striped Dolphin (*Stenella coeruleoalba*) inhabits pelagic and oceanic waters. All sightings have been made in waters where the sea surface temperature exceeds 25 °C. Striped Dolphins may travel in large groups of several hundreds and even thousands, and are most frequently found in deep waters (deeper than 1000 m), preferring areas with large seasonal changes in surface temperature and thermocline depth and with seasonal upwelling (DoEE, 2019ac). Striped Dolphins do not co-occur with tuna as commonly as Spotted and Spinner Dolphins do, and so are less vulnerable to being entangled and caught in tuna purse seine nets.

The distribution of Spotted Dolphin (also called Pantropical Spotted Dolphins) (*Stenella attenuate*) has not been surveyed however there have been sightings recorded off the Northern Territory, Western Australia down south to Augusta, Queensland and NSW. This species inhabits both near-shore and oceanic habitats in tropical and warm temperate seas. They have also been found on the shelf and along the continental slope, indicating that they may use neritic (over the continental slope) habitat as well. The Spotted Dolphin diet overlaps greatly with that of Yellowfin Tuna and a close association has been noted between these species and sea birds in the eastern tropical Pacific (DoEE, 2019ad).

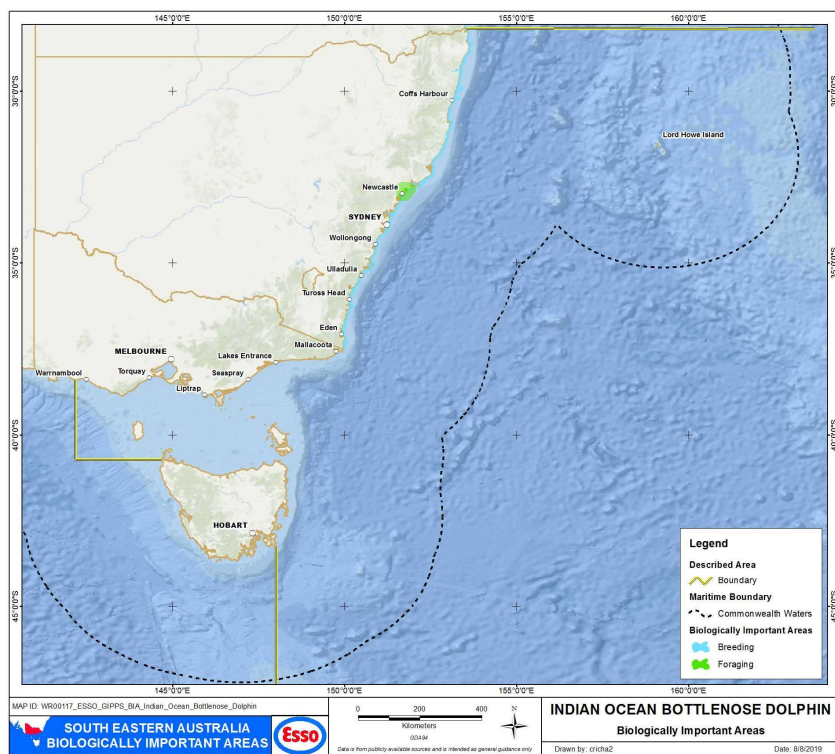

Long-snouted Spinner Dolphins (*Stenella longirostris*) are primarily pelagic (occurring in open ocean) but they can be neritic (occurring over the continental shelf) in some regions. They occur in tropical, subtropical and occasionally temperate waters around the world. Long-snouted Spinner Dolphins associate with tuna. The lack of abundance and distribution data prohibits definitive assessment of the Australian populations of Long-snouted Spinner Dolphins however they are not considered rare (DoEE, 2019ab).

Similar to the other pelagic dolphin species described above, the Rough-toothed Dolphin (*Steno bredanensis*) has been recorded from Western Australia (Barrow Island), the Northern Territory, Queensland and southern New South Wales. They are regularly seen with Pilot Whales and Bottlenose Dolphins, and occasionally with Spotted and Spinner Dolphins. Specific information on the Rough-toothed Dolphin is also lacking. Their notoriety for stealing bait and fish off fishing lines makes them unpopular with many recreational and commercial fishers and may lead to both incidental captures and mortalities from fisher targeting. Additionally, their regular association with schools of Yellowfin and Skipjack Tuna, plus Dorado (Dolphinfish/Mahi Mahi), may make them susceptible to entanglement in purse-seine nets set for these fish species (DoEEa, 2019ae).

Fraser's Dolphin is another pelagic or oceanic dolphin which in Australia is found north of 300 S and in waters deeper than 1000 m. Increasing ocean temperatures predicted by climate change scenarios could potentially increase the extent of occurrence of Fraser's Dolphin, with warmer water extending southwards along both coasts. Fraser's Dolphin feeds on mesopelagic fish, squid and crustaceans. It is a stocky dolphin with a short beak and thick tail stock. Distribution information on this species in Australia is derived from beach casts and is thought to be potentially abundant, however it is not well surveyed (DoEE, 2019as).

Australian Snubfin Dolphins are characterised by a broadly rounded head and no beak, with a straight mouth line. All available data on the distribution and habitat preferences of Australian Snubfin Dolphins indicate that they mainly occur in one location: shallow coastal and estuarine waters of Queensland, Northern Territory and north Western Australia. Feeding may occur in a variety of habitats, from mangroves to sandy bottom estuaries and embayments, to rock and/or coral reefs, primarily in waters less than 20m depth. A study of a population in Cleveland Bay, north Queensland showed that the species spends most of its time foraging and travelling and little time socialising. This population only

spent approximately 30 days in the year in this one location, following a pattern of emigration and reimmigration, suggesting that the territories or ranges for this species is large (DoEE, 2019aq).

### 2.3.1.7 Pinnipeds

Pinnipeds are a widely distributed and diverse group of carnivorous, fin-footed, semiaquatic marine mammals. They comprise the families Odobenidae (i.e. walrus), Otariidae (i.e. the eared seals, such as sea lions and fur seals), and Phocidae (i.e. the earless or true seals).

There are three pinniped species (or species habitat) that may occur within the DA; this includes species classified as threatened and migratory. The type of presence varies between species, and includes important behaviours (e.g. breeding) for some species (Table 2-41) (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m).

There are 10 established breeding colonies of the Australian fur seal, which are restricted to islands in the Bass Strait; six occurring off the coast of Victoria and four off the coast of Tasmania (Kirkwood et al., 2010; Pemberton & Kirkwood 1994; Warneke, 1995). Australian fur seals breed during the summer months, with pups born from late October to late December. The closest colonies of the Australian fur seal are located at Gabo Island, Kanowna Island (off Wilson's Promontory) and The Skerries, which is home to a major Australian fur seal breeding colony with an estimated population of 11,500, representing approximately 12% of the national population. Between feeding trips seals return to land to rest, for example at the resting site at Cape Conran.

Satellite tracking of seals from both Kanowna Island and The Skerries, and reports from offshore facilities within the Gippsland Basin Exclusion Zone near the shore show that Australian fur seals commonly occur in the vicinity of these facilities (Arnould & Kirkwood, 2008) and commonly rest on these structures.

The New Zealand Fur-seal (long-nosed Fur seal) and the Australian Fur-seal have the widest range of the pinnipeds, occurring in coastal regions from South Australia through to New South Wales. While breeding for the New Zealand Fur-seal does occur along the coasts of Victoria and southern Tasmania (Figure 2-40), the main breeding sites (accounting for over 80% of the national population) are located further east in Western and South Australia (TSSC, 2017; Kirkwood et al., 2009; DSEWPaC, 2012c). Conversely, the main breeding locations for the Australian Fur-seal are typically on islands within Bass Strait (Figure 2-39) (DoEE, 2017n; Kirkwood et al., 2010). New Zealand Fur-seal breeding colonies are typically found in rocky habitat with jumbled boulders; Australian Fur-seal prefer flatter rocky shelves (Shaughnessy, 1999). Colonies for both species are typically occupied year-round, with greater activity during breeding seasons (Shaughnessy, 1999; DoEE, 2017n). Numbers of Australian Fur-seals on Montague Island (New South Wales), fluctuate through the year, with peak numbers occurring in September and October; this reflects the northward migration over the winter, and the subsequent return to the breeding colonies of the Bass Strait in late spring (DoEE, 2017n). The Australian and New Zealand Fur-seals have been recorded using Beware Reef as a haul-out site (Parks Victoria, 2017b).

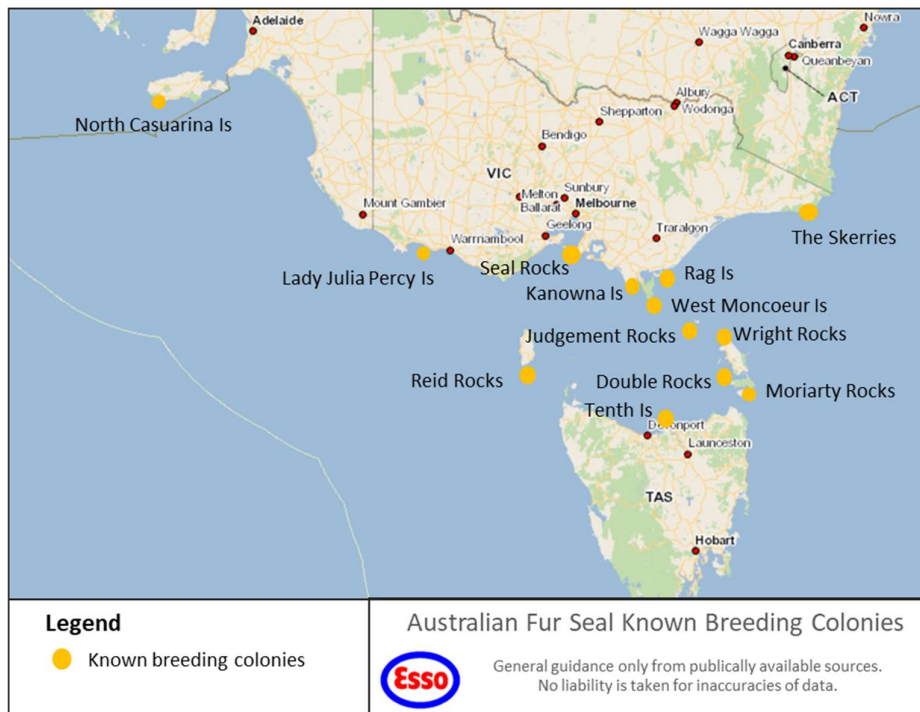

The Australian Sealion (*Neophoca cineria*) is a listed vulnerable species which is endemic to South Australia, and is found from Kangaroo Island, South Australia, to the Houtman Abrolhos Islands in Western Australia. Breeding colonies occur on islands or remote sections of coastline and biologically important areas occur outside the bounds of the DA (refer Figure 2-41). Lone or small numbers of animals will regularly visit known haul-out sites and occasionally visit other locations. The species has been sighted at over 200 locations and is known to occur within the DA (DoEE, 2019z). The Australian sea-lion uses a variety of habitats when onshore, including exposed islands and reefs, rocky terrain, sandy beaches and vegetated fore dunes and swales. They also use caves and deep cliff overhangs as haul-out sites or breeding habitat. Australian sea-lions are benthic foragers feeding on a wide variety of prey including fish, cephalopods and crustaceans (Gales, 2008). Females forage on the continental shelf, with the majority of diving occurring at 40–80 metres. Young sealions (as young as 7 months old) have been observed foraging at depths of 60m, up to 10km from birth colony (TSSC, 2010).

### 2.3.1.8 Sirenia

The dugong is the only species in the Family Dugongidae and one of four species in the Order Sirenia. It is most closely related to Steller's Sea Cow (*Hydrodamalis gigas*), which is extinct (Marsh et al. 2002).

The dugong or its habitat may occur in the north-eastern region of the DA (Table 2-43) (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). Biologically important areas for the dugong are in the north-west of Australia and do not occur in the DA. Dugongs occur in coastal and inland waters from Shark Bay in Western Australia (25° S) across the northern coastline to Moreton Bay in Queensland (27° S) (Marsh et al. 2002, 2011a). The winter range includes about 24 000 km of Australia's coast, which represents about 19% of the global extent of occurrence along coastline habitats (Marsh et al. 2011a). Stranded dugongs have been recorded as far south as ~36.5° S on the east coast, with occasional sightings south to 32–33.5° S (Newcastle region) in summer. In NSW the dugongs were sighted in coastal and estuarine waters around Wallis Lake, Port Stephens, Lake Macquarie and Brisbane Water in the summer of 2002/2003 (Allen et al., 2004). These areas are associated with some of the largest seagrass beds in New South Wales, some of which contain the *Halophila* seagrass species. The presence of dugongs in these areas at this time coincided with warm water temperatures (>18 °C).

### 2.3.1.9 Marine Reptiles - Turtles

Adult marine turtles spend the majority of their lives in the ocean, typically only coming onshore to nest. Females can lay (on average) between two and six clutches per season (DoEE, 2017g); with the period between clutches known as the internesting period. Female turtles typically remain close to the same nesting site during an internesting period. Egg incubation varies between species, but is typically approximately two months (DoEE, 2017g). Hatchlings disperse into oceanic currents, and the juveniles will stay in pelagic waters until large enough to settle into coastal feeding habitats. Leatherback Turtles are an exception to these general patterns, often exhibiting larger internesting zones, and travelling vast distances to forage rather than settling in a coastal habitat (DoEE, 2017g). Flatback Turtles also lack an oceanic phase and remain in the surface waters of the continental shelf.

There are six marine turtle species (or species habitat) that may occur within the DA; this includes species classified as threatened and migratory (Table 2-44) (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). A list of the conservation advice and/or recovery plans, with relevant management actions, is shown in Table 2-45. The type of presence varies between species, and includes important behaviours (e.g. foraging, breeding) for some species.

The Loggerhead Turtle has a global distribution throughout tropical, sub-tropical and temperate waters; and in Australia typically occurs in the waters of coral and rocky reefs, seagrass beds, or muddy bays throughout eastern, northern and western Australia (DoEE, 2017i). Loggerhead Turtles are carnivorous, feeding primarily on benthic invertebrates. While the species has a broad foraging range throughout Australian waters, nesting is known to occur (from two different genetic stocks) on sandy beaches on the central western and eastern coasts (Figure 2-42) (DoEE, 2017i). The eastern Australian population is smaller than the western Australian population; and has also undergone a decline from approximately 3,500 nesting females in 1977, to approximately 500 nesting females in 2000 (DoEE, 2017i). No nesting or internesting critical habitat, or BIAs, have been identified for the Loggerhead Turtle within the DA.

Green Turtles are found in tropical and subtropical waters throughout the world; usually occurring within the 20°C isotherms, although individuals can stray into temperate waters (DoEE, 2017j). Within Australia, Green Turtles typically nest, forage and migrate across tropical northern Australia (Figure 2-42) (DoEE, 2017j). No nesting or internesting critical habitat, or BIAs, have been identified for the Green Turtle within the EGBPA. The total Australian population of Green Turtles is approximately

70,000 individuals, with approximately 8,000 of these found in the Southern Great Barrier Reef area. Adult Green Turtles consume mainly seagrass and algae, although they will occasionally eat mangroves, fish-egg cases, jellyfish, and sponges; juvenile Green Turtles are typically more carnivorous, and will also consume plankton during their pelagic stage (DoEE, 2017j).

The Leatherback Turtle has the widest distribution of any marine turtle, occurring in tropical to sub-polar oceans (TSSC, 2008). In Australia, the Leatherback Turtle has been recorded foraging in all Australian states, but no large nesting populations have been recorded (Figure 2-42) (TSSC, 2008). The Leatherback Turtle is a highly pelagic species, venturing close to shore mainly during the nesting season (DoEE, 2017k). Adults feed mainly on pelagic soft-bodied creatures such as jellyfish, tunicates, salps, squid (DoEE, 2017k). No nesting or interesting critical habitat, or BIAs, have been identified for the Leatherback Turtle within the DA.

The Flatback Turtle is found in tropical waters of northern Australia, and is one of only two species of sea turtle without a global distribution (DoEE, 2017l). All known nesting locations for this species are within Australia (Figure 2-42) (DoEE, 2017l). No nesting or interesting critical habitat, or BIAs, have been identified for the Flatback Turtle within the DA. Flatback Turtles are primarily carnivorous, feeding on soft-bodied invertebrates; juveniles eat gastropod molluscs, squid, siphonophores. Limited data also indicate that cuttlefish, hydroids, soft corals, crinoids, molluscs and jellyfish may also form part of their diet (DoEE, 2017l).

The Hawksbill Turtle is found in tropical, subtropical and temperate waters all around the world (DoEE, 2017m). No nesting or interesting critical habitat, or BIAs, have been identified for the Hawksbill Turtle within the DA. Hawksbill Turtles are omnivorous, feeding on sponges, hydroids, cephalopods (octopus and squid), gastropods (marine snails), cnidarians (jellyfish), seagrass and algae (DoEE, 2017g, 2017m). During their pelagic phase (while drifting on ocean currents), young Hawksbill Turtles will feed on plankton. Hawksbill Turtles that forage on the Great Barrier Reef migrate to neighbouring countries including Papua New Guinea, Vanuatu, and the Solomon Islands; it is not known from which stock Hawksbill Turtles foraging in New South Wales originate (DoEE, 2017g).

The Olive Ridley Turtle is the smallest of Australian sea turtles. Low density nesting of the Olive Ridley turtle occurs in the northern parts of Australia including Arnhem Land coast and north-western Cape York Peninsula. Important foraging areas include the Great Barrier Reef but other shallow foraging habitats extend to south-east Queensland; most individuals have been captured by trawlers in the East Coast Otter Trawl fishery in Queensland. The EPBC database lists the species as likely to breed in the area of the DA, the Olive Ridley turtle has been identified as a conservation value in the North and North-west bioregional plans only and the literature suggests that only foraging may occur within the DA (DoEE, 2019ao).

### 2.3.1.10 Marine Reptiles –Other

The Elegant Seasnake is widespread in tropical Australia. This includes Queensland, Western Australia and the Northern Territory (Dell & Fry 2003) and it may occur in the DA (DoEE, 2019b, DoEE, 2019l, DoEE, 2019m). Its distribution extends from Shark Bay in Western Australia to Moreton Bay in Queensland. Sea snakes are air breathing reptiles and must come to the surface to breathe, however they can spend from 30 minutes to two hours diving between breaths. They also carry out cutaneous respiration whereby oxygen diffuses from sea water across the snake's skin into the blood. The waste product, carbon dioxide, is then diffused out of the snake's body, via the skin. The Elegant Seasnake uses a variety of marine and estuarine habitats, including sandy substrates in less than two metres of water to depths of approximately 80 m but is also sometimes found in freshwater habitats. They feed

on benthic (bottom-dwelling) fish such as Catfish, burrowing eels, Whiting, Gobies and Squid. Their main threat is bycatch from trawling, no specific conservation or listing advice exists for the species (DoEE, 2019z).

The Yellow-bellied sea snake is the most widely distributed of all sea snake species in Australia, while there have not been any recent surveys, it is found in most waters except for the colder southern coastline. The population living near the central coast of New South Wales was thought to be permanent and breeding at the time of the survey in 1975. It is the most pelagic of all known sea snakes, occurring in the open waters well away from coasts and reefs. Fish are attracted to it as it rests motionless on the surface of the sea (like an inanimate object) and are subsequently caught with a sudden lunge. The main threat to the species is through bycatch from trawling. No specific conservation or listing advice exists for the species (DoEE, 2019aa). This snake species may occur in the DA.

The Stokes' Seasnake inhabits the tropical seas of northern Australia, including Western Australia, the Northern Territory and Queensland. It occurs in the Great Barrier Reef Marine Park and in the Commonwealth Reserve of Ashmore Reef in Western Australia. It is amongst the largest and bulkiest of seasnakes reaching 2 metres in length and 26cm in girth. The Stokes' Seasnake is a strong swimmer and forages for slow-moving fish in holes and crevices on the sea floor, muddy substrates and in reefs. In Australia, the Stokes' Seasnake moves southward into more temperate latitudes of Queensland and Western Australia during summer and therefore may approach the DA in this season (DoEE, 2019ar). Of the other five tropical seasnakes the Olive seasnake is also large reaching up to 2 metres.

Sea kraits are sea snakes that depend on the shore of coral islets for digestion, reproduction (mating and egg laying), skin sloughing and resting after foraging at sea. They are distinct by the black bands that go down their body. Two species of sea kraits are listed as may occurring in the DA. Although they are widely distributed from India, particularly the Andaman Islands to the islands of the west Pacific only extralimital specimens have been encountered on beaches in QLD, NSW and VIC. No breeding is known to occur in Australia (DAWE, 2020e).

The Salt-water Crocodile is the largest species of crocodile and the largest living reptile in the world and is found in Australian coastal waters, estuaries, lakes, inland swamps and marshes from Gladstone in Queensland (beyond the DA) through the Northern Territory and as far south as Carnarvon in the Western Australia (DAWE, 2020d).

### 2.3.2 Plankton Species

Plankton species, including both phytoplankton and zooplankton, are a key component in oceanic food chains.

Phytoplankton are autotrophic planktonic organisms living within the photic zone that spend either part or all of their lifecycle drifting with the ocean currents. They are the start of the food chain in the ocean (McClatchie et al., 2006). Phytoplankton communities are largely comprised of protists, including green algae, diatoms, and dinoflagellates (McClatchie et al. 2006). There are three size classes of phytoplankton: microplankton (20-200 µm), nanoplankton (2-20 µm) and picoplankton (0.2-2 µm). Diatoms and dinoflagellates are the most abundant of the micro and nanoplankton size classes, and are generally responsible for the majority of oceanic primary production (McClatchie et al. 2006). Phytoplankton are dependent on oceanographic processes (e.g. currents and vertical mixing), that supply nutrients needed for photosynthesis. Thus, phytoplankton biomass is typically variable (spatially and temporally), but greatest in areas of upwelling, or in shallow waters where nutrient levels are high. Seasonal variation in phytoplankton (via chlorophyll-a concentrations) has been demonstrated in Australian waters from the analysis for MODIS-Aqua sensor imagery (Figure 2-43).

Phytoplankton biomass ranges across Bass Strait (integrated over 0-100m depth), from about 1.6 µg chlorophyll a/L from shallow to 0.1µg/L in deeper waters (Gibbs *et al.* 1991). Phytoplankton biomass rapidly drops off with water depth, to about 0.1 µg/L below 100m, due to diminishing light penetration.

Zooplankton is the faunal component of plankton, comprised of small protozoa, crustaceans (such as krill) and the eggs and larvae from larger animals. More than 170 species of zooplankton have been recorded in eastern and central Bass Strait, but it has been found that seven dominant species make up 80% of individuals (Esso, 2009). Zooplankton biomass is higher in shallow waters of Bass Strait (16.1 mg/m<sup>3</sup> dry weight off Mallacoota and 15.5 mg/m<sup>3</sup> off Seaspray), dropping to between 1.2 – 2.1 mg/m<sup>3</sup> further offshore (integrated over the top 50 m of the water column), near the deepest regions of the EGBPA (Gibbs *et al.* 1991). As with phytoplankton, zooplankton biomass appears to be higher in the shallow waters of the shelf. Copepods dominate the species encountered (Watson & Chaloupka, 1982).

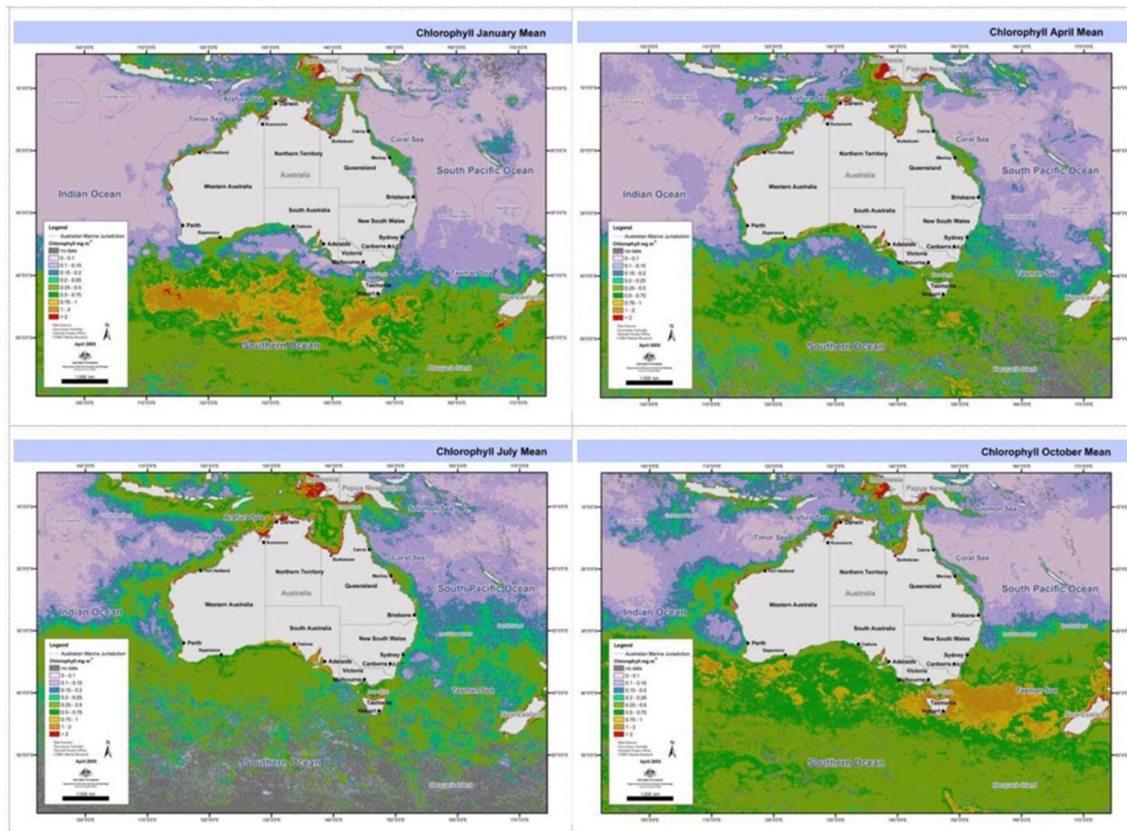

Figure 2-43 Seasonal phytoplankton growth from MODIS ocean colour composites (McClatchie et al. 2006)

### 2.3.3 Benthic Habitat

#### 2.3.3.1 Bare Substrate

Unvegetated bare substrate is a widespread habitat in both intertidal and subtidal areas, particularly in areas beyond the photic zone. The biodiversity and productivity can vary depending upon depth, light, temperature and the type of sediment present.

In the Gippsland Basin, seabed material is predominantly calcium carbonate comprised of calcarenite marls and marine shales (Esso, 2009). Folk sediment classification of the samples taken at the West Kingfish and Tuna platforms describe the sediments as ranging between slightly muddy, gravelly ((m)/g/S) and muddy, gravelly sand (m/g/S) with two locations at Tuna being classed as gravelly sand (g/S) (Cardno, 2019). Similarly, the West Barracouta geophysical survey classified the seabed as featureless with consistently medium to high variable reflectivity, with backscatter characteristics indicative of fine to coarse calcareous sand with shells (DWSS, 2018). The 2009 Snapper study found that the seabed surrounding the platform is entirely comprised of soft sediments with no areas of hard substrate of rocky reef (Coffey, 2009). Generalised cross section taken from the Blackback Site survey report and accompanying representative sediment photographs indicate that the seabed sediments at the Blackback region are dense fine to medium grained siliceous carbonate sand (carbonate content ~80%) with some silt and shell debris. The samples from the canyon areas had a higher proportion of gravel and shell fragments relative to the slope and ridge samples.

The Gippsland Basin is composed of a series of massive sediment flats, interspersed with small patches of reef, bedrock and consolidated sediment. The sandy plains are only occasionally broken by low ribbons of reef; however, these reefs do not support the large brown seaweeds characteristic of many Victorian reefs, but instead are inhabited by resilient red seaweeds and encrusting animals that can survive the sandy environment (Esso, 2009). A study of the seascape of the south-eastern Australian

continental shelf conducted in 2001 found that 89% of the seabed was sediment flats/bare substrate with prominent hard-grounds making up the remaining 11% of the seabed (CSIRO, 2001).

The benthic fauna present on the soft sediment can be broadly divided into two groupings:

- The epibenthos which includes sessile species such as sponges and bryozoans, hydroids, ascidians, poriferans and mobile fauna including hermit crabs, sea stars and octopus;
- The infauna which includes a diverse range of species such as amphipods, shrimps, bivalves, tubeworms, small crustaceans, nematodes, nemertean, seapens, polychaetes and molluscs (Parry et al. 1990).

Many of these species are burrowing organisms that cause moderate bioturbation (Edgar, 2001).

Scientific surveys have shown that some shallow Victorian sandy environments have the highest levels of animal diversity in the sea ever recorded (ParksVic, 2016). In the area around the Ninety Mile Beach Gippsland more than 600 different marine animal species, many of them very small, have been found within an area of 10 m<sup>2</sup> (ParksVic, 2016). This high species richness was a major factor in the creation of a Marine National Park on the Ninety Mile Beach (ParksVic, 2017c). The subtidal sand invertebrate fauna are dominated by small animals, mostly crustaceans, molluscs, echinoderms and polychaetes (Plummer et al. 2003, Bax and Williams, 2001).

Parry et al. (1990) found high diversity and patchiness of benthos sampled off Lakes Entrance, where a total of 353 species of infauna was recorded. Crustaceans (53%), polychaetes (32%) and molluscs (9%) dominated sample results. A significant site for the listed opisthobranch mollusc (seaslug) *Platydorid galbana* is located off Delray Beach, 2 km south-west of Golden Beach on the shoreline (O'Hara & Barmby, 2000). An ROV seabed survey was conducted following drilling at the Snapper operational area in 2009 (Coffey 2010) and a seabed monitoring program conducted near West Tuna in 1999 (URS, 2000) confirmed that polychaetes and crustaceans were the most abundant infaunal taxa present in the seabed sediments.

This results were further supported by two studies conducted in 2018 for Esso. The first, an in-situ sediment quality and infauna sampling program conducted at West Kingfish and Tuna (including reference locations), confirmed that polychaetes, crustaceans and molluscs were the most abundant groups of taxa at all the sampled locations. The dominance (in terms of abundance) of particular taxa varied among zones and reference locations at each platform and between platforms. The benthic infauna assemblages were diverse with a range of taxa having a substantial contribution to the overall assemblage structure. The study investigated the drivers for potential influence on the entire assemblage of benthic infauna and found that it was the proportion of gravel (> 2.00 mm) particles in the sediment that was the most significant influencing factor. Figure 2-44 shows the proportion of the assemblage represented by the Crustacea, Polychaeta, Mollusca, Echinodermata and the Order groups for 'Other Worm Phyla' and 'Other Phyla' for the West Kingfish sampling and Figure 2-45 shows the proportion of the those assemblages for the sampling conducted at Tuna. The graphs show that the proportions of these assemblages were generally consistent between locations at the West Kingfish platform, however there were significant differences in the benthic infauna assemblages between locations at Tuna platform. Analysis indicated these differences were driven by changes in the physical characteristics of the environment, for example grain size and hydrodynamic differences between locations (Cardno, 2019).

The second 2018 Esso baseline study for the West Barracouta project found similarities in the dominant taxa throughout the survey locations which included annelids (polychaetes), crustaceans (amphipoda, isopoda and decapoda) and molluscs (gastropods and bivalves). This study also found that there was dissimilarity between infauna groups and these were variable throughout the survey area, likely reflecting the heterogeneous nature of the survey area (MST, 2018). Figure 2-46 shows the taxo-classed abundance of infauna at each of the monitoring sites at West Barracouta. The variation in abundance seen between the West Kingfish/Tuna studies and the West Barracouta study is due to the sample sizes taken. West Kingfish/Tuna sample size averaged 2.3L. West Barracouta sample size was 66L (0.66m<sup>2</sup>).

Figure 2-44 Number of taxa sampled at West Kingfish platform (Zones 1 and 2) and reference locations (Locations 1 and 2). Values in parentheses indicate the total number of taxa sampled.

Figure 2-45 Number of taxa sampled at Tuna platform (Zones 1 and 2) and reference locations (Locations 1 and 2). Values in parentheses indicate the total number of taxa sampled.

**Figure 2-46 Taxa classed abundance of infauna at West Barracouta monitoring**

The studies above suggest there is a consistent variation in the types and abundance of benthic infaunal species forming assemblages across the across Bass Strait. Though the benthic infauna taxa collected during this study are similar to those previously recorded, the contribution of each one to the overall assemblage was different in the majority of cases. The differences in the contribution of individual taxa to the overall assemblage between studies could have resulted from a number of natural factors including habitat heterogeneity (micro and macro-scale), depth and sediment characteristics (URS 2000, Marine Solutions 2018) and temporal differences between sampling periods (Cardno, 2017). This is consistent with the 2004 study of Sediments and Benthic Biota of Bass Strait (GA, 2004), which concluded that it is not possible to classify the biological assemblages into a scheme that can be mapped across Bass Strait. The study emphasized that assemblages can have different distribution patterns to species and that environmental gradients rather than discrete bioregions or habitats better explain the biotic patterns observed in the sea bed of Bass Strait. Analysis of physical variables, derived from data collected on previous surveys by Geoscience Australia and supplemented by more recent data, show that longitude and depth are also important factors in explaining the biological diversity (GA, 2004).

The introduced New Zealand screw shell (*Maoricolpus roseus*) is present in eastern Bass Strait and is known to form extensive and dense beds on the sandy seafloor spreading to the 80 m isobath off eastern Victoria and NSW (Patil et al. 2004).

Larger animals found in these soft sediment environments in Victoria have included Smooth Stingray (*Dasyatis brevicaudata*), Pipi (*Plebidonax deltoids*), Dumpling Squid (*Euprymna tasmanica*), Common Stargazer (*Kathetostoma leave*) and Heart Urchin (*Echinocardium cordatum*) (Parks Victoria, 2016).

Soft sediment habitat is the dominant habitat within the EGBPA.

### 2.3.3.2 Seagrass

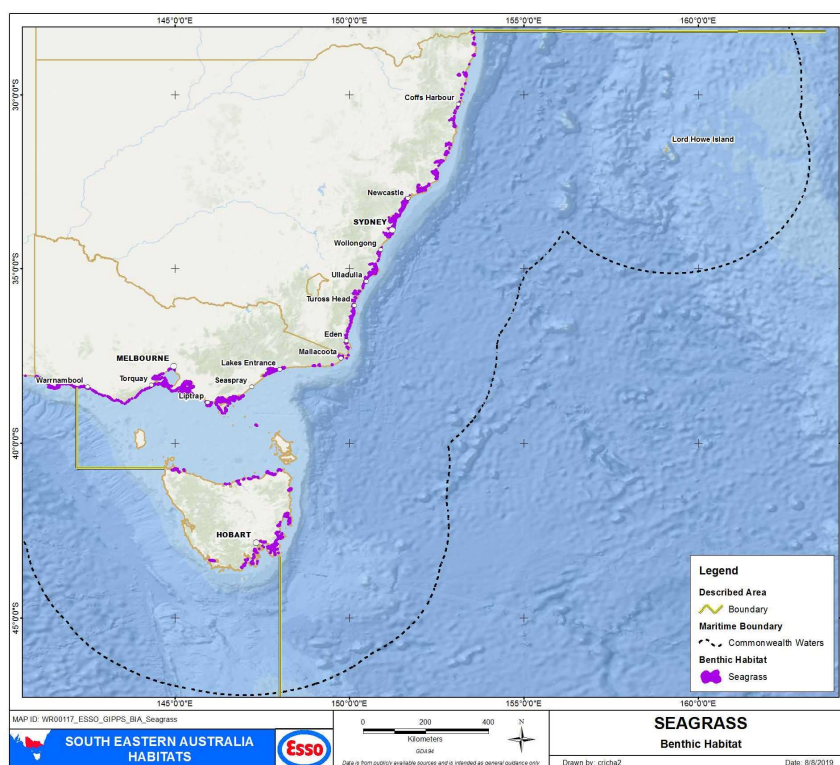

Seagrasses are marine flowering plants, with about 30 species found in Australian waters (Huisman 2000). There is a distinction between tropical and temperate seagrasses, and the approximate latitude for the change occurs at Moreton Bay (southern Queensland). The dominant temperate species in the DA are *Amphibolis antarctica*, *Halophila australis*, *Heterozostera tasmanica*, *Posidonia australis*, *Posidonia angustifolia* and *Zostera muelleri* (Kirkham 1997). Seagrasses generally grow in sediments in intertidal and shallow subtidal waters where there is sufficient light, and are common in sheltered

coastal areas such as bays, lees of island and fringing coastal reefs (DEWR, 2006; McLeay et al., 2003; Rogers et al., 2013; McClatchie et al. 2006).

Seagrass meadows are important in trapping and stabilising sediments, as seagrass leaves baffle wave action and reduce water movement to the extent that fine suspended particles settle out and are trapped (Edyvane, 1999). Seagrass meadows also provide habitat and nursery grounds for juvenile fish and invertebrates, enhance biodiversity and promote primary production (Huisman 2000; Rogers et al. 2013; Kirkman 1997).

Known areas of seagrass within the DA include Corner Inlet and Lakes Entrance in Victoria, and numerous inlets and estuaries along the NSW coast (Figure 2-47) (Lucieer et al., 2017). While seagrass meadows are present throughout this region, the proportion of seagrass habitat is not high compared to the rest of Australia, in particular with parts of South Australia and Western Australia) (Kirkham, 1997).

Seagrasses are highly productive habitats that occur on intertidal flats and in shallow coastal waters worldwide from arctic to tropical climates. Water temperature, light penetration, sediment type, salinity, and wave or current energy control seagrass distribution. Seagrasses provide breeding and nursery grounds for fish and wildlife. Seagrasses are used by fish and shellfish as nursery areas.

**Figure 2-47 Seagrass dominated nearshore habitat within the DA**

### 2.3.3.3 Subtidal Rocky Reefs

This habitat occurs either as extensions of intertidal rocky shores or as isolated offshore reefs and are always submerged. The rocky reefs of southern Australia support a highly endemic marine flora and fauna. Subtidal rocky reefs are scattered along the Gippsland shore and make up approximately 11% of the south-eastern Australian shelf (CSIRO, 2001).

This habitat consists of subtidal substrates composed primarily of limestone reefs and outcrops of sandstone and granite. The composition and characteristics of the substrate varies across the region based on its geologic origin and history. Fossiliferous limestone, as the name suggests, is composed of skeletons of dead animals, such as bivalve and bryozoan clasts. The skeletal elements are cemented together by a fine-grained calcareous matrix formed by a slow rate of sedimentation suggesting that the

process is continuing to (slowly) occur on the Gippsland basin continental shelf (CSIRO, 2001). Known locations of this type of substrata are Howe Reef, Gabo Reef and Broken Reef.

Limestones usually form in large, tabular slabs of low relief (<2 m) as is the case in Broken Reef, however they can also form as low-lying hard grounds that are bored and encrusted by benthic organisms. These are likely to form 'patches' or mosaics of hard substratum that show little (<20 cm) or no vertical relief. An example of this is the low relief limestone South-east Reef which is mapped to occur in the VIC/L5 licence area and beneath the Cobia platform. Based on ROV video surveillance, the presence of South East Reef is not evident when comparing the abundance of biota around the Cobia platform versus other facilities (base on Esso ROV inspection data from 2010, 2013 and 2014). This may be due to the layer of sediment coverage over the hard substrate or the lack of extrusions/elevations.

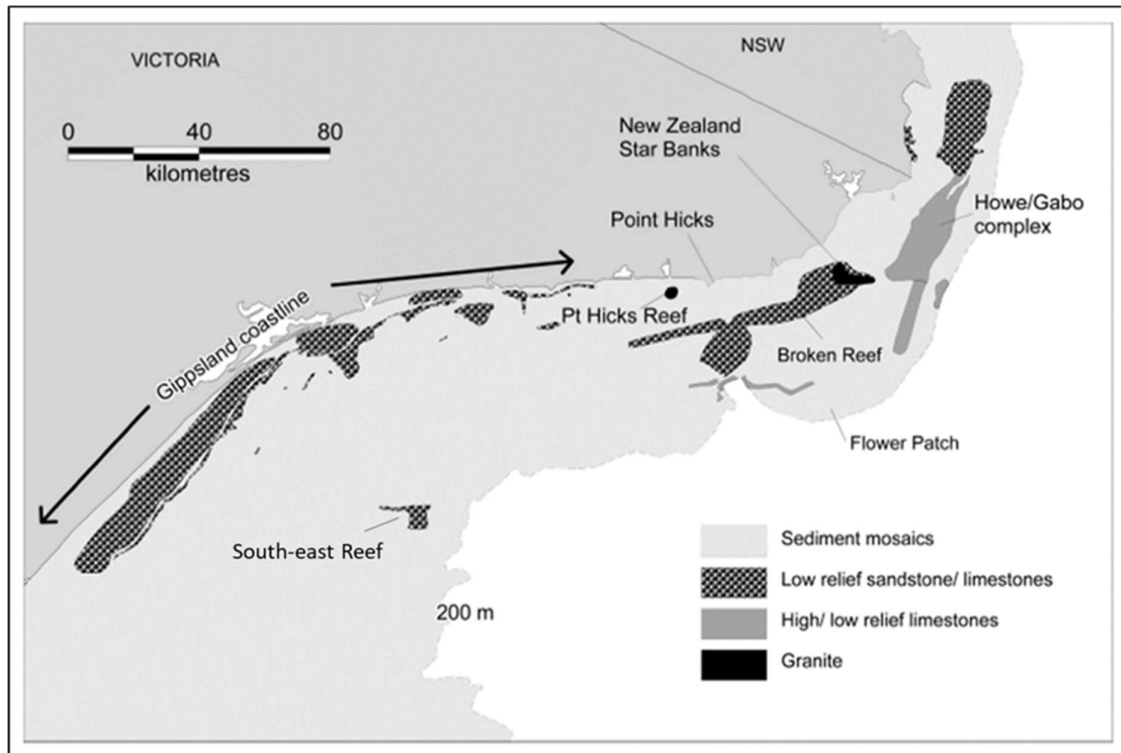

Another form of the hard substrate is the coarse-grained, quartz rich sandstone. In Gippsland, sandstone, together with fossiliferous sandstone, occurs as elongate, low relief slabs which crop out from soft sediments along the Gippsland coastline. Whilst not confirmed this type of sandstone is also likely to be a common constituent of banks or reefs further offshore.

On the inner shelf of the Gippsland coastline are relatively localized, higher relief (>10m) outcrops formed of distinctive irregular, hexagonally jointed, coarsely crystalline granite, or hard reefs. Point Hicks and New Zealand Star Banks are areas of granite reef. Figure 2-48 shows high level substrata distribution in south-east Australia (CSIRO, 2001).

Rocky reef habitats can support rich, diverse communities of attached epifauna (e.g., stalked chrinoids, sponges, ascidians etc.) and associated algae and other fauna. Structures with a higher relief (reef or bank) several metres high can provide protection and food and attract a diversity of fish and invertebrate species (NOAA 2010).

The substrata is only one factor which influences the presence of biological communities. The distribution of fish and invertebrate communities is also correlated with latitude, depth, temperature and hydrology. Areas where the overlap of temperate and subtropical currents coincide will have a different distribution of communities to places like Horseshoe Canyon where upwelling occurs.

Other known areas of subtidal rocky reef include ; Bastion Point, Quarry Beach, Little Rame Head, Long Reef, Wingan Point, The Skerries Special Management Area, Rame Head, Petrel Point, Thurra River, Pearl Point, Yeerung River Estuary (Intermittently open), Cape Conran (East Cape, Cowrie Bay, Flat Rocks), Point Ricardo and Ricardo Beach.

**Figure 2-48 Substrata on the south-eastern Australian continental shelf**

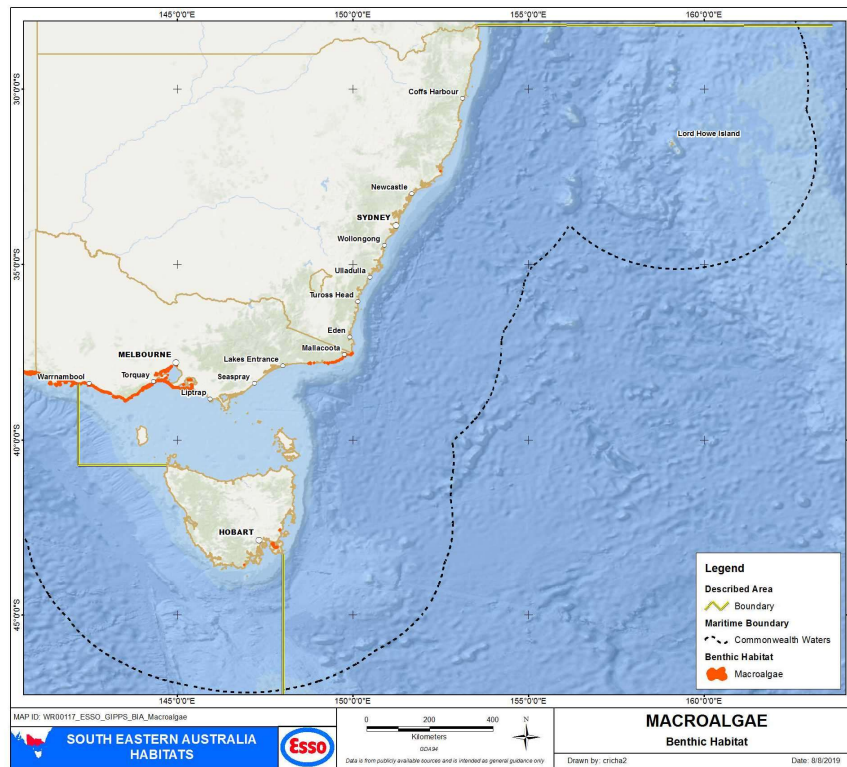

#### 2.3.3.4 Macroalgae

Macroalgae are multicellular, marine algae, commonly known as seaweed. Macroalgae communities are generally found on intertidal and shallow subtidal rocky substrates as they require a surface to attach themselves to, and can occur throughout Australian nearshore waters. Macroalgae are divided into three groups: Phaeophyceae (brown algae), Rhodophyta (red algae), and Chlorophyta (green algae). Brown algae are typically the most visually dominant and form canopy layers (McClatchie et al. 2006). Macroalgae assemblages vary, but *Ecklonia radiata* and *Sargassum* sp. are typically common in deeper areas. The principal physical factors affecting the presence and growth of macroalgae include temperature, nutrients, water motion, light, salinity, substratum, sedimentation and pollution (Sanderson, 1997). Macroalgal systems are an important source of food and shelter for many ocean species; including in their unattached drift or wrack forms (McClatchie et al. 2006).

Kelps are very large brown algae that grow on hard sub tidal substrates in cold temperate regions. Kelps have a holdfast that attaches to the substrate, a stem-like or trunk-like stipe, and large, flattened, leaf-like blades called fronds. The Giant Kelp Marine Forests are classed as threatened ecological communities. Refer to section 2.2.4.1 for information on giant kelp marine forests.

Macroalgae is not a common dominant habitat within the EGBPA, however known areas include around Gabo Island and within the Bemm River estuary (Figure 2-49) (Lucieer et al., 2017).

**Figure 2-49 Macroalgae dominated nearshore habitat within the DA**

### 2.3.3.5 Coral

Corals are generally divided into two broad groups: the zooxanthellate ('reef-building', 'hermatypic' or 'hard') corals, which contain symbiotic microalgae (zooxanthellae) that enhance growth and allow the coral to secrete large amounts of calcium carbonate; and the azooxanthellate ('ahermatypic' or 'soft') corals, which are generally smaller and often solitary (Tzioumis and Keable, 2007). Hard corals are generally found in shallower (<50 m) waters, while soft corals are found at most depths, including in deeper waters throughout the continental shelf, slope and offslope regions, to well below the limit of light penetration.

There are three factors that appear to drive the spawning of warm water corals – a gradual rise in sea temperature (this triggers the gametes to mature), the lunar cycle, and the diurnal light cycle. As such, the timing of coral spawning events varies around Australia. Large spawning events for Great Barrier Reef corals typically occur four to five days after the full moon in October or November (and occasionally into December). Reproduction methods for cold water corals are not as well understood, but it is likely that some are still broadcast spawners (like their tropical counterparts), while others brood and release formed larvae (Roberts et al., 2009).

While corals may not occur as a dominant habitat type within the Gippsland sector, their presence has been recorded within the region (e.g. Kent Group Marine Reserve, Freycinet Marine Park, and around Wilsons Promontory). Soft corals are typically present in deeper waters throughout the continental shelf, slope and offslope regions, to well below the limit of light penetration.

Subtidal rocky reefs located along the Gippsland shore include; Bastion Point, Quarry Beach, Little Rame Head, Long Reef, Wingan Point, The Skerries, Rame Head, Petrel Point, Thurra River, Point Hicks Marine National Park, Pearl Point, Yeerung River Estuary (Intermittently open), Cape Conran (East Cape, Cowrie Bay, Flat Rocks), Beware Reef, Point Ricardo and Ricardo Beach.

The cauliflower soft coral (*Dendronephthya australis*) is considered an endangered species and may occur within the PEA. The species is predominantly found in estuarine environments in NSW at depths of 1 – 15 m, however, it occasionally occurs offshore to depths of 30 m and provides habitat for a variety

of fish and invertebrates, including the endangered White seahorse (*Hippocampus whitei*) and juvenile snapper (DPI NSW website).

### 2.3.3.6 Submarine Canyons

Submarine canyons are abundant features along continental and oceanic island margins that connect continental shelves to deep ocean basins. Because of the physical complexity of canyon habitats, predictions concerning the effects of canyons on diversity are not straightforward since a variety of environmental and physical characteristics interact in canyon habitats. The most important driver affecting biodiversity and biomass/abundance patterns in canyons is organic matter input and is mostly related to coastal detrital inputs or pelagic productivity regimes (De Leo et al., 2010).

Seafloor terrain and substrate heterogeneity account for the second most important driver of benthic biodiversity in submarine canyons. One of these factors, sediment grain size, can be considered as a 'super-parameter' (Etter and Grassle 1992) since it directly or indirectly reflects local physical energy and sedimentation patterns. At moderate rates of flow and sediment deposition, suspension- and deposit feeding, macrobenthos can be enhanced in abundance and/or diversity in canyons (Vetter and Dayton, 1998), whereas at high rates of flow and sediment accumulation, canyon fauna can become impoverished, yielding low species richness and high dominance by a few tolerant species (Rowe et al. 1982, Gage et al., 1995, Vetter and Dayton, 1998).

While some studies have reported levels of megafaunal biodiversity in canyons rivalling seamounts (Schlacher et al., 2007), in other cases high disturbance rates (Rowe et al., 1982) and absence of stable habitat heterogeneity lead to faunal impoverishment compared to adjacent slope environments (Vetter et al., 2010).

### Bass Canyon System

The Bass Canyon is an 80 km long, narrow (10 km wide) and linear, southeast trending flat bottomed canyon located at 3,000–4,000 m depth in the Gippsland Basin (Figure 2-50) (Mitchell et al., 2007). Entering the head of the Bass Canyon at 3,000 m depth are five shelf-breaching tributary canyons and three slope-confined tributary canyons (Mitchell et al., 2007). The Bass Strait canyons are characterised by dense shelf water cascades (Godfrey et al. 1980).

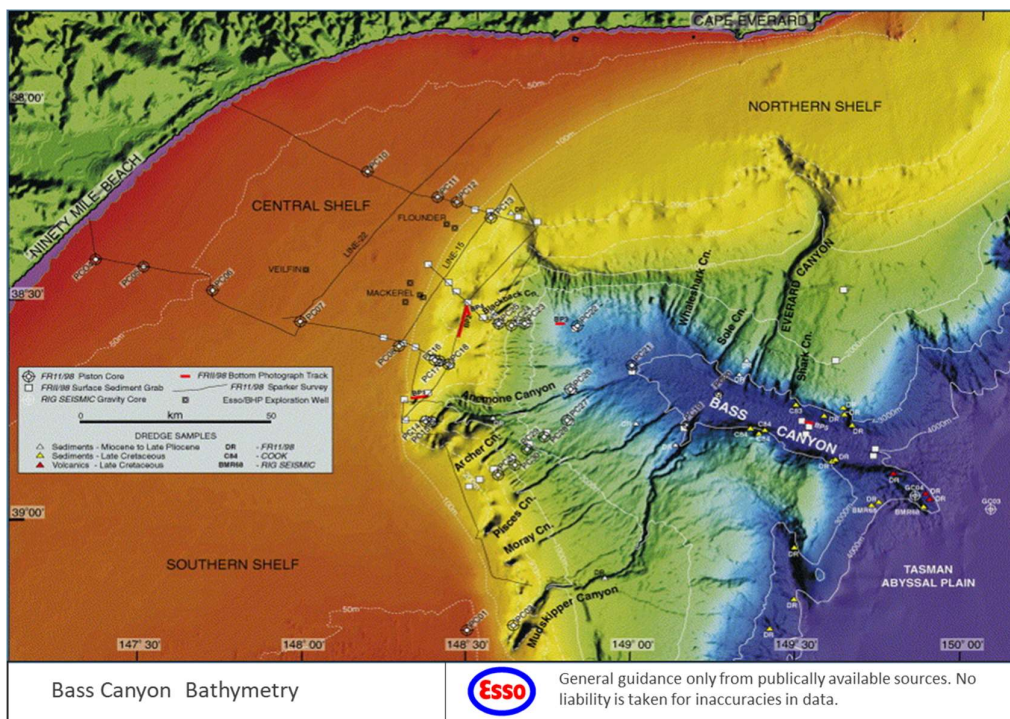

Figure 2-50 Bathymetry of the Bass Canyon

### 2.3.3.7 Seamounts

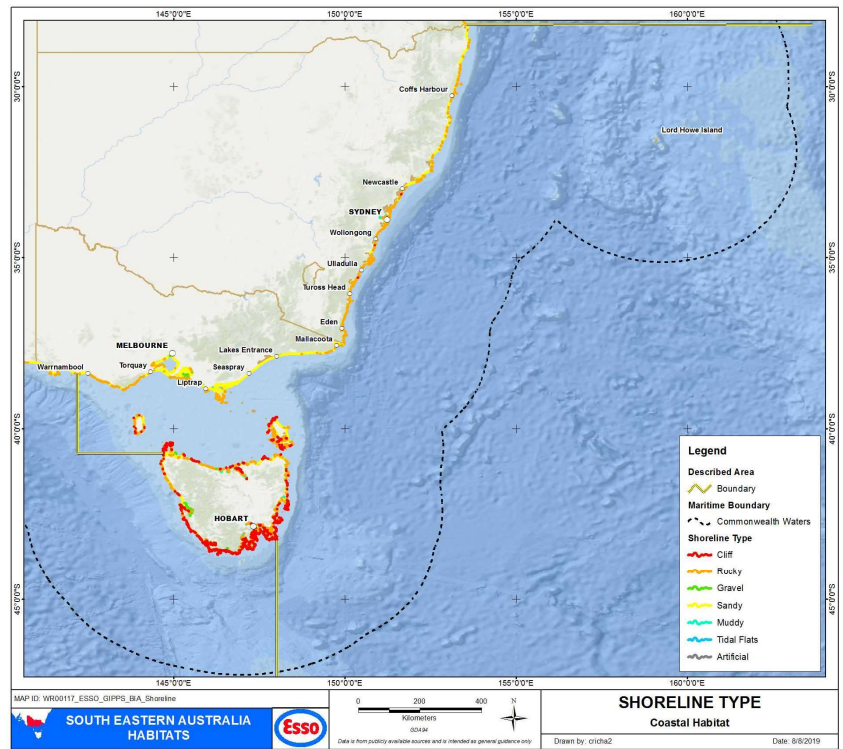

Seamounts are also classed as key ecological features. The Seamounts of South and East Tasmania occur in the DA, refer to section 2.2.7.5 for information on seamounts.

### 2.3.4 Coastal Habitat

A range of shoreline types are represented along the coastal areas within the DA. Figure 2-51 (Griffin et al., 2012) depicts the shorelines in the region and the characteristics of each habitat is described in the sections below.

The coastline, from Wilson’s Promontory in the west to Cape Howe in the east near the NSW border consists mainly of steep sandy beaches and rocky outcrops. The shoreline of the inland waters adjacent to the EGBPA which includes Corner Inlet, the Gippsland Lakes and Mallacoota Inlet consist of sandy beach, salt marsh, mangrove or mudflats (Boon et al., 2010).

The NSW coast consists primarily rocky outcrops with sections of sandy beaches and rocky cliffs. The offshore islands in Bass Strait are characterised by their steep cliffs and rocky shores. These shoreline types are also dominant along the north and east coast of Tasmania.

**Figure 2-51 Shoreline types within the DA**

#### 2.3.4.1 Shoreline (Sandy)

This shoreline type has been defined as beaches dominated by sand-sized (0.063–2 mm) particles, and also includes mixed sandy beaches (i.e. sediments may include muds or gravel, but sand is the dominant particle size).

Sandy beaches are dynamic environments, naturally fluctuating in response to external forcing factors (e.g. waves, currents etc.). Sandy beaches can support a variety of infauna, and provide nesting and/or foraging habitat to shorebirds and seabirds and pinnipeds. Sand particles vary in size, structure and mineral content; this in turn affects the shape, colour and inhabitants, of the beach.

This shoreline type is the most common along the entire Victorian coast, including popular locations such as Ninety Mile Beach (East Gippsland, Victoria) and Squeaky Beach (Wilson’s Promontory, Victoria).

#### 2.3.4.2 Shoreline (Rocky)

Sheltered rocky shores are characterized by a rocky substrate that can vary widely in permeability. This shoreline type has been defined as hard and soft rocky shores, including bedrock outcrops, platforms, low cliffs (less than five metres in height), and scarps. Depending on exposure, rocky shores can be host to a diverse range of flora and fauna, including barnacles, mussels, tube building worms, sea squirts (cunjevoi), sea anemones, sponges, sea snails, starfish and algae. Australian fur-seals are also known to use rocky shores for haul-out and/or breeding. Most animals on the intertidal rocky shores are herbivorous molluscs, grazing algae off rock surfaces.

This is a common shoreline type along the southern NSW coast, the islands of Bass Strait, and for smaller areas of Victoria's coast (e.g. Wilsons Promontory). Intertidal rocky shores occur at Bastion Point, Quarry Beach, Shipwreck Creek, Seal Cove, Little Rame Head, Sandpatch Point, Petrel Point, Thurra River, Clinton Rocks, Cloke Rock, Tamboon Inlet and Shelley Beach.

#### 2.3.4.3 Shoreline (Cliff)

The intertidal zone is steep (>30° slope) and narrow with very little width.

Sediment accumulations are uncommon because waves remove debris that has slumped from the eroding cliffs. There is strong vertical zonation of intertidal biological communities. Species density and diversity vary greatly, but barnacles, snails, mussels, polychaetes, and macroalgae can be abundant (NOAA, 2010).

This environment occurs behind Betka Beach and Secret Beach through to Little Rame Head, Sandpatch Point, Wingan Point, The Skerries, Rame Head, Petrel Point, Point Hicks, Clinton Rocks, Tamboon Inlet, Pearl Point, Cape Conran (Needle Rocks, Irvine Rocks, Quincy Rocks Salmon Rocks), and at Ricardo Point.

This is a common shoreline type for the Furneaux Island group in Bass Strait (e.g. Flinders Island, Clarke Island) (Figure 2-51).

#### 2.3.4.4 Muddy- Sheltered Intertidal Flats and Bare Sediment

This shoreline type has been defined as areas with predominantly mud-sized (<0.063 mm) particles, and also includes mixed sediments (e.g. sands, shell or gravel), where the mud fraction is dominant. These areas are also exposed to high tidal variation, including tidal flats, and are often associated with mangrove or saltmarsh environments.

Sheltered intertidal flats are composed primarily of mud with minor amounts of sand and shell. They are usually present in calm-water habitats, sheltered from major wave activity, and frequently backed by marshes like estuaries or bays. The sediments are very soft and cannot support even light foot traffic in many areas. There can be large concentrations of bivalves, worms, and other invertebrates in the sediments. They are heavily used by birds for feeding (NOAA 2010).

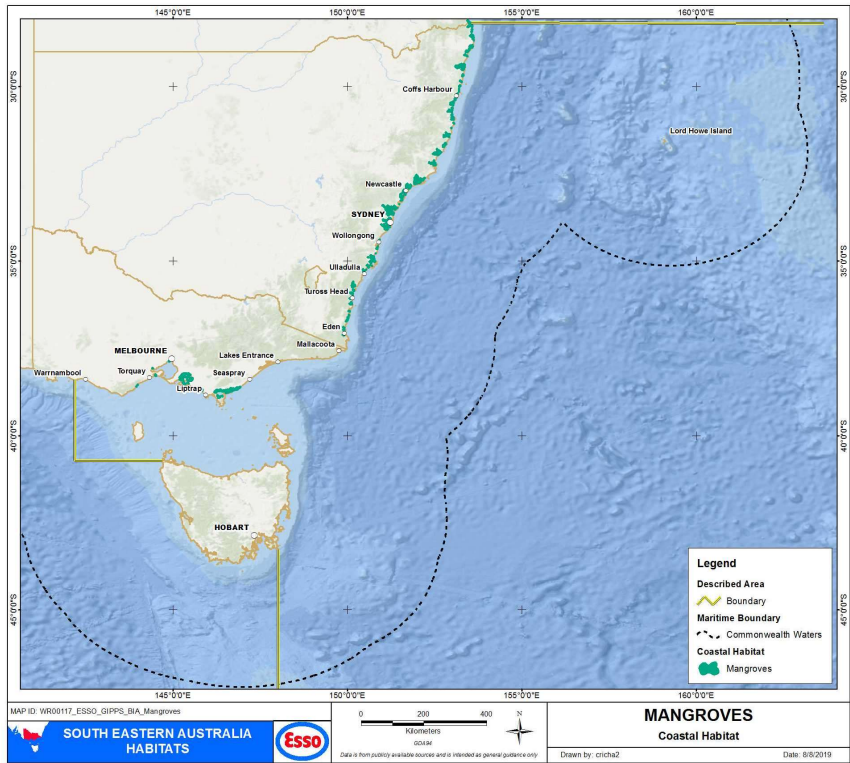

Sheltered intertidal flats occur at Corner Inlet and Nooramunga Marine and Coastal Parks. Bare sediment occurs at Mallacoota Inlet, Wingan Inlet, Sydenham Inlet - Bemm River and Mud Lake.

#### Mangroves

Along the Gippsland coast, mangroves can be found in Corner Inlet and Nooramunga Marine and Coastal Park and more recently have also been found in Cunningham Arm at Lakes Entrance (Figure 2-52) (Lucieer et al., 2017).

The roots and trunks are intertidal, with only the lowest leaves inundated by high tide. The width of the forest can range from one tree, to many kilometres. The substrate can be sand, mud, leaf litter, or peat, often as a veneer over bedrock. They are highly productive, serve as nursery habitat, and support a great diversity and abundance of animal and plant species (NOAA, 2010).

**Figure 2-52 Distribution of Mangroves within DA**

**2.3.4.5 Saltmarsh**

Saltmarshes are terrestrial halophytic (salt-adapted) ecosystems that mostly occur in the upper-intertidal zone, and are widespread along the coast. They are typically dominated by dense stands of halophytic plants such as herbs, grasses and low shrubs. Depending on location and inter-annual variations in rainfall and runoff, associated vegetation may include species tolerant or adapted to salt, brackish, or even tidal freshwater conditions. The diversity of saltmarsh plant species increases with increasing latitude (in contrast to mangroves). The vegetation in these environments is essential to the stability of the saltmarsh, as they trap and bind sediments. The sediments are generally sandy silts and clays, and can often have high organic material content. Saltmarshes provide a habitat for a wide range of both marine and terrestrial fauna, including infauna and epifaunal invertebrates, fish and birds (NOAA, 2010).

Saltmarsh is found along the coast throughout the DA (Figure 2-53), although is most extensive behind the sand dunes of Ninety Mile Beach in Gippsland (Boon et al., 2011).

Salt marshes can be found behind Mallacoota Entrance to Lake Barracouta, Wingan Inlet, inside Cann River Estuary, Tamboon Inlet, Sydenham Inlet (Bemm River Estuary and Mud Lake), Dock Inlet, inside Snowy River Estuary, Lake Tyers Estuary, and inside Lakes Entrance - Gippsland Lakes Ramsar Site. In southern NSW between Towradgi Creek about 40km north of the limits of the DA to the Victorian border there are approximately 12km<sup>2</sup> of saltmarsh spread over 62 estuaries (NSW DPI, 2013). These include the areas of Shoalhaven River, Carama Creek, Clyde River, Tomaga River and Moruya River, Tuross Lake, Wapengo Lake, Bega River, Merimbula Lake and Wonboyn River (Creese et al., 2009).

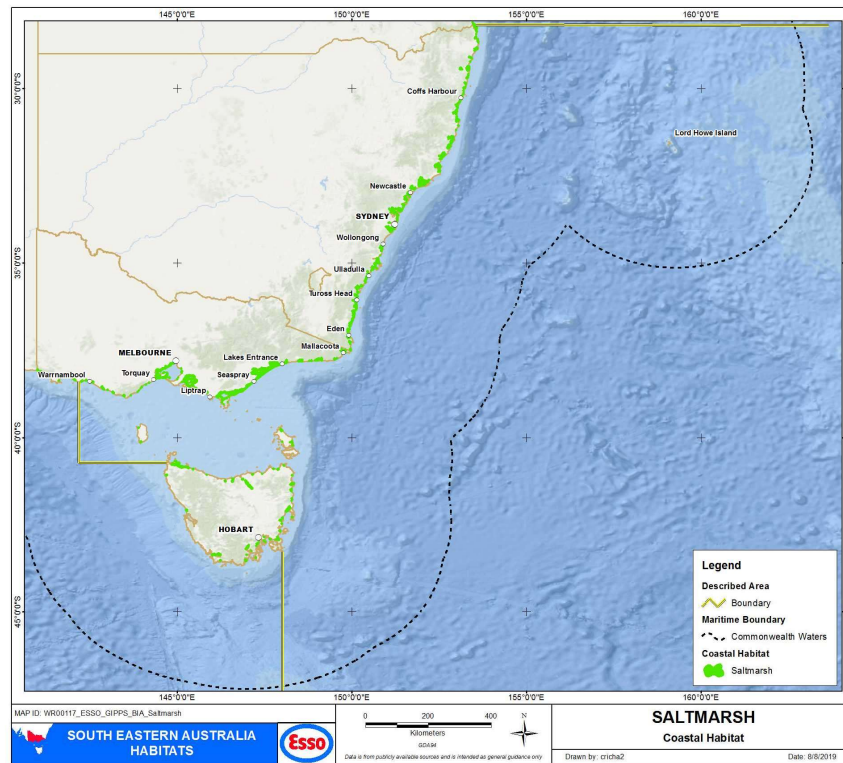

Figure 2-53 Saltmarsh dominated nearshore habitat within the DA

### 2.3.4.6 Coastal Vine Thicket

Coastal vine thickets are also classed as threatened ecological communities. These occur in the DA, refer to section 2.2.4.2 for information on coastal vine thickets.

## 2.4 Economic Environment

### 2.4.1 Fishing

#### 2.4.1.1 Commercial Fishing

Commercial fishing in south-eastern Australia includes inshore coastal waters, mainly state administered fisheries, and areas along the continental slope, mainly Commonwealth fisheries. The majority of the commercial fishing (volume basis) occurs in Commonwealth waters along the continental shelf and the upper continental slope (see Figure 2-54).

The main commercial Commonwealth fisheries in the vicinity of the EGBPA are the Southern and Eastern Scalefish and Shark Fishery (SESSF) which includes ((AFMA, 2014a, 2016, ABARES, 2016 and 2017) :

- Commonwealth Trawl Sector (CTS); and
- Gillnet, Hook and Trap Sectors (GHTS)

Of these, Danish seiners and otter-board trawlers of the Commonwealth Trawl Sector are most likely to be encountered near the EGBPA.

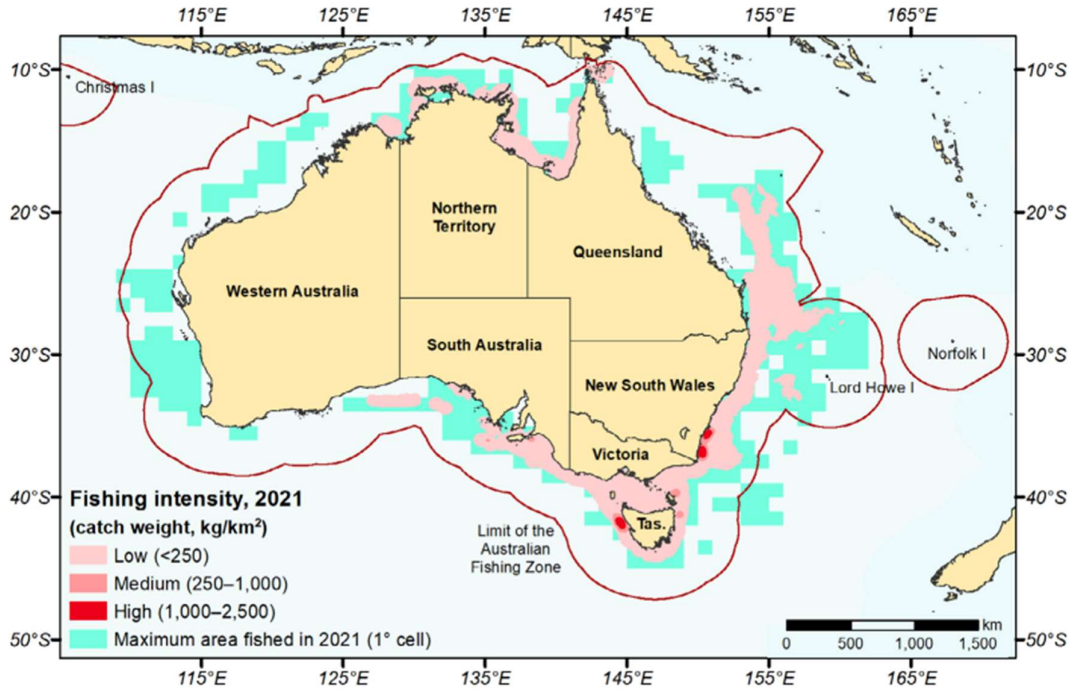

Figure 2-54 Relative catch levels of Commonwealth-managed fisheries, 2021 (ABARES, 2022)

### 2.4.1.2 Commercial Fishing – Commonwealth

Commonwealth fisheries are managed by the Australian Fisheries Management Authority (AFMA), with the fisheries typically operating within 3 nm to 200 nm offshore (i.e. to the extent of the Australian Fishing Zone). In 2020-2021 the Gross Value of Production (GVP) from Commonwealth fisheries was estimated at \$474 million; contribution 27% of Australia's wild catch fisheries GVP (Figure 2-55) (Patterson et al., 2022).

Figure 2-55 Gross Value of Production of Commonwealth Fisheries from 2010-2021 (Patterson et al., 2022).

There are seven commonwealth-managed commercial fisheries with management areas that intersect with the DA:

- Bass Strait Central Zone Scallop;
- Eastern Tuna and Billfish Fishery;
- Small Pelagic Fishery;
- Southern and Eastern Scalegfish and Shark Fishery;
- Southern Bluefin Tuna Fishery;
- Southern Squid Jig Fishery; and
- Norfolk Island Fishery.

### 2.4.1.3 Bass Strait Central Zone Scallop Fishery

There are three zones of scallop fishing in Bass Strait and these are divided into state/commonwealth jurisdictions with the states zones extending out to 20nm from the high tide water mark. The current boundaries were settled in 1986 with an Offshore Constitutional Settlement agreed between the three jurisdictions. Figure 2-56 shows the jurisdictional allocation of the Bass Strait scallop fisheries. Refer to Section 2.4.1.10, Table 2-47 for information on the Victorian and Tasmanian scallop fisheries.

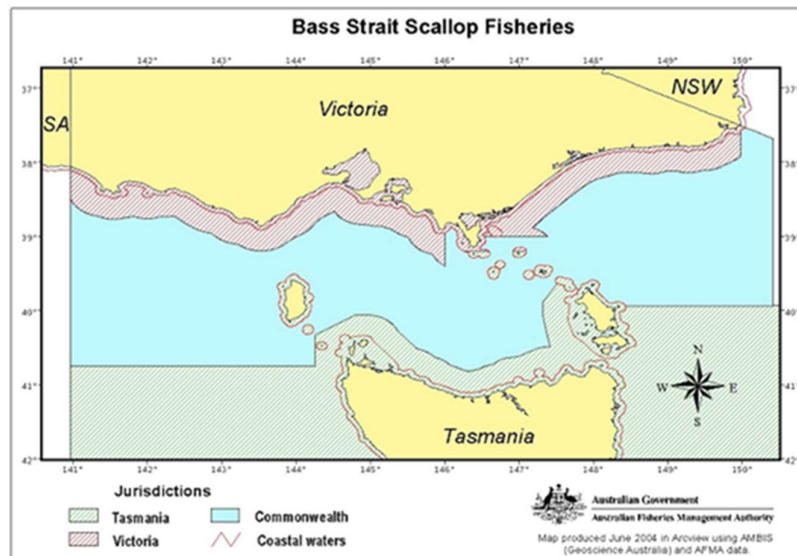

Figure 2-56 Bass Strait Scallop Fisheries (VFA, 2019)

The Bass Strait Central Zone Scallop Fishery operates in Commonwealth waters between Victoria and Tasmania (Figure 2-57). The default fishing season is 1 April to 31 December each year (note, the exact dates can vary each year) (DSEWPaC, 2013c); and the target species is Commercial Scallop (*Pecten fumatus*). The commercial scallop usually matures at about 12 to 18 months of age. Once maturity has been reached (fecundity increases with age), scallop spawning occurs from winter to spring (June to November); however, the timing is dependent on environmental conditions such as wind and water temperature (Sause et al., 1987). Scallop populations throughout the world fluctuate quite dramatically in response to variable environmental conditions. Relatively high populations occur in some years. These can be followed by relative scarcity, but populations can quickly rebound to large numbers provided enough adults remain for successful breeding and recruitment (VFA 2017b). Scallops are seldom found in commercial quantities in depths greater than 60-70 m.

Fishing method is via scallop dredge. Primary landing ports are Queenscliff and Apollo Bay (Victoria), and Stanley (Tasmania). The primary market for commercial scallops is domestic (Marton et al., 2012).

During 2021, fishing was concentrated on beds east of Flinders Island (a similar area to that of 2020) (Figure 2-57). The fishery experienced a peak in 2017, despite a reduction in dredge-hours (Patterson

et al., 2018). The value of the fishery can vary markedly, with the 2020 season reporting \$5.3 million GVP and the 2021 season reporting a \$4.7 million GVP (Patterson et al., 2022).

**Figure 2-57 Bass Strait Central Zone Scallop Fishery Management Area and 2017 Relative Fishing Intensity (Patterson et al., 2022).**

**2.4.1.4 Eastern Tuna and Billfish Fishery**

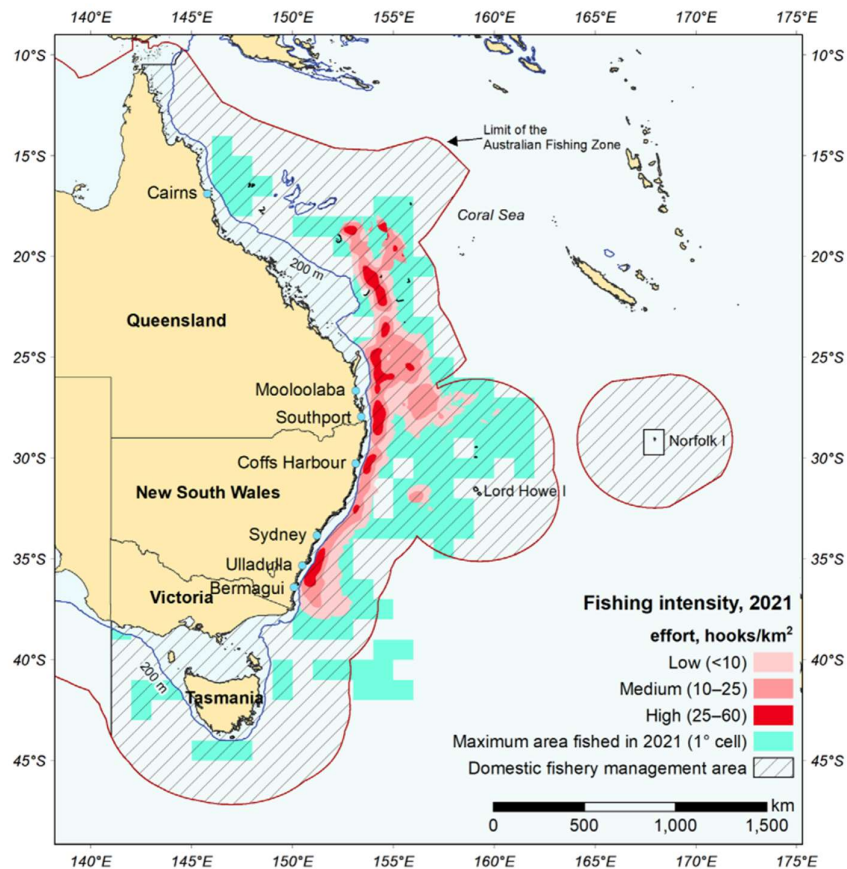

The Eastern Tuna and Billfish Fishery operates in Commonwealth waters from Cape York (Queensland) to the Victoria – South Australia border (Figure 2-58).

It is a 12-month fishing season, commencing 1 March each year. Primary target species are:

- Albacore Tuna (*Thunnus alulunga*);
- Bigeye Tuna (*Thunnus obesus*);
- Yellowfin Tuna (*Thunnus albacares*);
- Broadbill Swordfish (*Xiphias gladius*);
- Striped Marlin (*Tetrapturus audux*).

Primary landing ports for the Eastern Tuna and Billfish Fishery are Bermagui, Coffs Harbour, Ulladulla (New South Wales), and Cairns, Mooloolaba, Southport (Queensland). Fishing methods include pelagic longline, and minor line (trolling, rod and reel, handline).

During 2021, fishing was concentrated offshore of New South Wales and southern/central Queensland coasts (Figure 2-58). The number of active vessels in the fishery have decreased over the last decade from approximately 150 in 2002 to 41 in 2021 (Patterson et al., 2022). The value of the fishery during 2020-2021 financial year was \$34.4 million (Patterson et al., 2022).

**Figure 2-58 Eastern Tuna and Billfish Fishery Management Area and 2021 Relative Fishing Intensity (Patterson et al., 2022).**

### 2.4.1.5 Small Pelagic Fishery

The Small Pelagic Fishery operates in Commonwealth waters from southern Queensland to southern Western Australia (Figure 2-59). Most historical fishing efforts has occurred of the east and west coasts of Tasmania. It is a 12-month fishing season, commencing 1 May each year. Primary target species are:

- Australian sardine (*Sardinops sagax*);
- Blue mackerel (*Scomber australasicus*);
- Jack mackerel (*Trachurus declivis*, *T. murphyi*);
- Redbait (*Emmelichthys nitidus*).

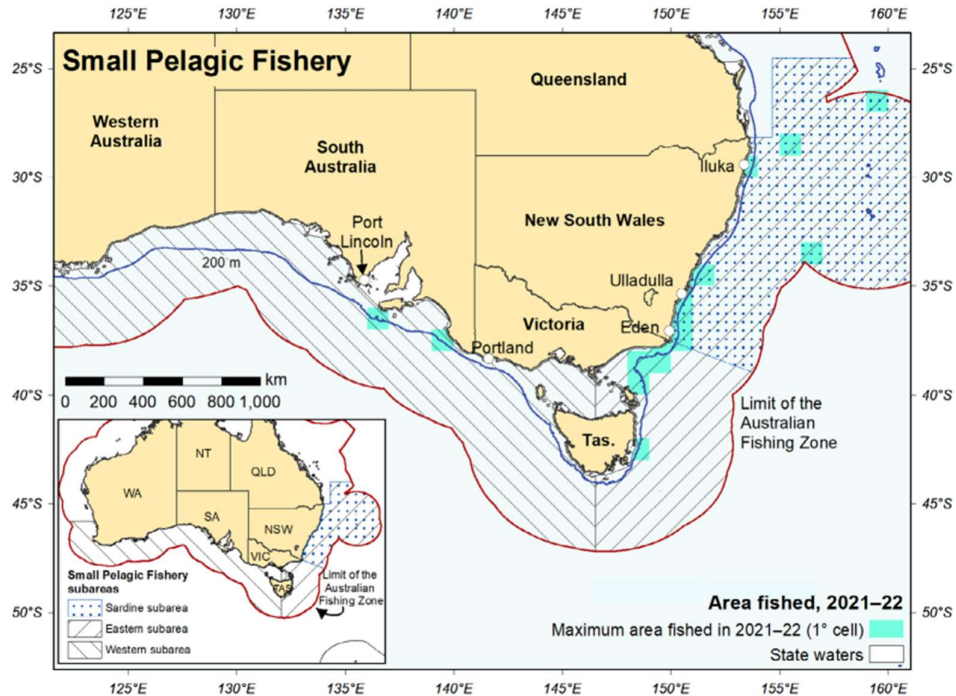

Primary landing ports within the DA are Eden and Iluka (New South Wales). Fishing methods include purse seine and midwater trawl; midwater trawl has been the main method since 2002. Commercial value of the fishery is confidential (Patterson et al., 2022).

Small pelagic fish are generally caught during targeted fishing for a single species. They are also caught in small quantities in other Commonwealth- and state-managed fisheries, including the Southern and Eastern Scalefish and Shark Fishery, the Eastern Tuna and Billfish Fishery, the Western Tuna and Billfish Fishery, and the New South Wales Ocean Hauling Fishery. There are no active small pelagic fisheries near the EGBPA.

Jack mackerel are found in continental shelf waters between 27 to 460 m, although generally in waters less than 300m deep. They live for 16 years, maturing at 3 to 4 years. Spawning occurs between December and March (ABARES, 2018).

Blue mackerel are found in continental shelf waters between 87 to 265 m. They live for about 7 years, maturing at 2 years. Spawning occurs between September and May (ABARES, 2018).

Redbait are found in continental shelf waters between 86 to 500 m. They live for about 21 years, maturing at 2 to 4 years. Spawning occurs between September and November (ABARES 2018).

**Figure 2-59 Small Pelagic Fishery Management Area and 2021-22 Area Fished**

#### 2.4.1.6 Southern and Eastern Scalefish and Shark Fishery

The Southern and Eastern Scalefish and Shark Fishery (SESSF) is a multisector, multigear and multispecies fishery, targeting a variety of fish, squid and shark stock (Figure 2-60). Primary target species include:

- Blue grenadier (*Macruronus novaezelandiae*);
- Tiger flathead (*Neoplatycephalus richardsoni*);
- Silver warehou (*Seriolella punctata*);
- Gummy shark (*Mustelus antarcticus*);
- Pink ling (*Genypterus blacodes*).

It is a 12-month fishing season, commencing 1 May each year. Primary ports include Eden (New South Wales), Lakes Entrance, Portland, Port Welshpool (Victoria), and Devonport and Hobart (Tasmania).

The SESSF incorporates the Commonwealth Trawl Sector (formerly the Southeast Trawl Sector), the Great Australian Bight Trawl Sector (GABTS), East Coast Deepwater Trawl Sector (ECDTS) and Gillnet, Hook and Trap Sector (GHTS; formerly the Southern Shark and Southeast Non-trawl Sectors) under a common set of management objectives. The SESSF extends from waters off southern Queensland, south around Tasmania and then west to Cape Leeuwin in Western Australia. Fishing intensity varied in location for each fishery, with no catch effort within the East Coast Deep Water Trawl Sector for 2021-22 (Figure 2-61). The value of the fishery in 2020-21 was approximately \$88.84 million (\$64 million from the Commonwealth Trawl and Scalefish Hook Sectors; \$24.84 million from the Shark Gillnet and Shark Hook Sector) (Patterson et al., 2022).

Sharks are fished using predominantly demersal gillnets (Walker et al., 2001), with a small percentage caught by demersal longlines. The deepwater demersal sharks occur between 50 and 1,800m depth offshore and live up to 50 years, maturing between 25 and 30 years (ABARES, 2016c).

The trawl and scalefish-hook sectors of the fishery include over 100 species that are captured, but 16 species provide the bulk of trawl landings and are subject to quota management. Fishing is year round, varying according to availability, market price and progress with quotas.

The trawl sector includes otter trawl and Danish seine methods. Otter trawlers use larger boats, generally greater than 20 m long, while Danish seiners use smaller boats and operate in nearshore shelf areas often in more restricted areas unavailable to otter trawlers (Larcombe & Begg 2008). Board boats can stay out at sea for 5-7 days, whilst Danish seiners usually fish for a maximum of three days. The range of Danish seiners, which target predominantly flathead, is limited to a 100 km radius from Lakes Entrance.

Otter board trawlers, operating out of Lakes Entrance, concentrate their fishing operations in deeper waters and consequently catch more morwong, ling, blue grenadier and other deep sea species. The net is towed by two wire ropes and fixed, between these ropes and the net, are paravanes (commonly known as boards or doors). Unlike the Danish seine net which closes and stops fishing after about two minutes of towing, the board trawl net remains open and may be towed for any length of time, although it is rare for tows to exceed four hours (Leftrade 2013). Distribution of the fishing effort shows a predominance of effort concentrated along the 100-250 m contour; (ABARES 2017).

The SESSF includes several stocks that are classified as overfished. These overfished stocks are blue warehou (*Seriolella brama*), eastern gemfish (*Rexea solandri*), gulper sharks (*Centrophorus harrissoni*, *C. moluccensis*, *C. zeehaani*), school shark (*Galeorhinus galeus*), redfish (*Centroberyx affinis*) and orange roughy (*Hoplostethus atlanticus*) in two zones (southern and western) (ABARES, 2017).

**Figure 2-61 2021-2022 Relative Fishing Intensity for (a) Commonwealth Trawl Sector (b) Commonwealth Trawl Sector: Danish-seine, (c) Scalefish Hook Sector, (d) Shark Gillnet Sector, and (e) Shark Hook Sector, (f) East Coast Deepwater Trawl Sector (Patterson et al., 2022)**

### 2.4.1.7 Southern Bluefin Tuna Fishery

The Southern Bluefin Tuna Fishery operates within the Australian Fishing Zone. It is a 12-month fishing season, commencing 1 December each year. Primary target species is the Southern Bluefin Tuna (*Thunnus maccoyii*).

The majority of the catch is taken in the Great Australian Bight (i.e. outside of the Environment Sectors) by purse-seine vessels. Longline fishing is used off the east coast, and the number of vessels and fishing intensity is variable (Figure 2-62). The value of the fishery during 2020-2021 financial year was \$41.39 million (Patterson et al., 2022).

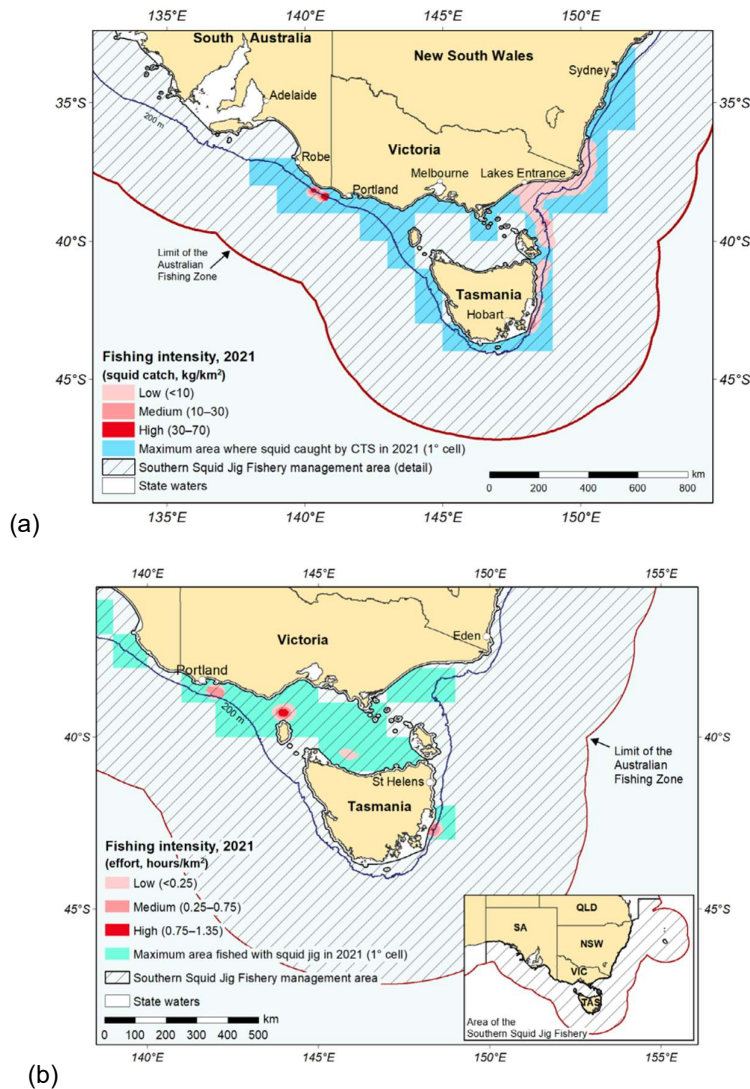

**Figure 2-62 Southern Bluefin Tuna Management Area and 2020-21 Fishing Intensity (Patterson et al., 2022)**

### 2.4.1.8 Southern Squid Jig Fishery

The Southern Squid Jig Fishery is located in waters off New South Wales, Victoria, Tasmania and South Australia, and in a small area off southern Queensland. The Southern Squid Jig Fishery is a single-method (jigging) fishery, primarily targeting the Gould's squid (*Nototodarus gould*). Vessels typically operate at night in continental shelf waters between 60–120 m water depths. Squid are also caught in the Commonwealth Trawl Sector and GAB Trawl Sector of the Southern and Eastern Scalefish and Shark Fishery.

It has a 12-month fishing season, commencing 1 January each year. Most direct fishing effort occurs off Lakes Entrance (Victoria) for the Commonwealth Trawl Sector (Figure 2-63) (a)), and north of King Island (Tas) for the Southern Squid Jig Fishery (Figure 2-63(b)). The value of the Southern Squid Jig Fishery during the 2021 financial year is \$3.3 million (Patterson et al., 2022).

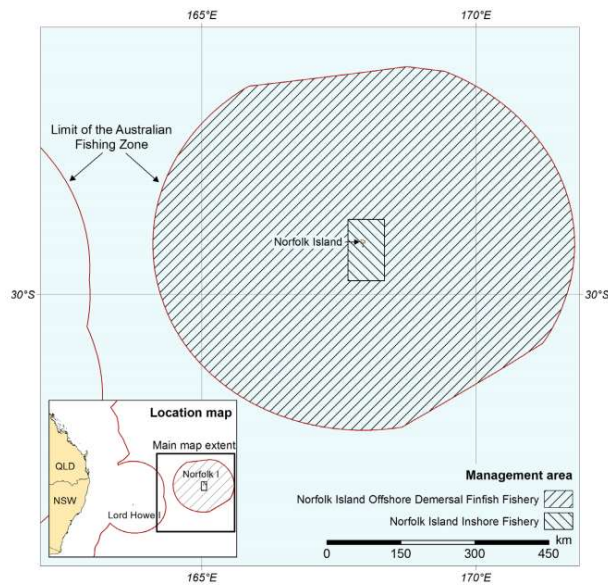

**Figure 2-63 (a) Squid Catch from the Commonwealth Trawl Sector 2021, and (b) 2021 Fishing Intensity in the Southern Squid Jig Fishery (Patterson et al., 2022)**

#### 2.4.1.9 Norfolk Island Fishery

The Norfolk Island Fishery is currently an inshore recreational and charter-based line fishery (Figure 2-64).

An offshore exploratory commercial trawl-and-line fishery operated between 2000 and 2003. Limited effort in the fishery during this period meant that the permit holders failed to meet the required 50 days of fishing over three years.

No harvest strategy has been developed for the fishery because of the absence of commercial fishing. A harvest strategy and management plan will need to be developed before establishment of a commercial fishery (Patterson et al., 2019).

**Figure 2-64 Managed area of the Norfolk Island Fishery**

#### 2.4.1.10 Commercial Fishing - State

Each state operations under their own constitutional arrangement:

- Tasmanian fisheries are managed under the Living Marine Resources Management Act 1995;
- South Australian fisheries are managed under the Fisheries Management Act 2007;
- Victorian fisheries are managed under the Fisheries Act 1995;
- New South Wales fisheries are managed under the Fisheries Management Act 1994; and
- Queensland fisheries are managed under the Fisheries Act 1994.

The Offshore Constitutional Settlement (OCS) allows for individual fisheries to be managed under relevant State government, with fishing areas extending into both Commonwealth and State waters.

There are seven Victorian and eight New South Wales state-managed commercial fisheries with management areas that intersect with the DA (Table 2-47).

**Table 2-47 State-managed commercial fisheries with management areas that intersect the DA.**

<b>Fishery</b>	<b>Description</b>	<b>Extends into Cth Waters</b>	<b>Target Species</b>
<b>Victoria</b>			
Abalone Fishery	<p>Abalone are caught along the majority of the Victorian coastline. Abalone diving activity typically occurs close to the shoreline (generally up to water depths of 30 m). The fishery is quota managed, with a total allowable commercial catch set annually based on the outcomes of a stock assessment process. There are three (Western, Central and Eastern) management zones.</p> <p>The blacklip abalone (<i>Haliotis rubra</i>) forms the basis of the abalone fisheries in NSW, Victoria and Tasmania, however greenlip abalone (<i>Haliotis laevegata</i>) are also targeted. Blacklip abalone are commonly found, mainly on rocky substrates, and are widely distributed along the southern half of Australia as far as Rottneest Island in the West to Coffs Harbour in the East.</p> <p>Abalone are sourced from the wild and from coastal farms. There are about 40 reefs from Iron Prince to Marlo Reef in Victoria. In NSW, most commercial abalone fishing takes place on the south coast, primarily from Jervis Bay to the Victorian border (DPI 2007).</p> <p>Victoria's abalone farms are situated primarily in Port Phillip Bay and southwest Victoria, however farms are also located off Tullaberga Island and Gabo Island.</p>	Yes	<p>Greenlip Abalone (<i>Haliotis laevigata</i>)</p> <p>Blacklip Abalone (<i>Haliotis rubra</i>)</p>
Eel Fishery	Eel are harvested in Victorian coastal river basins south of the Great Dividing Range. Short-finned eels are found across the State, while long-finned eels are only found in eastern Victoria.	No	<p>Short-finned eel (<i>Anguilla australis</i>)</p> <p>Long-finned eel (<i>Anguilla reinhardtii</i>)</p>
Giant Crab Fishery	The commercial fishery has two management zones, the Western Zone and Eastern Zone, a division which reflects the zonal boundaries of the rock lobster fishery. The fishery is based in the Western Zone; at the time of writing there was no giant crab fishing in the Eastern Zone. Giant crabs inhabit the continental slope at approximately 200 m depth and are most abundant along the narrow band of the shelf edge.	Yes	Giant crab ( <i>Pseudocarcinus gigas</i> )
Pipi Fishery	Pipi is the common name given to the small bivalve which is found on high-energy sandy beaches in the intertidal zone. The fishery covers the entire Victorian coastline, with the exception of Port Phillip Bay and Marine National Parks where shellfish cannot be harvested in the intertidal region. However, the fishery is only currently open at Discovery Bay (targeted primarily by commercial fishers) and Venus Bay (primarily a recreational fishery).	No	Pipi ( <i>Donax deltoids</i> )

Fishery	Description	Extends into Cth Waters	Target Species
Rock Lobster Fishery	<p>The fishery is divided into two separately managed zones: Eastern and Western. The Eastern Zone extends west from the New South Wales border to Apollo Bay; the Western Zone extends from Apollo Bay west to the border with South Australia. The main ports in the Eastern Zone are Queenscliff, San Remo and Lakes Entrance.</p> <p>The Victorian, the southern rock lobster (<i>Jasus edwardsii</i>). Rock lobster is Victoria's second most profitable fishery after abalone. Southern Rock Lobsters are found to depths of 150 m, with most of the catch coming from inshore waters less than 100 m deep. Eastern rock lobster (<i>Jasus verreauxi</i>) is the main species harvested by the NSW Lobster Fishery, but occasionally southern rock lobster, and tropical rock lobster are also caught.</p> <p>Rock lobster fishing grounds exist around Ulladulla and Bateman's Bay, the southern tip of Wilsons Promontory and around Bass Strait islands, such as the Hogan Group, Curtis Group, Kent Group islands and Flinders Island. Most fishing occurs between mid-November and March, outside the June to mid-November spawning season.</p>	Yes	<p>Southern rock lobster (<i>Jasus edwardsii</i>)</p> <p>Eastern rock lobster (<i>Jasus verreauxi</i>)</p>
Scallop Fishery	<p>The Victorian Scallop Fishery is one of three scallop zones in the Bass Strait, and extends out from the coastline to 20 nm excluding the bays and inlets along the coast where commercial fishing for scallops is prohibited. The same arrangement is in place for Tasmania. Historically, the majority of the fishing activity in the Victorian zone has occurred in the eastern waters of the State, with most vessels launching from the ports of Lakes Entrance and Welshpool. The Victorian Scallop Fishery is based on the species, <i>Pecten Fumatus</i>. Occasionally, incidental catches of doughboy scallops (<i>Chlamys asperimus</i>) are taken as by-product, but are generally not in commercial quantities. Scallop abundance is naturally highly variable causing catches to fluctuate widely from season to season. When open, the fishery is managed using a quota management system of individual transferable quota. Annual consultation is undertaken to determine the total allowable catch (TAC) and is based on a combination of stock survey analysis and scientific and industry expertise. Fisheries Victoria, on behalf of the Minister for Agriculture and Food Security, sets the TAC via a Quota Notice which is distributed equally amongst the 91 maximum allowable licences.</p>	No	<p><u>Primary:</u></p> <p>Commercial scallop (<i>Pecten fumatus</i>)</p> <p><u>Other:</u></p> <p>Doughboy scallop (<i>Chlamys asperimus</i>)</p>
Wrasse Fishery	<p>The commercial fishery extends along the entire length of the Victorian coastline and out to 20 nm offshore, except for marine reserves. Most wrasse is harvested by hook and line although commercial rock lobster fishers who also hold a commercial wrasse licences can keep those fish that they catch in their rock lobster pots.</p>	No	<p><u>Primary:</u></p> <p>Bluethroat Wrasse (<i>Notolabrus tetricus</i>)</p> <p>Purple Wrasse (<i>N. fucicola</i>)</p> <p><u>Other:</u></p>

Fishery	Description	Extends into Cth Waters	Target Species
			Rosy Wrasse ( <i>Pseudolabrus psittaculus</i> ) Senator Wrasse ( <i>Pictilabrus laticlavus</i> ) Southern Maori Wrasse ( <i>Ophthalmolepis lineolatus</i> )
Sea Urchin Fishery	<p>The sea urchin fishery comprises four individual management zones. The central and eastern zones intersect the DA. The central zone covers Victorian waters from Hopkins River to Lakes Entrance. The eastern zone extends from Lakes Entrance to the NSW border. The target species are the White sea urchin (<i>Heliocidaris erythrogramma</i>) and the Black, long-spined sea urchin (<i>Centrostephanus rodgersii</i>).</p> <p>The sea urchin is usually collected by hand by divers. Currently, sea urchin will only be harvested in eastern Victoria, primarily out of Mallacoota, and in Port Phillip Bay (VFA 2017b).</p>		White sea urchin ( <i>Heliocidaris erythrogramma</i> ) Black, long-spined sea urchin ( <i>Centrostephanus rodgersii</i> )
Commercial Bay and Inlet Fisheries	<p>The commercial bay and inlet fisheries of Victoria are a collection of complex multi-species, multi-gear fisheries which operate in environments that are ecologically distinct to those existing in waters of both their catchment tributaries and the nearby ocean. Although between 60 to 80 fish species have been recorded from commercial bay and inlet catches, only about a dozen or so key species, including King George whiting, black bream, snapper, flathead, mullet, garfish, flounder, anchovies and pilchards, are usually targeted by commercial fishers.</p> <p>Commercial fishing for fin fish occurs in Port Phillip Bay, Corner Inlet/Nooramunga and the Gippsland Lakes. All other Victorian bays, inlets and estuaries are closed to commercial fishing (other than for eels and bait). The main bay and inlet commercial fishing methods are seine nets and gillnets.</p>	no	King George Whiting Black Bream Snapper Flathead Mullet Garfish Flounder Anchovies Pilchards
<b>New South Wales</b>			
Abalone Fishery	The blacklip abalone forms the basis of the abalone fishery in NSW. Abalone are commercially harvested from rocky reefs by divers typically using surface-supplied air or scuba. In practice, most commercial abalone fishing	No	Blacklip abalone ( <i>Haliotis rubra</i> )

Fishery	Description	Extends into Cth Waters	Target Species
	takes place on the south coast of NSW, primarily from Jervis Bay to the Victorian border, with most abalone found close to the shore.		
Estuary General Fishery	The Estuary General Fishery is a diverse multi-species multi-method fishery that may operate in 76 of the NSW's estuarine systems. This fishery is a significant contributor to regional and state economies providing high quality seafood and bait to the community. The fishery includes all forms of commercial estuarine fishing (other than estuary prawn trawling) in addition to the gathering of pipis and beachworms from ocean beaches. The most frequently used fishing methods are mesh and haul netting. Other methods used include trapping, hand-lining and hand-gathering. Sea mullet, luderick, yellowfin bream, school prawn, blue swimmer crab, dusky flathead, sand whiting, pipi, mud crab and silver biddy make up over 80% of the catch (DPI 2014).	No	Sea Mullet ( <i>Mugil cephalus</i> ) Luderick ( <i>Girella tricuspidata</i> ) Yellowfin bream ( <i>Acanthopagrus australis</i> ) School Prawn ( <i>Metapenaeus macleayi</i> ) Blue Swimmer Crab ( <i>Portunus pelagicus</i> ) Dusky Flathead ( <i>Platycephalus fuscus</i> ) Sand Whiting ( <i>Sillago ciliata</i> ) Pipi ( <i>Donax deltoides</i> ) Mud Crab ( <i>Scylla serrata</i> ) Silver Biddy ( <i>Gerres subfasciatus</i> )
Estuary Prawn Trawl Fishery	The fishery uses otter trawl nets in three estuaries in NSW, (the Clarence, Hawkesbury and Hunter Rivers). With the exception of the Hawkesbury River, the fishery operates for defined seasons (generally October to May) and within each estuary is confined to specific times and areas. The majority of prawn catches are landed during the 'dark' of the moon (between the last and first quarter), on either run out or 'slack' tides.	No	School Prawns Eastern King Prawns
Lobster Fishery	The Fishery extends from the Queensland border to the Victorian border and includes all waters under jurisdiction of NSW to around 80 miles from the coast.	Yes	<u>Primary:</u>

Fishery	Description	Extends into Cth Waters	Target Species
	It is characterised by inshore and offshore sectors. Inshore fishers use small beehive or square traps in waters up to 10 metres in depth, whilst offshore fishers use large rectangular traps.		Eastern rock lobster ( <i>Sagmaraisus verreauxi</i> ) Other: Southern Rock Lobster ( <i>Jasus edwardsii</i> ) Tropical Rock Lobster ( <i>Panulirus longipes</i> and <i>P. ornatus</i> ).
Ocean Hauling Fishery	The Ocean Hauling Fishery is broken up into seven regions along the NSW coast and targets approximately 20 finfish species using commercial hauling and purse seine nets from sea beaches and in ocean waters within 3 nautical miles of the coast.	No	Pilchards ( <i>Sardinops sagax</i> ) Sea Mullet ( <i>Mugil cephalus</i> ) Australian Salmon ( <i>Arripis trutta</i> ) Blue Mackerel ( <i>Scomber australasicus</i> ) Yellowtail Scad ( <i>Trachurus novaezelandiae</i> ) Yellowfin Bream ( <i>Acanthopagrus australis</i> )
Ocean Trap and Line Fishery	The Ocean Trap and Line fishery is a multi-method, multi species fishery targeting demersal and pelagic fish along the entire NSW coast, in continental shelf and slope waters.  The Ocean Trap and Line Fishery is a share management fishery. This means that commercial fishers must hold sufficient shares to be eligible for an endorsement to operate in the fishery. An endorsement authorises the use of specific gear to take fish for sale from certain waters.	Yes	<u>Primary:</u> Snapper Yellowtail kingfish Leatherjackets Bonito Silver trevally

Fishery	Description	Extends into Cth Waters	Target Species
			<p>Other:</p> <ul style="list-style-type: none"> <li>Rubberlip (grey)</li> <li>Morwong</li> <li>Blue-eye Trevalla</li> <li>Sharks</li> <li>Bar Cod</li> <li>Yellowfin Bream</li> <li>Spanner Crabs</li> </ul>
<p>Ocean Trawl Fishery</p>	<p>There are two sectors to the Ocean Trawl Fishery: the prawn trawl sector and the fish trawl sector. Both sectors use otter trawl nets.</p> <p>The fishery is a share management fishery; meaning commercial fishers must hold sufficient shares to be eligible for an endorsement to operate in the fishery. An endorsement authorises the use of specific gear to take fish for sale from certain waters. Many of the fishers endorsed for fish trawling are also endorsed for prawn trawling.</p>	<p>Yes</p>	<p>School whiting (comprising of stout whiting and red spot whiting)</p> <p>Eastern King, School and Royal Red prawns</p> <p>Tiger Flathead</p> <p>Silver Trevally</p> <p>Various species of sharks and rays, squid, octopus and bugs</p>
<p>Sea Urchin and Turban Shell Restricted Fishery</p>	<p>The NSW Sea Urchin and Turban Shell restricted fishery is relatively small with few divers participating. The main constraint on development is high processing costs and limited domestic markets. Fishing for sea urchins is generally constrained to that part of the year when the roe is well developed. A number of the fishing sub-regions have been closed to commercial fishing since 1994.</p>	<p>No</p>	<p>Sea Urchin</p> <p>Turban Shell</p>
<p><b>Tasmania</b></p>			
<p>Shellfish Fishery</p>	<p>The commercial shellfish fishery includes clams (<i>Veneruptis largillierti</i>) for which there are three licences restricted to Georges Bay, native oyster (<i>Ostrea angasi</i>) for which there are two licences restricted to Georges Bay and cockles (<i>Katelysia scalarina</i>) for which there are four licences restricted to Ansons Bay and wild Pacific oyster (<i>Crassostrea gigas</i>) (DPIPWE 2017d).</p>	<p>no</p>	<p>clams (<i>Veneruptis largillierti</i>)</p> <p>native oyster (<i>Ostrea angasi</i>)</p>

Fishery	Description	Extends into Cth Waters	Target Species
	Temperate climate bivalves generally have two spawning periods within a year following spring and autumnal peaks in phytoplankton production.		cockles ( <i>Katylsia scalarina</i> ) wild Pacific oyster ( <i>Crassostrea gigas</i> )
Abalone Fishery	The Tasmanian abalone fishery is the largest wild abalone fishery in the world and the fishery area surrounds the entire island of Tasmania extending northwards into Bass Strait to include Bass Strait islands such as the Furneaux Group. The Tasmanian wild harvest abalone fishery for Blacklip ( <i>H. rubra</i> ) and Greenlip ( <i>H. laevigata</i> ) produces 25% of the total annual global production of wild caught abalone and is harvested by divers. Annual catch limits are set by the government and the limits are spread across the fishing zones to manage resource sustainability. This system includes closures of some parts of the fishery as published by the Tasmanian regulator Department of Primary Industries, Parks, Water & Environment (DPIPWE, 2019a).	no	Blacklip ( <i>H. rubra</i> ) Greenlip ( <i>H. laevigata</i> )
Rock Lobster Fishery	The rock lobster fishery is a major Tasmanian industry providing significant benefits from exports from the commercial fishery. The Southern rock lobster ( <i>Jasus edwardsii</i> ) commonly known as crayfish, lives in a variety of habitats ranging from shallow rocky inshore pools out to the continental shelf. Pots are used as the catch method and over 300 licences issued each year. The fishery is managed by quota management, supplemented by size limits, gear restrictions and seasonal closures (DPIPWE, 2019b).	no	Southern rock lobster ( <i>Jasus edwardsii</i> )
Giant Crab	The Giant Crab ( <i>Pseudocarcinus gigas</i> ) fishery is a comparatively small fishery with annual harvest set at 46.6 tonnes, but is of relatively high value, with the landed valued estimated to be around \$2 million. The Tasmanian Giant Crab fishery is managed by limited entry, setting a total annual commercial catch and by an individual transferable quota management system. This regime is supplemented by size limits, gear restrictions and seasonal closures. The permitted gear types are pot (or trap) for the commercial fishery. (Ogier et al., 2018)	no	Giant Crab ( <i>Pseudocarcinus gigas</i> )
Scalefish Fishery	The Tasmanian Scalefish Fishery is a multi-species and multi-gear fishery that is predominantly made up of small owner operated commercial businesses and a large and diverse recreational fishery. Some of the species commercially targeted include: banded morwong, southern calamari, octopus, tiger flathead, school whiting, southern garfish, wrasse, Gould's squid, bastard trumpeter, blue warehou, silver flounder, silver trevally and striped trumpeter. The main gear types include gillnet, hooks and seine nets, other fishing gears in use include traps, Danish seine, dip nets and spears. For many commercial operators, scalefish represent an adjunct to other activities, for instance rock lobster fishing (DPIPWE, 2019c)	yes	Wrasse Banded morwong ( <i>Cheilodactylus spectabilis</i> ) Southern calamari ( <i>Sepioteuthis australis</i> )

Fishery	Description	Extends into Cth Waters	Target Species
Commercial Dive Fishery	The fishery primarily targets Purple Sea Urchin ( <i>Heliocidaris erythrogramma</i> ), Longspine Sea Urchin ( <i>Centrostephanus rodgersii</i> ), and Periwinkle ( <i>Lunella undulata</i> ). It operates entirely in state waters in five separate management zones (central eastern, south eastern, north eastern, northern and eastern) (DoEE, 2016).	no	Purple Sea Urchin ( <i>Heliocidaris erythrogramma</i> ) Longspine Sea Urchin ( <i>Centrostephanus rodgersii</i> ) Periwinkle ( <i>Lunella undulata</i> )
Scallop	This fishery targets Commercial Scallop ( <i>Pecten fumatus</i> ) using a scallop harvester (dredge). Although commercial fishers can legally take the doughboy scallop and the queen scallop, these species have only minor commercial significance in Tasmania. Pre-season surveys are carried out to determine which areas meet predetermined criteria and can be opened for scallop fishing. The market for commercial harvested scallops is largely domestic. Scallops beds occur on the shelf in water deeper than 20 metres (Ogier et al., 2018).	no	Commercial Scallop ( <i>Pecten fumatus</i> )
<b>Queensland</b>

Fishery	Description	Extends into Cth Waters	Target Species
	<p>East coast fin fishery has 2 major commercial net fisheries::</p> <ul style="list-style-type: none"> <li>- the Gulf of Carpentaria inshore fin fish fishery (not in DA)</li> <li>- the east coast inshore fin fish fishery.</li> </ul>		<ul style="list-style-type: none"> <li>• king and blue threadfins - 7% of total net catch</li> <li>• barramundi - 6% of total net catch</li> <li>• shark - 9% of total net catch</li> <li>• grey mackerel - 3% of total net catch.</li> </ul> <p>The southern areas of the east coast inshore fin fish fishery harvests mainly subtropical fin fish species, such as:</p> <ul style="list-style-type: none"> <li>• mullet</li> <li>• tailor</li> <li>• whiting</li> <li>• flathead</li> <li>• bream</li> <li>• mulloway</li> <li>• school mackerel</li> </ul>
Development	<p>Developmental fishing determines whether a potential new fishery is commercially viable, socially acceptable and ecologically sustainable.</p> <p>Developmental fishing is generally regarded as:</p> <ul style="list-style-type: none"> <li>• fishing for a species of fish that has been previously unexploited or significantly underutilised</li> <li>• fishing for an existing commercial species using apparatus currently not permitted by legislation</li> <li>• fishing for an existing commercial species or use of prescribed apparatus (or both) in locations where such activities have not previously occurred</li> <li>• combinations of the above.</li> </ul>	Developmental Jellyfish Fishery	

#### 2.4.1.11 Commercial Aquaculture – State

The Sydney rock oyster (*Saccostrea glomerata*) is the main species grown in NSW. Commercial production in the State occurs in 41 estuaries between Eden in the south to the Tweed River in the north. Wallis Lake and the Hawkesbury River are the main producing areas.

The Sydney rock oyster industry in NSW is largely dependent on natural spawning. The first spawning of a Sydney rock oyster is usually as a male and subsequent spawnings as a female. During spawning, adult females disperse up to 20 million eggs and males hundreds of millions of sperms into the water when the tide and current are optimal for the widest distribution. Fertilisation takes place in the water column and development continues for up to 3 to 4 weeks as the larval stages of the oyster grow, with the 'spat' ultimately being caught on 'sticks'. Oysters are knocked off these sticks at 0.5 to 3 years of age for growing intertidally on trays until maturity in 3 to 4 years. Alternative growing systems such as baskets and tumblers are also being used, and some oysters are grown subtidally on rafts or on floating culture.

#### 2.4.2 Oil and Gas

Statistics from 2014–2015 showed that oil (38%) and gas (24%) remained Australia's largest energy sources (APPEA, 2017). The industry also contributed approximately \$34 billion to the Australian economy during the 2014–2015 financial year (APPEA, 2016).

Victoria's petroleum (oil and gas) exploration and production is concentrated in the offshore Commonwealth waters of the Otway and Gippsland basins; there are a number of current exploration and offshore production permit areas within both basins (Figure 2-65). Information on the Production licences, Exploration Permits and Retention Leases within Gippsland Basin at the time of writing are presented in Table 2-48.

From 1967–2015, the Gippsland Basin Joint Venture alone produced 54% of Australia's crude oil and gas (DIIS, 2017). Petroleum infrastructure in Gippsland Basin is well developed, with a network of pipelines transporting hydrocarbons produced offshore to onshore petroleum processing facilities at Longford and Orbost (Figure 2-66). Overall production of crude oil and condensate from the Gippsland Basin had been declining for over three decades, while gas production remained steady. However, in recent years, hydrocarbon production has remained relatively strong due to infill drilling in the developed fields and work-overs undertaken to renew down-hole equipment and to open new zones (DIIS, 2017). Total petroleum production from the Gippsland Basin was 74.8 MMboe (11.9 GL) in 2016, up from 61.4 MMboe (9.76 GL) in 2015 (DIIS, 2017).

### 2.4.3 Shipping

The south-east and eastern coasts are some of Australia's busiest in terms of shipping activity and volumes. This traffic includes international and coastal cargo trade, and passenger and ferry services. Major ports include Melbourne, Geelong, Western Port, Sydney and Brisbane; with other minor ports important to commercial and recreational fishing, yachts and other pleasure craft. Bass Strait is one of Australia's busiest shipping areas, with more than 3,000 vessels passing through Bass Strait each year (NOO 2002).

A shipping exclusion zone ('area to be avoided') exists around the operating oil and gas platforms in the Gippsland Basin, whereby unauthorised vessels larger than 200 gross tonnes are excluded from entry (Figure 2-67). Two traffic separation schemes have been implemented to enhance safety of navigation around the 'Area to be Avoided' by separating shipping into one-direction lanes for vessels heading north eastwards and those heading south westwards. One separation area is located south of Wilson's Promontory, and the other south of the Kingfish B platform.

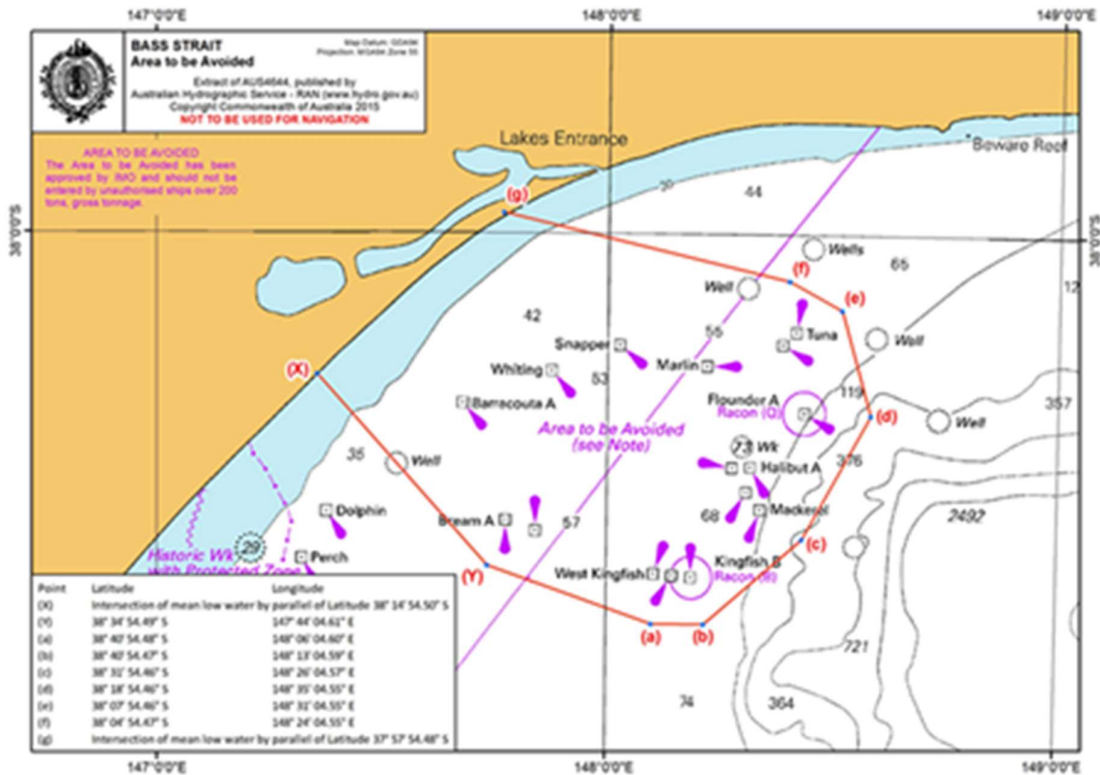

Figure 2-67 Shipping exclusion zones (Area to be Avoided) (ABF, 2017)

Figure 2-68 show real time vessel density maps around the area to be avoided as derived from the position of individual vessels, as broadcast by AIS (Automatic Identification System). Figure 2-69 shows similar time vessel density map for the DA.

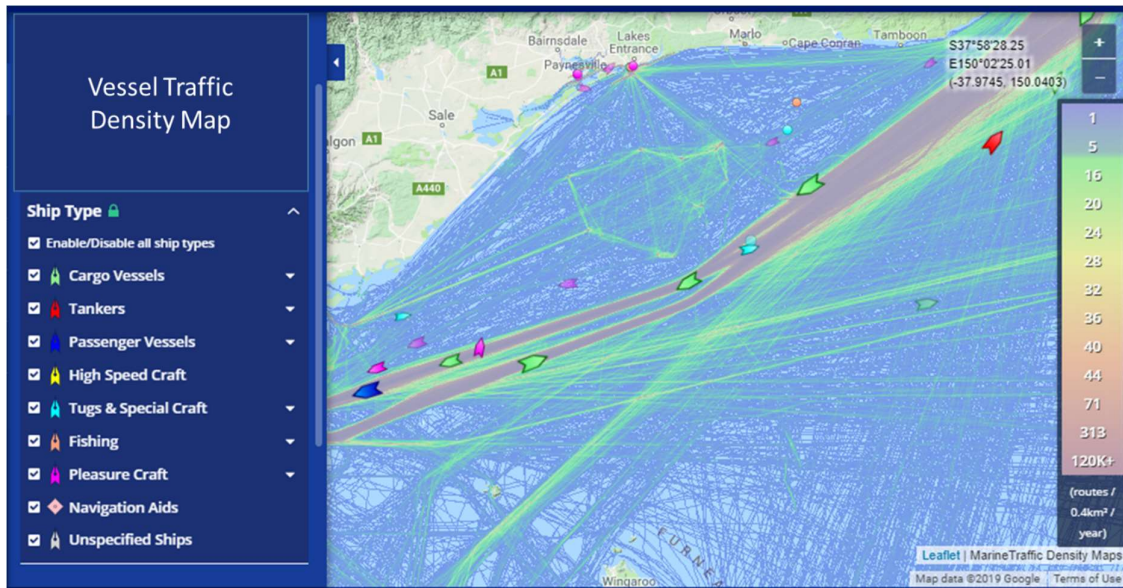

Figure 2-68 Shipping density around the Area to be Avoided real time data April, 2019 (VT, 2019)

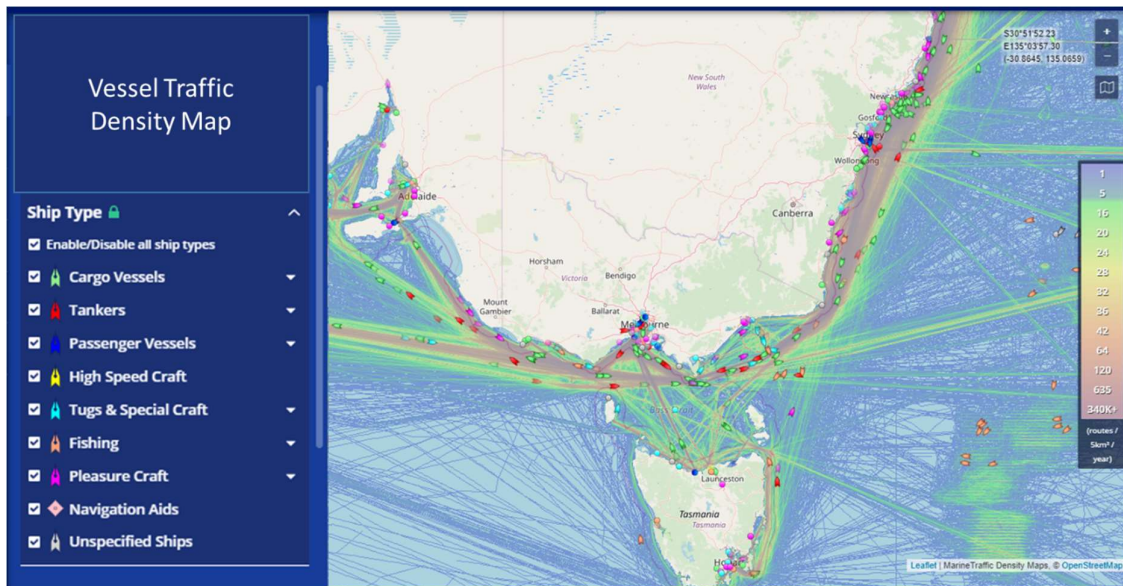

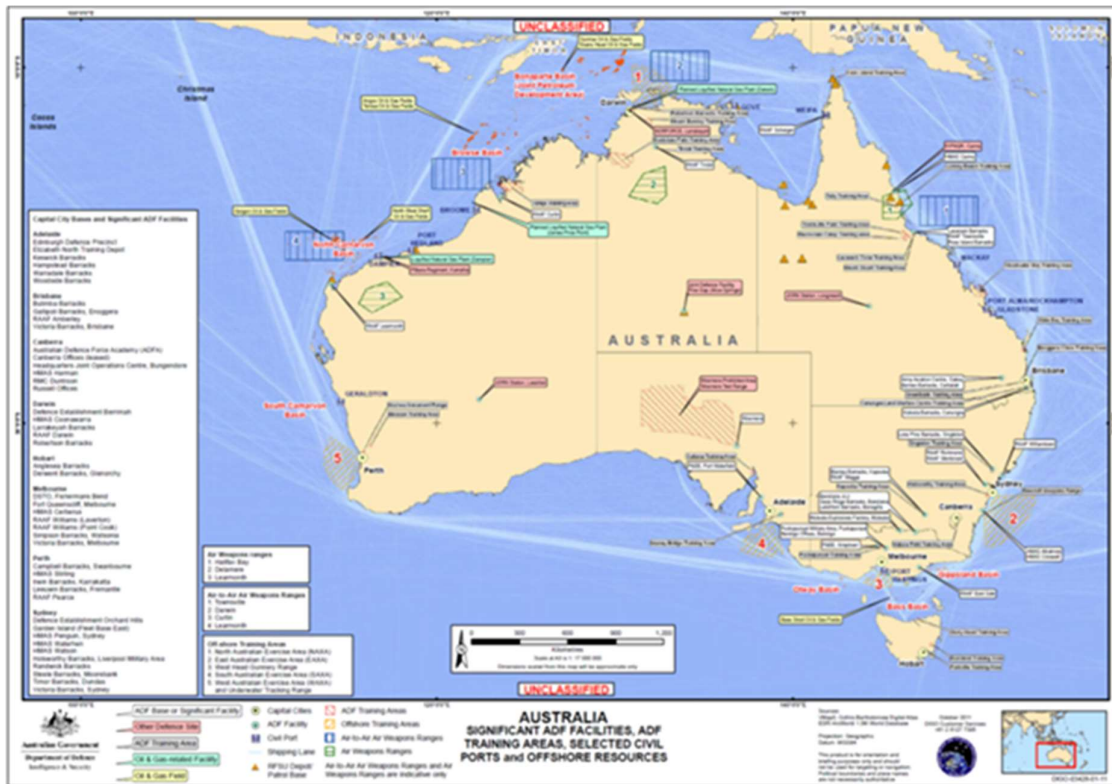

Figure 2-69 Shipping density in the DA real time data May, 2019 (VT, 2019)

### 2.4.4 Defence

The Australian Defence Force conducts a range of training, research activities, and preparatory operations in Australian waters (Figure 2-70). These activities may include transit of naval vessels, training exercises, shipbuilding and repairs, hydrographic survey, surveillance and enforcement, demolition, use of explosives, use of radar, sonar, sonobuoys, flares, sensors and other equipment, and search and rescue.

**Figure 2-70 Significant Defence bases and facilities (Department of Defence, 2014)**

Major defence bases within the DA include the multi-purpose wharf (naval operations) at Twofold Bay, Eden (New South Wales).

Primary training locations within the DA include the East Australia Exercise Area off the south coast of New South Wales.

Mine fields were laid in Australian waters during World War II. Post-war minefields were swept to remove mines and to make marine waters safe for maritime activities. There are three areas identified as dangerous due to unexploded ordnances, located south and east of Wilson's Promontory.

### 2.4.5 Tourism

The Australian coast and marine waters provide a diverse range of recreation and tourism opportunities, including scuba diving, charter boat cruises, cruise shipping, whale and wildlife watching, sailing, snorkelling, surfing, and kayaking.

In 2013-2014 the tourism industry contributed approximately \$1.2 billion to the Gippsland economy; and employed approximately 12,400 (12.2%) (Tourism Victoria, 2014a, 2014b). Overnight visitors to the Gippsland area were predominantly Australian (86% intrastate, 11% interstate), with low (3%) international visitors (Tourism Victoria, 2014a). In East Gippsland, primary tourist locations are the Gippsland Lakes (the largest inland waterway in Australia), Lakes Entrance, Marlo, Cape Conran and Mallacoota. The area is renowned for its nature-based tourism (e.g. Croajingolong National Park), recreational fishing and water sports (lake and beaches) (Travel Victoria, 2017).

NSW has the highest expenditure and most domestic and international visitors in all of Australia, even excluding Sydney, regional NSW leads regional Australia in its share of visitors (Destination NSW, 2019). In 2017-2018 the South Coast NSW tourism industry contributed \$2.6 billion to the economy. National and international visitor surveys identified 'going to the beach' as the second most popular activity (Destination NSW, 2018). The South Coast Region includes all the towns from Wollongong

south to the Victorian border. The northern NSW regions, including Central, Hunter and North coast, collectively contributed approximately \$9.3 billion to the economy (Destination NSW, 2019).

Tourism in Tasmania directly contributed \$1.44 billion or about 4.9% to Tasmania's Gross Product in the 2016-2017 period (TT, 2019). It directly supports around 18 900 jobs in Tasmania or about 7.9 per cent of total Tasmanian employment.

Tourism directly and indirectly supports around 38,000 jobs in Tasmania or about 15.8% of total Tasmanian employment - higher than the national average and the highest in the country.

The East Coast has been identified as one of the most tourism-dependent regions in Australia. Port Arthur and the Freycinet National Park are rated in the top ten destinations in Tasmania (DT, 2019).

Visitors to the three, southern most tourist regions of QLD (Gold Coast, Brisbane and Sunshine Coast) spent over \$15 billion in the year ending September 2019 (TEQ, 2020a), representing three of the top four tourist regions in Qld (Tropical North Queensland is the 3<sup>rd</sup> highest performing region). Tourism is QLD's third largest export industry and supports over 200,000 jobs directly and indirectly (TEQ, 2020b).

## 2.5 Cultural

The *Commonwealth Heritage List* (DCCEEW, 2021) is a list of Indigenous, historic and natural heritage places owned or controlled by the Australian Government which have a significant heritage value to the nation. These and other places within the DA with cultural values are described in this section.

### 2.5.1 Indigenous

Only one indigenous place is listed on the *Commonwealth Heritage List* (DCCEEW, 2021) within the DA: the Jervis Bay Territory (refer Booderee National Park, Section 2.2.8.73). Other listed indigenous places are terrestrial and within a listed place, and so will not be impacted by activities. Other indigenous protected and recognised places are described below. In addition, places with indigenous cultural values are described within the National Parks and Reserves where they exist (Refer Section 2.2.8).

#### Indigenous Protected Areas

Indigenous Protected Areas (IPAs) are an essential component of Australia's National Reserve System, which is the network of formally recognised parks, reserves and protected areas across Australia, designed to protect the nation's biodiversity. Indigenous Protected Areas protect cultural heritage into the future, and provide employment, education and training opportunities for Indigenous people in remote areas. There are five IPAs that occur over 100 kilometres from the nearest DA, on and around Flinders Island to the southwest as seen in Figure 2-71. They are all important rookeries for mutton birds and important cultural resources for Tasmanian Aboriginal people.

In April 2021, the Australian Government committed funding to the Sea Country IPA Program, under which grants will be provided to Indigenous organisations to expand existing IPAs and create new IPAs (DCCEEW, 2023). The program seeks to increase the area of sea within IPAs in Australia. Ten Sea Country IPA consultation projects were announced in May 2022, including the Nanjit to Mallacoota Sea Country IPA consultation project, which extends from Corner Inlet to the Victoria/New South Wales border (Figure 2-72). The Gunaikurnai Land and Waters Aboriginal Corporation (GLaWAC) has signed an agreement with the Australian Government to start the process of establishing the Sea Country IPA and is currently undertaking engagement with families and clans who may have an interest in participating in the development of the IPA (GLaWAC, 2023). The proposed Sea Country IPA area is illustrated in Figure 2-69 and is located in coastal waters, including the Gippsland Lakes and estuaries around Mallacoota, over 35 kilometres from the nearest DA.

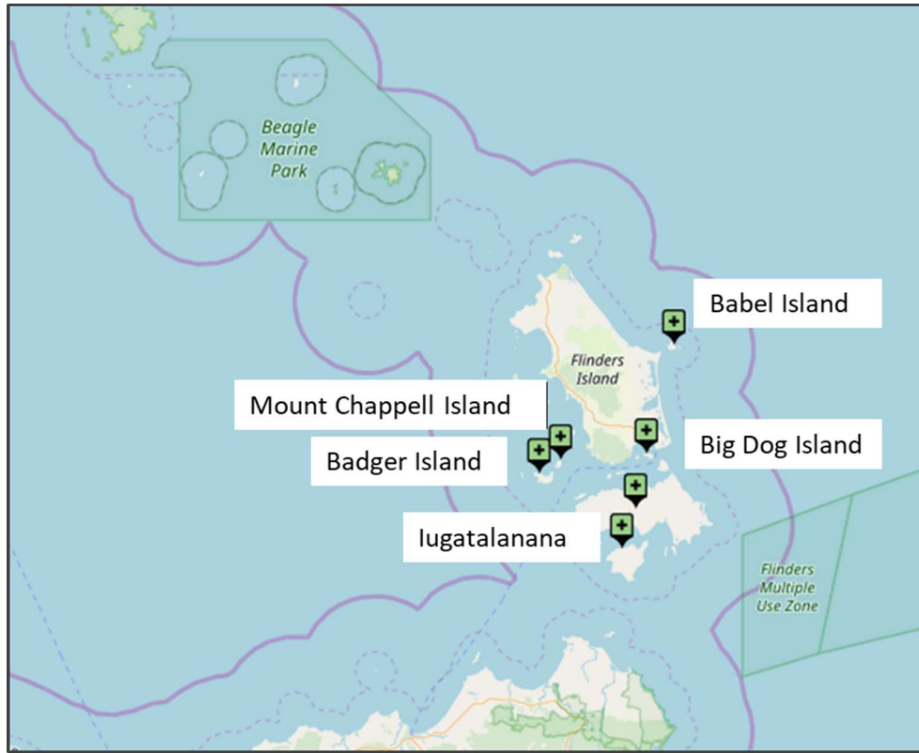

Figure 2-71 Indigenous Protected Areas in the DA (DMPC, 2019 a)

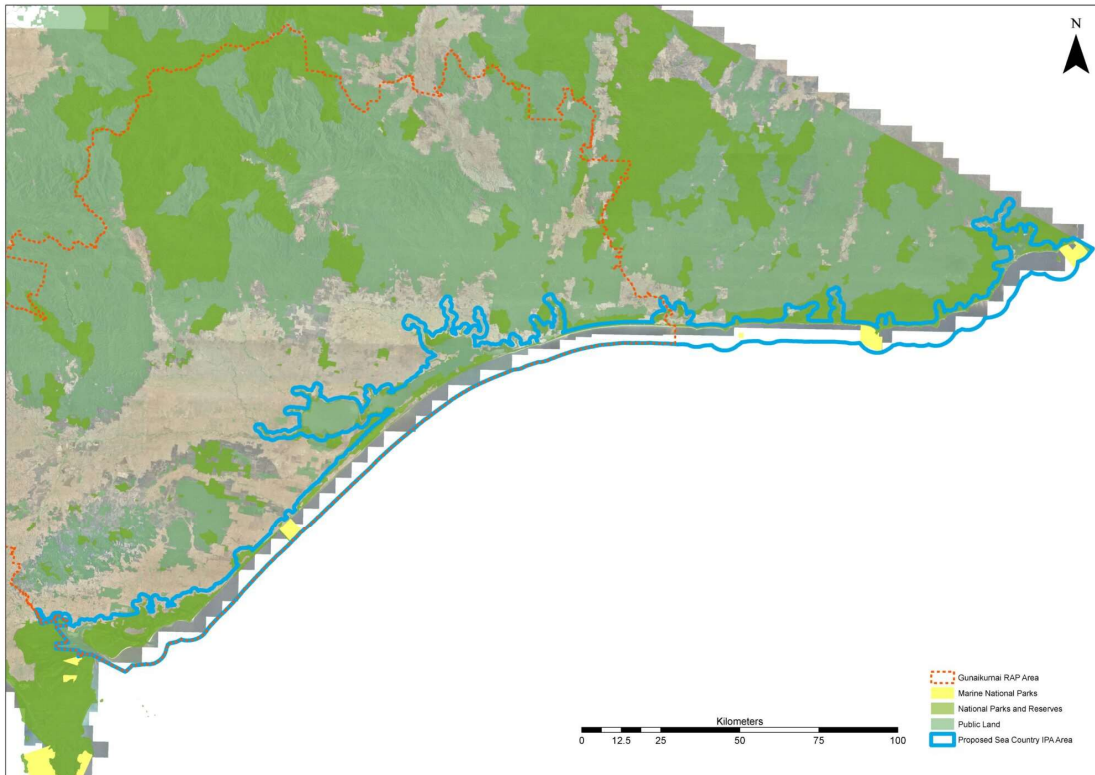

Figure 2-72 Proposed Nanjtit to Mallacoota Sea Country IPA

## Native Title

Non-exclusive native title rights and interests that exist over land and water in the determination area include:

- Rights of access.
- Rights to use and enjoy the land.
- Rights to take resources from the land for non-commercial purposes.
- Rights to protect and maintain sites of importance within the determination area.
- Rights to engage in certain activities on the land (including camping, cultural activities, rituals, ceremonies, meetings, gatherings, and teaching about the sites of significance within the determination area).

These rights do not confer exclusive rights of possession, use and enjoyment of the land or waters. Native title does not exist in minerals, petroleum or groundwater.

The Gunaikurnai people hold native title over much of Gippsland. The native title determination area (Tribunal file no. VCD2010/001) covers approximately 45,000 hectares and extends from west Gippsland near Warragul, east to the Snowy River, and north to the Great Dividing Range, (Figure 2-73). It also includes 200 metres of offshore sea territory between Lakes Entrance and Marlo. The area includes 10 parks and reserves that are jointly managed by the Victorian government and the Gunaikurnai people (NNTT, 2010). The closest of these parks and reserves to the DAs are the Gippsland Lakes Coastal Park and the Lakes National Park, located approximately 25km from the closest DA. The Gunaikurnai people have occupied, used and managed the coastal land and sea environment along the coastline adjacent to the DA for many thousands of years. These include areas that were dry land before the current sea level stabilised about 5,000 years ago. During the last Ice Age approximately 25,000 years ago, coastlines were on average 125m lower than the present day (Umwelt, 2022). The Gunaikurnai peoples cultural and spiritual connection with these landscapes continues, even where evidence of previous occupation now lies beneath the ocean (GLaWAC, 2015).

In the past, coastal wetlands were highly productive areas for hunter-gatherer people, having a variety of habitats and species, so the majority of archaeological sites in Victoria are found within 1 km of the coast (LCC, 1993). Along the Gippsland coast, stone artefacts that have been found were mostly made from silcrete and quartz from the hinterland. Middens on offshore islands indicate that in the past, Aboriginal people from the area now known as Wilsons Promontory were likely to have visited (Jones & Allen, 1979).

The Gunaikurnai people see no distinction between the land and the sea – it is all part of Country (GLaWAC, 2023). ‘Sea Country’ can include parts of open ocean, beaches, land and freshwater on the coast. It encompasses all living things, beliefs, values, creation spirits and cultural obligations connected to an area (The University of Adelaide, 2023). Water is of particular cultural significance to First Nations people as an integral part of songs, ceremonies, hunting and collecting, and other activities that bind people to their country and each other, including fishing (Smyth, Egan, & Kennett, 2018).

Coastal environments are an integrated cultural landscape/seascape that is conceptually very different from the broader Australian view of land and sea. Protecting this cultural heritage is a major concern for First Nation people (National Oceans Office, 2022).

At the time of writing a Native Title Claimant Application was registered by the Gunaikurnai people (VID734/2014) for an area covering the Wilsons Promontory area (NNTT, 2022). The Gunaikurnai people’s native title determination does not extend to offshore (Commonwealth) waters. However, native title rights and interests can be recognised in offshore waters. In September 2019, the Gunaikurnai withdrew the claim.

There are no native title determinations in NSW within the limits of the DA however a Native Title Claimant Application was registered by the South Coast People (NSD1331/2017) for an area covering the NSW south coast from the south of Sydney to Eden, including the coastal waters (NNTT, 2018). Indigenous places along the southern NSW coast include Barlings Beach, Ten Pelican Lake BrouBarunguba Aboriginal Place, Mystery Bay Fish Trap, Merriman Island and Bermagui Waterhole (NSW OEH, 2019a).

There are no native title determinations in Tasmania, although there are areas of indigenous cultural significance and indigenous protected areas including Mt Chappell Island, Badger Island, Babel Island, Great Dog Island in the Ferneaux Group (DPMC, 2019).

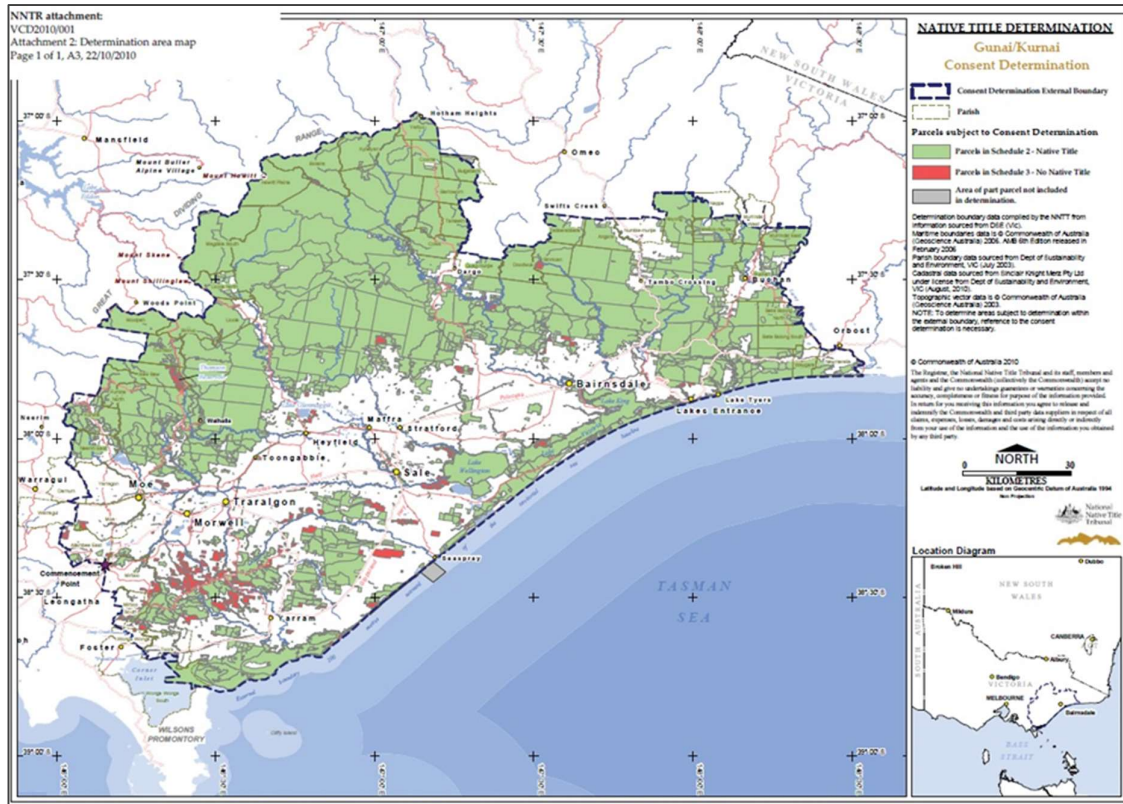

Figure 2-73 Gunaikurnai Native Title Determination Area (VCD2010/01)

### 2.5.2 Natural

The *Commonwealth Heritage List* (DCCEEW, 2021) is a list of Indigenous, historic and natural heritage places owned or controlled by the Australian Government. There are four listings on the *Commonwealth Heritage List* (DCCEEW, 2021) under the natural classification which occur in the DA.

- Point Wilson is an important part of the Western Port Phillip Bay Ramsar Area in Victoria, an internationally significant wetland that provides habitat for many migratory and resident wading birds and waterfowl. The Point Wilson Defence Area is a productive and diverse wetland and saltmarsh habitat supporting many shorebirds.
- The Beecroft Peninsula is the best example of a Permian cliffed coast in New South Wales. It is about 4040ha south of the town of Currarong. The area supports a high diversity of vegetation types within a small area including mangroves, saltmarsh, freshwater swamps, heathland, eucalypt forest and subtropical and littoral rainforest. Beecroft Peninsula retains the largest area of heath remaining on the south coast of New South Wales. This floristically rich vegetation provides important habitat for a variety of bird species, including the vulnerable ground parrot (*PEZOPORUS WALLICUS*). The peninsula, and associated Jervis Bay Sea Cliffs, are recognised Nationally Important Wetlands; the place supports 35 bird species listed on international migratory bird treaties (JAMBA, CAMBA, and the Bonn Convention). The ground parrot (*PEZOPORUS WALLICUS*), which is listed as vulnerable in New South Wales, occurs in heath, swamp and sedgeland habitats and has an estimated maximum population size of 450 individuals on the peninsula. The area of Commonwealth land on the Beecroft Peninsula at Jervis Bay is of particular significance to the Jerinja and Wreck Bay Aboriginal communities as part of their traditions. There are a large numbers of middens mainly located near the beaches on the southern and western sides of the Peninsula that contain evidence of past

patterns of Aboriginal exploitation of marine resources. The Beecroft Peninsula also contains the Currarong Rockshelters Area and Crocodile Head Area (heritage listed terrestrial features).

- The Malabar Headland just north of Botany Bay, NSW contains two significant bushland remnants – referred to as the coastal section and the western section. Together, these contain what is probably the largest area of essentially unmodified bushland in Sydney’s Eastern Suburbs. The bushland is a significant part of one of two semi-natural corridors between Botany Bay and Port Jackson. The two sections support at least seven distinct plant communities. This diversity of habitats is only matched in the Eastern Suburbs in Botany Bay National Park (DoEE, 2019a).
- Tasmanian Seamounts Area – also a key ecological feature, refer to Section 2.2.7.5 for information on the Seamounts South and East of Tasmania.

### 2.5.3 Historic – Commonwealth Heritage

The majority of listings on the *Commonwealth Heritage List* (DCCEEW, 2021) under the historic classification which occur in the DA are lighthouses; these and the other listings are not considered relevant.

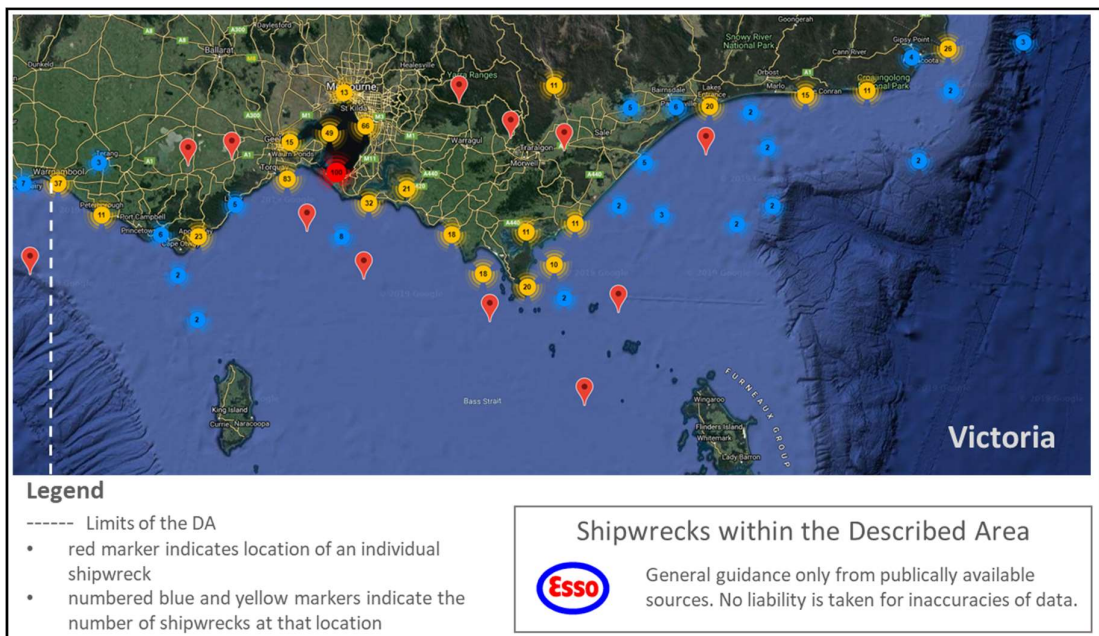

No Historic Indigenous Commonwealth listed places were found within the DA (DoEE, 2019am).

#### 2.5.3.1 Historic – Maritime

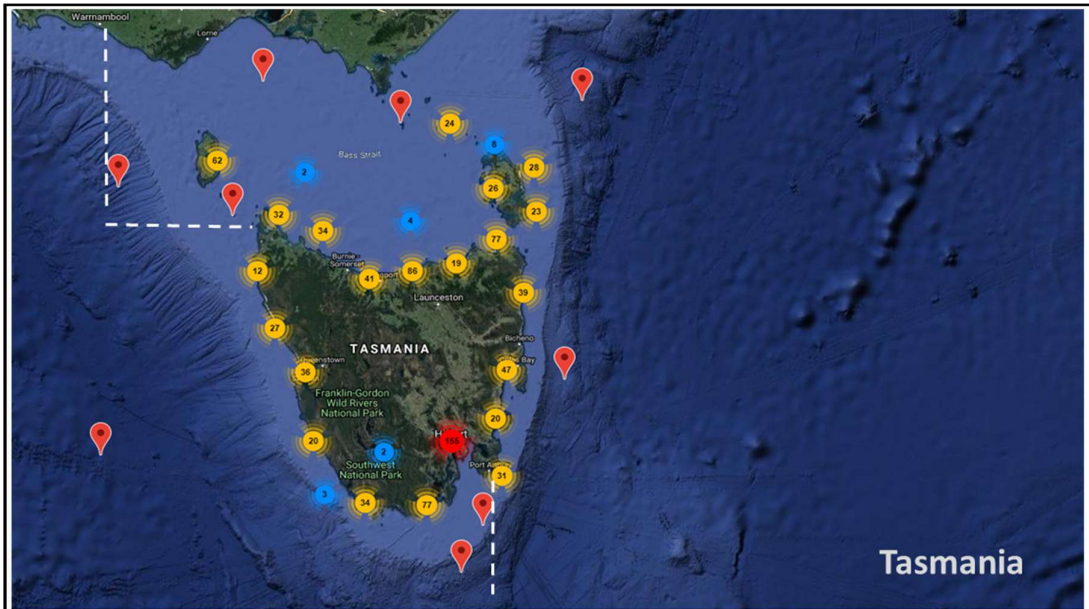

A search of the National Shipwrecks Database which includes all known shipwrecks in Australian waters, identified 1160 historic shipwrecks within the DA at the time of writing. The Historic Shipwrecks Act, 1976, protects historic wrecks that are more than 75 years old and in Commonwealth waters (DoEE, 2019g). Table 2-49 below summarises both the historic and other shipwrecks within the DA, by state. Figure 2-74 maps the location of the shipwrecks.

**Table 2-49 Shipwreck numbers within the DA by state**

	Historic Shipwrecks	Other Shipwrecks
Victoria	417	126
Tasmania	415	167
New South Wales	328	76
Queensland	172	54

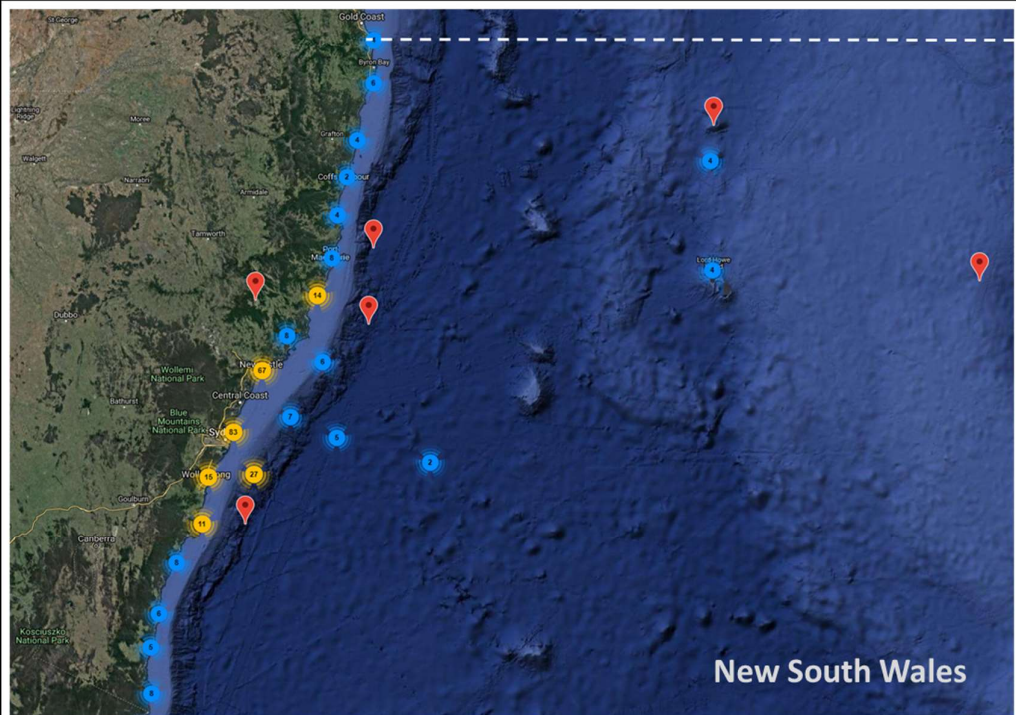

**Legend**

- Limits of the DA
- red marker indicates location of an individual shipwreck
- numbered blue and yellow markers indicate the number of shipwrecks at that location

**Shipwrecks within the Described Area**

General guidance only from publically available sources. No liability is taken for inaccuracies of data.

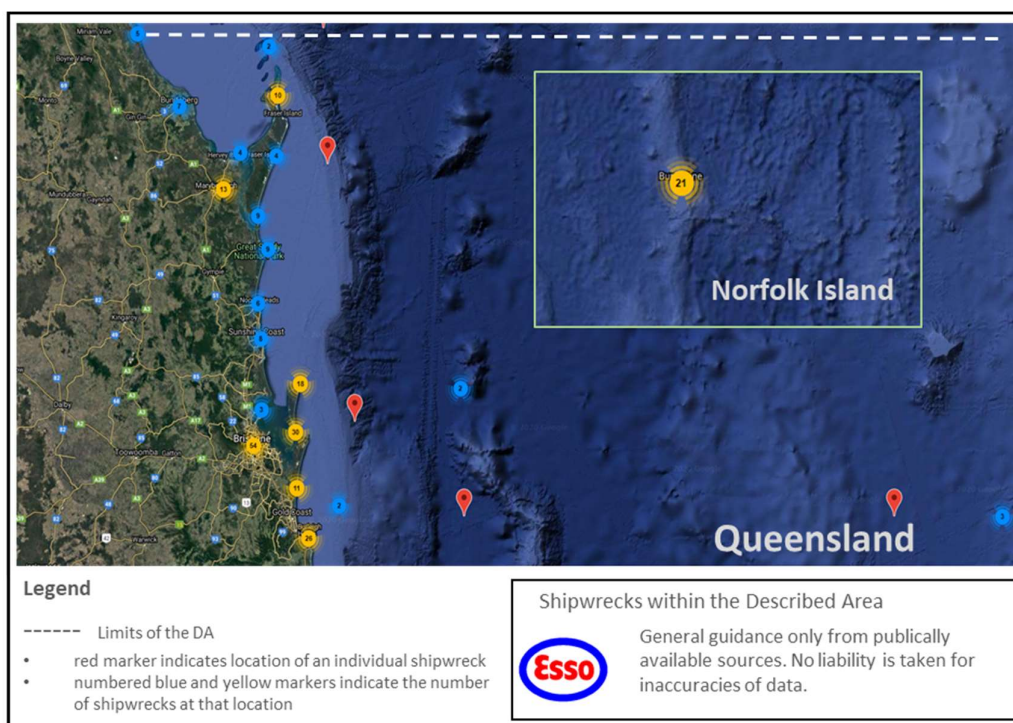

**Legend**

- Limits of the DA

**Figure 2-74 Shipwreck sites in the DA as listed in the National Shipwrecks Database (DoEE, 2019)**

Table 2-50 lists the shipwrecks within the ATBA; five of these are along the coastline and none occur within the exclusion zones of the production facilities.

**Table 2-50 Shipwrecks within the Area to Be Avoided.**

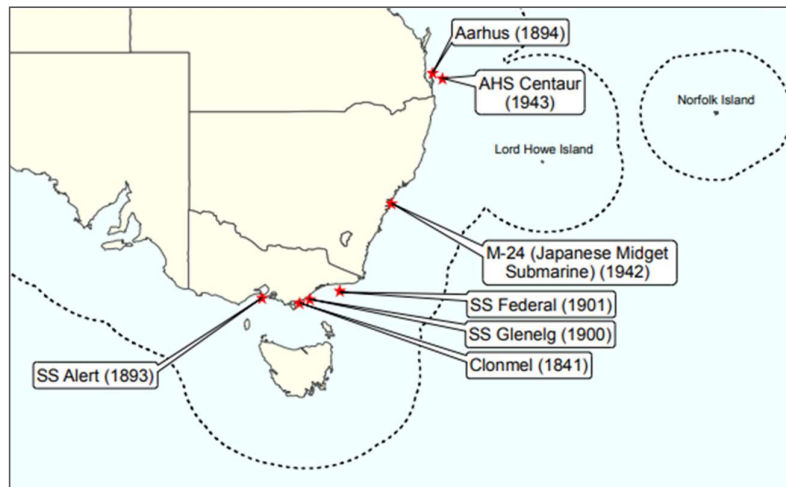

Vessel Name	Year wrecked	Location Latitude	Location Longitude
Struan Sailing vessel	1856	-38.5	147.75
Rembrandt Sailing vessel	1861	-38.67	148.2
Talark	unknown	-38.37	148.3
Favourite Sailing Vessel	1852	-38.215	147.95
Unidentified (ID 6719)*	unknown	-37.98	147.79
Latrobe Sailing Vessel*	1978	-37.97	147.79
Pretty Jane*	1882	-38.045	147.64
Norfolk Screw Steamer*	1914	-38.055	147.61
Julius*	1892	-38.09	147.565
Leven Lass	1854	-38.165	148.46
Colleen Bawn	1913	-38.265	147.425

\* Coastal shipwrecks

Some historic shipwrecks lie within protected or no-entry zones. These zones cover an area around a wreck site, and ensure that a fragile or sensitive historic shipwreck is actively managed.

Five of the historic shipwreck protected zones occur within nearshore coastal waters of the DA (Figure 2-75):

- SS Alert (1893)
- Clonmel (1841)
- SS Glenelg (1900),
- SS Federal (1901) and
- M24 (Japanese Midget Submarine) (1942)
- AHS Centaur (1943)
- Aarhus (1894)

**Figure 2-75 Historic Shipwreck Protected Zones within DA (ERIN, 2017)**

The SS Glenelg, located approximately 10km from the EGBPA at the entrance to Gippsland Lakes, was a twin screw steamer owned by J.B.Ellerker. It was put on the coastal run during 1893 in opposition to Huddart Parker's S.S. Despatch. The vessel foundered suddenly on 25 March 1900, shortly after leaving Lakes Entrance. Only three people got ashore in a lifeboat. At the Marine Court of Inquiry, a number of possible reasons for the disaster were suggested. However, no evidence was found to explain the sinking, which took 38 lives.

The Clonmel is a famous Australian historic shipwreck located at the entrance to Corner Inlet approximately 60km west of the EGBPA. The luxury paddle steamer Clonmel was one of the first steamships to operate in Australian waters and was built especially for the Australian intercolonial passenger trade, intending to ply the sea-route between Sydney, Melbourne and Launceston in the early 1840s. It was also one of the last wooden steamships to be built before iron became the more popular construction material.

On just its second inter-colonial voyage, en route from Sydney to Port Phillip (Melbourne) with 80 passengers and crew, the Clonmel stuck a sandbar on the east coast of Victoria. All passengers were transferred to the shore, where a makeshift survivors' camp was established. The passengers stayed for nine days after the wrecking, before being finally transferred to their destination.

Favourable descriptions of the arable land and 'welcoming bay' near the wrecksite were seized upon with great enthusiasm by the press and shortly thereafter the Gipps Land Company was formed. The wreck of the Clonmel was consequently instrumental in opening up East Gippsland for trade and pastoral settlement, and throughout the 1850s and 1860s was the centre of trade for south eastern Victoria (DOEE, 2019). Little is known about the SS Federal other than it was last seen in Cape Everand off Bass Strait. It was discovered during mine sweeping operations in World War I.

Both the M24 submarine and the AHS Centaur were wrecks resulting from World War II. No one knew of the fate of the M24 until it was discovered in 2006. It was last seen leaving Sydney in May 1942. The AHS Centaur was a merchant ship converted to an Australian Hospital Ship (AHS) but was torpedoed on its first medical voyage by the Japanese resulting in 268 casualties (DAWE, 2020f). The Aarhus, wrecked in 1894 was an Iron sailing Barque which sailed from New York and wrecked on Smith Rock

off cape Morton whilst waiting for a pilot vessel. It is now a popular dive site as the wreck is in 21m of water (DEHP, 2020).

## 2.6 Social Environment

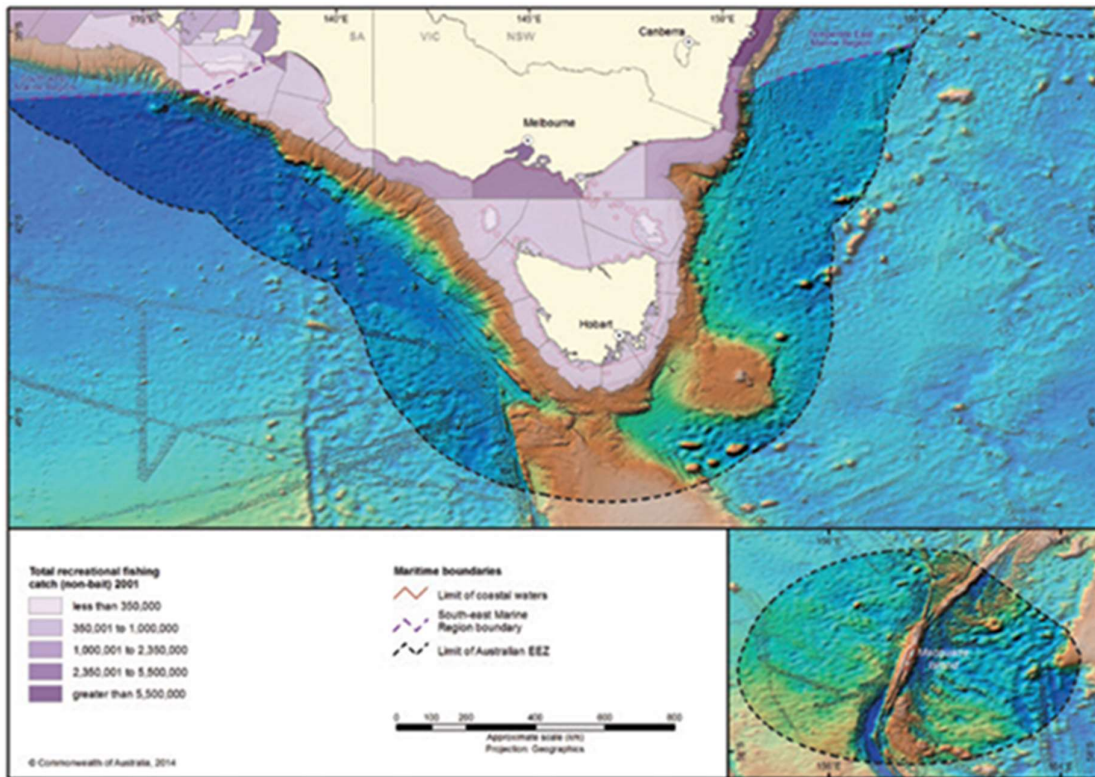

The Social values of the environment can be defined in many ways and the relative importance of the values will vary depending on the perspective and interests of the people, groups or organisations affected (or otherwise). Social values, therefore can be described in terms of conservation and biodiversity values (Section 2.2), economic drivers (Section 2.4) or cultural significance (Section 2.5). These values have been described in the sections noted. This section describes the values of the recreational activities in the DA.

### 2.6.1 Recreational Fishing

Recreational fishing in Australia is a multi-billion dollar industry. Most recreational fishing typically occurs in nearshore coastal waters (shore or inshore vessels), and within bays and estuaries. Offshore fishing (>5 km from the coast) only accounts for approximately 4% of recreational fishing activity in Australia; charter fishing vessels are likely to account for the majority of this offshore fishing activity.

The variation in recreational fishing intensity along the coast is illustrated in Figure 2-76; there is moderate to high recreational use along the majority of the coast in the DA. Common recreational fish species include Tiger Flathead, bream, snapper, Australian Salmon, and lobster. Offshore catches can include mackerel, tuna, groper and shark.

Recreational fishing amongst the Nooramunga islands, on the Gippsland Lakes, along Ninety Mile Beach, at Cape Conran Coastal Park and Croajingolong National Park and off the coast of Mallacoota, comprising both boat based fishing and beach based surf fishing. Boat based fishing includes charter operations and private craft launched from boat ramps in the region. Boatyards and slipways are located at Bullock Island (Lakes Entrance), Port Welshpool and Mallacoota.

**Figure 2-76 Recreational Fishing Catch in Temperate East (top) and South-eastern (bottom) Marine Region (DoEE, 2015a)**

### 2.6.2 Recreational Boating and Leisure Activities

Australia and its people are renowned for their love of the outdoors – the outback and the beaches are often celebrated as part of its (our) cultural identity. With the majority of the population residing in coastal areas, recreational boating, coastal camping, hiking, touring and visits to the beach are leisure activities accessible to all most people and are integral to life in Australia for all ages. Popular coastal destinations are located across the coastline of the DA. Further description of declared parks and reserves are provided in Section 2.2.8.

## 3 Legislative and other requirements

### 3.1 Legislative Framework

The principal offshore legislation for production activities beyond three nautical miles to the outer extent of the Australian Exclusive Economic Zone at 200 nautical miles is the Commonwealth Offshore Petroleum and Greenhouse Gas Storage (OPGGS) Act 2006. The OPGGS Act is administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

### 3.2 Relevant Legislation

In accordance with Regulation 13(4), relevant Commonwealth, Victorian, New South Wales and Tasmanian Legislation as it applies to the operation of facilities and petroleum pipelines and projects is provided in Table 3-1, Table 3-2, Table 3-3 and Table 3-4 respectively.

The Australian Petroleum Production and Exploration Association (APPEA) Code of Environmental Practice 2008 provides guidance on a set of recommended minimum standards for petroleum industry activities offshore. These standards are aimed at minimising adverse impact on the environment, and ensuring public health and safety by using the best practical technologies available.

The Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC 2000) are also relevant to the activity and provide water quality guidelines proposed to protect and manage the environmental values supported by the water resources.

### 3.3 Federal Court Decisions

On 21 September 2022, the Federal Court of Australia ruled in the *Tipakalippa vs NOPSEMA (No. 2) [2022] FCA 1121* case to set aside NOPSEMA's decision to accept an EP (the Santos Barossa Development Drilling and Completions EP) on the basis NOPSEMA could not be reasonably satisfied that the EP met the criteria specified in the OPGGS (Environment) Regulations. This ruling specifically related to the undertaking of relevant person consultation, as required by Regulation 11A of the OPGGS (Environment) Regulations. A subsequent appeal to this decision, *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193*, was dismissed by the Federal Court on the 2 December 2022. From this date, the appeal decision represents the law regarding requirements for consultation in accordance with the OPGGS (Environment) Regulations. Following the Federal Court decisions, NOPSEMA has developed a guideline for industry *Consultation in the course of preparing an environment plan* (NOPSEMA, 2022). This guideline and the appeal decision have informed the preparation of this EP.

	aviation, maintenance; general operational and flight rules; and aerial application operations.	could have environmental impacts as described in Vol 2.	
Radiocommunications Act 1992	The Act provides for the <b>management of the radiofrequency spectrum</b> in order to make adequate provision of the spectrum for use by agencies involved in the defence or national security of Australia, law enforcement or the provision of emergency services; and for use by the public or community services.	Radiocommunications systems on platforms, vessels and aircraft operate within frequency ranges permitted under the Act. Clear communication channels are required to enable effective controls preventing or limiting potential impacts from incidents (e.g., collision, emergency response) as defined in Vol 2 and Vol 3 Prevention of collision	Australian Communications and Media Authority (ACMA)

**Table 3-2 Key Victorian legislation**

Legislation	Coverage
Environment Protection Act 1970	This Act is the key Victorian Legislation regulating emissions to the environment within Victoria (relevant for waste transfer and disposal, National Pollutant Inventory reporting). Administered by the Victorian Environment Protection Authority.
Pollution of Waters by Oil and Noxious Substances Act 1986	This Act is the Victorian state legislation giving effect to the requirements of MARPOL 73/78 within state waters. Administered by the Victorian Environment Protection Authority
Emergency Management Act 1986	This Act ensures that the components of emergency management (prevention, response and recovery) are organised to facilitate planning, preparedness, operational coordination and community participation. Administered by Department of Justice's Police and Emergency Management Victoria..
Port Management Act 1995	Under this Act all managers of local and commercial ports must prepare a Safety Management Plan and Environmental Management Plan (together known as SEMPs).
Marine Safety Act 2010	This Act provides for safe marine operations in Victoria.

Legislation	Coverage
Heritage Act 1995	This Act is the Victorian state legislation which protects the heritage values of shipwrecks and relics within state waters. Administered by the Heritage Council of Victoria.
National Parks Act 1975	This Act provides for the protection, use and management of Victoria's national and other parks. Administered by the Department of Energy, Environment and Climate Action.
Radiation Act 2005	This Act provides for licencing for use and management of radioactive sources, and conducting radiation practice (including radiation testing).
Catchment and Land Protection Act 1994	This Act sets up a framework for the integrated management and protection of catchments. Administered by the Catchment Management Authorities.
Coastal Management Act 1995	This Act provides for co-ordinated strategic planning and management for Victorian coast, the preparation and implementation of management plans for coastal Crown land and a co-ordinated approach to approvals for use and development of coastal Crown land.
Land Titles Validation Act 1994	This Act validates past acts, provides for compensation rights for the holders of native title which has been affected by past acts, and confirms certain existing rights. The Act also confirms ownership by the Crown of natural resources, the right to regulate water flows and existing fishing rights under State law; and public access to waterways, beds and banks of waterways, coastal waters, beaches and public areas.
Dangerous Goods Act 1985	This Act, the associated Dangerous Goods (Storage and Handling) Regulations 2012 and the Code of Practice for the Storage and Handling of Dangerous Goods 2013 (WorkSafe) promotes the safety of persons and property in relation to the manufacture, storage, transfer, transport, sale, purchase and use of dangerous goods and the import of explosives and other dangerous goods.
OPGGS Act 2010 and OPGGS Regulations 2011	This Act and Regulations apply to petroleum operations effectively within three nautical miles of the Victorian coast and address licensing, health, safety, environmental and royalty issues for offshore petroleum exploration and development operations. Waters greater than 3 nautical miles offshore from the coast are Commonwealth waters and are covered by Commonwealth legislation ( <i>OPGGS Act 2006</i> ). The Commonwealth and Victorian legislation are, by agreement, very similar with regard to petroleum.

**Table 3-3 Key New South Wales legislation**

Legislation	Coverage
Protection of the Environment Operations Act 1997	This is the main piece of NSW environmental legislation covering water, land, air and noise pollution and waste management. Administered by the NSW Environment Protection Authority
Marine Pollution Act 2012	This Act is the NSW state legislation giving effect to the requirements of MARPOL 73/78 within state waters. Administered by Transport for NSW.

Ports and Maritime Administration Act 1995	This Act provides for the provision of marine safety services and emergency environment protection services for dealing with pollution incidents in NSW waters.
Heritage Act 1977	This Act provides for the identification, registration and interim protection of items of State heritage significance (including shipwrecks within state waters) in NSW. Administered by Heritage Council of NSW.
National Parks and Wildlife Act 1974	This Act provides for the care, control and management of all national parks, historic sites, nature reserves, conservation reserves, Aboriginal areas and game reserves, and the protection and care of native flora and fauna, and Aboriginal places and objects. Administered by the NSW National Parks and Wildlife Service.
Wilderness Act 1987	This Act affords declared wilderness the most secure level of protection, requiring it to be managed in a way that will maintain its wilderness values and pristine condition by limiting activities likely to damage flora, fauna and cultural heritage. Administered by the NSW National Parks and Wildlife Service.
Marine Parks Act 1997	This Act provides for the protection and management of marine areas. Administered by the NSW Marine Parks Authority.

**Table 3-4 Key Tasmanian legislation**

Legislation	Coverage
Environmental Management and Pollution Control Act 1994	This is the primary environment protection and pollution control legislation in Tasmania. Administered by the Environment Protection Authority Tasmania
Pollution of Waters by Oil and Noxious Substances Act 1987	This Act is the Tasmanian state legislation giving effect to the requirements of MARPOL 73/78 within state waters. Administered by Environment Protection Authority Tasmania.
Emergency Management Act 2006	This Act establishes the Tasmanian emergency management framework which operates at state, regional and municipal levels.
Marine and Safety Authority Act 1997	This Act establishes Marine and Safety Tasmania as the authority responsible for the safe No probs. operation of vessels in Tasmanian waters and managing its marine facilities.
Historic Cultural Heritage Act 1995	This Act provides for the identification, assessment, protection and conservation of places having historic cultural heritage significance (including shipwrecks within state waters) in Tasmania. Administered by Tasmanian Heritage Council and Historic Heritage Section of Parks and Wildlife Service Tasmania (shipwrecks).
National Parks and Reserves Management Act 2002	This Act provides for the management of national parks and other reserved land. Administered by the Parks and Wildlife Service Tasmania.

## APPENDIX A – Esso’s Environmental Policy

### INTRODUCTION

The high quality of the directors, officers, and employees of Exxon Mobil Corporation is the Corporation’s greatest strength. The resourcefulness, professionalism, and dedication of those directors, officers, and employees make the Corporation competitive in the short term and well positioned for ongoing success in the long term.

The Corporation’s directors, officers, and employees are responsible for developing, approving, and implementing plans and actions designed to achieve corporate objectives. The methods we employ to attain results are as important as the results themselves. The Corporation’s directors, officers, and employees are expected to observe the highest standards of integrity in the conduct of the Corporation’s business.

The Board of Directors of the Corporation has adopted and oversees the administration of the Corporation’s *Standards of Business Conduct*. The policies in the *Standards of Business Conduct* are the foundation policies of the Corporation. Wholly-owned and majority-owned subsidiaries of Exxon Mobil Corporation generally adopt policies similar to the Corporation’s foundation policies. Thus, the Corporation’s foundation policies collectively express the Corporation’s expectations and define the basis for the worldwide conduct of the businesses of the Corporation and its majority-owned subsidiaries.

The directors, officers, and employees of Exxon Mobil Corporation are expected to review these foundation policies periodically and apply them to all of their work. The Corporation publishes from time to time guidelines with respect to selected policies. Those guidelines are interpretive and administrative and are not part of the *Standards of Business Conduct*. Any employee who has questions concerning any aspect of these policies should not hesitate to seek answers from management or the other sources indicated in the section below called “Procedures and Open Door Communication.”

No one in the ExxonMobil organization has the authority to make exceptions or grant waivers with respect to the foundation policies. Regardless of how much difficulty we encounter or pressure we face in performing our jobs, no situation can justify the willful violation of these policies. Our reputation as a corporate citizen depends on our understanding of and compliance with these policies.

Darren W. Woods  
Chairman  
January 2017

## ENVIRONMENT POLICY

It is Exxon Mobil Corporation's policy to conduct its business in a manner that is compatible with the balanced environmental and economic needs of the communities in which it operates. The Corporation is committed to continuous efforts to improve environmental performance throughout its operations.

Accordingly, the Corporation's policy is to:

- comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist;
- encourage concern and respect for the environment, emphasize every employee's responsibility in environmental performance, and foster appropriate operating practices and training;
- work with government and industry groups to foster timely development of effective environmental laws and regulations based on sound science and considering risks, costs, and benefits, including effects on energy and product supply;
- manage its business with the goal of preventing incidents and of controlling emissions and wastes to below harmful levels; design, operate, and maintain facilities to this end;
- respond quickly and effectively to incidents resulting from its operations, in cooperation with industry organizations and authorized government agencies;
- conduct and support research to improve understanding of the impact of its business on the environment, to improve methods of environmental protection, and to enhance its capability to make operations and products compatible with the environment;
- communicate with the public on environmental matters and share its experience with others to facilitate improvements in industry performance;
- undertake appropriate reviews and evaluations of its operations to measure progress and to foster compliance with this policy.

## APPENDIX C – EPBC Act Search Reports

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 29/07/19 20:30:28

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	None
<a href="#">National Heritage Places:</a>	None
<a href="#">Wetlands of International Importance:</a>	None
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	1
<a href="#">Listed Threatened Ecological Communities:</a>	None
<a href="#">Listed Threatened Species:</a>	36
<a href="#">Listed Migratory Species:</a>	41

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

<a href="#">Commonwealth Land:</a>	None
<a href="#">Commonwealth Heritage Places:</a>	None
<a href="#">Listed Marine Species:</a>	34
<a href="#">Whales and Other Cetaceans:</a>	40
<a href="#">Critical Habitats:</a>	None
<a href="#">Commonwealth Reserves Terrestrial:</a>	None
<a href="#">Australian Marine Parks:</a>	None

## Extra Information

This part of the report provides information that may also be relevant to the area you have nominated.

<a href="#">State and Territory Reserves:</a>	None
<a href="#">Regional Forest Agreements:</a>	None
<a href="#">Invasive Species:</a>	None
<a href="#">Nationally Important Wetlands:</a>	None
<a href="#">Key Ecological Features (Marine)</a>	None

# Details

## Matters of National Environmental Significance

### Commonwealth Marine Area

[\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

## Extra Information

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

- [-Other groups and individuals](#)

The Department is extremely grateful to the many organisations and individuals who provided expert advice and information on numerous draft distributions.

Please feel free to provide feedback via the [Contact Us](#) page.

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 27/05/19 20:16:47

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	1
<a href="#">National Heritage Places:</a>	8
<a href="#">Wetlands of International Importance:</a>	3
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	2
<a href="#">Listed Threatened Ecological Communities:</a>	10
<a href="#">Listed Threatened Species:</a>	152
<a href="#">Listed Migratory Species:</a>	91

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

<a href="#">Commonwealth Land:</a>	21
<a href="#">Commonwealth Heritage Places:</a>	19
<a href="#">Listed Marine Species:</a>	138
<a href="#">Whales and Other Cetaceans:</a>	40
<a href="#">Critical Habitats:</a>	None
<a href="#">Commonwealth Reserves Terrestrial:</a>	None
<a href="#">Australian Marine Parks:</a>	11

## Extra Information

This part of the report provides information that may also be relevant to the area you have nominated.

<a href="#">State and Territory Reserves:</a>	42
<a href="#">Regional Forest Agreements:</a>	1
<a href="#">Invasive Species:</a>	58
<a href="#">Nationally Important Wetlands:</a>	7
<a href="#">Key Ecological Features (Marine)</a>	5

# Details

## Matters of National Environmental Significance

### World Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
<a href="#">Lord Howe Island Group</a>	NSW	Declared property

### National Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
------	-------	--------

#### Natural

<a href="#">Ku-ring-gai Chase National Park, Lion, Long and Spectacle Island Nature Reserves</a>	NSW	Listed place
<a href="#">Lord Howe Island Group</a>	NSW	Listed place
<a href="#">Royal National Park and Garawarra State Conservation Area</a>	NSW	Listed place

#### Historic

<a href="#">Bondi Beach</a>	NSW	Listed place
<a href="#">Kamay Botany Bay: botanical collection sites</a>	NSW	Listed place
<a href="#">Kurnell Peninsula Headland</a>	NSW	Listed place
<a href="#">North Head - Sydney</a>	NSW	Listed place
<a href="#">Bondi Surf Pavilion</a>	NSW	Within listed place

### Wetlands of International Importance (Ramsar) [\[ Resource Information \]](#)

Name	Proximity
------	-----------

<a href="#">Hunter estuary wetlands</a>	Within 10km of Ramsar
<a href="#">Myall lakes</a>	Within Ramsar site
<a href="#">Towra point nature reserve</a>	Within 10km of Ramsar

### Commonwealth Marine Area [\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

#### Name

EEZ and Territorial Sea  
Extended Continental Shelf

### Marine Regions [\[ Resource Information \]](#)

If you are planning to undertake action in an area in or close to the Commonwealth Marine Area, and a marine bioregional plan has been prepared for the Commonwealth Marine Area in that area, the marine bioregional plan may inform your decision as to whether to refer your proposed action under the EPBC Act.

#### Name

[Temperate East](#)

### Listed Threatened Ecological Communities [\[ Resource Information \]](#)

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Name	Status	Type of Presence
------	--------	------------------

<a href="#">Central Hunter Valley eucalypt forest and woodland</a>	Critically Endangered	Community may occur within area
<a href="#">Coastal Swamp Oak (Casuarina glauca) Forest of New South Wales and South East Queensland ecological community</a>	Endangered	Community likely to occur within area
<a href="#">Coastal Upland Swamps in the Sydney Basin Bioregion</a>	Endangered	Community likely to occur within area
<a href="#">Eastern Suburbs Banksia Scrub of the Sydney Region</a>	Endangered	Community known to occur within area
<a href="#">Illawarra and south coast lowland forest and woodland ecological community</a>	Critically Endangered	Community likely to occur within area
<a href="#">Littoral Rainforest and Coastal Vine Thickets of Eastern Australia</a>	Critically Endangered	Community likely to occur within area

Name	Status	Type of Presence
<a href="#">Lowland Rainforest of Subtropical Australia</a>	Critically Endangered	Community likely to occur within area
<a href="#">Posidonia australis seagrass meadows of the Manning-Hawkesbury ecoregion</a>	Endangered	Community likely to occur within area
<a href="#">Subtropical and Temperate Coastal Saltmarsh</a>	Vulnerable	Community likely to occur within area
<a href="#">Upland Basalt Eucalypt Forests of the Sydney Basin Bioregion</a>	Endangered	Community may occur within area

## Listed Threatened Species [ [Resource Information](#) ]

Name	Status	Type of Presence
<b>Birds</b>		
<a href="#">Anthochaera phrygia</a> Regent Honeyeater [82338]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Botaurus poiciloptilus</a> Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Dasyornis brachypterus</a> Eastern Bristlebird [533]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea antipodensis gibsoni</a> Gibson's Albatross [82270]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Erythrotriorchis radiatus</a> Red Goshawk [942]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Fregetta grallaria grallaria</a> White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Breeding known to occur within area
<a href="#">Grantiella picta</a> Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Hypotaenidia sylvestris</a> Lord Howe Woodhen [87732]	Endangered	Breeding likely to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Limosa lapponica baueri</a> Bar-tailed Godwit (baueri), Western Alaskan Bar-tailed Godwit [86380]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Limosa lapponica menzbieri</a> Northern Siberian Bar-tailed Godwit, Bar-tailed Godwit (menzbieri) [86432]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pachyptila turtur subantarctica</a> Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Phoebastria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
<a href="#">Pterodroma heraldica</a> Herald Petrel [66973]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Pterodroma leucoptera leucoptera</a> Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Breeding known to occur within area
<a href="#">Pterodroma neglecta neglecta</a> Kermadec Petrel (western) [64450]	Vulnerable	Breeding known to occur within area
<a href="#">Rostratula australis</a> Australian Painted-snipe, Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
<a href="#">Sternula nereis nereis</a> Australian Fairy Tern [82950]	Vulnerable	Breeding likely to occur within area
<a href="#">Strepera graculina crissalis</a> Lord Howe Island Currawong, Pied Currawong (Lord Howe Island) [25994]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche bulleri platei</a> Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta cauta</a> Shy Albatross, Tasmanian Shy Albatross [82345]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Name	Status	Type of Presence
<a href="#">Thalassarche cauta steadi</a> White-capped Albatross [82344]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<b>Fish</b>		
<a href="#">Epinephelus daemeli</a> Black Rockcod, Black Cod, Saddled Rockcod [68449]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Maccullochella peelii</a> Murray Cod [66633]	Vulnerable	Species or species habitat may occur within area
<a href="#">Macquaria australasica</a> Macquarie Perch [66632]	Endangered	Species or species habitat may occur within area
<a href="#">Prototroctes maraena</a> Australian Grayling [26179]	Vulnerable	Species or species habitat likely to occur within area
<b>Frogs</b>		
<a href="#">Heleioporus australiacus</a> Giant Burrowing Frog [1973]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Litoria aurea</a> Green and Golden Bell Frog [1870]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Litoria littlejohni</a> Littlejohn's Tree Frog, Heath Frog [64733]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Mixophyes balbus</a> Stuttering Frog, Southern Barred Frog (in Victoria) [1942]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Mixophyes iteratus</a> Giant Barred Frog, Southern Barred Frog [1944]	Endangered	Species or species habitat may occur within area
<b>Insects</b>		
<a href="#">Argynnis hyperbius inconstans</a> Australian Fritillary [88056]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Dryococelus australis</a> Lord Howe Island Phasmid, Land Lobster [66752]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Phyllodes imperialis smithersi</a> Pink Underwing Moth [86084]	Endangered	Species or species habitat may occur within area
<b>Mammals</b>		

Name	Status	Type of Presence
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat may occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Chalinolobus dwyeri</a> Large-eared Pied Bat, Large Pied Bat [183]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dasyurus maculatus maculatus (SE mainland population)</a> Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
<a href="#">Isoodon obesulus obesulus</a> Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Petauroides volans</a> Greater Glider [254]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Petrogale penicillata</a> Brush-tailed Rock-wallaby [225]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Phascolarctos cinereus (combined populations of Qld, NSW and the ACT)</a> Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) [85104]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Potorous tridactylus tridactylus</a> Long-nosed Potoroo (SE mainland) [66645]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pseudomys novaehollandiae</a> New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pteropus poliocephalus</a> Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area
<b>Other</b>		
<a href="#">Gudeoconcha sophiae magnifica</a> Magnificent Helicarionid Land Snail [82864]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Mystivagor mastersi</a> Masters' Charopid Land Snail [81247]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Placostylus bivaricosus</a> Lord Howe Flax Snail, Lord Howe Placostylus [66769]	Endangered	Species or species habitat known to occur within area
<a href="#">Pseudocharopa ledgbirdi</a> Mount Lidgbird Charopid Land Snail [85279]	Critically Endangered	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#">Pseudocharopa whiteleggei</a> Whitelegge's Land Snail [81249]	Critically Endangered	Species or species habitat likely to occur within area
<b>Plants</b>		
<a href="#">Acacia bynoeana</a> Bynoe's Wattle, Tiny Wattle [8575]	Vulnerable	Species or species habitat may occur within area
<a href="#">Acacia courtii</a> Northern Brother Wattle [56299]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Acacia terminalis subsp. terminalis MS</a> Sunshine Wattle (Sydney region) [88882]	Endangered	Species or species habitat known to occur within area
<a href="#">Acronychia littoralis</a> Scented Acronychia [8582]	Endangered	Species or species habitat likely to occur within area
<a href="#">Allocasuarina defungens</a> Dwarf Heath Casuarina [21924]	Endangered	Species or species habitat known to occur within area
<a href="#">Allocasuarina glareicola</a> [21932]	Endangered	Species or species habitat may occur within area
<a href="#">Allocasuarina portuensis</a> Nielsen Park She-oak [21937]	Endangered	Species or species habitat known to occur within area
<a href="#">Allocasuarina simulans</a> Nabiac Casuarina [21935]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Allocasuarina thalassoscopica</a> [21927]	Endangered	Species or species habitat known to occur within area
<a href="#">Angophora inopina</a> Charmhaven Apple [64832]	Vulnerable	Species or species habitat may occur within area
<a href="#">Arthraxon hispidus</a> Hairy-joint Grass [9338]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Asperula asthenes</a> Trailing Woodruff [14004]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Asterolasia elegans</a> [56780]	Endangered	Species or species habitat known to occur within area
<a href="#">Caladenia tessellata</a> Thick-lipped Spider-orchid, Daddy Long-legs [2119]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Calystegia affinis</a> [48909]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Commersonia prostrata</a> Dwarf Kerrawang [87152]	Endangered	Species or species habitat may occur within area
<a href="#">Corunastylis insignis</a> Wyong Midge Orchid 1, Variable Midge Orchid 1 [84692]	Critically Endangered	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Corunastylis littoralis</a> Tuncurry Midge Orchid [82945]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Cryptocarya foetida</a> Stinking Cryptocarya, Stinking Laurel [11976]	Vulnerable	Species or species habitat may occur within area
<a href="#">Cryptostylis hunteriana</a> Leafless Tongue-orchid [19533]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cynanchum elegans</a> White-flowered Wax Plant [12533]	Endangered	Species or species habitat known to occur within area
<a href="#">Diploglottis campbellii</a> Small-leaved Tamarind [21484]	Endangered	Species or species habitat may occur within area
<a href="#">Diuris praecox</a> Newcastle Doubletail [55086]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Elymus multiflorus subsp. kingianus</a> Phillip Island Wheat Grass [82413]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Endiandra hayesii</a> Rusty Rose Walnut, Velvet Laurel [13866]	Vulnerable	Species or species habitat may occur within area
<a href="#">Eucalyptus camfieldii</a> Camfield's Stringybark [15460]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Eucalyptus parramattensis subsp. decadens</a> Earp's Gum, Earp's Dirty Gum [56148]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Euphrasia arguta</a> [4325]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Geniostoma huttonii</a> [56368]	Endangered	Species or species habitat known to occur within area
<a href="#">Genoplesium baueri</a> Yellow Gnat-orchid [7528]	Endangered	Species or species habitat likely to occur within area
<a href="#">Grevillea caleyi</a> Caley's Grevillea [9683]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Grevillea parviflora subsp. parviflora</a> Small-flower Grevillea [64910]	Vulnerable	Species or species habitat may occur within area
<a href="#">Grevillea shiressii</a> [19186]	Vulnerable	Species or species habitat may occur within area
<a href="#">Haloragis exalata subsp. exalata</a> Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Haloragodendron lucasii</a> Hal [6480]	Endangered	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#">Hicksbeachia pinnatifolia</a> Monkey Nut, Bopple Nut, Red Bopple, Red Bopple Nut, Red Nut, Beef Nut, Red Apple Nut, Red Boppel Nut, Ivory Silky Oak [21189]	Vulnerable	Species or species habitat may occur within area
<a href="#">Kunzea rupestris</a> [8798]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Lepidorrhachis mooreana</a> Little Mountain Palm, Moorei Palm [6388]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Macadamia integrifolia</a> Macadamia Nut, Queensland Nut Tree, Smooth-shelled Macadamia, Bush Nut, Nut Oak [7326]	Vulnerable	Species or species habitat may occur within area
<a href="#">Macadamia tetraphylla</a> Rough-shelled Bush Nut, Macadamia Nut, Rough-shelled Macadamia, Rough-leaved Queensland Nut [6581]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Marsdenia longiloba</a> Clear Milkvine [2794]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Melaleuca biconvexa</a> Biconvex Paperbark [5583]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Melaleuca deanei</a> Deane's Melaleuca [5818]	Vulnerable	Species or species habitat may occur within area
<a href="#">Parsonsia dorrigoensis</a> Milky Silkpod [64684]	Endangered	Species or species habitat likely to occur within area
<a href="#">Persicaria elatior</a> Knotweed, Tall Knotweed [5831]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Persoonia hirsuta</a> Hairy Geebung, Hairy Persoonia [19006]	Endangered	Species or species habitat known to occur within area
<a href="#">Phaius australis</a> Lesser Swamp-orchid [5872]	Endangered	Species or species habitat known to occur within area
<a href="#">Pimelea curviflora var. curviflora</a> [4182]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pimelea spicata</a> Spiked Rice-flower [20834]	Endangered	Species or species habitat likely to occur within area
<a href="#">Polystichum moorei</a> Rock Shield Fern [40755]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum sp. Wybong (C.Phelps ORG 5269)</a> a leek-orchid [81964]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Prostanthera askania</a> Tranquillity Mintbush, Tranquillity Mintbush [64958]	Endangered	Species or species habitat known to occur within area
<a href="#">Prostanthera densa</a> Villous Mintbush [12233]	Vulnerable	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#">Prostanthera junonis</a> Somersby Mintbush [64960]	Endangered	Species or species habitat may occur within area
<a href="#">Pterostylis gibbosa</a> Illawarra Greenhood, Rufa Greenhood, Pouched Greenhood [4562]	Endangered	Species or species habitat likely to occur within area
<a href="#">Pterostylis saxicola</a> Sydney Plains Greenhood [64537]	Endangered	Species or species habitat may occur within area
<a href="#">Pterostylis sp. Botany Bay (A.Bishop J221/1-13)</a> Botany Bay Bearded Greenhood, Botany Bay Bearded Orchid [64965]	Endangered	Species or species habitat likely to occur within area
<a href="#">Pultenaea aristata</a> [18062]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pultenaea glabra</a> Smooth Bush-pea, Swamp Bush-pea [11887]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Rutidosis heterogama</a> Heath Wrinklewort [13132]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Samadera sp. Moonee Creek (J.King s.n. Nov. 1949)</a> [86885]	Endangered	Species or species habitat likely to occur within area
<a href="#">Syzygium paniculatum</a> Magenta Lilly Pilly, Magenta Cherry, Daguba, Scrub Cherry, Creek Lilly Pilly, Brush Cherry [20307]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tetratheca juncea</a> Black-eyed Susan [21407]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Thelymitra kangaloonica</a> Kangaloon Sun Orchid [81861]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Thesium australe</a> Austral Toadflax, Toadflax [15202]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tylophora woollsii</a> [20503]	Endangered	Species or species habitat likely to occur within area
<a href="#">Xylosma parvifolia</a> [48040]	Endangered	Species or species habitat known to occur within area
<a href="#">Zieria granulata</a> Hill Zieria, Hilly Zieria, Illawarra Zieria [17147]	Endangered	Species or species habitat likely to occur within area
<a href="#">Zieria prostrata</a> Headland Zieria [56782]	Endangered	Species or species habitat known to occur within area
<b>Reptiles</b>		
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Name	Status	Type of Presence
<a href="#">Christinus guentheri</a> Lord Howe Island Gecko, Lord Howe Island Southern Gecko [59250]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Hoplocephalus bungaroides</a> Broad-headed Snake [1182]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Oligosoma lichenigera</a> Lord Howe Island Skink [82034]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Saiphos reticulatus</a> Three-toed Snake-tooth Skink [88328]	Vulnerable	Species or species habitat may occur within area

## Sharks

<a href="#">Carcharias taurus (east coast population)</a> Grey Nurse Shark (east coast population) [68751]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Breeding known to occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

## Listed Migratory Species

[ [Resource Information](#) ]

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Migratory Marine Birds</b>		
<a href="#">Anous stolidus</a> Common Noddy [825]		Breeding known to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardenna carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
<a href="#">Ardenna grisea</a> Sooty Shearwater [82651]		Breeding known to occur within area
<a href="#">Ardenna pacifica</a> Wedge-tailed Shearwater [84292]		Breeding known to occur within area
<a href="#">Ardenna tenuirostris</a> Short-tailed Shearwater [82652]		Breeding known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Phaethon rubricauda</a> Red-tailed Tropicbird [994]		Breeding known to occur within area
<a href="#">Phoebastria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
<a href="#">Sternula albifrons</a> Little Tern [82849]		Breeding known to occur within area
<a href="#">Sula dactylatra</a> Masked Booby [1021]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<b>Migratory Marine Species</b>		
<a href="#">Balaena glacialis australis</a> Southern Right Whale [75529]	Endangered*	Species or species habitat known to occur

Name	Threatened	Type of Presence within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat may occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Breeding known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Species or species habitat may occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Isurus oxyrinchus</a> Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
<a href="#">Isurus paucus</a> Longfin Mako [82947]		Species or species habitat likely to occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat likely to occur within area
<a href="#">Lamna nasus</a> Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
<a href="#">Manta alfredi</a> Reef Manta Ray, Coastal Manta Ray, Inshore Manta Ray, Prince Alfred's Ray, Resident Manta Ray [84994]		Species or species habitat known to occur within area
<a href="#">Manta birostris</a> Giant Manta Ray, Chevron Manta Ray, Pacific Manta Ray, Pelagic Manta Ray, Oceanic Manta Ray [84995]		Species or species habitat likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
<a href="#">Sousa chinensis</a> Indo-Pacific Humpback Dolphin [50]		Species or species habitat likely to occur within area
<b>Migratory Terrestrial Species</b>		
<a href="#">Cuculus optatus</a> Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat known to occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat known to occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Species or species habitat known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<b>Migratory Wetlands Species</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species

Name	Threatened	Type of Presence
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		habitat known to occur within area  Species or species habitat known to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris subminuta</a> Long-toed Stint [861]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Foraging, feeding or related behaviour known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Breeding known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Species or species habitat known to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Thalasseus bergii</a> Crested Tern [83000]		Breeding known to occur

Name	Threatened	Type of Presence within area
<a href="#">Tringa brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa incana</a> Wandering Tattler [831]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Foraging, feeding or related behaviour known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area

## Other Matters Protected by the EPBC Act

### Commonwealth Land [\[ Resource Information \]](#)

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius ruficapillus</a> Red-capped Plover [881]		Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea gibsoni</a> Gibson's Albatross [64466]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Eudyptula minor</a> Little Penguin [1085]		Breeding known to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Foraging, feeding or related behaviour known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Haliaeetus leucogaster</a> White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
<a href="#">Heteroscelus brevipes</a> Grey-tailed Tattler [59311]		Roosting known to occur within area
<a href="#">Heteroscelus incanus</a> Wandering Tattler [59547]		Roosting known to occur within area
<a href="#">Himantopus himantopus</a> Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat known to occur within area
<a href="#">Larus dominicanus</a> Kelp Gull [809]		Breeding known to occur within area

Name	Threatened	Type of Presence
<a href="#">Larus novaehollandiae</a> Silver Gull [810]		Breeding known to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Merops ornatus</a> Rainbow Bee-eater [670]		Species or species habitat may occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat known to occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Species or species habitat known to occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pachyptila turtur</a> Fairy Prion [1066]		Species or species habitat known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Breeding known to occur within area
<a href="#">Pelagodroma marina</a> White-faced Storm-Petrel [1016]		Breeding known to occur within area
<a href="#">Phaethon rubricauda</a> Red-tailed Tropicbird [994]		Breeding known to occur within area

Name	Threatened	Type of Presence
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Species or species habitat known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Procelsterna cerulea</a> Grey Noddy, Grey Ternlet [64378]		Breeding known to occur within area
<a href="#">Pterodroma nigripennis</a> Black-winged Petrel [1038]		Breeding known to occur within area
<a href="#">Pterodroma solandri</a> Providence Petrel [1040]		Breeding known to occur within area
<a href="#">Puffinus assimilis</a> Little Shearwater [59363]		Breeding known to occur within area
<a href="#">Puffinus carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Breeding known to occur within area
<a href="#">Puffinus griseus</a> Sooty Shearwater [1024]		Breeding known to occur within area
<a href="#">Puffinus pacificus</a> Wedge-tailed Shearwater [1027]		Breeding known to occur within area
<a href="#">Puffinus tenuirostris</a> Short-tailed Shearwater [1029]		Breeding known to occur within area
<a href="#">Recurvirostra novaehollandiae</a> Red-necked Avocet [871]		Roosting known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<a href="#">Rostratula benghalensis (sensu lato)</a> Painted Snipe [889]	Endangered*	Species or species habitat likely to occur within area
<a href="#">Sterna albifrons</a> Little Tern [813]		Breeding known to occur within area
<a href="#">Sterna bergii</a> Crested Tern [816]		Breeding known to occur within area
<a href="#">Sula dactylatra</a> Masked Booby [1021]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed	Vulnerable	Species or species

Name	Threatened	Type of Presence
Albatross [64459]		habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area

## Regional Forest Agreements [\[ Resource Information \]](#)

Note that all areas with completed RFAs have been included.

Name	State
<a href="#">North East NSW RFA</a>	New South Wales

## Invasive Species [\[ Resource Information \]](#)

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resources Audit, 2001.

Name	Status	Type of Presence
<b>Birds</b>		
Acridotheres tristis Common Myna, Indian Myna [387]		Species or species habitat likely to occur within area
Alauda arvensis Skylark [656]		Species or species habitat likely to occur within area
Anas platyrhynchos Mallard [974]		Species or species habitat likely to occur within area
Carduelis carduelis European Goldfinch [403]		Species or species habitat likely to occur within area
Carduelis chloris European Greenfinch [404]		Species or species habitat likely to occur within area
Columba livia Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species habitat likely to occur within area
Lonchura punctulata Nutmeg Mannikin [399]		Species or species habitat likely to occur within area

Name	Status	Type of Presence
Passer domesticus House Sparrow [405]		Species or species habitat likely to occur within area
Passer montanus Eurasian Tree Sparrow [406]		Species or species habitat likely to occur within area
Pycnonotus jocosus Red-whiskered Bulbul [631]		Species or species habitat likely to occur within area
Streptopelia chinensis Spotted Turtle-Dove [780]		Species or species habitat likely to occur within area
Sturnus vulgaris Common Starling [389]		Species or species habitat likely to occur within area
Turdus merula Common Blackbird, Eurasian Blackbird [596]		Species or species habitat likely to occur within area
Turdus philomelos Song Thrush [597]		Species or species habitat likely to occur within area
<b>Frogs</b>		
Rhinella marina Cane Toad [83218]		Species or species habitat known to occur within area
<b>Mammals</b>		
Bos taurus Domestic Cattle [16]		Species or species habitat likely to occur within area
Canis lupus familiaris Domestic Dog [82654]		Species or species habitat likely to occur within area
Capra hircus Goat [2]		Species or species habitat likely to occur within area
Equus caballus Horse [5]		Species or species habitat likely to occur within area
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Feral deer Feral deer species in Australia [85733]		Species or species habitat likely to occur within area
Lepus capensis Brown Hare [127]		Species or species habitat likely to occur within area
Mus musculus House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species habitat likely to occur within area
Rattus norvegicus Brown Rat, Norway Rat [83]		Species or species habitat likely to occur

Name	Status	Type of Presence
Rattus rattus Black Rat, Ship Rat [84]		within area Species or species habitat likely to occur within area
Sus scrofa Pig [6]		Species or species habitat likely to occur within area
Vulpes vulpes Red Fox, Fox [18]		Species or species habitat likely to occur within area
<b>Plants</b>		
Alternanthera philoxeroides Alligator Weed [11620]		Species or species habitat likely to occur within area
Anredera cordifolia Madeira Vine, Jalap, Lamb's-tail, Mignonette Vine, Anredera, Gulf Madeiravine, Heartleaf Madeiravine, Potato Vine [2643]		Species or species habitat likely to occur within area
Asparagus aethiopicus Asparagus Fern, Ground Asparagus, Basket Fern, Sprengi's Fern, Bushy Asparagus, Emerald Asparagus [62425]		Species or species habitat likely to occur within area
Asparagus asparagoides Bridal Creeper, Bridal Veil Creeper, Smilax, Florist's Smilax, Smilax Asparagus [22473]		Species or species habitat likely to occur within area
Asparagus plumosus Climbing Asparagus-fern [48993]		Species or species habitat likely to occur within area
Asparagus scandens Asparagus Fern, Climbing Asparagus Fern [23255]		Species or species habitat likely to occur within area
Cabomba caroliniana Cabomba, Fanwort, Carolina Watershield, Fish Grass, Washington Grass, Watershield, Carolina Fanwort, Common Cabomba [5171]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera subsp. monilifera Boneseed [16905]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera subsp. rotundata Bitou Bush [16332]		Species or species habitat likely to occur within area
Cytisus scoparius Broom, English Broom, Scotch Broom, Common Broom, Scottish Broom, Spanish Broom [5934]		Species or species habitat likely to occur within area
Dolichandra unguis-cati Cat's Claw Vine, Yellow Trumpet Vine, Cat's Claw Creeper, Funnel Creeper [85119]		Species or species habitat likely to occur within area
Eichhornia crassipes Water Hyacinth, Water Orchid, Nile Lily [13466]		Species or species habitat likely to occur within area
Genista linifolia Flax-leaved Broom, Mediterranean Broom, Flax Broom [2800]		Species or species habitat likely to occur within area
Genista monspessulana Montpellier Broom, Cape Broom, Canary Broom, Common Broom, French Broom, Soft Broom		Species or species habitat likely to occur

Name	Status	Type of Presence
[20126] Genista sp. X Genista monspessulana Broom [67538]		within area  Species or species habitat may occur within area
Lantana camara Lantana, Common Lantana, Kamara Lantana, Large-leaf Lantana, Pink Flowered Lantana, Red Flowered Lantana, Red-Flowered Sage, White Sage, Wild Sage [10892] Lycium ferocissimum African Boxthorn, Boxthorn [19235]		Species or species habitat likely to occur within area  Species or species habitat likely to occur within area
Nassella neesiana Chilean Needle grass [67699]		Species or species habitat likely to occur within area
Nassella trichotoma Serrated Tussock, Yass River Tussock, Yass Tussock, Nassella Tussock (NZ) [18884]		Species or species habitat likely to occur within area
Opuntia spp. Prickly Pears [82753]		Species or species habitat likely to occur within area
Pinus radiata Radiata Pine Monterey Pine, Insignis Pine, Wilding Pine [20780]		Species or species habitat may occur within area
Rubus fruticosus aggregate Blackberry, European Blackberry [68406]		Species or species habitat likely to occur within area
Sagittaria platyphylla Delta Arrowhead, Arrowhead, Slender Arrowhead [68483]		Species or species habitat likely to occur within area
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		Species or species habitat likely to occur within area
Salvinia molesta Salvinia, Giant Salvinia, Aquarium Watermoss, Kariba Weed [13665]		Species or species habitat likely to occur within area
Senecio madagascariensis Fireweed, Madagascar Ragwort, Madagascar Groundsel [2624]		Species or species habitat likely to occur within area
Solanum elaeagnifolium Silver Nightshade, Silver-leaved Nightshade, White Horse Nettle, Silver-leaf Nightshade, Tomato Weed, White Nightshade, Bull-nettle, Prairie-berry, Satansbos, Silver-leaf Bitter-apple, Silverleaf-nettle, Trompillo [12323] Ulex europaeus Gorse, Furze [7693]		Species or species habitat likely to occur within area  Species or species habitat likely to occur within area
<b>Reptiles</b>		
Hemidactylus frenatus Asian House Gecko [1708]		Species or species habitat likely to occur within area

## Nationally Important Wetlands

[ [Resource Information](#) ]

Name	State
<a href="#">Avoca Lagoon</a>	NSW
<a href="#">Clybucca Creek Estuary</a>	NSW
<a href="#">Cockrone Lagoon</a>	NSW
<a href="#">Crowdy Bay National Park</a>	NSW

## Key Ecological Features (Marine) [ [Resource Information](#) ]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
<a href="#">Canyons on the eastern continental slope</a>	Temperate east
<a href="#">Lord Howe seamount chain</a>	Temperate east
<a href="#">Shelf rocky reefs</a>	Temperate east
<a href="#">Tasman Front and eddy field</a>	Temperate east
<a href="#">Tasmantid seamount chain</a>	Temperate east

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

The Department is extremely grateful to the many organisations and individuals who provided expert advice and information on numerous draft distributions.

Please feel free to provide feedback via the [Contact Us](#) page.

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 27/05/19 20:05:01

## [Summary](#)

## [Details](#)

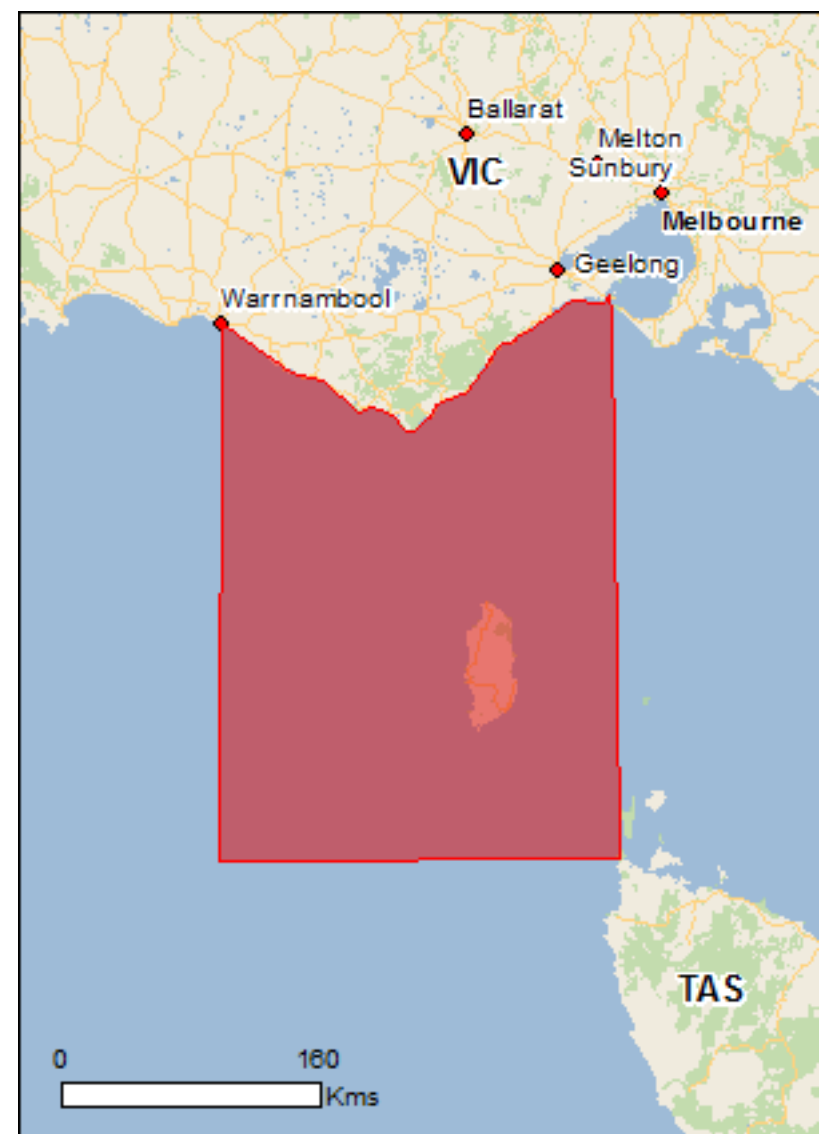

[Matters of NES](#)

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	None
<a href="#">National Heritage Places:</a>	2
<a href="#">Wetlands of International Importance:</a>	2
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	1
<a href="#">Listed Threatened Ecological Communities:</a>	8
<a href="#">Listed Threatened Species:</a>	98
<a href="#">Listed Migratory Species:</a>	69

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

<a href="#">Commonwealth Land:</a>	1
<a href="#">Commonwealth Heritage Places:</a>	1
<a href="#">Listed Marine Species:</a>	113
<a href="#">Whales and Other Cetaceans:</a>	29
<a href="#">Critical Habitats:</a>	1
<a href="#">Commonwealth Reserves Terrestrial:</a>	None
<a href="#">Australian Marine Parks:</a>	4

## Extra Information

This part of the report provides information that may also be relevant to the area you have nominated.

<a href="#">State and Territory Reserves:</a>	63
<a href="#">Regional Forest Agreements:</a>	2
<a href="#">Invasive Species:</a>	52
<a href="#">Nationally Important Wetlands:</a>	11
<a href="#">Key Ecological Features (Marine)</a>	1

# Details

## Matters of National Environmental Significance

### National Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
<b>Historic</b>		
<a href="#">Great Ocean Road and Scenic Environs</a>	VIC	Listed place
<a href="#">Point Nepean Defence Sites and Quarantine Station Area</a>	VIC	Listed place

### Wetlands of International Importance (Ramsar) [\[ Resource Information \]](#)

Name	Proximity
<a href="#">Lavinia</a>	Within Ramsar site
<a href="#">Port phillip bay (western shoreline) and bellarine peninsula</a>	Within Ramsar site

### Commonwealth Marine Area [\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

Name
EEZ and Territorial Sea

### Marine Regions [\[ Resource Information \]](#)

If you are planning to undertake action in an area in or close to the Commonwealth Marine Area, and a marine bioregional plan has been prepared for the Commonwealth Marine Area in that area, the marine bioregional plan may inform your decision as to whether to refer your proposed action under the EPBC Act.

Name
<a href="#">South-east</a>

### Listed Threatened Ecological Communities [\[ Resource Information \]](#)

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Name	Status	Type of Presence
<a href="#">Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community</a>	Endangered	Community likely to occur within area
<a href="#">Giant Kelp Marine Forests of South East Australia</a>	Endangered	Community may occur within area
<a href="#">Grassy Eucalypt Woodland of the Victorian Volcanic Plain</a>	Critically Endangered	Community likely to occur within area
<a href="#">Natural Damp Grassland of the Victorian Coastal Plains</a>	Critically Endangered	Community likely to occur within area
<a href="#">Natural Temperate Grassland of the Victorian Volcanic Plain</a>	Critically Endangered	Community likely to occur within area
<a href="#">Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains</a>	Critically Endangered	Community likely to occur within area
<a href="#">Subtropical and Temperate Coastal Saltmarsh</a>	Vulnerable	Community likely to occur within area
<a href="#">White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland</a>	Critically Endangered	Community likely to occur within area

### Listed Threatened Species [\[ Resource Information \]](#)

Name	Status	Type of Presence
<b>Birds</b>		
<a href="#">Acanthiza pusilla archibaldi</a>	Endangered	Species or species habitat likely to occur within area
King Island Brown Thornbill, Brown Thornbill (King Island) [59430]	Endangered	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#">Acanthornis magna greeniana</a> King Island Scrubtit, Scrubtit (King Island) [82329]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Anthochaera phrygia</a> Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Aquila audax fleayi</a> Tasmanian Wedge-tailed Eagle, Wedge-tailed Eagle (Tasmanian) [64435]	Endangered	Breeding likely to occur within area
<a href="#">Botaurus poiciloptilus</a> Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Ceyx azureus diemenensis</a> Tasmanian Azure Kingfisher [25977]	Endangered	Species or species habitat known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Fregetta grallaria grallaria</a> White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Grantiella picta</a> Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Limosa lapponica baueri</a> Bar-tailed Godwit (baueri), Western Alaskan Bar-tailed Godwit [86380]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Limosa lapponica menzbieri</a> Northern Siberian Bar-tailed Godwit, Bar-tailed Godwit (menzbieri) [86432]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pachyptila turtur subantarctica</a> Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pedionomus torquatus</a> Plains-wanderer [906]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Platycercus caledonicus brownii</a> Green Rosella (King Island) [67041]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterodroma leucoptera leucoptera</a> Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
<a href="#">Rostratula australis</a> Australian Painted-snipe, Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
<a href="#">Sternula nereis nereis</a> Australian Fairy Tern [82950]	Vulnerable	Breeding likely to occur within area
<a href="#">Strepera fuliginosa colei</a> Black Currawong (King Island) [67113]	Vulnerable	Breeding likely to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche bulleri platei</a> Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta cauta</a> Shy Albatross, Tasmanian Shy Albatross [82345]	Vulnerable	Breeding known to occur within area
<a href="#">Thalassarche cauta steadi</a> White-capped Albatross [82344]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thinornis rubricollis rubricollis</a> Hooded Plover (eastern) [66726]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tyto novaehollandiae castanops (Tasmanian population)</a> Masked Owl (Tasmanian) [67051]	Vulnerable	Species or species habitat known to occur within area
<b>Crustaceans</b>		
<a href="#">Astacopsis gouldi</a> Giant Freshwater Crayfish, Tasmanian Giant Freshwater Lobster [64415]	Vulnerable	Species or species habitat may occur within area
<b>Fish</b>		
<a href="#">Galaxiella pusilla</a> Eastern Dwarf Galaxias, Dwarf Galaxias [56790]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Maccullochella peelii</a> Murray Cod [66633]	Vulnerable	Species or species habitat may occur within area
<a href="#">Nannoperca obscura</a> Yarra Pygmy Perch [26177]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Prototroctes maraena</a> Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
<b>Frogs</b>		
<a href="#">Litoria raniformis</a> Growling Grass Frog, Southern Bell Frog, Green and Golden Frog, Warty Swamp Frog [1828]	Vulnerable	Species or species habitat known to occur within area
<b>Insects</b>		
<a href="#">Synemon plana</a> Golden Sun Moth [25234]	Critically Endangered	Species or species habitat may occur within area
<b>Mammals</b>		
<a href="#">Antechinus minimus maritimus</a> Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Dasyurus maculatus maculatus (SE mainland population)</a> Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Dasyurus maculatus maculatus (Tasmanian population)</a> Spotted-tail Quoll, Spot-tailed Quoll, Tiger Quoll (Tasmanian population) [75183]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dasyurus viverrinus</a> Eastern Quoll, Luaner [333]	Endangered	Species or species habitat may occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Breeding known to occur within area
<a href="#">Isoodon obesulus obesulus</a> Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
<a href="#">Mastacomys fuscus mordicus</a> Broad-toothed Rat (mainland), Tooarrana [87617]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Miniopterus orianae bassanii</a> Southern Bent-wing Bat [87645]	Critically Endangered	Breeding known to occur within area
<a href="#">Neophoca cinerea</a> Australian Sea-lion, Australian Sea Lion [22]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Perameles gunnii gunnii</a> Eastern Barred Bandicoot (Tasmania) [66651]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Petauroides volans</a> Greater Glider [254]	Vulnerable	Species or species habitat may occur within area
<a href="#">Potorous tridactylus tridactylus</a> Long-nosed Potoroo (SE mainland) [66645]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pseudomys fumeus</a> Smoky Mouse, Konoom [88]	Endangered	Species or species habitat likely to occur within area
<a href="#">Pseudomys novaehollandiae</a> New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pteropus poliocephalus</a> Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Sarcophilus harrisii</a> Tasmanian Devil [299]	Endangered	Species or species habitat likely to occur within area
<b>Plants</b>		
<a href="#">Amphibromus fluitans</a> River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Caladenia caudata</a> Tailed Spider-orchid [17067]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Diuris lanceolata</a> Snake Orchid [10231]	Endangered	Species or species habitat known to occur within area
<a href="#">Glycine latrobeana</a> Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species

Name	Status	Type of Presence
<a href="#">Haloragis exalata subsp. exalata</a> Wingless Raspwort, Square Raspwort [24636]	Vulnerable	habitat known to occur within area Species or species habitat known to occur within area
<a href="#">Hypolepis distans</a> Scrambling Ground-fern [2148]	Endangered	Species or species habitat likely to occur within area
<a href="#">Ixodia achillaeoides subsp. arenicola</a> Sand Ixodia, Ixodia [21474]	Vulnerable	Species or species habitat may occur within area
<a href="#">Lachnagrostis adamsonii</a> Adamson's Blown-grass, Adamson's Blowngrass [76211]	Endangered	Species or species habitat may occur within area
<a href="#">Leiocarpa gatesii</a> Wrinkled Buttons [76212]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Lepidium aschersonii</a> Spiny Pepper-cress [10976]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pimelea spinescens subsp. spinescens</a> Plains Rice-flower, Spiny Rice-flower, Prickly Pimelea [21980]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum frenchii</a> Maroon Leek-orchid, Slaty Leek-orchid, Stout Leek-orchid, French's Leek-orchid, Swamp Leek-orchid [9704]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum secutum</a> Northern Leek-orchid [64954]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum spicatum</a> Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis chlorogramma</a> Green-striped Greenhood [56510]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pterostylis cucullata</a> Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis tenuissima</a> Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis ziegeleri</a> Grassland Greenhood, Cape Portland Greenhood [64971]	Vulnerable	Species or species habitat may occur within area
<a href="#">Senecio psilocarpus</a> Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Taraxacum cygnorum</a> Coast Dandelion [2508]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Thelymitra epipactoides</a> Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
<a href="#">Thelymitra matthewsii</a> Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat likely to occur

Name	Status	Type of Presence within area
<a href="#">Xerochrysum palustre</a> Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat likely to occur within area
<b>Reptiles</b>		
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<b>Sharks</b>		
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<b>Listed Migratory Species</b>		<b>[ Resource Information ]</b>
* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.		
Name	Threatened	Type of Presence
<b>Migratory Marine Birds</b>		
<a href="#">Anous stolidus</a> Common Noddy [825]		Species or species habitat likely to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardenna carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Ardenna tenuirostris</a> Short-tailed Shearwater [82652]		Breeding known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Sternula albifrons</a> Little Tern [82849]		Species or species habitat may occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Breeding known to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<b>Migratory Marine Species</b>		
<a href="#">Balaena glacialis australis</a> Southern Right Whale [75529]	Endangered*	Breeding known to occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Isurus oxyrinchus</a> Shortfin Mako, Mako Shark [79073]		Species or species

Name	Threatened	Type of Presence
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		habitat likely to occur within area  Species or species habitat likely to occur within area
<a href="#">Lamna nasus</a> Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<b>Migratory Terrestrial Species</b>		
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat known to occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat likely to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat may occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Breeding known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<b>Migratory Wetlands Species</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat known to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur

Name	Threatened	Type of Presence within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Species or species habitat known to occur within area
<a href="#">Phalaropus lobatus</a> Red-necked Phalarope [838]		Roosting known to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Tringa brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area

## Other Matters Protected by the EPBC Act

### Commonwealth Land

[\[ Resource Information \]](#)

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

#### Name

Commonwealth Land -

### Commonwealth Heritage Places

[\[ Resource Information \]](#)

Name	State	Status
<a href="#">Historic Cape Wickham Lighthouse</a>	TAS	Listed place

### Listed Marine Species

[\[ Resource Information \]](#)

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Birds</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Anous stolidus</a> Common Noddy [825]		Species or species habitat likely to occur within area
<a href="#">Anseranas semipalmata</a> Magpie Goose [978]		Species or species habitat may occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardea alba</a> Great Egret, White Egret [59541]		Breeding known to occur within area
<a href="#">Ardea ibis</a> Cattle Egret [59542]		Species or species habitat may occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat known to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Catharacta skua</a> Great Skua [59472]		Species or species

Name	Threatened	Type of Presence
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		habitat may occur within area  Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius ruficapillus</a> Red-capped Plover [881]		Roosting known to occur within area
<a href="#">Chrysococcyx osculans</a> Black-eared Cuckoo [705]		Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Eudyptula minor</a> Little Penguin [1085]		Breeding known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Haliaeetus leucogaster</a> White-bellied Sea-Eagle [943]		Breeding known to occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Heteroscelus brevipes</a> Grey-tailed Tattler [59311]		Roosting known to occur within area
<a href="#">Himantopus himantopus</a> Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat known to occur within area
<a href="#">Larus novaehollandiae</a> Silver Gull [810]		Breeding known to occur within area
<a href="#">Larus pacificus</a> Pacific Gull [811]		Breeding known to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur

Name	Threatened	Type of Presence
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		within area  Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Merops ornatus</a> Rainbow Bee-eater [670]		Species or species habitat may occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat likely to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat may occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Breeding known to occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pachyptila turtur</a> Fairy Prion [1066]		Species or species habitat known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Species or species habitat known to occur within area
<a href="#">Pelagodroma marina</a> White-faced Storm-Petrel [1016]		Breeding known to occur within area
<a href="#">Pelecanoides urinatrix</a> Common Diving-Petrel [1018]		Breeding known to occur within area
<a href="#">Phalacrocorax fuscescens</a> Black-faced Cormorant [59660]		Breeding known to occur within area
<a href="#">Phalaropus lobatus</a> Red-necked Phalarope [838]		Roosting known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
<a href="#">Puffinus carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Puffinus tenuirostris</a> Short-tailed Shearwater [1029]		Breeding known to occur within area
<a href="#">Recurvirostra novaehollandiae</a> Red-necked Avocet [871]		Roosting known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<a href="#">Rostratula benghalensis (sensu lato)</a> Painted Snipe [889]	Endangered*	Species or species habitat likely to occur within area
<a href="#">Sterna albifrons</a> Little Tern [813]		Species or species habitat may occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Breeding known to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche sp. nov.</a> Pacific Albatross [66511]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thinornis rubricollis</a> Hooded Plover [59510]		Species or species habitat known to occur within area
<a href="#">Thinornis rubricollis rubricollis</a> Hooded Plover (eastern) [66726]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species

Name	Threatened	Type of Presence
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		habitat known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area
<b>Fish</b>		
<a href="#">Heraldia nocturna</a> Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
<a href="#">Hippocampus abdominalis</a> Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
<a href="#">Hippocampus breviceps</a> Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
<a href="#">Hippocampus minotaur</a> Bullneck Seahorse [66705]		Species or species habitat may occur within area
<a href="#">Histiogamphelus briggsii</a> Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
<a href="#">Histiogamphelus cristatus</a> Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
<a href="#">Hypsognathus rostratus</a> Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
<a href="#">Kaupus costatus</a> Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
<a href="#">Kimblaeus bassensis</a> Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
<a href="#">Leptoichthys fistularius</a> Brushtail Pipefish [66248]		Species or species habitat may occur within area
<a href="#">Lissocampus caudalis</a> Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
<a href="#">Lissocampus runa</a> Javelin Pipefish [66251]		Species or species habitat may occur within area
<a href="#">Maroubra perserrata</a> Sawtooth Pipefish [66252]		Species or species habitat may occur within area
<a href="#">Mitotichthys mollisoni</a> Mollison's Pipefish [66260]		Species or species habitat may occur within area
<a href="#">Mitotichthys semistriatus</a> Halfbanded Pipefish [66261]		Species or species habitat may occur within area
<a href="#">Mitotichthys tuckeri</a> Tucker's Pipefish [66262]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
<a href="#">Notiocampus ruber</a> Red Pipefish [66265]		Species or species habitat may occur within area
<a href="#">Phycodurus eques</a> Leafy Seadragon [66267]		Species or species habitat may occur within area
<a href="#">Phyllopteryx taeniolatus</a> Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
<a href="#">Pugnaso curtirostris</a> Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
<a href="#">Solegnathus robustus</a> Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
<a href="#">Solegnathus spinosissimus</a> Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
<a href="#">Stigmatopora argus</a> Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
<a href="#">Stigmatopora nigra</a> Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
<a href="#">Stipecampus cristatus</a> Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
<a href="#">Urocampus carinirostris</a> Hairy Pipefish [66282]		Species or species habitat may occur within area
<a href="#">Vanacampus margaritifer</a> Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
<a href="#">Vanacampus phillipi</a> Port Phillip Pipefish [66284]		Species or species habitat may occur within area
<a href="#">Vanacampus poecilolaemus</a> Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
<b>Mammals</b>		
<a href="#">Arctocephalus forsteri</a> Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
<a href="#">Arctocephalus pusillus</a> Australian Fur-seal, Australo-African Fur-seal [21]		Breeding likely to occur within area
<a href="#">Neophoca cinerea</a> Australian Sea-lion, Australian Sea Lion [22]	Vulnerable	Species or species habitat known to occur within area
<b>Reptiles</b>		
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Name	Threatened	Type of Presence
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<b>Whales and other Cetaceans</b>		
<a href="#">[ Resource Information ]</a>		
Name	Status	Type of Presence
<b>Mammals</b>		
<a href="#">Balaenoptera acutorostrata</a> Minke Whale [33]		Species or species habitat may occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Berardius arnuxii</a> Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
<a href="#">Delphinus delphis</a> Common Dophin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Breeding known to occur within area
<a href="#">Globicephala macrorhynchus</a> Short-finned Pilot Whale [62]		Species or species habitat may occur within area
<a href="#">Globicephala melas</a> Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
<a href="#">Grampus griseus</a> Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
<a href="#">Kogia breviceps</a> Pygmy Sperm Whale [57]		Species or species habitat may occur within area
<a href="#">Kogia simus</a> Dwarf Sperm Whale [58]		Species or species habitat may occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat likely to occur within area
<a href="#">Lissodelphis peronii</a> Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species

Name	Status	Type of Presence
<a href="#">Mesoplodon bowdoini</a> Andrew's Beaked Whale [73]		habitat known to occur within area  Species or species habitat may occur within area
<a href="#">Mesoplodon densirostris</a> Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
<a href="#">Mesoplodon grayi</a> Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
<a href="#">Mesoplodon hectori</a> Hector's Beaked Whale [76]		Species or species habitat may occur within area
<a href="#">Mesoplodon layardii</a> Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
<a href="#">Mesoplodon mirus</a> True's Beaked Whale [54]		Species or species habitat may occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Pseudorca crassidens</a> False Killer Whale [48]		Species or species habitat likely to occur within area
<a href="#">Tursiops aduncus</a> Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
<a href="#">Tursiops truncatus s. str.</a> Bottlenose Dolphin [68417]		Species or species habitat may occur within area
<a href="#">Ziphius cavirostris</a> Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

## Invasive Species

[ [Resource Information](#) ]

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resources Audit, 2001.

Name	Status	Type of Presence
<b>Birds</b>		
<i>Acridotheres tristis</i> Common Myna, Indian Myna [387]		Species or species habitat likely to occur within area
<i>Alauda arvensis</i> Skylark [656]		Species or species habitat likely to occur within area
<i>Anas platyrhynchos</i> Mallard [974]		Species or species habitat likely to occur within area
<i>Callipepla californica</i> California Quail [59451]		Species or species habitat likely to occur within area
<i>Carduelis carduelis</i> European Goldfinch [403]		Species or species habitat likely to occur within area
<i>Carduelis chloris</i> European Greenfinch [404]		Species or species habitat likely to occur within area
<i>Columba livia</i> Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species habitat likely to occur within area
<i>Meleagris gallopavo</i> Wild Turkey [64380]		Species or species habitat likely to occur within area
<i>Passer domesticus</i> House Sparrow [405]		Species or species habitat likely to occur within area
<i>Passer montanus</i> Eurasian Tree Sparrow [406]		Species or species habitat likely to occur within area
<i>Pavo cristatus</i> Indian Peafowl, Peacock [919]		Species or species habitat likely to occur within area
<i>Phasianus colchicus</i> Common Pheasant [920]		Species or species habitat likely to occur within area
<i>Pycnonotus jocosus</i> Red-whiskered Bulbul [631]		Species or species habitat likely to occur within area
<i>Streptopelia chinensis</i> Spotted Turtle-Dove [780]		Species or species habitat likely to occur within area
<i>Sturnus vulgaris</i> Common Starling [389]		Species or species

Name	Status	Type of Presence
Turdus merula		habitat likely to occur within area
Common Blackbird, Eurasian Blackbird [596]		Species or species habitat likely to occur within area
Turdus philomelos		
Song Thrush [597]		Species or species habitat likely to occur within area
<b>Mammals</b>		
Bos taurus		
Domestic Cattle [16]		Species or species habitat likely to occur within area
Canis lupus familiaris		
Domestic Dog [82654]		Species or species habitat likely to occur within area
Capra hircus		
Goat [2]		Species or species habitat likely to occur within area
Felis catus		
Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Feral deer		
Feral deer species in Australia [85733]		Species or species habitat likely to occur within area
Lepus capensis		
Brown Hare [127]		Species or species habitat likely to occur within area
Mus musculus		
House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus		
Rabbit, European Rabbit [128]		Species or species habitat likely to occur within area
Rattus norvegicus		
Brown Rat, Norway Rat [83]		Species or species habitat likely to occur within area
Rattus rattus		
Black Rat, Ship Rat [84]		Species or species habitat likely to occur within area
Sus scrofa		
Pig [6]		Species or species habitat likely to occur within area
Vulpes vulpes		
Red Fox, Fox [18]		Species or species habitat likely to occur within area
<b>Plants</b>		
Alternanthera philoxeroides		
Alligator Weed [11620]		Species or species habitat likely to occur within area
Anredera cordifolia		
Madeira Vine, Jalap, Lamb's-tail, Mignonette Vine, Anredera, Gulf Madeiravine, Heartleaf Madeiravine, Potato Vine [2643]		Species or species habitat likely to occur within area
Asparagus asparagoides		
Bridal Creeper, Bridal Veil Creeper, Smilax, Florist's Smilax, Smilax Asparagus [22473]		Species or species habitat likely to occur within area

Name	Status	Type of Presence
Asparagus scandens Asparagus Fern, Climbing Asparagus Fern [23255]		Species or species habitat likely to occur within area
Austrocylindropuntia spp. Prickly Pears [85132]		Species or species habitat likely to occur within area
Carrichtera annua Ward's Weed [9511]		Species or species habitat may occur within area
Cenchrus ciliaris Buffel-grass, Black Buffel-grass [20213]		Species or species habitat may occur within area
Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]		Species or species habitat may occur within area
Chrysanthemoides monilifera subsp. monilifera Boneseed [16905]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera subsp. rotundata Bitou Bush [16332]		Species or species habitat likely to occur within area
Cytisus scoparius Broom, English Broom, Scotch Broom, Common Broom, Scottish Broom, Spanish Broom [5934]		Species or species habitat likely to occur within area
Eichhornia crassipes Water Hyacinth, Water Orchid, Nile Lily [13466]		Species or species habitat likely to occur within area
Genista linifolia Flax-leaved Broom, Mediterranean Broom, Flax Broom [2800]		Species or species habitat likely to occur within area
Genista monspessulana Montpellier Broom, Cape Broom, Canary Broom, Common Broom, French Broom, Soft Broom [20126]		Species or species habitat likely to occur within area
Genista sp. X Genista monspessulana Broom [67538]		Species or species habitat may occur within area
Lycium ferocissimum African Boxthorn, Boxthorn [19235]		Species or species habitat likely to occur within area
Nassella neesiana Chilean Needle grass [67699]		Species or species habitat likely to occur within area
Nassella trichotoma Serrated Tussock, Yass River Tussock, Yass Tussock, Nassella Tussock (NZ) [18884]		Species or species habitat likely to occur within area
Olea europaea Olive, Common Olive [9160]		Species or species habitat may occur within area
Opuntia spp. Prickly Pears [82753]		Species or species habitat likely to occur within area
Rubus fruticosus aggregate Blackberry, European Blackberry [68406]		Species or species habitat likely to occur within area

Name	Status	Type of Presence
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		Species or species habitat likely to occur within area
Ulex europaeus Gorse, Furze [7693]		Species or species habitat likely to occur within area

### Key Ecological Features (Marine) [ [Resource Information](#) ]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
<a href="#">West Tasmania Canyons</a>	South-east

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 15/05/19 16:27:26

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	None
<a href="#">National Heritage Places:</a>	None
<a href="#">Wetlands of International Importance:</a>	None
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	1
<a href="#">Listed Threatened Ecological Communities:</a>	1
<a href="#">Listed Threatened Species:</a>	58
<a href="#">Listed Migratory Species:</a>	60

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

<a href="#">Commonwealth Land:</a>	None
<a href="#">Commonwealth Heritage Places:</a>	None

<a href="#">Regional Forest Agreements:</a>	1
<a href="#">Invasive Species:</a>	21
<a href="#">Nationally Important Wetlands:</a>	None
<a href="#">Key Ecological Features (Marine)</a>	None

# Details

## Matters of National Environmental Significance

### Commonwealth Marine Area

[\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

#### Name

EEZ and Territorial Sea

### Marine Regions

[\[ Resource Information \]](#)

If you are planning to undertake action in an area in or close to the Commonwealth Marine Area, and a marine bioregional plan has been prepared for the Commonwealth Marine Area in that area, the marine bioregional plan may inform your decision as to whether to refer your proposed action under the EPBC Act.

#### Name

[South-east](#)

### Listed Threatened Ecological Communities

[\[ Resource Information \]](#)

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thinornis rubricollis_rubricollis</a> Hooded Plover (eastern) [66726]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tyto novaehollandiae_castanops (Tasmanian population)</a> Masked Owl (Tasmanian) [67051]	Vulnerable	Species or species habitat known to occur within area
<b>Crustaceans</b>		
<a href="#">Astacopsis gouldi</a> Giant Freshwater Crayfish, Tasmanian Giant Freshwater Lobster [64415]	Vulnerable	Species or species habitat may occur within area
<b>Fish</b>		
<a href="#">Galaxiella pusilla</a> Eastern Dwarf Galaxias, Dwarf Galaxias [56790]	Vulnerable	Species or species habitat may occur within area
<a href="#">Prototroctes maraena</a> Australian Grayling [26179]	Vulnerable	Species or species habitat likely to occur within area
<b>Frogs</b>		
<a href="#">Litoria raniformis</a> Growling Grass Frog, Southern Bell Frog, Green and Golden Frog, Warty Swamp Frog [1828]	Vulnerable	Species or species habitat likely to occur within area
<b>Mammals</b>		
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Dasyurus maculatus_maculatus (Tasmanian population)</a> Spotted-tail Quoll, Spot-tailed Quoll, Tiger Quoll (Tasmanian population) [75183]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Dasyurus viverrinus</a> Eastern Quoll, Luaner [333]	Endangered	Species or species habitat may occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Sarcophilus harrisii</a> Tasmanian Devil [299]	Endangered	Species or species habitat likely to occur within area

### Plants

<a href="#">Caladenia caudata</a> Tailed Spider-orchid [17067]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Caladenia dienema</a> Windswept Spider-orchid [64858]	Endangered	Species or species habitat may occur within area
<a href="#">Diuris lanceolata</a> Snake Orchid [10231]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum atratum</a> Three Hummock Leek-orchid [82677]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Prasophyllum secutum</a> Northern Leek-orchid [64954]	Endangered	Species or species habitat likely to occur within area
<a href="#">Pterostylis cucullata</a> Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis ziegeleri</a> Grassland Greenhood, Cape Portland Greenhood [64971]	Vulnerable	Species or species habitat may occur within area

### Reptiles

<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area

### Sharks

<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
--	------------	---

### Listed Migratory Species [\[ Resource Information \]](#)

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Migratory Marine Birds</b>		
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardenna carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Ardenna tenuirostris</a> Short-tailed Shearwater [82652]		Breeding known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Hydroprogne caspia</a> Caspian Tern [808]		Breeding known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Sternula albifrons</a> Little Tern [82849]		Species or species habitat may occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Breeding known to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<b>Migratory Marine Species</b>		
<a href="#">Balaena glacialis australis</a> Southern Right Whale [75529]	Endangered*	Species or species habitat known to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely

Name	Threatened	Type of Presence
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	to occur within area Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat may occur within area
<a href="#">Lamna nasus</a> Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<b>Migratory Terrestrial Species</b>		
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat likely to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat may occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Species or species habitat known to occur within area
<b>Migratory Wetlands Species</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat may occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area

Name	Threatened	Type of Presence
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat may occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Tringa brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area

## Other Matters Protected by the EPBC Act

### Listed Marine Species [ [Resource Information](#) ]

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Birds</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat may occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardea alba</a> Great Egret, White Egret [59541]		Species or species habitat known to occur within area
<a href="#">Ardea ibis</a> Cattle Egret [59542]		Species or species habitat may occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat may occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Catharacta skua</a> Great Skua [59472]		Species or species habitat may occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius ruficapillus</a> Red-capped Plover [881]		Roosting known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely

Name	Threatened	Type of Presence
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	to occur within area Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Eudyptula minor</a> Little Penguin [1085]		Breeding known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Haliaeetus leucogaster</a> White-bellied Sea-Eagle [943]		Breeding known to occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Heteroscelus brevipes</a> Grey-tailed Tattler [59311]		Roosting known to occur within area
<a href="#">Himantopus himantopus</a> Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat likely to occur within area
<a href="#">Larus novaehollandiae</a> Silver Gull [810]		Breeding known to occur within area
<a href="#">Larus pacificus</a> Pacific Gull [811]		Breeding known to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Species or species habitat known to occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pachyptila turtur</a> Fairy Prion [1066]		Species or species habitat known to occur within area
<a href="#">Pelagodroma marina</a> White-faced Storm-Petrel [1016]		Breeding known to occur within area
<a href="#">Pelecanoides urinatrix</a> Common Diving-Petrel [1018]		Breeding known to occur within area
<a href="#">Phalacrocorax fuscescens</a> Black-faced Cormorant [59660]		Breeding known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
<a href="#">Puffinus carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Puffinus tenuirostris</a> Short-tailed Shearwater [1029]		Breeding known to occur within area
<a href="#">Sterna albifrons</a> Little Tern [813]		Species or species habitat may occur within area
<a href="#">Sterna caspia</a> Caspian Tern [59467]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Breeding known to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Species or species habitat may occur within area

Name	Threatened	Type of Presence
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche sp. nov.</a> Pacific Albatross [66511]	Vulnerable*	Species or species habitat may occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thinornis rubricollis</a> Hooded Plover [59510]		Species or species habitat known to occur within area
<a href="#">Thinornis rubricollis rubricollis</a> Hooded Plover (eastern) [66726]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area
<b>Fish</b>		
<a href="#">Heraldia nocturna</a> Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
<a href="#">Hippocampus abdominalis</a> Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		Species or species habitat may occur within area
<a href="#">Hippocampus breviceps</a> Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
<a href="#">Histiogamphelus briggsii</a> Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
<a href="#">Histiogamphelus cristatus</a> Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
<a href="#">Hypselognathus rostratus</a> Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
<a href="#">Kaupus costatus</a> Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
<a href="#">Kimblaeus bassensis</a> Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
<a href="#">Leptoichthys fistularius</a> Brushtail Pipefish [66248]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
<a href="#">Lissocampus caudalis</a> Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
<a href="#">Lissocampus runa</a> Javelin Pipefish [66251]		Species or species habitat may occur within area
<a href="#">Maroubra perserrata</a> Sawtooth Pipefish [66252]		Species or species habitat may occur within area
<a href="#">Mitotichthys semistriatus</a> Halfbanded Pipefish [66261]		Species or species habitat may occur within area
<a href="#">Mitotichthys tuckeri</a> Tucker's Pipefish [66262]		Species or species habitat may occur within area
<a href="#">Notiocampus ruber</a> Red Pipefish [66265]		Species or species habitat may occur within area
<a href="#">Phycodurus eques</a> Leafy Seadragon [66267]		Species or species habitat may occur within area
<a href="#">Phyllopteryx taeniolatus</a> Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
<a href="#">Pugnaso curtirostris</a> Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
<a href="#">Solegnathus robustus</a> Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
<a href="#">Solegnathus spinosissimus</a> Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
<a href="#">Stigmatopora argus</a> Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
<a href="#">Stigmatopora nigra</a> Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
<a href="#">Stipecampus cristatus</a> Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
<a href="#">Urocampus carinirostris</a> Hairy Pipefish [66282]		Species or species habitat may occur within area
<a href="#">Vanacampus margaritifer</a> Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
<a href="#">Vanacampus phillipi</a> Port Phillip Pipefish [66284]		Species or species habitat may occur within area
<a href="#">Vanacampus poecilolaemus</a> Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
<a href="#">Arctocephalus forsteri</a> Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
<a href="#">Arctocephalus pusillus</a> Australian Fur-seal, Australo-African Fur-seal [21]		Species or species habitat may occur within area
<b>Reptiles</b>		
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
<b>Whales and other Cetaceans</b>		<a href="#">[ Resource Information ]</a>
Name	Status	Type of Presence
<b>Mammals</b>		
<a href="#">Balaenoptera acutorostrata</a> Minke Whale [33]		Species or species habitat may occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
<a href="#">Delphinus delphis</a> Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
<a href="#">Globicephala macrorhynchus</a> Short-finned Pilot Whale [62]		Species or species habitat may occur within area
<a href="#">Grampus griseus</a> Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat may occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<a href="#">Tursiops truncatus s. str.</a> Bottlenose Dolphin [68417]		Species or species habitat may occur within area

## Critical Habitats [\[ Resource Information \]](#)

Name	Type of Presence
<a href="#">Thalassarche cauta (Shy Albatross) - Albatross Island, The Mewstone, Pedra Branca</a>	Listed Critical Habitat

## Extra Information

### State and Territory Reserves [\[ Resource Information \]](#)

Name	State
Albatross Island	TAS
Bird Island	TAS
Harbour Islets	TAS
Hunter Island	TAS
Kangaroo Island	TAS
Penguin Islet	TAS
Petrel Islands	TAS
Seacrow Islet	TAS
Stack Island	TAS
Three Hummock Island	TAS

### Regional Forest Agreements [\[ Resource Information \]](#)

Note that all areas with completed RFAs have been included.

Name	State
<a href="#">Tasmania RFA</a>	Tasmania

### Invasive Species [\[ Resource Information \]](#)

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resources Audit, 2001.

Name	Status	Type of Presence
<b>Birds</b>		
Alauda arvensis Skylark [656]		Species or species habitat likely to occur within area
Anas platyrhynchos Mallard [974]		Species or species habitat likely to occur within area
Carduelis carduelis European Goldfinch [403]		Species or species habitat likely to occur within area
Carduelis chloris European Greenfinch [404]		Species or species habitat likely to occur within area
Columba livia Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species habitat likely to occur within area
Passer domesticus House Sparrow [405]		Species or species habitat likely to occur within area

Name	Status	Type of Presence
Pavo cristatus Indian Peafowl, Peacock [919]		Species or species habitat likely to occur within area
Sturnus vulgaris Common Starling [389]		Species or species habitat likely to occur within area
Turdus merula Common Blackbird, Eurasian Blackbird [596]		Species or species habitat likely to occur within area
<b>Mammals</b>		
Bos taurus Domestic Cattle [16]		Species or species habitat likely to occur within area
Canis lupus familiaris Domestic Dog [82654]		Species or species habitat likely to occur within area
Capra hircus Goat [2]		Species or species habitat likely to occur within area
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Lepus capensis Brown Hare [127]		Species or species habitat likely to occur within area
Mus musculus House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species habitat likely to occur within area
<b>Plants</b>		
Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]		Species or species habitat may occur within area
Lycium ferocissimum African Boxthorn, Boxthorn [19235]		Species or species habitat likely to occur within area
Rubus fruticosus aggregate Blackberry, European Blackberry [68406]		Species or species habitat likely to occur within area
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		Species or species habitat likely to occur within area
Ulex europaeus Gorse, Furze [7693]		Species or species habitat likely to occur within area

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 02/08/19 16:45:18

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	None
<a href="#">National Heritage Places:</a>	None
<a href="#">Wetlands of International Importance:</a>	1
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	2
<a href="#">Listed Threatened Ecological Communities:</a>	3
<a href="#">Listed Threatened Species:</a>	107
<a href="#">Listed Migratory Species:</a>	89

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

# Details

## Matters of National Environmental Significance

### Wetlands of International Importance (Ramsar) [\[ Resource Information \]](#)

Name	Proximity
<a href="#">Elizabeth and middleton reefs marine national nature reserve</a>	Within Ramsar site

### Commonwealth Marine Area [\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

Name
EEZ and Territorial Sea
Extended Continental Shelf

### Marine Regions [\[ Resource Information \]](#)

If you are planning to undertake action in an area in or close to the Commonwealth Marine Area, and a marine bioregional plan has been prepared for the Commonwealth Marine Area in that area, the marine bioregional plan may inform your decision as to whether to refer your proposed action under the EPBC Act.

Name
<a href="#">Temperate East</a>

### Listed Threatened Ecological Communities [\[ Resource Information \]](#)

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Name	Status	Type of Presence
<a href="#">Coastal Swamp Oak (Casuarina glauca) Forest of New South Wales and South East Queensland ecological community</a>	Endangered	Community likely to occur within area
<a href="#">Littoral Rainforest and Coastal Vine Thickets of Eastern Australia</a>	Critically Endangered	Community likely to occur within area
<a href="#">Subtropical and Temperate Coastal Saltmarsh</a>	Vulnerable	Community likely to occur within area

### Listed Threatened Species [\[ Resource Information \]](#)

Name	Status	Type of Presence
<b>Birds</b>		
<a href="#">Anthochaera phrygia</a> Regent Honeyeater [82338]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Botaurus poiciloptilus</a> Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area

Name	Status	Type of Presence
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Cyclopsitta diophthalma coxeni</a> Coxen's Fig-Parrot [59714]	Endangered	Species or species habitat known to occur within area
<a href="#">Dasyornis brachypterus</a> Eastern Bristlebird [533]	Endangered	Species or species habitat may occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea antipodensis gibsoni</a> Gibson's Albatross [82270]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Erythrotriorchis radiatus</a> Red Goshawk [942]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Fregetta grallaria grallaria</a> White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Limosa lapponica baueri</a> Bar-tailed Godwit (baueri), Western Alaskan Bar-tailed Godwit [86380]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Limosa lapponica menzbieri</a> Northern Siberian Bar-tailed Godwit, Bar-tailed Godwit (menzbieri) [86432]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pachyptila turtur subantarctica</a> Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur

Name	Status	Type of Presence within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
<a href="#">Poephila cincta cincta</a> Southern Black-throated Finch [64447]	Endangered	Species or species habitat may occur within area
<a href="#">Pterodroma heraldica</a> Herald Petrel [66973]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Pterodroma leucoptera leucoptera</a> Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Species or species habitat may occur within area
<a href="#">Pterodroma neglecta neglecta</a> Kermadec Petrel (western) [64450]	Vulnerable	Foraging, feeding or related behaviour may occur within area
<a href="#">Rostratula australis</a> Australian Painted-snipe, Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche bulleri platei</a> Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta cauta</a> Shy Albatross, Tasmanian Shy Albatross [82345]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta steadi</a> White-capped Albatross [82344]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Species or species habitat may occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Turnix melanogaster</a> Black-breasted Button-quail [923]	Vulnerable	Species or species habitat likely to occur within area
<b>Fish</b>		
<a href="#">Epinephelus daemeli</a> Black Rockcod, Black Cod, Saddled Rockcod [68449]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Nannoperca oxleyana</a> Oxleyan Pygmy Perch [64468]	Endangered	Species or species habitat known to occur within area
<b>Frogs</b>		
<a href="#">Litoria aurea</a> Green and Golden Bell Frog [1870]	Vulnerable	Species or species

Name	Status	Type of Presence
<a href="#">Litoria olongburensis</a> Wallum Sedge Frog [1821]	Vulnerable	habitat known to occur within area Species or species habitat known to occur within area
<a href="#">Mixophyes fleayi</a> Fleay's Frog [25960]	Endangered	Species or species habitat likely to occur within area
<a href="#">Mixophyes iteratus</a> Giant Barred Frog, Southern Barred Frog [1944]	Endangered	Species or species habitat may occur within area
<b>Insects</b>		
<a href="#">Argynnis hyperbius inconstans</a> Australian Fritillary [88056]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Phyllodes imperialis smithersi</a> Pink Underwing Moth [86084]	Endangered	Breeding may occur within area
<b>Mammals</b>		
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat may occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Chalinolobus dwyeri</a> Large-eared Pied Bat, Large Pied Bat [183]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Dasyurus maculatus maculatus (SE mainland population)</a> Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Congregation or aggregation known to occur within area
<a href="#">Petauroides volans</a> Greater Glider [254]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Petrogale penicillata</a> Brush-tailed Rock-wallaby [225]	Vulnerable	Species or species habitat may occur within area
<a href="#">Phascolarctos cinereus (combined populations of Qld, NSW and the ACT)</a> Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) [85104]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Potorous tridactylus tridactylus</a> Long-nosed Potoroo (SE Mainland) [66645]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pseudomys novaehollandiae</a> New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pteropus poliocephalus</a> Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur

Name	Status	Type of Presence within area
<a href="#">Xeromys myoides</a> Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat likely to occur within area
<b>Other</b>		
<a href="#">Thersites mitchellae</a> Mitchell's Rainforest Snail [66774]	Critically Endangered	Species or species habitat known to occur within area
<b>Plants</b>		
<a href="#">Acronychia littoralis</a> Scented Acronychia [8582]	Endangered	Species or species habitat likely to occur within area
<a href="#">Allocasuarina thalassoscopica</a> [21927]	Endangered	Species or species habitat known to occur within area
<a href="#">Arthraxon hispidus</a> Hairy-joint Grass [9338]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Corokia whiteana</a> [17820]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Cryptocarya foetida</a> Stinking Cryptocarya, Stinking Laurel [11976]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cryptostylis hunteriana</a> Leafless Tongue-orchid [19533]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Cynanchum elegans</a> White-flowered Wax Plant [12533]	Endangered	Species or species habitat likely to occur within area
<a href="#">Davidsonia jerseyana</a> Davidson's Plum [67219]	Endangered	Species or species habitat known to occur within area
<a href="#">Davidsonia johnsonii</a> Smooth Davidsonia, Smooth Davidson's Plum, Small-leaved Davidson's Plum [67178]	Endangered	Species or species habitat likely to occur within area
<a href="#">Diploglottis campbellii</a> Small-leaved Tamarind [21484]	Endangered	Species or species habitat may occur within area
<a href="#">Elaeocarpus williamsianus</a> Hairy Quandong [8956]	Endangered	Species or species habitat likely to occur within area
<a href="#">Endiandra floydii</a> Floyd's Walnut [52955]	Endangered	Species or species habitat known to occur within area
<a href="#">Endiandra hayesii</a> Rusty Rose Walnut, Velvet Laurel [13866]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Eucalyptus tetrapleura</a> Square-fruited Ironbark [7490]	Vulnerable	Species or species habitat may occur within area
<a href="#">Floydia praealta</a> Ball Nut, Possum Nut, Big Nut, Beefwood [15762]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Fontainea australis</a> Southern Fontainea [24037]	Vulnerable	Species or species

Name	Status	Type of Presence
<a href="#">Hicksbeachia pinnatifolia</a>		habitat may occur within area
Monkey Nut, Bopple Nut, Red Bopple, Red Bopple Nut, Red Nut, Beef Nut, Red Apple Nut, Red Boppel Nut, Ivory Silky Oak [21189]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Leucopogon confertus</a>		
Torrington Beard-heath [14417]	Endangered	Species or species habitat likely to occur within area
<a href="#">Macadamia integrifolia</a>		
Macadamia Nut, Queensland Nut Tree, Smooth-shelled Macadamia, Bush Nut, Nut Oak [7326]	Vulnerable	Species or species habitat may occur within area
<a href="#">Macadamia tetraphylla</a>		
Rough-shelled Bush Nut, Macadamia Nut, Rough-shelled Macadamia, Rough-leaved Queensland Nut [6581]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Marsdenia longiloba</a>		
Clear Milkvine [2794]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Ochrosia moorei</a>		
Southern Ochrosia [11350]	Endangered	Species or species habitat likely to occur within area
<a href="#">Olax angulata</a>		
Minnie Waters Olax [10666]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Persicaria elatior</a>		
Knotweed, Tall Knotweed [5831]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Phaius australis</a>		
Lesser Swamp-orchid [5872]	Endangered	Species or species habitat known to occur within area
<a href="#">Prostanthera palustris</a>		
Swamp Mint-bush [66703]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Randia moorei</a>		
Spiny Gardenia [10577]	Endangered	Species or species habitat known to occur within area
<a href="#">Rutidosis heterogama</a>		
Heath Wrinklewort [13132]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Samadera sp. Moonee Creek (J.King s.n. Nov. 1949)</a>		
[86885]	Endangered	Species or species habitat likely to occur within area
<a href="#">Syzygium hodgkinsoniae</a>		
Smooth-bark Rose Apple, Red Lilly Pilly [3539]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Syzygium moorei</a>		
Rose Apple, Coolamon, Robby, Durobby, Watermelon Tree, Coolamon Rose Apple [12284]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Thesium australe</a>		
Austral Toadflax, Toadflax [15202]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Zieria prostrata</a>		
Headland Zieria [56782]	Endangered	Species or species habitat known to occur within area
<b>Reptiles</b>		
<a href="#">Caretta caretta</a>		
Loggerhead Turtle [1763]	Endangered	Breeding known to occur

Name	Status	Type of Presence within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Delma torquata</a> Adorned Delma, Collared Delma [1656]	Vulnerable	Species or species habitat may occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Furina dunmalli</a> Dunmall's Snake [59254]	Vulnerable	Species or species habitat may occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

## Sharks

<a href="#">Carcharias taurus (east coast population)</a> Grey Nurse Shark (east coast population) [68751]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pristis zijsron</a> Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding may occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

## Listed Migratory Species

[ [Resource Information](#) ]

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Migratory Marine Birds</b>		
<a href="#">Anous stolidus</a> Common Noddy [825]		Species or species habitat likely to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardenna carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area
<a href="#">Ardenna pacifica</a> Wedge-tailed Shearwater [84292]		Breeding known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
<a href="#">Sternula albifrons</a> Little Tern [82849]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Species or species habitat may occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Species or species habitat may occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<b>Migratory Marine Species</b>		
<a href="#">Balaena glacialis australis</a> Southern Right Whale [75529]	Endangered*	Species or species habitat likely to occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat may occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Species or species habitat may occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Isurus oxyrinchus</a> Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
<a href="#">Isurus paucus</a> Longfin Mako [82947]		Species or species habitat likely to occur within area
<a href="#">Lamna nasus</a> Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
<a href="#">Manta alfredi</a> Reef Manta Ray, Coastal Manta Ray, Inshore Manta Ray, Prince Alfred's Ray, Resident Manta Ray [84994]		Species or species habitat known to occur within area
<a href="#">Manta birostris</a> Giant Manta Ray, Chevron Manta Ray, Pacific Manta Ray, Pelagic Manta Ray, Oceanic Manta Ray [84995]		Species or species habitat likely to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Congregation or aggregation known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Orcaella heinsohni</a> Australian Snubfin Dolphin [81322]		Species or species habitat likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat may occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Pristis zijsron</a> Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding may occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
<a href="#">Sousa chinensis</a> Indo-Pacific Humpback Dolphin [50]		Species or species habitat known to occur within area
<b>Migratory Terrestrial Species</b>		
<a href="#">Cuculus optatus</a> Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat may occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat likely to occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Breeding known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<b>Migratory Wetlands Species</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris subminuta</a> Long-toed Stint [861]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Breeding known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Thalasseus bergii</a> Crested Tern [83000]		Breeding known to occur within area
<a href="#">Tringa brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa glareola</a> Wood Sandpiper [829]		Roosting known to occur within area

<a href="#">Tringa incana</a> Wandering Tattler [831]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area

## Other Matters Protected by the EPBC Act

### Commonwealth Heritage Places [\[ Resource Information \]](#)

Name	State	Status
Historic		
<a href="#">Cape Byron Lighthouse</a>	NSW	Listed place

### Listed Marine Species [\[ Resource Information \]](#)

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
Birds		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Anous stolidus</a> Common Noddy [825]		Species or species habitat likely to occur within area
<a href="#">Anseranas semipalmata</a> Magpie Goose [978]		Species or species habitat may occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardea alba</a> Great Egret, White Egret [59541]		Breeding known to occur within area
<a href="#">Ardea ibis</a> Cattle Egret [59542]		Species or species habitat may occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species

Name	Threatened	Type of Presence
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		habitat known to occur within area  Species or species habitat likely to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris subminuta</a> Long-toed Stint [861]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Catharacta skua</a> Great Skua [59472]		Species or species habitat may occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius ruficapillus</a> Red-capped Plover [881]		Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea gibsoni</a> Gibson's Albatross [64466]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Eudyptula minor</a> Little Penguin [1085]		Breeding known to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area

Name	Threatened	Type of Presence
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Haliaeetus leucogaster</a> White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
<a href="#">Heteroscelus brevipes</a> Grey-tailed Tattler [59311]		Roosting known to occur within area
<a href="#">Heteroscelus incanus</a> Wandering Tattler [59547]		Roosting known to occur within area
<a href="#">Himantopus himantopus</a> Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Larus novaehollandiae</a> Silver Gull [810]		Breeding known to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
<a href="#">Merops ornatus</a> Rainbow Bee-eater [670]		Species or species habitat may occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat likely to occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Breeding known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Name	Threatened	Type of Presence
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pachyptila turtur</a> Fairy Prion [1066]		Species or species habitat known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Breeding known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Phoebastria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Puffinus carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Species or species habitat known to occur within area
<a href="#">Puffinus pacificus</a> Wedge-tailed Shearwater [1027]		Breeding known to occur within area
<a href="#">Recurvirostra novaehollandiae</a> Red-necked Avocet [871]		Species or species habitat known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<a href="#">Rostratula benghalensis (sensu lato)</a> Painted Snipe [889]	Endangered*	Species or species habitat likely to occur within area
<a href="#">Sterna albifrons</a> Little Tern [813]		Breeding known to occur within area
<a href="#">Sterna bergii</a> Crested Tern [816]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Species or species habitat may occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Species or species habitat may occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area

Name	Threatened	Type of Presence
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche sp. nov.</a> Pacific Albatross [66511]	Vulnerable*	Species or species habitat may occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Tringa glareola</a> Wood Sandpiper [829]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area
<b>Fish</b>		
<a href="#">Acentronura tentaculata</a> Shortpouch Pygmy Pipehorse [66187]		Species or species habitat may occur within area
<a href="#">Campichthys tryoni</a> Tryon's Pipefish [66193]		Species or species habitat may occur within area
<a href="#">Corythoichthys amplexus</a> Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
<a href="#">Corythoichthys ocellatus</a> Orange-spotted Pipefish, Ocellated Pipefish [66203]		Species or species habitat may occur within area
<a href="#">Festucalex cinctus</a> Girdled Pipefish [66214]		Species or species habitat may occur within area
<a href="#">Filicampus tigris</a> Tiger Pipefish [66217]		Species or species habitat may occur within area
<a href="#">Halicampus grayi</a> Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
<a href="#">Hippichthys cyanospilos</a> Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
<a href="#">Hippichthys heptagonus</a> Madura Pipefish, Reticulated Freshwater Pipefish [66229]		Species or species habitat may occur within area
<a href="#">Hippichthys penicillus</a> Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
<a href="#">Hippocampus kelloggi</a> Kellogg's Seahorse, Great Seahorse [66723]		Species or species habitat may occur within area
<a href="#">Hippocampus kuda</a> Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within

Name	Threatened	Type of Presence area
<a href="#">Hippocampus planifrons</a> Flat-face Seahorse [66238]		Species or species habitat may occur within area
<a href="#">Hippocampus trimaculatus</a> Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
<a href="#">Hippocampus whitei</a> White's Seahorse, Crowned Seahorse, Sydney Seahorse [66240]		Species or species habitat known to occur within area
<a href="#">Lissocampus runa</a> Javelin Pipefish [66251]		Species or species habitat may occur within area
<a href="#">Maroubra perserrata</a> Sawtooth Pipefish [66252]		Species or species habitat may occur within area
<a href="#">Micrognathus andersonii</a> Anderson's Pipefish, Shortnose Pipefish [66253]		Species or species habitat may occur within area
<a href="#">Micrognathus brevirostris</a> thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
<a href="#">Microphis manadensis</a> Manado Pipefish, Manado River Pipefish [66258]		Species or species habitat may occur within area
<a href="#">Solegnathus dunckeri</a> Duncker's Pipehorse [66271]		Species or species habitat may occur within area
<a href="#">Solegnathus hardwickii</a> Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
<a href="#">Solegnathus spinosissimus</a> Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
<a href="#">Solenostomus cyanopterus</a> Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
<a href="#">Solenostomus paradoxus</a> Ornate Ghostpipefish, Harlequin Ghost Pipefish, Ornate Ghost Pipefish [66184]		Species or species habitat may occur within area
<a href="#">Stigmatopora nigra</a> Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
<a href="#">Syngnathoides biaculeatus</a> Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
<a href="#">Trachyrhamphus bicoarctatus</a> Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
<a href="#">Urocampus carinirostris</a> Hairy Pipefish [66282]		Species or species habitat may occur within area
<a href="#">Vanacampus margaritifer</a> Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
<b>Mammals</b>		
<a href="#">Dugong dugon</a> Dugong [28]		Species or species habitat may occur within area
<b>Reptiles</b>		
<a href="#">Astrotia stokesii</a> Stokes' Seasnake [1122]		Species or species habitat may occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Hydrophis elegans</a> Elegant Seasnake [1104]		Species or species habitat may occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Pelamis platurus</a> Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area
<b>Whales and other Cetaceans</b>		<b>[ Resource Information ]</b>
Name	Status	Type of Presence
<b>Mammals</b>		
<a href="#">Balaenoptera acutorostrata</a> Minke Whale [33]		Species or species habitat may occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat may occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Delphinus delphis</a> Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
<a href="#">Feresa attenuata</a> Pygmy Killer Whale [61]		Species or species habitat may occur within area
<a href="#">Globicephala macrorhynchus</a> Short-finned Pilot Whale [62]		Species or species habitat may occur within area
<a href="#">Globicephala melas</a> Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
<a href="#">Grampus griseus</a> Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
<a href="#">Hyperoodon planifrons</a> Southern Bottlenose Whale [71]		Species or species habitat may occur within area
<a href="#">Kogia breviceps</a> Pygmy Sperm Whale [57]		Species or species habitat may occur within area
<a href="#">Kogia simus</a> Dwarf Sperm Whale [58]		Species or species habitat may occur within area
<a href="#">Lagenodelphis hosei</a> Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
<a href="#">Lissodelphis peronii</a> Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Congregation or aggregation known to occur within area
<a href="#">Mesoplodon bowdoini</a> Andrew's Beaked Whale [73]		Species or species habitat may occur within area
<a href="#">Mesoplodon densirostris</a> Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
<a href="#">Mesoplodon ginkgodens</a> Ginkgo-toothed Beaked Whale, Ginkgo-toothed Whale, Ginkgo Beaked Whale [59564]		Species or species habitat may occur within area
<a href="#">Mesoplodon grayi</a> Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
<a href="#">Mesoplodon layardii</a> Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
<a href="#">Orcaella brevirostris</a> Irrawaddy Dolphin [45]		Species or species habitat likely to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Peponocephala electra</a> Melon-headed Whale [47]		Species or species habitat may occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Pseudorca crassidens</a> False Killer Whale [48]		Species or species habitat likely to occur within area
<a href="#">Sousa chinensis</a> Indo-Pacific Humpback Dolphin [50]		Species or species habitat known to occur within area
<a href="#">Stenella attenuata</a> Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
<a href="#">Stenella coeruleoalba</a> Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
<a href="#">Stenella longirostris</a> Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
<a href="#">Steno bredanensis</a> Rough-toothed Dolphin [30]		Species or species habitat may occur within area
<a href="#">Tursiops aduncus</a> Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
<a href="#">Tursiops truncatus s. str.</a> Bottlenose Dolphin [68417]		Species or species habitat may occur within area
<a href="#">Ziphius cavirostris</a> Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

## Invasive Species [\[ Resource Information \]](#)

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resources Audit, 2001.

Name	Status	Type of Presence
<b>Birds</b>		
Acridotheres tristis Common Myna, Indian Myna [387]		Species or species habitat likely to occur within area
Anas platyrhynchos Mallard [974]		Species or species habitat likely to occur within area
Carduelis carduelis European Goldfinch [403]		Species or species habitat likely to occur within area
Columba livia Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species habitat likely to occur within area
Lonchura punctulata Nutmeg Mannikin [399]		Species or species habitat likely to occur within area
Passer domesticus House Sparrow [405]		Species or species habitat likely to occur within area
Pycnonotus jocosus Red-whiskered Bulbul [631]		Species or species habitat likely to occur within area
Streptopelia chinensis Spotted Turtle-Dove [780]		Species or species habitat likely to occur within area
Sturnus vulgaris Common Starling [389]		Species or species habitat likely to occur within area
Turdus merula Common Blackbird, Eurasian Blackbird [596]		Species or species habitat likely to occur within area
<b>Frogs</b>		
Rhinella marina Cane Toad [83218]		Species or species habitat known to occur within area
<b>Mammals</b>		
Bos taurus Domestic Cattle [16]		Species or species habitat likely to occur within area

Name	Status	Type of Presence
Canis lupus familiaris Domestic Dog [82654]		Species or species habitat likely to occur within area
Equus caballus Horse [5]		Species or species habitat likely to occur within area
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Feral deer Feral deer species in Australia [85733]		Species or species habitat likely to occur within area
Lepus capensis Brown Hare [127]		Species or species habitat likely to occur within area
Mus musculus House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species habitat likely to occur within area
Rattus norvegicus Brown Rat, Norway Rat [83]		Species or species habitat likely to occur within area
Rattus rattus Black Rat, Ship Rat [84]		Species or species habitat likely to occur within area
Sus scrofa Pig [6]		Species or species habitat likely to occur within area
Vulpes vulpes Red Fox, Fox [18]		Species or species habitat likely to occur within area
<b>Plants</b>		
Alternanthera philoxeroides Alligator Weed [11620]		Species or species habitat likely to occur within area
Anredera cordifolia Madeira Vine, Jalap, Lamb's-tail, Mignonette Vine, Anredera, Gulf Madeiravine, Heartleaf Madeiravine, Potato Vine [2643]		Species or species habitat likely to occur within area
Asparagus aethiopicus Asparagus Fern, Ground Asparagus, Basket Fern, Sprengi's Fern, Bushy Asparagus, Emerald Asparagus [62425]		Species or species habitat likely to occur within area
Asparagus africanus Climbing Asparagus, Climbing Asparagus Fern [66907]		Species or species habitat likely to occur within area
Asparagus plumosus Climbing Asparagus-fern [48993]		Species or species habitat likely to occur within area
Cabomba caroliniana Cabomba, Fanwort, Carolina Watershield, Fish Grass, Washington Grass, Watershield, Carolina Fanwort, Common Cabomba [5171]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]		Species or species habitat likely to occur within area

Name	Status	Type of Presence
Chrysanthemoides monilifera subsp. rotundata Bitou Bush [16332]		Species or species habitat likely to occur within area
Dolichandra unguis-cati Cat's Claw Vine, Yellow Trumpet Vine, Cat's Claw Creeper, Funnel Creeper [85119]		Species or species habitat likely to occur within area
Eichhornia crassipes Water Hyacinth, Water Orchid, Nile Lily [13466]		Species or species habitat likely to occur within area
Genista sp. X Genista monspessulana Broom [67538]		Species or species habitat may occur within area
Lantana camara Lantana, Common Lantana, Kamara Lantana, Large-leaf Lantana, Pink Flowered Lantana, Red Flowered Lantana, Red-Flowered Sage, White Sage, Wild Sage [10892]		Species or species habitat likely to occur within area
Opuntia spp. Prickly Pears [82753]		Species or species habitat likely to occur within area
Pinus radiata Radiata Pine Monterey Pine, Insignis Pine, Wilding Pine [20780]		Species or species habitat may occur within area
Rubus fruticosus aggregate Blackberry, European Blackberry [68406]		Species or species habitat likely to occur within area
Sagittaria platyphylla Delta Arrowhead, Arrowhead, Slender Arrowhead [68483]		Species or species habitat likely to occur within area
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		Species or species habitat likely to occur within area
Salvinia molesta Salvinia, Giant Salvinia, Aquarium Watermoss, Kariba Weed [13665]		Species or species habitat likely to occur within area
Senecio madagascariensis Fireweed, Madagascar Ragwort, Madagascar Groundsel [2624]		Species or species habitat likely to occur within area

## Reptiles

Hemidactylus frenatus Asian House Gecko [1708]		Species or species habitat likely to occur within area

## Key Ecological Features (Marine)

[ [Resource Information](#) ]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
<a href="#">Canyons on the eastern continental slope</a>	Temperate east
<a href="#">Elizabeth and Middleton reefs</a>	Temperate east
<a href="#">Lord Howe seamount chain</a>	Temperate east
<a href="#">Shelf rocky reefs</a>	Temperate east

Name	Region
<a href="#">Tasman Front and eddy field</a>	Temperate east
<a href="#">Tasmantid seamount chain</a>	Temperate east

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 01/03/19 12:21:17

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	2
<a href="#">National Heritage Places:</a>	4
<a href="#">Wetlands of International Importance:</a>	11
<a href="#">Great Barrier Reef Marine Park:</a>	None
<a href="#">Commonwealth Marine Area:</a>	2
<a href="#">Listed Threatened Ecological Communities:</a>	17
<a href="#">Listed Threatened Species:</a>	213
<a href="#">Listed Migratory Species:</a>	91

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

<a href="#">Commonwealth Land:</a>	29
<a href="#">Commonwealth Heritage Places:</a>	20

<a href="#">Invasive Species:</a>	64
<a href="#">Nationally Important Wetlands:</a>	93
<a href="#">Key Ecological Features (Marine)</a>	5

# Details

## Matters of National Environmental Significance

### World Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
<a href="#">Australian Convict Sites (Darlington Probation Station Buffer Zone)</a>	TAS	Buffer zone
<a href="#">Australian Convict Sites (Darlington Probation Station)</a>	TAS	Declared property

### National Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
<b>Historic</b>		
<a href="#">Darlington Probation Station</a>	TAS	Listed place
<a href="#">Point Nepean Defence Sites and Quarantine Station Area</a>	VIC	Listed place
<a href="#">Port Arthur Historic Site</a>	TAS	Listed place
<a href="#">Quarantine Station and Surrounds</a>	VIC	Within listed place

### Wetlands of International Importance (Ramsar) [\[ Resource Information \]](#)

Name	Proximity
<a href="#">Apsley marshes</a>	Within Ramsar site
<a href="#">Corner inlet</a>	Within Ramsar site
<a href="#">East coast cape barren island lagoons</a>	Within Ramsar site
<a href="#">Flood plain lower ringarooma river</a>	Within Ramsar site
<a href="#">Gippsland lakes</a>	Within Ramsar site
<a href="#">Jocks lagoon</a>	Within Ramsar site
<a href="#">Little waterhouse lake</a>	Within Ramsar site
<a href="#">Logan lagoon</a>	Within Ramsar site
<a href="#">Moulting lagoon</a>	Within Ramsar site
<a href="#">Port phillip bay (western shoreline) and bellarine peninsula</a>	Within 10km of Ramsar
<a href="#">Western port</a>	Within Ramsar site

### Commonwealth Marine Area [\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

### Name

EEZ and Territorial Sea  
Extended Continental Shelf

### Marine Regions [\[ Resource Information \]](#)

If you are planning to undertake action in an area in or close to the Commonwealth Marine Area, and a marine bioregional plan has been prepared for the Commonwealth Marine Area in that area, the marine bioregional plan may inform your decision as to whether to refer your proposed action under the EPBC Act.

### Name

[South-east](#)  
[Temperate East](#)

### Listed Threatened Ecological Communities [\[ Resource Information \]](#)

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Name	Status	Type of Presence
<a href="#">Alpine Sphagnum Bogs and Associated Fens</a>	Endangered	Community likely to occur within area
<a href="#">Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community</a>	Endangered	Community likely to occur within area
<a href="#">Coastal Swamp Oak (Casuarina glauca) Forest of New South Wales and South East Queensland ecological community</a>	Endangered	Community likely to occur within area

Name	Status	Type of Presence
<a href="#">Eucalyptus ovata - Callitris oblonga Forest</a>	Vulnerable	Community likely to occur within area
<a href="#">Giant Kelp Marine Forests of South East Australia</a>	Endangered	Community likely to occur within area
<a href="#">Gippsland Red Gum (Eucalyptus tereticornis subsp. mediana) Grassy Woodland and Associated Native Grassland</a>	Critically Endangered	Community likely to occur within area
<a href="#">Illawarra and south coast lowland forest and woodland ecological community</a>	Critically Endangered	Community likely to occur within area
<a href="#">Littoral Rainforest and Coastal Vine Thickets of Eastern Australia</a>	Critically Endangered	Community likely to occur within area
<a href="#">Lowland Grassy Woodland in the South East Corner Bioregion</a>	Critically Endangered	Community likely to occur within area
<a href="#">Lowland Native Grasslands of Tasmania</a>	Critically Endangered	Community likely to occur within area
<a href="#">Natural Damp Grassland of the Victorian Coastal Plains</a>	Critically Endangered	Community likely to occur within area
<a href="#">Natural Temperate Grassland of the South Eastern Highlands</a>	Critically Endangered	Community may occur within area
<a href="#">Seasonal Herbaceous Wetlands (Freshwater) of the Temperate Lowland Plains</a>	Critically Endangered	Community likely to occur within area
<a href="#">Southern Highlands Shale Forest and Woodland in the Sydney Basin Bioregion</a>	Critically Endangered	Community likely to occur within area
<a href="#">Subtropical and Temperate Coastal Saltmarsh</a>	Vulnerable	Community likely to occur within area
<a href="#">Upland Basalt Eucalypt Forests of the Sydney Basin Bioregion</a>	Endangered	Community may occur within area
<a href="#">White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland</a>	Critically Endangered	Community may occur within area

## Listed Threatened Species [ [Resource Information](#) ]

Name	Status	Type of Presence
<b>Birds</b>		
<a href="#">Anthochaera phrygia</a> Regent Honeyeater [82338]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Aquila audax fleayi</a> Tasmanian Wedge-tailed Eagle, Wedge-tailed Eagle (Tasmanian) [64435]	Endangered	Breeding likely to occur within area
<a href="#">Botaurus poiciloptilus</a> Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Ceyx azureus diemenensis</a> Tasmanian Azure Kingfisher [25977]	Endangered	Breeding known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Dasyornis brachypterus</a> Eastern Bristlebird [533]	Endangered	Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Name	Status	Type of Presence
<a href="#">Diomedea antipodensis gibsoni</a> Gibson's Albatross [82270]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Fregetta grallaria grallaria</a> White-bellied Storm-Petrel (Tasman Sea), White-bellied Storm-Petrel (Australasian) [64438]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Grantiella picta</a> Painted Honeyeater [470]	Vulnerable	Breeding known to occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Breeding known to occur within area
<a href="#">Limosa lapponica baueri</a> Bar-tailed Godwit (baueri), Western Alaskan Bar-tailed Godwit [86380]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Limosa lapponica menzbieri</a> Northern Siberian Bar-tailed Godwit, Bar-tailed Godwit (menzbieri) [86432]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pachyptila turtur subantarctica</a> Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pardalotus quadragintus</a> Forty-spotted Pardalote [418]	Endangered	Species or species habitat known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pterodroma heraldica</a> Herald Petrel [66973]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Pterodroma leucoptera leucoptera</a> Gould's Petrel, Australian Gould's Petrel [26033]	Endangered	Breeding known to occur within area

Name	Status	Type of Presence
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
<a href="#">Pterodroma neglecta neglecta</a> Kermadec Petrel (western) [64450]	Vulnerable	Foraging, feeding or related behaviour may occur within area
<a href="#">Rostratula australis</a> Australian Painted-snipe, Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
<a href="#">Sternula nereis nereis</a> Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche bulleri platei</a> Northern Buller's Albatross, Pacific Albatross [82273]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta cauta</a> Shy Albatross, Tasmanian Shy Albatross [82345]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta steadi</a> White-capped Albatross [82344]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thinornis rubricollis rubricollis</a> Hooded Plover (eastern) [66726]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tyto novaehollandiae castanops (Tasmanian population)</a> Masked Owl (Tasmanian) [67051]	Vulnerable	Breeding known to occur within area
<b>Crustaceans</b>		
<a href="#">Astacopsis gouldi</a> Giant Freshwater Crayfish, Tasmanian Giant Freshwater Lobster [64415]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Engaeus granulatus</a> Central North Burrowing Crayfish [78959]	Endangered	Species or species habitat known to occur within area
<a href="#">Engaeus martigener</a> Furneaux Burrowing Crayfish [67220]	Endangered	Species or species habitat known to occur within area
<a href="#">Engaeus yabbimunna</a> Burnie Burrowing Crayfish [66781]	Vulnerable	Species or species

Name	Status	Type of Presence
<b>Fish</b>		
<a href="#">Brachionichthys hirsutus</a> Spotted Handfish [64418]	Critically Endangered	habitat known to occur within area Species or species habitat may occur within area
<a href="#">Brachiopsilus ziebelli</a> Ziebell's Handfish, Waterfall Bay Handfish [83757]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Epinephelus daemeli</a> Black Rockcod, Black Cod, Saddled Rockcod [68449]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Galaxias fontanus</a> Swan Galaxias [26167]	Endangered	Species or species habitat likely to occur within area
<a href="#">Galaxiella pusilla</a> Eastern Dwarf Galaxias, Dwarf Galaxias [56790]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Maccullochella peelii</a> Murray Cod [66633]	Vulnerable	Species or species habitat may occur within area
<a href="#">Macquaria australasica</a> Macquarie Perch [66632]	Endangered	Species or species habitat may occur within area
<a href="#">Prototroctes maraena</a> Australian Grayling [26179]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Thymichthys politus</a> Red Handfish [83756]	Critically Endangered	Species or species habitat likely to occur within area
<b>Frogs</b>		
<a href="#">Heleioporus australiacus</a> Giant Burrowing Frog [1973]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Litoria aurea</a> Green and Golden Bell Frog [1870]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Litoria littlejohni</a> Littlejohn's Tree Frog, Heath Frog [64733]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Litoria raniformis</a> Growling Grass Frog, Southern Bell Frog, Green and Golden Frog, Warty Swamp Frog [1828]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Mixophyes balbus</a> Stuttering Frog, Southern Barred Frog (in Victoria) [1942]	Vulnerable	Species or species habitat likely to occur within area
<b>Insects</b>		
<a href="#">Antipodia chaostola leucophaea</a> Tasmanian Chaostola Skipper, Heath-sand Skipper [77672]	Endangered	Species or species habitat known to occur within area
<a href="#">Hoplogonus bornemisszai</a> Bornemissza's Stag Beetle [66754]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Hoplogonus simsoni</a> Simson's Stag Beetle [66796]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Lissotes latidens</a> Broad-toothed Stag Beetle, Wielangta Stag Beetle [66760]	Endangered	Species or species habitat known to occur within area
<a href="#">Oreixenica ptunarra</a> Ptunarra Brown, Ptunarra Brown Butterfly, Ptunarra Xenica [26327]	Endangered	Species or species habitat may occur within area
<a href="#">Synemon plana</a> Golden Sun Moth [25234]	Critically Endangered	Species or species habitat may occur within area
<b>Mammals</b>		
<a href="#">Antechinus minimus maritimus</a> Swamp Antechinus (mainland) [83086]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Chalinolobus dwyeri</a> Large-eared Pied Bat, Large Pied Bat [183]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dasyurus maculatus maculatus (SE mainland population)</a> Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area
<a href="#">Dasyurus maculatus maculatus (Tasmanian population)</a> Spotted-tail Quoll, Spot-tailed Quoll, Tiger Quoll (Tasmanian population) [75183]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Dasyurus viverrinus</a> Eastern Quoll, Luaner [333]	Endangered	Species or species habitat known to occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
<a href="#">Isoodon obesulus obesulus</a> Southern Brown Bandicoot (eastern), Southern Brown Bandicoot (south-eastern) [68050]	Endangered	Species or species habitat known to occur within area
<a href="#">Mastacomys fuscus mordicus</a> Broad-toothed Rat (mainland), Tooarrana [87617]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Perameles gunnii gunnii</a> Eastern Barred Bandicoot (Tasmania) [66651]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Petauroides volans</a> Greater Glider [254]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Petrogale penicillata</a> Brush-tailed Rock-wallaby [225]	Vulnerable	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#"><u>Phascolarctos cinereus (combined populations of Qld, NSW and the ACT)</u></a>		
Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) [85104]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Potorous longipes</u></a>		
Long-footed Potoroo [217]	Endangered	Species or species habitat known to occur within area
<a href="#"><u>Potorous tridactylus tridactylus</u></a>		
Long-nosed Potoroo (SE mainland) [66645]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Pseudomys fumeus</u></a>		
Smoky Mouse, Konoom [88]	Endangered	Species or species habitat likely to occur within area
<a href="#"><u>Pseudomys novaehollandiae</u></a>		
New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Pteropus poliocephalus</u></a>		
Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area
<a href="#"><u>Sarcophilus harrisii</u></a>		
Tasmanian Devil [299]	Endangered	Translocated population known to occur within area
<b>Other</b>		
<a href="#"><u>Megascolides australis</u></a>		
Giant Gippsland Earthworm [64420]	Vulnerable	Species or species habitat likely to occur within area
<a href="#"><u>Parvulastra vivipara</u></a>		
Tasmanian Live-bearing Seastar [85451]	Vulnerable	Species or species habitat likely to occur within area
<a href="#"><u>Tasmanipatus anophthalmus</u></a>		
Blind Velvet Worm [66773]	Endangered	Species or species habitat known to occur within area
<b>Plants</b>		
<a href="#"><u>Acacia axillaris</u></a>		
Midlands Mimosa, Midlands Wattle [13563]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Acacia bynoeana</u></a>		
Bynoe's Wattle, Tiny Wattle [8575]	Vulnerable	Species or species habitat may occur within area
<a href="#"><u>Acacia caerulescens</u></a>		
Limestone Blue Wattle, Buchan Blue, Buchan Blue Wattle [21883]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Acacia constablei</u></a>		
Narrabarba Wattle [10798]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Acacia georgensis</u></a>		
Bega Wattle [9848]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Amphibromus fluitans</u></a>		
River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat known to occur within area
<a href="#"><u>Astrotricha crassifolia</u></a>		
Thick-leaf Star-hair [10352]	Vulnerable	Species or species habitat may occur within area
<a href="#"><u>Banksia vincentia</u></a>		
[88276]	Critically Endangered	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Barbarea australis</a> Native Wintercress, Riverbed Wintercress [12540]	Endangered	Species or species habitat likely to occur within area
<a href="#">Bertya tasmanica subsp. tasmanica</a> Tasmanian Bertya [78359]	Endangered	Species or species habitat known to occur within area
<a href="#">Boronia deanei</a> Deane's Boronia [8397]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Boronia gunnii</a> Gunn's Boronia, Cataract Gorge Boronia [29394]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Boronia hippopala</a> Velvet Boronia [78925]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Budawangia gnidioides</a> Budawangs Cliff-heath [55850]	Vulnerable	Species or species habitat may occur within area
<a href="#">Caladenia campbellii</a> Thick-stem Caladenia [64857]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Caladenia caudata</a> Tailed Spider-orchid [17067]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Caladenia dienema</a> Windswept Spider-orchid [64858]	Endangered	Species or species habitat may occur within area
<a href="#">Caladenia lindleyana</a> Lindley's Spider-orchid [9305]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Caladenia orientalis</a> Eastern Spider Orchid [83410]	Endangered	Species or species habitat known to occur within area
<a href="#">Caladenia robinsonii</a> Frankston Spider-orchid [24375]	Endangered	Species or species habitat likely to occur within area
<a href="#">Caladenia tessellata</a> Thick-lipped Spider-orchid, Daddy Long-legs [2119]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Caladenia tonellii</a> Robust Fingers [64861]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Callitris oblonga</a> Pygmy Cypress-pine, Pigmy Cypress-pine, Dwarf Cypress-pine [66687]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Callitris oblonga subsp. oblonga</a> South Esk Pine [64864]	Endangered	Species or species habitat known to occur within area
<a href="#">Cassinia rugata</a> Wrinkled Cassinia, Wrinkled Dollybush [21885]	Vulnerable	Species or species habitat may occur within area
<a href="#">Colobanthus curtisiae</a> Curtis' Colobanth [23961]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Commersonia prostrata</a> Dwarf Kerrawang [87152]	Endangered	Species or species habitat known to occur within area
<a href="#">Conospermum hookeri</a> Variable Smoke-bush [68161]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Correa baeuerlenii</a> Chef's Cap [17007]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Corunastylis brachystachya</a> Short-spiked Midge-orchid [76410]	Endangered	Species or species habitat known to occur within area
<a href="#">Corunastylis firthii</a> Firth's Midge-orchid [76411]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Cryptostylis hunteriana</a> Leafless Tongue-orchid [19533]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cynanchum elegans</a> White-flowered Wax Plant [12533]	Endangered	Species or species habitat known to occur within area
<a href="#">Daphnandra johnsonii</a> Illawarra Socketwood [67186]	Endangered	Species or species habitat likely to occur within area
<a href="#">Dianella amoena</a> Matted Flax-lily [64886]	Endangered	Species or species habitat known to occur within area
<a href="#">Diuris lanceolata</a> Snake Orchid [10231]	Endangered	Species or species habitat known to occur within area
<a href="#">Dodonaea procumbens</a> Trailing Hop-bush [12149]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Epacris apsleyensis</a> Apsley Heath [15428]	Endangered	Species or species habitat likely to occur within area
<a href="#">Epacris barbata</a> Bearded Heath, Freycinet Heath [17625]	Endangered	Species or species habitat likely to occur within area
<a href="#">Epacris exserta</a> South Esk Heath [19879]	Endangered	Species or species habitat known to occur within area
<a href="#">Epacris grandis</a> Grand Heath, Tall Heath [18719]	Endangered	Species or species habitat known to occur within area
<a href="#">Epacris limbata</a> Border Heath, Bordered Heath [24011]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Epacris virgata</a> Pretty Heath, Dan Hill Heath [20375]	Endangered	Species or species habitat known to occur within area
<a href="#">Eucalyptus langleyi</a> Albatross Mallee [56224]	Vulnerable	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#">Eucalyptus strzeleckii</a> Strzelecki Gum [55400]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Euphrasia amphisysepala</a> Shiny Cliff Eyebright [4534]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Euphrasia collina subsp. muelleri</a> Purple Eyebright, Mueller's Eyebright [16151]	Endangered	Species or species habitat known to occur within area
<a href="#">Euphrasia phragmostoma</a> Buftons Eyebright, Hairy Cliff Eyebright [7720]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Euphrasia semipicta</a> Peninsula Eyebright [9986]	Endangered	Species or species habitat likely to occur within area
<a href="#">Euphrasia sp. Bivouac Bay (W.R.Barker 7626 et al.)</a> Masked Eyebright, Masked Cliff Eyebright [82044]	Endangered	Species or species habitat known to occur within area
<a href="#">Genoplesium baueri</a> Yellow Gnat-orchid [7528]	Endangered	Species or species habitat known to occur within area
<a href="#">Genoplesium vernale</a> East Lynne Midge-orchid [68379]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Glycine latrobeana</a> Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Grevillea celata</a> Colquhoun Grevillea, Nowa Nowa Grevillea [64907]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Grevillea parviflora subsp. parviflora</a> Small-flower Grevillea [64910]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Haloragis exalata subsp. exalata</a> Wingless Raspwort, Square Raspwort [24636]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Irenepharsus trypherus</a> Delicate Cress, Illawarra Irene [14664]	Endangered	Species or species habitat known to occur within area
<a href="#">Leionema ralstonii</a> [64926]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Lepidium hyssopifolium</a> Basalt Pepper-cress, Peppercross, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat known to occur within area
<a href="#">Leucochrysum albicans var. tricolor</a> Hoary Sunray, Grassland Paper-daisy [56204]	Endangered	Species or species habitat known to occur within area
<a href="#">Limonium australe var. baudinii</a> Baudin's Sea-lavender [86369]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Melaleuca biconvexa</a> Biconvex Paperbark [5583]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Persicaria elatior</a> Knotweed, Tall Knotweed [5831]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Persoonia hirsuta</a> Hairy Geebung, Hairy Persoonia [19006]	Endangered	Species or species habitat may occur within area
<a href="#">Phebalium daviesii</a> Davies' Waxflower, St Helens Waxflower [16959]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Philothea freyciana</a> Freycinet Waxflower [68227]	Endangered	Species or species habitat known to occur within area
<a href="#">Pimelea spicata</a> Spiked Rice-flower [20834]	Endangered	Species or species habitat known to occur within area
<a href="#">Pomaderris brunnea</a> Rufous Pomaderris [16845]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pomaderris parrisiae</a> Parris' Pomaderris [22119]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Prasophyllum affine</a> Jervis Bay Leek Orchid, Culburra Leek-orchid, Kinghorn Point Leek-orchid [2210]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum apoxychilum</a> Tapered Leek-orchid [64947]	Endangered	Species or species habitat known to occur within area
<a href="#">Prasophyllum atratum</a> Three Hummock Leek-orchid [82677]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Prasophyllum castaneum</a> Chestnut Leek-orchid [64948]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum correctum</a> Gaping Leek-orchid [64533]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum frenchii</a> Maroon Leek-orchid, Slaty Leek-orchid, Stout Leek-orchid, French's Leek-orchid, Swamp Leek-orchid [9704]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum incorrectum</a> Golfers Leek-orchid [78898]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Prasophyllum limnetes</a> Marsh Leek-orchid [82678]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Prasophyllum pulchellum</a> Pretty Leek-orchid [64953]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Prasophyllum secutum</a> Northern Leek-orchid [64954]	Endangered	Species or species habitat likely to occur within area
<a href="#">Prasophyllum spicatum</a> Dense Leek-orchid [55146]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Prostanthera densa</a> Villous Mintbush [12233]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Prostanthera galbraithiae</a> Wellington Mintbush [64959]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis chlorogramma</a> Green-striped Greenhood [56510]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis commutata</a> Midland Greenhood [64535]	Critically Endangered	Species or species habitat may occur within area
<a href="#">Pterostylis cucullata</a> Leafy Greenhood [15459]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis gibbosa</a> Illawarra Greenhood, Rufa Greenhood, Pouched Greenhood [4562]	Endangered	Species or species habitat known to occur within area
<a href="#">Pterostylis pulchella</a> Pretty Greenhood [6448]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis tenuissima</a> Swamp Greenhood, Dainty Swamp Orchid [13139]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pterostylis vernalis</a> Halbury Rustyhood [84711]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Pterostylis ziegeleri</a> Grassland Greenhood, Cape Portland Greenhood [64971]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pultenaea aristata</a> [18062]	Vulnerable	Species or species habitat may occur within area
<a href="#">Rhizanthella slateri</a> Eastern Underground Orchid [11768]	Endangered	Species or species habitat known to occur within area
<a href="#">Senecio psilocarpus</a> Swamp Fireweed, Smooth-fruited Groundsel [64976]	Vulnerable	Species or species habitat may occur within area
<a href="#">Spyridium lawrencei</a> Small-leaf Spyridium [27036]	Endangered	Species or species habitat likely to occur within area
<a href="#">Spyridium obcordatum</a> Creeping Dusty Miller [17447]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Stenanthemum pimeleoides</a> Spreading Stenanthemum, Propellor Plant [15450]	Vulnerable	Species or species habitat may occur within area
<a href="#">Stonesiella selaginoides</a> Clubmoss Bush-pea [68100]	Endangered	Species or species habitat likely to occur within area
<a href="#">Syzygium paniculatum</a> Magenta Lilly Pilly, Magenta Cherry, Daguba, Scrub Cherry, Creek Lilly Pilly, Brush Cherry [20307]	Vulnerable	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Thelymitra epipactoides</a> Metallic Sun-orchid [11896]	Endangered	Species or species habitat known to occur within area
<a href="#">Thelymitra jonesii</a> Sky-blue Sun-orchid [76352]	Endangered	Species or species habitat known to occur within area
<a href="#">Thelymitra kangaloonica</a> Kangaloon Sun Orchid [81861]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Thelymitra matthewsii</a> Spiral Sun-orchid [4168]	Vulnerable	Species or species habitat may occur within area
<a href="#">Thesium australe</a> Austral Toadflax, Toadflax [15202]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Triplarina nowraensis</a> Nowra Heath-myrtle [64544]	Endangered	Species or species habitat known to occur within area
<a href="#">Xanthorrhoea arenaria</a> Sand Grasstree [21603]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Xanthorrhoea bracteata</a> Shiny Grasstree [7950]	Endangered	Species or species habitat known to occur within area
<a href="#">Xerochrysum palustre</a> Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Zieria baeuerlenii</a> Bomaderry Zieria, Bomaderry Creek Zieria [56781]	Endangered	Species or species habitat known to occur within area
<a href="#">Zieria granulata</a> Hill Zieria, Hilly Zieria, Illawarra Zieria [17147]	Endangered	Species or species habitat likely to occur within area
<a href="#">Zieria tuberculata</a> Warty Zieria [56736]	Vulnerable	Species or species habitat known to occur within area
<b>Reptiles</b>		
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Hoplocephalus bungaroides</a> Broad-headed Snake [1182]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Name	Status	Type of Presence
<b>Sharks</b>		
<a href="#">Carcharias taurus (east coast population)</a> Grey Nurse Shark (east coast population) [68751]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Breeding known to occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

### Listed Migratory Species [\[ Resource Information \]](#)

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Migratory Marine Birds</b>		
<a href="#">Anous stolidus</a> Common Noddy [825]		Species or species habitat likely to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardenna carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Ardenna grisea</a> Sooty Shearwater [82651]		Breeding known to occur within area
<a href="#">Ardenna pacifica</a> Wedge-tailed Shearwater [84292]		Breeding known to occur within area
<a href="#">Ardenna tenuirostris</a> Short-tailed Shearwater [82652]		Breeding known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
<a href="#">Hydroprogne caspia</a> Caspian Tern [808]		Breeding known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely

Name	Threatened	Type of Presence
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	to occur within area Foraging, feeding or related behaviour likely to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Sternula albifrons</a> Little Tern [82849]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<b>Migratory Marine Species</b>		
<a href="#">Balaena glacialis australis</a> Southern Right Whale [75529]	Endangered*	Species or species habitat known to occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Breeding known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Species or species habitat may occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Isurus oxyrinchus</a> Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
<a href="#">Isurus paucus</a> Longfin Mako [82947]		Species or species habitat likely to occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat likely to occur within area
<a href="#">Lamna nasus</a> Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
<a href="#">Manta birostris</a> Giant Manta Ray, Chevron Manta Ray, Pacific Manta Ray, Pelagic Manta Ray, Oceanic Manta Ray [84995]		Species or species habitat known to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<a href="#">Phocoena dioptrica</a> Spectacled Porpoise [66728]		Species or species habitat may occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
<b>Migratory Terrestrial Species</b>		
<a href="#">Cuculus optatus</a> Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area

Name	Threatened	Type of Presence
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat known to occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat may occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Breeding known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<b>Migratory Wetlands Species</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat known to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Foraging, feeding or related behaviour known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area

Name	Threatened	Type of Presence
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Species or species habitat known to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting known to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limnodromus semipalmatus</a> Asian Dowitcher [843]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Species or species habitat known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Thalasseus bergii</a> Crested Tern [83000]		Breeding known to occur within area
<a href="#">Tringa brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa glareola</a> Wood Sandpiper [829]		Roosting known to occur within area
<a href="#">Tringa incana</a> Wandering Tattler [831]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area

## Other Matters Protected by the EPBC Act

### Commonwealth Land

[ [Resource Information](#) ]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

#### Name

Commonwealth Land -  
 Commonwealth Land - Australian Academy of Science  
 Commonwealth Land - Australian National University  
 Commonwealth Land - Australian Postal Commission  
 Commonwealth Land - Australian Postal Corporation  
 Commonwealth Land - Australian Telecommunications Commission  
 Commonwealth Land - Booderee National Park  
 Commonwealth Land - Commonwealth Trading Bank of Australia  
 Commonwealth Land - Defence Housing Authority  
 Commonwealth Land - Defence Service Homes Corporation  
 Commonwealth Land - Director of War Service Homes  
 Commonwealth Land - Royal Australian Navy Central Canteens Board  
 Commonwealth Land - Telstra Corporation Limited  
 Defence - BAIRNSDALE TRAINING DEPOT  
 Defence - BEECROFT RAPIER RANGE  
 Defence - BUCKLAND TRAINING AREA  
 Defence - BURNIE TRAINING DEPOT  
 Defence - DCO NOWRA  
 Defence - DEVONPORT TRAINING DEPOT  
 Defence - DUTSON BOMBING RANGE  
 Defence - HMAS ALBATROSS  
 Defence - PARACHUTE DROPPING ZONE (PARACHUTE TRAINING SCHOOL) ; NOWRA - PTS  
 Defence - STONYHEAD TRAINING AREA  
 Defence - SUSSEX INLET - DEFENCE RESERVE  
 Defence - Shop 3  
 Defence - Suite 18, Holt Centre  
 Defence - TRAINING CENTRE (Norris Barracks) - Portsea  
 Defence - TS Leven  
 Defence - WEST HEAD GUNNERY RANGE

### Commonwealth Heritage Places

### Listed Marine Species

[ [Resource Information](#) ]

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
------	------------	------------------

Name	Threatened	Type of Presence
<b>Birds</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Anous stolidus</a> Common Noddy [825]		Species or species habitat likely to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardea alba</a> Great Egret, White Egret [59541]		Breeding known to occur within area
<a href="#">Ardea ibis</a> Cattle Egret [59542]		Species or species habitat may occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat known to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Catharacta skua</a> Great Skua [59472]		Species or species habitat may occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius ruficapillus</a> Red-capped Plover [881]		Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Foraging, feeding or related behaviour known to occur within area

Name	Threatened	Type of Presence
<a href="#">Chrysococcyx osculans</a> Black-eared Cuckoo [705]		Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea gibsoni</a> Gibson's Albatross [64466]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Eudyptula minor</a> Little Penguin [1085]		Breeding known to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Species or species habitat known to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting known to occur within area
<a href="#">Haliaeetus leucogaster</a> White-bellied Sea-Eagle [943]		Breeding known to occur within area
<a href="#">Halobaena caerulea</a> Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
<a href="#">Heteroscelus brevipes</a> Grey-tailed Tattler [59311]		Roosting known to occur within area
<a href="#">Heteroscelus incanus</a> Wandering Tattler [59547]		Roosting known to occur within area
<a href="#">Himantopus himantopus</a> Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]		Species or species habitat known to occur within area
<a href="#">Larus dominicanus</a> Kelp Gull [809]		Breeding known to occur within area
<a href="#">Larus novaehollandiae</a> Silver Gull [810]		Breeding known to occur within area

Name	Threatened	Type of Presence
<a href="#">Larus pacificus</a> Pacific Gull [811]		Breeding known to occur within area
<a href="#">Lathamus discolor</a> Swift Parrot [744]	Critically Endangered	Breeding known to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limnodromus semipalmatus</a> Asian Dowitcher [843]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Merops ornatus</a> Rainbow Bee-eater [670]		Species or species habitat may occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Morus serrator</a> Australasian Gannet [1020]		Breeding known to occur within area
<a href="#">Motacilla flava</a> Yellow Wagtail [644]		Species or species habitat may occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Breeding known to occur within area
<a href="#">Neophema chrysogaster</a> Orange-bellied Parrot [747]	Critically Endangered	Migration route known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pachyptila turtur</a> Fairy Prion [1066]		Species or species habitat known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Species or species habitat known to occur within area
<a href="#">Pelagodroma marina</a> White-faced Storm-Petrel [1016]		Breeding known to occur within area

Name	Threatened	Type of Presence
<a href="#">Pelecanoides urinatrix</a> Common Diving-Petrel [1018]		Breeding known to occur within area
<a href="#">Phalacrocorax fuscescens</a> Black-faced Cormorant [59660]		Breeding known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Pterodroma mollis</a> Soft-plumaged Petrel [1036]	Vulnerable	Species or species habitat may occur within area
<a href="#">Puffinus carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Puffinus griseus</a> Sooty Shearwater [1024]		Breeding known to occur within area
<a href="#">Puffinus pacificus</a> Wedge-tailed Shearwater [1027]		Breeding known to occur within area
<a href="#">Puffinus tenuirostris</a> Short-tailed Shearwater [1029]		Breeding known to occur within area
<a href="#">Recurvirostra novaehollandiae</a> Red-necked Avocet [871]		Roosting known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<a href="#">Rostratula benghalensis (sensu lato)</a> Painted Snipe [889]	Endangered*	Species or species habitat likely to occur within area
<a href="#">Sterna albifrons</a> Little Tern [813]		Breeding known to occur within area
<a href="#">Sterna bergii</a> Crested Tern [816]		Breeding known to occur within area
<a href="#">Sterna caspia</a> Caspian Tern [59467]		Breeding known to occur within area
<a href="#">Sterna fuscata</a> Sooty Tern [794]		Breeding known to occur within area
<a href="#">Sterna nereis</a> Fairy Tern [796]		Breeding known to occur within area
<a href="#">Sterna striata</a> White-fronted Tern [799]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta</a> Tasmanian Shy Albatross [89224]	Vulnerable*	Foraging, feeding or related behaviour likely

Name	Threatened	Type of Presence
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	to occur within area Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche sp. nov.</a> Pacific Albatross [66511]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thinornis rubricollis</a> Hooded Plover [59510]		Species or species habitat known to occur within area
<a href="#">Thinornis rubricollis rubricollis</a> Hooded Plover (eastern) [66726]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Tringa glareola</a> Wood Sandpiper [829]		Roosting known to occur within area
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area
<b>Fish</b>		
<a href="#">Acentronura tentaculata</a> Shortpouch Pygmy Pipehorse [66187]		Species or species habitat may occur within area
<a href="#">Cosmocampus howensis</a> Lord Howe Pipefish [66208]		Species or species habitat may occur within area
<a href="#">Festucalex cinctus</a> Girdled Pipefish [66214]		Species or species habitat may occur within area
<a href="#">Filicampus tigris</a> Tiger Pipefish [66217]		Species or species habitat may occur within area
<a href="#">Heraldia nocturna</a> Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
<a href="#">Hippichthys penicillus</a> Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species

Name	Threatened	Type of Presence
<a href="#">Hippocampus abdominalis</a> Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse [66233]		habitat may occur within area  Species or species habitat may occur within area
<a href="#">Hippocampus breviceps</a> Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
<a href="#">Hippocampus minotaur</a> Bullneck Seahorse [66705]		Species or species habitat may occur within area
<a href="#">Hippocampus whitei</a> White's Seahorse, Crowned Seahorse, Sydney Seahorse [66240]		Species or species habitat known to occur within area
<a href="#">Histiogamphelus briggsii</a> Crested Pipefish, Briggs' Crested Pipefish, Briggs' Pipefish [66242]		Species or species habitat may occur within area
<a href="#">Histiogamphelus cristatus</a> Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
<a href="#">Hypsognathus rostratus</a> Knifesnout Pipefish, Knife-snouted Pipefish [66245]		Species or species habitat may occur within area
<a href="#">Kaupus costatus</a> Deepbody Pipefish, Deep-bodied Pipefish [66246]		Species or species habitat may occur within area
<a href="#">Kimblaeus bassensis</a> Trawl Pipefish, Bass Strait Pipefish [66247]		Species or species habitat may occur within area
<a href="#">Leptoichthys fistularius</a> Brush-tail Pipefish [66248]		Species or species habitat may occur within area
<a href="#">Lissocampus caudalis</a> Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
<a href="#">Lissocampus runa</a> Javelin Pipefish [66251]		Species or species habitat may occur within area
<a href="#">Maroubra perserrata</a> Sawtooth Pipefish [66252]		Species or species habitat may occur within area
<a href="#">Mitotichthys mollisoni</a> Mollison's Pipefish [66260]		Species or species habitat may occur within area
<a href="#">Mitotichthys semistriatus</a> Halfbanded Pipefish [66261]		Species or species habitat may occur within area
<a href="#">Mitotichthys tuckeri</a> Tucker's Pipefish [66262]		Species or species habitat may occur within area
<a href="#">Notiocampus ruber</a> Red Pipefish [66265]		Species or species habitat may occur within area
<a href="#">Phycodurus eques</a> Leafy Seadragon [66267]		Species or species habitat may occur within

Name	Threatened	Type of Presence area
<a href="#">Phyllopteryx taeniolatus</a> Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
<a href="#">Pugnaso curtirostris</a> Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
<a href="#">Solegnathus robustus</a> Robust Pipehorse, Robust Spiny Pipehorse [66274]		Species or species habitat may occur within area
<a href="#">Solegnathus spinosissimus</a> Spiny Pipehorse, Australian Spiny Pipehorse [66275]		Species or species habitat may occur within area
<a href="#">Solenostomus cyanopterus</a> Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
<a href="#">Solenostomus paradoxus</a> Ornate Ghostpipefish, Harlequin Ghost Pipefish, Ornate Ghost Pipefish [66184]		Species or species habitat may occur within area
<a href="#">Stigmatopora argus</a> Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
<a href="#">Stigmatopora nigra</a> Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
<a href="#">Stipecampus cristatus</a> Ringback Pipefish, Ring-backed Pipefish [66278]		Species or species habitat may occur within area
<a href="#">Syngnathoides biaculeatus</a> Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
<a href="#">Trachyrhamphus bicoarctatus</a> Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
<a href="#">Urocampus carinirostris</a> Hairy Pipefish [66282]		Species or species habitat may occur within area
<a href="#">Vanacampus margaritifer</a> Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
<a href="#">Vanacampus phillipi</a> Port Phillip Pipefish [66284]		Species or species habitat may occur within area
<a href="#">Vanacampus poecilolaemus</a> Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
<b>Mammals</b>		
<a href="#">Arctocephalus forsteri</a> Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
<a href="#">Arctocephalus pusillus</a> Australian Fur-seal, Australo-African Fur-seal [21]		Breeding known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Species or species habitat may occur within area

Name	Threatened	Type of Presence
<b>Reptiles</b>		
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

**Whales and other Cetaceans** [ [Resource Information](#) ]

Name	Status	Type of Presence
<b>Mammals</b>		
<a href="#">Balaenoptera acutorostrata</a> Minke Whale [33]		Species or species habitat may occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Berardius arnuxii</a> Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
<a href="#">Delphinus delphis</a> Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
<a href="#">Eubalaena australis</a> Southern Right Whale [40]	Endangered	Species or species habitat known to occur within area
<a href="#">Feresa attenuata</a> Pygmy Killer Whale [61]		Species or species habitat may occur within area
<a href="#">Globicephala macrorhynchus</a> Short-finned Pilot Whale [62]		Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Globicephala melas</a> Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
<a href="#">Grampus griseus</a> Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
<a href="#">Hyperoodon planifrons</a> Southern Bottlenose Whale [71]		Species or species habitat may occur within area
<a href="#">Kogia breviceps</a> Pygmy Sperm Whale [57]		Species or species habitat may occur within area
<a href="#">Kogia simus</a> Dwarf Sperm Whale [58]		Species or species habitat may occur within area
<a href="#">Lagenorhynchus cruciger</a> Hourglass Dolphin [42]		Species or species habitat may occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat likely to occur within area
<a href="#">Lissodelphis peronii</a> Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Mesoplodon bowdoini</a> Andrew's Beaked Whale [73]		Species or species habitat may occur within area
<a href="#">Mesoplodon densirostris</a> Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
<a href="#">Mesoplodon ginkgodens</a> Ginkgo-toothed Beaked Whale, Ginkgo-toothed Whale, Ginkgo Beaked Whale [59564]		Species or species habitat may occur within area
<a href="#">Mesoplodon grayi</a> Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
<a href="#">Mesoplodon hectori</a> Hector's Beaked Whale [76]		Species or species habitat may occur within area
<a href="#">Mesoplodon layardii</a> Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
<a href="#">Mesoplodon mirus</a> True's Beaked Whale [54]		Species or species habitat may occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur within area
<a href="#">Peponocephala electra</a> Melon-headed Whale [47]		Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Phocoena dioptrica</a> Spectacled Porpoise [66728]		Species or species habitat may occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Pseudorca crassidens</a> False Killer Whale [48]		Species or species habitat likely to occur within area
<a href="#">Steno bredanensis</a> Rough-toothed Dolphin [30]		Species or species habitat may occur within area
<a href="#">Tasmacetus shepherdi</a> Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area
<a href="#">Tursiops aduncus</a> Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area

## Regional Forest Agreements [\[ Resource Information \]](#)

Note that all areas with completed RFAs have been included.

Name	State
<a href="#">East Gippsland RFA</a>	Victoria
<a href="#">Eden RFA</a>	New South Wales
<a href="#">Gippsland RFA</a>	Victoria
<a href="#">Southern RFA</a>	New South Wales
<a href="#">Tasmania RFA</a>	Tasmania

## Invasive Species [\[ Resource Information \]](#)

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resources Audit, 2001.

Name	Status	Type of Presence
<b>Birds</b>		
Acridotheres tristis Common Myna, Indian Myna [387]		Species or species habitat likely to occur within area
Alauda arvensis Skylark [656]		Species or species habitat likely to occur within area
Anas platyrhynchos Mallard [974]		Species or species habitat likely to occur within area
Callipepla californica California Quail [59451]		Species or species habitat likely to occur within area
Carduelis carduelis European Goldfinch [403]		Species or species habitat likely to occur within area
Carduelis chloris European Greenfinch [404]		Species or species habitat likely to occur within area
Columba livia Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species habitat likely to occur within area
Gallus gallus Red Junglefowl, Domestic Fowl [917]		Species or species habitat likely to occur within area
Lonchura punctulata Nutmeg Mannikin [399]		Species or species habitat likely to occur within area
Meleagris gallopavo Wild Turkey [64380]		Species or species habitat likely to occur within area
Passer domesticus House Sparrow [405]		Species or species habitat likely to occur

Name	Status	Type of Presence within area
Passer montanus Eurasian Tree Sparrow [406]		Species or species habitat likely to occur within area
Pavo cristatus Indian Peafowl, Peacock [919]		Species or species habitat likely to occur within area
Phasianus colchicus Common Pheasant [920]		Species or species habitat likely to occur within area
Pycnonotus jocosus Red-whiskered Bulbul [631]		Species or species habitat likely to occur within area
Streptopelia chinensis Spotted Turtle-Dove [780]		Species or species habitat likely to occur within area
Sturnus vulgaris Common Starling [389]		Species or species habitat likely to occur within area
Turdus merula Common Blackbird, Eurasian Blackbird [596]		Species or species habitat likely to occur within area
Turdus philomelos Song Thrush [597]		Species or species habitat likely to occur within area
<b>Frogs</b>		
Rhinella marina Cane Toad [83218]		Species or species habitat may occur within area
<b>Mammals</b>		
Bos taurus Domestic Cattle [16]		Species or species habitat likely to occur within area
Canis lupus familiaris Domestic Dog [82654]		Species or species habitat likely to occur within area
Capra hircus Goat [2]		Species or species habitat likely to occur within area
Equus caballus Horse [5]		Species or species habitat likely to occur within area
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Feral deer Feral deer species in Australia [85733]		Species or species habitat likely to occur within area
Lepus capensis Brown Hare [127]		Species or species habitat likely to occur within area
Mus musculus House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species

Name	Status	Type of Presence
<p>Rattus norvegicus Brown Rat, Norway Rat [83]</p>		<p>habitat likely to occur within area</p> <p>Species or species habitat likely to occur within area</p>
<p>Rattus rattus Black Rat, Ship Rat [84]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Sus scrofa Pig [6]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Vulpes vulpes Red Fox, Fox [18]</p>		<p>Species or species habitat likely to occur within area</p>
<b>Plants</b>		
<p>Alternanthera philoxeroides Alligator Weed [11620]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Anredera cordifolia Madeira Vine, Jalap, Lamb's-tail, Mignonette Vine, Anredera, Gulf Madeiravine, Heartleaf Madeiravine, Potato Vine [2643]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Asparagus aethiopicus Asparagus Fern, Ground Asparagus, Basket Fern, Sprengi's Fern, Bushy Asparagus, Emerald Asparagus [62425]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Asparagus asparagoides Bridal Creeper, Bridal Veil Creeper, Smilax, Florist's Smilax, Smilax Asparagus [22473]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Asparagus plumosus Climbing Asparagus-fern [48993]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Asparagus scandens Asparagus Fern, Climbing Asparagus Fern [23255]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Austrocylindropuntia spp. Prickly Pears [85132]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Cabomba caroliniana Cabomba, Fanwort, Carolina Watershield, Fish Grass, Washington Grass, Watershield, Carolina Fanwort, Common Cabomba [5171]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Carrichtera annua Ward's Weed [9511]</p>		<p>Species or species habitat may occur within area</p>
<p>Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Chrysanthemoides monilifera subsp. monilifera Boneseed [16905]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Chrysanthemoides monilifera subsp. rotundata Bitou Bush [16332]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Cytisus scoparius Broom, English Broom, Scotch Broom, Common Broom, Scottish Broom, Spanish Broom [5934]</p>		<p>Species or species habitat likely to occur within area</p>
<p>Eichhornia crassipes Water Hyacinth, Water Orchid, Nile Lily [13466]</p>		<p>Species or species</p>

Name	Status	Type of Presence
Genista linifolia		habitat likely to occur within area
Flax-leaved Broom, Mediterranean Broom, Flax Broom [2800]		Species or species habitat likely to occur within area
Genista monspessulana		Species or species habitat likely to occur within area
Montpellier Broom, Cape Broom, Canary Broom, Common Broom, French Broom, Soft Broom [20126]		
Genista sp. X Genista monspessulana		Species or species habitat may occur within area
Broom [67538]		
Lantana camara		Species or species habitat likely to occur within area
Lantana, Common Lantana, Kamara Lantana, Large-leaf Lantana, Pink Flowered Lantana, Red Flowered Lantana, Red-Flowered Sage, White Sage, Wild Sage [10892]		
Lycium ferocissimum		Species or species habitat likely to occur within area
African Boxthorn, Boxthorn [19235]		
Nassella neesiana		Species or species habitat likely to occur within area
Chilean Needle grass [67699]		
Nassella trichotoma		Species or species habitat likely to occur within area
Serrated Tussock, Yass River Tussock, Yass Tussock, Nassella Tussock (NZ) [18884]		
Olea europaea		Species or species habitat may occur within area
Olive, Common Olive [9160]		
Opuntia spp.		Species or species habitat likely to occur within area
Prickly Pears [82753]		
Pinus radiata		Species or species habitat may occur within area
Radiata Pine Monterey Pine, Insignis Pine, Wilding Pine [20780]		
Rubus fruticosus aggregate		Species or species habitat likely to occur within area
Blackberry, European Blackberry [68406]		
Sagittaria platyphylla		Species or species habitat likely to occur within area
Delta Arrowhead, Arrowhead, Slender Arrowhead [68483]		
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii		Species or species habitat likely to occur within area
Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		
Salvinia molesta		Species or species habitat likely to occur within area
Salvinia, Giant Salvinia, Aquarium Watermoss, Kariba Weed [13665]		
Senecio madagascariensis		Species or species habitat likely to occur within area
Fireweed, Madagascar Ragwort, Madagascar Groundsel [2624]		
Ulex europaeus		Species or species habitat likely to occur within area
Gorse, Furze [7693]		
<b>Reptiles</b>		
Hemidactylus frenatus		Species or species habitat likely to occur within area
Asian House Gecko [1708]

## Key Ecological Features (Marine) [\[ Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
<a href="#">Big Horseshoe Canyon</a>	South-east
<a href="#">Seamounts South and east of Tasmania</a>	South-east
<a href="#">Upwelling East of Eden</a>	South-east
<a href="#">Canyons on the eastern continental slope</a>	Temperate east
<a href="#">Shelf rocky reefs</a>	Temperate east

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

# EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about [Environment Assessments](#) and the EPBC Act including significance guidelines, forms and application process details.

Report created: 11/05/20 11:18:52

# Summary

## Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

<a href="#">World Heritage Properties:</a>	3
<a href="#">National Heritage Places:</a>	4
<a href="#">Wetlands of International Importance:</a>	2
<a href="#">Great Barrier Reef Marine Park:</a>	2
<a href="#">Commonwealth Marine Area:</a>	2
<a href="#">Listed Threatened Ecological Communities:</a>	4
<a href="#">Listed Threatened Species:</a>	168
<a href="#">Listed Migratory Species:</a>	96

## Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <http://www.environment.gov.au/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

<a href="#">Commonwealth Land:</a>	2
<a href="#">Commonwealth Heritage Places:</a>	7

# Details

## Matters of National Environmental Significance

### World Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
<a href="#">Australian Convict Sites (Kingston and Arthurs Vale Historic Area)</a>	EXT	Declared property
<a href="#">Fraser Island</a>	QLD	Declared property
<a href="#">Great Barrier Reef</a>	QLD	Declared property

### National Heritage Properties [\[ Resource Information \]](#)

Name	State	Status
<b>Natural</b>		
<a href="#">Fraser Island</a>	QLD	Listed place
<a href="#">Great Barrier Reef</a>	QLD	Listed place
<b>Historic</b>		
<a href="#">HMS Sirius Shipwreck</a>	EXT	Listed place
<a href="#">Kingston and Arthurs Vale Historic Area</a>	EXT	Listed place

### Wetlands of International Importance (Ramsar) [\[ Resource Information \]](#)

Name	Proximity
<a href="#">Great sandy strait (including great sandy strait, tin can bay and tin can Moreton bay)</a>	Within Ramsar site
<a href="#">Moreton bay</a>	Within Ramsar site

### Great Barrier Reef Marine Park [\[ Resource Information \]](#)

Type	Zone	IUCN
Buffer	B-22-3012	IV
Marine National Park	MNP-22-1154	II

### Commonwealth Marine Area [\[ Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside the Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area. Generally the Commonwealth Marine Area stretches from three nautical miles to two hundred nautical miles from the coast.

#### Name

EEZ and Territorial Sea  
Extended Continental Shelf

### Marine Regions [\[ Resource Information \]](#)

If you are planning to undertake action in an area in or close to the Commonwealth Marine Area, and a marine bioregional plan has been prepared for the Commonwealth Marine Area in that area, the marine bioregional plan may inform your decision as to whether to refer your proposed action under the EPBC Act.

#### Name

[Coral Sea](#)  
[South-east](#)  
[Temperate East](#)

### Listed Threatened Ecological Communities [\[ Resource Information \]](#)

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Name	Status	Type of Presence
<a href="#">Coastal Swamp Oak (Casuarina glauca) Forest of New South Wales and South East Queensland ecological community</a>	Endangered	Community likely to occur within area
<a href="#">Giant Kelp Marine Forests of South East Australia</a>	Endangered	Community may occur within area
<a href="#">Subtropical and Temperate Coastal Saltmarsh</a>	Vulnerable	Community likely to occur within area

<a href="#">Abutilon julianae</a> Norfolk Island Abutilon [27797]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Acacia attenuata</a> [10690]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Achyranthes arborescens</a> Chaff Tree, Soft-wood [65879]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Achyranthes margaretarum</a> Phillip Island Chaffy Tree [68426]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Acronychia littoralis</a> Scented Acronychia [8582]	Endangered	Species or species habitat known to occur within area
<a href="#">Allocasuarina thalassoscopica</a> [21927]	Endangered	Species or species habitat may occur within area
<a href="#">Archidendron lovelliae</a> Bacon Wood, Tulip Siris [13451]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Arthraxon hispidus</a> Hairy-joint Grass [9338]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Baloghia marmorata</a> Marbled Baloghia, Jointed Baloghia [8463]	Vulnerable	Species or species habitat may occur within area
<a href="#">Blechnum norfolkianum</a> Norfolk Island Water-fern [65885]	Endangered	Species or species habitat known to occur within area
<a href="#">Boehmeria australis subsp. australis</a> Tree Nettle, Nettle tree [83309]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Bosistoa transversa</a> Three-leaved Bosistoa, Yellow Satinheart [16091]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Calystegia affinis</a> [48909]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Clematis dubia</a> a creeper, Clematis [22035]	Critically Endangered	Species or species habitat known to occur within area

Name	Status	Type of Presence
<a href="#">Coprosma baueri</a> Coastal Coprosma [37851]	Endangered	Species or species habitat known to occur within area
<a href="#">Coprosma pilosa</a> Mountain Coprosma [37884]	Endangered	Species or species habitat known to occur within area
<a href="#">Cordyline oblecta</a> Ti [65878]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cryptocarya foetida</a> Stinking Cryptocarya, Stinking Laurel [11976]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cryptostylis hunteriana</a> Leafless Tongue-orchid [19533]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Cynanchum elegans</a> White-flowered Wax Plant [12533]	Endangered	Species or species habitat may occur within area
<a href="#">Dendrobium brachypus</a> Norfolk Island Orchid [2592]	Endangered	Species or species habitat known to occur within area
<a href="#">Diploglottis campbellii</a> Small-leaved Tamarind [21484]	Endangered	Species or species habitat may occur within area
<a href="#">Dysoxylum bijugum</a> Sharkwood, a tree [65892]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Elatostema montanum</a> Mountain Procris [33862]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Elymus multiflorus subsp. kingianus</a> Phillip Island Wheat Grass [82413]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Endiandra floydii</a> Floyd's Walnut [52955]	Endangered	Species or species habitat likely to occur within area
<a href="#">Eucalyptus conglomerata</a> Swamp Stringybark [3160]	Endangered	Species or species habitat may occur within area
<a href="#">Euphorbia norfolkiana</a> Norfolk Island Euphorbia [65887]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Euphorbia obliqua</a> a herb [44385]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Fontainea australis</a> Southern Fontainea [24037]	Vulnerable	Species or species habitat may occur within area
<a href="#">Gossia fragrantissima</a> Sweet Myrtle, Small-leaved Myrtle [78867]	Endangered	Species or species habitat may occur within area
<a href="#">Hibiscus insularis</a> Phillip Island Hibiscus [30614]	Critically Endangered	Species or species habitat likely to occur within area

Name	Status	Type of Presence
<a href="#">Hypolepis dicksonioides</a> Downy Ground-fern, Brake Fern, Ground Fern [10243]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Ileostylus micranthus</a> Mistletoe [65891]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Lastreopsis calantha</a> Shield-fern, Shieldfern [65884]	Endangered	Species or species habitat known to occur within area
<a href="#">Macadamia integrifolia</a> Macadamia Nut, Queensland Nut Tree, Smooth-shelled Macadamia, Bush Nut, Nut Oak [7326]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Macadamia ternifolia</a> Small-fruited Queensland Nut, Gympie Nut [7214]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Macadamia tetraphylla</a> Rough-shelled Bush Nut, Macadamia Nut, Rough-shelled Macadamia, Rough-leaved Queensland Nut [6581]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Macrozamia pauli-guilielmi</a> Pineapple Zamia [5712]	Endangered	Species or species habitat likely to occur within area
<a href="#">Marattia salicina</a> King Fern, Para, Potato Fern [16197]	Endangered	Species or species habitat likely to occur within area
<a href="#">Melicope littoralis</a> Shade Tree [22042]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Melicytus latifolius</a> Norfolk Island Mahoe [56677]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Melicytus ramiflorus subsp. oblongifolius</a> Whiteywood, a tree [56680]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Meryta angustifolia</a> a tree [65881]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Meryta latifolia</a> Shade Tree, Broad-leaved Meryta [65882]	Critically Endangered	Species or species habitat likely to occur within area
<a href="#">Muehlenbeckia australis</a> Shrubby Creeper, Pohuehue [68510]	Endangered	Species or species habitat known to occur within area
<a href="#">Myoporum obscurum</a> Popwood, Sandalwood, Bastard Ironwood [50255]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Myrsine ralstoniae</a> Beech [83889]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pennantia endlicheri</a> Pennantia [65890]	Endangered	Species or species habitat known to occur within area
<a href="#">Persicaria elatior</a> Knotweed, Tall Knotweed [5831]	Vulnerable	Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Phaius australis</a> Lesser Swamp-orchid [5872]	Endangered	Species or species habitat known to occur within area
<a href="#">Phaius bernaysii</a> Yellow Swamp-orchid [4918]	Endangered	Species or species habitat likely to occur within area
<a href="#">Phreatia limenophylax</a> Norfolk Island Phreatia [9239]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Phreatia paleata</a> an orchid [20193]	Endangered	Species or species habitat known to occur within area
<a href="#">Pittosporum bracteolatum</a> Oleander [47181]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Planchonella costata</a> [30944]	Endangered	Species or species habitat known to occur within area
<a href="#">Polyphlebium endlicherianum</a> Middle Filmy Fern [87494]	Endangered	Species or species habitat known to occur within area
<a href="#">Pteris kingiana</a> King's Brakefern [35183]	Endangered	Species or species habitat likely to occur within area
<a href="#">Pteris zahlbruckneriana</a> Netted Brakefern [65893]	Endangered	Species or species habitat likely to occur within area
<a href="#">Randia moorei</a> Spiny Gardenia [10577]	Endangered	Species or species habitat known to occur within area
<a href="#">Samadera bidwillii</a> Quassia [29708]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Senecio australis</a> a daisy [40250]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Senecio evansianus</a> a daisy [55340]	Endangered	Species or species habitat known to occur within area
<a href="#">Senecio hooglandii</a> a daisy [55346]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Sophora fraseri</a> [8836]	Vulnerable	Species or species habitat may occur within area
<a href="#">Streblus pendulinus</a> Siah's Backbone, Sia's Backbone, Isaac Wood [21618]	Endangered	Species or species habitat known to occur within area
<a href="#">Syzygium hodgkinsoniae</a> Smooth-bark Rose Apple, Red Lilly Pilly [3539]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Syzygium moorei</a> Rose Apple, Coolamon, Robby, Durobby, Watermelon Tree, Coolamon Rose Apple [12284]	Vulnerable	Species or species habitat may occur within area

Name	Status	Type of Presence
<a href="#">Taeniophyllum norfolkianum</a> Minute Orchid, Ribbon-root Orchid [82347]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Thelymitra jonesii</a> Sky-blue Sun-orchid [76352]	Endangered	Species or species habitat may occur within area
<a href="#">Thesium australe</a> Austral Toadflax, Toadflax [15202]	Vulnerable	Species or species habitat may occur within area
<a href="#">Tmesipteris norfolkensis</a> Hanging Fork-fern [65895]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Triunia robusta</a> Glossy Spice Bush [14747]	Endangered	Species or species habitat likely to occur within area
<a href="#">Ungeria floribunda</a> Bastard Oak [41714]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Wikstroemia australis</a> Kurrajong [42074]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Zehneria baueriana</a> Native Cucumber, Giant Cucumber [39253]	Endangered	Species or species habitat known to occur within area
<b>Reptiles</b>		
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Breeding known to occur within area
<a href="#">Christinus guentheri</a> Lord Howe Island Gecko, Lord Howe Island Southern Gecko [59250]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Delma torquata</a> Adorned Delma, Collared Delma [1656]	Vulnerable	Species or species habitat may occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Furina dunmalli</a> Dunmall's Snake [59254]	Vulnerable	Species or species habitat may occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
<a href="#">Oligosoma lichenigera</a> Lord Howe Island Skink [82034]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Saiphos reticulatus</a> Three-toed Snake-tooth Skink [88328]	Vulnerable	Species or species habitat likely to occur

Name	Status	Type of Presence within area
<b>Sharks</b>		
<a href="#">Carcharias taurus (east coast population)</a> Grey Nurse Shark (east coast population) [68751]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Pristis zijsron</a> Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding may occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

**Listed Migratory Species** [\[ Resource Information \]](#)

\* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
<b>Migratory Marine Birds</b>		
<a href="#">Anous stolidus</a> Common Noddy [825]		Breeding known to occur within area
<a href="#">Apus pacificus</a> Fork-tailed Swift [678]		Species or species habitat likely to occur within area
<a href="#">Ardenna carneipes</a> Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat known to occur within area
<a href="#">Ardenna grisea</a> Sooty Shearwater [82651]		Species or species habitat likely to occur within area
<a href="#">Ardenna pacifica</a> Wedge-tailed Shearwater [84292]		Breeding known to occur within area
<a href="#">Calonectris leucomelas</a> Streaked Shearwater [1077]		Species or species habitat known to occur within area
<a href="#">Diomedea antipodensis</a> Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea epomophora</a> Southern Royal Albatross [89221]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea exulans</a> Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Diomedea sanfordi</a> Northern Royal Albatross [64456]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Fregata ariel</a> Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
<a href="#">Fregata minor</a> Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
<a href="#">Macronectes giganteus</a> Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Name	Threatened	Type of Presence
<a href="#">Macronectes halli</a> Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Phaethon rubricauda</a> Red-tailed Tropicbird [994]		Breeding known to occur within area
<a href="#">Phoebetria fusca</a> Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
<a href="#">Sternula albifrons</a> Little Tern [82849]		Breeding known to occur within area
<a href="#">Sula dactylatra</a> Masked Booby [1021]		Breeding known to occur within area
<a href="#">Thalassarche bulleri</a> Buller's Albatross, Pacific Albatross [64460]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche cauta</a> Shy Albatross [89224]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche chrysostoma</a> Grey-headed Albatross [66491]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche eremita</a> Chatham Albatross [64457]	Endangered	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche impavida</a> Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche melanophris</a> Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche salvini</a> Salvin's Albatross [64463]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Thalassarche steadi</a> White-capped Albatross [64462]	Vulnerable*	Foraging, feeding or related behaviour likely to occur within area
<b>Migratory Marine Species</b>		
<a href="#">Balaena glacialis australis</a> Southern Right Whale [75529]	Endangered*	Species or species habitat known to occur within area
<a href="#">Balaenoptera bonaerensis</a> Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera borealis</a> Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
<a href="#">Balaenoptera edeni</a> Bryde's Whale [35]		Species or species habitat likely to occur within area
<a href="#">Balaenoptera musculus</a> Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
<a href="#">Balaenoptera physalus</a> Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely

Name	Threatened	Type of Presence
<a href="#">Caperea marginata</a> Pygmy Right Whale [39]		to occur within area  Foraging, feeding or related behaviour may occur within area
<a href="#">Carcharodon carcharias</a> White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Caretta caretta</a> Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
<a href="#">Chelonia mydas</a> Green Turtle [1765]	Vulnerable	Breeding known to occur within area
<a href="#">Crocodylus porosus</a> Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
<a href="#">Dermochelys coriacea</a> Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Dugong dugon</a> Dugong [28]		Species or species habitat known to occur within area
<a href="#">Eretmochelys imbricata</a> Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Isurus oxyrinchus</a> Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
<a href="#">Isurus paucus</a> Longfin Mako [82947]		Species or species habitat likely to occur within area
<a href="#">Lagenorhynchus obscurus</a> Dusky Dolphin [43]		Species or species habitat likely to occur within area
<a href="#">Lamna nasus</a> Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
<a href="#">Lepidochelys olivacea</a> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
<a href="#">Manta alfredi</a> Reef Manta Ray, Coastal Manta Ray, Inshore Manta Ray, Prince Alfred's Ray, Resident Manta Ray [84994]		Species or species habitat known to occur within area
<a href="#">Manta birostris</a> Giant Manta Ray, Chevron Manta Ray, Pacific Manta Ray, Pelagic Manta Ray, Oceanic Manta Ray [84995]		Species or species habitat likely to occur within area
<a href="#">Megaptera novaeangliae</a> Humpback Whale [38]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
<a href="#">Natator depressus</a> Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
<a href="#">Orcaella heinsohni</a> Australian Snubfin Dolphin [81322]		Species or species habitat likely to occur within area
<a href="#">Orcinus orca</a> Killer Whale, Orca [46]		Species or species habitat likely to occur

Name	Threatened	Type of Presence within area
<a href="#">Phocoena dioptrica</a> Spectacled Porpoise [66728]		Species or species habitat may occur within area
<a href="#">Physeter macrocephalus</a> Sperm Whale [59]		Species or species habitat may occur within area
<a href="#">Pristis zijsron</a> Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding may occur within area
<a href="#">Rhincodon typus</a> Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
<a href="#">Sousa chinensis</a> Indo-Pacific Humpback Dolphin [50]		Breeding known to occur within area
<b>Migratory Terrestrial Species</b>		
<a href="#">Cuculus optatus</a> Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat may occur within area
<a href="#">Hirundapus caudacutus</a> White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area
<a href="#">Monarcha melanopsis</a> Black-faced Monarch [609]		Species or species habitat known to occur within area
<a href="#">Monarcha trivirgatus</a> Spectacled Monarch [610]		Species or species habitat known to occur within area
<a href="#">Myiagra cyanoleuca</a> Satin Flycatcher [612]		Species or species habitat known to occur within area
<a href="#">Rhipidura rufifrons</a> Rufous Fantail [592]		Species or species habitat known to occur within area
<b>Migratory Wetlands Species</b>		
<a href="#">Actitis hypoleucos</a> Common Sandpiper [59309]		Species or species habitat known to occur within area
<a href="#">Arenaria interpres</a> Ruddy Turnstone [872]		Roosting known to occur within area
<a href="#">Calidris acuminata</a> Sharp-tailed Sandpiper [874]		Roosting known to occur within area
<a href="#">Calidris alba</a> Sanderling [875]		Roosting known to occur within area
<a href="#">Calidris canutus</a> Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
<a href="#">Calidris ferruginea</a> Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Calidris melanotos</a> Pectoral Sandpiper [858]		Species or species habitat known to occur within area
<a href="#">Calidris ruficollis</a> Red-necked Stint [860]		Roosting known to occur

Name	Threatened	Type of Presence within area
<a href="#">Calidris subminuta</a> Long-toed Stint [861]		Roosting known to occur within area
<a href="#">Calidris tenuirostris</a> Great Knot [862]	Critically Endangered	Roosting known to occur within area
<a href="#">Charadrius bicinctus</a> Double-banded Plover [895]		Roosting known to occur within area
<a href="#">Charadrius leschenaultii</a> Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Roosting known to occur within area
<a href="#">Charadrius mongolus</a> Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
<a href="#">Charadrius veredus</a> Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
<a href="#">Gallinago hardwickii</a> Latham's Snipe, Japanese Snipe [863]		Roosting known to occur within area
<a href="#">Gallinago megala</a> Swinhoe's Snipe [864]		Roosting likely to occur within area
<a href="#">Gallinago stenura</a> Pin-tailed Snipe [841]		Roosting likely to occur within area
<a href="#">Limicola falcinellus</a> Broad-billed Sandpiper [842]		Roosting known to occur within area
<a href="#">Limnodromus semipalmatus</a> Asian Dowitcher [843]		Roosting known to occur within area
<a href="#">Limosa lapponica</a> Bar-tailed Godwit [844]		Species or species habitat known to occur within area
<a href="#">Limosa limosa</a> Black-tailed Godwit [845]		Roosting known to occur within area
<a href="#">Numenius madagascariensis</a> Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
<a href="#">Numenius minutus</a> Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
<a href="#">Numenius phaeopus</a> Whimbrel [849]		Roosting known to occur within area
<a href="#">Pandion haliaetus</a> Osprey [952]		Breeding known to occur within area
<a href="#">Philomachus pugnax</a> Ruff (Reeve) [850]		Roosting known to occur within area
<a href="#">Pluvialis fulva</a> Pacific Golden Plover [25545]		Roosting known to occur within area
<a href="#">Pluvialis squatarola</a> Grey Plover [865]		Roosting known to occur within area
<a href="#">Tringa brevipes</a> Grey-tailed Tattler [851]		Roosting known to occur within area
<a href="#">Tringa glareola</a> Wood Sandpiper [829]		Roosting known to occur within area
<a href="#">Tringa incana</a> Wandering Tattler [831]		Roosting known to occur within area

Name	Threatened	Type of Presence
<a href="#">Tringa nebularia</a> Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
<a href="#">Tringa stagnatilis</a> Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
<a href="#">Xenus cinereus</a> Terek Sandpiper [59300]		Roosting known to occur within area

## Other Matters Protected by the EPBC Act

### Commonwealth Land [\[ Resource Information \]](#)

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Name
Commonwealth Land - Commonwealth Land - Norfolk Island National Park

<b>Invasive Species</b>		[ <a href="#">Resource Information</a> ]
Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resources Audit, 2001.		

Name	Status	Type of Presence
<b>Birds</b>		
Acridotheres tristis Common Myna, Indian Myna [387]		Species or species habitat likely to occur within area
Anas platyrhynchos Mallard [974]		Species or species habitat likely to occur within area
Callipepla californica California Quail [59451]		Species or species habitat likely to occur within area
Carduelis carduelis European Goldfinch [403]		Species or species habitat likely to occur within area
Carduelis chloris European Greenfinch [404]		Species or species habitat likely to occur within area
Columba livia Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species

Name	Status	Type of Presence
Gallus gallus		habitat likely to occur within area
Red Junglefowl, Feral Chicken, Domestic Fowl [917]		Species or species habitat likely to occur within area
Lonchura punctulata		
Nutmeg Mannikin [399]		Species or species habitat likely to occur within area
Passer domesticus		
House Sparrow [405]		Species or species habitat likely to occur within area
Pycnonotus jocosus		
Red-whiskered Bulbul [631]		Species or species habitat likely to occur within area
Streptopelia chinensis		
Spotted Turtle-Dove [780]		Species or species habitat likely to occur within area
Sturnus vulgaris		
Common Starling [389]		Species or species habitat likely to occur within area
Turdus merula		
Common Blackbird, Eurasian Blackbird [596]		Species or species habitat likely to occur within area

Rattus exulans Pacific Rat, Polynesian Rat [79]		Species or species habitat likely to occur within area
Rattus norvegicus Brown Rat, Norway Rat [83]		Species or species habitat likely to occur within area
Rattus rattus Black Rat, Ship Rat [84]		Species or species habitat likely to occur within area
Sus scrofa Pig [6]		Species or species habitat likely to occur within area
Vulpes vulpes Red Fox, Fox [18]		Species or species habitat likely to occur within area
<b>Plants</b>		
Alternanthera philoxeroides Alligator Weed [11620]		Species or species habitat likely to occur within area
Anredera cordifolia Madeira Vine, Jalap, Lamb's-tail, Mignonette Vine, Anredera, Gulf Madeiravine, Heartleaf Madeiravine, Potato Vine [2643]		Species or species habitat likely to occur within area
Asparagus aethiopicus Asparagus Fern, Ground Asparagus, Basket Fern, Sprengi's Fern, Bushy Asparagus, Emerald Asparagus [62425]		Species or species habitat likely to occur within area
Asparagus africanus Climbing Asparagus, Climbing Asparagus Fern [66907]		Species or species habitat likely to occur within area
Asparagus plumosus Climbing Asparagus-fern [48993]		Species or species habitat likely to occur within area
Asparagus scandens Asparagus Fern, Climbing Asparagus Fern [23255]		Species or species habitat likely to occur within area
Cabomba caroliniana Cabomba, Fanwort, Carolina Watershield, Fish Grass, Washington Grass, Watershield, Carolina Fanwort, Common Cabomba [5171]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera subsp. rotundata Bitou Bush [16332]		Species or species habitat likely to occur within area
Cryptostegia grandiflora Rubber Vine, Rubbervine, India Rubber Vine, India Rubbervine, Palay Rubbervine, Purple Allamanda [18913]		Species or species habitat likely to occur within area
Dolichandra unguis-cati Cat's Claw Vine, Yellow Trumpet Vine, Cat's Claw Creeper, Funnel Creeper [85119]		Species or species habitat likely to occur within area
Eichhornia crassipes Water Hyacinth, Water Orchid, Nile Lily [13466]		Species or species habitat likely to occur within area
Genista sp. X Genista monspessulana Broom [67538]		Species or species habitat may occur within area

Name	Status	Type of Presence
Hymenachne amplexicaulis Hymenachne, Olive Hymenachne, Water Stargrass, West Indian Grass, West Indian Marsh Grass [31754]		Species or species habitat likely to occur within area
Lantana camara Lantana, Common Lantana, Kamara Lantana, Large-leaf Lantana, Pink Flowered Lantana, Red Flowered Lantana, Red-Flowered Sage, White Sage, Wild Sage [10892]		Species or species habitat likely to occur within area
Lycium ferocissimum African Boxthorn, Boxthorn [19235]		Species or species habitat likely to occur within area
Opuntia spp. Prickly Pears [82753]		Species or species habitat likely to occur within area
Parthenium hysterophorus Parthenium Weed, Bitter Weed, Carrot Grass, False Ragweed [19566]		Species or species habitat likely to occur within area
Pinus radiata Radiata Pine Monterey Pine, Insignis Pine, Wilding Pine [20780]		Species or species habitat may occur within area
Rubus fruticosus aggregate Blackberry, European Blackberry [68406]		Species or species habitat likely to occur within area
Sagittaria platyphylla Delta Arrowhead, Arrowhead, Slender Arrowhead [68483]		Species or species habitat likely to occur within area
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		Species or species habitat likely to occur within area
Salvinia molesta Salvinia, Giant Salvinia, Aquarium Watermoss, Kariba Weed [13665]		Species or species habitat likely to occur within area
Senecio madagascariensis Fireweed, Madagascar Ragwort, Madagascar Groundsel [2624]		Species or species habitat likely to occur within area

## Reptiles

Hemidactylus frenatus Asian House Gecko [1708]		Species or species habitat likely to occur within area
Ramphotyphlops braminus Flowerpot Blind Snake, Brahminy Blind Snake, Cacing Besi [1258]		Species or species habitat likely to occur within area

## Nationally Important Wetlands

[ Resource Information ]

Name	State
<a href="#">Bribie Island</a>	QLD
<a href="#">Fraser Island</a>	QLD
<a href="#">Great Barrier Reef Marine Park</a>	QLD
<a href="#">Great Sandy Strait</a>	QLD
<a href="#">Moreton Bay</a>	QLD
<a href="#">Noosa River Wetlands</a>	QLD
<a href="#">North Stradbroke Island</a>	QLD
<a href="#">Pumicestone Passage</a>	QLD

## Key Ecological Features (Marine)

[ Resource Information ]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
<a href="#">Tasmantid seamount chain</a>	Coral Sea
<a href="#">Seamounts South and east of Tasmania</a>	South-east
<a href="#">Canyons on the eastern continental slope</a>	Temperate east
<a href="#">Lord Howe seamount chain</a>	Temperate east
<a href="#">Norfolk Ridge</a>	Temperate east
<a href="#">Shelf rocky reefs</a>	Temperate east
<a href="#">Tasman Front and eddy field</a>	Temperate east
<a href="#">Tasmantid seamount chain</a>	Temperate east
<a href="#">Upwelling off Fraser Island</a>	Temperate east

# Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

### Units

Abbreviation	Unit
µg	Microgram
µPa	Micropascal
API	API gravity – The method used for measuring the density of petroleum as defined in American Petroleum Institute standards
bbbl	Standard barrel
dB	Decibel
g	Gram
Hz	Hertz
kg	Kilogram
kHz	kiloHertz

Abbreviation	Unit
km	Kilometre
km <sup>2</sup>	Square kilometre
km <sup>3</sup>	Cubic kilometre
m	Metre
m <sup>2</sup>	Square metre
m <sup>3</sup>	Cubic metre
MT	Metric tonnes
nm	Nautical Mile
°C	Celsius degrees
°F	Fahrenheit degrees
ppb	Parts Per Billion
psi	Pounds per square inch
RMS	Root-mean-squared
TVD	True Vertical Depth – The absolute vertical distance between a datum, such as the rotary table, and a point in the wellbore
TVDSS	True Vertical Depth Subsea – The absolute vertical distance between mean sea level and a point in the wellbore

## 1 Introduction

Esso Australia Resources Pty Ltd (Esso) is the operator of joint ventures for the exploration, development and production of oil and gas from Bass Strait, Victoria. The offshore Bass Strait production network is comprised of 421 wells, 19 offshore platforms and five subsea facilities that are inter-connected by over 800 kilometres of pipelines. Esso has been producing oil and gas in Bass Strait since 1969 and in this time has supplied over 50 percent of Australia's crude oil and liquids and over 40 percent of all of Eastern Australia's natural gas, hence contributing significantly to the national economy and supporting growth in industry and employment. Although the Bass Strait production network has been producing energy for more than 50 years, it remains today the largest single source of gas supply to the Australian east coast domestic market, and has the potential to continue supplying one third of southeast Australia's domestic gas demand through to the end of this decade.

After delivering energy to Australia for over 50 years, many of the Bass Strait fields are now reaching the end of their productive life. The Plug and Abandonment (P&A) of the Gudgeon-1 and Terakihi-1 subsea wells is being pursued with the Helix Energy Solutions Group Inc. (Helix) Q7000 Light Well Intervention Vessel (LWIV) to manage well integrity risks as described in Section 2.1. The campaign is a, as low as reasonably practicable (ALARP), action in its own right and should be considered in this context. It is proposed to use the LWIV as a 'rig of opportunity' to P&A the wells and mitigate the integrity risk.

### 1.1 Titleholder details

Esso, a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is the operator for the Gippsland Basin Joint Venture (Esso and Woodside Energy (Bass Strait) Pty Ltd). Esso receives services, including personnel, from its wholly owned subsidiary, Esso Australia Pty Ltd, which is also a wholly owned subsidiary of ExxonMobil Australia Pty Ltd.

Petroleum Production Licences applicable to this EP are VIC/L06 and VIC/L20.

The nominated registered office for the proponent is as follows:

---

*Esso Australia Resources Pty Ltd (ACN 091 829 819)*

*Level 9, 664 Collins Street, Docklands VIC 3008*

---

The environmental contact for this activity is:

---

*Louise Mayboehm, Offshore Risk, Environment and Regulatory Supervisor*

*Esso Australia Pty Ltd for and on behalf of Esso*

*Telephone: (03) 9261 0000*

*Email: [IEAPL.Regulatory@exxonmobil.com](mailto:IEAPL.Regulatory@exxonmobil.com)*

---

The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) will be notified of a change in titleholder, a change in the environmental contact or a change in the contact details for either the titleholder or the environmental contact in accordance with Regulation 15(3) of the Offshore Petroleum and Greenhouse Gas (Environment) Regulations 2009 (OPGGs (Environment) Regulations).

## **1.2 Scope**

Esso has developed this Environment Plan (EP) to manage the environmental impacts and risks associated with P&A of the Gudgeon-1 and Terakihi-1 subsea wells, to be completed by an LWIV at the following two leases:

- VIC/L06 (Gudgeon-1): Initial Grant Date: 14-05-1968; Last Renewal Date: 09-11-2011
- VIC/L20 (Terakihi-1): Initial Grant Date: 02-01-1998, Last Renewal Date: 26-09-2019.

The two Operational Areas (OAs) for the purposes of this EP are defined by the 500 metre Petroleum Safety Zones (PSZ) around the Gudgeon-1 and Terakihi-1 subsea facilities. Activities included in the scope of this EP are described in detail in Section 2 and include LWIV positioning, plug and abandonment activities (including well head removal), support vessels, Remotely Operated Vehicles (ROVs) activities and use of helicopters.

Activities excluded from the scope of this EP are vessels (including the LWIV) transiting to or from the OAs. These vessels are deemed to be operating under the Commonwealth *Navigation Act 2012* and not performing a petroleum activity.

## **2 Description of the activity**

### **2.1 Overview and location**

The P&A campaign will utilise the Helix Q7000 LWIV to P&A the Gudgeon-1 and Terakihi-1 subsea wells. The two wells will be permanently abandoned by installation of cement plugs as barriers, followed by the retrieval of wellheads from the seafloor. This campaign will eliminate loss of containment risks and will remove obstructions and snag points for commercial fishermen. The campaign is an ALARP action in its own right and should be considered in this context.

The P&A campaign will take place in Production Licences VIC/L06 and VIC/L20 (as shown in Figure 2-1), located at the edge of the Gippsland Basin of the eastern Bass Strait, and adjacent to the Bass Canyon system (refer to Figure 2-2).

The two Operational Areas (OAs) for the purposes of this EP are defined by the 500 metre Petroleum Safety Zones (PSZ) around the Gudgeon-1 and Terakihi-1 subsea facilities also shown in Figure 2-1.

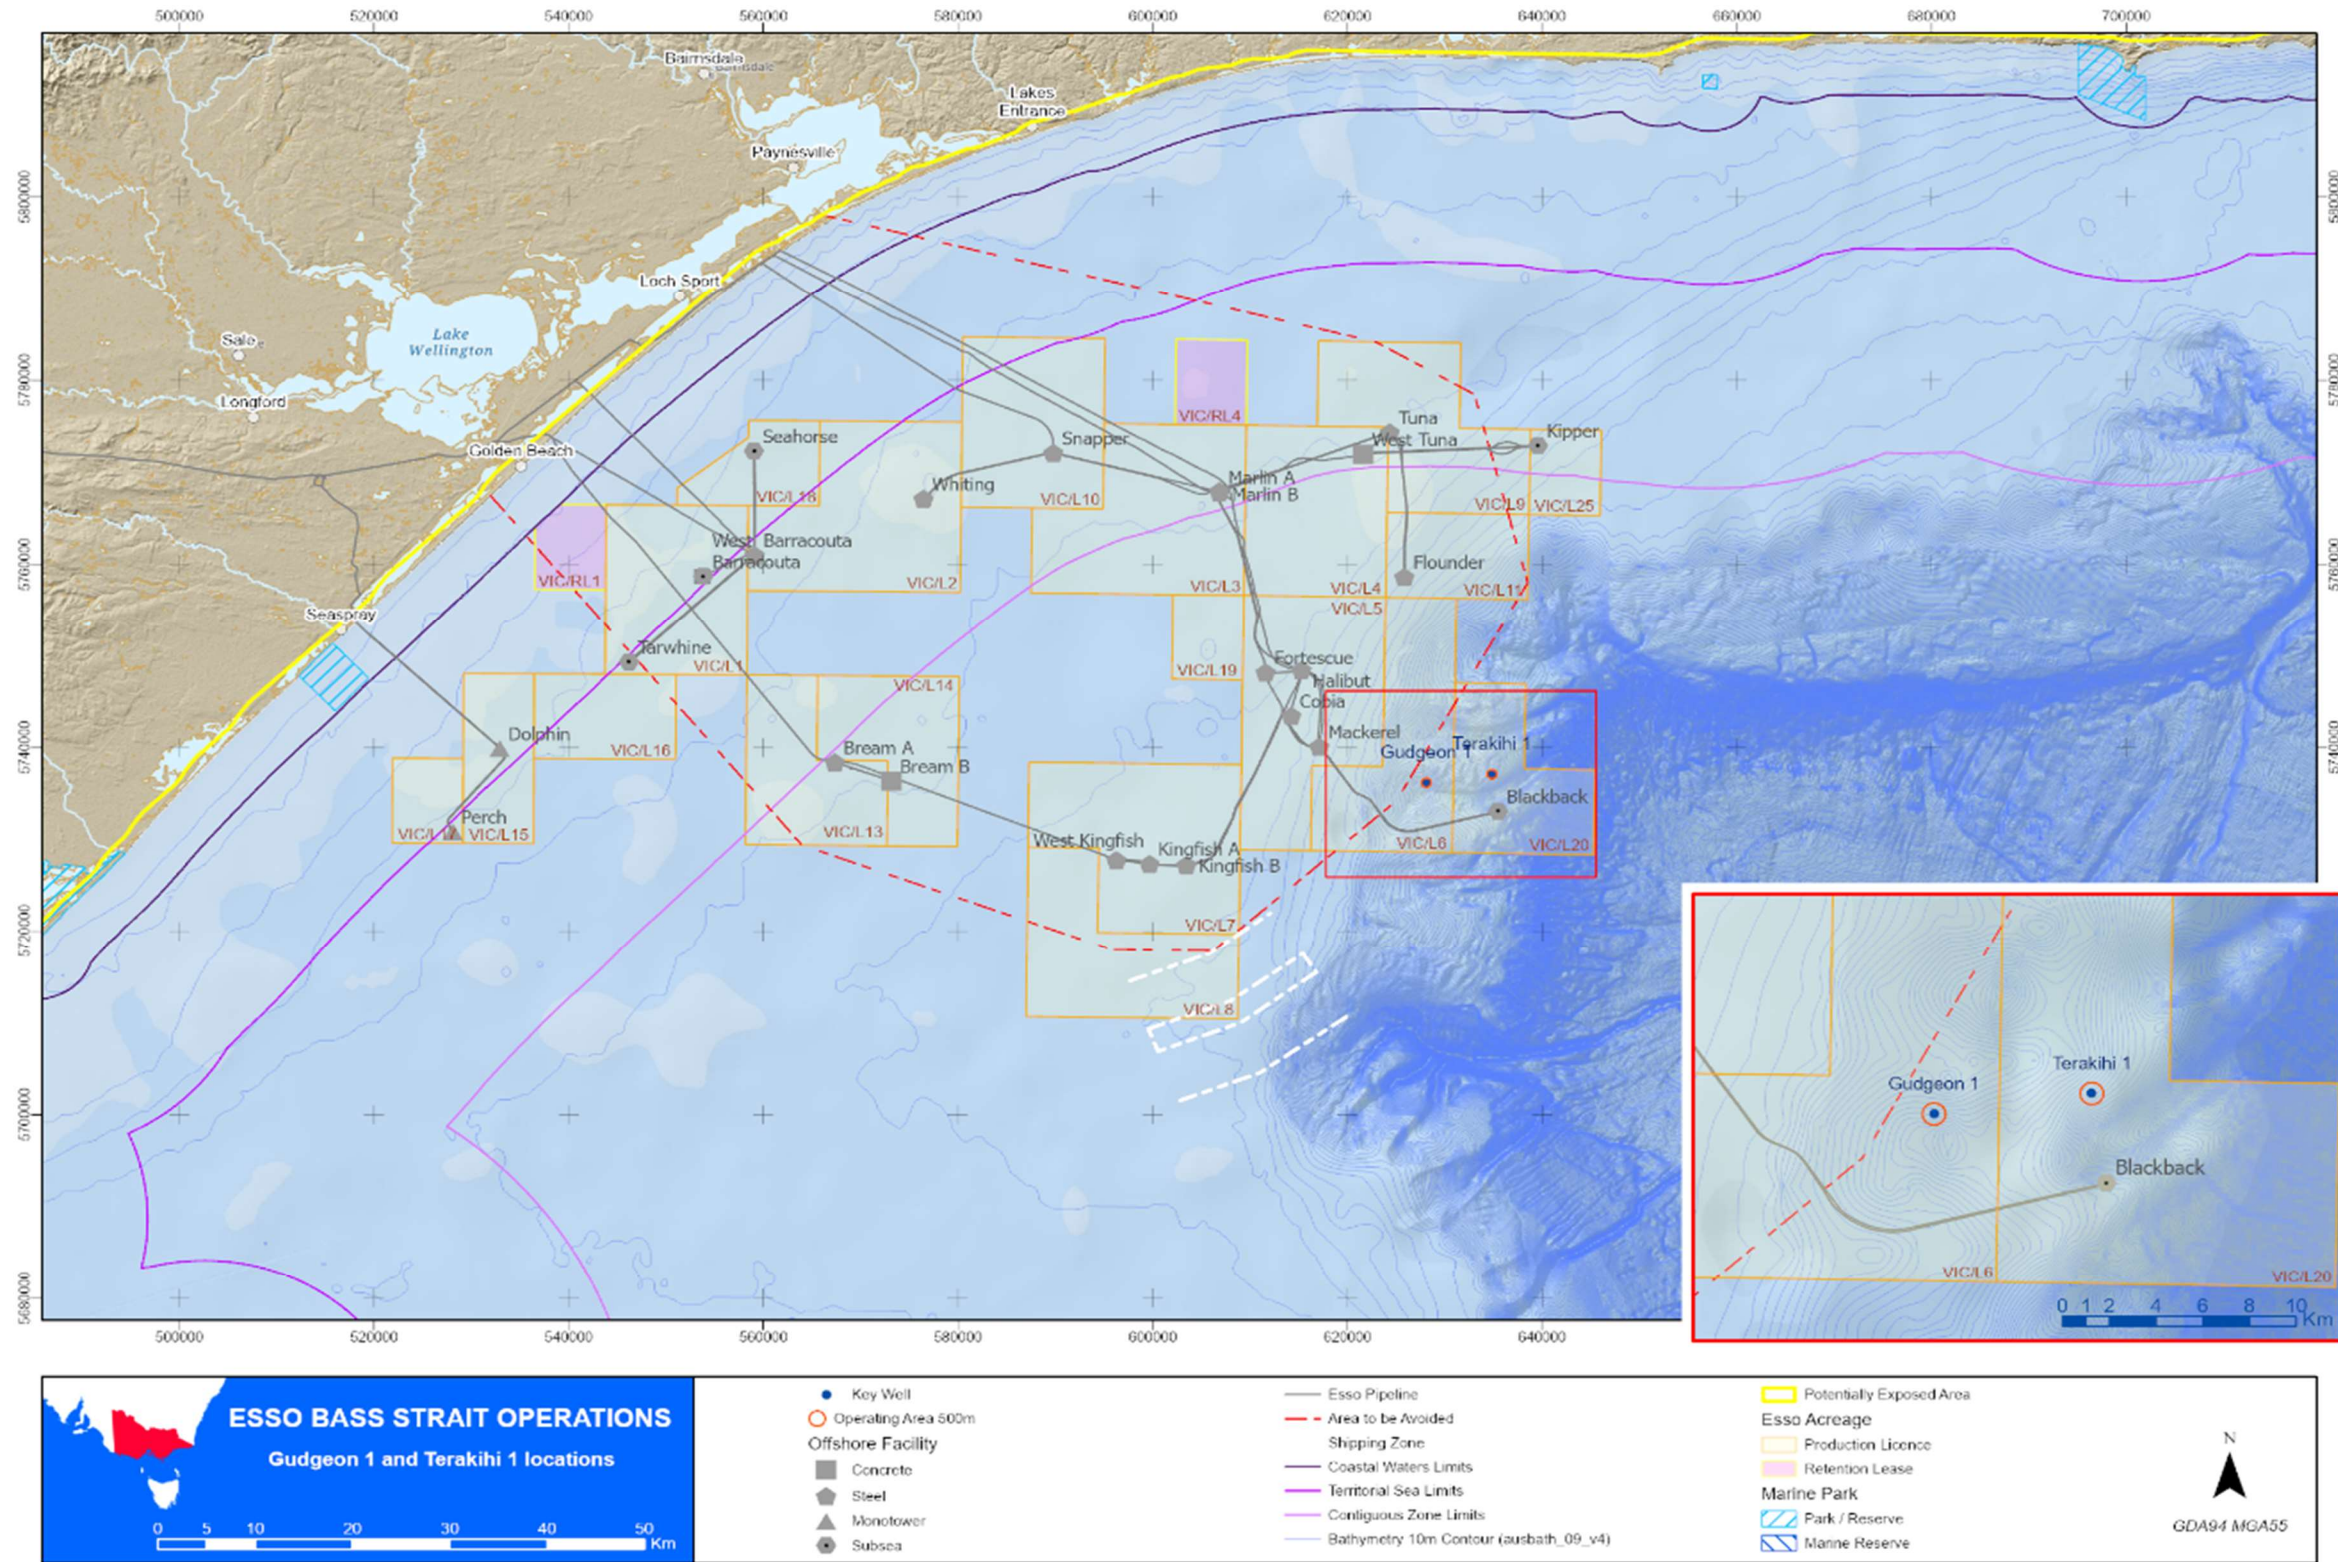

Figure 2-1 Gudgeon VIC/L06 and Terakihi VIC/L20, Gippsland Basin

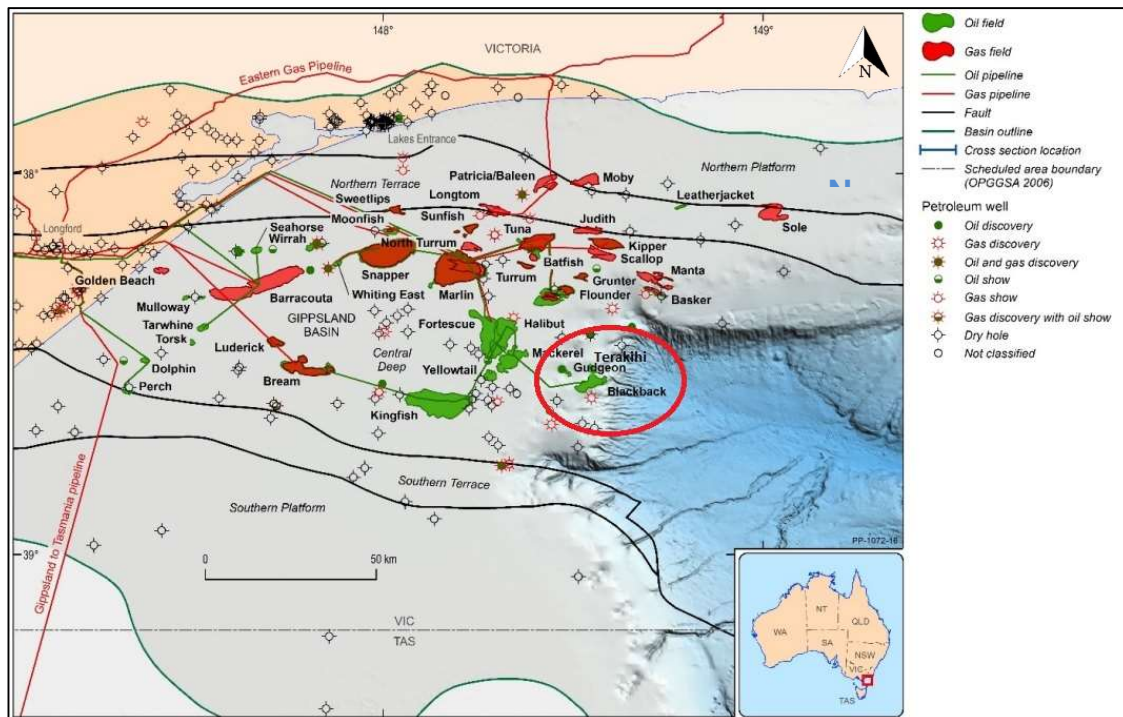

The Gudgeon-1 exploration well is located within Production Licence VIC/L06, approximately 82 kilometres southeast of Lake Entrance (Gippsland) and 142 kilometres northeast of King Island (Tasmania), in approximately 304 metres of water depth. The coordinates for the subsea facility are provided in Table 2-1. The subsea facility consists of a single subsea exploration well (Gudgeon-1).

**Table 2-1 Location details of Gudgeon-1 and Terakihi-1 subsea wells (GDA94; UTM Zone 55)**

Location (UTM Zone 55)	Licence Area	Latitude	Longitude	Southerly	Easterly	Water depth
Gudgeon-1 Subsea exploration well	VIC/L06	38° 30' 54" S	148° 28' 05" E	627988 S	5736021 E	304m
Terakihi-1 Subsea exploration well	VIC/L20	38° 30' 21" S	148° 32' 43" E	634738 S	5736928 E	424m

The Terakihi-1 exploration well is located within Production Licence VIC/L20, approximately 85 kilometres southeast of Lakes Entrance (Gippsland) and 146 kilometres northeast of King Island (Tasmania), in approximately 424 metres of water depth. The coordinates for the subsea facility are provided in Table 2-1. The subsea facility consists of a single subsea exploration well (Terakihi-1). Terakihi-1 is located approximately 18 kilometres east-southeast of the Mackerel platform.

**Figure 2-2 Gudgeon-1 and Tarakihi-1 exploration wells adjacent to Bass Canyon (Department of Industry, Innovation and Science, 2017)**

The Gudgeon-1 and Terakihi-1 wells are about 7 kilometres apart and lie just outside the Bass Strait Area To Be Avoided (ATBA) and in the pathway of the International Maritime

Organisation (IMO) recognised Bass Strait Traffic Separation Scheme (TSS) . The pathway of the TSS sees some of the heaviest commercial shipping traffic in Australia with approximately 80 percent of traffic being cargo vessels entering or departing Melbourne port, which is the second largest container and general cargo port in Australia (after Port Hedland) and the fourth largest container port in the Southern hemisphere. Because of this, there is a requirement to re-establish 'temporary fairways' around the facilities during P&A activities, in collaboration with the Australian Maritime Safety Authority (AMSA), as outlined in Section 5.2.

The Bass Strait ATBA is a routing measure. Ships in excess of 200 gross tonnage should avoid the area due to the high concentration of offshore facilities and it is hazardous to navigate this area with unauthorised vessels. The ATBA is described in Schedule 2 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cmth) (OPGGGS Act) [https://www.legislation.gov.au/Details/c2014c00030/Html/Volume\\_3\\_-\\_Toc377031658](https://www.legislation.gov.au/Details/c2014c00030/Html/Volume_3_-_Toc377031658). The area excludes waters within the coastal waters of Victoria and within a PSZ. The approximate size of the ATBA is 5362 square kilometres. Navigation charts show the ATBA to the coastline.

In addition to the TSS, a temporary fairway was established in consultation with AMSA and the Australian Hydrographic Office (AHO). Notice to Mariners issued by the AHO on 29 April 2022 (369(P)/2022) and 747(T)/2022 was established noting decommissioning activities at Gudgeon, Terakihi and Blackback. The new temporary shipping fairways and a separation zone have been established to keep transiting ships away from decommissioning activities and came into effect at 0000 UTC 1 August 2022.

## 2.2 Timing of the activity

The earliest commencement date for the P&A program is fourth quarter (Q4) 2023, with all activity anticipated to be completed by second quarter (Q2) 2024. Activities are planned to be conducted 24 hours per day, seven days per week.

It is expected to take approximately 30 days per well to complete P&A activities, inclusive of LWIV positioning activities, dependent on weather, scheduling and well conditions.

## 2.3 Current status of Gudgeon-1 and Terakihi-1 subsea facilities

The subsea facilities each consist of a single subsea oil well, each with well head. Neither of these exploration wells have ever gone into production. As such, no flow lines, umbilicals or other subsea interfaces to the wellhead have ever been installed.

Survey operations were conducted at Gudgeon-1 and Terakihi-1 locations in December 2020 to provide infrastructure positioning in preparation for the Gudgeon-1 and Terakihi-1 P&A campaign outlined in this EP. Refer to Table 2-2.

**Table 2-2 Gudgeon-1 and Terakihi-1 well details**

	Gudgeon-1	Terakihi-1
Year drilled	1995	1990
Water depth	304m	403m
Perforated/tested	No	No
Reservoir properties	4005psi and 199°F at 2861m TVDSS	4026psi(absolute) and 154°F at 2830m TVDSS

	Gudgeon-1	Terakihi-1
Shallow gas	No shallow gas identified	No shallow gas identified
<b>Well control</b>		
Wellhead pressure (assuming cement plug has integrity issue) at mudline	3196psi (gas)/1097psi (oil)	3230 psi (gas)/1354psi (oil)
Seawater overbalance	440psi	585psi
Annulus	9-5/8" x 13-3/8" (455bbls)	9-5/8" x 13-3/8" (406bbls)
Volume below shallow cement plug	670bbls	590bbls
<b>Well status</b>		
Reservoir cement plug	No reservoir cement plug (A*)	No reservoir cement plug (A*)
Casing cement plug	Casing cement plug only (B*)	Casing cement plug only (B*)
ROV inspection	December 2020	December 2020
Loss of containment and pitting corrosion on wellhead cap	No loss of containment or pitting	No loss of containment or pitting

\* Refer to diagrams Figure 2-3 and Figure 2-4.

### 2.3.1 Gudgeon-1

The Gudgeon-1 exploration well was spudded in March 1995, with drilling to a total depth of 3836 metres completed in May 1995, in 304 metres water depth. It was drilled by the *Ocean Bounty* (operated by Diamond Offshore). The well was cased and suspended as a potential future oil producer. A schematic of the Gudgeon-1 is provided Figure 2-3.

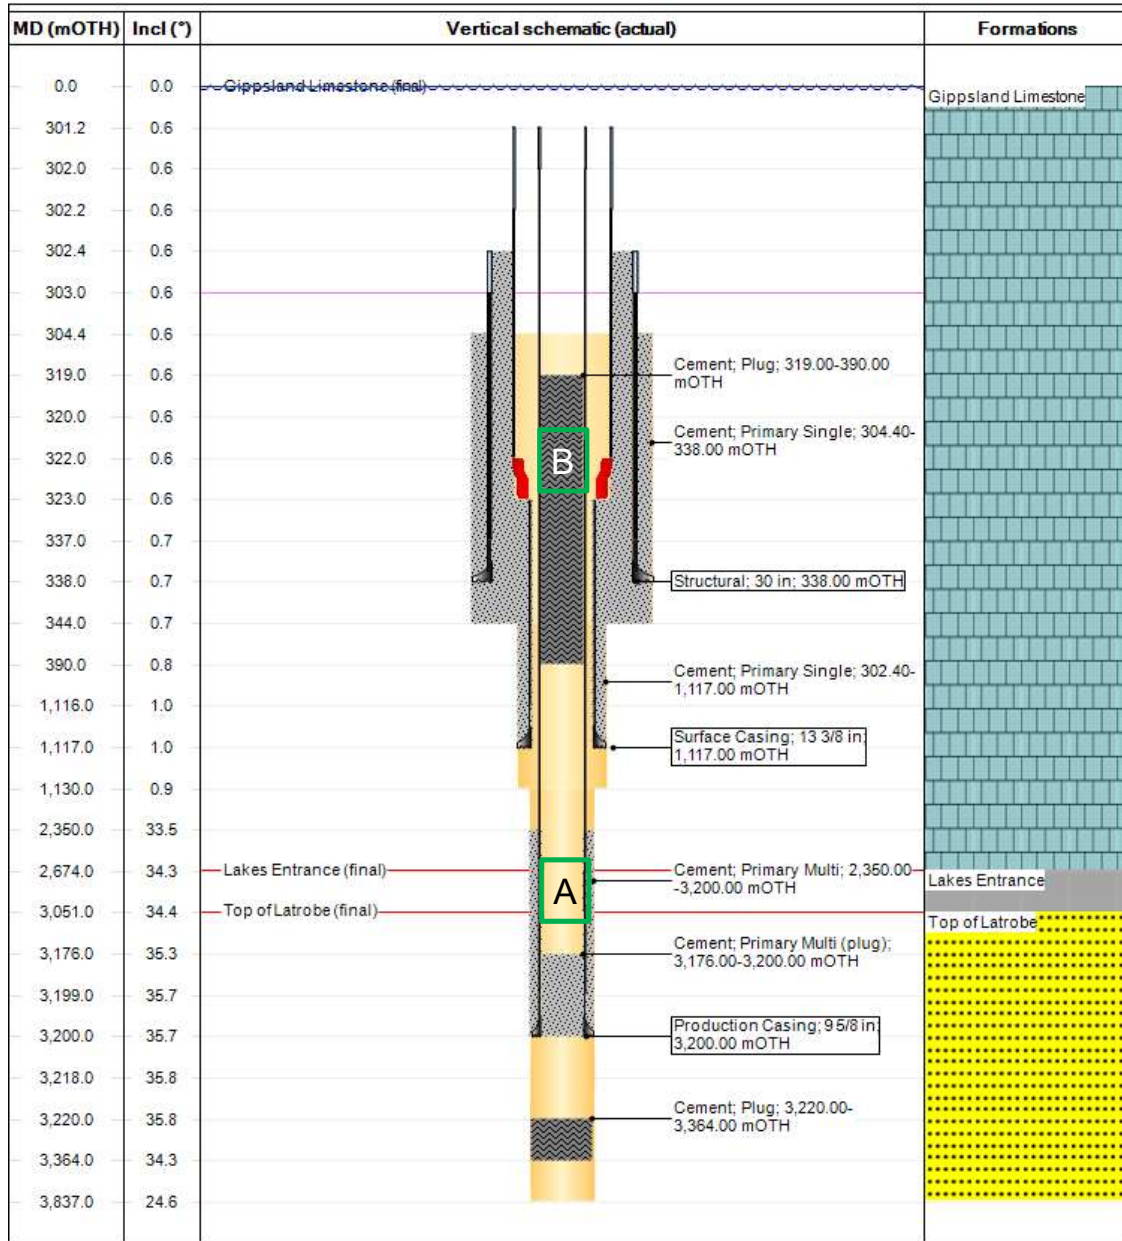

Figure 2-3 Gudgeon-1 schematic (current status)

### 2.3.2 Terakihi-1

The Terakihi-1 exploration well was spudded on 30 March 1990, with drilling completed on 1 May 1990 to a total depth of 3040 metres, in 403 metres water depth. It was drilled by the *Southern Cross* semi-submersible, operated by South Seas Drilling (now: Atwood Southern Cross, owned by Atwood Oceanics). It was cased and suspended as a potential future oil producer. A schematic of the Terakihi-1 subsea facility is provided in Figure 2-4.

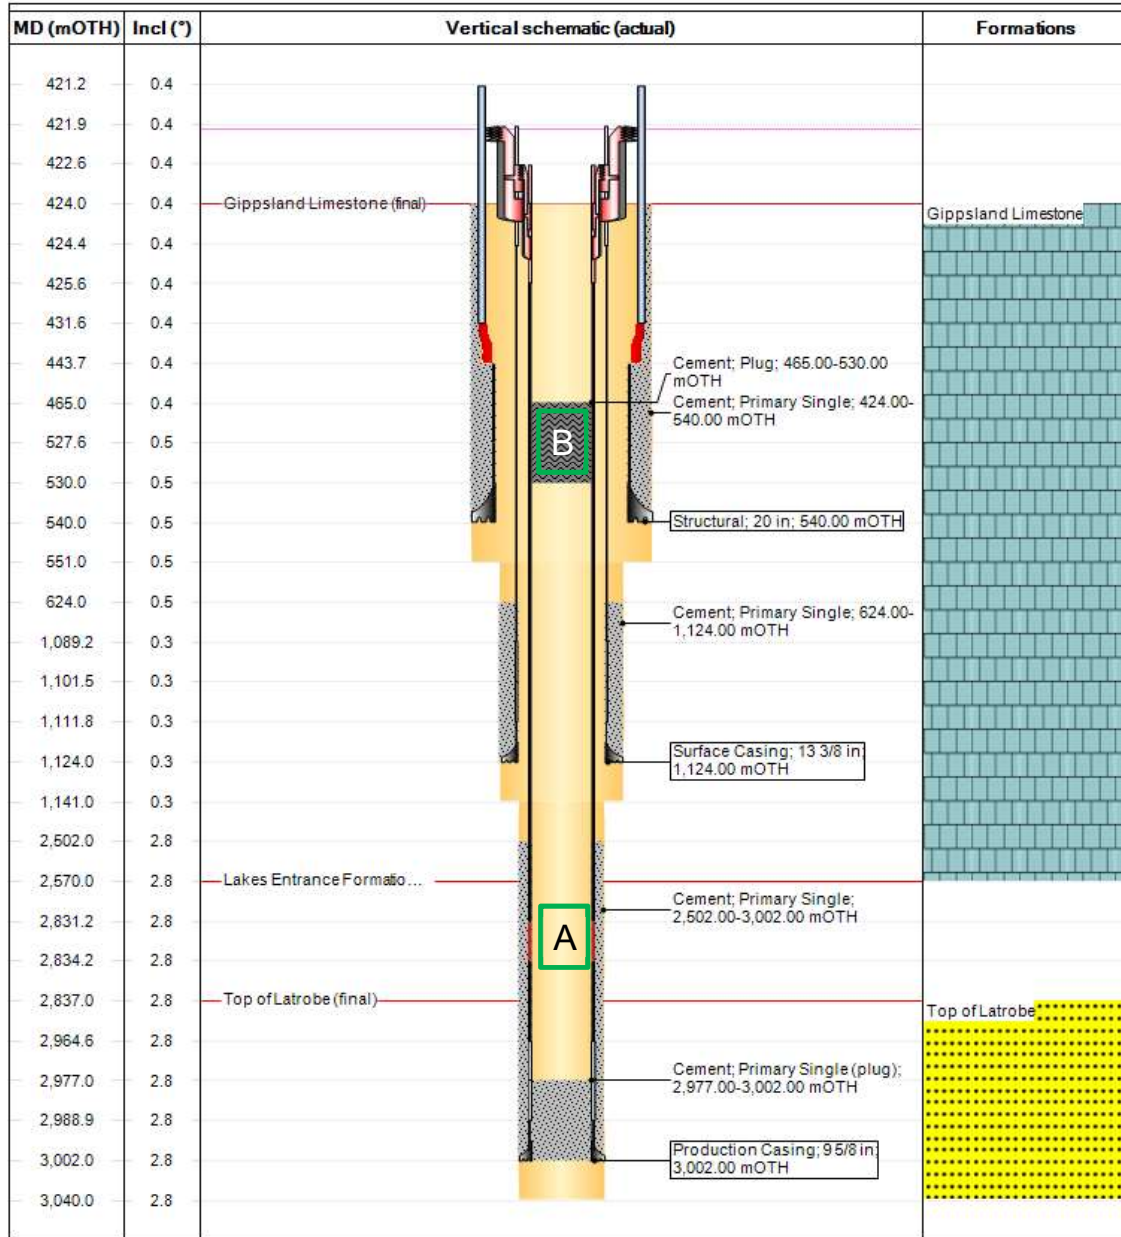

Figure 2-4 Terakihi-1 schematic (current status)

## 2.4 Hydrocarbons overview

The hydrocarbon sample from both Gudgeon-1 and Terakihi-1 during exploration drilling was a Group IV (persistent) crude; the properties of the hydrocarbons are provided in Table 2-3. Additional information is also provided in Section 6.7.2.

**Table 2-3 Gudgeon-1 and Terakihi-1 hydrocarbon composition prior to the wells being shut-in**

	Gudgeon-1	Terakihi-1
Density	808kg/m <sup>3</sup>	797kg/m <sup>3</sup>
API	43.7	46.0
Dynamic viscosity	-	-
CO <sub>2</sub>	<0.26%	<0.25%
H <sub>2</sub> S	0%	0.04%
Wax content	23.4%	8%
Pour point	29°C	22°C
Oil classification	Group IV	Group IV

## 2.5 Well abandonment program sequence

Each well's operational sequence will be dependent on multiple factors however, a generic sequence of work that will be followed for the abandonment of each well is:

- Remove shallow production casing cement plug (suspension plug).
- Set 60- to 150-metre combination cement plug in Lakes Entrance (cap rock) to isolate reservoir.
- Set 60- to 150-metre combination cement plug in Gippsland Limestone (within consolidated rock) to isolate open annuli and any potential shallow hydrocarbon.
- No potential shallow hydrocarbon or permeable sand identified.
- Cut and remove all equipment at or below the mud line.

Schematics of the existing wells (refer to Figure 2-3 and Figure 2-4) and planned, completed P&A status are shown in Figure 2-5 and Figure 2-6. The program sequence and the P&A designs are subject to change. However, the final designs will be included in the Well Operations Management Plan (WOMP) which must be accepted by NOPSEMA prior to the LWIV arriving on location and operations commencing.

**Figure 2-5 Gudgeon-1 schematic – Proposed plug and abandonment design**

**Figure 2-6 Terakihi-1 schematic – Proposed plug and abandonment design**

### 2.5.1 Fluids return handling

The choke manifold is located on the main deck. Its main functions include to route and isolate well fluid flushing returns via the surface flowhead production bore wing valve, control returns routed back to a stock tank and facilitate overboard venting during an emergency disconnect (refer to Section 3.9.7 of *Q7000 Safety Case (Australia)* (Helix, 2021)).

Circulated returns from the well to surface will be processed accordingly through fluids/solids handling equipment. Refer to Section 5.8, Section 5.9 and Section 5.10 for further details.

### 2.5.2 Cementing operations

Cement plugs are installed at specific depths in the well to act as permanent barriers (refer to Section 5.8).

### 2.5.3 Wellhead cutting and removal

A wellhead severance tool will be used to cut the casing at or below the mudline. Metal shavings and cement cuttings will be generated during this process, and some will settle on the seafloor.

Should the initial retrieval attempt be unsuccessful, an additional cut will be made at a shallower depth. After indications that the cut has been made, the severed wellhead equipment, including the high-pressure wellhead housing, conductor/cement stub and casings, and the temporary guidebase, will be retrieved.

Should the wellhead be unable to cut below the mudline, the final height above mudline will be recorded on the Daily Operations Report which NOPSEMA will receive during the abandonment program with an additional email notification made to the NOPSEMA Well Integrity Team.

In the event that the wellhead and equipment such as the Temporary Guide Bases for Gudgeon-1/Terakihi-1 cannot be removed (e.g. subsided TGB that is heavily cemented to the seafloor), refer to the process outlined in Section 2.5.4.

### 2.5.4 In-situ storage

The Gudgeon-1 and Terakihi-1 P&A program is part of the Bass Strait decommissioning program and subject to General Direction 817 issued under Section 574 of the OPGGS Act in May 2021. Direction 2b requires Esso to plug or close, to the satisfaction of NOPSEMA, all wells associated with the titles listed in Schedule 3, as soon as reasonably practicable and no later than 30 September 2027. Schedule 3 includes the following 'suspended or temporarily abandoned wells not associated with a production platform':

- East Pilchard-1 (VIC/L09)
- Gudgeon-1 (VIC/L06)
- Halibut-1 (VIC/L05)
- Marlin-1 (VIC/L03)
- Mulloway-1 (VIC/RL01)
- Terakihi-1 (VIC/L20)
- Whiptail-1 (VIC/L01).

In accordance with requirements of Section 572 of the OPGGS Act, Esso commits to remove from the relevant title area all Gudgeon-1 and Terakihi-1 structures and all equipment and other property that is neither used nor to be used in connection with the operations.

The following pieces of equipment/debris are currently located in the Gudgeon-1 and Terakihi-1 licence areas:

- Gudgeon-1 and Terakihi-1 wellheads
- temporary subsea equipment, such as completion guidebases and temporary guidebases.

There is unlikely to be a need for wet storage of subsea equipment/debris at Gudgeon-1 and Terakihi-1 subsea facility locations, as these exploration wells were never tied back to the subsea facilities, so that flowlines, umbilicals, hydraulic flying leads, electrical flying leads, umbilical termination assemblies, and the like, were never installed.

At the completion of P&A activities it is planned to remove the subsea trees and wellheads. In the unlikely event that the wellhead or associated wellhead equipment is not able to be retrieved, it will be left in-situ and removal of equipment above the seabed will be considered in future decommissioning plans.

Should in-situ storage be required, the items will be maintained in accordance with the inspection, maintenance and repair processes outlined in the Bass Strait Operations EP (AUGO-EV-EMM-002).

## 2.6 Plug and abandonment operations

### 2.6.1 Helix Q7000 Light Well Intervention Vessel (LWIV)

The LWIV will be used for the proposed campaign. The LWIV was built by Jurong Shipyard in Singapore in 2017.

The Q7000 technical specifications are provided in Table 2-4. The Q7000 can perform through-riser well intervention and decommissioning operations in water depths ranging from 85 metres to 3000 metres, utilising the Helix designed Intervention Riser System (IRS) which features a high-angle disconnect system. With its' open deck plan and tri-axial configuration, the Q7000 is capable of a wide range of production enhancement operations as well as well clean-up and field development support. It is equally optimised for well decommissioning including suspension, tubing removal, tree recovery and seabed clearance. It has below deck twin work class ROV systems, bulk fluids storage and pumping systems.

**Table 2-4 Light well intervention vessel technical specifications**

<b>Vessel name</b>	Q7000
<b>Owner</b>	Helix Energy Solutions Group Inc.
<b>Design</b>	Helix-designed Intervention Riser System Full suite of Schlumberger equipment, providing an integrated approach to subsea well services
<b>Built</b>	Jurong Shipyard, Singapore, 2017

<b>Class</b>	+1A1 Column Stabilized Well Intervention Unit 2, HELDK-SH, CRANE, E0, DYNPOS-AUTRO, CLEAN, WELL (1), UKVS, BWM-T, COM-V (1)C(3)	
<b>Registry</b>	Sailing under the flag of Bahamas	
<b>Principal dimensions</b>	Length of pontoons (LOA)e	97.50m
	Breadth of pontoons	14.30m
	Cross bracings	4
	Upper deck length	70.20m
	Upper deck breadth	61.10m
	Depth of deck box	7.50m
	Transit draft	9.00m
	Operating draft	18.25m
	Operational air gap	8.75m
	Survival draft	15.0m
	Survival air gap	12.0m
	Moon pool on lower deck	8.8m x 6.5m
<b>Displacement at operating draft</b>	29,735Te	
<b>Design max. transit speed</b>	10 knots	
<b>Dynamic Positioning (DP) Capabilities</b>	DP3 DNV ERN 99/99/99/99 (Unrestricted Worldwide Operation) (IMO certified)	
<b>Accommodation (persons on board)</b>	Worldwide – 140 persons UK North Sea – 130 persons	
<b>Fluid capacities</b>	Water ballast	10,501m <sup>3</sup>
	Fuel oil	1,799m <sup>3</sup>
	Drill water	422m <sup>3</sup>
	Brine	321m <sup>3</sup>
	Acid/special fluids	305m <sup>3</sup>
	Potable water	422m <sup>3</sup>
	Base oil	162m <sup>3</sup>
	Fluid header tanks	145m <sup>3</sup>
	Well return tanks	173m <sup>3</sup>
	Dry bulk	81m <sup>3</sup>
	Mud tank	162m <sup>3</sup>
<b>Pressure Control Equipment (PCE)</b>	LRP hydraulic shear seal valves	2x 7-3/8" 10,000psi cutting gate valves
	Subsea coiled tubing unit	PCE optional

### 2.6.2 Support vessels

The Q7000 will be serviced by the existing Esso fleet *Skandi Feistein*, *Skandi Darwin* and potentially other vessels of similar design or function. There will only be one support vessel in the OA (PSZ) at any one time. The support vessels will primarily operate out of Barry Beach Marine Terminal for routine supply operations although other ports in the region, such as Eden, Bell Bay, Burnie, Melbourne, Geelong or Hastings, may be used. Support vessels will operate in accordance with DP Class 2 requirements consistent with an International Association of Classification Society (IACS) accredited Classification Society. During offshore operations their anchors will not be deployed. The Q7000 is self-propelled and dynamically positioned therefore no anchor handling or towing is expected to be required during mobilisation or demobilisation. Vessel support activities could include:

- supply provisions including food, bulk chemicals, and diesel fuels, and other cargo to the LWIV and removal of waste to shore
- deployment of ROVs
- surveys and other subsea activities including crane operations
- personnel transfer
- monitoring and maintaining the 500-metre PSZ or any additional safety zones
- emergency response and rescue.

Although details are yet to be finalised, vessels supporting the project will be specified and operated in accordance with International and Australian regulatory requirements. The vessels will be subject to a marine assurance program and will be certified as being in compliance with international maritime legislative requirements by a Classification Society registered with IACS.

### 2.6.3 Helicopter support

Helicopter support will be provided from the Longford Heliport or alternate, to support the LWIV as follows:

- personnel transfers between shore and the LWIV for crew changes
- emergency response, including medivac, evacuation of the LWIV, and search and rescue.

Non-emergency helicopter operations will be limited to daylight hours and will usually entail one return flight each weekday.

Helicopter operations are performed in accordance with Civil Aviation Safety Authority regulations. Helicopter type, suitability, and performance criteria are contractually controlled, as are minimum flight and engineering crew qualifications and experience levels. Helicopter refuelling will not occur on the LWIV.

### 2.6.4 Remotely operated vehicles

During the P&A activities a ROV may be deployed from either the LWIV or support vessel (or ROVs deployed from both simultaneously) and can be fitted with various tools that can assist with subsea operational requirements, and camera systems which can be used to capture imagery of the environment and operations.

### 3 Environmental impact and risk assessment methodology

Environmental impact assessment is concerned with activities that are reasonably certain to occur (such as planned discharges to the air or water), while environmental risk assessment is concerned with unplanned events that may possibly occur (such as hydrocarbon spills, introductions of marine pests, loss of waste overboard).

Environmental Impacts result from activities that are an inherent part of the P&A campaign and will result in a change to the environment or a component of the environment, whether adverse or beneficial. As the LWIV remains on DP, seabed disturbance from anchoring has been eliminated. However, subsea noise from DP thrusters is an impact on the environment that cannot be avoided for the activity to achieve its aims.

Environmental Risks resulting from unplanned activities are those where a change to the environment or component of the environment may occur (i.e. there may be impacts if the event actually occurs). Risk is a combination of the impact or consequence of an event and the associated likelihood (probability) of the event occurring. For example, a hydrocarbon spill may occur if a support vessel's fuel tank is punctured by a collision during the activity. The risk of this event is determined by assessing the consequence or environmental impact (using factors such as the type and volume of fuel and the nature of the receiving environment) and the likelihood of this event happening (which may be determined qualitatively or quantitatively).

Impacts and risks associated with the P&A campaign were identified in accordance with ExxonMobil's *Environmental Aspects Guide* (ExxonMobil, 2012). This ExxonMobil Guide is consistent with the approach outlined in *ISO 14001 Environmental Management Systems*, *ISO 31000:2009 Risk Management* and *HB203:2012 Environmental Risk Management – Principles and Process*.

#### 3.1 Definitions

**Table 3-1 Definitions**

Term	Definition
Activity	An activity refers to a component or task within a project which results in one or more environmental aspects.
Aspect	An environmental aspect is an element or characteristic of an activity, product, or service that interacts or can interact with the environment. Environmental aspects can cause environmental impacts.
Impact (HB203:2012)	Any change to the environment or a component of the environment, whether adverse or beneficial, wholly or partly resulting from an organisation's environmental aspects.
Risk (HB203:2012)	The effect of uncertainty on objectives. The level of risk can be expressed in terms of a combination of the consequences and the likelihoods of those consequences occurring.
Receptor	The term receptor refers to a feature of the natural and human surroundings that can potentially be impacted. This includes air, water, land, flora, and fauna including people.

Term	Definition
Consequence	The consequence of an impact is the outcome of the event on affected receptors. Consequence can be positive or negative.
Likelihood	The likelihood of an impact is the chance (probability) of the impact occurring.

### 3.2 Identification and characterisation of environmental aspects

All components of the petroleum activity have been identified and described in Section 2 of this EP.

After describing the petroleum activity, an assessment was carried out to identify environmental receptors and potential interactions between the petroleum activity and the receiving environment, including potential interactions with relevant persons. The interactions, or environmental aspects associated with this petroleum activity have been identified as shown in Table 3-2. The environmental receptors identified as occurring in the area are described in Volume 1.

Based upon an understanding of the environmental aspects, impacts or risks were defined and ecological and social receptors identified enabling a systematic evaluation to be undertaken.

Table 3-2 Activity – Aspect matrix

Activity	Physical presence – Seabed disturbance	Physical interaction – Other	Sound emissions	Emissions to air	Light emissions	Planned discharge – Treated bilge and deck drainage	Planned discharge – Sewage and food waste	Planned discharge – Cement	Planned operation discharge – Subsea	Planned operation discharge – Surface	Physical interaction – Marine fauna	Physical interaction – Introduction of IMS	Accidental release – Dropped objects	Accidental release – Waste	Accidental release – Loss of containment: Hazardous/non-hazardous substances	Accidental Release – Loss of containment: Refined oils (collision)	Accidental Release – Loss of containment: Reservoir hydrocarbons
P&A execution			Yes							Yes							Yes
Cement operations								Yes									
Wellhead cutting and removal	Yes		Yes						Yes				Yes				
LWIV operations	Yes	Yes	Yes	Yes	Yes	Yes	Yes					Yes	Yes	Yes	Yes		
Vessel operations		Yes	Yes	Yes	Yes	Yes	Yes				Yes	Yes	Yes	Yes	Yes	Yes	
Helicopter operations			Yes														
ROV operations			Yes										Yes		Yes		

### 3.3 Environmental impact assessment

Environmental impacts, or consequences, can be evaluated in terms of the degree of the effects and the sensitivity of the environment. Esso evaluates three effects dimensions (scale, duration, and intensity) (Table 3-3) and three environmental sensitivity dimensions (irreplaceability, vulnerability, and influence) (Table 3-4) (ExxonMobil, 2012).

The determination of consequence severity involves evaluating each dimension as lower, moderate, or higher based on qualitative descriptions. Once each dimension is evaluated, results for effects and sensitivity are compared against interpretive criteria to define overall Consequence Level (Table 3-5).

**Table 3-3 Evaluation of environmental effects dimensions**

Effect Dimension	Value	Description
Duration	Short-term (lower)	Hours to days; effects highly transitory.
	Medium-term (moderate)	Weeks to months. Trigger/cause is temporary; effects decline over time. For chemicals, consider persistence, breakdown product, and bioaccumulation potential in determining effects duration.
	Long-term (higher)	Years: effects are ongoing. For chemicals, consider persistence or bioaccumulation potential in determining effects duration.
Size/scale	Localised (lower)	Within or near an operational site, facility, etc.; affecting an area similar to or smaller than a typical operational site (for small and/or mobile sources); effects are physically contained/controlled; not a significant portion of any sensitive area.
	Moderate	Affecting an area significantly larger than a typical operational site, facility, etc.; a significant portion of a <i>habitat</i> , watershed or single ecological area; a significant portion of the range or occurrence of a population of a species.
	Widespread (higher)	Encompassing entire <i>ecosystems</i> , watersheds, or bioregions (landscape-scale); affecting most of the global range or occurrence of a species; having a noticeable impact on corporate-level <i>environmental performance</i> reporting.
Intensity	Minor (lower)	Minor changes to wildlife, <i>habitat</i> , water occurrence/drainage, or vegetation; low density. For chemical effects: low concentration or hazard* potential.
	Moderate	Moderate or partial changes to <i>habitat</i> , water occurrence/flow, ground cover, ground stability, vegetation or wildlife. For chemicals, moderate concentrations, bioaccumulation or hazard* potential; sub-lethal, non-reproductive direct or indirect effects on organisms.
	Significant (higher)	Notable changes to, fragmentation of, or elimination of <i>habitat</i> , water drainage/features, ground cover, ground stability, vegetation, and/or wildlife; for chemicals, high concentrations, bioaccumulation, or hazard*potential. Significant direct or indirect survival and/or reproductive effects on organisms.

\* Chemical hazard generically includes radioactivity, reactivity, toxicity, carcinogenicity, mutagenicity, pathogenicity, reproductive effects potential, etc.

**Table 3-4 Evaluation of sensitivity dimensions**

Sensitivity dimension	Value	Description (applies to species, ecosystem, and/or ecosystem features/functions/services, all at same scale as consequence)
Irreplaceability	Lower	Common, plentiful.
	Moderate	Less common or plentiful, but not rare or unique.
	Higher	Unique or rare.
Vulnerability	Lower	Healthy, resilient, unthreatened, undamaged, or no remaining natural elements (such as some industrial settings).
	Moderate	Moderately resilient, existing stress or damage not significantly impairing function. Sustainable demand on resources/services.
	Higher	Not resilient or capable of recovery, highly stressed, threatened and/or endangered, functions/ services failing (such as collapsing fishery).
Influence	Lower	Providing few or no services (supporting, regulating, provisioning, cultural).
	Moderate	Considered moderately important, providing a range of ecological, cultural, social, or commercial services for humans and biodiversity.
	Higher	Highly productive and/or biodiverse, critical for human well-being (such as subsistence), functions/services provide critical support for key human/biological communities (such as clean water), considered highly important by public.

**Table 3-5 Determination of environmental and public impact consequence severity**

Consequence Level	Environmental impact	Public impact	Interpretative examples of environmental consequence dimension considerations
I	Potential widespread, long term, significant adverse effects	<ul style="list-style-type: none"> <li>Extended (&gt;3 months) national or international media coverage.</li> <li>Large community disruption or evacuation (&gt;1000 people).</li> <li>Closure of major transportation route &gt;24 hours.</li> </ul>	Sensitivity of receptors are higher; Effects are longer term and widespread and/or of a higher intensity.
II	Potential localised, medium term,	<ul style="list-style-type: none"> <li>National media coverage.</li> </ul>	Sensitivity of receptors are moderate or higher; Effects are medium to long term and/or

Consequence Level	Environmental impact	Public impact	Interpretative examples of environmental consequence dimension considerations
	significant adverse effects	<ul style="list-style-type: none"> <li>• Medium community disruption or evacuation (100–1000 people).</li> <li>• Closure of major transportation &lt;24 hours.</li> </ul>	have a moderate to higher intensity.
III	Potential short term, minor adverse effects	<ul style="list-style-type: none"> <li>• Public complaints; small community impact (&lt;100 people).</li> <li>• Closure of secondary transportation route &lt;24 hours.</li> <li>• Tier 1 Process Safety Event.</li> </ul>	<ul style="list-style-type: none"> <li>• Sensitivity of receptors are lower to moderate; Effects are medium term and/or moderate intensity, or</li> <li>• Sensitivity of receptors is lower, but Effects are longer term/higher intensity, or</li> <li>• Effects are localised, short term and/or low intensity, regardless of receptor sensitivity.</li> </ul>
IV	Inconsequential or no adverse effects	<ul style="list-style-type: none"> <li>• Public complaint.</li> <li>• Temporary closure of minor transportation route.</li> <li>• Minor inconvenience.</li> </ul>	Sensitivity of receptors are lower; Effects are generally short term, localised and of low to moderate intensity.

### 3.4 Environmental risk assessment

#### 3.4.1 Determination of consequence

The potential consequence or environmental impact of an unplanned event is determined as described in Section 3.3.

##### 3.4.1.1 Oil spill modelling

Acknowledging the potential large scale of an oil spill, further analysis is undertaken for unplanned oil spill consequence assessment.

Spill modelling is performed using an advanced three-dimensional trajectory and fates model called Spill Impact Mapping Analysis Program. The Program model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types.

The modelling uses:

- a five-year dataset of currents that includes the combined influence of ocean currents and tidal currents
- high-resolution local winds from the National Centre for Environmental Prediction Climate Forecast System Reanalysis model
- detailed hydrocarbon characteristics relevant to the risk scenario being modelled
- hydrocarbon density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point ranges.

The output is a three-dimensional oil spill model which simulates the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling is conducted using a stochastic (random or non-deterministic) approach, which involves running 100 spill simulations for the scenario, initiated at random start times. This ensures that each simulation is subject to different wind and current conditions and, in turn, movement and weathering of the oil.

Results from the simulations then are combined and statistically analysed to assist with understanding the potential impacts of an oil spill as discussed below.

Results from the simulations are combined and statistically analysed by applying appropriate threshold values to interpret and apply modelling outputs to assist with understanding:

- the total area that could be exposed to hydrocarbon
- the potential impacts of an oil spill, and
- oil spill response planning.

### Potentially Exposed Area

Oil spill modelling is used to determine the total area that could be exposed to hydrocarbon, including trace concentrations of oil in the water column, as a result of any spill. This is known as the Potentially Exposed Area (PEA) and is used for planning purposes to ensure that all social and environmental sensitivities are acknowledged, described and considered in the development of the EP. The hydrocarbon thresholds, or exposure levels used to define the PEA are shown in Table 3-6. The values and sensitivities within the PEA are described in Section 4.

**Table 3-6** Thresholds used to define the Potentially Exposed Area

Exposure level	Threshold	Description
Surface – low exposure	1g/m <sup>2</sup>	Approximates range of socioeconomic effects and establishes planning area for scientific monitoring (NOPSEMA, 2019).
Shoreline – low exposure	10g/m <sup>2</sup>	Predicts potential for some socioeconomic impact (NOPSEMA, 2019).
In-water (dissolved) – low exposure	10ppb (instantaneous)	Establishes planning area which may be considered for scientific monitoring based on potential for exceedance of water quality triggers (NOPSEMA, 2019).

Exposure level	Threshold	Description
In-water (entrained) – low exposure	10ppb (instantaneous)	Establishes planning area which may be considered for scientific monitoring based on potential for exceedance of water quality triggers (NOPSEMA, 2019).

### Impact assessment

Modelling is also used to inform specific impact assessments by understanding the location and extent of oil at concentrations likely to result in environmental consequences. There is no agreed exposure level below which environmental impacts will not occur so outputs should not be interpreted as a boundary. However, mapping areas which could be moderately impacted by a spill is a useful tool for impact or consequence assessment. Moderately exposed areas (per moderate exposure values as listed in Table 3-7) are used to inform the risk assessments in Section 6.6 and Section 6.7.

**Table 3-7** Thresholds used to inform oil spill risk evaluations and oil spill response planning

Exposure level	Threshold	Description
Surface – moderate exposure	10g/m <sup>2</sup>	Thresholds used for informing oil spill risk evaluations and oil spill response.
Shoreline – moderate exposure	100g/m <sup>2</sup>	
In-water (dissolved) – moderate exposure	50ppb (instantaneous)	

Oil spill response operations are typically confined to those areas where oil is present in sufficient quantities to enable them to be effective (refer to Table 3-7). Spill modelling enables maps to be generated which define these areas, to enable effective response planning and capability assessment. Further details can be found in the Bass Strait Oil Pollution Emergency Plan (AUGO-EV-ELI-001) (OPEP) included as Volume 3 Appendix A.

Note that the modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that might be in place during operations. The modelling makes no allowance for intervention following a spill to reduce volumes and/or prevent hydrocarbons from reaching sensitive areas.

Fate and weathering characteristics of spilled oil are also useful inputs for impact assessment as these provide insight into which environmental sensitivities are most likely to be affected (e.g. surface oil effects on wildlife vs. water quality effects on aquatic species) as well as the persistence and duration of exposure to oil as it weathers. Prediction of the fate and weathering of spilled oil is completed using deterministic modelling, that is, one of the 100 simulations used to complete stochastic modelling is selected for further analysis. Selection is based on the 'worst case' taking into account the fate of modelled oil.

#### 3.4.2 Determination of likelihood

Once the most severe environmental impact or consequence of an unplanned event is assessed, the likelihood of those consequences being realised is assessed. This is done by assessing the probability for each failure, event, or condition necessary to produce the impact or consequence.

The likelihood of lower severity consequences is also evaluated to determine whether any have sufficiently higher probability to result in a higher risk.

The five Likelihood Categories are as shown in Table 3-8.

**Table 3-8 Likelihood Categories**

Likelihood Category	Qualitative interpretation guidance	Quantitative interpretation guidance (probability of occurring per year of exposure)
<b>A</b>	<b>Very likely</b> Similar event has occurred once or more at site in the last 10 years. Has happened several times at site or many times in Company.	0.1 to 1
<b>B</b>	<b>Somewhat likely</b> Has happened once before at site or several times in Company.	0.01 to 0.1
<b>C</b>	<b>Unlikely</b> Has not happened before at site or has happened a few times in Company.	0.001 to 0.01
<b>D</b>	<b>Very unlikely</b> Have been isolated occurrences in Company or has happened several times in industry.	0.0001 to 0.001
<b>E</b>	<b>Very highly unlikely</b> Has happened once or not at all in Company. Has happened a few times or not at all in industry.	<0.0001

### 3.4.3 Determining significance of risk

The combination of consequence severity and likelihood of occurrence determines the level of risk. ExxonMobil's risk framework considers existing controls when determining risk. The overall risk category is given on the basis of the likelihood of the consequence occurring after application of the control measures. The effectiveness of control measures was considered when determining the likelihood of events with control measures in place, i.e. factors such as functionality, availability, reliability, survivability, independence and compatibility of control measures, were considered.

ExxonMobil classifies risk into four risk levels or categories (refer to Figure 3-1). The significance of each Risk Category is as follows:

- **Risk Category 1:** A higher risk that should have specific controls established in the short term and be reduced as soon as possible.

- **Risk Category 2:** A medium risk that should be reduced unless it is not ‘reasonably practicable’ to do so. Reasonably practicable is:
  - The level of resource expenditure is not significantly disproportionate in relation to the resulting decrease of risk.
- **Risk Category 3:** A medium risk that should be reduced if ‘lower cost’ options exist to do so. Lower cost denotes follow-up work that can be completed without:
  - Allocating extensive engineering, technical, and operations manpower, or
  - The need for unit shutdowns or activities which may introduce other risks or use resources that may be more appropriately used to address higher risk category items.
- **Risk Category 4:** A lower risk that is expected to be effectively managed in base OIMS practices:
  - Typically requires ‘No Further Action’
  - Risk mitigation measures that are in place to manage the risk to Risk Category 4 should be continued.

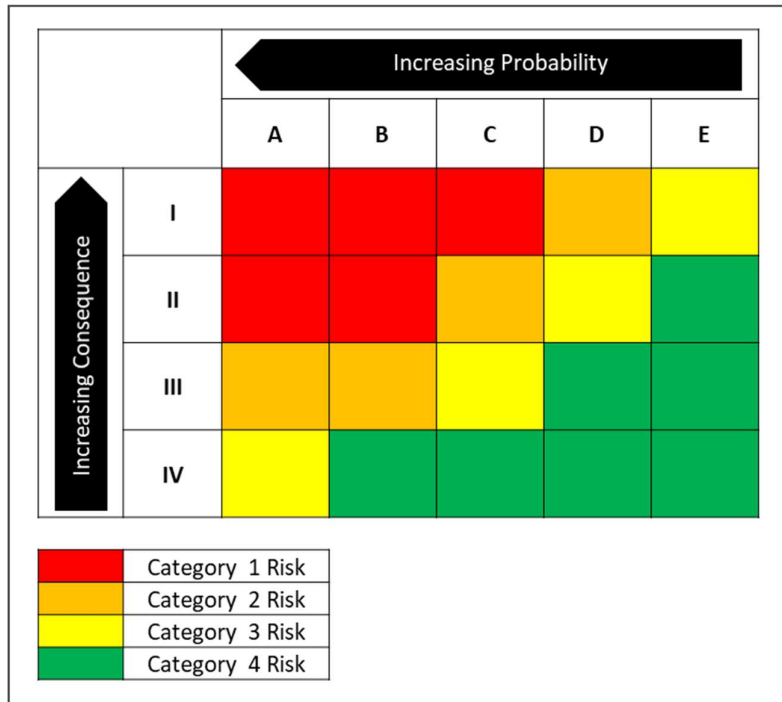

Figure 3-1 Risk matrix

### 3.5 Demonstration of As Low As Reasonably Practicable

The OPGGS (Environment) Regulations 13(5) requires that the EP detail how the control measures will be used to reduce the impacts and risks of the activity to ALARP and to an acceptable level.

ALARP means that the cost involved in reducing the risk further would be grossly disproportionate to the benefit gained. The ALARP principle arises from the fact that infinite time, effort and money could be spent attempting to reduce a risk or impact to zero.

NOPSEMA’s guideline (NOPSEMA, 2021) states that in order to demonstrate ALARP, a titleholder must be able to implement all available control measures where the cost is not

grossly disproportionate to the environmental benefit gained from implementing the control measure.

There is no universally accepted guidance to applying the ALARP principle to environmental assessments. In alignment with NOPSEMA's guidance (NOPSEMA, 2020a), Esso has adapted the approach developed by Oil and Gas UK (OGUK) (OGUK, 2014) for use in an environmental context to determine the assessment technique required to demonstrate that potential impacts and risks are ALARP (Figure 3-2).

Specifically, the framework considers impact severity and several guiding factors:

- activity type
- risk and uncertainty
- stakeholder influence.

'Good practice' is considered sufficient demonstration of ALARP in cases where the risk is relatively well understood, the potential impacts are low, activities are well practised, and there are no conflicts with company values nor significant media interest. This is referred to as an 'ALARP Decision Context A'.

An engineering risk assessment is required to demonstrate ALARP in cases where there is greater uncertainty or complexity around the activity and/or risk, the potential impact is moderate, it may attract local media attention and some persons may object. This is referred to as an 'ALARP Decision Context B'.

An 'ALARP Decision Context C' typically involves sufficient complexity, high potential impact, uncertainty, or stakeholder influence to require a precautionary approach. In this case, relevant good practice still must be met, engineering risk assessment is required, and the precautionary approach applied for those controls that only have a marginal cost benefit.

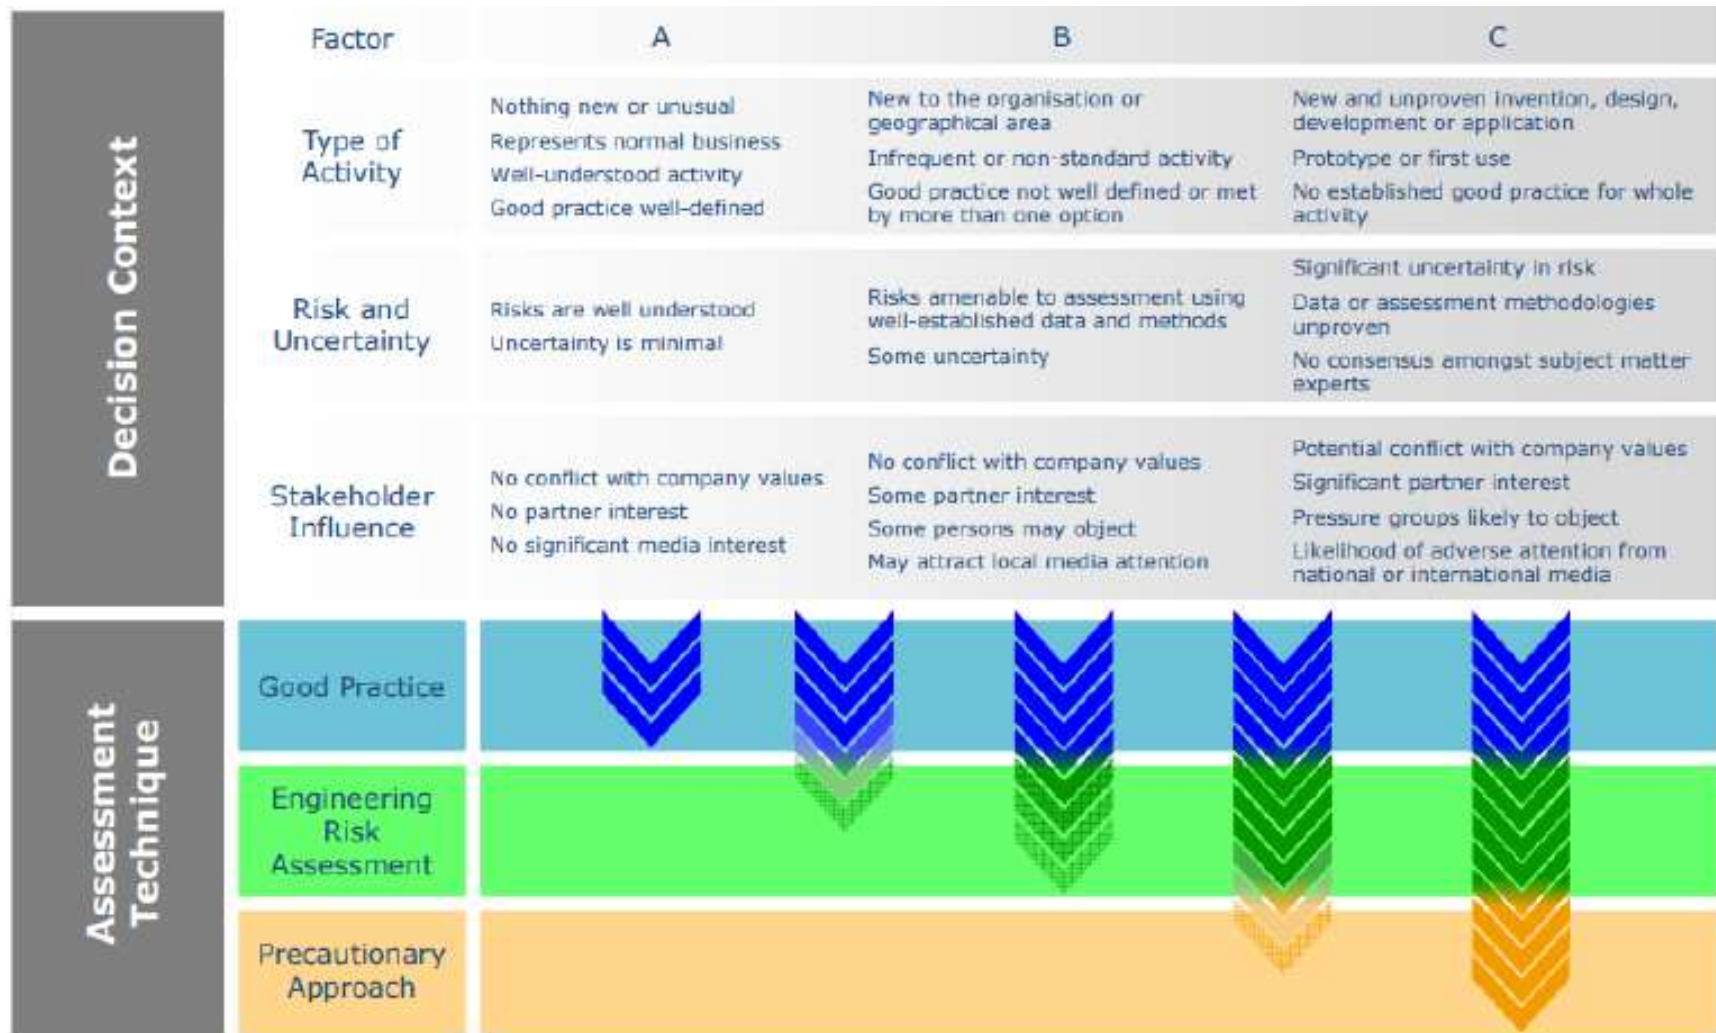

Figure 3-2 As Low As Reasonably Practicable decision support framework (OGUK, 2014)

The ALARP Decision Context has been identified for each aspect in Sections 5 and 6.

The assessment techniques considered include:

- good practice
- engineering risk assessment
- precautionary approach.

### 3.5.1 Good practice

'Good practice' is defined (OGUK, 2014) as:

"The recognised risk management practices and measures that are used by competent organisations to manage well-understood hazards arising from their activities".

Good practice can also be used as the generic term for those measures that are recognised as satisfying the law. For this EP, sources of good practice include:

- requirements from Australian legislation and regulations
- relevant Australian policies
- relevant Australian Government guidance
- relevant industry standards
- relevant international conventions.

If the ALARP technique is determined to be good practice (ALARP Decision Context A), further assessment (engineering risk assessment) is not required to identify additional controls. However, additional controls that provide a suitable environmental benefit for an insignificant cost are also identified at this point.

### 3.5.2 Engineering risk assessment

All impacts and risks that require further assessment are subject to an engineering risk assessment in which a comparative assessment of risks, costs, and environmental benefit is conducted (OGUK, 2014). The cost-benefit analysis shows the balance between the environmental benefit and the cost of implementing the identified measure.

### 3.5.3 Precautionary approach

If the assessment, considering all available engineering and scientific evidence, is insufficient, inconclusive, or uncertain, then a precautionary approach to hazard management is needed (OGUK, 2014).

A precautionary approach will mean that environmental considerations are expected to take precedence over economic considerations, and a control measure that may reduce environmental impact is more likely to be implemented.

## 3.6 Demonstration of acceptable level

Esso considers a range of factors when evaluating the acceptability of environmental impacts or risks associated with its activities. This evaluation works at several levels, as outlined in Table 3-9 and is based on NOPSEMA's EP content requirement guidance note (NOPSEMA, 2020) and EP decision making guideline (NOPSEMA, 2021). The acceptability evaluation for each aspect associated with this activity is undertaken in accordance with Table 3-9.

These factors are used to demonstrate acceptability in Sections 5 and 6.

**Table 3-9 Demonstration of acceptability test**

Factor	Demonstration of acceptability
<b>Risk Assessment process for unplanned event</b>	The level of environmental risk is either Risk Category 2, 3 or 4.
<b>Principles of Ecologically Sustainable Development (ESD)</b>	<ul style="list-style-type: none"> <li>• No potential to affect biological diversity and ecological integrity</li> <li>• Activity does not have the potential to result in serious or irreversible environmental damage.</li> <li>• Or if it does: there is no significant scientific uncertainty associated with the aspect.</li> <li>• Or if there is: the precautionary principle has been applied.</li> </ul>
<b>Legislative and other requirements</b>	All good practice control measures have been identified for the aspect including those identified in relevant <i>Environment Protection and Biodiversity Conservation Act 1999</i> (EPBC Act)-listed species recovery plans or approved conservation advices.
<b>Internal context</b>	All Esso management system standards and impact or risk control processes have been identified for the aspect.
<b>External context</b>	The concerns of relevant persons have been considered/addressed through the relevant persons consultation process.

ESD Principles are:

- Decision making processes should effectively integrate both long term and short term economic, environmental, social and equitable considerations
- This principle is inherently met through the EP assessment process. This principle is not considered separately for each acceptability evaluation.
- If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.
- An evaluation is completed to determine if the activity will result in serious or irreversible environmental damage. Where the activity has the potential to result in serious or irreversible environmental damage, further assessment is undertaken to determine if there is significant uncertainty in the evaluation.
- The principle of inter-generational equity – that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations.
- Where the potential impacts and risk are determined to be serious or irreversible the precautionary principle is implemented to ensure the environment is maintained for the benefit of future generations.
- The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision making.
- An assessment is completed to determine if there is the potential to impact biological diversity and ecological integrity.

- Improved valuation, pricing and incentive mechanisms should be promoted.
- Not relevant to this EP.

## 4 Description of environment

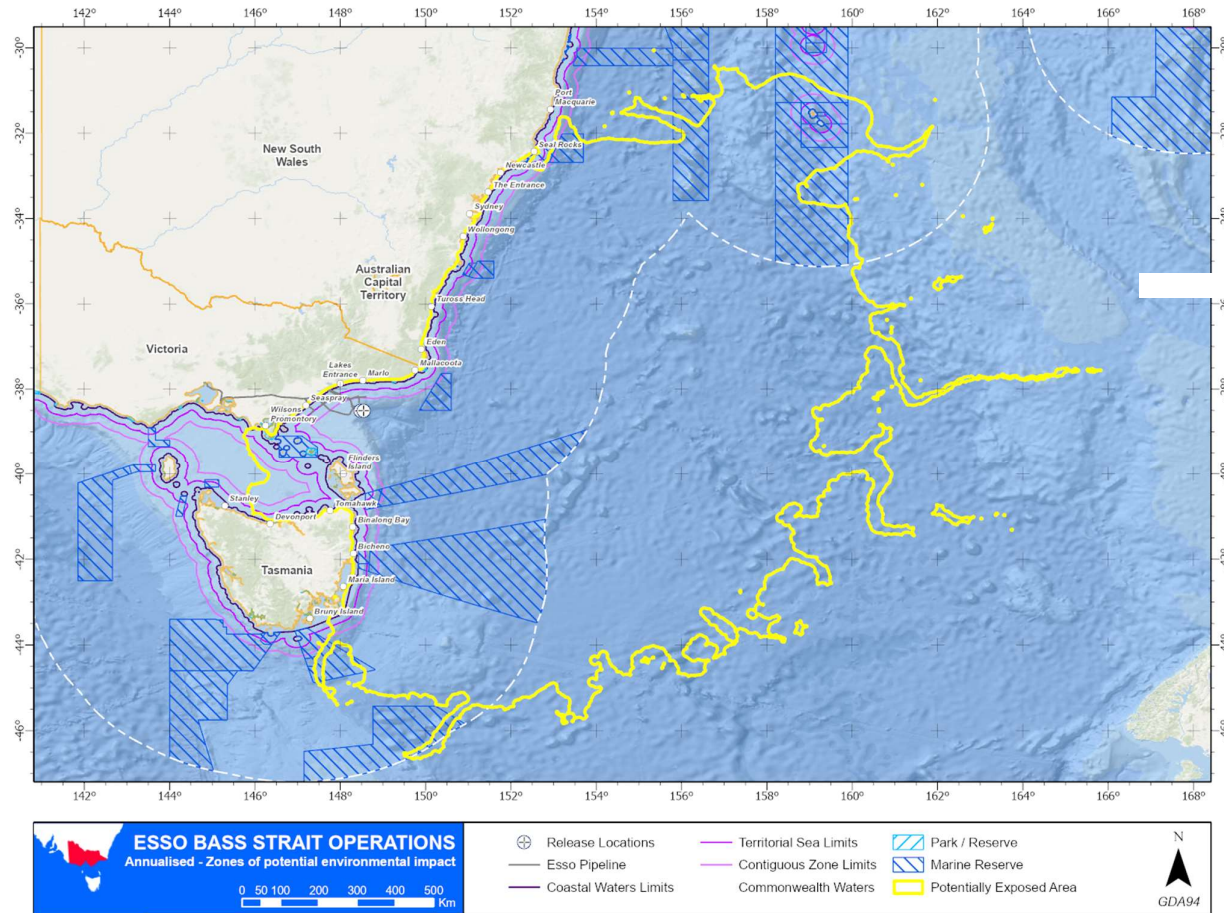

In order to set the environmental context required to assess impacts and risks associated with the petroleum activities described in this EP, two areas, within the overarching Described Area of Volume 1, have been identified as follows:

- **OA** – The area where the petroleum activities will take place. The two OAs for the purposes of this EP consist of the 500-metre PSZ around the Gudgeon-1 and Terakihi-1 subsea facilities respectively as shown in .
- **Potentially Exposed Area (PEA)** – Determined by oil spill modelling (see Section 3.4.1.1) and is the total area that could be exposed to hydrocarbon, including trace concentrations of oil in the water column, as a result of any spill from this activity. The PEA is based on hydrocarbon exposures above the thresholds in Table 3-6 (see Section 3.4.1) for both the accidental release of Marine Diesel Oil (MDO) from a vessel collision (see Section 6.6) and the accidental release of condensate from a loss of well control (LOWC) (see Section 6.7).

Figure 4-1 shows the PEA for this activity; stochastic modelling of instantaneous contact at lowest hydrocarbon thresholds (10ppb instantaneous entrained). The PEA extends from Cape Liptrap in Victoria and follows the eastern coast past Mallacoota and up the entire coast of NSW until Charlotte Head (north of Newcastle). The PEA also reaches both the north eastern and eastern coast of Tasmania (from Somerset until Cape Raoul) and surrounds Flinders Island.

The values, sensitivities and receptors found within the combined OAs and PEA are provided in Table 4-1, with detailed descriptions of receptors found in the Volume 1.

The EPBC Act Protected Matters Search Tool Reports for the OAs and PEA are presented in Appendix A.

Value/sensitivity	Receptor type	OAs	PEA	Description
<b>Protected Matter</b>				
World Heritage (Volume 1 Section 2.2.1) (See Figure 4-2)	Lord Howe Island Group (Volume 1 Section 2.2.1.2)	-	Y	The Lord Howe Island Group is located 700 kilometres north-east of Sydney and covers an area of 1,463 km <sup>2</sup> , the Lord Howe Island Group comprises Lord Howe Island, Admiralty Islands, Mutton Bird Islands, Ball's Pyramid, and associated coral reefs and marine environments. The justification criteria for its World Heritage listing are its exceptional diversity of spectacular and scenic landscapes within a small area, including sheer mountain slopes, a broad arc of hills enclosing the lagoon and Balls Pyramid rising abruptly from the ocean.
National Heritage (Volume 1 Section 2.2.2) (See Figure 4-3)	Bondi Beach (Volume 1 Section 2.2.2.4)	-	Y	Bondi Beach is significant in the course of Australia's cultural history as the site of the foundation of Australia's first recognised surf lifesaving club in 1907
Wetlands of International Importance (Ramsar) (Volume 1 Section 2.2.3) (See Figure 4-4)	Gippsland Lakes Ramsar Site (Volume 1 Section 2.2.3.1)	-	Y	<p>The Gippsland Lakes Ramsar Site, located in Victoria inland from the Esso Gippsland permit area is a series of large, shallow, coastal lagoons approximately 70km in length and 10km wide, separated from the sea by sand dunes.</p> <p>Meets five of the Ramsar criteria: 1, 2, 4, 6 and 8.</p> <p>Critical components include a broad range of wetland types: marine subtidal aquatic beds (C1); coastal brackish or saline lagoons (C2); freshwater (C3); brackish (C4) and saltmarsh/hypersaline wetlands (C5).</p> <p>Critical wetland flora and fauna are present and abundance and diversity of waterbirds (C6), presence of threatened frog species and presence of threatened wetland flora.</p> <p>Critical processes are the hydrological regime of freshwater and groundwater flows into the wetland system and marine inflows that affect habitat structure and condition, and waterbird breeding functions provided by the critical breeding habitats for a variety of waterbird species.</p> <p>Critical services/benefits: wetlands provide support for vulnerable or endangered wetland flora and fauna that contribute to biodiversity and the site supports key fisheries habitats and stocks of commercial and recreational significance.</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
	Corner Inlet (Volume 1 Section 2.2.3.2)	-	Y	<p>Corner Inlet is a wetland enclosed by barrier islands in Victoria and contains extensive intertidal mudflats.</p> <p>Meets six of the Ramsar criteria: 1, 2, 4, 5, 6 and 8.</p> <p>The two critical components are key wetland mega-habitat types (seagrass, intertidal sand or mud flats, mangroves, saltmarshes, permanent shallow marine water) (C1); and abundance and diversity of waterbirds (C2).</p> <p>The critical process is waterbird breeding, with important sites present on the sand barrier islands</p> <p>Critical services and benefits are that the site supports nationally threatened fauna species. The site supports outstanding fish habitat values that contribute to the health and sustainability of the bioregion.</p>
	East Coast Cape Barren Islands Lagoons (Volume 1 Section 2.2.3.4)	-	Y	<p>East Coast Cape Barren Island Lagoons is located on the east coast of Cape Barren Island in Tasmania. The site is significant as it forms a representative sample of coastal lagoons in the Flinders Biogeographic Region and is relatively undisturbed.</p> <p>The site meets two of the Ramsar Criteria: 1 and 3.</p> <p>The critical components and processes for the site at the time of listing in 1982 have been determined to be geomorphology, hydrology and vegetation types.</p> <p>Critical services/benefits: provides important habitat for a number of plant species and vegetation communities. Thirteen threatened species listed in Tasmania occur on the site.</p>
	Flood Plain Lower Ringarooma (Volume 1 Section 2.2.3.5)	-	Y	<p>The Flood Plain Lower Ringarooma River Ramsar site is located on the far north-east coast of Tasmania, between Cape Portland and Waterhouse Point. The site contains good condition, regionally representative examples of wetland systems within a flood plain, with a mosaic of permanent and seasonal marshlands and a large river estuary (Boobyalla Inlet).</p> <p>The site meets Ramsar Criteria 1, 2, 3 and 4.</p> <p>The site supports several nationally threatened wetland dependent species and provides important feeding and nesting place for many species of waterbirds.</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
	Logan Lagoon (Volume 1 Section 2.2.3.3)	-	Y	<p>The Logan Lagoon Ramsar site is enclosed within the Logan Lagoon Conservation Area located on the south-east corner of Flinders Island, Tasmania. The site is an excellent, regionally representative example of a coastal estuarine wetland system.</p> <p>The site meets five of the Ramsar Criteria: 1, 2, 3, 4 and 6.</p> <p>The site supports species and communities threatened in the Tasmania Drainage Division, particularly <i>Callitdeidea</i> forest and the rayless starwort. The site also provides breeding habitat for the Fairy tern and Little tern (both species are threatened in the region).</p> <p>The site is an important area for birds migrating between south-eastern Australia and Tasmania, supporting five migratory bird species.</p>
	Myall Lakes (Volume 1 Section 2.2.3.11)	-	Y	<p>The Myall Lakes Ramsar site is entirely within the Port Stephens Great Lakes Marine Park (NSW). The site supports a rich biodiversity, containing a range of undisturbed terrestrial and wetland vegetation communities with a large number of plant and animal species.</p> <p>The site meets Ramsar criteria 1a, 1c, 2a and 3b.</p> <p>The site supports 22 species of migratory shorebirds listed under migratory bird agreements and five wetland dependent threatened species.</p>
	Towra Point Nature Reserve (Volume 1 Section 2.2.3.13)	-	Y	<p>Towra Point Nature Reserve Ramsar site is located on the southern shore of Botany Bay NSW, within Towra Point Nature Reserve. Towra Point is important in providing ecological connectivity for itinerant species and is important for maintaining biodiversity in the greater Sydney region.</p> <p>The site meets Ramsar criteria 2, 3, 4 &amp; 8.</p> <p>The site is a critical roosting and feeding habitat for large numbers of migratory shorebird species and a significant nesting site for the endangered little tern (<i>Sterna albifrons</i>). The site also contains an abundance and diversity of fish species.</p>

Listed Threatened Ecological Communities	Littoral Rainforest and Coastal Vine Thicket	-	Y	The ecological community is a complex of rainforest and coastal vine thickets influenced by its proximity to the sea; and provides habitat for over 70 threatened plants and animals and provides important stepping-stones along the eastern Australian coast for various migratory and marine birds. It occurs as a series of naturally disjunct and localised stands within two kilometres of the eastern coastline of Australia or adjacent to a large saltwater body, such as an estuary on a range of landforms including dunes and flats, headlands and sea-cliffs, including offshore islands. Within																		

Value/sensitivity	Receptor type	OAs	PEA	Description
(Volume 1 Section 2.2.4)  (See Figure 4-6)	(Volume 1 Section 2.2.4.2)			the PEA these occur on the east Gippsland coast (including locations near Lakes Entrance, Marlo and Mallacoota) and communities can be found along most of the New South Wales coastline beginning north of Eden.
	Subtropical and Temperate Coastal Saltmarsh  (Volume 1 Section 2.2.4.3)	-	Y	The Subtropical and Temperate Coastal Saltmarsh ecological community occurs within a narrow margin in the subtropical and temperate climatic zones; and includes coastal saltmarsh occurring on islands within these climatic zones. The physical environment for the ecological community is coastal areas under regular or intermittent tidal influence. The community consists mainly of salt-tolerant (halophyt-s - grasses, herbs, sedges, rushes and shrubs) and non-vascular vegetation including epiphytic algae, diatoms and cyanobacterial. The ecological community is inhabited by a wide range of infaunal and epifaunal invertebrates, and temporary inhabitants such as prawns, fish and birds (and can often constitute important nursery habitat for fish and prawn species). The dominant marine residents are benthic invertebrates, including molluscs and crabs that rely on the sediments, vascular plants, and algae, as providers of food and habitat across the intertidal landscape. This community occurs sporadically on the coastline which intersects with the PEA.
	Giant Kelp Marine Forests of Southeast Australia  (Volume 1 Section 2.2.4.1)	-	Y	Kelps are very large brown algae that grow on hard sub tidal substrates in cold temperate regions. Because kelps require constant water motion to provide nutrients, they are located in relatively high-energy settings. The community is characterised by a closed to semi-closed surface or subsurface canopy of giant kelp ( <i>Macrocystis pyrifera</i> ), and extends between the ocean floor and ocean surface, exhibiting a 'forest-like' structure with a diverse range of organisms occupying its benthic, pelagic and upper-canopy layers. These organisms include fish, invertebrates, and marine mammals as well as important algal communities. The high primary and secondary productivity of the giant kelp forests create and provide a number of ecosystem services to the local environment including settlement habitat for juvenile life stages of commercially important fisheries, improvements in local water quality conditions and coastal protection via buffering strong wave conditions from reaching the shore. Giant Kelp Marine Forests occur around the islands in central Bass Strait and on the far eastern Victorian Coast approximately from Wingan Inlet in the Croajingolong National Park to the New South Wales border.
	Coastal Swamp Oak ( <i>casuarina glauca</i> ) Forest of New South Wales and	-	Y	This TEC occurs along South East Corner bioregions of NSW in coastal catchments, on coastal flats, floodplains, drainage lines, lake margins, wetlands and estuarine fringes where soils are at least occasionally saturated, water-logged or inundated.  The vegetation of the Coastal Swamp Oak Forest provides diverse habitat values and is a source of food for a wide range of fauna, particularly the crevices and hollows within older trees. Most

Value/sensitivity	Receptor type	OAs	PEA	Description
	Soulhi East Queensland (Volume 1 Section 2.2.4.5)			fauna species that form a part of the Coastal Swamp Oak Forest also inhabit adjacent wetlands, grasslands, woodlands and forests. Many fauna species within the ecological community are listed as threatened under State and/or Commonwealth legislation.
	Assemblages of Species Associated with Open-coast Salt-wedge Estuaries of Western and Central Victoria Ecological Community (Volume 1 Section 2.2.4.5)	-	Y	<p>This ecological community is the assemblage of native plants, animals and micro-organisms associated with the dynamic salt-wedge estuary systems that occur within the temperate climate, microtidal regime, high wave energy coastline of western and central Victoria.</p> <p>Salt-wedge estuaries are typically ecosystems of high ecological value which are increasingly under threat. They contribute high levels of productivity to coastal and nearshore marine environments, and provide important refuge, nursery or breeding habitat for a wide range of invertebrates, fish and birds.</p>
	Coastal swamp sclerophyll forest of New South Wales and South East Queensland (2.2.4.7)	-	Y	<p>This TEC includes the plants, animals and other organisms typically associated with forested palustrine wetlands, or swamp forests, found in the temperate to subtropical coastal valleys between the Great Dividing Range and the coastline from near Gladstone in QLD, through to the south coast of NSW.</p> <p>This TEC often has a layered canopy, dominated by melaleucas and/or <i>Eucalyptus robusta</i>, supporting a range of aquatic, ground dwelling and aboreal species.</p>
	Coastal Upland Swamps in the Sydney Basin (2.2.4.6)	-	Y	<p>This TEC is endemic to NSW and includes a range of vegetation and fauna associated with periodically waterlogged soils on the Hawkesbury sandstone plateaux. This TEC present in the eastern part of the Sydney Basin, majority of the swamps exist at elevations of 200-450 metres ASL.</p> <p>This TEC is characterised by highly diverse and variable mosaics of vegetation depending on soil conditions, size of the site, recent rainfall conditions, fire regimes and disturbance history. The swamps also provide habitat for a wide range of fauna permanently or as transients.</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
	Posidonia australis seagrass meadows of the Manning Hawkesbury ecoregion (2.2.4.8)	-	Y	<p>This TEC comprises of plants, animals and micro-organisms associated with seagrass meadows dominated by <i>Posidonia australis</i> occurring in the warm temperate Manning Shelf and Hawkesbury Shelf bioregions. This TEC mainly occurs within sheltered environments of permanently open estuaries, typically in subtidal waters at depths ranging less than 1m to 10 m on sand and silty mud substrate.</p> <p>The wide strap-like leaves of <i>Posidonia australis</i> provides substrate for a diverse collection of benthic flora, the species is believed to provide the greatest habitat structure of any of the seagrass species found in NSW, supporting an abundance of fauna.</p>
<p>Australian Marine Parks (AMPs) (Volume 1 Section 2.2.6) (See Figure 4-7)</p>	<p>East Gippsland Marine Park (Volume 1 Section 2.2.6.1)</p>	-	Y	<p>The East Gippsland Marine Park contains representative samples of an extensive network of canyons, continental slope and escarpment at depths from 600m to more than 4000m. The geomorphic features of this reserve include rocky-substrate habitat, submarine canyons, escarpments and a knoll, which juts out from the base of the continental slope. The reserve includes both warm and temperate waters, which create habitat for free-floating aquatic plants or microscopic plants (i.e. phytoplankton) communities. Complex seasonality in oceanographic patterns influences the biodiversity and local productivity. The East Australian Current brings subtropical water from the north, and around Cape Howe the current forms large eddies, with a central core of warm water. Around the outside of the eddies, cooler, nutrient-rich waters mix with the warm water creating conditions for highly productive phytoplankton growth, which supports a rich abundance of marine life. During winter, upwellings of cold water may occur and bring nutrient-rich waters to the surface, boosting productivity. Many oceanic seabirds forage in these waters, including albatrosses (e.g. wandering albatross (<i>Diomedea exulans</i>); black-browed albatross (<i>Thalassarche melanophris</i>); Indian yellow-nosed albatross (<i>Thalassarche chlororhynchos</i>); shy albatross (<i>Thalassarche cauta</i>); great-winged petrel (<i>Pterodroma macroptera</i>); wedge-tailed shearwater (<i>Ardenna pacifica</i>); and the cape petrel (<i>Daption capense</i>). Humpback whales (<i>Megaptera novaeangliae</i>) pass by during their migrations north and south along the eastern seaboard.</p> <p><u>Multiple Use Zone</u></p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>examples of ecosystems, habitats and communities associated with the Southeast Transition and associated with sea-floor features of abyssal plain/deep ocean floor, canyon, escarpment, knoll/abyssal hill and slope</li> </ul>

Value/sensitivity	Receptor type	OAs	PEA	Description
				<ul style="list-style-type: none"> <li>• features with high biodiversity and productivity are the Bass Cascade and Upwelling East of Eden</li> <li>• important foraging area for the wandering, black-browed, Indian yellow-nosed and shy albatrosses; great-winged petrel; wedge-tailed shearwater; and cape petrel</li> <li>• important migration area for the humpback whale.</li> </ul>
	Beagle Marine Park (Volume 1 Section 2.2.6.2)	-	Y	<p>The Beagle Marine Park lies entirely within Bass Strait and represents an area of shallow continental shelf ecosystems in depths of about 50–70m that extends around south-eastern Australia to the east of Tasmania. The seabed that it covers formed a land bridge between Tasmania and Victoria during the last ice age 10,000 years ago.</p> <p><u>Multiple Use Zone</u></p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>• ecosystems, habitats and communities associated with the Southeast Shelf Transition and associated with sea-floor features of basin, plateau, shelf, sill.</li> <li>• important migration and resting on migration area for the Southern right whale (<i>Eubalaena australis</i>) (SRW) and important foraging area for the Australian fur seal (<i>Arctocephalus pusillus doriferus</i>), killer whale (<i>Orcinus orca</i>), shy albatross, Australasian gannet (<i>Morus serrator</i>), short-tailed shearwaters (<i>Ardenna tenuirostris</i>), Pacific gulls (<i>Larus pacificus</i>); silver gulls (<i>Chroicocephalus novaehollandiae</i>), crested tern (<i>Thalasseus bergii</i>), common diving petrel (<i>Pelecanoides urinatrix</i>), fairy prion (<i>Pachyptila turtur</i>), black-faced cormorant (<i>Phalacrocorax fuscescens</i>), little penguin (<i>Eudyptula minor</i>), and great white shark (<i>Carcharodon carcharias</i>)</li> <li>• Maritime heritage site of the wreck of the steamship SS Cambridge and the wreck of the ketch Eliza Davies</li> </ul>
	Flinders Marine Park (Volume 1 Section 2.2.6.3)	-	Y	<p>The Flinders Marine Park is located east of the north-east tip of Tasmania and Flinders Island, and extends over 400km eastward. It covers a depth range from about 40m on the shallow continental shelf to abyssal depths of 3000m or more near the edge of Australia’s exclusive economic zone.</p> <p><u>Multiple Use Zone/Marine National Park Zone</u></p> <p>Major conservation values are:</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
				<ul style="list-style-type: none"> <li>ecosystems habitats and communities associated with the Tasmania Province, the Tasmanian Shelf Province, the Southeast Transition, the Southeast Shelf Transition</li> <li>associated with sea-floor features are abyssal plain/deep ocean floor, canyon, plateau, seamount/guyot and shelf slope</li> <li>features with high biodiversity and productivity are east Tasmania subtropical convergence zone</li> <li>the park is an important foraging area for wandering, black-browed, Indian yellow-nosed and shy albatrosses; northern giant petrel (<i>Macronectes halli</i>); Gould's petrel (<i>Pterodroma leucoptera</i>); cape petrel (<i>Daption capense</i>); killer whale (<i>Orcinus orca</i>); great white shark and Harrison's dogfish (<i>Centrophorus harrissoni</i>)</li> <li>Important migration area for the humpback whale</li> </ul>
	Jervis Marine Park (Volume 1 Section 2.2.6.15)	-	Y	<p>Jervis Marine Park is located about 20km offshore, adjacent to the New South Wales Jervis Marine Park comprising an area of 2473km<sup>2</sup> and covering a depth range from 120m to 5000m approximately.</p> <p>It has Habitat Protection and Special Purpose (Trawl) zones.</p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>ecosystems habitats and communities associated with the Central Eastern Province and Southeast Shelf Transition</li> <li>important foraging area for seabirds, grey nurse shark (<i>Carcharias Taurus</i>) and humpback whales</li> <li>canyons on the eastern continental slope (see Key Ecological Features (KEFs) below)</li> <li>the Marine Park contains one known shipwreck listed under the <i>Historic Shipwrecks Act 1-76</i> - HMAS Tattoo (wrecked in 1939).</li> </ul>
	Freycinet Marine Park (Volume 1 Section 2.2.6.4)	-	Y	<p>The Freycinet Marine Park is located east of Tasmania, offshore from the Freycinet Peninsula. It covers 57,942 km<sup>2</sup>, with depths from 40m to over 3000m.</p> <p>It has National Park, Recreational Use and Multiple Use Zones.</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
				<p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>ecosystems habitats and communities associated with the Tasmania Province, the Tasmanian Shelf Province, the Southeast Transition</li> <li>associated with sea-floor features are abyssal plain/deep ocean floor, canyon, escarpment, knoll/abyssal hill, saddle, seamount/guyot, terrace and shelf</li> <li>features with high biodiversity and productivity are east Tasmania subtropical convergence zone</li> <li>the park is an important foraging area for wandering, black-browed, and shy albatrosses, cape petrel, fairy prion, sei whales (<i>Balaenoptera borealis</i>) and killer whales (<i>Orcinus orca</i>)</li> <li>important migration and resting on migration area for SRWs</li> <li>important migration area for the humpback whales.</li> </ul>
	Central Eastern Marine Park  (Volume 1 Section 2.2.6.12)	-	Y	<p>Central Eastern Marine Park begins 30km east of Coffs Harbour. It covers 70,054km<sup>2</sup>, with depths from 120m to 6000m.</p> <p><u>Marine National Park Zone Habitat Protection Zone/Special Purpose Zone (Trawl)</u></p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>Ecosystems, habitats and communities associated with Central Eastern Province, Central Eastern Shelf Transition and Tasman Basin Province</li> <li>It is an important area for foraging and breeding of seabirds and migrating humpback whales</li> <li>KEFs of the Marine Park are the Tasmantid Seamount Chain, Canyons on the eastern continental slope and Tasman Font and Eddy Field</li> <li>Sea country is valued for Indigenous cultural identity</li> <li>Maritime heritage site for shipwrecks Amelia (1816) and Illagong (1872)</li> <li>Social values are tourism, commercial fishing and recreation.</li> </ul>

Value/sensitivity	Receptor type	OAs	PEA	Description
	Lord Howe Marine Park  (Volume 1 Section 2.2.6.11)	-	Y	<p>The Lord Howe Marine Park is located approximately 550km offshore of New South Wales, adjacent to the New South Wales Lord Howe Island Marine Park and World Heritage Area.</p> <p>National Park Zone/Habitat Protection Zone, Habitat Protection Zone (Lord Howe), Recreation Zones/Special Purpose Zone (Trawl)</p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>• ecosystems, habitats and communities associated with Lord Howe Province and Tasman Basin Province</li> <li>• important area for foraging and breeding of seabirds and migrating humpback whales</li> <li>• KEFs of the Marine Park are Lord Howe Seamount Chain, Elizabeth and Middleton Reefs and Tasman Font and Eddy Field</li> <li>• cultural values are the marine environment around Lord Howe Island valued by the Islanders and sea country is valued by the Indigenous people.</li> </ul>
	South Tasman Rise Marine Park  (Volume 1 Section 2.2.6.16)	-	Y	<p>The South Tasman Rise is an area of seafloor that lies 550 km south of Hobart, Tasmania in the Southern Ocean where water depths are about 1,500 metres. This deep ocean park covers 27,704 square kilometres. It is designated as a Special Purpose zone.</p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>• ecosystems, habitats and communities associated with Tasman Province and associated with sea-floor features; abyssal plain/deep ocean floor, canyon, plateau and seamount/guyot.</li> <li>• important foraging area for: wandering and black-browed albatrosses, Short-tailed shearwater, white-headed and white-chinned petrels</li> </ul>
	Huon Marine Park  (Volume 1 Section 2.2.6.9)	-	Y	<p>The Huon Marine Park located off Southern Tasmania covers approximately 991 square kilometres of outer continental shelf, continental slope and deeper seabed, ranging from 70 metres to over 3000 metres. The marine park has Habitat Protection and Multiple Use zones.</p> <p>Major conservation values are:</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
				<ul style="list-style-type: none"> <li>ecosystems, habitats and communities associated with Tasman Shelf Province and The Tasman Province</li> <li>associated with sea-floor features; canyon, knoll/abyssal hill (seamount), pinnacle, saddle, shelf and terrace</li> <li>features with high biodiversity and productivity: seamounts south and east of Tasmania</li> <li>Important foraging area for: black-browed, Buller's and shy albatrosses, great-winged petrel, short-tailed shearwater, fairy prion, Australian fur seal and killer whale.</li> <li>Important migration area for: humpback whale</li> </ul>
	Hunter Marine Park (Volume 1 Section 2.2.6.13)	-	Y	<p>The Hunter Marine Park is located offshore from Port Stephens in NSW and extends out approximately 100km. The marine park has Habitat Protection Special Purpose zones.</p> <p>Major conservation values are:</p> <ul style="list-style-type: none"> <li>ecosystems, habitats and communities associated with: Central Eastern Province and Central Eastern Shelf Province</li> <li>Important area for: foraging seabirds and humpback whales, migrating humpback whales and aggregation of grey nurse sharks</li> <li>Key ecological features of the Marine Park are: Canyons on the eastern continental slope, Shelf rocky reefs and Tasman Front and eddy field</li> <li>The Marine Park contains one known shipwreck listed under the Historic Shipwrecks Act 1976— India (wrecked in 1884)</li> <li>Commercial fishing, tourism and recreation, including fishing, are important activities in the Marine Park. KEFs (Volume 1 Section 2.2.7)	Upwelling East of Eden (Volume 1 Section 2.2.7.2)	-	Y	<p>The Upwelling East of Eden is present along the eastern Victorian and southern New South Wales coasts and is defined as a KEF as it is an area of high productivity and aggregations of marine life.</p> <p>Dynamic eddies of the East Australian Current cause episodic productivity events when they interact with the continental shelf and headlands. The episodic mixing and nutrient enrichment</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
(See Figure 4-8)				<p>events drive phytoplankton blooms, the basis of productive food chains including zooplankton, copepods, krill and small pelagic fish.</p> <p>The upwelling supports regionally high primary productivity which supports fisheries and biodiversity, including top order predators, marine mammals and seabirds.</p> <p>This area is one of two feeding areas for blue whales (<i>Balaenoptera musculus</i>) and humpback whales, known to arrive when significant krill aggregations form. The area is also important for seals, other cetaceans, sharks and seabirds.</p>
	Big Horseshoe Canyon (Volume 1 Section 2.2.7.1)	-	Y	<p>Big Horseshoe Canyon is defined as a KEF as it is an area of high productivity and aggregations of marine life.</p> <p>Steep, rocky slopes provide hard substrate habitat for megafloora to attach.</p> <p>Sponges and other habitat forming species provide structural refuges for benthic fishes, including the commercially important pink ling.</p> <p>The only known temperate location of the stalked crinoid (<i>Metacrinus cyaneus</i>).</p>
	Shelf Rocky Reefs (Volume 1 Section 2.2.7.6)	-	Y	<p>Rocky reefs and hard grounds are located on the continental shelf of south-eastern Australia, in 50m to 150-220m water depth. They support macroalgae and sessile invertebrates and provide habitat and shelter for fish and are important for aggregations of biodiversity and enhanced productivity. This KEF has not been spatially defined however it is expected to occur along the continental shelf of Bass Strait.</p>
	Canyons on the Eastern Continental Slope (Volume 1 Section 2.2.7.12)	-	Y	<p>The Canyons on the eastern continental slope lie off the coast of New South Wales and are defined as a KEF as they are a unique seafloor feature with enhanced ecological functioning and integrity, and biodiversity, which apply to both its benthic and pelagic habitats.</p> <p>localised currents caused by the steep canyon face act to funnel nutrients and sediments into the canyon causing enhanced productivity.</p> <p>hard substrate provides an anchoring point and vertical relief for filter feeder benthic species (e.g. attached sponges and crinoids) thereby attracting higher trophic level species, including crustaceans, echinoderms, bivalves, cephalopods and fish.</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
	Seamounts South and East of Tasmania (Volume 1 Section 2.2.7.5)	-	Y	These seamounts are a chain or cluster of seamounts rising from the abyssal plain, continental rise or plateau situated 200km or more from shore (east of Flinders Island to southeast of southern Tasmania). They are an area of high productivity and aggregations of marine life. Seamounts with hard substrate summits and slopes provide attachment points for sessile invertebrates, while the soft sediments can be habitat for species that burrow into the sediments.
	Tasmantid Seamount Chain (Volume 1 Section 2.2.7.8)	-	Y	Tasmantid Seamount Chain are isolated, oceanic reefs formed by submerged volcanoes are thought to support a diverse range of tropical and temperate marine life, including both warm-water and cold-water corals and an abundance of fish species. This diversity is a result of the effect of the East Australian Current on the reefs as it exposes the area to its warm waters, in contrast to the surrounding cooler ocean.  Note: The information on the Tasmantid Seamounts has been based on observations from some seamounts in other locations.
	Tasman Front and Eddy Field (Volume 1 Section 2.2.7.10)*	-	Y	The Tasman Front and Eddy Field occurs in the Temperate East Marine Region between latitudes 19 and 33 degrees south and is defined as a KEF formed by complex and dynamic oceanographic processes supporting transient patches of enhanced productivity that, in turn, attract aggregations of species across trophic levels, including top predators such as tuna and sharks. It is formed by currents which cause the eddy resulting in enhanced productivity.
	Shelf Rocky Reefs (Temperate East) (Volume 1 Section 2.2.7.11)	-	Y	The Shelf Rocky Reefs habitat occurs from offshore Narooma on the east coast of New South Wales and extends north to south of Wollongong. It has been identified as a KEF as it is considered a unique sea-floor feature which is associated with ecological properties of regional significance.  Support a range of complex benthic habitats that, in turn, support diverse benthic communities such as crustaceans, molluscs, annelids and echinoderms.  Algal communities dominate shallower waters, shifting to attached invertebrates including dense populations of large sponges, with a mixed assemblage of moss animals and soft corals in waters greater than ~45m.  Contribute to increased survival of juvenile fish by providing refuge from predation.

Value/sensitivity	Receptor type	OAs	PEA	Description
				Supports a diverse assemblage of demersal fish, which show distinct patterns of association with shelf-reef habitats.
	Lord Howe seamount chain (Volume 1 Section 2.2.7.9)	-	Y	<p>The Lord Howe Seamount Chain is a chain of submerged volcanoes running 1000 km north–south, the seamount chain includes Lord Howe Island and Elizabeth and Middleton Reefs. This seamount chain runs east of the Tasmanid Seamount discussed above.</p> <p>The isolated, oceanic reefs support a diverse range of tropical and temperate marine life, including both warm-water and cold water corals and an abundance of fish species. This diversity is a result of the effect of the East Australian Current on the reefs as it exposes the area to its warm waters, in contrast to the surrounding cooler ocean</p>
Other Protected Areas				
Social/Cultural/Conservation	National Parks and Reserves (Volume 1 Section 2.2.8)	-	Y	<p>Only protected areas with marine/coastal features that are intersected by the PEA are listed below. The PMST report (see Volume 1 Appendix C) has a detailed list of other protected areas (terrestrial).</p> <p>Victoria (See Figure 4-9):</p> <ul style="list-style-type: none"> <li>• Anser Island Reference Area</li> <li>• Bemm, Goolengook, Arte and Errinundra Heritage River</li> <li>• Beware Reef Marine Sanctuary (2.2.8.7)</li> <li>• Cape Howe Marine Park National (2.2.8.1)</li> <li>• Cape Conran Coastal Park (2.2.8.8)</li> <li>• Cape Howe Wilderness Zone</li> <li>• Cape Howe Marine National Park</li> <li>• Croajingolong National Park (2.2.8.5)</li> <li>• Corner Inlet and Nooramunga Marine and Coastal Parks (2.2.8.11)</li> <li>• Corner Inlet Marine National Park (2.2.8.12)</li> <li>• Cape Liptrap Coastal Park (2.2.8.14)</li> </ul>

Value/sensitivity	Receptor type	OAs	PEA	Description
Cultural - Indigenous Heritage (Volume 1 Section 2.5.1)	Indigenous Protected Areas (Volume 1 Section 2.5.1)	-	Y	Five Indigenous Protected Areas occur on and around Flinders Island in central Bass Strait, they are all important rookeries for mutton birds and important cultural resource for Tasmanian Aboriginal people. They are Babel Island, Big Dog Island, Mont Chappell Island, Badger Island and Lugatalanana.
Commonwealth Heritage Listed Natural place (Volume 1 Section 2.5.2)*	Natural Heritage Place (Volume 1 Section 2.5.2)	-	Y	<ul style="list-style-type: none"> <li>Malabar Headland.</li> <li>The Beecroft Peninsula.</li> <li>Tasmanian Seamounts Area.</li> </ul>
Commonwealth Heritage Listed Historic place (Volume 1 Section 2.5.3)*	Nil	-	-	The majority of listings on the Commonwealth Heritage list under the historic classification which occur in the Described Area are lighthouses; these and the other listings are not considered relevant.
Commonwealth Heritage Listed Indigenous Place		-	Yes	<ul style="list-style-type: none"> <li>Crocodile Head Area.</li> <li>Currarong Rockshelters Area.</li> <li>Jervis Bay Territory.</li> </ul>
Historic Maritime (Volume 1 Section 2.5.3)*	Historic Shipwrecks (Volume 1 Section 2.5.3.1) (See Figure 4-12)	-	Y	Historic shipwrecks are located all along the Australian coastline, 29 are located within approximately 15km of the Esso Gippsland Permit area. Two historic shipwrecks within a protected zone occur within the PEA on the south coast of New South Wales, near Eden; the Bega (1908) and the Lady Darling (1880). Within approximately 25km from the PEA on the Victorian coast the PS Clonmel, 1841 also in a protected zone.
<b>Environmental Values – Other</b>				

Value/sensitivity	Receptor type	OAs	PEA	Description
Physical Environment	Climate and Meteorology Bass Strait (Volume 1 Section 2.1.1)	Y	Y	<p>Bass Strait climate conditions display an average summer range of 13-21°C and an average winter range of 9-14°C.</p> <p>Rainfall ranges from 41mm in January (highest 162mm) to 78mm in June (highest 247mm).</p> <p>Wind speeds are in the range of 10 to 30km/hour, with maximum gusts reaching 100km/hour.</p> <p>Wind direction is predominately westerly during winter, westerly and easterly during spring and autumn (when wind speeds are highest) and easterly during summer.</p> <p>Storms with associated high wind and waves occur regularly, generally caused by low pressure systems.</p>
	Oceanography (Volume 1 Section 2.1.2)	Y	Y	<p>Bass Strait is characterised by shallow water and tidal currents. Wind driven currents can also be caused by passing weather systems and influenced by systems passing over the Great Australian Bight.</p> <p>The eastern parts of the Region are strongly influenced by the East Australian Current that flows southward adjacent to the east coast of New South Wales, Victoria and Tasmania, carrying warm equatorial waters and forming eddies which in turn cause upwellings.</p> <p>At the shelf break east of Bass Strait, nutrient-rich waters rise to the surface in winter as part of the processes of the Bass Strait Water Cascade creating an area of high productivity.</p> <p>Further offshore currents are driven by the Sub-Antarctic Water movement, coming from the south, and the Bass Strait Water movement from the west.</p>
	Bathymetry - Bass Strait (Volume 1 Section 2.1.2.4)	Y	Y	<p>A steep nearshore profile (0-20m water depth) extends to a less steep inner (20-60m water depth) and moderate profile (60-120m water depth), concluding with a flat outer shelf plain (greater than 120m water depth) in the western part (central Bass Strait) and a steep slope into the Bass Canyon in the east.</p>
	Benthic Habitat OA (Volume 1 Section 2.3.3.1)	Y	Y	<p>The Gippsland Basin is composed of a series of massive sediment flats, interspersed with small patches of reef, bedrock and consolidated sediment. The sandy plains are only occasionally broken by low ribbons of reef; however, these reefs do not support the large brown seaweeds characteristic of many Victorian reefs, but instead are inhabited by resilient red seaweeds and encrusting animals that can survive the sandy environment.</p>

Value/sensitivity	Receptor type	OAs	PEA	Description
				<p>Benthic fauna present on the soft sediment can be broadly divided into two groupings:</p> <ul style="list-style-type: none"> <li>epibenthos which includes sessile species such as sponges and bryozoans, hydroids, ascidians, poriferans and mobile fauna including hermit crabs, sea stars and octopus</li> <li>infauna which includes a diverse range of species such as amphipods, shrimps, bivalves, tubeworms, small crustaceans, nematodes, nemerteans, seapens, polychaetes and molluscs.</li> </ul>
Economic Environment (Volume 1 Section 2.4)	Commercial Fishing (Volume 1 Section 2.4.1)	Y - Y Y - Y  - - - - Y Y - -	Y Y Y Y Y  Y Y Y Y  Y Y Y Y	<p>Commonwealth Fisheries:</p> <ul style="list-style-type: none"> <li>Bass Strait Central Zone Scallop - 0.001% overlap with the OAs and 48% overlap with the PEA (See Figure 4-13)</li> <li>Eastern Tuna and Billfish Fishery – 0% overlap with the OAs and 24% overlap with the PEA (See Figure 4-14)</li> <li>Small Pelagic Fishery – 0.0001% overlap with the OAs and 26% overlap with the PEA (See Figure 4-15)</li> <li>Southern and Eastern Scalefish and Shark Fishery -0.0001% overlap with the OAs and 27% overlap with the PEA (See Figure 4-16)</li> <li>Southern Bluefin Tuna Fishery - 0% overlap with the OAs and 12% overlap with the PEA (See Figure 4-17)</li> <li>Southern Squid Jig Fishery - 0.0001% overlap with the OAs and 32% overlap with the PEA (See Figure 4-18)</li> </ul> <p>State Fisheries – Victoria:</p> <ul style="list-style-type: none"> <li>Abalone Fishery – 0.0015% overlap with the OAs and 46% overlap with the PEA (See Figure 4-19)</li> <li>Eel Fishery – data unavailable for this fishery</li> <li>Giant Crab Fishery - 0.0015% overlap with the OAs and 46% overlap with the PEA (See Figure 4-20)</li> <li>Pipi Fishery - 0.0021% overlap with the OAs and 55% overlap with the PEA (See Figure 4-21)</li> </ul>

Value/sensitivity	Receptor type	OAs	PEA	Description
				<ul style="list-style-type: none"> <li>• Ocean Hauling Fishery</li> <li>• Ocean Trap and Line Fishery</li> <li>• Ocean Trawl Fishery</li> <li>• Sea Urchin and Turban Shell Restricted Fishery.</li> </ul>
	Oil and Gas (Volume 1 Section 2.4.2)	-	Y	<p>Other than the Esso permit areas in the Gippsland Basin there are 11 other permit areas held by other operators:</p> <ul style="list-style-type: none"> <li>• Cooper Energy (VIC/L21, VIC/L32, VIC/RL13, VIC/L14, VIC/L15, VIC/P72)</li> <li>• SGH Energy (VIC/L29)</li> <li>• Carnarvon Hibiscus (VIC/L31, VIC/P57)</li> <li>• Emperor Energy/Shell Energy (VIC/P47)</li> <li>• Lanberis Energy (VIC/P71).</li> </ul>
	Shipping (Volume 1 Section 2.4.3)  (See Figure 4-30)	-	Y	The southeast and east coast of Australia have high shipping activity. This traffic includes international and coastal cargo trade, and passenger and ferry services. An ATBA exists around the operating oil and gas platforms in the Gippsland Basin, whereby unauthorised vessels larger than 200 gross tonnes are excluded from entry.
	Defence (Volume 1 Section 2.4.4)	-	Y	Australian defence force base operates at Twofold Bay, Eden New South Wales. Primary training location is the East Australia Exercise Area off the south coast of New South Wales.
	Tourism (Volume 1 Section 2.4.5)	-	Y	In East Gippsland, primary tourist locations are the Gippsland Lakes (the largest inland waterway in Australia), Lakes Entrance, Marlo, Cape Conran and Mallacoota. The area is renowned for its nature-based tourism (e.g. Croajingolong National Park), recreational fishing and water sports (lake and beaches). The South Coast Region includes all the towns from Wollongong south to the Victorian border.

Value/sensitivity	Receptor type	OAs	PEA	Description
Cultural (Volume 1 Section 2.5)	Native Title (Volume 1 Section 2.5) (See Figure 4-31)	-	Y	Gunai-Kurnai Native Title Determination Area – this area includes most coastal regions between Marlo Victoria, through to Corner Inlet.
Social Environment (Volume 1 Section 2.6)	Recreational fishing, boating and leisure (Volume 1 Section 2.6)	-	Y	Popular coastal destinations for recreational activities occur throughout the PEA including well known places like Gippsland Lakes, Mallacoota and Merimbula in New South Wales. Over 90% of recreational fishing typically occurs in nearshore coastal waters (shore or inshore vessels), and within bays and estuaries.

## 5 Environmental impact assessment

Environmental impacts are a fundamental part of undertaking specific activities due to the unavoidable nature of the operations.

A discussion of the environmental impacts associated with the activity to be carried out under this EP, the predicted consequences and the control measures that will be implemented to reduce impacts to ALARP, are presented in this section. Alternative controls identified and considered to ensure impacts are ALARP and comply with the acceptability criteria are also covered. Environmental Performance Outcomes (EPOs), Environmental Performance Standards (EPSs), controls and measurement criteria are provided for each aspect of the planned activities.

### 5.1 Physical presence – Seabed disturbance

#### 5.1.1 Sources of seabed disturbance

Positioning the LWIV on location will be undertaken in accordance with an approved LWIV move procedure. When not on DP and not being towed for extended deep sea passage/transit, the vessel is self-propelled when moving onto location.

The Q7000 is equipped with one anchor and anchor line for normal marine anchoring purposes in shallow water (540 metres anchor line, suitable for a depth of up to 100 metres depth). The anchors are used for normal marine anchoring purposes only. They will not be used for maintaining position during operations; all vessel station-keeping will be by DP (refer to Section 3.10.13 of *Q7000 Safety Case (Australia)* (Helix, 2021)). As the OAs are too deep for normal anchoring, seabed disturbance from anchoring as part of this scope is unlikely.

The last step of the P&A sequence is to remove the wellheads. Retrieval of subsea infrastructure will result in an area of approximately 50 square metres of benthic disturbance per well. Therefore, the total disturbed area is expected to be relatively small. The discharge of metal shavings and cement cuttings from wellhead cutting are addressed in Section 5.9.

#### 5.1.2 Impacts of seabed disturbance

Impacts of seabed disturbance on receptors, including benthic habitats and assemblages and demersal fish, considered are:

- change in habitat (and smothering)
- change in water quality (increased turbidity in the water column near the seabed).

#### 5.1.3 Impact assessment

Receptors affected by seabed disturbance and that have been identified in Volume 1 as occurring in the area are identified in Table 5-1.

**Table 5-1 Impact scoping**

Impacts	Receptors	
	Benthic habitat – Bare substrate	Fish
Change in habitat	✓	

Smothering	✓	
Change in water quality		✓

### 5.1.3.1 Change in habitat and smothering

The benthic habitat within the OAs is characterised by a homogenous soft sediment and shelly seabed, infauna communities and sparse epibiotic communities. There are no known sensitive seabed features (such as reefs, sponge gardens, seagrass meadows or scallop beds), so positioning will not result in a loss of sensitive or geographically restricted habitats.

Any impact will be limited to the immediate vicinity of the well locations and thus the extent of potential impact is considered to be localised. The disturbance may result in the mortality of flora and sessile fauna within this footprint and potentially the mortality of benthic infauna associated with the habitat. However, the area that will be disturbed compared with the overall extent of this habitat in the region is small and consequently, there will be no long-term impact on the diversity and abundance of benthic fauna.

Minor disturbance to the immediate wellhead area will occur through abandonment activities including conductor and surface casing removal below the seabed. However, these areas will remain a viable habitat that would be expected to recolonise with benthic species within weeks to months following removal of the disturbance (Currie & Isaacs, 2005). Therefore, the potential impact has been determined as

**CONSEQUENCE LEVEL IV**

### 5.1.3.2 Change in water quality

Turbidity may occur when seabed sediments are stirred up during wellhead cutting however this disturbance will settle quickly after cutting is completed (hours, not days).

Any turbidity created is likely to be within the limits of natural variability when considering the turbidity created by currents in the open-water environment of the OAs and is not addressed further.

### 5.1.4 Controls

**Table 5-2 Environmental performance**

EPO	Control	EPS	Measurement criteria
Avoid physical damage to sensitive habitats (i.e. benthic features such as reefs).	<b>CMP1:</b> Site-specific geotechnical assessment	Results of the site-specific geotechnical assessment are used to inform the well locations and confirm the proposed location is free from seabed obstacles, including benthic features.	As the LWIV is on DP, no geotechnical assessment is required.
	<b>CMP20:</b> LWIV move procedure	The approved LWIV move procedure details how the LWIV will be moved onto and moved off location. It includes approach	Approved procedure is available on site and utilised.

EPO	Control	EPS	Measurement criteria

### 5.1.6 Demonstration of acceptability

**Table 5-6 Demonstration of acceptability test**

Factor	Demonstration criteria	Criteria met	Rationale
<b>Principles of ESD</b>	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to

Factor	Demonstration criteria	Criteria met	Rationale
			affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in a Consequence Level IV thus are not considered as having the potential to result in serious or irreversible environmental damage.
<b>Legislative and other requirements</b>	Legislative and other requirements have been identified and met.	✓	<p>The proposed activities align with the requirements of the OPGGS Act:</p> <ul style="list-style-type: none"> <li>• Section 280(2) – no interference with the conservation of the resources of the sea and seabed to a greater extent than is necessary for the exercise of the rights conferred by titles granted.</li> <li>• Schedule 3 (occupational health and safety) of the OPGGS Act and <i>OPGGS (Safety) Regulations 2009</i> (OPGGS (Safety) Regulations). The OPGGS (Safety) Regulations require the operator of each offshore facility to prepare a Safety Case for submission to NOPSEMA. Activities at a facility, including positioning and jacking operations, must be conducted in accordance with a Safety Case that has been accepted by NOPSEMA.</li> <li>• Regulation 11 – relevant persons consultation.</li> </ul>
<b>Internal context</b>	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	Although there is no specific standard related to offshore (i.e. seabed) land use, the controls proposed meet the requirements of the Upstream Standard on Land Use specifically to "avoid use of land within environmentally or

Factor	Demonstration criteria	Criteria met	Rationale
			socioeconomically sensitive areas” and “site selection process considers impacts on the ecological and social environment”.
	Meets ExxonMobil Operations Integrity Management System (OIMS) Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to qualify, evaluate and select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.</li> </ul>
<b>External context</b>	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No specific relevant person concerns have been raised concerning sound emissions.

## 5.2 Physical interaction – Other marine users

### 5.2.1 Sources of interaction with other marine users

The movement of vessels within the OA, and the physical presence of the LWIV and support vessels has the potential to result in interactions with other marine users such as commercial fishing and shipping. The Gudgeon-1 and Terakihi-1 wells lie just outside the Bass Strait ATBA Section 2.1), and in the pathway of the TSS. The presence of the LWIV and associated supply vessels within the shipping route has the potential to disrupt marine traffic due to the proximity to the TSS. The TSS operates to control coastal shipping whereby all ships operational in or near the scheme must comply with Rule 10 of the *International Regulations for Preventing Collisions at Sea 1972*.

Approved PSZs will be in place around the well locations during field operations (PSZs to be established at least one month before start of field activities). Note that interactions with recreational activities have not been considered, due to the distance of the OA from shore, the presence of the PSZs, and the water depth.

In order to manage shipping interactions, Esso has consulted with AMSA and the AHO in order to minimise the risk of collisions during the campaign (refer to Section 5.2.1.1).

At the completion of P&A activities it is planned to remove the wellheads and the temporary guidebase. In the unlikely event that the wellhead is not able to be retrieved, it will be left in-situ and removal of equipment above the seabed will be considered in future decommissioning plans (refer to Section 2.5.4). Note that this section deals with displacement or interference in a socioeconomic sense; collision risk (and potential diesel spill impacts) is addressed in Section 6.6.

### 5.2.1.1 Gippsland Basin temporary fairways

Esso has consulted with AMSA and AHO in order to find a way to manage shipping interactions and minimise the risk of collisions during P&A of the Gudgeon-1 and Terakihi-1 wells. In dialogue with AMSA and AHO, it was agreed that AMSA and AHO will establish temporary fairways around these locations, with a 2 nautical miles radius buffer around each location (Figure 5-1), in order to deviate commercial shipping away from these locations. Details will be published as Notices to Mariners issued by the AHO, as well as the UK Hydrographic Office through its global [Notices to Mariners](#) service (UK Hydrographic Office, 2022).

To ensure that shipping is accustomed to these deviations well before the start of field activities, it is important that the temporary fairways are established well in advance of field activities.

The temporary fairways were established on 1 August 2022 and will be cancelled on completion of the P&A program, so that shipping can resume the normal TSS shipping routes.

Ongoing monitoring of passing vessel traffic behaviour through the TSS and temporary fairways is done through periodic consultation with AMSA.

### 5.2.2 Impacts of interaction with other marine users

Impacts of interaction with other marine users considered are:

- changes to the function, interests or activities of other users through disruption to commercial activities.

Disruption to commercial activities includes:

- diversion from navigation path (displacement of third-party vessels)
- loss of access to PSZ (exclusion from fishing grounds and subsequent loss of catch)
- obstacle to trawling (presence of infrastructure).

### 5.2.3 Impact assessment

Other marine users that have been identified in Volume 1 as occurring in the area are identified in Table 5-7.

**Table 5-7 Impact scoping**

Impacts	Receptors		
	Fisheries – Commercial (Commonwealth)	Fisheries – Commercial (State)	Industry – Shipping
Change to the function, interests or activities of other users	✓	✓	✓

5.2.3.1 *Change to the function, interests or activities of other users – Shipping*

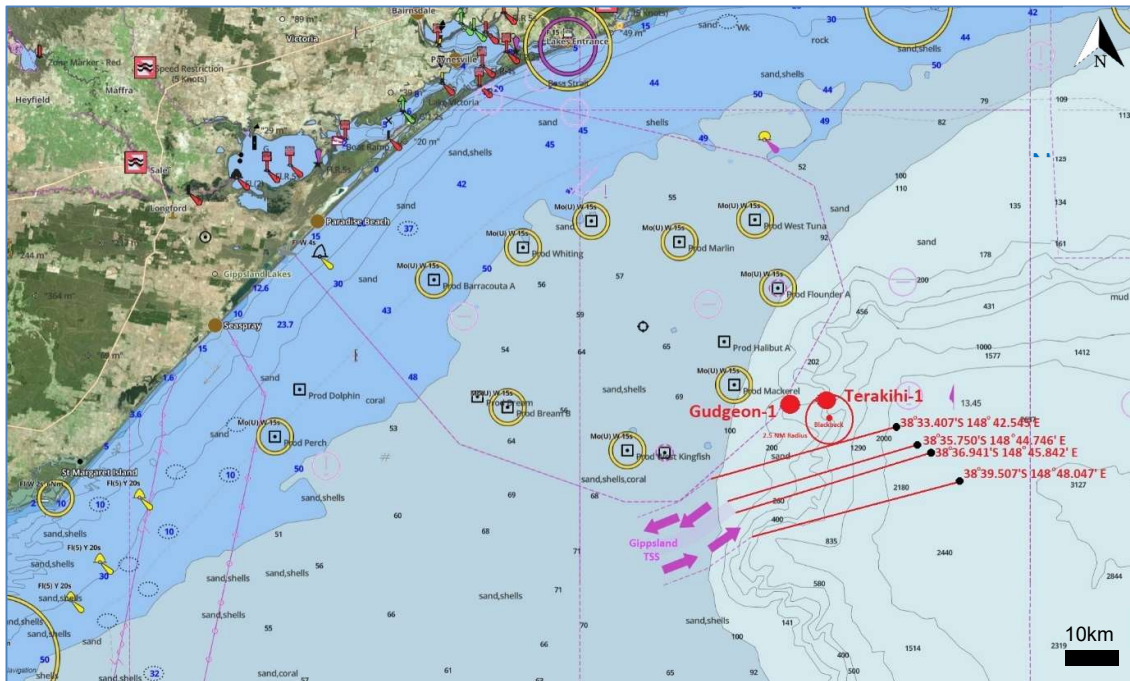

Displacement of third-party vessels by the LWIV is unlikely to occur because the LWIV is stationary and highly visible (due to its height above the water line and lighting), meaning vessels have sufficient time to detect the LWIV (visually and by radar) and instigate an early detour around the PSZ.

Field activities at Gudgeon-1 and Terakihi-1 have the potential to interfere with marine traffic passing through the TSS. In order to minimise collision risk, temporary fairways will be in place during field activities, to divert marine traffic away from P&A activities at Gudgeon-1 and Terakihi-1.

This diversion of shipping around the OA would result in a negligible increase in travel time and fuel cost at most, but in the context of an entire journey, this is not considered significant.

A Notice to Mariners was issued by the AHO on 29 April 2022 (369(P)/2022). The temporary fairways and separation zone came into effect on 1 August 2022 and will remain in place until further notice.

Planned controls include a ‘virtual buoy’ aid to navigation (automatic identification system base station) transmitting a signal to ‘mark’ the change on the Electronic Chart Display and Information Systems of passing vessels, as well as AMSA assistance to promulgate navigation warnings from the northern and southern approaches to ships, if deemed appropriate.

Based on <https://www.gpsnauticalcharts.com/>

**Figure 5-1 Proposed temporary fairways to the east of the Bass Strait Traffic Separation Scheme**

5.2.3.2 *Change to the function, interests or activities of other users – Fisheries*

Implementation of the relevant persons identification process has resulted in identifying the following fisheries which may have an active presence in the relevant OAs: the Victorian

Wrasse (Ocean) Fishery, the Commonwealth Trawl Sector, Shark Gillnet Sector and Southern Squid Jig fisheries. Fishing intensity plots for the other Commonwealth fisheries indicate low or no active presence in the area. Fishing intensity for State fisheries could not be obtained.

Based on annual fishing records and the size of the fishing grounds, the proposed activities and use of PSZs are not expected to result in a significant impact to commercial fishing operations (via loss of catches, loss of fishing grounds or damage to fishing equipment).

As part of the P&A activity it is planned to remove wellheads and temporary guidebases, which will reduce the risk of entanglement of fishing gear. Failure to retrieve one or more wellheads (or associated wellhead equipment) from the seabed will have minor impacts due to the small footprint against the large area available for fishing in the region, and protruding height above seabed. Failure to remove equipment situated below the mudline will not have any ongoing adverse impact on other marine users.

Since the wellhead is planned to be removed and casing cut below the seabed, the risk of snagging of fishing gear is significantly reduced. Although snagging on equipment may still occur on rare occasions, this is not considered to be a significantly greater snagging risk than the broader existing environment (e.g. rock snags, shipwrecks in other areas). There have been no reports of fishing gear snags since the wellheads were put in place several decades ago. Pipelines, gaslift lines and umbilicals are absent from these P&A locations and have therefore never posed a snagging risk. On completion of P&A activities the risk is assessed to be equal or less than the current state which is assessed to be very low.

Based on the above assessment, any impacts would be  
**CONSEQUENCE LEVEL IV**  
with little to no potential adverse effect on other marine users

5.2.4 Controls

**Table 5-8 Environmental performance**

EPO	Control	EPS	Measurement criteria
Marine users are informed prior to commencement of the P&A campaign such that they are able to plan their activities and avoid unexpected interference.	<b>CMP2:</b> Petroleum Safety Zone	PSZs established in accordance with OPGGS Act.	Government Gazette contains notice of establishment of PSZs.
		Establishment of adequate navigation aids and communication systems on LWIV and supporting facilities (virtual buoy).  Collaboration with AMSA in promulgating adequate warnings and Notices to Mariners.	Records confirm that navigation aids and communication systems were established prior to field activities.
		Implementation of vessel communication procedures for management of vessels.	Records confirm that vessel communication procedures were established prior to field activities.

	<b>CMP36:</b> Establishment of temporary fairways	Establishment of temporary fairways and Notice to Mariners buffer zone through AMSA and AHO.	Notice to Mariners records confirm that temporary fairways and buffer zone were established prior to the start of field activities.
	<b>CM36:</b> Pre-start notifications	AMSA Joint Rescue Coordination Centre (JRCC) notified before operations commence to enable AMSA to distribute an AUSCOAST warning.	Records confirm that information to distribute an AUSCOAST warning was provided to the JRCC before operations commenced. Issued AUSCOAST warning dated prior to, or on the date operations commenced.
		AHO notified before operations commence to allow generation of navigation warnings (including Notice to Mariners).	Issued Notice to Mariners dated prior to, or on the date operations commenced.
		Relevant persons are notified of activities approximately four weeks and again one week prior to commencement.	Relevant persons consultation records confirm that information was distributed to relevant persons in required timeframes.

5.2.5 Demonstration of As Low as Reasonably Practicable

**Table 5-9 ALARP Decision Context and justification**

<b>ALARP Decision Context A</b>	<p>Offshore petroleum operations are widely undertaken both locally, nationally and internationally.</p> <p>The impacts associated with marine user interactions are well managed via legislative control measures. These controls are understood and well implemented by the industry.</p> <p>The use of temporary fairways have previously been implemented near the TSS and have proven to be effective in managing vessel interactions.</p> <p>No concerns were raised during relevant persons consultation and the socioeconomic consequence was identified as Consequence Level IV (the lowest level).</p> <p>Esso believes ALARP Decision Context A should apply.</p>

	Meets ExxonMobil Environmental Standards.	✓	The proposed controls meet the requirements of the <i>ExxonMobil Upstream Socioeconomic Management Standard</i> (ExxonMobil, 2021) specifically in relation to managing community relations.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>• OIMS System 10-1 objective to maintain public awareness and confidence in the Operations Integrity of operations and facilities.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning interference with commercial activities. Esso consulted with AMSA regarding legislative control measures.

### 5.3 Planned discharge – Sewage and food waste

#### 5.3.1 Sources of sewage and food waste discharges

Vessels and facilities used in the oil and gas industry vary in size but often include accommodation facilities for crew and passengers. The crew and passengers will generate wastes, including food wastes (or putrescibles), and the use of ablution, laundry and galley facilities will result in the generation of sewage and grey water which are routinely discharged to the marine environment.

The average volume of putrescible waste from each vessel depends on the number of persons on board and is estimated at 1 to 2 kilograms per person per day (NERA, 2017). Total volumes of sewage and grey water (from the use of ablution, laundry and galley facilities) typically generated at offshore facilities ranges between 0.04 and 0.45 cubic metres per person per day (NERA, 2017). Assuming 120 people working on the LWIV each day and 15 people on each of the two support vessels (a total of 150 people), this equates to up to 67.5 cubic metres of sewage and grey water discharged daily. The Q7000 has a maximum persons on board of 130.

#### 5.3.2 Impacts of sewage and food waste discharges

Impacts of the discharge of sewage or food waste considered are:

- Change in water quality (temporary and localised increase in nutrients and biological oxygen demand)
- Change in fauna behaviour (changing predator/prey dynamics from increased scavenging behaviours).

#### 5.3.3 Impact assessment

Receptors affected by discharge of sewage and food waste and that have been identified in Volume 1 as occurring in the area are identified in Table 5-13.

**Table 5-13 Impact scoping**

Impacts	Receptors				
	Plankton	Fish	Marine reptiles – Turtles	Birds	Marine mammals
Change in water quality	✓	✓	✓	✓	✓
Change in fauna behaviour		✓	✓	✓	✓

##### 5.3.3.1 Change in water quality

The pygmy blue whale (*Balaenoptera musculus brevicauda*) (PBW) and a number of protected seabirds such as shearwaters, albatrosses and petrels have foraging habitat overlapping the OAs.

Sewage will be treated through sewage treatment plants to the MARPOL standard, so there are no potential impacts relating to the release of particulate matter, chemicals and pathogens in untreated sewage.

Nutrients in sewage, such as phosphorus and nitrogen, may contribute to eutrophication of receiving waters (although usually only calm, inland waters) causing algal blooms, which can degrade aquatic habitats by depleting oxygen levels, reducing light levels and producing certain toxins, some of which are harmful to marine life and humans. Given the tidal movements and currents in deep open waters, eutrophication of receiving waters will not occur.

Discharges will disperse and dilute rapidly, with concentrations of wastes significantly dropping with distance from the discharge point. The effects of sewage and sullage discharges on the water quality at Scott Reef were monitored for a drill rig operating near the edge of the deep-water lagoon area at South Reef. Monitoring at stations 50 metres, 100 metres and 20 metres downstream of the rig and at five different water depths confirmed that the discharges were rapidly diluted in the upper 10 metres water layer and no elevations in water quality monitoring parameters (e.g. total nitrogen, total phosphorous and selected metals) were recorded above background levels at any station (Woodside Energy, 2011).

The receptors with the greatest potential to be impacted are those in the immediate vicinity of the discharge. Given that sewage discharges from vessels and facilities are at or near the surface, and are buoyant discharges, the receptors with the potential to be impacted are also those within or on surface waters; for example, plankton, fish and other marine fauna.

Plankton forms the basis of all marine ecosystems, and plankton communities have a naturally patchy distribution in both space and time (ITOPF, 2011). They are known to have naturally high mortality rates (primarily through predation), however in favourable conditions (e.g. supply of nutrients), plankton populations can rapidly increase. Once the favourable conditions cease, plankton populations will collapse and/or return to previous conditions. Plankton populations have evolved to respond to these environmental perturbations by copious production within short generation times (ITOPF, 2011). However, any potential change in phytoplankton or zooplankton abundance and composition is expected to be localised, typically returning to background conditions within tens to a few hundred metres of the discharge location (Abdellatif, Ali, Khalil, & Nyonje, 1993) (Axelrad, et al., 1981) (Parnell, 2003).

Effects on environmental receptors along the food chain, namely, fish, reptiles, birds and cetaceans are therefore not expected beyond the immediate vicinity of the discharge in deep open waters.

#### *5.3.3.1 Change in fauna behaviour*

The overboard discharge of macerated food wastes has the result of creating a localised and temporary food source for scavenging marine fauna or seabirds, whose numbers may temporarily increase as a result. This in turn can provide an increase in food source for predatory species. The rapid consumption of this food waste by scavenging fauna, and physical and microbial breakdown, ensures that the impacts of putrescible waste discharges are insignificant and temporary.

Consequently, the potential impacts from the discharge of sewage and food waste are considered to be

**CONSEQUENCE LEVEL IV**

as these activities may result in localised, short-term impacts to a species of conservation value (seabirds; PBWs) through impacting their foraging habitat

5.3.4 Controls

**Table 5-14 Environmental performance**

EPO	Control	EPS	Measurement criteria
Sewage discharges comply with the International Convention for the Prevention of Pollution from Ships (MARPOL) Annex IV requirements.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex IV as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.
Food waste discharges comply with MARPOL Annex V requirements.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex V as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.

5.3.5 Demonstration of As Low as Reasonably Practicable

**Table 5-15 ALARP Decision Context and justification**

<b>ALARP Decision Context A</b>	<p>Discharge of sewage, greywater and food waste offshore (from vessels and other facilities) is a commonly practised activity.</p> <p>The potential impacts are well regulated via various treaties and legislation, both nationally and internationally, which specify industry best practice control measures. These are well understood and implemented by the industry. Monitoring programs have been undertaken previously and a Consequence Level IV (the lowest level) identified.</p> <p>No objections or claims were raised by relevant persons with regard to the discharge of sewage and food waste.</p> <p>Esso believes ALARP Decision Context A should apply.</p>

			select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.
<b>External context</b>	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning sewage and food waste discharges.

## 5.4 Sound emissions

### 5.4.1 Sources of sound emissions

Impulsive (pulsed) sound emissions will be generated from subsea positioning equipment (i.e. Ultra-Short Base Line (USBL transponders). Continuous sound emissions will be generated from:

- LWIV operations (LWIV DP thrusters, machinery and mechanical operation of the drill string)
- support vessel operations (DP thrusters and machinery)
- cutting to remove wellheads and protruding casing above mudline
- ROV operations
- helicopter operations.

Continuous sound will be generated by the LWIV and support vessel operations for the duration of the activity (approximately 30 days per well, inclusive of LWIV positioning activities, dependent on weather, scheduling and well conditions). The cutting tool will also generate continuous sound during cutting activities. This will be used intermittently and for a short duration (hours, not days).

The largest cumulative sound emissions will be generated when the LWIV is operating under DP with a support vessel alongside (under DP), along with simultaneous ROV cutting operations.

#### 5.4.1.1 Subsea Positioning Equipment

Subsea positioning equipment consists of a number of transducers and receivers positioned on the subsea infrastructure and LWIV hull near the sea surface. Positioning equipment will be retrieved as soon as possible from the seabed.

Subsea positioning systems typically emit short pulses of medium to high frequency sound, normally within the range of 15 to 40 kHz. The estimated Sound Pressure Level (SPL) would be 180 to 206 dB re 1  $\mu$ Pa at 1 m (Jiménez-Arranz et al., 2020). Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders will not emit any sound when on standby (Jiménez-Arranz et al, 2020).

Austin et al. (2012) calculated the distances to SPL isopleths for a comparable USBL system in open water and found the distance to 160 dB re 1  $\mu$ Pa (SPL)<sup>1</sup> to be 36 m. As subsea positioning equipment does not generate significant underwater noise, it is not considered in this impact assessment.

#### 5.4.1.2 LWIV

The Helix Q7000 is a DP Class 3 semi-submersible well intervention vessel. While in operation, it will hold position by using thrusters under DP. As such, the underwater noise emitted from the Helix Q7000 is expected to originate primarily from cavitation in the thrusters whilst under DP.

The source level spectrum for the Helix Q7000 is based on recently published median noise measurements from three similarly sized but higher powered vessels (two semi-submersibles and a drillship) measured by JASCO whilst under DP, over multi-week periods and including periods of rough weather in which the vessels had to use high power levels to maintain station (Austin, Martin, & and McPherson, 2023) These measured vessels are considered as suitable proxies for the Helix Q7000 as they generally have more installed propulsion power (and greater noise potential) than the Helix Q7000.

Thruster noise from the Helix Q7000 was modelled as a point source at a 15.3 m depth. The estimated broadband energy source level (ESL) (10 Hz to 25 kHz) is 185.0 dB re 1  $\mu$ Pa<sup>2</sup>m<sup>2</sup>s (Muellenmeister et al., 2023).

#### 5.4.1.3 Support Vessels

The LWIV will be serviced by support vessels of medium size (approximately 85 metres) including the existing Esso fleet *Skandi Feistein*, *Skandi Darwin* and potentially one other support vessel of similar design or function. The LWIV does not require the support from an anchor handling tow vessel as it is self-propelled.

There will be several support vessel trips per week between the supply base and the LWIV. A support vessel may at times be 'on standby' outside the 500-metre PSZ. When on standby, a support vessel will reduce to the minimum number of thrusters and power required for safe navigation. A support vessel will only come alongside the LWIV (using DP) during loading/offloading which typically takes less than six hours. Only one support vessel will be alongside the LWIV at any one time.

Underwater sound that radiates from vessels is produced mainly by propeller and thruster cavitation. The typical sound levels generated by vessels are broadband and typically increase with increasing vessel size. Sound levels tend to be the highest when thrusters are used to position the vessel (DP) and when the vessel is transiting at high speeds.

Vessels will operate under the *International Guidelines for The Safe Operation of Dynamically Positioned Offshore Supply Vessels* (IMCA, 2022) which means that normally, vessels operate at levels less than 50% capacity. These guidelines are used to develop the Activity Specific

---

<sup>1</sup> 160 dB re 1  $\mu$ Pa (SPL) is the behavioural threshold for marine mammals for impulsive sounds.

Operating Guidelines (ASOG) for each vessel and include safe operating limits (based on relevant factors and primarily include power consumption and thruster output levels).

The monopole source levels (MSLs) and the spectra for the *Skandi Feistein* were previously measured during a monitoring program conducted by JASCO for Esso (McPherson et al. 2022). As the *Skandi Darwin* has greater installed power than the *Feistein* (*Feistein* has 6,160 kW; *Darwin* has 7130 kW), the *Darwin* was used in the modelling as a conservative approach. The acoustic source level and spectrum were scaled up to give an estimated broadband ESL for the vessels of 173.8 dB re 1  $\mu\text{Pa}^2\text{m}^2\text{s}$  (Muellenmeister et al., 2023).

#### 5.4.1.4 ROV cutter tool

The surface casings will be cut at or below the seabed to enable wellhead recovery, which is generally done using mechanical cutters (hardened metal knives) within the casing. A diamond wire saw operated via a ROV is the contingency plan.

Underwater sound measurement data during an underwater diamond wire cutting of a 32-inch conductor (10 metres above seabed in approximately 80 metres depth) found that the sound radiated was not easily discernible above the background noise at the closest recorder located 100 m from the source and was primarily detectable at higher acoustic frequencies (above around 5 kHz) which is above the hearing range of low frequency cetaceans (LFC) (Pangerc, Robinson, Theobald, & Galley, 2016). In another study, the United States Navy measured underwater sound levels when a diamond wire saw was cutting caissons for replacing piles. They reported an average SPL for a single diamond wire cutter at 136.1 to 141.4 decibels SPL at 10 metres (Fairweather Science LLC, 2019). This measurement was back-propagated using spherical spreading ( $20\log_{10}(R)$ ) to estimate the broadband ESL for the cutter of 161.3 dB re 1  $\mu\text{Pa}^2\text{m}^2\text{s}$  (Muellenmeister et al., 2023).

#### 5.4.1.5 Helicopters

Helicopters will be used to transport personnel and freight to the LWIV. Helicopter operations produce strong underwater sounds for brief periods when the helicopter is directly overhead (Richardson, Greene, Malme, & Thomson, 1995). The received sound level underwater depends on the helicopter altitude and lateral distance, the receiver depth and water depth.

Sound emitted from helicopter operations is typically below 500 Hz and sound pressure is greatest at surface in the water directly below a helicopter, but this diminishes quickly with depth. Reports show figures for a Bell 214 helicopter (stated to be one of the noisiest) being audible in the air for four minutes before it passed over underwater hydrophones, and detectable underwater for 38 seconds at three metres depth and 11 seconds at 18 metres depth (Richardson, Greene, Malme, & Thomson, 1995). Noise from helicopter activities is therefore localised and infrequent.

Given this short duration of underwater detection and the limited number of flights each week, helicopter noise is not considered to be significant in contributing to potential impacts to marine fauna and is not considered to contribute to cumulative impacts of noise sources.

### 5.4.2 Impacts of sound emissions

The impacts and risks resulting from underwater sound are generally well understood with regard to potential mortality and/or physiological injury for species in the water column, however, uncertainty lies in understanding the spatial and temporal extents of behavioural disturbances and the potential effects on populations and requires the application of context-specific information. The potential environmental impacts to marine fauna from high levels of underwater sound are:

- Physical injury to auditory tissues or other air-filled organs;
- Hearing impairment:
  - Temporary threshold shift (TTS) – the temporary loss of hearing sensitivity caused by excessive noise exposure, or
  - Permanent threshold shift (PTS) – a permanent loss of hearing sensitivity caused by excessive noise exposure, considered an auditory injury.
- Direct behavioural effects through disturbance or displacement, and consequent disruption of natural behaviours or processes (e.g., foraging, migration, resting, calving or spawning); and
- Indirect behavioural effects by impairing/masking the ability to navigate, find food or communicate, or by affecting the distribution or abundance of prey species.

Specifically, underwater sound from the activity has the potential to adversely affect the following environmental values and sensitivities within and in the vicinity of the activity area, to varying degrees:

- Plankton (including commercially important fish larvae/eggs);
- Marine invertebrate assemblages;
- Fish:
  - Mobile pelagic and demersal species that are likely to move away as sound levels increase.
  - Site-attached/dependent fish species associated with reef habitats. These species are less likely to move away and are expected to seek shelter within reef areas where present.
- Cetaceans:
  - Foraging, migrating and transient whales known to occur in the region (e.g., pygmy blue whales and southern right whales);
  - Dolphin species (e.g., bottlenose dolphin, common dolphin).
- Pinnipeds - foraging habitat;
- Foraging habitat for seabirds; and
- Target species for commercially important fisheries.

#### 5.4.3 The Environment that May Be Affected (EMBA) by Underwater Sound

The underwater sound EMBA is the area where noise levels are predicted to be above the noise behaviour criteria. Sound modelling undertaken to determine the EMBA is described below. In summary, the largest distances to predicted impacts from the LWIV are:

- Behavioural effect: 9.53 km (Scenario 5 – Table 5-23)
- TTS: 1.26 km (for low frequency cetaceans [LFCs]) (Scenario 5 – Table 5-24)
- PTS: 60 m (for LFCs) (Scenario 5 – Table 5-24).

Specific impact thresholds for each species and/or hearing group are described in the section below.

The EPBC Protected Matters Report (Appendix A) for the underwater sound EMBA is based on the 9.53 km behavioural effect distance.

#### 5.4.4 Underwater Sound modelling

JASCO Applied Sciences (JASCO) performed a modelling study of underwater sound levels associated with this activity (Muellenmeister et al., 2023) (Appendix B). This study evaluated the combined scenario of the Helix Q7000 LWIV, a support vessel with ROV and a cutting tool, which is used as the basis of the impact assessment for sound emissions in this EP. The modelling locations were Gudgeon-1 at 294 m water depth and Terakihi-1 at 393 m water depth.

The energy source levels (ESL) for the sound sources are summarised in Table 5-19.

**Table 5-19 Energy source levels used in the modelling study**

Source	Energy source level
LWIV	185.0 dB re 1 $\mu\text{Pa}^2\text{m}^2\cdot\text{s}$
Support Vessels	173.8 dB re 1 $\mu\text{Pa}^2\text{m}^2\cdot\text{s}$
ROV cutter tool	161.3 dB re 1 $\mu\text{Pa}^2\text{m}^2\cdot\text{s}$

There were five scenarios modelled at each of the Gudgeon and Terakihi locations (10 scenarios in total):

- Scenario 1: LWIV under DP
- Scenario 2: Support vessel under DP (that may use ROV)
- Scenario 3: LWIV under DP + support vessel under DP
- Scenario 4: Support vessel under DP + ROV cutting tool
- Scenario 5: LWIV under DP + Support vessel under DP + ROV cutting tool.

##### 5.4.4.1 Underwater sound effect criteria (thresholds)

Estimated underwater sound levels were presented as 'sound pressure levels' (SPL ( $L_p$ ; dB re 1  $\mu\text{Pa}$ ) and 'accumulated sound exposure levels' ( $L_{E,XXh}$ ; dB re 1  $\mu\text{Pa}^2\cdot\text{s}$ ) as appropriate for non-impulsive (continuous) noise sources.

For marine mammals, this study considered SEL over accumulation periods of eight hours or 24 hours ( $SEL_{8h}$  or  $SEL_{24h}$ ) to provide results for different periods of operations. During different periods of the activity, the different vessels will likely operate in different combinations, and not always be present. Eight hours was selected as a nominal secondary timeframe to help understand how a shorter exposure period translates into potential impact distances as compared to the nominal 24-hour time period.

Table 5-20 presents the effects criteria for marine mammals. Table 5-21 presents the effects criteria for fish and turtles, adapted from Popper et al. (2014) and Table 5-22 presents the revised thresholds for non-impulsive PTS and TTS for turtles, considering frequency weighted SEL, from Finneran et al. (2017).

**Table 5-20 Criteria for effects of continuous noise exposure, including vessel noise, for marine mammals: Unweighted SPL and SEL<sub>24h</sub> thresholds**

Hearing group	(NOAA, 2019)	(NMFS, 2018)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL ( $L_p$ ; dB re 1 $\mu$ Pa)	Weighted SEL <sub>24h</sub> Threshold ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> · s)	
Low frequency cetaceans (LFC)	120	199	179
High frequency cetaceans (HFC)		198	178
Very high frequency cetaceans (VHFC)		173	153
Otariid seals		219	199

$L_p$  denotes sound pressure level period and has a reference value of 1  $\mu$ Pa.

$L_E$  denotes cumulative sound exposure over a 24 h period and has a reference value of 1  $\mu$ Pa<sup>2</sup> · s.

**Table 5-21 Guidelines for vessel noise exposure for fish and turtles, adapted from Popper et al. (2014). Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F)**

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Turtles	(N) Low (I) Low	(N) Low (I) Low	(N) Moderate (I) Low	(N) High (I) High	(N) High (I) Moderate

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
	(F) Low	(F) Low	(F) Low	(F) Moderate	(F) Low
Fish eggs and fish larvae	(N) Low	(N) Low	(N) Low	(N) High	(N) Moderate
	(I) Low	(I) Low	(I) Low	(I) Moderate	(I) Moderate
	(F) Low	(F) Low	(F) Low	(F) Low	(F) Low

SPL: Sound pressure level dB re 1 µPa

**Table 5-22 Acoustic effects of continuous noise on turtles, weighted SEL, Finneran et al. (2017)**

PTS onset thresholds* (received level)	TTS onset thresholds* (received level)
220	200

\*  $L_E$  denotes cumulative sound exposure over a 24 h and has a reference value of 1 µPa<sup>2</sup>·s.

#### 5.4.4.2 Modelling results

The maximum ( $R_{max}$ ) horizontal distances (in km) to SPL threshold levels from Gudgeon and Terakihi is shown in Table 5-23. The maximum ( $R_{max}$ ) horizontal distances (in km) to PTS and TTS thresholds and the maximum ensonified area (km<sup>2</sup>) are presented below for Gudgeon and Terakihi using frequency-weighted SEL<sub>24h</sub> (Table 5-24). Note that PTS and TTS thresholds for otariid seals were not reached within the limits of the modelled resolution (20 m).

**Table 5-23 Maximum ( $R_{max}$ ) horizontal distances (in km) to sound pressure level (SPL) from Gudgeon (G) and Terakihi (T)**

A dash indicates the level was not reached within the limits of the modelled resolution (20 m).

Note that the worst-case (i.e. furthest impact distance) has been selected for evaluation of potential impacts (highlighted in **bold** in Table 5-23 and Table 5-24).

**5.4.5 Impact assessment – marine mammals**

The PMST search report (Appendix A) found that four species of threatened cetaceans are likely to, or known to occur within the 9.53 km radius behavioural EMBA, including:

- Blue whale (endangered)
- Southern right whale (endangered)
- Fin whale (vulnerable)
- Sei whale (vulnerable).

These whales are also listed as migratory and are classified as LFCs with respect to the assessment of underwater noise impacts (see Table 5-20).

There are also a number of listed migratory whales reported within the behavioural EMBA (Table 5-25) as well as a number of other species listed as cetaceans and/or marine species (including dolphins and seals).

**Table 5-25 Listed migratory whales reported within the behavioural EMBA**

Species	Presence	Hearing group (see Table 5-20)
Pygmy right whale	Foraging, feeding or related behaviour likely to occur within area	LFC

Species	Presence	Hearing group (see Table 5-20)
Humpback whale	Species or species habitat known to occur within area	LFC
Bryde's whale	Species or species habitat may occur within area	LFC
Antarctic minke whale	Species or species habitat likely to occur within area	LFC
Sperm whale	Species or species habitat may occur within area	HFC
Killer whale, orca	Species or species habitat likely to occur within area	HFC
Dusky dolphin	Species or species habitat likely to occur within area	HFC

#### 5.4.5.1 Seals

Both the Australian and New Zealand fur seals may occur within the OAs and the behavioural EMBA. The otariid seal (Australian and New Zealand fur-seals and Australian sea lion) PTS and TTS criteria were not reached within the limits of the modelled resolution (20 m) (see Table 5-20).

Impacts are predicted to be temporary avoidance. The consequence level is assessed as IV from underwater sound on seals, as there are no biologically important behaviours, BIAs, aggregation areas or haul-out area identified within the behavioural EMBA.

#### 5.4.5.2 Very high frequency cetaceans

The furthest distance to the VHFC PTS criteria is 50 m and the TTS criteria is 880 m (Table 5-24). The PMST report for the activity area identified that VHFC such as pygmy and dwarf sperm whales may occur within the OAs, however, no BIAs or behaviours were identified within the behavioural EMBA and therefore they are not assessed further.

Impacts are predicted to be temporary avoidance. The consequence level is assessed as III as there are no biologically important behaviours or BIAs identified within the behavioural EMBA.

#### 5.4.5.3 High frequency cetaceans

The HFC PTS criteria was not reached within the limits of the modelled resolution (20 m). The furthest distance to the TTS criteria was 30 m (Table 5-24). The PMST report for the activity area identified a number of migratory species (Table 5-25), several dolphin species, beaked and toothed whales, however, no BIAs or behaviours were identified within the behavioural EMBA and therefore they are not assessed further.

Impacts are predicted to be temporary avoidance. The consequence level is assessed as III as there are no biologically important behaviours or BIAs identified within the predicted behavioural EMBA area.

#### 5.4.5.4 Low frequency cetaceans

The furthest distance to the PTS criteria is 60 m and the furthest distance to the TTS criteria is 1.26 km (Table 5-24). PTS is not considered credible due to the extended duration (24 hours) for which an individual would need to be in close proximity to the sound source (i.e. LWIV). BIAs for pygmy blue whales and SRW (Known Core Range, Migration and resting on migration, Breeding May Occur) occur within the wider region (Figure 5-2). Both the OAs and the behavioural EMBA overlap the BIA for pygmy blue whales (Foraging – Possible Foraging).

The consequence level is assessed as III for blue whales as there is potential for the temporary displacement of blue whales from a small area while foraging. The consequence level is also assessed as III for other LFCs as there are no biologically important behaviours identified within the area.

#### Blue whales

The blue whale (*Balaenoptera musculus*) has four subspecies, two of which occur within Australian waters, including the Antarctic blue whale (*B. m. intermedia*) and the pygmy blue whale (*B. m. breviceuda*) (Rice 1998, in (Department of the Environment, 2023)). The pygmy blue whale has two acoustically and genetically differentiated populations occurring in Australian waters; the Indo-Australian and New Zealand populations (Möller, et al., 2020).

Long term passive acoustic recorders set by McCauley et al. (2018) found Antarctic blue whale calls along the entire southern Australian coast, while calls from the New Zealand pygmy blue whale population occur predominantly eastward of Bass Strait, and calls from the Indo-Australian pygmy blue whale population were heard west of Bass Strait.<sup>2</sup> The Indo-Australian pygmy blue whale population wasn't recorded on the east Australian coast or east of Bass Strait and the New Zealand pygmy blue whale population was always heard in the Bass Strait recordings, and only ever heard as far west as Portland. The Antarctic blue whale was recorded at all sites south of 19° S (McCauley et al., 2018).

Balcazar et al. (2015) suggests that the Australian continent acts as a geographic boundary, separating Indo-Australian and New Zealand pygmy blue whale acoustic populations at the junction of the Indian and Pacific Ocean basins (Balcazar, et al., 2015).

Krill is the key to understanding the ecology and behaviour of blue whales. Krill is sensitive to temperature and migrates vertically and horizontally to maintain optimal positioning with respect to nutrients, often being found along thermal fronts and thermoclines. Krill abundance in a given season may be linked to oceanographic conditions of the previous year. The Krill species, *Nyctiphanes australis* frequently swarm at or near the surface, making it easily available to foraging blue whales. It can also be found at depth, where blue whales must dive to search and consume it. Foraging is energetically expensive for blue whales, which must regularly find sufficient food to balance their enormous energy requirements (Gill., 2020).

There are two important seasonal feeding aggregations areas known in Australia where large numbers of pygmy blue whales have been recorded: the Bonney Coast Upwelling KEF and adjacent waters off South Australia and Victoria; and the Perth Canyon KEF and adjacent waters off Western Australia. Prominent surface upwelling commonly occurs west of Portland

---

<sup>2</sup> The Bass Strait recorder location was at 145.8°E – approximately 230 km west of the OAs.

where the shelf is narrow (the Bonney Upwelling); whereas on the broader shelf between Portland and King Island, upwelling is usually subsurface, with cooler upwelled water beneath a warmer surface layer (Gill., 2020).

The distribution of pygmy blue whales in the Australian region is shown in Figure 5-3. There are few contemporary records of blue whales in the Gippsland region.

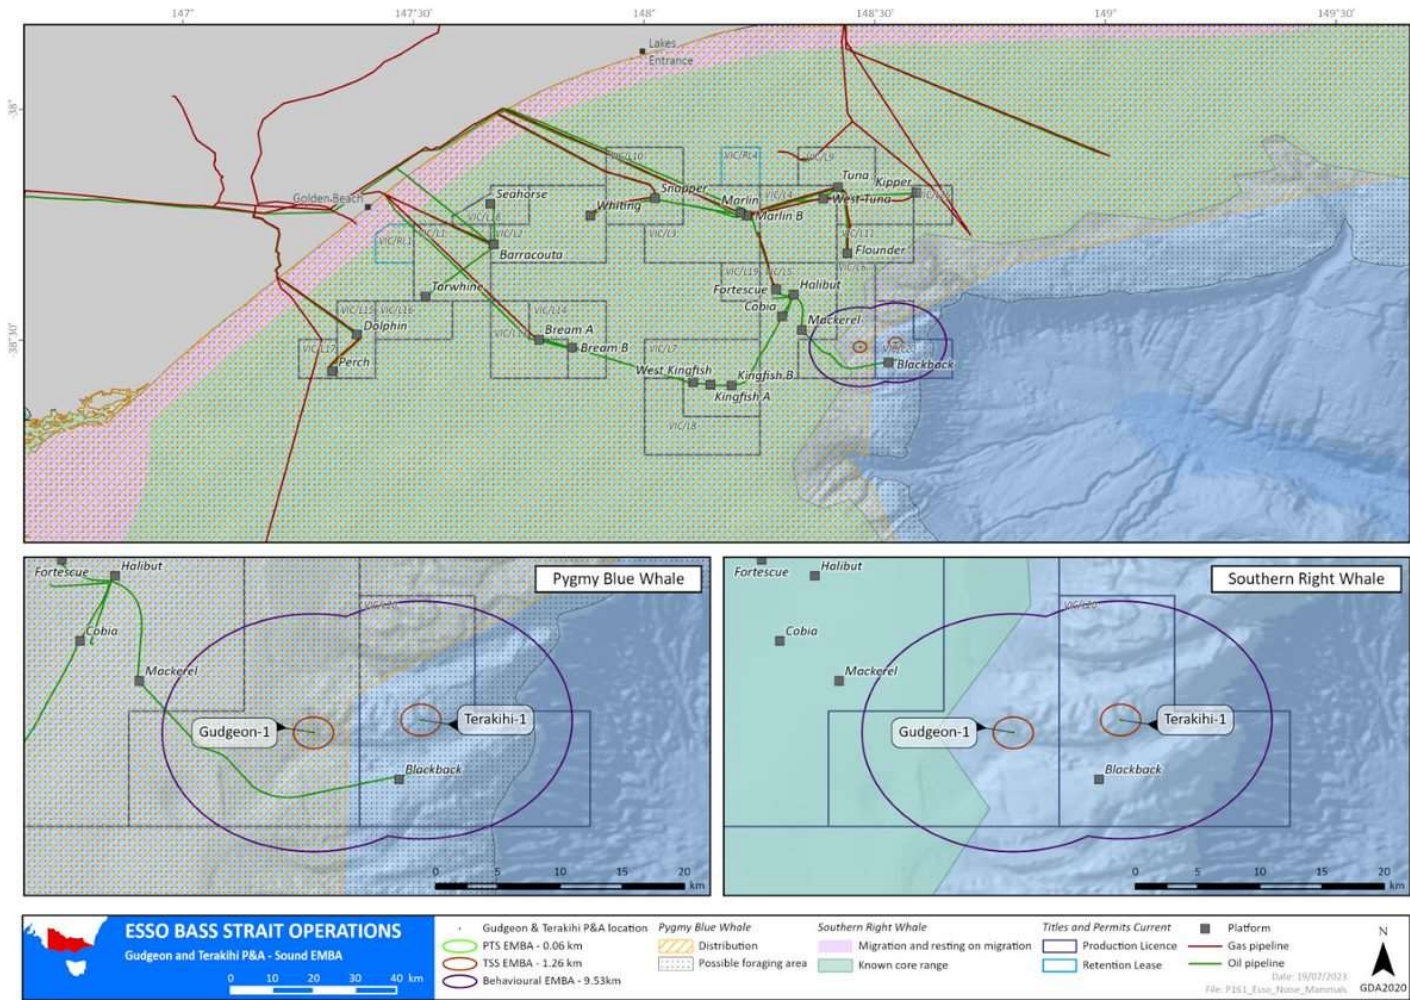

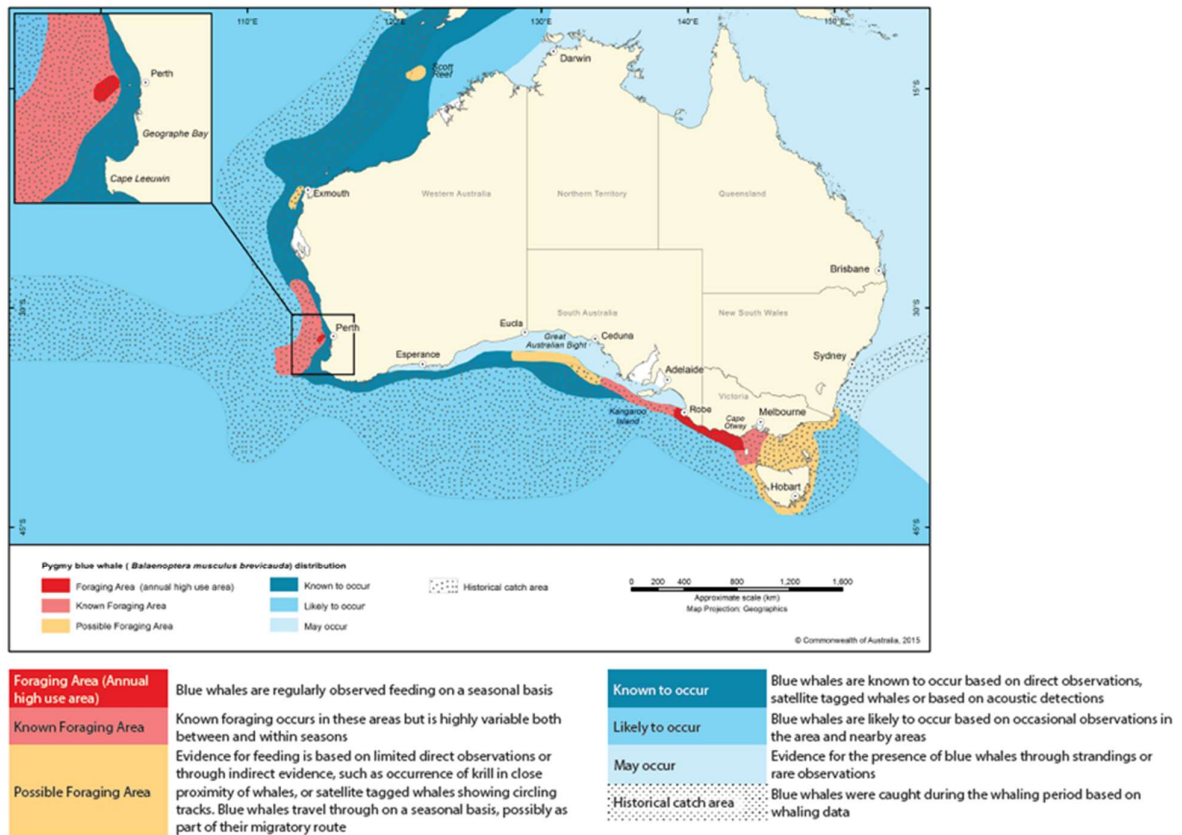

Figure 5-2 BIAs for pygmy blue whales and southern right whales

**Figure 5-3 Pygmy blue whale distribution areas around Australia (Commonwealth of Australia, 2015)**

**Antarctic blue whale**

The Antarctic blue whale subspecies consists of one or more populations that feed off Antarctica during summer, and limited evidence suggests that some proportion migrate to subtropical latitudes of the Pacific and Indian Ocean to breed. They have been acoustically detected off the West and North coasts of Tasmania predominately from May to December. Based on the seasonality of recordings, these areas possibly form part of their migratory route, breeding habitat or a combination of the two (Commonwealth of Australia, 2015). It is possible that the Antarctic blue whale may occur within the behavioural EMBA.

**Indo-Australian pygmy blue whale**

The distribution and migration patterns of Indo-Australian pygmy blue whale are relatively well understood in areas further west of the OAs. Satellite tagging of Indo-Australian pygmy blue whales by Double et al. (2014) and Möller, et al. (2020) has revealed that the Indo-Australian population migrates from southern Australian foraging grounds through a Western Australian migratory corridor to (presumed) breeding grounds in waters around Indonesia.

The known foraging area BIA is approximately 260 km to the west of the OAs and the BIA for foraging (annual high use area) is approximately 420 km west. These areas form the eastern extent of the Bonney Upwelling (extending from Robe, South Australia into the Otway region) and Indo-Australian PBW are known to gather here in large numbers on a seasonal basis between December and June.

The time and location of the appearance of Indo-Australian PBW generally coincides with the upwelling of cold water in summer and autumn along the Bonney Upwelling and the associated aggregations of krill that they feed on (Gill & Morrice, 2003). The Bonney Upwelling generally starts in the eastern part of the Great Australian Bight in November or December and spreads eastwards to the Otway Basin around February as southward migration of the subtropical high-pressure cell creates upwelling favourable winds. Sighting data indicates that blue whales are seasonally distributed (Gill P. M., 2011) (McCauley, Gavrilov, Jolliffe, Ward, & Gill, 2018) .

It is considered unlikely that Indo-Australian pygmy blue whales would be found within the behavioural EMBA.

#### ***New Zealand pygmy blue whale***

Relatively little is known about New Zealand pygmy blue whales. Antarctic blue whales are known to co-occur with pygmy blue whales around New Zealand. Antarctic blue whale detections peaked during austral winter and spring, indicating that New Zealand, and the South Taranaki Bight in particular, is a migratory corridor for them. Some Antarctic blue whale calls were also detected during the breeding season (September and October). Pygmy blue whale calls were highly concentrated in the South Taranaki Bight, particularly between March and May, suggesting that an aggregation may occur here (Warren, McPherson, Giorli, Goetz, & Radford, 2021).

The nearest recognised upwelling system to the OAs is the Upwelling East of Eden KEF, approximately 13.5 km to the north of Terakihi. Upwelling influence areas were mapped between September and May (austral spring, summer and autumn) each year for a period of 14 years (Sept 2002 to May 2016) along 4,500 km of the south-eastern coast of Australia using monthly MODIS sea surface temperature (SST) data (Huang & Hua Wang, 2019).

The study confirmed that there were three seasonal/semi-seasonal upwelling centres: the Bonney coast upwelling; the Kangaroo Island upwelling; and the Eyre Peninsula upwelling, in the WVIC/SA coastal upwelling system. The NSW coastal upwelling system is a persistent/semi-persistent system occurring continuously from austral spring to autumn, although during mid to late autumn the upwelling may be either lacking or isolated and restricted to the coast. The intensity of the southern NSW/eastern Victorian (SNSW/EVIC), centred on the Eden upwelling, has a less distinct seasonal pattern (Figure 5-4) (Huang & Hua Wang, 2019).

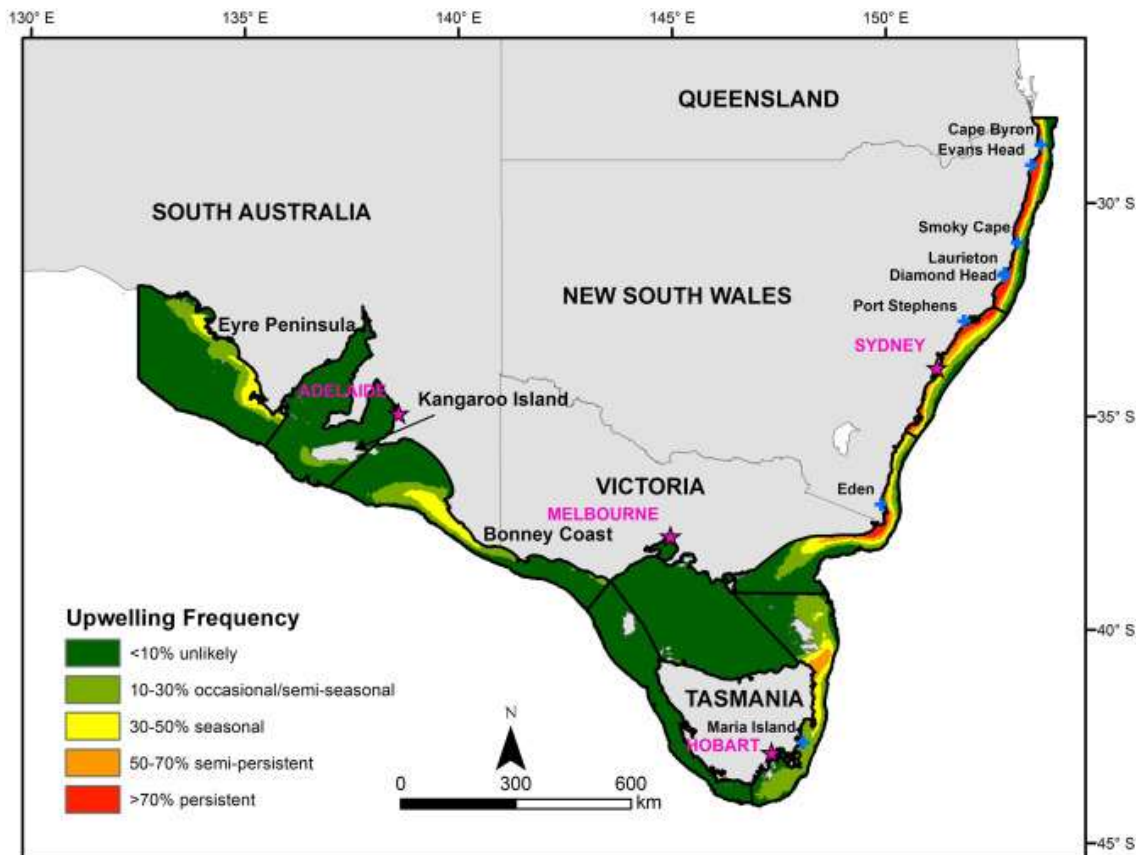

Figure 5-4 Upwelling frequency (Huang & Hua Wang, 2019)

#### ***Blue whales in the Gippsland Basin***

Sightings of blue whales in the Gippsland Basin are reasonably rare (Bannister, Kemper, & Warneke, 1996). Peter Gill (CEO at Blue Whale Study Inc.) was contacted for this activity to discuss the presence of blue whales in the Gippsland Basin. He stated that there had been few cetacean surveys carried out in the region and that the limited data suggests that they occur in low numbers, feeding on krill generated from the Upwelling East of Eden and in eddies formed in the convergence zone. He stated that the Bass Canyon is likely to be an important feeding area, at times, for blue whales. He advised that all blue whales observed should be assumed to be foraging (Gill P., 2023).

As discussed above, it is considered that Antarctic blue whales and New Zealand pygmy blue whales may occur in the Gippsland Basin. Indo-Australian pygmy blue whales are unlikely to occur (Möller, et al., 2020, Balcazar, et al., 2015, McCauley et al., 2018), with their occurrence/seasonality in the Otway region strongly linked to the timing of the Bonney Upwelling (Gill & Morrice, 2003).

The Upwelling East of Eden has a less distinct seasonal pattern (Figure 5-4) (Huang & Hua Wang, 2019) and may provide foraging opportunities for blue whales on a year round basis. The lesser intensity of the Upwelling East of Eden (Huang & Hua Wang, 2019) means that it is likely a less important foraging area than the Bonney Upwelling.

### **Impact assessment**

As blue whales are listed as Endangered under the EPBC Act and have known biologically important behaviours within the behavioural EMBA, it is appropriate that the *principles of ecologically sustainable development* as described in Part 3A of the EPBC Act be applied. In the context of potential impacts from underwater noise emissions, a precautionary approach has been taken in assuming that blue whales may be present, albeit in relatively low numbers, in the Gippsland Basin at any time of year.

The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015) requires that ‘anthropogenic noise in BIAs be managed such that any blue whale continues to utilise the area without injury and is not displaced from a foraging area’. The Guidance on Key Terms within the Blue Whale Conservation Management Plan (DAWE & NOPSEMA, 2021) defines the requirements further “to ensure that any blue whale can continue to forage with a high degree of certainty in a Foraging Area, and that any blue whale is not displaced from a Foraging Area”. Note that in the Conservation Management Plan for the Blue Whale, the OAs occur within an area defined as “possible foraging area” and that in the DAWE Guidance on Key Terms within the Conservation Management Plan for the Blue Whale (DAWE & NOPSEMA, 2021), the broader term ‘foraging’ encompasses ‘Foraging Area’, ‘Known Foraging Area’ and ‘Possible Foraging Area.’

The Guidance on Key Terms within the Blue Whale Conservation Management Plan suggests a whale could be displaced from a foraging area if stopped or prevented from foraging, caused to move when foraging, or stopped or prevented from entering a foraging area. A whale is considered to be displaced from a foraging area if foraging behaviour is disrupted, regardless of whether the whale can continue to forage elsewhere within that foraging area (DAWE & NOPSEMA, 2021).

The consequence level from underwater sound impact is assessed as III for blue whales as there is potential for the displacement of blue whales whilst foraging within a small area. This is considered acceptable because:

- The underwater sound modelling has conservatively been based on 100% power levels for the LWIV DP thrusters, whereas, power levels will not exceed 75% thruster power in operational circumstances (refer Section 2.1.1 of Appendix B).
- A conservative approach has been taken in applying the sound modelling and results such as the furthest distance to the PTS and TTS criteria for the scenarios modelled to assess potential impacts.
- As there is limited data available on blue whales within the region, a precautionary approach (ALARP Decision Context B) has been adopted in considering controls to minimise and/or mitigate potential impacts from underwater noise (Section 5.4.8).
- If blue whales are present, they are unlikely to be in large numbers.
- If blue whales are present, they are assumed to be foraging.
- The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015) states that shipping and industrial noise are classed as a ‘minor’ consequence (defined as: individuals are affected but no affect at a population level).
- The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015) states that “It is the high intensity signals with high peak pressures received at very short range that can cause acute impacts such as injury and death.” As vessel noise is a continuous noise source and does not have high intensity signals, it is unlikely that they would cause injury to foraging pygmy blue whales.
- The activity will be of a short duration (anticipated to be 60 days maximum).

- The area within the low frequency cetacean TTS threshold (1.26 km) is 4.99 km<sup>2</sup>, which represents 0.0005% of the pygmy blue whale BIA for Foraging – Foraging Likely. The area within the behavioural EMBA (9.53 km) represents 0.212% of the BIA.
- The OAs are ~420 km from the Bonney coast upwelling KEF, which is a known feeding aggregation area (Gill et al. 2011; McCauley et al. 2018).
- Adopting the controls in Section 5.4.7 are aimed to prevent PTS, TTS and displacement impacts to pygmy blue whales that may be foraging. The guidance on key terms (DAWE & NOPSEMA, 2021) regarding the definition of ‘displaced from a foraging area’ states that mitigation measures must be implemented to reduce the risk of displacement occurring during operations where modelling indicates that behavioural disturbance within a foraging area may occur. The implementation of the control measures and EPS in Section 5.4.7 means that blue whale displacement from a foraging area is unlikely to occur. As such, the activity will be managed in a manner that is not inconsistent with the Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015), specifically Action Area A.2. See Table 5-26 for an assessment of the activity with the conservation objectives and actions of the Conservation Management Plan for the Blue Whale.

**Table 5-26 Assessment of underwater noise against the Conservation Management Plan for the Blue Whale**

Relevant aim / objective / action	Assessment
<b>Relevant Interim Recovery Objective</b>	
4. Anthropogenic threats are demonstrably minimised.	The EP provides a comprehensive assessment to address anthropogenic noise generated by this activity on pygmy blue whales. The EPS listed in Table 5-28 address anthropogenic noise from the activity and effectively reduce its potential for impact on blue whales. The activity will be managed in a manner that is not inconsistent with this conservation objective.
<b>Relevant Interim Objective Targets</b>	
Target 4-1: Robust and adaptive management regimes leading to a reduction in anthropogenic threats to Australian blue whales are in place.	The EPS listed in Table 5-28 provide controls that reduce anthropogenic noise on blue whales. The activity will be managed in a manner that is not inconsistent with this conservation objective.
Target 4-2: Management decisions are supported by high quality information and high priority research projects identified in this plan are achieved or underway.	The EPS listed in Table 5-28 are based on a precautionary approach, scientifically robust noise modelling and information from Mr. Pete Gill of the Blue Whale Study. MMOs will be engaged throughout the activity.
<b>Relevant Actions Areas</b>	

Relevant aim / objective / action	Assessment
Action Area A.2. Assessing and addressing anthropogenic noise.	The EIA in this EP provides a comprehensive assessment of assessing and addressing anthropogenic noise generated by this activity on blue whales. The EPS listed in Table 5-28 provide controls that reduce anthropogenic noise on blue whales. The activity will be managed in a manner that is not inconsistent with this conservation objective.
Action 3. Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury and is not displaced from a foraging area.	

### Southern Right Whale

The behavioural EMBA overlaps the SRW BIA for Known Core Range. The nearest SRW BIAs for known biologically important behaviours (i.e. Migration and resting on migration, Breeding May Occur) are approximately 65 km and 120 km beyond the furthest extent of the behavioural EMBA (Figure 5-2).

There is the potential for SRW to be present within the Known Core Range BIA between May and November. The consequence level from sound impacts is assessed as III for SRW. This is considered acceptable because:

- A conservative approach has been taken in applying the sound modelling and results such as the furthest distance to the PTS and TTS criteria for the scenarios modelled to assess potential impacts.
- The Conservation Management Plan for the SRW (DSEWPAC, 2012) identifies chronic and acute industrial noise as a threat that is classed as a 'moderate' consequence (defined as population recovery stalls or reduces), while shipping noise is classed as a 'minor' consequence (defined as individuals are affected but no affect at a population level). Types of industrial noise identified as chronic and acute, such as pile driving, drilling and laying pipe, have significantly higher source volumes and durations than the modelled scenarios, which are more closely related to shipping noise.
- Though activities may occur during the period when SRW are within the Known Core Range BIA (217,825 km<sup>2</sup>), the area of potential impact within the behavioural EMBA area is small (285 km<sup>2</sup>), which represents 0.13% of the BIA.
- No biologically important behaviours are known to occur within the Known Core Range BIA.
- PTS and TTS impacts are not predicted to SRW, by themselves or with calf, that may be moving through the Known Core Range. Based on mean recorded swim speeds between 3 – 3.3 km/hr (Charlton, 2017) and the furthest distance to the TTS criteria of 1.26 km (24 h SEL), it is considered likely that individuals would move out of the area before PTS or TTS could occur.
- Southern right whales may avoid the area where the behavioural criteria is reached but there is no impediment to them continuing to and from coastal aggregation and migration areas. Southern right whales are a highly mobile migratory species that travel thousands of kilometres between habitats used for essential life functions (DSEWPAC, 2012). Along the Australian coast, individual SRWs use widely separated coastal areas (200–1,500 km apart) within a season, indicating substantial coast-wide movement. The longest movements are undertaken by non-calving whales, though calving whales

have also been recorded at locations up to 700 km apart within a single season (DSEWPAC, 2012). As such, avoidance of the area is unlikely to prevent or hinder them from undertaking their seasonal migrations.

- It is unlikely that calving whales would remain in the activity area with water depths greater than 100 m, as the whales prefer to occupy depths of less than 10 m.
- PTS, TTS or behavioural criteria are not reached at the BIAs for known biologically important behaviours (i.e. Migration and resting on migration, Breeding May Occur).

The Conservation Management Plan for the SRW (DSEWPAC, 2012) states that where whales approach and leave the Australian coast to and from offshore areas is not well understood however, more-or-less direct approaches and departures to the coast are likely. The behavioural EMBA covers approximately 0.13% of the SRW known core range (217,825 km<sup>2</sup>) and is not likely to impede access to areas where biologically important behaviours are known to occur. See Table 5-27 for an assessment of the activity with the conservation objectives and actions of the Conservation Management Plan for the SRW.

**Table 5-27 Assessment of underwater noise against the Conservation Management Plan for the Southern Right Whale**

Relevant aim / objective / action	Assessment
<b>Relevant Interim Recovery Objectives and Targets</b>	
<i>Interim Recovery Objective 2: Demonstrate that the number of southern right whale occurring off south-east Australia (nominally the south-east Australia population) is showing signs of increase.</i>	
<p>Target 2.2: the number of whales off south-east Australia shows an apparent increase for the period 2011–2021 relative to 2005–2010:</p> <ul style="list-style-type: none"> <li>• no aggregation area identified in 2011 drops to a lower category by 2021 (categories are defined by the number of whales occupying an aggregation area each year)</li> <li>• aggregations categorised as small established areas in 2011 are used by an equivalent or increased number of whales by 2021</li> <li>• aggregations categorised as emerging areas in 2011 meet criteria for an established area by 2021; OR are occupied in a greater number of years from 2011–2021 compared with 2005–2010</li> </ul>	<p>The EIA and EPS listed in this EP (Table 5-28) show that anthropogenic threats are demonstrably minimised and reduced wherever possible. The furthest extent of the behavioural EMBA is 65 km from any areas where aggregations are known to occur. Although the behavioural EMBA overlaps the Known Core Range BIA, no significant impacts are predicted.</p>

Relevant aim / objective / action	Assessment
<ul style="list-style-type: none"> <li>historic high use areas not identified as aggregation areas in 2011 show signs of increased use by 2021.</li> </ul>	
<p>Interim Recovery Objective 5: Anthropogenic threats are demonstrably minimised.</p>	<p>The EIA and EPS listed in this EP (Table 5-28) demonstrates that anthropogenic threats are demonstrably minimised and reduced wherever possible. Therefore, the activity will be managed in a manner such that it is not inconsistent with the relevant interim objective targets.</p>
<p>Target 5.1: robust and adaptive management regimes leading to a reduction in anthropogenically-induced SRW mortality in Australian waters are in place.</p>	<p>The EIA and EPS listed in this EP (Table 5-28) has been designed to avoid mortality of SRW.</p>
<p>Target 5.2: management decisions are supported by high quality information and high priority research targets identified in this plan are achieved or underway by 2021.</p>	<p>The information included in this EP regarding impacts to whales is based on detailed sound modelling that uses relevant behavioural threshold criteria and detailed assessment for SRW in the region.</p>
<p><b>Relevant Actions Areas and Actions</b></p>	
<p><i>Action Area A.2. Assessing and addressing anthropogenic noise.</i></p>	
<p>Action: Improve the understanding of what impact anthropogenic noise may have on SRW populations by:</p> <p>a) Assessing anthropogenic noise in key calving areas</p> <p>b) Assessing responses of southern right whales to anthropogenic noise</p> <p>c) If necessary, developing further mitigation measures for noise impacts.</p>	<p>The furthest extent of the behavioural EMBA is 65 km from any areas where aggregations are known to occur, or key calving areas.</p> <p>The EIA has assessed responses of SRW to anthropogenic noise.</p> <p>As per the EPS listed in Table 5-28.</p>
<p>Assess and address anthropogenic noise (shipping, industrial and seismic).</p>	<p>The EIA in this EP is not inconsistent with this conservation objective.</p>

#### 5.4.5.5 Other LFC

Foraging behaviour for fin, pygmy right and sei whales may occur within the area where the PTS, TTS and behavioural criteria are reached. The fin, pygmy right and sei whales do not have conservation management plans. The fin and sei whales have conservation advice (TSSCa, 2015) (TSSCb, 2015) which both identify anthropogenic noise as a threat with the conservation and management actions of:

- Once the spatial and temporal distribution (including biologically important areas) of sei whales is further defined an assessment of the impacts of increasing anthropogenic noise (including from seismic surveys, port expansion, and coastal development) should be undertaken on this species.
- If required, additional management measures should be developed and implemented to ensure the ongoing recovery of sei whales.

The consequence of underwater sound impacts is assessed as III and is of an acceptable level based on:

- The fin and sei whale's conservation advice (TSSCa, 2015) (TSSCb, 2015) has a consequence rating for anthropogenic noise and acoustic disturbance as minor with the extent over which the threat may operate as moderate-large. There is no conservation advice for the pygmy right whale and the Species Profile and Threats Database (DCCEEW, 2023) does not identify anthropogenic noise and acoustic disturbance as a threat.
- The fin and sei whale's conservation advice (TSSCa, 2015) (TSSCb, 2015) has a consequence rating for anthropogenic noise and acoustic disturbance as 'minor' with the extent over which the threat may operate as 'moderate'-'large'.
- The pygmy right whale Species Profile and Threats Database (DCCEEW, 2023),, does not identify anthropogenic noise and acoustic disturbance as a threat.
- Low numbers of fin, sei and pygmy right whales are predicted within the PTS, TTS and behavioural EMBA based on the following:
- the PTS and TTS EMBA is ~260 km from the eastern most extent of the Bonney coast upwelling KEF, which is known as a feeding aggregation area (Gill P. M., 2011) (McCauley, Gavrilov, Jolliffe, Ward, & Gill, 2018)
- no BIAs were identified for these species.

#### 5.4.6 Impact assessment – other species

##### 5.4.6.1 Fish

There is no direct evidence of mortality or potential mortality to fish from ship sound emissions. The risks of mortality and potential mortality, and recoverable injury impacts to fish with no swim bladder (sharks) or where the swim bladder is not involved in hearing is low and that TTS may be a moderate risk at near distances (tens of metres) from the vessel (Popper, et al., 2014). For fish with a swim bladder involved in hearing, risks of mortality and potential mortality impacts are low. However, some evidence suggests that fish sensitive to acoustic pressure show a recoverable loss in hearing sensitivity, or injury when exposed to high levels of sound. Popper et al. (2014) details SPL criteria for fish with a swim bladder involved in hearing (See Table 5-21).

A study for Cooper Energy found multiple fish species on and around the wells and flowline routes (Ierodiaconou, et al., 2020); some with swim bladders (e.g. Jackass morwong (*Nemadactylus macropterus*), foxfish (*Bodianus frenchii*), and some without (e.g. handfish

(*Brachionichthyidae*), stingaree (*Urolophidae*). However these features are at the seabed, over 250 metres from the primary surface sound sources such as supply vessels and the LWIV. Resident fish are therefore not expected to be within range of TTS. No cumulative impacts are expected as there are no habitats likely to support site-attached fish in the OAs.

The recoverable injury threshold was not reached for any scenario. The 12 hr TTS criteria for fish with a swim bladder involved in hearing was reached within 30 m of combined activities. As there are no habitats likely to support site-attached fish within 30 m of the sound source/s it is unlikely that fish species would be present for a period of 12 hours. Thus, TTS impacts are not predicted.

Behavioural impacts such as moving away from the operations, are more likely than staying within the TTS or PTS zone. There are no habitats or features within the OAs that would restrict fish and sharks from moving away from the vessel.

The OAs are within a distribution BIA for the white shark though no habitat critical to the survival of the species or behaviours were identified. The BIA for Breeding (Nursery Area) is approximately 55 km beyond the furthest extent of the behavioural EMBA. The Recovery Plan for the White Shark (*Carcharodon carcharias*) (DSEWPAC, 2013) does not identify sound as a threat.

Low levels of commercial fishing for other fish species were identified within the OA's. Thus, temporary avoidance may occur during activities. The extent of the area of impact is predicted to be within the operational areas for the duration of activities. Consequence impacts from underwater sound is assessed as IV and is of an acceptable level based on:

- The Recovery Plan for the White Shark (*Carcharodon carcharias*) (DSEWPAC, 2013) does not identify sound impacts as a threat.
- Avoidance behaviour may occur within the OAs, however, no habitats likely to support site-attached fish have been identified within the OAs.
- Temporary avoidance behaviour may occur within the OAs for commercially important fish species; however recovery would occur once the activity had finished. Based on the small area of impact, low fishing activity and that displaced fish would still be available to be caught outside of the OAs, impacts to commercial fishing are not predicted.

#### 5.4.6.2 Turtles

The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017) identifies noise interference as a threat to turtles. It details that exposure to chronic (continuous) loud noise in the marine environment may lead to avoidance of important habitat.

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to develop sound exposure criteria for fish and turtles. The Working Group developed guidelines with specific thresholds for different levels of effects for several species groups including turtles (Popper, et al., 2014) (Table 5-21). Popper et al. (2014) noted that there is no direct evidence of mortality or potential mortal injury to sea turtles from ship sound emissions.

Using semi-quantitative analysis, Popper et al. (2014) suggests that there is a low risk to marine turtles from shipping and continuous sound except for TTS near (tens of metres) to the sound source, and masking at near, intermediate (hundreds of metres) and far (thousands of metres) distances and behaviour at near and intermediate distances from the sound source. Based on this information avoidance behaviour may occur within the OA.

Revised thresholds for turtle PTS and TTS for continuous sound were subsequently developed (Finneran, et al., 2017) (Table 5-22). These thresholds were not reached in the current study, therefore there will be no PTS or TTS (Muellenmeister et al., 2023).

Three marine turtle species may occur within the OAs though no BIAs or habitat critical to the survival of the species were identified. The extent of the area of potential impact is predicted to be confined within the OAs. The consequence level of underwater sound impacts to turtles is assessed as IV based on:

- The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017) notes that exposure to chronic (continuous) loud noise in the marine environment may lead to avoidance of important habitat. No marine turtle habitat critical areas or BIAs are located within the area that may be impacted.
- Thresholds for turtle PTS and TTS over 24 hrs were not reached in the modelling study (Muellenmeister et al., 2023).
- Avoidance behaviour may occur within the OAs.
- Low numbers of marine turtles are predicted in the OAs and therefore impacts would be limited to a small number of individuals.

Consequently, the potential impacts from noise emissions are considered to be

**CONSEQUENCE LEVEL IV**

for all marine fauna other than PBW and SRW.

For the PBWs and SRWs potential impacts have been highly conservatively considered to have a potential

**CONSEQUENCE LEVEL III**

where this activity may result in highly localised, short-term behavioural impacts to species of recognised conservation value, but is not expected to affect the population or local ecosystem functions

5.4.7 Controls

Table 5-28 Environmental performance

EPO	Control	EPS	Measurement criteria
There is no injury (TTS and PTS) or displacement from foraging, aggregation, calving/breeding or migrating grounds in cetacean BIAs from sound emissions from the P&A activity	<b>CMP4:</b> Helicopter Pilot	Interaction between helicopters and cetaceans within the OA will be consistent with Part 8 Division 8.1 of the <i>Environment Protection and Biodiversity Conservation Regulations 2000</i> (EPBC Regulations):  Helicopters will not fly lower than 1650ft (503m) when within 500m horizontal distance of a cetacean except when landing or taking off and will not approach a cetacean from head on.	Annual refresher memo demonstrates that pilots are aware of flight requirements when in the vicinity of a cetacean.

EPO	Control	EPS	Measurement criteria
	<b>CM8:</b> Vessel Master	<p>Vessel masters will implement cetacean interaction management actions consistent with the Australian National Guidelines for Whale and Dolphin Watching (2017) (which enact) Part 8 Division 8.1 of the EPBC Regulations, including:</p> <ul style="list-style-type: none"> <li>• Caution zones - vessels will not knowingly travel faster than 6 knots within 300m of an adult whale or 150m of an adult dolphin</li> <li>• No approach zone - vessels will not knowingly get closer than 100m of an adult whale or 50m of an adult dolphin.</li> </ul> <p>If a cetacean approaches the vessel within the above zones, the vessel will avoid rapid changes in engine speed or direction.</p>	Daily operations reports note when cetaceans were sighted in the caution zone and interaction management actions implemented.
		Support vessel shall maintain thrust/power limits of no more than 45% during operations alongside the LWIV and as specified in the vessel's Activity Specific Operating Guidelines (ASOG).	Vessel DP setup and watch keeping checklist records verify thrust loads are less than 45%.
		Only one support vessel is to be within the OA at any one time.	Daily operation reports note when supply vessels are alongside.
	<b>CMP35:</b> LWIV Master	Operations will be suspended in the event that LWIV thruster levels are forecast to exceed 75% of their capacity (via weather forecasting).	Well Specific Operations Criteria (WSOG) and Thruster And Generator Operating Strategy (TAGOS) define 75% maximum operating limit.
	<b>CMP26:</b> Fauna observations	<p>Vessel Masters and all crew undertake an awareness induction for managing sound impact to PBW and SRW whales which includes:</p> <ul style="list-style-type: none"> <li>• requirements of the adaptive whale management procedure (CMP33).</li> <li>• whale observation and identification and distance</li> </ul>	Induction records

EPO	Control	EPS	Measurement criteria
		measurement and reporting.	
		Crew members on active duty will report observations of megafauna (cetaceans) to bridge watch officers as soon as it is safe to do so.	Daily reports confirm recordings of cetacean sightings.
	<b>CMP34:</b> Marine Mammal Observer	Two (2) MMOs (with recognised training and experience in whale observation, distance estimation and reporting in accordance with Part A.2 and B.1 of the EPBC Act Policy Statement 2.1 (DEWHA, 2008)) will be onboard the LWIV for the duration of the activity.	Training records confirm MMOs have the required training and experience per <i>EPBC Act Policy Statement 2.1</i> (DEWHA, 2008) and are trained in the adaptive management requirements (CMP33).
		At least one MMO will be on shift on the LWIV during daylight hours to implement the EPBC Act Policy Statement 2.1, with the second MMO available to take over the previous shift or assist the MMO on shift as required.	MMO daily reports verify an MMO was on shift during daylight hours.
		<p>The following parts of the EPBC Act policy Statement 2.1 .1 (DEWHA, 2008) will be implemented by the MMOs (noting that seismic survey airguns are not part of this activity and therefore soft starts cannot be undertaken):</p> <p>Part A. 3.1 Pre Start up Visual Observation</p> <ul style="list-style-type: none"> <li>During the pre-start phase of the adaptive whale management procedure (see CMP33).</li> </ul> <p>Part A. 3.4. Operations Procedure</p> <ul style="list-style-type: none"> <li>During the operations phase of the adaptive whale management procedure (see CMP33).</li> </ul> <p>Part A.3.5 Stop-Work procedure</p> <ul style="list-style-type: none"> <li>Addressed by the loading/unloading procedure in the operations phase of the adaptive whale management procedure (see CMP33).</li> </ul> <p>Part A. 3.6. Night-time and low visibility procedures</p>	MMO daily reports verify the adaptive whale management procedure was implemented.

EPO	Control	EPS	Measurement criteria
	<p><b>CMP33:</b> Adaptive Whale management procedure PBW and SRW.</p>	<ul style="list-style-type: none"> <li>• During the operations phase of the adaptive whale management procedure (see CMP33).</li> </ul> <p>The following adaptive whale management procedure (for PBW and SRW) will be implemented for the activity (regardless of activity timing) (see the accompanying decision tree in Figure 5-5):</p> <ul style="list-style-type: none"> <li>• Pre-activity vessel-based survey – while en-route to the OA, crew onboard the LWIV and support vessel will maintain watch for PBW and SRW when approaching or in the observation zone (i.e. 9.5km radius behavioural EMBA).</li> <li>• Pre-activity vessel survey - if PBW or SRW have been observed, this will be communicated to the LWIV. The LWIV and support vessels will not be permitted to commence DP operations on location until there have been no PBW or SRW sightings for 30 minutes or the whale/s have been observed leaving the observation zone.</li> <li>• LWIV DP operations (daytime) – MMOs, LWIV Master and crew maintain observations for PBW and SRW while it is on DP within the observation zone</li> <li>• LWIV DP operations (night-time or low visibility) - support vessel will not come alongside the LWIV using DP (e.g. loading/unloading) unless the whale has not been observed within the observation zone in the preceding 3 daylight hours.</li> </ul> <p>If a PBW or SRW is sighted in the observation zone:</p>	<p>Daily reports contain information on PBWs and SRW sightings (and other cetaceans) , and actions taken as a result of sightings are consistent with the adaptive management procedure requirements CMP33.</p>

EPO	Control	EPS	Measurement criteria
		<ul style="list-style-type: none"> <li>• support vessel will not come alongside the LWIV under DP (e.g. loading/unloading) unless PBWs/SRWs have not been observed for a continuous 30 minutes within the observation zone.</li> </ul> <p>If a vessel is alongside the LWIV, and if a PBW/SRW is sighted within the observation zone:</p> <ul style="list-style-type: none"> <li>• if loading/unloading can be safely and quickly stopped, any vessel alongside the LWIV will move to a safe position away from the LWIV and away from the direction of the whale until the whale moves out of the observation zone or when 30 mins have lapsed since the last sighting</li> <li>• if loading/unloading operations cannot be safely and quickly stopped to allow departure of the vessel, the vessel will adjust heading to reduce thrust to the extent possible for the safe operation of the vessel in accordance with the vessel ASOG, until the whale moves out of the observation zone or has not been sighted for 30 mins..</li> </ul>	

5.4.8 Demonstration of ALARP

**Table 5-29 ALARP Decision Context and justification**

<p><b>ALARP Decision Context A</b></p>	<p>Impacts from underwater sound emissions are relatively well understood, however there is the potential for uncertainty in relation to the level of impact.</p> <p>Activities are well practised, and there are no conflicts with company values, no partner interests and no significant media interests.</p> <p>Because the potential impacts to marine mammals evaluated as Risk Category 2, Esso believes ALARP Decision Context A should apply.</p>
<p><b>ALARP Decision Context B</b></p>	<p>ALARP decision context B has been applied in relation to PBW because there is a residual (low) risk in relation to the TTS and behavioural disturbance to this species within a BIA. The particular action which triggers this decision context is Action Area A.2.3 from the CMPBW. Further</p>

	<p>controls to manage these residual risks have been considered and several additional controls have been adopted. The adopted controls ensure the EPO can be met and are not inconsistent with the objectives and relevant actions of the species recovery plan.</p> <p>Esso believes ALARP Decision Context B should apply.</p>
--	---

**Table 5-30 Good practice controls**

Good practice	Adopted	Control	Rationale
<p>Part 8 Division 8.1 of the EPBC Regulations.</p> <p>Australian National Guidelines for Whale and Dolphin Watching 2017 (Commonwealth of Australia, 2017).</p>	✓	<p><b>CM8:</b> Vessel Master</p> <p><b>CMP4:</b> Helicopter Pilot</p>	<p>The Vessel Master or Helicopter Pilot has responsibility for ensuring the requirements of these Regulations and Guidelines are followed.</p> <p>The Guidelines describe strategies to ensure whales and dolphins are not harmed during offshore interactions with people.</p> <p>These Guidelines were developed jointly by all state and territory governments through the Natural Resource Management Ministerial Council and, although more relevant for tourism activities, provide a list of requirements that are generally adopted by the oil and gas industry to minimise the risk of cetacean strike occurring; this also has the effect of ensuring distance from vessel propellers and helicopter rotor blades that cause sound emissions.</p> <p>Note: Both the lack of visibility of seals in the water and number of seals in close proximity to oil and gas offshore installations make applicability of these guidelines to seals impracticable. Furthermore fauna interaction management actions as described in the guidelines will not prevent seals approaching vessels.</p>
<p>Dedicated MMOs on LWIV</p>	✓	<p><b>CMP34:</b> MMO</p>	<p>Adopted.</p> <p>MMOs will be able to identify cetaceans species and implement the adaptive whale management procedures designed to reduce the risk of impact to PBW and SRW</p>

**Table 5-31 Engineering risk assessment**

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
Do not undertake the activity.	Eliminates underwater sound generation.	Esso is under a General Direction to P&A the wells. Not doing so would be a breach of this direction and a breach of Section 572 of the OPGGS Act (maintenance and removal of property).  This is not a feasible option.	Not adopted.
Only conduct P&A activities outside of indicative peak PBW season (April to June)	Very little benefit, given that PBW could be present at any time of the year.	Not feasible.  The within-season distribution trends of PBWs in the Bass Strait are unknown (refer to CMPBW). Although they are known to frequent the Bonney Upwelling to the west of Bass Strait in November and December and may be present in the Bass Strait between April and June. Esso's preference would be to undertake P&A activities in the summer periods when Bass Strait has more favourable environmental conditions. Furthermore, during the summer period there is less likelihood of operational downtime due to cetacean presence and weather conditions. However, timings of P&A activity are linked to LWIV availability and operational requirements.  The impact (in the event of whales being present) will be managed through controls and adaptive management.  This control measure is not feasible and the costs of implementing it are grossly disproportionate to the environmental benefits.	Not adopted.
Only conduct P&A activities outside of the <u>SRW</u> migration season (~April to October)	No benefit.	The CMPSRW identifies April to October as the migratory season for SRWs. While there may be some overlap between the timing of the activity and this migration period, the behavioural distance to effect for LFC around the OA means that there remains a 65 km buffer between the coastal migration corridor and the behavioural zone of effect. This means the activity will not cause any impacts to biologically important activities.	Not adopted

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
		The cost of this control is grossly disproportionate to the additional benefits of implementing this control measure considering the distance between potential effects and the coastal migration corridor.	
Shut down all DP thrusters on the LWIV when PBW or SRW are sighted in the observation zone	Reduces the potential for PTS, TTS and behavioural impacts.	<p><b>Cost:</b> Coming off DP would result in the LWIV drifting off location and if this happened while connected to the drill string, it could potentially break the connection with the drill string and lead to project suspension and project failure. This may also result in the potential for safety risks and a hydrocarbon release.</p> <p><b>Limitation:</b> With DP off but the LWIV not connected to the drill string, the LWIV would drift off location and into the shipping fairway, potentially leading to vessel collision.</p> <p>This control measure is not technically feasible and would lead to unacceptable safety risks.</p>	Not adopted.
Shut down DP on the LWIV <u>and disconnect</u> when PBW or SRW are sighted in the observation zone	Reduces the potential for PTS, TTS and behavioural impacts.	<p><b>Cost:</b> Disconnecting from DP and from the drill string each time a PBW or SRW is sighted in the shutdown zone has the potential to jeopardise the primary objectives of the activity. To disconnect during operations is not technically feasible and would add significant cost and time to the schedule.</p> <p><b>Limitation:</b> As per the row above. Once connected to the subsea equipment, good practice is to maintain connected unless it is absolutely necessary to disconnect (for safety reasons).</p> <p>This control measure is not technically feasible and the costs of implementing it are grossly disproportionate to the environmental benefits.</p>	Not adopted.
Limit power to LWIV	Reduces the potential for PTS, TTS and behavioural impacts.	<p>Power is maintained in a manner to safely operate the LWIV. Depending on LWIV operations and weather conditions the thrusters will be maintained to as low as possible for safe operation.</p> <p><b>Limitations:</b> The LWIV must be able to hold station to safely undertake P&amp;A activities.</p>	Adopted.

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
		Operations will be suspended in in the event that the LWIV thrusters levels need to exceed 75% of their capacity as per the WSOG and TAGOS. Weather forecasting will indicate at least a week in advance to allow operations to be suspended.	
Shutdown support vessel thrusters and engines when PBW or SRW are sighted in the observation zone while alongside the LWIV.	Minimises the potential for TTS impacts.	<p><b>Limitations:</b> When a support vessel is alongside the LWIV, it must maintain position with DP; mooring to the LWIV is not feasible (as previously outlined). To shut down the vessel thrusters and engines while alongside could lead to the vessel drifting significantly, impacting the safety of operations and increasing the risk of vessel collision with the LWIV.</p> <p>This is not a feasible option.</p>	Not adopted.
Power to the thrusters on the support vessel are limited to reduce noise generation while inside the OA	Reduces potential for TTS impacts.	<p>Power is maintained in a manner to safely operate the vessel. Depending on vessel operations and weather conditions, the vessel thrusters will be maintained to as low as possible for safe operation.</p> <p><b>Limitations:</b> Thruster power levels are optimised to the operating modes and conditions, and for efficiency reasons are maintained at the minimum power to safely maintain position. It is not safe to adjust thruster power outside of operationally defined ranges. Support vessels will not use more than 45% power as per their ASOG when alongside the LWIV.</p>	Adopted.
Use of competent (trained and experienced) MMOs	Reduces potential displacement of foraging PBW/SRW.	<p>Two MMOs onboard the LWIV at all times, with at least one of these MMOs on shift during daylight hours, means that a trained expert is dedicated to search for whales and implement the adaptive whale management procedure. Based on recent drilling campaigns offshore Victoria, vision from the bridge of the LWIV is possible up to about 7km.</p> <p>Longer daylight hours in southern Australia during the summer months (up to 15 hours) are greater than a 12-hr work shift, so having two competent MMOs onboard is required to ensure each shift can be reliably completed.</p>	Adopted.

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
		<p><b>Cost:</b> The MMOs will be contracted through a reputable consultancy that trains and provides MMOs on a range of projects around Australia or can provide the required training to dedicated personnel. This will add a negligible amount to the daily costs of the activity, up to \$2,000 each day for both MMOs.</p> <p><b>Limitations:</b> Sourcing trained and experienced MMOs to be available at the time of the activity can be logistically very difficult, as the market for such skilled people is tight.</p> <p>The environmental benefits of having MMOs onboard the LWIV outweighs the costs of implementing this control measure and is considered best practice.</p>	
Additional MMO on support vessel	Prevent TTS impacts. Provides extended monitoring range.	<p><b>Cost:</b> An additional two MMOs on the support vessel for the duration of the activity is estimated to cost ~\$100,000.</p> <p><b>Limitations:</b> This control measure is limited by the following factors:</p> <ul style="list-style-type: none"> <li>• Support vessels are only in the OA or behavioural zone for limited time whilst servicing the LWIV.</li> <li>• There is very little overlap between the behavioural impact zone and the PBW foraging BIA and for a very short period of time.</li> <li>• 2 MMOs will be on the LWIV</li> </ul> <p>The OA is located 73 km from the mapped SRW migratory corridor and nursery grounds (which favour waters &lt;10m depth and generally limited to 2km from the shore) and therefore will not be impacted. Limited numbers of individuals are present within Bass Strait, with less than 10% of the Australian SRWs distributed east of Adelaide.</p> <p>The costs associated with the addition of MMOs on the support vessels is grossly disproportionate to the potential environmental benefits.</p>	Not adopted.

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
<p>Continuous monitoring of the observation zone from dedicated MMO <u>vessel/s</u> to inform support vessel shutdowns</p>	<p>Minimise behavioural impacts.</p>	<p><b>Cost:</b> Estimated at approximately \$30,000 per day.</p> <p>The field of vision remains limited from the support vessel, so the vessel/s will need to transit the entirety of the observation zone for this to be an effective control.</p> <p>There are few locally- or regionally-based vessels large enough to spend continuous time at sea for this activity and meet Esso's required safety standards.</p> <p>Additional vessels may actually increase the risk of vessel strike with cetaceans and increase underwater sound impacts and will result in other routine vessel-related impacts and risks (e.g., GHG emissions).</p> <p>While this control measure would add to the paucity of data on PBW and SRW presence and absence in eastern Bass Strait, the costs are disproportionate to the potential environmental benefit for this activity.</p> <p>The cost to implement this control measure is grossly disproportionate to the environmental benefit and may actually contribute to increased environmental risk.</p>	<p>Not adopted.</p>
<p>Undertake <u>pre-activity aerial</u> survey within the behavioural zone for PBW and SRW</p>	<p>Adopting this control measure can monitor the behavioural zone and increases the confidence that there are no foraging PBW or SRW in the behavioural or TTS zones that could be displaced upon the start of LWIV DP activities.</p>	<p><b>Cost:</b> Approximately \$50,000 per flight, including MMOs.</p> <p><b>Limitations:</b> Flights in small aircraft over open water introduce significant safety risks, and there is no guarantee that whales will be spotted.</p>	<p>Not Adopted.</p>
<p>Undertake pre-activity <u>vessel-based</u> observations within the behavioural zone for</p>	<p>Increases the confidence that there are no foraging PBW or SRW in the behavioural or TTS zones that could be</p>	<p><b>Cost:</b> No additional costs. Bridge crew and personnel are trained in the process for visual observations of whales and will report any sighting whilst on route to the LWIV.</p>	<p>Adopted.</p>

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
PBW and SRW while on route to the OA	displaced upon the start of LWIV DP activities.	<b>Limitations:</b> Vessel-based surveys do not guarantee that whales will be sighted, and the field of vision from the vessel (which depends on height of observation) only covers a small portion of the behaviour zone at any point in time. Observations can be hampered by the same reasons outlined for aerial flights (glare, rough seas, mist/fog). Vessel-based observations take longer to complete than aerial observations.	
Dedicated daily aerial surveys of the observation zone during the activity	Minimise behavioural impacts. Provides advanced notice of the potential need to activate the support vessel shutdown procedure. Adds to the knowledge of whale distribution in the region.	<b>Cost:</b> Estimated at \$50,000/day. It also comes with environmental costs (e.g. GHG emissions from fuel use). <b>Limitations:</b> Adding additional aerial flights adds additional safety risks. Sourcing and retaining a pool of additional MMOs to undertake aerial surveys in the current tight market for MMOs is likely to be challenging and costly. While this control measure would add to the current paucity of data on PBW and SRW distribution and abundance in eastern Bass Strait, the costs and safety risks are grossly disproportionate to the potential environmental benefit for this activity.	Not adopted.
Move support vessel away from LWIV during vessel unloading/loading if a PBW/SRW is observed.	Minimise noise source.	If loading/unloading activities are able to be stopped safely and quickly, they will be ceased and the support vessel will move away from the LWIV until the whale moves out of the observation zone radius or when 30 minutes have lapsed since the last sighting. If a vessel is alongside the LWIV undertaking loading/unloading and a whale is sighted, it may not be practicable or safe for the activities to cease and the vessel to move away (e.g. during diesel bunkering, or complex lifts). It may take some time to cease the activity of loading/unloading in a safe manner, by which time it is likely that an individual whale would have passed. If feasible, vessels in this scenario will reduce thrusters and adjust heading (CMP33) and this will help minimise noise and disturbance.	Adopted subject to safety considerations.

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
Undertake aerial surveillance with drones	Monitoring and detection.	<p>Drones have been considered as a method of increasing the observation distance of MMOs and monitoring the PTS, TTS and observation zones. Drone surveys have been carried out for cetaceans mainly in the nearshore marine environment via beach operations.</p> <p>Additionally, Esso adopted the use of sophisticated drones during Seahorse/Tarwhine P&amp;A activities to extend the field of vision from the bridge. Observations were made by the MMO from the bridge in all circumstances, well before a drone could be launched. And in all cases, whale observations were confirmed by means of binoculars and photograph/video images from the bridge, rather than through use of a drone.</p> <p>Drone surveys have not proven to be effectively used as a real-time monitoring method. Drone effectiveness offshore is limited due to the following:</p> <ul style="list-style-type: none"> <li>• physical range of drones is only approximately 4-5km</li> <li>• drone operations are sensitive to wind, particularly gusting winds, and excessive wave action while launching and retrieving, which would limit the use of this equipment</li> <li>• technical support and operators required</li> <li>• Any sightings are far easier spotted from the bridge, using powerful binoculars, or even with the naked eye, rather than with a drone, even when it is equipped with a high-definition camera with remote display on the bridge.</li> </ul> <p>Given two MMOs will be present, the extra observation distance that may be afforded through the use of drones provides negligible observation benefit. The additional cost, safety issues and operational limitations outweigh the negligible environmental benefit.</p>	Not adopted.
Use of Passive Acoustic Monitoring (PAM)	Monitor for cetaceans	As a cetacean detection method, PAM has been used to detect whales that vocalise at high frequencies/intensities such as (HFC and VHFC	Not adopted

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
		<p>(e.g., sperm whales) and, in conjunction with visual monitoring, can enhance cetacean detection effectiveness.</p> <p>PAM has the advantage of potentially detecting cetaceans during night hours and during periods of poor visibility when they cannot be visually detected.</p> <p>Although PAM can be a valuable tool in identifying the presence of cetaceans, the following factors limit its effectiveness:</p> <ul style="list-style-type: none"> <li>• most suitable for HFC and VHFC, which are generally of lower concern in this region compared to LFC. It is difficult for PAM to pick up vocalisations of LFC such as blue whales and SRW</li> <li>• bearing accuracy and range estimation is limited because it is not as accurate as visual observations.</li> </ul> <p>The use of an experienced MMO negates the need for using PAM given that LFC (which surface to breath more regularly than deeper-water HFC and VHFC) will generally be able to be easily detected.</p>	
Operate autonomous monitoring gliders to detect PBW and SRW in the observation zone	<p>Gliders could enhance the ability to detect the presence of whales where MMOs cannot.</p> <p>Cost can be less than the use of dedicated MMO vessels, thereby eliminating the option for vessels.</p> <p>Can provide information on whale locations, including proximity to activity location.</p>	<p><b>Cost:</b> Unconfirmed but advised by knowledgeable personnel to be less than the cost of operating a support vessel. Eliminates the need for MMOs, though an operator would take the place of one MMO.</p> <p><b>Limitations:</b> Scarce availability of commercially proven underwater sound monitoring gliders in Australia.</p>	Not adopted.
Use of satellite imagery to detect whales	Increases the detection distance to enable early	A number of satellite types exist, however the most suitable for monitoring whales is Digital Globe's WorldView3 Satellite which uses 30 cm resolution. This is recommended by a study by Cubaynes et al	Not adopted

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
	warning of potential supply vessel DP shutdown.	<p>(2018) due to the better resolution that is needed to confidently identify objects such as whales (e.g., characteristic features such as flippers and flukes that are not easily detected on lower resolution images (e.g., 50 cm), and which are essential for identifying an object such as a whale, and for differentiating between species (e.g., PBW vs another large baleen whale)).</p> <p><b>Limitations:</b> Several factors make the use of satellite imagery to monitor for whale presence unviable, including:</p> <ul style="list-style-type: none"> <li>• Uncertainty as to whether satellite image quality will be sufficient to identify whales.</li> <li>• There will be a lag between when the satellite images are being taken and when Esso will receive them. Additional time will then be required to analyse the images. This delay makes satellite imagery unsuitable for making a decision to mobilise or to begin operations.</li> </ul> <p>Whales need to be at or above the sea surface to be identifiable – therefore submerged whales, even if just below the surface, will be missed.</p> <p>This unreliability of this technology for the purpose of whale identification, together with the cost, make this control measure grossly disproportionate to any environmental benefits.</p>	
Deploy bubble curtains around the LWIV	Reduce the potential for TTS or PTS.	<p>Bubble curtains are sometimes utilised within offshore construction projects that involve piling or detonation of explosives. The bubble curtain (perforated hose) is deployed to the seabed and encompasses the noise source in an aim to obscure noise transmission, resulting in a reduction of received sound levels to receptors outside of the bubble curtain. Circa 15 dB noise attenuation has been reported for impulsive noise from piling; efficacy is dependent on various factors.</p> <p><b>Limitations:</b> The deployment of bubble curtains for this activity is limited by the following factors:</p>	Not adopted

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
		<ul style="list-style-type: none"> <li>Water depth – the maximum working depth of bubble curtains is typically &lt;100m. Providing oil-free air to the seabed would require a large quantity of large diesel-run air compressors housed on at least one additional dedicated DP support vessel, which would add more underwater sound.</li> <li>Currents – bubble curtains are drastically impacted by currents. Current speeds and directional shifts with wind and tide would result in bubble curtains being distorted and ineffective by the time bubbles rise from the seabed to surface.</li> </ul> <p>Alternate options such as the deployment of hoses on the LWIV pontoons at thruster locations, or offset on nearby buoys present SIMOPS and safety risks, including congestion of the safety zone and potential interference with/from thrusters from the supply vessels.</p> <p>This control measure is not technically feasible at the activity location.</p>	
<p>Undertake vessel loading/unloading during daylight hours only (i.e. when visual observations can be made)</p>	<p>Minimises the potential for TTS impacts.</p>	<p><b>Limitations:</b> Bass Strait can experience extreme and dangerous environmental conditions (high winds and seas states). As such, it is often a case of finding windows of opportunity that are considered safe for deliveries to/from facilities; weather limits are outlined in safety documentation such as facility Safety Cases. To only undertake loading/unloading activities during daylight periods may result in long and unacceptable periods when vessels cannot attend the LWIV when it is safe to do so. This will also increase vessel time offshore and the associated vessel related risks.</p> <p>Commencing loading/unloading operations at night or in low visibility conditions (i.e. when observations cannot extend to the extent of the observation zone) can only occur if there have been no sightings of individual PBW or SRW in the observation zone in the preceding 3 daylight hours.</p>	<p>Conditionally adopted.</p>

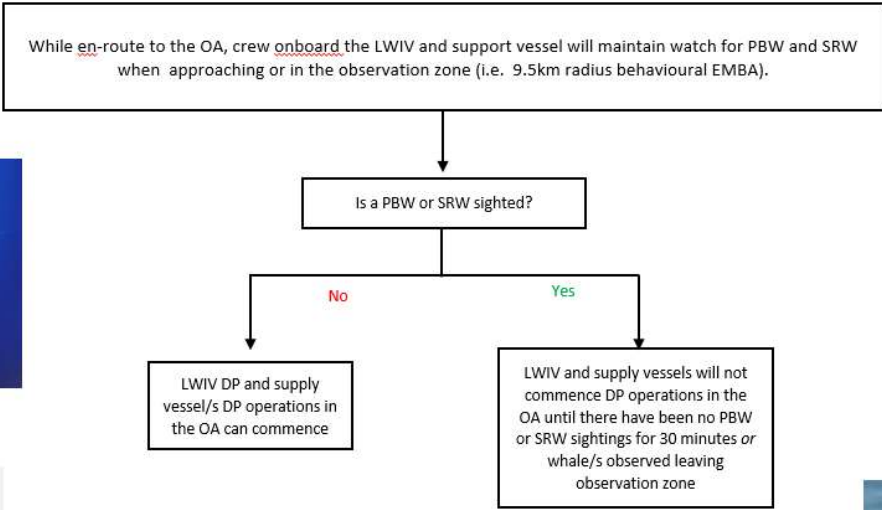

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted Y/N
Limit the number of vessels alongside the LWIV	Reduce the potential for TTS or PTS.	<p><b>Limitation:</b> None. Only one support vessel will be operating within the OA at any one time.</p> <p>This is a standard control measure and is therefore adopted.</p>	Adopted.
Limit the duration that support vessel is alongside the LWIV	Minimises the potential for TTS impacts.	<p><b>Limitations:</b> Vessels are only alongside a LWIV for the minimum time required to safely load/unload, which is usually six hours. If a support vessel is alongside the LWIV undertaking loading/unloading and a whale is sighted, it may not be practicable or safe for the activities to cease and the vessel to move away (e.g. during complex lifts).</p> <p>It may take some time to cease the activity of loading/unloading in a safe manner, by which time it is likely that an individual whale would have passed through the shutdown zone. If feasible, vessels in this scenario will reduce thrusters and adjust heading (CMP33) and this will minimise noise and disturbance.</p> <p>If loading/unloading activities can be stopped safely and quickly, they will, and the supply vessel will move away from the LWIV until the whale moves out of the observation zone or when 30 minutes have lapsed since the last sighting (CMP33).</p> <p>This control measure is adopted subject to safety considerations at the time it needs to be implemented.</p>	Conditionally adopted.

### Adaptive Whale Management Procedure – Pre-Start

\*Observation zone = 9.53 km radius around the LWIV while using DP on location.

LWIV = lightweight intervention vessel  
OA = operational area, 500-m radius around each well (also doubles as the petroleum safety zone, PSZ)  
PBW = pygmy blue whale  
SRW = southern right whale  
DP = dynamic positioning  
MMO = marine mammal observer

### Adaptive Whale Management Procedure - Operations

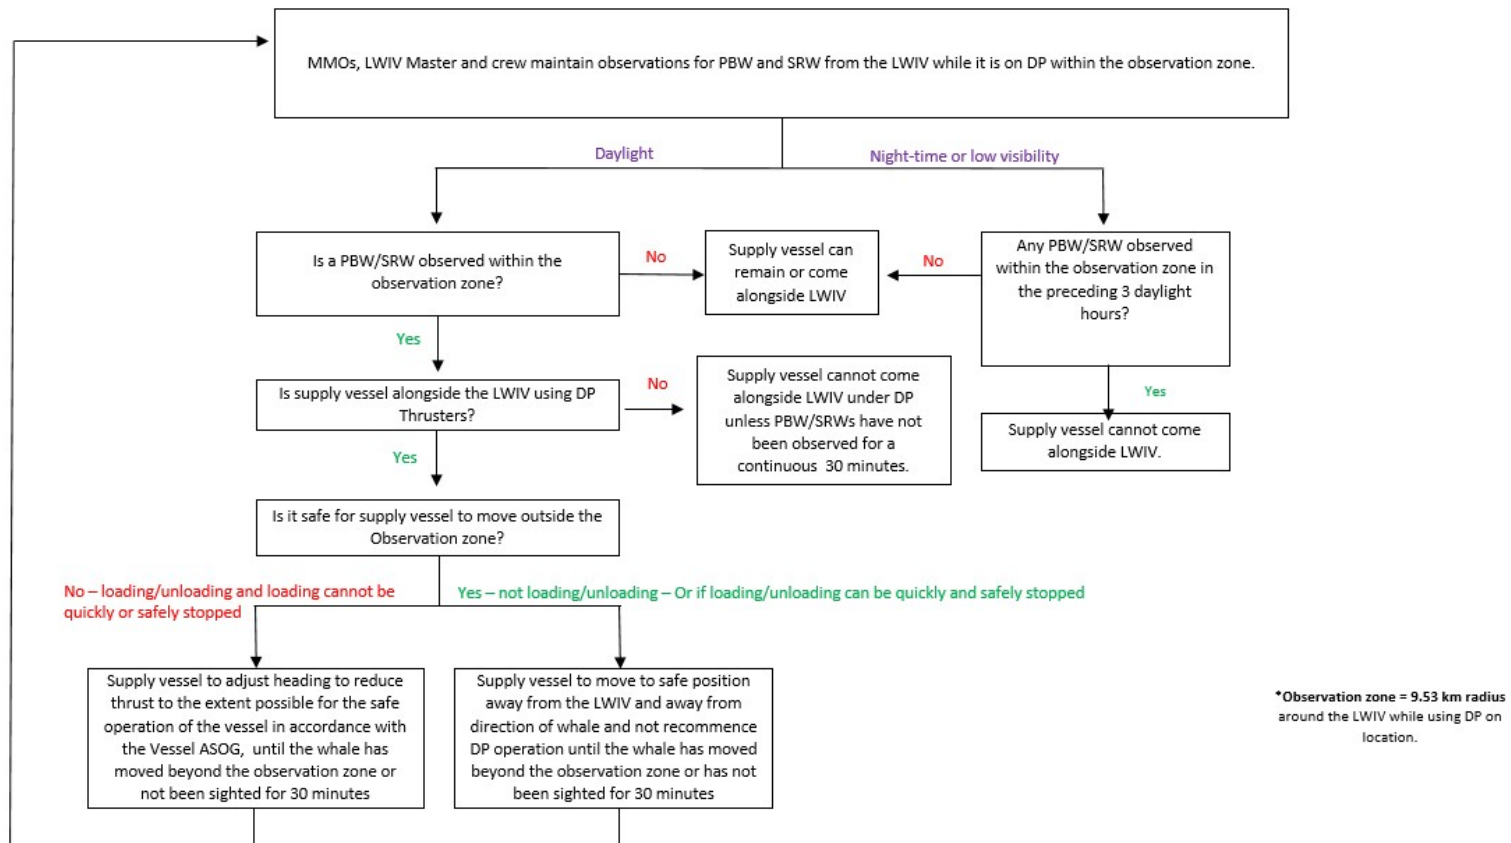

Figure 5-5 Adaptive whale management procedure

## 5.4.9 Demonstration of acceptability

Table 5-32 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
Principles of ESD	No potential to affect biological diversity and ecological integrity.	✓	The impacts associated with this aspect are potentially significant but moderate in size/scale and medium-term, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activity is not considered as having the potential to result in long term or irreversible environmental damage.
Legislative and other requirements	Legislative and other requirements have been identified and met.	✓	<p>Requirements of Part 8 Division 8.1 of the EPBC Regulations, although more relevant to tourism activities (e.g., whale watching), have been adopted.</p> <p>The following other requirements were identified as relevant to impacts from sound emissions. Noise interference is a recognised threat to these species and proposed controls are consistent with conservation/management actions where specified:</p> <ul style="list-style-type: none"> <li>• CMPBW</li> <li>• Conservation Advice for humpback whales (TSSC, 2015)</li> <li>• CMPSRW</li> <li>• Conservation Advice for sei whales (TSSCb, 2015)</li> <li>• Conservation Advice for fin whales (TSSCa, 2015)</li> <li>• <i>Recovery Plan for Marine Turtles in Australia, 2017-2027</i> (DoEE, 2017)</li> <li>• <i>Recovery Plan for the White Shark (Carcharodon carcharias)</i> (DSEWPAC, 2013)</li> <li>• <i>Issues Paper for the Australian Sea Lion (Neophoca cinerea)</i> (DSEWPAC, 2013)</li> </ul>
Internal context	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and

Factor	Demonstration criteria	Criteria met	Rationale
			apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to sound emissions (except those associated specifically with marine geophysical operations) but the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objective to clearly define and communicate OIMS requirements to contractors.</li> </ul>
<b>External context</b>	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning sound emissions.

## 5.5 Light emissions

### 5.5.1 Sources of light emissions

Both the LWIV and support vessels are equipped with navigational and safety lights. It is expected that operations will be conducted 24 hours a day.

### 5.5.2 Impacts of light emissions

Impacts of light emissions considered are:

- change in fauna behaviour (attraction of light sensitive species affecting predator-prey dynamics; behavioural disturbance leading to injury/mortality).

### 5.5.3 Impact assessment

Receptors that could be affected by light emissions and that have been identified in Volume 1 as occurring in the area are identified in Table 5-33.

Table 5-33 Impact scoping

Impacts	Receptors				
	Plankton	Fish	Marine reptiles – Turtles	Birds	Marine mammals
Change in fauna behaviour	✓	✓	✓	✓	✓

### 5.5.3.1 Change in fauna behaviour

#### Plankton and fish

Plankton and fish (and marine invertebrates such as squid) may be directly or indirectly attracted to lights at distances of up to 5 kilometres (Shell, 2010)), leading to aggregation at the surface and increased predation.

The proportion of zooplankton exposed and subjected to higher predation rates within the vessel light field is negligible.

The OA is within a distribution BIA for the great white shark; however, no threats have been identified in the Recovery Plan for the Great White Shark. For fish and squid, impacts are expected to be localised and short-term (behavioural change i.e. attraction will cease once the light ceases), any potential effect of increased predation would be undetectable at a population level and is considered inconsequential.

#### Marine reptiles – turtles

Light pollution can be an issue along, or adjacent to, turtle nesting beaches where emerging hatchlings orient to, and head towards, the low light of the horizon unless distracted by other lights which disorient and affect their passage from the beach to the sea (Commonwealth of Australia, 2017).

Three listed/threatened species of marine turtle may occur within the OA, although there are no BIAs or critical habitats, and all marine turtles are known to have a more northerly distribution. The *Recovery Plan for Marine Turtles in Australia, 2017 – 2027* (DoEE, 2017) lists light pollution as a key threat, however this relates specifically to turtle hatchlings and nesting sites. It is anticipated that the light emissions from the activities within the OA do not impact on marine turtles.

#### Birds

Birds may be attracted to vessels at night due to light glow. Bright lighting can disorientate flying birds resulting in behavioural changes e.g. circling light sources leading to disrupted foraging and starvation, or exhaustion (leading ultimately to injury or mortality near the light source) (Wiese, et al., 2001).

Seabirds that are active at night while migrating, foraging or returning to colonies that are directly affected include petrels, shearwaters, albatross, noddies, terns and some penguin species. Fledglings are more affected by artificial lighting than adults due to the synchronised mass exodus of fledglings from their nesting sites. They can be affected by lights up to 15 kilometres away (Commonwealth of Australia, 2020).

Artificial light can cause significant impacts on *Procellariiformes* (petrels, storm petrels, gadfly petrels, diving petrels and shearwaters) that breed in burrows and only attend breeding colonies at night (Commonwealth of Australia, 2020). Fledglings often become disoriented and grounded because of artificial light adjacent to rookeries as they attempt to make their first flight to sea, a phenomenon known as 'fallout'. The effects of artificial lighting from road lighting on short-tailed shearwater fledglings were investigated (Rodríguez, et al., 2014). The study established that, by removing the light source from nesting areas, there was a decrease in grounded fledglings and a corresponding reduction in bird fatalities. Less studied are the effects of light on the colony attendance of these nocturnal species which could lead to higher predation risks by gulls, skuas or other diurnal predators (Commonwealth of Australia, 2020).

The OA is more than 20 kilometres offshore however it is within foraging BIAs for black-browed albatross, Campbell albatross (*Thalassarche impavida*), Indian yellow-nosed albatross, wandering albatross, Buller's albatross (*Thalassarche bulleri*) and shy albatross. Light emissions are not identified as a threat for these species in the *National Recovery Plan for Threatened Albatrosses and Giant Petrels 2011-2016* (DSEWPAC, 2011). The closest breeding BIAs for light-sensitive seabirds which may forage in the area, short-tailed shearwaters and common diving petrels (*Pelecanoides urinatrix*), are located on the Tasmanian islands of Bass Strait over 100 kilometres away from where P&A activities will be occurring.

Any impacts to migratory or foraging birds from light emissions will be highly localised and short-term (behavioural disturbance will cease once the light ceases). Injury/mortality of transient individuals disturbed by the presence of lighting from the LWIV or support vessels will not affect population levels.

### Marine mammals

There is no evidence to suggest that artificial light sources adversely affect the migratory, feeding or breeding behaviours of cetaceans. Cetaceans predominantly utilise acoustic senses to monitor their environment rather than visual sources (Simmonds, Dolman, & Weilgart, 2003), so light is not considered to be a significant factor in cetacean behaviour or survival.

The potential impacts from light emissions are conservatively considered to be Consequence Level III as this type of activity may result in highly localised, short-term impacts to seabird species of recognised conservation value, but is not expected to affect the population or local ecosystem functions.

#### 5.5.4 Controls

**Table 5-34 Environmental performance**

EPO	Control	EPS	Measurement criteria
Lighting will be limited to that required for safe navigation and work requirements.	<b>CMP30:</b> Lighting will be limited	Lighting will be limited to that required for safe navigation and work requirements, with unnecessary light spill to sea minimised.	Inspection confirms light spill to sea is minimised except where required for safe work/navigation.

5.5.5 Demonstration of As Low as Reasonably Practicable

Table 5-35 ALARP Decision Context and justification

<b>ALARP Decision Context A</b>	<p>The use of navigational lights and other lights to enable 24-hour operations to be undertaken, are routine activities in the offshore petroleum sector and are required for the safety of the vessels and the crew. Other 24-hour vessel operations are not unusual in this area. Commercial fishing activities and merchant vessels in Bass Strait use similar navigational lights or other lights for safety purposes.</p> <p>Good practice measures, minimising external lighting to reduce exposure and incident reporting (refer to Volume 4 Table 2-2) are implemented in accordance with the National Light Pollution Guidelines for Wildlife (Commowearth of Australia, 2020).</p> <p>The impacts associated with light emissions are well understood and the most significant impacts of light emissions are generally associated with operating within close proximity of shorelines that support light sensitive bird species. The impact assessment undertaken has identified that impacts are non-existent or inconsequential for all marine fauna other than several species of foraging seabird (albatross) which may be affected by a highly conservative Consequence Level III impact, due to their threatened/vulnerable status.</p> <p>No objections or claims were raised by relevant persons with regard to light emissions.</p> <p>Esso believes ALARP Decision Context A should apply.</p>

### 5.5.6 Demonstration of acceptability

Table 5-38 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
Principles of ESD	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in non-existent or inconsequential impacts for all marine fauna other than several threatened species of foraging seabird (albatross) which may be affected by a highly conservative Consequence Level III impact thus are not considered as having the potential to result in serious or irreversible environmental damage.
Legislative and other requirements	Legislative and other requirements have been identified and met.	✓	Management actions for seabirds and migratory shorebirds contained in the <i>National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds</i> (Commonwealth of Australia, 2020) have been adopted where relevant for LWIV/vessel-based activities.  The following other requirements were identified as relevant to impacts from light emissions. Light pollution is a recognised threat to these species and proposed activity is consistent with conservation/management actions where specified:

Factor	Demonstration criteria	Criteria met	Rationale
			<ul style="list-style-type: none"> <li>Recovery Plan for Marine Turtles in Australia, 2017-2027 (DoEE, 2017).</li> </ul>
Internal context	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to light emissions (except that associated specifically with flaring reduction which is not relevant to this EP) but the activities proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>OIMS System 8-1 objective to qualify, evaluate and select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning light emissions.

## 5.6 Planned discharge – Treated bilge water and deck drainage

### 5.6.1 Sources of treated bilge water and deck drainage

Bilge water consists of oily water that has accumulated in the lowest part of the vessel/LWIV typically from closed deck drainage and machinery spaces. Bilge water is treated onboard the vessel or LWIV using the oily water separator to reduce the discharge to below the regulated level of less than or equal to 15 parts per million. Oily content exceeding the 15 parts per million set levels routes the discharge to oily water separator 2, which recirculates treated water back to the hazardous drain holding tank. Clean water is recirculated until the oil content returns to below set levels. Sludge from the oily water separator 2 is transferred to sludge tank 2 (refer to Section 3.10.8.3 of *Q7000 Safety Case (Australia)* (Helix, 2021)).

Deck drainage comprising seawater from waves/spray, rainwater and deck wash water, may contain minor quantities of detergents, and oil and grease which has been spilled on the deck.

### 5.6.2 Impacts of treated bilge water and deck drainage discharge

Impacts of the discharge of treated bilge water and deck drainage considered are:

- change in water quality.

### 5.6.3 Impact assessment

Receptors affected by the discharge of treated bilge and deck drainage and that have been identified in Volume 1 as occurring in the area are identified in Table 5-39.

**Table 5-39 Impact scoping**

Impacts	Receptors	
	Plankton	Fish
Change in water quality	✓	✓

#### 5.6.3.1 Change in water quality

A discharge of treated bilge or deck drainage is non-continuous and infrequent. Given the nature of bilge or deck washing discharges, marine fauna most susceptible to toxic impacts are mainly limited to less mobile fish embryo, larvae, and other plankton. There is potential for short-term impacts to species that rely on plankton as a food source. Any impact to prey species would be temporary as the duration of exposure would be limited, and fish larvae and other plankton are expected to rapidly recover as they are known to have high levels of natural mortality and a rapid replacement rate (UNEP, 1985).

**Consequently, the potential impacts from planned discharge of treated bilge and deck drainage are considered to be localised and short-term and have been rated as**

**CONSEQUENCE LEVEL IV**

### 5.6.4 Controls

**Table 5-40 Environmental performance**

EPO	Control	EPS	Measurement criteria
Deck drainage discharges comply with MARPOL Annex V requirements.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex V as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.

	Meets ExxonMobil Environmental Standards.	✓	The proposed controls meet the requirements of the Upstream Water Management Standard specifically "to meet regulatory requirements and legally binding agreements".
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>OIMS System 8-1 objective to qualify, evaluate and select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning treated bilge water and deck drainage discharges.

## 5.7 Emissions to air

### 5.7.1 Sources of emissions to air

The use of fuel, specifically MDO used to power engines, generators and mobile and fixed plant (e.g. ROV, cranes), and the possible venting of natural gas from the LWIV fluids handling package, will result in gaseous emissions of greenhouse gases (GHG) such as carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>) and nitrous oxide (N<sub>2</sub>O), along with non-GHG emissions such as sulphur oxides (SO<sub>x</sub>) and nitrous oxides (NO<sub>x</sub>).

As per the *Greenhouse Gas Protocol: a Corporate Accounting and Reporting Standard* (World Resources Institute and World Business Council for Sustainable Development, 2004), GHG emissions are classified as:

- Scope 1 – GHG emissions that a company makes directly
- Scope 2 – GHG emissions a company makes indirectly such as through the purchase of electricity

- Scope 3 – GHG emissions associated, not with the company itself, but that the organisation is indirectly responsible for, up and down its value chain. For example, from buying products from its suppliers and the emissions associated with making the products, and from its own products when customers use them.

For the purposes of this activity, the following applies:

- Scope 1 – GHG emissions associated with the activity (i.e. Combustion of MDO from the vessel engines, generators and fixed and mobile deck equipment during the activity). Since the LWIV is operated by Helix, these emissions are reported by Helix.
- Scope 2 – are not relevant to this activity as no electricity is purchased
- Scope 3 – is not relevant for this activity as the production, transport and use of fuel is not included within the activity.

The following fuel combustion and gas venting data applies to this activity:

- LWIV - estimated to be 24 m<sup>3</sup>/day of MDO use while using DP thrusters. At an estimated 60 days for the activity, this equates to 1,440 m<sup>3</sup> of MDO.
- Support vessel – estimated to be very low while in the OAs, about 1 m<sup>3</sup>/day, equating to 60 m<sup>3</sup> for the duration of the activity.
- Gudgeon-1 gas venting contingency in the event of unexpected trapped gas– estimated at 566 m<sup>3</sup>.

#### 5.7.2 Terakihi-1 gas venting contingency in the event of unexpected trapped gas – estimated at 22,653 m<sup>3</sup>. Impacts of emissions to air

Impacts of atmospheric emissions considered are:

- change in air quality (localised and temporary decrease in air quality)
- contribution to the global GHG effect.

#### 5.7.3 Impact assessment

Receptors affected by emissions to air and that have been identified in Volume 1 as occurring in the area are identified below.

**Table 5-45 Impact scoping**

Impacts	Receptors		
	Birds	Marine reptiles – Turtles	Marine mammals
Change in air quality	✓	✓	✓
Contribution to the GHG effect	✓	✓	✓

##### 5.7.3.1 Decrease in air quality

A recent review of the National Environment Protection (Ambient Air Quality) Measure (National Environment Protection Council, 2021) recommended that exposure to nitrogen dioxide (NO<sub>2</sub>) on an hourly basis should be below 0.08 parts per million and on an annual

average of less than 0.015 parts per million. BP has modelled NO<sub>2</sub> emissions from a MODU power generation for an offshore project (BP, 2013). NO<sub>2</sub> is the focus of the modelling as this considered the main (non-greenhouse) atmospheric pollutant of concern, on account of the larger predicted emission volumes compared to the other pollutants, and the potential for NO<sub>2</sub> to impact on human health (as a proxy for environmental receptors). Results of this modelling indicated that even the highest hourly averages (0.00039 parts per million or 0.74 micrograms per cubic metre) were restricted to within approximately 5 kilometres from the offshore MODU (BP, 2013), which is also expected to apply to the LWIV

Potential receptors above the sea surface within 5 kilometres of the activity that may be exposed to reduced air quality include seabirds and marine fauna that surface for air (e.g. cetaceans and turtles). The OA is within the foraging BIAs for the PBW and some seabird species, however given that emissions will quickly dissipate, the potential for any exposure to reduced air quality is not expected to affect the health of these fauna.

Given there is minimal venting of gases required as the fluids are processed through the fluids return handling package as described in Section 2.5.1 (including the low volume and slow release rates if venting does occur), this activity is not expected to generate exposures significant enough to result in impacts to any identified environmental receptors.

#### 5.7.3.2 Contribution to the global greenhouse gases effect

The following CO<sub>2</sub>-e Scope 1 GHG emissions apply to this activity using the National Greenhouse and Energy Reporting (NGER) online calculator:

- LWIV - 65 tonnes CO<sub>2</sub>-e/day, for a total of 3,902 tonnes CO<sub>2</sub>-e
- Support vessel – a total of 163 tonnes CO<sub>2</sub>-e
- Gudgeon-1 gas venting – 1 tonne CO<sub>2</sub>-e
- Terakihi-1 gas venting – 46 tonnes CO<sub>2</sub>-e.

In total, it is estimated that up to 4,112 tonnes CO<sub>2</sub>-e of Scope 1 GHG emissions will be generated for the activity, which represents 0.22% of ExxonMobil's Australian total Scope 1 emissions for the 2021-22 financial year (as per the NGERs reporting).

While these emissions add to the GHG load in the atmosphere, which adds to global warming effect, they are relatively small on a global scale. The activity is similar to other industrial activities contributing to the accumulation of GHG in the atmosphere. Consequently, no further evaluation has been undertaken.

**The potential impacts from atmospheric emissions are considered to be**

#### **CONSEQUENCE LEVEL IV**

**as this type of activity may result in localised, short-term impacts to species of recognised conservation value, but is not expected to affect local ecosystem functions**

5.7.4 Controls

Table 5-46 Environmental performance

EPO	Control	EPS	Measurement criteria
Fuel combustion equipment complies with the requirements of MARPOL Annex VI.	<b>CM9:</b> Class certification	Vessel compliant with MARPOL Annex VI as appropriate to vessel class.	Vessels have class certification verified and issued by IACS member.

5.7.5 Demonstration of As Low As Reasonably Practicable

Table 5-47 ALARP Decision Context and justification

<b>ALARP Decision Context A</b>	<p>Emissions to air from venting and fuel combustion generated by vessels and other offshore facilities is a common occurrence both nationally and internationally.</p> <p>Managing the impacts from emissions to air is well understood with good practice controls that are well implemented by the industry. Emissions will dissipate rapidly and the consequence of any impact assessed as Consequence Level IV (the lowest level).</p> <p>No objections or claims were raised by relevant persons with regard to emissions to air.</p> <p>Esso believes ALARP Decision Context A should apply.</p>
---------------------------------	---

Table 5-48 Good practice controls

Good practice	Adopted	Control	Rationale
MARPOL Annex VI Regulations for the Prevention of Air Pollution from Ships.	✓	<b>CM9:</b> Class certification	<p>The vast majority of commercial ships are built to and surveyed for compliance with the standards (i.e. Rules) laid down by classification societies. The role of vessel classification and classification societies has been recognised by the IMO across many critical areas including the SOLAS, the 1988 Protocol to the International Convention on Load Lines and the MARPOL.</p> <p>A vessel built in accordance with the applicable Rules of an IACS member society may be assigned a class designation relevant to the IMO rules, on satisfactory completion of the relevant classification society surveys. For ships in service, the society carries out routine scheduled surveys to verify that the ship remains in compliance with those Rules. Should any defects that may affect class become apparent, or damages be sustained between the relevant surveys, the owner is required to inform the society concerned without delay.</p>

Good practice	Adopted	Control	Rationale
			MARPOL Annex VI specifically require vessels (as appropriate to class) hold an International Air Pollution Prevention certificate and one Engine International Air Pollution Prevention certificate for each diesel engine of $\geq 130\text{kW}$ ; vessel engine NO <sub>x</sub> emission levels comply with Regulation 13; sulphur content of any fuel oil used on board does not exceed 5.5%; and ongoing maintenance of engines, generators and deck equipment to ensure efficient operation.

	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>OIMS System 8-1 objective to qualify, evaluate and select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning emissions to air.

## 5.8 Planned discharge – Cement

### 5.8.1 Sources of cement discharge

P&A activities use cement for the setting of abandonment plugs and will result in planned discharges of cement.

The estimated volumes of cement discharged to the environment include:

- a small proportion of dry cement from the bulk transfer process may be blown overboard during pneumatic transfer operations
- in the event that a pumped cement plug fails to set, potentially up to 135 barrels per well (depending on the design requirements) of cement slurry will be circulated out and discharged at the surface.

- washing the cementing pump, piping and blending tanks with seawater to prevent curing, resulting in a release of cement/water mix (surface discharge of approximately 20 barrels (3 cubic metres per well)).

At the end of the Gudgeon-1 and Terakihi-1 P&A activities, excess dry cement remaining in the cement storage silos will remain onboard the *Q7000* for its subsequent petroleum activities. Where cement cannot be transferred to the next operator it will be mixed with seawater and discharged overboard.

### 5.8.2 Impacts of cement discharges

Impacts of the planned discharge of cement on marine fauna considered are:

- change in water quality (increased turbidity of the water column and potential toxicity).

### 5.8.3 Impact assessment

Receptors affected by discharge of cement and that have been identified in Volume 1 as occurring in the area are identified in Table 5-51.

**Table 5-51 Impact scoping**

Impacts	Receptors	
	Plankton	Fish
Change in water quality	✓	✓

#### 5.8.3.1 Change in water quality

##### Increased turbidity in the water column

Cementing fluids are not routinely discharged to the marine environment at the surface; however, volumes of a cement-water mix may be released in surface waters during equipment washing. The cement particles will disperse under action of waves and currents, and eventually settle out of the water column; the initial discharge will generate a downwards plume, increasing the initial mixing of receiving waters.

Modelling of the release of 18 cubic metres of cement wash water (De Campos, Paiva, Rodrigues, Ferreira, & Junior, 2017) indicate an ultimate average deposition of 0.05 milligrams per square metre of material on the seabed; with particulate matter deposited within the three-day simulation period. Given the low concentration of the deposition of the material, it is therefore expected that the in-water suspended solids (i.e. turbidity) created by the discharge is not likely to be high for an extended period of time, or over a wide area.

Modelling of larger cement discharges was undertaken by BP (BP, 2013), which is useful as a conservative comparison of the potential impacts from this activity. This modelling was undertaken for significantly larger discharges at surface, i.e. 480 barrels per hour (equivalent to approximately 76 cubic metres per hour) and intermittent surface discharge of cement (following flushing of lines and equipment) in shallower water depths. The BP modelling results provide a high level of conservatism and as such is considered appropriate to apply for this program. The modelling indicates that two hours after the start of discharge, plume concentrations are between 5 to 50 milligrams per litre with the horizontal and vertical extents of the plume approximately 150 metres and 10 metres respectively (BP, 2013). Four hours

after the start of the discharge, the modelling indicates that the plume will have completely dispersed to concentrations of less than 5 milligrams per litre (BP, 2013).

The PBW has distribution and foraging habitat overlapping the OAs and the SRW migration BIA also overlaps the OAs. Research data detailing potential impacts from suspended solids to megafauna is scarce, however such megafauna is highly mobile, transitory, and able to avoid the plumes. The area of the turbidity plumes is regarded as a very small percentage of the foraging grounds of protected seabirds such as shearwaters, albatrosses, and petrels.

The environmental receptors with the potential for exposure and considered to be most sensitive to an increase in turbidity include pelagic fish species and plankton found in the area around the well locations. The great white shark breeding and distribution BIAs overlap the OAs.

Suspended sediments greater than 500 milligrams per litre are likely to produce a measurable impact upon larvae of most fish species, and that levels of 100 milligrams per litre will affect the larvae of some species if exposed for periods greater than 96 hours (Jenkins & McKinnon, 2006). It is also indicated that levels of 100 milligrams per litre may affect the larvae of several marine invertebrate species and that fish eggs and larvae are more vulnerable to suspended sediments than older life stages.

Neither modelling (De Campos, Paiva, Rodrigues, Ferreira, & Junior, 2017) (BP, 2013) suggests that suspended solids concentrations from a discharge of the cement washing will be at or near levels required to cause an effect on fish or invertebrate larvae.

**Based upon the estimated discharge volumes identified for this program, and the potential impact thresholds (Jenkins & McKinnon, 2006), a discharge of cement from the surface is expected to result in a very short exposure of increased turbidity such that potential impacts would be expected to be localised (i.e. within 150 metres) and short-term (a few hours), and consequences are considered to be**

**CONSEQUENCE LEVEL IV**

### **Potential toxicity**

The potential for toxicity is associated with chemicals that are added to the dry cement mix (cement itself is classed as Poses Little or No Risk (PLONOR) to the environment and as such, toxicity associated with the discharge of cement is limited to the surface discharge of cement slurry or equipment washings (not surface discharge of dry cement).

While the cementing program has not yet been finalised, cement additives will be assessed and approved for discharge in accordance with the Esso Chemical Discharge Assessment Procedure. The procedure uses the Offshore Chemical Notification Scheme (OCNS) ranking in conjunction with toxicity, biodegradation, and bioaccumulation data to determine potential impacts to the environment and acceptability of planned discharges. The process is described as part of the Implementation Strategy in Volume 4.

Table 5-52 Indicative cement additives

Function	OCNS ranking <sup>1</sup>	
	CHARM	Non-CHARM
Antifoaming agent	Silver	
Antifoaming agent/foam breaker	Gold/substitution warning

Lost circulation material		E
Low temperature liquid dispersant	Gold/substitution warning	
Multi-temperature cement retarder	Gold/substitution warning	
Retarder		E
Spacer Additive	Gold/substitution warning	
Spacer viscosifier	Gold/substitution warning	
Well stimulation chemical	Gold/substitution warning	

<sup>1</sup> The OCNS uses the Harmonised Mandatory Control Scheme developed through the OSPAR Convention. This ranks chemical products according to Hazard Quotient, calculated using the Chemical Hazard and Risk Management (CHARM) model.

The environmental receptors with the potential to be exposed and most at risk from an increase in toxicity include pelagic fish species and plankton.

Given exposure to in-water concentrations are expected to be low due to the rapid dispersion and dilution, as shown in previous discharge modelling (BP, 2013), the potential for acute or chronic effects although possible will be limited such that potential impacts will result in a limited local decrease in water quality with a

EPO	Control	EPS	Measurement criteria
All cements and additives planned for discharge approved according to the chemical discharge assessment process.	<b>CM3:</b> Chemical discharge assessment process	All cement and additives planned for discharge are evaluated as acceptable in accordance with the chemical discharge assessment process.	Chemical assessment records confirm evaluation of each component making up cement as acceptable prior to use/discharge and appropriate approvals documented.
			Environmental performance fluid tracking shows cement and additives used.
No discharge of unmixed cement.	<b>CMP5:</b> Cementing procedures	Detailed cementing procedures developed and implemented including no surface discharge of unmixed cement.	Cementing procedures developed and implemented.  Environmental performance fluid tracking verifies no discharge of unmixed cement.

5.8.5 Demonstration of As Low As Reasonably Practicable

**Table 5-54 ALARP Decision Context and justification**

<b>ALARP Decision Context A</b>	<p>The impacts of inert discharges such as cement are well known. The practice of discharging cement to the marine environment is a well understood activity both nationally and internationally and good practice is well defined. Industry good practice control measures are considered sufficient to reduce the impacts and risks associated with this hazard to ALARP.</p> <p>The consequence of any impact associated with these discharges was assessed as Consequence Level IV (the lowest level).</p> <p>No objections or claims were raised by relevant persons with regard to the planned discharge of cement.</p> <p>Esso believes ALARP Decision Context A should apply.</p>
---------------------------------	---

**Table 5-55 Good practice controls**

Good practice	Adopted	Control	Rationale
Discharge of least	✓	<b>CM3:</b> Chemical discharge	This risk control practice requires that new chemicals must be approved prior to use.

environmentally hazardous chemical.		assessment process	This practice assesses chemicals that have the potential to be discharged to the environment (i.e. not household chemicals) to ensure the lowest toxicity, most biodegradable and least accumulative chemicals are selected which meet the technical requirements of the application.
No overboard discharge of unmixed cement.	✓	<b>CMP5:</b> Cementing procedures	It is a general industry standard that unmixed cement is not discharged offshore; this has also been applied to this program.  Where cement cannot be transferred to the next operator at the completion of the LWIV campaign it will be mixed with seawater and discharged overboard.

**Table 5-56 Engineering risk assessment**

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
Dust recovery system	Collects dust from vent lines of bulk storage silos/tanks and reduces the amount of cement emitted into the environment during pneumatic transport.	If space is available and fitting the equipment feasible (e.g. cyclones mounted on a secondary receiving vessel), the cost of retrofitting this equipment, combined with the additional time required during transfer to unload the collected product and transfer it back to the primary storage vessel, and the potential for costly delays due to blockage of the vent lines is considered to outweigh the benefit gained.	Not adopted
Transfer of unused dry cement back to vessel	In the event that excess dry cement could not be transferred to the next operator for use, transferring the unused dry cement back to the vessel would eliminate the need to mix and discharge it overboard.	Transferring excess cement back to the vessels risks contamination issues combined with the additional time required to transfer the cement back to the vessel, combined with the 10% loss of product which occurs through the transfer operations is considered to outweigh the benefit gained. The activity does not intentionally carry excess cement. Cement is also a standard requirement for drilling/P&A operations, therefore it is common practice for excess to be transferred to the next operator.	Not adopted

## 5.8.6 Demonstration of acceptability

Table 5-57 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
Principles of ESD	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in a Consequence Level IV thus are not considered as having the potential to result in serious or irreversible environmental damage.
Legislative and other requirements	Legislative and other requirements have been identified and met.	✓	No environmental legislation or other requirements were deemed relevant.
Internal context	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist"
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to the discharge of cement but the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>• OIMS System 7-1 objective to evaluate change against an established set of criteria and establish endorsement/approval levels</li> <li>• OIMS System 8-1 objective to clearly define and communicate Operations Integrity requirements to contractors.</li> </ul>

Factor	Demonstration criteria	Criteria met	Rationale
<b>External context</b>	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	<p>Community Over Mining Relevant Person asked what Esso would do with the 'left over' cement and fluids.</p> <p>Esso provided information on the controls in place in the Environment Plan for the disposal of cement and fluids.</p> <p>Esso has addressed all Community Over Mining feedback.</p> <p>For Full details see Volume 4 Appendix A – Community over mining</p>

## 5.9 Planned discharges – Subsea

### 5.9.1 Sources of subsea discharges

The following activities have been identified as resulting in subsea discharges during severing and removing surface casing and wellhead. Seabed disturbance associated with wellhead cutting is addressed in Section 5.1.

### 5.9.2 Impacts of subsea discharges

Impacts of planned subsea discharges considered are:

- change in water quality
- change in habitat (and smothering).

### 5.9.3 Impact assessment

Receptors affected by planned operational discharges and that have been identified in Volume 1 as occurring in the area are identified in Table 5-58.

**Table 5-58 Impact scoping**

Impacts	Receptors		
	Benthic habitat – Bare substrate	Plankton	Fish
Change in water quality		✓	✓
Change in habitat	✓		
Smothering	✓		

#### 5.9.3.1 Change in water quality

Early life stages of fish (embryos, larvae) and other plankton would be most susceptible to the toxic exposure from chemicals in the discharges, as they are less mobile and therefore can

become exposed to the plume at the outfall. However, these are expected to rapidly recover once the activity ceases, as they are known to have high levels of natural mortality and a rapid replacement rate (UNEP, 1985).

As such, exposure of planktonic communities is not considered to result in significant impacts on population levels of organisms that would affect ecological diversity or productivity within Commonwealth marine areas and therefore is considered to result in an undetectable or limited local degradation of the environment, rapidly returning to original state by natural action.

Pelagic species are mobile; at worst, it is expected that they would be subjected to very low levels of chemicals for a very short time as they swim near the discharge plume. As such, transient species are not expected to experience any acute or chronic effects.

Prior to discharge the chemical constituents of all fluids will be assessed using the Esso Chemical Discharge Assessment Procedure (refer to Volume 4) which uses the OCNS ranking in conjunction with toxicity, biodegradation and bioaccumulation data to determine potential impacts to the environment and acceptability of planned discharges.

**For benthic invertebrates, or mobile demersal and pelagic species which may be present at the wellheads, given the localised and short-term nature of the discharge the environmental impact is expected to have a**  
**CONSEQUENCE LEVEL IV**  
**to these species**

#### *5.9.3.2 Change in habitat and smothering*

Given the homogenous seafloor environment within the OA, comprising soft sediment benthic communities, the small volume of solid discharge which may settle on the seabed is not expected to result in an impact to those communities. The majority of the metal shavings and cuttings are expected to remain in the well and a small percentage is anticipated to be displaced to the seabed.

Any impact will be limited to the immediate vicinity of the wellhead locations and thus the extent of potential impact is considered to be localised. The disturbance may result in the mortality of flora and sessile fauna within this footprint through smothering and potentially the mortality of benthic infauna associated with the habitat. However, the area that will be impacted is small compared with the overall extent of this habitat in the region and consequently, there will be no long-term impact on the diversity and abundance of benthic fauna.

**Following removal of the wellheads, the area around the wells will be disturbed with some minor volumes of cement cuttings and metal shavings. The area will remain a viable habitat that would be expected to recolonise with benthic species within weeks to months following removal of the disturbance (Currie & Isaacs, 2005). Therefore the potential impact has been determined as**  
**CONSEQUENCE LEVEL IV**

5.9.4 Controls

Table 5-59 Environmental performance

EPO	Control	EPS	Measurement criteria
All operational discharges approved according to the chemical discharge assessment process.	<b>CM3:</b> Chemical discharge assessment process	All chemicals planned for discharge are evaluated as acceptable in accordance with the chemical discharge assessment process. Good practice	Adopted	Control	Rationale
Discharge of least environmentally hazardous chemical.	✓	<b>CM3:</b> Chemical discharge assessment process	This risk control practice requires that new chemicals must be approved prior to use. This practice assesses chemicals that have the potential to be discharged to the environment (i.e. not household chemicals) to ensure the lowest toxicity, most biodegradable and least accumulative chemicals are selected which meet the technical requirements of the application.

Table 5-62 Engineering risk assessment

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
Local containment of hydraulic fluid released during valve movement.	Reduce planned discharge of hydraulic fluid to the marine environment.	Local containment of operational releases of hydraulic fluid is not considered practical, as this would add safety and environmental risk of the valve being prohibited from venting and therefore not closing when demanded in an emergency isolation scenario.	Not adopted
Displace fluid above cement plug to inhibited sea water or weighted brine.	Low to no toxicity to environment.	Operationally feasible.	Adopted

## 5.9.6 Demonstration of acceptability

Table 5-63 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
Principles of ESD	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in a Consequence Level IV thus are not considered as having the potential to result in serious or irreversible environmental damage.
Legislative and other requirements	Legislative and other requirements have been identified and met.	✓	The following other requirements were identified as relevant to impacts from operational discharges. Chronic chemical pollution is a recognised threat to these species however no conservation/management actions are specified: <ul style="list-style-type: none"> <li>• CMPBW</li> <li>• Conservation Advice for sei whales (TSSCb, 2015)</li> <li>• Conservation Advice for fin whales (TSSCa, 2015).</li> </ul>

Factor	Demonstration criteria	Criteria met	Rationale
Internal context	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	The Upstream Water Management Standard does not specifically address P&A or drilling related discharges (other than non-aqueous fluid muds) but the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>• OIMS System 7-1 objective to evaluate change against an established set of criteria and establish endorsement/ approval levels</li> <li>• OIMS System 8-1 objective to clearly define and communicate Operations Integrity requirements to contractors.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning planned operational discharges.

## 5.10 Planned discharges – Surface

### 5.10.1 Sources of surface discharges

The following activities have been identified as resulting in surface discharges:

- circulation of residual fluids in production casing
- circulation of residual fluids in intermediate casing annulus.

**Table 5-64 Summary of typical plug and abandonment discharges – Surface**

Fluid Type	Nature of discharge (infrequent / continuous etc.)	Indicative volume (per well)
Residual kill weight fluid (NaCl brine, with corrosion inhibitor, biocide and oxygen scavenger/'Baracarb' (calcium carbonate pill))	Once per well	215bbl
Residual water-based muds (seawater, gel, polymer)	Once per well	1660bbl
NaCl brine (corrosion inhibitor, biocide and oxygen scavenger)	Infrequent – as required	200bbl

A summary of the types of fluids discharged and volumes (per well) is summarised in Table 5-64. The indicative constituents of the P&A fluids (NaCl brine plus additives) are listed in Table 5-65.

**Table 5-65 Indicative constituents of plug and abandonment fluids**

Function	OCNS ranking <sup>1</sup>	
	CHARM	Non-CHARM
Acidity control		E
Viscosifier	Gold

Corrosion Inhibitor	Gold	
Surfactant, cleaning agent	Gold	
pH control		E
Water hardness control agent		E
H <sub>2</sub> S scavenger	Gold	

<sup>1</sup> The OCNS uses the Harmonised Mandatory Control Scheme developed through the OSPAR Convention. This ranks chemical products according to Hazard Quotient, calculated using the CHARM model.

### 5.10.2 Impacts of surface discharges

Impacts of the planned discharge of brines and residual water-based muds considered are:

- change in water quality (increased salinity and potential toxicity in the water column).

### 5.10.3 Impact assessment

Receptors affected by planned operational discharges and that have been identified in Volume 1 as occurring in the area are identified in Table 5-66.

**Table 5-66 Impact scoping**

Impacts	Receptors			
	Plankton	Fish	Marine reptiles – Turtles	Marine mammals
Change in water quality	✓	✓	✓	✓

#### 5.10.3.1 Change in water quality

##### Potential toxicity

As these discharges will occur at the surface, it is anticipated that ecological receptors that have the potential to be exposed are those that use the surface waters for transit or foraging such as whales, turtles, fish and plankton. The OA is within a foraging BIA for the PBW.

All fluids will be assessed using the Esso Chemical Discharge Assessment Procedure (refer to Volume 4) which uses the OCNS ranking in conjunction with toxicity, biodegradation and bioaccumulation data to determine potential impacts to the environment and acceptability of planned discharges.

Discharges will be one-off or infrequent, and of small volumes which will disperse rapidly in the open ocean currents within the OA. It is therefore expected that any exposure will be limited in duration.

Early life stages of fish (embryos, larvae) and other plankton would be most susceptible to the toxic exposure from chemicals in the discharges, as they are less mobile and therefore can become exposed to the plume at the discharge point. However, these are expected to rapidly recover once the activity ceases, as they are known to have high levels of natural mortality and a rapid replacement rate (UNEP, 1985). As such, exposure of planktonic communities is not considered to result in significant impacts on population level of organisms that would affect ecological diversity or productivity within Commonwealth marine areas and therefore is considered to result in an undetectable or limited local degradation of the environment, rapidly returning to original state by natural action.

Pelagic species are mobile; at worst, it is expected that they would be subjected to very low levels of chemicals for a very short time as they swim near the discharge plume. As such, transient species are not expected to experience any acute or chronic effects.

##### Increased salinity

Brine water will sink through the water column where it will be rapidly mixed with receiving waters and dispersed by ocean currents. As such, any potential impacts are expected to be limited to the source of the discharge where concentrations are highest. This is confirmed by studies that indicate effects from increased salinity on planktonic communities in areas of high

mixing and dispersion are generally limited to the point of discharge only (Abdul Azis, et al., 2003).

The receptors with the potential to be exposed to an increase in salinity include pelagic fish species and plankton found in surface waters within the OA. Changes in salinity can affect the ecophysiology of marine organisms. Most marine species are able to tolerate short-term fluctuations in salinity in the order of 20 percent to 30 percent (Walker & McComb, 1990). However, larval stages, which are crucial transition periods for marine species, are known to be more susceptible to impacts of increased salinity (Neuparth, Costa, & Costa, 2002). Mobile pelagic species may be subjected to slightly elevated salinity levels (approximately 10 to 15 percent higher than seawater) for a very short period which they are expected to be able to tolerate.

Any impacts from the discharge of brine and other operational fluids will be localised and short-term and the consequence of increased salinity and potential chemical toxicity has been assessed as  
**CONSEQUENCE LEVEL IV**

5.10.4 Controls

Table 5-67 Environmental performance

EPO	Control	EPS	Measurement criteria
All operational discharges approved according to the chemical discharge assessment process.	<b>CM3:</b> Chemical discharge assessment process	All planned chemical discharges are evaluated as acceptable in accordance with the chemical discharge assessment process.	Chemical assessment records confirm evaluation of chemical discharges as acceptable prior to use/discharge and appropriate approvals documented.
			Environmental performance fluid tracking shows components of all planned operational discharges.
Circulated fluids/tank washings/NaCl brine fluids measured for accepted maximum oil content before discharge.	<b>CMP6:</b> Worksite Operations Safety Plan	Test result for circulated fluids/tank washings/NaCl brine fluids must be below 5% oil in water by volume to be acceptable for discharge.	Test reports document circulated fluids/tank washings/NaCl brine fluids oil in water content measured.  Oil in water content of circulated fluids/tank washings/NaCl brine fluids is recorded in environmental performance fluid tracking when discharge occurs.

5.10.5 Demonstration of As Low As Reasonably Practicable

Table 5-68 ALARP Decision Context and justification

<b>ALARP Decision Context A</b>	The surface discharge of fluids during drilling and well abandonment activities is a well-practiced activity, both nationally and internationally. The

## 6 Environmental risk assessment

This section describes the outcome of the environmental risk assessment of unplanned events associated with activities described in this EP.

The risk assessment addresses the levels of predicted risk, with controls in place, to contribute to the process of ensuring risks are reduced ALARP and of an acceptable level. EPOs, EPSs and measurement criteria are also presented.

### 6.1 Physical interaction – Marine fauna

#### 6.1.1 Causes of physical interaction with marine fauna

The movement of support vessels has the potential to result in collision with marine fauna. Note: Within the 500-metre OA, support vessels will be under a LWIV procedure to ensure that vessel handling is undertaken in a safe and controlled manner. Refer to Helix's Well Operations UK support vessel checklist (refer to Section 4.6.3 of Q7000 Safety Case (*Australia*) (Helix, 2021)).

#### 6.1.2 Risks of physical interaction with marine fauna

Interaction with marine fauna has the potential to result in:

- injury/mortality to marine fauna.

#### 6.1.3 Risk assessment

Receptors that could be affected by physical interaction and that have been identified in Volume 1 as occurring in the area are identified in Table 6-1.

**Table 6-1 Impact scoping**

Impacts	Receptors	
	Marine reptiles – Turtles	Marine mammals
Injury/mortality to fauna	✓	✓

##### 6.1.3.1 Injury/mortality to fauna

Marine megafauna are at the most risk from this hazard and thus are the focus of this evaluation.

Several marine turtle species including species listed as either threatened and/or migratory under the EPBC Act may occur within the OAs, however no critical habitat or BIAs for turtles have been identified.

Several marine mammals (e.g. whales, dolphins, seals) including those listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the OAs. The PBW has distribution and foraging habitat BIAs overlapping the OAs and the SRW migration BIA also overlaps the OAs.

Cetaceans are naturally inquisitive marine mammals that are often attracted to offshore vessels and facilities. The reaction of whales to the approach of a vessel is quite variable.

Some species remain motionless when in the vicinity of a vessel, while others are curious and often approach ships that have stopped or are slow moving, although they generally do not approach, and sometimes avoid, faster-moving ships (Richardson, Greene, Malme, & Thomson, 1995).

Although collisions with marine fauna can happen anywhere in Australian waters, the risk of collision is greater in breeding areas and along seasonal migration routes. Collision risk also increases in shallower waters where a vessel has less under-keel clearance, leaving an animal less room to avoid the vessel. (AMSA, 2023). Larger vessels with reduced manoeuvrability moving in excess of 10 knots may cause fatal or severe injuries to cetaceans, with the most severe injuries caused by vessels travelling faster than 14 knots (Laist, Knowlton, Mead, Collet, & Podesta, 2001). Vessels typically used to support these activities do not have the same limitations on manoeuvrability and would not be moving at these speeds when conducting activities inside the OA.

The Australian and New Zealand fur-seals are highly agile species that haul themselves onto rocks and oil and gas platform structures. As such, it is likely that they will avoid any collision with moving support vessels.

Vessel strike data from (1997-2015) for marine species in Australian waters was reviewed and identified the following (Peel, Smith, & Childerhouse, 2016):

- whales including the humpback whale, PBW, Antarctic blue whale, SRW, dwarf minke (*Balaenoptera acutorostrata*), Antarctic minke whale (*Balaenoptera bonaerensis*) fin whale, Bryde's whale (*Balaenoptera edeni*), pygmy right whale (*Caperea marginata*), sperm whale, pygmy sperm whale (*Kogia breviceps*) and Pilot species were identified as having interacted with vessels. The humpback whale exhibited the highest incidence of interaction followed by the SRW. A number of these species may be observed in the waters within the vicinity of the OA
- dolphins including the Australian humpback (*Sousa sahalensis*), common bottlenose (*Tursiops 204runcates s. str.*), Indo-Pacific bottlenose (*Tursiops aduncus*) and Risso's dolphin (*Grampus griseus*) species were also identified as interacting with vessels. The common bottlenose dolphin exhibited the highest incidence of interaction. A number of these species may be observed within the vicinity of the OA
- there were no vessel interaction reports during the period for either the Australian or New Zealand fur seal. There have been incidents of seals being injured by boat propellers, however all indications are rather than 'boat strike' these can be attributed to be the seal interacting/playing with a boat, with experts indicating the incidence of boat strike for seals is very low.

The period of fauna exposure to support vessel strike is limited to the duration of works under this EP; expected to be approximately 30 days per well. If a fauna strike occurred and resulted in death, it is not expected that it would have a detrimental effect on the overall population. Consequently, the potential consequence from fauna strike is considered to be Consequence Level III as this type of event may result in a localised, short-term impact to species of recognised conservation value but is not expected to affect the population or local ecosystem function.

Due to the restricted area of operation PSZ and the slow speed of support vessels when operating in this area, if contact is made with species, the impact due to vessel strike is expected to be non-life threatening and the likelihood of vessel strike and associated severe injury or death of an individual is considered Likelihood Category E (very highly unlikely) during these activities. However, in considering the potential for mammals to be playful/interactive with slow moving vessels or vessels in DP mode and the possibility of seals being in the area

even though they are generally known to be attracted to operating facilities which have warm pipework, the short duration of this activity, the likelihood of vessel interaction with mammals and associated severe injury or death of an individual is considered Likelihood Category D (very unlikely) during these activities.

#### 6.1.4 Risk ranking

**Table 6-2 Risk ranking outcome**

Consequence Level	Likelihood Category	Risk Category
III	D	4

#### 6.1.5 Controls

**Table 6-3 Environmental performance**

EPO	Control	EPS	Measurement criteria
No injury or death of megafauna resulting from vessel strike.	<b>CM8:</b> Vessel Master	<p>Vessel Master is aware of and implements interaction management actions consistent with Part 8 Division 8.1 of the EPBC Regulations, including:</p> <ul style="list-style-type: none"> <li>vessels will not knowingly travel faster than 6 knots within 300m of a whale or 150m of a dolphin</li> <li>vessels will not knowingly get closer than 100m of a whale or 50m of a dolphin</li> <li>if a cetacean approaches the vessel within the above zones, the vessel will avoid rapid changes in engine speed or direction.</li> </ul>	Daily operations reports note when cetaceans were sighted in the caution zone and interaction management actions implemented.

#### 6.1.6 Demonstration of As Low As Reasonably Practicable

**Table 6-4 ALARP Decision Context and justification**

<b>ALARP Decision Context B</b>	<p>Offshore petroleum operations are widely undertaken both locally, nationally and internationally.</p> <p>The risk of cetacean vessel strike is well managed via legislative control measures that are considered industry best practice. These controls are well understood and implemented by the industry. However, these legislative controls do not manage the risk of death or injury to seals via interaction/playing with vessels.</p>
---------------------------------	--

	<p>The consequence of any impact associated with a vessel strike was assessed as Consequence Level III.</p> <p>No objections or concerns were raised by relevant persons with regard to the risk of physical interaction with marine fauna.</p> <p>Esso believes ALARP Decision Context B should apply.</p>
--	---

**Table 6-5 Good practice controls**

Good practice	Adopted	Control	Rationale
<p>Part 8 Division 8.1 of the EPBC Regulations.</p> <p>Australian National Guidelines for Whale and Dolphin Watching 2017. (Commonwealth of Australia, 2017)</p>	✓	<b>CM8:</b> Vessel Master	<p>The Vessel Master has responsibility for ensuring the requirements of these Regulations and Guidelines are followed.</p> <p>The Guidelines describe strategies to ensure whales and dolphins are not harmed during offshore interactions with people.</p> <p>These Guidelines were developed jointly by all state and territory governments through the Natural Resource Management Ministerial Council and, although more relevant for tourism activities, provide a list of requirements that are generally adopted by the oil and gas industry to minimise the risk of cetacean strike occurring.</p> <p>Note: Both the lack of visibility of seals in the water and number of seals in close proximity to oil and gas offshore installations make applicability of these guidelines to seals impracticable. Furthermore, fauna interaction management actions as described in the guidelines will not prevent seals approaching / playing with vessels.</p>

**Table 6-6 Engineering risk assessment**

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
Grates on vessel thrusters	Grates on vessel tunnel thrusters would prevent entrapment of marine mammals, in particular seals which are known to approach/play with vessels while stationary on DP.	<p>Smaller support vessels (such as those used to deploy ROVs) do not generally have grates on tunnel thrusters, however it is more common for larger PSVs.</p> <p>Adding grates to thrusters significantly impacts efficiency of vessels leading to increased fuel usage and air emissions, particularly for small vessels. Further, grates lead to increased potential for marine growth (which further reduces efficiency of thrusters)</p> <p>Retrofitting of grates to vessels requires dry docking at significant cost.</p>	Not adopted**.

\*\* Bow thruster guards are not a mandatory requirement for vessels on this activity. However, where a vessel without thruster guards is planned to be used for the activity and is required to dry dock for IMS inspection or cleaning, the additional fitment of thruster guards shall be considered as part of the docking process. As part of this consideration, a risk assessment will be completed to consider additional hazards that could be introduced to the vessel (including failure of the thruster guard and ingestion into the thruster, or hull damage due to guard failure). With the agreement of the vessel owner and where the assessment shows that there is no additional risk, the opportunity will be taken to install bow thruster guards whilst the vessel is in dry dock.

Note: The *Skandi Darwin* and *Skandi Feistein* have tunnel guard thrusters.

### 6.1.7 Demonstration of acceptability

**Table 6-7 Demonstration of acceptability test**

Factor	Demonstration criteria	Criteria met	Rationale
<b>Risk assessment process for unplanned events</b>	The risk ranking is lower than Risk Category 1.	✓	The risk ranking is Risk Category 4 (the lowest category) and is therefore considered acceptable.
<b>Principles of ESD</b>	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in a Consequence Level IV thus are not considered as having the potential to result in serious or irreversible environmental damage.
<b>Legislative and other requirements</b>	Legislative and other requirements have been identified and met.	✓	<p>Requirements of EPBC Regulations 2000 – Part 8 Division 8.1: Interacting with cetaceans, although more relevant for tourism activities, have been adopted.</p> <p>The following other requirements were identified as relevant to the risk of vessel strike. Vessel disturbance is a recognised threat to these species and proposed controls are consistent with conservation/management actions where specified:</p> <ul style="list-style-type: none"> <li>• CMPBW</li> <li>• Conservation Advice for humpback whales (TSSC, 2015)</li> <li>• CMPSRW</li> <li>• Conservation Advice for sei whales (TSSCb, 2015)</li> </ul>

Factor	Demonstration criteria	Criteria met	Rationale
			<ul style="list-style-type: none"> <li>Conservation Advice for fin whales (TSSCa, 2015)</li> <li><i>Recovery Plan for Marine Turtles in Australia 2017-2027</i> (DoEE, 2017)</li> <li>Conservation Advice for leatherback turtles (TSSC, 2008)</li> </ul>
Internal context	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	There is no specific Environmental Standard which addresses interaction with marine fauna but the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>OIMS System 8-1 objective to clearly define and communicate Operations Integrity requirements to contractors.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning the risk of physical interaction with marine fauna.

## 6.2 Physical presence – Introduction of Invasive Marine Species

### 6.2.1 Causes of introduction of Invasive Marine Species

An Invasive Marine Species (IMS) is a species occurring, as a result of human activities, beyond its accepted normal distribution and which threatens valued environmental, agricultural or other social resource by the damage it causes (DCCEEW, 2022). Not all non-indigenous marine species introduced into new environments will cause demonstrable effects, some are relatively benign, and few have spread widely beyond ports and harbours.

The following activities have the potential to result in the introduction of IMS in the activity area:

- discharge of ballast water from support vessels containing foreign species
- translocation of foreign species through biofouling of the LWIV and support vessel hull and niches (e.g. sea chests, bilges, strainers).

### 6.2.2 Risks of introduction of Invasive Marine Species

The translocation of IMS through biofouling or ballast water discharge has the potential to result in effects to seabed habitat and marine ecosystems due to:

- change in ecosystem dynamics.

### 6.2.3 Risk assessment

Receptors that could be affected by the introduction of IMS and that have been identified in Volume 1 as occurring in the area are identified in Table 6-8.

**Table 6-8 Impact scoping**

Impacts	Receptors		
	Benthic habitat – Bare substrate	Fisheries – Commercial (Commonwealth)	Fisheries – Commercial (State)
Change in ecosystem dynamics	✓	✓	✓

#### 6.2.3.1 Change in ecosystem dynamics

Successful IMS invasion requires the following three steps:

- colonisation and establishment of the marine pest on a vector (e.g. vessel hull) in a donor region (e.g. home port)
- survival of the settled marine species on the vector during the voyage from the donor to the recipient region (e.g. activity area)
- colonisation (e.g. dislodgement or reproduction) of the marine species in the recipient region, followed by successful establishment of a viable new local population.

It is estimated that there are more than 250 exotic species in the Australian marine environment and that about one in six to ten introduced marine species become 'pests' (i.e. the effects of the introduced organisms are sufficiently severe) (DCCEEW, 2022).

Over 100 exotic marine species are known to have become established in Victorian marine waters (Hewitt, et al., 2004). Some have become marine pests. The most concerning marine pest species in Victoria include (Parks Victoria, 2023):

- northern pacific seastar (*Asterias amurensis*)
- Wakame (*Undaria pinnatifida*)
- Pacific oyster (*Crassostrea gigas*)
- green shore crab (*Carcinus maenus*)
- European fan worm (*Sabella spallanzanii*)

- New Zealand screw shell (*Maoricolpus roseus*).

These species are largely known to occur in and around port areas. The New Zealand screw shell however is known to have become established in vast beds in Bass Strait and off the coasts of eastern and northern Tasmania, Victoria and New South Wales (MESA, 2023). Figure 6-1 shows the current known distribution of the New Zealand screw shell.

**Figure 6-1** Current known distribution (in black) of New Zealand screw shell in Australian waters (Environment Australia, 2003) with approximate plug and abandonment activity location represented by yellow dot

Marine Management Plans for Victorian Marine National Parks and Marine Sanctuaries (e.g. Beware Reef Marine Sanctuary and Point Hicks Marine National Park) acknowledge that New Zealand screw shell is established in Bass Strait and note the possibility of the occurrence of this species within soft sediment habitats in the parks or sanctuaries (Parks Victoria, 2006) (Parks Victoria, 2006). The Ninety Mile Beach Marine National Park Management Plan (Parks Victoria, 2006c) notes that due to the park's inaccessibility and associated difficulty in conducting regular, detailed surveys, incursions of marine pests are unlikely to be detected until they are fully established and beyond potential control.

IMS are likely to have little or no natural competition or predators, thus potentially outcompeting native species for food or space, preying on native species, or changing the nature of the environment.

Marine pest species can also deplete fishing grounds and aquaculture stock, with between 10 percent and 40 percent of Australia's fishing industry being potentially vulnerable to marine pest incursion. For example, the introduction of the Northern Pacific seastar (*Asterias amurensis*) in Victorian and Tasmanian waters was linked to a decline in scallop fisheries (Dommissé & Hough, 2004). Similarly, the New Zealand screw shell thought to have been introduced on dry ballast or through the live oyster trade, may threaten other mollusc species, including scallops. The New Zealand screw shell can densely blanket the sea floor with live and dead shells, and faecal pellets and therefore also smother other seafloor species (ABC Science, 2000).

Marine pests can also damage marine and industrial infrastructure, such as encrusting jetties and marinas or blocking industrial water intake pipes. By building up on vessel hulls, they can slow the vessels down and increase fuel consumption.

The benthic habitat within the OA is characterised by a soft sediment and shell/rubble seabed, infauna communities, and sparse epibiotic communities (typically sponges). The nearest area of higher value or sensitivity, the Ninety Mile Beach Marine National Park on the Victorian coast, is located more than 15 kilometres inshore from either of the OAs.

Once established, some pests can be difficult to eradicate (Hewitt, et al., 2004) and therefore there is the potential for a long-term or persistent change in habitat structure. It has been found that highly disturbed environments (such as marinas) are more susceptible to colonisation than open-water environments, where the number of dilutions and the degree of dispersal are high (Paulay, Kirkendale, Lambert, & Meyer, 2002).

If an IMS was introduced, and if it did colonise an area, it is expected that any colony would remain fragmented and isolated, and only within the vicinity of the wells (i.e. it would not be able to propagate to nearshore environments, and protected marine areas present in the wider region). Therefore, there is the potential for a localised, but irreversible, impact to habitat resulting in a Consequence Level III.

### **Support Vessel operations**

Support vessels may pose a risk of introducing IMS through ballast water and hull biofouling. Compliance with regulatory requirements for the management of ballast water and ensuring all vessels are assessed as posing a low biofouling risk through the screening via Esso's IMS Risk Assessment Procedure and in accordance with national guidelines will significantly reduce the likelihood of translocation of an IMS into Bass Strait. Similarly, the risk of secondary translocation through operational movements in Bass Strait is considered in the IMS Risk Assessment Procedure for vessels intended to be used for the activity ensuring that low biofouling risk is posed through vessel movement.

### **Bringing the Light Well Intervention Vessel to Bass Strait**

Compliance with regulatory requirements for the management of ballast water and ensuring all vessels are assessed as posing a low biofouling risk through screening via the IMS Risk Assessment Procedure and in accordance with national guidelines will significantly reduce the likelihood of translocation of an IMS. Successful colonisation in the recipient region would be difficult given the nature of the benthic habitats near the OA (i.e. predominantly bare sands with patchy occurrences of hard substrate), depth (greater than 300 metres) and location outside of coastal waters where the risk of IMS establishment is considered greatest (BRS, 2007).

It is considered Likelihood Category D (very unlikely) that this activity would result in the introduction of an IMS and any subsequent impact to receptors.

### **Movement of the Light Well Intervention Vessel between activity locations**

The risk of transporting IMS to Bass Strait is considered low as discussed above. There is a risk of secondary translocation between activity locations within Bass Strait as the LWIV moves from one activity location to the next. Therefore, the risk of further spreading between activity locations must be considered.

New Zealand screw shells are suspension feeders and are restricted to the seabed surface. Unlike most biofouling organisms, they do not settle on and attach to hard surfaces, and so

would be loosely attached, and their presence only incidental. The Q7000 is self-propelled and no contact with the seabed is required as the LWIV will remain stationary above the wells by means of DP, using its thrusters. Only the pressure control equipment and well intervention tools may come into contact with the seabed. However, this equipment will be recovered onboard the Q7000 and cleaned before re-deployment. Desiccation during relocation between wells will further minimise the risk of secondary translocation between drill locations.

It is known that New Zealand screw shell is already established in Bass Strait (Figure 6-1), and given natural distribution of larvae would have most likely already spread the species to suitable habitats, it is considered Likelihood Category D (very unlikely) that this activity would result in translocating/further spreading of IMS between activity locations.

#### 6.2.4 Risk ranking

**Table 6-9 Risk ranking outcome**

Consequence Level	Likelihood Category	Risk Category
III	D	4

#### 6.2.5 Controls

**Table 6-10 Environmental performance**

EPO	Control	EPS	Measurement criteria
No introduction and establishment of IMS.	<b>CM23:</b> Ballast Water Management Plan	Ballast Water Management Plan approved in accordance with International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004 (BWM Convention) and guidance (Resolution MEPC.127(53), 2005) (Resolution MEPC.306(73), 2018)	Records show an approved Ballast Water Management Plan which complies with the BWM Convention requirements including the implementation of its D-2 standard in accordance with the agreed timeline per the Class or flag state of the respective vessel.
	<b>CM24:</b> Ballast Water Management Certificate	Ballast Water Management Certificate approved in accordance with the BWM Convention, including implementation of D-2 standard per the agreed timeline.	Records show an approved Ballast Water Management Certificate which complies with the BWM Convention requirements including the implementation of D-2 standard in accordance with the agreed timeline per the Class or flag state of the respective vessel.
	<b>CMP7:</b> Ballast water record system	Ballast water record system is maintained in accordance with Regulation B-2 of the Annex to the BWM Convention including: <ul style="list-style-type: none"> <li>start and finish coordinates</li> </ul>	Ballast water records.

EPO	Control	EPS	Measurement criteria
		<ul style="list-style-type: none"> <li>actual pumping times</li> <li>residual volume remaining in the tank at the end of the empty cycle prior to refill (empty refill method only).</li> </ul>	
	<b>CM25:</b> Biosecurity clearance when entering Australian territory	Vessel Master to obtain biosecurity clearance to enter Australian territory through pre-arrival information reported through Maritime Arrivals Reporting System.	Records confirm biosecurity status.
	<b>CM8:</b> Vessel Master	Vessel Master to adhere to Australian ballast water requirements and BWM Convention.	Ballast water records show location of ballast water uptake and discharge.
	<b>CM26:</b> Invasive Marine Species Risk Assessment Procedure	Biofouling risk assessment conducted in accordance with Esso's IMS Risk Assessment Procedure shows low risk.	Biofouling risk assessment record confirms vessel poses low risk of introducing IMS.
	<b>CMP8:</b> Immersible retrievable equipment cleaning	All immersible retrievable equipment has been cleaned and/or inspected in accordance with <i>National Biofouling Guidelines for the Petroleum Production and Exploration Industry</i> (DAWR, 2009) prior to commencement of the activity.	Records document cleaning and/or inspection of immersible retrievable equipment.

6.2.6 Demonstration of As Low As Reasonably Practicable

**Table 6-11 ALARP Decision Context and justification**

<b>ALARP Decision Context B</b>	<p>The causes resulting in an introduction of IMS from ballast water discharge or biofouling are well understood and well managed by national and international regulations and industry guidance. Esso is experienced in the implementation of industry requirements through their existing ongoing operations.</p> <p>Given the potential for an irreversible (although localised) effect on the benthic habitat, there is the potential for Consequence Level III impacts.</p> <p>No issues, objections or claims were raised by relevant persons with regard to the risk of introduction of IMS.</p> <p>Based on the Consequence Level III rating, Esso believes ALARP Decision Context B should apply.</p>
---------------------------------	---

Table 6-12 Good practice controls

Good practice	Adopted	Control	Rationale
BWM Convention.	✓	<p><b>CM23:</b> Ballast Water Management Plan</p> <p><b>CM24:</b> Ballast Water Management Certificate</p> <p><b>CMP7:</b> Ballast water record system</p>	<p>The BWM Convention requires signatory flag states to ensure that ships flagged by them comply with standards and procedures for the management and control of ships' ballast water and sediments. The BWM Convention aims to prevent the spread of harmful aquatic organisms from one region to another and halt damage to the marine environment from ballast water discharge, by minimising the uptake and subsequent discharge of sediments and organisms.</p> <p>The BWM Convention requires all vessels designed to carry ballast water to implement a ballast water management plan and to carry out ballast water management procedures in accordance with approved methods. Specifically, these are:</p> <ul style="list-style-type: none"> <li>• use of a ballast water management system</li> <li>• ballast water exchange in an acceptable area (at least 12nm from land and in at least 50m water depth)</li> <li>• use of low-risk ballast water</li> <li>• retention of high-risk ballast water on board</li> <li>• discharge to an approved ballast water reception facility.</li> </ul> <p>A management certificate is required for all vessels to which the BWM Convention applies, this certificate verifies that the vessel has been surveyed to a standard compliant with the BWM Convention.</p> <p>All vessels that carry ballast water must maintain a ballast water record system.</p>
Maritime Arrivals Reporting System.	✓	<p><b>CM25:</b> Biosecurity clearance when entering Australian territory</p>	<p>The Vessel Master has responsibility for ensuring a pre-arrival report is submitted in Maritime Arrivals Reporting System and clearance to enter Australian territory is obtained from the Department of Agriculture and Water Resources (DAWR).</p> <p>Offshore installations operating outside of Australian territory are not under the jurisdiction of the <i>Biosecurity Act 2015</i>. However, any conveyance (vessel or aircraft) which leaves Australian territory and is not subject to biosecurity control,</p>

Good practice	Adopted	Control	Rationale
			<p>and which interacts with an installation (or other conveyance) outside of the Australian territory will become an 'exposed conveyance'.</p> <p>A conveyance becomes exposed by being in physical contact with, in close proximity to or being contaminated by the installation or another conveyance. When the exposed conveyance returns to Australian territory, it becomes subject to biosecurity control and it must complete a pre-arrival report and notify if it intends to unload goods, unless exempt under the <i>Biosecurity (Exposed conveyance – exceptions from biosecurity control) Determination 2016</i>.</p>
<p><i>Australian Ballast Water Management Requirements</i> (DAWR, 2017)</p>	✓	<p><b>CM8:</b> Vessel Master</p>	<p>The Vessel Master has responsibility for ensuring these Requirements are followed.</p> <p>The Requirements describe the obligations on vessel operators with regards to the management of ballast water and sediments when operating in Australian seas.</p> <p>The acceptable area for a ballast water exchange between an offshore oil and gas installation and an Australian port is in areas that are no closer than 500m from the offshore installation and no closer than 12nm from the nearest land.</p>
<p><i>National Biofouling Guidelines for the Petroleum Production and Exploration Industry</i> (DAWR, 2009).</p>	✓	<p><b>CM26:</b> Invasive Marine Species Risk Assessment Procedure</p>	<p>Biofouling risk in accordance with National Biofouling Guidelines (DAWR, 2009) is assessed and documented through the IMS Risk Assessment Procedure.</p> <p>Consistent with the 'best practice' approach set out in the IMO Guidelines for the Management of Ships Biofouling (IMO Guidelines) (IMO, 2012) the risk assessment considers many parameters of the vessel or LWIV including (where relevant):</p> <ul style="list-style-type: none"> <li>• transport method (dry verses wet haulage)</li> <li>• presence and age of antifouling coating</li> <li>• evidence of in-water inspection by divers or inspection in dry dock and cleaning of hull</li> <li>• presence and operation of internal seawater treatment systems if applicable</li> </ul>

Good practice	Adopted	Control	Rationale
			<ul style="list-style-type: none"> <li>• duration of stay in overseas or interstate coastal waters</li> <li>• location of drilling operations (OA), timings and durations.</li> </ul> <p>Where the initial indicative assessment (conducted by an IMS Expert and/or via the online Vessel Check portal (<a href="http://www.vessel-check.com">www.vessel-check.com</a>)) results in 'Low Risk', the risk assessment is provided to the Principal Officer IMS, Department of Jobs, Precincts and Regions. If the Principal Officer is satisfied that no further action is necessary following this consultation the vessel or LWIV is deemed acceptable for use.</p> <p>If the risk assessment result is uncertain or high risk, or further action is recommended by the Principal Officer, an IMS Expert is consulted to determine whether additional controls can be implemented to reduce the vessel risk status to 'Low Risk'.</p> <p>Examples of potential control/mitigation measures to reduce risk that may be proposed are consistent with the National Biofouling Guidelines (DAWR, 2009) and the IMO Guidelines. The control measures proposed must meet the standard of performance described in IMS-risk assessment process.</p> <p>Following implementation of these mitigation measures, the IMS Expert is consulted to reassess the level of risk for the activity and determine whether the level of risk for the activity is 'Low Risk' and meets the ALARP and Acceptability criteria (Sections 3.5 and 3.6).</p> <p>If this process still results in an uncertain or higher risk then an alternative vessel or LWIV must be sought for the activity.</p>
		<p><b>CMP8:</b> Immersible retrievable equipment cleaning</p>	<p>Management of submersible equipment will be in accordance with the <i>National Biofouling Guidelines for the Petroleum Production and Exploration Industry</i> (DAWR, 2009).</p>
<p>Removal of sediment from spud cans.</p>	<p>✓</p>	<p><b>CMP37:</b> Water jetting activated on spud cans</p>	<p>It is considered best practice to 'clean before you leave' to remove any surface deposits from spud cans which were in contact with the sea floor prior to moving from one site to another.</p>

Table 6-13 Engineering risk assessment

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
Use of freshwater ballast	By using freshwater ballast, the likelihood of introducing an IMS can be reduced. However, because the likelihood of the consequence is already low (see above), there is limited environmental benefit associated with implementing this measure.	Costs associated with this measure are high, and disproportionate to the benefit.	Not adopted
Use only vessels that are currently operating in Bass Strait to reduce the potential for introduction of IMS.	By only using vessels that are currently operating in Bass Strait, the likelihood of introducing an IMS can be reduced. However, because the likelihood of the consequences is already low (see above), there is limited environmental benefit associated with implementing this measure.	Limiting vessel selection to use of those currently operating in Bass Strait could potentially pose a significant risk in terms of time and duration for sourcing a vessel, as well as the ability of those chosen to perform the required tasks. This potential cost (and time required) is grossly disproportionate to the minor environmental gain (of reducing the potential likelihood of IMS introduction) achieved and is not reasonably practicable.	Not adopted
Inspect and clean all vessels	By dry docking and cleaning all wetted surfaces on all vessels the likelihood of a pest relocation is considerably lowered.	Inspection and cleaning require specialist facilities, sites with no pests immediately prior to the work commencing. The risk already has a low likelihood so the substantial cost (and time required) to inspect and clean all vessels outweighs the environmental benefit.	Not adopted
Dry tow LWIV between activity locations	Dry tow would increase the likelihood of dehydration of the IMS on the vector and therefore reduce the risk of survivability and colonisation at the next location.	Dry tow requires a Heavy Lift Vessel (HLV) which is not needed for wet tow. The LWIV would need to be welded/secured to the HLV for the tow. The use of a HLV and additional time taken to load, weld/secure, move, remove welds, unload has substantial costs associated with it.  Since Gudgeon-1 and Terakihi-1 are about 7km apart and both locations are well away from the nearest shore, in >200m water depth, the resulting reduction in IMS risk from adopting this strategy is negligible.  This cost far outweighs the environmental benefit.	Not adopted

## 6.2.7 Demonstration of acceptability

Table 6-14 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
Risk assessment process for unplanned events	The risk ranking is lower than Risk Category 1.	✓	The risk ranking is Risk Category 4 (the lowest category) and therefore considered acceptable.
Principles of ESD	No potential to affect biological diversity and ecological integrity.	✓	There is potential for a localised, but irreversible, impact to benthic communities resulting in a Consequence Level III. This impact is limited in extent (i.e. localised) and is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	Although the habitat with the potential to be impacted is characterised by soft sediment communities, because of the potential for irreversible impacts, this aspect is considered as having the potential to (although very unlikely) result in serious or irreversible environmental damage.  Therefore, further evaluation against the remaining Principles of ESD is required. There is little uncertainty associated with this aspect as the activities are well practised, the cause pathways are well known, and activities are well regulated and managed.  It is not considered that there is significant scientific uncertainty associated with this aspect. Therefore, the precautionary principle has not been applied.
Legislative and other requirements	Legislative and other requirements have been identified and met.	✓	The requirements of the BWM Convention have been adopted.  The following legislative and other requirements are considered relevant as they apply to the implementation of the BWM Convention in Australia: <ul style="list-style-type: none"> <li>• <i>Biosecurity Act 2015</i></li> <li>• <i>Protection of the Sea (Harmful Anti-fouling Systems) Act 2006</i></li> </ul>

Factor	Demonstration criteria	Criteria met	Rationale
			<ul style="list-style-type: none"> <li><i>Marine Order 98 (Marine pollution – anti-fouling systems) 2013.</i></li> </ul> <p><i>Australian Ballast Water Management Requirements (DAWR, 2017)</i> will be adhered to and measures for managing ballast water discharges in this document are incorporated in the controls.</p> <p>Biofouling risk is assessed, and mitigated, in accordance with the <i>National Biofouling Guidelines for the Petroleum Production and Exploration Industry (DAWR, 2009)</i>.</p>
Internal context	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist"
	Meets ExxonMobil Environmental Standards.	✓	There is no specific Environmental Standard which addresses interaction with marine fauna but the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>OIMS System 8-1 objective to qualify, evaluate and select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.</li> </ul>
External context	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning the risk of introduction of IMS.

## 6.3 Accidental release – Dropped objects

### 6.3.1 Causes of dropped objects

Dropped objects may be released by accidentally dropping objects (e.g. small tools (such as spanners) or equipment (such as clamps), cargo loads (such as bulk chemical containers or chemical wastes), recovered infrastructure (such as wellheads and protruding casing) overboard from the LWIV or support vessels, or during ROV operations, due to human error, equipment failure or adverse weather. However, there are no live flowlines, umbilicals hydraulic flying leads/electrical flying leads, jumpers or export lines within the vicinity of the wells.

### 6.3.2 Risks of dropped objects

The accidental release of dropped objects has the potential to result in:

- change in habitat
- change in water quality.

### 6.3.3 Risk assessment

Receptors that could be affected by dropped objects and that have been identified in Volume 1 as occurring in the area are identified in Table 6-15.

**Table 6-15 Impact scoping**

Impacts	Receptors				
	Benthic habitat – Bare substrate	Plankton	Fish	Marine reptiles – Turtles	Marine mammals
Change in habitat	✓				
Change in water quality		✓	✓	✓	✓

#### 6.3.3.1 Change in habitat

In the unlikely event of an accidental dropped object from either the LWIV or support vessels, or during ROV operations, effects will be limited to localised physical disturbance to benthic communities arising from equipment sinking to and dragging across the seabed. Any environmental impact caused by damage to small areas of seabed and associated communities would be mitigated by ubiquitous distribution of similar habitat in the region.

Severity of impact to benthic communities is affected by density of biota, sensitivity of biota to disturbance and recovery potential of benthic communities. Physical disturbance to the seabed from a dropped load would be limited to the footprint of the load (estimated at less than or equal to 10 square metres) and temporary in nature if the item was retrieved and long term if irretrievable. Both are likely to pose minor environmental risk as the seabed within the OA is largely sandy sediment with benthic assemblages (predominantly polychaetes (worms), crustaceans and molluscs) and not particularly susceptible to physical disturbance.

Wastes such as paint cans containing paint residue, batteries and so forth, would settle on the seabed if dropped overboard. Over time, this may result in the leaching of chemicals to the

seabed resulting in a small area of substrate becoming toxic and unsuitable for colonisation by benthic fauna. Given the low release volumes it is expected that only very small areas of benthic habitat would be affected.

Considering the possible footprint of a dropped object (against the total area of similar habitat within the Bass Strait region) it is highly unlikely that a dropped object would have an effect on any benthic community other than a minor and localised one resulting in a Consequence Level IV.

#### 6.3.3.2 Change in water quality

Impacts from a chemical release during crane transfer of bulk chemical containers – with the maximum volume based upon the loss of an intermediate bulk container 1 cubic metre – would be minimal, due to the small potential volumes released, and the fact that spilled chemicals will rapidly evaporate, disperse and weather. In the open ocean environment, the spilled liquids would be rapidly dispersed and diluted to concentrations at which they are non-toxic resulting in a Consequence Level IV.

The greater risk to benthic habitat is if a cargo load or subsea equipment is dropped during lifting. However, given the controls in place it is considered Likelihood Category D (very unlikely) that such a dropped object would result in the impacts described above.

#### 6.3.4 Risk ranking

**Table 6-16 Risk ranking outcome**

Consequence Level	Likelihood Category	Risk Category
IV	D	4

#### 6.3.5 Controls

**Table 6-17 Environmental performance**

EPO	Control	EPS	Measurement criteria
No dropped objects which result in disturbance of benthic habitat.	<b>CMP10:</b> Crane handling and transfer procedures	The crane handling and transfer procedure is in place and implemented by crane operators (and others, such as dogmen).	Completed handling and transfer procedure checklist, Permit to Work and/or risk assessments verify that the procedure is implemented prior to each transfer.
	<b>CM18:</b> Preventative Maintenance System	Visual inspection of lifting gear is undertaken every quarter by a qualified competent person (e.g. maritime officer) and lifting gear is tested regularly in line with the Preventative Maintenance System (PMS).	Inspection of PMS records and lifting register verifies that inspections and testing have been conducted to schedule.

EPO	Control	EPS	Measurement criteria
	<b>CM19:</b> Cargo securing manual	All cargo securely fastened to or stored during transport in accordance with approved cargo securing manual to prevent loss to sea.	A completed pre-departure inspection checklist verifies that cargo is securely sea-fastened.
	<b>CMP11:</b> LWIV Move Guidance Checklist	All cargo securely fastened to or stored during transport in accordance with cargo securing manual or LWIV move guidance checklist to prevent loss to sea.	LWIV Move Guidance Checklist verifies that cargo is securely sea-fastened.

### 6.3.6 Demonstration of As Low As Reasonably Practicable

**Table 6-18 ALARP Decision Context and justification**

<b>ALARP Decision Context A</b>	<p>The use of cranes and other lifting equipment to handle equipment and materials offshore is well practiced. There is a good understanding of potential dropped object sources, and the control measures required to manage these. Furthermore, the associated safety risks mean that these activities are well regulated.</p> <p>There is little uncertainty associated with the potential environmental impacts which have been evaluated as Consequence Level IV (the lowest level).</p> <p>No issues, objections or concerns were raised by relevant persons during the consultation process with regard to the risk of dropped objects.</p> <p>Esso believes ALARP Decision Context A should apply.</p>
---------------------------------	--

**Table 6-19 Good practice controls**

Good practice	Adopted	Control	Rationale
American Petroleum Industry (API) Recommended Practice (RP) 2D	✓	<b>CMP10:</b> Crane handling and transfer procedures	API RP 2D are industry-developed requirements which provide guidance in the development of operating and maintenance procedures for use in the safe operation of cranes on fixed or floating off-shore platforms. The LWIV holds Cargo Gear Certificates which certify that the deck cranes and accessory gear are compliant with API RP 2D (refer to Section 2.5.19 of <i>Q7000 Safety Case (Australia)</i> (Helix, 2021)).
Maintenance of lifting gear.	✓	<b>CM18:</b> Preventative	It is industry good practice that a PMS is in place to ensure that the lifting gear continues to operate at the required standard.

## 6.4 Accidental release – Waste

### 6.4.1 Causes of accidental release of waste

The handling and storage of materials and waste on board the LWIV and support vessels has the potential for accidental over-boarding of hazardous/non-hazardous materials and waste. Small quantities of hazardous/non-hazardous materials (solids and liquids) will be used and wastes created, and then handled and stored on board until transferred to port facilities for disposal at licenced onshore facilities. However, accidental releases to sea are a possibility, such as in rough ocean conditions when items may roll off or be blown off the deck.

The LWIV uses separate clearly identified cans, drums, boxes, bags or other containers for short-term (disposable garbage) and trip-long (non-disposable garbage) storage. Short-term storage would be appropriate for holding otherwise disposable garbage while a ship is passing through a restricted discharge area. As standard the following will always be carried for the storage of waste on-board the *Q7000* (refer to Section 3.10.8.5 of *Q7000 Safety Case (Australia)* (Helix, 2021)):

- compactor for accommodation and mixed food waste
- skip for metals
- containers for storage of:
  - fluorescent tubes and lamps
  - paint, glues, varnishes, etc.
  - aerosol cans
  - medical waste
  - contaminated waste such as oily rags, filters, etc.

The following non-hazardous materials and wastes will be disposed of to shore, but have the potential to be accidentally dropped or released overboard:

- paper and cardboard
- wooden pallets
- scrap steel, metal, aluminium, cans
- glass
- plastics.

The following hazardous materials may be used and waste generated through the use of consumable products and will be disposed to shore, but may be accidentally dropped or released overboard:

- hydrocarbons, hydraulic oils and lubricants
- hydrocarbon-contaminated materials (e.g., oily rags, pipe dope, oil filters)
- batteries, empty paint cans, aerosol cans, fluorescent tubes, printer cartridges
- contaminated personal protective equipment
- acids and solvents (laboratory wastes).

#### 6.4.2 Risk of accidental releases of waste

The potential environmental impacts associated with the accidental release of waste are:

- injury/mortality to fauna
- change in habitat.

#### 6.4.3 Risk assessment

Receptors that could be affected by the accidental release of waste and that have been identified in Volume 1 as occurring in the area are identified in Table 6-22.

**Table 6-22 Impact scoping**

Impacts	Receptors					
	Plankton	Benthic habitat – Bare substrate	Fish	Marine reptiles – Turtles	Birds	Marine mammals
Injury/mortality to fauna			✓	✓	✓	✓
Change in habitat	✓	✓	✓	✓	✓	✓

##### 6.4.3.1 Injury/mortality to fauna

Discharged overboard, wastes can cause injury or death to marine fauna or seabirds through ingestion or entanglement (e.g. plastics caught around the necks of seals or ingested by seabirds, fish or cetaceans). Several marine mammals (e.g. whales, dolphins, seals), marine reptiles and fish including those listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the OA. The PBW has distribution and foraging habitat overlapping the OAs and the SRW migration BIA also overlaps the OAs. The great white shark breeding and distribution BIAs overlap the OAs.

Most records of impacts of plastic debris on wildlife relate to entanglement, rather than ingestion. However, the rate of ingestion of plastic debris by marine wildlife is difficult to assess as not all dead animals are necropsied or ingested plastic debris may not be recorded where it is not considered as the primary cause of death.

The patterns of reports of entanglement in and ingestion of plastic debris by wildlife in Australian waters are likely to be influenced by factors such as the size and distribution of populations, foraging areas, migration patterns, diets, proximity of species to urban centres, changes in fisheries equipment and practices, weather patterns, and ocean currents, as well as the frequency of monitoring and/or observation of wildlife. Species dominating existing

entanglement and ingestion records are turtles and humpback whales. Australian pelicans and a number of cormorant species are also frequently reported (Ceccarelli, 2009).

#### 6.4.3.2 Change in habitat

Hazardous wastes released to the sea can cause pollution and contamination, with either direct or indirect effects on marine organisms. For example, chemical residues (depending on the volumes released) can impact on marine life from plankton to pelagic fish communities, causing physiological damage through ingestion or absorption through the skin. Impacts from a minor accidental release would be limited to the immediate area surrounding the release, prior to the dilution of the chemical with the surrounding seawater. In an open ocean environment such as the OA, it is expected that any release would be rapidly diluted and dispersed, and thus temporary and localised.

Solid hazardous wastes, such as paint cans containing paint residue, batteries and so forth, would settle on the seabed if dropped overboard. Over time, this may result in the leaching of hazardous materials to the seabed, which is likely to result in a small area of substrate becoming toxic and unsuitable for colonisation by benthic fauna. The benthic habitats of the area are broadly similar to those elsewhere in the region, so impacts to very localised areas of seabed will not result in the long-term loss of benthic habitat or species diversity or abundance.

Given the restricted exposures and limited quantity of marine pollution expected from this program, it is expected that any impacts from marine pollution may be Consequence Level IV resulting from a localised short-term impact to species of recognised conservation value but not affecting local ecosystem functioning.

The likelihood of an accidental release of waste resulting in these impacts is considered to be Likelihood Category D (very unlikely).

#### 6.4.4 Risk ranking

**Table 6-23 Risk ranking outcome**

Consequence Level	Likelihood Category	Risk Category
IV	D	4

#### 6.4.5 Controls

**Table 6-24 Environmental performance**

EPO	Control	EPS	Measurement criteria
No unplanned overboard release of waste.	<b>CM9:</b> Class certification	Vessels compliant with MARPOL Annex V as appropriate to vessel class which includes measures to prevent loss of waste to the ocean such as: <ul style="list-style-type: none"> <li>prohibition of discharge of garbage to the</li> </ul>	Vessels have class certification verified and issued by IACS member.

## 6.5 Accidental release – Loss of containment of hazardous or non-hazardous substances

### 6.5.1 Causes of loss of containment of hazardous or non-hazardous substances

Hazardous and non-hazardous materials that could be accidentally released to the environment include fuels, hydraulic fluids and well fluids/additives. As there are no live facilities in the vicinity of the Gudgeon-1 and Terakihi-1 wells, release of inhibited seawater and other fluids is minimal (refer to Section 2.3 for status of pipelines and Section 6.3 for dropped objects), this risk was not deemed credible and not considered further. Causes of accidental releases from the LWIV, support vessels and ROVs may include:

- failure or mechanical breakdown of equipment that use, store or transfer hazardous or non-hazardous materials
- failure to align valves correctly during transfer to tanks
- overfilling of chemical or well operations fluid tanks on the LWIV
- incorrectly operated 'environmentally sensitive' valves
- overfilling of fuel bulk storage tanks on the LWIV.

An evaluation of these types of events was completed to determine indicative volumes associated with each type of event.

Both hydraulic line failure and failure or breakdown of equipment onboard were associated with small volume spill events. A ROV underwater hydraulic line failure, for example, is estimated to result in a maximum spill volume of 20 Litres.

Operational fluids such as P&A brines or residual well fluids/muds, inadvertently released from a valve misalignment or unintentionally dumped from the storage tanks would pose the same or lesser risk. Volumes are likely to be less as the tanks are compartmentalised and have redundant alarms systems.

As an example, (AMSA, 2015) suggests the maximum credible spill volume from a refuelling incident with continuous supervision is approximately the transfer rate over 15 minutes. Assuming failure of dry-break couplings and based on the largest typical transfer rate in the order of 250 cubic metres per hour, this equates to an instantaneous spill of approximately 63 cubic metres.

### 6.5.2 Risks of loss of containment of hazardous or non-hazardous substances

A minor loss of containment has the potential to result in chronic and acute impacts to marine fauna via:

- change in water quality.

### 6.5.3 Risk assessment

Receptors that could be affected by a Loss of Containment (LOC) of hazardous or non-hazardous substances and that have been identified in Volume 1 as occurring in the area are identified in Table 6-29.

**Table 6-29 Impact scoping**

Impacts	Receptors			
	Plankton	Fish	Marine reptiles – Turtles	Marine mammals
Change in water quality	✓	✓	✓	✓

Given the low toxicity and high biodegradability of ROV hydraulic fluid the accidental release of a small volume is unlikely to adversely affect the receiving environment.

Effects from planned operational discharges and the planned discharge of cement are discussed in Sections 5.8, 5.9 and 5.10. In the event of an unplanned loss of containment little incremental effect is expected on the benthic habitat beyond that predicted for planned discharges. The loss of a small area of habitat, until it can be re-colonised, will not adversely affect the viability of local populations of infauna or epifauna, the ecology of the local area or the biodiversity of the region. The incremental increase in consequence is considered Consequence Level IV as supported by considering the footprint as a percentage of the area of the Bass Strait region.

Small open sea hydrocarbon spills result in similar short-term impacts as that of a large hydrocarbon release (Brussaard, et al., 2016). The characteristics of open sea waters is a significant mitigating factor in dispersing small oil spills, such that, no definitive evidence of long-term effects on marine fauna has been identified (Dicks, 1998). The environmental risks associated with a larger loss of diesel fuel from a vessel collision are assessed in Section 6.6.

Considering the small volumes of chemicals or hydrocarbons associated with this type of event together with the control measures in place, the likelihood of a loss of containment of hazardous substances resulting in the impacts described above is considered Likelihood Category D (very unlikely).

### 6.5.4 Risk ranking

**Table 6-30 Risk ranking outcome**

Consequence Level	Likelihood Category	Risk Category
IV	D	4

## 6.5.5 Controls

Table 6-31 Environmental performance

EPO	Control	EPS	Measurement criteria
No unplanned release of hazardous or non-hazardous substances to the marine.	<b>CM14:</b> Procedures for bulk transfer of fluids from support vessels	Bulk transfer of fluids from support vessels undertaken in accordance with relevant procedures.	Permit to Work records for liquid bulk transfers.
	<b>CMP13:</b> Design and certification of hoses	Transfer hoses shall comprise sufficient floating devices and self-sealing weak-link couplings in the mid-section of the hose string, where required, and suitable pressure rating.	Hose certificate confirms suitable fittings and rating.
	<b>CM18:</b> Preventative Maintenance System	The LWIV transfer hoses are inspected and replaced in accordance with the PMS or when they are visibly degraded.	The LWIV hose register and PMS indicate regular inspection and replacement of fuel/chemical/mud hoses.
	<b>CM21:</b> Remotely Operated Vehicle pre-post dive checks	A ROV pre- and post-dive inspection visually check for leaks.	Records of ROV pre- and post-dive inspection checklist.
	<b>CM22:</b> Remotely Operated Vehicle International Marine Contractors Association Audit	ROV installation inspected against IMCA guidelines.	Audit report developed and corrective action(s) managed in accordance with IMCA category rating.
	<b>CMP14:</b> Bunding	Bulk liquid transfer points and equipment located on deck utilising hydraulic fluids will have primary bunding or sheathing.  Chemicals and oils stored on deck are stored within bunded areas.	Inspection records demonstrate that bulk transfer points and equipment located on deck utilising hydraulic fluids have primary bunding or sheathing.  Inspection records demonstrate that chemicals and oils stored on deck are

## 6.5.7 Demonstration of acceptability

Table 6-35 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
<b>Risk assessment process for unplanned events</b>	The risk ranking is lower than Risk Category 1.	✓	The risk ranking is Risk Category 4 (the lowest category) and therefore considered acceptable.
<b>Principles of ESD</b>	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in a Consequence Level IV thus are not considered as having the potential to result in serious or irreversible environmental damage.
<b>Legislative and other requirements</b>	Legislative and other requirements have been identified and met.	✓	The requirements of MARPOL Annex I have been adopted.  The following legislative and other requirements are considered relevant as they apply to the implementation of MARPOL in Australia:

Factor	Demonstration criteria	Criteria met	Rationale
			<ul style="list-style-type: none"> <li>• <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i></li> <li>• <i>Navigation Act 2012 – Chapter 4 (Prevention of Pollution)</i></li> <li>• <i>Marine Order 91 (Marine pollution prevention – oil) 2014.</i></li> </ul>
<b>Internal context</b>	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist".
	Meets ExxonMobil Environmental Standards.	✓	The Upstream Water Management Standard does not specifically address P&A or drilling related discharges (other than non-aqueous fluid muds) but the controls proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	Proposed activities meet: <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements; and</li> <li>• OIMS System 8-1 objectives to clearly define and communicate Operations Integrity requirements to contractors and to qualify, evaluate and select contractors based on their ability to perform work in a safe, secure and environmentally sound manner.</li> </ul>
<b>External context</b>	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning the accidental release of hazardous substances.

## 6.6 Accidental release – Loss of containment refined oils (collision)

### 6.6.1 Causes of loss of containment of refined oils

The following activities have the potential to result in a spill of MDO:

- a collision between the support vessel and the LWIV or another third-party vessel that results in tank rupture and MDO loss.

Vessel drift or powered grounding is not considered credible given the distance from shore of the OA and the lack of emergent features in the OA.

### 6.6.2 Spill modelling

#### 6.6.2.1 Modelling methodology

To understand the potential consequences of a MDO spill and the response preparedness required, stochastic and deterministic modelling was undertaken in accordance with Section 3.4.1.1 (RPS, 2022).

**Table 6-36 Release locations used as part of the Gippsland Basin vessel activities marine diesel oil spill modelling study**

Scenario	Location	Latitude	Longitude	Depth (mLAT)	Spill volume (m <sup>3</sup> )
1	West Kingfish platform	38° 35' 39" S	148° 06' 15" E	76	280
2	Perch platform	38° 34' 15" S	147° 19' 16" E	42	280
3	Barracouta platform	38° 17' 53" S	147° 40' 28" E	46	280
4	Kipper facility	38°10' 53" S	148° 35' 35" E	94	280
5	Halibut platform	38°24'16" S	148°19'13" E	73	220

Esso commissioned RPS to carry out quantitative oil spill modelling to assess five potential hydrocarbon spill scenarios associated with support vessel activities in the Gippsland Basin. The five spill locations are used as representative indicators to assess potential impacts of spill risks across Esso's Bass Strait operations. The five spill locations are listed in Table 6-36 and spill volumes in all cases are based on rupture of the largest single fuel tank on the support vessel. The West Kingfish platform location was chosen to represent the Gudgeon-1 and Terakihi-1 locations. West Kingfish is about 33 kilometres southwest from Gudgeon-1, in 76 metres water depth, approximately 72 kilometres from shore, and is considered to be a conservative assessment for a release occurring within the OA.

The spill model inputs and parameters are summarised in Table 6-37.

Table 6-37 Vessel collision marine diesel oil spill modelling inputs

Parameter	Details			
Number of spill simulations	100			
Period of the year (season)	Annual analysis			
Hydrocarbon type	MDO Group II			
Total spill volume	280m <sup>3</sup>			
Volume basis	AMSA's guideline for indicative maximum credible spill volumes for other, nonoil tanker, vessel collision (AMSA, 2015) is the volume of the largest fuel tank. The loss of a full tank is most likely an overestimate as hydrostatic pressure would limit the release and pumping of material to another tank could also restrict the amount lost. Based on the type of support vessel that may be used, the largest MDO tank volume of 280m <sup>3</sup> has been used to undertake the impact assessment.			
Release location	West Kingfish platform: 38° 17' 54" S, 147° 40' 29" E			
Location basis	Modelling was undertaken from a release point located at the West Kingfish platform, approximately 33km SW from Gudgeon-1. This location is appropriate for the assessment of impacts. Although it is in a shallower water depth (76m), It is at a similar distance to sensitive shoreline and marine receptors and is considered to be directly analogous to a release occurring within the Gudgeon-1 and Terakihi-1 OAs.			
Release duration	6 hours			
Modelled duration	30 days			
MDO Characteristics:				
Density	829kg/m <sup>3</sup> @ 15°C			
API	37.6			
Dynamic viscosity	4.0 cP @ 25°C			
Pour point	-14°C			
Oil property category	Group II (light persistent oil)			
Boiling point	Volatile (<180°C) 6.0%	Semi-volatile (180–265°C) 34.6%	Low volatility (265–38 °C) 54.4%	Residual (>380°C) 5.0%

### 6.6.2.2 Modelling outputs - weathering and fate

Marine diesel contains 95 percent of light hydrocarbons (or non-persistent constituents) that are likely to evaporate when available to the atmosphere. The remaining 5 percent is composed of heavy hydrocarbons (or persistent compounds) that may persist on the sea-surface for extended times.

It is important to note that the viscosity of marine diesel does not change significantly over time and hence has a strong tendency to physically entrain into the upper water column as oil droplets in the presence of waves, where it is subjected to microbial degradation (decay) but can re-float to the surface if wave energies abate.

Figure 6-2 clearly shows that evaporation is the dominant process contributing to the removal of MDO from the sea surface.

Figure 6-2 presents the fates and weathering graph for the West Kingfish 'worst' single spill trajectory. At the conclusion of the simulation period, approximately 68 percent spilled oil was lost to the atmosphere through evaporation, approximately 17 percent of the MDO was predicted to have decayed by the end of the simulation, while approximately 15 percent was predicted to remain within the water column. None is predicted to arrive ashore.

**Figure 6-2 Predicted weathering and fates graph as volume for the selected single West Kingfish marine diesel oil spill trajectory: largest oil volume ashore, longest length of actionable shoreline oil and minimum time to exposure of nearshore waters to visible oil**

### 6.6.2.3 Modelling outputs – stochastic

Oil spill modelling predicts that the total area that could be exposed to hydrocarbon, including trace concentrations of oil in the water column, as a result of any spill. This is known as the PEA and is used for planning purposes to ensure that all social and environmental sensitivities are acknowledged, described and considered in the development of the EP.

Modelling is also used to inform specific impact assessments by understanding the location and extent of oil at concentrations likely to result in environmental consequences. There is no

agreed exposure level below which environmental impacts will not occur so outputs should not be interpreted as a boundary. However, mapping areas which could be moderately impacted by a spill is a useful tool for impact or consequence assessment. The environmental sensitivities within this area are described in Table 6-38.

**Table 6-38 Vessel collision marine diesel oil modelling output summary**

Model parameter	Exposure value	Stochastic modelling (based on 100 annualised spill trajectories)
		West Kingfish (as representative spill location for Gudgeon-1 and Terakihi-1)
Surface exposure	Moderate (10g/m <sup>2</sup> )	<p>Maximum distance from release site is ~15km in an east-northeast direction. The zone of moderate exposure overlaps the following BIAs (92% probability):</p> <p><u>Birds</u></p> <ul style="list-style-type: none"> <li>• Black-browed albatross - foraging</li> <li>• Buller’s albatross - foraging</li> <li>• Campbell albatross - foraging</li> <li>• Common diving-petrel - foraging</li> <li>• Indian yellow-nosed albatross - foraging</li> <li>• Short-tailed shearwater - foraging</li> <li>• Shy albatross - foraging</li> <li>• Wandering albatross – foraging.</li> </ul> <p><u>Marine mammals</u></p> <ul style="list-style-type: none"> <li>• PBW - distribution and foraging</li> <li>• SRW – migration</li> <li>• Great white shark – distribution.</li> </ul> <p>Does not extend into State waters or contact any National Parks and Reserves.</p>
	High (50g/m <sup>2</sup> )	<p>Maximum distance from release site is ~5km in a westerly direction. The zone of moderate exposure overlaps the following BIAs (10% probability):</p> <p><u>Birds</u></p> <ul style="list-style-type: none"> <li>• Black-browed albatross - foraging</li> <li>• Buller’s albatross - foraging</li> <li>• Campbell albatross - foraging</li> <li>• Common diving petrel - foraging</li> <li>• Indian yellow-nosed albatross - foraging</li> <li>• Short-tailed shearwater - foraging</li> <li>• Shy albatross - foraging</li> <li>• Wandering albatross – foraging.</li> </ul>

Model parameter	Exposure value	Stochastic modelling (based on 100 annualised spill trajectories)

		BTA (as representative spill location for Gudgeon-1 and Terakihi-1)
		<p>probability of being exposed at low instantaneous dissolved hydrocarbon threshold.</p> <p>Upwelling East of Eden KEF may be exposed at low threshold (1%).</p> <p>Exposure not predicted to extend into Victorian, New South Wales or Tasmanian State waters.</p>
In-water (entrained) Exposure	Low (10ppb instantaneous)	<p>Exposure will be confined to the surface 10m of the water column.</p> <p><u>0-10m water depth</u></p> <p>In-water entrained hydrocarbon at the low threshold extends along the southern Australian coast from the Bass Strait Islands, Tasmania to Ulladulla, New South Wales. The probability of contact with the nearshore waters of various terrestrial National Parks and Reserves ranges from approximately 10% at Croajingolong, to less than 6% at Cape Conran, Mimosa Rocks and Bournda.</p> <p>Entrained hydrocarbon at the low threshold is predicted to encroach upon Victorian and New South Wales state waters with likelihoods of 20% and 15% respectively and contact Point Hicks, and Cape Howe Marine National Parks, Beware Reef Marine Sanctuary and Batemans Marine Park (New South Wales)</p> <p>Entrained hydrocarbon is predicted to encroach upon Tasmanian waters with a likelihood of 7% including the waters surrounding the terrestrial National Parks and Reserves of the Kent and Hogan Groups, East and West Moncouer Islands and Curtis Island.</p> <p>Other receptors predicted to be contacted by entrained oil at the low threshold –</p> <p>With probabilities of 20 - 50% are:</p> <ul style="list-style-type: none"> <li>• Albatross, shearwater and petrel - foraging BIAs</li> <li>• Little penguin - foraging BIA</li> <li>• PBW - distribution and foraging BIAs</li> <li>• SRW - migration BIA</li> <li>• Indo-Pacific/spotted bottlenose dolphin - breeding BIA</li> <li>• Great white shark - foraging and distribution BIAs</li> <li>• KEF: Upwelling East of Eden.</li> </ul> <p>With probabilities at, or less than, 15% are:</p> <ul style="list-style-type: none"> <li>• Little penguin - breeding BIA</li> <li>• Grey nurse shark - foraging and migration BIAs</li> <li>• Great white shark - breeding BIA</li> <li>• Humpback whale - foraging BIA</li> <li>• KEFs: Big Horseshoe Canyon, Canyons on the Eastern Continental Slope, and Shelf Rocky Reefs</li> <li>• Beagle, East Gippsland and Flinders AMP.</li> </ul>

**6.6.3 Risks of loss of containment of refined oils**

An accidental release of MDO has the potential to result in the following impacts:

- injury/mortality to fauna
- change in habitat
- change to the function, interests or activities of other users.

**6.6.4 Risk assessment**

Receptors that could be affected by a LOC of MDO and that have been identified in Volume 1 as occurring in the area are identified in Table 6-40.

**Table 6-40 Impact scoping**

Impacts	Receptors					
	Benthic Habitats	Plankton	Fish	Marine reptiles - Turtles	Birds	Marine mammals
Injury/mortality to fauna		✓	✓	✓	✓	✓
	Coastal habitats		AMPs	KEFs	National Parks and Reserves	
Change in habitat	✓				✓	
	Fisheries – Commercial (Commonwealth and State)			Cultural - Indigenous and historic		Recreation and tourism
Change to the function, interests or activities of other users	✓					✓

Discussion of the key receptors considered to be at risk in the event of a MDO spill are described in Table 6-41.

**Table 6-41 Risks of surface, shoreline and in-water hydrocarbon exposure from marine diesel oil spill**

Receptor	Impact of MDO exposure	Exposure risk assessment
Plankton	<p>Plankton are found in nearshore and open waters beneath the surface in the water column. These organisms migrate vertically through the water column to feed in surface waters at night (NRDA, 2012). As they move close to the sea surface it is possible that they may be exposed to both surface hydrocarbons but to a greater extent, hydrocarbons dissolved or entrained in the water column</p>	<p>There is no predicted exposure above the moderate in-water (dissolved) threshold. The consequences to plankton are assessed as Consequence Level IV.</p>
Fish	<p>Fish can be exposed to oil through a variety of pathways, including: direct dermal contact (e.g. swimming through oil); ingestion (e.g. directly or via oil-affected prey/foods); and inhalation (e.g. elevated dissolved contaminant concentrations in water passing over the gills). Fish are generally considered vulnerable to oil spills because they inhabit areas coincident with oil exploration and production and those areas that may be subsequently impacted by an oil spill; including coral reefs, seagrasses, nearshore areas, deep offshore areas, pelagic habitats and demersal habitats (Moore &amp; Dwyer, 1974) (Gundlach &amp; Hayes, 1978). Of the potential toxicants, monoaromatic and polycyclic aromatic hydrocarbons (PAH) are generally regarded as the most toxic to fish.</p> <p><u>Surface oil</u></p> <p>Since fish and sharks do not generally break the sea surface, the exposure of surface hydrocarbons to fish and shark species are unlikely to occur. Near the sea surface, fish are able to detect and avoid contact with surface slicks meaning fish mortalities rarely occur in the event of a hydrocarbon spill in open waters (Volkman, et al., 2004). As a result, wide-ranging pelagic fish of the open ocean generally are not highly susceptible to impacts from surface hydrocarbons. Adult fish kills reported after oil spills occur mainly to shallow water, near-shore benthic species (Volkman, et al., 2004). Following the Deep Water Horizon (DWH) incident, it was suggested that whale sharks may be vulnerable to oiling of gills if exposed to the oil. The tendency of whale sharks to feed close to surface waters will</p>	<p>MDO spills in open water are so rapidly diluted that fish kills are rarely observed (ITOPF, 2011) (NOAA, 2013). The predicted impact from surface oiling on fish is considered to be negligible at a population level.</p> <p>Pelagic free-swimming fish and sharks are unlikely to suffer either acute or chronic effects from oil spill exposure because dissolved/entrained hydrocarbons in the water column are predicted to be below thresholds at which impacts might occur and their mobile, transitory characteristics reduce the risk of prolonged exposure.</p> <p>The consequences to fish are assessed as Consequence Level IV.</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>increase the likelihood of exposure to surface slicks and elevated hydrocarbon concentrations beneath slicks.</p> <p><u>In-water oil</u></p> <p>Exposure to hydrocarbons entrained or dissolved in the water column can be toxic to fishes. Studies have shown a range of impacts including changes in abundance, decreased size, inhibited swimming ability, changes to oxygen consumption and respiration, changes to reproduction, immune system responses, DNA damage, visible skin and organ lesions, and increased parasitism. However, many fish species can metabolize toxic hydrocarbons, which reduces the risk of bioaccumulation (NRDA, 2012). Pelagic free-swimming fish and sharks are unlikely to suffer long-term damage from oil spill exposure because dissolved/entrained hydrocarbons in water are not expected to be sufficient to cause harm. Pelagic species are also generally highly mobile and as such are not likely to suffer extended exposure (e.g. &gt;96 hours) at concentrations that would lead to chronic effects due to their patterns of movement. Demersal fish are not expected to be impacted given the presence of in-water hydrocarbons in surface layers only.</p> <p>Fish are most vulnerable to hydrocarbon discharges during their embryonic, larval and juvenile life stages. Oil exposure may result in decreased spawning success and abnormal larval development. Impacts on eggs and larvae entrained in the upper water column are not expected to be significant given the temporary period of water quality impairment, and the limited areal extent of a spill. As egg/larvae dispersal is widely distributed in the upper layers of the water column it is expected that current induced drift will rapidly replace any oil affected populations.</p>	

Receptor	Impact of MDO exposure	Exposure risk assessment
<p>Marine Reptiles - Turtles</p>	<p>Marine turtles are vulnerable to the effects of oil at all life stages; eggs, hatchlings, juveniles, and adults. Oil exposure affects different turtle life stages in different ways; and each turtle life stage frequents a habitat with varied potential to be impacted during an oil spill. Several aspects of turtle biology and behaviour place them at particular risk, including a lack of avoidance, indiscriminate feeding in convergence zones, and large pre-dive inhalations.</p> <p>Marine turtles can be exposed to oil externally (e.g. swimming through oil slicks) or internally (e.g. swallowing the oil, consuming oil affected prey, or inhaling of volatile oil related compounds).</p> <p><u>Surface oil</u></p> <p>Effects of oil on turtles include increased egg mortality and developmental defects; direct mortality due to oiling in hatchlings, juveniles, and adults; and negative impacts to the skin, blood, digestive and immune systems, and salt glands. Oil can enter cavities such as the eyes, nostrils, or mouth; and oil covering their bodies may interfere with breathing because they inhale large volumes of air to dive.</p> <p>Experiments on physiological and clinical pathological effects of hydrocarbons on loggerhead turtles (~15 to 18 months old) showed that the turtles' major physiological systems were adversely affected by both chronic and acute exposures (96 hour exposure to a 0.05cm layer of South Louisiana crude oil versus 0.5cm for 48 hours) (Lutcavage, Lutz, Bossart, &amp; Hudson, 1995). Recovery from the sloughing skin and mucosa took up to 21 days, increasing the turtle's susceptibility to infection or other diseases, such as fibro papilloma (Lutcavage, Lutz, Bossart, &amp; Hudson, 1995).</p> <p>Records of oiled wildlife during spills rarely include marine turtles, even from areas where they are known to be relatively abundant (Short, 2011). An exception to this was the large number of marine turtles collected (613 dead and 536 live) during the DWH incident in the Gulf of Mexico (GoM), although many of these animals did not show any sign of oil exposure (NOAA, 2013). Of the dead turtles</p>	<p>While marine turtles, including threatened species, are known to occur in the area potentially exposed to MDO at moderate - high concentrations they are not noted to reside or aggregate in significant numbers, and there are no recognised BIAs in the region.</p> <p>There are no turtle nesting beaches along the Gippsland coastline, so impacts to turtles from shoreline oiling will not occur.</p> <p>Although the effects of MDO on marine reptiles, specifically turtles can be severe, the low density of turtles expected in the region (due to lack of BIA or aggregations) suggests that few, if any, individuals would be affected. Consequently, the potential impacts to marine reptiles are considered to be Consequence Level IV.</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>found, 3.4% were visibly oiled and 85% of the live turtles found were oiled (NOAA, 2013). Of the captured animals, 88% of the live turtles were later released, suggesting that oiling does not inevitably lead to mortality.</p> <p><u>Shoreline oil</u></p> <p>Turtles may experience oiling impacts on nesting beaches and eggs through chemical exposures resulting in decreased survival to hatching and developmental defects in hatchlings. Adult females crossing an oiled beach could cause external oiling of the skin and carapace; nothing that most oil is deposited at the high-tide line, and most turtles nest well above this level. Studies on freshwater snapping turtles showed uptake of PAH from contaminated nest sediments, but no impacts on hatching success or juvenile health following exposure of eggs to dispersed weathered light crude (Rowe, Mitchelmore, &amp; Baker, 2009). However, other studies found evidence that exposure of freshwater turtle embryos to PAH results in deformities (Bell, Spotila, &amp; Congdon, 2006) (Van Meter, Spotila, &amp; Avery, Polycyclic Aromatic Hydrocarbons Affect Survival and Development of Common Snapping Turtle (<i>Chelydra serpentina</i>) Embryos and Hatchlings., 2006). Turtle hatchlings may be more vulnerable to smothering as they emerge from the nests and make their way over the intertidal area to the water. Hatchlings that contact oil residues while crossing a beach can exhibit a range of effects including impaired movement and bodily functions (Milton, Lutz, &amp; Shigenaka, 2003). Hatchlings sticky with oily residues may also have more difficulty crawling and swimming, rendering them more vulnerable to predation.</p> <p>It should be noted that the threat and relative impacts of an unplanned discharge on some marine reptile species are considered less damaging than other stressors. Report cards produced on protected marine reptiles in Australia generally ranked oil pollution as either 'not of concern' or 'of less concern' depending on the marine region (DSEWPAC, 2012b).</p>	

Receptor	Impact of MDO exposure	Exposure risk assessment
<p>Birds</p>	<p>Seabirds and shorebirds are sensitive to the impacts of oiling, with their vulnerability arising from the fact that they cross the air - water interface to feed, while their shoreline habitats may also be oiled (Hook, Batley, Holloway, Irving, &amp; Ross, 2016). Species that raft together in large flocks on the sea surface are particularly at risk (ITOPF, 2011).</p> <p><u>Surface oil</u></p> <p>Birds foraging at sea have the potential to directly interact with oil on the sea surface some considerable distance from breeding sites in the course of normal foraging activities. Seabird species most at risk include those that readily rest on the sea surface (e.g. shearwaters) and surface plunging species (e.g. terns, boobies). As seabirds are a top order predator, any impact on other marine life (e.g. pelagic fish) may disrupt and limit food supply both for the maintenance of adults and the provisioning of young.</p> <p>For seabirds, direct contact with hydrocarbons can foul feathers, which may subsequently result in hypothermia due to a reduction in the ability of the bird to thermo-regulate and impair waterproofing. A bird suffering from cold, exhaustion and a loss of buoyancy may also dehydrate, drown or starve (DSEWPAC, 2011). Increased heat loss as a result of a loss of water-proofing results in an increased metabolism of food reserves in the body, which is not countered by a corresponding increase in food intake, may lead to emaciation (DSEWPAC, 2011). The greatest vulnerability in this case occurs when birds are feeding or resting at the sea surface (Peakall, Wells, &amp; Mackay, A hazard assessment of chemically dispersed oil spills and seabirds., 1987). In a review of 45 actual marine spills, there was no correlation between the numbers of bird deaths and the volume of the spill (Burger, 1993).</p> <p>Penguins may be especially vulnerable to oil because they spend a high portion of their time in the water and readily lose insulation and buoyancy if their feathers are oiled (Hook, Batley, Holloway, Irving, &amp; Ross, 2016). The Iron Baron vessel spill (325MT of bunker fuel in</p>	<p>Several threatened, migratory and/or listed marine species may occur in the area exposed to moderate-high surface thresholds. There are foraging BIA's for some species of petrels and albatrosses throughout the exposed area. However, there are no breeding BIAs within this area.</p> <p>Seabirds rafting, resting, diving or feeding at sea have the potential to come into contact with surface oil, ranging from moderate to high exposure.</p> <p>Given the extensive ocean foraging habitat available to species such as albatross and petrel, the small area and temporary nature of MDO on the sea surface makes it unlikely that a spill will limit their ability to forage for unaffected prey. When first released, the MDO has higher toxicity due to the presence of volatile components. Individual birds making contact close to the spill source at the time of the spill may suffer impacts however it is unlikely that a large number of birds will be affected. As such, acute or chronic toxicity impacts (death or long-term poor health) to small numbers of birds are possible, however this is not considered significant at a population level.</p> <p>The maximum length of shoreline predicted to be exposed to shoreline loading of hydrocarbons that may have biological impacts to birds (greater than 100 grams per square metre) is 9 kilometres.</p> <p>This section of coastline comprises mostly wide sandy beaches that provides habitat for shorebird species such as Hooded plovers and terns and nesting habitat for seabird species. MDO is unlikely to persist on the surface of sandy beaches because it quickly penetrates porous sediments (NOAA, 2013).</p> <p>This behaviour limits the duration of exposure to fauna on the shoreline. Shorebirds foraging for food in intertidal areas or along the high tide mark and splash zone may encounter weathered hydrocarbons that may be brought back to nests. Hydrocarbon entering the sandy nests of Hooded plovers, terns or other bird species is likely to percolate through the sand and not accumulate</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>Tasmania in 1995) is estimated to have resulted in the death of up to 20,000 penguins (Hook, Batley, Holloway, Irving, &amp; Ross, 2016).</p> <p><u>Shoreline oil</u></p> <p>Shorebirds are likely to be exposed to oil when it directly impacts the intertidal zone and onshore due to their feeding habitats. Foraging shorebirds will be at potential risk of both direct impacts through contamination of individual birds (e.g. fouling of feathers) and indirect impacts (e.g. fouling and/or a reduction in prey items) (Clarke &amp; Herrod, 2016). Birds that are coated in oil can also suffer from damage to external tissues, including skin and eyes, as well as internal tissue irritation in their lungs and stomachs</p> <p>Breeding birds (both seabirds and shorebirds) may be exposed to oil via direct contact or the contamination of the breeding habitat (e.g. shores of islands) (Clarke &amp; Herrod, 2016). Bird eggs may subsequently be damaged if an oiled adult sits on the nest. Fresh crude was shown to be more toxic than weathered crude, which had a medial lethal dose of 21.3 milligrams per egg. Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos.</p> <p>Toxic effects on birds may result where oil is ingested as the bird attempts to preen its feathers, or via consumption of oil-affected prey. Whether this toxicity ultimately results in mortality will depend on the amount consumed and other factors relating to the health and sensitivity of the particular bird species.</p> <p>The threshold thickness of oil that could impart a lethal dose to an individual wildlife species is 10 micro metres (approximately 10 grams per square metre) (Engelhardt, Petroleum effects on marine mammals, 1983) (Clark, 1984) (Geraci &amp; St. Aubin, 1988) (Jenssen, 1994). A layer 25 micro metres thick would be harmful for most birds that contact the slick (Scholten, et al., 1996).</p>	<p>in the feathers of adults or young. Toxicity effects from ingestion of contaminated prey caught in the intertidal zone or from direct exposure, or transport back to, are unlikely, as the volatile components are likely to have flashed off prior to stranding (minimum stranding times range from 2 days).</p> <p>The populations of seabird and shorebird species have a wide geographic range, meaning that impacts to individuals or a population at one location will not necessarily extend to populations at other un-impacted locations.</p> <p>Consequently, the potential consequence of risks to seabirds and shorebirds from a vessel collision event are considered to be Consequence Level III to account for a species of local importance being affected.</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
<p>Marine Mammals (Pinnipeds)</p>	<p>Pinnipeds are directly at risk from impacts associated with the exposure to surface, shoreline and in-water hydrocarbons.</p> <p><u>Sea surface oil</u></p> <p>Pinnipeds are vulnerable to sea surface exposures in particular given they spend much of their time on or near the surface of the water, as they need to surface every few minutes to breathe, and regularly haul out on to beaches. Pinnipeds are also sensitive as they will stay near established colonies and haul-out areas, meaning they are less likely to practise avoidance behaviours. This is corroborated by (Geraci &amp; St. Aubin, 1988) who suggest seals, sea lions and fur-seals have been observed swimming in oil slicks during a number of documented spills.</p> <p>As a result of exposure to surface oils, pinnipeds, with their relatively large, protruding eyes are particularly vulnerable to effects such as irritation to mucous membranes that surround the eyes and line the oral cavity, respiratory surfaces, and anal and urogenital orifices. Seals appear not to be very sensitive to contact with oil, but instead to the toxic impacts from the inhalation of volatile components (Hook, Batley, Holloway, Irving, &amp; Ross, 2016).</p> <p>For some pinnipeds, fur is an effective thermal barrier because it traps air and repels water. Petroleum stuck to fur reduces its insulative value by removing natural oils that waterproof the pelage. Consequently, the rate of heat transfer through fur seal pelts can double after oiling (Geraci &amp; St. Aubin, 1988), adding an energetic burden to the animal. It is suggested (Kooyman, Gentry, &amp; McAllister, 1976) that in fact, fouling of approximately one-third of the body surface resulted in 50 percent greater heat loss in fur seals immersed in water at various temperatures. Fur-seals are particularly vulnerable due to the likelihood of oil adhering to fur. Heavy oil coating and tar deposits on fur-seals may result in reduced swimming ability and lack of mobility out of the water.</p> <p><u>In-water oil</u></p>	<p>Seals are known to occur within the area exposed to moderate-high surface threshold. However, these areas are not identified as critical habitat and there are no identified BIAs for seals in the region.</p> <p>There is no predicted oil stranding along shorelines known to be used by Australian or New Zealand fur-seals as breeding or haul-out sites. As such, it is unlikely that oiling of seals will occur on shorelines.</p> <p>Although the characteristics of MDO reduce the risk of hyperthermia from oiling, other effects of surface and in-water MDO on pinnipeds can be severe. Long term impacts at a population level are considered unlikely however the consequence is assessed as Consequence Level III.</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>Ingested hydrocarbons can irritate or destroy epithelial cells that line the stomach and intestine, thereby affecting motility, digestion and absorption.</p> <p>However, pinnipeds have been found to have the enzyme systems necessary to convert absorbed hydrocarbons into polar metabolites, which can be excreted in urine (Engelhardt, 1982) (Addison &amp; Brodie, 1984) (Addison, Brodie, Edwards, &amp; Sadler, 1986) . Benzene and naphthalene ingested by seals is quickly absorbed into the blood through the gut, causing acute stress, with damage to the liver considered likely. If ingested in large volumes, hydrocarbons may not be completely metabolized, which may result in death (Volkman, Miller, Revill, &amp; Connell, 1994).</p> <p><u>Shoreline oil</u></p> <p>Breeding colonies (used to birth and nurse until pups are weaned) are particularly sensitive to hydrocarbon spills (Higgins &amp; Gass, 1993). Species that rely on fur to regulate their body temperature (such as fur-seals) are the most vulnerable to oil as the animals may die from hypothermia or overheating, depending on the season, if the fur becomes matted with oil (ITOPF, 2011).</p> <p>It is reported that most pinnipeds scratch themselves vigorously with their flippers and do not lick or groom themselves, so are less likely to ingest oil from skin surfaces (Geraci &amp; St. Aubin, 1988). However, mothers trying to clean an oiled pup may ingest oil.</p> <p>The Long-Term Environmental Impact and Recovery report for the Iron Barren oil spill concluded that “The number of pups born at Tenth Island in 1995 was reduced when compared to previous years. There was a strong relationship between the productivity of the seal colonies and the proximity of the islands to the oil spill wherein the islands close to the spill showed reduced pup production and those islands more distant to the oil spill did not” (Tasmanian SMPC, 1999).</p> <p>Pinnipeds are further at risk because they appear to rely on scent to establish a mother-pup bond (Sandegren, 1970) (Fogden, 1971), and consequently oil-coated pups may not be recognisable to their</p>	

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>mothers. This is only theorised, with studies and research indicating interaction between mothers and oiled pups were normal (Davis &amp; Anderson, 1976) (Davies, 1949) (Shaughnessy &amp; Chapman, 1984).</p> <p>Australian sea lions have naturally poor recovery abilities due to unusual reproductive biology and life history (DSEWPAC, 2013). Due to the extreme philopatry of females and limited dispersal of males between breeding colonies, the removal of only a few individuals annually may increase the likelihood of decline and potentially lead to the extinction of some of the smaller colonies.</p>	
<p>Marine Mammals (Cetaceans)</p>	<p>Whales and dolphins can be exposed to the chemicals in oil through:</p> <ul style="list-style-type: none"> <li>• internal exposure by consuming oil or contaminated prey</li> <li>• inhaling volatile oil compounds when surfacing to breathe</li> <li>• external exposure, by swimming in oil and having oil directly on the skin and body</li> <li>• maternal transfer of contaminants to embryos (NRDA, 2012).</li> </ul> <p><u>Surface oil</u></p> <p>Direct surface oil contact with hydrocarbons is considered to have little deleterious effect on whales, possibly due to the skin's effectiveness as a barrier to toxicity, and effect of oil on cetacean skin is probably minor and temporary (Geraci &amp; St. Aubin, 1988). A 10 to 25 micro metre oil thickness threshold has the potential to impart a lethal dose to the species, however also estimates a probability of 0.1 percent mortality to cetaceans if they encounter these thresholds based on the proportion of the time spent at surface (French-McCay D. P., 2009). The inhalation of oil droplets, vapours and fumes is a distinct possibility if whales surface in slicks to breathe. Exposure to hydrocarbons in this way could damage mucous membranes, damage airways or even cause death.</p> <p><u>In-water oil</u></p>	<p>Several threatened, migratory and/or listed cetacean species may traverse the MDO spill plume. The foraging BIA for the PBW and the migration BIA for the SRW may be exposed to surface concentrations at moderate-high thresholds.</p> <p>Biological effects of physical contact with areas of moderate concentrations of MDO at the sea surface are unlikely to lead to any long-term consequences. In the unlikely event of an MDO spill, the environmental impact would be limited to a relatively short period following the release and would need to coincide with migration to result in exposure of a large number of individuals. The highly mobile nature of cetacean species means that such exposure is not anticipated to result in long term population viability effects and the resultant impact is assessed as Consequence Level III.</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>The physical impacts from ingested hydrocarbon with subsequent lethal or sub-lethal impacts are both applicable to entrained oil. However, the susceptibility of cetaceans varies with feeding habits. Baleen whales (such as blue, southern right and humpback) are not particularly susceptible to ingestion of oil in the water column as they feed by skimming the surface. Oil may stick to the baleen while they 'filter feed' near slicks. Toothed whales and dolphins may be susceptible to ingestion of dissolved and entrained oil as they gulp feed at depth. As highly mobile species, in general it is very unlikely that these animals will be constantly exposed to concentrations of hydrocarbons in the water column for continuous durations (for example greater than 96 hours) that would lead to chronic effects. Note also, many marine mammals appear to have the necessary liver enzymes to metabolise hydrocarbons and excrete them as polar derivatives.</p> <p>Evidence suggests that many cetacean species are unlikely to detect and avoid spilled oil (Matkin, Saulitis, Ellis, Olesiuk, &amp; Rice, 2008). There are numerous examples where cetaceans have appeared to incidentally come into contact with oil and/or not demonstrated any obvious avoidance behaviour; e.g. following the Exxon Valdez oil spill, (Matkin, Saulitis, Ellis, Olesiuk, &amp; Rice, 2008) reported killer whales in slicks of oil as early as 24 hours after the spill.</p> <p>Some whales, particularly those with coastal migration and reproduction, display strong site fidelity to specific resting, breeding and feeding habitats, as well as to their migratory paths and this may override any tendency for cetaceans to avoid the noxious presence of hydrocarbons. The SRW exhibits varying degrees of site fidelity, with the majority of females and calves returning to the same birthing location, while some also travel long distances between breeding grounds within a season (CMPSRW). If spilled oil reaches these biologically important habitats, the pollution may disrupt natural behaviours, displace animals, reduce foraging or reproductive success rates and increase mortality. If sufficiently high numbers are</p>	

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>impacted, the greater population may experience reduced recovery and survival rates.</p>	
<p>Coastal Habitat – Sandy Shoreline</p>	<p>Sandy beaches provide potential foraging and breeding habitat for numerous bird, marine turtle and pinniped species. These activities primarily occur above the high tide line, with exception of haul outs. Note, most of the oil on a sandy shore will be concentrated at, and below, the high tide mark. Sandy beaches are also inhabited by a diverse assemblage (although not always abundant) of infauna (including nematodes, copepods and polychaetes); and macroinvertebrates (e.g. crustaceans). Because the sand retains oil, such animals may be killed if oil penetrates into the sediments. Long-term depletion of sediment fauna could have an adverse effect on birds or fish that use tidal flats as feeding grounds (IPIECA, 1999).</p> <p>Depth of penetration in sandy sediment is influenced by:</p> <ul style="list-style-type: none"> <li>• particle size. Penetration is not generally as great on mud as on coarser sediments</li> <li>• oil viscosity. Viscous oils and mousse (water-in-oil emulsion) tend to penetrate less deeply than low-viscosity oils such as light crudes or diesel oil</li> <li>• drainage. If sediments are poorly drained (as is often the case with tidal flats remote from creeks or channels), the water content may prevent the oil from penetrating into the sediment. In contrast, oil may reach depths greater than one metre in coarse well-drained sediments</li> <li>• animal burrows and root pores. Penetration into fine sediments is increased if there are burrows of animals such as worms, or pores left where plant roots have decayed.</li> </ul> <p>A 100 grams per square metre threshold (considered a 'stain' or 'film', and equivalent to 0.1 millimetre thickness) is assumed as the lethal threshold for invertebrates on hard substrates and sediments (mud, silt, sand, gravel) in intertidal habitats. A threshold of 100 grams per</p>	<p>The maximum length of coastline potentially at risk from stranded oil at the moderate threshold is 9 kilometres. This coastline is dominated by wide sandy beaches.</p> <p>With the shortest time to shoreline accumulation at the moderate threshold being approximately 3 days the MDO will have partially weathered. The shoreline loadings may result in acute toxicity, and mortality, of invertebrate communities, especially as the MDO will easily penetrate into sandy sediments. However, tidal action is expected to lead to rapid weathering of any hydrocarbons in the intertidal area and the populations of these communities would be likely to rapidly recover. The impact of MDO coming ashore on sandy beaches is considered to have a Consequence Level III.</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>square metre oil thickness would be enough to coat an animal and likely impact its survival and reproductive capacity (French-McCay D. P., 2009). Based on this, areas of heavy oiling would likely result in acute toxicity, and death, of many invertebrate communities, especially where oil penetrates into sediments through animal burrows (IPIECA, 1999). However, these communities would be likely to rapidly recover (recruitment from unaffected individuals and recruitment from nearby areas) as oil is removed from the environment.</p> <p>Following the Sea Empress spill (in west Wales, 1996) many amphipods (sandhoppers), cockles and razor shells were killed. There were mass strandings on many beaches of both intertidal species (such as cockles) and shallow sub-tidal species. Similar mass strandings occurred after the Amoco Cadiz spill (in Brittany, France, 1978) (IPIECA, 1999). Following the Sea Empress spill, populations of mud snails recovered within a few months, but some amphipod populations had not returned to normal after one year. Opportunists such as some species of worm may actually show a dramatic short-term increase following an oil spill (IPIECA, 1999).</p> <p>In March 2014, small volumes of crude oil from an unidentified source (confirmed to not be offshore oil and gas production facilities) washed up along a 7 kilometre section of sandy beach on the Victorian Gippsland coast as small (a few millimetres thick) granular balls (Gippsland Times, 2014). No impacts were observed over the course of two months following the incident (AMSA, 2014).</p> <p>As a result of the DWH incident, oil washed up on sandy beaches of the Alabama coastline. The natural movement of sand and water through the beach system continually transformed and re-distributed oil within the beach system, and 18 months after the event, mobile remnant oil remained in various states of weathering buried at different depths in the beaches (Hayworth, Clement, &amp; Valentine, 2011). There is also evidence that submerged oil mats exist just offshore of the Alabama beaches (ranging in thickness from a few millimetres to several centimetres), which has resulted in the regular</p>	

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>washing up of tar balls onto sandy beaches. These submerged oil mats may serve as long-term sources of remnant oil to the beach ecosystem (Hayworth, Clement, &amp; Valentine, 2011). Long-term changes to the beach ecosystem as a result of stranded oil are unknown.</p> <p>Other results from beach sampling undertaken at Dapuhin Island, Alabama, in May (pre-impact) and September 2011 (post-impact) found a large shift in the diversity and abundance of microbial species (e.g., nematodes, annelids, arthropods, polychaetes, protists, fungi, algae and bacteria). Post-spill, sampling indicated that species composition was almost exclusively dominated by a few species of fungi. DNA analyses revealed that the 'before' and 'after' communities at the same sites weren't closely related to each other (Bik, Halanych, Sharma, &amp; Thomas, 2012). Similar studies found that oil deposited on the beaches caused a shift in the community structure toward a hydrocarbonoclastic consortium (petroleum hydrocarbon degrading microorganisms) (Lamendella, et al., 2014).</p>	
National Parks and Reserves	Potential impacts to sensitive receptors related to the shoreline of the Gippsland Lakes Coastal Park, such as sandy beaches and birds, are discussed in the appropriate sections above.	<p>Part of the coast bordering the Gippsland Lakes Coastal Park is within the zone of moderate shoreline exposure.</p> <p>The consequence to Gippsland Lakes Coastal Park is assessed as localised and short-term, and ranked as Consequence Level III.</p>
Commercial fisheries	<p>Commercial fishing has the potential to be impacted through exclusion zones associated with the spill, the spill response and subsequent reduction in fishing effort. Exclusion zones may impede access to commercial fishing areas, for a short period of time, and nets and lines may become oiled. The impacts to commercial fishing from a public perception perspective, however, may be much more significant and longer term than the spill itself.</p> <p>Fishing areas may be closed for fishing for shorter or longer periods because of the risks of the catch being tainted by oil. Concentrations of petroleum contaminants in fish and crustacean and mollusc tissues could pose a significant potential for adverse human health effects,</p>	<p>Several commercial fisheries may operate within the area potentially exposed in the event of a LOWC and a temporary fisheries closure may be put in place.</p> <p>Oil may foul the hulls of fishing vessels and associated equipment, such as gill nets. A temporary fisheries closure, combined with oil tainting of target species (actual or perceived), may lead to financial losses to fisheries and economic losses for individual licence holders.</p> <p>Due to the rapid weathering of the MDO in the high energy Bass Strait environment (see Section 6.6.2.1) it is unlikely that an exclusion zone would be established, consequently, the potential</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>and until these products from nearshore fisheries have been cleared by the health authorities, they could be restricted for sale and human consumption. Indirectly, the fisheries sector will suffer a heavy loss if consumers are either stopped from using or unwilling to buy fish and shellfish from the region affected by the spill.</p> <p>Impacts to fish stocks have the potential for reduction in profits for commercial fisheries, and exclusion zones exclude fishing effort. Detectable tainting of fish flesh was reported after a 24-hour exposure at crude concentrations of 0.1 parts per million, marine fuel oil concentrations of 0.33 parts per million and diesel concentrations of 0.25 parts per million (Davis, Moffat, &amp; Shepherd, 2002).</p> <p>The Montara spill (as the most recent [2009] example of a large hydrocarbon spill in Australian waters) occurred over an area fished by the Northern Demersal Scalefish Managed Fishery (with 11 licences held by 7 operators), with goldband snapper (<i>Pristipomoides typus</i>), red emperor (<i>Lutjanus sebae</i>), saddletail snapper (<i>Lutjanus malabaricus</i>) and yellow spotted rockcod (<i>Epinephelus andersoni</i>) being the key species fished (PTTEP, 2013). As a precautionary measure, the WA Department of Fisheries advised the commercial fishing fleet to avoid fishing in oil-affected waters. Testing of fish caught in areas of visible oil slick (November 2009) found that there were no detectable petroleum hydrocarbons in fish muscle samples, suggesting fish were safe for human consumption. In the short-term, fish had metabolised petroleum hydrocarbons.</p> <p>Limited ill effects were detected in a small number of individual fish only (PTTEP, 2013). No consistent effects of exposure on fish health could be detected within two weeks following the end of the well release. Follow up sampling in areas affected by the spill during 2010 and 2011 (PTTEP, 2013) found negligible ongoing environmental impacts from the spill.</p> <p>Since testing began in the month after the DWH blowout in the GoM levels of oil contamination residue in seafood consistently tested 100 to 1,000 times lower than safety thresholds established by the USA Food and Drug Administration (FDA), and every sample tested was</p>	<p>impacts to commercial fisheries from an MDO LOC are considered to be Consequence Level III (based on public impact consequence considerations as per the <i>Risk Matrix Application Guide</i> (ExxonMobil, 2018).</p>

Receptor	Impact of MDO exposure	Exposure risk assessment
	<p>found to be far below the USA FDA's safety threshold for dispersant compounds (BP, 2015). The USA FDA testing of oysters found oil contamination residues to be ten to one hundred times below safety thresholds (BP, 2015). Sampling data shows that post-spill fish populations in the GoM since 2011 were generally consistent with pre-spill ranges and for many shellfish species, commercial landings in the GoM in 2011 were comparable to pre-spill levels. In 2012, shrimp (prawn) and blue crab landings were within 2.0 percent of 2007 to 2009 landings. Recreational fishing harvests in 2011, 2012 and 2013 exceeded landings from 2007-09 (BP, 2015).</p>	
<p>Cultural – Indigenous and Historic</p>	<p>Visible sheen has the potential to reduce the visual amenity of cultural heritage sites such as indigenous or historic (e.g. shipwreck) protected areas.</p>	<p>Oil sheen is predicted to encroach upon nearshore waters in the vicinity of the Gunai Kurnai Native Title Determination Area and a number of historic shipwrecks. However, given the relatively short duration, and limited extent of predicted exposure the consequence is considered Consequence Level IV (based on public impact consequence considerations as per the Risk Matrix Application Guide (ExxonMobil, 2018).</p>
<p>Recreation and Tourism</p>	<p>Refer to sections on fish, cetaceans and sandy shorelines above.</p>	<p>Tourism and recreation is also linked to the presence of marine fauna (e.g. whales), particular habitats and locations for swimming or recreational fishing.</p> <p>The modelling predicts a low probability of visible oil extending into Victorian waters (including Ninety Mile Beach Marine National Park) and to the sandy shoreline along Ninety Mile Beach (including Gippsland Lakes Coastal Park).</p> <p>Short-term impacts to nature-based tourism and other human uses of beaches (and nearshore waters) may occur as a result of temporary beach closures to protect human health or due to perceptions of a polluted environment that is not desirable to visit.</p> <p>However, given the relatively short duration, and limited extent of predicted shoreline contact the consequence is considered Consequence Level III based on public impact consequence</p>

---

Receptor	Impact of MDO exposure	Exposure risk assessment
		considerations as per the Risk Matrix Application Guide (ExxonMobil, 2018).

Based on industry data, vessel collisions are considered rare. As most vessel collisions involve the loss of containment of a forward tank, which are generally double-lined and smaller than other tanks, the loss of the maximum volume used in the scenario above is unlikely.

Considering the inherent low likelihood of a collision occurring, the safeguards in place and enactment of the SMPEP and OPEP, and the rapid weathering of MDO the likelihood of the impacts described above occurring is considered Likelihood Category E (very highly unlikely).

### 6.6.5 Risk ranking

**Table 6-42 Risk ranking outcome**

Consequence Level	Likelihood Category	Risk Category
III	E	4

### 6.6.6 Controls

**Table 6-43 Environmental performance**

EPO	Control	EPS	Measurement criteria
No unplanned release of MDO to the marine environment from support vessel collision.	<b>CM53:</b> Establishment of temporary fairways	Establishment of temporary fairways during field activities (see in Section 5.2).	Temporary fairways have been established at least 6 months before the start of field activities to ensure timely adoption of these measures by maritime traffic.
	<b>CM27:</b> Support vessel approach procedure	LWIV Manager to coordinate with support vessels to avoid a collision (Refer to Helix's Well Operations UK support vessel checklist and Section 4.6.3 of <i>Q7000 Safety Case (Australia)</i> (Helix, 2021).	Radio operations communications log verifies coordination with approaching vessels have been issued when necessary.
	<b>CM28:</b> Activity Specific Operating Guidelines/Critical Activity Mode procedures	ASOG or (WSOC)Critical Activity Mode procedures developed to IMCA standards.	Implementation procedures signed by Vessel Master and available.
	<b>CM29:</b> Support vessel dynamic positioning system	All support vessels engaged in DP operations have Class recognised DP 2 or3 systems.	Vessel has IACS member DP Notation, Failure Mode and Effects Analysis, proving trials and Annual Trials.
		Watchkeepers in charge of watch hold DP certification.	Watchkeepers' DP certificates available.

## 6.6.7 Demonstration of As Low As Reasonably Practicable

Table 6-44 ALARP Decision Context and justification

<b>ALARP Decision Context A</b>	<p>Operating vessels close to an offshore facility (platform, LWIV) is common practice for activities such as fuel transfer, provision of cargo, and reverse logistical support. These activities are well regulated with associated control measures, well understood, and are implemented across the offshore industry.</p> <p>Although there is the potential for impacts of Consequence Level III from a vessel collision, spill source volumes are limited in size, the environmental impact of MDO is well understood, a credible spill volume has been modelled and a very conservative threshold has been selected to define the PEA, so there is limited uncertainty associated with this event.</p> <p>No issues, objections or claims were raised by relevant persons during the consultation process with regard to the risk of LOC resulting from a vessel collision.</p> <p>Esso believes ALARP Decision Context A should apply.</p>
---------------------------------	--

Table 6-45 Good practice controls

Good practice	Adopted	Control	Rationale
Support vessel approach protocols.	✓	<b>CM27:</b> Support vessel approach procedure	It is standard industry practice for procedures describing support vessel approach protocols to be developed.
Structured operational limits criteria for DP operations.	✓	<b>CM28:</b> Activity Specific Operating Guidelines/Critical Activity Mode procedures	The application of ASOG/Critical Activity Mode risk management tools is industry best practice for DP operations. Critical Activity Mode describes how to configure the vessels DP system and ASOG sets out the operational, environmental and equipment performance limits considered necessary for safe DP operations whilst carrying out a specific activity.
DP Class 2.	✓	<b>CM29:</b> Support vessel dynamic positioning system	DP Class 2 (redundancy so that no single fault in an active system will cause the system to fail) is the industry standard where loss of position keeping capability may cause personnel injury, pollution or damage with large economic consequences.
Pre-start notifications.	✓	<b>CM36:</b> Pre-start notifications	<p>Under the <i>Navigation Act 2012</i>, the AHO is responsible for maintaining and disseminating hydrographic and other nautical information and nautical publications including:</p> <ul style="list-style-type: none"> <li>• Notices to Mariners</li> <li>• AUSCOAST warnings.</li> </ul> <p>Details of the PSZ will be published in Notices to Mariners, thus enabling other marine users to plan their activities, and minimising disruption to exclusion zones.</p>

Good practice	Adopted	Control	Rationale
			<p>Relevant details will be provided to the JRCC to enable AUSCOAST warnings to be disseminated.</p> <p>Pre-start notices will be provided to all relevant persons approximately 4 weeks and then 1 week prior to activities commencing.</p>
SMPEP.	✓	<b>CM20:</b> Shipboard Marine Pollution Emergency Plan	<p>The vast majority of commercial ships are built to and surveyed for compliance with the standards (i.e. Rules) laid down by classification societies. The role of vessel classification and classification societies has been recognised by the IMO across many critical areas including the SOLAS, the 1988 Protocol to the International Convention on Load Lines and MARPOL.</p> <p>A vessel built in accordance with the applicable Rules of an IACS member society may be assigned a class designation relevant to the IMO rules, on satisfactory completion of the relevant classification society surveys. For ships in service, the society carries out routine scheduled surveys to verify that the ship remains in compliance with those Rules. Should any defects that may affect class become apparent, or damages be sustained between the relevant surveys, the owner is required to inform the society concerned without delay.</p> <p>MARPOL Annex I Regulations for the Prevention of Pollution by Oil specifically require that a SMPEP (or equivalent, according to class) is in place.</p> <p>To prepare for a spill event, the SMPEP details:</p> <ul style="list-style-type: none"> <li>• response equipment available to control a spill event</li> <li>• review cycle to ensure that the SMPEP is kept up to date</li> <li>• testing requirements, including the frequency and nature of these tests.</li> </ul> <p>In the event of a spill, the SMPEP details:</p> <ul style="list-style-type: none"> <li>• reporting requirements and a list of authorities to be contacted</li> <li>• activities to be undertaken to control the release</li> <li>• procedures for coordinating with local authorities.</li> </ul>

Good practice	Adopted	Control	Rationale
Oil spill response planning.	✓	<b>CM12:</b> Oil Pollution Emergency Plan	Under the OPGGS (Environment) Regulations, NOPSEMA require that the petroleum activity have an accepted OPEP in place before commencing the activity. In the event of a vessel collision the OPEP will be implemented.
Oil spill monitoring planning.	✓	<b>CM35:</b> Operational and Scientific Monitoring Plan	Esso's OSMP details the arrangements and capability in place for: <ul style="list-style-type: none"> <li>operational monitoring of a hydrocarbon spill to inform response activities</li> <li>scientific monitoring of environmental impacts of the spill and response activities.</li> </ul> Operational monitoring will allow adequate information to be provided to aid decision making to ensure response activities are timely, safe, and appropriate. Scientific monitoring will identify if potentially longer-term remediation activities are required.

Table 6-46 Engineering risk assessment

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted

## 6.6.8 Demonstration of acceptability

Table 6-47 Demonstration of acceptability test

Factor	Demonstration criteria	Criteria met	Rationale
<b>Risk assessment process for unplanned events</b>	The risk ranking is lower than Risk Category 1.	✓	The risk ranking is Risk Category 4 (the lowest category) and therefore considered acceptable.
<b>Principles of ESD</b>	No potential to affect biological diversity and ecological integrity.	✓	The potential impact associated with this aspect is limited to a localised short-term impact, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activities were evaluated as having the potential to result in a Consequence Level IV thus are not considered as having the potential to

Factor	Demonstration criteria	Criteria met	Rationale
			result in serious or irreversible environmental damage.
<b>Legislative and other requirements</b>	Legislative and other requirements have been identified and met.	✓	<p>The proposed activities align with the requirements of the:</p> <ul style="list-style-type: none"> <li>• <i>Navigation Act 2012 – Chapter 6 (Safety of Navigation) Part 6 deals with safe navigation including provisions about reporting of movement of vessels.</i></li> </ul> <p>The requirements of MARPOL Annex I has been adopted.</p> <p>The following legislative and other requirements are considered relevant as they apply to the implementation of MARPOL in Australia:</p> <ul style="list-style-type: none"> <li>• <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i></li> <li>• <i>Navigation Act 2012 – Chapter 4 (Prevention of Pollution)</i></li> <li>• <i>Marine Order 91 (Marine pollution prevention – oil) 2014.</i></li> </ul>
<b>Internal context</b>	Consistent with Esso's Environment Policy.	✓	Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist"
	Meets ExxonMobil Environmental Standards.	✓	There is no standard related to a LOC of MDO but the activities proposed meet the strategic objectives of the Upstream Environmental Standards.
	Meets ExxonMobil OIMS Objectives.	✓	<p>Proposed activities meet:</p> <p>OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements:</p> <ul style="list-style-type: none"> <li>• OIMS System 8-1 objective to clearly define and communicate operations</li> </ul>

Factor	Demonstration criteria	Criteria met	Rationale
			integrity requirements to contractors <ul style="list-style-type: none"> <li>OIMS System 10-2 objectives to document, resource and communicate emergency response plans, and conduct training, exercises and/or drills to determine the adequacy of the plans.</li> </ul>
<b>External context</b>	Concerns of relevant persons have been considered/addressed through the consultation process.	✓	No relevant person concerns have been raised concerning the risk of LOC resulting from a vessel collision.

## 6.7 Accidental release – Loss of containment reservoir hydrocarbons

### 6.7.1 Causes of loss of containment of reservoir hydrocarbons

#### 6.7.1.1 Damage to subsea infrastructure during rig move

As the LWIV is self-propelled and on DP during normal P&A activities, the risk of any damage to subsea infrastructure is not credible. In addition, the closest subsea infrastructure is associated with Mackerel platform, 11 kilometres from Gudgeon-1 and 18 kilometres from Terakihi-1, while Kingfish B is 25 kilometres from Gudgeon-1 and 32 kilometres from Terakihi-1 (and Figure 2-2). Both platforms are non-producing and have been drained and depressured prior to cessation of production. Refer to Volume 2, Section 2.4.1 of Bass Strait Operations EP (AUGO-EV-EMM-002).

The LWIV will be manoeuvred into position under DP (see Section 3.4 of *Q7000 Safety Case (Australia)* (Helix, 2021)). Once on location and in the correct orientation, P&A activities will commence. The LWIV will remain on DP at all times; no mooring or anchoring is required during normal operations. When not on DP control the vessel transits as a conventional marine vessel, utilising the aft azimuth thrusters for forward and astern propulsion; the tunnel thrusters are used for manoeuvring in and out of port.

The released volumes as a result of damage to the wellheads during LWIV mobilisation are considerably less than from a LOWC and therefore are not assessed further, their controls are however carried forward to Section 6.7.6.

#### 6.7.1.2 Loss of well control

A LOWC can occur when primary and secondary well control measures fail, which could potentially result in a release of reservoir hydrocarbons into the marine environment, if there is communication from the reservoir section to the wellbore. Note the Gudgeon-1 and Terakihi-1 wells were never perforated, and the only scenario where a LOWC is conceivable is if casing across the reservoir section has corroded and there is failure of the cement plugs and cement behind casing.

## 6.7.2 Spill modelling

To understand the potential consequences of a LOWC and the response preparedness required, stochastic and deterministic modelling was undertaken as detailed in Section 3.4.1.1 (RPS, 2022).

### 6.7.2.1 Stochastic

Stochastic modelling is used to determine the total area that may be exposed. By overlaying 100 spill simulations initiated at random different start times into a single map, stochastic modelling shows all the areas that could be affected, not just the area affected by a single spill. Using the Worst Case Discharge Scenario (WCDS) scenario and the low threshold hydrocarbon exposure levels per Table 3-6, which is described in Section 3.4.1.1, stochastic modelling has been used to define the PEA in Section 4 (Figure 4-1). Stochastic modelling also predicts the extent and the degree of exposure which enables an assessment of the possible consequence to environmental receptors as discussed in Section 6.7.2.6 and Section 6.7.4.

### 6.7.2.2 Deterministic

Deterministic modelling for a single worst case simulation is used to predict the fate and weathering of spilled hydrocarbons as described in Section 6.7.2.5. It is also used to inform initial response planning by ensuring sufficient resources are available to mount an effective response and inform decisions relating to protection priorities of potential receptors at risk, noting that in the event of a spill the actual trajectory will depend on the nature of the spill and the environmental conditions at the time. A map of the worst-case deterministic simulation is included in the activity specific Quick Reference Information in Appendix D of the OPEP (Volume 3 Appendix A).

**Table 6-48 Terakihi and Gudgeon oil properties as compared with Flounder and West Kingfish proxies**

1 See Volume 2, Appendix 2, Table 8, except BPD (estimated from lab analysis reports) of the Bass Strait Operations EP (AUGO-EV-EMM-002).

2 (RPS, 2022)

3 Due to their high pour point (above ambient sea temp), both Gudgeon-1 and Terakihi-1 classify as Group IV under the (ITOPF, 2014) classification, despite a relatively high API (API >35).

### 6.7.2.3 Representative crude selection

On completion of exploration drilling, both wells were suspended, as described in Section 2.3. Reservoir analysis dates back to this period and there is no means of accessing samples from the Gudgeon-1 and Terakihi-1 wells to provide current pressure, volume, temperature analysis for determining the fluid behaviours and properties of oil and gas samples needed to perform the modelling. Instead, sufficiently characterised pre-existing data from the Gudgeon-1 and Terakihi-1 wells allowed an analogue to be identified.

The Flounder assay was chosen as analog for Terakihi-1 while the West Kingfish assay was selected as the best-match analogue for Gudgeon-1. Table 6-48 shows the properties of the Flounder and West Kingfish assays, compared to the Gudgeon-1 and Terakihi-1 samples, which are incomplete and do not include the long chain hydrocarbon components (the persistent elements). Flounder and West Kingfish assays are classified as Group II (light persistent oil), while Gudgeon-1 and Terakihi-1 are classified as Group IV (persistent oil) due to their high pour point (above ambient sea temperature), despite a relatively high API (greater than 35) (ITOPF, 2014). The boiling point distribution of the proxies was analysed across the entire temperature range (RPS, 2022), unlike the available Gudgeon-1 and Terakihi-1 samples.

The wax content for West Kingfish assay closely matches that of Gudgeon (23.4 percent versus 25 percent). Volatiles are somewhat higher in Gudgeon-1, but percentage residuals are a good match (Figure 6-3). Pour points deviate, with Gudgeon-1 oil (29 degrees Celsius) in solid phase at ambient (15 degrees Celsius) and West Kingfish (9 degrees Celsius) in liquid phase. RPS advises that this is not a major concern as the model is set up to assume that release is in a liquid state.

- Flounder was selected as best match for Terakihi. Although volatiles are substantially higher in Terakihi, percentage residuals (critical in oil spills) are a good match. Wax content is higher in the Flounder assay (8 percent for Terakihi-1 versus 32 percent for Flounder), which over-estimates the impact of persistent elements.

- Both Flounder and West Kingfish assays are included in the Bass Strait Operations EP (AUGO-EV-EMM-002) and OPEP, so that no major changes are required to the OPEP (See Volume 3, Section 7.2.2.5 of the Bass Strait Operations EP (AUGO-EV-EMM-002)).

#### *6.7.2.4 Modelling inputs and discharge scenarios*

The Gudgeon-1 and Terakihi-1 WCDS are defined by a sum of two possible flowpaths. Flowpath 1 is via (i) failed primary cement behind 9-5/8 inch casing coupled with (ii) failed 9-5/8 inch casing/shoe resulting in (iii) leak into wellbore accumulating underneath the shallow cement plug, and followed by (iv) failed tested barriers (PCE, riser etc.) after drilling through the shallow plug. Flowpath 2 via (i) failed primary cement behind 9-5/8 inch casing resulting in (v) leak into 13-3/8 inch x 9-5/8 inch annulus which is then discharged after releasing the casing hanger during the P&A.

#### *6.7.2.5 Modelling outputs - weathering and fate*

Flounder and West Kingfish crude are composed of hydrocarbons that have a wide range of boiling points and volatiles at atmospheric temperatures, and which will begin to evaporate at different rates on exposure to the atmosphere. Flounder has 10.9 percent volatiles and 13.3 percent semi-volatile compounds (non-persistent, expected to evaporate within 24 hours), 44.4 percent low-volatility compounds (expected to evaporate within several days) and 31.4 percent persistent compounds.

West Kingfish has 18.8 percent volatiles and 24.4 percent semi-volatile compounds (non-persistent, expected to evaporate within 24 hours), 38.7 percent low-volatility compounds (expected to evaporate within several days) and 18.1 percent persistent compounds.

Both Figure 6-4 and Figure 6-5 show that evaporation is the dominant process contributing to the removal of the light crude oil from the sea surface.

The deterministic trajectory for each set of LOWC modelling that resulted in the maximum volume of oil on shore was considered the 'worst' simulation and was selected for weathering and fate analysis.

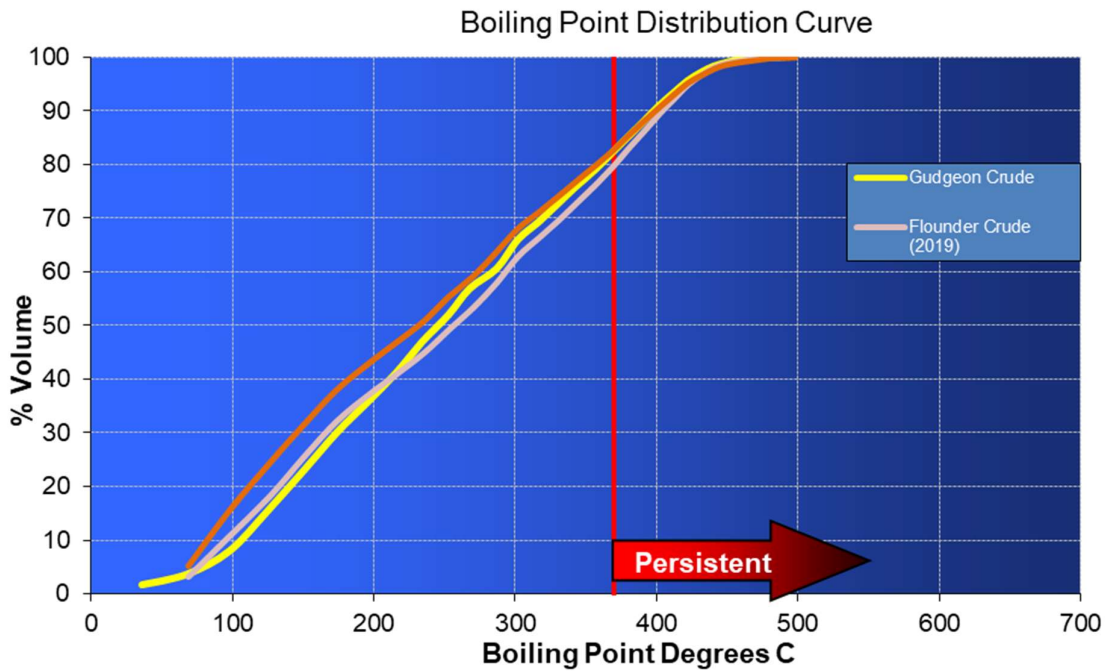

Figure 6-3 Comparison of boiling point distribution for Gudgeon-1 and Terakihi-1 proxies

Table 6-49 Loss of well control spill modelling inputs

Parameter	Scenario 1 – Terakihi-1 P&A	Scenario 2 – Gudgeon-1 P&A
Number of spill simulations	100	
Period of the year (season)	Annual analysis	
Oil type	Flounder crude	West Kingfish crude
Oil rate	2.4 thousand stock tank barrel per day	1.1 thousand stock tank barrel per day
Gas rate	4.0 million standard cubic feet per day	0.03 million standard cubic feet per day
Gas/oil ratio	29 standard cubic feet bbl	1638 standard cubic feet bbl
Release type	Subsea (424m)	Subsea (304m)
Release duration	98 (simulation for 112 days)	98 (simulation for 112 days)
Total release volume	37,397m <sup>3</sup> (235,200bbl) oil (subsea release)	15,894m <sup>3</sup> (99,960bbl) oil (subsea release)
Volume basis	<ul style="list-style-type: none"> <li>spill resulting from leak through downhole casing cement and cement plug, as well as the loss of multiple surface barriers during P&amp;A wellwork</li> </ul>	

	<ul style="list-style-type: none"> <li>• flow to surface through casing, then drill rig riser, with no restrictions in the wellbore</li> <li>• discharge at the PCE and/or riser resulting in loss of containment at sea level conditions.</li> </ul>	
Release location	T: 38° 30' 21" S, 148° 32' 43" E	G: 38° 30' 54" S, 148° 28' 05" E
Release depth	424m	395m
Release duration	98 days (tracked for 118 days)	
Duration basis	Relief well assumed to be primary response plan (refer to Volume 3). The response time for a relief well is based on rig mobilisation from Singapore; 98 days was chosen for volume calculations, assuming a Semi-submersible MODU or LWIV.	

**\*\*Note:** For the purposes of assessing impacts from a LOWC in this EP, modelling assumed reservoir pressure based on original Gudgeon-1 and Terakihi-1 formation pressure, water-cut 0% based on casing hole within oil column interval, inflow modelled as 1" perforation interval through corroded casing and flow through entire wellbore (9-5/8" casing) with no drill string in hole and no other choke effects and no gas lift to create artificial lift. Refer to insert reference to WCDS modelling.

**Figure 6-4** Predicted weathering and fates graph as volume for the selected single Terakihi-1 loss of well control trajectory: largest volume of oil ashore (Scenario 1: 37,397m<sup>3</sup> subsea release of Flounder crude at Terakihi-1)

**Figure 6-5** Predicted weathering and fates graph as volume for the selected single Gudgeon-1 loss of well control trajectory: largest volume of oil ashore (Scenario 2: A 15,894m<sup>3</sup> subsea release of West Kingfish crude at the Gudgeon-1)

Figure 6-4 presents the fates and weathering graph for the Gudgeon-1 ‘worst’ single spill trajectory. At the conclusion of the simulation (112 days after WCDS), approximately 64 percent of the crude was lost to the atmosphere through evaporation, approximately 20% of the oil was predicted to have decayed or biodegraded, 16% remained within the water column as entrained hydrocarbons (less than 0.05 percent as dissolved hydrocarbons) and a peak volume of 0.1 percent (21 cubic metres) was predicted to arrive ashore (on day 102).

Figure 6-5 presents the fates and weathering graph for the Terakihi-1 ‘worst’ single spill trajectory. At the conclusion of the simulation (112 days after WCDS), approximately 37 percent of the crude was lost to the atmosphere through evaporation, approximately 34 percent of the oil was predicted to have decayed or biodegraded, 29 percent remained within the water column as entrained hydrocarbons (0.1 percent as dissolved hydrocarbons) and a peak volume of 0.2 percent (68 cubic metres) was predicted to arrive ashore (on day 74).

#### 6.7.2.6 Modelling outputs - stochastic

As described in Section 3.4.1.1, oil spill modelling predicts the total area that could be exposed to hydrocarbon, including trace concentrations of oil in the water column, as a result of any spill. The PEA (Refer Section 4) is derived from this data and is used for planning purposes to ensure that all potentially exposed social and environmental sensitivities are acknowledged, described and considered in the development of the EP.

Modelling is also used to inform specific impact or consequence assessment by understanding the predicted location and extent of oil at different concentrations. There is no agreed exposure level below which environmental impacts will not occur so outputs should not be interpreted

as a boundary. However, mapping areas which could be moderately impacted by a spill is a useful tool for impact or consequence assessment. Figure 6-6 and Table 6-51 show hydrocarbon exposure above the moderate thresholds (refer Table 3-7) for the WCDS spill from the Gudgeon-1 and Terakihi-1 subsea facilities respectively.

The environmental sensitivities within the moderate threshold area are described in Table 6-50. The sensitivities outside of the mapped (moderately exposed) area but that are within the PEA are shown in Table 6-51.

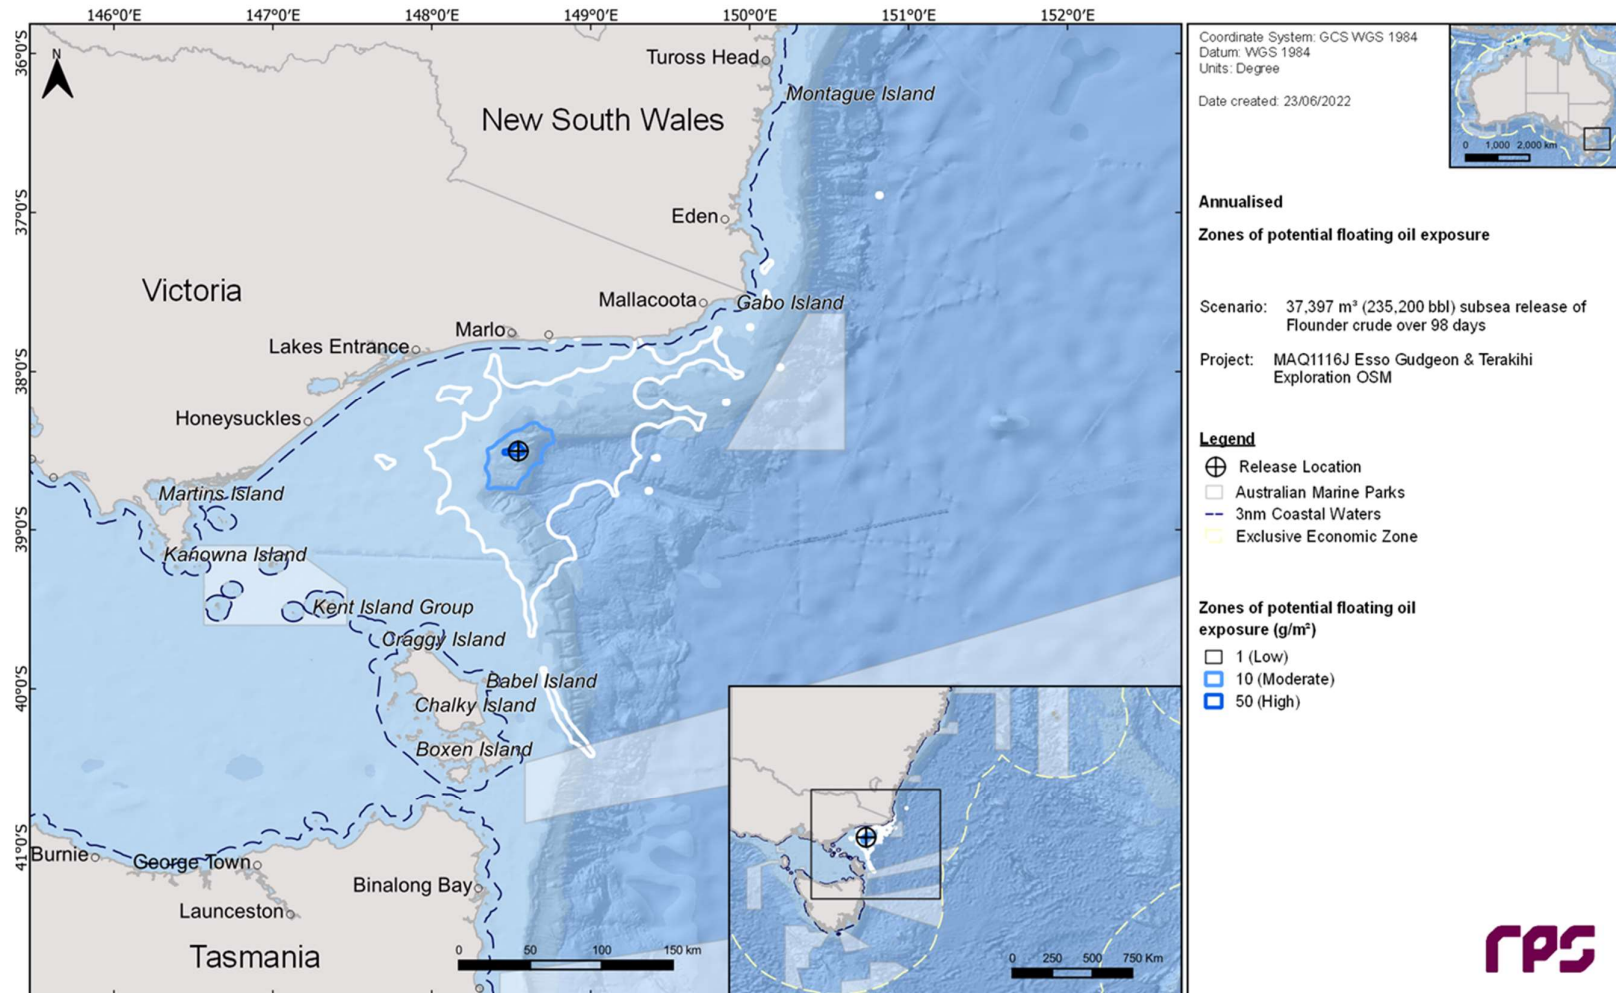

Figure 6-6 Loss of well control spill stochastic modelling output at Terakihi-1 (Scenario 1). Surface hydrocarbon exposure at surface thresholds (Low: 1 g/m<sup>2</sup>, Moderate: 10 g/m<sup>2</sup>, High: 50 g/m<sup>2</sup>)

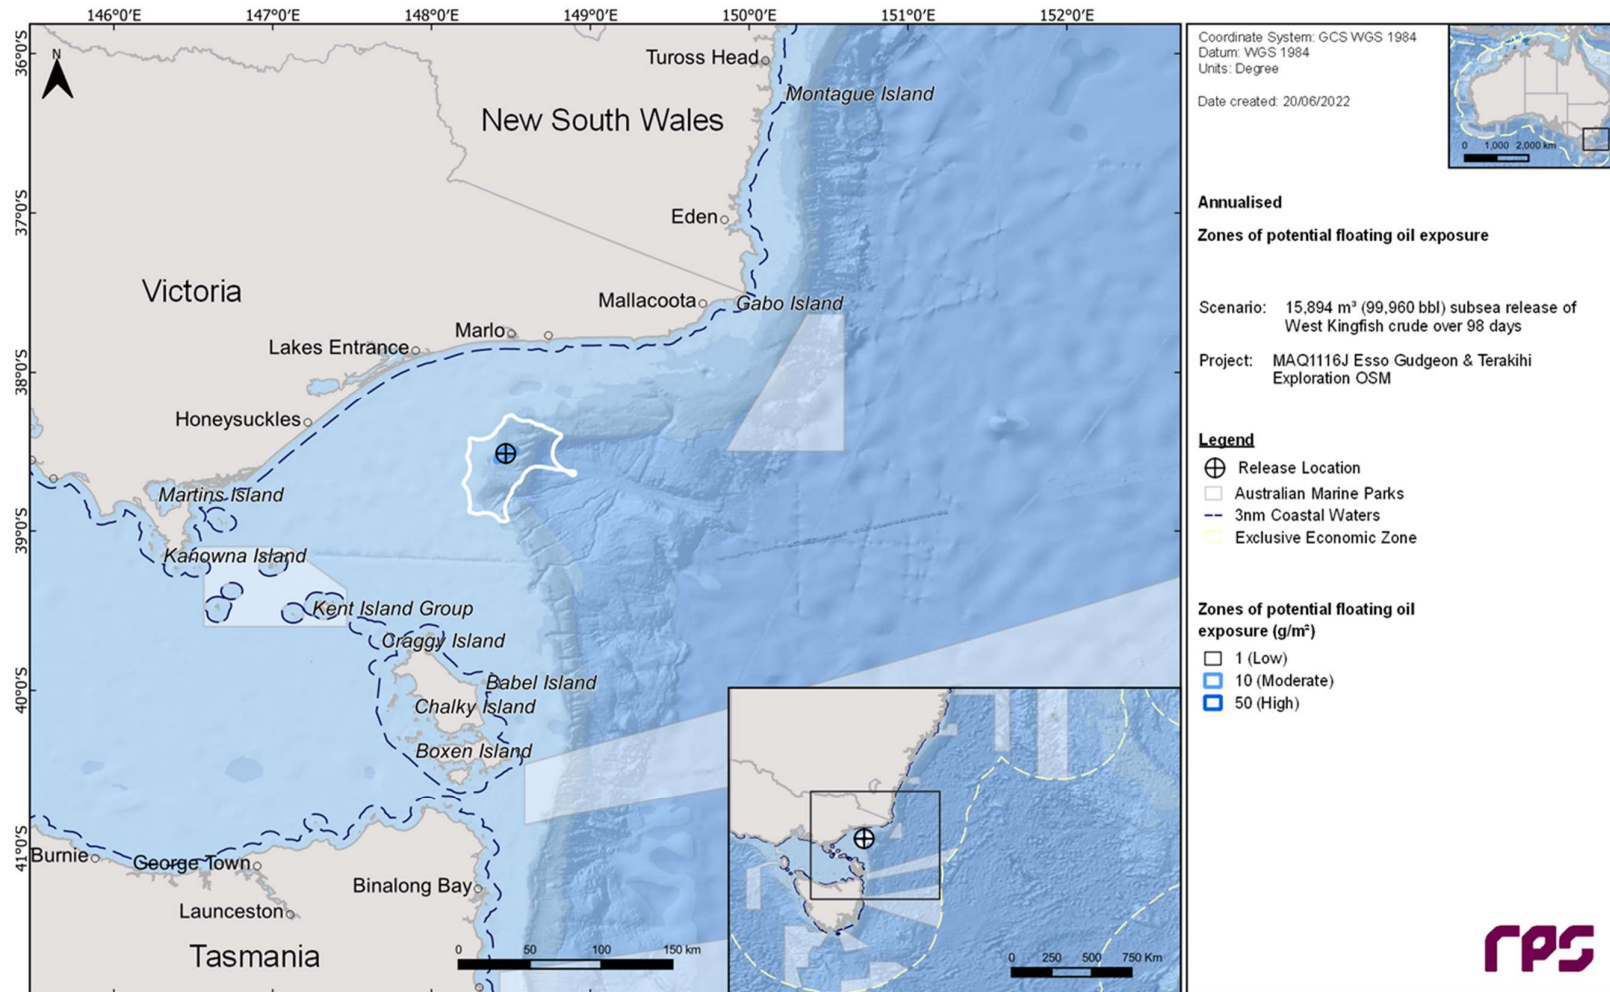

Figure 6-7 Loss of well control spill stochastic modelling output at Gudgeon-1 (Scenario 2). Surface hydrocarbon exposure at surface thresholds (Low: 1 g/m<sup>2</sup>, Moderate: 10 g/m<sup>2</sup>, High: 50 g/m<sup>2</sup>)

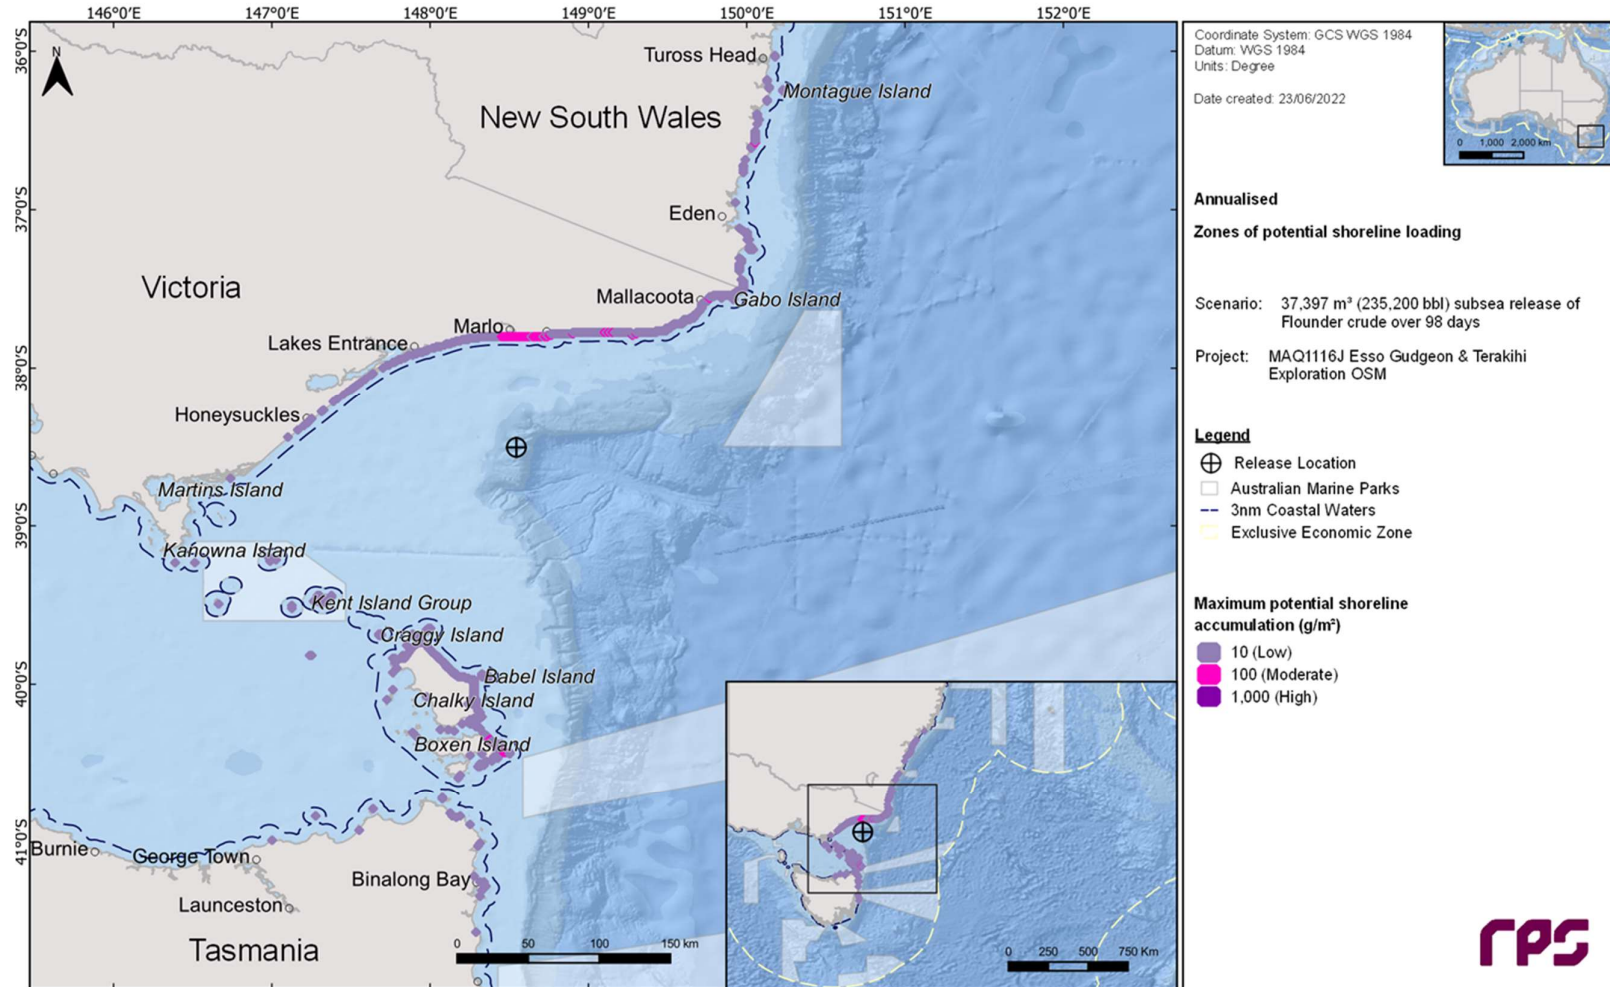

Figure 6-8 Loss of well control spill stochastic modelling output at Terakihi-1 (Scenario 1). Shoreline hydrocarbon exposure at shoreline thresholds (Low: 10 g/m<sup>2</sup>, Moderate: 100 g/m<sup>2</sup>, High: 1000 g/m<sup>2</sup>)

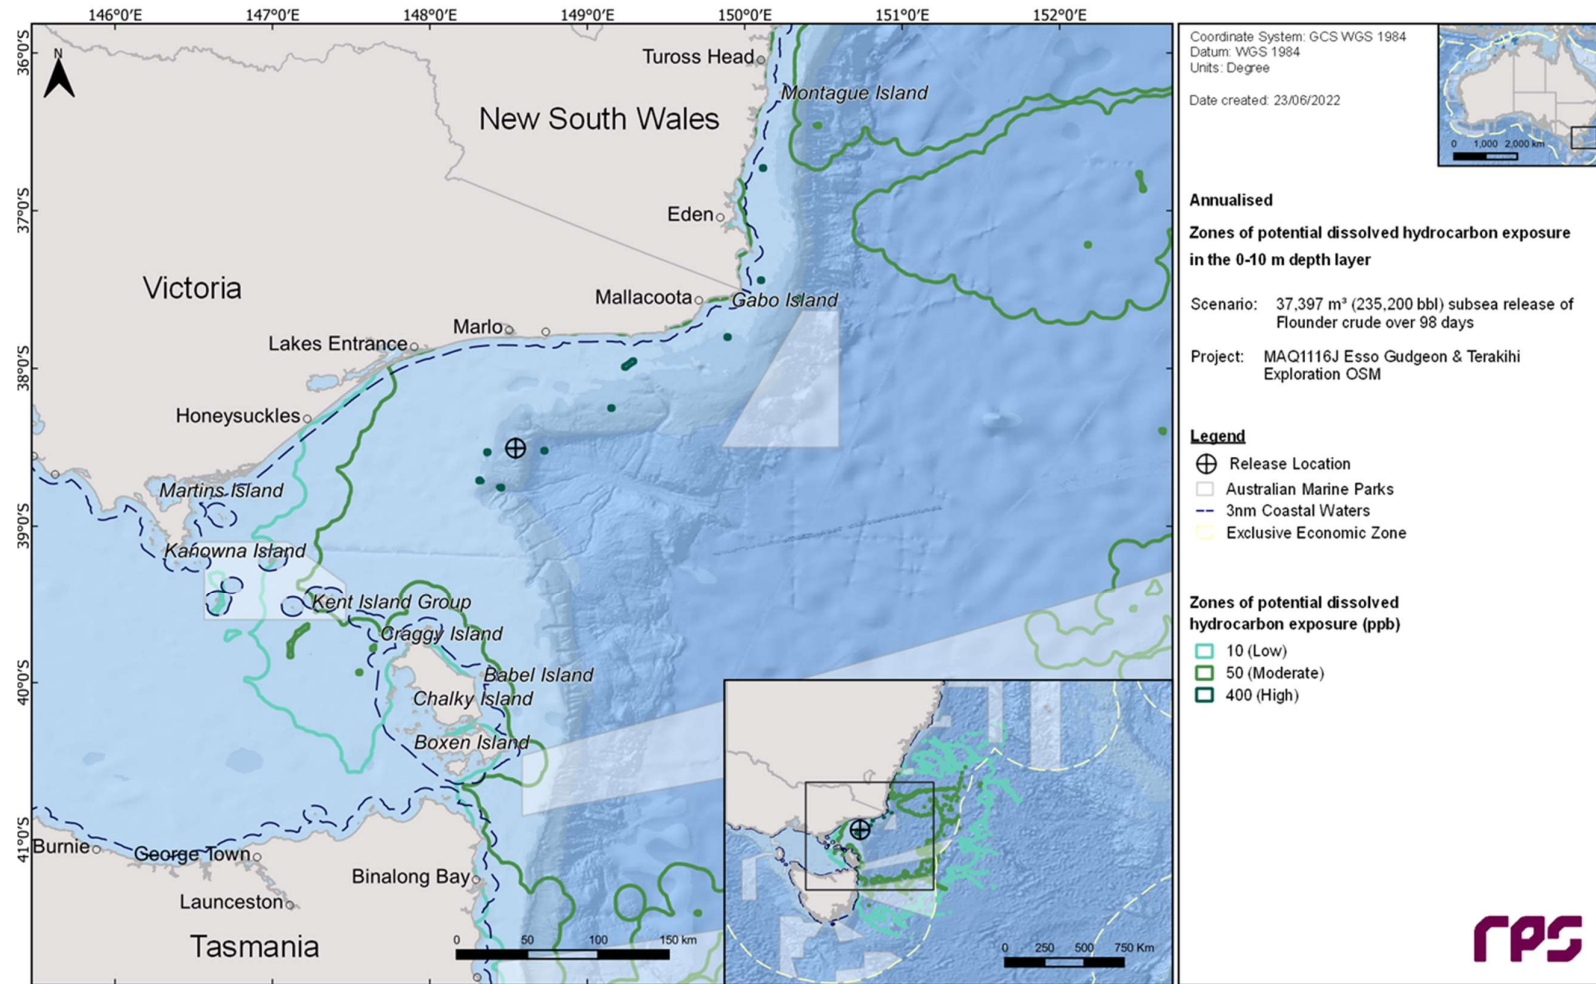

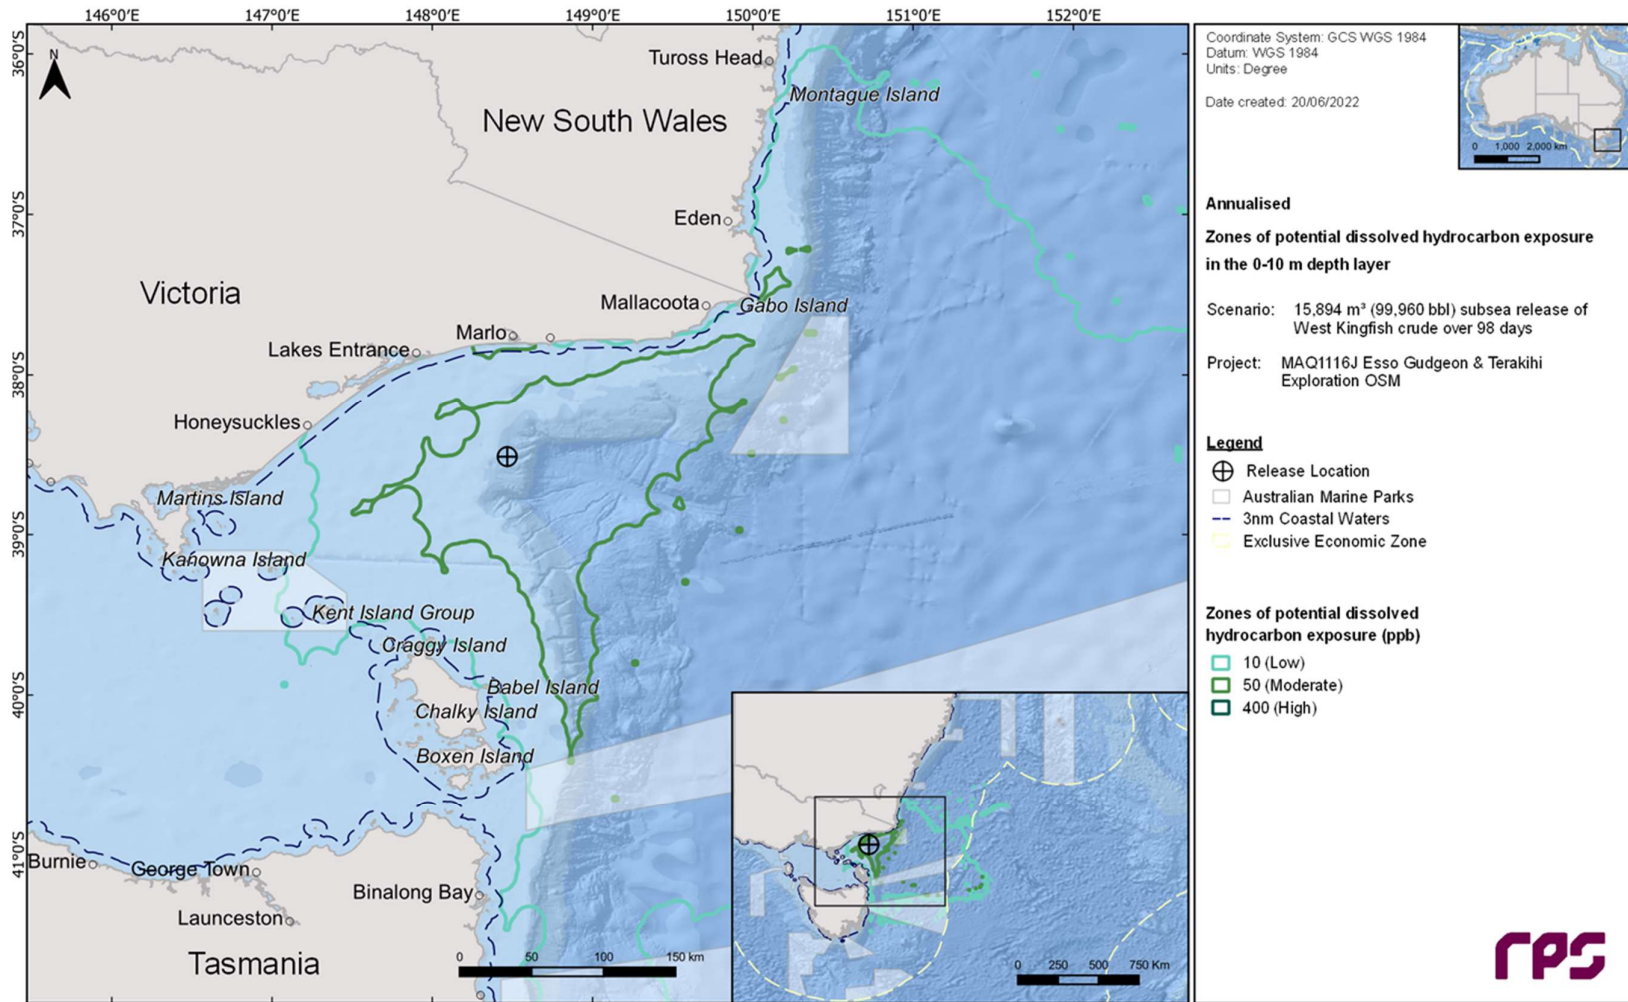

Figure 6-10 Loss of well control spill stochastic modelling output at Terakihi-1 (Scenario 1). Dissolved hydrocarbon exposure in 0-10m depth at dissolved thresholds (Low: 10 ppb, Moderate: 50ppb, High: 400ppb)

**Figure 6-11** Loss of well control spill stochastic modelling output at Gudgeon-1 (Scenario 2). Dissolved hydrocarbon exposure in 0-10m depth at dissolved thresholds (Low: 10 ppb, Moderate: 50 ppb, High: 400 ppb)

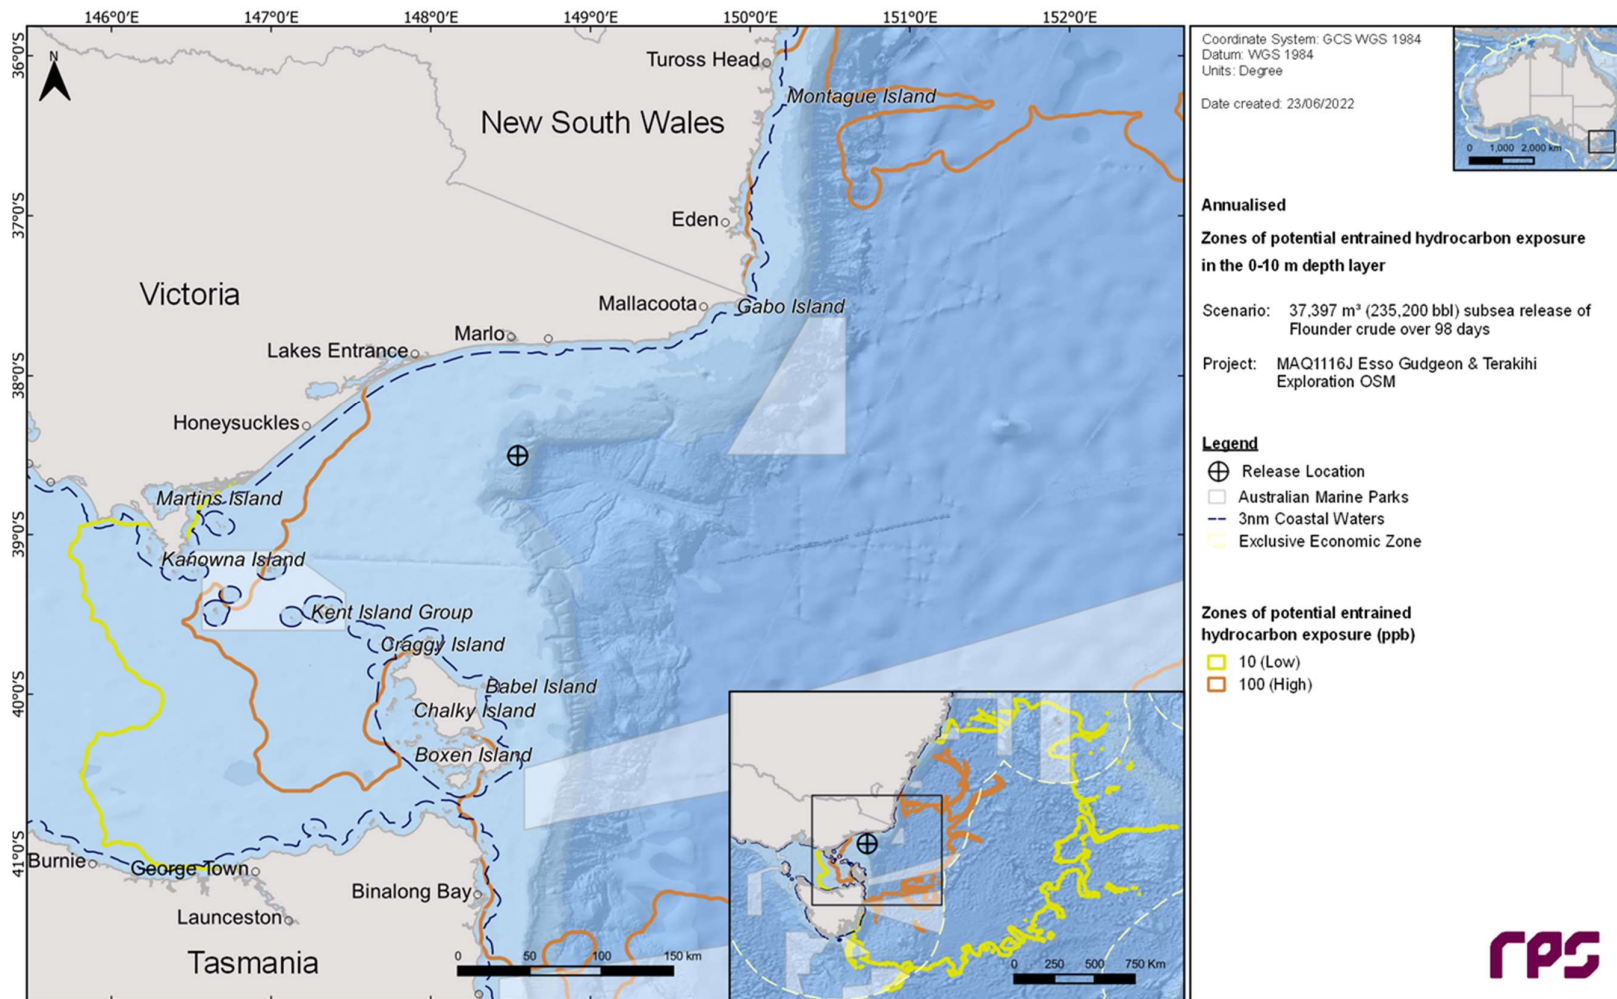

Figure 6-12 Loss of well control spill stochastic modelling output at Terakihi-1 (Scenario 1). Entrained hydrocarbon exposure in 0-10m depth at entrained thresholds (Low: 10 ppb, High: 100 ppb)

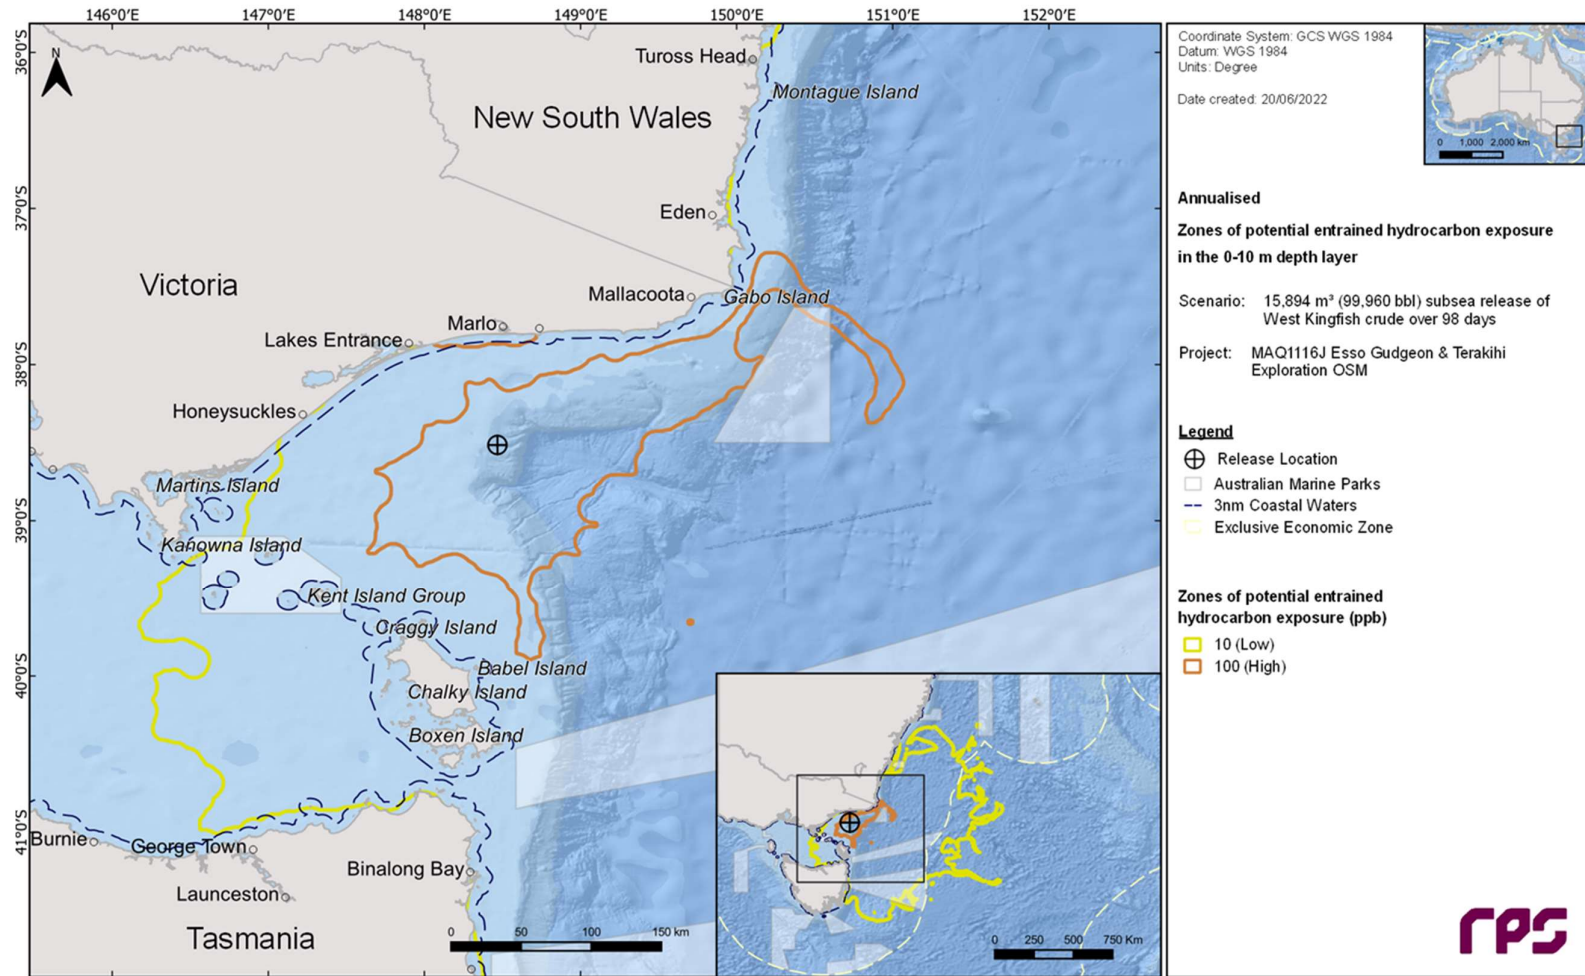

Figure 6-13 Loss of well control spill stochastic modelling output at Gudgeon-1 (Scenario 2). Entrained hydrocarbon exposure in 0-10m depth at entrained thresholds (Low: 10 ppb, High: 100 ppb)

**Table 6-50 Loss of well control sensitivities within moderate threshold**

Model Parameter	Exposure Value	Stochastic Modelling (based on 100 annualised spill trajectories)	
		Terakihi-1 well location	Gudgeon-1 well location
Surface exposure	Moderate (10g/m <sup>2</sup> ) Approximates lower limit for harmful exposures to birds and marine mammals (NOPSEMA, 2019).	<p>Zone of moderate exposure extends approx. 29km from release location in a predominantly south-westerly direction. The zone of moderate exposure overlaps the following BIAs:</p> <p><u>Birds</u></p> <ul style="list-style-type: none"> <li>• Antipodean albatross (<i>Diomedea exulans antipodensis</i>) – foraging (100% probability)</li> <li>• Black-browed albatross– foraging (100% probability)</li> <li>• Buller’s albatross– foraging (100% probability)</li> <li>• Campbell albatross– foraging (100% probability)</li> <li>• Common diving petrel – foraging (100% probability)</li> <li>• Indian yellow-nosed albatross– foraging (100% probability)</li> <li>• PBW – distribution (100% probability)</li> <li>• PBW – foraging (100% probability)</li> <li>• Short-tailed shearwater – foraging (100% probability)</li> <li>• Shy albatross– foraging (100% probability)</li> <li>• SRW – migration (47% probability)</li> <li>• Wandering albatross– foraging (100% probability)</li> <li>• Great white shark – distribution (100% probability)</li> </ul>	<p>Zone of moderate exposure extends approx. 7km from release location in a predominantly south-westerly direction. The zone of moderate exposure overlaps the following BIAs:</p> <p><u>Birds</u></p> <ul style="list-style-type: none"> <li>• Antipodean albatross– foraging (2% probability)</li> <li>• Black-browed albatross– foraging (94% probability)</li> <li>• Buller’s albatross– foraging (94% probability)</li> <li>• Campbell albatross– foraging (94% probability)</li> <li>• Common diving petrel – foraging (94% probability)</li> <li>• Indian yellow-nosed albatross– foraging (94% probability)</li> <li>• PBW – distribution (94% probability)</li> <li>• PBW – foraging (94% probability)</li> <li>• Shy albatross– foraging (94% probability)</li> <li>• SRW – migration (1% probability)</li> <li>• Wandering albatross– foraging (94% probability)</li> <li>• Great white shark – distribution (94% probability)</li> </ul> <p>KEF Upwelling East of Eden has 15% probability of exposure at low threshold only.</p>

Model Parameter	Exposure Value	Stochastic Modelling (based on 100 annualised spill trajectories)	
		Terakihi-1 well location	Gudgeon-1 well location
		KEF Upwelling East of Eden has 5% probability of exposure at moderate threshold.	
	High (100g/m <sup>2</sup> )	<p>Maximum distance from release location was approx. 7km from release location in a westerly direction. The zone of high exposure overlaps the following BIAs:</p> <p><u>Birds</u></p> <ul style="list-style-type: none"> <li>• Antipodean albatross– foraging (78% probability)</li> <li>• Black-browed albatross– foraging (78% probability)</li> <li>• Buller’s albatross– foraging (78% probability)</li> <li>• Campbell albatross– foraging (78% probability)</li> <li>• Common diving-petrel – foraging (78% probability)</li> <li>• Indian yellow-nosed albatross– foraging (78% probability)</li> <li>• PBW – distribution (2% probability)</li> <li>• PBW – foraging (78% probability)</li> <li>• Shy albatross– foraging (78% probability)</li> <li>• Wandering albatross– foraging (78% probability)</li> <li>• Great white shark – distribution (78% probability)</li> </ul>	No exposure predicted to individual receptors at high threshold.

Model Parameter	Exposure Value	Stochastic Modelling (based on 100 annualised spill trajectories)	
		Terakihi-1 well location	Gudgeon-1 well location
Shoreline Accumulation	Moderate (100g/m <sup>2</sup> ) Area likely to require clean-up effort (NOPSEMA, 2019).	<p>Probability of accumulation on any shoreline at the low threshold: 84%.</p> <p>Shoreline contact at the moderate exposure threshold is predicted to be low: Bega Valley (1%), Cape Barren Island (3%), East Gippsland (9%), Cape Conran (5%), Cape Howe/Mallacoota (1%), Corringale (3%), Marlo (4%), Point Hicks (3%), Sydenham Inlet (2%).</p> <p>The minimum time before shoreline accumulation at the moderate threshold is approximately 6.5 days (at Marlo and East Gippsland).</p> <p>The maximum length of shoreline exposed at moderate threshold is 19km (average 6km).</p>	<p>Probability of accumulation on any shoreline at the low threshold: 31%.</p> <p>Shoreline contact at the low exposure threshold is predicted to be &lt;14%, with none at moderate threshold.</p> <p>The minimum time before shoreline accumulation at the low threshold is approximately 11 days.</p> <p>The maximum length of shoreline exposed at low threshold is 58km (average 12km).</p>
	High (1000g/m <sup>2</sup> )	No shoreline contact is predicted at the high threshold.	No shoreline contact is predicted at the high threshold.
In-water (dissolved) Exposure	Moderate (50ppb instantaneous) Approximates potential toxic effects including lethal effects to sensitive species. (NOPSEMA, 2019)	<p>The probability of in-water dissolved hydrocarbon exposure at the moderate threshold at the 0-10m depth layer are predicted to be low:</p> <p>Contact with Beagle (1%), East Gippsland (7%), Flinders (8%), Freycinet (3%).</p> <p>BIAs:</p> <ul style="list-style-type: none"> <li>• Antipodean albatross – foraging (100%)</li> <li>• Black petrel (<i>Procellaria parkinsoni</i>) – foraging (3%)</li> <li>• Black-browed albatross – foraging (100%)</li> <li>• Black-faced cormorant – foraging (1%)</li> </ul>	<p>The probability of in-water dissolved hydrocarbon exposure at the moderate threshold at the 0-10m depth layer are predicted to be low:</p> <p>Contact with East Gippsland (1%), Flinders (1%), Freycinet (1%).</p> <p>BIAs:</p> <ul style="list-style-type: none"> <li>• Antipodean albatross– foraging (17%)</li> <li>• Black-browed albatross– foraging (30%)</li> <li>• Buller’s albatross– foraging (30%)</li> <li>• Campbell albatross– foraging (30%)</li> <li>• Common diving petrel – foraging (30%)</li> </ul>

### 6.7.3 Risks of loss of containment of reservoir hydrocarbons

A loss of containment of reservoir hydrocarbons has the potential to result in the following impacts:

- injury/mortality to fauna
- change in habitat
- change to the function, interests or activities of other users.

### 6.7.4 Risk assessment

Receptors that could be affected by a LOC of reservoir hydrocarbons and that have been identified in Volume 1 as occurring in the area are identified in Table 6-52.

**Table 6-52 Impact scoping**

Impacts	Receptors					
	Benthic habitats	Plankton	Fish	Marine reptiles – Turtles	Birds	Marine mammals
Injury/mortality to fauna		✓	✓	✓	✓	✓
Change in habitat	✓					
	Coastal habitats	Wetlands	AMPs	KEFs	National Parks and Reserves	
Change in habitat	✓	✓	✓	✓	✓	
	Fisheries – Commercial (Commonwealth and State)		Cultural – Historic and indigenous		Tourism and recreation	
Change to the function, interests or activities of other users	✓		✓		✓	

**Table 6-53 Risks of surface, shoreline and in-water hydrocarbon exposure**

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
<p>Benthic habitats – Bare substrate, coral, seagrass, macroalgae, subtidal rocky reef</p>	<p><u>Bare substrate</u></p> <p>While this receptor represents the 'bare sand' areas offshore, it does provide habitat for benthic invertebrates (both infauna and macroinvertebrates).</p> <p>Unconsolidated mixed and particulate sediments are likely to be dominated by burrowing fauna (e.g. annelid worms, molluscs, echinoderms, crustaceans, cnidarians). Many of the organisms that live in these habitats are habitat modifiers (e.g. through burrows or shell production), stabilising and/or oxygenating the sediments around them, and providing additional ecological niches for colonisation by other fauna – increasing local biodiversity.</p> <p>Surveys undertaken after the Montara blowout found no obvious visual signs of major disturbance at Barracouta and Vulcan shoals (Heyward, Moore, Radford, &amp; Colquhoun, 2010), which occur about 20-30m below the water line in otherwise deep waters (generally &gt;150m water depth). Later sampling indicated the presence of low-level severely degraded oil at some shoals, though in the absence of pre-impact data, this could not be directly linked to the Montara spill. Levels of hydrocarbons in the sediments were, in any case, several orders of magnitude lower than levels at which biological effects become possible (Heyward, et al., 2012) (Gagnon &amp; Rawson, 2011).</p> <p>Studies undertaken since the DWH incident have shown that fewer than 2% of the more than 8000 sediment samples collected exceeded the US Environmental Protection Agency sediment toxicity benchmark for aquatic life, and these were largely limited to the area close to the wellhead (BP, 2015).</p>	<p>Exposure to in-water hydrocarbons is restricted to 30m below the surface and therefore any potential impact to benthic habitats from in-water hydrocarbons will only occur in shallower nearshore waters. The zone of moderate exposure to dissolved hydrocarbons is predicted to extend into nearshore Victorian waters off the Gippsland coast.</p> <p>The predominant benthic habitat in the Gippsland Basin is bare substrate. However, known areas of seagrass which may be exposed include at Corner Inlet, Lakes Entrance, Bemm River Estuary and Tamboon Inlet. There is the potential that exposure could result in sub-lethal impacts, more so than lethal impacts, possibly because much of seagrasses' biomass is underground in their rhizomes (Zieman, Macko, &amp; Mills, 1984). Seagrass in this region isn't considered a significant food source for marine fauna.</p> <p>Suitable hard substrate for macroalgal beds including the threatened giant kelp occur in areas such as around Gabo Island and within the Bemm River Estuary. Little is known about the effects of oil on giant kelp, but some studies (Edgar &amp; Barrett, 2000) (Reed &amp; Lewis, 1994) suggest that this species, like other macroalgae, may be some of the least sensitive marine species to oil exposure. As described opposite, intertidal species of macroalgae are more prone to direct exposure than subtidal beds, however sub-lethal toxicity effects from in-water (dissolved) hydrocarbons may be observed.</p> <p>Corals are not a common habitat type in the Gippsland Basin however solitary soft corals may occur where suitable hard substrate, such as rocky reef or man-made structures, is present. Sub-lethal toxicity effects may result from direct contact with in-water hydrocarbons or indirectly through feeding on contaminated prey (plankton).</p> <p>Direct contact with benthic species in the immediate vicinity of the release locations may occur. The benthic habitat of the OA is predominantly featureless muddy, gravelly sand and no areas of rocky reef have been observed. Recent studies have shown that infaunal taxa are similar</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment																							
	<p>Acute or chronic exposure through contact and/or digestion can result in toxicological risks to invertebrates. However, the presence of an exoskeleton (e.g. crustaceans) reduces the impact of hydrocarbon absorption through the surface membrane. Invertebrates with no exoskeleton and larval forms may be more prone to impacts. Exposure can induce changes in burrowing depth into the substrate (which can lead to higher predation rates on some species) and can limit the growth, recruitment and reproductive capacity of some marine invertebrates (Fukuyama, Shigenaka, &amp; VanBlaricom, 1988).</p> <p>Deep water benthic invertebrates are usually protected from oiling by the buoyant nature of hydrocarbons, although the depth of oil penetration is dependent on turbulence in the water column. Hydrocarbons can also reach the benthos through the settlement of oiled particles such as faeces, dead plankton or inorganic sand particles (Jewett, Dean, Smith, &amp; Blanchard, 1999).</p> <p><u>Coral</u></p> <p>Corals are generally located in shallow and intertidal regions, where there is the potential for exposure to surface and in-water hydrocarbons.</p> <p>Experimental studies and field observations indicate all coral species are sensitive to the effects of oil, although there are considerable differences in the degree of tolerance between species. Differences in sensitivities may be due to the ease with which oil adheres to the coral structures, the degree of mucous production and self-cleaning, or simply different physiological tolerances.</p> <p>Direct contact of coral by hydrocarbons may impair respiration and also photosynthesis by symbiotic zooanthellae (Van Dam, 2011). Coral gametes or larvae in the surface layer where they are exposed to the slick may also be fouled (Epstein, Bak, &amp; Rinkevich, 2000). Physical oiling of coral tissue can cause a</p>	<p>across the Bass Strait but the contribution of each to the assemblage varies. Where hard substrate or points of attachment (facilities) are present, colonisation by epifauna occurs mostly in the form of sessile, invertebrate, filter feeders. The degree of colonisation varies between facilities however sponge beds have only been detected at Bream B.</p> <p>Benthic invertebrate species closer to shore may be affected, although these effects will be localised and temporary. Invertebrates of value (i.e. target species, see Commercial Fisheries) have been identified to include squid, crustaceans (rock lobster, crabs) and molluscs (scallops, abalone). Filter-feeding, sessile benthic invertebrates such as sponges, bryozoans, scallops, abalone and hydroids may be exposed to sub-lethal impacts however population level impacts are considered unlikely.</p> <p>The consequence of a LOWC on benthic habitats is assessed as Consequence Level II.</p> <table border="1" data-bbox="1102 776 1904 1073"> <thead> <tr> <th colspan="2">Effect Dimensions</th> <th colspan="2">Sensitivity Dimensions</th> </tr> </thead> <tbody> <tr> <td>Duration</td> <td>M</td> <td>Irreplaceability</td> <td>M-H</td> </tr> <tr> <td>Size/Scale</td> <td>M</td> <td>Vulnerability</td> <td>M</td> </tr> <tr> <td>Intensity</td> <td>M</td> <td>Influence</td> <td>M</td> </tr> <tr> <td colspan="2">M</td> <td colspan="2">M</td> </tr> </tbody> </table>				Effect Dimensions		Sensitivity Dimensions		Duration	M	Irreplaceability	M-H	Size/Scale	M	Vulnerability	M	Intensity	M	Influence	M	M		M

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>decline in metabolic rate and may cause varying degrees of tissue decomposition and death (Negri &amp; Heyward, 2000). Oil may also cling to certain types of sediment causing oil to sink to the seafloor, covering corals in oiled sediment.</p> <p>Where corals come into direct contact with surface exposures (i.e., intertidal/shallow areas), they are more susceptible due to physical presence, than toxicity associated with dissolved oil components within the water column which, in some cases, may be more toxic than the floating surface slicks (Volkman, Miller, Revill, &amp; Connell, 1994). A range of impacts is reported to result from toxicity including partial mortality of colonies, reduced growth rates, bleaching and reduced photosynthesis.</p> <p>Laboratory and field studies have demonstrated that branching corals appear to have a higher susceptibility to hydrocarbon exposure than massive corals or corals with large polyps.</p> <p>Chronic effects of oil exposure have been consistently noted in corals and, ultimately, can kill the entire colony. Chronic impacts include histological, biochemical, behavioural, reproductive and developmental effects. Field studies of chronically polluted areas and manipulative studies in which corals are artificially exposed to oil show that some coral species tolerate oil better than other species (NOAA, 2010).</p> <p>Reproductive stages of corals have been found to be more sensitive to oil toxicity. Fertilisation of coral species has been observed to be completely blocked in staghorn coral (<i>Acropora tenuis</i>) at heavy fuel oil concentrations of 150ppb (Lane &amp; Harrison, 2002), with significant reductions in fertilisation of sea ginger (<i>A.millepora</i>) and <i>A. valida</i> at concentrations between 580 and 5800ppb, in addition to developmental abnormalities and reduced survival of coral larvae at similar concentrations. Lower concentrations of less than 100 ppb crude oil were observed to inhibit larval metamorphosis in <i>A. millepora</i> (Negri &amp; Heyward, 2000).</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>Studies undertaken after the Montara incident included diver surveys to assess the status of Ashmore, Cartier and Seringapatam coral reefs. These found that other than a region-wide coral bleaching event caused by thermal stress (i.e., caused by sea water exceeding 32°C), the condition of the reefs was consistent with previous surveys, suggesting that any effects of hydrocarbons reaching these reefs was minor, transitory or sub-lethal and not detectable (Heyward <i>et al.</i>, 2010). This is despite AMSA observations of surface slicks or sheen nears these shallow reefs during the spill (Heyward, Moore, Radford, &amp; Colquhoun, 2010). Surveys in 2011 indicated that the corals exhibiting bleaching in 2010 had largely survived and recovered (Heyward, et al., 2012), indicating that potential exposure to hydrocarbons while in an already stressed state did not have any impact on the healthy recovery of the coral.</p> <p>In addition, surveys undertaken after the Montara blowout on the plateau areas of Barracouta and Vulcan shoals (Heyward, Moore, Radford, &amp; Colquhoun, 2010), which occur about 20-30m below the water line in otherwise deep waters (generally &gt;150m water depth), and contain algae, hard coral and seagrass, found no obvious visual signs of major disturbance.</p> <p><u>Macroalgae</u></p> <p>Macroalgae are generally limited to growing on intertidal and subtidal rocky substrata in shallow waters to 10m depth. As such, they may be exposed to subsurface and entrained and dissolved hydrocarbons, however, are susceptible to surface hydrocarbon exposure more so in intertidal habitats as opposed to subtidal habitats.</p> <p>Reported toxic responses to oils have included a variety of physiological changes to enzyme systems, photosynthesis, respiration, and nucleic acid synthesis (Lewis &amp; Pryor, 2013). Despite the well-established pool of literature on macroalgae</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>exposure to petroleum oils, very few investigations have reported effects on species that are common in Australian waters (Lewis &amp; Pryor, 2013).</p> <p>Smothering, fouling and asphyxiation are some of the physical effects that have been documented from oil contamination in marine plants (Blumer, 1971) (Cintron, Lugo, Marinez, Cintron, &amp; Encarnacion, 1981). In macroalgae, oil can act as a physical barrier for the diffusion of CO<sub>2</sub> across cell walls (O'Brien &amp; Dixon, 1976). The effect of hydrocarbons however is largely dependent on the degree of direct exposure and how much of the hydrocarbon adheres to algae, which will vary depending on the oils physical state and relative 'stickiness'. The morphological features of macroalgae, such as the presence of a mucilage layer or the presence of fine 'hairs' will influence the amount of hydrocarbon that will adhere to the algae. A review of field studies conducted after spill events (Connell, Miller, &amp; Farrington, 1981) indicated a high degree of variability in the level of impact, but in all instances, the algae appeared to be able to recover rapidly from even very heavy oiling. The rapid recovery of algae was attributed to the fact that for most algae, new growth is produced from near the base of the plant while the distal parts (which would be exposed to the oil contamination) are continually lost. Other studies have indicated that oiled kelp beds had a 90% recovery within 3-4 years of impact, however full recovery to pre-spill diversity may not occur for long periods after the spill (French-McCay D. , 2004).</p> <p>Intertidal macroalgal beds are more prone to oil spills than subtidal beds because although the mucous coating prevents oil adherence, oil that is trapped in the upper canopy can increase the persistence of the oil, which impacts upon site-attached species. Additionally, when oil sticks to dry fronds on the shore, they can become overweight and break as a result of wave action (IPIECA, 1995).</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>The toxicity of hydrocarbons to macroalgae varies for the different macroalgal life stages, with water-soluble hydrocarbons more toxic to macroalgae (O'Brien &amp; Dixon, 1976). Toxic effect concentrations for hydrocarbons and algae have varied greatly among species and studies, ranging 2-10,000,000ppb (Lewis &amp; Pryor, 2013). The sensitivity of gametes, larva and zygote stages however have all proven more responsive to petroleum oil exposure than adult growth stages (Lewis &amp; Pryor, 2013).</p> <p>Macrophytes, including macroalgae, require light to photosynthesise. So in addition to the potential impacts from direct smothering or exposure to entrained and dissolved hydrocarbons, the presence of entrained hydrocarbon within the water column can affect light qualities and the ability of macrophytes to photosynthesise.</p> <p>Exposure to in-water hydrocarbons poses the greatest threat to sensitive macroalgal assemblages, specifically the Giant Kelp Forests TEC, that grow on rocky reefs from the sea floor <math>\geq 8\text{m}</math> below sea level. The largest extent of this TEC is in Tasmanian coastal waters. Substrate on which this TEC may occur is also found in Victoria along the west coast of Wilson's Promontory and from Sydenham Inlet to Gabo Island (DSEWPAC, 2012b).</p> <p><u>Seagrass</u></p> <p>Seagrasses generally grow in sediments in intertidal and shallow subtidal waters where there is sufficient light and are common in sheltered coastal areas such as bays, lees of islands and fringing coastal reefs. As such, they may be exposed to both surface and sub-surface hydrocarbons. Submerged vegetation in nearshore areas can be exposed to oil by direct contact (i.e., smothering) and by uptake by rhizomes through contaminated sediments. Exposure also can take place via uptake of hydrocarbons through plant</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>membranes. In addition, seeds may be affected by contact with oil contained within sediments (NRDA, 2012).</p> <p>When seagrass leaves are exposed to petroleum oil, sub-lethal quantities of the soluble fraction can be incorporated into the tissue, causing a reduction in tolerance to other stress factors (Zieman, Macko, &amp; Mills, 1984). The toxic components of petroleum oils are thought to be the PAH, which are lipophilic and therefore able to pass through lipid membranes and tend to accumulate in the thylakoid membranes of chloroplasts (Ren, Huang, McConkey, Dixon, &amp; Greenberg, 1994).</p> <p>As such, the susceptibility of seagrasses to hydrocarbon spills will depend largely on distribution. Deeper communities will be protected from oiling under all but the most extreme weather conditions. Shallow seagrasses are more likely to be affected by dispersed oil droplets or, in the case of emergent seagrasses, direct oiling. Theoretically, intertidal seagrass communities would be the most susceptible because the leaves and rhizomes may both be affected.</p> <p><u>Subtidal rocky reefs</u></p> <p>Nearshore and offshore subtidal reef habitats are dominated by seaweeds, mobile invertebrates and fish. Potential impacts to sensitive receptors related to these reefs discussed in the appropriate sections. It was observed that the release of large quantities of fuel oil during the grounding of the Iron Baron did not substantially affect populations of subtidal reef associated organisms (Edgar &amp; Barrett, 1995).</p>	
Plankton	<p>Plankton are found in nearshore and open waters beneath the surface in the water column. These organisms migrate vertically through the water column to feed in surface waters at night (NRDA, 2012). As they move close to the sea surface it is possible that they may be exposed to floating hydrocarbons but</p>	<p>Plankton are likely to be exposed to in-water (dissolved) hydrocarbons above the moderate exposure threshold within a zone (up to approximately 5 km in width) extending parallel to the Gippsland coastline (for up to approximately 250km from the release location). Plankton are at their highest concentrations below surface waters (e.g. 60m water depth for phytoplankton during the day) and undertake a vertical migration</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>plankton also has the potential to be directly affected by in-water hydrocarbons as a result of toxicity effects.</p> <p>Phytoplankton are typically not sensitive to the impacts of oil, though they do accumulate it rapidly (Hook, Batley, Holloway, Irving, &amp; Ross, 2016) due to their small size and high surface area to volume ratio. Oil can affect the rate of photosynthesis and inhibit growth in phytoplankton, depending on the concentration range. For example, photosynthesis is stimulated by low concentrations of oil in the water column (10–30ppb) but becomes progressively inhibited above 50ppb. Conversely, photosynthesis can be stimulated below 100ppb for exposure to weathered oil (González, et al., 2009). In addition, the potential for effects to photosynthesis (i.e. temporary suppression of primary production) from shading caused by continuous surface slicks may have implications for consumers of phytoplankton (Hook, Batley, Holloway, Irving, &amp; Ross, 2016), though a prolonged surface coverage over an extensive area would be required. During the DWH oil spill it was observed that plankton and other surface material were found to be sinking at rates of more than 10 times the normal level. It was hypothesised that the weathered spilled oil catalysed clumping of organic particles (Schrope, 2013). It is currently unclear as to whether this effect was caused by the chemical characteristics of the weathered oil, or a bacterial effect.</p> <p>Zooplankton (microscopic animals such as rotifers, copepods and krill that feed on phytoplankton) are vulnerable to hydrocarbons (Hook, Batley, Holloway, Irving, &amp; Ross, 2016). Water column organisms that come into contact with oil risk exposure through ingestion, inhalation and dermal contact (NRDA, 2012), which can cause immediate mortality or declines in egg production and hatching rates along with a decline in swimming speeds (Hook, Batley, Holloway, Irving, &amp; Ross, 2016).</p>	<p>which would likely reduce their potential for (and duration of) exposure to dissolved hydrocarbons in the surface layer of the water column.</p> <p>The impact to plankton is therefore predicted to be <b>Level III</b> with potential effects on the food web recognised.</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>Plankton are generally abundant in the upper layers of the water column and is the basis of the marine food web, so an oil spill in any one location is unlikely to have long-lasting impacts on plankton populations at a regional level. Reproduction by survivors or dispersion from unaffected areas (via sea surface currents) is likely to rapidly replenish losses (Abbriano, et al., 2011). Plankton have life cycles based on rapid reproduction with levels of high productivity. It is also in the nature of plankton to be dispersive. Oil spill field observations show minimal or transient effects on plankton (Abbriano, et al., 2011). Once background water quality is re-established, plankton takes weeks to months to recover (ITOPF, 2011). Plankton found in open waters of the exposure zone is expected to be widely represented within waters of the wider Bass Strait region and generally across all waters in the southeastern offshore region, which aids in the re-establishment of communities.</p>	
Fish	<p>Fish can be exposed to oil through a variety of pathways, including: direct dermal contact (e.g. swimming through oil); ingestion (e.g. directly or via oil-affected prey/foods); and inhalation (e.g. elevated dissolved contaminant concentrations in water passing over the gills). Fish are generally considered vulnerable to oil spills because they inhabit areas coincident with oil exploration and production and those areas that may be subsequently impacted by an oil spill; including coral reefs, seagrasses, nearshore areas, deep offshore areas, pelagic habitats and demersal habitats (Moore &amp; Dwyer, 1974) (Gundlach &amp; Hayes, 1978). Of the potential toxicants, monoaromatic and PAH are generally regarded as the most toxic to fish.</p> <p><u>Surface oil</u></p> <p>Since fish and sharks do not generally break the sea surface, the exposure of surface hydrocarbons to fish and shark species are unlikely to occur. Near the sea surface, fish are able to detect and avoid contact with surface slicks meaning fish</p>	<p>The release locations are located in open waters however being between approximately 15 and 25km from shore floating oil is predicted to extend into shallower nearshore waters along the Ninety Mile Beach and eastwards towards Gabo Island. Moderate surface exposure is predicted to cover a maximum area of approximately 40km<sup>2</sup>. The zone of moderate exposure to dissolved hydrocarbons is predicted to extend into nearshore Victorian waters.</p> <p>Shallow inshore fish species including various syngnathids (seahorses, pipefish, pipehorses and seadragons) are less likely to be able to move away from surface or in-water oils and therefore may be exposed to elevated levels or for longer periods. Their habitats are typically widespread however any impacts are expected to be local on individual organism levels.</p> <p>Although pelagic fish species may be exposed to moderate levels of dissolved oil their mobile, transitory characteristics reduce the risk of prolonged exposure. Large-scale population level effects following a LOC on fish species, abundances or assemblage composition would be unlikely due to the wide geographical distribution of many fish in Bass</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment																							
	<p>mortalities rarely occur in the event of a hydrocarbon spill in open waters (Volkman, et al., 2004) . As a result, wide-ranging pelagic fish of the open ocean generally are not highly susceptible to impacts from surface hydrocarbons. Adult fish kills reported after oil spills occur mainly to shallow water, near-shore benthic species (Volkman, et al., 2004). Following the DWH incident, it was suggested that Whale sharks may be vulnerable to oiling of gills if exposed to the oil. The tendency of Whale sharks to feed close to surface waters will increase the likelihood of exposure to surface slicks and elevated hydrocarbon concentrations beneath slicks.</p> <p><u>In-water oil</u></p> <p>Exposure to hydrocarbons entrained or dissolved in the water column can be toxic to fishes. Studies have shown a range of impacts including changes in abundance, decreased size, inhibited swimming ability, changes to oxygen consumption and respiration, changes to reproduction, immune system responses, DNA damage, visible skin and organ lesions, and increased parasitism. However, many fish species can metabolize toxic hydrocarbons, which reduces the risk of bioaccumulation (NRDA, 2012). Pelagic species are also generally highly mobile and as such are not likely to suffer extended exposure (e.g. &gt;96 hours) at concentrations that would lead to chronic effects due to their patterns of movement. Demersal fish are not expected to be impacted given the presence of in-water hydrocarbons in surface layers only.</p> <p>Fish are most vulnerable to hydrocarbon discharges during their embryonic, larval and juvenile life stages. Oil exposure may result in decreased spawning success and abnormal larval development. Impacts on eggs and larvae entrained in the upper water column are not expected to be significant given the temporary period of water quality impairment, and the limited areal extent of the spill. As egg/larvae dispersal is widely distributed in the upper layers of the water column it is expected</p>	<p>Strait and the potential for rapid recolonisation, especially in the cases of widely distributed relatively common pelagic species. Deep water demersal fish are not expected to be impacted given the presence of in-water hydrocarbons in upper layers (0-30 m) of the water column only.</p> <p>The zone of moderate exposure to dissolved hydrocarbons may contact the great white shark distribution and breeding BIAs and grey nurse shark foraging and migration BIAs. Pelagic species of shark are at greatest risk of being exposed to oil following a LOC given their wide foraging areas and risks of consuming contaminated prey. Great white sharks are known to aggregate near Ninety Mile Beach and philopatric characteristics means they may return to the place of birth to breed even if habitats are contaminated. This species is widely distributed and thus unlikely to suffer ecologically important declines in abundance.</p> <p>The consequences to fish and sharks are assessed as Consequence Level II, taking into consideration the potential impacts to threatened species such as the great white shark and grey nurse shark.</p> <table border="1" data-bbox="1100 834 1906 1133"> <thead> <tr> <th colspan="2">Effect Dimensions</th> <th colspan="2">Sensitivity Dimensions</th> </tr> </thead> <tbody> <tr> <td>Duration</td> <td>M</td> <td>Irreplaceability</td> <td>M</td> </tr> <tr> <td>Size/Scale</td> <td>M</td> <td>Vulnerability</td> <td>H</td> </tr> <tr> <td>Intensity</td> <td>M</td> <td>Influence</td> <td>M</td> </tr> <tr> <td colspan="2">M</td> <td colspan="2">M - H</td> </tr> </tbody> </table>				Effect Dimensions		Sensitivity Dimensions		Duration	M	Irreplaceability	M	Size/Scale	M	Vulnerability	H	Intensity	M	Influence	M	M		M - H

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>that current induced drift will rapidly replace any oil affected populations.</p>	
<p>Birds</p>	<p>Seabirds and shorebirds are sensitive to the impacts of oiling, with their vulnerability arising from the fact that they cross the air-water interface to feed, while their shoreline habitats may also be oiled (Hook, Batley, Holloway, Irving, &amp; Ross, 2016). Species that raft together in large flocks on the sea surface are particularly at risk (ITOPF, 2011).</p> <p><u>Sea surface oil</u></p> <p>Birds foraging at sea have the potential to directly interact with oil on the sea surface some considerable distance from breeding sites in the course of normal foraging activities. Seabird species most at risk include those that readily rest on the sea surface (e.g. shearwaters) and surface plunging species (e.g. terns, boobies). As seabirds are a top order predator, any impact on other marine life (e.g. pelagic fish) may disrupt and limit food supply both for the maintenance of adults and the provisioning of young.</p> <p>For seabirds, direct contact with hydrocarbons can foul feathers, which may subsequently result in hypothermia due to a reduction in the ability of the bird to thermo-regulate and impair waterproofing. A bird suffering from cold, exhaustion and a loss of buoyancy may also dehydrate, drown or starve (DSEWPAC, 2011). Increased heat loss as a result of a loss of water-proofing results in an increased metabolism of food reserves in the body, which is not countered by a corresponding increase in food intake, may lead to emaciation (DSEWPAC, 2011). The greatest vulnerability in this case occurs when birds are feeding or resting at the sea surface (Peakall, Wells, &amp; Mackay, 1987). In a review of 45 actual marine spills, there was no correlation between the numbers of bird deaths and the volume of the spill (Burger, 1993).</p>	<p>A number of listed threatened and/or migratory seabird species may occur in the area exposed above moderate surface thresholds. There are foraging BIA's for several species of petrels, shearwater and albatross and breeding BIAs for the White faced storm petrel and Little penguin which overlap with this exposed area. Moderate surface exposure is predicted to cover a maximum area of approximately 40km<sup>2</sup>.</p> <p>Seabirds rafting, resting, diving or feeding at sea have the potential to come into contact with surface oil, ranging from moderate to high exposure, as such, acute or chronic toxicity impacts (death or long-term poor health) to seabirds are possible. Most species tend to forage on their own, though large feeding flocks will gather at rich or passing food sources.</p> <p>The length of shoreline predicted to be exposed to shoreline loading of hydrocarbons that may have biological impacts to birds is approximately 550km above the moderate threshold and 250km above the high threshold. This section of coastline comprises mostly wide sandy beaches that provide nesting habitat for species such as Hooded plovers and terns or rocky islands and headlands that provide habitat for seabird colonies (such as little penguin, petrels and albatrosses).</p> <p>The Little penguin is not considered at risk globally, but some colonies are at risk on a regional scale (Cannell, et al., 2016) and declines in the status of this species have been reported from Tasmania (Stevenson &amp; Woehler, 2007). Oil concentrations at the moderate to high threshold are predicted to accumulate on the shorelines of Gabo Island, which supports the world's largest Little penguin colony, The Skerries and Tasmanian Bass Strait islands such as Curtis Island potentially impacting local populations. Under certain metocean conditions the zone of moderate surface exposure is predicted to overlap with the Little penguin breeding BIA.</p> <p>There are many listed threatened and migratory shorebird species likely to occur in the area overlapping the extent of exposed shoreline. In the</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment																				
	<p>Penguins may be especially vulnerable to an oil spill because they do not fly and therefore spend a high proportion of their time in the water when away from resting and breeding locations and readily lose insulation and buoyancy if their feathers are oiled (Hook, Batley, Holloway, Irving, &amp; Ross, 2016). This species also has strong attachment to its natal area (Colombelli-Négrel, 2016) and consequently, birds are likely to retain a strong attachment to a site even if the site and adjacent waters are severely contaminated by oil. The Iron Baron vessel spill (325MT of bunker fuel in Tasmania in 1995) is estimated to have resulted in the death of up to 20,000 penguins (Hook, Batley, Holloway, Irving, &amp; Ross, 2016).</p> <p><u>Shoreline oil</u></p> <p>Shorebirds are likely to be exposed to oil when it directly impacts the intertidal zone and onshore due to their feeding habitats. Foraging shorebirds will be at potential risk of both direct impacts through contamination of individual birds (e.g. fouling of feathers) and indirect impacts (e.g. fouling and/or a reduction in prey items) (Clarke &amp; Herrod, 2016). Birds that are coated in oil can also suffer from damage to external tissues, including skin and eyes, as well as internal tissue irritation in their lungs and stomachs</p> <p>Breeding birds (both seabirds and shorebirds) may be exposed to oil via direct contact or the contamination of the breeding habitat (e.g. shores of islands) (Clarke &amp; Herrod, 2016). Bird eggs may subsequently be damaged if an oiled adult sits on the nest. Fresh crude was shown to be more toxic than weathered crude, which had a medial lethal dose of 21.3 milligrams peregg. Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos.</p> <p>Toxic effects on birds may result where oil is ingested as the bird attempts to preen its feathers, or via consumption of oil-</p>	<p>event of a LOWC, these birds are potentially at risk of shoreline exposure. Birds are not likely to be significantly affected by in-water concentrations of hydrocarbons due to their limited exposure time in the water column. Shorebirds foraging in intertidal areas or along the high tide mark and splash zone, or nest in coastal areas particularly close to the high-water mark, are most at risk of exposure effects. Because the zone of moderate in-water exposure extends into nearshore waters, foraging shorebirds may be indirectly impacted by the loss of invertebrate prey.</p> <p>The populations of both seabird and shorebird species have a wide geographic range, meaning that impacts to individuals at one location will not necessarily extend to populations at other un-impacted locations.</p> <p>Consequently, the potential consequence of risks to seabirds and shorebirds from a LOWC are considered to be Consequence Level II.</p> <table border="1" data-bbox="1100 776 1902 1075"> <thead> <tr> <th colspan="2">Effect Dimensions</th> <th colspan="2">Sensitivity Dimensions</th> </tr> </thead> <tbody> <tr> <td>Duration</td> <td>M</td> <td>Irreplaceability</td> <td>H</td> </tr> <tr> <td>Size/Scale</td> <td>M</td> <td>Vulnerability</td> <td>H</td> </tr> <tr> <td>Intensity</td> <td>M</td> <td>Influence</td> <td>H</td> </tr> <tr> <td colspan="2">M</td> <td colspan="2">H</td> </tr> </tbody> </table>	Effect Dimensions		Sensitivity Dimensions		Duration	M	Irreplaceability	H	Size/Scale	M	Vulnerability	H	Intensity	M	Influence	H	M		H

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment																				
	<p>affected prey. Whether this toxicity ultimately results in mortality will depend on the amount consumed and other factors relating to the health and sensitivity of the particular bird species.</p> <p>The threshold thickness of oil that could impart a lethal dose to an individual wildlife species is 10µm (~10 g/m<sup>2</sup>) (Engelhardt, Petroleum effects on marine mammals, 1983) (Clark, 1984) (Geraci &amp; St. Aubin, 1988) (Jenssen, 1994). A layer 25µm thick would be harmful for most birds that contact the slick (Scholten, et al., 1996).</p>																					
<p>Marine reptiles - Turtles</p>	<p>Marine turtles are vulnerable to the effects of oil at all life stages; eggs, hatchlings, juveniles, and adults. Oil exposure affects different turtle life stages in different ways; and each turtle life stage frequents a habitat with varied potential to be impacted during an oil spill. Several aspects of turtle biology and behaviour place them at particular risk, including a lack of avoidance, indiscriminate feeding in convergence zones, and large pre-dive inhalations.</p> <p>Marine turtles can be exposed to oil externally (e.g. swimming through oil slicks) or internally (e.g. swallowing the oil, consuming oil affected prey, or inhaling of volatile oil related compounds).</p> <p><u>Surface oil</u></p> <p>Effects of oil on turtles include increased egg mortality and developmental defects; direct mortality due to oiling in hatchlings, juveniles, and adults; and negative impacts to the skin, blood, digestive and immune systems, and salt glands. Oil can enter cavities such as the eyes, nostrils, or mouth; and oil covering their bodies may interfere with breathing because they inhale large volumes of air to dive.</p> <p>Experiments on physiological and clinical pathological effects of hydrocarbons on loggerhead turtles (~15–18 months old) showed that the turtles' major physiological systems were</p>	<p>While marine turtles, including threatened species, are known to occur in the area potentially exposed to hydrocarbons above surface and in-water (dissolved) moderate exposure thresholds they are not noted to reside or aggregate in significant numbers, and there are no recognized BIAs in the region.</p> <p>There are no turtle nesting beaches along the Gippsland or southern New South Wales coastlines, so impacts to turtles from shoreline oiling will not occur.</p> <p>Although the effects of hydrocarbons on marine reptiles, specifically turtles can be severe, the low density of turtles expected in the region (due to lack of BIA or aggregations) suggests that a LOWC would affect individuals rather than population level. Consequently, the potential impacts to marine reptiles are considered to be Consequence Level II.</p> <table border="1" data-bbox="1100 1052 1900 1351"> <thead> <tr> <th colspan="2">Effect dimensions</th> <th colspan="2">Sensitivity dimensions</th> </tr> </thead> <tbody> <tr> <td>Duration</td> <td>M</td> <td>Irreplaceability</td> <td>H</td> </tr> <tr> <td>Size/Scale</td> <td>M</td> <td>Vulnerability</td> <td>H</td> </tr> <tr> <td>Intensity</td> <td>M</td> <td>Influence</td> <td>H</td> </tr> <tr> <td colspan="2">M</td> <td colspan="2">H</td> </tr> </tbody> </table>	Effect dimensions		Sensitivity dimensions		Duration	M	Irreplaceability	H	Size/Scale	M	Vulnerability	H	Intensity	M	Influence	H	M		H

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>adversely affected by both chronic and acute exposures (96 hour exposure to a 0.05 cm layer of South Louisiana crude oil versus 0.5cm for 48 hours) (Lutcavage, Lutz, Bossart, &amp; Hudson, 1995). Recovery from the sloughing skin and mucosa took up to 21 days, increasing the turtle's susceptibility to infection or other diseases, such as fibropapilloma (Lutcavage, Lutz, Bossart, &amp; Hudson, 1995).</p> <p>Records of oiled wildlife during spills rarely include marine turtles, even from areas where they are known to be relatively abundant (Short, 2011). An exception to this was the large number of marine turtles collected (613 dead and 536 live) during the DWH incident in the GoM, although many of these animals did not show any sign of oil exposure (NOAA, 2013). Of the dead turtles found, 3.4% were visibly oiled and 85% of the live turtles found were oiled (NOAA, 2013). Of the captured animals, 88% of the live turtles were later released, suggesting that oiling does not inevitably lead to mortality.</p> <p><u>Shoreline oil</u></p> <p>Turtles may experience oiling impacts on nesting beaches and eggs through chemical exposures resulting in decreased survival to hatching and developmental defects in hatchlings. Adult females crossing an oiled beach could cause external oiling of the skin and carapace; nothing that most oil is deposited at the high-tide line, and most turtles nest well above this level. Studies on freshwater snapping turtles showed uptake of PAH from contaminated nest sediments, but no impacts on hatching success or juvenile health following exposure of eggs to dispersed weathered light crude (Rowe, Mitchelmore, &amp; Baker, 2009). However, other studies found evidence that exposure of freshwater turtle embryos to PAH results in deformities (Bell, Spotila, &amp; Congdon, 2006) (Van Meter, Spotila, &amp; Avery, 2006). Turtle hatchlings may be more vulnerable to smothering as they emerge from the nests and make their way over the intertidal area to the water (AMSA,</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>2015). Hatchlings that contact oil residues while crossing a beach can exhibit a range of effects including impaired movement and bodily functions (Milton, Lutz, &amp; Shigenaka, 2003). Hatchlings sticky with oily residues may also have more difficulty crawling and swimming, rendering them more vulnerable to predation.</p> <p>It should be noted that the threat and relative impacts of an unplanned discharge on some marine reptile species are considered less damaging than other stressors. Report cards produced on protected marine reptiles in Australia generally ranked oil pollution as either 'not of concern' or 'of less concern' depending on the marine region (DSEWPAC, 2012b).</p>	
<p>Marine mammals (pinnipeds)</p>	<p>Pinnipeds are directly at risk from impacts associated with the exposure to surface, shoreline and in-water hydrocarbons.</p> <p><u>Sea surface oil</u></p> <p>Pinnipeds are vulnerable to sea surface exposures in particular given they spend much of their time on or near the surface of the water, as they need to surface every few minutes to breathe, and regularly haul out on to beaches. Pinnipeds are also sensitive as they will stay near established colonies and haul-out areas, meaning they are less likely to practise avoidance behaviours. Seals, sea lions and fur-seals have been observed swimming in oil slicks during a number of documented spills (Geraci &amp; St. Aubin, 1988).</p> <p>As a result of exposure to surface oils, pinnipeds, with their relatively large, protruding eyes are particularly vulnerable to effects such as irritation to mucous membranes that surround the eyes and line the oral cavity, respiratory surfaces, and anal and urogenital orifices. Seals appear not to be very sensitive to contact with oil, but instead to the toxic impacts from the inhalation of volatile components (Hook, Batley, Holloway, Irving, &amp; Ross, 2016).</p>	<p>Both the New Zealand fur seal (<i>Arctocephalus forsteri</i>) and the Australian fur seal are listed marine species with habitat and breeding sites known to occur in areas potentially exposed to surface, in-water and shoreline oil above the moderate threshold. These areas are not identified as critical habitat and there are no identified BIAs for fur seals in the region.</p> <p>Both the Australian and New Zealand fur seals are at risk to surface oil while at sea and shoreline accumulated oil at haul out sites or rookeries. The direct effect to pups from exposure to shoreline oil at <math>\geq 100\text{g/m}^2</math> could result in mortality, while indirect effects could be negative behavioural changes associated with the smell of shoreline oil or contamination of prey.</p> <p>The Australian fur seal is vulnerable to a population decline following a LOWC because breeding locations are restricted to the islands of Bass Strait. It is predicted that major rookeries on The Skerries and Gabo Island may be exposed to accumulated shoreline oil at moderate to high thresholds. Oil is also predicted to accumulate at the moderate threshold on islands off Wilsons Promontory which also support significant breeding populations.</p> <p>These species are particularly vulnerable to oil because oil is believed to adhere more readily to their coats. Such oiling can have significant effects to this function if foraging in areas with fresh oil. Fur seals are known to</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment			
	<p>For some pinnipeds, fur is an effective thermal barrier because it traps air and repels water. Petroleum stuck to fur reduces its insulative value by removing natural oils that waterproof the pelage. Consequently, the rate of heat transfer through fur seal pelts can double after oiling (Geraci &amp; St. Aubin, 1988), adding an energetic burden to the animal. It is suggested (Kooyman, Gentry, &amp; McAllister, 1976) that in fact, fouling of approximately one-third of the body surface resulted in 50% greater heat loss in fur seals immersed in water at various temperatures. Fur-seals are particularly vulnerable due to the likelihood of oil adhering to fur. Heavy oil coating and tar deposits on fur-seals may result in reduced swimming ability and lack of mobility out of the water.</p> <p><u>In-water oil</u></p> <p>Ingested hydrocarbons can irritate or destroy epithelial cells that line the stomach and intestine, thereby affecting motility, digestion and absorption.</p> <p>However, pinnipeds have been found to have the enzyme systems necessary to convert absorbed hydrocarbons into polar metabolites, which can be excreted in urine (Engelhardt, 1982) (Addison &amp; Brodie, 1984) (Addison, Brodie, Edwards, &amp; Sadler, 1986). Benzene and naphthalene ingested by seals is quickly absorbed into the blood through the gut, causing acute stress, with damage to the liver considered likely. If ingested in large volumes, hydrocarbons may not be completely metabolized, which may result in death (Volkman, Miller, Revill, &amp; Connell, 1994).</p> <p><u>Shoreline oil</u></p> <p>Breeding colonies (used to birth and nurse until pups are weaned) are particularly sensitive to hydrocarbon spills (Higgins &amp; Gass, 1993). Species that rely on fur to regulate their body temperature (such as fur-seals) are the most vulnerable to oil as the animals may die from hypothermia or overheating,</p>	<p>aggregate around offshore oil and gas facilities where, in the event of a release, exposure to fresh oil would occur.</p> <p>The consequence of a LOWC on pinnipeds is assessed as Consequence Level II.</p>

		H		M	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>depending on the season, if the fur becomes matted with oil (ITOPF, 2011).</p> <p>It is reported that most pinnipeds scratch themselves vigorously with their flippers and do not lick or groom themselves, so are less likely to ingest oil from skin surfaces (Geraci &amp; St. Aubin, 1988). However, mothers trying to clean an oiled pup may ingest oil. The Long-Term Environmental Impact and Recovery report for the Iron Barren oil spill concluded that “The number of pups born at Tenth Island in 1995 was reduced when compared to previous years. There was a strong relationship between the productivity of the seal colonies and the proximity of the islands to the oil spill wherein the islands close to the spill showed reduced pup production and those islands more distant to the oil spill did not” (Tasmanian SMPC, 1999).</p> <p>Pinnipeds are further at risk because they appear to rely on scent to establish a mother-pup bond (Sandegren, 1970) (Fogden, 1971) and consequently oil-coated pups may not be recognizable to their mothers. This is only theorised, with studies and research indicating interaction between mothers and oiled pups were normal (Davis &amp; Anderson, 1976) (Davies, 1949) (Shaughnessy &amp; Chapman, 1984).</p> <p>Australian sea lions have naturally poor recovery abilities due to unusual reproductive biology and life history (DSEWPAC, 2013). Due to the extreme philopatry of females and limited dispersal of males between breeding colonies, the removal of only a few individuals annually may increase the likelihood of decline and potentially lead to the extinction of some of the smaller colonies. Note: Australian sea lions are endemic to Australia, found only in South Australia and Western Australia (DSEWPAC, 2013).</p>	
<p>Marine mammals (cetaceans)</p>	<p>Whales and dolphins can be exposed to the chemicals in oil through:</p>	<p>Several threatened, migratory and/or listed cetacean species may traverse the spill plume.</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment									
	<ul style="list-style-type: none"> <li>• internal exposure by consuming oil or contaminated prey</li> <li>• inhaling volatile oil compounds when surfacing to breathe</li> <li>• external exposure, by swimming in oil and having oil directly on the skin and body</li> <li>• maternal transfer of contaminants to embryos (NRDA, 2012).</li> </ul> <p><u>Surface oil</u></p> <p>Unlike with pinnipeds oil would not be expected to adhere well to the surface of cetacean skin due to the lack of hairs and the frequent sloughing of skin cells (Engelhardt, 1983) (Helm, et al., 2015). In addition, oil should not readily penetrate cetacean skin due to tight intercellular bridges and thick epidermis (O’Hara &amp; O’Shea, 2001). Nevertheless, cetaceans can be exposed to oil through direct contact with the eyes, mouth (ingestion), and airways (inhalation), potentially leading to inflammation and lung congestion (Geraci &amp; St. Aubin, 1988).</p> <p>Inhalation of toxic compounds associated with fresh oil was of greater concern than absorption through the skin and ingestion (Helm, et al., 2015). The inhalation of oil droplets, vapours and fumes is a distinct possibility if whales or dolphins surface in slicks to breathe. Exposure to hydrocarbons in this way could damage mucous membranes, damage airways or even cause death. Cetaceans may incidentally draw seawater and floating oil, into their lungs by breathing in splashed droplets or liquid that has collected near the blowhole just prior to inhalation. Aspiration of liquid oil can cause physical injuries to the respiratory tract by irritating tissues/membranes and can also lead to absorption of toxicants into the blood, as in inhalation exposure (Takeshita R. , et al., 2017). Exposure to oil</p>	<p>The distribution and possible (see CMPBW) foraging BIAs for the PBW and the migration BIA for the SRW may be exposed to surface and in-water concentrations above the moderate exposure threshold. The foraging BIA for the Humpback whale and breeding BIA for the Indo-Pacific bottlenose dolphin (which extends northwards into New South Wales from the Victorian border) may also overlap the zones of moderate surface and in water (dissolved) hydrocarbon.</p> <p>If present, these species (and other cetaceans) may be exposed to oil in the manner described in this table.</p> <p>It is plausible that individual whales could encounter surface oil above the moderate exposure threshold (or high exposure threshold in the immediate vicinity of the release location), but the release would need to coincide with pod migration or foraging for a greater number of individuals to be present in the plume. Sightings of blue whales in the Gippsland Basin are reasonably rare (Bannister, Kemper, &amp; Warneke, 1996) and acoustic detecting indicates that the PBW are predominantly located to the east, west and south of the OA. It is difficult to predict with certainty if a spill would lead to levels of mortality or reproductive depression that would manifest in terms of a population-level response.</p> <p>The highly mobile and transitory nature of cetacean species in Bass Strait means that exposure to moderate to high levels of surface oil (in the vicinity of the release location) or moderate levels of in-water hydrocarbon is not anticipated to result in long term population viability effects. Nevertheless, taking into account that the populations of some whale species remain small relative to pre-whaling days and are thought to have a multi-decadal recovery time, mortality of even a small number of adults and or calves as result of oiling could inhibit or retard species recovery, the resultant impact is therefore assessed as Consequence Level II.</p> <table border="1" data-bbox="1100 1222 1902 1339"> <thead> <tr> <th colspan="2" data-bbox="1100 1222 1501 1279">Effect dimensions</th> <th colspan="2" data-bbox="1501 1222 1902 1279">Sensitivity dimensions</th> </tr> </thead> <tbody> <tr> <td data-bbox="1100 1279 1377 1339">Duration</td> <td data-bbox="1377 1279 1501 1339">H</td> <td data-bbox="1501 1279 1780 1339">Irreplaceability</td> <td data-bbox="1780 1279 1902 1339">H</td> </tr> </tbody> </table>		Effect dimensions		Sensitivity dimensions		Duration	H	Irreplaceability	H

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment			
	<p>concentrations of 10g/m<sup>2</sup> could result in mortality to marine mammals (French-McCay D. , 2016).</p> <p>Evidence suggests that many cetacean species are unlikely to detect and avoid spilled oil (Matkin, Saulitis, Ellis, Olesiuk, &amp; Rice, 2008). There are numerous examples where cetaceans have appeared to incidentally come into contact with oil and/or not demonstrated any obvious avoidance behaviour. Following the Exxon Valdez oil spill, (Matkin, Saulitis, Ellis, Olesiuk, &amp; Rice, 2008) reported killer whales in slicks of oil as early as 24 hours after the spill and evidence (Aichinger Dias, et al., 2017) showed that following the DWH oil spill cetaceans in the GoM came into direct contact with both oil and sheen by swimming through them.</p> <p>Although in the GoM it was observed that cetaceans were able to detect the thick and dark-coloured patches of oil, detection of the lighter substances may have been more difficult. Photographs of dolphins with oil on their bodies showed that oil can adhere to and persist on cetacean skin, and contrary to suggestions from previous studies, direct contact with oil and resultant exposure to toxic compounds is of concern (Aichinger Dias, et al., 2017).</p> <p><u>In water (dissolved and entrained) oil</u></p> <p>The physical impacts from ingested hydrocarbon with subsequent lethal or sub-lethal impacts are applicable to both dissolved and entrained oil. However, the susceptibility of cetaceans varies with feeding habits. Baleen whales (such as blue, southern right and humpback) are not particularly susceptible to ingestion of oil in the water column as they feed by skimming the surface. Oil may stick to the baleen whale while they 'filter feed' near slicks. Toothed whales and dolphins may be susceptible to ingestion of dissolved and entrained oil as they gulp feed at depth. As highly mobile species, in general it is very unlikely that these animals will be constantly exposed to concentrations of hydrocarbons in the water column for</p>	Size/Scale	M	Vulnerability	H
		Intensity	M	Influence	H
		M-H		H	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>continuous durations (e.g., &gt;96 hours) that would lead to chronic effects. Note also, many marine mammals appear to have the necessary liver enzymes to metabolise hydrocarbons and excrete them as polar derivatives (Ball &amp; Truskewycz, 2013).</p> <p>Ingestion of oil may however result in acute nausea and vomiting and aspiration of oily vomitus into the lungs. Research conducted in the GoM linked aspiration pneumonia, lung abscesses, and pulmonary infections in dolphins to exposure to DWH oil (Takeshita R. , et al., 2017).</p> <p>Some whales, particularly those with coastal migration and reproduction, display strong site fidelity to specific resting, breeding and feeding habitats, as well as to their migratory paths and this may override any tendency for cetaceans to avoid the noxious presence of hydrocarbons. The SRW exhibits varying degrees of site fidelity, with the majority of females and calves returning to the same birthing location, while some also travel long distances between breeding grounds within a season (CMPSRW). If spilled oil reaches these biologically important habitats, the pollution may disrupt natural behaviours, displace animals, reduce foraging or reproductive success rates and increase mortality. It was concluded that the range of adverse health effects and increased mortality/reproductive failure observed in cetacean populations throughout the GoM since the DWH oil spill are consistent with the range of exposure scenarios (Takeshita R. , et al., 2017).</p> <p>If sufficiently high numbers of animals are impacted, the greater population may experience reduced recovery and survival rates. The restitution time for cetaceans affected at a population level is assumed to be long term, i.e. 40 years, based on consensus on recovery times for marine mammals following the DWH incident (Bock, et al., 2018).</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
<p>Coastal habitats and communities – Sandy shoreline, rocky shoreline, mangroves and saltmarsh</p>	<p><u>Sandy beaches</u></p> <p>Sandy beaches provide potential foraging and breeding habitat for numerous bird, marine turtle and pinniped species. These activities primarily occur above the high tide line, with exception of haul outs. Note, most of the oil on a sandy shore will be concentrated at, and below, the high tide mark. Sandy beaches are also inhabited by a diverse assemblage (although not always abundant) of infauna (including nematodes, copepods and polychaetes); and macroinvertebrates (e.g. crustaceans). Because the sand retains oil, such animals may be killed if oil penetrates into the sediments. Long-term depletion of sediment fauna could have an adverse effect on birds or fish that use tidal flats as feeding grounds (IPIECA, 1999).</p> <p>Depth of penetration in sandy sediment is influenced by:</p> <ul style="list-style-type: none"> <li>• Particle size – Penetration is not generally as great on mud as on coarser sediments.</li> <li>• Oil viscosity – Viscous oils and mousse (water-in-oil emulsion) tend to penetrate less deeply than low-viscosity oils such as light crudes or diesel oil.</li> <li>• Drainage – If sediments are poorly drained (as is often the case with tidal flats remote from creeks or channels), the water content may prevent the oil from penetrating into the sediment. In contrast, oil may reach depths greater than one metre in coarse well-drained sediments.</li> <li>• Animal burrows and root pores – Penetration into fine sediments is increased if there are burrows of animals such as worms, or pores left where plant roots have decayed.</li> </ul> <p>A 100g/m<sup>2</sup> threshold (considered a 'stain' or 'film', and equivalent to 0.1mm thickness) is assumed as the lethal</p>	<p>There are different types of shorelines found along the Gippsland and southern New South Wales coast and offshore islands (including Tasmanian islands), however this coastline is dominated by wide sandy beaches with intermittent rocky shores, and salt marshes and isolated mangroves within tidal estuaries, coastal lakes and bays.</p> <p>The type of shoreline will influence the volume of hydrocarbon that could be stranded ashore and its thickness before the shoreline saturation point occurs (ITOPF, 2014). For instance, a sandy beach may allow hydrocarbon to percolate through the sand, and weathered oil may be buried, thus increasing its ability to hold more hydrocarbon ashore over tidal cycles and various wave actions in comparison to a rocky shore; hence hydrocarbon can increase in thickness onshore over time.</p> <p>The maximum length of shoreline exposed to oil at the moderate threshold is 558km and at the high threshold 262km.</p> <p>The high shoreline loadings would likely result in acute toxicity, and death, of many invertebrate communities, especially for the light crude release scenarios which will easily penetrate into sandy sediments. However, tidal action is expected to lead to rapid weathering of these hydrocarbons in the intertidal area and the populations of these communities would be likely to rapidly recover.</p> <p>More persistent waxy residues are less likely to penetrate into intertidal sediments but may be forced to depth by wave action on high energy beaches. Oil residue retained deep beneath sediment may be protected from re-mobilisation and exposure to further weathering reduced (Lee, Shim, Lee, &amp; Kim, 2011). Rocky shores along the Gippsland and southern New South Wales coastline are generally exposed and any oil deposited would be rapidly removed by wave action. Impacts on intertidal communities are typically short term unless acute exposure to fresh product causes high mortality.</p> <p>In Victoria, mangroves are known to occur within sheltered bays or inlets such as Western Port, Lakes Entrance and Corner Inlet. Based on the modelling results, mangrove habitats at most risk, are those near Lakes Entrance however many of the strands are in river estuaries or</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>threshold for invertebrates on hard substrates and sediments (mud, silt, sand, gravel) in intertidal habitats. A threshold of 100g/m<sup>2</sup> oil thickness would be enough to coat an animal and likely impact its survival and reproductive capacity (French-McCay D. P., 2009). Based on this, areas of heavy oiling would likely result in acute toxicity, and death, of many invertebrate communities, especially where oil penetrates into sediments through animal burrows (IPIECA, 1999). However, these communities would be likely to rapidly recover (recruitment from unaffected individuals and recruitment from nearby areas) as oil is removed from the environment.</p> <p>Following the Sea Empress spill (in west Wales, 1996) many amphipods (sandhoppers), cockles and razor shells were killed. There were mass strandings on many beaches of both intertidal species (such as cockles) and shallow sub-tidal species. Similar mass strandings occurred after the Amoco Cadiz spill (in Brittany, France, 1978) (IPIECA, 1999). Following the Sea Empress spill, populations of mud snails recovered within a few months but some amphipod populations had not returned to normal after one year. Opportunists such as some species of worm may actually show a dramatic short-term increase following an oil spill (IPIECA, 1999). In March 2014, small volumes of crude oil from an unidentified source (confirmed to not be offshore oil and gas production facilities) washed up along a 7km section of sandy beach on the Victorian Gippsland coast as small (a few millimetres thick) granular balls (Gippsland Times, 2014). No impacts were observed over the course of two months following the incident.</p> <p>As a result of the DWH spill, oil washed up on sandy beaches of the Alabama coastline. The natural movement of sand and water through the beach system continually transformed and re-distributed oil within the beach system, and 18 months after the event, mobile remnant oil remained in various states of weathering buried at different depths in the beaches (Hayworth, Clement, &amp; Valentine, 2011). There is also evidence that</p>	<p>associated wetlands with only limited or intermittent access to the open ocean. Further north, the New South Wales coast mangroves may be exposed under certain conditions to shoreline accumulations of oil above moderate thresholds.</p> <p>For New South Wales, oil arriving would be well weathered with little lasting impact on salt marshes. Isolated marshes in Victoria near Wilsons Promontory potentially could be exposed to above moderate threshold shoreline accumulation. Salt marsh are important benthic primary producers and provide habitat for other species, thus the loss of salt marshes could have long-lasting indirect effects on other organisms. The effect of a LOWC on individual shorelines will depend on the type of shoreline, aspect and whether they are high or low energy shores. Shoreline recovery studies link restitution times to oil type, climate, shoreline type and results range depending on the receptors monitored and level of clean up.</p> <p>The oil from the 2010 DWH spill in the GoM was documented by shoreline assessment teams as stranding on 1773km of shoreline (Michel, et al., 2013). Shoreline clean-up activities were authorized on 660 km, or 73.3% of oiled beaches and up to 71km, or 8.9% of oiled marshes and associated habitats. One year after the spill began, oil remained on 847km; two years later, oil remained on 687km, though at much lesser degrees of oiling. For example, shorelines characterised as heavily oiled went from a maximum of 360km, to 22.4km one year later, and to 6.4km two years later (Michel, et al., 2013).</p> <p>Hence recovery can range widely from around 2 years (Sea Empress, 1996, North Sea crude) to more than 20 years for soft sediment shorelines deeply contaminated during the 1991 Gulf War spills (IOGP, 2016).</p> <p>Of the shorelines of the states potentially impacted, the consequence to shorelines in Victoria is predicted to be greatest (contacted first, highest loadings and freshest oil). The resultant impact is assessed conservatively as a Consequence Level II.</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment			
	<p>submerged oil mats exist just offshore of the Alabama beaches (ranging in thickness from a few millimetres to several centimetres), which has resulted in the regular washing up of tar balls onto sandy beaches. These submerged oil mats may serve as long-term sources of remnant oil to the beach ecosystem (Hayworth, Clement, &amp; Valentine, 2011). Long-term changes to the beach ecosystem as a result of stranded oil are unknown.</p> <p>Other results from beach sampling undertaken at Dapuhin Island, Alabama, in May (pre-impact) and September 2011 (post-impact) found a large shift in the diversity and abundance of microbial species (e.g., nematodes, annelids, arthropods, polychaetes, protists, fungi, algae and bacteria). Post-spill, sampling indicated that species composition was almost exclusively dominated by a few species of fungi. DNA analyses revealed that the 'before' and 'after' communities at the same sites weren't closely related to each other (Bik, Halanych, Sharma, &amp; Thomas, 2012). Similar studies found that oil deposited on the beaches caused a shift in the community structure toward a hydrocarbonoclastic consortium (petroleum hydrocarbon degrading microorganisms) (Lamendella, et al., 2014).</p> <p><u>Rocky shorelines</u></p> <p>Rocky shores encompass a wide variety of habitats. Exposure to the sun and wave energy are key factors in determining the types of plants and animals that inhabit the rocky shores. The persistence of oil is largely governed by the same forces (IOGP, 2016). Rock surfaces exposed to strong wave action are typically dominated by barnacles and limpets that are firmly attached and if oil strands on those surfaces it may result in mortality of the affected animals but is unlikely to persist. Sheltered rocky shores in estuaries or inlets are typically dominated by macroalgae (seaweed) with various invertebrates living on or under the algae. Oil deposited in these habitats may</p>	Effect dimensions		Sensitivity dimensions

		Intensity	M	Influence	M
		M-H		M	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>not be washed off so quickly and recovery from impacts may take longer.</p> <p><u>Mangroves and salt marshes</u></p> <p>Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (DoEE, 2016). The effects of surface hydrocarbons on mangroves include damage by smothering of lenticels (mangrove breathing pores) on pneumatophores or aerial prop roots, or the lower trunk; or by the loss of leaves (defoliation) due to chemical burning. It is also known that mangroves take up hydrocarbons from contact with leaves, roots or sediments, and it is suspected that this uptake causes defoliation through leaf damage and tree death (Wardrop, Butler, &amp; Johnson, 1987).</p> <p>In-water entrained and dissolved hydrocarbons may affect mangrove communities directly through root uptake of toxic contaminants or indirectly due to effects on benthic infauna leading to reduced rates of bioturbation and subsequent oxygen stress on the plants root systems. Observed thresholds for effects are likely to vary depending on the health of the system, the hydrocarbon spilled and the environmental conditions; however, observations (Lin &amp; Mendelsohn, 1996) demonstrated that more than 1kg/m<sup>2</sup> of oil during the growing season would be required to affect salt marsh or mangrove plants significantly.</p> <p>“Subtropical and temperate coastal salt marsh” (otherwise referred to as coastal salt marsh) is listed as a TEC. This TEC is usually associated with sandy/muddy shores of estuaries and embayments along low wave energy coastlines. The physical environment for the TEC is coastal areas under regular or intermittent tidal influence, with salt marsh being the key vegetation type – that being salt-tolerant grasses, herbs, sedges, rushes and shrubs generally less than 50 cm high (DSEWPAC, 2013). Salt marshes occur in sheltered conditions,</p>	

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>commonly in the strandline zone, and the vegetation offers a large surface area for oil absorption and trapping. Additionally, many salt marsh grasses, which can be dominant over large areas, have corrugated leaf surfaces which increase their holding capacity.</p> <p>Evidence from case histories and experiments shows that the damage resulting from oiling is very variable – as are recovery times. Lighter, more penetrating oils are more likely to cause acute toxic damage than heavy or weathered oils. In areas of light to moderate oiling where oil is mainly on perennial vegetation with little penetration of sediment, the shoots of the plants may be killed, but recovery can take place from the underground systems. Good recovery commonly occurs within one to two years. Where thick deposits of viscous oil or mousse accumulate on the marsh surface, vegetation is likely to be killed by smothering and recovery delayed because persistent deposits inhibit recolonization.</p>	
Wetlands	<p>Most wetlands of international importance i.e. Ramsar wetlands have minimal risk of receiving oil following a LOWC because they have no, or very narrow and/or seasonal, connections to the sea. If surface oil was to enter a Ramsar site, the level of effect would be dependent on the type of receptors exposed to oil and the proportion of the site exposed to oil as well as the nature of the oil (fresh versus weathered).</p> <p>Sensitive receptors found in Ramsar sites connected to the sea could include mangroves, salt marshes, fish, shorebirds and seabirds. The consequences of oil exposure to these specific receptors have been described individually in the sections above.</p>	<p>Under certain metocean conditions floating surface oil and in-water (dissolved) hydrocarbons at or above the moderate threshold are predicted to reach the Gippsland Lakes Ramsar site. Oil is predicted to accumulate at high – moderate thresholds on the shoreline at Lakes Entrance and along the Ninety Mile Beach. However, the single, narrow entrance and presence of coastal dunes means the wetland itself is highly unlikely to be affected in any manner.</p> <p>Floating surface oil and In-water (dissolved) hydrocarbons are not predicted to reach the Corner Inlet Ramsar site at or above the moderate threshold. Under certain conditions shoreline oil is predicted to accumulate at high – moderate thresholds along the shoreline of Corner Inlet. Whilst the tidal mudflats are in part protected by narrow entrance channels and the coastal dune system. It is noted that there was potential for “devastating effects” of oil spills on Corner Inlet (Parks Victoria, 2005). The consequence is assessed as Consequence Level II.</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment			
		Effect dimensions		Sensitivity dimensions	
		Duration	H	Irreplaceability	M
		Size/Scale	M	Vulnerability	H
		Intensity	M	Influence	H
		M-H		M-H	
National Parks and Reserves	<p>Potential impacts to sensitive receptors related to the shorelines of the terrestrial parks, such as coastal habitats and birds, and the waters of the marine parks, such as benthic habitats, fish, cetaceans and pinnipeds, are discussed in the appropriate sections above.</p> <p>Impacts on tourism and recreation from degraded aesthetic values and water quality or restricted access to the coast and recreational locales within the Parks due to clean up efforts are discussed below.</p>	<p>Modelling predicts contact at the moderate in-water (dissolved) threshold for six marine parks, reserves and sanctuaries (Wilsons Promontory, Ninety Mile Beach, Point Hicks, Cape Howe and Beware Reef in Victoria and Batemans in New South Wales).</p> <p>Oil is predicted to accumulate above the moderate-high exposure threshold on the Gippsland and southern New South Wales coastline adjacent to several terrestrial parks and reserves including Wilsons Promontory, Corner Inlet, Nooramunga, Gippsland Lakes, Cape Conran and Croajingolong in Victoria and Nadgee, Ben Boyd, Bournda, Mimosa Rocks, Montague Island, Eurobodalla and Booderee in New South Wales). Oil at or above the moderate threshold is predicted to accumulate on the shoreline of the Kent Group National Park, Hogan Island Group and Moncouer and Curtis Islands (Tasmania).</p> <p>The consequence is assessed as Consequence Level II taking into consideration the length of shoreline potentially impacted and the extent of oil accumulation predicted.</p>			
AMPs	<p>AMPs vary in their conservation objectives and specific values, but all are designed to conserve fauna, habitats and water quality over the long term. AMPs support populations of threatened seabird, marine mammal and fish species. A temporary deterioration of water quality could have negative effects on organisms, such as plankton, seabirds, marine mammals and fisheries resources which in turn affect the</p>	<p>Surface and in-water (dissolved) oil entering these AMPs will degrade water quality until the oil is broken down and or currents shift the weathering oil outside the boundaries of the AMPs. Thus, water quality effects are predicted to persist only over the short to medium term in the AMPs.</p>			

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>values of that Park. These impacts are discussed individually within other sections.</p>	<p>Modelling indicated that no AMPs would be exposed to moderate thresholds of in water (dissolved) oil. Under certain metocean conditions floating oil was predicted to encroach upon the northwest corner of East Gippsland AMP at the outer edge of the zone of moderate exposure.</p> <p>The overall consequence is assessed as Consequence Level III.</p>
<p>KEFs</p>	<p>KEFs are underwater features, and hence are not at direct risk from floating surface oil or shoreline accumulated oil. Deepwater geological features, such as the Big Horseshoe Canyon and Canyons on the Eastern Continental Slope will not be impacted directly by oil.</p> <p>However, biological values associated with KEFs such as the Upwelling East of Eden and Shelf Rocky Reefs may be at risk from oil.</p> <p>Potential impacts to sensitive receptors related to the KEF Upwelling East of Eden such as plankton and cetaceans, or to the KEF Shelf Rocky Reefs such as benthic communities and fish, are discussed in the appropriate sections above.</p>	<p>While a spill would not affect the KEF Upwelling East of Eden itself, if the spill occurs at the time of an upwelling event, it may result in krill being exposed to in-water phase hydrocarbons. PBWs feeding at this time may suffer from reduced availability of prey however these impacts are expected to be localised and temporary.</p> <p>The consequence is assessed as Consequence Level III.</p>
<p>Cultural – Indigenous and historic</p>	<p>Visible sheen or oil stranded on the shoreline has the potential to reduce the visual or cultural (including activities such as camping, rituals and ceremonies) amenity of cultural heritage sites such as historic (e.g. shipwreck) or indigenous protected areas.</p> <p>Impacts from oil exposure are unlikely for submerged shipwrecks.</p>	<p>Oil sheen is predicted to encroach upon nearshore waters in the vicinity of the Gunai-Kurnai Native Title Determination Area and a number of historic shipwrecks. Parts of the Gippsland coast over which the Gunai-Kurnai people hold native title are predicted to be exposed to moderate – high shoreline oil loadings which may lead to reduced amenity or temporary exclusions during clean-up. Impacts from degraded aesthetics of sites along the coast may take time to recover but loss of access to sites during response or for health reasons are temporary and relatively short term. The consequence is considered Consequence Level III based on public impact consequence considerations (media coverage, the scope of the disruption (personal, commerce, transportation or socioeconomic) and the size of the population affected) as per the <i>Risk Matrix Application Guide</i> (ExxonMobil, 2018). Refer to Figure 3-1.</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
<p>Commercial fisheries</p>	<p>Commercial fishing has the potential to be impacted through exclusion zones associated with the spill, the spill response and subsequent reduction in fishing effort. Exclusion zones may impede access to commercial fishing areas, for a short period of time, and nets and lines may become oiled. The impacts to commercial fishing from a public perception perspective however, may be much more significant and longer term than the spill itself.</p> <p>Fishing areas may be closed for fishing for shorter or longer periods because of the risks of the catch being tainted by oil. Concentrations of petroleum contaminants in fish and crustacean and mollusc tissues could pose a significant potential for adverse human health effects, and until these products from nearshore fisheries have been cleared by the health authorities, they could be restricted for sale and human consumption. Indirectly, the fisheries sector will suffer a heavy loss if consumers are either stopped from using or unwilling to buy fish and shellfish from the region affected by the spill.</p> <p>Impacts to fish stocks have the potential for reduction in profits for commercial fisheries, and exclusion zones exclude fishing effort. Detectable tainting of fish flesh after a 24-hour exposure at crude concentrations of 0.1 ppm, marine fuel oil concentrations of 0.33ppm and diesel concentrations of 0.25ppm (Davis, Moffat, &amp; Shepherd, 2002).</p> <p>The Montara spill (as the most recent [2009] example of a large hydrocarbon spill in Australian waters) occurred over an area fished by the Northern Demersal Scalefish Managed Fishery (with 11 licences held by 7 operators), with goldband snapper, red emperor, saddletail snapper and yellow spotted rockcod being the key species fished (PTTEP, 2013). As a precautionary measure, the WA Department of Fisheries advised the commercial fishing fleet to avoid fishing in oil-affected waters. Testing of fish caught in areas of visible oil slick (November 2009) found that there were no detectable</p>	<p>Several commercial fisheries may operate within the area potentially exposed in the event of a LOWC. Floating oil is predicted to extend 10's of kilometres outside the subsea facility PSZ (from which fishing vessels are already excluded) making it likely that in these situations an exclusion zone (or fisheries closure) would be established.</p> <p>There are currently no commercially viable scallop beds fished in the area potentially exposed to dissolved hydrocarbons (Patterson, et al., 2021) (Koopman, Knuckey, Harris, &amp; Hudson, 2018). Limited data is publicly available on the location and extent of abalone fishing within Victorian waters however a number of licences are active and it is known that harvesting occurs off Cape Conran and at Mallacoota (DEDJPR, 2015). Of the State and Commonwealth administered fisheries which overlap the PEA (see Section 4 Description of Environment) the fisheries most active in the area potentially exposed to hydrocarbons, and therefore potentially most at risk of socioeconomic impact from reduced market confidence, are the Southern and Eastern Scalefish and Shark Fishery (31 trawl vessels, 19 Danish-seine vessels and 21 scalefish hook vessels active in total) and the Wrasse Fishery (22 licences in total) (Patterson, et al., 2021) (Koopman, Knuckey, Harris, &amp; Hudson, 2018).</p> <p>A temporary fisheries closure and the flow on losses from the lack of income derived from these fisheries based on reduced market confidence and the potential for extended media coverage (potentially greater than 3 months) has the possibility of exceeding medium community disruption (&gt; 100 – 1000 people) such as reduced employment (in fisheries service industries and the seafood supply chain).</p> <p>The potential economic impacts to commercial fisheries from LOWC are considered to be Public Impact Consequence Level I based on public impact consequence considerations (media coverage, the scope of the disruption (personal, commerce, transportation or socioeconomic) and the size of the population affected) as per the <i>Risk Matrix Application Guide</i> (ExxonMobil, 2018). Refer to Figure 3-1.</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
	<p>petroleum hydrocarbons in fish muscle samples, suggesting fish were safe for human consumption. In the short-term, fish had metabolized petroleum hydrocarbons. Limited ill effects were detected in a small number of individual fish only (PTTEP, 2013). No consistent effects of exposure on fish health could be detected within two weeks following the end of the well release. Follow up sampling in areas affected by the spill during 2010 and 2011 (PTTEP, 2013) found negligible ongoing environmental impacts from the spill.</p> <p>Since testing began in the month after the DWH blowout in the GoM (2010), levels of oil contamination residue in seafood consistently tested 100 to 1,000 times lower than safety thresholds established by the USA FDA, and every sample tested was found to be far below the USA FDA's safety threshold for dispersant compounds (BP, 2015). The USA FDA testing of oysters found oil contamination residues to be 10 to 100 times below safety thresholds (BP, 2015). Sampling data shows that post-spill fish populations in the GoM since 2011 were generally consistent with pre-spill ranges and for many shellfish species, commercial landings in the GoM in 2011 were comparable to pre-spill levels. In 2012, shrimp (prawn) and blue crab landings were within 2.0% of 2007-09 landings. Recreational fishing harvests in 2011, 2012 and 2013 exceeded landings from 2007-09 (BP, 2015).</p>	
<p>Tourism and recreation</p>	<p>Refer also to sections on fish, cetaceans, benthic and coastal habitats and National Parks and Reserves above.</p>	<p>Tourism and recreation is also linked to the presence of marine fauna (e.g. whales), particular habitats and locations for swimming or recreational fishing.</p> <p>The modelling predicts visible oil extending into nearshore Victorian waters (including waters of Ninety Mile Beach, Point Hicks and Cape Howe Marine National Parks and Beware Reef Marine Sanctuary). Oil is predicted to contact hundreds of kilometres of shoreline at the moderate – high exposure threshold. The shoreline is dominated by sandy beaches popular for a range of recreational activities. A number of National parks and Reserves including the very popular Wilsons Promontory and</p>

Receptor	Impact of hydrocarbon exposure	Exposure risk assessment
		<p>(Gippsland) Lakes National Parks are situated along this potentially exposed coastline.</p> <p>Short to medium-term impacts to nature-based tourism and other human uses of beaches (and nearshore waters) may occur as a result of temporary beach closures to enable clean-up, protect human health or due to perceptions of a polluted environment that is not desirable to visit.</p> <p>With respect to human health, post-Macondo oil spill (April 2010) studies in December found of 17,000 water samples, none exceeded US Environmental Protection Agency benchmarks for protection of human health (OSAT, 2010) and a year later residual oil in nearshore and sandy shoreline areas was highly weathered and concentrations of constituents of concern were below levels of concern for human health (OSAT, 2011).</p> <p>Alaska's tourism economy took approximately two years to recover from the Exxon Valdez (BOEM, 2017). The Eastern Research Group (2014) reported that while the DWH spill had had a significant impact on several areas of tourism in the short term and had wide-ranging impacts across the GoM, the tourism economy has rebounded to pre-spill levels within four years.</p> <p>The extent of potential impacts to tourism and recreation depends on when the spill occurs, size and where it comes ashore. Considering the range of activities and locations, the potential for reduced amenity of areas used by coastal tourists and recreational visitors, temporary health implications and possible closures, the consequence is considered Consequence Level I, based on public impact consequence considerations (media coverage, the scope of the disruption (personal, commerce, transportation or socio-economic) and the size of the population affected) as per the <i>Risk Matrix Application Guide</i> (ExxonMobil, 2018). Refer to Figure 3-1.</p>

The likelihood of LOWC has been developed based on the Norwegian Institute of Technology records (as presented in the IOGP Risk Assessment Data Directory for Blowout Frequencies 2019 (IOGP-IPIECA. , 2019), which presents the recommended frequencies of blowouts and well release incident based on industry data. The likelihood for LOWC has been established based on the following assumptions:

- drilling and well operations are defined as being “of North Sea Standard” (“Operation performed with PCE installed including shear ram and two barrier principle followed”) given the relevant Safety Case has been developed based on European standards and references various North Sea standards (e.g. NORSOK for barrier analysis, IOGP for relief well studies, Oil & Gas UK for relief well planning).

The specific controls to prevent LOWC are listed below (Section 6.7.6) which support the assumptions of the SINTEF data (North Sea Standard) and also include the measures taken to address the Gudgeon-1 and Terakihi-1 well specific status as described in Section 2.3.

Based on these assumptions the frequency of blowout is expected to be  $2 \times 10^{-4}$  for an oil well and  $4 \times 10^{-4}$  for a gas well. This indicates the chances of the activity resulting in a LOWC (and the subsequent impacts to receptors) are between  $1 \times 10^{-4}$  and  $1 \times 10^{-3}$  (Likelihood Category D (very unlikely)).

#### 6.7.5 Risk ranking

		maintained, to enable reliable performance.	maintenance in accordance with PMS.
	<b>CMP19:</b> Pressure Control Equipment testing	PCE is tested before deployment on each well.	Records show that PCE has successfully passed PCE test prior to deployment of the PCE and subsequent tests as per WOMP.
No loss of containment of hydrocarbons from damage to subsea assets.	<b>CMP20:</b> LWIV move procedure	The approved LWIV move procedure details how the LWIV will be moved onto and moved off location. It includes approach path, communication protocols, Permit to Work arrangements and survey criteria to prevent an impact with subsea assets.	Approved procedure is available on site and utilised.  Daily reports confirm that the procedure is followed.
	<b>CMP21:</b> Rig mover	The LWIV is moved onto and off location under the control of a rig mover.	Daily reports confirm that the rig mover is in control of rig moves.
Minimise the impact on the environment from a LOWC.	<b>CM12:</b> Oil Pollution Emergency Plan	Capability is maintained to ensure OPEP can be implemented in response to an incident, as expected.  Emergency response activities will be implemented in accordance with the OPEP.	Test records confirm that emergency response capability has been maintained in accordance with that described in Volume 4 and the OPEP.  Records confirm that emergency response activities have been implemented in accordance with the OPEP.
	<b>CM35:</b> Operational and Scientific Monitoring Plan	Capability is maintained to ensure OSMP can be implemented in response to an incident, as expected.  Operational and scientific monitoring will be implemented in accordance with the OSMP.	Test records confirm that emergency response capability has been maintained in accordance with that described in the OSMP.  Records confirm that emergency response activities have been implemented in accordance with the OPEP.
	<b>CMP22:</b> Source Control Emergency Response Arrangements	Source control emergency response arrangements consistent with <i>IOGP Report 594</i> (IOGP-IPIECA. ,	Check/gap analysis against the requirements of <i>IOGP Report 594</i> (IOGP-IPIECA. , 2019)

EPO	Control	EPS	Measurement criteria
	included in the Australia Wells Tier II/III Emergency Response Plan	<p>2019)and The Australian Petroleum Production and Exploration Association (APPEA) <i>Australian Offshore Titleholders Source Control Guideline</i> (APPEA, 2021) will be in place prior to commencement of P&amp;A activities.</p> <p>Source control emergency response arrangements includes:</p> <ul style="list-style-type: none"> <li>• SFRT</li> <li>• installation of capping stack (including logistics plan)</li> <li>• drilling a relief well (if required).</li> </ul>	<p>and <i>Australian Offshore Titleholders Source Control Guideline</i> (APPEA, 2021) on file.</p> <p>Contracts with third-party provider for well construction material, as well as logistics contracts are in place for this campaign.</p>
	<b>CMP23:</b> Availability of suitable Mobile Offshore Drilling Unit to drill relief well	Availability of MODU to meet minimum requirements/specifications for the MODU (to drill relief well).	Status and location of suitable MODU to drill relief well identified 30 days prior to P&A activity commencing on the first well and on a monthly basis throughout P&A campaign.
	<b>CMP24:</b> Availability of resources to meet relief well timeframe commitments	In the unlikely event that there is no suitable MODU available, or information becomes available to Esso or its rig contractor to indicate that resources may be required beyond those identified in the SCERP to allow a relief well to be drilled in the committed 98-day timeframe, the well activities will be made safe and any further activities will be suspended until such time as the activity can comply with this EP or the EP is resubmitted and accepted.	Records of tracking process indicate that a suitable MODU were available/identified throughout the activity.
Minimise the impact on commercial fisheries from a LOWC.	<b>CM51:</b> Utilisation of idle fishing vessels	Opportunities to utilise idle fishing vessels for oil spill response and monitoring activities will be taken where there is agreement of the	Esso IMT records reflect communications with fishing industry looking for opportunities to utilise idle fishing vessels.

EPO	Control	EPS	Measurement criteria
		vessel owner and where a risk assessment shows that there are no additional risks to vessels and crew.	
	<b>CM52:</b> Communication with fisheries	Should a spill occur, then updates on oil spill response and monitoring will be provided to fishery representative bodies (through South East Trawl Fishing Industry Association) to enable accurate information on spill status, impacts and effects of spilled hydrocarbons on seafood safety to be provided to fishing industry members and the public. Daily updates provided in the first week until the modelling is completed and then as needed, until relief well completed (and beyond if there is ongoing concern).	Relevant person consultation records show communication with South East Trawl Fishing Industry Association per the performance standard.

As the Capping stack installation assessment has proven that vertical deployment of a capping stack is a viable option, the source control emergency response process in the Australian Wells Tier II/III emergency response plan has been updated to include a Capping stack mobilisation logistics plan. This plan is tested as part of the pre campaign emergency response preparedness drills. This would be the primary response prior to drilling a relief well.

In the event the capping stack is required the following source control logistics plan will be executed.

The capping stack equipment has two potential mobilisation pathways from Singapore to the Gudgeon-1 and Terakihi-1 well centres located in Melbourne. The air and sea freight detailed project timelines can be found below in Table 6-56 Capping Stack Mobilisation plan

**Table 6-56 Capping Stack Mobilisation plan**

Mobilisation Path	Estimated timeline	Enablers
Air Freight – Singapore to Melbourne	12 Days	Aircraft availability, availability of suitable capping stack deployment vessel that can be at Barry Beach Marine terminal within 10 days of incident. Capping stack crews that

Mobilisation Path	Estimated timeline	Enablers
		can be in Melbourne within 7 days of incident.
Sea Freight – Singapore to Gudgeon-1 and Terakihi-1 well locations	23 days	Availability of suitable capping stack deployment vessel that can be in Singapore within 4 days of incident.

A critical part of the response will be to secure a suitable rig capable of drilling a relief well. Depending on the type of MODU and location, the rig may be self-propelled or require being towed to the relief well location (towed MODU averages 4 knots). The selection of a suitable MODU and support vessels would focus on the units currently operating in Australia under an accepted Safety Case that are suitable to drill the relief well (considering water depth and other well specifications). If required, a vessel Safety Case acceptance would be worked during the time it takes to mobilise the rig to the incident location (approximately 51 days).

The accepted *Q7000 Safety Case (Australia)* (Helix, 2021) as revised for the Gudgeon-1 and Terakihi-1 P&A campaign would be used as the basis of preparing the relief rig Safety Case and best efforts would be made to secure acceptance for the relief rig within the mobilisation timeframe. Rig, HLV and support vessels would need to meet project ballast water/biofouling requirements.

**Table 6-57 Response time breakdown (wet tow scenario)**

Operation	Duration (days)	Cumulative (days)
Notifications; Mobilize specialist personnel; Initiate SCERP; Source MODU; Contract; Source anchor handling tow and support.	7	7
MODU suspend well, demobilise, transit to Dampier	14	21
Tow to incident location (4 knots)	30	51
Load materials	2	53
Moor and drill relief well	35	88
Weather allowance	5	93
Kill well	5	98

### 6.7.7 Demonstration of As Low As Reasonably Practicable

**Table 6-58 ALARP Decision Context and justification**

<b>ALARP Decision Context B</b>	The permanent plugging and abandonment of offshore wells is a well-established practice and the environmental and public impact risks (Risk Category 3 (medium) and Risk Category 2 (medium) respectively) associated with a LOWC are well understood and effectively managed by existing controls. The environmental and public consequences of a LOWC
---------------------------------	---

	<p>have been assessed as moderate – high and in recognition of the interest from both relevant persons and the public about the potential impacts of a major oil spill ALARP Decision Context B has been applied. The utilisation of idle fishing vessels (where practicable and safe to do so) and ensuring ongoing communication with the fishing industry bodies will assist in mitigating socioeconomic impacts to commercial fisheries and the seafood supply chain.</p> <p>Consequently, Esso believes ALARP Decision Context B should apply.</p>
--	---

**Table 6-59 Good practice controls**

Good practice	Adopted	Control	Rationale
Well operations planning to prevent LOWC.	✓	<b>CM32:</b> NOPSEMA accepted Well Operations Management Plan	<p>Under Part 5 of the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011, NOPSEMA is required to accept a WOMP to enable well activities to be undertaken.</p> <p>The key elements of the WOMP, which function to reduce the likelihood of LOWC include the specification of well abandonment design and barriers to be used to prevent a loss of well integrity.</p> <p>Esso’s NOPSEMA-accepted WOMP will describe the minimum requirements for plug and abandonment barriers during operations.</p>
Implementation of a safety management system which controls risks arising from major incidents and achieves safe operation of the facility.	✓	<b>CM34:</b> NOPSEMA accepted Safety Case	<p>Under the OPGGS (Safety) Regulations, NOPSEMA requires that the facility (i.e. the Q7000 LWIV) has an accepted Safety Case in place before commencing the activity.</p> <p>The key elements of the Safety Case that function to reduce the likelihood of LOWC include:</p> <ul style="list-style-type: none"> <li>• Training (of LWIV team). See Section 2.4 and Annex 2B of Q7000 Safety Case (Australia) (Helix, 2021)</li> <li>• Qualifications (of LWIV team). See Section 2.4.4 of Q7000 Safety Case (Australia) (Helix, 2021)</li> <li>• Maintenance (of PCE and LWIV equipment). See Section 2.5.9 of Q7000 Safety Case (Australia) (Helix, 2021)</li> <li>• Section 2.5.10: Subsea Inspection Maintenance and Repair, and Subsea Construction/Installation</li> <li>• Section 1.11: Justification for Continued Operation</li> <li>• Section 2.5.3 Management of Change</li> <li>• Section 3.7.2 Subsea Pressure Control Equipment</li> <li>• Section 3.7.3.3 Control System</li> </ul>

Good practice	Adopted	Control	Rationale
			<ul style="list-style-type: none"> <li>Section 3.7.9 Riser</li> <li>Section 3.7.12 Well Testing</li> <li>Section 3.10.2.4 Power Management System</li> <li>Chapter 5 – Emergency Response</li> <li>Chapter 6 – Performance Monitoring</li> <li>Appendix 3B – Safety Critical Element Codes and Standards</li> </ul>
Oil spill response planning.	✓	<b>CM12:</b> Oil Pollution Emergency Plan	Under the OPGGS (Environment) Regulations, NOPSEMA requires that the petroleum activity has an accepted OPEP in place before commencing the activity. In the event of a LOWC the OPEP will be implemented.
	✓	<b>CMP22:</b> Source Control Emergency Response Arrangements in the Australia Wells Tier II/III Emergency Response Plan	<p>Source control tools available include:</p> <ul style="list-style-type: none"> <li>SFRT</li> <li>installation of capping stack</li> <li>drilling a relief well (if required).</li> </ul> <p>Relief well and dynamic kill analysis studies:</p> <ul style="list-style-type: none"> <li>dynamic kill analysis to determine kill fluid density, kill flow rate and required volume. The WOMP shall summarise the relief well and dynamic kill analysis studies.</li> <li>the gas dispersion and radiant heat studies (RPS, 2022b) that any gaseous components being released from the well during a WCDS blowout scenario will not reach the water surface. As a result there is no radiant heat hazard, so that the relief well and capping stack locations maybe safely positioned close to the blowout location.</li> </ul> <p>Contracts with third-party provider for well construction material, as well as logistics contracts are in place for this campaign.</p>
	✓	<b>CMP23:</b> Availability of suitable Mobile Offshore Drilling Unit to drill relief well	<p>The status and location of suitable rig to drill relief well are identified 30 days prior to P&amp;A works commencing on first well and subsequently each month throughout the P&amp;A campaign.</p> <p>The monitoring process used to identify availability of suitable rigs and support vessels is done through a system which allows Esso to determine how long the rigs are likely to be available for and therefore provides an outlook of when availability might change in advance.</p>

Good practice	Adopted	Control	Rationale
			In the unlikely event that there is no suitable rig available to allow a relief well to be drilled in the committed 98-day timeframe, the well activities will be made safe and any further activities will be suspended until such time as the activity can comply with this EP or a revised EP has been submitted and accepted.
Oil spill monitoring planning.	✓	<b>CM35:</b> Operational and Scientific Monitoring Plan	Esso's OSMP details the arrangements and capability in place for: <ul style="list-style-type: none"> <li>operational monitoring of a hydrocarbon spill to inform response activities</li> <li>scientific monitoring of environmental impacts of the spill and response activities.</li> </ul> Operational monitoring will allow adequate information to be provided to aid decision making to ensure response activities are timely, safe, and appropriate. Scientific monitoring will identify if potential longer-term remediation activities may be required.

Table 6-60 Engineering risk assessment

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
Third level of well barriers	Increased level of protection from uncontrolled flow from a well beyond the 'two barrier' requirement.	The two-barrier philosophy is considered industry best practice, specifically designed to reduce the risk to ALARP.	Not adopted
Standby MODU available locally to reduce mobilisation time	Having a MODU on standby may allow the relief well to be drilled 34 days earlier. There is an extremely low probability of occurrence of a source control event.	Having a standby MODU would effectively double the cost of the P&A program, thus potentially jeopardising its viability. The mobilisation/ demobilisation cost is estimated at \$AUD22M. The standby costs for a MODU spread for the duration of the program are estimated at \$AUD61M.  Given the high potential costs to the program, implementing this control measure is considered disproportionate, given that the source control event has an extremely low likelihood of occurrence.	Not adopted
Relief well materials staged locally	Response time for relief well drilling is dependent on the availability of necessary well	Wellhead and casing requirements will be identified during the planning	Not adopted

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
	<p>construction equipment (i.e. wellhead, casing).</p> <p>No meaningful reduction in time for relief well drilling as sufficient materials available as spares or can be sourced within short timeframes.</p>	<p>phase done concurrent with LWIV mobilisation.</p> <p>Any additional equipment would be mobilised from existing ExxonMobil global inventory.</p>	
<p>Prepare detailed Relief Well Plan in advance of spudding</p>	<p>A preliminary plan forms part of the WOMP; further case by case details can be developed immediately after event.</p> <p>Wild Well Control assessed the requirements and parameters for a relief well as a basis for the development of a relief well plan.</p> <p>Sufficient time would be available to prepare a detailed relief well plan when the specific blow-out parameters for a relief well can be determined, immediately following the incident, and whilst the relief rig is being mobilised.</p>	<p>Detailed Relief Well Plan needs to be developed on a case-by-case basis.</p> <p>Detailed Plan can be developed immediately after LOWC scenario is fully understood, and while relief well rig is being mobilised.</p> <p>The benefit from preparing a detailed relief well plan without knowing specifics of the LOWC is nominal.</p>	<p>Not adopted</p>
<p>Pre-drill relief well top hole to reduce the relief well drilling time.</p>	<p>May reduce response time, possibly by up to approximately 20 days.</p>	<p>Based on the relief well design, the top-hole sections of the relief well would take ~20 days to drill.</p> <p>This would result in an additional cost to the well construction program. At a conservative MODU spread-rate of AUD\$800k per day, this control measure could result in a cost of \$16M.</p> <p>The pre-drilling of a relief well top hole would result in further environmental impacts and risks.</p> <p>Given the high costs to the program, implementing this control measure is considered disproportionate to the level of environmental benefit gained, given that the source control event has an extremely low.</p>	<p>Not adopted</p>
<p>Capping Stack System (CSS)</p>	<p>If possible - could reduce the uncontrolled blowout duration.</p>	<p>The deployment of a vertical Capping Stack at the Gudgeon-1</p>	<p>Adopted</p>

Additional, alternative, improved controls	Benefit	Cost/feasibility	Adopted
		and Terakihi-1 wells is feasible See CMP22.	

6.7.8 Demonstration of acceptability

**Table 6-61 Demonstration of acceptability test**

Factor	Demonstration criteria	Criteria met	Rationale
<b>Risk assessment process for unplanned events</b>	The risk ranking is lower than Risk Category 1.	✓	The environmental risk ranking is Risk Category 3 and the public impact risk ranking is Risk Category 2, and therefore considered acceptable.
<b>Principles of ESD</b>	No potential to affect biological diversity and ecological integrity.	✓	The impacts associated with this aspect are potentially significant but moderate in size/scale and medium-term, which is not considered as having the potential to affect biological diversity and ecological integrity.
	Activity does not have the potential to result in serious or irreversible environmental damage.	✓	The activity is not considered as having the potential to result in long term or irreversible environmental damage.

<p><b>Legislative and other requirements</b></p>	<p>Legislative and other requirements have been identified and met.</p>	<p>✓</p>	<p>The proposed activities align with the requirements of the OPGGS Act:</p> <ul style="list-style-type: none"> <li>• Schedule 3 (occupational health and safety) of the OPGGS Act and OPGGS (Safety) Regulations. The OPGGS (Safety) Regulations require the operator of each offshore facility to prepare a Safety Case for submission to NOPSEMA. Activities at a facility must be conducted in accordance with a Safety Case that has been accepted by NOPSEMA.</li> <li>• Part 5, OPGGS (Resource Management and Administration) Regulations 2011 which require NOPSEMA to accept a WOMP to enable well activities to be undertaken.</li> </ul> <p>The following other requirements were identified as relevant to impacts from a LOWC. Oil spills are a recognised threat to these species and proposed activity is consistent with conservation/management actions where specified.</p>
<p><b>Internal context</b></p>	<p>Consistent with Esso's Environment Policy.</p>	<p>✓</p>	<p>Proposed activities are consistent with Esso's Environment Policy, in particular, to "comply with all applicable environmental laws and regulations and apply responsible standards where laws and regulations do not exist"</p>
	<p>Meets ExxonMobil Environmental Standards.</p>	<p>✓</p>	<p>There is no standard related to a LOC of reservoir hydrocarbons but the activities proposed meet the strategic objectives of the Upstream Environmental Standards.</p>

	<p>Meets ExxonMobil OIMS Objectives.</p>	<p>✓</p>	<p>Proposed activities meet:</p> <ul style="list-style-type: none"> <li>• OIMS System 6-5 objective to identify and assess environmental aspects; significant aspects are addressed and controlled consistent with policy and regulatory requirements</li> <li>• OIMS System 8-1 objective to clearly define and communicate operations integrity requirements to contractors</li> <li>• OIMS System 10-1 objective to anticipate community concerns and develop response plans, as appropriate</li> <li>• OIMS System 10-2 objectives to document, resource and communicate emergency response plans, and conduct training, exercises and/or drills to determine the adequacy of the plans.</li> </ul>
<p><b>External context</b></p>	<p>Concerns of relevant persons have been considered/addressed through the consultation process.</p>	<p>✓</p>	<p>Concerns raised about accidental release were considered with relevant persons at two sessions. No change to the EP is required.</p> <p>Any new relevant persons issues, objections or claims will be considered in line with the ongoing consultation.</p>

## Appendix A – Environment Protection and Biodiversity Conservation Act-listed species and Protected Matters Search Tool Reports

Table A-1 lists the Environment Protection and Biodiversity Conservation Act-listed fish (bony) species or species habitat that may occur within the Potentially Exposed Area. A description of these species is provided in Volume 1 section 2.3.1.2.

**Table A-1 Environment Protection and Biodiversity Conservation Act-listed fish (bony) species or species habitat that may occur within the Potentially Exposed Area**

Scientific name	Common name	Threatened species	Migratory species	Listed marine species	Type of presence
<b>Fish</b>					
<i>Acentronura tentaculata</i>	Shortpouch pygmy pipehorse			✓	MO
<i>Brachionichthys hirsutus</i>	Spotted handfish	CE			MO
<i>Brachiopsilus ziebelli</i>	Ziebell's handfish, Waterfall Bay handfish	V			LO
<i>Cosmocampus howensis</i>	Lord Howe pipefish			✓	MO
<i>Epinephelus daemeli</i>	Black rockcod	V			LO
<i>Festucalex cinctus</i>	Girdled pipefish			✓	MO
<i>Filicampus tigris</i>	Tiger pipefish			✓	MO
<i>Galaxias fontanus</i>	Swan falaxias	E			KO
<i>Galaxiella pusilla</i>	Eastern dwarf galaxias, dwarf galaxias	V			KO
<i>Halicampus boothae</i>	Booth's pipefish			✓	MO
<i>Heraldia nocturna</i> *	Upside-down pipefish, eastern upside-down pipefish, eastern upside-down pipefish			✓	MO

Scientific name	Common name	Threatened species	Migratory species	Listed marine species	Type of presence
<i>Hippichthys heptagonus</i>	Madura pipefish, reticulated freshwater pipefish			✓	MO
<i>Hippichthys penicillus</i>	Beady pipefish, steep-nosed pipefish			✓	MO
<i>Hippocampus abdominalis</i> *	Big-belly seahorse, eastern potbelly seahorse, New Zealand potbelly seahorse			✓	MO
<i>Hippocampus breviceps</i> *	Short-head seahorse, short-snouted seahorse			✓	MO
<i>Hippocampus kelloggi</i>	Kellogg's seahorse			✓	MO
<i>Hippocampus minotaur</i> *	Bullneck seahorse			✓	MO
<i>Hippocampus whitei</i>	White's seahorse	E		✓	KO
<i>Histiogamphelus briggsii</i> *	Crested pipefish, Briggs' crested pipefish, Briggs' pipefish			✓	MO
<i>Histiogamphelus cristatus</i> *	Rhino pipefish, Macleay's crested pipefish, ring-back pipefish			✓	MO
<i>Hoplostethus atlanticus</i> *	Orange roughy, deep-sea perch, red roughy	CD			LO
<i>Hypselognathus rostratus</i> *	Knifesnout pipefish, knife-snouted pipefish			✓	MO
<i>Kaupus costatus</i> *	Deepbody pipefish, deep-bodied pipefish			✓	MO
<i>Kimblaeus bassensis</i> *	Trawl pipefish, Bass Strait pipefish			✓	MO
<i>Leptoichthys fistularius</i> *	Brushtail pipefish			✓	MO

Scientific name	Common name	Threatened species	Migratory species	Listed marine species	Type of presence
<i>Lissocampus caudalis</i>	Australian smooth pipefish			✓	MO
<i>Lissocampus runa</i> *	Javelin pipefish			✓	MO
<i>Maccullochella peelii</i>	Murray cod				KO
<i>Macquaria australasica</i>	Macquarie perch				KO
<i>Maroubra perserrata</i> *	Sawtooth pipefish			✓	MO
<i>Mitotichthys mollisoni</i>	Mollison's pipefish			✓	MO
<i>Mitotichthys semistriatus</i> *	Halfbanded pipefish			✓	MO
<i>Mitotichthys tuckeri</i> *	Tucker's pipefish			✓	MO
<i>Notiocampus ruber</i> *	Red pipefish			✓	MO
<i>Phyllopteryx taeniolatus</i> *	Common seadragon, weedy seadragon			✓	MO
<i>Prototroctes maraena</i>	Australian grayling	V			KO
<i>Pugnaso curtirostris</i>	Pugnose pipefish			✓	MO
<i>Rexea solandri</i> * (eastern Australian population)	Eastern gemfish	CD			LO
<i>Seriolella brama</i> *	Blue warehou	CD			KO
<i>Solegnathus dunckeri</i>	Duncker's pipehorse			✓	MO
<i>Solegnathus robustus</i> *	Robust pipehorse, robust spiny pipehorse			✓	MO

Scientific name	Common name	Threatened species	Migratory species	Listed marine species	Type of presence
<i>Solegnathus spinosissimus</i> *	Spiny pipe horse, Australian spiny pipehorse			✓	MO
<i>Solenostomus cyanopterus</i>	Robust ghost pipefish, blue-finned ghost pipefish,			✓	MO
<i>Solenostomus paradoxus</i>	Ornate ghost pipefish, harlequin ghost pipefish, ornate ghost pipefish			✓	MO
<i>Stigmatopora argus</i> *	Spotted pipefish, Gulf pipefish, peacock pipefish			✓	MO
<i>Stigmatopora nigra</i> *	Widebody pipefish, wide-bodied pipefish, black pipefish			✓	MO
<i>Stipecampus cristatus</i> *	Ringback pipefish, ring-backed pipefish			✓	MO
<i>Syngnathoides biaculeatus</i> *	Double-end pipehorse, double-ended pipehorse, alligator pipefish			✓	MO
<i>Thunnus maccoyii</i> *	Southern bluefin tuna	CD			LO
<i>Thymichthys politus</i>	Red handfish	CE			LO
<i>Trachyrhamphus bicoarctatus</i>	Bentstick pipefish, bend stick pipefish, short-tailed pipefish			✓	MO
<i>Urocampus carinirostris</i> *	Hairy pipefish			✓	MO
<i>Vanacampus margaritifer</i> *	Mother-of-pearl pipefish			✓	MO
<i>Vanacampus phillipi</i> *	Port Phillip pipefish			✓	MO

Scientific name	Common name	Threatened species	Migratory species	Listed marine species	Type of presence
<i>Vanacampus poecilolaemus</i> *	Long-snout pipefish, Australian long-snout pipefish			✓	MO
<b>Threatened Species:</b> V Vulnerable E Endangered CD Conservation Dependant		<b>Type of Presence:</b> MO Species or species habitat may occur within the area LO Species or species habitat likely to occur within the area KO Species or species habitat known to occur within the area			

**Note:** Shaded species denotes that they occur in both the OAs and the PEA. \* Denotes that the species occurs within the underwater sound behavioural EMBA.

Table A-2 lists the Environment Protection and Biodiversity Conservation Act-listed fish (cartilaginous) species or species habitat that may occur within the Potentially Exposed Area. A description of these species is provided in Volume 1 Section 2.3.1.3. The figures that follow this table show the fish species BIAs that are present within the OAs and/or the PEA.

## Executive Summary

JASCO Applied Sciences (JASCO) performed a modelling study of underwater sound levels associated with Esso's Plug and Abandonment (P&A) campaign. The modelling study considers specific components of the program at the Gudgeon-1 and Terahiki-1 (G&T) well locations. The study considers the dynamic positioning (DP) of the Helix Q7000, a DP Class-3 semi-submersible well intervention unit, a platform supply vessel (PSV) under DP, a support vessel hosting a remotely operated underwater vehicle (ROV) under DP, and the ROV cutting tool. These four sources are considered in different combinations across the two well locations, for a total of 10 scenarios.

The study assessed distances from operations where underwater sound levels reached thresholds corresponding to various levels of potential impact to marine fauna. The animals considered here included marine mammals, sea turtles, and fish. Due to the variety of species considered, there are several different thresholds for evaluating effects, including: mortality, injury, temporary reduction in hearing sensitivity, and behavioural disturbance.

The modelling methodology considered scenario specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels for non-impulsive (continuous) noise sources are presented as: sound pressure levels (SPL,  $L_p$ ), and as accumulated sound exposure levels (SEL,  $L_E$ ) as appropriate for different noise effect criteria. In this report, the time duration for SEL accumulation is defined as an eight or 24-hour period. Eight hours was selected as a nominal secondary timeframe to help understand how a shorter exposure period changes potential impact contours.

The  $SEL_{8h}$  or  $SEL_{24h}$  is a cumulative metric that reflects the dosimetric impact of noise levels within eight or 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding  $SEL_{8h}$  or  $SEL_{24h}$  radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for eight or 24 hours. Therefore, a reported radius for  $SEL_{8h}$  or  $SEL_{24h}$  criteria does not mean that marine fauna travelling within this radius of the noise source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for eight or 24 hours.

Maps are provided in the report to assist with contextualising tabulated distances. The key results of this modelling study are summarised in Tables 1 and 2.

### **Marine mammals:**

The maximum distances to the (NOAA) (2019) marine mammal behavioural response criterion of 120 dB re 1  $\mu$ Pa (SPL) are presented in Table 1. The results for the criteria from Southall et al. (2019) for marine mammal Permanent Threshold Shift (PTS) and Temporary Threshold Shift (TTS) for the vessel operations are assessed at in-field, the maximum distances and total ensonified areas are presented in Table 2.

Table 1. Maximum ( $R_{max}$ ) and 95% ( $R_{95\%}$ ) horizontal distances (in km) to the marine mammal behavioural response criterion of 120 dB re 1  $\mu$ Pa (SPL) from the well location.

Vessel	Description	Terahiki-1		Gudgeon-1	
		$R_{max}$ (km)	$R_{95\%}$ (km)	$R_{max}$ (km)	$R_{95\%}$ (km)
Helix Q7000	Helix operations	9.52	7.62	9.51	8.20
PSV	PSV under DP during resupply (by itself for context only)	0.31	0.29	0.31	0.30
Helix Q7000 and PSV	Helix operations and PSV under DP during resupply	9.53	7.66	9.53	8.25
ROV vessel and ROV cutter	ROV vessel under DP with ROV at seafloor cutting	0.32	0.31	0.35	0.33

### Fish:

Sound produced by the Helix Q7000 and/or vessel operations reach the sound levels associated with physiological effects, recoverable injury, and TTS for some fish species in close proximity to the sound sources (Table 3), but in order for the thresholds to be exceeded, the fish must remain at those distances for either 12 or 48 h.

Table 3. Summary: SPL: Maximum ( $R_{max}$ ) horizontal distances (in km) to sound pressure level (SPL) from most appropriate location for considered sources per scenario.

Location	Maximum ( $R_{max}$ ) distance to threshold (km)	
	TTS (12 h)	Recoverable injury (48 h)

# 1. Introduction

JASCO Applied Sciences (JASCO) performed a modelling study of underwater acoustic noise levels associated with Esso's plug and abandonment (P&A) activities along with the site-specific environmental parameters that effect the propagation of underwater sound.

The modelling study specifically predicted the distances from operations at which underwater sound levels reached noise effect thresholds and criteria. The corresponding marine mammal thresholds include levels associated with behavioural response, permanent threshold shift (PTS) and temporary threshold shift (TTS). The marine mammal functional hearing groups considered were low-, high- and very high-frequency cetaceans and otariid seals. Estimated underwater acoustic levels are presented as sound pressure levels (SPL,  $L_p$ ), and accumulated sound exposure levels (over 8 or 24 hours) ( $SEL_{8 \text{ or } 24h}$ ,  $L_{E,8h \text{ or } 24h}$ ), as appropriate for non-impulsive (continuous) noise sources.

This report is further structured as follows, the remainder of Section 1 provides details on the scenarios considered for modelling. Section 2 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 3 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the considered sound sources and the environmental parameters. Section 4.1 presents the acoustic results as tabulated ranges to thresholds, Section 4.2 provides sound level contour maps. The acoustic modelling results are then discussed in Section 5.

## 1.1. Modelling Scenarios

This acoustic and exposure study considered the following sound-producing activities associated with the drilling campaign:

- Helix Q7000 under DP,
- Vessel noise from PSV – similar to *Skandi Feistein* or *Skandi Darwin*,
- Vessel noise from ROV vessel – similar to *Skandi Feistein* or *Skandi Darwin*,
- ROV cutter.

Esso has indicated that as part of the operational logistics of the P&A plan, there will be only one additional vessel operating within the vicinity of the Helix Q7000. For the considered modelled scenarios, this may be either a PSV or a ROV vessel but not both concurrently.

Figure 1 displays an overview of the modelling area showing the modelled sites, the southern right whale BIA, the pygmy blue whale BIA, and the regional bathymetry. Tables 4 and 5 outline the modelled site locations and scenarios.

## 2. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is necessary to first establish exposure criteria (thresholds) for which sound levels may be expected to have an adverse effect on animals. Whether acoustic levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, SPL and SEL, are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over an eight or 24-hour period. Appropriate subscripts indicate any frequency weighting applied (see Appendix A.4). The acoustic metrics in this report reflect the ANSI and ISO standards for acoustic terminology, ANSI S1.1 (S1.1-2013) and ISO 18405:2017 (2017).

The following thresholds and guidelines for this study were chosen because they represent the best available science:

1. Frequency-weighted accumulated sound exposure levels (SEL;  $L_{E, 8h \text{ or } 24h}$ ) from Southall et al. (2019) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals for non-impulsive sound sources.
2. Marine mammal behavioural threshold based on the current interim US National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals of 120 dB re 1  $\mu$ Pa (SPL;  $L_p$ ) for non-impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014).
4. Frequency-weighted accumulated sound exposure levels (SEL;  $L_{E, 8h \text{ or } 24h}$ ) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in sea turtles for non-impulsive sources.

Section 2.1, along with Appendix A.3 and A.4, expand on the thresholds, guidelines, and sound levels for marine mammals.

### 2.1. Marine Mammals

The criteria applied in this study to assess possible effects of non-impulsive noise sources on marine mammals are summarised in Table 6. Cetaceans and otariids were identified as the marine mammals requiring assessment. Details on thresholds related to auditory threshold shifts or hearing loss and behavioural response are provided in Appendix A.3, with frequency weighting explained in detail in Appendix A.4. Of particular note, whilst the newly published Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals. As such the interim guidelines from the US National Oceanic and Atmospheric Administration (NOAA) (2019) have been used.

Table 6. Criteria for effects of non-impulsive noise exposure, including vessel noise, for marine mammals: Unweighted SPL and SEL<sub>24h</sub> thresholds.

Hearing group	NOAA (2019)	Southall et al. (2019)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL ( $L_p$ ; dB re 1 $\mu$ Pa)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)	Weighted SEL <sub>24h</sub> ( $L_{E,24h}$ ; dB re 1 $\mu$ Pa <sup>2</sup> ·s)
Low-frequency (LF) cetaceans	120	199	179
High-frequency (HF) cetaceans		198	178
Very High-frequency (VHF) cetaceans		173	153
Otariid Seals		219	199

$L_p$  denotes sound pressure level period and has a reference value of 1  $\mu$ Pa.

$L_E$  denotes cumulative sound exposure over a 24 h period and has a reference value of 1  $\mu$ Pa<sup>2</sup>·s.

### 2.1.1. Behavioural Response

The NMFS non-pulsed noise criterion was selected for this assessment because it represents the most commonly applied behavioural response criterion by regulators. The distances at which behavioural responses could occur were therefore determined to occur in areas ensonified above an unweighted SPL of 120 dB re 1  $\mu$ Pa (NMFS 2019). Appendix A.4 provides more information about the development of this criteria.

### 2.1.2. Injury and Hearing Sensitivity Changes

There are two categories of auditory threshold shifts or hearing loss: permanent threshold shift (PTS), a physical injury to an animal's hearing organs; and temporary threshold shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued.

To assist in assessing the potential for effect on marine mammals, this report applies the criteria recommended by Southall et al. (2019), considering both PTS and TTS (see Table 6). Appendix A.3 provides more information about the Southall et al. (2019) criteria.

## 2.2. Fish, Sea turtles, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Sea Turtles was formed to continue developing noise exposure criteria for fish and sea turtles, work begun by a NOAA panel two years earlier. The Working Group developed guidelines with specific thresholds for different levels of effects for several species groups (Popper et al. 2014). The guidelines define quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death,
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma, and
- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges,

these effects are not addressed in this report and are included in Table 7 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure depends on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Sea turtles, fish eggs, and fish larvae are considered separately.

### 2.2.1. Sea Turtles

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles).

Finneran et al. (2017) presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). Their rationale is that sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Bartol and Ketten 2006, Dow Piniak et al. 2012). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014).

Table 7 lists the relevant effects thresholds from Popper et al. (2014) for non-impulsive noise (e.g. vessel and drilling noise). Some evidence suggests that fish sensitive to acoustic pressure show a recoverable loss in hearing sensitivity, or injury when exposed to high levels of noise (Scholik and Yan 2002, Amoser and Ladich 2003, Smith et al. 2006); this is reflected in the SPL thresholds for fish with a swim bladder involved in hearing. Finneran et al. (2017) presented revised thresholds for turtle injury, considering frequency weighted SEL, which have been applied in this study for vessels (Table 8).

Table 7. Criteria for non-impulsive (vessel and drilling) noise exposure for fish, adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Sea turtles	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Sound pressure level dB re 1 µPa.

Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F).

Table 8. Acoustic effects of non-impulsive noise on sea turtles, weighted SEL<sub>24h</sub>, Finneran et al. (2017).

PTS onset thresholds* (received level)	TTS onset thresholds* (received level)
220	200

### 3. Methods and Parameters

The modelled sites for the operations considered in this study were located on the continental slope of south-eastern Australia near the shelf break (refer to regional bathymetry in Appendix B.1.1). The sites were situated in water depths of approximately 300 and 400 m.

To allow for operational flexibility, the sound speed profile considered for modelling was selected through a sensitivity analysis considering all months. The month of June was found to be the most favourable for sound propagation and was selected for modelling. Additional details can be found in Appendix B.1.2.

The geologic and geoacoustic profiles of the seabed were generated using lithographic descriptions from the geotechnical and geophysical reports supplied by the client and considering previous underwater acoustic modelling and measurement studies. Appendix B.1.3 provides additional detail.

The following sections provided a description of the inputs used for this underwater noise modelling study. The sections are divided into subsections detailing the source inputs for the Helix Q7000, PSV/ROV vessel, and ROV cutter (Section 3.1) with Sections 3.2–3.3 providing details on the applied modelling techniques and model configuration information.

#### 3.1. Vessel Radiated Noise

Underwater sound that radiates from vessels is produced mainly by propeller and thruster cavitation, with a portion of noise produced by sound transmitted through the hull, such as by engines, gearing, and other mechanical systems. Sound levels tend to be the highest when thrusters are used to position the vessel and when the vessel is transiting at high speeds. A vessel's sound signature depends on the vessel's size, power output, propulsion system (e.g., conventional propellers vs. Voith Schneider propulsion), and the design characteristics of the given system (e.g., blade shape and size). A vessel produces broadband acoustic energy with most of the energy emitted below a few kilohertz. Sound from onboard machinery, particularly sound below 200 Hz, dominates the sound spectrum before cavitation begins (Spence et al. 2007).

The exact position of the vessels and/or ROV in modelled scenarios is not known and will likely vary due to operational conditions and requirements during the P&A campaign. Therefore, for scenarios involving multiple adjacent sources in simultaneous operation, sources were modelled at the same geographic (i.e., horizontal) location but with source depths that reflect the vessel/source being modelled.

The spectra for the vessels and ROV considered in this study are shown in Figure 2.

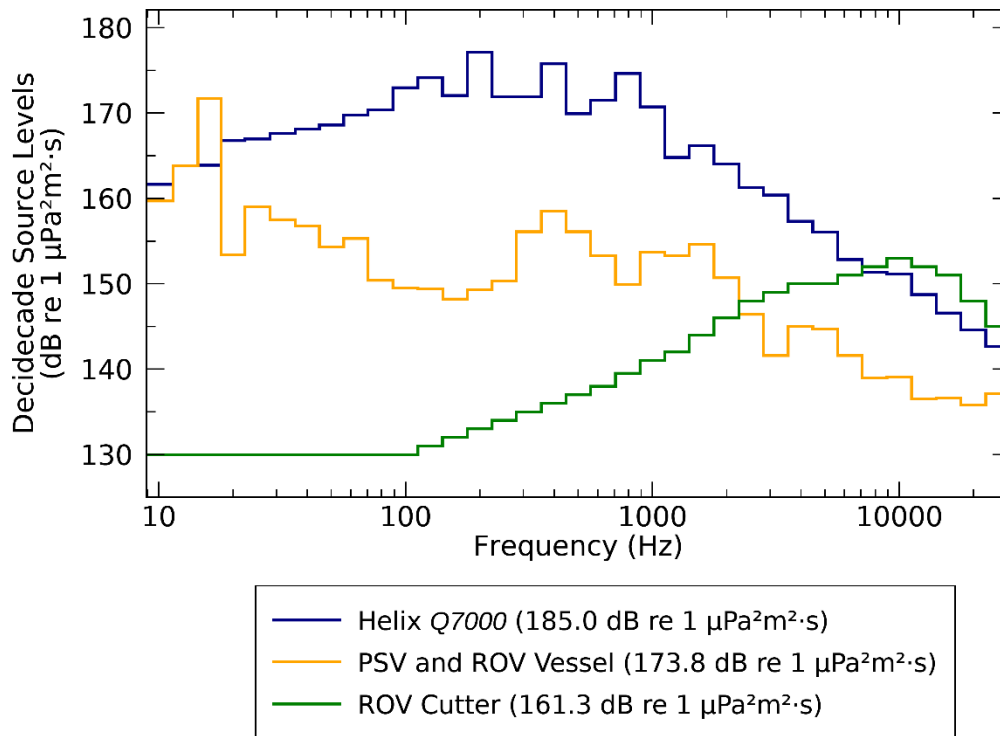

Figure 2. Energy source level (ESL) spectra (in decadeade frequency-band) for all sound sources.

### 3.1.1. Helix Q7000

The Helix Q7000 is a DP Class 3 semi-submersible well intervention vessel that is planned for use in the P&A campaign considered in this study (Figure 3). While in operation, it will hold position by using thrusters under dynamic positioning. As such, the underwater noise emitted from the Helix Q7000 is expected to originate primarily from cavitation in the thrusters whilst under DP.

Figure 3. Well intervention unit Helix Q7000 semi-submersible platform (Helix Energy Solutions 2020).

Thruster noise from the Helix Q7000 was modelled as a point source at a 15.3 m depth. This source depth was determined in a similar fashion to the work done in Cooper Energy Limited (2022) by selecting the median depth following Gray and Greeley (1980). The vessel schematics, thruster positions and propeller diameter for each thruster module were considered in the selection.

The source level spectrum for the Helix Q7000 was based on median noise measurements from similarly sized but higher powered semi-submersible vessels previously measured by JASCO whilst under DP (Austin et al. 2023). These measurements were conducted over a multi-week period and

included periods of rough weather in which the vessels had to use high power levels to maintain station. As part of a conservative approach, these measured vessels were considered a suitable proxy for the Helix. These vessels generally have more installed propulsion power than the Helix Q7000. As such, their noise generation potential is larger. Moreover, based on operational specifications for the Helix provided by Esso, the maximum operating power is likely to be significantly less than the total installed power, potentially reducing the noise generation potential of the Helix Q7000.

Considering these together, it is reasonable and conservative to consider the energy sound level spectra for the Helix Q7000 under DP to be based on the median broadband source levels of the three semi-submersible vessels under DP from Austin et al. (2023). The estimated decidecade energy source level (ESL) spectrum used to represent DP operations of the Helix Q7000 is shown in Figure 4, the broadband ESL (10 Hz to 25 kHz) of this spectrum is 185.0 dB re 1  $\mu\text{Pa}^2\text{m}^2\cdot\text{s}$ . This is quieter than that considered in Cooper Energy Limited (2022) but draws on newly published measurements, which were previously unavailable.

Figure 4. Estimated decidecade energy source level (ESL) spectra of the Helix Q7000, with a broadband ESL (10 Hz to 25 kHz) of 185.0 dB re 1  $\mu\text{Pa}^2\text{m}^2\cdot\text{s}$ .

## 3.1.2. Support Vessels

### 3.1.2.1. PSV and ROV vessels

As part of the P&A operational plan, there will be only one additional vessel operating within the vicinity of the Helix Q7000. This may be a PSV or a ROV vessel but not both concurrently. The PSV and the ROV vessel have currently been identified as likely to be the *Skandi Feistein*, *Skandi Darwin*, or similar DP2 class vessels.

The monopole source levels (MSLs) and the spectra for the *Skandi Feistein* were previously measured during a monitoring program conducted by JASCO for Esso (McPherson et al. 2022). The measurements of the *Skandi Feistein* included several different operational trials, including manoeuvres such as stationary position keeping on DP. Data from these trials were used to determine an average source level for the *Skandi Feistein* that is consistent with the modelling scenarios considered in this report.

To allow for operational flexibility a single source level and spectrum was used for modelling. This source level was used to represent both the PSV and the ROV vessel. The source spectrum of the *Skandi Feistein*, as described above, was used as a reference acoustic source level and spectrum. They were adjusted by scaling the spectrum based on the ratio of maximum installed thruster power between the *Skandi Feistein* and the *Skandi Darwin* using Equation (1). The maximum installed thruster power of the *Feistein* is 6160 kW and the *Darwin* is 7130 kW.

$$SL = SL_{ref} + 10 \log_{10} \left( \frac{P}{P_{ref}} \right) \tag{1}$$

The source depth for modelling was based on the approximate location of noise emissions using a depth of 0.7 x ship draft, which aligns with current international standards, ISO 17208-1 (2016). Therefore, the source depth of the PSV and ROV vessel has been modelled as 4.6 m.

Figure 5. Photograph of the *Skandi Feistein* (left) and *Skandi Darwin* (right).

Figure 6. Estimated decidecade energy source level (ESL) spectra representative of the PSV and ROV vessel, with a broadband ESL (10 Hz to 25 kHz) of 173.8 dB re 1 μPa²m²·s.

### 3.1.3. ROV Cutter

A diamond wire saw operated via an ROV is the likely cutting tool for the 150 and 200 mm production pipelines. Published and grey literature available to quantify the underwater sound fields from diamond wire saws, or other cutting technologies, is very limited.

Pangerc et al. (2016) described the underwater sound measurement data during an underwater diamond wire cutting of a 32” conductor (10 m above seabed in ~80 m depth) and found that at lower frequencies, the operation was generally indistinguishable above the background noise; however, the sound that could be associated with the diamond wire cutting was primarily detectable above the background noise at the higher acoustic frequencies (above around 5 kHz). The background noise levels were substantially higher at lower frequencies; therefore, it is likely that the spectra of the noise peaks at lower frequencies, which has been approximated between 2.5 and 20 kHz.

In another study, the US Navy measured underwater sound levels when the diamond saw was cutting caissons for replacing piles at an old fuel pier at Naval Base Point Loma and reported an average SPL for a single cutter at 136.1–141.4 dB re 1  $\mu$ Pa at 10 m, as reported in Fairweather Science (2018).

In the absence of other information representing the cutting of pipes up to 200 mm diameter via a diamond wire saw underwater, the information provided in Pangerc et al. (2016) was used to estimate a representative decidecade-band spectra for the diamond wire saw underwater, which was scaled to have a level of 141.4 dB re 1  $\mu$ Pa at 10 m, and then then backpropagated using spherical spreading ( $20\log_{10}(R)$ ) to determine an ESL spectra (in decidecade frequency band). This was estimated to be the most appropriate approach given the limited information available. Figure 7 shows the representative decidecade-band ESL spectra, with a broadband ESL for the cutter being 161.3 dB re 1  $\mu$ Pa<sup>2</sup>m<sup>2</sup>s.

Figure 7. Estimated decidecade energy source level (ESL) spectra of the ROV Cutter, with a broadband ESL (10 Hz to 25 kHz) of 161.3 dB re 1  $\mu$ Pa<sup>2</sup>m<sup>2</sup>s.

### 3.2. Geometry and Modelled Regions

JASCO’s Marine Operations Noise Model (MONM-BELLHOP; see Appendix B.2.2) was used to predict the acoustic field at frequencies of 10 Hz to 25 kHz for all sources. To supplement the MONM

results, high-frequency results for propagation loss were modelled using BELLHOP (Porter and Liu 1994) for frequencies from 1.25 to 25 kHz. The MONM and BELLHOP results were combined to produce results for the full frequency range of interest. Modelling calculated propagation loss up to 80 km from the source, with a horizontal separation of 20 m between receiver points along the modelled radials. The sound fields were modelled with a horizontal angular resolution of  $\Delta\theta = 2.5^\circ$  for a total of  $N = 144$  radial planes. Receiver depths were chosen to span the entire water column over the modelled areas, from 2 m to a maximum of 4000 m.

To produce the maps of received sound level isopleths, and to calculate distances to specified sound level thresholds, the maximum-over-depth level was calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth levels were then resampled (by linear triangulation) to produce a regular Cartesian grid. The contours and threshold ranges were calculated from these grids of the modelled acoustic field.

### 3.3. Accumulated SEL

In this study, the sound sources were considered to be continuously operating with new sound energy constantly being introduced to the environment. The reported received levels are usually in terms of sound pressure levels (SPL), representing the average instantaneous acoustic received level from a source. To evaluate the cumulative sound field (i.e., in terms of  $SEL_{24h}$ ), the accumulated SEL depends on the number of seconds of operation during the accumulation period.

The SPL modelling results were converted to SEL by the duration of the activity, which is appropriate for non-impulsive noise sources. SEL was assessed over 8 and 24 h and for a stationary vessel(s)/source. The conversion from SPL was obtained by increasing the levels by  $10 \cdot \log_{10}(T)$ , where  $T$  is 28,800 s or 86,400 s (the number of seconds in 8 or 24 h). Additional information on acoustic metrics can be found in Appendix A.1.

## 4. Results

The maximum-over-depth sound fields for the modelled scenarios are presented below in two formats: as tables of distances to sound levels (Section 4.1) and, where the distances are long enough, as contour maps showing the isopleths (noise contours) of various sound levels. Maps and are provided in Section 4.2 to assist in with contextualising tabulated distances.

### 4.1. Tabulated Results

Tables 9 and 10 present the maximum and 95% distances (defined in Appendix B.3) to SPL isopleths and threshold for all scenarios (Table 5). The SPL sound footprints presented represent the instantaneous sound field and do not depend on accumulation time. Tables 11 and 12 present the maximum distances to frequency-weighted SEL<sub>24h</sub> thresholds, as well as total ensonified area.

Additional frequency-weighted PTS and TTS results with an 8 h accumulation period (SEL<sub>8h</sub>) are provided in Appendix C.1 to inform the potential distances for alternative operational durations.

Table 9. *Terakihi-1*, SPL: Maximum ( $R_{max}$ ) and 95% ( $R_{95\%}$ ) horizontal distances (in km) to sound pressure level (SPL) from most appropriate location for considered sources per scenario. Scenario descriptions are given in Table 5.

## 4.2. Sound Field Maps

Maps of the estimated sound fields, threshold contours, and isopleths of interest for SPL and SEL<sub>24h</sub> sound fields are presented in Figures 8 to 17 and Figures 18 to 27 respectively. Additional maps for an 8 h accumulation period (SEL<sub>8h</sub>) are provided in Appendix C.2.

### 4.2.1. SPL Sound level Contour Maps

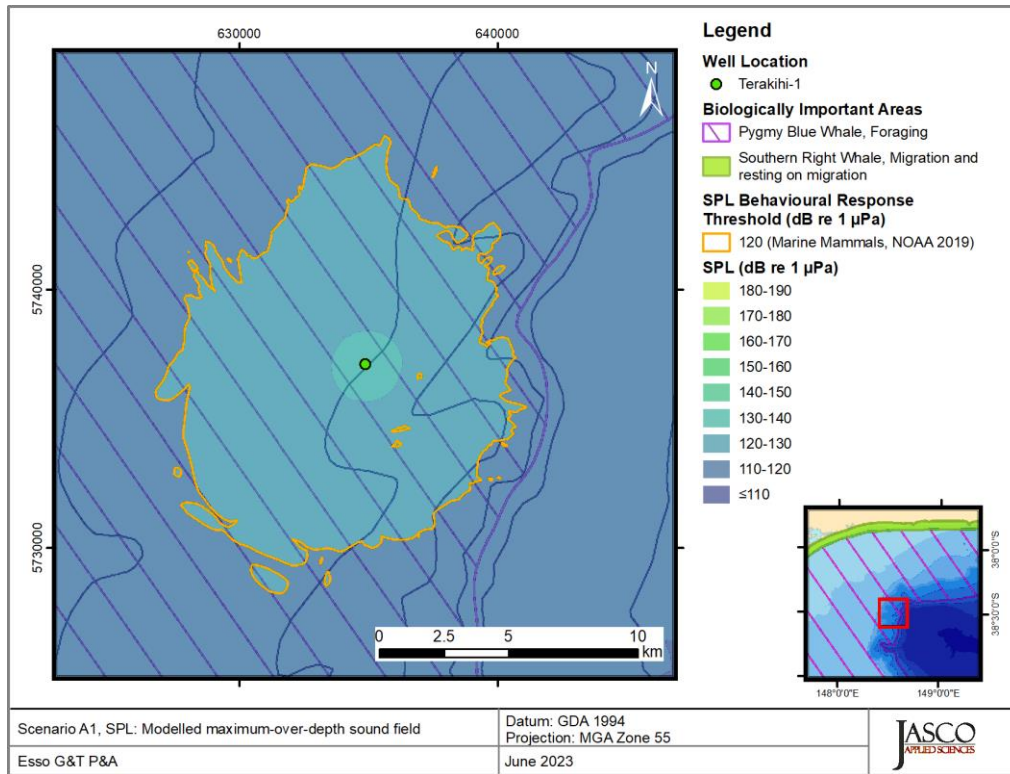

Figure 8. Scenario A1, Helix Q7000, Terahiki-1, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

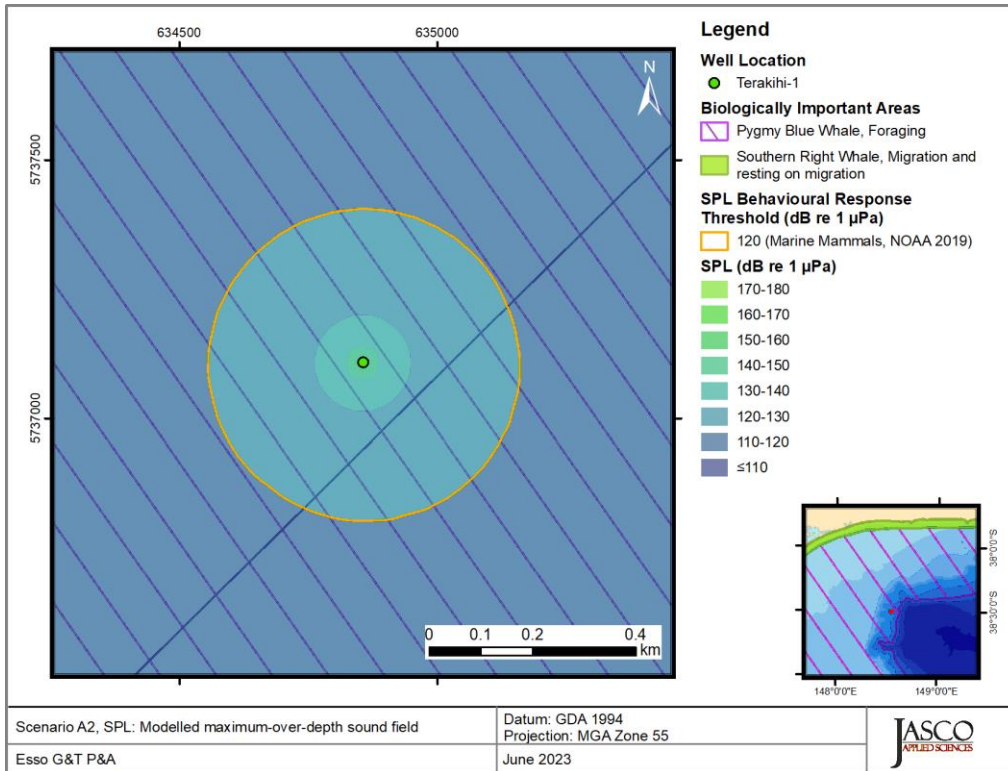

Figure 9. Scenario A2, PSV, Terahiki-1, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

### 4.2.2. Accumulated SEL<sub>24h</sub> Sound level Contour Maps

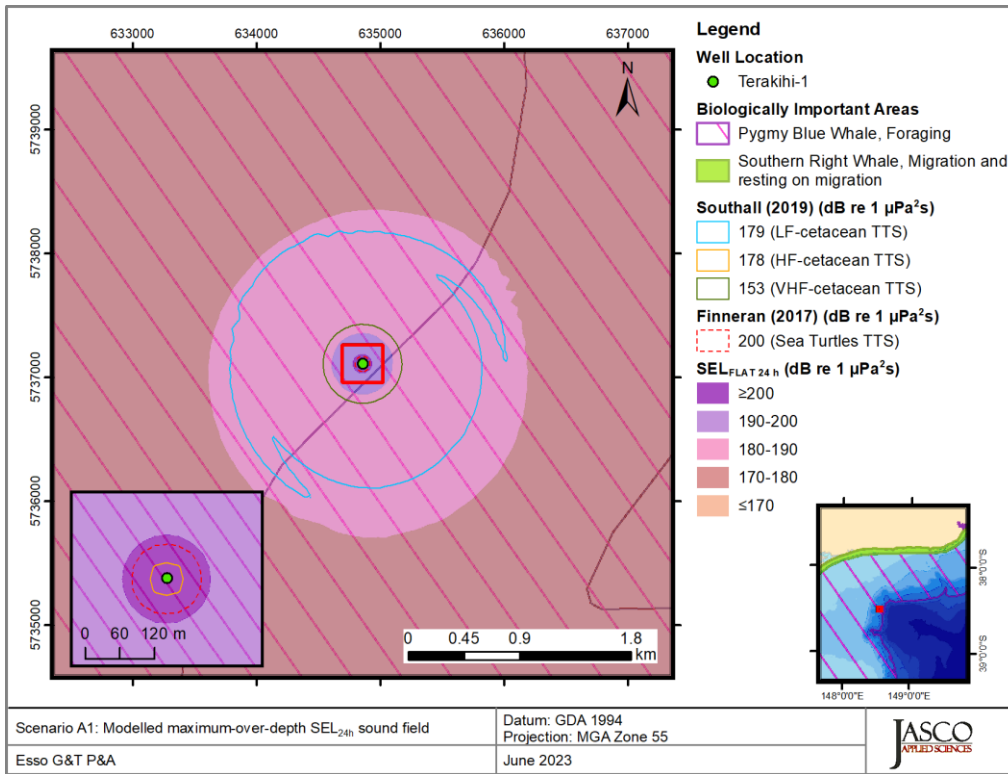

Figure 18. Scenario A1, Helix Q7000, Terakahi-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

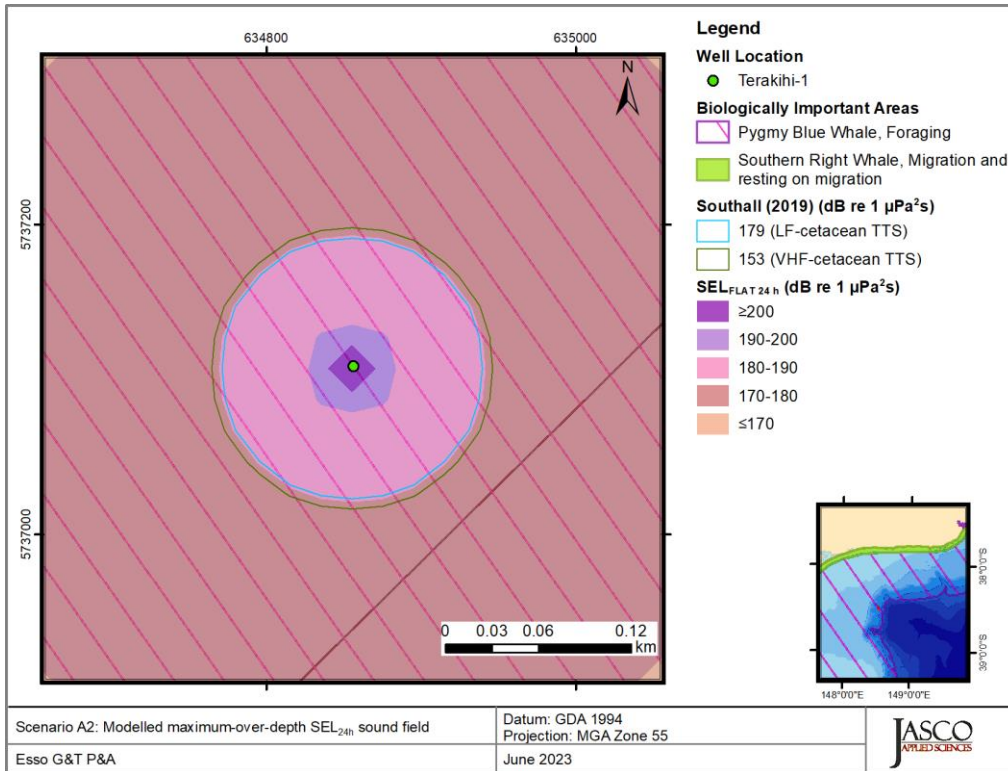

Figure 19. Scenario A2, PSV, Terakih-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

Figure 20. Scenario A3, Helix Q7000 and PSV, Terakih-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

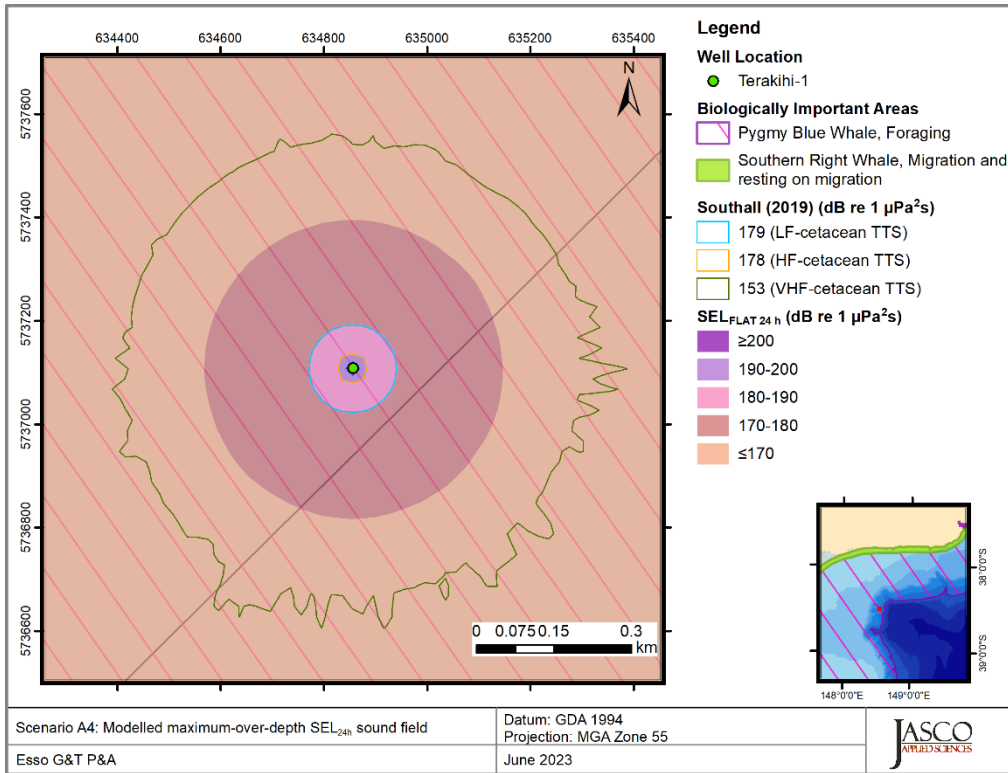

Figure 21. Scenario A4, ROV vessel and ROV cutter, Terahiki-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

Figure 22. Scenario A5, Helix Q7000, ROV vessel, and ROV cutter, Terahiki-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

Figure 23. Scenario B1, Helix Q7000, Gudgeon-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

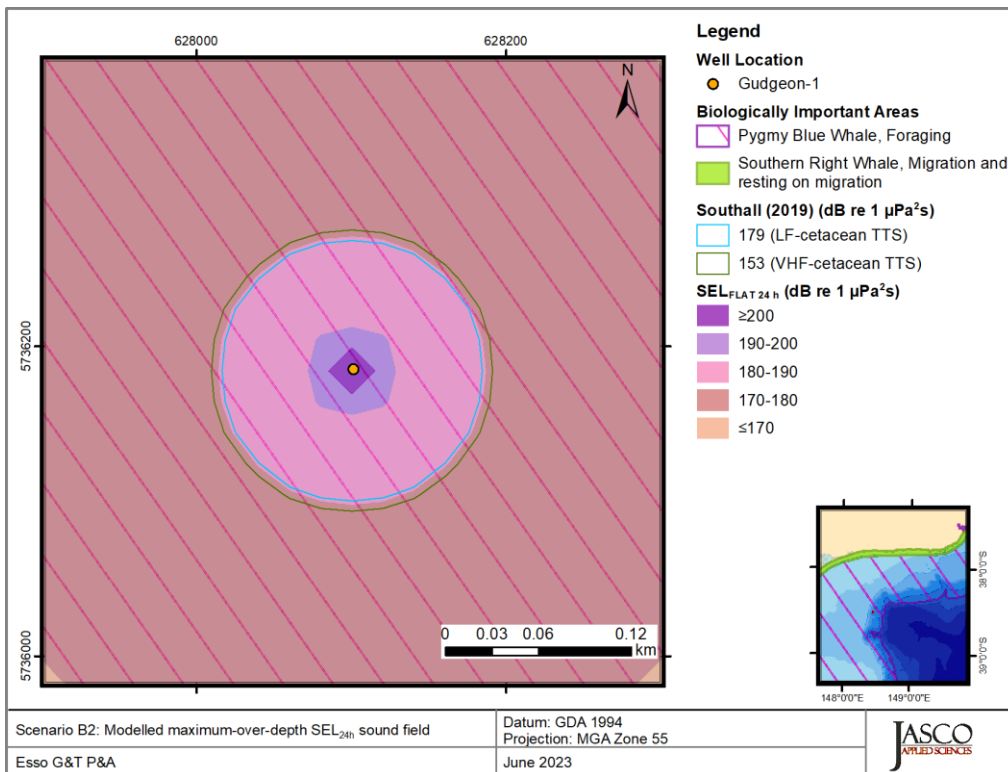

Figure 24. Scenario B2, PSV, Gudgeon-1, accumulated SEL<sub>24h</sub>: Sound level contour map showing weighted maximum-over-depth SEL<sub>24h</sub> results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

Figure 25. Scenario B3, Helix Q7000 and PSV, Gudgeon-1, accumulated  $SEL_{24h}$ : Sound level contour map showing weighted maximum-over-depth  $SEL_{24h}$  results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

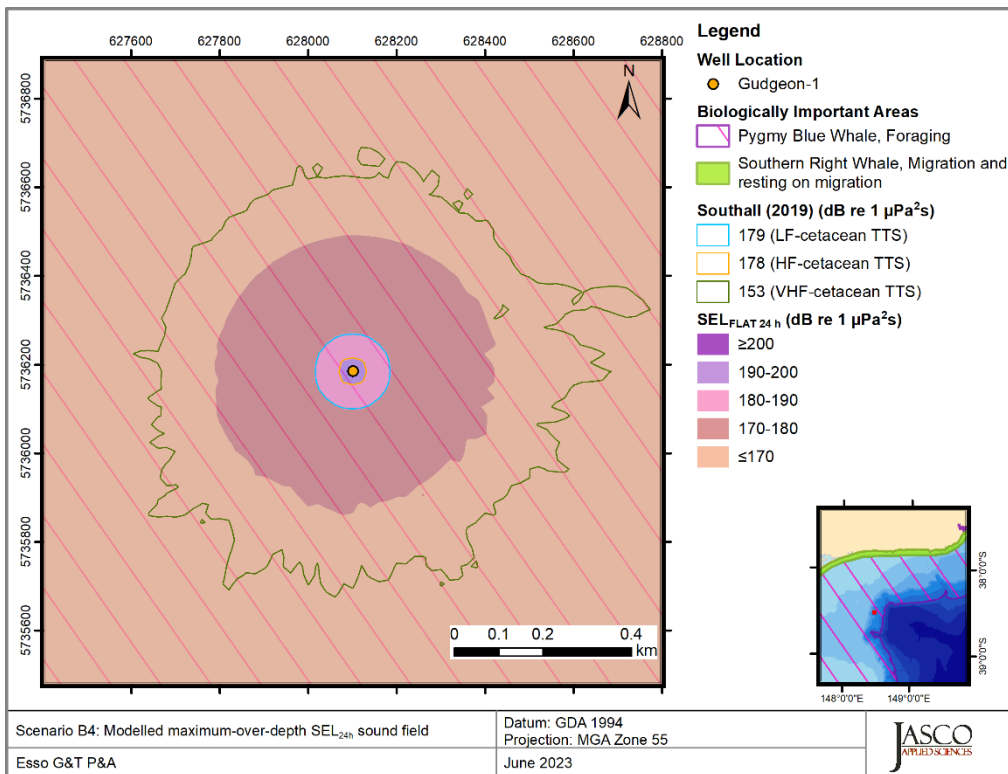

Figure 26. Scenario B4, ROV vessel and ROV cutter, Gudgeon-1, accumulated  $SEL_{24h}$ : Sound level contour map showing weighted maximum-over-depth  $SEL_{24h}$  results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

Figure 27. Scenario B5, Helix Q7000, ROV vessel, and ROV cutter, Gudgeon-1, accumulated  $SEL_{24h}$ : Sound level contour map showing weighted maximum-over-depth  $SEL_{24h}$  results, along with isopleths for TTS in cetaceans and sea turtles. Thresholds omitted here were not reached or not long enough to display graphically.

## 5. Discussion and Conclusion

The sound speed profile was derived from data from the U.S. Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). The month of June was chosen based on an analysis of the temperature, salinity, and sound speed profiles extracted from this database. The final profile consisted of a combination of three representative profiles within the modelled area to capture the propagation effects associated with shallow and deep-water regimes (Appendix B.1.2).

The June sound speed profile was primarily upward refracting between the sea surface and 110 m water depth. The upward refracting sound speed profile has the potential trap frequencies above 162.5 Hz based on the thickness of this layer (Jensen et al. 2011). Frequencies higher than 162 Hz also correspond to the majority of the highest spectral levels for the considered sources detailed in Section 3.1, which can further enhance large distances to isopleths and criteria compared to other months.

The modelled scenarios were located in water depths of approximately 300 and 400 m. The water depths generally increase to the east of as the continental slope environment deepens. The maximum-over-depth sound footprint maps (Section 4.2) assist in demonstrating the influence of the bathymetry, sound speed profile and seabed composition on the sound field. Considering both well locations are situated on the upper section of the slope, variations in bathymetry generally had the most noticeable effect on the sound field footprints.
