## Person ID 337 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
800	Letter	Outgoing	1/05/2023	Follow Up: Re send Request for consultation: Regia Marine Seismic Survey initial contact letter sent out via email. Also inviting for meeting when in the area.
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
1891	In person meeting	Neutral	30/05/2023	Discussion on activity and consultation
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2669	Email	Outgoing	22/09/2023	Requesting in person meeting with Regia team when in area week beginning 9th October. Also sent link to newly published documents.
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
3031	Phone call	Outgoing	11/10/2023	Left voicemail on general enquiries number following up on 22/9/23 email requesting meeting.
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
4069	Email	Neutral	7/12/2023	Informing team of date in February in which titleholders can meet to talk with heritage team.
4015	Email	Outgoing	12/12/2023	The email conveys appreciation for the recipient's response to the Regia marine seismic survey consultation. CGG has followed the consultation process outlined in the initial letter and extended it by five months. This allowed for a reasonable period of consultation, during which CGG gathered important insights that informed the development of their Environment Plan. The email proposes a meeting to discuss the Sea Country Protection Program (SCPP), emphasizing collaboration with First Nations Australians and the opportunity for Traditional Owners to co-design and co-implement the program. look forward to receiving further details about the upcoming meeting.

## Person ID 347 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
826	Letter	Outgoing	4/05/2023	Initial contact letter sent as identified as relevant stakeholder as a potential oil spill may enter Tasmanian waters.
1175	Email	Outgoing	26/05/2023	Following up to confirm receipt of letter and documents
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
2927	Phone call	Outgoing	9/06/2023	Phone call to request confirmation on receipt of initial contact letter. voicemail left.
1387	Email	Outgoing	9/06/2023	Requesting confirmation of receipt of initial email
1420	Email	Neutral	13/06/2023	Confirming receipt of initial letter.
1421	Email	Neutral	13/06/2023	Arranging meeting
1422	Email	Outgoing	13/06/2023	Stakeholder confirming meeting. Sent invite.
2928	Email	Outgoing	13/06/2023	Final Confirmation of Meeting.
2033	Online meeting	Neutral	28/06/2023	Discussion on the oil spill risks of the survey. Request to explicitly consider protection for bird colonies on the north of King Island. Likely that the EPA would consider hazing, and protection booming. Unlikely to consider pre-emptive capture but wouldn't rule it out completely. Discussed expectations for review of the OPEP.
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2701	Email	Outgoing	26/09/2023	Advising update on Regia Marine Seismic Survey. Noting activity planning process is nearing completion. Regia team welcome any feedback available to provide. links to all draft environmental assessment information provided and details on when the full EP will be open for public comment in October/November. Noting happy to arrange another MS teams meeting to discuss anything if needed.
2719	Email	Neutral	26/09/2023	Appreciate clarity and timeline. Will schedule review last two weeks of November.
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.

## Person ID 385 - Consultation Summary

<b>Id</b>	<b>Event Type</b>	<b>Sentiment</b>	<b>Start Date</b>	<b>Summary</b>
664	Letter	Outgoing	18/04/2023	Initial letter: Request for consultation: Regia Marine Seismic Survey
798	Email	Outgoing	1/05/2023	Notice of community information session stating there will be more planned and offering in person meetings.
887	Phone call	Outgoing	8/05/2023	Details provided by organization member. Left answerphone message requesting a return call to discuss if there is potential for interaction with survey activities and the weekly yacht race, held each Saturday.
956	Phone call	Outgoing	11/05/2023	Provided location (at closest point), he doesn't think there will be any risk of interaction with the Saturday races as they don't head that far offshore. He did state that there is a large yacht race where participants sail from Queenscliff to Port Fairy, they take the fastest line but sometimes have to tack out (depends on wind conditions). Can be 3nm maybe 4nm.
955	Email	Outgoing	11/05/2023	Email with summary of phone call

## Person ID 391 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
906	Survey	Negative	5/05/2023	Consultation Survey - Functions, interests, activities - local surfer, strongly oppose the proposed oceanic seismic testing due to potential harm to marine life, including lobsters, abalone, and cetaceans. The noise may disrupt ocean rhythms, impacting both recreational activities like surfing and the local economy dependent on tourism and marine industries.
2076	Interactive Map Comment	Negative	9/05/2023	Seismic testing, availability of gas and visual impact were mentioned/
907	Email	Outgoing	9/05/2023	Confirming receipt of webpage sign up, providing info on specific activities, prompting ongoing engagement
919	Phone call	Neutral	9/05/2023	Called to say he had attended Port Fairy community session and asked for Environment Managers surname.
1023	Interactive Map Comment		9/05/2023	Concern about seismic testing, climate change and visual impact.
1916	Newsletter	Outgoing	9/05/2023	Regia MSS Newsletter 3 - 9.5.2023.
4182	Email	Outgoing	17/05/2023	Explained the email was providing background information to specific concerns raised. Providing accessible information. Noting email then invites recipient to engage and ask questions to clarify information. As discussed on phone will organise a separate information session as requested in Port Fairy. Can also organise in person meeting with Environment Manager.
994	Email	Negative	17/05/2023	Person stated disagreement with information sent, requested one on one meeting.
1005	Phone call	Outgoing	18/05/2023	Called to arrange in person meeting (June 16th). Informed that there will be a stand alone information session as requested. Records of the first Port Fairy session requested.
1003	Email	Outgoing	18/05/2023	Confirming one on one meeting arrangements and request for first session records.
1020	Campaign Email	Outgoing	19/05/2023	Advising on Community Information Session in Port Fairy - June 16- Regia Marine Seismic Survey
1029	Phone call	Neutral	22/05/2023	Left voicemail requesting clarification on stand alone CGG info session.
1027	Email	Outgoing	22/05/2023	Confirming both the joint May session, and standalone June info session.
4183	Email	Outgoing	22/05/2023	Confirming information sessions on 30th May and June 16th
1028	Email	Neutral	22/05/2023	Conversation with stakeholder confirming he's received the community info session requested.
1925	Campaign Email	Outgoing	22/05/2023	Regia MSS Webinar 3 - Registration Mail out 22.5.2023
1887	Webinar	Outgoing	25/05/2023	Regia MSS 3rd Live Webinar
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
1440	Email	Outgoing	14/06/2023	Providing requested meeting notes
1443	Email	Outgoing	15/06/2023	Stakeholder acknowledging received meeting notes.

2024	In person meeting	Neutral	16/06/2023	A long discussion on the need for gas, the objectives of the survey, the known and unknown impacts of the survey, the role of activism in the consultation process, and the question of 'if' the survey should occur rather and just 'how' and 'when'.
1731	Public meeting	Outgoing	16/06/2023	Port Fairy Regia only info session
1732	Email	Outgoing	22/06/2023	PF community meeting follow up
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2659	Email	Outgoing	22/09/2023	Advising draft environmental assessments and commercial fisheries analysis report available online in document library. Regia team in area Oct 9th for a week, querying availability to meet with him.
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
2946	Email	Outgoing	5/10/2023	Suggesting meeting date and time
2973	Email	Neutral	5/10/2023	Agreeing to suggested meeting times and dates
3413	In person meeting	Neutral	12/10/2023	Discussion of issues associated with the survey. Also asked if Conoco and CGG should go through public comment at the same time. Received advice that both EP's going through public comment together was not a good idea. See follow-up email for meeting record in Event 3414.
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3414	Email	Outgoing	24/10/2023	<p>Thanking for in-person meeting, reiterating the extension until submission. Recording that stakeholder and their organisation:</p> <ul style="list-style-type: none"> <li>•Do not have any further information requests about the possible consequences of the Regia MSS on your functions, interests, or activities currently. (Note that you can request information from us at any time).</li> <li>•You have had access to sufficient information and enough time to consider the information we've made available online and provided to you.</li> <li>•You are aware that you can request information you provide us to be treated confidentially.</li> </ul> <p>Restating that no objections or claims about the adverse impact on functions, interests, and activities had been received and reiterating these can be raised at any time, including public comment.</p> <p>Requesting assistance from the stakeholder in engagement with one of their contacts who we have received out to but have no received replies from.</p>

3415	Email	Negative	24/10/2023	<p>Stakeholder confirming no further information requests, agreeing that they have had access to sufficient information and enough time to consider it, confirming they are aware they can request information provided be treated confidentially.</p> <p>They state no specific objections and claims provided because they wish to cover this in detail during public comment. They do not believe that refinements could ever be enough to mitigate damage of seismic blasting. Precautionary principle should apply and no seismic used to map the sea bed. No social license for activity along affected coastline and Traditional Owners sensitivities cannot be considered if question is how and when, not if.</p> <p>Confirming their contact is extremely busy, but to keep reaching out as she wishes to be heard.</p>
3416	Email	Outgoing	27/10/2023	Regarding stakeholders contact that wishes to be heard: explaining have received responses from associates and family of stakeholder but direct messages to contact not responded to and would like to make contact.
3705	Email	Neutral	7/11/2023	Questioning precautionary principle application, new technology testing, risk assessments/ALARP, the requirement for new gas
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
3866	Email	Outgoing	7/12/2023	Asking if anyone came forward as a relevant person at the stakeholders community event. Requesting stakeholder provide our details, or with permission theirs, if a RP did come forward. Thanking for invite to social media group. Letting stakeholder know team will reply to previous email shortly.
3908	Email	Neutral	8/12/2023	Confirming no relevant persons came forward. Asking if full financial position of companies project would be to be known in order to consider if something is ALARP.
4016	Email	Outgoing	12/12/2023	Forwarding consultation engagement letter requesting if they could forward on to relevant parties as Regia Team has not been able to make direct contact.
4063	Email	Outgoing	13/12/2023	Disappointed that Regia Teams effort to provide opportunity to engage has been seen as a box ticking exercise. Reconfirming points raised in original email. Offering again opportunity to speak to Regia team regarding project, via email, phone, meeting. Again noting that views can be put forward during public comment.
4062	In person meeting	Neutral	13/12/2023	Discussed the email received in error and discussed reasons that CGG are encouraging Person 1163 to come forward prior to submission. Also discussed the concept of ALARP in detail.

## Person ID 679 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
4202	Phone call	Outgoing	8/02/2023	Initial phone call, voicemail left.
4203	Phone call	Outgoing	15/02/2023	Initial call, voicemail left.
3210	Email	Outgoing	28/03/2023	Sending Initial Contact letter and supporting documents.
1649	Email	Neutral	20/06/2023	Requested contact, noted operates two non for profit associations attached position statement.
4232	Email	Outgoing	20/06/2023	Requested clarity on organisations.
1686	Email	Neutral	20/06/2023	Clarification on organization relevance.
4231	Email	Outgoing	20/06/2023	Thanking for explaining associations. Sent NOPSEMA Brochure. Noted concerns will be reviewed by team.
3211	Email	Neutral	20/06/2023	Sending additional document - last email had repeat of document.
3213	Email	Outgoing	20/06/2023	Further clarification as four companies mentioned. Request to confirm which of four are referring to.
3212	Email	Neutral	20/06/2023	Stakeholder stating both organisations are relevant.
3215	Email	Neutral	21/06/2023	Providing address and details for records.
1828	Email	Outgoing	3/07/2023	Noting to keep communications clear Regia will respond to each relevant organisation individually. Acknowledging concerns regarding compensation. Requested information on functions/interests/activities in the area.
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
2003	Email	Neutral	4/07/2023	Response to outgoing email sent 03/07 - Will only consult through this email. Will not engage in duplicate discussions over organisations.
2002	Email	Negative	10/07/2023	Stating concern of lack of engagement with nominated organizations from newsletter update.
1974	Email	Outgoing	17/07/2023	Acknowledging and explaining Environment manager is travelling but will respond soon.
1995	Email	Outgoing	18/07/2023	Enquiring if available for online meeting with Environment manager.
3216	Email	Neutral	18/07/2023	At conference - suggesting following week.
2004	Email	Outgoing	20/07/2023	Providing possible dates on following week.
3217	Email	Neutral	20/07/2023	Confirmed any of meeting times fine. Sent engagement document for environment manager to review.
3350	Online meeting	Neutral	3/08/2023	Discussed the historical engagement of seismic proponents. Outlined dissatisfaction with CGG in the past and hopeful of better relations this time. Outlined the opportunity for engagement on the NERA protocol and agreed to compensate CO for their time in consultation with CGG.
2222	Email	Outgoing	8/08/2023	Sent NERA Commercial Fishing Industry Adjustment Protocol. Requested meeting to discuss after reviewing document. Document also sent to Person ID 213
2320	Email	Neutral	8/08/2023	Agreeing to meet to discuss and listing comments from review.
2337	Email	Neutral	14/08/2023	Person ID 213 responding to NERA protocol, happy to meet to discuss, but will need time to review.
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023

2557	Email	Neutral	15/09/2023	Questioning Fisheries data from ABARES, requesting value of fish caught in area
2654	Email	Outgoing	21/09/2023	Confirming receipt of, and thanking for, preliminary comments on fishing report. Explaining data is presented in a way to retain confidentiality for fishers. Providing links to where data was sourced from. Requesting explanation on why actual value data information should be provided for discussion of compensation protocol.
4237	Email	Neutral	21/09/2023	Noted goal was to understand catch and its materiality in each fishery.
2655	Email	Outgoing	21/09/2023	Thanking for prompt response, but stating there is still confusion on why the aggregate tonnage of fish data is needed for consultation. Requesting explanation as may be missing something. Requesting discussion on common goals to ensure alignment, outlining current stated goal relevant to stakeholders members is to ensure no commercial fisher is worse off due to the activity.
4236	Email	Negative	22/09/2023	Raised concerns in how companies understand catch and queries on the compensation plans.
4235	Email	Neutral	22/09/2023	Query regarding catch and revenue.
4234	Email	Negative	22/09/2023	adding more context to previous email. info and questions regarding compensation.
3349	Email	Outgoing	2/10/2023	Requesting meeting to discuss Otway activities in relation to an Otway Compensation Protocol. Suggested agenda was provided.
3351	Email	Neutral	3/10/2023	Stakeholder requesting tonnage and dollar amount of displacement totals. Agreeing to meet.
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
2894	Email	Outgoing	4/10/2023	Contact re obtaining or sharing commercial information. Stating reasons why obtaining or sharing information about the value of previous catch is not required to proceed and will not improve predictive accuracy. Understand that stakeholder has this information available on a fee-for-service basis.
3382	Email	Negative	4/10/2023	Stakeholder stating data other than ABARES is needed to understand displacement and if compensation is owed to quota owners. Stating cost for association to provide this data. 20 year average data is required. Unless this is done the associations will oppose the survey.
3855	Email	Neutral	4/10/2023	Stakeholder cc'ing their treasurer, stating costs for involvement (both associations)
2930	Email	Outgoing	5/10/2023	Acknowledgement of stakeholders position, request to separate discussions into two parts: compensation protocol and provision of catch overlap value data. Reconfirmed reluctant to ascertain and provide data due to conflict of interest although open to reasons why this may be required, and remain keen to engage on a fee-for-service arrangement,
3355	Email	Negative	6/10/2023	Stating discussion has become circular and providing some statements for clarity
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3746	Email	Neutral	30/10/2023	Stakeholder sending letter as attachment
3747	Email	Neutral	31/10/2023	Sending attachment missing from previous email
3856	Email	Outgoing	30/11/2023	Apologising for delay in response, would like to use fee for service, stating the tasks required. Requesting PO details, if separate or joint.

3857	Email	Neutral	30/11/2023	Requesting listed work already incurred is included (virtual meetings, etc).
4039	Email	Outgoing	30/11/2023	Agreeing to previous costs being included in new PO
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
4043	Email	Neutral	30/11/2023	Discussing fee for service arrangements and plans regarding communication expenses related to sending SMS and Facebook posts. The need for understanding overlap with trawl fishing is emphasized as it could potentially nullify or significantly reduce these expenses. CC'ing new treasurer.
4045	Email	Outgoing	6/12/2023	Providing PO. Noting that 6 months notice may not be able to be provided as unlikely to have a start date that early. Other notices should be fine though.
4046	Email	Neutral	7/12/2023	Confirming PO received, questioning overlap and asking if project has EP yet.
4047	Email	Outgoing	7/12/2023	Team is preparing formal response to letter from 30/10. Established there is overlap with original survey design with stakeholders organizations members, the issue appears to be the need to calculate associated value of overlap. Requests taken seriously and measures put in place to help reduce, following discussion with trawlers from Portland. This work has delayed response to letter.
4048	Email	Negative	7/12/2023	Stakeholder saying value or tonnes is needed to provide feedback. Stating unwise to change proposal based on unnamed fishers from Portland. Other proponents provide data.
3879	Email	Outgoing	7/12/2023	Providing the email and info sheet for members, explaining why it will also be sent to Cwth fishers via obtained details.
3898	Email	Outgoing	8/12/2023	Providing information sheet with spelling error corrected
4049	Email	Neutral	8/12/2023	Confirming info sheet has been passed on to members. Listing issues: without knowing normal annual catch in area impossible to assess if co-existence is possible, compensation agreement not agreed and will be very difficult without understanding the overlap (as per first issue), understand requirement to contact via AFMA details but effort is misplaced and annoys unimpacted rights holders.
4128	Email	Neutral	19/12/2023	Stakeholder asking if any more information on fishing overlap is available
4129	Email	Outgoing	20/12/2023	The message updates stakeholder on ongoing efforts to minimise overlap with fishing activities. Acknowledging the complexity involved and thanking for patience. Mentioning contact from team to share links for individual fishers to provide feedback on the NERA adjustment protocol and the Facebook post to be shared as per agreement.
4127	Email	Outgoing	20/12/2023	Providing link to NERA protocol and feedback box for individual fishers, requesting facebook post be shared as per agreement
4233	Email	Neutral	21/12/2023	Noting facebook post has been shared and printed email has been sent a few weeks ago to all members.

## Person ID 863 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
4036	Email	Neutral	11/07/2023	Received an email about the Regia MSS project update but noticed no mention of the survey's impact on pygmy blue whales, a concern in a Biologically Important Area. They express disappointment in not being contacted during the consultation period and offer to discuss the matter in person, given their proximity to Portland.
1933	Email	Outgoing	11/07/2023	Thanking for email and input and specialist knowledge on blue whales. Enquired if the email address the team had already contacted was correct or if should update to this one. would there be availability for meeting with Regia environment manager. Outlined current whale measures.
4037	Email	Neutral	13/07/2023	Apologies the original email sent to had not been checked for a few weeks. Provided best contact details. Enquired which whale researchers had been contacted and would like to meet with Regia environment manager.
1971	Email	Outgoing	14/07/2023	Confirming that contact details will be updated in the system. Enquiring if available to meet with Regia team online or in person when Environment manager is in the area.
4064	Email	Neutral	17/07/2023	Enquiring on name of person talking to over email. Noted happy to speak to team online and may be able to catch up with environment manager when he is in Portland.
1992	Email	Outgoing	18/07/2023	Explaining who can access inbox, meeting arrangements
4065	Email	Neutral	18/07/2023	Confirming Time of meeting.
1998	Email	Outgoing	19/07/2023	Confirming will send through meeting invitation. Also explaining shared inbox as high number of enquiries inbox is used to provide initial information and then directed to appropriate person.
2000	Email	Neutral/Outgoing	19/07/2023	Person acknowledging process explanation and team inviting questions at any time.
2007	Online meeting	Neutral	20/07/2023	Meeting with stakeholder to discuss Blue Whale - See ID 2066 meeting notes email
2066	Email	Outgoing	26/07/2023	<p>Regia MSS 20.7.23 Meeting Notes -</p> <ul style="list-style-type: none"> <li>-Blue whale monitoring discussed for population recovery assessment</li> <li>-Southern Right Whale Study in GAB provides long-term data</li> <li>-Challenges in monitoring blue whales due to offshore and dispersed nature</li> <li>-Latest population estimate from McCauley acoustic (IMOS) work</li> <li>-Options for blue whale monitoring in Otway, including acoustic (IMOS) and aerial surveillance</li> <li>-Review of blue whale monitoring data</li> <li>-not currently collaborating with oil and gas companies</li> <li>-Blue whales at risk of disturbance due to reliance on daily feeding</li> <li>-Oil and gas operators in Otway collaborating on whale detection technologies</li> <li>-NOPSEMA and Department of Industry, Science, and Resources innovation program grants for whale detection technology</li> <li>-working on various projects, including krill/upwelling and a PHD on the same</li> <li>-Proposal to consolidate current knowledge on blue whales in Otway and identify needed studies</li> </ul>
2114	Phone call	Outgoing	28/07/2023	Called to confirm receipt of email.
2135	Email	Neutral	31/07/2023	Person responding to query on blue whale feeding. Noting delay in replying as unwell
4066	Email	Outgoing	1/08/2023	Thanking for information below as it makes it a lot clearer, noted would be working through some thoughts this week and would revert back.
2390	Email	Outgoing	25/08/2023	Providing person notice of going on leave.

## Person ID 1203 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
3004	Survey	Neutral	10/10/2023	New response for survey: Regia MSS & Newsletter Registration on project: Regia MSS
3384	Email	Negative	11/10/2023	Requesting more time in order to engage external bodies to assist them in their review of the draft EP chapters. Objections and claims on: Modelling Report – Sound Emissions, Underwater Sound – Plankton, Underwater Sound – Marine Mammals
3143	Email	Outgoing	12/10/2023	Thanking for website interaction. Requesting confirmation on if interest is with an organisation, as an individual or both.
3385	Email	Neutral	13/10/2023	Confirming webpage interaction was on behalf of organisation, and stating functions, interests and activities.
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3386	Email	Negative	26/10/2023	Following up on questions submitted, concerns that they have not been contacted with offer of meeting as yet.
3368	Email	Outgoing	27/10/2023	Team explaining each submission is carefully considered and reviewed, to ensure thoroughly understood and addressed, with any actions/measures required being put in place. This is then communicated for feedback when all the information is available, to avoid consultation fatigue. Communicating that stakeholder received email from the team, after a survey submission, requesting confirmation as the stakeholder can be an individual relevant person, in addition to representing a relevant organisation. Thanking stakeholder for confirming they have received the project update with granted time extension as requested in the correspondence. Team will endeavour to provide a written response by 8th November. Requesting stakeholders preference on engagement method following this.
3387	Email	Neutral	27/10/2023	Out of office automatic reply
3639	Email	Neutral	3/11/2023	Confirming stakeholder would like a written response and may later request video meeting.
3637	Email	Outgoing	13/11/2023	Providing responses to objections and claims. Inviting further engagement.
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
3885	Email	Outgoing	8/12/2023	Asking if any relevant persons came forward at their community event. If so, requesting their details (with permission) or for them to supply ours.
4016	Email	Outgoing	12/12/2023	Forwarding consultation engagement letter requesting if they could forward on to relevant parties as Regia Team has not been able to make direct contact.
4063	Email	Outgoing	13/12/2023	Disappointed that Regia Teams effort to provide opportunity to engage has been seen as a box ticking exercise. Reconfirming points raised in original email. Offering again opportunity to speak to Regia team regarding project, via email, phone, meeting. Again noting that views can be put forward during public comment.
4075	Email	Negative	19/12/2023	Stating no obligation to let team know if anyone came forward (event ID3885), describing purpose of the community event held.

3854	Email	Outgoing	6/12/2023	Confidential discussion on agreement
3862	Email	Neutral	7/12/2023	Confidential discussion on agreement
3860	Email	Outgoing	7/12/2023	Confidential discussion on agreement
3861	Phone call	Outgoing	7/12/2023	Confidential discussion on agreement
4212	Email	Outgoing	7/12/2023	Follow up on behalf of Environment Manager and thanking for time on phone. Confirmed reviewing email concerning Victorian Rock Lobster Committee.  Notes on Confidential agreement and noted would send through information sheet later today
3880	Email	Outgoing	7/12/2023	Providing the email and info sheet for members, explaining why it will also be sent to Cwth fishers via obtained details.
3899	Email	Outgoing	8/12/2023	Providing comm fisher info sheet with spelling mistake corrected
4049	Email	Neutral	8/12/2023	Confirming info sheet has been passed on to members. Listing issues: without knowing normal annual catch in area impossible to assess if co-existence is possible, compensation agreement not agreed and will be very difficult without understanding the overlap (as per first issue), understand requirement to contact via AFMA details but effort is misplaced and annoys unimpacted rights holders.
4031	Email	Neutral	14/12/2023	Confidential - Discussion on agreement.
4131	Email	Outgoing	20/12/2023	Requesting confirmation that they have received fully executed documents, providing NERA protocol link for individual fishers.
4163	Email	Outgoing	21/12/2023	Sending signed agreement
4161	Email	Neutral	21/12/2023	Stakeholder explaining they did not yet receive the signed documents.
4177	Email	Neutral	21/12/2023	Stakeholder returning fully executed copy
4178	Email	Outgoing	21/12/2023	Thanking for sending fully executed contract back, as requested, re-sending fisher info sheet, draft email and NERA link.
4213	Email	Neutral	22/12/2023	Thanking for information summary - will action distribution in January.

3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
4069	Email	Neutral	7/12/2023	Informing team of date in February in which titleholders can meet to talk with heritage team.
4015	Email	Outgoing	12/12/2023	The email conveys appreciation for the recipient's response to the Regia marine seismic survey consultation. CGG has followed the consultation process outlined in the initial letter and extended it by five months. This allowed for a reasonable period of consultation, during which CGG gathered important insights that informed the development of their Environment Plan. The email proposes a meeting to discuss the Sea Country Protection Program (SCPP), emphasizing collaboration with First Nations Australians and the opportunity for Traditional Owners to co-design and co-implement the program. look forward to receiving further details about the upcoming meeting.

## Organisation ID 32 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
50	Letter	Outgoing	15/02/2023	Initial Contact Letter with supporting documents.
443	Phone call	Neutral	23/03/2023	Reception was unable to confirm that initial letter was received and requested for email be resent to same email address.
453	Letter	Outgoing	24/03/2023	Re send of initial contact letter and supporting documents.
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
2178	Email	Outgoing	3/08/2023	Following up on request for consultation: Regia Marine Seismic Survey. Sent NOPSEMA brochure and requested confirmation previous emails had reached the correct person.
2331	Phone call	Outgoing	18/08/2023	Called to confirm receipt of email. Unable to see email in inbox which means it has probably been placed in a folder, couldn't see Regia on council agenda. Suggested it may be out of scope of council and requested description of what Regia is/what we are looking for from council. Noted that the councils concern is that we have reached out to the groups in the area. Agreed that sending email covering what we have done so far will be best. explained what Regia/seismic is (also informed of the webpage), how permitting works and how we are reaching out to traditional owner groups in the region. Suggested we re-send the email stating who we have contacted/what we have done so far.
2332	Email	Outgoing	18/08/2023	Follow up from phone call, stating who has been contacted and requesting any assistance council could provide
2745	Email	Neutral	21/08/2023	Thanking for reaching out, sent link for contact details for 5 RAPs. Offered assistance if issues found contacting RAPs.
2350	Email	Neutral	22/08/2023	Thanking for links to contacts. Alternative email addresses on website also contacted. Will reach out if further help needed.
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023

122	Letter	Outgoing	28/02/2023	Initial Contact Letter with supporting documents.
153	Email	Neutral	28/02/2023	Automatic reply confirming message has been received - receipt of Initial Contact Letter
571	Phone call	Outgoing	11/04/2023	Spoke to organisation who found the original email with documents and took message to forward on to the appropriate person.
579	Phone call	Neutral	12/04/2023	Confirmed project is separate to wind farms. Provided background information on activity and seismic/multi-client. Discussed consultation formats available, expressed interest in workshops and community forums (council able to host). Constituents have expressed concern about wind farm project, so feeling is they may have concerns about the MSS. Mentioned an org as an important group, with opposition to offshore activities.
581	Email	Outgoing	12/04/2023	Follow up to phone call, offering in person presentation to council
631	Email	Neutral	12/04/2023	Thanking for phone call and confirming that she will respond regarding suggested meeting date.
892	Email	Outgoing	8/05/2023	Conversation following up to ensure they have all info required and if they would like a meeting online or in June when environment manager returns.
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23

1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
1396	Email	Neutral	9/06/2023	Stating business partner of a Person ID and asking for background information on project as handles corporate matters.
1397	Email	Outgoing	9/06/2023	Responding to inquiry, forwarding initial letter
1649	Email	Neutral	20/06/2023	Requested contact, noted operates two non for profit associations attached position statement.
4232	Email	Outgoing	20/06/2023	Requested clarity on organisations.
1686	Email	Neutral	20/06/2023	Clarification on organization relevance.
4231	Email	Outgoing	20/06/2023	Thanking for explaining associations. Sent NOPSEMA Brochure. Noted concerns will be reviewed by team.
3211	Email	Neutral	20/06/2023	Sending additional document - last email had repeat of document.
3213	Email	Outgoing	20/06/2023	Further clarification as four companies mentioned. Request to confirm which of four are referring to.
3212	Email	Neutral	20/06/2023	Stakeholder stating both organisations are relevant.
3215	Email	Neutral	21/06/2023	Providing address and details for records.
1730	Email	Neutral	22/06/2023	Read receipt: Request for consultation: Regia Marine Seismic Survey
1828	Email	Outgoing	3/07/2023	Noting to keep communications clear Regia will respond to each relevant organisation individually. Acknowledging concerns regarding compensation. Requested information on functions/interests/activities in the area.
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
2003	Email	Neutral	4/07/2023	Response to outgoing email sent 03/07 - Will only consult through this email. Will not engage in duplicate discussions over organisations.
2002	Email	Negative	10/07/2023	Stating concern of lack of engagement with nominated organizations from newsletter update.
1974	Email	Outgoing	17/07/2023	Acknowledging and explaining Environment manager is travelling but will respond soon.
1995	Email	Outgoing	18/07/2023	Enquiring if available for online meeting with Environment manager.
3216	Email	Neutral	18/07/2023	At conference - suggesting following week.
2004	Email	Outgoing	20/07/2023	Providing possible dates on following week.

3217	Email	Neutral	20/07/2023	Confirmed any of meeting times fine. Sent engagement document for environment manager to review.
3350	Online meeting	Neutral	3/08/2023	Discussed the historical engagement of seismic proponents. Outlined dissatisfaction with CGG in the past and hopeful of better relations this time. Outlined the opportunity for engagement on the NERA protocol and agreed to compensate CO for their time in consultation with CGG.
2222	Email	Outgoing	8/08/2023	Sent NERA Commercial Fishing Industry Adjustment Protocol. Requested meeting to discuss after reviewing document. Document also sent to Person ID 213
2320	Email	Neutral	8/08/2023	Agreeing to meet to discuss and listing comments from review.
2337	Email	Neutral	14/08/2023	Person ID 213 responding to NERA protocol, happy to meet to discuss, but will need time to review.
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2557	Email	Neutral	15/09/2023	Questioning Fisheries data from ABARES, requesting value of fish caught in area
2654	Email	Outgoing	21/09/2023	Confirming receipt of, and thanking for, preliminary comments on fishing report. Explaining data is presented in a way to retain confidentiality for fishers. Providing links to where data was sourced from. Requesting explanation on why actual value data information should be provided for discussion of compensation protocol.
4237	Email	Neutral	21/09/2023	Noted goal was to understand catch and its materiality in each fishery.
2655	Email	Outgoing	21/09/2023	Thanking for prompt response, but stating there is still confusion on why the aggregate tonnage of fish data is needed for consultation. Requesting explanation as may be missing something. Requesting discussion on common goals to ensure alignment, outlining current stated goal relevant to stakeholders members is to ensure no commercial fisher is worse off due to the activity.
4236	Email	Negative	22/09/2023	Raised concerns in how companies understand catch and queries on the compensation plans.
4235	Email	Neutral	22/09/2023	Query regarding catch and revenue.
4234	Email	Negative	22/09/2023	adding more context to previous email. info and questions regarding compensation.
3349	Email	Outgoing	2/10/2023	Requesting meeting to discuss Otway activities in relation to an Otway Compensation Protocol. Suggested agenda was provided.
3351	Email	Neutral	3/10/2023	Stakeholder requesting tonnage and dollar amount of displacement totals. Agreeing to meet.
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
2894	Email	Outgoing	4/10/2023	Contact re obtaining or sharing commercial information. Stating reasons why obtaining or sharing information about the value of previous catch is not required to proceed and will not improve predictive accuracy. Understand that stakeholder has this information available on a fee-for-service basis.

3382	Email	Negative	4/10/2023	Stakeholder stating data other than ABARES is needed to understand displacement and if compensation is owed to quota owners. Stating cost for association to provide this data. 20 year average data is required. Unless this is done the associations will oppose the survey.
3855	Email	Neutral	4/10/2023	Stakeholder cc'ing their treasurer, stating costs for involvement (both associations)
2930	Email	Outgoing	5/10/2023	Acknowledgement of stakeholders position, request to separate discussions into two parts: compensation protocol and provision of catch overlap value data. Reconfirmed reluctant to ascertain and provide data due to conflict of interest although open to reasons why this may be required, and remain keen to engage on a fee-for-service arrangement,
3355	Email	Negative	6/10/2023	Stating discussion has become circular and providing some statements for clarity
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3746	Email	Neutral	30/10/2023	Stakeholder sending letter as attachment
3747	Email	Neutral	31/10/2023	Sending attachment missing from previous email
3856	Email	Outgoing	30/11/2023	Apologising for delay in response, would like to use fee for service, stating the tasks required. Requesting PO details, if separate or joint.
3857	Email	Neutral	30/11/2023	Requesting listed work already incurred is included (virtual meetings, etc).
4039	Email	Outgoing	30/11/2023	Agreeing to previous costs being included in new PO
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
4043	Email	Neutral	30/11/2023	Discussing fee for service arrangements and plans regarding communication expenses related to sending SMS and Facebook posts. The need for understanding overlap with trawl fishing is emphasized as it could potentially nullify or significantly reduce these expenses. CC'ing new treasurer.
4045	Email	Outgoing	6/12/2023	Providing PO. Noting that 6 months notice may not be able to be provided as unlikely to have a start date that early. Other notices should be fine though.
4046	Email	Neutral	7/12/2023	Confirming PO received, questioning overlap and asking if project has EP yet.
4047	Email	Outgoing	7/12/2023	Team is preparing formal response to letter from 30/10. Established there is overlap with original survey design with stakeholders organizations members, the issue appears to be the need to calculate associated value of overlap. Requests taken seriously and measures put in place to help reduce, following discussion with trawlers from Portland. This work has delayed response to letter.
4048	Email	Negative	7/12/2023	Stakeholder saying value or tonnes is needed to provide feedback. Stating unwise to change proposal based on unnamed fishers from Portland. Other proponents provide data.

3879	Email	Outgoing	7/12/2023	Providing the email and info sheet for members, explaining why it will also be sent to Cwth fishers via obtained details.
3898	Email	Outgoing	8/12/2023	Providing information sheet with spelling error corrected
4049	Email	Neutral	8/12/2023	Confirming info sheet has been passed on to members. Listing issues: without knowing normal annual catch in area impossible to assess if co-existence is possible, compensation agreement not agreed and will be very difficult without understanding the overlap (as per first issue), understand requirement to contact via AFMA details but effort is misplaced and annoys unimpacted rights holders.
4128	Email	Neutral	19/12/2023	Stakeholder asking if any more information on fishing overlap is available
4129	Email	Outgoing	20/12/2023	The message updates stakeholder on ongoing efforts to minimise overlap with fishing activities. Acknowledging the complexity involved and thanking for patience. Mentioning contact from team to share links for individual fishers to provide feedback on the NERA adjustment protocol and the Facebook post to be shared as per agreement.
4127	Email	Outgoing	20/12/2023	Providing link to NERA protocol and feedback box for individual fishers, requesting facebook post be shared as per agreement
4233	Email	Neutral	21/12/2023	Noting facebook post has been shared and printed email has been sent a few weeks ago to all members.

## Organisation ID 241 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
906	Survey	Negative	5/05/2023	Consultation Survey - Functions, interests, activities - local surfer, strongly oppose the proposed oceanic seismic testing due to potential harm to marine life, including lobsters, abalone, and cetaceans. The noise may disrupt ocean rhythms, impacting both recreational activities like surfing and the local economy dependent on tourism and marine industries.
2076	Interactive Map Comment	Negative	9/05/2023	Seismic testing, availability of gas and visual impact were mentioned/
907	Email	Outgoing	9/05/2023	Confirming receipt of webpage sign up, providing info on specific activities, prompting ongoing engagement
919	Phone call	Neutral	9/05/2023	Called to say he had attended Port Fairy community session and asked for Environment Managers surname.
1023	Interactive Map Comment		9/05/2023	Concern about seismic testing, climate change and visual impact.
1916	Newsletter	Outgoing	9/05/2023	Regia MSS Newsletter 3 - 9.5.2023.
994	Email	Negative	17/05/2023	Person stated disagreement with information sent, requested one on one meeting.
4182	Email	Outgoing	17/05/2023	Explained the email was providing background information to specific concerns raised. Providing accessible information. Noting email then invites recipient to engage and ask questions to clarify information. As discussed on phone will organise a separate information session as requested in Port Fairy. Can also organise in person meeting with Environment Manager.
1005	Phone call	Outgoing	18/05/2023	Called to arrange in person meeting (June 16th). Informed that there will be a stand alone information session as requested. Records of the first Port Fairy session requested.
1003	Email	Outgoing	18/05/2023	Confirming one on one meeting arrangements and request for first session records.
1020	Campaign Email	Outgoing	19/05/2023	Advising on Community Information Session in Port Fairy - June 16- Regia Marine Seismic Survey
1029	Phone call	Neutral	22/05/2023	Left voicemail requesting clarification on stand alone CGG info session.
1027	Email	Outgoing	22/05/2023	Confirming both the joint May session, and standalone June info session.
4183	Email	Outgoing	22/05/2023	Confirming information sessions on 30th May and June 16th
1028	Email	Neutral	22/05/2023	Conversation with stakeholder confirming he's received the community info session requested.
1925	Campaign Email	Outgoing	22/05/2023	Regia MSS Webinar 3 - Registration Mail out 22.5.2023
1887	Webinar	Outgoing	25/05/2023	Regia MSS 3rd Live Webinar
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
1440	Email	Outgoing	14/06/2023	Providing requested meeting notes

1443	Email	Outgoing	15/06/2023	Stakeholder acknowledging received meeting notes.
2024	In person meeting	Neutral	16/06/2023	A long discussion on the need for gas, the objectives of the survey, the known and unknown impacts of the survey, the role of activism in the consultation process, and the question of 'if' the survey should occur rather and just 'how' and 'when'.
1731	Public meeting	Outgoing	16/06/2023	Port Fairy Regia only info session
1846	Interactive Map Comment	Negative	22/06/2023	Input re exclusion depths and distances.
1732	Email	Outgoing	22/06/2023	PF community meeting follow up
1735	Email	Outgoing	22/06/2023	Thanks for interest in survey, confirmed added to records as interested community member. Query on interests/activities in area. Sent NOPSEMA brochure.

1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
1847	Email	Outgoing	4/07/2023	Sent link to JASCO sound modelling report
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2659	Email	Outgoing	22/09/2023	Advising draft environmental assessments and commercial fisheries analysis report available online in document library. Regia team in area Oct 9th for a week, querying availability to meet with him.
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
2946	Email	Outgoing	5/10/2023	Suggesting meeting date and time
2973	Email	Neutral	5/10/2023	Agreeing to suggested meeting times and dates
3413	In person meeting	Neutral	12/10/2023	Discussion of issues associated with the survey. Also asked if Conoco and CGG should go through public comment at the same time. Received advice that both EP's going through public comment together was not a good idea. See follow-up email for meeting record in Event 3414.
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3327	Facebook	Outgoing	23/10/2023	Team response to FB post, agreeing consultation is not consent and requesting engagement.

3414	Email	Outgoing	24/10/2023	<p>Thanking for in-person meeting, reiterating the extension until submission. Recording that stakeholder and their organisation:</p> <ul style="list-style-type: none"> <li>•Do not have any further information requests about the possible consequences of the Regia MSS on your functions, interests, or activities currently. (Note that you can request information from us at any time).</li> <li>•You have had access to sufficient information and enough time to consider the information we've made available online and provided to you.</li> <li>•You are aware that you can request information you provide us to be treated confidentially.</li> </ul> <p>Restating that no objections or claims about the adverse impact on functions, interests, and activities had been received and reiterating these can be raised at any time, including public comment.</p> <p>Requesting assistance from the stakeholder in engagement with one of their contacts who we have received out to but have no received replies from.</p>
3415	Email	Negative	24/10/2023	<p>Stakeholder confirming no further information requests, agreeing that they have had access to sufficient information and enough time to consider it, confirming they are aware they can request information provided be treated confidentially.</p> <p>They state no specific objections and claims provided because they wish to cover this in detail during public comment. They do not believe that refinements could ever be enough to mitigate damage of seismic blasting. Precautionary principle should apply and no seismic used to map the sea bed. No social license for activity along affected coastline and Traditional Owners sensitivities cannot be considered if question is how and when, not if.</p> <p>Confirming their contact is extremely busy, but to keep reaching out as she wishes to be heard.</p>
3416	Email	Outgoing	27/10/2023	<p>Regarding stakeholders contact that wishes to be heard: explaining have received responses from associates and family of stakeholder but direct messages to contact not responded to and would like to make contact.</p>
3705	Email	Neutral	7/11/2023	<p>Questioning precautionary principle application, new technology testing, risk assessments/ALARP, the requirement for new gas</p>
3811	Campaign Email	Outgoing	30/11/2023	<p>Regia MSS November Project Update</p>
3866	Email	Outgoing	7/12/2023	<p>Asking if anyone came forward as a relevant person at the stakeholders community event. Requesting stakeholder provide our details, or with permission theirs, if a RP did come forward.</p> <p>Thanking for invite to social media group. Letting stakeholder know team will reply to previous email shortly.</p>

3957	Facebook	Neutral	8/12/2023	Invitation to Regia MSS team to join Fight for the Bight private Facebook group - Regia MSS accepted invitation
3908	Email	Neutral	8/12/2023	Confirming no relevant persons came forward. Asking if full financial position of companies project would be to be known in order to consider if something is ALARP.
4016	Email	Outgoing	12/12/2023	Forwarding consultation engagement letter requesting if they could forward on to relevant parties as Regia Team has not been able to make direct contact.
4063	Email	Outgoing	13/12/2023	Disappointed that Regia Teams effort to provide opportunity to engage has been seen as a box ticking exercise. Reconfirming points raised in original email. Offering again opportunity to speak to Regia team regarding project, via email, phone, meeting. Again noting that views can be put forward during public comment.
4062	In person meeting	Neutral	13/12/2023	Discussed the email received in error and discussed reasons that CGG are encouraging Person 1163 to come forward prior to submission. Also discussed the concept of ALARP in detail.

2921	Email	Neutral	4/10/2023	Accepted Meeting invitation @ Thu 12 Oct 2023 2pm - 3pm (AEDT)
2933	Email	Outgoing	5/10/2023	Conversation re request for meeting; thanking for confirmation and forwarding invite.
3697	Online meeting	Neutral	12/10/2023	Discussion around activity/consultation process, environmental assessment process, stakeholder position on MSS's in general (opposition), concerns around sound on marine mammals/other species, concerns on how precautionary principle/ESD have been applied. Cumulative impact concerns discussed, if multiple MSS being acquired.
3701	Email	Outgoing	19/10/2023	Thanking stakeholder for meeting, providing meeting notes and action items. Requesting assistance with contacting SOPEC and asking if anyone else stakeholder thinks we should speak to.
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
3890	Email	Outgoing	9/12/2023	Providing requested map of TGS and Regia MSS areas
4016	Email	Outgoing	12/12/2023	Forwarding consultation engagement letter requesting if they could forward on to relevant parties as Regia Team has not been able to make direct contact.
4057	Email	Negative	13/12/2023	Email received in error. Highlighted the importance CGG has placed on consultation and strategized with other recipients about how to stop the activity.
4058	Email	Neutral	13/12/2023	Acknowledging that the email was cc'd in error
4063	Email	Outgoing	13/12/2023	Disappointed that Regia Teams effort to provide opportunity to engage has been seen as a box ticking exercise. Reconfirming points raised in original email. Offering again opportunity to speak to Regia team regarding project, via email, phone, meeting. Again noting that views can be put forward during public comment.

Notes	

## Organisation ID 250 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
1903	Survey	Neutral	26/06/2023	Consultation Survey - actively involved in the protection, preservation and restoration of the Belfast Coastal Reserve's natural and cultural values.
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
1904	Email	Outgoing	6/07/2023	Follow up from consultation survey. Confirmed organisation now in records. Requested Interests and activities in the area. Sent NOPSEMA Brochure.
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3728	Email	Outgoing	22/11/2023	Final email follow up for engagement
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
3801	Campaign SMS	Outgoing	30/11/2023	Bulk SMS send out to provide option for interests/activities and functions to be communicated to Regia MSS team. Provided link to follow up email sent and also allowed for option to unsubscribe.
4091	Email	Negative	19/12/2023	Introducing the organization and describing their conservation efforts for a coastal reserve. The reserve, rich in natural and cultural significance, hosts diverse flora and fauna, including threatened species. Concerns are raised about potential risks associated with seismic testing, emphasizing the need to mitigate these risks and monitor their effects. Questions are posed regarding the compatibility of proposed activities with environmental regulations, international climate goals, and federal threatened species plans. Naming a bird conservation group that they suggest we contact.

4092	Email	Outgoing	19/12/2023	<p>The response acknowledges the concerns raised about the proposed activity and that these concerns will be considered in the submitted Environment Plan, due for public comment and regulatory assessment early in the New Year. The response provides detailed explanations regarding the mitigation measures implemented to address the potential risks of seismic testing on the marine environment. It emphasizes the usage of available literature, stakeholder consultations, modeling reports, and an implementation strategy to monitor and manage environmental impact before, during, and after the activity.</p> <p>Additionally, the response discusses the alignment of proposed activities with international climate goals, stating that decisions about ongoing gas exploration and national energy policies are not under their purview. It confirms that NOPSEMA's decisions will align with federal threatened species recovery plans and acknowledges the need to consult BirdLife Australia.</p> <p>The email also includes information about the possibility of sensitive information not being published in the Environment Plan, in compliance with regulatory obligations.</p>

## Organisation ID 326 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
3396	Survey	Neutral	31/10/2023	Newsletter sign up through website
3398	Email	Neutral	31/10/2023	Stakeholder reached out as may be affected due to marine and coastal interest along Victoria. Requested meeting to discuss.
3399	Email	Outgoing	31/10/2023	Thanking stakeholder for interest in project, requesting their availability and offering information.
3400	Email	Neutral	31/10/2023	Stakeholder requesting further information on research, mitigation measures and impact assessments. Providing meeting date options.
3411	Email	Outgoing	1/11/2023	Providing requested information (research that's been done by Regia on impact to marine life, mitigation measures proposed specifically around fish/mammals/plankton/inverts, impacts on state marine national parks and what assessment has been done for these), suggesting meeting date and time, offering any further information and encouraging feedback
3744	Email	Neutral	23/11/2023	Stakeholder apologizing for missing email and requesting updated meeting time.
3743	Email	Outgoing	23/11/2023	Responding with dates and times available
3750	Email	Neutral	24/11/2023	Stakeholder confirming preferred date and time for meeting
3751	Email	Outgoing	24/11/2023	Thanking stakeholder, confirming calendar invite had been sent
3752	Email	Neutral	24/11/2023	Stakeholder requesting the 'Identification of Mitigation and Management Measures and Demonstration of ALARP' referred to in previous email
3753	Email	Outgoing	24/11/2023	Explaining 'Identification of Mitigation and Management Measures and Demonstration of ALARP' is section in draft impact documents and can be found via the table of contents, providing example of this.
3754	Email	Neutral	24/11/2023	Stakeholder thanking for direction on location of information in the draft impact assessments
3783	Online meeting	Neutral	28/11/2023	Discussed NOPSEMA's regulatory framework and minimizing environmental impacts. Discussions included strategies to reduce risks to biodiversity, especially marine mammals, using methods like overflights, citizen science, and direct observations. Stakeholder raised concerns about the number of planned overflights and promised a written response. There were also talks about finalizing a marine mammal management plan and the importance of incorporating Victoria's marine and coastal policy into the Environmental Plan documentation.
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
3915	Email	Neutral	11/12/2023	Requesting email address for Environment Manager to follow up on some items from online meeting.
3916	Email	Outgoing	11/12/2023	Forwarding contact for Environment Manager and requesting to keep regia email address cc'd on correspondence
4010	Email	Neutral	11/12/2023	Confirming that they will cc' in the project email.

## Organisation ID 330 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
3229	Email	Neutral	24/02/2023	Thanks for reaching out about activities. Noting please contact organisation. incoming email stating notification of anomalies which may represent heritage sites is required
558	Email	Outgoing	6/04/2023	Acknowledged information provided, asked if wish to receive stakeholder updates
559	Email	Outgoing	6/04/2023	Acknowledged response, provided requested information (docs from webpage) and shp files for review.
562	Email	Neutral	11/04/2023	Confirming stakeholder status would like to remain via main stakeholder email.
597	Email	Neutral	13/04/2023	Acknowledgement of receipt of initial letter
653	Email	Neutral	18/04/2023	Confirmed no licensing requirements - indicated potential objections and claims. Provided information for titleholders on points to consider and evaluate. Emergency response information.
655	Email	Outgoing	18/04/2023	Thanking for information, provided link to PEIRA and confirmed will respond in detail when risk treatment finalised. Regia noting objections and claims.
1182	Newsletter	Outgoing	26/05/2023	Regia MSS Newsletter 4 - 26/5/23
1327	Email	Neutral	6/06/2023	Email to request briefing on project with Regia team.
1353	Email	Outgoing	8/06/2023	Regia team enquiring on availability to meet on 13th June.
1751	Email	Outgoing	9/06/2023	Addressing objections and claims.
1391	Phone call	Neutral	9/06/2023	Arranged an in person meeting, followed up with calendar invite
4223	Email	Outgoing	13/06/2023	Unable to attend meeting due to illness.
1418	Email	Neutral	13/06/2023	Unable to attend meeting due to illness.
4224	Email	Outgoing	16/06/2023	Emailing to schedule an online meeting
1474	Email	Neutral	16/06/2023	Emailing to schedule an online meeting
1643	Email	Outgoing	20/06/2023	Prompting reschedule
1814	Survey	Neutral	28/06/2023	Newsletter Survey Registration
4230	Email	Neutral	28/06/2023	Apologies for the delay in replying - previous contact has moved on from the team. They will review information and provide a response.
1771	Email	Outgoing	28/06/2023	Confirming receipt of email and will update records accordingly.
1817	Email	Outgoing	30/06/2023	Thanks for signing up to newsletter. Enquiring if interest is personal or on behalf of organisation.

3195	Email	Neutral	30/06/2023	Stating signed up to newsletter to stay informed on project developments. Interests are largely on behalf of organisation
3196	Email	Outgoing	3/07/2023	Enquiring if update for Victoria Parks should be updated or if there is an alternative contact? Sent Initial Contact Letter.
3197	Email	Neutral	3/07/2023	Noted best contact as away on extended leave.
1841	Email	Neutral	3/07/2023	Out of office email - away from office till 6th July
1837	Email	Outgoing	3/07/2023	Contact passed from another person in Organization. Enquired on availability of online meeting with Regia Environment Manager.
1830	Newsletter	Outgoing	3/07/2023	Regia MSS Newsletter Regia MSS Newsletter - 3rd July 2023
4229	Email	Neutral	4/07/2023	Apologies for not replying before leave and suggesting new meeting time.
4228	Email	Outgoing	4/07/2023	Confirming Friday 14th will work.
1860	Email	Neutral	5/07/2023	Thanking for meeting invite
2035	Online meeting	Neutral	14/07/2023	Discussed the status of the Regia MSS and the role of GORCPA. Discussed the need for coastal access and protection. Highlighted that the activity would be some way offshore and that beaches would remain open. No further information requests at this time.
2171	Email	Outgoing	3/08/2023	Re-requesting online meeting to discuss project
2192	Email	Outgoing	7/08/2023	Available to meet Environment Manager on Thursday 10th
2205	Email	Outgoing	8/08/2023	Noted received decline note for meeting.
2244	Email	Neutral	8/08/2023	noting reply must have not come back with decline, advising Friday meeting would be better.
2243	Email	Outgoing	9/08/2023	Updated meeting to 1pm Friday.
2282	Online meeting	Neutral	11/08/2023	Discussion on the values of the State marine parks. Looked at all parks in EPA and decided Twelves Apostiles was the park of most concern.
2312	Email	Outgoing	15/08/2023	Requesting update on new management plan and confirming correspondence includes underwater heritage
2316	Letter	Outgoing	16/08/2023	Regia Marine Seismic Survey. Sent initial contact letter and supporting documents along with NOPSEMA brochure
2561	Campaign Email	Outgoing	14/09/2023	Regia MSS Project Update - 14th September 2023
2562	Email	Neutral	15/09/2023	Automated confirmation of receipt of newsletter
2890	Campaign Email	Outgoing	3/10/2023	Regia MSS project update - Upcoming webinar and Important Dates.
2961	Email	Outgoing	6/10/2023	Introducing project, providing information resources, offering specific information, NOPSEMA brochure and requesting contact details to be passed to other relevant people if known.

2972	Email	Outgoing	6/10/2023	Thanking for forwarding on: Introducing project, providing information resources, offering specific information, NOPSEMA brochure and requesting contact details to be passed to other relevant people if known.
2986	Email	Neutral	6/10/2023	Thanks for contacting the Customer Contact Centre
2988	Email	Neutral	6/10/2023	Stating in new role, forwarding to colleague
3331	Campaign Email	Outgoing	20/10/2023	Regia Project Update - 20th October - Update to inform due to feedback from consultation public comment will now be in 2024
3375	Email	Neutral	20/10/2023	Confirmation of project updated received
3759	Email	Outgoing	27/11/2023	Engagement close out email
3772	Email	Outgoing	28/11/2023	Resending initial and close out email to alternative email address found online.
3790	Email	Outgoing	29/11/2023	Sending map showing 12 Apostles exclusion zone, inviting feedback.
3811	Campaign Email	Outgoing	30/11/2023	Regia MSS November Project Update
3801	Campaign SMS	Outgoing	30/11/2023	Bulk SMS send out to provide option for interests/activities and functions to be communicated to Regia MSS team. Provided link to follow up email sent and also allowed for option to unsubscribe.
3812	Phone call	Outgoing	1/12/2023	No answer, but reached message bank that confirmed stakeholder still in position at organization. Left message to request response to confirm if stakeholders opt out from project updates was also an opt out of engagement.
4208	Email	Neutral	22/12/2023	Thanking for sending through map with exclusion zone. Requested rationale for 5km buffer zone. Keen to ensure this buffer will be adequate.
4220	Email	Outgoing	28/12/2023	Answer to question on rationale for a 5km buffer.

## Organisation ID 333 - Consultation Summary

Id	Event Type	Sentiment	Start Date	Summary
4099	Email	Outgoing	19/12/2023	Initial email, explaining the activity and that another stakeholder suggested we contact them. Providing links to NOPSEMA document, activity overview, the website and specific links to impact assessments on birds and light. Requesting they provide F,I,A's and providing multiple methods of contact.
4100	Email	Neutral	19/12/2023	Automatic response, receipt of initial email
4188	Campaign Email	Outgoing	22/12/2023	December 2023 Mail out - noting next steps and plan to submit EP for public comment in early 2024

### 3 Feedbacks

Compilation of feedbacks from consultation.

Feedback: 2

Person ID	124
Organisation ID	190
Feedback type	Objection
Feedback summary	Objection to the undemocratic nature of how SPAs are awarded.
Communication event	Phone call
Communication issue	Activity:Petroleum activity
Assessment of merit	Objection is not about the adverse effects of the activity.
Outcome of assessment	Nil
Measure(s) adopted	Nil
Measure(s) adopted (type)	
Response to Relevant Person	Verbally explained requirement for objections and claims to be about the adverse effects of the activity for CGG to be able to treat them. Explained that this concern is a matter for NOPTA, the Minister for Resources, or the local member for parliment to progress.

Feedback: 3

Person ID	385
Organisation ID	219
Feedback type	Claim
Feedback summary	A yacht race is held every Saturday. A different yacht race occurs every Easter.
Communication event	Phone call, Email
Communication issue	Impacts:Displacement
Assessment of merit	Stewart Pyers, PFYC Commodore, when provided with the offshore distance of survey does not see any issue in regard to the Saturday races. The offshore distance of the Easter race is dependent on wind conditions, and can be known to tack 3-4nm offshore. When considering the vessel exclusion zone, there is a chance of potential interaction.
Outcome of assessment	Complete an assessment when final activity area and vessel exclusion zone is confirmed.
Measure(s) adopted	Survey timing will be outside of the Easter period.
Measure(s) adopted (type)	Activity limitation
Response to Relevant Person	Event 955 confirmed activity timing would not coincide with race and unlikely to overlap with race area.

Feedback: 12

Person ID	743
Organisation ID	
Feedback type	Objection
Feedback summary	Objection to oil and gas
Communication event	Interactive Map Comment
Communication issue	Other:Objection to oil and gas
Assessment of merit	Objections to oil and gas activities are not about the adverse effects of the activity. These are not assessed further.
Outcome of assessment	No further action.
Measure(s) adopted	Nil
Measure(s) adopted (type)	
Response to Relevant Person	The legislative framework in Australia permits some impact from offshore petroleum if it is managed and of an acceptable level. We believe that responsible development of gas is essential for maintaining the current quality of life we all enjoy and ensuring we pass that quality of life on to future generations. Gas is part of the Labour governments energy transition plan.

Feedback: 48

Person ID	148, 10
Organisation ID	10
Feedback type	Objection
Feedback summary	Activities that may prevent or displace Pygmy Blue Whales or Southern Right Whales’ use of BIAs are avoided.
Communication event	Email
Communication issue	Impacts:Sound, Impacts:Light, Impacts:Damage/mortality to marine life
Assessment of merit	This objection relates to the adverse effects of the activity.
Outcome of assessment	The Regia MSS will be undertaken in a manner that does not prevent or displace Pygmy Blue Whales or Southern Right Whales’ use of BIAs. This will be done by implementing spatial and/or temporal zones and where these cannot be implemented mitigation controls will be implemented. Controls will be evaluated with expert opinion from acoustic specialists and whale researchers to ensure they are effective.
Measure(s) adopted	Whale Management Plan MMOs PAM Operators

Feedback: 172

<i>Person ID</i>	679
<i>Organisation ID</i>	
<i>Feedback type</i>	Claim
<i>Feedback summary</i>	Fishing associations request the need to understand the overlap of the survey with historical fishing activities.
<i>Communication event</i>	Email
<i>Communication issue</i>	Impacts:Displacement
<i>Assessment of merit</i>	Claim is about the adverse affect of the activity. Agree that understanding the historical physical overlap is necessary to help CGG design the activity to minimise overlap.
<i>Outcome of assessment</i>	CGG commissioned a report to understand the historical overlap with commercial fisheries (State and Commonwealth). Subsequently activity limitations were adopted to manage this interference to the least possible whilst retaining the geophysical objectives of the survey.
<i>Measure(s) adopted</i>	Activity limitation of no acquisition beyond 200 m depth contour.
<i>Measure(s) adopted (type)</i>	Activity limitation
<i>Response to Relevant Person</i>	Event 4129, 3898

Feedback: 173

Person ID	679
Organisation ID	
Feedback type	Request
Feedback summary	Request that you review AFMA data and report back to us on the extent of average annual overlap with each fishery in terms of tonnes or monetary value.
Communication event	Email
Communication issue	Impacts:Long term catchability
Assessment of merit	Request is for information about the adverse effect of the activity. However, provision of this data does not help to understand the impacts on a fishery for a future event, given there is already a commitment to compensation in place. Given any calculations would be inaccurate (fishing effort isn't so predictable) and likely overestimate the tonnes/value of the fishery displaced (because fish and fishers can relocated) this data is not required.
Outcome of assessment	CGG has decided not to grant this data request. CGG acknowledges it is data that could be calculated (at cost) but any cost is unreasonable given the data won't lead to any further mitigations than a) reducing the size of the survey to avoid overlap and b) putting a compensation protocol in place for any unavoidable overlap.
Measure(s) adopted	Compensation Protocol Activity Limitation - No acquisition deeper than 200 m.
Measure(s) adopted (type)	Activity limitation, Control measure
Response to Relevant Person	Event 4129, 3989

<i>Feedback summary</i>	Interference with Orange Roughy Research Program
<i>Communication event</i>	Email
<i>Communication issue</i>	Impacts:Damage/mortality to marine life
<i>Assessment of merit</i>	Claim about the adverse effects of the activity.
<i>Outcome of assessment</i>	Mapped reaserch monitoring sites and confirmed no overlap.
<i>Measure(s) adopted</i>	Sail line plan
<i>Measure(s) adopted (type)</i>	Control measure
<i>Response to Relevant Person</i>	Event 3350

Feedback: 214

<i>Person ID</i>	679
<i>Organisation ID</i>	195, 127, 98
<i>Feedback type</i>	Request
<i>Feedback summary</i>	Request for dealing with the issue of compensation through the associations.
<i>Communication event</i>	Email
<i>Communication issue</i>	Impacts:Displacement
<i>Assessment of merit</i>	This request is about the adverse affects of the activity. However, other feedback from fishers has expressly stated that they want input into the review of the compensation protocol and that fishing assocations should not be involved at all.
<i>Outcome of assessment</i>	CGG have agreed that both fishing associations and individual fishers can have an additional opportunity to input into the design and content of the compensation protocol and that the starting point is to use the NERA protocol.
<i>Measure(s) adopted</i>	A compensation protocol will be adopted and the content put up for review through a collaborative process with other willing titleholders in the region.
<i>Measure(s) adopted (type)</i>	Control measure
<i>Response to Relevant Person</i>	Event 3349, 3879

Feedback: 215

Person ID	679
Organisation ID	195, 127, 98
Feedback type	Request
Feedback summary	Request that the exclusion zones start a month earlier.
Communication event	Email
Communication issue	Impacts:Displacement
Assessment of merit	This request is about the adverse affects of the activity. Timing of the activity has changed since this feedback was received and there will now be an overlap between fishing and survey activities.
Outcome of assessment	Survey timing is driven by protection of SRW and BW peak periods. The costs of moving to another time are part of deciding if the impacts and risks from the survey are reduced to ALARP. There is less ecological impact from surveying during times of economic value which can be compensated.
Measure(s) adopted	A compensation protocol will be adopted. The sail line plan provides confidence the activity limitations will not be exceeded.
Measure(s) adopted (type)	Control measure
Response to Relevant Person	Event 3350

Feedback: 216

Person ID	679

<i>Assessment of merit</i>	This objection relates to the adverse effects of the activity.
<i>Outcome of assessment</i>	Included the notification request in the Implementation Strategy.
<i>Measure(s) adopted</i>	Included the notification request in the Implementation Strategy.
<i>Measure(s) adopted (type)</i>	Activity limitation
<i>Response to Relevant Person</i>	Event 1751

Feedback: 237

<i>Person ID</i>	1187, 825, 831, 1186
<i>Organisation ID</i>	17
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	Concerned about the impact of the project on the Twelve Apostles Marine Park.
<i>Communication event</i>	Email, Online meeting
<i>Communication issue</i>	Impacts:Damage/mortality to marine life, Indigenous Heritage
<i>Assessment of merit</i>	The objection relates to the adverse effects of the activity.
<i>Outcome of assessment</i>	A buffer of 5 km around the Twelve Apostles Marine Park will create an exclusion zone from all vessel activities.
<i>Measure(s) adopted</i>	5 km buffer around park limits.
<i>Measure(s) adopted (type)</i>	Activity limitation
<i>Response to Relevant Person</i>	Event 4220

Feedback: 239

<i>Person ID</i>	1187, 825, 831, 1186
<i>Organisation ID</i>	17
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	Oil spill concerns.
<i>Communication event</i>	Email, Online meeting
<i>Communication issue</i>	Risks:Oil Spill
<i>Assessment of merit</i>	The objection relates to the adverse effects of activity.
<i>Outcome of assessment</i>	A 50km buffer to all marine parks for refuelling.
<i>Measure(s) adopted</i>	A 50km buffer to all marine parks for refuelling.
<i>Measure(s) adopted (type)</i>	Activity limitation
<i>Response to Relevant Person</i>	Event 4220

Feedback: 249

<i>Person ID</i>	1187, 825, 831, 1136
<i>Organisation ID</i>	17
<i>Feedback type</i>	Request
<i>Feedback summary</i>	A map showing the adjusted survey area with Twelve Apostles exclusion zone was requested.
<i>Communication event</i>	Email, Online meeting
<i>Communication issue</i>	Processes or Info:Consultation process
<i>Assessment of merit</i>	Requested updated information of the survey area after consultation.
<i>Outcome of assessment</i>	An updated map showing the adjustments made to the survey area was sent over email.
<i>Measure(s) adopted</i>	An adjusted map showing the adjustments made to the survey was provided.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Event 3790

Feedback: 255

<i>Person ID</i>	213
<i>Organisation ID</i>	
<i>Feedback type</i>	Claim
<i>Feedback summary</i>	Consultation process and effects of seismic activities on the rock lobster fishery
<i>Communication event</i>	Online meeting
<i>Communication issue</i>	Impacts:Damage/mortality to marine life, Processes or Info:Consultation process, Processes or Info:Decision-making criteria
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	This feedback raises issues regarding the potential impact of seismic activities on rock lobster industry.
<i>Outcome of assessment</i>	A briefing on community engagement completed to date including fishers. Provided information about previous effects of seismic activities on rock lobster fishery.
<i>Measure(s) adopted</i>	A briefing on community engagement completed to date. Discussed the previous case studies outlining the effects of seismic activities on rock lobster fishery.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Event 1816

Feedback: 256

<i>Person ID</i>	337
<i>Organisation ID</i>	
<i>Feedback type</i>	Claim
<i>Feedback summary</i>	Requested that the industry need to come back to the Gunditjmirring with a better approach to consultation. Cultural Heritage
<i>Communication event</i>	In person meeting
<i>Communication issue</i>	Processes or Info:Consultation process, Processes or Info:Decision-making criteria
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	Another in-person meeting was requested.
<i>Outcome of assessment</i>	Latest documents related to the activity were shared and availability for next in-person meeting was provided.
<i>Measure(s) adopted</i>	Newly published documents were shared providing more information about the project.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Event 2669

Feedback: 257

Person ID	242, 247
Organisation ID	
Feedback type	Objection
Feedback summary	Concerns about consultation process and impacts on lobster
Communication event	Group Meeting
Communication issue	Impacts:Damage/mortality to marine life, Processes or Info:Consultation process
Feedback status	Closed
Assessment of merit	The concerns raised were related to the potential adverse effects of the drilling activity on lobsters and fishing activities
Outcome of assessment	Draft environmental assessments and commercial fisheries report was provided.
Measure(s) adopted	Advising draft environmental assessments and commercial fisheries analysis report available online in document library.
Measure(s) adopted (type)	Information
Response to Relevant Person	Event 2644

Feedback: 258

Person ID	782
Organisation ID	
Feedback type	Objection
Feedback summary	Concern for impacts of seismic survey on penguins, diving birds and other marine fauna. Impacts of light
Communication event	Online meeting
Communication issue	Impacts:Light, Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	An objection to the project was raised due to its potential impact on penguins and other marine fauna.
Outcome of assessment	A draft report containing information about environmental assessments and commercial fisheries was shared.
Measure(s) adopted	Advising draft environmental assessments and commercial fisheries analysis report was provided.
Measure(s) adopted (type)	Information
Response to Relevant Person	Event 2657

Feedback: 259

<i>Person ID</i>	1187, 825, 831, 1186
<i>Organisation ID</i>	17

<i>Assessment of merit</i>	Request relates to the adverse effects of the activity.
<i>Outcome of assessment</i>	Include notification requirements in Implementation Strategy.
<i>Measure(s) adopted</i>	Inclusion of mandatory notification requirements.
<i>Measure(s) adopted (type)</i>	Implementation change
<i>Response to Relevant Person</i>	Event

Feedback: 261

<i>Person ID</i>	61, 158
<i>Organisation ID</i>	249
<i>Feedback type</i>	Request
<i>Feedback summary</i>	Requested a single map of the TGS survey and the Regia MSS.
<i>Communication event</i>	Email, Online meeting
<i>Communication issue</i>	Processes or Info:Consultation process
<i>Assessment of merit</i>	More information regarding the project was requested.
<i>Outcome of assessment</i>	A map of TGS and Regia MSS areas was sent over email.
<i>Measure(s) adopted</i>	Map of TGS and Regia MSS areas was provided.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Event 3890

Feedback: 262

<i>Person ID</i>	1954, 1953
<i>Organisation ID</i>	132
<i>Feedback type</i>	Statement
<i>Feedback summary</i>	Acknowledged and appreciated the depth limitation measures that have been put in place to protect Abalone.
<i>Communication event</i>	Online meeting
<i>Communication issue</i>	Processes or Info:Environmental assessment process
<i>Assessment of merit</i>	Acknowledgment of protective measures by implementing depth limitations.
<i>Outcome of assessment</i>	The stakeholders acknowledged the depth limitation measures adopted.
<i>Measure(s) adopted</i>	Depth limitations
<i>Measure(s) adopted (type)</i>	Activity limitation, Control measure, Information
<i>Response to Relevant Person</i>	Event 3367

Feedback: 263

<i>Person ID</i>	1954, 1953
<i>Organisation ID</i>	132
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	Concern for divers and enquiry about SIMOPS management.
<i>Communication event</i>	Online meeting
<i>Communication issue</i>	Other:Cumulative impacts
<i>Assessment of merit</i>	Concerned about divers and wanted more information on SIMOPS plan.
<i>Outcome of assessment</i>	Appropriate measures were adopted and more informaiton was provided.
<i>Measure(s) adopted</i>	Certain lines would be acquired at night-time only.
<i>Measure(s) adopted (type)</i>	Activity limitation, Control measure, Information
<i>Response to Relevant Person</i>	Event 3367

Feedback: 264

<i>Person ID</i>	1954, 1953
<i>Organisation ID</i>	132
<i>Feedback type</i>	Claim
<i>Feedback summary</i>	Compensation for divers.
<i>Communication event</i>	Online meeting
<i>Communication issue</i>	Processes or Info:Consultation process
<i>Assessment of merit</i>	Information regarding the compensation for divers was requested.
<i>Outcome of assessment</i>	Compensation would be provided under certain circumstances. Both parties agreed that avoidance is preferable.
<i>Measure(s) adopted</i>	Compensation
<i>Measure(s) adopted (type)</i>	Information, Other
<i>Response to Relevant Person</i>	Event 3367

## Feedback: 266

<i>Person ID</i>	1163
<i>Organisation ID</i>	316
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	From desktop research: Koontapool (Southern Right Whale) birthing and calving disrupted at Logan's Beach whale nursery.
<i>Communication event</i>	Print Media, Radio
<i>Communication issue</i>	Impacts:Damage/mortality to marine life, Indigenous Heritage
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	This objection relates to the adverse effects of the activity.
<i>Outcome of assessment</i>	No discharge of sound within 12km of a SRW BIA. No discharge of sound source in waters less than 50m deep.
<i>Measure(s) adopted</i>	No discharge of the sound source within 12 km of a Southern Right Whale BIA or Habitat Critical to Survival (HCTS) while Southern Right Whales are present in the BIA and HCTS. No discharge of the sound source at full power in water depths of less than 50 m. Underwater detection technologies monitoring the presence of Koontapool migrating to and within 12km of the BIA. Further assessment of BW.
<i>Measure(s) adopted (type)</i>	Activity limitation, Control measure, Implementation change
<i>Response to Relevant Person</i>	Event ID 4106

Feedback: 267

Person ID	1163
Organisation ID	316
Feedback type	Objection
Feedback summary	From desktop research: Disruption to Wuulok (Blue Whale).
Communication event	Print Media, Radio
Communication issue	Impacts:Damage/mortality to marine life, Indigenous Heritage
Feedback status	Closed
Assessment of merit	This objection relates to the adverse effects of the activity.
Outcome of assessment	Only discharge the sound source in the Pygmy Blue Whale foraging BIA when low numbers of Pygmy Blue Whales and other foraging whales are in the BIA off Otway. Further assessment of BW.
Measure(s) adopted	Only discharge the sound source in the Pygmy Blue Whale foraging BIA when low numbers of Pygmy Blue Whales and other foraging whales are in the BIA off Otway. Further assessment of BW.
Measure(s) adopted (type)	Control measure, Implementation change
Response to Relevant Person	Event ID 4106

Feedback: 268

<i>Person ID</i>	1163
<i>Organisation ID</i>	316
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	From desktop research: Cultural significance of Deen Maar.
<i>Communication event</i>	Print Media, Radio
<i>Communication issue</i>	Indigenous Heritage
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	This objection relates to the adverse effects of the activity.
<i>Outcome of assessment</i>	Activity limitation within 10.3 km of Deen Maar.
<i>Measure(s) adopted</i>	Project vessels will not traverse between Lady Percy Julia Island / Deen Maar and the mainland. No discharge of the sound source within 10.3 km of Lady Percy Julia Island / Deen Maar.
<i>Measure(s) adopted (type)</i>	Activity limitation
<i>Response to Relevant Person</i>	Event ID 4106

Feedback: 269

Person ID	1163
Organisation ID	316
Feedback type	Objection
Feedback summary	From desktop research: General effects on marine eco-system from seismic.
Communication event	Print Media, Radio
Communication issue	Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	This objection relates to the adverse effects of the activity.
Outcome of assessment	Activity limitations and control measures were adopted which included reduction in source size and fauna management system.
Measure(s) adopted	Reduced source size and acquisition areas. Fauna Management System Further assessment of ecological integrity and biodiversity protection.
Measure(s) adopted (type)	Activity limitation, Control measure, Implementation change, Performance Standard
Response to Relevant Person	Event ID 4106

Feedback: 270

<i>Person ID</i>	1163
<i>Organisation ID</i>	316
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	From desktop research: Objection to seismic surveys
<i>Communication event</i>	Print Media, Radio
<i>Communication issue</i>	Other:Objection to oil and gas
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	This objection is not about the adverse effects of the activity and are not assessed further.
<i>Outcome of assessment</i>	Objections are not about the adverse effects of the activity, so no further assessments needed.
<i>Measure(s) adopted</i>	Not required.
<i>Measure(s) adopted (type)</i>	
<i>Response to Relevant Person</i>	Not required.

Feedback: 271

<i>Person ID</i>	391
<i>Organisation ID</i>	241
<i>Feedback type</i>	Request
<i>Feedback summary</i>	Requested financial information on CGG's projected profit to assess ALARP
<i>Communication event</i>	Email
<i>Communication issue</i>	Processes or Info:Decision-making criteria
<i>Feedback status</i>	In Progress
<i>Assessment of merit</i>	This request is about the processes run to decide on whether ALARP has been reached.
<i>Outcome of assessment</i>	Further assessment of ALARP to be presented at public comment.
<i>Measure(s) adopted</i>	Carry out further assessment.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Response yet to be sent – will provide the ALARP assessment.

Feedback: 272

<i>Person ID</i>	391
<i>Organisation ID</i>	241
<i>Feedback type</i>	Request
<i>Feedback summary</i>	We request that you use alternate methods to seismic blasting to map the seabed.
<i>Communication event</i>	Email
<i>Communication issue</i>	Activity:Petroleum activity
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	The is a reasonable request about the activity and the reduction of impacts.
<i>Outcome of assessment</i>	Write back and explain why marine vibriosis is not a suitable alternativ method.
<i>Measure(s) adopted</i>	Provide information to person on assessment of request.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Event 3416

Feedback: 273

Person ID	391
Organisation ID	241
Feedback type	Objection
Feedback summary	Appreciate that the operating area and timing has been refined in relation to identified sensitivities, but I do not believe such refinements are enough to mitigate the damage of seismic blasting, nor could ever be.
Communication event	Email
Communication issue	Other:Objection to oil and gas
Feedback status	Closed
Assessment of merit	This objection is not about the adverse effects of the activity.
Outcome of assessment	No action required.
Measure(s) adopted	Nil
Measure(s) adopted (type)	Information
Response to Relevant Person	Event 3416

Feedback: 274

Person ID	391
Organisation ID	241
Feedback type	Objection
Feedback summary	I would reiterate that lack of evidence is not evidence of lack of damage. The precautionary principal needs to apply and as such seismic should not be used.
Communication event	Email
Communication issue	Processes or Info:Environmental assessment process, Processes or Info:Decision-making criteria
Feedback status	Closed
Assessment of merit	This objection relates to the processes being run to assess whether seismic surveys are consistent with the precautionary principle.
Outcome of assessment	Undertake an additional assessment of consistency with ESD.
Measure(s) adopted	Further assessment/demonstration.
Measure(s) adopted (type)	Information
Response to Relevant Person	Event 3416

Feedback: 275

<i>Person ID</i>	391
<i>Organisation ID</i>	241
<i>Feedback type</i>	Objection
<i>Feedback summary</i>	Traditional Owners sensitivities cannot genuinely be considered for Gunditjmara Sea Country if the question is HOW and WHEN, and not IF.
<i>Communication event</i>	Email
<i>Communication issue</i>	Indigenous Heritage
<i>Feedback status</i>	Closed
<i>Assessment of merit</i>	This objection relates to the processes being run to consult with Traditional Owners not including their consent.
<i>Outcome of assessment</i>	Explain the purpose of consultation and that consent is not part of the regime.
<i>Measure(s) adopted</i>	Sea Country Protection Program.
<i>Measure(s) adopted (type)</i>	Information
<i>Response to Relevant Person</i>	Event 3416

Feedback: 276

Person ID	242, 243, 251, 1956, 247, 1957
Organisation ID	
Feedback type	Objection
Feedback summary	The Investigator survey in 1999 killed everything in its path and the area has never recovered.
Communication event	Group Meeting
Communication issue	Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	Assessments by the VFA using SRL fisheries data have concluded that CPUE has almost tripled from 2009/10 with standardised catches continuing to increase, reflecting a stable and relatively healthy fishery. Fishing effort has been very low in the greater MSS area including the area encompassing the Investigator seismic survey in 1999. Maps of fishing effort across the area indicate effort is very heavily influenced by the type of bottom habitat available. There is a ridge of more complicated reef (providing more habitat for lobsters) running in a SW direction from the tip of Cape Otway which is clearly seen on navigation charts. Fishing effort data from VFA shows effort is heavily concentrated along this ridgeline and drops off dramatically when the bottom becomes more homogenous - see Figure F3-1 below. Video footage of the bottom as part of the Otway Gas Development confirms a low-profile limestone base dominated by sponges (Beach Energy 2022).
Outcome of assessment	Communicate findings to fishers at next visit.
Measure(s) adopted	Further assessment, including request for more data from the VFA.
Measure(s) adopted (type)	Information
Response to Relevant Person	At next visit to the region.

Feedback: 277

Person ID	242, 243, 251, 1956, 247, 1957
Organisation ID	
Feedback type	Objection
Feedback summary	The long-term effects on rock lobsters won't be known for 7 years.
Communication event	Group Meeting
Communication issue	Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	There have been multiple seismic surveys conducted across the greater region for over 20 years. There are no patterns of recruitment and stock abundance of SRL that can be linked to a seismic survey. The scale of impact by seismic is overwhelmed by the scale of climate events (currents, wind, water temperatures, ENSO events), spatial distribution of habitat and fishing. There is no stock-recruitment relationship evident at small scales.
Outcome of assessment	Communicate findings to fishers at next visit.
Measure(s) adopted	Further assessment.
Measure(s) adopted (type)	Information
Response to Relevant Person	At next visit to the region.

Feedback: 278

Person ID	242, 243, 251, 1956, 247, 1957
Organisation ID	
Feedback type	Objection
Feedback summary	Seismic effects the recruitment to the fishery and has resulted in declines in stock.
Communication event	Group Meeting
Communication issue	Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	Multiple studies have identified synchrony in larval settlement and recruitment patterns is coherent across southern Australia. This broad scale connectivity completely overwhelms any localised recruitment dynamics and is a key part of imbuing resilience in SRL populations. Rather, it is changing climate that is being identified as a major driver of changes to population dynamics in SRL. Recent work has suggested a regional scale drop in Surplus Production since the late 90's early 2000's is likely behind a reduction in fisheries output across the greater region with changes to water temperature a likely driver of this
Outcome of assessment	Communicate findings to fishers at next visit.
Measure(s) adopted	Further assessment.
Measure(s) adopted (type)	Information
Response to Relevant Person	At next visit to the region.

Feedback: 279

Person ID	242, 243, 251, 1956, 247, 1957
Organisation ID	
Feedback type	Objection
Feedback summary	Wherever there has been seismic the fishing grounds are no longer productive.
Communication event	Group Meeting
Communication issue	Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	Fishing effort in the Western Victoria SRL Fishery is now at the lowest it's been since the 1980's. Another way to state this is that it's never been easier to catch a designated quota, with "catches per unit of effort – CPUE" as high as they've ever been. Less and less pot lifts are being required to catch TACC quotas. Seismic has been occurring adjacent to the Western Victoria coast for over 20 years however SRL populations continue to support an improving fishery.
Outcome of assessment	Communicate findings to fishers at next visit.
Measure(s) adopted	Further assessment.
Measure(s) adopted (type)	Information
Response to Relevant Person	At next visit to the region.

Feedback: 280

Person ID	242, 243, 251, 1956, 247, 1957
Organisation ID	
Feedback type	Objection
Feedback summary	The fishery is in decline and seismic is a major cause of the decline.
Communication event	Group Meeting
Communication issue	Impacts:Damage/mortality to marine life
Feedback status	Closed
Assessment of merit	As noted above there have been changes to total catch across southern Australia which have been correlated with large scale environmental drivers but not seismic. As reported by the VFA the SRL fishery in Western Victoria is currently in the best health it has been for some time with fleet efficiencies adding to the increasing CPUE since 2010. Surplus production declines which are seen as a major driver of any declines in population of SRL have been occurring over scales much larger than any seismic survey areas.
Outcome of assessment	Communicate findings to fishers at next visit.
Measure(s) adopted	Further assessment.
Measure(s) adopted (type)	Information
Response to Relevant Person	At next visit to the region.

Feedback: 281

Person ID	61, 158
Organisation ID	249
Feedback type	Request
Feedback summary	Requested a more detailed analysis of how the EP preparation process has considered the principles of ESD, particularly the precautionary principle holistically.
Communication event	Email, Online meeting
Communication issue	Processes or Info:Environmental assessment process
Feedback status	Closed
Assessment of merit	Request is a reasonable request as the feedback that completing these assessments aspect-by-aspect doesn't give this person the whole picture.
Outcome of assessment	Further assessment of the how the activity is consistent with the principles of ESD.
Measure(s) adopted	Further assessment of ESD.
Measure(s) adopted (type)	Information
Response to Relevant Person	Event 3890

## 1 Introduction

The Consultation Materials report compiles copies and reports on the integration of supplementary consultation tools and communication used during the consultation period.

## 2 Information Session Presentations

2.1 May Information Sessions

2.2 June Information Sessions

# Information Sessions

Warrnambool, Port Fairy, Portland

May 29, 30, & 31

# Agenda

- Introduction to the Regia Marine Seismic Survey (Regia MSS)
- Consultation process and progress
- Q&A

## Purpose

To provide access to initial information to assist people determine if they may be affected by the Regia MSS and if they want to enter into the 'relevant persons' consultation process.

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- CGG is required to prepare an Environment Plan which mandates consultation with 'relevant persons'.
- Consultation started on 1 February 2023 and is open until 30 **July** 2023.

Activity Planning Parameter	Detail
Earliest start date	1st November 2023
Latest finish date	31st October 2028
Survey duration	90 days
Maximum acquisition days	60 days

Information Flyers are available at [www.regiamss.com.au](http://www.regiamss.com.au)

# Information for the community

## Available Information

- Information summaries
  - Consultation processes summary
  - Regia activity overview
  - What is a seismic survey?
- Interactive map

## Information Coming Soon

- Initial sound modelling report.
- Environmental assessment summaries.
- Fisheries assessment report.

## Communication Events

- Community information sessions
  - Warrnambool
  - Portland
  - Peterborough
  - Port Campbell
  - Apollo Bay
  - Port Fairy
- Advertised in print media, on radio, and Facebook, Instagram, and LinkedIn.
- Participated in local radio interviews.
- Newsletters and webinars available.

# Information for relevant persons

## Initial Information

- Community Consultation and Engagement Plan
- Description of Activity
- Preliminary Environmental Impact and Risk Assessment
- Interactive map online

## Sufficient Information

- Differs for each person.
- Needs to be in a format suited to each person.
- Written to everyone who registered at the April community sessions seeking to understand people functions, interests, and activities.
- Published our draft environmental assessments
  - Light emissions
  - Accidental release of waste
  - Accidental collisions with fauna
  - Introduction of invasive marine species

# Further information available

## Decision-Making Criteria

- Information about how we make decisions about environmental management.
- Defines and justifies acceptable levels of impact and risk.

## Implementation Strategy

- How we conduct marine seismic surveys.
- Details our environmental management system.
- Details our monitoring and reporting requirements.

## Legislative Requirements

- Input into Decision-making Criteria.
- 114 legislative instruments identified that we must comply with.

# Consultation Process

The consultation process is being extended from 5 months to 6 months.

Have your say at [www.regiamss.com.au](http://www.regiamss.com.au)

## Raise Awareness

- Consultation Opens
- Notifying government agencies

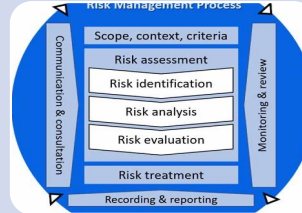

Feb (Complete)

## Establish Context

- Invite comment
- Notify affected persons
- Provide information

March (Complete)

## Environmental Assessment

- Prepare impact assessment
- Prepare risk assessment

April & May

## Mitigation and Management

- Determine control measures
- Set environmental performance
- Publish full EP

May June

## Raise Objections & Claims

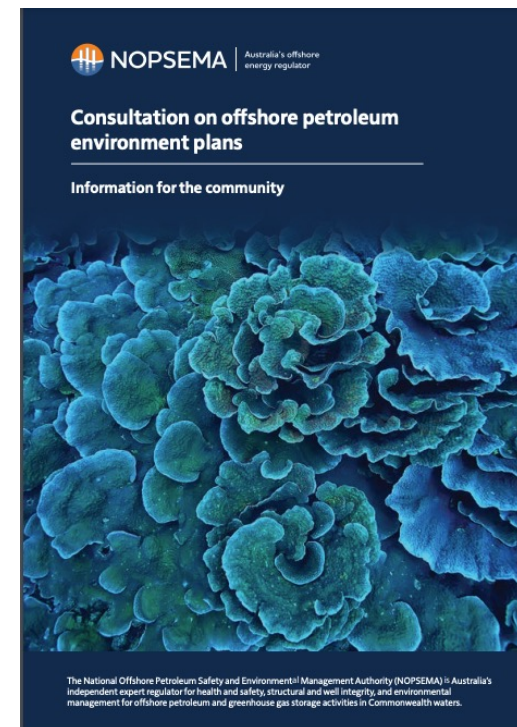

- Community engagement
- Listen

June July

# New guidance for relevant persons

- Reminder: Anyone with functions, activities, or interests in the Environment Planning Area may be a relevant person.
- NOPSEMA guidance explains that:
  - Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species.
  - Your interests should be more than a general interest in the environment or offshore petroleum activities.
- Relevant persons will experience a better consultation process if they can be specific about how they may be affected by the Regia MSS.
- Community members may choose not to engage in the relevant persons consultation process and prefer to write directly to NOPSEMA or participate through the public comment process.

<https://www.nopsema.gov.au/sites/default/files/documents/Consultation%20on%20offshore%20petroleum%20environment%20plans%20brochure.pdf> ç

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Deen Maar/Lady Julia Percy Island is a significant place for ecological and cultural heritage values and sensitivities.	<p><i>Ecological</i> We have identified protected species on the island and have modelled sound propagation around the area. We agree that ecological values should be protected.</p> <p><i>Cultural heritage</i> We have introductory discussions with Traditional Owners this week. We understand that there may be spiritual values to protect both on the island and between the island and the mainland.</p>	<p><i>Ecological</i> Implemented a 10.3km exclusion around the island which is the behavioral response threshold for marine mammals.</p> <p><i>Cultural heritage</i> As above for a starting point around the island, plus, preparing to put an exclusion zone in place between the island and the mainland. Need validation of appropriateness through consultation.</p>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Why are you doing seismic in this area again?	We are mostly surveying areas that have not been surveyed before.	Provide maps to the community of previous seismic surveys over the area in the context of the Regia MSS.
The community is fatigued by the consultation for all these petroleum activities.	We understand the burden being placed on relevant persons.	We undertook joint community events to try and reduce the fatigue people may experience.
There is confusion about what activities are planned in this region because you haven't separated the consultation.  We care more about the seismic activity and want separate consultation events.	We understand that there may be some confusion arising from our response to claims of consultation fatigue.	Undertook a requested session in Port Fairy. Plan to carry out Regia MSS only community sessions in Apollo Bay and Port Fairy.

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
No impacts from seismic are of an acceptable level.	This is not supported by the literature or the legislation.	Publish our predicted levels of impact and risk.
Seismic surveying is not required given that no new oil or gas should be developed to be consistent with increased temperature increase of 1.5 degrees (the Paris Agreement).	The 'no new oil or gas' statement comes from the IEA WEO 2021, NZE Scenario which is a global analysis predicated on a demand driven decrease in fossil fuel use. It does not explicitly consider that at an Australia level, the AEMO predicts shortfalls of gas as early as 2027 in its Victorian Gas Planning Report (March 2023).	Record instances of the objection and faithfully report those to NOPSEMA.  Respond to individuals who raise this objection with references to government documentation supporting the need for new local gas developments.
The community doesn't want oil and gas development here (and called for a vote objecting to the activity).	We understand community opposition to the activity. There is already gas development in the Otway and the government has awarded titles for further exploration.	Share the views of the community with NOPSEMA and accurately record the vote counts from the community sessions.

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
There would be unacceptable impacts to marine mammals and in particular Southern Right Whales (SRW) and Blue Whales (BW).	<p>We recognize the importance and elevated levels of protection afforded to SRW and BW. Temporary threshold shifts to these species are unacceptable. We can have lesser impacts such as some behavioral responses.</p> <p>We must be consistent with the Conservation Management Plans in place for all species and with Policy Statement 2.1 which protects marine fauna interactions with seismic surveys.</p>	<p>No seismic surveying to occur in the SRW reproduction Biologically Important Area while they are present (May-November).</p> <p>Marine Fauna Observers on watch during daylight hours.</p> <p>Passive Acoustic Monitoring during night-time.</p> <p>Shutdown operations for all whales for observations closer than 2000 meters from the seismic survey.</p> <p>+ more under consideration</p>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Seismic blasts from seismic surveys are over 230-260 decibels and the sound travels for thousands of kilometers every few seconds for months.	<p>We acknowledge that sound propagates through the ocean over long distances (particularly in deeper water) and that the sound levels at the source are high.</p> <p>The more relevant data for impact assessments of elevated underwater sound levels are received levels of sound at specified distances from the sound source and the effect level thresholds for the hearing capabilities of different species.</p> <p>Elevated levels of sound from seismic are limited to the duration of acquisition (60 days) i.e., temporary.</p>	<p>Publish the sound propagation modelling report in full.</p> <p>Share the scientific basis for the:</p> <ul style="list-style-type: none"><li>- Propagation calculations</li><li>- Selected effect level thresholds</li></ul>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
The effects on fish and fish population are permanent and will damage our commercial fishing industry.	The effects of seismic sound on most species are well understood. There are no mortal effects predicted to any fish or invertebrate species from seismic sound.	Consult with commercial fishers and the VFA to understand the productivity and utilization of commercial fishing resources in the area.
Seismic blasting will kill zooplankton out to 1.2km which have a fundamental role for ecological integrity as food for krill and subsequently krill are food for whales.	<p>The effects of seismic sound from the Regia MSS may have mortal effects on zooplankton out to approximately 220m.</p> <p>Zooplankton are ubiquitous and abundant with natural mortality rates of 20-50% and high levels of recoverability (within days). The Regia MSS will cover 0.2% of the bioregion per day.</p>	<p>Publish the modelling and impact assessment of sound on zooplankton.</p> <p>Carry out the activity within the limits set by the Environment Plan.</p>

Q&A

# Information Sessions

Apollo Bay and Port Fairy

June 14 & 16

# Agenda

- Introduction to the Regia Marine Seismic Survey (Regia MSS)
- Consultation process and progress
- Q&A

## **Purpose**

To provide access to initial information to assist people determine if they may be affected by the Regia MSS and if they want to enter into the 'relevant persons' consultation process.

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- CGG is required to prepare an Environment Plan which mandates consultation with 'relevant persons'.
- Consultation started on 1 February 2023 and is open until 30 **July** 2023.

Activity Planning Parameter	Detail
Earliest start date	1st November 2023
Latest finish date	31st October 2028
Survey duration	90 days
Maximum acquisition days	60 days

Information Flyers are available at [www.regiamss.com.au](http://www.regiamss.com.au)

# Information for the community

## Available Information

- Information summaries
  - Consultation processes summary
  - Regia activity overview
  - What is a seismic survey?
- Interactive map

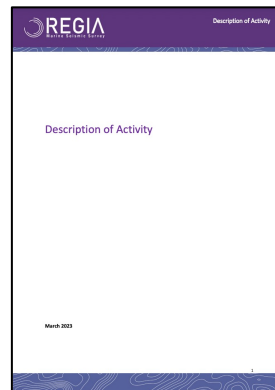

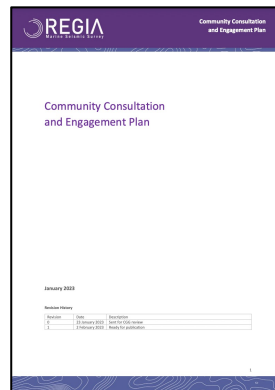

## Communication Events

- Community information sessions
  - Warrnambool x2
  - Portland x2
  - Peterborough
  - Port Campbell
  - Apollo Bay
  - Port Fairy x2
- Advertised in print media, on radio, and Facebook, Instagram, and LinkedIn.
- Participated in local radio interviews.
- Newsletters and webinars available.

# Information for relevant persons

## Initial Information

- Community Consultation and Engagement Plan
- Description of Activity
- Preliminary Environmental Impact and Risk Assessment
- Interactive map online

## Sufficient Information

- Differs for each person.
- Needs to be in a format suited to each person.
- Written to everyone who registered at the April community sessions seeking to understand people functions, interests, and activities.
- Published our draft environmental assessments
  - Light emissions
  - Accidental release of waste
  - Accidental collisions with fauna
  - Introduction of invasive marine species

# Further information available

## Decision-Making Criteria

- Information about how we make decisions about environmental management.
- Defines and justifies acceptable levels of impact and risk.

## Legislative Requirements

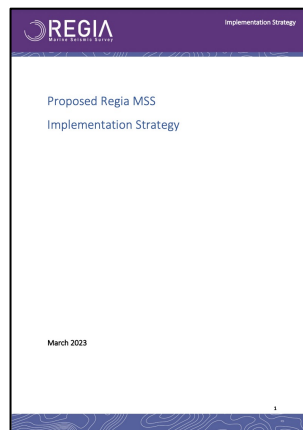

- Input into Decision-making Criteria.
- 114 legislative instruments identified that we must comply with.

# Further information available

## Implementation Strategy

- How we conduct marine seismic surveys.
- Details our environmental management system.
- Details our monitoring and reporting requirements.

## Sound Modelling Report

- Initial modelling to inform survey design and impact assessment for elevated levels of sound.
- Demonstrates the threshold distances for various effects to representative marine fauna.
- Identified concerns we have for divers/swimmers in some locations.

# Information coming soon

## **EP Content**

- Fisheries assessment report.
- Impact Assessment: Interactions with other marine users.
- Impact Assessment: Elevated underwater sound levels impact.
- Oil Spill Emergency Plan
- Operational and Scientific Monitoring Plan
- Cultural Heritage Management Plan
- Marine Mammal Adaptive Management Plan

## **Summaries**

- Case studies on long-term effects of seismic surveys on commercial fishing.
- Effects of underwater sound on divers/swimmers.
- Protection of marine mammals.
- Compensation for commercial fishers.

# Consultation Process

The consultation process is being extended from 5 months to 6 months.

Have your say at [www.regiamss.com.au](http://www.regiamss.com.au)

## Raise Awareness

- Consultation Opens
- Notifying government agencies

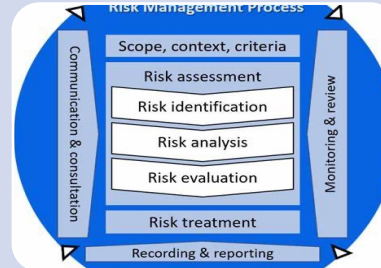

Feb (Complete)

## Establish Context

- Invite comment
- Notify affected persons
- Provide information

March (Complete)

## Environmental Assessment

- Prepare impact assessment
- Prepare risk assessment

April & May

## Mitigation and Management

- Determine control measures
- Set environmental performance
- Publish full EP

May June

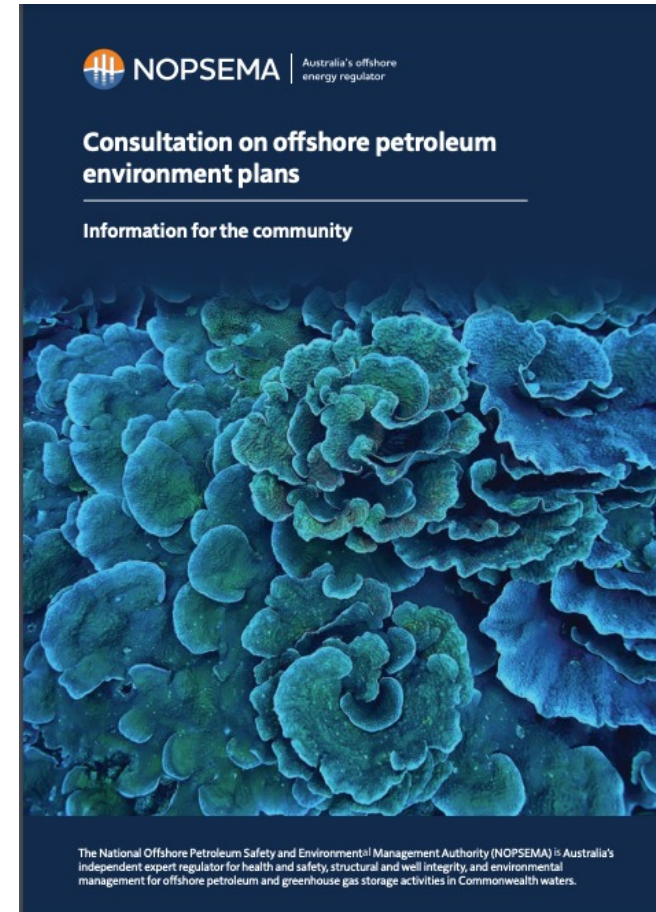

## Raise Objections & Claims

- Community engagement
- Listen

June July

# New guidance for relevant persons

- Reminder: Anyone with functions, activities, or interests in the Environment Planning Area may be a relevant person.
- NOPSEMA guidance explains that:
  - Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species.
  - Your interests should be more than a general interest in the environment or offshore petroleum activities.
- Relevant persons will experience a better consultation process if they can be specific about how they may be affected by the Regia MSS.
- Community members may choose not to engage in the relevant persons consultation process and prefer to write directly to NOPSEMA or participate through the public comment process.

# Objections and Claims

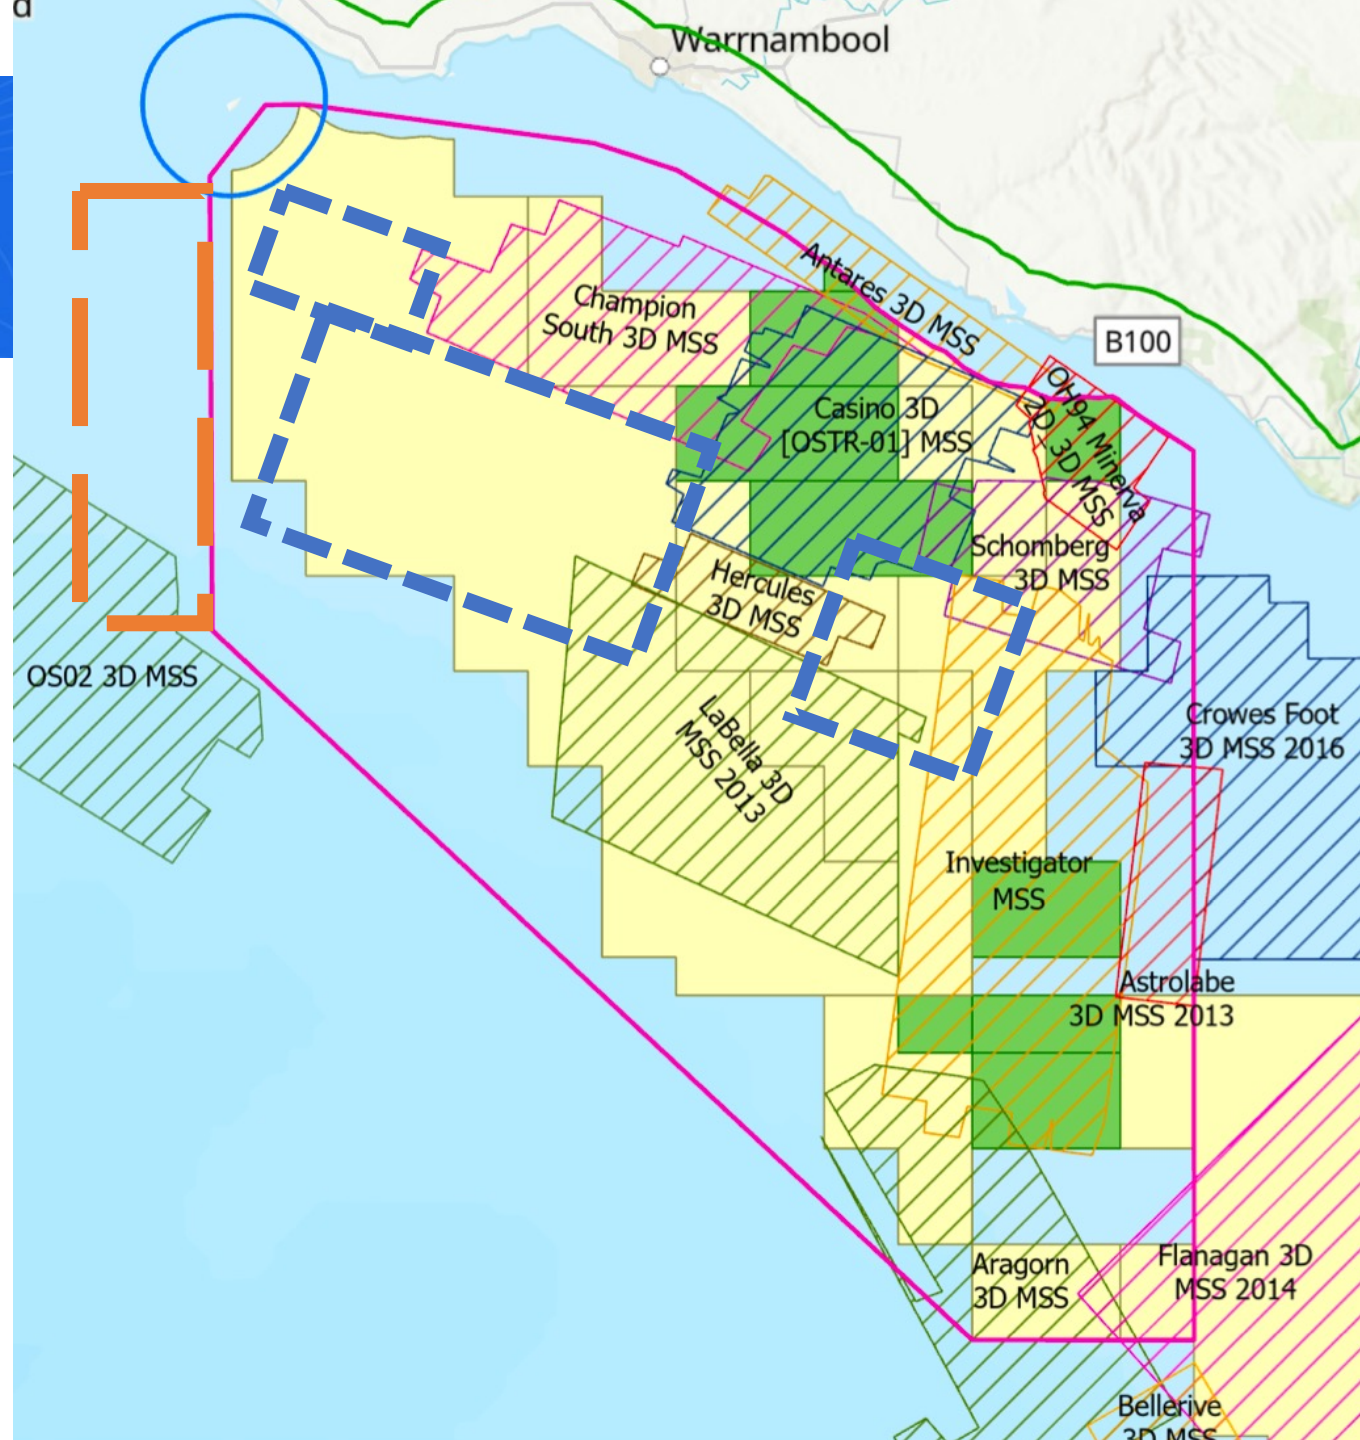

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Deen Maar/Lady Julia Percy Island is a significant place for ecological and cultural heritage values and sensitivities.	<p><i>Ecological</i> We have identified protected species on the island and have modelled sound propagation around the area. We agree that ecological values should be protected.</p> <p><i>Cultural heritage</i> We have introductory discussions with Traditional Owners this week. We understand that there may be spiritual values to protect both on the island and between the island and the mainland.</p>	<p><i>Ecological</i> Implemented a 10.3km exclusion around the island which is the behavioral response threshold for marine mammals.</p> <p><i>Cultural heritage</i> As above for a starting point around the island, plus, preparing to put an exclusion zone in place between the island and the mainland. Need validation of appropriateness through consultation.</p>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Why are you doing seismic in this area again?	We are targeting areas that have not been surveyed before though there will be some overlap with previous surveys.	Provide maps to the community of previous seismic surveys over the area in the context of the Regia MSS.
The community is fatigued by the consultation for all these petroleum activities.	We understand the burden being placed on relevant persons.	We undertook joint community events to try and reduce the fatigue people may experience.
There is confusion about what activities are planned in this region because you haven't separated the consultation.  We care more about the seismic activity and want separate consultation events.	We understand that there may be some confusion arising from our response to claims of consultation fatigue.	Undertook a requested session in Port Fairy. Plan to carry out Regia MSS only community sessions in Apollo Bay and Port Fairy.

# Maps

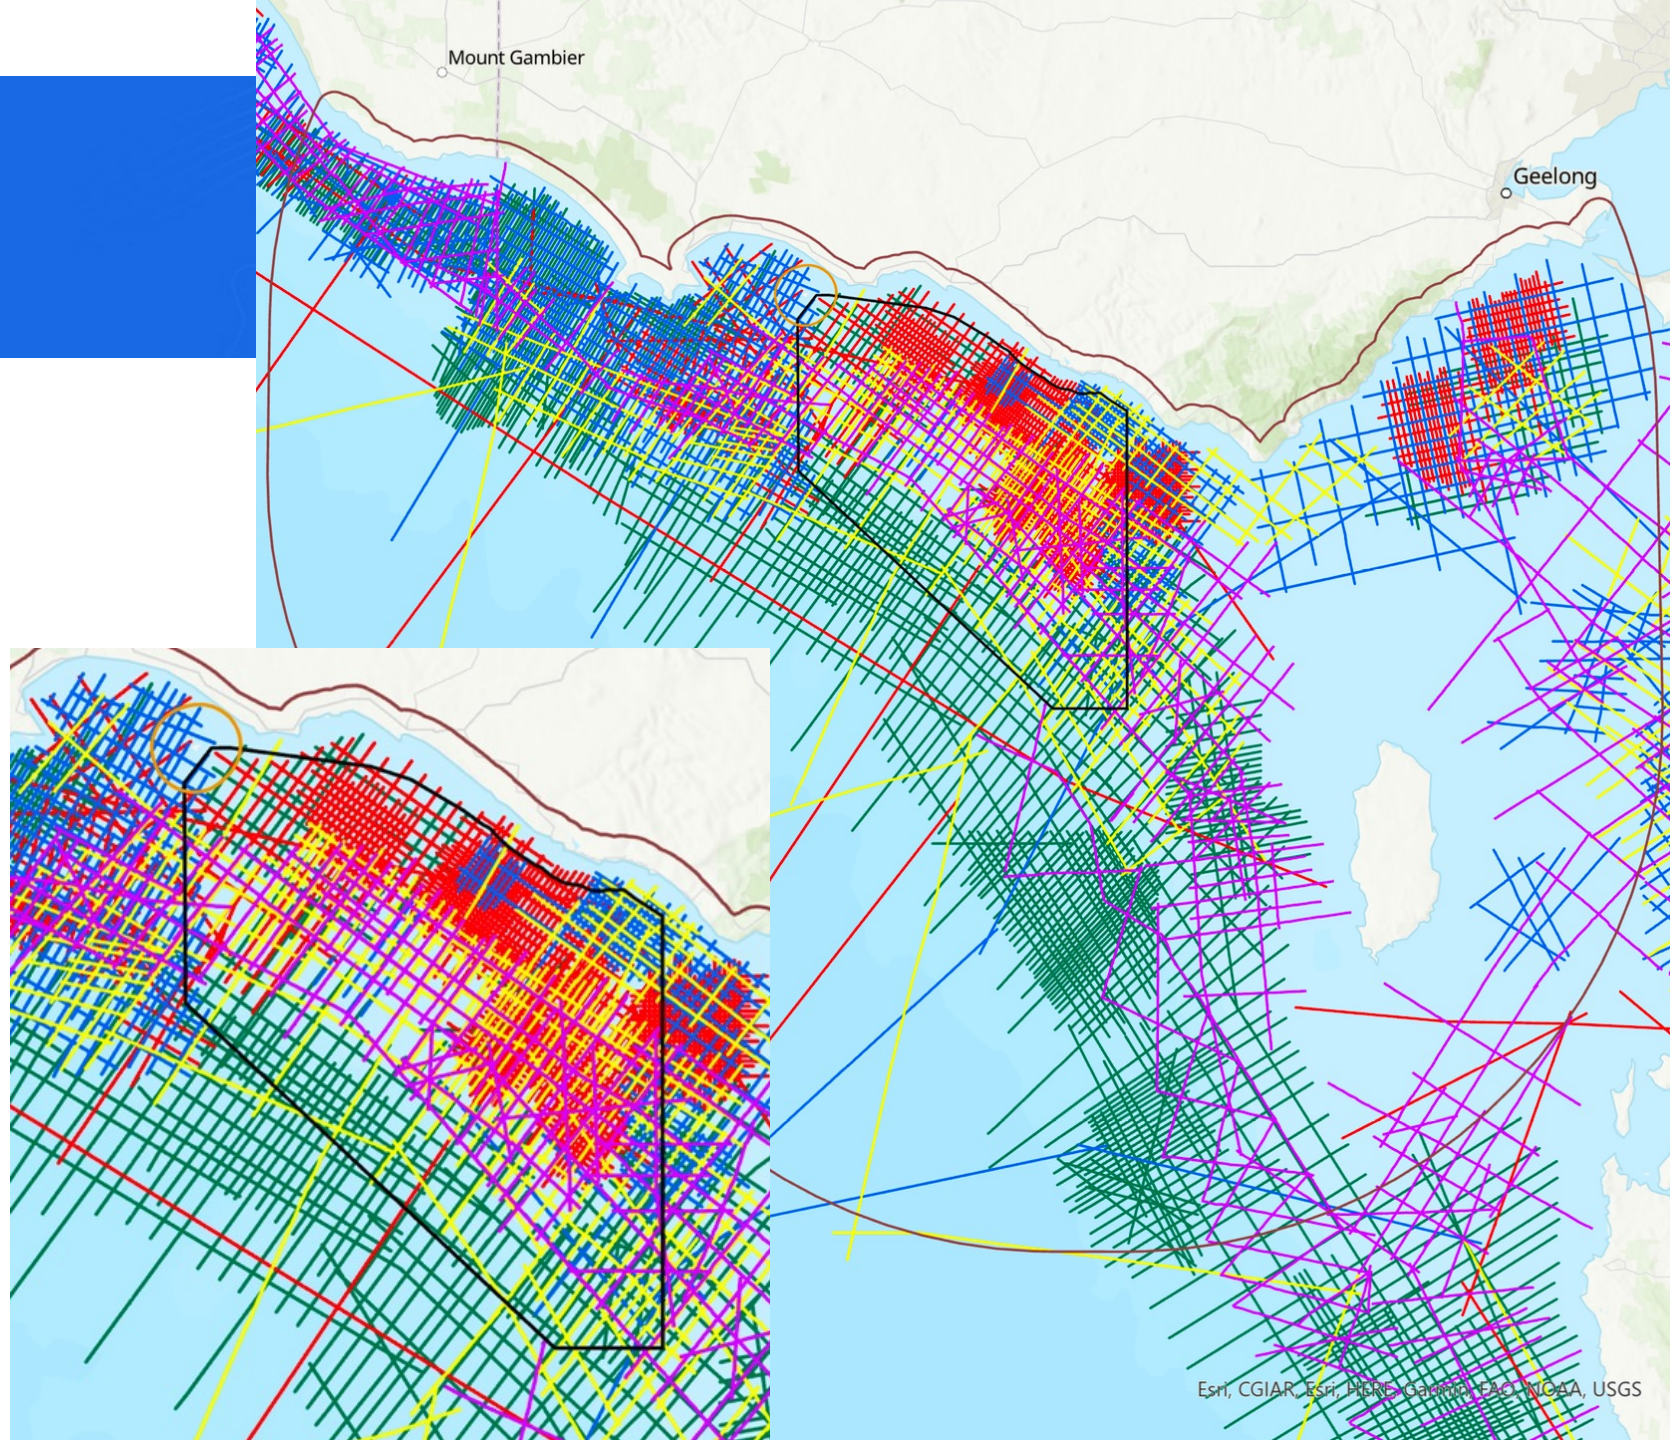

- Previous 3D Seismic
- Proposed acquisition area
- New activity area
- Possibility of phasing

# Maps (2)

- Previous 2D Seismic
- 82 surveys since 1963
- Exploring case studies

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
No impacts from seismic are of an acceptable level.	This is not supported by the literature or the legislation.	Publish our predicted levels of impact and risk.
Seismic surveying is not required given that no new oil or gas should be developed to be consistent with increased temperature increase of 1.5 degrees (the Paris Agreement).	The 'no new oil or gas' statement comes from the IEA WEO 2021, NZE Scenario which is a global analysis predicated on a demand driven decrease in fossil fuel use. Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
The effects on fish and fish population are permanent and will damage our commercial fishing industry.	The effects of seismic sound on most species are well understood. There are no mortal effects predicted to any fish or invertebrate species from seismic sound.	Consult with commercial fishers and the VFA to understand the productivity and utilization of commercial fishing resources in the area.
Seismic blasting will kill zooplankton out to 1.2km which have a fundamental role for ecological integrity as food for krill and subsequently krill are food for whales.	<p>The effects of seismic sound from the Regia MSS may have mortal effects on zooplankton out to approximately 220m.</p> <p>Zooplankton are ubiquitous and abundant with natural mortality rates of 20-50% and high levels of recoverability (within days). The Regia MSS will cover 0.2% of the bioregion per day.</p>	<p>Publish the modelling and impact assessment of sound on zooplankton.</p> <p>Carry out the activity within the limits set by the Environment Plan.</p>

# Additional Measures Under Assessment

- Avoidance of West Tasmanian Canyons (and others)
- Avoidance of >400m contour for upwelling avoidance (if early summer)
- Testing some new technology:
  - Underwater glider whale monitoring
  - Moored buoy monitoring
  - High frequency elimination/reduction sound source
  - Drones for whale detections
- Phasing survey across 2 or 3 years to reduce impacts given timing sensitivities
- Buffers (distance) from other petroleum activities

# Q&A

### 3 Newsletter and Campaign Emails Report

This report documents all newsletter and campaign emails related to the Regia MSS consultation. Mailouts originating from both Mailerlite and Consultation Manager are accompanied by supplementary reports, providing in-depth insights to percentage of emails opened, link clicks and other relevant metrics.

Subject: Regia Marine Seismic Survey - Webinar Wednesday 1st March 2023

Date: Monday, 27 February 2023 9:49:00 AM

Attachments: [image004.png](#)

Good Morning,

Thank you for registering for the Regia MSS Webinar, please see details below.

### ***Details of Webinar***

CGG invites you to hear from our environment team about our proposed Regia Marine Seismic Survey. The purpose of this first webinar is to raise awareness about the project. Specifically we will introduce our consultation framework and the environmental assessment process.

In this webinar we will cover; an introduction to the Regia MSS proposed activity, the consultation and environmental assessment processes, progress so far, and what happens next. There will be time for questions and answers. CGG is proposing to undertake the Regia Marine Seismic Survey. Details about the activity can be found on the activity website [www.regiamss.com.au](http://www.regiamss.com.au).

Consultation started on 1 February 2023 and will continue until 30 June 2023 when we pause to prepare a submission for public comment facilitated by the regulator, the National Offshore Petroleum Safety and Environmental Management Authority. This webinar is the first in the series of public monthly webinars about the progress of the project.

### ***Speaker:***

#### **Matt Smith**

Environment Consultant CGG/Klarite

Matt Smith will host and present this webinar. He has over 20 years experience in offshore energy projects with particular expertise in community consultation and environmental management. He was a regulator with NOPSEMA between 2011 and 2018 and has been supporting offshore energy projects gain social licence ever since.

**Link to Webinar Registration:** <https://events.teams.microsoft.com/event/13e11331-95d5-4aee-ad3e-30d417f8ded2@6ffac073-90f2-4945-b014-1c83f279a621>

We look forward to seeing you at the Webinar on Wednesday 1<sup>st</sup> March. If you are unable to attend, a link to a recording of the webinar will be sent out to you.

Kind Regards

Regia MSS Environmental Consultant Team.

## **Welcome to the Regia MSS Newsletter**

Thank you for registering for the Regia Marine Seismic Survey newsletter. We hope you've been able to find some time to review the information on our website. In this month's newsletter we will update you on progress made on the activity design, the consultation process, and the environmental assessments.

---

## Activity Design

We are currently progressing the final designs of the activity. The Activity Planning Area has been set and there will be no petroleum activity outside this area. The Activity Planning Area can be seen above and on our [interactive map](#). Currently the window of the activity is between 1 November 2023 and 31 October 2028. This will naturally narrow as we complete consultations with the community and undertake the environmental assessments.

By the end of March we aim to be in a position to share our Acquisition Area(s), our Active Source Area(s), and our Operational Area. We will also share an indication of our sail lines as soon as they are available. These will all be within the Activity Planning Area.

# ENGAGE WITH REGIA MSS

## Consultation

We have commenced consultation with the community on 1 February 2023 and published our Community Consultation and Engagement Plan. We are currently looking for people who may be affected by the Regia MSS.

We have created social media sites for Regia on Facebook, Instagram and LinkedIn. We have been interviewed on ABC Southwest Victoria and are about to raise awareness about the activity on Coast FM, 3CS, MixxFM, 3HA, and 3CSFM. We have written to relevant Commonwealth/State agencies and to fishing associations. We have also written to Traditional Owner representative groups, conservation groups and local Chambers of Commerce.

In the coming month we will continue to identify persons who may be affected by the Regia MSS. We will continue to post updates on our social media sites. Our print media and radio campaigns start shortly. Planning for community visits and face-to-face meetings will commence in March and we invite you to share your preferred times and places to meet with us.

[Contact us](#)

---

# Environmental Assessments

We understand that our environmental assessments underpin our credibility with the community and with our regulators. We have committed to a transparent process as we complete the impact and risk assessments.

We have commissioned a preliminary environmental impact and risk assessment (PEIRA) that will identify the possible cause/effect pathways that arise from our activity. The PEIRA will also identify the possible extent and duration of our impacts and risks and identify where we need to complete more detailed assessments.

Alongside the PEIRA we will share our processes for environmental impact and risk assessment, known as EIA and ERA respectively. We will publish our environmental assessment processes and the PEIRA, inviting the public to comment on and improve the basis for our environmental management of the Regia MSS.

In March, we are seeking further environmental context for our detailed assessments. We hope that the community will be able to share their environmental knowledge with us by providing location-based feedback through our interactive map.

Regia MSS - Webinar 1 - 1st March 2023 - Recording

**Date:**

Monday, 6 March 2023 10:31:00 AM

Good Morning,

Thank you for your interest in the Regia MSS webinar series. A recording of our first webinar is available on our website at [www.regiamss.com.au](http://www.regiamss.com.au) if you would like to rewatch or if you were unable to attend the live webinar last week.

Many thanks  
Regia MSS Team

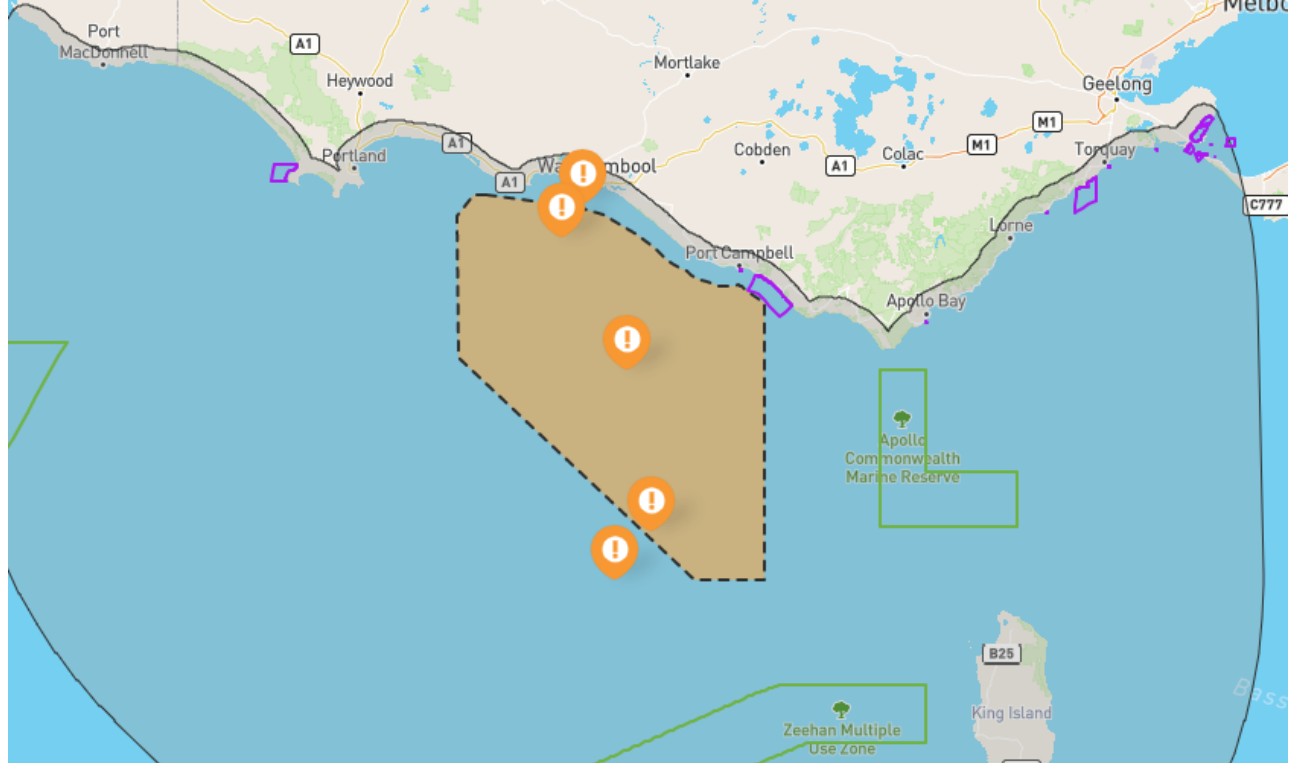

## **Welcome to the March Newsletter for the Regia Marine Seismic Survey**

Thank you for registering for the Regia Marine Seismic Survey newsletter. We hope you've been able to find some time to review the information on our website. We have had another busy month raising awareness about our activity and commencing consultation with relevant persons. Like last month, this newsletter covers updates to the activity, the consultation process, and the environmental assessment process.

---

## Activity Update

We have published our full Description of Activity and identified the environmental aspects arising from the activity. We have added a change register to this document to record how our activity design changes over time because of the impact assessment and consultation.

In April, we will start the process of narrowing the activity parameters to:

- Minimise our overall environmental impact.
- Comply with legislative requirements.
- Reflect community feedback.
- Ensure we can demonstrate acceptable levels of impact and risk.

In early April we will publish our Implementation Strategy. This document explains how we plan to monitor our environmental performance before, during, and after the activity. It is directly aligned with the regulatory requirements and, like the Description of Activity, will be updated over time to reflect commitments we make to protect the environment.

---

# ENGAGE WITH REGIA MSS

## Consultation Update

In March, the following efforts have been made to raise awareness about the project and identify relevant persons for consultation:

- 4-week radio campaign of adverts
- Interviews on 3 local radio stations
- 4-week print media campaign
- Ongoing social media advertisements and posts

Our website continues to see increased visitors with over 1200 unique visitors and 31 responses to surveys. Our website will launch its discussion forums in April to invite dialogue on the environmental aspects of our activity.

We have received our first comments on the interactive map. We acknowledge that there have been objections to the Regia MSS and commit to listening to these concerns. As a reminder, the initial purpose of community engagement is about finding each affected person to consult with directly. The purpose of our community engagement is not to question if petroleum activity is necessary – the Australian Government has already deemed it to be necessary. As such, and as per NOPSEMA guidance, objections to oil and gas alone are not a relevant consideration to their decision making. Notwithstanding, we commit to working with relevant persons despite these objections to reveal underlying issues about how the Regia MSS needs to manage environmental impacts and risks.

In that light, from our consultations to date, we have heard that Southern Right Whales and fishing interests are some of the communities' top priorities for

protection. We are committed to finding ways of doing this by involving those who care about these receptors in our decision making.

So far, we have identified and communicated with 137 organisations and 97 people and are still awaiting responses in some cases. We are committed to identifying each relevant person and we are ramping up our efforts to find people who may be affected by our activities.

We will be visiting the community along the Victorian coast throughout April, May and June. We aim to visit local businesses and community groups as well as hosting information sessions throughout these months in multiple locations. If you would like an information session to be held near you, please get in touch with us on [contact@regiamss.com.au](mailto:contact@regiamss.com.au)

Contact us

---

## Environmental Update

Our environmental assessment process ramps up in the coming months since we have now achieved the following milestones:

- Commissioned and published a Preliminary Environment Impact and Risk Assessment.
- Completed and published our Proposed Decision Making Criteria for community review.
- Commenced and published our Environment Plan Chapter on Legislative Requirements.
- Commissioned sound propagation modelling with an independent expert consultancy.
- Commence analysis of historical accidental fuel releases from seismic activities.

We have requested fishing data from the Victorian Fisheries Authority so that we can complete detailed impact assessments and identify the individual fishers who may be affected by the survey.

In April, we will start preparation of our impact and risk assessments. Once available, each of these assessments will be published on the Regia MSS Consultation Hub. These documents are not traditionally published prior to submission. However, we believe it is more transparent and supports a more meaningful consultation process to have these documents easily accessible to people as soon as they are available.

Visit our Interactive Map

---

### Join us for our monthly webinar

CGG invites you to hear from our environment team about our proposed Regia Marine Seismic Survey. The purpose of this second webinar is to communicate progress on designing the activity, the environmental assessment, and the consultation processes. There will be time for questions and answers at the end of the presentation. This webinar is the second in the series of public monthly webinars about the progress of the activity. A recording of the webinar will be made available afterwards if you miss this timing.

Subject: Regia Marine Seismic Survey - Webinar Tuesday 4th April 2023

Date: Saturday, 1 April 2023 11:59:00 AM

Attachments: [image001.png](#)

---

Good Morning,

Thank you for registering for the Regia MSS Webinar, please see details below.

***Details of Webinar***

**Regia MSS - Webinar 2**

CGG invites you to hear from our environment team about our proposed Regia Marine Seismic Survey. The purpose of this second webinar is to communicate progress on designing the activity, the environmental assessment, and the consultation processes. There will be time for questions and answers at the end of the presentation. This webinar is the second in the series of public monthly webinars about the progress of the activity. A recording of the webinar will be made available afterwards if you miss this timing.

***Speaker:***

**Matt Smith**

Environment Consultant CGG/Klarite

Matt Smith will host and present this webinar. He has over 20 years experience in offshore energy projects with particular expertise in community consultation and environmental management. He was a regulator with NOPSEMA between 2011 and 2018 and has been supporting offshore energy projects gain social licence ever since.

**Link to Webinar Registration:** <https://events.teams.microsoft.com/event/8562f76a-8cf7-48d4-988f-9d0684799802@6ffac073-90f2-4945-b014-1c83f279a621>

We look forward to seeing you at the Webinar on Tuesday 4<sup>th</sup> April. If you are unable to attend, a link to a recording of the webinar will be sent out to you.

Kind Regards

Regia MSS Environmental Consultant Team.

**From:**

[Redacted email address]

**Subject:** Regia MSS - Webinar 2 - 4th April 2023 - Recording

**Date:** Tuesday, 4 April 2023 5:09:00 PM

---

Good Afternoon,

Thank you for your interest in the Regia MSS webinar series. A recording of our second webinar is available on our website at [www.regiamss.com.au](http://www.regiamss.com.au) if you would like to rewatch or if you were unable to attend the live webinar today.

Many thanks

Regia MSS Team

## **Welcome to Newsletter 3 for the Regia Marine Seismic Survey**

Planning for the Regia Marine Seismic Survey (Regia MSS) continued over the last month with community information sessions, as well as consultation with individuals, local councils and associations, providing input into the activity design and environmental assessments. As usual, this newsletter will update readers on the consultation process, the activity design, and the environmental assessment process.

---

# ENGAGE WITH REGIA MSS

## Consultation Process

Our consultation with relevant persons has ramped up over the last month with 1714 visitors to the website, with 49 community members registering as relevant persons, and 29 comments received on the interactive map. We were pleased to welcome nearly 100 people to information sessions in Warrnambool, Portland, Peterborough, Port Campbell, Apollo Bay, and Port Fairy.

We have been listening to comments received in these information sessions, both positive and negative and have committed to sharing our characterisation of these views with the community in future sessions. We continue to encourage people to share their views and to share their underlying reasons so that we can manage them. We want to hear about the specific environmental values of the community so that we can protect them or minimise harm.

We have heard in our consultations that the community values the oceans highly with lots of recreational users (surfers, swimmers, fishers) self-identifying as relevant persons. We have heard specific concerns for marine mammals, abalone, rock lobster, shellfish, and zooplankton. We will address these concerns in our environmental assessments and will publish these as soon as they are ready.

We are planning our next visits to the region. We are looking to carry out further community information sessions in late May or early June. Details of these sessions will be shared in a future newsletter and again on radio, social media, and print media.

## Activity Design

The activity areas and timing continue to be narrowed and refined based on community feedback. We have heard from the community that acquiring seismic when the Southern Right Whales are present in their Biologically Important Area would be unacceptable. We agree and have made this commitment to protecting Southern Right Whales. We are still listening to the community and talking to relevant persons as we balance our geophysical objectives with the priorities for environmental protection in the region.

We heard from attendees at the Warrnambool session about the environmental value of Lady Julia Percy Island, known as Deen Maar or Dhinmar in the Guditjmarra language. Whilst we have struggled to connect with Eastern Maar and Guditjmarra people so far, we will continue to try to connect with them so that we can learn about this, and other, important cultural sensitivities. We are preparing to put an exclusion zone around Deen Maar and will continue to seek out Traditional Owner representatives to determine what an appropriate distance this should take.

---

## Environmental Assessments

We have been progressing our assessments of environmental impact and risk over recent weeks. These assessments build on the preliminary work that we have already published. Our assessments are focused on the ways that the activity interacts with the environment and are informed by the legislated protections put in place for different species. Community views are also considered in the assessment process, and you can share specific concerns with our assessment team by sending relevant information to [contact@regjamss.com.au](mailto:contact@regjamss.com.au).

Our environmental assessments will use our Decision-Making Criteria to analyse environmental impact and risks and make a prediction of the level of impact and risk. These levels will be compared to the defined acceptable levels we have previously published. You can comment on the Decision-Making

Criteria and our defined acceptable levels of impact and risk through the website.

**Date:** Tuesday, 16 May 2023 12:37:22 PM

---

Hello,

You are receiving this email due as a relevant person or organisation, or as an interested community member, for the planned Regia Marine Seismic Survey (the project webpage is available [here](#)).

We are holding another Community Information Session in Apollo Bay, details are as follows:

**Date:** Wednesday June 14<sup>th</sup>  
**Time:** 6pm  
**Venue:** Apollo Bay Bowls Club

If you have any questions, please don't hesitate to contact us.

Kind regards,

Regia MSS Environment Team  
[contact@regiamss.com.au](mailto:contact@regiamss.com.au)

As per Clause 11A(4) of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, we are obligated to tell you that you may request that information you provide to us not be published in the Environment Plan. Correspondence between us will be provided in full to NOPSEMA in a part of the Environment Plan which is marked as sensitive and will not be published.

---

Hello,

You are receiving this email due as a relevant person or organisation, or as an interested community member, located in Port Fairy, for the planned Regia Marine Seismic Survey (the project webpage is available [here](#)).

We are holding another Community Information Session in Port Fairy, details are as follows:

Date: Friday June 16th

Time: 6pm

Venue: Port Fairy Community House, 5 Railway Place, Port Fairy

If you have any questions, please don't hesitate to contact us.

Kind regards,

Regia MSS Environment Team

## Regia MSS Newsletter 4

Planning for the Regia Marine Seismic Survey (Regia MSS) continued over the last month with consultation with relevant persons who provided input into the activity design and environmental assessments. As usual, this newsletter will update readers on the consultation process, the activity design, and the environmental assessment process.

## Activity Design

We have been grateful for all the feedback about environmental values and sensitivities in the region. As our understanding of the environment develops, we are adjusting our activity to minimise our impacts. We can now make the following commitments.

1. Activity Limitation: No seismic acquisition shallower than 40 metres water depth to reduce impacts to commercial and recreational fishers, surfers, swimmers, and coastal users.

2. Activity Limitation: No seismic acquisition within 10.3 kilometres of Lady Julia Percy Island/Deen Maar to ensure no effects to resident sea lion populations, nesting birds, and other species. This distance is based on preliminary results from our sound modelling for the behavioural response criteria for marine mammals.

The interactive map has been updated to show these exclusion zones along with a justification for the exclusion.

These limitations mean that we've had to adjust our activity planning area. We will be extending the activity planning area 10 kms west to accommodate vessel movements and line turns. There will be no acquisition in this extended area. This change will be reflected on the interactive map shortly.

[View Updated Interactive Map](#)

## Consultation Process

We have scheduled the next round of visits to the community so that we can meet people who were unable to attend the first sessions and update the community on our environmental assessments. We will be sharing with the community what we've heard so far and how we have taken that feedback into account.

We are scheduled to present in the following venues in the next week alongside ConocoPhillips:

- Warrnambool, 29 May at 6–8pm in the Archie Graham Community Centre
- Port Fairy, 30 May at 6–8pm in the Star of the West Hotel

- Portland, 31 May at 6–8pm in the Portland Yacht Club

As requested by the community we are also undertaking Regia Marine Seismic Survey only Information Sessions at the following venues:

- Apollo Bay, 14 June at 6–8pm in the Apollo Bay Bowls Club
- Port Fairy, 16 June at 6–8pm in the Port Fairy Community Centre

NOPSEMA has recently published a brochure with information for the community about consultation on offshore petroleum environment plans. The brochure has excellent information to help people decide if you are a relevant person and can be found [here](#). We strongly encourage those of you uncertain about whether you are a relevant person to consider this information.

According to the NOPSEMA brochure, you may be a relevant person if you or your organisation have functions, interests, or activities that may be affected by an offshore petroleum activity proposed under an environment plan being prepared or already underway under an environment plan being revised. The terms ‘functions’ ‘interests’ and ‘activities’ should be read broadly. You do not have to have a legal or financial interest that may be affected by an offshore petroleum activity to be a relevant person. Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species. However, to be a relevant person your interests should be more than a general interest in the environment and/or offshore petroleum activities.

If you believe you are a relevant person, we need to understand your activities or interests so that we can provide the right information to you. When engaging with our team we encourage you to be specific about how you may be affected so that we can properly consider how we might avoid or lessen those affects.

NOPSEMA Brochure

---

## Environmental Assessment

We have completed 7 of 9 of our draft environmental assessments and they will be published tomorrow. These documents step through our impact assessment and conclude with a clear prediction of the levels of environmental impact and risk from the Regia MSS. These documents are marked as 'Draft for consultation' and will form the basis of the Environment Plan submission.

These documents are being published three weeks behind our intended schedule as we've taken onboard community information. As a result, we can no longer maintain our intended schedule to pause consultation on 30 June

and submit the Environment Plan in July. Therefore, we are going to delay the submission of our Environment Plan to give the community an additional month to comment on the content. Our website will be updated with the new timeframes soon. The pause in consultation will now occur on 30 July with submission of the Environment Plan in August. As a reminder, consultation continues with relevant persons after the pause, all the way through to the conclusion of the Environmental Plan commitments.

---

## Regia MSS Newsletter - 3rd July 2023

Welcome to the latest Regia MSS newsletter. Once again, the content below focuses on the activity design process, the consultation we're doing, and the environmental assessments underway. You can also watch the latest webinar on demand on our website [www.regiamss.com.au](http://www.regiamss.com.au).

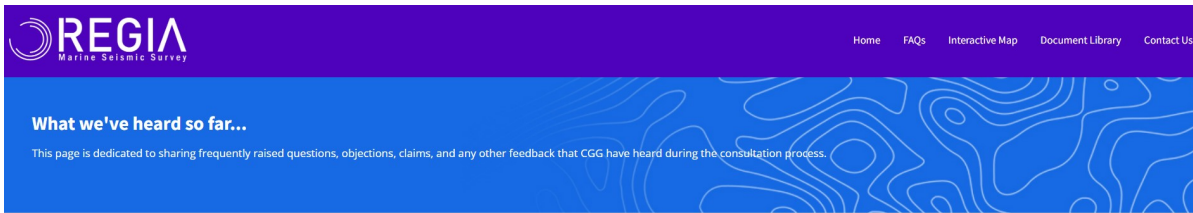

### Activity Update

The activity design is nearly complete. We are carefully considering our buffer distances and exclusion zones before we release our final acquisition areas and operational areas. We have been provided several high use dive sites and surf locations that we're studying to make sure we're protecting anyone who may be in the water during the activity.

We are looking at phasing the activity across years so that we can adequately manage our environmental impacts. Any subsequent phase of the Regia MSS would be subject to a revision of the Environment Plan and therefore a new and separate consultation effort would be required.

We will shortly announce our latest exclusion zones as soon as we've confirmed that we can accommodate the compromises to our geophysical objectives. They may include the West Tasmanian Canyons Key Ecological Feature, some high value fishing grounds, and buffer zones around marine parks.

# Consultation Update

Consultation is an ongoing process of listening to feedback and adapting the Regia MSS to ensure that environmental impacts and risks are properly managed. To support a transparent process for relevant persons we have committed to publishing the objections and claims that we've heard from the community, our view on the feedback, and what we've changed or will do because of the consultations.

The below table is a thematic representation of the feedback we've heard. If you do not see your feedback, objection, or claim shown accurately it may be due to our thematic summary. If you would like to raise other specific feedback, objections, or claims please get in touch with our consultation team at [contact@regiamss.com.au](mailto:contact@regiamss.com.au).

Feedback (Objections or Claims)	Our View (Assessment of Merit)	Measures adopted because of the consultations
Deen Maar/Lady Julia Percy Island is a significant place for ecological and cultural heritage values and sensitivities.	We have identified protected species on the island and have modelled sound propagation around the area. We agree that ecological values should be protected.  We have had introductory discussions with Traditional Owners. We understand that there may be spiritual/cultural values to protect both on the island and between the island and the mainland.	Implemented a 10.3km exclusion around the island which is the behavioral response threshold for marine mammals. This buffer is a starting point around the island for protection of cultural heritage. We are also preparing to put an exclusion zone in place between the island and the mainland. We need to validate the appropriateness through consultation with Traditional Owners.
Why are you doing seismic in this area again?	We are targeting areas that have not been surveyed before though there will be some overlap with previous surveys for operational efficiency and tying together previous data.	Provide maps to the community of previous seismic surveys over the area in the context of the Regia MSS.

We have had a liaison officer out in the community for the last 3 months. Open community sessions and 1-on-1 meetings have taught us a lot about the environmental values and sensitivities the community has in the region. We are grateful to everyone that has provided time and input into our environmental assessment processes.

We will be back in the community and available for meetings in early August. If you would like to request an in person meeting with one of the Regia MSS team please email [contact@regiamss.com.au](mailto:contact@regiamss.com.au) and we'll organise a time to ensure you have sufficient information to make an informed assessment of how you may be affected by the activity. We are also able to accommodate online meetings and presentations, phone calls, and written correspondence, through-out the consultation process.

To remain transparent, we have published a new page on our website ([What we've heard so far...](#)) sharing a thematic summary of the objections and claims we've heard and what we're doing in response to this feedback. We hope it helps the community understand the collective views we've heard from our travels in the region and our perspective on those matters.

To date, we have published all available information from our environmental assessments on our website. Recently we have published our initial sound modelling report, a summary for divers/swimmers, and a summary on marine mammal protection measures. There is lots more to come so we've extended the timeframe for consultation for another month. This takes the process to 7

months prior to submission. Consultation continues even after submission, as well as prior to, during, and after the activity.

# Environmental Assessment

We have recently been provided more information from relevant persons on the areas used by divers and surfers and we're taking that into account. Similarly, we've learned more about the importance of the little penguin and eels. We're taking some extra time to ensure we're adequately protecting these species.

We aim to publish our final two impact assessments within the next fortnight. They are about our predictions of interference with other marine users, and our predictions of impacts from elevated levels of sound. We are currently working on a series of management plans or programs to protect cultural heritage, recreational marine users, and marine mammals.

---

*As part of the Regia MSS project, we value open and inclusive communication. We understand that not everyone may have desired to receive this newsletter, and we apologize for any inconvenience caused. We remain committed to ensuring a full and thorough consultation process for all. If you prefer not to receive future newsletters from us, we respect your decision and kindly invite you to unsubscribe using the link provided below. Your feedback and preferences matter to us, and we appreciate your continued engagement with this project.*

## **Regia MSS Newsletter – 3 July 2023**

Welcome to the latest Regia MSS newsletter. Once again, the content below focuses on the activity design process, the consultation we're doing, and the environmental assessments underway. You can also watch the latest webinar on demand on our website [www.regiamss.com.au](http://www.regiamss.com.au).

### ***Activity Update***

The activity design is nearly complete. We are carefully considering our buffer distances and exclusion zones before we release our final acquisition areas and operational areas. We have been provided several high use dive sites and surf locations that we're studying to make sure we're protecting anyone who may be in the water during the activity.

We are looking at phasing the activity across years so that we can adequately manage our environmental impacts. Any subsequent phase of the Regia MSS would be subject to a revision of the Environment Plan and therefore a new and separate consultation effort would be

required.

We will shortly announce our latest exclusion zones as soon as we've confirmed that we can accommodate the compromises to our geophysical objectives. They may include the West Tasmanian Canyons Key Ecological Feature, some high value fishing grounds, and buffer zones around marine parks.

### *Consultation Update*

We have had a liaison officer out in the community for the last 3 months. Open community sessions and 1-on-1 meetings have taught us a lot about the environmental values and sensitivities the community has in the region. We are grateful to everyone that has provided time and input into our environmental assessment processes.

We will be back in the community and available for meetings in early August. If you would like to request an in person meeting with one of the Regia MSS team please email [contact@regiamss.com.au](mailto:contact@regiamss.com.au) and we'll organise a time to ensure you have sufficient information to make an informed assessment of how you may be affected by the activity. We are also able to accommodate online meetings and presentations, phone calls, and written correspondence, through-out the consultation process.

To remain transparent, we have published a new page on our website ([What we've heard so far...](#)) sharing a thematic summary of the objections and claims we've heard and what we're doing in response to this feedback. We hope it helps the community understand the collective views we've heard from our travels in the region and our perspective on those matters.

To date, we have published all available information from our environmental assessments on our website. Recently we have published our initial sound modelling report, a summary for divers/swimmers, and a summary on marine mammal protection measures. There is lots more to come so we've extended the timeframe for consultation for another month. This takes the process to 7 months prior to submission. Consultation continues even after submission, as well as prior to, during, and after the activity.

## *Environmental Assessment*

We have recently been provided more information from relevant persons on the areas used by divers and surfers and we're taking that into account. Similarly, we've learned more about the importance of the little penguin and eels. We're taking some extra time to ensure we're adequately protecting these species.

We aim to publish our final two impact assessments within the next fortnight. They are about our predictions of interference with other marine users, and our predictions of impacts from elevated levels of sound. We are currently working on a series of management plans or programs to protect cultural heritage, recreational marine users, and marine mammals.

As part of the Regia MSS project, we value open and inclusive communication. We understand that not everyone may have desired to receive this newsletter, and we apologize for any inconvenience caused. We remain committed to ensuring a full and thorough consultation process for all. If you prefer not to receive future newsletters from us, we respect your decision and kindly invite you to unsubscribe using the link provided below. Your feedback and preferences matter

to us, and we appreciate your continued engagement with this project.

## **Project Update - Regia MSS Progress**

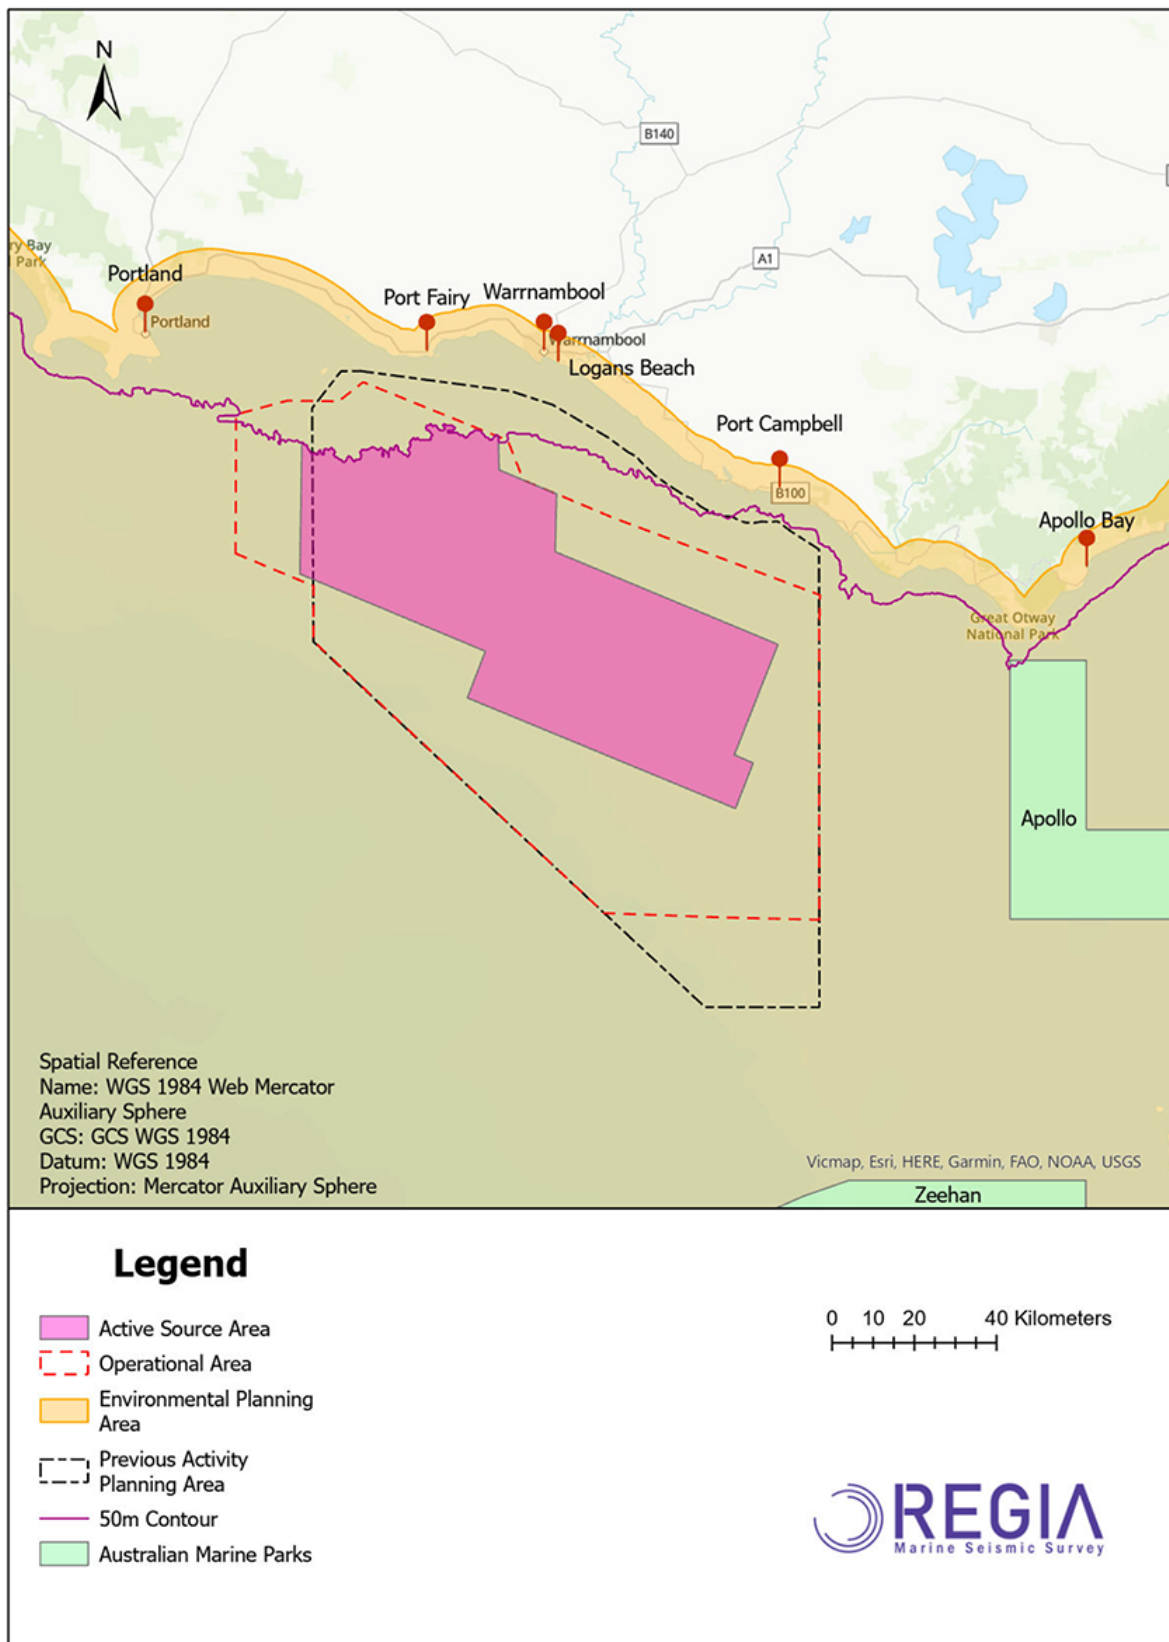

This week we have reached a significant milestone in the preparation of an Environment Plan for submission to the regulator, NOPSEMA. This update outlines advancements in activity design, ongoing environmental assessments, and the consultation process going forward, in preparation of an Environment Plan (EP) for submission to NOPSEMA.

## **Activity Design**

We have finalised the proposed operational area, active source area, and timing for the survey in response to community feedback. The operational area is where the vessel may be present and the active source area is where the sound source may be discharged at full-power. These areas underpin our environmental assessments and may narrow as we further refine the activity design.

## Consultation

Following consultation with relevant persons we have decided to alter our activity timing from a 6-month window (November – May), to two separate 3-month windows of April – June, or September – November. The activity will

occur once in these windows between 2024 and 2028. The decision to alter timing reflects an additional priority for protection and the implementation of an additional impact management buffer for Southern Right Whales (SRW).

SRW's remain our priority for protection and we are now increasing the level of protection afforded to the biodiversity associated with the summer upwelling events. Finding ways to reduce impacts to these sensitivities has led to the implementation of:

- an additional impact management area for SRW's (which extends 11.3km beyond the proposed reproductive biologically important area), and
- the change in timing to avoid the expected increase in blue whales associated with the summer upwelling.

Further activity limitations and impact management zones as a result of this change are being finalised and will be announced soon.

## Operational

Further analysis of operational requirements has shown that we will no longer need to acquire data in water shallower than 50m. This has the added advantage of increasing the survey's distance from shore and offers additional biodiversity protection.

## Environmental Assessment

All assessments, except for the effects from elevated levels of underwater sound and oil spill risks, have been available on our website since 27th May 2023. The completion of our environmental assessment work was extended due to community input and the above mentioned design modifications, and now all assessment reports are available on the [Regia MSS website](#), including:

- Seismic sound studies report
- Commercial fisheries analysis report
- Vessel physical presence
- Oil spill risk assessment
- Impact assessment of underwater sound on birds

- Impact assessment of underwater sound on turtles
- Impact assessment of underwater sound on marine mammals
- Impact assessment of underwater sound on plankton
- Impact assessment of underwater sound on fish
- Impact assessment of underwater sound on invertebrates
- Impact assessment of underwater sound on divers, swimmers, and surfers

These documents have been prepared to help relevant persons review the high volume of content we are presenting and to encourage involvement in the environmental planning process.

We welcome feedback from anyone on the quality of our work and/or any information that we may have overlooked or underappreciated. We remain open to consider alternative, additional, or improved ways of protecting the environment.

## Consultation Update

To enhance understanding, we are delivering sufficient information to facilitate informed assessment of potential consequences on relevant persons' functions, interests, and activities. We have extended consultation timeframes a third time as outlined below.

- Pre-submission to NOPSEMA: 20<sup>th</sup> October 2023
- NOPSEMA Public comment period: Nov – Dec 2023

Comments received outside of the NOPSEMA public comment period after 20<sup>th</sup> October will be addressed in the resubmission of the EP after the public comment. However, consultation remains active throughout the EP preparation, NOPSEMA assessment, and beyond.

You have flexibility in how you consult with us on the Regia MSS, whether through consultation as a relevant person or through public submissions to NOPSEMA. Being identified as a relevant person ensures ongoing input in the environmental planning process beyond NOPSEMA's assessment, aiding in the continuous improvement of environmental management of the Regia MSS.

---

*As part of the Regia MSS project, we value open and inclusive communication. We understand that not everyone may have desired to receive this project update, and we apologize for any inconvenience caused. We remain committed to ensuring a full and thorough consultation process for all. If you prefer not to receive future updates from us, we respect your decision and kindly invite you to unsubscribe using the link provided below. Your feedback and preferences matter to us, and we appreciate your continued engagement with this project.*

# Project Update & Webinar Registration

You are receiving this email as an interested party or relevant person for the proposed Regia Marine Seismic Survey, as there are some important dates you may need to know regarding the upcoming public comment period.

## Consultation

Consultation will be paused on **20<sup>th</sup> October** for approximately 10 days while the EP is prepared for submission to the regulator, NOPSEMA. We intend to submit the EP to NOPSEMA on **30<sup>th</sup> October**, after which NOPSEMA will carry out a completeness check within 5 business days. At this time NOPSEMA may decide the EP is incomplete and so it will not be published until additional work is undertaken. If it is accepted as complete, NOPSEMA will publish the EP on their [website](#) to allow public comments to be submitted.

Comments received after 20<sup>th</sup> October will be addressed in the EP after the public comment period, ahead of its submission for formal assessment by NOPSEMA. However, consultation will remain active throughout the EP preparation, NOPSEMA assessment, and beyond.

As always, we welcome and encourage both new and continued engagement. Our environmental impact and risk assessments are available now in the [document library](#), for review and feedback. If you feel someone you know may

be a relevant person you are encouraged to pass on our [contact details](#) to them.

# Webinar

We will be holding a webinar on Friday 6<sup>th</sup> October at 1600 AEST, to discuss recent project updates, the public comment process and to answer any questions you may have concerning this. To sign up to the webinar please follow this link.

Webinar Registration

The recording of the webinar will be available within 48 hours on our website, [www.regiamss.com.au](http://www.regiamss.com.au).

---

# Public Comment

A description on the public comment process taken from the NOPSEMA website is as follows:

*The public comment process provides an opportunity for community members to raise issues about environmental management matters that have not yet been considered in an environment plan for the proposed activity. To be considered a relevant issue or key matter, a comment must relate to the information contained in the environment plan. Comments could, for example relate to:*

- *the way the existing environment is described in the environment plan for the proposed activity*
- *the environmental impacts and environmental risks of the activity*
- *the titleholders proposed management measures for reducing the environmental impacts and environmental risks*

- *the titleholders proposed methods for monitoring the environmental performance of the activity*

*If there is new information that NOPSEMA and/or the titleholder should consider, commenters are encouraged to provide supporting documents, such as data or scientific reports, or clearly labelled photographs or maps. These can be uploaded via the online platform. It is also important that commenters double check which activity they are submitting a public comment for.*

*Comments submitted accidentally for a different activity will not be considered, nor can they be redirected to the correct activity/titleholder.*

*Information that is irrelevant to NOPSEMA's decision making criteria cannot be considered, examples include:*

- *statements of fundamental objection to oil and gas activity*
- *comments that contain personal threats or profanities*
- *comments that pose questions to NOPSEMA and or/the titleholder*
- *comments made through online social media channels*
- *SPAM mail*
- *petitions*

---

*As part of the Regia MSS project, we value open and inclusive communication. We understand that not everyone may have desired to receive this project update, and we apologize for any inconvenience caused. We remain committed to ensuring a full and thorough consultation process for all. If you prefer not to receive future updates from us, we respect your decision and kindly invite you to unsubscribe using the link provided below. # Project Update

## 20th October 2023

You are receiving this email as an interested party or relevant person for the proposed Regia Marine Seismic Survey.

### What we've heard...

During our consultation on Country last week, we heard that our public comment timing, being similar to other activities in the area and at a busy time of year for many, could result in increased consultation fatigue in the community. First Nations Corporations have also expressed that they have limited resources when engaging with multiple projects.

### What we've changed...

Our engagement process is based on one of co-design with relevant persons, therefore, to address the resourcing and timing concern we have postponed our submission for public comment until next year and **will not be pausing consultation** at this time.

---

# What we're continuing...

As always, we are here to listen and learn about the environmental, cultural, and spiritual importance of the area, so we can co-design the survey to manage any potential impacts. We also encourage conversation and feedback on measures already in place, and on the draft chapters, available [here](#) in our document library.

We encourage you to share our resources and contact details with anyone you may know with an interest in the activity:

Via email at - [contact@regiamss.com.au](mailto:contact@regiamss.com.au)

Via our website - [www.regiamss.com.au](http://www.regiamss.com.au)

Via our project hotline - [+61 455 344 625](tel:+61455344625)

---

Subject:

Regia MSS Consultation

Date:

Friday, 17 November 2023 11:36:00 AM

Good Morning

You are receiving this email as we have recorded your contact details as a potentially relevant person for the proposed marine seismic survey Regia MSS. We are yet to receive a response from you regarding your functions, interests, or activities, that may be affected by the potential impacts of our project. Please find a link to a NOPSEMA that may be of assistance to you in determining this, here: [Consultation on offshore petroleum environment plans brochure](#)

If you would like to consult with us, please respond by **17 December 2023**, describing your functions, interests, or activities, or to request further information to help determine how they may be affected. We also invite you to raise any concerns, objections, or claims you have to the project. This is to make sure your functions, interests, activities, objections, claims and feedback are addressed and reflected in the submitted Environment Plan (EP).

We aim to complete and submit our Environment Plan for public comment and regulatory assessment in the New Year. The public comment provides a further opportunity for community members to raise issues about environmental management matters that have not yet been considered in an environment plan for the proposed activity. More information can be found here, on the NOPSEMA website: [Public Comment](#)

This opportunity to consult with CGG about the activity prior to submission, allows us to better understand the values and sensitivities of the environment and inform the evaluation of the potential impacts and risks associated with the activity, and how to manage them appropriately.

If, after **17 December 2023** you believe that you may be affected by the activity and would like to consult with us, the opportunity to do so remains available to you. To re-register for consultation and to stay informed on this activity you can contact us at any time.

As you have been identified as a potentially relevant person, we will continue to send you

project updates, including notice of the start of Public Comment. If you no longer wish to be contacted by us or receive any further project information, please let us know.

Please note any information you provide can be kept in the sensitive information report and not published upon your request.

Thank you very much for your time

Regia MSS Environment Team

[contact@regiamss.com.au](mailto:contact@regiamss.com.au)

[www.regiamss.com.au](http://www.regiamss.com.au)

+61 455 344 625

The Regia Team, c/oCGG Services (Australia) Pty Ltd  
1 Ord Street  
West Perth WA 6005

**Please note this is a shared email inbox.**

As per Clause 11A(4) of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, we are obligated to tell you that you may request that information you provide to us not be published in the Environment Plan. Correspondence between us will be provided in full to NOPSEMA in a part of the Environment Plan which is marked as sensitive and will not be published.

# **Project Update**

## **November 2023**

You are receiving this email as an interested party or relevant person for the proposed Regia Marine Seismic Survey.

## **How are we doing?**

With an aim to always keep improving, we'd like to hear from you how you think the consultation process has been so far. To provide feedback please follow the link: [Regia MSS Consultation Feedback Survey](#)

As always, we are here to listen and learn about the environmental, cultural, and spiritual importance of the area, so we can co-design the survey to manage any potential impacts. We also encourage conversation and feedback on measures already in place, and on the draft chapters, available here in our [document library](#).

## **We'd like to hear from you...**

Is there a topic relevant to the proposed Regia activity that you would like covered in the next webinar on 12th December? You can submit your questions for the webinar and register [here](#).

# Know someone who may be relevant?

We encourage you to share our consultation material and contact details with anyone you may know with a function, interest or activity in the project. We understand this process is voluntary, however we believe its important to hear from people who live, work and enjoy the environment we would like to work in, prior to us submitting our Environment Plan.

Via email at - [contact@regiamss.com.au](mailto:contact@regiamss.com.au)

Via our website - [www.regiamss.com.au](http://www.regiamss.com.au)

Via our project hotline - [+61 455 344 625](tel:+61455344625)

## Need more information?

We welcome information requests, including summaries of information already available in our document library, at any time through the links above.

---

*As part of the Regia MSS project, we value open and inclusive communication. We understand that not everyone may have desired to receive this project update, and we apologize for any inconvenience caused. We remain committed to ensuring a full and thorough consultation process for all. If you prefer not to receive future updates from us, we respect your decision and kindly invite you to unsubscribe using the link provided below. Your feedback and preferences matter to us, and we appreciate your continued engagement with this project.*

**Subject:** Regia MSS: Information for Commercial Fishers  
**Date:** Friday, 8 December 2023 12:13:04 PM  
**Attachments:** [Regia Marine Seismic Survey & Commercial Fishing Information Sheet.pdf](#)

---

To Whom It May Concern,

We are writing to you regarding the planned Regia project, a 3D marine seismic survey in the Otway Basin. As a commercial fisher, you may have functions, interests and activities that may be affected by the Regia project. Please find enclosed an information sheet for Commercial Fishers, which includes a map, coordinates and potential impacts and measures we have put in place.

Please indicate [here](#), your preferences for ongoing engagement with the project. If you do not respond, we will attempt to contact you again to ensure receipt.

**Other functions, interests, or activities in the activity area?**

Please contact us describing these so we can work with you to ensure any potential impacts are managed and any measures required are put in place. For example, an individual may be a relevant person via commercial fishing activities **and** through a spiritual connection to Sea Country.

**Know someone who may be relevant?**

We encourage you to share our consultation material and contact details with anyone you may know who may be affected by this activity. We understand this process is voluntary, however we believe it's important to hear from people who live, work and enjoy the environment we would like to work in, prior to us submitting our Environment Plan.

**How to get in touch**

Via email at - [contact@regiamss.com.au](mailto:contact@regiamss.com.au)

Via our website - [www.regiamss.com.au](http://www.regiamss.com.au)

Via our project hotline - +61 455 344 625

Mail: CGG Services Australia Pty Ltd, c/o Paul Rheinberg, 1 Ord St, West Perth, WA 6005

Kind regards,

Regia MSS Environment Team

[contact@regiamss.com.au](mailto:contact@regiamss.com.au)

As per Clause 11A(4) of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, we are obligated to tell you that you may request that information you provide to us not be published in the Environment Plan. Correspondence between us will be provided in full to NOPSEMA in a part of the Environment Plan which is marked as sensitive and will not be published.

[Sea Country Protection Program - Draft for consultation.pdf](#)

Hello,

After following our consultation process outlined in previous correspondence, and extending that process by 5 months, CGG believe we have provided all identified relevant persons with sufficient information and a reasonable period for consultation on the Regia marine seismic survey prior to submission. CGG has learned about important values and sensitivities which helped to inform our Environment Plan.

With that being said, we remain open to input from Traditional Owners on the development of our Sea Country Protection Program (SCPP). This program will be used by CGG and other titleholders to help protect Sea County values and promote best-practice collaboration between the oil and gas industry and First Nations Australians. A feature of the SCPP is the opportunity for Traditional Owners with Sea Country values to co-design and co-implement the program.

Please note that you have a further opportunity to input into the preparation of our Environment Plan through the public comment process that we aim to undertake in January 2024. You are also welcome to join the consultation process at any point throughout the project's duration by contacting us via the below:

**How to get in touch**

Via email at - [contact@regiamss.com.au](mailto:contact@regiamss.com.au)

Via our website - [www.regiamss.com.au](http://www.regiamss.com.au)

Via our project hotline - +61 455 344 625

Mail: CGG Services Australia Pty Ltd, c/o Paul Rheinberg, 1 Ord St, West Perth, WA 6005

**Know someone who may be relevant?**

We encourage you to share our consultation material and contact details with anyone you may know who may be affected by this activity. We understand this process is voluntary, however we believe it's important to hear from people who live, work and enjoy the environment we would like to work in, preferably prior to us submitting our Environment Plan.

Thank you very much for your time.

Kind regards

Regia MSS Environment Team

[contact@regiamss.com.au](mailto:contact@regiamss.com.au)

**Please note this is a shared email inbox.**

From:

Subject: Regia marine seismic survey - proceeding to submission in January 2024  
Date: Tuesday, 12 December 2023 7:12:00 PM

---

Good Evening,

After following our consultation process available on our website, and extending that process by 5 months, CGG have provided all identified relevant persons with sufficient information and a reasonable period for consultation on the Regia marine seismic survey prior to submission. CGG has learned about important values and sensitivities which helped to inform our Environment Plan.

You are receiving this email as we have recorded your contact details as a potentially relevant person for the proposed marine seismic survey Regia MSS. We are yet to receive a response from you regarding your functions, interests, or activities, that may be affected by the potential impacts of our project. Please find a link to a NOPSEMA that may be of assistance to you in determining this, here: [Consultation on offshore petroleum environment plans brochure](#)

If you would like to consult with us, please respond describing your functions, interests, or activities, or to request further information to help determine how they may be affected. We also invite you to raise any concerns, objections, or claims you have to the project. This is to make sure your functions, interests, activities, objections, claims and feedback are addressed and reflected in the submitted Environment Plan (EP).

We aim to complete and submit our Environment Plan for public comment and regulatory assessment in the New Year. The public comment provides a further opportunity for community members to raise issues about environmental management matters that have not yet been considered in an environment plan for the proposed activity. More information can be found here, on the NOPSEMA website: [Public Comment](#)

This opportunity to consult with CGG about the activity prior to submission, allows us to better understand the values and sensitivities of the environment and inform the evaluation of the potential impacts and risks associated with the activity, and how to manage them appropriately.

If after submission, you believe that you may be affected by the activity and would like to consult with us, the opportunity to do so remains available to you. To re-register for consultation and to stay informed on this activity you can contact us at any time.

As you have been identified as a potentially relevant person, we will continue to send you project updates, including notice of the start of Public Comment. If you no longer wish to be contacted by us or receive any further project information, please let us know.

Please note any information you provide can be kept in the sensitive information report

and not published upon your request.

Thank you very much for your time

# Project Update

## December 2023

You are receiving this email as an interested party or relevant person for the proposed Regia Marine Seismic Survey.

## Next Steps

We aim to complete and submit our Environment Plan for public comment and regulatory assessment early in the New Year. The public comment provides a further opportunity for community members to raise issues about environmental management matters that have not yet been considered in an environment plan for the proposed activity. More information can be found here, on the NOPSEMA website: [Public Comment](#)

We began our engagement process 11 months ago, in February 2023. During this time we have met, spoken to, or exchanged correspondence with, many individuals and organisations. We thank all those who participated in this process and have helped us ensure the cultural and environmental values of the area are protected.

# Sensitive information

Please note any information you provide can be kept in the sensitive information report and not published. Please contact us by January 1<sup>st</sup> to request this.

## NOPSEMA: Consultation on offshore petroleum environment plans

A reminder that NOPSEMA's 'Information for the community' brochure is available on the activity website [here](#).

---

*As part of the Regia MSS project, we value open and inclusive communication. We understand that not everyone may have desired to receive this project update, and we apologize for any inconvenience caused. We remain committed to ensuring a full and thorough consultation process for all. If you prefer not to receive future updates from us, we respect your decision and kindly invite you to unsubscribe using the link provided below. Your feedback and preferences matter to us, and we appreciate your continued engagement with this project.*

## 4 Social Media Report

This report examines the social media activities for the Regia MSS consultation. A selection of posts were boosted as adverts to widen audience reach with results noted next to corresponding post. Please find below definitions of the result categories.

**ThruPlay** – ThruPlays is a metric in development, which will count the number of times a video is played to completion or at least 15 seconds.

**Reach** – Reach is the number of people who saw any content from your Page or about your Page.

**Impressions** – Impressions are the number of times any content from your Page or about your Page entered a person's screen

**Link Click** – The number of clicks on links within the ad that led to destinations or experiences, on or off Facebook.

**Landing Page View** – When a person lands on your ad's destination URL (landing page) after clicking a link in your ad.

### Boosted Advert Audience

#### Estimated audience size

270,000 – 318,000

#### Location:

Australia: Port MacDonnell (+59 km) South Australia; Lorne (+40 km), Port Campbell (+57 km), Portland (+40 km), Torquay (+40 km), Warrnambool (+40 km) Victoria.

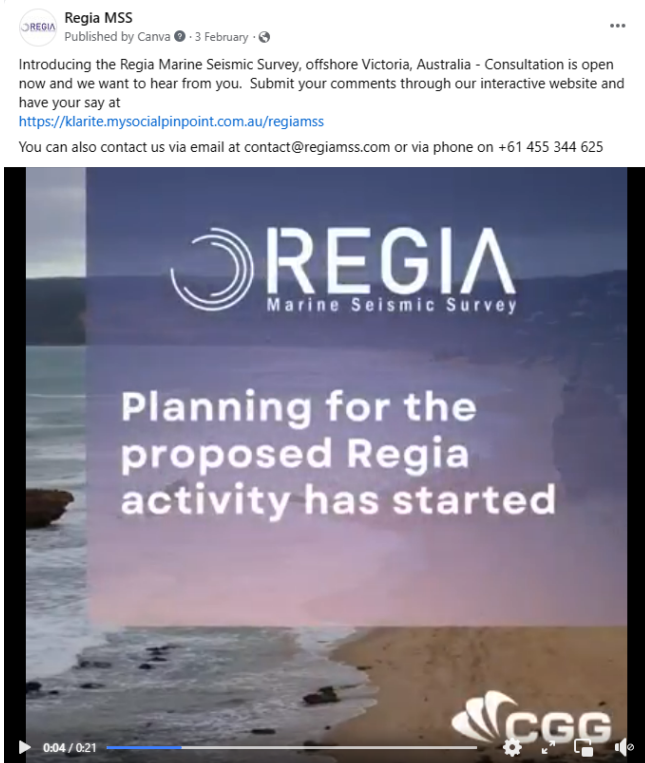

#### Age:

18-65+

#### People who match:

Interests: Fishing, Surfing, Outdoor recreation, Ecotourism, Commercial fishing, Boating, Marine, Windsurfing, Recreational Fishing, Transmission, Tourism, Beaches, Marine mammal, Shipping News, Ship transport or Freight transport, Industry: Farming, fishing and forestry.

Webinar recording now available to view in document library

## Social Media Post 24 - 21st December 2023

Posted on Facebook, Instagram and LinkedIn

Invitation to submit feedback on NERA protocol.

## 5 [www.regiamss.com.au](http://www.regiamss.com.au) Website Report

The Regia website was designed, compiled, and maintained, to align goals and outcomes between CCG's consultation methodology and the IAP2 spectrum, allowing persons to access every piece of information they would need to make informed decisions and objections, and self-identify. It also allows persons to submit information requests, questions (both publicly and privately), or request an alternate form of communication and engagement.

Widely advertised through traditional print and social medias, radio spots, community events, and through direct communications, the website allows for two-way communication exchange and the accessing of information through the following features:

- Comprehensive document library
- Interactive map<sup>1</sup>
- Instant Feedback
- Consultation Survey
- Commercial fisher NERA survey
- FAQ's
- NOPSEMA 'Information for the community' brochure
- Newsletter sign up and archive of previous newsletters
- Webinar sign up and archive of previous webinars
- Environment Plan Preparations and Consultation timeline
- 'What we've heard so far', sharing in thematic style of feedbacks received so far, our assessment and any adopted measures
- Highlighting and details of upcoming community information events
- Links to activity social medias
- Contact card, with Environment Managers details and alternative contact information

The report includes

- Website engagement summary
- Pdf copies of website pages
- Pdf copy of Consultation Survey
- Copies of information summaries provided on the website

---

<sup>1</sup> This map included a boundary of the EPA and invited members of the public to place a 'marker' and share feedback for the activity. There were also instructions indicating that leaving a marker is a contribution as a member of the public and not as a relevant person pursuant to the Regulations. These instructions also provided an email, phone number, and a link to the consultation survey should someone believe they were a relevant person and mandatory consultee.

#### CONSULTATION EXTENDED:

Following further consultation, the Regia MSS Environment Plan submission for public comment will now take place in 2024.

### We'd like to hear from you...

Is there a topic relevant to the proposed Regia activity that you would like covered in the next webinar on 12th December? You can submit your questions for the webinar and register [here](#).

### What we've heard so far...

Discover what we have learned through our extensive consultation process, how we have actively listened to the community, and engaged them in environmental management decision-making on our website's dedicated page.

### NOPSEMA - Information for the community

Under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 there are several ways the community can participate in the environmental approvals process for offshore petroleum activities in Commonwealth waters. Advice to the community is provided by the regulator, the National Offshore Petroleum and Environmental Management Authority (NOPSEMA).

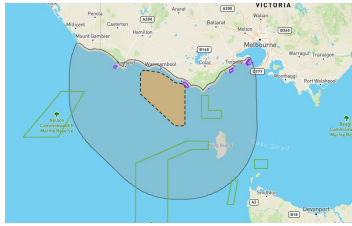

Please click on image of the Brochure to read more from NOPSEMA.

## Connect with Regia MSS

Connect and access information on our Regia MSS activity, via the following engagement tools.

### Decision-Making Criteria

Help us set acceptable levels of environmental impact and risk.

START 1 May 2023

END 30 Jun 2023

Discussion

## Environment Plan Preparation and Consultation Lifecycle

## Information Summaries

- ✓ **Notice of preparation of an Environment Plan**  
We shared information and inviting feedback on the activity, our consultation process and our risk management framework.
- ✓ **Establishing context**  
We shared our decision making criteria, our implementation strategy, the legislative requirements, and a preliminary environmental impact and risk assessment to help relevant persons determine if they may be affected.
- ✓ **Environmental assessment**  
We have shared our detailed predictions of environmental impact and risk including the independent reports we commissioned to fully understand the impacts and risks of the Regia MSS. These documents can be found in our [Document Library](#).
- ✓ **Environmental impact & risk treatment**  
We shared our evaluations of environmental impact and risks and our treatment plans as soon as they were available. They can be found in the [Document Library](#).
- ★ **Current Phase**  
  - ★ **Opportunity to raise objections or claims**  
You can share your feedback at any time. We invite you to raise concerns and provide feedback to ensure your views have been taken into account before submission.
- ✓ **Submission to NOPSEMA**  
The Environment Plan approval document will be submitted to NOPSEMA for formal public comment and assessment. The current target is to submit on 30 October 2023. We expect public comment to be invited by NOPSEMA in early November 2023.
- ✓ **Ongoing consultation**  
Post acceptance: If approved to proceed, we will continue consultation throughout the activity and respond to changing circumstances.

## How can we help?

Find answers to frequently asked questions below. Don't see an answer to your question?

[Submit your question to us](#)

### Questions about seismic surveys and their impacts

#### What is a marine seismic survey and what is it used for?

A marine seismic survey is a method used to map the subsurface of the ocean floor. It involves discharging a pneumatic sound source underwater to generate sound pulses that travel through the water and into the subsurface. The data collected from the survey is then used to create a map of the subsurface geology, which can be used for a variety of purposes such as oil and gas exploration, carbon capture, and environmental studies.

#### How will the survey impact the local fishing industry?

The survey has the potential to temporarily displace fish and other marine life from the survey area, which may temporarily impact the local fishing industry. However, measures will be taken to minimize the impact, such as conducting surveys during the time of year when fish are less likely to be in the area and implementing exclusion zones around fishing grounds. If exclusions zones cannot be accommodated, we will work with individual fishers to ensure they are no worse off because of the survey.

#### How will the survey impact local recreational activities such as boating and swimming?

Most of the survey will be conducted far from the coast and will not impede the normal recreational activities such as boating and swimming. If our predictions of impact and risk show any residual harm to recreational marine users the risks will be clearly communicated, the vessels will be clearly marked, and any exclusion zones will be clearly marked and communicated to the public.

#### What are the potential impacts of a marine seismic survey on marine life and their habitat?

Marine seismic surveys have the potential to harm marine life if mitigation plans are not in place. Marine mammals, fish, and other marine fauna can be affected by the sound levels they are exposed to from a seismic survey. The sound generated by the survey can cause hearing loss or injury, as well as disturbance of feeding, breeding, and other essential behaviours. It is important to minimise the levels of sound input into the marine environment and manage sound impacts appropriately.

#### What measures are being taken to mitigate the impacts of the survey on marine life and their habitat?

Measures to mitigate the impacts of the survey on marine life and their habitat include:

- Conducting the survey during a time of year marine mammals and fish are less likely to be in the area.
- Reducing the sound source to the lowest settings and reducing the number of times the sound source is activated.
- Implementing marine mammal and fish monitoring programs during the survey.
- Implementing exclusion zones around marine mammals and fish to minimize the potential for injury or harm.
- In-field monitoring of the ocean for the presence of marine life.
- Following strict guidelines as set by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

#### What are the benefits of the survey to the community and the environment?

The survey will provide valuable information about the subsurface geology of the ocean floor, which can be used for a variety of purposes such as oil and gas exploration, environmental studies, and natural resource management. Additionally, the survey will be conducted in compliance with strict environmental regulations and guidelines to minimize any potential impacts on the marine environment.

### Questions about how to engage in consultation on the Regia MSS

#### What should I do if I want to be included in consultation?

If you want to be consulted, you will need to provide us with contact details and an indication of your functions, interests or activities that may be affected by the proposed survey. Through the course of EP development, we will work with you to ensure the provision of sufficient information so you can make an informed assessment of the potential consequences of the activity to you. You will then need to provide feedback on the information provided and work with us to lessen or remove any consequences to you or your interests.

#### What should I do if I don't want to be consulted?

If you have been contacted by us and don't want to be consulted as part of EP development, please tell us in writing that you wish to opt out of consultation and no longer want to be consulted for this activity. This decision can be reversed at any time. You can opt back into the consultation process by advising us in writing at any time.

#### What happens if I don't respond to the information provided to me throughout the consultation process?

CGG will attempt to contact you multiple times using multiple methods to gather your feedback. Your feedback is important to us, this is why we ask you to provide several contact methods.

#### I think someone I know could be a relevant person, what should I do?

Please share this website with them and encourage them to contact us.

### Questions about the consultation framework and processes

#### How can I get involved in the design and conduct of this activity?

There are several ways for people to get involved in the design and conduct of the Regia MSS. We have social media channels, a hotline, email, a monthly newsletter, surveys, an interactive map, and mobile number for texts. When you engage with us, we'll work with you to select whether you should consult with us as a member of the public or as a 'relevant person' who is a mandatory consultee under Australian law with duties under the [Offshore Petroleum and Greenhouse Gas Storage \(Environment\) Regulations 2006](#).

## What is the process for community consultation during the marine seismic survey?

Community consultation is an important aspect of the marine seismic survey planning process. We will be reaching out to interested members of the community, through various means such as information sessions, social media, and webinars, to provide information about the survey and to gather feedback. Your input and feedback will be considered in the planning and execution of the survey.

## How do I arrange a meeting with CGG about the Regia MSS?

Contact us using any of the contact points listed on the footer of this website.

## Questions about the Regulations and the regulatory processes

## How will the survey be regulated to ensure compliance with the Offshore Petroleum and Greenhouse Gas Storage Act 2006?

The survey will be regulated by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) to ensure compliance with the Offshore Petroleum and Greenhouse Gas Storage Act 2006. This includes obtaining all necessary permits, conducting environmental assessments, and implementing a stringent set of control measures that manage our interactions with the environment below an acceptable level of impact.

## How are seismic survey approvals prepared and authorized?

The Australian Government requires petroleum and greenhouse gas (GHG) companies to conduct their activities in a manner that meets a high standard of environmental protection. The seismic industry's environmental record in Australia, particularly in offshore areas, has been exemplary. No offshore seismic survey proposal would be approved unless the highest environmental standards had been met.

Under Environment Regulations, an operator is legally required to submit an Environment Plan to the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for public disclosure. Once accepted by NOPSEMA, an electronic version of the Environment Plan will be available on NOPSEMA's website.

Environment Plans submitted for petroleum activities in Commonwealth waters are available on the NOPSEMA website at this [link](#).

CGG is currently commissioning Klarite, a specialist environmental consultancy, to prepare a detailed Environment Plan for NOPSEMA using the best available science. If this is accepted, a permit may be granted to conduct the seismic survey under the conditions agreed to in the environmental plan.

## Questions about CGG Australia

## Who is CGG Australia?

CGG has had offices in Australia since 1983 and currently employs 24 people, in Perth. A leader in cutting-edge geoscience, we have a strong focus on innovation and a commitment to delivering the best sustainable solutions to our clients' energy challenges. We bring our clients a unique range of technologies, services and equipment designed to acquire extremely precise data and images of the Earth's subsurface. We also provide state-of-the-art services for analyzing that data and developing a deeper understanding of the subsurface for exploration, production and optimization of oil and gas reservoirs.

The Regia Marine Seismic Survey will be carried out by CGG Services (Australia) Pty Ltd, operating under Australia Business Number 70 081 777 755.

## What is 'multi-client data'?

Geophysical surveys are acquired in two ways, either as a multi-client survey or as a proprietary survey. A proprietary survey is acquired by a single company using a geophysical contractor, over its area of interest only. Multi-client data is acquired by a geophysical company and covers a larger area of interest. The data is licensed to clients on a non-exclusive basis. In both cases the data is ultimately owned by the Commonwealth of Australia.

## Why is data needed in this area?

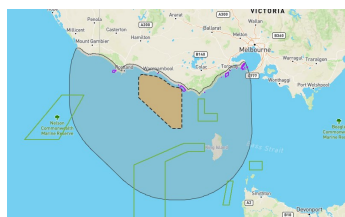

The Otway Basin has been producing hydrocarbons since the 1990's and has seen the discovery of several gas fields. Since that time acquisition and processing technologies have advanced dramatically. New surveys allow us to apply new technologies to our understanding of the geophysics of an area. Additionally, the Regia MSS aims to survey an area where 3D geophysical data has not been acquired previously.

## Consultation survey

This survey will help to guide you determine how best to engage in consultation on this project. We are required to consult with relevant persons in accordance with the OPGGS (Environment) Regulations. We are also seeking to engage with any other person to improve our environmental management of this activity.

This survey is designed to help you determine if you are a relevant person and why. If you are a relevant person, we will be in contact to discuss your information needs and how you'd like us to tailor our consultation processes to your needs.

To take part in consultation for this activity please provide your email address to start the survey.

### 1. First Name\*

### 2. Surname\*

### 3. Email\*

## Relevant Person Determination

We are required to provide sufficient information to persons whose functions, interests, or activities may be affected by the activity.

A **function** could be a role that is performed or something to be exercised. For example, government agencies have legislated functions to perform.

An **interest** is any interest above that of the public and it is not limited to a financial, property, or legal interest.

An **activity** is something that you do, probably associated with the marine environment i.e., fish, dive, swim, or surf.

### 4. Functions, Interests, and Activities\*

Based on the information on this website, do you have any functions, interests, or activities that may be affected by the activity?

- ☐ Yes
- ☐ No
- ☐ I need more information

By answering yes, we have a legislated obligation to consult with you. We will contact you to discuss your information needs and how you'd like to consult with us. You will be asked to assess the information to determine possible consequences to your functions, interests, or activities. You will be asked to provide feedback to us on your assessment including any objections or claims you have about the adverse effects from the activity.

### 5. Describe your functions, interests, or activities.

Please describe your functions, interests, or activities that may be affected by the activity. It is useful if you can describe them in such a way that will help us prepare information about the activity for you.

### 6. Information needs\*

You have indicated that you need more information to make a determination about whether you may be affected by the activity. Please select any of the following areas you would like more information and we will contact you to continue the conversation.

- ☐ Select All
- ☐ The activity
- ☐ The environmental assessment process
- ☐ Environmental aspects (i.e. the ways the activity interacts with the marine environment)
- ☐ Predicted levels of environmental impact
- ☐ Predicted levels of environmental risk
- ☐ The environmental management of the activity
- ☐ The consultation processes

## Regia MSS Consultation Survey

☐ The regulations or the regulatory processes

☐ Other (describe)

## General Public Consultation

Your responses to the survey have indicated that you are not a relevant person for the purposes of the mandatory consultation process. We would still like to hear your views on the project. Please answer the questions below about the best way to engage in this process and we look forward to hearing from you.

### 7. Choose your preferred consultation method

We have determined that if a person, organisation, or authority would like to self-determine themselves to be a 'relevant person' they can opt-in to be consulted in accordance with the legislated processes. Alternatively, we welcome comments on the website, through our social media channels, and through direct messages. Please indicate how you would like to continue your engagement with this activity.

- ☐ I'd like to carry on consultation as a relevant person
- ☐ I'll make comments on the website

## Relevant Persons Notice

You have indicated that you have a function, interest, or activity that may be affected by the activity; you need more information; or, you have self-identified as a relevant person.

### 8. Ongoing participation in the consultation process

As a relevant person, we have a legislated obligation to consult with you. We recognise that you may not want to consult with us. Please indicate your willingness to proceed with the consultation process (which will be tailored to your needs) or to opt-out of further consultation. As a relevant person you may opt-in again at any time by notifying us in writing.

- ☐ Opt-in: I want to proceed with the consultation process
- ☐ Opt-out: I do not wish to be contacted again about this activity

### 9. Confidentiality\*

As a relevant person, we are required to inform you that you may request that particular information you provide during the consultation not be published. All information you provide must be shared, in full, with the National Petroleum Safety and Environmental Management Authority (NOPSEMA). Please select how you would like your information treated.

- ☐ Treat all my information confidentially.
- ☐ I am happy for the information I provide to be shared publicly.

### 10. Secondary contact details

You have already provided your email address, thank you. Can you please provide a secondary method for contacting you and we'll be in touch soon.

**Mobile**

**Landline**

**Alternative email**

**Postal address**

Let's continue the conversation

You have indicated that you need more information to make a determination about whether you may be affected by the activity. Please provide some secondary contact information and a member of our environment team will be in touch with you to continue the conversation.

11. Please provide your secondary contact details

Mobile	<input type="text"/>
Landline	<input type="text"/>
Alternative email	<input type="text"/>
Postal address	<input type="text"/>

The following project overview is provided as an indication of the proposed activity. The details below are intended to initiate consultation with relevant persons.

CGG is planning to undertake the Regia 3D Marine Seismic Survey (the 'survey') in the Otway Basin over open and held acreage, in Commonwealth waters. At its nearest points, the survey area is located approximately 8.5 km from the city of Warrnambool and may come within 7km of the Victorian coast. Water depths in this area range from 15 m to 1,000 m.

The survey design will be the subject of consultation with relevant persons and with our clients and is not yet finalised. The process of refining the survey will occur during the consultation period which runs from 1 February 2023 to 20 October 2023 and throughout the regulatory assessment period.

To assist the public and relevant persons understand the proposed activity the following details are the current planning basis for the Regia survey. The Activity Planning Area and the Activity Planning Risk Area can be seen in the [interactive map](#) where you can view and share location-based feedback. You can [subscribe to our newsletter](#) to stay up to date with how the activity details narrow over time to reduce our environmental impacts.

The survey vessel will sail back and forth across the acquisition area along sail lines between 500 m to 900 m apart, acquiring seismic data. Seismic sound will be generated from three acoustic source sub-arrays operating alternatively, one discharging as the others recompress, with a maximum source volume of 2,820 cubic inches (cui) and an operating pressure of 2,000 pounds per square inch (psi). The vessel will tow 12 hydrophone 'streamer' cables approximately 8,100 m long, which contain the sound sensors that detect the pressure and velocity of sound levels reflected from the geophysical structures being targeted.

We recognise that there are environmental trade-offs that need community consultation during the design of the survey. Our current understanding and preference is to avoid the Southern Right Whales while they use their known calving areas due to their vulnerability at this critical life stage. This occurs between May and October each year so we may have to limit the Regia survey to a November – April acquisition window. We acknowledge that impacts to Pygmy Blue Whales, Southern Rock Lobster, Giant Crabs, and other environmental sensitivities will have to be carefully considered and managed. CGG will work with relevant persons over the next 5 months to ensure the protection of other important marine fauna and socio-economic interests.

To request more information about the activity when it becomes available, please [register to receive the Regia Newsletter](#).

If you think you may be affected by this activity you can take our [consultation survey](#) to determine the best way for you to consult with CGG about this activity.

Activity Planning Parameter	Detail
Earliest start date	1st April 2024
Latest finish date	31st December 2028
Survey duration	90 days
Maximum acquisition days	60 days

We have designed a consultation framework to exceed the regulatory requirements. We invite anyone to engage in the design and environmental management of the Regia MSS. Take our [Consultation Survey](#) to determine if you are a relevant person and determine the best way for your voice to be heard.

Take our [Consultation Survey](#) to determine if you are a relevant person

Submit instant feedback

In a rush? Submit instant feedback to us through the website at any time.

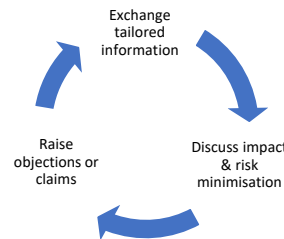

## Relevant Persons Consultation

Receive initial letter about the Regia MSS

Co-design the consultation process and agree the risk criteria

### Two-way Dialogue

Understand how unresolved objections and claims will be presented to the regulator

Make public comment to the regulator

Ongoing consultation as agreed

## Public Engagement

Read the information on the website

### Public Engagement Methods

- Submit instant feedback at any time
- Provide feedback through the website
- Comment on the interactive map
- Subscribe to the newsletter
- Call the hotline mobile number
- Send an email
- Attend a webinar
- Attend a townhall meeting

Make public comment to the regulator

### Relevant Persons Consultation Methods

- Request tailored information flyers
- Online and face-to-face meetings
- Talk with our environment team
- Group meetings
- Request extracts of the approval document
- Exchange letters

All public engagement methods are also available to relevant persons

Consultation efforts pause to allow CGG to prepare the EP submission for public comment.

Australia's offshore  
energy regulator

# Consultation on offshore petroleum environment plans

---

## Information for the community

The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) is Australia's independent expert regulator for health and safety, structural and well integrity, and environmental management for offshore petroleum and greenhouse gas storage activities in Commonwealth waters.

The protection and preservation of the marine environment is best achieved when there are opportunities for the community to participate in the environmental approvals process through consultation.

---

## Who can participate?

Under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (the regulations) there are several ways the community can participate in the environmental approvals process for offshore petroleum activities in Commonwealth waters.

### Public comment for new projects and exploration activities

Offshore project proposals (OPPs) for new offshore petroleum projects and environment plans for offshore petroleum exploration activities are subject to a mandatory public comment period. Public comment must be done before the OPP or environment plan is submitted to NOPSEMA for assessment. Further information about public comment can be found at [nopsema.gov.au](http://nopsema.gov.au).

### Relevant persons consultation

Titleholders must consult with a specific category of people or organisations referred to as 'relevant persons' while preparing an environment plan for any offshore petroleum activity. This consultation must be done before the environment plan is submitted to NOPSEMA.

Some categories of relevant persons are specified in the regulations, such as government departments, however the information in this brochure is for the category of relevant persons who are not specified but who have 'functions, interests or activities' that may be affected by the offshore activity.

### Correspondence directly to the regulator (NOPSEMA)

You can send correspondence directly to NOPSEMA; however, this generally cannot be considered until after the environment plan has been submitted. It is always better to use the public comment and relevant persons consultation processes in the first instance.

## What is 'relevant persons' consultation?

Consultation on offshore petroleum activities is a two-way process where information is shared between titleholders and relevant persons. It is a requirement for titleholders when preparing an environment plan and is an important part of good environmental management.

Consultation provides an opportunity for people or organisations who may be affected by an offshore petroleum activity to raise concerns, including objections or claims, about the potential impacts of the activity, to seek information about how they may be affected, and how the titleholder intends to manage the activity to ensure the associated impacts are as low as reasonably practicable and are acceptable.

Information provided by relevant persons in consultation may also help titleholders better understand the values and sensitivities of the environment and inform the evaluation of the potential impacts and risks associated with the activity and how to manage them appropriately.

## Am I a relevant person?

You may be a relevant person if you or your organisation have functions, interests, or activities that may be affected by an offshore petroleum activity proposed under an environment plan being prepared or already underway under an environment plan being revised.

The terms 'functions' 'interests' and 'activities' should be read broadly. You do not have to have a legal or financial interest that may be affected by an offshore petroleum activity to be a relevant person.

Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species. However, to be a relevant person your interests should be more than a general interest in the environment and/or offshore petroleum activities.

## If I am a representative body, can I consult on behalf of all my members?

The law recognises that interests may be held communally. In some cases, all members of a community may agree that their representative body can consult on their behalf. However, this may not always be the case. Representative bodies should inform titleholders whether or not they have the authority to consult with titleholders on behalf of all their members.

Representative bodies, such as peak bodies and prescribed body corporates, may be relevant persons in their own right. They may also be an initial point of contact for titleholders to seek information about who else they should approach for consultation.

It is the titleholder's responsibility to provide all members of a community who have a shared interest opportunities to participate in consultation. In some circumstances, representative bodies may offer to assist titleholders with this.

## Do I have to participate?

If you are a relevant person, you have the right to be consulted by titleholders of offshore petroleum activities when they are preparing an environment plan to submit to NOPSEMA.

Titleholders have a duty to provide you an opportunity to be consulted, however there is no obligation on you to participate in consultation. If you do not wish to be consulted, you should advise titleholders of this when they first contact you.

Titleholders must make reasonable efforts to consult with relevant persons, but the regulations do not require them to get a response to their requests. If you want to participate in consultation but need more information or time then it is best to communicate this to titleholders when they contact you. If you do not respond, they might assume you do not wish to be consulted.

If you are an organisation or representative body that is regularly approached for consultation you may consider developing guidance outlining how and when you want to be consulted. You could also consider documenting your functions, interests and activities. Both measures may help with managing regular requests for consultation.

In some instances, the likelihood of you being affected by an activity is very low and/or the impact on your functions, interests or activities may be minor. For example, if you are only going to be affected by the activity in the very unlikely event of an oil spill you may wish to inform titleholders you only want to be consulted if a spill occurs as part of the requirement for ongoing consultation set out in the regulations.

## What if I want to be consulted but the titleholder hasn't contacted me?

Titleholders have a duty to identify who may be a relevant person and provide them opportunities to participate in consultation. However, even with best endeavors, titleholders may miss people or organisations who may be relevant.

If you believe you are a relevant person and you want to be consulted on offshore petroleum activities, then you should contact titleholders directly and identify yourself as a relevant person.

If a titleholder refuses to consult with you, and you believe you are a relevant person, you can write to NOPSEMA. Once an environment plan is submitted to NOPSEMA, this information can be considered in the assessment of whether or not the titleholder has met the requirements for consultation.

It is always better to attempt to resolve issues with the titleholder in the first instance. Relevant persons consultation is carried out before an environment plan is submitted, so NOPSEMA is limited in its ability to require titleholders to consult with a particular person or organisation.

## What is the process for consultation?

There is no detailed process set out for how consultation should be carried out, however there are requirements that must be met under the regulations. These include:

- That you are given sufficient information to make an informed assessment about whether you are likely to be affected by the activity, how you may be affected, and to raise any concerns, including objections or claims, about the potential impacts of the activity.
- That you are given a reasonable period of time to consider the information provided to you and give feedback to the titleholder on the potential impacts of the activity on your functions, interests or activities.

What constitutes sufficient information and a reasonable period of time depends on several factors including the nature of your functions, interests and activities. You should communicate as early as possible in consultation with titleholders about what information and how much time you may need so that they can consider, respond and address these in their planning.

The information provided to you should be in a form that is appropriate and readily accessible to you. Consultation is generally a two-way process where information is shared between titleholders and relevant persons rather than a one-way process of seeking feedback to a fact sheet or high-level information.

## What if I don't have the resources to participate?

If you are a relevant person and you believe you have information that is important to the understanding of the potential impacts of an offshore petroleum activity or you want to raise concerns, including objections or claims, then you should discuss with the titleholder how you can participate in consultation.

This might include requesting information in a different format, asking for more time to consider information or help to understand the information to provide an informed response.

There is no requirement in the law for titleholders to pay the costs incurred by relevant persons to be consulted, however they may choose to provide assistance to relevant persons to ensure consultation is carried out efficiently and is robust. This is a matter between the titleholder and relevant persons.

## How do I make sure my views are considered?

It is important to communicate clearly when participating in consultation with titleholders. You may provide information to titleholders that helps them understand the environment and raise specific concerns, objections or claims about the potential impacts of the activity or the way the titleholder proposes to manage the activity to ensure the associated impacts are as low as reasonably practicable and are acceptable.

The information you provide to a titleholder during consultation must be considered by that titleholder and addressed in their environment plan for NOPSEMA to consider in its assessment and decision-making.

NOPSEMA publishes environment plans on its website when they are submitted for public comment, for assessment and when they are approved. Relevant persons have the right to request that the information they have provided in consultation is not published and titleholders must ensure they communicate this right to relevant persons.

Relevant persons should be aware that while you are free to respond on any matter and raise any concern, this may not be able to be considered if it is outside the scope or purpose of the environment plan and approval process. Examples of issues that may not be considered under the regulations include statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities.

## Do titleholders need my consent?

Titleholders are not required by law to obtain agreement or consent from relevant persons for their offshore petroleum activities to proceed; however, they are required to demonstrate in their environment plan how the concerns, objections or claims raised by relevant persons were considered and demonstrate that their response to that information was appropriate.

NOPSEMA's assessment and decision-making will consider if titleholders have adequately demonstrated in the environment plan that genuine consultation has taken place with relevant persons in accordance with regulations.

## Do I need to respond to a request for consultation?

There is no obligation for relevant persons to respond to a request for consultation from a titleholder. However, if you are provided an opportunity to participate in consultation and you do not want to be consulted, or you only want to be consulted on specific offshore petroleum activities or environmental matters, then it is best that you communicate this to titleholders as soon as they contact you. If you do not respond to requests for consultation, titleholders may make many repeated attempts to contact you.

**NOPSEMA can help you understand the requirements for consultation and how to effectively participate in the process. Please contact [communications@nopsema.gov.au](mailto:communications@nopsema.gov.au) for assistance.**

# Information Sessions

Apollo Bay and Port Fairy

June 14 & 16

# Agenda

- Introduction to the Regia Marine Seismic Survey (Regia MSS)
- Consultation process and progress
- Q&A

## Purpose

To provide access to initial information to assist people determine if they may be affected by the Regia MSS and if they want to enter into the 'relevant persons' consultation process.

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- CGG is required to prepare an Environment Plan which mandates consultation with 'relevant persons'.
- Consultation started on 1 February 2023 and is open until 30 **July** 2023.

Activity Planning Parameter	Detail
Earliest start date	1st November 2023
Latest finish date	31st October 2028
Survey duration	90 days
Maximum acquisition days	60 days

Information Flyers are available at [www.regiamss.com.au](http://www.regiamss.com.au)

# Information for relevant persons

## Initial Information

- Community Consultation and Engagement Plan
- Description of Activity
- Preliminary Environmental Impact and Risk Assessment
- Interactive map online

## Sufficient Information

- Differs for each person.
- Needs to be in a format suited to each person.
- Written to everyone who registered at the April community sessions seeking to understand people functions, interests, and activities.
- Published our draft environmental assessments
  - Light emissions
  - Accidental release of waste
  - Accidental collisions with fauna
  - Introduction of invasive marine species

# Further information available

## Decision-Making Criteria

- Information about how we make decisions about environmental management.
- Defines and justifies acceptable levels of impact and risk.

## Legislative Requirements

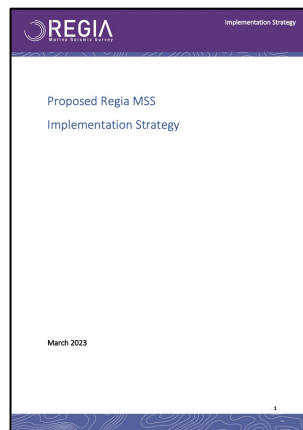

- Input into Decision-making Criteria.
- 114 legislative instruments identified that we must comply with.

# Further information available

## Implementation Strategy

- How we conduct marine seismic surveys.
- Details our environmental management system.
- Details our monitoring and reporting requirements.

## Sound Modelling Report

- Initial modelling to inform survey design and impact assessment for elevated levels of sound.
- Demonstrates the threshold distances for various effects to representative marine fauna.
- Identified concerns we have for divers/swimmers in some locations.

# Information coming soon

## **EP Content**

- Fisheries assessment report.
- Impact Assessment: Interactions with other marine users.
- Impact Assessment: Elevated underwater sound levels impact.
- Oil Spill Emergency Plan
- Operational and Scientific Monitoring Plan
- Cultural Heritage Management Plan
- Marine Mammal Adaptive Management Plan

## **Summaries**

- Case studies on long-term effects of seismic surveys on commercial fishing.
- Effects of underwater sound on divers/swimmers.
- Protection of marine mammals.
- Compensation for commercial fishers.

# Consultation Process

The consultation process is being extended from 5 months to 6 months.

Have your say at [www.regiamss.com.au](http://www.regiamss.com.au)

June July

# New guidance for relevant persons

- Reminder: Anyone with functions, activities, or interests in the Environment Planning Area may be a relevant person.
- NOPSEMA guidance explains that:
  - Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species.
  - Your interests should be more than a general interest in the environment or offshore petroleum activities.
- Relevant persons will experience a better consultation process if they can be specific about how they may be affected by the Regia MSS.
- Community members may choose not to engage in the relevant persons consultation process and prefer to write directly to NOPSEMA or participate through the public comment process.

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Deen Maar/Lady Julia Percy Island is a significant place for ecological and cultural heritage values and sensitivities.	<p><i>Ecological</i> We have identified protected species on the island and have modelled sound propagation around the area. We agree that ecological values should be protected.</p> <p><i>Cultural heritage</i> We have introductory discussions with Traditional Owners this week. We understand that there may be spiritual values to protect both on the island and between the island and the mainland.</p>	<p><i>Ecological</i> Implemented a 10.3km exclusion around the island which is the behavioral response threshold for marine mammals.</p> <p><i>Cultural heritage</i> As above for a starting point around the island, plus, preparing to put an exclusion zone in place between the island and the mainland. Need validation of appropriateness through consultation.</p>

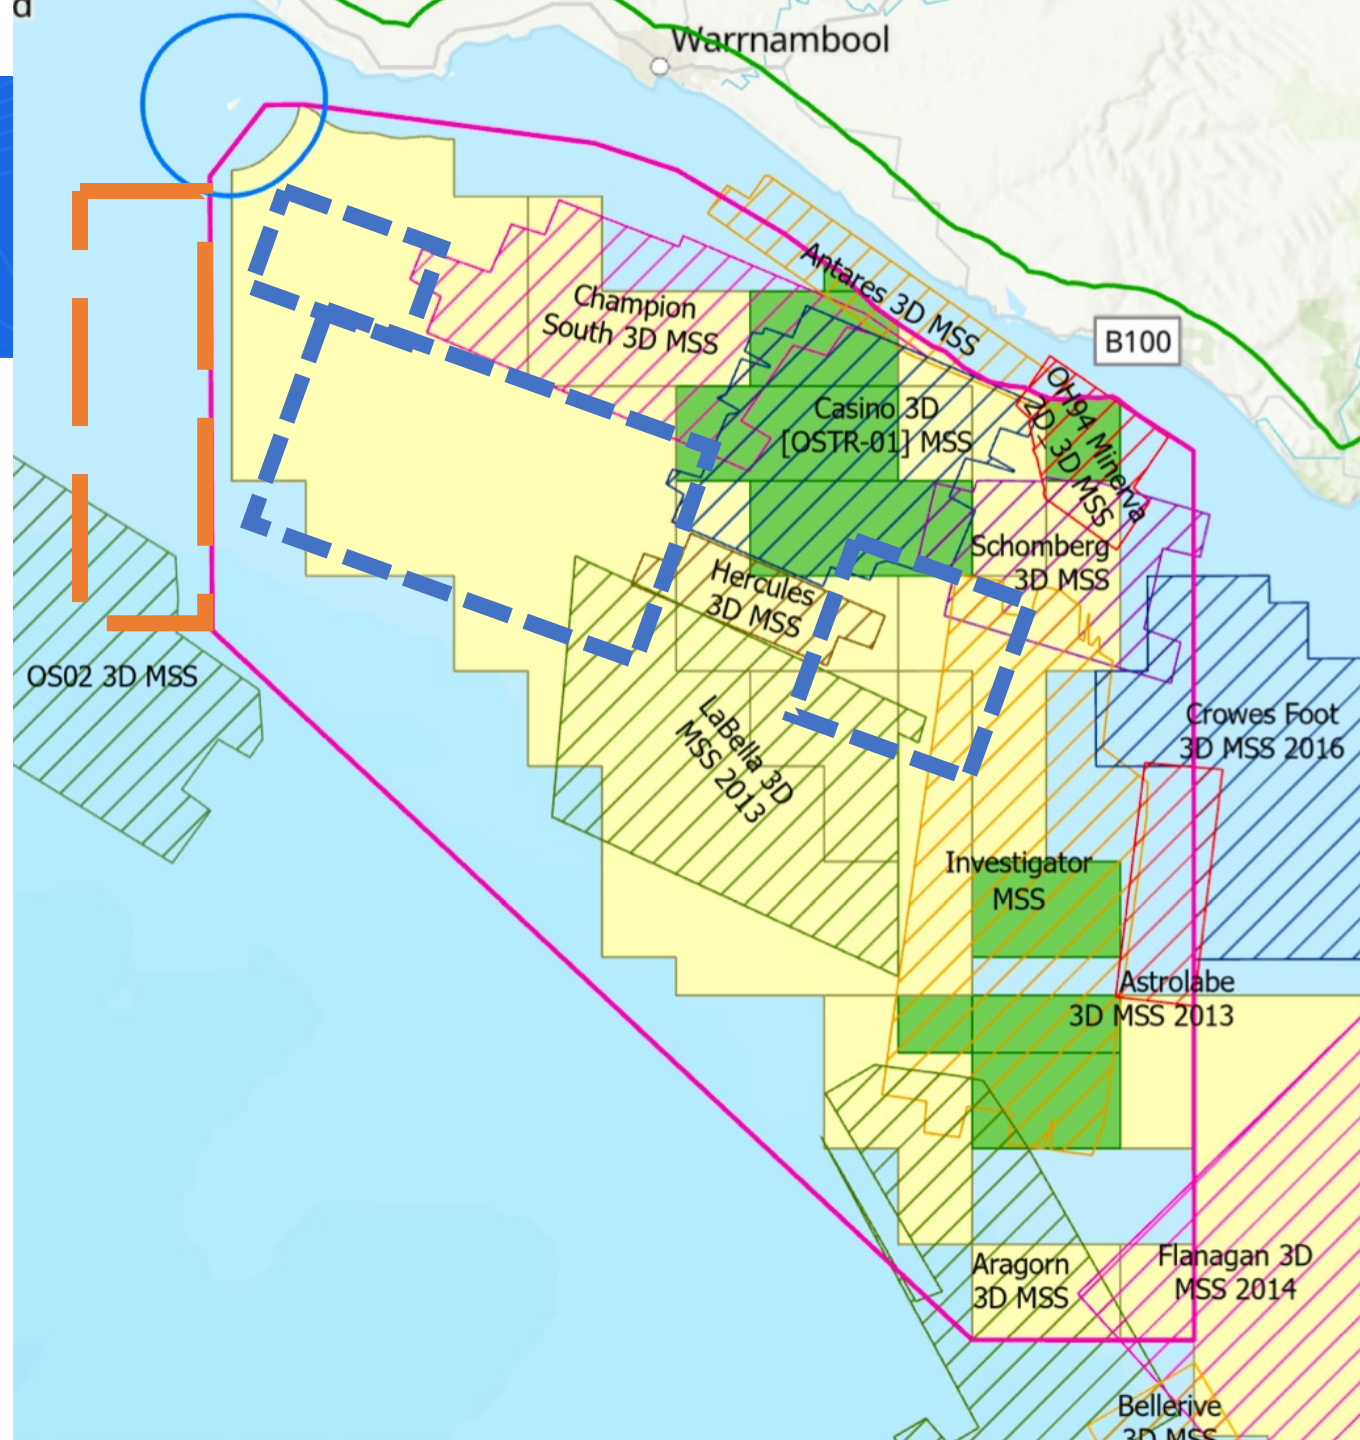

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Why are you doing seismic in this area again?	We are targeting areas that have not been surveyed before though there will be some overlap with previous surveys.	Provide maps to the community of previous seismic surveys over the area in the context of the Regia MSS.
The community is fatigued by the consultation for all these petroleum activities.	We understand the burden being placed on relevant persons.	We undertook joint community events to try and reduce the fatigue people may experience.
There is confusion about what activities are planned in this region because you haven't separated the consultation.  We care more about the seismic activity and want separate consultation events.	We understand that there may be some confusion arising from our response to claims of consultation fatigue.	Undertook a requested session in Port Fairy. Plan to carry out Regia MSS only community sessions in Apollo Bay and Port Fairy.

# Maps

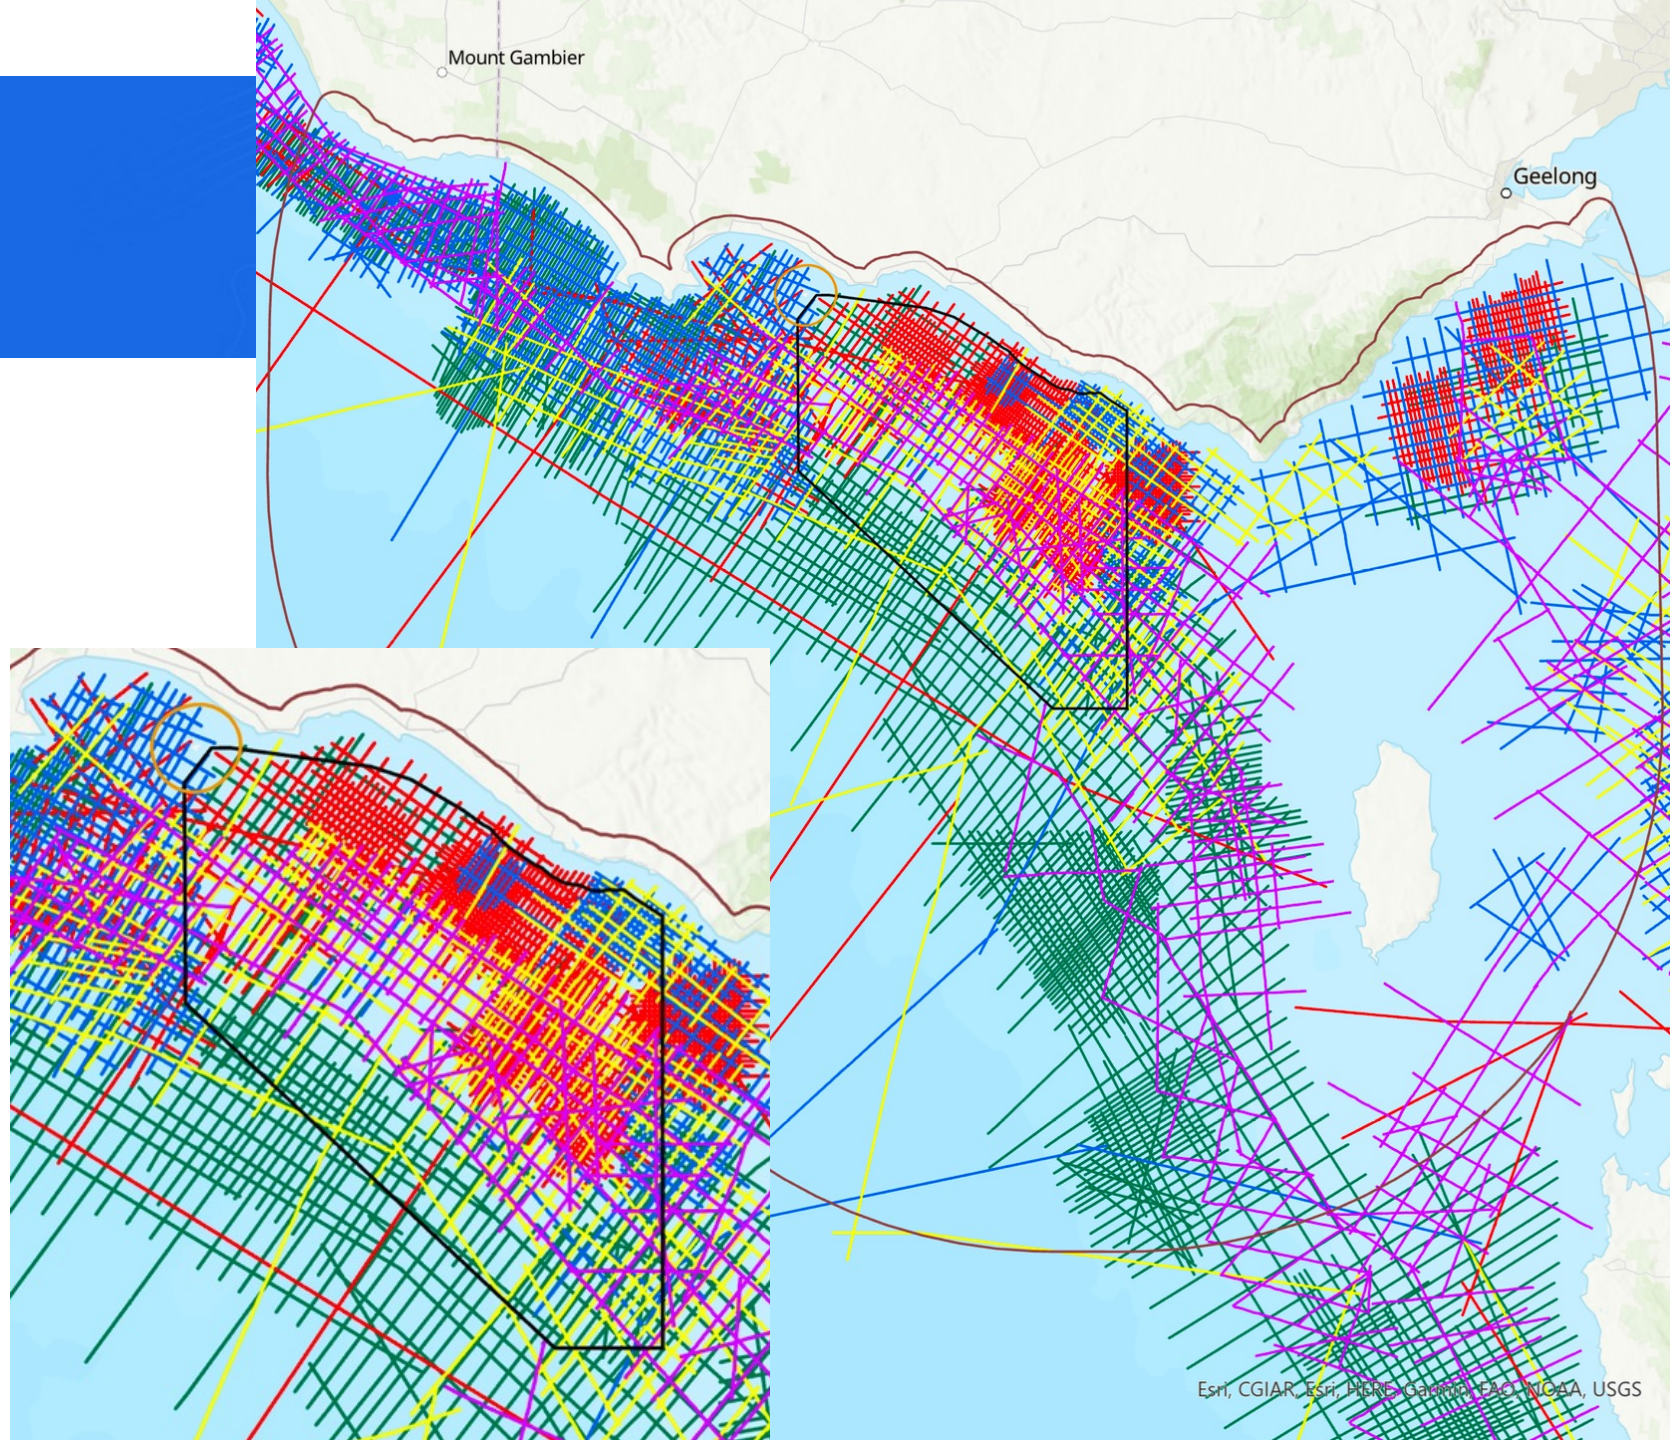

- Previous 3D Seismic
- Proposed acquisition area
- New activity area
- Possibility of phasing

# Maps (2)

- Previous 2D Seismic
- 82 surveys since 1963
- Exploring case studies

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
No impacts from seismic are of an acceptable level.	This is not supported by the literature or the legislation.	Publish our predicted levels of impact and risk.
Seismic surveying is not required given that no new oil or gas should be developed to be consistent with increased temperature increase of 1.5 degrees (the Paris Agreement).	The 'no new oil or gas' statement comes from the IEA WEO 2021, NZE Scenario which is a global analysis predicated on a demand driven decrease in fossil fuel use. It does not explicitly consider that at an Australia level, the AEMO predicts shortfalls of gas as early as 2027 in its Victorian Gas Planning Report (March 2023).	Record instances of the objection and faithfully report those to NOPSEMA.  Respond to individuals who raise this objection with references to government documentation supporting the need for new local gas developments.
The community doesn't want oil and gas development here (and called for a vote objecting to the activity).	We understand community opposition to the activity. There is already gas development in the Otway and the government has awarded titles for further exploration.	Share the views of the community with NOPSEMA and accurately record the vote counts from the community sessions.

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
There would be unacceptable impacts to marine mammals and in particular Southern Right Whales (SRW) and Blue Whales (BW).	<p>We recognize the importance and elevated levels of protection afforded to SRW and BW. Temporary threshold shifts to these species are unacceptable. We can have lesser impacts such as some behavioral responses.</p> <p>We must be consistent with the Conservation Management Plans in place for all species and with Policy Statement 2.1 which protects marine fauna interactions with seismic surveys.</p>	<p>No seismic surveying to occur in the SRW reproduction Biologically Important Area while they are present (May-November).</p> <p>Marine Fauna Observers on watch during daylight hours.</p> <p>Passive Acoustic Monitoring during night-time.</p> <p>Shutdown operations for all whales for observations closer than 2000 meters from the seismic survey.</p> <p>+ more under consideration</p>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Seismic blasts from seismic surveys are over 230-260 decibels and the sound travels for thousands of kilometers every few seconds for months.	<p>We acknowledge that sound propagates through the ocean over long distances (particularly in deeper water) and that the sound levels at the source are high.</p> <p>The more relevant data for impact assessments of elevated underwater sound levels are received levels of sound at specified distances from the sound source and the effect level thresholds for the hearing capabilities of different species.</p> <p>Elevated levels of sound from seismic are limited to the duration of acquisition (60 days) i.e., temporary.</p>	<p>Publish the sound propagation modelling report in full.</p> <p>Share the scientific basis for the:</p> <ul style="list-style-type: none"><li>- Propagation calculations</li><li>- Selected effect level thresholds</li></ul>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
The effects on fish and fish population are permanent and will damage our commercial fishing industry.	The effects of seismic sound on most species are well understood. There are no mortal effects predicted to any fish or invertebrate species from seismic sound.	Consult with commercial fishers and the VFA to understand the productivity and utilization of commercial fishing resources in the area.
Seismic blasting will kill zooplankton out to 1.2km which have a fundamental role for ecological integrity as food for krill and subsequently krill are food for whales.	<p>The effects of seismic sound from the Regia MSS may have mortal effects on zooplankton out to approximately 220m.</p> <p>Zooplankton are ubiquitous and abundant with natural mortality rates of 20-50% and high levels of recoverability (within days). The Regia MSS will cover 0.2% of the bioregion per day.</p>	<p>Publish the modelling and impact assessment of sound on zooplankton.</p> <p>Carry out the activity within the limits set by the Environment Plan.</p>

# Additional Measures Under Assessment

- Avoidance of West Tasmanian Canyons (and others)
- Avoidance of >400m contour for upwelling avoidance (if early summer)
- Testing some new technology:
  - Underwater glider whale monitoring
  - Moored buoy monitoring
  - High frequency elimination/reduction sound source
  - Drones for whale detections
- Phasing survey across 2 or 3 years to reduce impacts given timing sensitivities
- Buffers (distance) from other petroleum activities

# Q&A

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
Seismic blasts from seismic surveys are over 230-260 decibels and the sound travels for thousands of kilometers every few seconds for months.	<p>We acknowledge that sound propagates through the ocean over long distances (particularly in deeper water) and that the sound levels at the source are high.</p> <p>The more relevant data for impact assessments of elevated underwater sound levels are received levels of sound at specified distances from the sound source and the effect level thresholds for the hearing capabilities of different species.</p> <p>Elevated levels of sound from seismic are limited to the duration of acquisition (60 days) i.e., temporary.</p>	<p>Publish the sound propagation modelling report in full.</p> <p>Share the scientific basis for the:</p> <ul style="list-style-type: none"><li>- Propagation calculations</li><li>- Selected effect level thresholds</li></ul>

# Objections and Claims

Objection or Claim (What we've heard)	Assessment of Merit (Our view)	Measures Adopted Because of the Consultations
The effects on fish and fish population are permanent and will damage our commercial fishing industry.	The effects of seismic sound on most species are well understood. There are no mortal effects predicted to any fish or invertebrate species from seismic sound.	Consult with commercial fishers and the VFA to understand the productivity and utilization of commercial fishing resources in the area.
Seismic blasting will kill zooplankton out to 1.2km which have a fundamental role for ecological integrity as food for krill and subsequently krill are food for whales.	<p>The effects of seismic sound from the Regia MSS may have mortal effects on zooplankton out to approximately 220m.</p> <p>Zooplankton are ubiquitous and abundant with natural mortality rates of 20-50% and high levels of recoverability (within days). The Regia MSS will cover 0.2% of the bioregion per day.</p>	<p>Publish the modelling and impact assessment of sound on zooplankton.</p> <p>Carry out the activity within the limits set by the Environment Plan.</p>

Q&A

Seismic surveys, used for petroleum exploration generate low-frequency sound waves that penetrate the seafloor. These surveys can have detrimental impacts on marine mammals if left unmitigated. Marine mammals, including whales, dolphins, and seals, rely on sound for communication, navigation, and foraging. Anthropogenic noise introduced into their environment can lead to behavioural changes, communication disruption, stress, hearing loss, and, in extreme cases, physical injury (Nowacek, Thorne, Johnston, & Tyack, 2007; Weilgart, 2007). Therefore, to safeguard the health and welfare of these marine species, it's imperative to implement effective mitigation strategies during seismic activities.

In this context, we have proactively undertaken measures to mitigate impacts on marine mammals by the proposed Regia seismic survey in the Otway Basin. Several species of marine mammals found in the area could potentially be affected by the underwater noise produced during seismic surveys. However, thorough mitigation and management measures will be implemented to minimize any negative impacts.

Key to these controls is collaboration with whale researchers to devise effective mitigation strategies, particularly for Southern Right Whales and Blue Whales, which are known to exhibit biologically important behaviours within or near the survey area. We have pledged to refrain from any acquisition when Southern Right Whales are present in the nearby coastal areas. The Blue Whale Conservation Management Plan mandates that they must be able to continue to utilise their biologically important area without injury and must not be displaced from that foraging area. Protection for Blue Whales and our survey methods are being developed in coordination with relevant researchers and experts.

The implementation of industry-standard seismic survey controls, as delineated in the EPBC Act Policy Statement 2.1, further ensures the safety of marine mammals. Two marine mammal observers will be on the survey vessel during daylight hours, responsible for managing shutdown zones. The seismic source will be gradually ramped up over 30 minutes and can only begin if no whales have been observed within a 3km radius in the previous half-hour (Department of the Environment, 2012).

Moreover, additional measures under consideration include acoustic monitoring for whale detection and the use of vessel, aerial surveys, and shoreline observations for identifying the presence or absence of Southern Right Whales in coastal areas and other whales in offshore areas.

In summary, we are committed to taking all necessary steps to ensure the safety and protection of marine mammals during seismic surveys. These comprehensive management and mitigation measures will be combined into an Adaptive Management Plan for Marine Mammals which will be developed in collaboration with relevant authorities, researchers, and experts until they effectively minimize the potential impact on marine mammal biologically important behaviours.

CGG is planning to undertake the Regia 3D Marine Seismic survey in the Otway Basin over open and held acreage, in Commonwealth waters. The survey vessel will sail back and forth across the acquisition area along sail lines between 500m to 900m apart, acquiring seismic data. Seismic sound will be generated from three acoustic source sub-arrays operating alternatively, one discharging as the others recompress, with a maximum source volume of 2,820 cubic inches (cui) and an operating pressure of 2,000 pounds per square inch (psi). The vessel will tow a maximum of 14 hydrophone streamer cables approximately 8,100 m long, which contain the sound sensors that detect the pressure and velocity of sound levels reflected from the geophysical structures being targeted.

## Activity timing

Through consultation and environmental assessments, two suitable 3-month windows have been identified, April – June and September – November. The activity is likely to occur once in either of these windows between 2024 and 2028.

The survey duration is capped at 90 days with a maximum of 60 acquisition days.

## Operational Area Coordinates

## Identified Fisheries

A review of the presence of commercial fisheries with the operational area was undertaken<sup>1</sup>, and the following Commonwealth and state fisheries have been identified as currently operating in the activity planning area.

### Commonwealth:

- Eastern tuna and billfish fishery
- Small pelagic fishery western sub area
- Southern and eastern scale fish and shark fishery - shark gillnet and hook sector
- Commonwealth Trawl Sector of the Southern Eastern Scalefish and Shark Fishery
- Southern squid jig fishery
- Western tuna and billfish fishery

### Victorian:

- Giant Crab fishery
- Multi-species ocean fisheries
- Octopus fishery
- Rock Lobster fishery

The Regia MSS Commercial Fishery Review is available online in the document library on the Regia project website: [www.regiamss.com.au](http://www.regiamss.com.au)

## Commercial Fishers potential impacts and measures

Potential Impact	Description	Measure in place
Interaction with other vessels & Vessel Exclusion zone	<p>During acquisition the vessel will be towing up to 14 streamers, this means the vessel will have restricted manoeuvrability. Her minimum speed is 4 knots and she cannot come to a complete stop. For the safety of your vessel and equipment, it is advised not to approach closer than 5 km or 2 NM to the seismic vessel or its streamers.</p> <p>Please see the schematic diagram below, for a visual representation.</p>	<p>A yellow-coloured float called a tail buoy (see photo below ) will be attached at the end of each cable and will be equipped with a white flashing light. CGG will be issuing AHO a notice to mariners 4 weeks prior to commencement of the survey and advising AMSA JRCC 24-48 hrs prior. Fishers in our database (please contact us to confirm your preferred method of contact) will be notified 4 weeks prior to survey commencement and 2 weeks following completion.</p> <p>Lookaheads informing of the vessels location and plans for the next 48-72hrs will be provided to fishers. This will be done with 24-hour notifications during the survey. Notifications will be issued by the CGG vessel and distributed via daily emails, SMS and broadcast twice a day on VHF channel 16. The emails and SMS will contain an opt-out option if you don't wish to receive the notifications.</p> <p>We are also engaging with fishing associations to forward on water communications to their fishers. Two chase vessels will also accompany the seismic vessel and will be used to communicate with other vessels to maintain a safe distance.</p>
Sound	<p>Marine mammals, fish, and other marine fauna can be affected by the sound levels they are exposed to from a seismic survey.</p>	<p>Studies<sup>2</sup> were undertaken to understand the potential acoustic impacts on key regional receptors including fish and Invertebrates, and a review of commercial fisheries that fish in the area to identify the commercial fish and invertebrate species. This informed the impact assessments and identified the following measures to be implemented to bring impacts to an acceptable level and ALARP (as low as reasonably possible):</p> <ul style="list-style-type: none"> <li>• The seismic source will not be operated within the West Tasmania Canyons Key Ecological Feature (KEF). Further, there will be no survey deeper than the 400m depth contour to reflect that the features and values of this KEF extend throughout the shelf area.</li> <li>• As required by EPBC Act Policy Statement 2.1 - Interaction between offshore seismic activities and whales, the seismic source is required to be slowly ramped up to full power over 30 minutes. For mobile species they would move away from the source before it is at full power.</li> </ul>
Loss of catch & displacement	<p>The survey has the potential to temporarily displace fish and other marine life from the survey area, which may temporarily impact the local fishing industry. Economic loss can occur due to:</p> <ul style="list-style-type: none"> <li>• reduced catch in the regular fishing area due to impacts from a seismic survey</li> <li>• reduced catch from fishing in a new area to avoid a seismic survey</li> <li>• relocation of fishing operations from the regular fishing area to avoid a seismic survey</li> <li>• fishing gear loss or damage caused by a seismic vessel (including its in-water equipment or supporting vessels)</li> </ul>	<p>Implementing of exclusion zones around fishing grounds.</p> <p>The impact assessments have identified high levels of commercial fishing activity shallower than 50m and some trawling activity between 200m and 400m. We have excluded acquisition shallower than 50m and deeper than 200m to continue to allow access for fishing.</p> <p>If interference cannot be avoided, CGG will implement a commercial fishing industry adjustment protocol within the acquisition area. This will follow the principles of the NERA protocol<sup>3</sup> and allow for a practical, evidence-based process and ensure no commercial fisher is worse off due to the activity.</p>

## Commercial Fishers potential impacts and measures

Potential Impact	Description	Measure in place
Introduction of invasive species	<p>The introduction of marine pests could occur from vessels used for the Regia MSS because of:</p> <ul style="list-style-type: none"> <li>• Discharge of ballast water containing foreign species.</li> <li>• Translocation of species through biofouling of the vessel hull and/or niches (e.g., sea chests, bilges, and strainers) or in-water equipment (e.g., source array and streamers).</li> </ul>	<p>CGG will implement their marine assurance system to ensure compliance of contract vessels with pre-arrival biosecurity checks for international vessels, and ballast water and biofouling requirements<sup>4</sup>.</p> <p>The seismic source and towed streamers will be inspected and cleaned (where required) prior to deployment for the Regia MSS.</p>
Setting of traps and fixed fishing gear	Fishing gear may become lost or damaged if set in the path of the vessel	CGG requests that fishers contact CGG prior to laying traps or setting fishing gear in the vicinity of the proposed Regia MSS operational area, to ensure full understanding of the seismic vessel's movements over the next days to weeks. This will enable you to plan your activities around the location and future path of the seismic vessel and to avoid negative interactions between the seismic vessel, seismic equipment, fishing vessels and fishing gear.
Commercial Divers	Seismic surveys generate intense, low-frequency sound waves that have the potential to pose risks to divers	CGG will put in place measures such as prior notification to relevant parties, exclusion zones, monitoring, gradual ramp up of the seismic source, open communication channels and diver safety briefings. If you are a diver in this region, whether recreational, commercial, or scientific, please contact us at <a href="mailto:contact@regiamss.com.au">contact@regiamss.com.au</a>
Great Southern upwelling events	These seasonal events bring up cold, nutrient rich water, encouraging growth, such as phytoplankton blooms, which in turn contribute to the oceans food chain.	CGG has altered their acquisition timing, from November-May to April-June or September-November, to ensure no activity is undertaken during this time of increased biodiversity. CGG is prepared to incur additional costs due to weather related downtime, to implement this measure.

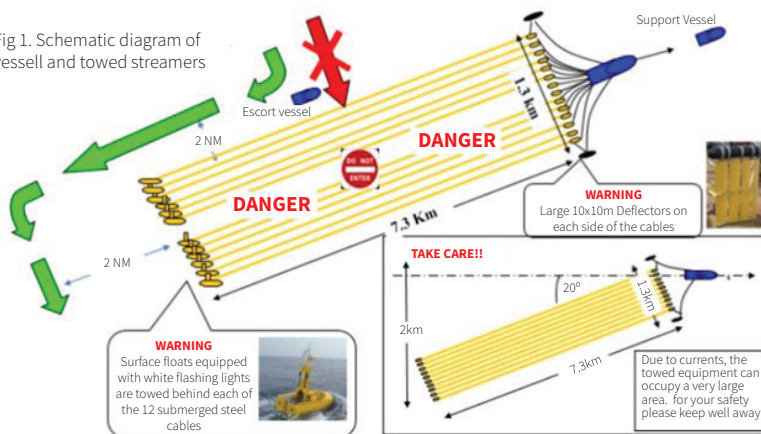

Fig 2. Tail Buoy

## How to get in touch

Via email at - [contact@regiamss.com.au](mailto:contact@regiamss.com.au) Via our website - [www.regiamss.com.au](http://www.regiamss.com.au) Via our project hotline - +61 455 344 625

### Other functions, interests, or activities in the activity area?

Please contact us describing these so we can work with you to ensure any potential impacts are managed and any measures required are put in place. For example, an individual may be a relevant person via commercial fishing activities or through a spiritual connection to Sea Country.

### Know someone who may be relevant?

We encourage you to share our consultation material and contact details with anyone you may know who may be affected by this activity. We understand this process is voluntary, however we believe it's important to hear from people who live, work and enjoy the environment we would like to work in, prior to us submitting our Environment Plan.

Activity carried out by

EP prepared by

**Summary - There may be effects from the Regia MSS to divers utilising the area. As per the Diving Medical Advisory Committee (DMAC) a simultaneous operations (SIMOPS) plan will be developed. If you dive along the Victorian coast between Portland and Apollo Bay, we want your input into the SIMOPS Plan.**

Sound propagation is a complex process influenced by the medium through which the sound waves travel. In both air and water, sound propagates as mechanical waves, requiring a medium for travel (Rossing, Moore, and Wheeler, 2002). However, the unique properties of these media—air and water—result in differing sound propagation characteristics.

**Speed:** Sound travels faster in water than in air due to the greater density and incompressibility of water. On average, the speed of sound in air is around 343 meters per second (at 20°C and sea level), whereas in water, it's around 1,500 meters per second (Lurton, 2010).

**Energy Transmission and Intensity:** The energy, or intensity (loudness) of a sound is measured on the decibel (dB) scale. It requires about 60 times more energy to transmit a sound through air than through water. This energy difference contributes to a 61.5 dB difference between sounds transmitted through air and water, implying that a sound intensity of 120 dB in water would correspond to an intensity of roughly 60 dB in air. This difference is crucial when comparing sounds in the ocean with sounds in the air (Webb 2021).

**Attenuation:** Despite the energy difference, sound waves attenuate or lose energy less in water, enabling sounds to travel much longer distances under the sea than in the air (Urlick, 1983). For example, low-frequency sounds (around 1 kHz) can travel for hundreds of miles in the ocean, whereas in air, they would lose most of their energy within a mile or so.

**Frequency Response:** Water more efficiently propagates low-frequency sounds than high-frequency sounds due to less attenuation. Conversely, in air, high frequencies are attenuated more rapidly, leading to a more balanced sound across different frequencies (Rossing, Moore, and Wheeler, 2002).

**Refraction:** Sound wave refraction in water can be influenced by temperature, pressure, and salinity gradients, resulting in more complex sound paths (Jensen, Kuperman, Porter, and Schmidt, 2011). In air, these effects are less pronounced, and sound travels more directly from the source to the receiver (Morfe, 2001).

The propagation of sound is a multifaceted process in both air and water, with factors such as the medium's properties, temperature, pressure, and frequency of sound playing significant roles.

## Seismic Sound

Underwater acoustic emissions from a seismic source are characterised by high energy pulses of low frequency sound. The frequency of the sound produced from each seismic pulse is primarily less than 2 kHz, with the highest levels at frequencies in the range of 10-500 Hz (McCauley 1994).

This range overlaps with the lower end of the frequency spectrum for human hearing, which typically spans from 20 Hz to 20 kHz (Masterton et al., 2011). However, underwater auditory threshold curves indicate that the human auditory system is most sensitive to waterborne sound at frequencies between 400 Hz to 1 kHz (Parvin et al. 1994). Therefore, while divers may not be able to hear seismic survey sounds as clearly as higher-frequency sounds, the intense low-frequency sounds used in seismic surveys can still pose potential risks to their hearing and overall wellbeing. Additionally, it's worth noting that sound perception can be subjective and variable among individuals, so individual sensitivity and response to seismic survey frequencies may vary.

## Impact of Underwater Sound on Divers/Swimmers

The propagation of sound in water has specific implications for divers/swimmers. The main parameters to consider are the sound pressure level (SPL), frequency of the sound, and exposure duration.

**Sound Pressure Level:** High sound pressure levels can potentially harm divers, however, a sound pressure level for physical injury has not been established due to ethical research protocols. Parvin (2005) reported vibration in forearms and thighs at 180 dB re 1 µPa but no physical injury.

**Frequency:** Underwater auditory threshold curves indicate that the human auditory system is most sensitive to waterborne sound at frequencies between 400 Hz to 1 kHz (Parvin et al. 1994) and these frequencies have the greatest potential for damage. The auditory threshold of hearing under-water was lowest at 1 kHz (70 dB re 1 µPa SPL) and increased for lower and higher frequencies to around 120 dB re 1 µPa at 20 Hz (Parvin 1998).

**Duration of Exposure:** The duration of exposure to the sound source is also critical. Longer exposure times to intense sounds can result in auditory fatigue and can increase the risk of hearing damage.

**Physiological Effects:** Apart from hearing damage, high-intensity underwater sound can also have other physiological effects on divers. These may include vertigo, nausea, disorientation, and in extreme cases, lung and sinus damage due to resonance effects.

**Psychological Effects:** High noise levels underwater can cause stress and anxiety, impair communication, and decrease the diver's ability to perceive and react to environmental signals, compromising safety (Hildebrand, 2009).

The propagation of sound underwater and the consequent effects on divers are complex and multifactorial. Both the immediate and long-term impacts on divers' health and safety need to be considered, particularly in environments with high levels of anthropogenic noise, such as near marine construction sites or busy shipping lanes.

## Acoustic Modelling for the Regia Marine Seismic Survey

As detailed in the Regia MSS acoustic modelling report, the human health assessment threshold of 145 dB re 1  $\mu$ Pa to assess sound exposure to people swimming and diving is based on controlled experiments exposing divers to tonal signals (Parvin, 2005). It is a lower and precautionary safety criterion for recreational divers and swimmers and does not imply that this level is associated with the onset of injury.

The aim of releasing the acoustic modelling is to identify diver/swimming locations where received sound levels could be above the 145 dB re 1  $\mu$ Pa safety criteria. This information is then used to refine the survey area. Initial modelling undertaken identified that received levels at Little River and Taylors Beach could be above the safety criteria, while other areas are below the criteria. If there is a location where people frequently dive or swim, lets us know as we will be undertaking more acoustic modelling soon.

Receiver ID	Sensitive receiver	SPL ( $L_p$ ; dB re 1 $\mu$ Pa)	Distance between receiver location and modelled site (km)	Associated Modelled Site
1	Lady Julia Percy Island	153.4	9.35	1
2	Southern Right Whales Migration and resting BIA	133.9	44.5	2
3	Discovery Bay	113.2	72.1	11
4	Portland	87.4	58.6	2
5	Little River and Taylors Beach	153.1	9.58	1
6	Port Fairy Bay	121.5	23.9	3
7	Twelve Apostles Marine Park	124.6	91.7	1
8	Aire River Beach	107.5	103.5	3

## Seismic Surveys and Diver Safety

Seismic surveys, often used in underwater exploration for oil and gas resources, generate intense, low-frequency sound waves that can pose risks to divers. There are a range of strategies and safety protocols that will be included in a co-designed simultaneous operations (SIMOPS) plan as recommended by the Divers Medial Advisory Committee (DMAC) Guideline 12. They include:

**Prior Notification:** Before conducting a seismic survey, operators should notify relevant parties, including commercial, recreational, and scientific diving groups in the area. This allows divers to avoid the area during survey operations.

**Exclusion Zones:** Seismic operators should establish exclusion zones around their operations. Divers should not enter these zones during active seismic surveys. The size of these zones can vary, but they should be large enough to ensure that sound levels within the zone do not exceed safe limits for divers.

**Monitoring:** Continuous monitoring for diver activity around the seismic survey area can be performed using on-board spotters, radar, or Automatic Identification System (AIS) data. If divers are detected within the exclusion zone, the seismic source should be shut down immediately.

**Gradual Ramp-up:** A technique called 'soft-start' or 'ramp-up' is often used at the start of seismic surveys. The seismic source starts at a low energy level and gradually increases to full power over 20-30 minutes. This provides a warning to any divers in the area and allows them to move away from the source before it reaches full intensity.

**Communication Channels:** Keeping open communication channels with diving operations and alert systems in the region allows for real-time sharing of information and swift response to any potential safety issues.

**Diver Safety Briefings:** Divers operating in areas with potential seismic survey activities should be briefed on the associated risks and advised on safety procedures, such as recognizing and responding to ramp-up signals.

By adhering to these practices, seismic survey operators can help ensure the safety of divers, while divers themselves can take steps to avoid potential hazards associated with seismic surveys.

A marine seismic survey is a technique used to explore and map the subsurface of the ocean floor. The primary goal of a seismic survey is to create a detailed image of the subsurface geology, including the location and characteristics of rock formations that may contain oil, gas, or other valuable resources.

The survey begins with the deployment of a ship equipped with specialized equipment, including equipment that creates underwater sound, and a network of hydrophones. Soundwaves travel through the water and into the subsurface. As the sound waves encounter different layers of rock and other subsurface materials, they are reflected back to the surface and recorded by the hydrophones.

The data collected by the hydrophones is then used to create a map of the subsurface geology. This map can be used to identify areas that are likely to contain valuable resources, such as oil and gas deposits. Additionally, marine seismic surveys can also be used for carbon capture purposes, to study the geology of the ocean floor, identify potential hazards, and monitor changes in the subsurface over time.

Marine seismic surveys are generally conducted in deep waters, beyond the reach of divers and other traditional exploration techniques. They are commonly used in the oil and gas industry, but they are also used in other industries and for scientific research purposes.

The survey process can be quite complex and time-consuming, and it requires specialized equipment and trained personnel to operate. The data obtained from the survey is analysed by geophysicists who use sophisticated software to create detailed images of the subsurface.

Source: [Energy Information Australia](#)

Marine seismic surveying may cause harm to marine life, for this reason, the method is heavily regulated. In 2019, an Australian Senate Inquiry was conducted into the impact of seismic testing on fisheries and the marine environment. The process, submissions, and concluding report can be found [here](#).

Printed Project Brochure - Leaflet Drop along Great ocean Road

April 2023

The brochure features a purple header with the REGIA Marine Seismic Survey logo and the text "Consultation in Progress". Below this is a map of the coastal region around Warrnambool, showing the "Activity Planning Area" in pink and the "Environmental Planning Area" in green. The map includes labels for Mount Gambier, Warrnambool, Geelong, and Melbourne. To the left of the map, text asks if the reader would like to consult with them and provides contact information. At the bottom left is a QR code, and at the bottom right is a blue bar with contact details.

## 7 Webinar Presentations

- 7.1 Webinar 1 – 1<sup>st</sup> March 2023
- 7.2 Webinar 2 – 4<sup>th</sup> April 2023
- 7.3 Webinar 3 – 25<sup>th</sup> May 2023
- 7.4 Webinar 4 – 28<sup>th</sup> June 2023
- 7.5 Webinar 5 – 6<sup>th</sup> October 2023
- 7.6 Webinar 6 – 12<sup>th</sup> December 2023

# Webinar Series

Webinar 1: Introducing the Regia Marine Seismic Survey

View Webinar [here](#)

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- The environmental impact and risk assessments start now.
- Consultation started on 1 February 2023 and is open until 30 June 2023.

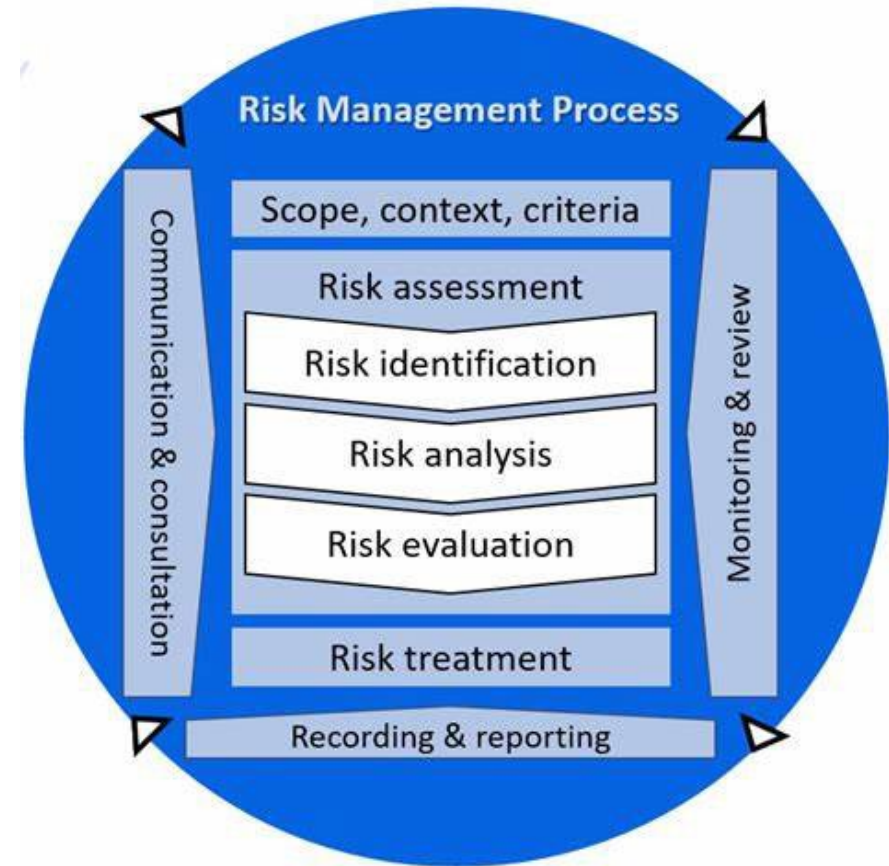

Activity Planning Parameter	Detail
Earliest start date	1st November 2023
Latest finish date	31st October 2028
Survey duration	90 days
Maximum acquisition days	60 days

Information Flyers are available at [www.regiamss.com.au](http://www.regiamss.com.au)

# Environmental Assessment

- CGG standards require our activities to be carried out in an environmental responsible manner.
- Regulatory requirements to:
  - Manage environmental impacts and risks.
  - Comply with environmental management law.
  - Consult with relevant persons who may be affected.
- Preliminary documentation will be published in March including:
  - Preliminary environmental impact and risk assessment.
  - Environmental assessment methodology.
  - Implementation strategy.

# Consultation Process

# What have we done so far?

## Consultation

- Published activity-specific website.
- Published the:
  - Community Consultation and Engagement Plan.
  - Activity overview flyer.
  - What is a seismic survey flyer.
- Advertised on social media (Instagram, LinkedIn, and Facebook).
- Undertaken radio interview on ABC SW Victoria.
- Written to all relevant State and Commonwealth government agencies.
- Written to local councils, conservation groups, traditional owners, and local businesses.
- Requested contact details for fishers.

## Environment Assessment

- Commissioned Preliminary Environmental Impact and Risk Assessment (PEIRA).
- Commenced searches for environmental values and sensitivities within the Environment Planning Area.

# What happens next?

## Consultation

- Searching for relevant persons continues.
- Place notices in local print media (Warrnambool Standard)
- Publish the:
  - Preliminary Environmental Impact and Risk Assessment.
  - Environmental Assessment Methodology.
  - Implementation Strategy.
- Continue to advertise on social media.
- Write to fishers, fishing associations, and other relevant persons as identified.
- Follow up with relevant persons already contacted.

## Environment Assessment

- Request and advertise for location-based feedback through the interactive map.
- Commence full assessment of identified environmental impacts and risks.
- Scope modelling requirements for impacts and risks with high levels of uncertainty.

# Location-based feedback

- Within the Environment Planning Area, anyone can:
  - Raise concerns
  - Provide information
  - Comment at specific locations.
- Drag an icon from the top menu bar.
- Write your feedback and input your contact details.
- Accept the terms and conditions.
- Submit your feedback.

The screenshot displays the REGIA Marine Salinity Survey web application. At the top, there is a navigation bar with the REGIA logo and icons for 'Drag to comment', 'Concerns', 'Information', and 'Comment'. A sidebar on the left contains links for 'About', 'Activity', and 'Consultation Survey'. The main area features a map of Victoria, Australia, with various coastal and inland locations labeled. A feedback form is overlaid on the map, titled 'Share your environmental information with us.' The form includes a text area for a comment, fields for first and last names, phone number, suburb, and postcode, and an email field. There is also an option to attach a photo. At the bottom of the form, there are checkboxes for 'Remember' and 'I agree my comment will be used as indicated in the terms and conditions'. A 'Next' button is located at the bottom right of the form. A legend in the bottom right corner identifies the REGIA MSS Activity Planning Area, Australian Marine Parks, Victorian State Marine Parks, and REGIA MSS Environmental Planning Area.

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- The environmental impact and risk assessments start now.
- Consultation started on 1 February 2023 and is open until 30 June 2023.

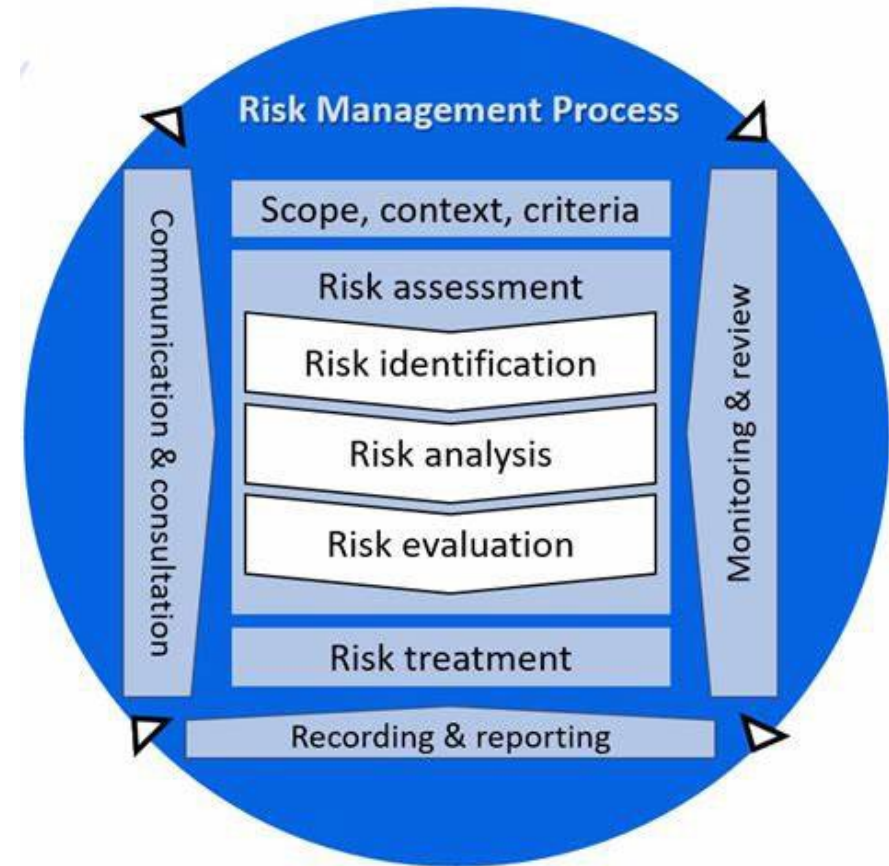

Activity Planning Parameter	Detail
Earliest start date	1st November 2023
Latest finish date	31st October 2028
Survey duration	90 days
Maximum acquisition days	60 days

Information Flyers are available at [www.regiamss.com.au](http://www.regiamss.com.au)

# Environmental Assessment

- CGG have published:
  - Preliminary environmental impact and risk assessment (PEIRA)
  - Draft decision-making criteria
  - Legislative requirements analysis
- CGG will shortly publish:
  - Environmental Assessment Method
  - Implementation Strategy
- Commenced work on:
  - Full impact assessments
  - Full risk assessments
  - Sound propagation modelling
  - Oil spill extent and duration analysis

# Preliminary Environmental Impact & Risk Assessment

Find out how and why we have eliminated some lower order impacts at [www.regiamss.com.au](http://www.regiamss.com.au)

## Environmental Impacts

- Screened out negligible aspects such as marine discharges
- Screened out negligible impacts such as effects of underwaters sound on birds
- Remaining aspects and impacts carried forward

Environmental Aspect	Environmental Impact	Preliminary Outcome
Artificial Light	Change in ambient light	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
Underwater Sound	Change in ambient sound	Qualitative assessment
	Change in fauna behaviour	Qualitative assessment
	Change in hearing capacity	Quantitative assessment
	Change in physical condition	Quantitative assessment
Physical Presence	Change in functions, interests, or activities	Quantitative assessment

# Preliminary Environmental Impact & Risk Assessment

Find out how and why we have eliminated some lower order risks at [www.regiamss.com.au](http://www.regiamss.com.au)

## Environmental Risks

- Screened out negligible aspects such as Accidental Release of Materials or Waste Overboard
- Remaining aspects and risks carried forward

Environmental Aspect	Environmental Risk	Preliminary Outcome
Accidental Release of Fuel	Change in water quality	Low
	Change in sediment quality	Low
	Change in ecosystem dynamics	Low
	Change in physical condition	Low
	Change in fauna behaviour	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Introduction Of Marine Pest Species	Change in ecosystem dynamics	Moderate
	Change to functions, interests, or activities	Moderate
Accidental Release of Materials or Waste Overboard	Change in physical condition	Low
	Change to functions, interests, or activities	Low
	Change in aesthetic value	Low
Collisions With Marine Fauna	Change in physical condition	Moderate

# Decision-making criteria

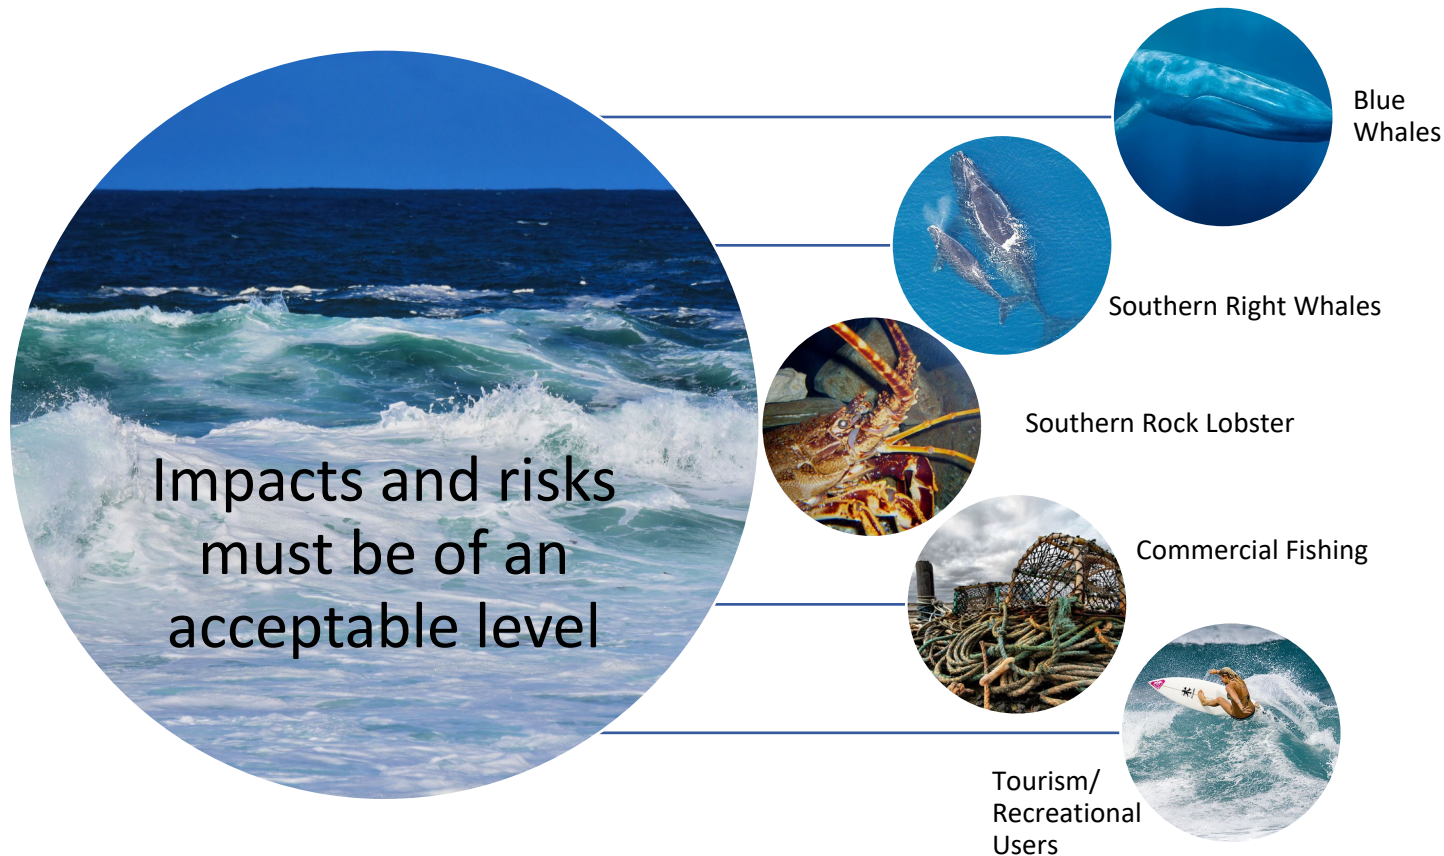

Table 2 - Defined Acceptable Levels of Impact and Risk

Category	Defined Acceptable Level for the Regia MSS Impacts and Risks
Principles of ESD	<p>The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.</p> <p>The impact and risk assessments are based on sufficient information to understand if:</p> <ul style="list-style-type: none"><li>• Serious/irreversible environmental damage is predicted; or</li><li>• The application of the precautionary principle is applied in the presence of scientific uncertainty.</li></ul> <p>Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.</p>
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.
Economic	Affected persons will not be worse off because of the activity.
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.
Company	<p>All reasonably practicable measures have been adopted to reduce environmental impacts and risks.</p> <p>Environmental impacts and risks are consistent with the CGG impact and risk assessment process such that:</p> <ul style="list-style-type: none"><li>• For an impact the consequence category is a rating of Moderate (3) or below).</li><li>• For a risk, the risk level is medium or below.</li></ul> <p>The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.</p>
Social	<p>Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.</p> <p>The views of the public have been considered in the impact and risk assessment.</p>

# Consultation Process

# Location-based feedback

- Reminder: Within the Environment Planning Area, anyone can:
  - Raise concerns
  - Provide information
  - Comment at specific locations.
- Acknowledge community objections to petroleum development.
- Our job is to consult on ‘how’ the activity proceeds, not ‘if’ it can.
- Note our experience is that this objection can mask other substantive issues that can be managed.
- We want to listen to reveal the concerns we can manage and lessen our environmental impact.

The screenshot displays the REGIA Marine Seismic Survey website. At the top, the REGIA logo is on the left, and navigation links for 'Drag to comment', 'Concerns', 'Information', and 'Comment' are on the right. A sidebar on the left contains links for 'About', 'Activity', and 'Consultation Survey'. The main area features a map of Victoria, Australia, with a feedback form overlay. The form is titled 'Share your environmental information with us.' and includes a text area for comments, fields for first and last names, phone number, suburb, and postcode, and an email field. There is also an option to attach a photo. A legend in the bottom right corner identifies the REGIA MSS Activity Planning Area, Australian Marine Parks, Victorian State Marine Parks, and the REGIA MSS Environmental Planning Area. The map is credited to Mapbox and OpenStreetMap.

# What have we done so far?

## Consultation (Feb)

- Published activity-specific website.
- Published the:
  - Community Consultation and Engagement Plan.
  - Activity overview flyer.
  - What is a seismic survey flyer.
- Advertised on social media (Instagram, LinkedIn, and Facebook).
- Undertaken radio interview on ABC SW Victoria.
- Written to all relevant State and Commonwealth government agencies.
- Written to local councils, conservation groups, traditional owners, and local businesses.
- Requested contact details for fishers.

## Consultation (March)

- 4 weeks of radio advertisement
- More radio interviews
- 4 weeks of print media advertisement
- 1200 unique visitors to the website
- Social media adverts continued
- First posts on our interactive map
- Written to 137 organisations and 97 people

# What happens next?

## Consultation (April)

- Searching for relevant persons continues.
- Port visits commence in late April.
- Information sessions to be held in:
  - Apollo Bay
  - Port Campbell
  - Peterborough
  - Warrnambool
  - Portland
  - Port McDonnell
- Continue to advertise on social media.
- Write to fishers, fishing associations, and other relevant persons as identified.
- Follow up with relevant persons already contacted.
- Hand out flyers at large community events.
- Initial meeting with local councils and regulators.
- Activity liaison officer to be located in region after Easter.

### Information Sessions

Commencing at regional ports from 17 April – 7 May.

Follow our social media channels for updates.

Venues, times and dates to be published ASAP on:

[www.regiamss.com.au](http://www.regiamss.com.au)

# What happens next?

## Activity Design

- Start to focus and narrow our Activity Planning Area into an:
  - Acquisition Area
  - Active Source Area
  - Operational Area
- Establish which months will have the least environmental impact including consideration of:
  - The sensitivity and vulnerability of receptors
  - The presence/absence of receptors
  - The burden of mitigation measures
  - If unavoidable, any trade-offs between receptors

## Environmental Assessments

- Complete and publish our draft environmental assessments for consultation.
- Review and publish our independent quantitative modelling reports.
- Design control measures and adaptive management plans to lessen impacts and risks.

Economic	Affected persons will not be worse off because of the activity.
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.
Company	<p>All reasonably practicable measures have been adopted to reduce environmental impacts and risks.</p> <p>Environmental impacts and risks are consistent with the CGG impact and risk assessment process such that:</p> <ul style="list-style-type: none"> <li>For an impact the consequence category is a rating of Moderate (3) or below).</li> <li>For a risk, the risk level is medium or below.</li> </ul> <p>The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.</p>
Social	<p>Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.</p> <p>The views of the public have been considered in the impact and risk assessment.</p>

# Activity Design

## Activity Limitations

- Excluded surveying in May – October to avoid Southern Right Whale presence in calving area.
- 10.3 km exclusion zone around Deen Maar/Lady Percy Julia Island to protect sea lions, birds, and other species on the island.
- 0-40m water depth exclusion in place to avoid impacts to species and commercial fishers who use that zone.
- Excluded vessel movements between Deen Maar and the mainland.

## Activity Changes

- Extension of activity planning area 10 km to the Western side to accommodate exclusion zones.

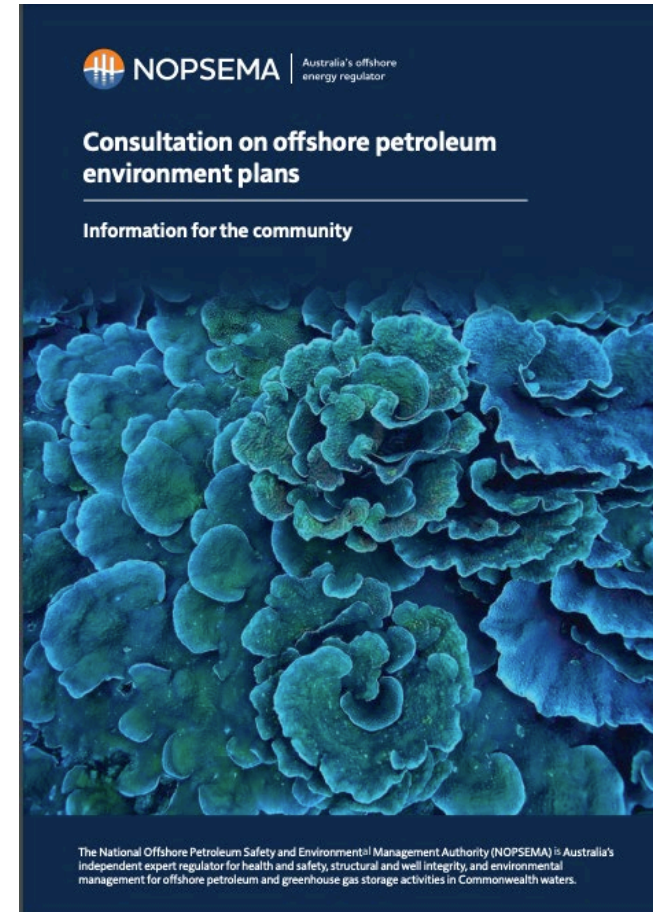

# Consultation Process

# New guidance for relevant persons

- Reminder: Anyone with functions, activities, or interests in the Environment Planning Area may be a relevant person.
- NOPSEMA guidance explains that:
  - Interests that may be affected can include things like cultural and spiritual connections to the sea or interests in the protection of specific marine species.
  - Your interests should be more than a general interest in the environment or offshore petroleum activities.
- Relevant persons will experience a better consultation process if they can be specific about how they may be affected by the Regia MSS.
- Community members may choose not to engage in the relevant persons consultation process and prefer to write directly to NOPSEMA or participate through the public comment process.

# What have we done so far?

## **Consultation (Feb - May)**

- Published activity-specific website with an interactive map for the community to easily identify environmental values and sensitivities.
- Meet with Government agencies and organisations.
- Advertised on social media (Instagram, LinkedIn, and Facebook), in print media, and on local radio.
- Undertaken multiple radio interviews.
- Written to all relevant State and Commonwealth government agencies, local councils, conservation groups, traditional owners, and local businesses.
- Carried out meetings with affected parties with a focus on commercial fishers.
- Undertaken 6 community information sessions with over 100 attendees.
- Visited each port along the Victorian coast and dropped off flyers.
- Located a liaison officer in the region.

# What happens next?

## Consultation (May/June)

- Searching for relevant persons continues.
- Follow up information sessions to be held in:
  - Warrnambool
  - Port Fairy
  - Portland
  - Apollo Bay
  - Port Fairy
- Continue to advertise on social media.
- Continue 1-on-1 consultation with relevant persons as identified.
- Follow up with relevant persons already contacted.

## Environmental Assessments

- Receive comment on our draft impact and risk assessments.
- Publish our modelling reports.
- Finalise our remaining assessments and publish ASAP.
- Evaluate all impacts and risks collectively.
- Commence cumulative impact assessment.
- Consider further control measures and activity limitations to reduce impacts and risks.

# What happens next?

## Activity Design

- Publish our:
  - Acquisition Area
  - Active Source Area
  - Operational Area
- Implement further exclusion zones where possible:
  - Distances from coastlines
  - Twelve Apostilles State Marine Park
  - Merri Marine Sanctuary
  - >400m water depth contour

# Consultation Process

# What have we done so far?

## Consultation (Feb - June)

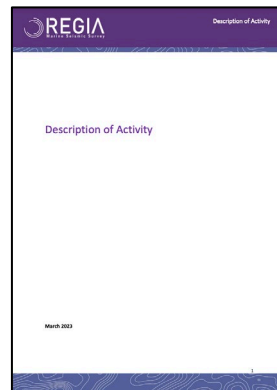

- Published activity-specific website with an interactive map for the community to easily identify environmental values and sensitivities.
- Meet with Government agencies and organisations.
- Advertised on social media (Instagram, LinkedIn, and Facebook), in print media, and on local radio.
- Undertaken multiple radio interviews.
- Written to all relevant State and Commonwealth government agencies, local councils, conservation groups, traditional owners, and local businesses.
- Carried out meetings with affected parties with a focus on commercial fishers.
- Undertaken 8 community information sessions with over 140 attendees.
- Visited each port along the Victorian coast and dropped off flyers.
- Located a liaison officer in the region.

# Information for relevant persons

## Initial Information

- Community Consultation and Engagement Plan
- Description of Activity
- Preliminary Environmental Impact and Risk Assessment
- Interactive map online

## Sufficient Information

- Differs for each person.
- Needs to be in a format suited to each person.
- Written to everyone who has registered seeking to understand people functions, interests, and activities.
- Published our draft environmental assessments
  - Light emissions
  - Accidental release of waste
  - Accidental collisions with fauna
  - Introduction of invasive marine species

# Further information available

## Decision-Making Criteria

- Information about how we make decisions about environmental management.
- Defines and justifies acceptable levels of impact and risk.

## Legislative Requirements

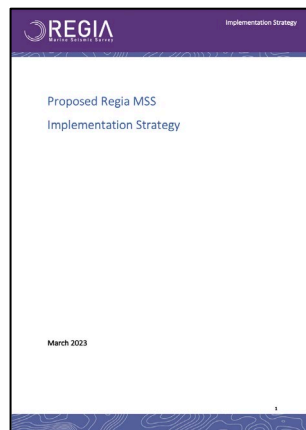

- Input into Decision-making Criteria.
- 114 legislative instruments identified that we must comply with.

# Further information available

## Implementation Strategy

- How we conduct marine seismic surveys.
- Details our environmental management system.
- Details our monitoring and reporting requirements.

## Sound Modelling Report

- Initial modelling to inform survey design and impact assessment for elevated levels of sound.
- Demonstrates the threshold distances for various effects to representative marine fauna.
- Identified concerns we have for divers/swimmers in some locations.

# Information coming soon

## **EP Content**

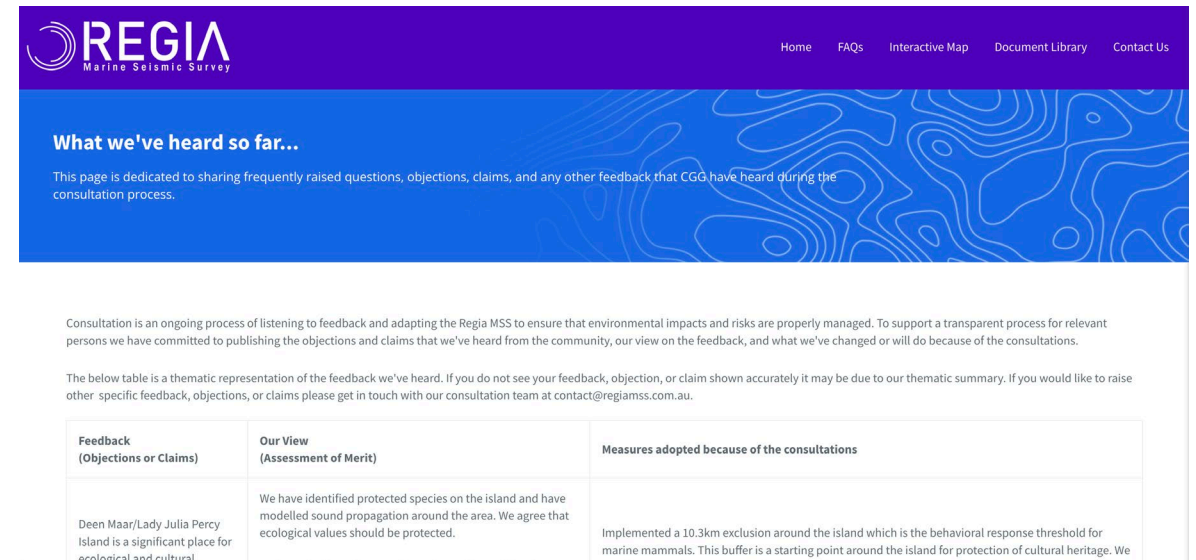

- Fisheries assessment report.
- Impact Assessment: Interactions with other marine users.
- Impact Assessment: Elevated underwater sound levels impact.
- Oil Spill Emergency Plan
- Operational and Scientific Monitoring Plan
- Cultural Heritage Management Plan
- Marine Mammal Adaptive Management Plan
- Cumulative Impact Assessment

## **Summaries**

- Case studies on long-term effects of seismic surveys on commercial fishing.
- Effects of underwater sound on divers/swimmers.
- Protection of marine mammals.
- Compensation for commercial fishers.

# What we've heard so far...

- New page on the website to share a thematic summary of:
  - Objections or claims
  - Our view
  - What we're going to do
- Demonstrates how we're involving the community in our environmental management decision making.
- We will keep this page up to date with thematic feedback from relevant persons to keep the community informed.

The screenshot shows the REGIA Marine Seismic Survey website. The header is purple with the REGIA logo and navigation links: Home, FAQs, Interactive Map, Document Library, and Contact Us. The main content area has a blue background with white topographic lines. It features the title 'What we've heard so far...' and a paragraph explaining the page's purpose. Below this, there is a paragraph about the consultation process and a table summarizing feedback.

**What we've heard so far...**

This page is dedicated to sharing frequently raised questions, objections, claims, and any other feedback that CGG have heard during the consultation process.

Consultation is an ongoing process of listening to feedback and adapting the Regia MSS to ensure that environmental impacts and risks are properly managed. To support a transparent process for relevant persons we have committed to publishing the objections and claims that we've heard from the community, our view on the feedback, and what we've changed or will do because of the consultations.

The below table is a thematic representation of the feedback we've heard. If you do not see your feedback, objection, or claim shown accurately it may be due to our thematic summary. If you would like to raise other specific feedback, objections, or claims please get in touch with our consultation team at [contact@regiamss.com.au](mailto:contact@regiamss.com.au).

Feedback (Objections or Claims)	Our View (Assessment of Merit)	Measures adopted because of the consultations
Deen Maar/Lady Julia Percy Island is a significant place for ecological and cultural	We have identified protected species on the island and have modelled sound propagation around the area. We agree that ecological values should be protected.	Implemented a 10.3km exclusion around the island which is the behavioral response threshold for marine mammals. This buffer is a starting point around the island for protection of cultural heritage. We

# What happens next?

## **Consultation (June/July)**

- Searching for relevant persons continues.
- Undertake 1-on-1 or small group engagements on request (online).
- Continue to advertise on social media.
- Continue 1-on-1 consultation with relevant persons as identified.
- Follow up with relevant persons already contacted.

## **Environmental Assessments**

- Receive comment on our draft impact and risk assessments.
- Publish our modelling reports.
- Finalise our remaining assessments and publish ASAP.
- Evaluate all impacts and risks collectively.
- Commence cumulative impact assessment.
- Consider further control measures and activity limitations to reduce impacts and risks.

# What happens next?

## Activity Design

- Publish our:
  - Acquisition Area
  - Active Source Area
  - Operational Area
- Implement further exclusion zones where possible:
  - Distances from coastlines
  - Particularly productive fishing blocks
  - Twelve Apostilles State Marine Park
  - Merri Marine Sanctuary
  - >400m water depth contour
  - West Tasmanian Canyons (KEF) and Victorian canyons

## Additional Measures Under Assessment

- Testing some new technology:
  - Underwater glider whale monitoring
  - Moored buoy monitoring
  - High frequency elimination/reduction sound source
  - Drones for whale detections
- Phasing survey across 2 or 3 years to reduce impacts given timing sensitivities
- Buffers (distance) from other petroleum activities

# Q&A

# Webinar Series

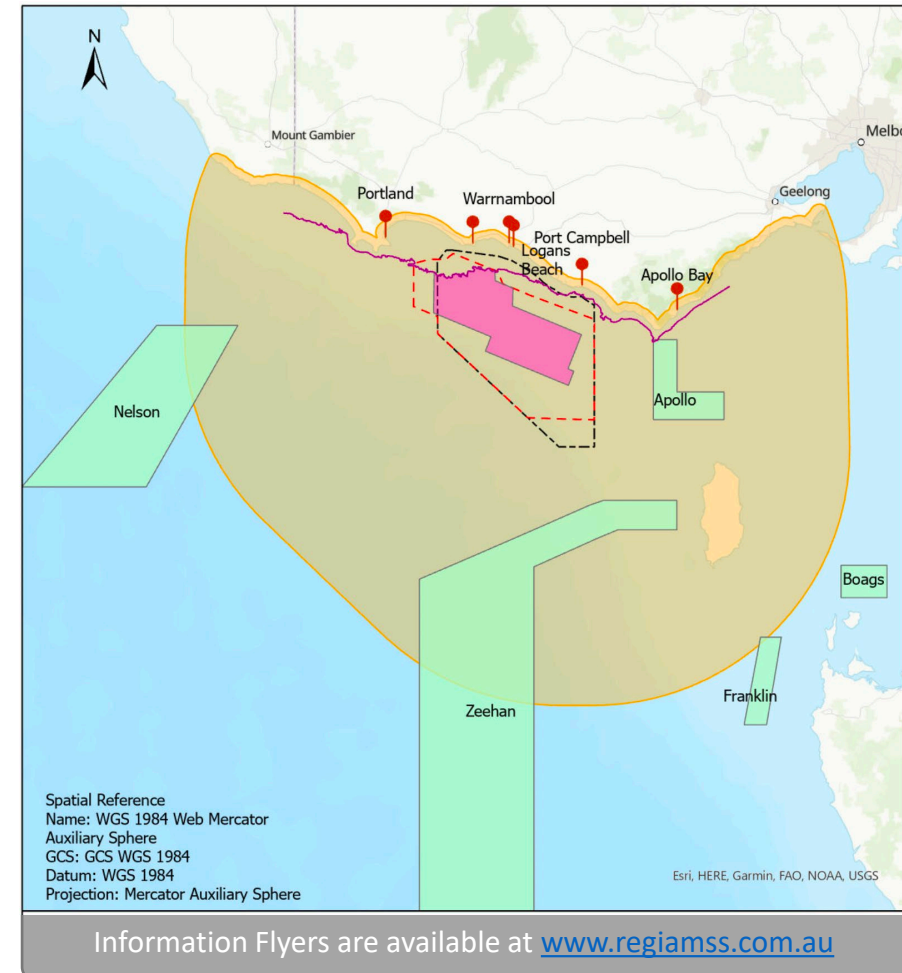

Webinar 5: Objections and Claims

View Webinar [Here](#)

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- The draft predictions of environmental impact and risk.
- Consultation started on 1 February 2023 and is “open” until 20 October 2023.

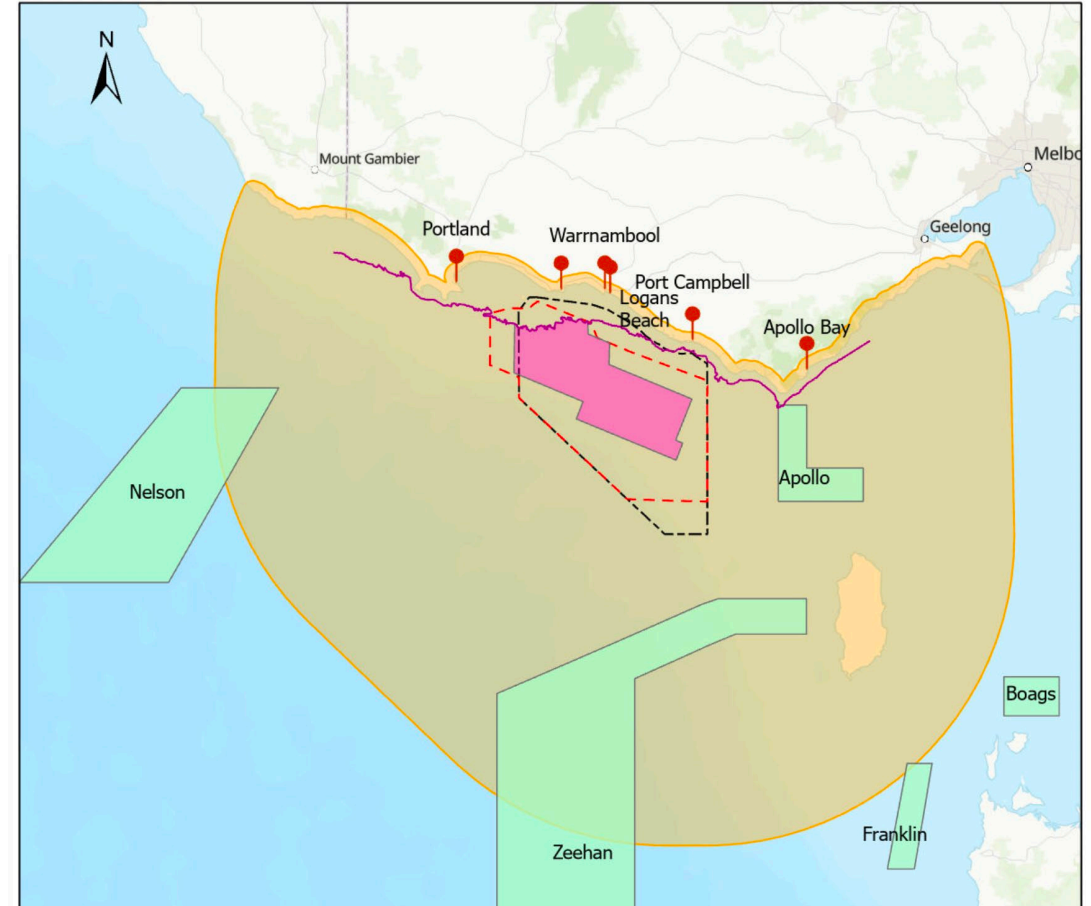

Activity Planning Parameter	Detail
Earliest start date	1st April 2024
Latest finish date	31st December 2028
Survey duration	90 days
Maximum acquisition days	60 days

# Activity Update

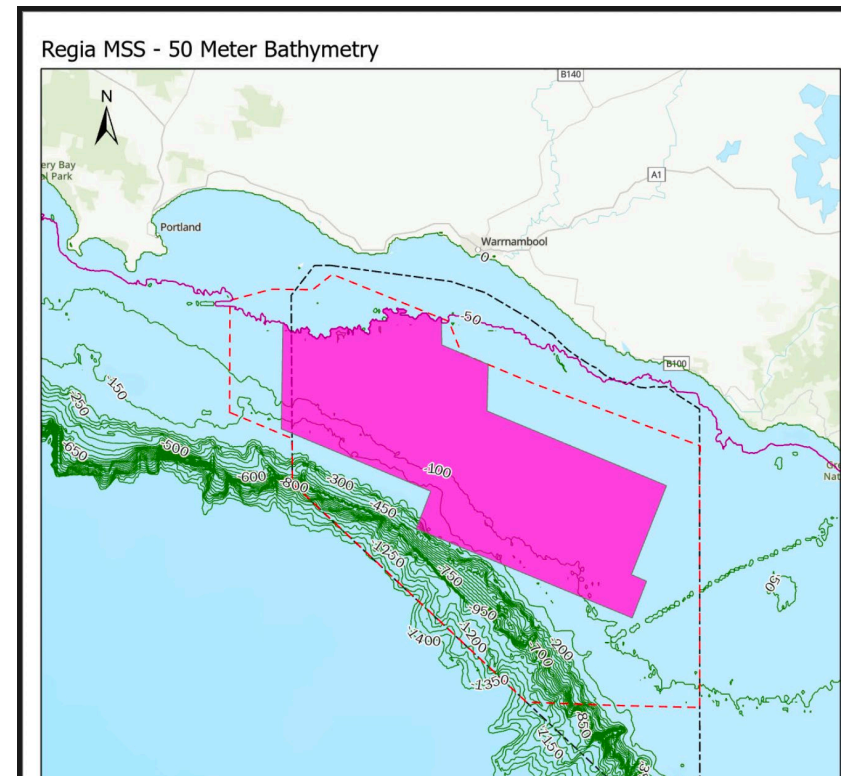

- Timing is now proposed to be either April/May/June or August/September/October.
  - Avoids Blue Whale presence.
  - Avoids upwelling and increased biodiversity concerns.
- 50m bathymetry contour governs the northern aspect of the survey.
  - Distances the survey from the Southern Right Whale reproductive BIA.
  - Further protection to divers/swimmers
- Extension to western side of active source area and operational area.

# Impact Management Zones

## Activity Limitations

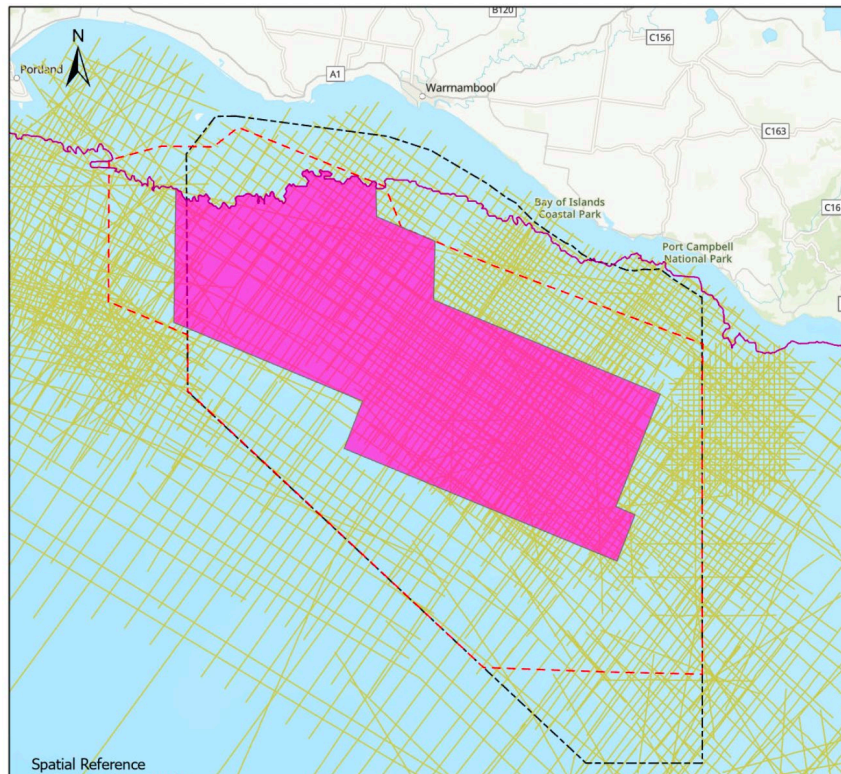

- No discharge of the sound source in the Southern Right Whale reproductive BIA at any time.
- No discharge of the sound source outside of the active source area.
- No discharge of the sound source in December, January, February, March, July, or August.
- No discharge of the sound source within 10.3km of Deen Maar.
- Project vessels will not traverse between Deen Maar and the mainland.
- No discharge of the sound source at full power in water depths of less than 50m.
- No discharge of the sound source at full power in water depths of greater than 400m.
- No discharge of the sound source within a Key Ecological Feature.
- No anchoring permitted within the activity planning area.
- Received levels of sound at coastal areas must be below 145 dB re 1  $\mu$ Pa.
- Seismic and support vessels will operate at no more than 6 knots during acquisition.

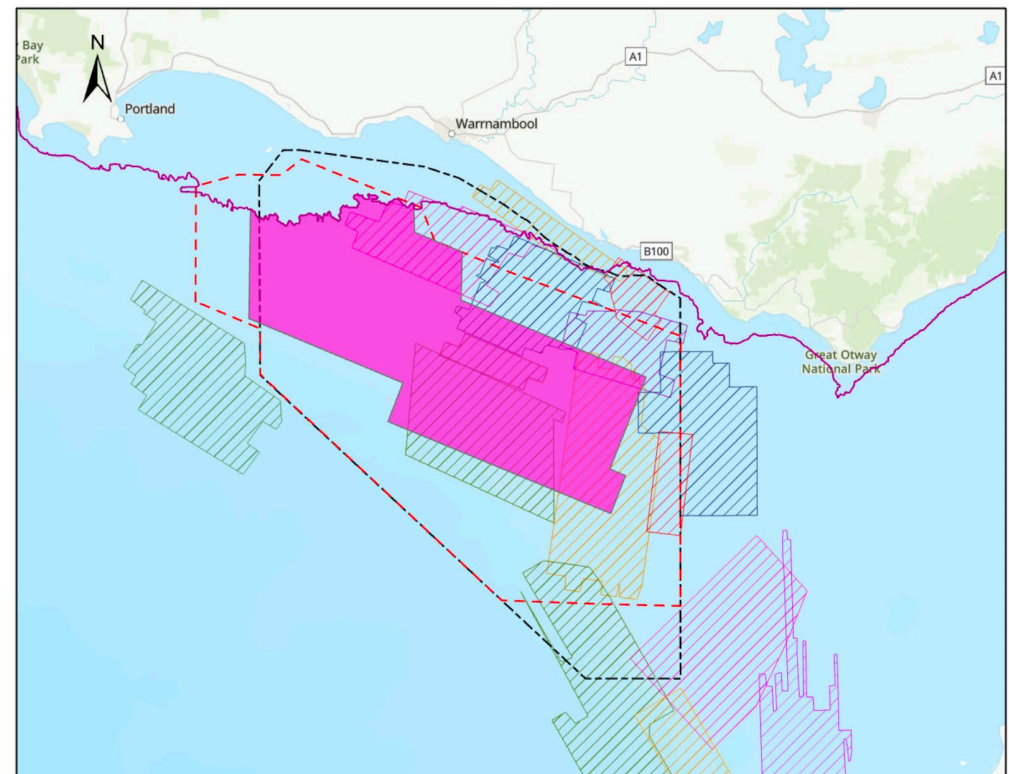

# New Maps

## Previous 2D MSS (Lines)

## Previous 3D MSS (Shapes)

# Control Measures

- Community Liaison Program (CLP)
- Relevant Person Consultation Management System
- Marine Mammal Adaptive Management Procedure
- Marine Mammal Observers (MMOs) and PAM Operators
- Project Vessels
- IMS Risk Assessment Procedure
- Marine Assurance System
- Vessel Bunkering Procedure
- Sail Line Procedure
- Company Site Representatives
- Adjustment Protocol
- Oil Pollution Emergency Plan
- Acquire Seismic On Paper (ASOP)
- Sea Country Protection Plan

# Next Steps

- Complete the EP preparation
  - Finalise control measures and environmental performance metrics
    - From industry standards and good practice
    - Because of the consultations
  - Self-assessment of acceptability
    - 10A Criteria
    - ALARP
    - Acceptable Levels
    - Principles of Ecologically Sustainable Development
- Submit the EP for public comment

- Update control measures
- Finalise environmental performance metrics
- Prepare consultation chapter
- Prepare full text records of consultation
- Prepare sensitive information chapter

- Ensure we've prepared correctly
- Ensure all parts of the EP are present

# Consultation Process

- We have ensured people are informed enough to decide whether they want to be a relevant person.
- Been clear that the purpose of consultation is to inform the impact and risk assessments.
- Documented our understanding of the existing environment including social, cultural, and economic features.
- We have used all reasonable efforts to find and contact each relevant person.
- Provided sufficient information to relevant persons.
  - We have published our impact and risk assessments in full – 15 September 2023.
  - We have written to each relevant person ask what more was needed.
- We have given 8 months to the process, three times extended it, and given all our current information to the public for at least 30 days prior to submission.
- We commit to continuing to publish each document we prepare to support transparency with the community.
- We acknowledge individuals may have information that provides more detailed knowledge and management of knowledge is a key part of our Implementation Strategy.
- Consultation with relevant persons continues through the NOPSEMA assessment process and after acceptance.

# Q&A

# Webinar Series

Webinar 6: Key Matters

View Webinar [Here](#)

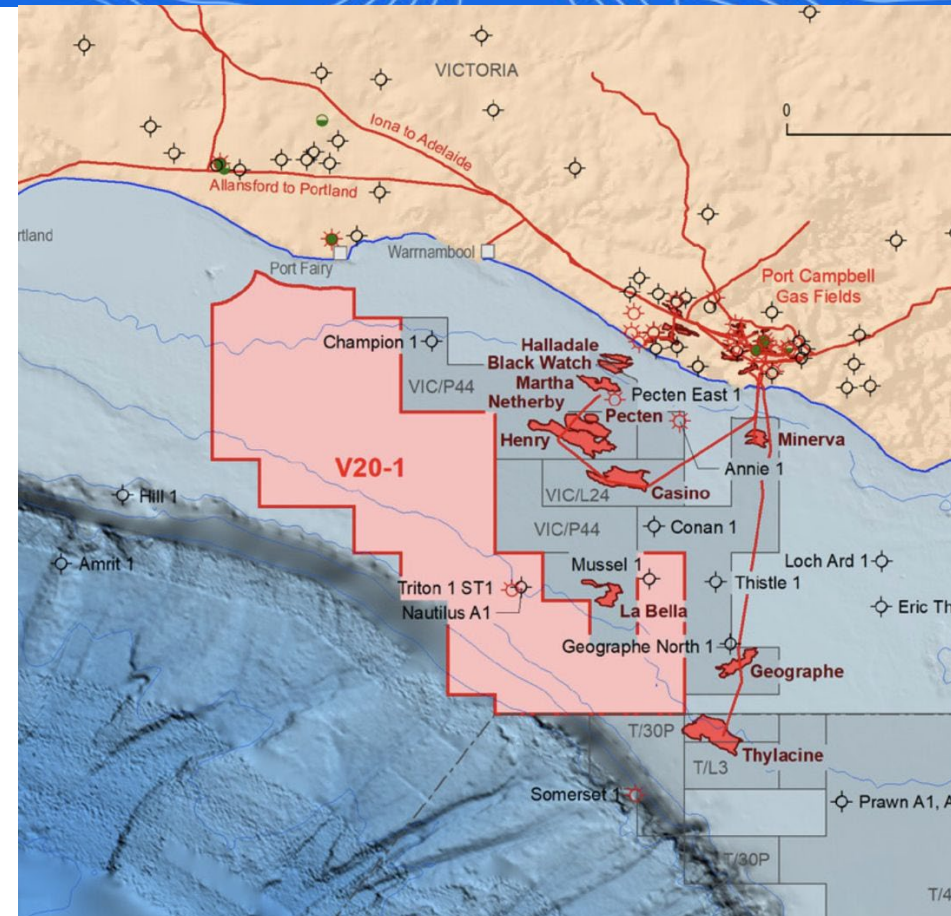

# Introduction

- Purpose of webinar 6 is to:
  - Provide the opportunity for relevant persons to request content to be discussed at this webinar (note zero response to newsletter request).
  - Update relevant persons and others on the status of the Regia MSS activity.
  - Update to some control measures following ongoing refinement of the activity.
  - Share what we've heard and what we've changed.
  - Update on the process going forward.
  - Provide time for Q&A.

# What is the Regia MSS?

- Regia is the name of a proposed marine seismic survey in the Otway region.
- Seismic surveys are a technique used to explore and map the subsurface of the ocean floor.
- Seismic surveys are necessary to understand the potential for petroleum resources within an area.

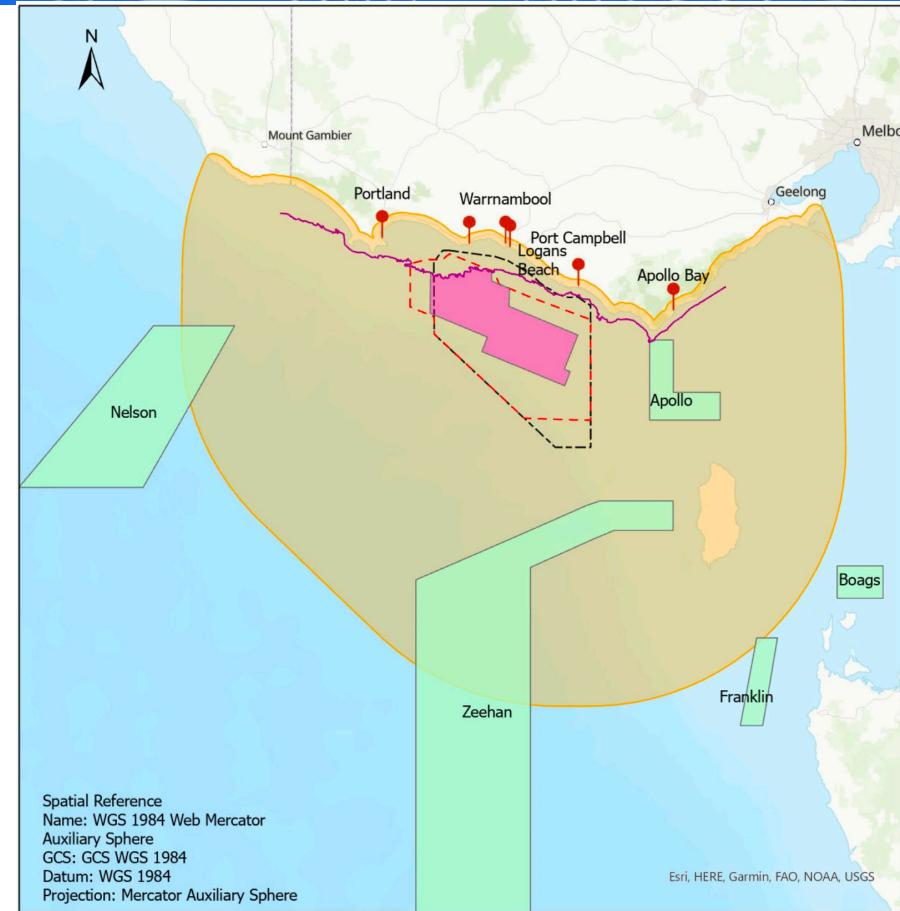

Activity Planning Parameter	Detail
Earliest start date	1st April 2024
Latest finish date	31st December 2028
Survey duration	90 days
Maximum acquisition days	60 days

Information Flyers are available at [www.regiamss.com.au](http://www.regiamss.com.au)

# EP Consultation Status

- Consultation started on 1 February 2023.
- In response to feedback, we have extended consultation multiple times.
- Thank you to those relevant persons
  - that have provided critical information into our assessments.
  - who have provided objections and claims for us to assess.
- CGG believe we have sufficient information to complete our environmental assessments and conclude pre-submission consultation.
- There is a further opportunity to voice concerns and provide information to CGG through the public comment process in the New Year.
- We continue to encourage relevant persons to self-identify pre-submission, throughout public comment, and post-acceptance.

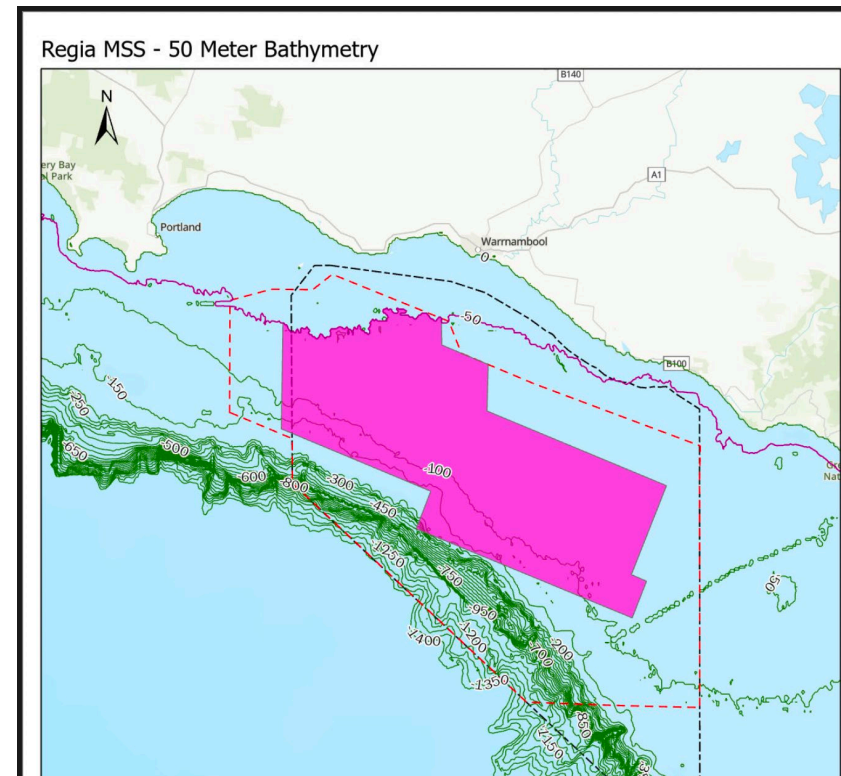

# Updates to Impact Management Zones

## Activity Limitations

- No discharge of the sound source in the Southern Right Whale reproductive BIA at any time.
- No discharge of the sound source outside of the active source area.
- No discharge of the sound source in December, January, February, March, July, or August.
- No discharge of the sound source within 18km ~~10.3km~~ of Deen Maar.
- Project vessels will not traverse between Deen Maar and the mainland.
- No discharge of the sound source at full power in water depths of less than 50m.
- No discharge of the sound source at full power in water depths of greater than 200m ~~400m~~.
- No discharge of the sound source within a Key Ecological Feature.
- No anchoring permitted within the activity planning area.
- Received levels of sound at coastal areas must be below 145 dB re 1  $\mu$ Pa.
- Seismic and support vessels will operate at no more than 6 knots during acquisition.

# What we've heard

Further to what we have published online about what we've heard...

Principles of ESD not holistically addressed

- Prepare a dedicated report on whether the Regia MSS is consistent with the principles of ESD.

Aspect-led approach to impact assessment inadequate

- Prepare Key Environmental Matters reports on subjects of highest environmental value and considered on a case-by-case basis on request.
- First KEM Reports will be on Southern Right Whales and Southern Rock Lobster

Sea Country protection is important to more than just Traditional Owners

- Implement a Sea Country Protection Program
- Provide the opportunity for TO's to co-design and co-implement the program.

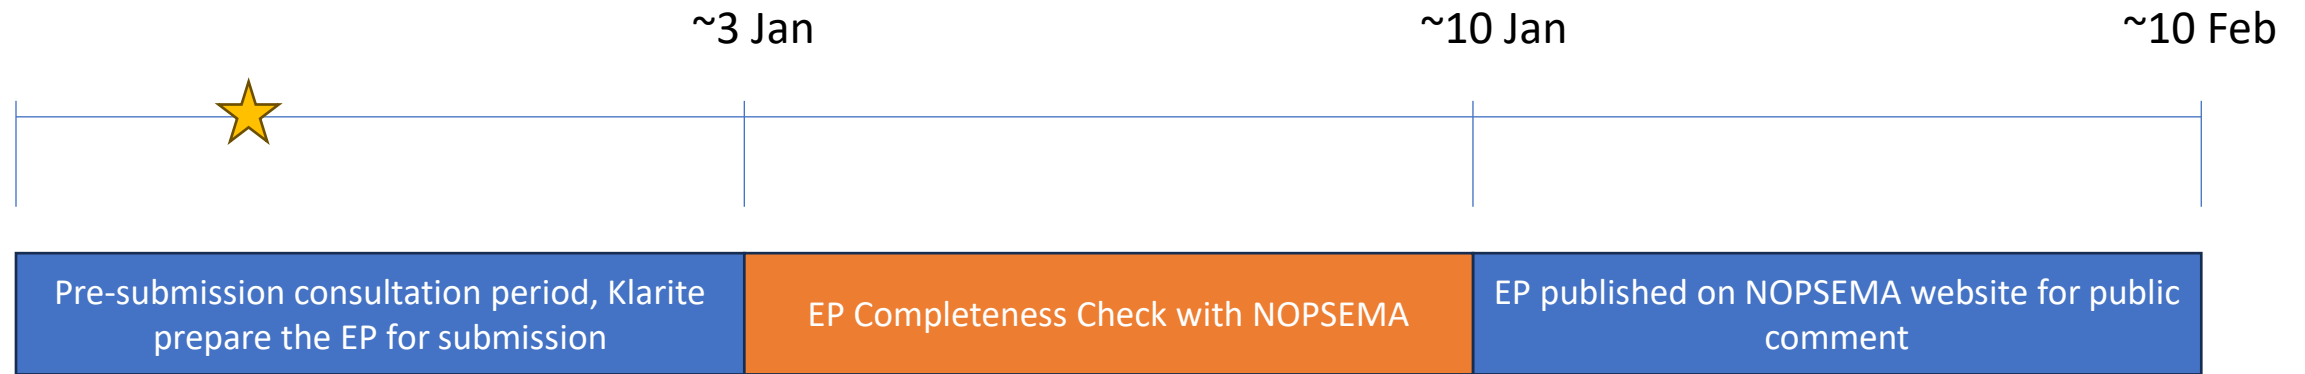

ALARP assessment is opaque and should be clearer

- Prepare a dedicated ALARP assessment report for inclusion in the EP.
- Show consideration of weighing cost (money, time, trouble) against environmental benefit gained.

Need more confidence in the effectiveness of control measures

- Prepare a dedicated Control Measures and Environmental Performance report.

# Public Comment (subject to change)

- Update control measures
- Finalise environmental performance metrics
- Prepare consultation chapter
- Prepare full text records of consultation
- Prepare sensitive information chapter

- Ensure we've prepared correctly
- Ensure all parts of the EP are present

# Q&A

# *Risk Assessment Accidental Release of Materials or Waste Overboard*

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (Regia MSS) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (PEIRA) (Appendix B4) for further assessment.

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (EP) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table D1-2-table D1-21 shows the feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table D1-2-1 shows how this feedback has been incorporated into the environmental assessments.

*Table D1-2-1 - Relevant person input into the preparation of the EP*

Objections and Claims	Feedback ID	Measure adopted because of consultation
Concerned about fuel spillage and need assurance that the project would not increase in rubbish washing up.	79	Provide garbage management plan when a vessel is allocated.

### 3 Aspect – Accidental Release of Materials or Waste Overboard

#### 3.1 How the Aspect Occurs

An accidental release of materials or waste may occur from the seismic and support vessels.  
No materials or solid wastes will be disposed at sea from vessels undertaking the Regia MSS.

#### 3.2 Extent and Duration of the Aspect

Duration: 90 days

Extent: Operational Area

The extent of the area where the risk of an accidental release of materials or waste may occur is within the Operational Area and the risk could occur while the activity is undertaken.

#### 3.3 Legislative and Other Requirements

Annex 1 of this document describes the legal and other requirements that apply to an accidental release of materials or waste, and how the requirements will be met.

## 4 Cause Effect Pathway

The PEIRA (Appendix B4) identified a cause-effect pathway for an accidental release of materials or waste for the following environmental components:

- Water quality
- Benthic assemblages
- Birds
- Sharks
- Marine reptiles
- Marine mammals
- Coastal developments
- Commercial fishing and aquaculture
- Indigenous culture
- Marine protected areas
- Marine industries

The PEIRA identified that risk of an accidental release of materials or waste to the following environment components was ranked as having a negligible level of effect and are not assessed further in this section:

- Water quality
- Benthic assemblages

There is the potential for materials or waste to be accidentally released overboard due to open bins, crane operator error or improper storage or handling. Materials or wastes that could potentially be released overboard are typically inert such as paper, cardboard, foam (earplugs) and plastics (wrapping material, hard hats). These materials or waste could pose a risk marine fauna via ingestion or entanglement. They may also result in visual pollution in the ocean and on shorelines impacting the values of coastal developments, indigenous culture, and marine protected areas.

Larger dropped objects may also occur such as loss of towed equipment (streamers, acoustic sources, paravanes for streamer steering) and sea containers. These may pose a navigational or entanglement hazard to commercial fishers and other marine users.

## 5 Description of the Existing Environment that May be Affected by the Activity

As detailed in the Section 3.2, the Operational Area has been adopted as the extent of the area where an accidental release of materials or waste may occur. To identify the presence of those species that may be at risk of ingestion or entanglement with materials or waste accidentally released overboard (birds, dolphins, pinnipeds, sharks, turtles, whales) a Protected Matters Search was undertaken for the Operational Area with the report available in Appendix B5. Annex 2 details those species identified, any biologically important areas and conservation advices or management plans.

Information is provided for those species undertaking biologically important behaviour within the Operational Area as these species are more likely to be at risk from ingestion or entanglement with materials or waste accidentally released overboard.

### 5.1 Birds

The PMST Report identified multiple bird species or species habitat within the Operational Area. Annex 2 provides a summary of the PMST Report. Several of these bird species were identified to be undertaking biologically important behaviours and/or have BIAs within the Operational Area. No habitat critical to the survival of the bird species were identified within the Operational Area.

The orange-bellied parrot, which is critically endangered is likely to migrate through Operational Area, however, it does not land at sea or use coastal areas as habitat so risks to this species are not predicted from marine debris.

Seabird species that forage at sea are more likely to encounter marine debris and hence are discussed further in this section.

Several albatross species were identified as foraging behaviour likely within the Operational Area with the White-capped Albatross identified as foraging behaviour known to occur (Annex 2). In addition, the following albatross species have foraging BIAs within the Operational Area:

- Antipodean – Appendix B12 MAP-REG-EPM-059
- Black-browed - Appendix B12 MAP-REG-EPM-060
- Buller's - Appendix B12 MAP-REG-EPM-071
- Campbell - Appendix B12 MAP-REG-EPM-061
- Indian Yellow-nosed - Appendix B12 MAP-REG-EPM-063
- Shy - Appendix B12 MAP-REG-EPM-066
- Wandering - Appendix B12 MAP-REG-EPM-072

These BIAs cover either most or all the South-east Marine Region (CoA 2015a).

Albatrosses and petrels are among the most oceanic of all seabirds, and seldom come to land unless breeding (CoA 2022). Albatross and petrel species exhibit a broad range of diets and foraging behaviours, and hence at-sea distributions are diverse. Combined with their ability to cover vast oceanic distances, all waters within Australian jurisdiction can be considered foraging habitat, however the most critical foraging habitat is those waters south of 25° where many species spend most of their foraging time (CoA 2022).

Albatrosses have a widespread distribution throughout the southern hemisphere. They feed mainly on cephalopods, fish and crustaceans, using surface feeding or plunge diving to seize their prey (ACAP 2020). Albatrosses are colonial, usually nesting on isolated islands and foraging across oceans in the winter months with most observations along the edge of the continental shelf (CoA 2022).

The Flesh-footed Shearwater and Northern Giant Petrel were also identified as foraging behaviour likely within the Operational Area. No BIAs for these species occur within the Operational Area. The Common Diving-petrel (Appendix B12 MAP-REG-EPM-062), Short Tailed Shearwater (Appendix B12 MAP-REG-EPM-065) and Wedge-tailed Shearwater (Appendix B12 MAP-REG-EPM-067) were identified as having foraging BIAs within the Operational Area.

Petrels are oceanic and have a widespread distribution throughout the southern hemisphere. They are colonial and breed on sub-Antarctic and Antarctic islands in a circumpolar band generally between 40°S and 60°S. Petrel species feed on small fish, cephalopods (octopus, squid and cuttlefish) and crustaceans along the edge of the continental shelf and open waters (CoA 2022).

The Australasian Gannet was also identified as having a foraging BIA within the Operational Area (Appendix B12 MAP-REG-EPM-073). The Australasian Gannet generally feeds over the continental shelf or inshore waters. Their diet is comprised mainly of pelagic fish, but also squid and garfish. Prey is caught mainly by plunge-diving, but it is also seen regularly attending trawlers (CoA 2015a).

Several shorebirds were identified from the PMST Report as being present in the Operational Area with the Australian Fairy Tern and White-fronted Tern identified as foraging behaviour likely within the Operational Area. Threatened shorebirds that may occur within the Operational Area are the Australian Fairy Tern, Curlew Sandpiper, Eastern Curlew, and Red Knot. These species are commonly found on coastal shores including beaches and rocky shores and either feed at low tide on worms, crustaceans and molluscs or fish species or feed on aquatic biota. Many of the wader species are migratory travelling from the Northern Hemisphere in non-breeding months. Most inhabit intertidal mudflats, rocky islets, sand beaches, mangroves, rocky coastline, and coral reefs. Roosting occurs in similar habitats and species are found feeding on fish, crustaceans, aquatic insects, as well as plants and seeds (Higgins & Davies 1996).

## 5.2 Pinnipeds

The PMST Report identified the Australian Fur-seal is likely to occur within the Operational Area, and the Australian Sea-lion and the New Zealand Fur-seal may occur. No biologically important behaviours or BIAs were identified within the Operational Area for these species.

## 5.3 Sharks

The PMST Report identified five shark species, that may (School), likely (Porbeagle, Mako, Little Gulper) or known (White) to occur within the Operational Area. Foraging and distribution BIAs were identified for the White Shark (Appendix B12 MAP-REG-EPM-057).

The White Shark is listed as Vulnerable. White Sharks are long-lived, living for 30 years or more (Bruce and Bradford 2008), and are found throughout temperate and sub-tropical regions in the northern and southern hemispheres (Last & Stephens 2009). The species is also commonly found in inshore waters in the vicinity of islands, and often near seal colonies (Malcolm et al. 2001). The foraging BIA that is within the Operational Area is centred on Lady Julia Percy Island which is a known seal breeding colony. The Operational Area also overlaps the distribution BIA that covers Australian waters from Barrow Island/Montebello Islands, WA to Yepoon/Swains Reef, Qld (Appendix B12 MAP-REG-EPM-057).

## 5.4 Turtles

The PMST Report identified three turtle species, that may (green) or are likely (leatherback and loggerhead) to occur within the Operational Area. No BIAs or habitat critical to the survival of the species were identified.

## 5.5 Dolphins and Whales

The PMST Report identified several dolphin and whale species that are known, likely or may occur within the Operational Area. Table D1-5-table D-51 details those species that have biologically important areas or biologically important behaviours identified within the Operational Area.

*Table D1-5-1: Cetacean Species Biologically Important Behaviours and/or BIAs within the Operational Area*

Receptor	Biologically Important Behaviour
Blue Whale	Foraging, feeding or related behaviour known to occur within area
	Foraging (annual high use area) BIA (Appendix B12 MAP-REG-EPM-068)
Fin Whale	Foraging, feeding or related behaviour known to occur within area
Pygmy Right Whale	Foraging, feeding or related behaviour likely to occur within area
Sei Whale	Foraging, feeding or related behaviour known to occur within area
Southern Right Whale	Breeding known to occur within area
	Migration BIA (Appendix B12 MAP-REG-EPM-069)

### 5.5.1 Blue whale

The Blue Whale (*Balaenoptera musculus*) is listed as an endangered species under the EPBC Act. There are two subspecies of blue whales that use Australian waters (including Australian Antarctic waters), the Pygmy Blue Whale (*B. m. brevicauda*) and the Antarctic Blue Whale (*B. m. intermedia*). The Otway region, where the Operational Area is located, is an important migratory and foraging area for Blue Whales, as shown by passive acoustic monitoring and aerial surveys (Gavrilov 2012, McCauley et al. 2018, Gill et al. 2011). Underwater acoustic monitoring programs have detected Antarctic and Pygmy Blue Whale calls in the Otway Region (McCauley et al. 2018).

Important foraging grounds for Blue Whales include the Great Australian Bight, South Australia, and off Portland Victoria. Research to date has found that Pygmy Blue Whales occupy the western area of the Bonney Upwelling system in the Eastern Great Australian Bight and adjacent to the Kangaroo Island canyons from November and December (DoE 2015e). Pygmy Blue Whales then move south-east to the Bonney Upwelling system off eastern South Australia and Victoria (e.g., between Robe, SA and Cape Otway, Vic). This occurs predominately between January to April (DoE 2015e).

The Blue Whale was extremely abundant until the early 20<sup>th</sup> century when they were hunted to near extinction. Approximately 341,830 Blue Whale takes were recorded by commercial whaling in the Antarctic and sub-Antarctic in the 20<sup>th</sup> century, of which 12,618 were identified as Pygmy Blue Whales (Branch et al. 2004). The current global population of Blue Whales is uncertain but is plausibly in the range of 10,000 to 25,000, corresponding to about 3-11% of the 1911 estimated population size (Reilly et al. 2008).

The Operational Area is within the foraging (annual high use) BIA where Pygmy Blue Whales predominately occur between January to April (DoE 2015e) (Appendix B12 MAP-REG-EPM-068).

### 5.5.2 Fin whale

The Fin Whale is a cosmopolitan migratory species that is listed as vulnerable and occurs from polar to tropical waters but is rarely sighted in inshore waters. Fin Whales show well defined migratory movements between polar, temperate, and tropical waters which are essentially north-south with little longitudinal dispersion.

While Australian Antarctic waters are important feeding grounds for Fin Whales, the species also feeds in the Bonney Upwelling during summer/autumn sometimes in the company of Blue and Sei Whales (DCCEE 2023b). Areas of upwelling and interfaces with mixed and stratified waters may be an important feature of Fin Whale feeding habitat with the species feeding on planktonic crustacea,

krill, some fish, and cephalopods (DCCEEW 2023b). Fin Whales frequently lunge or skim feed at or near the surface and they are known to dive to 230 m to feed.

There are no BIAs for the Fin Whale within Australian waters. Fin Whales are likely to be foraging in the Operational Area at similar time as Blue Whales, predominately occur between January to April.

#### 5.5.3 Pygmy Right Whale

The Pygmy Right Whale is a little-studied baleen whale species that is found in temperate and sub-Antarctic waters in oceanic and inshore locations. No population estimates are available for Pygmy Right Whales globally, or in Australian waters (DCCEEW 2023c). The species has never been hunted commercially and is listed as a migratory species under the EPBC Act.

Species distribution in Australia is found close to coastal upwellings and the Subtropical Convergence may be important for regulating distribution (Bannister et al. 1996). Key locations include south-east Tasmania, Kangaroo Island (SA) and southern Eyre Peninsula (SA) close to upwelling habitats rich in marine life and zooplankton upon which it feeds (Bannister et al. 1996).

There are no BIAs for the Pygmy Right Whale within Australian waters. Pygmy Right Whales are likely to be foraging in the Operational Area at similar time as Blue Whales, predominately occur between January to April.

#### 5.5.4 Sei Whale

The Sei Whale is listed as vulnerable under the EPBC Act. Sei Whales are considered a cosmopolitan species, ranging from polar to tropical waters, but tend to be found more offshore than other species of large whales. Sei Whales move between Australian waters and Antarctic feeding areas; subantarctic feeding areas (e.g. Subtropical Front); and tropical and subtropical breeding areas. The proportion of the global population in Australian waters is unknown as there are no estimates for Sei Whales in Australian waters.

In Australia, Sei Whales occur within Australian Antarctic Territory waters and Commonwealth waters, and have been infrequently recorded off Tasmania, NSW, Queensland, the Great Australian Bight, Northern Territory and Western Australia (Parker 1978, Bannister et al. 1996, Thiele et al. 2000, Chatto and Warneke 2000, Bannister 2008).

Sightings of Sei Whales within Australian waters includes areas such as the Bonney coast upwelling off South Australia (Miller et al. 2012), where opportunistic feeding has been observed between November and May (Gill et al. 2015).

There are no BIAs for the Sei Whale within Australian waters. Sei Whales are likely to be foraging in the Operational Area at similar time as Blue Whales, predominately occur between January to April.

#### 5.5.5 Southern Right Whale

The Southern Right Whale (*Eubalaena australis*) is listed as endangered under the EPBC Act. Southern Right Whales were depleted to less than 300 individuals globally due to commercial whaling in the 19<sup>th</sup> and 20<sup>th</sup> centuries (Tormosov et al. 1998). They were protected from whaling in 1935 however, due to illegal whaling in the 1970s and because Southern Right Whales have a slow rate of increase (7% per annum) compared to other marine mammals, their numbers remain low (IWC 2013). Global abundance estimates are 13,000 for the species, across key wintering grounds in South Africa, Argentina, Australia, and New Zealand.

Southern Right Whales are distributed in the Southern Hemisphere with a circumpolar distribution between latitudes of 16°S and at least 65°S. They migrate from southern feeding grounds in sub-Antarctic waters to Australia in between May and November to calve, mate and rest (Bannister et al. 1996, DCCEEW 2022). In Australian coastal waters, they occur along the southern coastline of the mainland and Tasmania and generally extend as far north as Sydney on the east coast and Perth on

the west coast (CoA 2012). There are occasional sightings further north, with the extremities of their range recorded at Hervey Bay and Exmouth (CoA 2012).

The largest established calving areas in Australia include Head of Bight in SA, and Doubtful Island Bay and Israelite Bay in WA. Smaller but established aggregation areas regularly occupied by Southern Right Whales include Yokinup Bay in WA, Fowlers Bay in SA and the Warrnambool and Portland in Victoria. Emerging aggregation areas include Flinders Bay, Hassell Beach, Cheyne/Wray Bays, and Twilight Cove in WA, and sporadically occupied areas include Encounter Bay in SA. Southern Right Whales generally occupy shallow sheltered bays within 2 km of shore and within water depths of less than 20 m (Charlton et al. 2017). A number of additional areas for Southern Right Whales are emerging that might be of importance, particularly to the south-eastern population. In these areas, small but growing numbers of non-calving whales regularly aggregate for short periods of time. These areas include coastal waters off Peterborough, Port Campbell, Port Fairy and Portland in Victoria (CoA 2012). These emerging areas off Victoria align with the Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022) which provides an update to BIAs and emerging aggregation areas (Figure D1-51-). The proposed changes are:

- Reproductive areas - Areas where mating, calving, nursing and/or presence of neonates are known, or likely, to occur. For Victoria this is the nearshore area between Portland and Port Campbell.
- Migration areas - Areas where Southern Right Whales are known, or likely, to use for movement between regions that support biologically important behaviour (e.g., coastal movement between reproductive areas).

The Operational Area overlaps the Southern Right Whale Migration BIA where the whales are present between April and October (NCVA 2023) (Appendix B12 MAP-REG-EPM-069).

## 5.6 Coastal Developments

No coastal developments are within the Operational Area. The closest coastal developments to the Operational Area are the towns of Port Campbell, Port Fairy, and Warrnambool. The Great Ocean Road, a major tourist draw card is popular for its pristine beaches. The nearest coastline is ~ 7 km from the Operational Area.

## 5.7 Commercial Fishing and Aquaculture

No aquaculture is undertaken within the Operational Area.

Based on the Commercial Fisheries Analysis report (Appendix B6), the Operational Area overlaps the following commercial fisheries that have catch effort:

- Commonwealth
  - Southern and Eastern Scalefish and Shark Fishery following sectors:
    - Shark Gillnet sector
    - Trawl – otter board
    - Southern Squid Jig Fishery
- Victorian:
  - Giant Crab
  - Multi-species Ocean
  - Octopus
  - Southern Rock Lobster
  - Wrasse

### 5.7.1 Commonwealth Fisheries

#### 5.7.1.1 *Southern and Eastern Scalefish and Shark Fishery*

The Southern and Eastern Scalefish and Shark Fishery (SESSF) stretches south from Fraser Island in southern Queensland, around Tasmania, to Cape Leeuwin in southern Western Australia. Information on the Shark Gillnet Sector and Commonwealth Trawl Sector are from the Fishery Status Reports (Patterson et al. 2022).

The Shark Gillnet Sector is part of the Gillnet, Hook and Trap Sector of the SESSF. Most fishing in the sector using nets occurs in Bass Strait targeting Elephantfish, Gummy Shark, Sawsharks and School Shark. Fishing is generally concentrated east of King Island. In the 2021-22 fishing season there were 32 active trawl vessels.

The Commonwealth Trawl Sector of the SESSF extends south from Barrenjoey Point in northern New South Wales to east of Kangaroo Island off South Australia. The Commonwealth Trawl Sector is a multispecies fishery, targeting a variety of fish and shark species. Effort in the fishery is widely distributed. However, since 2007 – after the closure to trawling of most SESSF waters deeper than 700 m – effort has become increasingly concentrated on the shelf (to 200 m) rather than on the slope. In the 2021-22 fishing season there were 27 active gillnet vessels.

#### 5.7.1.2 *Southern Squid Jig Fishery*

A single species fishery that operates year-round. Portland and Queenscliff are the major Victorian landing ports. Jigging typically occurs midwater at depths between 50 and 100 m at night using large lights that illuminate the waters around a boat. In 2021 there were eight active vessels in the fishery with the landing ports being Triabunna (Tasmania); Queenscliff and Apollo Bay (Victoria) (Patterson et al. 2022).

### 5.7.2 Victorian Fisheries

#### 5.7.2.1 *Giant Crab*

A small fishery operating in western Victoria and closely linked with the Rock Lobster Fishery. Most vessels are used primarily for rock lobster fishing with giant crab taken as by-product. Fishing effort is concentrated on continental shelf edge (~200 m deep). Giant crabs inhabit the continental slope at approximately 200 m depth and are most abundant along the narrow band of the shelf edge. Closed seasons operate for male (15 September to 15 November) and female (1 June to 15 November) giant crabs. Data for 2020/21 is not available due to insufficient data to report because there are less than five licence holders (policy requirement to protect commercial confidentiality of data) (VFA 2021).

#### 5.7.2.2 *Multi-species Ocean*

The wrasse, inshore trawl, southern rock lobster and giant crab Victorian fisheries are able to catch gummy shark and school sharks as part of their fishery. Snapper are caught using lines, nets and haul seine. Over 90% of the catch is from Port Phillip Bay, and around 5% from coastal waters. In 2020/21, 45 tonnes were landed but a value could not be provided as there is insufficient data to report because there are less than five licence holders (policy requirement to protect commercial confidentiality of data) (VFA 2021).

#### 5.7.2.3 *Octopus*

The octopus fishery is a new fishery harvesting mainly pale octopus (*Octopus pallidus*) in East Gippsland. The fishery may also catch maori octopus (*Macroctopus maorum*) and gloomy octopus (*Octopus tetricus*). Octopus are caught using purpose-built unbaited traps. The fishery commenced on 1<sup>st</sup> August 2020. Three zones have been established for the management of commercial octopus fishing in Victoria. Octopus Fishery Access Licences authorise commercial take of octopus from the eastern octopus zone where the majority of commercial octopus fishing in Victoria has occurred to date (VFA 2023). The Operational Area is within the western zone where fishing is less established and being managed by the Victorian Fishing Authority through exploratory, temporary permits.

#### 5.7.2.4 Southern Rock Lobster

Victoria's second most valuable fishery with a production value of A\$13.6 million in 2020/21 (VFA 2021). Since 2009/10, annual quotas for the western zone that overlaps the Operational Area have been set at between 230 and 260 tonnes and have been fully caught each year (VFA 2023a). In the western zone, most catch is landed through Portland, Port Fairy, Warrnambool, Port Campbell and Apollo Bay. Closed seasons operate for male (15 September to 15 November) and female (1 June to 15 November) lobsters. Southern rock lobsters are found to depths of 150 m, with most of the catch coming from inshore waters less than 100 m deep (VFA 2023a).

#### 5.7.2.5 Wrasse

The fishery extends the length of the Victorian coastline from high tide mark to 20 nm offshore (VFA 2023b). Fishers mostly use hook and line. Limited entry fishery with 22 current licences. Total annual catch in 2019/20 was 21.5 tonnes (VFA 2023b).

### 5.8 Indigenous Culture

The Operational Area is adjacent to Eastern Maar and Gunditjmara Native Title determinations (Appendix B12 MAP-REG-EPM-076). Native Title has not been identified to occur within the Operational Area. Appendix B10 outlines the cultural heritage values and sensitivities

Cultural values that may be at risk from a release of materials or waste overboard are Southern Right Whales. The Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022a) provides information on the cultural significance of southern right whales to Indigenous Australians. The plan details:

In Victoria, *Koontapool* (Southern Right Whales) occur along the coastlines of south-west Victoria in Gunditjmara Sea Country to feed and birth. These *Koontapool Woorkngan Yakeen* (Whale Birthing Dreaming Sites), are in coastal bay areas from Port Campbell to Portland, including Warrnambool. These places on Gunditjmara Country are known resting and feeding sites for mothers and calves and are directly related to Gunditjmara *Neeyn* (midwives), explaining why Gunditjmara is a Matrilineal Nation.

### 5.9 Marine Protected Areas

No marine protected areas are within the Operational Area (Appendix B12 MAP-REG-EPM-078 and MAP-REG-EPM-079).

The closest Australian Marine Parks (AMPs) are the Zeehan Marine Park which is ~49 km and the Apollo Marine Park which is ~36 km from the Operational Area (Appendix B12 MAP-REG-EPM-078).

The Operational Area is ~6 km from the Victorian Twelve Apostles Marine National Park (Appendix B12 MAP-REG-EPM-079). The Twelve Apostles Marine Park is managed in conjunction with the Arches Marine Sanctuary under the Management Plan for Twelve Apostles Marine National Park and The Arches Marine Sanctuary (Parks Victoria 2006b) and is classified as IUCN II. The Plan describes the key environmental, cultural, and social values as:

- Unique limestone rock formations, including the Twelve Apostles.
- Range of marine habitats representative of the Otway marine bioregion.
- Indigenous culture based on spiritual connection to sea country and a history of marine resource use.
- Wreck of the Loch Ard (shipwreck).
- Underwater limestone formations of arches and canyons.
- Diverse range of encrusting invertebrates.
- Spectacular dive site.

## 5.10 Marine Industries

Marine industries within the Operational Area that could be impacted by an accidental release of materials or waste are the offshore energy and shipping.

### 5.10.1 Offshore Energy

Within the Operational Area is the Beach Energy Otway Development consisting of subsea infrastructure and the Thylacine-A unmanned platform and the Cooper Energy Casino Henry Netherby Development consisting of subsea infrastructure. During the Regia MSS design envelope (1 November 2023 to 31 October 2028) there is the potential for exploration and development activities such as infrastructure inspection, maintenance and repairs campaigns, seabed surveys, seismic surveys, drilling, and infrastructure installation to be undertaken with vessels and drill rigs to support the ongoing energy supply of oil and gas and potentially renewables within the Otway Basin.

### 5.10.2 Shipping

The South East Marine Region is one of the busiest shipping regions in Australia and Bass Strait is one of Australia's busiest shipping routes. Commercial vessels use the route when transiting between ports on the east, south and west coasts of Australia, and there are regular passenger and cargo services between mainland Australia and Tasmania. Ports Australia provide statistics for port operations throughout Australia's main commercial ports. Based on the latest information (2021) the majority of commercial shipping traffic transiting to and from Victorian ports were container (3,682), general cargo (2,663), bulk liquid carriers (2,019), dry bulk (1,715), car carrier (1,342), bulk gas (220), other cargo (47) and livestock (9).

## 6 Predicted Levels of Risk

### 6.1 Injury/mortality to marine fauna

An accidental release of materials or waste may pose a risk marine fauna through ingestion and entanglement. Marine fauna such as birds, pinnipeds, sharks, turtles, dolphins and whales can be severely injured or die from entanglement in marine debris, causing restricted mobility, starvation, infection, amputation, drowning and smothering (DoEE 2018). Seabirds entangled in plastic packing straps or other marine debris may lose their ability to move quickly through the water, reducing their ability to catch prey and avoid predators, or they may suffer constricted circulation, leading to asphyxiation and death. In marine mammals and turtles, this debris may lead to infection or the amputation of flippers, tails, or flukes (DoEE 2018).

Fishing gear (ropes and nets made from synthetic fibres), balloons and plastic bags are the biggest entanglement threat to marine fauna, and plastic bags and utensils are the biggest ingestion risk for seabirds, turtles, and marine mammals (Wilcox et al. 2016). Studies published between 1985 and 2012 identified general plastic as the main debris ingested by marine turtles, followed by soft plastic, rope and styrofoam (Schuyler et al. 2014).

Australia is party to Annex V of the International Convention for the Prevention of Pollution from Ships (MARPOL), which regulates garbage pollution from ships. The discharge of plastic into the sea has been prohibited under MARPOL Annex V since 1988; the discharge of all types of garbage into the sea, with very limited exceptions (not related to plastics), has been prohibited since 2013. All vessels used for the Regia MSS will comply with the MARPOL requirements with no discharge of solid waste to the marine environment (M#05: CGG Marine Assurance System). In addition, waste with the potential to be windblown shall be stored in covered containers (M#05: CGG Marine Assurance System) reducing the potential for solid waste to be lost overboard.

If a loss of equipment or streamer occurred, they would not result in an entanglement risk to fauna as they are not flexible enough for fauna to become entangled.

The predicted level of consequence to marine fauna from an accidental release of materials or waste is assessed as minor (consequence may occur to an individual but is unlikely to affect species, populations, or ecosystems) with a likelihood of unlikely (event is possible but not expected to occur under normal circumstances) and the predicted level of risk is assessed as medium.

### 6.2 Changes to the functions, interests, or activities of other users

In the event of an accidental release of equipment or a streamer which cannot be recovered, if the object was buoyant, it may present a navigation or entanglement hazard to commercial fishers and other marine users. In addition, buoyant objects may become non-buoyant overtime and sink to the seabed, where it may present a snagging hazard for commercial trawling activities and create a potential risk to vessel safety and damage fishing equipment or may require commercial fishers to avoid a localised area for a period of time to avoid interaction.

Shipments to and from the survey vessel will be stored in containers (~ 10ft). These will be lifted onboard the seismic vessel, emptied, and returned to supply vessel. All containers will be secured on deck. In the unlikely event these are lost overboard, closed container will typically float while open top containers will sink. The loss of equipment or streamers could result in entanglement with other marine user's infrastructure or equipment (i.e., fishing gear, propellers) or damage to fishing, shipping, or other marine industry vessels if hit.

In the event of an accidental release of equipment or a streamer which cannot be recovered, the vessel would notify any known vessels in the area and notify Australian Safety Marine Authority who would provide any navigation warnings if required.

Historically there has been a report that a seismic streamer contacted a production platform. This occurred during extreme weather conditions and the vessel was not undertaking acquisition at the

time. As detailed in the Existing Environment (Section 5.10.1), the Beach Energy Thylacine-A unmanned platform is within the Operational Area. The platform has a 500 m Petroleum Safety Zone which unauthorised vessels cannot enter. In addition, if due to acquisition requirements any equipment is required to enter the 500 m Petroleum Safety Zone a Simultaneous Operations Plan (M#02) will be implemented.

An accidental release of materials or waste may also result in visual pollution changing the aesthetic values of coastal developments, marine protected areas such as marine parks and sea country. As detailed in the Existing Environment (Section 0) though there are no coastal developments or marine protected areas within the Operational Area, materials or waste could move from the offshore area to coastal areas or marine protected areas via wind and currents. The Great Ocean Road, Victorian Twelve Apostles Marine National Park and the towns of Port Campbell, Port Fairy and Warrnambool are along the coast adjacent to the Operational Area. These areas are major tourist draw cards and our popular for their pristine beaches.

As detailed in the assessment of an accidental release of materials or waste to fauna Australia is party to Annex V of the International Convention for the Prevention of Pollution from Ships (MARPOL), which regulates garbage pollution from ships. The discharge of plastic into the sea has been prohibited under MARPOL Annex V since 1988; the discharge of all types of garbage into the sea, with very limited exceptions (not related to plastics), has been prohibited since 2013. All vessels used for the Regia MSS will comply with the MARPOL requirements with no discharge of solid waste to the marine environment (M#05: CGG Marine Assurance System). In addition, waste with the potential to be windblown shall be stored in covered containers (M#05: CGG Marine Assurance System) reducing the potential for solid waste to be lost overboard.

It is unlikely that an accidental release of materials or waste would occur and if it did occur it would be a one-off event that is not predicted to pose a risk to the values of the coastal developments, tourism, marine protected areas, or sea country.

The predicted level of consequence to the functions, interests, or activities of other users from an accidental release of materials or waste is assessed as minor (consequences would be minor and temporary (days) but vessels or fishing gear may require some level of repair or replacement) with a likelihood of unlikely (event is possible but not expected to occur under normal circumstances) and the predicted level of risk is assessed as medium.

## 7 Comparison of Predicted Level of Risk with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.	An accidental release of materials or waste is not predicted.	Yes
	The impact and risk assessments are based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature and government management plans, recovery plans and conservation advice were used to inform the risk assessment. An accidental release of materials or waste is not predicted. There is high confidence in the prediction of risks to environmental components that are at risk from an accidental release of materials or waste.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	Management of the activity is consistent with EPBC Act Management Plans and Recovery Plans as detailed in Annex 1: Legislative and Other Requirements Relevant to Release of Materials or Waste Overboard .	Yes
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	The risks of an accidental release of materials or waste to biological features would be temporary and small scale and would not result in environmental damage at population levels.	Yes
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	The risks of an accidental release of materials or waste to ecological features is not predicted.	Yes
Economic	Affected persons will not be worse off as a result of the activity.	The risks of an accidental release of materials or waste is predicted to be a one-off event that would not result in affected persons being worse off as a result of the activity. As per M#07: Adjustment Protocol an adjustment process will be implemented in the event there is a financial loss to marine users from an accidental release of materials or waste.	Yes

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.	The risks of an accidental release of materials or waste is predicted to be a one off event that would have a to temporary / reversible, small scale, and low intensity risk to cultural values.	Yes
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce environmental risks as detailed in the following section.	Yes
	Environmental impacts and risks are consistent with the CGG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.	The predicted risk level is medium.	Yes
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the risk.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	<p>Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons as per the stakeholder feedback of:</p> <p>We want to be assured that your activities out at sea will not result in increased rubbish washing up. The dominant form of rubbish we collect is from ocean sources such as rubbish discarded from international shipping and fishing boats. We would like to see your waste management plan and have assurances that you will commit to zero rubbish disposed of at sea.</p> <p>I whale and seal and bird watch for pelagic and shorebirds along the southwest coast of Victoria and are concerned about their welfare in relation to the Regia MSS.</p> <p>As detailed in the Section below, Identification of Mitigation and Management Measures and Demonstration of ALARP, M#05: CGG Marine Assurance System will be implemented to ensure no waste material is disposed of overboard and all vessels used for the Regia MSS will be required to have a Garbage Management Plan.</p> <p>The risk assessment undertaken predicted that if an accidental release of materials or waste did occur and impacted marine fauna, it would be restricted to an individual and not affect the species at a population level. Thus, impacts to marine fauna watching along the southwest coast of Victoria is not predicted to be affected.</p>	Yes

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
	The views of public have been considered in the impact and risk assessment.	No public comments have been received in relation to an accidental release of materials or waste.	Yes

## 8 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure environmental risks will be of an acceptable level and ALARP.

No measures were assessed and not adopted.

Measures	Justification	Adopted
M#05: CGG Marine Assurance System	As part of CGG's contracting process, vessels will undergo OVID-style inspections to verify that systems are in place to ensure no waste material is disposed of overboard.  Australia is party to Annex V of the International Convention for the Prevention of Pollution from Ships (MARPOL), which regulates garbage pollution from ships. The discharge of plastic into the sea has been prohibited under MARPOL Annex V since 1988; the discharge of all types of garbage into the sea, with very limited exceptions (not related to plastics), has been prohibited since 2013. However, the MARPOL requirements only apply to:  Vessels 100 gross tonnes (or certified for 15 persons on-board) will have a Garbage Management Plan.  Vessels ≥400 gross tonnes (or certified for 15 persons on-board) will have a garbage record book.  All vessels, no matter their size or number of people, used for the Regia MSS are required to have:  Garbage Management Plan.  Garbage Record Book detailing waste transferred to shore.  Covered containers for waste that has the potential to be blown overboard.	Yes
	Streamers will have recovery units fitted to prevent benthic disturbance in the event of loss.	Yes
	The seismic vessel will have procedures for streamer inspection, maintenance, deployment, and retrieval.	Yes
	In the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.	Yes
M#02: Consultation Management System	If a loss of equipment poses a risk to other marine users, they will be notified via VHF Channel 16 and the event will be reported to AMSA, within 2 hrs.	Yes
	A simultaneous operations plan will be developed if the seismic vessels or any equipment will enter the 500 m Petroleum Safety Zone of the Thylacine-A platform.	Yes
M#07: Adjustment Protocol	An adjustment process will be implemented if a commercial fisher has a financial loss due to the Regia MSS.  The adjustment process will be developed in consultation with the fishery associations that represent the commercial fishers that fish within the Operational Area.  Other titleholders in the region will be invited to participate in the review, update, and implementation of the adjustment process.	Yes

## 9 Conclusions

This risk assessment has demonstrated that an accidental release of materials or waste causing a change to marine fauna and functions, interests, or activities of other users has a:

- **Predicted level of consequence of minor.**
- **Likelihood of unlikely.**
- **Predicted level of risk of medium.**

## 10 Recommendations

As demonstrated in this risk assessment, the predicted level of risk is medium and is clearly below the pre-defined acceptable levels of risk and the mitigation and management measures in place provide reliable prevention to have confidence in the predicted likelihood levels, thus there are no further recommendations.

## 11 Document Control

Date	Revision	Update
6 July 2023	A	Draft prepared for initial comment
23 August 2023	B	Update based on comments and relevant person feedback
11 Sept 2023	0	Approved for release on Regia MSS website
20 Dec 2023	1	EP submission to NOPSEMA

## Annex 1: Legislative and Other Requirements Relevant to Release of Materials or Waste Overboard

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Environment Protection and Biodiversity Conservation Act 1999	Injury and fatality to vertebrate marine life caused by ingestion of, or entanglement in, harmful marine debris has been listed as a key threatening process under the Act.	Materials or waste accidentally released overboard from vessels could pose a risk to listed species.  Marine debris resulting from the legal disposal of garbage at sea is excluded from the key threatening process. Under the International Convention for the Prevention of Pollution from Ships, overboard disposal of food, paper, glass, metal and crockery (but not plastics) is permitted from vessels more than 12 nautical miles from land.	This requirement is met by the implementation of M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels meet all legislative requirements including the International Convention for the Prevention of Pollution from Ships.
Protection of the Sea (Prevention of Pollution from Ships) Act 1983 Part IIIC (Prevention of pollution by garbage)  Marine Order 95: Marine Pollution Prevention – Garbage	The Act and Marine Order sets out the requirements for: <ul style="list-style-type: none"> <li>• Garbage Management Plans</li> <li>• Garbage Record Books</li> </ul>	Vessels, if >400 gross tonnes, are required to adhere to the Act and relevant MOs by having a Garbage Management Plans and Garbage Record Book.	This requirement is met by the implementation of M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Threat Abatement Plan for the Impacts of Marine Debris on Vertebrate Marine Life (CoA 2018)	This plan incorporates new actions needed to abate the listed key threatening process, particularly actions to develop understanding about microplastic impacts and the potential role of new technologies in waste management. The actions are intended to be feasible, effective and efficient, as required by the EPBC Act. The plan binds the Commonwealth and its agencies to respond to the impact of marine debris on vertebrate marine life, and identifies the research, management and other actions needed to reduce the impacts of marine debris on affected species.	<p>The plan details harmful marine debris includes land-sourced garbage, fishing gear from recreational and commercial fishing abandoned or lost to the sea, and vessel-sourced, solid, non-biodegradable floating materials disposed of or lost at sea.</p> <p>The management actions relevant to marine debris are:</p> <ul style="list-style-type: none"> <li>• Implementation of the requirements of Annex V of the International Convention for the Prevention of Pollution from Ships (MARPOL), which regulates garbage pollution from ships.</li> </ul>	This requirement is met by the implementation of M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels meet all legislative requirements including the International Convention for the Prevention of Pollution from Ships.
<b>Birds - Seabirds</b>			

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Wildlife Conservation Plan for Seabirds (CoA 2020a)	<p>The plan aims to provide a national framework for the research and management of listed marine and migratory seabirds and to outline national activities to support the conservation of listed seabirds in Australia and beyond.</p> <p>Threatened species are not covered by the plan and receive separate, approved conservation advice and, in some cases, a recovery plan which sets out what should be done to stop the decline and support the recovery of the species.</p>	<p>The plan identifies that marine debris can affect seabirds either through ingestion or entanglement.</p> <p>No actions specific to vessels marine debris were identified.</p>	<p>These requirements are met by the implementation of:</p> <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
National Recovery Plan for Albatrosses and Petrels (CoA 2022)	<p>The recovery plan provides a national strategy to guide the activities of government, industry, research organisations, and other stakeholders in the protection, conservation and management of listed threatened albatross and petrel species.</p> <p>The plan replaces the previous plan adopted in 2011.</p>	<p>The plan identifies marine debris as a threat.</p> <p>Relevant actions are:</p> <ul style="list-style-type: none"> <li>Improve understanding of and reduce the effects of marine debris, plastics and pollution on albatrosses and petrels.</li> </ul>	

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Commonwealth Listing Advice on Black-browed Albatross ( <i>Thalassarche melanopris</i> ) (TSSC 2005)	Eligible for listing as vulnerable under the EPBC Act.	Listing advice does not identify marine debris as a threat.	NA
Conservation Advice <i>Halobaena caerulea</i> Blue Petrel (TSSC 2015)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA
Conservation Advice <i>Pachyptila turtur subantarctica</i> Fairy Prion (southern) (TSSC 2015e)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Commonwealth Listing Advice on <i>Ardenna carneipes</i> (Flesh-footed Shearwater) (TSSC 2014)	Assessed as ineligible for listing.	Listing advice identifies plastic ingestion as a threat.	<p>These requirements are met by the implementation of:</p> <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
Gould's Petrel ( <i>Pterodroma leucoptera leucoptera</i> ) Recovery Plan (DEC NSW 2006)	Constitutes the formal Commonwealth and New South Wales recovery plan for Gould's Petrel. It identifies the actions to be taken to ensure the long-term viability of the Gould's Petrel in nature and the parties who will carry these out.	Recovery plan does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Approved Conservation Advice for <i>Thalassarche chrysostoma</i> (Grey-headed Albatross) (DEWHA 2009)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice identifies ingestion or entanglement in marine debris as a threat.  No actions specific to vessels marine debris were identified.	These requirements are met by the implementation of: <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
Commonwealth Listing Advice on <i>Macronectes halli</i> (Northern Giant-Petrel) (TSSC 2001)	Assessed as ineligible for listing.	Listing advice does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Conservation Advice <i>Thalassarche cauta</i> Shy Albatross (TSSC 2020)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice identifies marine plastics as a threat.  No actions specific to vessels marine debris were identified.	These requirements are met by the implementation of: <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
Conservation Advice <i>Pterodroma mollis</i> Soft-plumaged Petrel (TSSC 2015a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA
Commonwealth Listing Advice on <i>Macronectes giganteus</i> (Southern Giant-Petrel) (TSSC 2001a)	Recommends that the species be listed as Endangered under the EPBC Act	Listing advice does not identify marine debris as a threat.	NA
<b>Birds - Shorebirds</b>			

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)	The plan provides a framework to guide the conservation of migratory shorebirds and their habitat in Australia and, in recognition of their migratory habits, outlines national activities to support their appreciation and conservation throughout the East Asian-Australasian Flyway (EAAF).	Conservation plan does not identify marine debris as a threat.	NA
EPBC Act Policy Statement 3.21—Industry Guidelines for Avoiding, Assessing and Mitigating Impacts on EPBC Act Listed Migratory Shorebird Species (CoA 2017)	The purpose of this policy statement is to assist proponents in avoiding, assessing, and mitigating significant impacts on migratory shorebirds listed under the EPBC Act. This policy statement is a key action under the Wildlife Conservation Plan for Migratory Shorebirds.	<p>Thresholds of significance impacts on migratory shorebirds relevant to an accidental release of materials or waste are:</p> <ul style="list-style-type: none"> <li>• Degradation of habitat leading to a substantial reduction in migratory shorebird numbers.</li> <li>• Increased disturbance leading to a substantial reduction in migratory shorebird numbers.</li> <li>• Direct mortality of birds leading to a substantial reduction in migratory shorebird numbers.</li> </ul> <p>The guidelines details that defining substantial reduction is made on a case-by-case basis. Factors to consider include:</p>	As detailed in the risk assessment section, in the event an accidental release of materials or waste occurred risks to migratory shorebirds are predicted to be limited to an individual but is unlikely to affect species or populations or ecosystems. Thus, a significant risk to migratory shorebirds is not predicted.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
		<ul style="list-style-type: none"> <li>• The number of migratory shorebirds historically using an area (based on surveys and historical data).</li> <li>• Likely result in changes in bird numbers and species diversity.</li> <li>• Alterations to the value, quality, geographic extent of the area (for example, will the area still be classed as important habitat).</li> <li>• The function and role of the area (roosting, foraging) and likely changes in ecology and hydrology.</li> <li>• The regional and local context of the area.</li> <li>• The nature, extent, duration and timing of impacts, their likelihood and consequence.</li> </ul>	
National Recovery Plan for the Australian Fairy Tern ( <i>Sternula nereis nereis</i> ) (DAWE 2020)	The plan considers the conservation requirements of the species across its range and identifies the actions to be taken to ensure the long-term viability of the species, and the parties that will undertake those actions.	Recovery plan does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Conservation Advice <i>Limosa lapponica baueri</i> Bar-tailed Godwit (Western Alaskan) (TSSC 2016a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA
Conservation Advice <i>Calidris ferruginea</i> Curlew Sandpiper (DoE 2015d)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA
Conservation Advice <i>Numenius madagascariensis</i> Eastern Curlew (DoE 2015c)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA
Commonwealth Listing Advice on <i>Sterna albifrons sinensis</i> (Little Tern (Western Pacific)) (TSSC 2002)	Advice is that it is ineligible for listing as conservation dependent.	Conservation listing advice does not identify marine debris as a threat.	NA
National Recovery Plan for the Orange-bellied Parrot, <i>Neophema chrysogaster</i> (DEWLP 2016)	The recovery plan outlines the long-term strategy, and short-term objectives and actions, for the recovery of the Orange-bellied Parrot.	Recovery plan does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Conservation Advice <i>Calidris canutus</i> Red Knot (TSSC 2016)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation listing advice does not identify marine debris as a threat.	NA
<b><i>Pinnipeds</i></b>			
Conservation Advice <i>Neophoca cinerea</i> Australian Sea Lion (TSSC 2020b)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice identifies entanglement in marine debris and ingestion of plastics as threats.	These requirements are met by the implementation of: <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a</li> </ul>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Recovery Plan for the Australian Sea Lion ( <i>Neophoca cinerea</i> ) (DSEWPaC. 2013a)	<p>The overarching objective of this recovery plan is to halt the decline and assist the recovery of the Australian sea lion throughout its range in Australian waters by increasing the total population size while maintaining the number and distribution of breeding colonies with a view to:</p> <ul style="list-style-type: none"> <li>Improving the population status, leading to future removal of the Australian sea lion from the threatened species list of the EPBC Act.</li> <li>Ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future.</li> </ul>	<p>Recovery plan identifies marine debris as a threat.</p> <p>Relevant actions are:</p> <ul style="list-style-type: none"> <li>Develop and implement measures to mitigate the impacts of marine debris on Australian sea lion populations, noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life.</li> </ul>	<p>Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</p> <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
<b>Sharks</b>			
Commonwealth Listing Advice on <i>Centrophorus zeehaani</i> (Southern Dogfish) (TSSC 2013a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation listing advice does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Commonwealth Listing Advice on <i>Galeorhinus galeus</i> (TSSC 2009a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation listing advice does not identify marine debris as a threat.	NA
Listing Advice <i>Isurus oxyrinchus</i> Shortfin Mako Shark (TSSC 2014a)	Recommends as not listing.	Listing advice does not identify marine debris as a threat.	NA
Recovery Plan for the White Shark ( <i>Carcharodon carcharias</i> ) (DSEWPaC 2013b)	The plan considers the conservation requirements of the species across its range and identifies the actions to be taken to ensure the species' long-term viability in nature and the parties that will undertake those actions.	Recovery plan does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
<b>Turtles</b>			
Recovery Plan for Marine Turtles (DoEE 2017)	The long-term recovery plan objective for marine turtles is to minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so that they can be removed from the EPBC Act threatened species list.	<p>The plan identifies floating non-degradable debris, such as lost or discarded fishing gear (e.g. discarded nets, crab pots, synthetic ropes, floats, hooks, fishing line and wire trace), land-sourced garbage (e.g. plastic bags and bottles) and ship-sourced materials disposed of at sea (e.g. fibreglass, insulation) can pose a threat to marine turtles at all life stages through entanglement and ingestion.</p> <p>Relevant actions are:</p> <ul style="list-style-type: none"> <li>• Primary approach to management must be source reduction.</li> </ul>	<p>These requirements are met by the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>• M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
Approved Conservation Advice for <i>Dermochelys coriacea</i> (Leatherback Turtle) (DEWHA 2008)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	<p>Conservation advice identifies ingestion of marine debris as a threat.</p> <p>No actions specific to vessels marine debris were identified.</p>	

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
<b>Whales</b>			
Conservation Management Plan for the Blue Whale (DoE 2015e)	The long-term recovery objective for Blue Whales is to minimise anthropogenic threats to allow for their conservation status to improve so that they can be removed from the EPBC Act threatened species list.	Plan identifies marine debris as a threat. No actions specific to vessels marine debris were identified.	<p>These requirements are met by the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>• M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
Conservation Advice <i>Balaenoptera physalus</i> Fin Whale (TSSC 2015b)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Listing Advice <i>Megaptera novaeangliae</i> Humpback Whale (DAWE 2022a)	Recommends removal as a threaten species but remain a Matter of National Environmental Significance under the EPBC Act as a listed Migratory Species.	Listing advice identifies entanglement with marine debris as a threat.  No actions specific to vessels marine debris were identified.	These requirements are met by the implementation of: <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>• M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>
Conservation Advice <i>Balaenoptera borealis</i> Sei Whale (TSSC 2015c)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify marine debris as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
<p>Conservation Management Plan for the Southern Right Whale (CoA 2012)</p> <p>Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022)</p>	<p>The long-term recovery objective is to minimise anthropogenic threats to allow the conservation status of the southern right whale to improve so that it can be removed from the threatened species list under the EPBC Act.</p>	<p>Plan identifies entanglement with marine debris as a threat.</p> <p>No actions specific to vessels marine debris were identified.</p>	<p>These requirements are met by the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System to ensure no waste material is disposed of overboard and that vessels have a Garbage Management Plans and Garbage Record Book, and covered containers for waste that has the potential to be blown overboard.</li> <li>• M#05: CGG Marine Assurance System to ensure that in the event of an accidental release of materials or waste the support vessels will search for and retrieve the material or waste where possible and safe to do so.</li> </ul>

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (Regia MSS) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (PEIRA) (Appendix B4) for further assessment.

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (EP) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document.

## 2 Aspect Specific Relevant Person Objections and Claims

There was no feedback received during the preparation of the Regia MSS EP about this environmental aspect, or the draft chapter.

### 3 Aspect – Collisions with Fauna

#### 3.1 How the Aspect Occurs

The presence of the seismic and support vessels and towed equipment provides a risk of collision or entrapment of marine fauna potentially causing injury or mortality.

#### 3.2 Extent and Duration of the Aspect

Duration: 90 days

Extent: Operational Area

The extent of the area where the risk of a vessel collision with marine fauna may occur is within the Operational Area and the risk could occur while the activity is undertaken.

#### 3.3 Legislative and Other Requirements

Annex 1 of this document describes the legal and other requirements that apply to collisions with fauna and species that may be affected, and how the requirements will be met.

## 4 Cause Effect Pathway

The PEIRA (Appendix B4) identified a cause-effect pathway for collisions with fauna for the following environmental components:

- Fish
- Marine reptiles
- Marine mammals

Though vessel collisions with marine fauna occur within Australia they have not be reported during seismic surveys.

There have been no reported cases of marine fauna becoming entangled in seismic survey streamers in Australian waters. As the streamers are towed, they have a level of tautness that would not result in entanglement of fauna. Thus, there is no cause effect pathway for entanglement of fauna in streamers.

Historically turtles have been recorded as being trapped in the streamer tail buoys. Tail buoys are now of a design that does not represent an entrapment risk to turtles or turtle guards are used as standard equipment if the tail buoy is not of the newer design (M#05: CGG Marine Assurance System). Thus, there is no cause effect pathway for entrapment of turtles in streamer buoys.

The National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (CoA 2017a) identifies cetaceans, dugong, marine turtles, and whale sharks as being vulnerable to vessel collisions. Though vessel collisions with marine fauna occur within Australia they have not be reported during seismic surveys.

## 5 Description of the Existing Environment that May be Affected by the Activity

As detailed in the Section Extent and Duration of the Aspect, the Operational Area has been adopted as the extent of the area with collision with marine may occur. To identify the presence of those species that may be at risk of vessel collision (cetaceans, dugong, marine turtles, and whale sharks) a Protected Matters Search was undertaken for the Operational Area with the report available in Appendix B5.

The PMST Report identified cetaceans and marine turtles may be present within the Operational Area. Dugongs and whale sharks were not identified in the PMST Report for the Operational Area. Annex 2 details those species and identifies any biologically important areas and conservation advice or management plans.

### 5.1 Turtles

The PMST Report identified three turtle species, that may (green) or are likely (leatherback and loggerhead) to occur within the Operational Area. No BIAs or habitat critical to the survival of the species were identified.

### 5.2 Cetaceans

The PMST Report identified several cetacean (whales and dolphin) species that are known or are likely to occur within the Operational Area. Table D2-5-table D2-51 details those species that were identified as having biologically important areas or biologically important behaviours identified within the Operational Area.

Table D2-5-1: Cetacean Species Biologically Important Behaviours and/or BIAs within the Operational Area

Receptor	Biologically Important Behaviour
Blue Whale	Foraging, feeding or related behaviour known to occur within area
	Foraging (annual high use area) BIA (Appendix B12 MAP-REG-EPM-068)
Fin Whale	Foraging, feeding or related behaviour known to occur within area
Pygmy Right Whale	Foraging, feeding or related behaviour likely to occur within area
Sei Whale	Foraging, feeding or related behaviour known to occur within area
Southern Right Whale	Breeding known to occur
	Migration BIA (Appendix B12 MAP-REG-EPM-069)

#### 5.2.1 Blue whale

The Blue Whale (*Balaenoptera musculus*) is listed as an endangered species under the EPBC Act. There are two subspecies of blue whales that use Australian waters (including Australian Antarctic waters), the Pygmy Blue Whale (*B. m. brevicauda*) and the Antarctic Blue Whale (*B. m. intermedia*). The Otway region, where the Operational Area is located, is an important migratory and foraging area for Blue Whales, as shown by passive acoustic monitoring and aerial surveys (Gavrilov 2012, McCauley et al. 2018, Gill et al. 2011). Underwater acoustic monitoring programs have detected Antarctic and Pygmy Blue Whale calls in the Otway Region (McCauley et al. 2018).

Important foraging grounds for Blue Whales include the Great Australian Bight, South Australia, and off Portland Victoria where (Figure D2-5-figure D2-51tab). Research to date has found that Pygmy Blue Whales occupy the western area of the Bonney Upwelling system in the Eastern Great Australian Bight and adjacent to the Kangaroo Island canyons from November and December (DoE 2015e). Pygmy Blue Whales then move south-east to the Bonney Upwelling system off eastern South

Australia and Victoria (e.g., between Robe, SA and Cape Otway, Vic). This occurs predominately between January to April (DoE 2015e).

The Blue Whale was extremely abundant until the early 20th century when they were hunted to near extinction. Approximately 341,830 Blue Whale takes were recorded by commercial whaling in the Antarctic and sub-Antarctic in the 20th century, of which 12,618 were identified as Pygmy Blue Whales (Branch et al. 2004). The current global population of Blue Whales is uncertain but is plausibly in the range of 10,000 to 25,000, corresponding to about 3-11% of the 1911 estimated population size (Reilly et al. 2008).

The Operational Area is within the foraging (annual high use) BIA where blue whales predominately occur between January to April (DoE 2015e) (Appendix B12 MAP-REG-EPM-068).

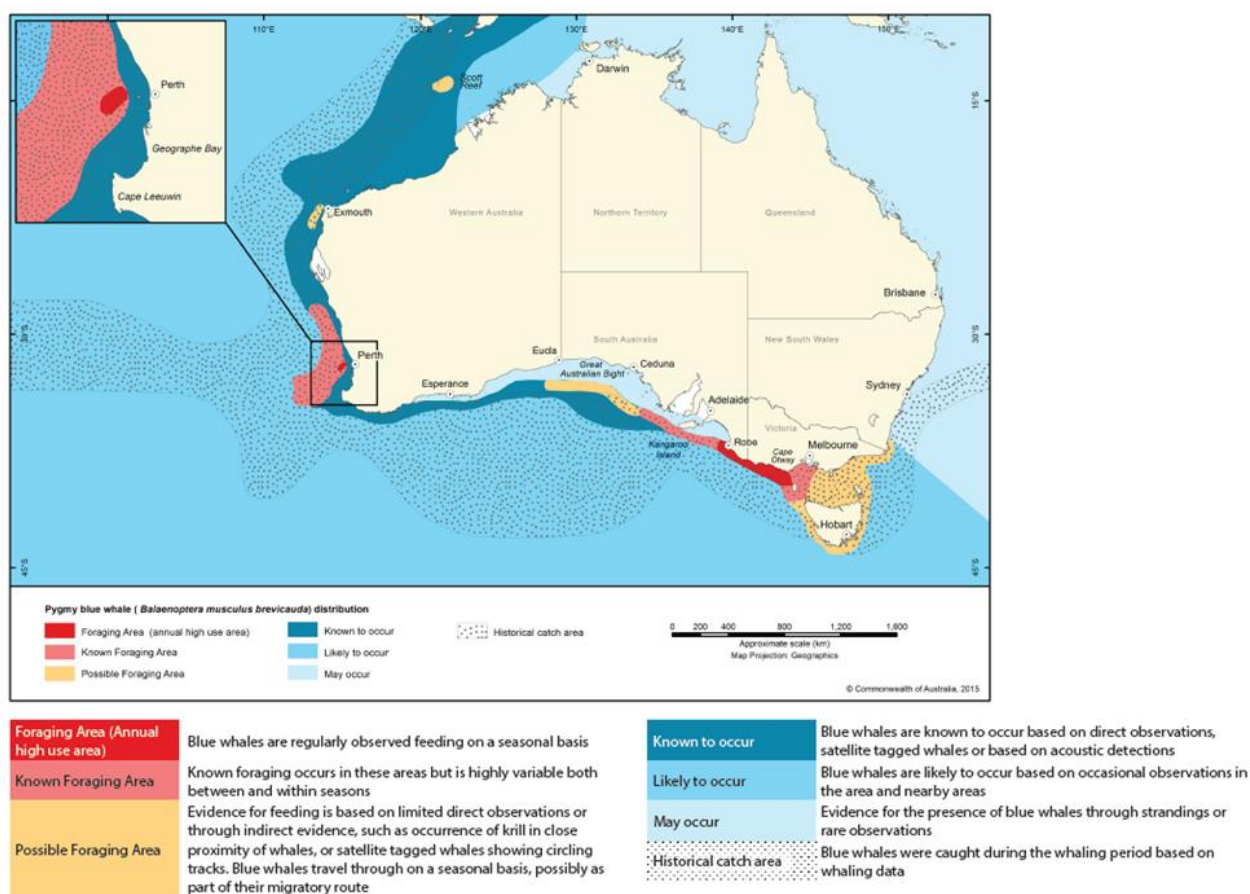

Figure D2-5-1: Pygmy Blue Whale Areas around Australia (DoE 2015e)

## 5.2.2 Fin whale

The Fin Whale is a cosmopolitan migratory species that is listed as vulnerable and occurs from polar to tropical waters but is rarely sighted in inshore waters. Fin Whales show well defined migratory movements between polar, temperate and tropical waters which are essentially north-south with little longitudinal dispersion.

While Australian Antarctic waters are important feeding grounds for Fin Whales, the species also feeds in the Bonney Upwelling during summer/autumn sometimes in the company of Blue and Sei Whales (DCCEEW 2023b). Areas of upwelling and interfaces with mixed and stratified waters may be an important feature of Fin Whale feeding habitat with the species feeding on planktonic crustacea, krill, some fish and cephalopods (DCCEEW 2023b). Fin Whales frequently lunge or skim feed at or near the surface and they are known to dive to 230 m to feed.

There are no BIAs for the Fin Whale within Australian waters. Fin Whales are likely to be foraging in the Operational Area at similar time as Blue Whales, predominately occur between January to April.

### 5.2.3 Pygmy Right Whale

The Pygmy Right Whale is a little-studied baleen whale species that is found in temperate and sub-Antarctic waters in oceanic and inshore locations. No population estimates are available for Pygmy Right Whales globally, or in Australian waters (DCCEEW 2012c). The species has never been hunted commercially and is listed as a migratory species under the EPBC Act.

Species distribution in Australia is found close to coastal upwellings and the Subtropical Convergence may be important for regulating distribution (Bannister et al. 1996). Key locations include south-east Tasmania, Kangaroo Island (SA) and southern Eyre Peninsula (SA) close to upwelling habitats rich in marine life and zooplankton upon which it feeds (Bannister et al. 1996).

There are no BIAs for the Pygmy Right Whale within Australian waters. Pygmy Right Whales are likely to be foraging in the Operational Area at similar time as Blue Whales, predominately occur between January to April.

### 5.2.4 Sei Whale

The Sei Whale is listed as vulnerable under the EPBC Act. Sei Whales are considered a cosmopolitan species, ranging from polar to tropical waters, but tend to be found more offshore than other species of large whales. Sei Whales move between Australian waters and Antarctic feeding areas; subantarctic feeding areas (e.g. Subtropical Front); and tropical and subtropical breeding areas. The proportion of the global population in Australian waters is unknown as there are no estimates for Sei Whales in Australian waters.

In Australia, Sei Whales occur within Australian Antarctic Territory waters and Commonwealth waters, and have been infrequently recorded off Tasmania, NSW, Queensland, the Great Australian Bight, Northern Territory and Western Australia (Parker 1978, Bannister et al. 1996, Thiele et al. 2000, Chatto and Warneke 2000, Bannister 2008).

Sightings of Sei Whales within Australian waters includes areas such as the Bonney coast upwelling off South Australia (Miller et al. 2012), where opportunistic feeding has been observed between November and May (Gill et al. 2015).

There are no BIAs for the Sei Whale within Australian waters. Sei Whales are likely to be foraging in the Operational Area at similar time as Blue Whales, predominately occur between January to April.

### 5.2.5 Southern Right Whale

The Southern Right Whale (*Eubalaena australis*) is listed as endangered under the EPBC Act. Southern Right Whales were depleted to less than 300 individuals globally due to commercial whaling in the 19th and 20th centuries (Tormosov et al. 1998). They were protected from whaling in 1935 however, due to illegal whaling in the 1970s and because Southern Right Whales have a slow rate of increase (7% per annum) compared to other marine mammals, their numbers remain low (IWC 2013). Global abundance estimates are 13,000 for the species, across key wintering grounds in South Africa, Argentina, Australia and New Zealand.

Southern Right Whales are distributed in the Southern Hemisphere with a circumpolar distribution between latitudes of 16°S and at least 65°S. They migrate from southern feeding grounds in sub-Antarctic waters to Australia in between May and November to calve, mate and rest (Bannister et al. 1996, DCCEEW 2022). They are distributed across thirteen primary aggregation areas along the southern coast of Australia. In Australian coastal waters, they occur along the southern coastline of the mainland and Tasmania and generally extend as far north as Sydney on the east coast and Perth on the west coast (CoA 2012). There are occasional sightings further north, with the extremities of their range recorded at Hervey Bay and Exmouth (CoA 2012).

The largest established calving areas in Australia include Head of Bight in SA, and Doubtful Island Bay and Israelite Bay in WA. Smaller but established aggregation areas regularly occupied by Southern Right Whales include Yokinup Bay in WA, Fowlers Bay in SA and the Warrnambool and Portland in Victoria. Emerging aggregation areas include Flinders Bay, Hassell Beach, Cheyne/Wray Bays, and Twilight Cove in WA, and sporadically occupied areas include Encounter Bay in SA (CoA 2012). Southern Right Whales generally occupy shallow sheltered bays within 2 km of shore and within water depths of less than 20 m (Charlton et al. 2017). A number of additional areas for Southern Right Whales are emerging that might be of importance, particularly to the south-eastern population. In these areas, small but growing numbers of non-calving whales regularly aggregate for short periods of time. These areas include coastal waters off Peterborough, Port Campbell, Port Fairy and Portland in Victoria (CoA 2012). These emerging areas off Victoria align with the Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022) which provides an update to BIAs and emerging aggregation areas. The proposed changes are:

- Reproductive areas - Areas where mating, calving, nursing and/or presence of neonates are known, or likely, to occur. For Victoria this is the nearshore area between Portland and Port Campbell.
- Migration areas - Areas southern right whales are known, or likely, to use for movement between regions that support biologically important behaviour (e.g., coastal movement between reproductive areas).

The Operational Area overlaps the Southern Right Whale Migration BIA where the whales are present between April and October (NCVA 2023) (Appendix B12 MAP-REG-EPM-069).

## 6 Predicted Levels of Risk

Though vessel collisions with marine fauna occur within Australia they have not been reported during seismic surveys. The extent of the area of where the risk of a vessel collision with marine fauna may occur is within Operational Area and the risk could occur while the activity is undertaken. The worst potential impact from vessel collision would be mortality or serious injury of an individual.

### 6.1.1 Turtles

No habitat critical to the survival of marine turtles or biologically important areas have been identified within the Operational Area, from the Recovery Plan for Marine Turtles in Australia (DoEE 2017) or PMST Report (Appendix B5). Thus, it is likely that the three marine turtle species identified in the PMST Report (Green, Leatherback and Loggerhead) may be present in low numbers within the Operational Area.

The Recovery Plan for Marine Turtles in Australia (DoEE 2017) details that impact from vessels can cause serious injury and/or death to individual marine turtles and is particularly an issue in shallow coastal foraging habitats and internesting areas where there are high numbers of recreational and commercial craft, and in areas of marine development. Although the outcome can be fatal for individual turtles, boat strike (as a standalone threat) has not been shown to cause stock level declines.

The National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (CoA 2017c) found speed to be a critical factor in determining a flee response in marine turtles being approached by vessels. The proportion of flee responses decreased significantly with increasing speed, particularly with close encounters. While speed is a particularly important factor, so too is the movement patterns of the vessel for example, whether a vessel is transiting a dedicated route or is a recreational boat that is moving erratically.

The predicted level of consequence to marine turtles from a vessel collision is assessed as major (injury or death of individuals of a protected species) with a likelihood of rare (almost impossible / unheard of in the industry) with a predicted level of risk of medium, based on:

- Though vessel collisions with marine fauna occur within Australia they have not been reported during seismic surveys.
- There is no habitat critical to the survival of marine turtles or BIAs within Operational Area.
- There are no shallow coastal marine turtle foraging habitats or internesting areas within the Operational Area.
- The seismic and support vessels will operate at low speed of no more than 6 knots during acquisition (M#01: Activity Limitation).
- The seismic survey is undertaken in a set racetrack pattern (see the Description of Activity in Appendix A2) so the vessels will be following a set path and not moving erratically.
- Marine fauna observers will be on the seismic vessel watching for fauna (M#03: Fauna Management System).
- If an incident occurred, it would be restricted to individual marine turtles and will not affect turtle species at a population level.

### 6.1.2 Cetaceans

Twenty-three whale species (or species habitat) may occur within the Operational Area (Annex 2). Foraging behaviours were identified for the Blue, Fin, Pygmy Right and Sei Whale and breeding for the Southern Right Whale. The Operational Area overlaps Southern Right Whale migration BIA and the Pygmy Blue Whale foraging (annual high use area) BIA. Other whale species identified are transient within the Operational Area.

The Conservation Management Plan for the Blue Whale (DoE 2015e) details that collisions will impede recovery of blue whale populations if a sufficient number of individuals in the population lose reproductive fitness or are killed. Although all forms of vessels can collide with whales, severe or lethal injuries are more likely to occur by larger or faster vessels. Blue Whales in the Bonney Upwelling region regularly feed at the surface on krill aggregations and are likely to be more vulnerable to ship strike.

The Conservation Management Plan for the Blue Whale (DoE 2015e) assesses the threat of vessel collision to Antarctic and Pygmy Blue Whales as having a moderate consequence (population recovery stalls or reduces) with a possible likelihood (might occur at some time) giving an overall rating of high. Relevant actions from the recovery plan are ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented.

The Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022) details that in Australia, Southern Right Whales are the second most common species involved in Australian vessel strikes, which is consistent with worldwide data. At present, there have been ten vessel strike reports of Southern Right Whales in Australian waters between 1997 and 2015, with at least four mortalities including mother-calf pairs in the region of the eastern population.

The Conservation Management Plan for the Southern Right Whale (DCCEEW 2022) assesses the threat of vessel collision as having a major consequence (population declines) with an almost certain likelihood (expected to occur every year) giving an overall rating of very high. Relevant actions from the recovery plan are ensure environmental impact assessments and associated plans consider and quantify the risk of vessel strike and associated potential cumulative risks in BIAs.

The Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022) details that proven effective mitigation measures for addressing vessel strike are to reduce co-occurrence of vessels with whales through separation of vessels from areas with high concentrations of whales and to reduce vessel speeds. Mitigation actions to prevent injury and minimise disturbance from vessels to Southern Right Whales include seasonal or temporary area restrictions/exclusions and speed restrictions in biologically important areas and habitat critical for survival.

The Conservation Advice for the Sei Whale (TSSC 2015c) and Fin Whale (TSSC 2015b) lists vessel strike as a threat with a minor consequence rating.

The National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (CoA 2017c) details that speed is a concern when considering collision risk and the outcome. Vanderlaan and Taggart (2007) observed that an escalation in speed of the vessel caused an increase in the severity of injury to large cetaceans. Slower moving vessels provide greater opportunity for both fauna and vessel to avoid collision.

Large, high-speed vessels have become a major concern as they are capable of travelling at speeds of up to 35 to 40 knots, which correlates to an increase in collisions (Weinrich 2004, Ritter 2010). According to Laist et al. (2001), 89 per cent of incidences where the whale was severely hurt or killed occurred at vessel travelling speeds greater than 14 knots and were most serious in large vessels (> 80 m). Furthermore, the chance of an injury being lethal increases significantly as vessel speed increases up to 13-15 knots (Vanderlaan and Taggart 2007).

The predicted level of consequence to cetaceans from a vessel collision is assessed as major (injury or death of individuals of a protected species) with a likelihood of rare (almost impossible / unheard of in the industry) with a predicted level of risk of medium, based on:

- Though vessel collisions with marine fauna occur within Australia they have not been reported during seismic surveys.
- The seismic and support vessels will operate at low speed of no more than 6 knots during acquisition (M#01: Activity Limitation).

- Separation distances will be applied to cetaceans as per the EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans (M#03: Fauna Management System)
- Marine fauna observers will be on the seismic vessel watching for fauna (M#03: Fauna Management System).
- If an incident occurred, it would be restricted to individual whales or dolphins and will not affect the species at a population level.

## 7 Comparison of Predicted Level of Risk with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.	Predicted risks are low intensity environmental damage as risks would be restricted to individual fauna and will not affect the species at a population level.	Yes
	The impact and risk assessment process is based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature and government management plans, recovery plans and conservation advice were used to inform the risk assessment.  Serious or irreversible environmental damage is not predicted as risks would be restricted to individual fauna and will not affect the species at a population level.  There is high confidence in the prediction of risks to species that are at risk from vessel collisions.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	Management of the activity is consistent with EPBC Act Management Plans and Recovery Plans as detailed in Annex 1 of this document.	Yes
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	Predicted risks are low intensity environmental damage as risks would be restricted to individual fauna and will not affect the species at a population level.	Yes
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	Predicted risks to ecological features associated with marine fauna are temporary / reversible, small scale, as risks would be restricted to individual fauna and will not affect the species at a population level.	Yes
Economic	Affected persons will not be worse off as a result of the activity.	Predicted risks to economic features associated with marine fauna are temporary / reversible, small scale, as risks would be restricted to individual fauna and will not affect the species at a population level.	Yes

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.	Predicted risks to cultural features associated with marine fauna are temporary / reversible, small scale, as risks would be restricted to individual fauna and will not affect the species at a population level.	Yes
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce environmental risks as detailed in the following section.	Yes
	Environmental impacts and risks are consistent with the CCG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.	The predicted risk level is medium.	Yes
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the risk.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	<p>To date no objections or claims in relation to fauna and vessel collisions have been made by relevant persons.</p> <p>A relevant person raised that they whale and seal watch along the southwest coast of Victoria and are concerned about their welfare in relation to the Regia MSS. A collision with a whale or seal is a rare event and has not been reported during seismic surveys. The implementation of M#03: Fauna Management System will ensure that fauna collision risk is as low as practicably possible.:</p> <p>The risk assessment undertaken predicted that if a collision did occur with marine fauna, it would be restricted to an individual and not affect the species at a population level. Thus, risks to marine fauna watching along the southwest coast of Victoria is not predicted to be affected.</p>	Yes
	The views of public have been considered in the impact and risk assessment.	To date there has been no views from the public in relation to fauna and vessel collisions.	Yes

## 8 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure environmental risks will be of an acceptable level and ALARP.

Measures	Justification	Adopted
M#01: Activity Limitation	<p>As detailed in the National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (CoA 2017c) and Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022) proven effective mitigation measures for addressing vessel strike are to reduce vessel speeds.</p> <p>Seismic and support vessels will operate at no more than 6 knots (11 km/hr) during acquisition.</p> <p>Reduction in vessel speed is good industry practice in areas where fauna is undertaking biologically important behaviours or there are BIAs. The environmental benefit outweighs the additional cost.</p>	Yes
M#03: Fauna Management System	<p>The Fauna Management System (Appendix G2) provides details about how the Regia MSS will be carried out in a manner by which the environmental impacts from collisions to marine fauna will be reduced to ALARP and be of an acceptable level.</p> <p>It details how the requirements of EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with Cetaceans will be met.</p> <p>The requirements of the EPBC Regulations set out measures to reduce vessel speed and avoid approaching cetaceans.</p> <p>It is a legislative requirement for vessels to comply with the EPBC Regulations.</p>	Yes
M#05: CGG Marine Assurance System	<p>Streamer tail buoys will be of a design that does not represent an entrapment risk to turtles or turtle guards will be used.</p>	Yes

Measures assessed and not adopted.

Measure	Justification	Adopted
Surveys only undertaken during daylight hours	<p>Though vessel collisions with marine fauna occur within Australia they have not been reported during seismic surveys. Undertaking the seismic survey only in daylight hours would have a disproportionate cost without a significant environmental benefit.</p> <p>Undertaking the seismic survey only in daylight hours would at best double the time taken to complete the survey. This increase in time would result in increased environmental impacts and risks and a doubling in costs without a significant reduction in the likelihood of a vessel collision with fauna occurring.</p> <p>To significantly reduce the likelihood of a vessel collision with fauna during the hours of darkness the survey and support vessels would need to be stationary. This is not feasible for the survey vessel when it has streamers in the water and during deployment and retrieval of the streamers. It is also not feasible for the support vessels to remain stationary as they are required to be with the survey vessel to reduce the risk of potential collisions with other marine users due to the limited manoeuvrability of the seismic vessel.</p>	No

## 9 Conclusions

This risk assessment has demonstrated that collision between marine fauna and the survey vessels has a:

- **Predicted level of consequence of major.**
- **Likelihood of rare.**
- **Predicted level of risk of medium.**

## 10 Recommendations

As demonstrated in this risk assessment, the predicted level of risk is medium and is clearly below the pre-defined acceptable levels of risk and the mitigation and management measures in place provide reliable prevention to have confidence in the predicted likelihood levels, thus there are no further recommendations.

## 11 Document Control

Date	Revision	Update
6 July 2023	A	Draft prepared for initial comment
23 August 2023	B	Update based on comments and relevant person feedback
11 Sept 2023	0	Approved for release on Regia MSS website
20 Dec 2023	1	EP submission to NOPSEMA

## Annex 1: Legislative and Other Requirements Relevant to Collisions with Marine Fauna

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Recovery Plan for Marine Turtles (DoEE 2017)	The long-term recovery plan objective for marine turtles is to minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so that they can be removed from the EPBC Act threatened species list.	Details boat strike is a highly visible threat because it more commonly occurs in highly populated areas.  No specific actions are identified in relation to vessel strikes to turtles.  Manage anthropogenic activities in Biologically Important Areas to ensure that biologically important behaviour can continue.	This requirement is met by this impact assessment. No impacts to turtle biologically important behaviour are predicted.
Approved Conservation Advice for Dermochelys coriacea (Leatherback Turtle) (DEWHA 2008)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Identifies boat strike as a threat.  No action relevant to boat strike.	This requirement is met by this impact assessment. No impacts to turtle biologically important behaviour and the recovery of the Leatherback Turtle are predicted.
EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with Cetaceans	The regulations specify how vessels, aircraft and people must behave around whales and dolphins.	The regulations detail the requirements for interactions with cetaceans for vessels including:  Travel at less than 6 knots within the cautionary zone of a cetacean (150 m radius for dolphins, 300 m for whales.  Do not approach closer than the caution zones for a cetacean.  If a cetacean shows signs of disturbance move away at a constant speed less than 6 knots.	This requirement is met by the implementation of M#03: Fauna Management System which details how the requirements of EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with Cetaceans will be met.
EPBC Act Policy Statement 2.1 – Interaction between offshore seismic exploration and whales (DEWHA 2008)	The policy statement provides guidance on how to minimise the impact of seismic surveys on whale populations, which may be affected by underwater noise and disturbance caused by these activities.	EPBC Act Policy Statement 2.1 Part B.1 – Additional Management Measures: Marine Mammal Observers details that as the likelihood of encountering whales increases marine fauna observers (MFOs) should be engaged.	This requirement is met by the implementation of M#03: Fauna Management System which details how the requirements Policy Statement 2.1 will be met.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (CoA 2017c)	The strategy is a guiding framework for identifying species most at risk of vessel collision; areas where these species are most at risk of vessel collision, and appropriate mitigation measures to reduce the risk of vessel collisions with marine megafauna.	<p>Management actions relevant to the activity are:</p> <p>Promote the use of risk assessments in planning facilities and activities in the marine environment to stakeholders, such as government agencies, tourism operators, mariners and port authorities.</p> <p>Identify and adopt best-practice mitigation measures and emerging technologies and encourage the development of new mitigation measures.</p> <p>Adaptive management principles, including the use of regular reviews are used during the implementation of mitigation measures.</p>	<p>This requirement is met by this impact assessment and the implementation of M#03: Fauna Management System.</p> <p>The adopted measures will be implemented and monitored as detailed in Appendix B3 Implementation Strategy to ensure they are effective in managing the impact.</p> <p>Whale and vessel strike incidents will be reported in the National Ship Strike Database Reporting as detailed in Appendix B3 Implementation Strategy.</p>
Conservation Management Plan for the Blue Whale (DoE 2015e)	The long-term recovery objective for Blue Whales is to minimise anthropogenic threats to allow for their conservation status to improve so that they can be removed from the EPBC Act threatened species list.	<p>Details that vessel collisions will impede recovery of Blue Whale populations if a sufficient number of individuals in the population lose reproductive fitness or are killed. The management actions relevant to vessel strikes are:</p> <p>Ensure all vessel strike incidents are reported in the National Ship Strike Database.</p> <p>Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented.</p>	<p>This requirement is met by this impact assessment and the implementation of M#03: Fauna Management System.</p> <p>The adopted measures will be implemented and monitored as detailed in Appendix B3 Implementation Strategy to ensure they are effective in managing the impact.</p> <p>Whale and vessel strike incidents will be reported in the National Ship Strike Database Reporting as detailed in Appendix B3 Implementation Strategy.</p>
Conservation Advice Balaenoptera physalus Fin Whale (TSSC 2015b)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Lists vessel strike as a threat with a minor consequence rating. The management action relevant to vessel strikes is ensure all vessel strike incidents are reported in the National Vessel Strike Database.	<p>Whale and vessel strike incidents will be reported in the National Ship Strike Database Reporting as detailed in Appendix B3 Implementation Strategy.</p> <p>In addition, this impact assessment does not predict impacts at a level that will impede the recovery of the Fin Whale, with the implementation of M#03: Fauna Management System.</p> <p>The adopted measures will be implemented and monitored as detailed in Appendix B3 Implementation Strategy to ensure they are effective in managing the impact.</p>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Listing Advice Megaptera novaeangliae Humpback Whale (DAWE 2022a)	Recommends removal as a threaten species but remain a Matter of National Environmental Significance under the EPBC Act as a listed Migratory Species.	Lists vessel strike as a threat with humpback whales are one of the most frequently reported whale species involved in vessel strikes worldwide.	<p>This requirement is met by this impact assessment which does not predict impacts to Humpback Whales, and the implementation of M#03: Fauna Management System.</p> <p>The adopted measures will be implemented and monitored as detailed in Appendix B3 Implementation Strategy to ensure they are effective in managing the impact.</p> <p>Whale and vessel strike incidents will be reported in the National Ship Strike Database Reporting as detailed in Appendix B3 Implementation Strategy.</p>
Conservation Advice Balaenoptera borealis sei whale (TSSC 2015c)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Lists vessel strike as a threat with a minor consequence rating. The management action relevant to vessel strikes is ensure all vessel strike incidents are reported in the National Vessel Strike Database.	<p>Whale and vessel strike incidents will be reported in the National Ship Strike Database Reporting as detailed in Appendix B3 Implementation Strategy.</p> <p>In addition, this impact assessment does not predict impacts at a level that will impede the recovery of the Sei Whale, with the implementation of M#03: Fauna Management System.</p> <p>The adopted measures will be implemented and monitored as detailed in Appendix B3 Implementation Strategy to ensure they are effective in managing the impact.</p>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
<p>Conservation Management Plan for the Southern Right Whale (CoA 2012)</p> <p>Draft National Recovery Plan for the Southern Right Whale (DCCEEW 2022)</p>	<p>The long-term recovery objective is to minimise anthropogenic threats to allow the conservation status of the southern right whale to improve so that it can be removed from the threatened species list under the EPBC Act.</p>	<p>Details that reducing ship strike mortality can be most easily done either by reducing vessel speed or by separating vessels and whales.</p> <p>The management actions relevant to vessel strikes are:</p> <p>Assess risk of vessel strike to Southern Right Whales in BIAs.</p> <p>Ensure environmental impact assessments and associated plans consider and quantify the risk of vessel strike and associated potential cumulative risks in BIAs.</p> <p>Ensure all vessel strike incidents are reported in the National Ship Strike Database managed through the Australian Marine Mammal Centre, Australian Antarctic Division.</p>	<p>This requirement is met by this impact assessment and the implementation of M#03: Fauna Management System.</p> <p>The adopted measures will be implemented and monitored as detailed in Appendix B3 Implementation Strategy to ensure they are effective in managing the impact.</p> <p>Whale and vessel strike incidents will be reported in the National Ship Strike Database Reporting as detailed in Appendix B3 Implementation Strategy.</p>

## Annex 2: EPBC Act Listed Species within the Operational Area Relevant to Collison

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
<i>Turtles</i>							
Green Turtle	Species or species habitat may occur within area	Vulnerable	Migratory	Migratory Marine Species	Listed	None identified	Recovery Plan for Marine Turtles (DoEE 2017)
Leatherback Turtle, Leathery Turtle	Species or species habitat likely to occur within area	Endangered	Migratory	Migratory Marine Species	Listed	None identified	Recovery Plan for Marine Turtles (DoEE 2017) Approved Conservation Advice for <i>Dermochelys coriacea</i> (Leatherback Turtle) (DEWHA 2008)

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (Regia MSS) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (PEIRA) (Appendix B4) for further assessment.

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (EP) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table D3-2-table D3-21 shows the feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table D3-2-table D3-21t shows how this feedback has been incorporated into the environmental assessments.

*Table D3-2-1 - Relevant person input into the preparation of the EP*

Objections and Claims	Feedback ID	Measure adopted because of consultation
Parks Victoria requested a rationale for choosing the 5 km buffer zone around the Twelve Apostles Marine Park was requested.	259	After considering the Twelve Apostles Marine National Park and the Arches Marine Sanctuary Management Plan, the main threat identified to marine habitats of the park was the risk of introducing invasive marine species. CGG carried out a risk assessment and identified the risk of introducing marine species decreases with water depth and distance from the coast. CGG examined the operational and geophysical objectives of the survey and determined that a 5 km buffer around the Twelve Apostles Marine Park would have minimal effect to the operations.

### 3 Aspect – Introduction of Marine Pest Species

#### 3.1 How the Aspect Occurs

The introduction of marine pests could occur from vessels used for the Regia MSS because of:

- Discharge of ballast water containing foreign species.
- Translocation of species through biofouling of the vessel hull and/or niches (e.g., sea chests, bilges, and strainers) or in-water equipment (e.g., source array and streamers).

#### 3.2 Extent and Duration of the Aspect

Duration: 90 days

Extent: Operational Area

The extent of the area where the risk of an introduction of marine pest species may occur is within the Operational Area and the risk could occur while the activity is undertaken.

#### 3.3 Legislative and Other Requirements

Annex 1: Legislative and Other Requirements describes the legal and other requirements that apply to marine pests and how the requirements will be met.

## 4 Cause Effect Pathway

The PEIRA (Appendix B4) identified a cause-effect pathway for marine pests for the following environmental components:

- Benthic assemblages
- Invertebrates
- Commercial Fishing and Aquaculture
- Diving
- Recreational fishing

No cause-effect pathway for marine pests and marine protected areas such as Australian and Victorian marine parks was identified as the closest Australian Marine Park (Apollo) is ~36 km from the Operational Areas (Appendix B12 MAP-REG-EPM-078). The Victorian Twelve Apostles Marine National Park was identified to abut the previous Activity Planning Area and to reduce the risk of IMS translocation into the park a 5 km buffer was put in place for the final Operational Area making the distance to the park from the Operational Area ~ 6 km (Appendix B12 MAP-REG-EPM-079).

Marine pest may become established where conditions are suitable, and these species may have impacts on local ecological and economic values. However, establishment of introduced marine species is mostly likely to occur in shallow waters in areas where large numbers of vessels are present and are stationary for an extended period.

Successful marine pest establishment requires the following three steps (Marine Pest Sectoral Committee 2018):

- Colonisation and establishment of the marine pest on a vector (e.g., vessel hull) in a donor region (e.g., home port).
- Survival of the settled marine species on the vector during the voyage from the donor to the recipient region (e.g., Operational Area).
- Colonisation (e.g., dislodgement or reproduction) of the marine species in the recipient region, followed by successful establishment of a viable new local population.

The Australian Government Bureau of Resource Sciences (BRS) established that the relative risk of a marine pest incursion around the Australian coastline decreases with distance from the shoreline. Modelling conducted by BRS (2007) estimates:

- 33% chance of colonisation at 3 nm
- 8% chance at 12 nm
- 2% chance at 24 nm.

If the risk of establishment of IMS is realised, the following known and potential environmental impacts may occur:

- Change in ecosystem dynamics.
- Changes to the functions, interests, or activities of other users.

Change in ecosystem dynamics may include reduction in native marine species diversity and abundance, displacement of native marine species, socio-economic impacts on commercial fisheries, and changes to conservation values of protected area.

## 5 Description of the Existing Environment that May be Affected by the Activity

As detailed in Section 3.2, the Operational Area has been adopted as the extent of the area where marine pest translocation could occur from Regia MSS vessels.

As detailed in the PMST Report for the Operational Area (Appendix B5) there are no marine protected areas within the Operational Area. The Operational Area overlaps the West Tasmanian Canyons Key Ecological Feature (KEF) and the Giant Kelp Marine Forests of Southeast Australia Threatened Ecological Community (TEC). However, giant kelp requires clear, shallow water no deeper than approximately 35 m deep (TSSC 2012) which is outside the water depths for the Regia MSS Operational Area (40 to 1,400 m) and thus it is not assessed further.

### 5.1.1 Marine Pests

In the South-east Marine Region, 115 marine pest species have been introduced and an additional 84 have been identified as possible introductions, or 'cryptogenic' species (NOO 2002). Several introduced species have become pests either by displacing native species, dominating habitats or causing algal blooms.

Marine pests in Victoria marine waters according to Parks Victoria (No date) and Agriculture Victoria (2023) are:

- Asian date mussel (*Musculista senhousia*) – prefers soft sediments in waters up to 20 m deep, forming mats and altering food availability for marine fauna. Found in Port Phillip and Western Port, including Yaringa and French Island Marine National Parks; some records from eastern Victoria, particularly the Gippsland Lakes.
- Asian shore crab (*Hemigrapsus sanguineus*) - found on hard surfaces like under rocks, shells, debris or artificial structures (marinas, moorings, etc.) in exposed rocky coasts, estuaries, tidal flats and shallow waters. Currently present in Port Phillip Bay.
- Cord grass (*Spartina anglica* and *Spartina x townsendii* sp) – found at the mouth of Bass River and in drain outlets near Tooradin in Westernport. Widespread in South Gippsland including Anderson's Inlet and Corner Inlet. Invades native saltmarsh, mangroves and mudflats, altering the mud habitat and excluding other species.
- Dead man's fingers (*Codium fragile* ssp. *fragile*) – widespread in Port Phillip and known to inhabit San Remo and Newhaven in Westernport. It grows rapidly to shade out native vegetation and can regenerate from a broken fragment enabling easy transfer from one area to another. Attaches to subtidal rocky reef and other hard surfaces.
- European fan worm (*Sabella spallanzanii*) - found at depths down to 30 m and is found in nutrient-rich waters in sheltered locations where there are no strong currents and little wave action. It is a filter feeder and grows on soft sediments or anchors itself to rocks, mollusc shells, jetties, pontoons or other solid surfaces. Well established in Port Phillip and some other local ports but not yet observed in Western Port or elsewhere.
- Green Shore Crab (*Carcinus maenas*) - voracious and aggressive predator with a broad diet, it out-competes native crabs for food and habitat. It is a major cause of mortality of native crabs and mollusc populations. Widespread across Victoria and common in Port Phillip and Western Port. This crab has been present in Victoria since the 1800s
- New Zealand screw shell (*Maoricolpus roseus*) – lies on or partially buried in sand, mud or gravel in waters up to 130 m deep. It can densely blanket the sea floor with live and dead shells and compete with native scallops and other shellfish for food. This species is widespread in coastal areas of Eastern Victoria, including Corner Inlet and has been found west of Wilsons Promontory in Waratah Bay and Shallow Inlet. Its range is slowly expanding westward. Not currently known in Port Phillip or Western Port.

- Northern pacific seastar (*Asterias amurensis*) – prefer soft sediment habitat, but also use artificial structures and rocky reefs, living in water depths usually less than 25 m but up to 200 m water depths. It is thought to have been introduced in 1995 through ballast water from Japan.
- Pacific Oyster (*Crassostrea gigas*) - alter habitats by covering substrates, forming reefs and over growing native species. It is fast growing and is a filter feeder, competing with native species for food. Known pest in Western Port. Also observed in Port Phillip, Tidal River, Corner Inlet and Nooramunga Marine and Coastal Park however not considered a pest in these locations.
- Red Algae (*Grateloupia turuturu*) - large size of the plant shades out native algae on the reef. It grows rapidly in summer and dies back in winter causing large change in the availability of food for grazers such as snails. Widespread in northern Port Phillip.
- Wakame (*Undaria pinnatifida*) - grows rapidly and forms dense underwater forests, outcompeting native kelp and algae for light and space, then dies back in summer, changing kelp habitat. Well established in Port Phillip but currently not present in other Victorian locations, apart from Apollo Bay Harbour.

The National Introduced Marine Pests Information System (NIMPIS 2023) indicates that Portland, a potential port for mobilisation, harbours the following marine pests:

- Bryozoan (*Bugula neritina*) - most abundant bryozoans in ports and harbours and an important member of the fouling community. They grow well on pier piles, vessel hulls, buoys, and similar submerged surfaces.
- Bryozoan (*Cryptosula pallasiana*) - typical habitats include seagrasses, drift algae, oyster reef, artificial structures such as piers and breakwaters, man-made debris, rock, shells, ascidians, glass and vessel hulls. It has been reported from depths down to 35 m.
- Dead man's fingers (*Codium fragile ssp. fragile*) - as per Victorian waters.
- East Asian bivalve (*Theora lubrica*) - typically lives in muddy sediments from the low tide mark to 50 m, however it has been found at 100 m.
- European clam (*Varicorbula gibba*) - inhabits the shallow sublittoral zone to depths of around 140 m, where it is a shallow burrower in thick muddy sand with coarse elements.
- European fan worm (*Sabella spallanzanii*) - as per Victorian waters.
- Fanworm (*Euchone limnicola*) - burrows into soft sediments, secreting a mucous layer to enable it to build firm burrow walls.
- Solitary ascidian (*Ascidella aspersa*) - found from intertidal to shallow subtidal waters to 50 m depth attached to clay, stones, rocks, algae and wharf piles, where it can be the dominant fouling species.
- Toxic dinoflagellate (*Alexandrium tamarense*) - found in the photic zone; 1-20 m depth inshore; possibly deeper offshore.
- Toxic dinoflagellate (*Alexandrium minutum*) - found to a depth of 20 m in inshore waters, but may be found deeper offshore.
- Wakame (*Undaria pinnatifida*) – as per Victorian waters.
- White bushy bryozoan (*Amathia distans*) - Usually found in sheltered, often turbid, waters. Rocks, rock reef, oyster reef, docks, pilings, breakwaters, buoys, pontoons, man-made debris, and drift algae are all good substrates for this species.

The National Introduced Marine Pests Information System (NIMPIS 2023) indicates that other ports which may be used for the survey, Warrnambool, Apollo Bay or Port Fairy do not currently harbour any marine pests.

### 5.1.2 Benthic Assemblages

Benthic assemblages are biological communities that live in or on the seabed. They typically contain light-dependent taxa such as algae, seagrass and corals, which obtain energy primarily from photosynthesis, and/or animals such as molluscs, sponges and worms. Benthic habitats are the seabed substrates that benthic communities grow on or in; these can range from unconsolidated sand to hard substrates (e.g., limestone) and occur either singly or in combination.

Rocky reefs and hard grounds are in all areas of the South-east Marine Region continental shelf including Bass Strait, from the sub-tidal zone shore to the continental shelf break. On the continental shelf, rocky reefs and hard grounds provide attachment sites for macroalgae and sessile invertebrates, increasing the structural diversity of shelf ecosystems. The reefs provide habitat and shelter for fish and are important for aggregations of biodiversity and enhanced productivity. The shallowest depth at which the rocky reefs occur in Commonwealth waters is approximately 50 m (CoE 2015a).

Corals do not occur as a dominant habitat type within the Environmental Planning area. Reef development by hard corals does not occur further south than Queensland (Tzioumis and Keable, 2007). Soft corals are typically present in deeper waters throughout the continental shelf, slope and off-slope regions, to well below the limit of light penetration (BBG 2003, Boreen et al. 1993). Gorgonian corals (soft corals) were identified during seabed surveys of the Beach Otway Development area within the Environmental Planning Area (Ramboll 2020).

James et al (2013) undertook extensive surveys of macroalgal communities along the Otway Shelf from Warrnambool to Portland in south-west Victoria. Sites were adjacent to shore or on offshore rocky reefs covering a depth range of 0 to 36 meters water depth. These surveys did not locate giant kelp at any site but identified that other brown algae species (*Durvillaea*, *Ecklonia*, *Phyllospora*, *Cystophora*, and *Sargassum*) are prolific to around 20 m water depth. Brown algae tend to be replaced by red algae in deeper waters.

### 5.1.3 Invertebrates

Studies by the Museum of Victoria found that invertebrate diversity was high in southern Australian waters although the distribution of species was patchy, with little evidence of any distinct biogeographic regions (Wilson and Poore 1987). Results of sampling in shallower inshore sediments reported high diversity and patchy distribution (Parry et al. 1990). In these areas, crustaceans, polychaetes, and molluscs were dominant.

Throughout the region, a variety of seabed habits support a range of animal communities such as sparse sponges to extensive ‘thickets’ of lace corals and sponges, polychaete worms and filter feeders (DNP 2013). Echinoderms, such as sea stars, sea urchins and sea cucumbers are also an important fauna species of the southern Australian and Tasmanian waters, with several species at risk of extinction (DPIPWE 2020).

### 5.1.4 West Tasmanian Canyons Key Ecological Feature

The West Tasmanian Canyons are located on the relatively narrow and steep continental slope west of Tasmania. This location has the greatest density of canyons within Australian waters where 72 submarine canyons have incised a 500 km-long section of slope (Heap & Harris 2008).

The Operational Area overlaps a small portion of the West Tasmanian Canyons KEF (Appendix B12 MAP-REG-EPM-004).

Submarine canyons modify local circulation patterns by interrupting, accelerating, or redirecting current flows that are generally parallel with depth contours. Their size, complexity and configuration of features determine the degree to which the currents are modified and therefore their influences on local nutrients, prey, dispersal of eggs, larvae and juveniles and benthic diversity with subsequent effects which extend up the food chain.

Eight submarine canyons surveyed in Tasmania, Australia, by Williams et al (2009) displayed depth-related patterns with regard to benthic fauna, in which the percentage occurrence of faunal coverage

visible in underwater video peaked at 200-300 m water depth, with averages of over 40% faunal coverage. Coverage was reduced to less than 10% below 400 m depth. Species present consisted of low-relief bryozoan thicket and diverse sponge communities containing rare but small species in 150 to 300 m water depth.

Sponges are concentrated near the canyon heads, with the greatest diversity between 200 m and 350 m depth. Sponges are associated with abundance of fishes and the canyons support a diversity of sponges comparable to that of seamounts. Based upon this enhanced productivity, the West Tasmanian Canyon system includes fish nurseries (blue wahoo and ocean perch), foraging seabirds (albatross and petrels), white shark and foraging blue and humpback whales (CoA 2015a).

### 5.1.5 Commercial and Recreational Fishing and Aquaculture

As detailed in the Commercial Fisheries Analysis Report (Appendix B6), the Operational Area overlaps the following fisheries that have catch effort:

- Commonwealth:
  - Southern and Eastern Scalefish and Shark (SESS) Fishery SESSF following sectors:
    - Scalefish Hook
    - Shark Gillnet sector
    - Trawl – otter board
  - Southern Squid Jig Fishery
- Victorian:
  - Giant Crab
  - Multi-species Ocean
  - Octopus
  - Southern Rock Lobster
  - Wrasse

Recreational fishing may occur within the Operational Area but there are no known popular areas.

No aquaculture sites have been identified within the Operational Area and thus it is not assessed further.

### 5.1.6 Diving

No dive sites have been identified within the Operational Area and thus it is not assessed further.

## 6 Predicted Levels of Risk

### 6.1.1 Change in ecosystem dynamics

The introduction and subsequent establishment and spread of a marine pest may result in the reduction in native marine species diversity and abundance, displacement of native marine species and changes to conservation values of protected areas. The extent of the initial risk to benthic assemblages are likely to be localised (isolated locations if there is no spread) but may become widespread if establishment and spread occurs.

Receptors which may occur within the Operational Area and are at risk from marine pest introduction are:

- Benthic Assemblages (sponges, bryozoans etc.)
- West Tasmania Canyons KEF
- Invertebrates

Only a small proportion of marine pests become invasive (Wells 2018) with the risk of a marine pest being able to successfully establish itself depending on depth, distance from the coast, water movement and latitude. Survival is not expected in deep oceanic waters (>90 m depth) with establishments more likely within shallower waters (<50m), where vessels are stationary for extended periods of time.

The Regia MSS vessels will not be stationary within the Operational Area and no anchoring will take place further reducing the risk of translocating a marine pest to the seabed. All subsea survey equipment is stored on the vessel so a marine pest would not be able to survive on equipment in these exposed dry conditions. Support vessels will generally not be alongside the survey vessel for more than two hours during support operations, so a cross transfer of a marine pest is highly unlikely.

As the Operational Area at its nearest point is ~7 km from the Victorian coast, BRS (2007) estimates indicate that the chance of colonisation of a marine pest is 33%. However, as detailed in the Existing Environment Section, marine pests which are known to occur in the Bass Strait are limited to either sheltered areas or shallow waters which are not present in the exposed well mixed waters of the Operational Area where water depths range from 40 to 1,400 m.

The CGG Marine Pest Risk Assessment Process ensures contracted vessels meet ballast water and biofouling legislative requirements to prevent the introduction of marine pests.

Values for the West Tasmania Canyons KEF includes sponges that are associated with abundance of fishes and a diversity, greatest between 200 and 350 m, comparable to that of seamounts (DCCEEW 2020d). At the water depths of these values the possibility of a marine pest becoming established is negligible.

No EPBC listed invertebrate species were identified from the PMST Report for the Operational Area (Appendix B5).

The predicted level of consequence of introducing a marine pest causing a change in ecosystem dynamics is assessed as major as there is the potential to alter ecosystem processes and reduce biodiversity, however, the likelihood of a marine pest being present on a Regia MSS vessel and becoming established is assessed as rare due to the implementation of ballast and biofouling management requirements and that a marine pest would be unable to colonize the benthic substrate due to the deep and well mixed waters within the Operational Area. The predicted level of risk is assessed as low.

### 6.1.2 Changes to the functions, interests or activities of other users

The introduction of a marine pest may result in the reduction in native marine species diversity and abundance, displacement of native marine species which could result in changes to commercial fish species diversity and abundance. The extent of the initial risk to commercial fisheries is likely to be localised if a marine pest introduction occurred and did not spread but may become more widespread if colonisation and spread occurs.

As detailed in the assessment of a change in ecosystem dynamics, the introduction of a marine pest in the Operational Area is unlikely to impact on fisheries within the region as colonisation and spread is unlikely based on the Operational Area water depth and distance from shore which BRS (2007) estimates indicate that the chance of colonisation of a marine pest is 33%. In addition, the low light levels (water depth of 40 to 1,400 m) and well mixed marine environment is not conducive to the establishment of marine pests.

The CGG Marine Assurance System ensures contracted vessels meet ballast water and biofouling legislative requirements to prevent the introduction of marine pests. Thus, it is highly unlikely that marine pests would be present on vessels.

None of the fisheries identified as being active in the Operational Area identified marine pests as a threat. Whilst Southern Rock lobster is susceptible to tail fan necrosis, caused by combination of a number of bacteria and fishing practices such as live holding (Musgrove et al. 2005) and both crab and lobster can be susceptible to paralytic shellfish toxin, none are related to the introduction of marine pests.

The predicted consequence of introducing a marine pest causing a change to the functions, interests or activities of commercial fisheries is assessed as major as there is the potential to alter ecosystem processes and reduce biodiversity, however, the likelihood of a marine pest being present on a Regia MSS vessel and becoming established is assessed as rare due to the implementation of ballast and biofouling management requirements and that a marine pest would be unable to colonize the benthic substrate due to the deep and well mixed waters within the Operational Area. The predicted level of risk is assessed as low.

## 7 Comparison of Predicted Level of Risk with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.	The introduction and establishment of marine pests is not predicted.	Yes
	The impact and risk assessment are based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature and government management plans, recovery plans and conservation advice were used to inform the risk assessment. The introduction and establishment of marine pests is not predicted. There is high confidence in the prediction of risk to environmental components that are at risk from the introduction of marine pests.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	Management of the activity is consistent with EPBC Act Management Plans and Recovery Plans as detailed in Annex 1 of this document.	Yes
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	The introduction and establishment of marine pests is not predicted.	Yes
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	The introduction and establishment of marine pests is not predicted.	Yes
Economic	Affected persons will not be worse off as a result of the activity.	The introduction and establishment of marine pests is not predicted.	Yes
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.	The introduction and establishment of marine pests is not predicted.	Yes
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce the risk of introducing a marine pest as detailed in the following section.	Yes

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
	Environmental impacts and risks are consistent with the CCG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.	The predicted risk level is medium.	Yes
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the risk.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	To date no objections or claims in relation to marine pests have been made by relevant persons.	Yes
	The views of public have been considered in the impact and risk assessment.	To date there has been no views from the public in relation to marine pests.	Yes

## 8 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure the environmental risk will be of an acceptable level and ALARP.

Measures	Justification	Adopted
M#05: CGG Marine Assurance System	Project vessels, as part of the CGG contracting process, will undergo OVID-style inspections to verify the validity and compliance pre-arrival biosecurity checks for international vessels, and ballast water and biofouling requirements including the requirements to have a Ballast Water and Sediment Management Plan, a Ballast Water Record Book, a Biofouling Management Plan and Record Book tailored to the vessel's class and operational requirements.	Yes
	The sound source and towed streamers will be inspected and cleaned (where required) prior to deployment for the Regia MSS.	Yes
	Vessels will conduct pre-port entry checks using the National Introduced Marine Pest Information System database and assess changes in known invasive species.	Yes

Measures assessed and not adopted.

Measure	Justification	Adopted
No discharge of ballast water from vessels.	Although, ballast water exchange is not expected to occur during the Regia MSS, the possibility of discharge or exchange cannot be ruled out. Ballast water exchange and uptake may be required in unexpected circumstances where the safety of persons on-board the vessel is a necessity. Ballast water will be managed in accordance with the Australian Ballast Water Management Requirements and the likelihood of introducing a marine pest via ballast water is highly unlikely. The control is not practicable to implement and is grossly disproportionate to the limited environmental benefit that would be gained in addition to existing controls.	No
Hull cleaning and/or new antifouling coat application to vessel hull and niche areas prior to the Regia MSS.	Given the existing control measure this control measure is not commensurate to the level of risk.  Should the risk assessment determine a vessel to have a medium or high marine pest risk from biofouling, further inspections or cleaning may be implemented. However, the cost of undertaking inspections and hull cleaning could range from tens to hundreds of thousands of dollars. This is not practicable to implement in all cases and is disproportionate to the level of risk if the existing risk profile for a vessel is already low.	No

## 9 Conclusions

This risk assessment has demonstrated that the introduction of marine pests causing a change to both ecosystem dynamics and to the functions, interests or activities of commercial fisheries has a:

- **Predicted level of consequence of major.**
- **Likelihood of rare.**
- **Predicted level of risk of low.**

## 10 Recommendations

As demonstrated in this risk assessment the predicted level of risk level is low, thus, good industry practice (including legislation and standards) has been applied and therefore these risks are of an acceptable level without further recommendations being required.

## 11 Document Control

Date	Revision	Update
6 July 2023	A	Draft prepared for initial comment
23 August 2023	B	Update based on comments and relevant person feedback
11 Sept 2023	0	Approved for release on Regia MSS website
20 Dec 2023	1	EP submission to NOPSEMA

## Annex 1: Legislative and Other Requirements Relevant to IMS

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Conservation Advice for Giant Kelp Marine Forests of South East Australia (DSEWPac 2012a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	The conservation advice identifies range expansion of invasive species as a threat. Relevant actions are: Manage shipping and aquaculture practices to minimise potential invasion of exotic species.	This requirement is met by this risk assessment and the implementation of M#05: CGG Marine Assurance System.
Commonwealth Listing Advice on Giant Kelp Marine Forests of South East Australia (TSSC 2012a)	Recommends the ecological community's inclusion on the EPBC Act list of threatened ecological communities.	The listing advice identifies invasive species such as Japanese seaweed ( <i>Undaria pinnatifida</i> ) as a threat. No relevant actions were identified.	This requirement is met by this risk assessment and the implementation of M#05: CGG Marine Assurance System.
Biosecurity Act 2015	The act provides a framework for managing biosecurity risks associated with the import and export of goods and vessels.	Vessels used for the Regia MSS are required to undertake the following: Pre-arrival information must be reported through MARS before arriving in Australian waters.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS have met these requirements.
Biosecurity Regulations 2016	The regulations provide additional guidance on the management of biosecurity risks associated with the import and export of goods and vessels.	Biofouling management plan and record book. Offshore Biofouling Risk Assessment Register, which considers biofouling and ballast water related risks, which may lead to inspections by suitably qualified personnel. Antifouling system certification for vessels is current and in accordance with AMSA Marine Order Part 98 (Antifouling systems)	
Biosecurity Amendment (Biofouling Management) Regulations 2021	The regulations require operators of all vessels to provide information on biofouling management practices prior to arriving in Australia.	Vessels used for the Regia MSS are required to undertake the following: Pre-arrival information must be reported through MARS before arriving in Australian waters and is to include biofouling management practices.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS have met this requirement.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Marine Order 98 - Marine pollution prevention - antifouling systems	Marine Order 98 sets out the requirements for the use of antifouling solutions on ships in Australian waters. The order establishes restrictions on the use of certain types of antifouling coatings, as well as requirements for the management of hull cleaning and maintenance.	Vessels used for the Regia MSS are required to meet the requirements of Marine Order 98 in relation to antifouling coatings and management of hull cleaning and maintenance.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS have met these requirement.
Australian Ballast Water Management Requirements	The requirements provide guidance on how vessel operators should manage ballast water when operating within Australian seas in order to comply with the Biosecurity Act 2015. They align to the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004.	<p>Vessels used for the Regia MSS are required to manage ballast water exchange/discharge using one of the following approved methods of management including:</p> <p>An approved ballast water management system.</p> <p>Ballast water exchange conducted in an acceptable area *</p> <p>Use of low-risk ballast water (e.g., fresh potable water, water taken up on the high seas, water taken up and discharged within the same place).</p> <p>Retention of high-risk ballast water on-board the vessel.</p> <p>Discharge to an approved ballast water reception facility.</p> <p>*Acceptable area is as defined in the Biosecurity (Ballast Water and Sediment) Determination 2017.</p> <p>Vessels will have an approved Ballast Water Management Plan (BWMP) and valid Ballast Water Management Certificate (BWMC) unless an exemption applies or is obtained.</p> <p>Vessels will maintain complete and accurate records of ballast water exchange that complies with Section B, Regulation B.2. of the Annex to the Ballast Water Convention.</p>	This requirement is met by the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS have met these requirements.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Australia Biofouling Management Requirements	The requirements provide guidance on how vessel operators should manage ballast water when operating within Australian seas in order to comply with the Biosecurity Act 2015, including those conducting a marine seismic survey. They align to the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004.	Vessels used for the Regia MSS are required to have a biofouling management plan (BFMP) which:  Provides specific details of the antifouling technology used, including antifouling paints and Marine Growth Prevention System (MGPS) and how and when they are operated where relevant.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS have met these requirements.
Guidelines for the Control and Management of Ships' Biofouling to Minimize the Transfer of Invasive Aquatic Species (Biofouling Guidelines)	Provide a globally consistent approach to the management of biofouling.	Describes the operating conditions suitable for the chosen technology.  Describes the operational profile of the vessel including operating speeds and time spent stationary.  Provides details of the areas of the hull that are particularly susceptible to biofouling, such as niche areas, and how the technology applied addresses this increased risk.  Provides information relating to the schedule of planned inspections, repairs, maintenance, inspection, and renewal of antifouling systems as well as circumstances by which opportunistic inspection to monitor efficacy might occur.  Describes the documentation required to verify any treatments and activities recorded in the biofouling record book.	
Marine Pest Plan 2018–2023: National Strategic Plan for Marine Pest Biosecurity	The plan outlines a coordinated approach to building Australia's capabilities to manage the threat of marine pests over the next five years. It represents agreed priorities and actions of governments, marine industries, and other stakeholders to achieve a common purpose: to manage the risks posed by marine pests and minimise their potential harm to marine industries, communities, and the environment.	Vessels used for the Regia MSS are required to manage the risks posed by marine pests and minimise their potential harm to marine industries, communities, and the environment	This requirement is met by this risk assessment and the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS pose a low risk of having marine pests.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
National Biofouling Management Guidance for the Petroleum Production and Exploration Industry 2009	Includes the following for operators of petroleum industry related vessels, equipment, and infrastructure:  Evaluation of biofouling risk of types of structures/facilities.  Guidance on biofouling management and decommissioning.	Vessels used for the Regia MSS are required to evaluate and manage their biofouling risk.	This requirement is met by this risk assessment and the implementation of M#05: CGG Marine Assurance System which checks that vessels used for the Regia MSS pose a low risk of having marine pests.

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (Regia MSS) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (PEIRA) (Appendix B4) for further assessment. This document also uses information in one preceding study:

### 1. Oil Spill Modelling Analysis (Appendix B11)

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (EP) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table D4-2-1 shows the feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table D4-2-1 shows how this feedback has been incorporated into the environmental assessments.

*Table D4-2-1 - Relevant person input into the preparation of the EP*

Objections and Claims	Feedback ID	Measure adopted because of consultation
Concern received through the interactive map stating oil spill risks are too great.	80	CGG will include a risk assessment and analysis provided for scrutiny.
Concern received through the interactive map regarding risk Mitigation for an oil spill	84	CGG agreed to implement the following measures: Class 1A vessel with dual propulsion. Navigations warnings. Bunkering procedures within Marine Assurance System.
Concern received through the interactive map regarding the environmental risk oil spills will pose.	86	CGG will produce OPEP & OSMP.
Parks Victoria raised an objection regarding concerns of an oil spill.	239	CGG will implement a 50km buffer to all marine parks for refuelling.

### 3 Aspect – Accidental Release of Fuel

#### 3.1 How the Aspect Occurs

The following hydrocarbons and chemicals will be present on the seismic vessel and support vessels:

- Marine diesel oil (MDO) used as fuel for the vessels.
- Hydraulic fluids such as engine and synthetic oils required for equipment and engine use.
- Chemicals for cleaning and maintenance purposes.

Hydrocarbons and chemicals are stored in contained areas but there is the potential for a loss of containment to occur resulting in a release of hydrocarbons or chemicals to the marine environment. Loss of containment scenarios are details in Table D4-3-1.

*Table D4-3-1: Accidental Release of Fuel Scenarios*

Scenario	Material and Potential Volume	Description
Vessel fuel tank rupture	257.4 m <sup>3</sup> MDO	<p>A collision between the survey vessel, support vessel or a third-party vessel has the potential to result in the breach of the vessel hull and subsequent rupture of a fuel tank. A spill to sea because of vessel collision/grounding is only likely to occur under exceptional circumstances where these conditions resulted in significant damage to one or more of the fuel tanks in the hull of the vessel. These may include:</p> <ul style="list-style-type: none"> <li>• Navigational error</li> <li>• Vessel loss of power</li> <li>• Floundering due to weather.</li> </ul> <p>If a collision/grounding involving the seismic vessel occurred, the worst-case credible scenario would be the loss of the largest single fuel tank volume (consistent with AMSA (2015) guidelines), which is 257.4 m<sup>3</sup> of MDO.</p>
Vessel refuelling failure	1.2 m <sup>3</sup> to 25 m <sup>3</sup> of MDO	<p>A vessel refuelling failure may result in the release of MDO to the marine environment.</p> <p>Using dry-break couplings (which provide an automatic mechanism to seal off both the hose and the fixed pipe end when the hose is disconnected), the maximum credible spill volume from a refuelling failure is the maximum typical volume of a transfer hose (1.2 m<sup>3</sup>). In the event dry break couplings fail, guidelines indicate the maximum credible spill volume from a refuelling incident with continuous supervision is equivalent to the volume of MDO transferred within a 15-minute period (AMSA 2053), which represent the estimated time required to shut down refuelling operations following discovery of a spill. Based on a transfer volume of 100 m<sup>3</sup>/hr, this may result in a spill volume of 25 m<sup>3</sup>.</p>
Loss of containment overboard	1 m <sup>3</sup> of hydraulic fluid, lubricating fluids, or chemicals	<p>A loss of containment may occur because of mechanical/ structural failure, human error, or poor housekeeping.</p> <p>Should a spill occur on a vessel deck, controls such as equipment bunds, scupper plugs and on-board clean up should prevent the spilt material reaching the marine environment.</p> <p>However, in the event these controls fail, or are not implemented, spill volumes released to the environment are likely to be less than 1 m<sup>3</sup> based on the inventory typically used on deck.</p>

#### 3.2 Extent and Duration of the Aspect

Duration: 90 days survey duration +30 days

A loss of containment could occur at any time during the activity (90 days). If there were a loss of containment the consequences of the largest release (fuel tank rupture) MDO may persist for up to 30 days post-incident for water quality to be below low thresholds due to the rapid evaporation and dispersion of the fuel.

Extent: Environmental Planning Area

If there were an accidental release of fuel it could potentially disperse 150 km from the location of the vessel. This area is the Environmental Planning Area (Appendix B12 MAP-REG-EPM-083).

The 150 km is based on the NERA Reference Case: Consequences analysis of an accidental release of MDO (NERA 2018) that found that MDO spills under 700m<sup>3</sup> were reliably predicted to disperse within 150 km from the source of the spill. However, this reference case was based on exposure values that are higher than the current commonly used exposure values for oil spill modelling (NOPSEMA 2019) that are selected to approximate the spatial extent and variability of the receiving environment's contact with oil and subsequently inform risk evaluation and planning for oil spill response and monitoring. Thus, to validate that 150 km was sufficiently conservative a review was undertaken to identify oil spill modelling that has been undertaken in the Otway area since the NOPSEMA Oil Spill Modelling Environment Bulletin was published in April 2019. The review, provided in Oil Spill Modelling Analysis (Appendix B11), confirmed that 150 km was sufficiently conservative to approximate the spatial extent and variability of the receiving environment's contact with oil and subsequently inform risk evaluation and planning for oil spill response and monitoring for a spill up to 250 m<sup>3</sup> of MDO within the Regia MSS Operational Area.

### 3.3 Legislative and Other Requirements

Annex 1 within this document describes the legal and other requirements that apply to loss of containment, and how the requirements will be met.

## 4 Cause Effect Pathway

The PEIRA identified a cause-effect pathway for an accidental release of fuel for the following environmental components:

- Water quality
- Sediment quality
- Benthic assemblages
- Coastal habitats and communities
- Plankton
- Invertebrates
- Fish
- Birds
- Marine reptiles
- Marine mammals
- Coastal development
- Indigenous culture
- Commercial fishing and aquaculture
- Marine industries
- Marine Tourism
- Diving
- Recreational Fishing
- Marine Protected Areas

Hydraulic fluids and lubricating fluids behave similarly to MDO when spilt in the marine environment. Hydraulic fluids are oils of light to moderate viscosity and have a relatively rapid spreading rate. Like MDO, they will dissipate quickly, particularly in high sea states, although lubricating oils are more viscous and so the spreading rate of a spill of these oils would be slightly slower.

Impacts associated with a spill of chemicals to the marine environment will depend on the nature of the liquid released, the volume and its behaviour in the marine environment (whether it sinks, floats, disperses, etc.). In the event of a spill to the marine environment, these liquids would be subjected to rapid dispersion and dilution by the open ocean water conditions and prevailing currents and would remain within the surface waters.

Potential impacts from minor spills of hydraulic fluids, lubricating fluids or chemicals include a temporary and highly localised decline in water quality. This would have limited potential for toxicity to marine fauna or impact socio-economic receptors, due to the short duration of exposure and rapid dilution of the released liquids in the marine environment. As there is no likely cause effect pathway to impact fauna or socio-economic receptors and impacts to water quality is predicted to be negligible no further assessment is required.

MDO is a light, refined petroleum product that when spilled on water, most of the oil evaporates or naturally disperses quickly (hours to days). However, the rates differ with both water and air temperature, more so with wind speed (and wave energy).

MDO is much lighter than water, so it is not possible for MDO to sink and accumulate on the seabed as pooled or free oil.

Dispersion into the sea by the action of wind and waves can result in 25–50% of the loss of hydrocarbons from surface slicks and dissolution (solubility of hydrocarbons) can account for 1-10% loss from the surface. While the majority of the MDO evaporates quickly, it is common for the residues of MDO spills after weathering to contain n-alkanes, iso-alkanes and naphthenic hydrocarbons.

Spilled MDO can affect biological receptors via direct contact or through inhalation of vapours as the MDO as it disperses. Visual slicks or oil shoreline oil can have impacts on socio-economic and cultural receptors especially where there is commercial, recreational, and traditional fishing, coastal activities and tourism.

The known and potential environmental impacts of a MDO spill are:

- Change in water quality leading to:
  - Injury or mortality of fauna.
  - Change in fauna behaviour.
  - Change in ecosystem dynamics.
  - Changes to the functions, interests, or activities of other users (e.g., commercial fisheries).

## 5 Description of the Existing Environment that may be Affected by the Activity

As detailed in Section 3.2, the Environmental Planning Area has been adopted as the extent of where receptors could be exposed to oil from a MDO spill.

To identify key values and sensitivities that may be present within the Environmental Planning Area a PMST search was undertaken using the Environmental Planning Area with the PMST Report available in Appendix B5: PMST Search Reports. A summary of the values and sensitivities protected under the EPBC Act relevant to a loss of containment is detailed in Annex 2 within this document. The summary also identifies any relevant conservation advice or recovery plans.

In addition, a review was undertaken of commercial fisheries that may fish within the Environmental Planning Area and is documented in the Commercial Fisheries Analysis Report (Appendix B6).

A description of the existing environment that may be affected by an accidental release of fuel is provided for each environmental component in Section 6 Predicted Levels of Risk.

## 6 Predicted Levels of Risk

Based upon an understanding of the cause/effect pathway, an accidental release of fuel releases 250 m<sup>3</sup> of MDO is used to predict the level of risk to receptors as this is the largest loss of containment scenario.

Table D4-6-1 provides the criteria used to determine the sensitivity of receptors within the Environmental Planning Area with the following tables assessing each receptor identified within the Environmental Planning Area having regard to the legislative and other requirement.

Table D4-6-1: Receptor Sensitivity Criteria

Sensitivity	Protected Areas	Species Status	BIA	Coastal Habitat Sensitivity	Relevant Receptors
Low	State - no marine protected areas. Commonwealth - multiple use zones are the dominant component of the protected area.	Species not threatened (or limited to only a few species of a particular faunal grouping). Present in the Environmental Planning Area only occasionally or as vagrants. Populations known to recover rapidly from disturbance.	No BIA (or limited to only a few species of a particular faunal grouping).	Low sensitivity habitat, such as fine-grained beaches, exposed wave-cut platform and exposed rocky shores, with rapid recovery from oiling (~ 1 year or less). Public recreation beaches not present or not widely used. No harbours or marinas.	Sediment quality Plankton Invertebrates Fish Marine protected areas
Medium	State – no marine protected area. Commonwealth -little to no special purpose zonation.	Species may be threatened (or some species of a particular faunal grouping). Species may or may not be present at time of activity. Some susceptibility to oiling. Populations may take a moderate time to recover from oiling.	Some intersection with one or more BIAs, generally for distribution or migration rather than breeding.	Moderately sensitive habitat present, such as sheltered rocky rubble coasts, exposed tidal flats, gravel beaches, mixed sand and gravel beaches, with a medium recovery period from oiling (~2-5 years). Public recreation beaches present but not often used. No harbours or marinas	Water quality Benthic assemblages Coastal habitats and communities Seabirds Marine reptiles Marine mammals Commercial fisheries and aquaculture Marine industries Marine protected areas
High	State - marine protected area present. Commonwealth -special purposes zones are the dominant component of the protected area.	Species are threatened (or most species of a particular faunal grouping). Species known to be present at time of activity. Known to be susceptible to oiling. Populations may take a long time to recover from oiling.	Significant intersection with one or more BIAs, particularly with regard to foraging or breeding.	Sensitive habitat present, such as mangrove, salt marshes, and sheltered tidal flats, with long recovery periods from oiling (> 5 years). Public recreation beaches present that are widely used. Busy harbours or marinas.	Coastal developments Aquatic birds Shorebirds Diving Indigenous culture Marine Tourism Marine protected areas Recreational fishing

## 6.1 Water Quality

<b>Water Quality</b>	
<b>Sensitivity Rating</b>	<b>Medium</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
Water quality within the Environmental Planning Area is expected to be typical of offshore waters of southern Australia. Water sampling undertaken for the Beach Otway Development area within the Environmental Planning Area (Ramboll 2020) detailed that the water quality at survey areas indicated an undisturbed mid-depth environment.	
Predicted Level of Risk	
<p>The Environmental Planning Area is based on the following thresholds where water quality could be potentially at risk:</p> <p>The low threshold to assess the potential for floating oil exposure of 1 g/m<sup>2</sup> equates to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (AMSA 2014). This threshold is used to establish the planning area for scientific monitoring.</p> <p>The low threshold of 10 ppb to assess the potential for dissolved and entrained oil exposure represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC &amp; ARMCANZ (2000) water quality guidelines. This threshold is used to establish the planning area for scientific monitoring.</p> <p>A summary of the mass balance of a MDO spill within the Environmental Planning Area (RPS 2022) showed:</p> <p>Under a constant 5 knot (~2.5 m/s) wind, 40.3% of the oil is predicted to evaporate within 24 hours. Under calm conditions, most of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation shall cease when the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.</p> <p>Under a variable-wind where the winds are of greater strength on average, entrainment of MDO into the water column is predicted to increase. Approximately 24 hours after the spill, 60.1% of the oil mass is forecast to have entrained and a further 38.4% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (&lt;0.1%).</p> <p>The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of 1.5% per day with or ~10.5% after 7 days, compared to &lt;0.1% per day and a total of 0.9% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.</p> <p>Based on the weathering properties of MDO water quality within the Environmental Planning Area, 40% of a 250 m<sup>3</sup> MDO spill will evaporate within 24 hours with the remaining oil to becoming entrained in the water column where it will decay below threshold levels within 30 days.</p>	

<b>Water Quality</b>
Thus, the predicted level of consequence to water quality from a 250 m <sup>3</sup> MDO spill is assessed as minor as any consequences will be short-term (< 30 days for oil to decay below low thresholds) within a localised area with full recovery, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.

## 6.2 Sediment Quality

Sediment Quality	
Sensitivity Rating	Low
Predicted Level of Risk	Low
Environmental Planning Area Existing Environment	
Sediment quality within the Environmental Planning Area is expected to be typical of coastal and nearshore area of southern Australia. Water sampling undertaken for the Beach Otway Development area within the Environmental Planning Area (Ramboll 2020) detailed that the sediment quality at survey areas had a high oxidation reduction potential and low or undetectable levels of toxicants indicating an unmodified seabed environment.	
Predicted Level of Risk	
<p>In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m<sup>2</sup> to assess the potential for shoreline accumulation. It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m<sup>2</sup> shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.</p> <p>As detailed in the assessment of water quality, the majority of surface oil will have evaporated or entrained in the water column within ~ 24 hours, thus only a small proportion is likely to move to shoreline areas above the low threshold. Furthermore, wave action in shoreline areas will further breakdown the remaining oil.</p> <p>Thus, the predicted level of consequence to sediment quality from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences will be short-term (&lt; 30 days) within a localised area with full recovery, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.</p>	

### 6.3 Benthic Assemblages

Benthic Assemblages	
Sensitivity Rating	Medium
Predicted Level of Risk	Medium
Environmental Planning Area Existing Environment	
<p>Benthic assemblages are biological communities that live in or on the seabed. They typically contain light-dependent taxa such as algae, seagrass and corals, which obtain energy primarily from photosynthesis, and/or animals such as molluscs, sponges and worms. Benthic habitats are the seabed substrates that benthic communities grow on or in; these can range from unconsolidated sand to hard substrates (e.g., limestone) and occur either singly or in combination.</p> <p>Given that MDO would only be present on the sea surface or within the water column to a depth of 10 m (RPS 2019a) the existing environment covers those benthic assemblages along the Victorian, South Australian and King Island coastlines within the Environmental Planning Area.</p> <p>Rocky reefs and hard grounds are located in all areas of the South-east Marine Region continental shelf including Bass Strait, from the sub-tidal zone shore to the continental shelf break. On the continental shelf, rocky reefs and hard grounds provide attachment sites for macroalgae and sessile invertebrates, increasing the structural diversity of shelf ecosystems. The reefs provide habitat and shelter for fish and are important for aggregations of biodiversity and enhanced productivity. The shallowest depth at which the rocky reefs occur in Commonwealth waters is approximately 50 m (CoE 2015a).</p> <p>Corals do not occur as a dominant habitat type within the Environmental Planning Area. Reef development by hard corals does not occur further south than Queensland (Tzioumis and Keable, 2007). Soft corals are typically present in deeper waters throughout the continental shelf, slope and off-slope regions, to well below the limit of light penetration (BBG 2003, Boreen et al. 1993). Gorgonian corals (soft corals) were identified during seabed surveys of the Beach Otway Development area within the Environmental Planning Area (Ramboll 2020).</p> <p>James et al (2013) undertook extensive surveys of macroalgal communities along the Otway Shelf from Warrnambool to Portland in south-west Victoria. Sites were adjacent to shore or on offshore rocky reefs covering a depth range of 0 to 36 meters water depth. These surveys did not locate giant kelp at any site but identified that other brown algae species (<i>Durvillaea</i>, <i>Ecklonia</i>, <i>Phyllospora</i>, <i>Cystophora</i>, and <i>Sargassum</i>) are prolific to around 20 m water depth. Brown algae tend to be replaced by red algae in deeper waters.</p> <p>Bull kelp or southern bull kelp (<i>Durvillaea potatorum</i>) is a fast-growing brown macroalgae (seaweed) with large dark brown and leathery strap-like blades. It consists of a body, called the thallus, with a stipe connecting the blades to the holdfast (a structure adhering the bull kelp to the seafloor. Offshore Victoria and Tasmania there are two main species of <i>Durvillaea</i>, these are <i>D. potatorum</i> and <i>D. amatheiae</i>. The approximate distribution of the species is shown in Figure D4-6-figure D4-6I with locations within the Environmental Planning Area.</p> <p>Bull kelp is a significant habitat. The holdfast can be inhabited by a diverse array of epifauna and infauna invertebrates. These burrow into the holdfast creating holes that can be used by a wide variety of animals. In addition, bull kelp grows in large groups or forests that can become important nursery areas and sanctuary areas for fish, crustaceans and other fauna. Bull kelp has a long history of use by First Nations in Australia, New Zealand, and Chile. In Australia this reportedly dates back 65,000 years (Thurstan et al. 2018). First Nation people in Tasmania used dried bull kelp to transport water and food. The species name came from this use: <i>potatorum</i> means 'to drink' in Latin (Govt of SA 2023).</p>	

### Benthic Assemblages

Thurstan et al. (2018) details a number of First Nations historical references for bull kelp including:

Cultural activities and cultural history –mythology and sacred songs.

Ceremonial activities –being burned or being used during smoking ceremonies.

Medicinal use –bandages and medicinal poultice.

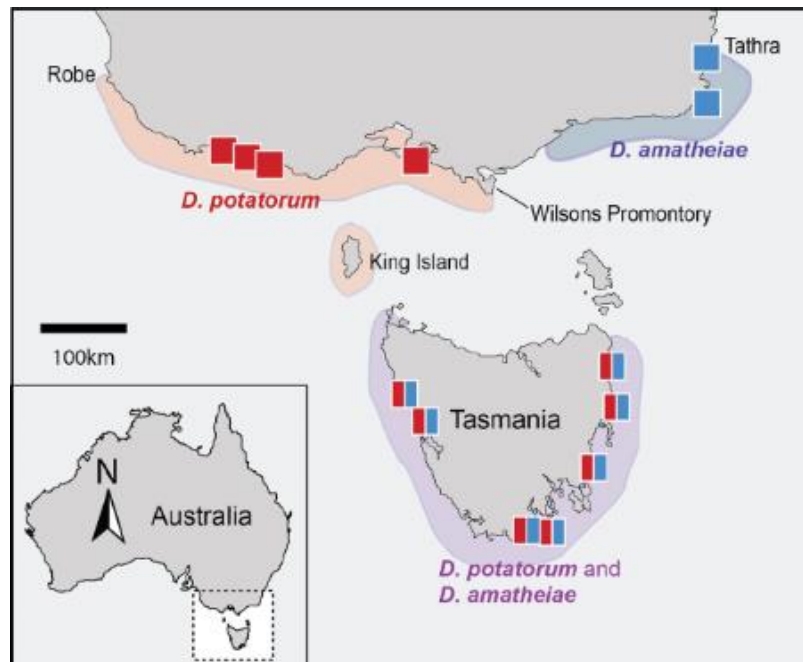

Clothing – cloaks and shoes.

Diet – raw, jelly, dried and roasted (preserving for several months).

Fishing – ropes and fishing nets / traps, traps for short-finned eels, also used to assist during diving for crayfish.

Shelter – waterproofing, wind proofing and carpeting.

Bulk kelp is also collected by the seaweed industry as described in the assessment of Commercial fishing and aquaculture.

<p><b>Benthic Assemblages</b></p> <p>Figure D4-6-1: Distribution of bull kelp off Victoria and Tasmania (Velasquez et al. 2029)</p> <p>The PMST Report (Appendix B5) for the Environmental Planning Area did not identify any Key Ecological Features with benthic habitats in water depths &gt; 10 m.</p> <p>The PMST Report (Appendix B5) for the Environmental Planning Area did identify the Giant Kelp Marine Forests of South East Australia threatened ecological community. The Giant Kelp Forests of South East Australia ecological community is defined as giant kelp growing typically at depths greater than eight metres below sea level and forming a closed or semi-closed surface or sub-surface canopy (TSSC 2012). The ecological community is characterised by a closed to semi-closed surface or subsurface canopy of <i>Macrocystis pyrifera</i> which is the only species of kelp able to provide this three-dimensional structure from the sea floor to the sea surface, so if giant kelp plants are lost or removed, the ecological community no longer exists (TSSC 2012). The giant kelp forests provide habitat for other marine flora such as seaweeds and marine fauna including fish, molluscs (sea snails), bryozoans (lace corals), polychaetes (worms), crustaceans (crabs, isopods, amphipods), echinoderms (sea urchins, seastars) and sponges (TSSC 2012). Their distribution is restricted to waters off the coast of Tasmania particularly in the Bruny, Freycinet and Davey bioregions, but also the Boags and Franklin, Flinders and Otway bioregions, the coast of South Australia in the Otway and Coorong bioregions as far west as Margaret Bock Reef and the coast of Victoria in the Otway, Flinders, Central Victoria and Twofold Shelf bioregions as far east as Gabo Island.</p>
<p><b>Predicted Level of Risk</b></p> <p>Studies of offshore benthic seaweeds in the northwest Gulf of Mexico prior to and after the Macondo well blowout at Sackett and Ewing banks (in water depths of 55–75 m) found a dramatic die-off of seaweeds after the spill (60 species pre-spill compared with 10 species post-spill) (Felder et al. 2014). Benthic decapod assemblages (crabs, lobsters, prawns) associated with the seaweeds and benthic substrate also showed a strong decline in abundance at both banks post-spill (species richness on Ewing Bank reduced by 42% and on Sackett Bank by 29%), though it is noted that these banks are exposed to influences from Mississippi River discharges that vary year to year, so definitive links to the oil spill are not possible. It is noted, however, that petroleum residues were observed on Ewing Bank, and it is possible that this may have caused localised mortalities, reduced the fecundity of surviving female decapods or reduced recruitment (Felder et al. 2014). Felder et al (2014) also notes that freshly caught soft-sediment decapod samples caught in early and mid-2011 near the spill site exhibited lesions that were severe enough to cause appendage loss and mortality.</p> <p>Water quality in benthic habitats exposed to entrained hydrocarbons would be expected to return to background conditions within weeks to months of contact. Several studies have indicated that rapid recovery rates may occur even in cases of heavy oiling (Committee on Oil in the Sea 2003).</p> <p>Studies undertaken after the Montara oil spill incident included diver surveys to assess the status of Ashmore, Cartier and Seringapatam coral reefs. These found that other than a region-wide coral bleaching event caused by thermal stress (i.e. caused by sea water exceeding 32°C), the condition of the reefs was consistent with previous surveys, suggesting that any effects of oil reaching these reefs was minor, transitory, or sub-lethal and not detectable (Heyward et al. 2010). This is despite AMSA observations of surface slicks or sheen nears these shallow reefs during the spill (Heyward et al. 2010). Surveys in 2011 indicated that the corals exhibiting bleaching in 2010 had largely survived and recovered (Heyward et al. 2012), indicating that potential exposure to hydrocarbons while in an already stressed state did not have any impact on the healthy recovery of the coral.</p> <p>Macroalgae are generally limited to growing on intertidal and subtidal hard substrata in shallow waters within the photic zone. As such, they may be exposed to subsurface and entrained and dissolved hydrocarbons, however, are susceptible to surface hydrocarbon exposure more so in intertidal habitats as opposed to subtidal habitats.</p> <p>Smothering, fouling, and asphyxiation are some of the physical effects that have been documented from oil contamination in marine plants (Blumer 1971, Cintron et al. 1981). In macroalgae, oil can act as a physical barrier for the diffusion of CO<sub>2</sub> across cell walls (O'Brian &amp; Dixon 1976). The effect of hydrocarbons, however, is largely dependent on the degree of direct exposure and how much of the hydrocarbon adheres to algae, which will vary depending on the oils physical state and relative 'stickiness'. The morphological features of macroalgae, such as the presence of a mucilage layer or the presence of fine 'hairs' will influence the amount of hydrocarbon that will adhere to the algae. A review of field studies conducted after spill events by Connell et al (1981) indicated a high degree of variability in the level of impact, but in all instances, the algae appeared to be able to recover rapidly from even very heavy oiling. The rapid recovery of algae was attributed to the fact that for most algae, new growth is produced from</p>

### **Benthic Assemblages**

near the base of the plant while the distal parts (which would be exposed to the oil contamination) are continually lost. Other studies have indicated that kelp beds oiled by crude oil had a 90% recovery within 3-4 years of impact, however full recovery to pre-spill diversity may not occur for long periods after the spill (French- McCay 2004).

Intertidal macroalgal beds are more prone to oil spills than subtidal beds because, although the mucous coating prevents oil adherence, oil that is trapped in the upper canopy can increase the persistence of the oil, which impacts upon site-attached species. Additionally, when oil sticks to dry fronds on the shore, they can become overweight and break as a result of wave action (IPIECA 2002).

The toxicity of hydrocarbons to macroalgae varies for the different macroalgal life stages, with water-soluble hydrocarbons more toxic (Van Overbeek and Blondeau 1954, Kauss et al. 1973 cited in O'Brien and Dixon, 1976). Toxic effect concentrations for hydrocarbons and algae have varied greatly among species and studies, ranging 0.002–10,000 ppm (Lewis & Pryor 2013). The sensitivity of gametes, larva and zygote stages however have all proven more responsive to petroleum oil exposure than adult growth stages (Thursby and Steele 2004, Lewis & Pryor 2013).

Macrophytes, including seagrasses and macroalgae, require light to photosynthesise. So, in addition to the potential impacts from direct smothering or exposure to entrained and dissolved hydrocarbons, the presence of entrained hydrocarbon within the water column can affect light qualities and the ability of macrophytes to photosynthesise.

Experiments verified the susceptibility of *Nereocystis luetkeana* (bull kelp – North America) tissue to the direct exposure to several petroleum types. Antrim et al (1995) showed that petroleum treatments resulted in visible tissue damage, with a distinct bleached line being the most visible indication of plant contact with the petroleum. Moderate to heavy colour loss, which was generally followed by rapid decay of tissue, was most pronounced in 24 h exposures to unweathered and weathered diesel.

The predicted level of consequence to benthic assemblages from a 250 m<sup>3</sup> MDO spill is assessed as moderate as the consequences could be longer lasting (> 30 days) if kelp and other macroalgal areas are exposure to oil above the low threshold level, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.

## 6.4 Coastal Habitats and Communities

Coastal Habitats and Communities	
<b>Sensitivity Rating</b>	<b>Medium</b>
<b>Predicted Level of Risk</b>	<b>Medium</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>The Environmental Planning Area overlaps a wide variety of shorelines along Victoria, South Australia, and King Island. Coastal habitats which have the potential to be contacted by MDO spill include sandy shorelines, rocky shorelines, and saltmarsh. Mangroves are not present along the west coast of Victoria or King Island where the Environmental Planning Area.</p> <p>Sandy and rocky shorelines are the dominant the coastal habitats within the Environmental Planning Area.</p> <p>The PMST Report (Appendix B5) for the Environmental Planning Area identified the following Threatened Ecological Communities that are present on the shoreline:</p> <ul style="list-style-type: none"> <li>• Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community.</li> <li>• Subtropical and Temperate Coastal Saltmarsh.</li> </ul> <p>The Subtropical and Temperate Coastal Saltmarsh TEC occurs in a relatively narrow strip along the Australian coast, within the boundary along 23°37' latitude along the east coast and south from Shark Bay on the west coast of WA (TSSC 2013). The community is found in coastal areas which have an intermittent or regular tidal influence.</p> <p>The coastal saltmarsh community consists mainly of salt-tolerant vegetation including grasses, herbs, sedges, rushes and shrubs. Succulent herbs, shrubs and grasses generally dominate, and vegetation is generally less than 0.5 m in height (Adam 1990). In Australia, the vascular saltmarsh flora may include many species, but is dominated by relatively few families, with a high level of endism at the species level.</p> <p>The saltmarsh community is inhabited by a wide range of infaunal and epifaunal invertebrates and low and high tide visitors such as fish, birds and prawns (Adam 1990). It is often important nursery habitat for fish and prawn species. Insects are also abundance and an important food source for other fauna. The dominant marine residents are benthic invertebrates, including molluscs and crabs (Ross et al. 2009). Saltmarsh communities are threatened by clearing and fragmentation, land reclamation, altered hydrology and tidal restriction, invasive species, climate change, mangrove encroachment, recreation, eutrophication, grazing, insect control and inappropriate fire regimes (TSSC 2013).</p> <p>The coastal saltmarsh community provides extensive ecosystem services such as the filtering of surface water, coastal productivity and the provision of food and nutrients for a wide range of adjacent marine and estuarine communities and stabilising the coastline and providing a buffer from waves and storms. Most importantly, the saltmarshes are one of the most efficient ecosystems globally in sequestering carbon, due to the biogeochemical conditions in the tidal wetlands being conducive to long-term carbon retention. A concern with the loss of saltmarsh habitat is that it could release the huge pool of stored carbon to the atmosphere.</p> <p>The Assemblages of species associated with open-coast salt-wedge estuaries of western and central KEE are an assemblage of native plants, animals and micro-organisms associated with the dynamic salt-wedge estuary systems that occur within the temperate climate, microtidal regime (&lt; 2 m), high wave energy coastline of western and central Victoria. The ecological community currently encompasses 25 estuaries in the region defined by the border between South Australia and Victoria and the most southerly point of Wilsons Promontory (DoEE 2018a).</p>	

<b>Coastal Habitats and Communities</b>
<p>Salt-wedge estuaries are usually highly stratified, with saline bottom waters forming a 'salt-wedge' below the inflowing freshwater layer of riverine waters. The dynamic nature of salt-wedge estuaries has important implications for their inherent physical and chemical parameters, and ultimately for their biological structure and ecological functioning. Some assemblages of biota are dependent on the dynamics of these salt-wedge estuaries for their existence, refuge, increased productivity and reproductive success. The ecological community is characterised by a core component of obligate estuarine taxa, with associated components of coastal, estuarine, brackish and freshwater taxa that may reside in the estuary for periods of time and/or utilise the estuary for specific purposes (e.g. reproduction, feeding, refuge, migration) (DoEE 2018a).</p>
<b>Predicted Level of Risk</b>
<p>Sandy beaches are regularly exposed to wave action and have low sediment total organic carbon and therefore generally a low abundance of marine life (Hook et al. 2016). The low concentration of total organic carbon and large particle size of sand means that any MDO deposited on the beach would not be retained. However, sandy beaches are important socio-economically, so an MDO spill reaching this type of shoreline may attract attention that is disproportionate to its sensitivity (Hook et al. 2016).</p> <p>Depth of penetration in sandy sediment is influenced by:</p> <ul style="list-style-type: none"> <li>• Particle size – penetration is great in coarser sediments (such as beach sand) compared to mud (in estuaries and tidal flats).</li> <li>• Oil viscosity – MDO quickly penetrates sandy sediments.</li> <li>• Drainage – coarse beach sands allow for rapid drainage (it may reach depths greater than one metre in coarse well-drained sediments).</li> <li>• Animal burrows and root pores – penetration into fine sediments is increased if there are burrows of animals such as worms, or pores left where plant roots have decayed.</li> </ul> <p>Areas of heavy oiling (&gt;1,000 g/m<sup>2</sup> threshold) would likely result in acute toxicity, and death, of many invertebrate communities, especially where oil penetrates sediments through animal burrows (IPIECA 1999). However, these communities would be likely to rapidly recover (recruitment from unaffected individuals and recruitment from nearby areas) as oil is removed from the environment. The results of exposure to oil may be acute (e.g., die off of amphipods and replacement by more tolerant species such as worms or chronic (i.e., gradual accumulation of oil and genetic damage) (Hook et al. 2016).</p> <p>Cracks and crevices, rock pools, overhangs and other shaded areas provide habitat for soft bodied animals such as sea anemones, sponges, and sea- squirts, and become places where hydrocarbons can become concentrated as it strands ashore. The same is true on stable boulder shores where the rich animal communities underneath the rocks are also the most vulnerable to hydrocarbon pollution.</p> <p>The vulnerability of a rocky shoreline to oiling is dependent on its topography and composition as well as its position. A vertical rock wall on a wave- exposed coast is likely to remain unoiled if an oil slick is held back by the action of the reflected waves (IPIECA-IOGP 2016). At the other extreme, a gradually sloping boulder shore in a calm backwater of a sheltered inlet can trap enormous amounts of hydrocarbons, which may penetrate deep down through the substratum. The complex patterns of water movement close to rocky coasts also tend to concentrate oil in certain areas. Some shores are well known to act as natural collection sites for litter and detached algae and oil is carried there in the same way. As on all types of shorelines, most of the oil is concentrated along the high tide mark while the lower parts are often untouched. As MDO is less sticky than other oils it is less likely to adhere to rocky shorelines and creates stains.</p> <p>Saltmarshes are considered to have a high sensitivity to hydrocarbon exposure. Saltmarsh vegetation offers a large surface area for oil absorption and tends to trap oil. Evidence from case histories and experiments shows that the damage resulting from oiling, and recovery times of oiled marsh vegetation, are very variable. In areas of light to moderate oiling where oil is mainly on perennial vegetation with little penetration of sediment, the shoots of the plants may be killed but recovery can take place from the underground systems. However, many case studies have shown good recruitment of annual species in the year following a spill (IPIECA-IOGP 2016).</p>

#### **Coastal Habitats and Communities**

Due to the exposed nature of the coastal areas within the Environmental Planning Area and the nature of MDO, long-term toxicity or smothering effects in areas of moderate MDO exposure are not expected and natural weathering should result in rapid recovery of communities. MDO shoreline loading at the high threshold is not predicted due to the low spill volume. Potential risks arising from a MDO spill on socio-economic receptors (tourism, cultural and/or other social values) are more likely to occur as a result of visual/ aesthetic impacts, rather than ecological impacts.

The predicted level of consequence to coastal habitats and communities from a 250 m<sup>3</sup> MDO spill is assessed as moderate as consequences could be longer lasting (> 30 days) if saltmarsh communities are exposure to oil above the low threshold level the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.

## 6.5 Plankton

<b>Plankton</b>	
<b>Sensitivity Rating</b>	<b>Low</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>Plankton is a key component in oceanic food chains and support nearly all marine life. Plankton is divided into two groups, namely phytoplankton (microscopic plants) and zooplankton (microscopic animals). Plankton is the dominant biomass of marine ecosystems (CSIRO 2015).</p> <p>Copepods are the most common zooplankton and are some of the most abundant animals on earth. Plankton communities are highly diverse, with members from almost all phyla. Phytoplankton are photosynthetic organisms that drift with ocean currents and are mostly microscopic; however, some gelatinous plankton can be up to 2 m in diameter. Phytoplankton is grazed by zooplankton such as small protozoa, copepods, decapods, krill and gelatinous zooplankton.</p> <p>The carrying capacity of marine ecosystems (the mass of fish resources) and recruitment of individual stocks is strongly related to plankton abundance, timing and composition. In the Environmental Planning Area, the seasonal Bonney coast upwelling is a productivity hotspot, with high densities of zooplankton and are important for fish and whales. The primary ecological importance of the Bonney coast upwelling is as a feeding area for the Pygmy Blue Whale (PBW) (<i>Balaenoptera musculus brevicauda</i>). The upwelled nutrient-rich water promotes blooms of coastal krill (<i>Nyctiphanes australis</i>), which in turn attracts PBW to the region to feed. The upwelling is one of only three identified feeding areas consistently used by PBW in Australian coastal waters (Butler et al. 2002). The upwelling occurs when strong south-easterly surface winds induce warm, nutrient-deficient surface waters away from the coastline. This leads to surface upwellings bringing cool, nutrient-rich deep waters closer to the surface where there is enough sunlight for primary production among planktonic organisms to take place (Hosack and Dambacher 2012).</p> <p>Plankton distribution from the upwelling area is dependent upon prevailing ocean currents including the Leeuwin Current, East Australia Current, flows into and from Bass Strait and Southern Ocean water masses. Populations are thought to be highly variable both spatially and temporally and are likely to comprise characteristics of tropical, southern Australian, central Bass Strait and Tasman Sea populations.</p> <p>A detailed analysis of satellite-derived ocean data (chlorophyll a levels) for the periods 1998-2000 and 2005- 2014 suggests that the western Tasmanian shelf also accommodates a productive ecosystem. Based upon the Kampf (2015) study, this region forms part of the Great South Australian Coastal Upwelling System and experiences two phytoplankton blooms per annum:</p> <p>The first and larger bloom – occurs in the late austral summer months (typically February-April) resulting from favourable winds that occur between December-April. Stronger upwelling winds do not always create phytoplankton blooms.</p> <p>The second smaller bloom – occurs in spring (October) coincident with the onset of spring bloom in the western Tasman Sea. The mechanism for this smaller bloom remains unclear.</p> <p>Kampf (2015) identifies that the accuracy of satellite data cannot be used to identify upwelling jets however would suggest the existence of upwelling jets on the western Tasmanian shelf. The significance of these jets is that they operate to disperse nutrient-rich water northwards along the shelf and possibly into western Bass Strait. This advective process would explain elevated chlorophyll a level in western Bass Strait – a typical feature of the region during austral summer months. The western Tasmanian upwelling system lies to the west of the Tasmanian mainland and at least 130 km southeast of the acquisition area.</p>	

<b>Plankton</b>
<b>Predicted Level of Risk</b>
<p>Plankton are likely to be exposed to oil within the upper 10 m of the water column in areas close to the spill source where oil concentrations are the highest.</p> <p>Phytoplankton is typically not sensitive to the impacts of oil, though they do accumulate it rapidly due to their small size and high surface area to volume ratio (Hook et al. 2016). If phytoplankton is exposed to hydrocarbons at the sea surface, this may directly affect their ability to photosynthesize via smothering and would have implications for the next trophic level in the food chain (e.g., small fish) (Hook et al. 2016). In addition, the presence of surface hydrocarbons may result in a reduction of light penetrating the water column, which may affect the rate of photosynthesis, particularly in instances where there is prolonged presence of surface hydrocarbons over an extensive area such that the phytoplankton was restricted from light exposure, in turn affecting the rate of photosynthesis and inhibiting growth, depending on the concentration range. For example, photosynthesis is stimulated by low concentrations of oil in the water column (10-30 ppb) but become progressively inhibited above 50 ppb. Conversely, photosynthesis can be stimulated below 100 ppb for exposure to weathered oil (Volkman et al. 2004).</p> <p>Zooplankton (microscopic animals such as rotifers, copepods and krill that feed on phytoplankton) are vulnerable to hydrocarbons due to their small size and high surface area to volume ratio, along with (in many cases) their high lipid content (that facilitates hydrocarbon uptake and bioaccumulation) (Hook et al. 2016). Water column organisms that come into contact with oil risk exposure through ingestion, inhalation, and dermal contact (NRDA 2012), which can cause immediate mortality or declines in egg production and hatching rates along with a decline in swimming speeds (Hook et al. 2016).</p> <p>Plankton is generally abundant in the upper layers of the water column and acts as the basis for the marine food web, meaning that a MDO spill in any one location is unlikely to have long-lasting impacts on plankton populations at a regional level. Variations in the temporal scale of oceanographic processes typical of the ecosystem have a greater influence on plankton communities than the direct effect of spilt hydrocarbons. This is because reproduction by survivors or migration from unaffected areas would be likely to rapidly replenish any losses from permanent zooplankton (Volkman et al. 2004).</p> <p>Field observations from oil spills show minimal or transient effects on marine plankton (Volkman et al. 2004). Once background water quality conditions have re-established, the plankton community will take weeks to months to recover (ITOPF 2011), allowing for seasonal influences on the assemblage characteristics.</p> <p>Thus, the predicted level of consequence to plankton from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences will be short-term (days to weeks to months), recoverable and affect a small portion of the plankton population that is widely representative of the region and would be unlikely to impede associated food chains within the region, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.</p>

## 6.6 Invertebrates

<b>Invertebrates</b>	
<b>Sensitivity Rating</b>	<b>Low</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>Studies by the Museum of Victoria found that invertebrate diversity was high in southern Australian waters although the distribution of species was patchy, with little evidence of any distinct biogeographic regions (Wilson and Poore 1987). Results of sampling in shallower inshore sediments reported high diversity and patchy distribution (Parry et al. 1990). In these areas, crustaceans, polychaetes, and molluscs were dominant.</p> <p>Throughout the region, a variety of seabed habits support a range of animal communities such as sparse sponges to extensive ‘thickets’ of lace corals and sponges, polychaete worms and filter feeders (DNP 2013). Echinoderms, such as sea stars, sea urchins and sea cucumbers are also an important fauna species of the southern Australian and Tasmanian waters, with several species at risk of extinction (DPIPWE 2020).</p> <p>Rock lobster, giant crab, scallops, abalone, and octopus are fished by commercial and recreational fishers in the Environmental Planning Area. Risks to these fisheries are assessed in the section on commercial fishing.</p>	
<b>Predicted Level of Risk</b>	
<p>The primary modes of exposure for benthic invertebrate communities for a surface oil spill are:</p> <p>Direct exposure to oil within the water column to a depth of 10 m (RPS 2019a).</p> <p>Direct exposure to oil on shoreline or within sediment within 10 m water depth.</p> <p>Indirect exposure to oil through the food web via uptake of oiled plankton, detritus, prey, etc. (NRDA 2012).</p> <p>Acute or chronic exposure, through surface contact, and/or ingestion can result in toxicological risks.</p> <p>Entrained and dissolved hydrocarbons can have negative impacts on marine invertebrates and associated larval forms. Impacts to some adult species (e.g. crustaceans) is reduced as a result of the presence of an exoskeleton, while other invertebrates with no exoskeleton and larval forms may be more prone to impacts from pelagic hydrocarbons.</p> <p>Localised impacts to larval stages may occur which could impact on population recruitment. If invertebrates are contaminated by hydrocarbons, tissue taint can remain for several months, although taint may eventually be lost. For example, it has been demonstrated that it took 2-5 months for lobsters to lose their taint when exposed to a light hydrocarbon (NOAA 2002) (see Commercial Fisheries’ assessment).</p> <p>Exposure to microscopic oil droplets may also impact aquatic biota either mechanically (especially filter feeders) or act as a conduit for exposure to semi-soluble hydrocarbons (that might be taken up by the gills or digestive tract) (McCay-French 2009). Toxicity is primarily attributed to water soluble PAHs, specifically the substituted naphthalene (C2 and C3) as the higher C-ring compounds become insoluble and are not bioavailable.</p> <p>ANZECC/ARMCANZ (2000) identifies the following 96-hr LC50 concentrations for naphthalene (a key PAH dissolved phase toxicant in crude oils):</p>	

#### Invertebrates

For the bivalve mollusc, *Katelysia opima*, a concentration of 57,000 ppb

For six species of marine crustaceans, a concentration between 850 and 5,700 ppb.

Other possible impacts from the presence of dispersed and non-dispersed oil include effects of oxygen depletion in bottom waters due to bacterial metabolism of oil (and/or dispersants), and light deprivation under surface oil (NRDA 2012).

Water quality in benthic habitats exposed to entrained hydrocarbons would be expected to return to background conditions within < 30 day. Several studies have indicated that rapid recovery rates may occur even in cases of heavy oiling (Committee on Oil in the Sea 2003).

Due to the low concentrations and physical properties of the MDO, and the exposed nature of shoreline and well- mixed nature of the waters in the Environmental Planning Area coating of invertebrates and prolonged exposure to hydrocarbons is considered highly unlikely.

Thus, the predicted level of consequence to invertebrates from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences will be short-term (days to weeks), recoverable and affect a small portion of the invertebrate population would be unlikely to impede associated food chains within the region the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.

## 6.7 Fish

<b>Fish</b>	
<b>Sensitivity Rating</b>	<b>Low</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>The PMST Report (Appendix B5) identified multiple fish species or species habitat within the Environmental Planning Area as detailed in Annex 2 of this document. None of these fish species were identified to be undertaking biologically important behaviours or have BIAs or habitat critical to the survival of the fish species.</p> <p>The Dwarf Galaxias is a freshwater species (Saddler et al. 2010) and the Yarra Pygmy Perch occurs in lakes, ponds, and slow flowing rivers (Sadler and Hammer 2010) which are outside the Environmental Planning Area.</p> <p>The Australian Grayling is a small to medium-sized, slender, silvery fish with soft-rayed fins lacking any spines. It is endemic to south-eastern Australia, including Victoria, Tasmania, and New South Wales, and is a migratory species that inhabits estuarine waters and coastal seas as larvae/juveniles, and freshwater rivers and streams as adults (Backhouse et al. 2008).</p> <p>The Blue Warehou is a medium-sized, deep-bodied fish, reaching a maximum total length of 90 cm and a maximum weight of 7 kg (TSSC 2015). Globally, the Blue Warehou is confined to Australian and New Zealand waters predominantly in coastal shelf, upper continental slope, and seamount waters offshore from New South Wales, Tasmania, Victoria and South Australia (TSSC 2015). Blue Warehou is a target species for the Tasmania Scalefish Fishery.</p> <p>The eastern population of Gemfish (Eastern Gemfish) is taken as bycatch in commercial fisheries. The largest proportion of catch of the species is taken in the South East Trawl sector of the Commonwealth Southern and Eastern Scalefish and Shark Fishery (SESSF), where it is caught primarily in deepwater trawl nets that are targeting multiple species that are found on the continental shelf. Eastern Gemfish are mesopelagic and inhabit deeper continental shelf habitats and upper slope waters from 100 m to 700 m (down to 1254 m) but are generally found in waters about 250 to 500 m deep (TSSC 2009).</p> <p>The Orange Roughy is a demersal fish targeted by the Southern and Eastern Scalefish and Shark Fishery. They are widely distributed throughout the world and forms dense spawning and feeding aggregations on or near topographic features such as seamounts, canyons, and plateaus (DCCEE 2023). No spawning or feeding aggregation areas have been identified in the Environmental Planning Area.</p> <p>Southern Bluefin Tuna can grow to 225 cm in length and 200 kg in weight (TSSC 2010). They are a highly migratory species that occurs globally in waters between 30°S and 50°S forming on single global population (TSSC 2010). In Australian waters, they range from northern Western Australia, around the southern region of the continent, to northern New South Wales (TSSC 2010). Southern Bluefin Tuna are a target species for the Southern Bluefin Tuna Fishery.</p> <p>Most of the listed marine ray-finned fish species identified in the PMST Report for the Environmental Planning Area are syngnathids, which includes seahorses and their relatives (sea dragon, pipehorse and pipefish). The majority of these species are associated with seagrass meadows, macroalgal seabed habitats, rocky reefs and sponge gardens located in shallow, inshore waters (e.g., protected coastal bays, harbours and jetties) less than 50 m deep (Fishes of Australia 2015). They are sometimes recorded in deeper offshore waters, where they depend on the protection of sponges and rafts of floating seaweed such as sargassum.</p> <p>The PMST Report (Appendix B5) identified five shark species were identified with the White Shark having foraging or feeding related behaviour and foraging and distribution BIAs as detailed in Annex 2 of this document.</p>	

<b>Fish</b>
<p>Gulpenner Sharks are targeted by the Southern and Eastern Scalefish and Shark Fishery. There are endemic to Australia in habitats on the upper-slope and are mainly demersal (bottom dwelling) between 180 m to 900 m (Williams et al. 2012) of the southern continental shelf.</p> <p>The Porbeagle occurs in waters from southern Queensland to south-west Australia (Last &amp; Stevens 2009). Animals typically occur in oceanic waters off the continental shelf, although they occasionally enter coastal waters (Francis et al. 2002). The Porbeagle is known to undertake seasonal migrations, although the timing and details of these migratory movements are not well-understood (Saunders et al. 2011). Individuals have been tracked moving large distances (i.e. 1500-1800 km along continental shelves and crossing the Atlantic Ocean between Europe and North America) (Francis et al. 2002).</p> <p>School Shark appears to have undergone a significant reduction in numbers as the result of commercial fishing in south eastern Australian waters (TSSC 2009a). School Shark is primarily a deep water demersal (bottom-dwelling) species, although individuals have been recorded undertaking daily vertical migrations, remaining at depths of around 500 m during the day and moving up to around 100 m at night (McLoughlin, 2007). Females and juveniles utilise inshore coastal areas around Victoria, Tasmania and parts of South Australia for nursery areas (Pogonoski et al., 2002).</p> <p>The Shortfin Mako is a large pelagic shark with a circum-global distribution inhabiting tropical and temperate waters. It is rarely encountered in waters with temperatures below 16°C (Last and Stevens 2009). In Australian waters, the shortfin mako has been recorded in offshore waters all around the continent's coastline except for the Arafura Sea, Gulf of Carpentaria, and Torres Strait. The species primarily occurs in offshore, oceanic waters and is pelagic (has no habitat associations with the seafloor) (Last and Stevens 2009).</p> <p>The White Shark is listed as Vulnerable. White Sharks are long-lived, living for 30 years or more (Bruce 2008), and are found throughout temperate and sub-tropical regions in the northern and southern hemispheres (Last &amp; Stephens 2009). The species is also commonly found in inshore waters in the vicinity of islands, and often near seal colonies (Malcolm et al. 2001). The foraging BIA that is within the Environmental Planning Area is centred on Lady Julia Percy Island which is a known seal breeding colony (Appendix B12 MAP-REG-EPM-057). The Environmental Planning Area also overlaps the distribution BIA that covers Australian waters from Barrow Island/Montebello Islands, WA to Yeppoon/Swains Reef, Qld.</p> <p>In addition to protected fish species, commercial fish and shark species such as mackerel, salmon, sardines, snapper, sawsharks, whiting and wrasse are likely to be present in the Environmental Planning Area.</p> <p>Short finned eels, known as Kooyang, are an important Indigenous cultural value, and may migrate through the Environmental Planning Area. The Environmental Planning Area does not overlap any freshwater or estuaries where eels spend most of their life cycle (VFA 2022) or where Indigenous eel traps are present.</p>
<b>Predicted Level of Risk</b>
<p>Fish are exposed to in-water hydrocarbon (entrained and dissolved) through a variety of pathways, including:</p> <p>Direct dermal contact such as swimming through oil or waters with elevated dissolved hydrocarbon concentrations and other constituents, with diffusion across their gills (Hook et al. 2016).</p> <p>Ingestion either directly or via food base, fish that have recently ingested contaminated prey may themselves be a source of contamination for their predators.</p> <p>Inhalation where elevated dissolved contaminant concentrations in water pass over the gills.</p> <p>Exposure to hydrocarbons entrained or dissolved in the water column can be toxic to fish. Studies have shown a range of impacts including changes in abundance, decreased size, inhibited swimming ability, changes to oxygen consumption and respiration, changes to reproduction, immune system responses, DNA damage, visible skin and organ lesions, and increased parasitism. However, many fish species can metabolise toxic hydrocarbons, which reduces the risk of bioaccumulation of contaminants in the food web and human exposure to contaminants through the consumption of seafood (NRDA 2012).</p>

Fish
<p>Sub-lethal impacts in adult fish include altered heart and respiratory rates, gill hyperplasia, enlarged liver, reduced growth, fin erosion, impaired endocrine systems, behavioural modifications and alterations in feeding, migration, reproduction, swimming, schooling, and burrowing behaviour (Kennish 1996). However, fish are highly mobile and unlikely to remain in the area of a spill for long enough to be exposed to sub-lethal doses of hydrocarbons.</p> <p>The toxicity of dissolved hydrocarbons and dispersed oil to fish species has been the subject of a number of laboratory studies (AMSA 1998). Generally, concentrations in the range of 0.1–0.4 mg/L dispersed oil have been shown to cause fish deaths in laboratory experiments (96-hour LC50). No reported studies of the impacts of oil spills on cartilaginous fish (including sharks, rays and sawfish) were found in the literature.</p> <p>The assessment of effects on fish species in the Timor Sea as a result of the Montara well blowout (a light gas condensate), conducted from November 2009 to November 2010 undertaken by Gagnon &amp; Rawson (2011), found that of the species studied (mostly Goldband Snapper <i>Pristipomoides multidens</i>, Red Emperor <i>Lutjanus sebae</i>, Rainbow Runner <i>Elegatis bipinnulata</i> and Spanish Mackerel <i>Scomberomorus commerson</i>), all 781 specimens were in good physical health at all sites. Results show that:</p> <p>Phase 1 study (November 2009, immediately after the blowout ceased) - indicated that in the short-term, fish were exposed to and metabolised petroleum hydrocarbons, however no consistent adverse effects on fish health or their reproductive activity were detected.</p> <p>Phase 2 study (March 2010, 5 months after the blowout ceased) – indicated continuing exposure to petroleum hydrocarbons, as detected by elevated liver detoxification enzymes and PAH biliary metabolites in three out of four species collected close to the spill site, and elevated oxidative DNA damage.</p> <p>Phase 3 study (November 2010, 12 months after the blowout ceased) – showed a trend towards a return to reference levels with often, but not always, comparable biomarker levels in fish collected from reference and impacted sites. This evidence of exposure to petroleum hydrocarbons at sites close to the spill location suggest an ongoing trend toward a return to normal biochemistry/physiology (Gagnon &amp; Rawson 2011).</p> <p>The main finding of the Gagnon &amp; Rawson (2011) study concluded that there were no detectable petroleum hydrocarbons found in the fish muscle samples, limited ill effects were detected in a small number of individual fish, and no consistent adverse effects of exposure on fish health could be detected within two weeks following the end of the well release. Notwithstanding, fishes from close to the Montara well, collected seven months after the discharge began, showed continuing exposure to hydrocarbons in terms of biomarker responses. Two years after the discharge, biomarker levels in fishes had mostly returned to reference levels, except for liver size. However, this was potentially attributed to local nutrient enrichment, or to past exposure to hydrocarbons. Fishes near Heyward Shoal, approximately 100 km southwest of the Montara well, had elevated biomarker responses indicating exposure to hydrocarbons, but were collected close to the Cornea natural hydrocarbon seep. Studies on the Montara discharge have shown recovery in terms of the abundance and composition of fishes, and toxicological and physiological responses of fishes.</p> <p>No reports of oil spills in open waters have been reported to cause fish kills (though mortality in aquaculture pens has), which is likely to be because vertebrates can rapidly metabolise and excrete hydrocarbons (Hook et al. 2016).</p> <p>Recovery of fish assemblages depends on the intensity and duration of an unplanned discharge, the composition of the discharge and whether dispersants are used, as each of these factors influences the level of exposure to potential toxicants. Recovery would also depend on the life cycle attributes of fishes. Species that are abundant, short-lived and highly fecund may recover rapidly. However less abundant, long-lived species may take longer to recover. The range of movement of fishes will also influence recovery. The nature of the receiving environment would influence the level of impact on fishes.</p> <p>None of the conservation advices or recovery plans for fish or sharks identify oil spill as a threat. The syngnathid species are most likely to be present in the top 10 m of the water column where oil may be present. The other fish and shark species are either demersal species (bottom dwelling) or pelagic species which swim large distances and hence these species are unlikely to be affected by oil from a diesel spill. Impacts to syngnathid species are more likely close to the spill location which oil concentrations would be highest, however as there are no reef or seagrass areas in the Operational Areas it is unlikely, they would be present in significant numbers.</p>

**Fish**

Thus, the predicted level of consequence to fish from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences will be short-term (days to weeks), recoverable and affect a small portion of the fish population would be unlikely to impede associated food chains within the region, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.

## 6.8 Birds

Birds	
Sensitivity Rating	Medium– seabirds
	High - aquatic birds, shorebirds
Predicted Level of Risk	Low – seabirds, aquatic birds
	Medium - shorebirds
Environmental Planning Area Existing Environment	
<p>The PMST Report (Appendix B5) identified multiple bird species or species habitat within the Environmental Planning Area as detailed in Annex 2 of this document. Several of these bird species were identified to be undertaking biologically important behaviours and/or have BIAs within the Environmental Planning Area. No habitat critical to the survival of the bird species were identified within the Environmental Planning Area.</p> <p>The orange-bellied parrot, which is critically endangered is known to migrate through the Environmental Planning Area, however, it does not land at sea or use coastal areas as habitat so impacts to this species are not predicted.</p> <p>A number of albatross and two petrel species were identified as foraging behaviour known or likely within the Environmental Planning Area as detailed in Annex 2 of this document. Of these the following have foraging BIAs:</p> <p>Antipodean Albatross (Appendix B12 MAP-REG-EPM-059)</p> <p>Black-browed Albatross (Appendix B12 MAP-REG-EPM-060)</p> <p>Buller's Albatross (Appendix B12 MAP-REG-EPM-071)</p> <p>Campbell Albatross (Appendix B12 MAP-REG-EPM-061)</p> <p>Indian Yellow-nosed Albatross (Appendix B12 MAP-REG-EPM-063)</p> <p>Shy Albatross (Appendix B12 MAP-REG-EPM-066)</p> <p>Wandering Albatross (Appendix B12 MAP-REG-EPM-072)</p> <p>Common Diving Petrel (Appendix B12 MAP-REG-EPM-062)</p> <p>White-face Storm Petrel (Appendix B12 MAP-REG-EPM-075)</p> <p>These BIAs cover either most or all the South-east Marine Region (CoA 2015a).</p> <p>In addition, the Common Diving Petrel has a breeding BIA on Lady Julia Percy Island which is within the Environmental Planning Area (Appendix B12 MAP-REG-EPM-062).</p>	

Birds
<p>Albatrosses and petrels are among the most oceanic of all seabirds, and seldom come to land unless breeding (CoA 2022). Albatross and petrel species exhibit a broad range of diets and foraging behaviours, and hence at-sea distributions are diverse. Combined with their ability to cover vast oceanic distances, all waters within Australian jurisdiction can be considered foraging habitat, however the most critical foraging habitat is those waters south of 25° where many species spend the majority of their foraging time (CoA 2022).</p> <p>Albatrosses have a widespread distribution throughout the southern hemisphere. They feed mainly on cephalopods, fish, and crustaceans, using surface feeding or plunge diving to seize their prey (ACAP 2020). Albatrosses are colonial, usually nesting on isolated islands and foraging across oceans in the winter months with most observations along the edge of the continental shelf (CoA 2022).</p> <p>Petrels are oceanic and have a widespread distribution throughout the southern hemisphere. They are colonial and breed on sub-Antarctic and Antarctic islands in a circumpolar band generally between 40°S and 60°S. Petrel species feed on small fish, cephalopods (octopus, squid, and cuttlefish) and crustaceans along the edge of the continental shelf and open waters (CoA 2022).</p> <p>Within the Environmental Planning Area Little Penguin breeding and foraging BIAs occur at Black Pyramid, Christmas Island and Councillor Island in Tasmanian waters (Appendix B12 MAP-REG-EPM-064). A small breeding colony also occurs at Middle Island off Victoria. Breeding typically occurs from September to February, but some birds reside at the colony all year round. The Bass Strait supports approximately 60% of the known breeding population, with additional breeding BIAs outside of the Environmental Planning Area located at Albatross Island (Tasmania), Egg Island (Tasmania), Hunter Island (Tasmania), Phillip Island (Victoria), Sisters Island (Tasmania) and Three Hummock Island (Tasmania).</p> <p>The Little Tern and Short-tailed Shearwater (migratory marine birds) were identified as breeding known to occur in the Environmental Planning Area with a proportion of the Short-tailed Shearwater breeding and foraging BIAs overlapping the Environmental Planning Area (Appendix B12 MAP-REG-EPM-065). Birds are typically present between September to May. The Environmental Planning Area also overlap breeding and foraging BIAs for the Wedge-tailed Shearwater (Appendix B12 MAP-REG-EPM-067) that covers an area 160 km from Mutton bird Island where birds may be present between August and May.</p> <p>The Black-faced Cormorant has two foraging/breeding BIAs within the Environmental Planning Area, at Christmas Island and Councillor Island just off King Island (Appendix B12 MAP-REG-EPM-074). Breeding usually occurs on rocky islands, but also on stacks, slopes, and sea cliffs in colonies of up to 2,500 individuals (del Hoyo et al. 1992). It feeds in coastal waters, sometimes in sheltered places such as bays and islets and can be found entering rivers along the coast (CoA. 2020a).</p> <p>The Australasian Gannet was identified as having a foraging BIA within the Environmental Planning Area (Appendix B12 MAP-REG-EPM-073). The Australasian Gannet generally feeds over the continental shelf or inshore waters. Their diet is comprised mainly of pelagic fish, but also squid and garfish. Prey is caught mainly by plunge-diving, but it is also seen regularly attending trawlers (CoA 2015a).</p> <p>Several shorebirds were identified from the PMST Report as being present in the Environmental Planning Area with the threatened species, Great Knot and Lesser Sand Plover identified as roosting in the area. No BIAs for shorebirds were identified. Other threatened shorebirds that are known to occur within the Environmental Planning Area are the Curlew Sandpiper, Eastern Curlew, Greater Sand Plover, Red Knot. These species are commonly found on coastal shores including beaches and rocky shores and either feed at low tide on worms, crustaceans and molluscs or fish species or feed on aquatic biota. Many of the wader species are migratory travelling from the Northern Hemisphere in non-breeding months. Most inhabit intertidal mudflats, rocky islets, sand beaches, mangroves, rocky coastline and coral reefs. Roosting occurs in similar habitats and species are found feeding on fish, crustaceans, aquatic insects, as well as plants and seeds (Higgins &amp; Davies 1996).</p> <p>Important coastal habitat where shorebirds are likely to be present within the Environmental Planning Area and have a marine interface are wetlands and shorelines. Impacts to these areas are assessed in the respective sections.</p> <p>The King Island Important Bird Area (IBA) is within the Environmental Planning Area. Birdlife International (2008) detail the following regarding the IBA. The IBA includes the entire coastline of King Island, which supports significant numbers of Hooded Plovers; Lavinia State Reserve, which supports the critically endangered Orange-bellied</p>

<b>Birds</b>
<p>Parrot and endemic subspecies of bush birds; and three inshore islands which support large numbers of nesting seabirds. These islands are Christmas Island (a 63 ha Nature Reserve), New Year Island (a 98 ha Game Reserve, on which harvesting of shearwaters is allowed) and Councillor Island (11 ha of Crown Land). The coastline is a mixture of rocky outcrops and long sandy beaches with beach-washed kelp. The IBA is defined as the coastal strip extending from the low water mark to 1 km inland of the high-water mark around the entire island; this is intended to capture most significant habitat for shorebirds and Orange-bellied Parrots.</p> <p>Two other IBAs within the Environmental Planning Area are Lawrence Rocks Wildlife Reserve, which consists of two rocky islets off the coast from Portland with a resident Australasian Gannett population, and the Discovery Bay Coast through to Picaninnie Ponds in South Australia with resident populations of Australasian Bittern, Hooded Plover, Rufous Bristlebird and Striated Fieldwren, and non-breeding Orange-bellied Parrot (Parks Victoria 2015).</p>
<b>Predicted Level of Risk</b>
<p>Seabirds, shorebirds, and aquatic birds are sensitive to the impacts of oiling, with their vulnerability arising from the fact that they cross the air-water interface to feed, while their shoreline habitats may also be oiled (Hook et al. 2016). Species that raft together in large flocks on the sea surface are particularly at risk (ITOPF 2011).</p> <p>Toxic effects of hydrocarbons on birds may result where the oil is ingested as the bird attempts to preen its feathers, and the preening process may spread the oil over otherwise clean areas of the body (ITOPF 2011). Whether this toxicity ultimately results in mortality will depend on the amount of hydrocarbons consumed and other factors relating to the health and sensitivity of the bird. Birds that are coated in oil also suffer from damage to external tissues including skin and eyes, as well as internal tissue irritation in their lungs and stomachs. Breeding seabirds may be directly exposed to oil via a number of potential pathways. Any direct impact of oil on terrestrial habitats has the potential to contaminate birds present at the breeding sites (Clarke 2010). Bird eggs may also be damaged if an oiled adult sits on the nest. Fresh crude was shown to be more toxic than weathered crude, which had a medial lethal dose of 21.3 mg/egg (Clarke 2010). Studies of contamination of duck eggs by small quantities of crude oil, mimicking the effect of oil transfer by parent birds, have been shown to result in mortality of developing embryos. Engelhardt (1983), Clark (1984), Geraci &amp; St Aubin (1988) and Jenssen (1994) indicated that the threshold thickness of oil that could impart a lethal dose to some intersecting wildlife individual is 10 <math>\mu\text{m}</math> (<math>\sim 10 \text{ g/m}^2</math>). Scholten et al (1996) indicates that a layer 25 <math>\mu\text{m}</math> thick would be harmful for most birds that contact the slick.</p> <p><i>Seabirds</i></p> <p>Birds foraging at sea have the potential to directly interact with oil on the sea surface some considerable distance from breeding sites in the course of normal foraging activities. Species most at risk include those that readily rest on the sea surface such as shearwaters and surface plunging species such as terns and boobies. As seabirds are top order predators, any impact on other marine life (e.g., pelagic fish) may disrupt and limit food supply both for the maintenance of adults and the provisioning of young.</p> <p>In the case of seabirds, direct contact with hydrocarbons is likely to foul plumage, which may result in hypothermia due to a reduction in the ability of the bird to thermo-regulate and impair waterproofing (ITOPF 2011). A bird suffering from cold, exhaustion and a loss of buoyancy resulting from fouling of plumage may dehydrate, drown, or starve (ITOPF 2011, DSEWPC 2011). It may also result in impaired navigation and flight performance (Hook et al. 2016). Increased heat loss as a result of a loss of water-proofing results in an increased metabolism of food reserves in the body, which is not countered by a corresponding increase in food intake and may lead to emaciation (DSEWPC 2011). The greatest vulnerability in this case occurs when birds are feeding or resting at the sea surface (Peakall et al. 1987). In a review of 45 marine hydrocarbon spills, there was no correlation between the numbers of bird deaths and the volume of the spill (Burger 1993).</p> <p>Most of the seabird species that are likely to occur in the Environmental Planning Area forage over an extensive area and are distributed over a wide geographic range. Seabirds plunge diving through the sea surface for prey are most likely to encounter the low concentration of hydrocarbons due to its broader extent than moderate and high concentrations. Seabirds rafting, resting, diving or feeding at sea have the potential to come into contact with oil. However, the low threshold level of exposure is not expected to result in the lethal impacts or feather matting and hypothermia. However, contact at the high threshold is expected to impart toxicity and ecological impacts. Though, oil at high thresholds is only predicted within a small area around the spill location and for a short duration (days).</p>

Birds
<p>The extensive ocean foraging habitat available to species such as albatrosses, petrels, shearwaters and terns and the small area and temporary nature of the hydrocarbon release on the sea surface (~ 24 hours) makes it unlikely that a spill will limit their ability to forage for unaffected prey, nor will the unlikely event of exposure at the sea surface result in permanent injury or mortality. The area where dissolved hydrocarbons would exceed the moderate threshold or entrained hydrocarbons exceed the high threshold during an MDO spill would be relatively small in comparison to the Bass Strait and Otway region where seabirds forage. It is these small areas where sub-lethal or toxic effects to birds may occur. There is a low probability that seabirds would be feeding exclusively or predominantly on fish found in areas of higher hydrocarbon thresholds, thus there is low probability of seabirds experiencing sub-lethal or toxic impacts as a result of consuming hydrocarbon-tainted fish.</p> <p>Seabird interactions with shorelines is expected to be largely during periods of rest and breeding activities. Most seabirds are oceanic and seldom come to land unless breeding in areas associated with burrows on sloping ground in coastal forest, scrubland, shrubland or grassland. As detailed in the assessment of coastal habitats and communities due to the exposed nature of the coastal areas within the Environmental Planning Area and the nature of MDO, long-term toxicity or smothering effects in areas of moderate or high MDO are not expected.</p> <p>The predicted level of consequence to seabirds from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences are unlikely to occur at thresholds levels where oiling of birds or tainting of food would occur, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.</p> <p><i>Shorebirds</i></p> <p>Shorebirds are likely to be exposed to oil when it directly impacts their intertidal feeding habitat. Shorebird species foraging for invertebrates on exposed sand and mud flats at lower tides will be at potential risk of both direct impacts through contamination of individual birds (ingestion or soiling of feathers) and indirect impacts through the contamination of foraging areas that may result in a reduction in available prey items (Clarke 2010).</p> <p>Shorebird species (e.g., plovers, godwits, curlews, etc.) prefer varying habitats including tidal flats, open saltmarsh, freshwater wetlands, open grasslands and sandy beaches. These habitats on the Victorian coastline inshore of the Operational Area could be exposed to moderate or high threshold shoreline oil due that has not yet evaporated or entrained. Exposure to moderate or high threshold shoreline oil at King Island and the King Island IBA is less likely due to the distance from the Operational Area.</p> <p>Due to the proximity to the Victorian coastline, the predicted level of consequence to shorebirds from a 250 m<sup>3</sup> MDO spill is assessed as moderate as consequences could be longer lasting (&gt; 30 days) if shorebirds are exposure to oil above low threshold, though if consequences occurred, they are likely to only affect a small portion of the shorebird population due to the low volume of oil that would come onshore, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.</p> <p><i>Aquatic birds</i></p> <p>Penguins may be especially vulnerable to oil because they spend a high portion of their time in the water and readily lose insulation and buoyancy if their feathers are oiled (Hook et al. 2016). The Iron Baron vessel spill (325 tonnes of bunker fuel in Tasmania in 1995) is estimated to have resulted in the death of up to 20,000 penguins (Hook et al. 2016).</p> <p>As characteristic of aquatic birds, Little Penguins forage while swimming and often forage for extended periods of time (dawn to dusk) and may forage up to 50 km from the colony. As such Little Penguins are most at risk of direct contact, ingestion or inhalation while feeding at sea. Little Penguins are most likely to encounter the low concentration of hydrocarbons due to its broader extent than moderate and high concentrations. However, the low threshold level of exposure is not expected to result in the lethal impacts of feather matting and hypothermia. The high threshold is expected to impart toxicity and ecological impacts. Given the offshore location of the spill volume, the small area of exposure and temporary nature of the hydrocarbon release on the sea surface (~ 24 hrs) it is unlikely that a spill would limit Little Penguins ability to forage for unaffected prey, nor will the unlikely event of exposure at the sea surface result in permanent injury or mortality.</p>

**Birds**

The area of exposure to dissolved hydrocarbons above the moderate threshold and entrained hydrocarbons above the high threshold during an MDO spill are relatively small in comparison to the Bass Strait and Otway region. It is these small areas where sub-lethal or toxic effects may occur. There is a low probability that Little Penguins would be feeding exclusively or predominantly on fish found in areas of higher hydrocarbon thresholds, thus there is low probability of Little Penguins experiencing sub-lethal or toxic impacts as a result of consuming hydrocarbon-tainted fish. The Little Penguin foraging/breeding BIAs on Black Pyramid Island off Tasmania and Christmas Island and Councillor Island off King Island are unlikely to be exposed to oil above the low threshold due to the distance from the Operational Area and low volume of MDO that could be spilt.

The predicted level of consequence to aquatic birds (Little Penguins) from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences are unlikely to occur at thresholds levels where oiling of birds, next or tainting of food would occur, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low

## 6.9 Marine Reptiles

<b>Marine Reptiles</b>	
<b>Sensitivity Rating</b>	<b>Medium</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>The PMST Report (Appendix B5) identified three turtle species within the Environmental Planning Area, green, leatherback and loggerhead turtle. No BIAs or habitat critical to the survival of the species were identified. The PMST Report also identified foraging, feeding or related behaviour known to occur within area for the leatherback and loggerhead turtle as detailed in Annex 2 of this document.</p> <p>Green turtles' nest, forage and migrate across tropical northern Australia. Green turtles spend their first 5-10 years drifting on ocean currents. Green turtles are predominantly found in Australian waters off the Northern Territory, Queensland, and Western Australian coastlines, with limited numbers in NSW, Victoria, and South Australia (DoEE 2017).</p> <p>Small numbers of leatherback turtles' nest on the Cobourg Peninsula (NT) and there are unconfirmed accounts of leatherback turtles nesting in Western Australia. Leatherback turtles are more commonly found foraging in Australian waters along the east coast and in Bass Strait. The southern waters of Australia are one of five identified foraging sites (where area restricted behaviour occurs) for Leatherback turtles (DoEE 2017).</p> <p>There are two genetically distinct stocks of loggerhead turtles nesting in Australia, one in Queensland (known as the south-west Pacific stock) and one in Western Australia. Loggerhead turtles forage in all coastal states and the Northern Territory, but are uncommon in South Australia, Victoria, and Tasmania (DoEE 2017).</p>	
<b>Predicted Level of Risk</b>	
<p>The Recovery Plan for Marine Turtles (DoEE 2017) identifies oil spill as a threat detailing that there is well documented evidence of the detrimental effects from encountering oil either via external contact, ingestion, or inhalation, resulting in breathing, sight or gastro-intestinal injuries.</p> <p>Sea turtles are vulnerable to the effects of oil at all life stages—eggs, post-hatchlings, juveniles, and adults in nearshore waters. Several aspects of sea turtle biology and behaviour place them at particular risk, including a lack of avoidance behaviour, indiscriminate feeding in convergence zones, and large pre-dive inhalations. Effects of oil on turtles include increased egg mortality and developmental defects, direct mortality due to oiling in hatchlings, juveniles and adults, and negative impacts to the skin, blood, digestive and immune systems and salt glands. Oil exposure affects different turtle life stages in different ways. Thus, information on oil toxicity needs to be organised by life stage. Turtles may be exposed to chemicals in oil in two ways:</p> <p>Internally – eating or swallowing oil, consuming prey containing oil-based chemicals, or inhaling of volatile oil related compounds; and</p> <p>Externally – swimming in oil or dispersants, or oil or dispersants on skin and body.</p> <p>Records of oiled wildlife during spills rarely include marine turtles, even from areas where they are known to be relatively abundant (Short 2011). An exception to this was the large number of marine turtles collected (613 dead and 536 live) during the Macondo spill in the Gulf of Mexico, although many of these animals did not show any sign of oil exposure (NOAA 2013). Of the dead turtles found, 3.4% were visibly oiled and 85% of the live turtles found were oiled (NOAA 2013). Of the captured animals, 88% of the live turtles were later released, suggesting that oiling does not inevitably lead to mortality.</p>	

### Marine Reptiles

There is potential for contamination of turtle eggs to result in similar toxic impacts to developing embryos as has been observed in birds. Studies on freshwater snapping turtles showed uptake of PAHs from contaminated nest sediments, but no impacts on hatching success or juvenile health following exposure of eggs to dispersed weathered light crude (Rowe et al. 2009). However, other studies found evidence that exposure of freshwater turtle embryos to PAHs results in deformities (Bell et al. 2006, Van Meter et al. 2006).

Turtles may experience oiling impacts on nesting beaches and eggs through chemical exposure, resulting in decreased survival to hatching and developmental defects in hatchlings. Turtle hatchlings may be more vulnerable to smothering as they emerge from the nests and make their way over the intertidal area to the open water (AMSA 1998). Hatchlings that contact oil residues while crossing a beach can exhibit a range of effects including impaired movement and bodily functions (Shigenaka 2003). Hatchlings sticky with oily residues may also have more difficulty crawling and swimming, rendering them more vulnerable to predation.

Ingested oil may cause harm to the internal organs of turtles. Oil covering their bodies may interfere with breathing because they inhale large volumes of air to dive. Oil can enter cavities such as the eyes, nostrils, or mouth. Turtles may experience oiling impacts on nesting beaches when they come ashore to lay their eggs, and their eggs may be exposed during incubation, potentially resulting in increased egg mortality and/or possibly developmental defects in hatchlings.

There are no turtle nesting sites within the Environmental Planning Area thus impacts to turtling eggs, post-hatchlings and juveniles are not predicted.

Turtle interaction with surface oil is likely to include direct contact due to resting behaviours floating on the sea surface and through inhalation of volatile compounds in the vicinity of unweathered MDO. At moderate and high concentrations, toxicity impacts may occur including sub-lethal irritation of skin or cavities. However, due to the absence of turtle BIAs and nesting locations in the Environmental Planning Area. As low numbers of turtles forage or migrate through the Otway area, individual marine reptiles may come into contact with hydrocarbons on the sea surface or within the water column. This is most likely to be at the low threshold levels as exposure levels above the low thresholds would be within a small area of the spill location for a short period of time (~24 hours).

Thus, the predicted level of consequence to marine turtles from a 250 m<sup>3</sup> MDO spill is assessed as minor as consequences will be short-term (days to weeks), recoverable and affect a small portion of the marine turtle population the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.

## 6.10 Marine Mammals

Marine Mammals	
Sensitivity Rating	Medium
Predicted Level of Risk	Medium
Environmental Planning Area Existing Environment	
<p>The PMST Report for the Environmental Planning Area (Appendix B5) identified the following for marine mammals:</p> <p>Three species (Blue, Fin and Sei whales) with foraging, feeding or related behaviour known to occur within area.</p> <p>Pygmy blue whale foraging (annual high use area) BIA and known foraging area BIA.</p> <p>Southern Right Whale breeding known to occur within area.</p> <p>Australian Fur-seal breeding known to occur within area.</p> <p>New Zealand Fur-seal and Australian Sea-lion may occur in the area.</p> <p>Six dolphin species likely or may occur in the area.</p> <p>23 whale species likely or may occur in the area.</p> <p>In addition, the Environmental Planning Area overlaps the Southern Right Whale BIAs for reproduction and migration.</p> <p>More information is provided on those species undertaking biologically important behaviour within the Environmental Planning Area.</p> <p>Australian Fur-seal</p> <p>Australian fur-seals (<i>Arctocephalus pusillus</i>) breed on islands of the Bass Strait but range throughout waters off the coasts of South Australia, Tasmania, Victoria and NSW. Numbers of this species are believed to be increasing as the population recovers from historic hunting (Hofmeyr et al. 2008). The species is endemic to south-eastern Australian waters.</p> <p>In Victorian waters they breed on offshore islands, including Lady Julia Percy Island, Seal Rocks in Westernport Bay, Kanowna and Rag Islands off the coast of Wilson's Promontory and The Skerries off Wingan Inlet in Gippsland. In Tasmanian waters they breed on Reid Rocks. There are important breeding sites on Lady Julia Percy Island and Seal Rocks, with 25% of the population occurring at each of these islands. Their preferred breeding habitat is a rocky island with boulder or pebble beaches and gradually sloping rocky ledges.</p> <p>Haul out sites with occasional pup births are located at Cape Bridgewater, at Moonlight Head, on various small islands off Wilsons Promontory and Marengo Reef near Apollo Bay. Australian fur-seals are present in the region all year, with breeding taking place during November and December.</p> <p>Research being undertaken at Lady Julia Percy Island indicates that adult females feed extensively in the waters between Portland and Cape Otway, out to the 200 m bathymetric contour. Seal numbers on the island reach a maximum during the breeding season in late October to late December. By early December, large numbers of lactating females are leaving for short feeding trips at sea and in late December there is an exodus of adult males. Thereafter, lactating females continue to alternate between feeding trips at sea and periods ashore to suckle their pups. Even after pups begin to venture to sea, the island remains a focus, and at any time during the year groups may be seen ashore resting (Robinson et al. 2008, Hume et al. 2004, Arnould &amp; Kirkwood 2007).</p> <p>Lady Julia Percy Island and Reid Rocks are within the Environmental Planning Area as is the haul out area at Cape Bridgewater.</p>	

Marine Mammals
<p><b>Blue whale</b></p> <p>The Blue Whale (<i>Balaenoptera musculus</i>) is listed as an endangered species under the EPBC Act. There are two subspecies of blue whales that use Australian waters (including Australian Antarctic waters), the Pygmy Blue Whale (<i>B. m. brevicauda</i>) and the Antarctic Blue Whale (<i>B. m. intermedia</i>). The Otway region, where the Operational Area is located, is an important migratory and foraging area for Blue Whales, as shown by passive acoustic monitoring and aerial surveys (Gavrilov 2012, McCauley et al. 2018, Gill et al. 2011). Underwater acoustic monitoring programs have detected Antarctic and Pygmy Blue Whale calls in the Otway Region (McCauley et al. 2018).</p> <p>Important foraging grounds for Blue Whales include the Great Australian Bight, South Australia, and off Portland Victoria. Research to date has found that Pygmy Blue Whales occupy the western area of the Bonney Upwelling system in the Eastern Great Australian Bight and adjacent to the Kangaroo Island canyons from November and December (DoE 2015e). Pygmy Blue Whales then move south-east to the Bonney Upwelling system off eastern South Australia and Victoria (e.g., between Robe, SA and Cape Otway, Vic). This occurs predominately between January to April (DoE 2015).</p> <p>The Blue Whale was extremely abundant until the early 20th century when they were hunted to near extinction. Approximately 341,830 Blue Whale takes were recorded by commercial whaling in the Antarctic and sub-Antarctic in the 20th century, of which 12,618 were identified as Pygmy Blue Whales (Branch et al. 2004). The current global population of Blue Whales is uncertain but is plausibly in the range of 10,000 to 25,000, corresponding to about 3-11% of the 1911 estimated population size (Reilly et al. 2008).</p> <p>The Environmental Planning Area is within the foraging (annual high use) and known foraging area BIA where blue whales predominately occur between January to April (DoE 2015) (Appendix B12 MAP-REG-EPM-068).</p> <p><b>Fin whale</b></p> <p>The Fin Whale is a cosmopolitan migratory species that is listed as vulnerable and occurs from polar to tropical waters but is rarely sighted in inshore waters. Fin Whales show well defined migratory movements between polar, temperate and tropical waters which are essentially north-south with little longitudinal dispersion.</p> <p>While Australian Antarctic waters are important feeding grounds for Fin Whales, the species also feeds in the Bonney Upwelling during summer/autumn sometimes in the company of Blue and Sei Whales (DCCEEW 2023b). Areas of upwelling and interfaces with mixed and stratified waters may be an important feature of Fin Whale feeding habitat with the species feeding on planktonic crustacea, krill, some fish, and cephalopods (DCCEEW 2023b). Fin Whales frequently lunge or skim feed at or near the surface and they are known to dive to 230 m to feed.</p> <p>There are no BIAs for the Fin Whale within Australian waters. Fin Whales are likely to be foraging in the Environmental Planning Area at similar time as Blue Whales, predominately occur between January to April.</p> <p><b>Sei Whale</b></p> <p>The Sei Whale is listed as vulnerable under the EPBC Act. Sei Whales are considered a cosmopolitan species, ranging from polar to tropical waters, but tend to be found more offshore than other species of large whales. Sei Whales move between Australian waters and Antarctic feeding areas; subantarctic feeding areas (e.g. Subtropical Front); and tropical and subtropical breeding areas. The proportion of the global population in Australian waters is unknown as there are no estimates for Sei Whales in Australian waters.</p> <p>In Australia, Sei Whales occur within Australian Antarctic Territory waters and Commonwealth waters, and have been infrequently recorded off Tasmania, NSW, Queensland, the Great Australian Bight, Northern Territory and Western Australia (Parker 1978, Bannister et al. 1996, Thiele et al. 2000, Chatto and Warneke 2000, Bannister 2008).</p> <p>Sightings of Sei Whales within Australian waters includes areas such as the Bonney coast upwelling off South Australia (Miller et al. 2012), where opportunistic feeding has been observed between November and May (Gill et al. 2015).</p>

Marine Mammals
<p>There are no BIAs for the Sei Whale within Australian waters. Sei Whales are likely to be foraging in the Environmental Planning Area at similar time as Blue Whales, predominately occur between January to April.</p> <p>Southern Right Whale</p> <p>The Southern Right Whale (<i>Eubalaena australis</i>) is listed as endangered under the EPBC Act. Southern Right Whales were depleted to less than 300 individuals globally due to commercial whaling in the 19th and 20th centuries (Tormosov et al. 1998). They were protected from whaling in 1935 however, due to illegal whaling in the 1970s and because Southern Right Whales have a slow rate of increase (7% per annum) compared to other marine mammals, their numbers remain low (IWC 2013). Global abundance estimates are 13,000 for the species, across key wintering grounds in South Africa, Argentina, Australia, and New Zealand.</p> <p>Southern Right Whales are distributed in the Southern Hemisphere with a circumpolar distribution between latitudes of 16°S and at least 65°S. They migrate from southern feeding grounds in sub-Antarctic waters to Australia in between May and November to calve, mate and rest (Bannister et al. 1996, DCCEE 2022). They are distributed across thirteen primary aggregation areas along the southern coast of Australia. In Australian coastal waters, they occur along the southern coastline of the mainland and Tasmania and generally extend as far north as Sydney on the east coast and Perth on the west coast (CoA 2012). There are occasional sightings further north, with the extremities of their range recorded at Hervey Bay and Exmouth (CoA 2012).</p> <p>The peak period for Southern Right Whale mating is from mid-July through to August (CoA 2012). Pregnant females generally arrive during late May/early June and depart with calves in September to October however the general time of arrivals and departures varies on an inter-annual basis. Calving females are known to have high site fidelity and a 3 to 4-year calving interval. Other population classes stay for shorter and variable periods undertaking coastal movements and departing the coast earlier than female-calf pairs (CoA 2012).</p> <p>The Environmental Planning Area overlaps the Southern Right Whale reproduction and migration BIAs (Appendix B12 MAP-REG-EPM-069).</p>
<b>Predicted Level of Risk</b>
<p>Marine mammals may be exposed to the chemicals in oil through:</p> <ul style="list-style-type: none"> <li>• Internal exposure by consuming oil or contaminated prey.</li> <li>• Inhaling volatile oil compounds when surfacing to breathe.</li> <li>• Dermal contact, by swimming in oil and having oil directly on the skin and body (NRDA 2012, Hook et al. 2016).</li> </ul> <p>The effects of this exposure include:</p> <ul style="list-style-type: none"> <li>• Maternal transfer of contaminants to embryos.</li> <li>• Hypothermia due to conductance changes in skin, resulting in metabolic shock (expected to be more problematic for non-cetaceans in colder waters).</li> <li>• Toxic effects and secondary organ dysfunction due to ingestion of oil.</li> <li>• Congested lungs.</li> <li>• Damaged airways.</li> <li>• Interstitial emphysema due to inhalation of oil droplets and vapour.</li> <li>• Gastrointestinal ulceration and haemorrhaging due to ingestion of oil during grooming and feeding.</li> <li>• Eye and skin lesions from continuous exposure to oil.</li> </ul>

Marine Mammals
<ul style="list-style-type: none"> <li>Decreased body mass due to restricted diet.</li> <li>Stress due to oil exposure and behavioural changes.</li> </ul> <p>Whales and Dolphins</p> <p>French-McCay (2009) identifies that a 10–25 µm oil thickness threshold has the potential to impart a lethal dose on marine species, however, they also estimate a probability of 0.1% mortality to cetaceans if they encounter these thresholds based on the proportion of the time spent at surface. Direct surface oil contact with hydrocarbons is considered to have little deleterious effect on whales, possibly due to the skin's effectiveness as a barrier to toxicity, as such effect of oil on cetacean skin is probably minor and temporary (Geraci &amp; St Aubin 1988). Cetaceans in particular have mostly smooth skins with limited areas of pelage (hair covered skin) or rough surfaces such as barnacled skin. Oil tends to adhere to rough surfaces, hair, or calluses of animals, so contact with hydrocarbons by cetaceans is expected to cause only minor hydrocarbon adherence.</p> <p>The physical impacts from ingested hydrocarbon with subsequent lethal or sub-lethal impacts are both applicable to entrained oil. However, the susceptibility of cetaceans varies with feeding habits. Baleen whales (such as blue, fin, humpback and sei whales) are not particularly susceptible to ingestion of oil in the water column but are susceptible to oil at the sea surface as they feed by skimming the surface. Oil may stick to the baleen while they 'filter feed' near slicks. Sticky, tar-like residues are particularly likely to foul the baleen plates.</p> <p>The inhalation of oil droplets, vapours and fumes is a distinct possibility if whales surface in slicks to breathe. Exposure to hydrocarbons in this way could damage mucous membranes, damage airways, or even cause death.</p> <p>Toothed whales and dolphins may be susceptible to ingestion of dissolved and entrained oil as they gulp feed at depth. There are reports of declines in the health of individual pods of killer whales (a toothed whale species), though not the population as a whole, in Prince William Sound after the Exxon Valdez vessel spill (heavy oil) (Hook et al. 2016). It has been stated that pelagic species will avoid hydrocarbon, mainly because of its noxious odours, but this has not been proven. The strong attraction to specific areas for breeding or feeding (e.g., use of the Warrnambool coastline as a nursery area for southern right whales) may override any tendency for cetaceans to avoid the noxious presence of hydrocarbons. So weathered or tar-like oil residues can still present a problem by fouling baleen whales feeding systems.</p> <p>Dolphin populations from Barataria Bay, Louisiana, USA, which were exposed to prolonged and continuous oiling from the Macondo oil spill in 2010, had higher incidences of lung and kidney disease than those in the other urbanised environments (Hook et al. 2016). The spill may have also contributed to unusually high perinatal mortality in bottlenose dolphins (Hook et al. 2016).</p> <p>There is the potential for the survey to occur when blue, fin and sei whales are foraging in the areas. If present, these species may be exposed to oil externally and via ingestion whilst feeding. If large quantities of zooplankton exposed to the spill were ingested, chronic toxicity impacts may occur. However, as oil exposure above low thresholds will only occur within a small area at the spill source and for ~24 hours biological consequences of physical contact with localised areas of low concentrations of hydrocarbons are unlikely to lead to any long-term population impacts, with temporary skin irritation and very light fouling/matting of baleen plates likely to occur.</p> <p>Southern Right Whales may also be present in the area of oil exposure and they and their calves could be exposed to oil. However, as oil exposure above low thresholds will only occur within a small area at the spill source and for ~ 24 hours biological consequences of physical contact with localised areas of low concentrations of hydrocarbons are unlikely to lead to any long-term population impacts.</p> <p>It is unlikely that highly mobile and transient species that are not undertaking biologically important behaviour would be affected by exposure to oil within the relatively small area of the Environmental Planning Area and that oil exposure above low thresholds will only occur within a small area at the spill source.</p> <p>The predicted levels of consequence to whales and dolphins from a 250 m3 MDO spill is assessed as moderate as exposure to oil above low thresholds could occur to whales undertaking biologically important behaviours (feeding, reproduction), though if consequences occurred, they are likely to only affect a small portion of the population due</p>

Marine Mammals
<p>to the low spill volume and short duration of any exposure the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.</p> <p><b>Pinnipeds</b></p> <p>Pinnipeds are vulnerable to sea surface exposures given they spend much of their time on or near the surface of the water as they need to surface every few minutes to breathe and regularly haul out on to beaches. Pinnipeds are also sensitive as they will stay near established colonies and haul-out areas, meaning they are less likely to practice avoidance behaviours. This is corroborated by Geraci &amp; St. Aubin (1988) who suggest seals, sea- lions and fur-seals have been observed swimming in oil slicks during a number of documented spills.</p> <p>Exposure to surface oil can result in skin and eye irritations and disruptions to thermal regulation. As a result of exposure to surface oils, pinnipeds, with their relatively large, protruding eyes are particularly vulnerable to effects such as irritation to mucous membranes that surround the eyes and line the oral cavity, respiratory surfaces, and anal and urogenital orifices. Hook et al (2016) reports that seals appear not to be very sensitive to contact with oil, but instead to the toxic impacts from the inhalation of volatile components.</p> <p>For some pinnipeds, fur is an effective thermal barrier because it traps air and repels water. Petroleum stuck to fur reduces its insulative value by removing natural oils that waterproof the pelage. Consequently, the rate of heat transfer through fur seal pelts can double after oiling (Geraci &amp; St. Aubin 1988), adding an energetic burden to the animal. Kooyman et al (1976) suggest that in fact, fouling of approximately one-third of the body surface resulted in 50% greater heat loss in fur seals immersed in water at various temperatures. Fur-seals are particularly vulnerable due to the likelihood of oil adhering to fur. Heavy oil coating and tar deposits on fur-seals may result in reduced swimming ability and lack of mobility out of the water. Davis and Anderson (1976) observed two Gray Seal pups drowning, their "flippers stuck to the sides of their bodies such that they were unable to swim".</p> <p>However, pinnipeds other than Fur-seals are less threatened by thermal effects of fouling, if at all. Oil has no effect on the relatively poor insulative capacity of sea-lion and bearded and ringed seal pelts; oiled Weddell seal samples show some increase in conductance (Oritsland 1975, Kooyman et al. 1976, 1977). ITOPF (2011) documents impacts on species that rely on fur to regulate their body temperature (such as fur-seals), demonstrating these species are most vulnerable to oil as the animals may die from hypothermia or overheating, depending on the season, if the fur becomes matted with oil.</p> <p>It is reported that most pinnipeds scratch themselves vigorously with their flippers and do not lick or groom themselves, so are less likely to ingest oil from skin surfaces (Geraci &amp; St. Aubin 1988). However, mothers trying to clean an oiled pup may ingest oil. All pinnipeds examined to date have the enzyme systems necessary to convert absorbed hydrocarbons into polar metabolites, which can be excreted in urine (Engelhardt 1982, Addison and Brodie 1984, Addison et al. 1986).</p> <p>Ingested hydrocarbons can irritate or destroy epithelial cells that line the stomach and intestine, thereby affecting motility, digestion and absorption. However, pinnipeds have been found to have the enzyme systems necessary to convert absorbed hydrocarbons into polar metabolites, which can be excreted in urine (Engelhardt 1982, Addison &amp; Brodie 1984, Addison et al. 1986). Geraci &amp; St. Aubin (1988) suggest that a small phocid weighing 50 kg might have to ingest approximately 1 litre of oil to be at risk.</p> <p>Volkman et al (1994) report that benzene and naphthalene ingested by seals is quickly absorbed into the blood through the gut, causing acute stress, with damage to the liver considered likely. If ingested in large volumes, hydrocarbon, may not be completely metabolised, which may result in death.</p> <p>Breeding colonies (used to birth and nurse until pups are weaned) are particularly sensitive to hydrocarbon spills (Higgins &amp; Gass 1993). Pinnipeds also appear to rely on scent to establish a motherpup bond (Sandegren 1970, Fogden 1971), and consequently oil-coated pups may not be recognisable to their mothers. This is only theorised, with studies and research indicating interaction between mothers and oiled pups were normal (Davis and Anderson 1976, Davies 1949, Shaughnessy &amp; Chapman 1984).</p>

Marine Mammals
<p>The long-term Environmental Impact and Recovery report for the Iron Barren oil spill (in Tasmania, 1995) concluded that “The number of seal pups born at Tenth Island in 1995 was reduced when compared to previous years. There was a strong relationship between the productivity of the seal colonies and the proximity of the islands to the oil spill wherein the islands close to the spill showed reduced pup production and those islands more distant to the oil spill did not” (Tasmanian SMPC 1999).</p> <p>Australian sea-lions have ‘naturally poor recovery abilities’ due to ‘unusual reproductive biology and life history’ (TSSC 2005). Due to the extreme philopatry of females and limited dispersal of males between breeding colonies, the removal of only a few individuals annually may increase the likelihood of decline and potentially lead to the extinction of some of the smaller colonies. Extinction of breeding colonies has the potential to further reduce genetic diversity and the already limited genetic flow between colonies. This, in turn, may weaken the genetic resilience of the species and impact on its ability to cope with other natural or anthropogenic impacts. In addition, the extreme philopatry of females suggests that extinction of breeding colonies may lead to a contraction of the range of the species as re-colonisation of breeding sites via immigration is limited.</p> <p>For the reasons outlined above, small breeding colonies are under particular pressure of survival from even low levels of anthropogenic mortality.</p> <p>As highly mobile species, in general it is very unlikely that marine mammals will be constantly exposed to concentrations of hydrocarbons in the water column for continuous durations (e.g., &gt;96 hours) that would lead to chronic toxicity effects.</p> <p>There is the potential for Lady Julia Percy Island and Cape Bridgewater to be exposed to oil above the low threshold levels, though unlikely for Reid Rocks due to the distance from the Operational Area. Thus, seals at Lady Julia Percy Island and Cape Bridgewater could be exposed to oil at levels that could result in some level of impact. As diesel is a light fuel and readily evaporates matting and heavy coating of fur is not predicted. Impacts from inhalation of vapours is more likely as the diesel evaporates resulting in irritations to mucous membranes. Ingestion and tainting of prey are less likely as pinnipeds have large foraging ranges and are less likely to be exposed to oil above low thresholds in the water column.</p> <p>The predicted level of consequence to pinnipeds from a 250 m<sup>3</sup> MDO spill is assessed as moderate as exposure to oil above low thresholds could occur to breeding and haul out locations, though if consequences occurred, they are likely to only affect a small portion of the population due to the low spill volume and short duration of any exposure the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.</p>

## 6.11 Coastal Developments

<b>Coastal Developments</b>	
<b>Sensitivity Rating</b>	<b>High</b>
<b>Predicted Level of Risk</b>	<b>Medium</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>Local government areas within the Environmental Planning Area are detailed below.</p> <p><i>Victoria</i></p> <p><i>Mornington Peninsula Shire</i></p> <p>Mornington Peninsula Shire coastal areas within the environmental planning area are St Andrews Beach, Rye, Blairgowrie, Sorrento, and Portsea. These towns are popular tourist areas with a variety of beaches and tourist attractions. The area was originally home to the Mayone-bulluk and Boonwurrung-Balluk clans and formed part of the Boonwurrung nation's territory prior to European settlement.</p> <p><i>Greater Geelong City</i></p> <p>Greater Geelong City coastal areas within the environmental planning area are St Leonards, Swan Bay, Point Lonsdale, Ocean Grove, Barwon Heads, Connewarre, and Breamlea. The largest of these towns is Ocean Grove with a population of 14,714 (ABS 2021). These towns are popular tourist areas with a variety of beaches and access to Port Phillip Bay.</p> <p><i>Surf Coast Shore</i></p> <p>Within the environmental planning area are the world-famous surfing beaches Bells Beach and Torquay Beach. In addition, the Great Ocean Road follows the coast from Anglesea past Lorne.</p> <p><i>Colac Otway Shire</i></p> <p>Within the environmental planning area, the Great Ocean Road follows the coast past Apollo Bay and then goes inland at Marengo. The Great Otway National Park coastal areas, including the Aire River outlet, which is a popular campaign area, are within the environmental planning area. The Apollo Bay Port is home to a local fishing industry and commercial fleet which employs more than 70 people and boasts 16 boats, including trawlers, crayfish, and charter boats (Colac Otway Shire 2023).</p> <p><i>Corangamite Shire</i></p> <p>The main Corangamite Shire coastal areas within the environmental planning area are Princetown and Port Campbell. The Great Ocean Road follows the coast within the shire and the Twelve Apostles Marine National Park abuts the coastal area. Port Campbell is one of the main ports for the Eastern Zone Rock Lobster Fishery (VFA 2023).</p> <p><i>Moyne Shire</i></p> <p>The main Corangamite Shire coastal areas within the environmental planning area are Peterborough, Warrnambool, and Port Fairy. The three towns are on the Great Ocean Road and are popular tourist areas for sightseeing, beaches and whale watching.</p>	

<b>Coastal Developments</b>
<p>Glenelg Shire</p> <p>Within the Glenelg Shire the main coastal town is Portland which is the oldest European settlement in Victoria. In 2021, the population was 10,016 (ABS 2021). The Great South West Walk, a 250 km walking track, begins in Portland. Portland has become known as 'Tuna Town' because of its reliable tuna fishing and the importance of the species to the tourist economy (VFA 2023a). Portland harbour exists for commercial boats and ships that support export industries and doubles as a first-class boating facility.</p> <p>South Australia</p> <p><i>District Council of Grant</i></p> <p>The area along the South Australian coast of the environmental planning area is known as the limestone coast. The main town is Port MacDonnell, originally known as <i>Ngaranga</i>, which is the southernmost town in South Australia. The area was originally inhabited by the Bungandij Aboriginal people. The 2021 Census reports that the locality of Port MacDonnell had a population of 859 (ABS 2021). Once a busy shipping port, the town now relies heavily on its fishing and summer tourism industries, particularly rock lobster harvest industry, proclaiming itself "Australia's Southern Rock Lobster Capital".</p> <p>Tasmania</p> <p><i>King Island Council</i></p> <p>King Island is at the western entrance to Bass Strait and is 64 km long by 27 km wide. The 2021 Census reports that the King Island had a population of 1,617 (ABS 2021). King Island was originally part of a land bridge linking Tasmania with the Australian mainland, which was submerged around 12,000 years ago due to rising sea levels. A human skeleton was discovered in a cave on the island in 1989, which was dated to approximately 14,000 years ago. However, previous examinations had revealed no "shell heaps, bones, charcoal or other remains which might indicate Aboriginal occupation", suggesting that the area was passed through by the ancestors of Aboriginal Tasmanians but not permanently inhabited (Sim 1990). The island is a popular tourist location and produces cheese, lobsters, kelp, and beef.</p>
<b>Predicted Level of Risk</b>
<p>Due to the distance to the South Australian and King Island coastal areas from the Operational Area (~130 km and ~ 70 km respectively) impacts to coastal areas above the low thresholds are not predicted. As the Operational Area is as close as ~7 km to the Victorian coast, there is the potential for diesel above the low threshold to be visible on the ocean surface in coastal waters and as a sheen on shoreline areas. Most of the diesel will be concentrated along the high tide mark while the lower/upper parts are often untouched (IPIECA 1995) and expected to be visible.</p> <p>Visible nearshore and shoreline hydrocarbons have the potential to reduce the visual amenity of the area for tourism and discourage recreational activities this can have a knock-on effect to local businesses if beaches are required to be closed to allow for the clean-up of any oil. Due to the low volumes, light nature of marine diesel and substantial wave action with the nearshore area's impacts are likely to be short term and not require intrusive clean-up response.</p> <p>The predicted level of consequence to coastal developments from a 250 m<sup>3</sup> MDO spill is assessed as moderate as exposure to oil above low thresholds could occur areas nearshore of the Operational Area, though if consequences occurred, they are likely to only affect a small portion of the coastal area for a short duration (hours to days) due to the low spill volume and short duration of any exposure, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.</p>

## 6.12 Indigenous Culture

<b>Indigenous Culture</b>	
<b>Sensitivity Rating</b>	<b>High</b>
<b>Predicted Level of Risk</b>	<b>Medium</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>The information provided below has been sourced from publicly available information and from consultation undertaken in preparing the EP.</p> <p>The Environmental Planning Area overlaps King Island which was part of a land bridge linking Tasmania with the Australian Mainland and was submerged around 12,000 years ago with rising sea levels. While uninhabited at the time of European discovery by Captain Reed in 1799 the first Tasmanians were a very mobile people, especially by water. They had a wide-ranging territory, travelling in season for hunting, gathering and ceremonial purposes. They built and used several different types of seaworthy boats and research suggests that they passed through but did not permanently inhabit King Island (KIC 2023).</p> <p>The Environmental Planning Area overlaps with the following Registered Aboriginal parties in Victoria:</p> <p>Gunditjmirring</p> <p>Eastern Maar</p> <p>Wathaurung</p> <p>There are many landscapes within Gunditjmara Country – <i>Nyamat Mirring</i> (Sea Country), <i>Tungatt Mirring</i> (Stone Country), <i>Bocara Mirring</i> (River Country) and <i>Woorrowarook Mirring</i> (Forest Country) – connecting Gunditjmara Traditional Owners to Country through dreaming stories, language, oral histories, cultural law/lore and customs (GMTOAC 2023).</p> <p>Within the Environmental Planning Area, the following have been identified as key values and sensitivities in relation to First Nations.</p> <p>Deen Maar (Lady Julia Percy Island) is of cultural significance where ancestors leave the earth (GMTOAC 2023, Parks Victoria 2015).</p> <p>Eeling remains an important traditional, social, and economic practice among First Nations (EMAC 2015). See Section 6.7.</p> <p>Southern Right Whales (DCCEEW 2022a). See Section 0.</p>	
<b>Predicted Level of Risk</b>	
<p>Due to the distance to the South Australian and King Island coastal areas from the Operational Area (~130 km and ~70 km respectively) impacts to coastal areas above the low thresholds are not predicted. As the Operational Area is as close as ~7 km to the Victorian coast, there is the potential for diesel above</p>	

### Indigenous Culture

the low threshold to be visible on the ocean surface in coastal waters and as a sheen on shoreline areas. Most of the diesel will be concentrated along the high tide mark while the lower/upper parts are often untouched (IPIECA 1995) and expected to be visible.

Visible nearshore and shoreline hydrocarbons have the potential to reduce the visual amenity of the area but impacts to cultural values are not predicted due to the low volumes, light nature of marine diesel and substantial wave action with the nearshore areas impacts are likely to be short term and not require intrusive clean-up response.

The predicted level of consequence to coastal developments from a 250 m<sup>3</sup> MDO spill is assessed as moderate as exposure to oil above low thresholds could occur areas nearshore of the Operational Area, though if consequences occurred, they are likely to only affect a small portion of the coastal area for a short duration (hours to days) due to the low spill volume and short duration of any exposure, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.

### 6.13 Commercial Fisheries

<b>Commercial Fisheries</b>	
Sensitivity Rating	<b>Medium</b>
Predicted Level of Risk	<b>Medium</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>The Environmental Planning Area overlaps the following fisheries that have catch effort. A description of these fisheries is provided in the Regia MSS Commercial Fishery Review in Appendix B6.</p> <p>Commonwealth:</p> <ul style="list-style-type: none"> <li>• Bass Strait Central Zone Scallop Fishery</li> <li>• Eastern Tuna and Billfish Fishery</li> <li>• Small Pelagic Fishery (Western sub-area)</li> <li>• Southern and Eastern Scalefish and Shark (SESS) Fishery SESSF following sectors: <ul style="list-style-type: none"> <li>○ Shark Gillnet and Hook</li> <li>○ Scalefish Hook</li> <li>○ Trawl – otter board</li> </ul> </li> <li>• Southern Squid Jig Fishery</li> <li>• Western Tuna and Billfish Fishery</li> </ul> <p>Victorian:</p> <ul style="list-style-type: none"> <li>• Abalone</li> <li>• Giant Crab</li> <li>• Multi-species Ocean</li> <li>• Octopus</li> <li>• Rock Lobster</li> <li>• Wrasse</li> </ul> <p>Tasmanian:</p>	

Commercial Fisheries
<ul style="list-style-type: none"> <li>• Abalone</li> <li>• Giant Crab</li> <li>• Octopus</li> <li>• Rock Lobster</li> </ul> <p>South Australian:</p> <ul style="list-style-type: none"> <li>• Abalone</li> <li>• Charter Boat</li> <li>• Giant Crab</li> <li>• Marine Scalefish Fishery</li> <li>• Rock Lobster</li> </ul>
Predicted Level of Risk
<p>Commercial fishing has the potential to be impacted through exclusion zones associated with the spill, the spill response and subsequent reduction in fishing effort. Exclusion zones may impede access to commercial fishing areas, for a short period of time, and nets and lines may become oiled. The impacts to commercial fishing from a public perception, however, may be much more significant and longer term than the spill itself.</p> <p>Fishing areas may be closed for fishing for shorter or longer periods because of the risks of the catch being tainted by oil. Concentrations of petroleum contaminants in fish and crustacean and mollusc tissues could pose a significant potential for adverse human health effects, and until these products have been cleared by the health authorities, they could be restricted for sale and human consumption. Toxicity in adult fish has been reported in response to crude oils, HFO and diesel (Holdway 2002, Shigenaka 2011). Uptake of hydrocarbons has been demonstrated in bony fish after exposure to water-accommodated fraction hydrocarbons of between 24 and 48 hours. Davis et al (2002) report detectable tainting of fish flesh after a 24-hour exposure at crude concentrations of 0.1 ppm, marine fuel oil concentrations of 0.33 ppm and diesel concentrations of 0.25 ppm. The majority of studies, either from laboratory trials or of fish collected after spill events (including the Hebei Spirit, Macondo, and Sea Empress) find evidence of elimination of PAHs in fish tissues returning to reference levels within two months of exposure (Challenger and Mauseth 2011, Davis et al. 2002, Gagnon &amp; Rawson 2011, Gohlke et al. 2011, Jung 2011, Law 1997, Rawson et al. 2011).</p> <p>Should there be impacts to fish stocks associated with impacts to plankton life phase there is the potential for reduction in profits for commercial fisheries over a longer period of time, and potential for reduced fishing quotas or exclusion zones exclude fishing effort, associated with sustainable fisheries management.</p> <p>The Montara spill of a light gas condensate, (as the most recent [2009] example of a large hydrocarbon spill in Australian waters) occurred over an area fished by the Northern Demersal Scalefish Managed Fishery (with 11 licences held by 7 operators), with Goldband Snapper, Red Emperor, Saddletail Snapper and Yellow Spotted Rockcod being the key species fished (PTTEP 2013). As a precautionary measure, the WA Department of Fisheries advised the commercial fishing fleet to avoid fishing in oil-affected waters. Testing of fish caught in areas of visible oil slick (November 2009) found that there were no detectable petroleum hydrocarbons in fish muscle samples, suggesting fish were safe for human consumption. In the short-term, fish had metabolised petroleum hydrocarbons. Limited ill effects were detected in a small number of individual fish only (PTTEP 2013). No consistent effects of exposure on fish health could be detected within two weeks following the end of the well release. Follow up sampling in areas affected by the spill during 2010 and 2011 (PTTEP 2013) found negligible ongoing environmental impacts from the spill.</p>

#### Commercial Fisheries

Similarly, the Macondo well blowout in the Gulf of Mexico (2010), began testing a month after the event showing levels of oil contamination residue in seafood consistently tested 100 to 1,000 times lower than safety thresholds established by the USA FDA, and every sample tested was found to be far below the FDA's safety threshold for dispersant compounds (BP 2015). FDA testing of oysters found oil contamination residues to be 10 to 100 times below safety thresholds (BP 2014). Sampling data shows that post-spill fish populations in the Gulf of Mexico since 2011 were generally consistent with pre-spill ranges and for many shellfish species, commercial landings in the Gulf of Mexico in 2011 were comparable to pre-spill levels. In 2012, shrimp (prawn) and blue crab landings were within 2.0% of 2007-09 landings.

In the event of a MDO spill, a temporary fisheries closure may be put in place by the fishing authority or voluntarily by the fishers themselves. A temporary fisheries closure, combined with oil tainting of target species (actual or perceived), may lead to financial losses to fisheries and economic losses for individual licence holders. Fisheries closures and the flow on losses from the lack of income derived from these fisheries are likely to have short-term but potentially widespread socio-economic consequences, such as reduced employment in the fisheries and fisheries service industries, such as tackle and bait supplies, fuel, marine mechanical services, accommodation and so forth.

Oiling of fishing vessel hull and fishing equipment is not predicted given the light nature of MDO and that surface oil is predicted to have evaporated or entrained with 24 hours.

A spill event may result in a short-term fishing exclusion zone (days to weeks) being implemented by the appropriate fishing authority. Areas of moderate dissolved and high entrained exposure thresholds are expected to be very small as MDO is predicted to weather quickly and the area would return to pre-spill conditions rapidly. MDO is not predicted to accumulate among benthic sediments due to the significant mixing of waters and dilution of the low concentration of hydrocarbons in the water column, as such reducing impacts to habitats in 10 m depth, which are likely slower to recover.

The predicted level of consequence to commercial fisheries from a 250 m<sup>3</sup> MDO spill is assessed as moderate as consequences could be longer lasting (> 30 days) if fishery closures and public perception of fishing tainting occur, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.

## 6.14 Seaweed Industry

<b>Seaweed Industry</b>	
<b>Sensitivity Rating</b>	<b>Medium</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>The Australian seaweed industry is small: currently valued at an estimated GVP of AUD \$3 million. Of this, the majority is from one company, Kelp Industries Pty Ltd on King Island in Tasmania, who hand collect plants cast bull kelp (<i>Durvillea potatorum</i>) on the beaches from predominantly the west coast of the island, predominantly for export to a large alginate manufacturer and for use in biofertiliser products (Australian Seaweed Institute 2023). Australia Bureau of Statistics (ABS) data shows seaweed exports from Australia are valued at \$1.5 million for non-human consumption and it is assumed that this is almost entirely from Kelp Industries exports.</p> <p>Besides Kelp Industries, other seaweed collectors in Tasmania include Kelpomix and TasKelp. There are also licenses for wild harvest of the invasive species of <i>Undaria</i> in Tasmania (KaiHo Ocean Treasure) and some in Victoria (Australian Seaweed Institute 2023).</p> <p>The harvesting of native seaweed in Victorian marine waters is prohibited without a permit (s. 112(2) Fisheries Act 1995) and licences enabling seaweed aquaculture are not currently available in Victoria (VFA 2023b).</p> <p>While there are numerous research projects taking place or being planned, currently there are two projects in Tasmania (Australian Seaweed Institute 2023). The first, is a CRC-P project involving collaboration with Tassal, Spring Bay Seafoods and University of Tasmania (UTAS). This project aims to demonstrate the benefits of Kelps as part of an integrated multitrophic aquaculture approach. The second is a research collaboration between UTAS and Huon Aquaculture in Storm Bay that will also yield its first harvest in late 2020.</p> <p>The west coast of King Island where bull kelp is collected is within the Environmental Planning Area.</p>	
<b>Predicted Level of Risk</b>	
<p>Experiments verified the susceptibility of <i>Nereocystis luetkeana</i> (bull kelp – north America) tissue to the direct exposure to several petroleum types. Antrim et al (1995) showed that petroleum treatments resulted in visible tissue damage, with a distinct bleached line being the most visible indication of plant contact with the petroleum. Moderate to heavy colour loss, which was generally followed by rapid decay of tissue, was most pronounced in 24 h exposures to unweathered and weathered diesel. The study did not look at how this would affect the productivity of bull kelp.</p> <p>Bull kelp affect by oil would not be suitable for collection and processing which could result in a temporary closure to the industry and a perception of tainting of product. This could lead to financial losses to kelp collection and processing businesses. However, given the distance to King Island from the Operational Area oil exposure above low threshold levels are not predicted and thus impacts are unlikely to be a significant to seaweed collection and associated income.</p> <p>The relatively short duration and low volume means there may be short-term and localised consequences, which are ranked as Moderate.</p> <p>Thus, the predicted level of consequence to seaweed industries from a 250 m<sup>3</sup> MDO spill is assessed as minor as exposure is likely to be below low thresholds and any consequences would be short-term (days to weeks), recoverable and affect a small portion of bull kelp, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.</p>	

## 6.15 Marine Industries

<b>Marine Industry</b>	
<b>Sensitivity Rating</b>	<b>Medium</b>
<b>Predicted Level of Risk</b>	<b>Low</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>Marine industries identified within the Environmental Planning Area are:</p> <p><b>Defence</b></p> <p>A defence practice area is located within the Environmental Planning Area. There is also a number of potential unexploded ordnance areas, however, these are not predicted to be impacted by oil exposure and is not assessed further.</p> <p><b>Desalination Plant</b></p> <p>The Victorian Desalination Plant, located at Wonthaggi, is outside of the Environmental Planning Area.</p> <p><b>Offshore Energy</b></p> <p>Within the Environmental Planning Area there is the Beach Energy Otway Development consisting of subsea infrastructure and an unmanned platform and the Cooper Energy Casino Henry Netherby Development consisting of subsea infrastructure. During the Regia MSS design envelope (1 November 2023 to 31 October 2028) there is the potential for exploration and development activities such as infrastructure inspection, maintenance and repairs campaigns, seabed surveys, seismic surveys, drilling and infrastructure installation to be undertaken with vessels and drill rigs to support the ongoing energy supply of oil and gas and potentially renewables within the Otway Basin.</p> <p><b>Shipping</b></p> <p>The South East Marine Region is one of the busiest shipping regions in Australia and Bass Strait is one of Australia's busiest shipping routes. Commercial vessels use the route when transiting between ports on the east, south and west coasts of Australia, and there are regular passenger and cargo services between mainland Australia and Tasmania. Ports Australia provide statistics for port operations throughout Australia's main commercial ports. Based on the latest information (2021) the majority of commercial shipping traffic transiting to and from Victorian ports were container (3,682), general cargo (2,663), bulk liquid carriers (2,019), dry bulk (1,715), car carrier (1,342), bulk gas (220), other cargo (47) and livestock (9).</p> <p><b>Submarine cables</b></p> <p>INDIGO-Central submarine cable which at a depths greater than 100 m is not predicted to be affected by oil exposure and is not assessed further.</p>	
<b>Predicted Level of Risk</b>	
<p>Marine industries have the potential to be impacted through exclusion zones associated with the spill and the spill response. Exclusion zones may impede access to shipping lanes, defence practice areas and offshore energy infrastructure, for a short period of time. Oiling of vessel hulls or the Thylacine-A platform is not predicted given the light nature of MDO and that surface oil is predicted to have evaporated or entrained with 24 hours.</p>	

<b>Marine Industry</b>
Thus, the predicted level of consequence to seaweed industries from a 250 m <sup>3</sup> MDO spill is assessed as minor as exposure is likely to be below low thresholds and any consequences would be short-term (days to weeks), recoverable and affect a small portion of marine industries, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of low.

## 6.16 Tourism including Diving and Recreational Fishing

Tourism including Diving and Recreational Fishing	
<b>Sensitivity Rating</b>	<b>High</b>
<b>Predicted Level of Risk</b>	<b>Medium</b>
Environmental Planning Area Existing Environment	
<p>The coastal areas of the Environmental Planning Area offer a wide and diverse range for marine based tourism and recreational activities, including snorkelling, scuba diving, surfing, kayaking, whale, and wildlife watching, sailing and charter boat cruises. Popular tourist destinations in the Environmental Planning Area include Portland, Port Fairy, Warrnambool, the Great Ocean Road, Great Otway National Park, and King Island.</p> <p>The west coast of Victoria from Warrnambool to Portland is known as reliable spots to catch tuna, kingfish, and trevalla in areas such as Lawrence Rock, the North Shore, Lady Julia Percy Island, Killarney, The Craggs, Minerva Reef, Julia Reef and the Horseshoe off Cape Bridgewater (VFA 2023a). May, June, and July are reliable months to find schools of bluefin tuna (VFA 2023c).</p> <p>The Arches Marine Sanctuary and Twelve Apostles Marine National are well known locally for excellent scuba diving sites (Parks Victoria 2006)</p> <p>Seal and Dolphin watching occur within Discovery Bay Marine National Park and Deen Maar (Lady Julia Percy Island).</p>	
Predicted Level of Risk	
<p>Due to the distance to the South Australian and King Island coastal areas from the Operational Area (~130 km and ~70 km respectively) impacts to coastal areas above the low thresholds are not predicted. As the Operational Area is as close as ~7 km to the Victorian coast, there is the potential for diesel above the low threshold to be visible on the ocean surface in coastal waters and as a sheen on shoreline areas. Most of the diesel will be concentrated along the high tide mark while the lower/upper parts are often untouched (IPIECA 1995) and expected to be visible.</p> <p>Visible nearshore and shoreline hydrocarbons have the potential to reduce the visual amenity of the area for tourism and discourage recreational activities. Due to the low volumes, light nature of marine diesel and substantial wave action with the nearshore areas impacts are likely to be short term and not require intrusive clean-up response.</p> <p>The predicted level of consequence to tourism and recreation from a 250 m<sup>3</sup> MDO spill is assessed as moderate as exposure to oil above low thresholds could occur in areas nearshore of the Operational, though if consequences occurred, they are likely to only affect a small portion of the coastal area for a short duration (hours to days) due to the low spill volume and short duration of any exposure, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.</p>	

## 6.17 Protected Areas

<b>Protected Areas</b>	
<b>Sensitivity Rating</b>	<b>High</b>
<b>Predicted Level of Risk</b>	<b>Medium</b>
<b>Environmental Planning Area Existing Environment</b>	
<p>There are no World Heritage Areas within the Environmental Planning Area.</p> <p>The PMST Report for the Environmental Planning Area (Appendix B5) identified the following for protected areas.</p> <p>National Heritage Places</p> <p>Three places of National Heritage were identified in the Environmental Planning Area:</p> <p>Quarantine Station and Surrounds</p> <p>Great Ocean Road and Scenic Environs</p> <p>Point Nepean Defence Sites and Quarantine Station Area</p> <p>The Point Nepean Defence Sites and Quarantine Station Area and Quarantine Station and Surrounds are above the shoreline and hence would not be directly affected by oil. They are also on the bay side of the Mornington Peninsula which is not predicted to be impacted by a spill.</p> <p>The Great Ocean Road and Scenic Environs is above the shoreline and hence would not be directly affected by oil. However, the scenic environs could be impacts by surface or shoreline oil.</p> <p>The Australian Heritage Council found the Great Ocean Road and its scenic environs road from Torquay to Allansford, a journey of 242 kms, as a place of outstanding national heritage significance. Constructed by workers, including more than 3000 returned servicemen, as a memorial to First World War servicemen, the Great Ocean Road is a significant reminder of the participation of Australian servicemen in the First World War, the Australian community's appreciation of their service, and the support provided for the welfare of servicemen and women upon returning to Australia.</p> <p>The scenic environs include all views from the Great Ocean Road and Great Ocean Walk, including the Twelve Apostles, the Bay of Islands and Bay of Martyrs. The coastline from Lorne to Kennett River is among the world's most dramatic cliff and ocean scenery able to be viewed from a vehicle.</p> <p>Along the length of the Great Ocean Road, the pullover points and lookouts beside or nearby the road provide travellers with spectacular views of the coastline, hinterland, and Bass Strait seascape, framed only by cliffs, lighthouses and unencumbered by intrusive built structures. The place is also listed for its; outstanding rocky coastline, dinosaur fossil sites, geomorphological monitoring sites, its association with the pioneering landscape architect Edna Walling, and for the significance of Bells Beach to surfing.</p> <p>Commonwealth Heritage Places</p> <p>Six places of National Heritage were identified in the Environmental Planning Area</p> <p>Cape Northumberland Lighthouse SA (Historic, Listed place)</p>	

Protected Areas
<p>Cape Wickham Lighthouse TAS (Historic, Listed place)</p> <p>Fort Queenscliff VIC (Historic, Listed place)</p> <p>Sorrento Post Office VIC (Historic, Listed place)</p> <p>Swan Island Defence Precinct VIC (Historic, Listed place)</p> <p>Swan Island and Naval Waters VIC (Natural, Listed place)</p> <p>Only the Swan Island and Naval Waters includes coastal areas within the Environmental Planning Area and is described.</p> <p>Swan Island is the largest emergent sand accumulation feature in Port Phillip Bay. The island, which has been built principally by wave actions rather than by aeolian forces, has played a major role in determining the pattern of sedimentation in Swan Bay and preserves geomorphological evidence of changing Quaternary sea levels. The eastern and northern shores of the eastern arm of Swan Island are of regional significance as an example of active coastal depositional and erosional processes (DCCEEW 2023c).</p> <p>Swan Island and adjacent naval waters provide important habitat for 46 water bird species, of which 26 species are listed under the Japan-Australia and China-Australia migratory bird agreements, and 8 species are listed under the Bonn Convention on Migratory Species (DCCEEW 2023c). During the migration season Swan Bay supports internationally significant populations of the Eastern Curlew, Ruddy Turnstone, Red-necked Stint, Sharp-tailed Sandpiper, Curlew Sandpiper, and Grey Plover (DCCEEW 2023c). Nationally significant populations of the Greenshank, Pacific Golden Plover, Double-banded Plover, and Lesser Sand Plover also occur (DCCEEW 2023c). Sand Island is the most important high tide roosting area in Swan Bay and at high tide regularly supports half of the shorebirds in the Swan Bay - Mud Islands complex.</p> <p>Ramsar Wetlands</p> <p>Four Ramsar Wetlands were identified in the Environmental Planning Area.</p> <p>Glenelg Estuary and Discovery Bay</p> <p>Key features of the site (DCCEEW 2023d):</p> <p>The Glenelg Estuary and Discovery Bay Ramsar Site is situated in western Victoria. It covers approximately 22,289 hectares and comprises portions of the Lower Glenelg National Park, the Discovery Bay Coastal Park and the Nelson Streamside Reserve. The Glenelg River estuary is the longest in the bioregion, extending 75 kilometres. The Ramsar site comprises three broad systems that support different wetland types: freshwater wetlands, the Glenelg Estuary and the beach and dune system. The site contains several regionally (and internationally) rare wetland types: intact fen peatlands and a humid dune slack system.</p> <p>The site:</p> <p>Supports the nationally vulnerable coastal saltmarsh ecological community and eight nationally / internationally listed threatened flora and fauna species.</p> <p>Provides habitat for 95 waterbird species including 24 species listed under international agreements. Beach nesting birds such as Hooded Plover (<i>Thinornis rubricollis</i>) and Red-capped Plover (<i>Charadrius ruficapillus</i>) are regularly recorded nesting on the dunes of the Discovery Bay Coastal Park.</p> <p>Supports 14 species of native fish which are diadromous, migrating between habitats for part of their lifecycle by providing food, spawning grounds and nurseries. It also acts as a migration path on which diadromous fishes of the region depend.</p> <p>Provides habitat for obligate aquatic species in the permanent wetlands of the Long Swamp complex and Bridgewater Lakes when the surrounding landscape is dry and during drought conditions.</p> <p>Supports &gt; 1% of the population of the wetland dependent invertebrate species the Ancient Greenling (<i>Hemiphysalis mirabilis</i>) in the Baumea sedgeland.</p>

Protected Areas
<p>The area is popular for recreational and tourism activities, including sightseeing, walking, camping, and recreational fishing. Importantly, the Gunditjmara Indigenous people have a living association with the Ramsar site, which has great cultural significance for them, as it is part of their Koonang (sea) and Bocara Woorrowarook (river forest) country.</p> <p>Lavinia</p> <p>Key features of the site (DCCEEW 2023e):</p> <p>The Lavinia Ramsar site is located on the north-east coast of King Island, Tasmania. The boundary of the site forms the Lavinia State Reserve, with major wetlands in the reserve including the Sea Elephant River estuary area, Lake Martha Lavinia, Penny's Lagoon, and the Nook Swamps. The shifting sands of the Sea Elephant River's mouth have caused a large back-up of brackish water in the site, creating the saltmarsh which extends up to five kilometres inland. The present landscape is the result of several distinct periods of dune formation.</p> <p>The extensive Nook Swamps, which run roughly parallel to the coast, occupy a flat depression between the newer parallel dunes to the east of the site and the older dunes further inland. Water flows into the wetlands from the catchment through surface channels and groundwater and leaves mainly from the bar at the mouth of the Sea Elephant River and seepage through the young dune systems emerging as beach springs.</p> <p>The Lavinia State Reserve is one of the few largely unaltered areas of the island and contains much of the remaining native vegetation on King Island. The vegetation communities present on the site include Succulent Saline Herbland, Coastal Grass and Herbfield, Coastal Scrub and King Island Eucalyptus globulus Woodland. The freshwater areas of the Nook Swamps are dominated by swamp forest. Nook Swamps and the surrounding wetlands contain extensive peatlands.</p> <p>The site is an important refuge for a collection of regional and nationally threatened species, including the nationally endangered Orange-bellied Parrot. This parrot is heavily dependent upon the samphire plant, which occurs in the saltmarsh, for food during migration. They also roost at night in the trees and scrub surrounding the Sea Elephant River estuary.</p> <p>Several species of birds which use the reserve are rarely observed on the Tasmanian mainland, including the Dusky Moorhen, Nankeen Kestrel, Rufous Night Heron and the Golden-headed Cisticola.</p> <p>The site is currently used for conservation and recreation, including boating, fishing, camping and off-road driving. There are artefacts of Indigenous Australian occupation on King Island that date back to the last ice age when the island was connected to Tasmania and mainland Australia via the Bassian Plains.</p> <p>Piccaninnie Ponds Karst</p> <p>Key features of the site (DCCEEW 2023f):</p> <p>The Piccaninnie Ponds Karst Wetlands Ramsar Site is located in south-east South Australia, near Mount Gambier. It is an exceptional example of karst spring wetlands, with the largest and deepest of the springs reaching a depth of more than 110 m. The majority of the water comes from an unconfined regional aquifer and is consistently 14-15 degrees Celsius. The karst springs support unique macrophyte and algal associations, with macrophyte growth extending to 15 m below the surface as a result of exceptional water clarity. A number of different wetland types exist on the site, including a large area of peat fens.</p> <p>There are four distinct areas of the Ramsar site. Piccaninnie Ponds (also known as Main Ponds) consists of three interconnected bodies of water - First Pond, The Chasm and Turtle Pond - rounded by an area of shrub dominated swamp. Western Wetland consists of dense closed tea-tree and paperbark shrubland over shallow dark clay on limestone soils. Eastern Wetland includes the spring-fed Hammerhead Pond. Pick Swamp, on the extreme west of the site, includes areas of fen, marshes and sedgeland as well as the spring-fed Crescent Pond on peat soils.</p>

Protected Areas
<p>The system is an important remnant of an extensive system of wetlands that once occupied much of the south-east of South Australia. The major groundwater discharge points are Main Ponds, Hammerhead Pond and Crescent Pond. Water principally leaves the site via Outlet Creek and the Pick Swamp drain outlet, which connect the site to the sea. There are a number of fresh groundwater beach springs located on the site.</p> <p>The geomorphic and hydrological features of the site produce a complex and biologically diverse ecosystem which supports considerable biodiversity, including a significant number of species of national and/or international conservation value. These include the orange-bellied parrot, Australasian bittern and Yarra pygmy perch.</p> <p>The site attracts 20,000 visitors annually for cave diving, snorkelling, bushwalking, educational activities and birdwatching. The site also has spiritual and cultural value. The Traditional Owners of the land, the Bunganditj (Boandik) and local Indigenous people have a strong connection with the site. Traditionally the site provided a good source of food and fresh water, and evidence of previous occupation still exists.</p> <p>Port Phillip Bay (Western Shoreline) and Bellarine Peninsula</p> <p>Key features of the site (DCCEEW 2023g):</p> <p>The Port Phillip Bay (Western Shoreline) and Bellarine Peninsula Ramsar site is located in the western portion of Port Phillip Bay, near the city of Geelong in Victoria. The site comprises six distinct areas that include Point Cook/Cheetham, Werribee/Avalon, Point Wilson/Limeburners Bay, Swan Bay, Mud Islands, and the Lake Connemara Complex. The Ramsar site is a low-lying area and a natural discharge point for the rivers draining southern central Victoria. The tidal amplitude within the bay is reduced compared with Bass Strait due to the narrow opening of the Bay (Port Phillip Heads).</p> <p>Port Phillip Bay (Western Shoreline) and Bellarine Peninsula support a variety of wetland types ranging from shallow marine waters to seasonal freshwater swamps and extensive sewage ponds. Wetland areas include freshwater lakes, estuaries, some with White Mangrove, saltmarshes, intertidal mudflats and seagrass beds. The Ramsar site supports some plants species threatened in Victoria, such as Small Scurf-pea and Rare Bitter-bush.</p> <p>This Ramsar site is the sixth most important area in Australia for migratory waders and the most important in Victoria. Large numbers of bird species including Pied Oystercatchers, Banded Stilts, Red-necked Stint, Sharp-tailed Sandpiper, Fairy Tern, Australasian Shoveler, Red-necked Avocets, Blue-billed Duck, and Freckled Duck, have been recorded at the site. Furthermore, the Melbourne Water Corporation Sewage Farm and Western Treatment Plant at Werribee support many waterbirds on its retention ponds.</p> <p>Port Phillip Bay (Western Shoreline) and Bellarine Peninsula provides important habitat for threatened species such as the Little Tern and Striped Legless Lizard. In particular, large numbers of the nationally threatened Orange-bellied Parrot utilise Port Phillip Bay during the winter after their summer migration to Tasmania to breed. Swan Bay and Limeburners Lagoon are also valuable fish breeding grounds for many of the commercial species caught in Port Phillip Bay.</p> <p>There are a number of important indigenous sites within the wetlands, including burial sites, middens and artefacts, with the oldest midden in the area being at least 5000 years old. Currently over three million people live around Port Phillip Bay, which is used intensively for recreation, nature conservation, sewage treatment, aquaculture, fishing, and salt production.</p> <p>Nationally Important Wetlands</p> <p>Information on Nationally Important Wetlands is from the DCCEEW Directory of Important Wetlands. The following wetlands have a coastal intersect.</p> <p>Aire River and Lower Aire River</p> <p>The Aire River is located in south-western Victoria. The Aire River reach is of high value for its flora and fauna which is of national and state significance, particularly its large continuous stands of cool temperate rainforest. There are fourteen threatened flora species within the Aire reach and its associated corridor of which two are listed nationally.</p>

Protected Areas
<p>There are twenty-seven threatened fauna species within the Aire River reach and its associated corridor of which five are listed nationally. Significant fauna species in the reach are the Cape Barren Goose, Ground Parrot, Rufous Bristlebird, Eastern Barred Bandicoot, and the Australian Grayling.</p> <p>Social values are trout fishing, picnicking, camping, and scenic driving are. Hopetoun Falls Scenic reserve is the most popular area for sight-seeing along the reach.</p> <p>There are approximately eighteen archaeological sites in the area, most of which are Aboriginal shell middens. The area also contains the site of the 1848 Katabanuut Aboriginal massacre.</p> <p>Glenelg River and Estuary</p> <p>The Glenelg River reach begins at Dartmoor, on the southern side of the Grampians National Park, and flows through the Lower Glenelg National Park to the sea at Nelson, near the Discovery Bay Coastal Park. There are 25 threatened flora species found within the Glenelg River reach and its associated corridor of which ten are listed nationally. The river reach provides an important habitat link between the inland woodland environments and coastal environments. There are seventy-two threatened flora species found within the Glenelg River reach and its associated corridor of which 12 are listed nationally.</p> <p>The river was a source a food supplies for the Dhauwurd Wurrung Aboriginal Group. Shell middens and surface scatters as well as isolated artefacts and a scarred tree around the coastal dunes have been found just outside the river reach. The Princess Margaret Rose Caves are of significant historical values and are listed as an historic place of regional significance. Patterson's Canoe Camp recreation area is also of regional significance. Tourism in the river reach is increasing in Nelson and the caves. Other attractions are bushwalking such as the Great South West Walk, camping, sight-seeing, picnicking, canoeing, fishing, motor-boating, house-boating and water-skiing.</p> <p>Lavinia Nature Reserve – see Lavinia Ramsar Wetland Description above.</p> <p>Lower Merri River</p> <p>The Lower Merri River Wetlands consist of two connected wetlands developed in a swale between calcareous dune ridges and fed by the Merri River. Lower Merri River Wetland is of high value for its avifauna. There are large areas of Common Reed <i>Phragmites australis</i> with Spiky Club-sedge, saltmarsh and mudflats. Also, of high value for its geomorphology and are a well-preserved example of interdunal wetlands fed by a small drainage system.</p> <p>The wetlands are used for hunting, walking and bird watching. The Mahogany Trail follows the edge of these wetlands. The Mahogany Ship is reputed to be buried under sand dunes adjacent to Saltwater Swamp. Surface scatters exist at Kelly Swamp indicating a history of Aboriginal occupation.</p> <p>Princetown Wetlands</p> <p>These wetlands consist of swamps of varying salinity on the floodplains of the Gellibrand River and its tributary, the Serpentine (Latrobe) Creek. Wetlands types present are a deep freshwater marsh, semi- permanent saline marshes and a shallow freshwater marsh.</p> <p>The Princetown Wetlands have extensive beds of Common Reed (<i>Phragmites australis</i>) and meadows dominated by Beaded Glasswort which can support large numbers of waterbirds. The saltmarsh habitat surrounding these swamps is likely to be important for migration of the Orange-bellied Parrot. Australasian Bittern and Lewin's Rail have been recorded. Camping, fishing, boating, and duck hunting occur within the wetlands.</p> <p>Swan Bay</p> <p>Swan Bay is a shallow marine embayment partly enclosed by spits and barrier islands such as Swan Island. It is generally &lt;2 m in depth, with 700-1,000 ha of mudflats exposed at low tide, and has extensive seagrass beds. The bay is fringed with saltmarsh including some extensive flats and there are some stands of remnant woodland.</p> <p>The bay is of high value for its avifauna and flora. It is very productive for birds, molluscs, and fish. The saltmarsh and intertidal seagrass meadows are regionally significant. The avifauna is particularly diverse, with 190 bird species recorded.</p>

Protected Areas
<p>Swan Bay is a high value wetland for its ecological, recreational, and educational features. Swan Bay is an unusual shallow embayment with a mixture of seagrass species which is relatively undisturbed and in good ecological condition.</p> <p>Australian Marine Parks</p> <p>Four Australian Marine Parks (AMPs) were identified in the Environmental Planning Area (Appendix B12 MAP-REG-EPM-078).</p> <p>Apollo</p> <p>The Apollo AMP is located off Apollo Bay on Victoria's west coast in waters 80 m to 120 m deep on the continental shelf. The reserve covers 1,184 km<sup>2</sup> (DNP 2013). The reserve encompasses the continental shelf ecosystem of the major biological zone that extends from South Australia to the west of Tasmania. The area includes the Otway Depression, an undersea valley that joins the Bass Basin to the open ocean. Apollo AMP is a relatively shallow reserve with big waves and strong tidal flows; the rough seas provide habitats for fur seals and school sharks (DNP 2013).</p> <p>The major conservation values of the Apollo AMP (DNP 2013) are:</p> <p>Ecosystems, habitats, and communities associated with the Western Bass Strait Shelf Transition and the Bass Strait Shelf Province and associated with the seafloor features: deep/hole/valley and shelf.</p> <p>Important migration area for blue, fin, sei and humpback whales.</p> <p>Important foraging area for black-browed and shy albatross, Australasian gannet, short-tailed shearwater and crested tern.</p> <p>Cultural and heritage site - wreck of the MV City of Rayville.</p> <p>Franklin</p> <p>The Franklin AMP covers an area of 671 km<sup>2</sup> west of the north-western corner of Tasmania and south-east of King Island (DNP 2013). At its northern end, the waters are only 40 m deep, and in much of the reserve the sea floor slopes gently and is covered by fine and coarse sediments. At the southern end of the reserve there is a valley where the water is up to 150 m deep.</p> <p>The major conservation values for the Franklin AMP (DNP 2013) are:</p> <p>Examples of ecosystems, habitats and communities associated with the Tasmanian Shelf Province and Western Bass Strait Shelf Transition and associated with sea-floor features shelf, deep/hole/valley, escarpment and plateau.</p> <p>Important foraging area for Shy Albatross, Short-tailed Shearwater, Australasian Gannet, Fairy Prion, Little Penguin, Common Diving petrel, Black-faced Cormorant and Silver Gull.</p> <p>Black Pyramid Rock, 6 km north of the reserve supports the largest breeding colony of the Australasian gannet in Tasmania, and one of only eight breeding sites for this species in Australia. White shark also forages in the reserve.</p> <p>Nelson</p> <p>The Nelson AMP spans the deepwater ecosystems (greater than 3,000 m depth) extending from South Australia to the west of Tasmania (DNP 2013). The reserve spans a range of geological features including plateaus, knolls, canyons and the abyssal plain (a large area of extremely flat or gently sloping ocean floor just offshore from the continent). The knoll features provide a rocky substrate above the abyssal plain. Little is known about the benthic biodiversity of this reserve; however, marine mammals are known to occur here.</p>

Protected Areas
<p>The major conservation values of the Nelson AMP (DNP 2013) are:</p> <p>Examples of ecosystems, habitats and communities associated with the West Tasmanian Transition and associated with the seafloor features including the abyssal plain/deep ocean floor, canyon, knoll/abyssal hill, plateau, and slope.</p> <p>Important migration area for Blue, Fin, Humpback and Sei whales.</p> <p>Zeehan</p> <p>The Zeehan AMP covers an area of 19,897 km<sup>2</sup> to the west and south-west of King Island in Commonwealth waters surrounding north-western Tasmania (DNP 2013). It covers a broad depth range from the shallow continental shelf depth of 50 m to the abyssal plain which is over 3,000 m deep. The reserve spans the continental shelf, continental slope and deeper water ecosystems of the major biological zone that extends from South Australia to the west of Tasmania. Four submarine canyons incise the continental slope, extending from the shelf edge to the abyssal plains. A rich community made up of large sponges and other permanently attached or fixed invertebrates is present on the continental shelf, including Giant Crab. Concentrations of larval Blue Wahoo and Ocean Perch demonstrate the role of the area as a nursery ground.</p> <p>Rocky limestone banks provide important seabed habitats for a variety of commercial fish and crustacean species including the Giant Crab. The area is also a foraging area for a variety of seabirds such as Fairy Prion, Shy Albatross, Silver Gull, and Short Tail Shearwater (DNP 2013).</p> <p>The major conservation values for the Zeehan AMP (DNP 2013) are:</p> <p>Examples of ecosystems, habitats and communities associated with the Tasmania Province, the West Tasmania Transition and the Western Bass Strait Shelf Transition and associated with the seafloor features: abyssal plain/deep ocean floor, canyon, deep/hole/valley, knoll/abyssal hill, shelf and slope.</p> <p>Important migration area for Blue and Humpback whales.</p> <p>Important foraging habitat for Black-browed, Shy and Wandering albatrosses, and Great-winged and Cape Petrels.</p> <p>Victorian Marine Parks and Sanctuaries</p> <p>Four Victorian Marine National Parks (Appendix B12 MAP-REG-EPM-079) and six Marine Sanctuaries were identified in the Environmental Planning Area. In addition, two Conservation Parks, two Wildlife Reserves and three National Parks were identified as having coastal areas within the Environmental Planning Area.</p> <p>The Narrwong Coastal Reserve and Yambuck Coastal Reserve are long stretches of beach between Narrawong and Porty Fairy, however, no information on the reserves could be found.</p> <p>Barwon Bluff Marine Sanctuary</p> <p>Barwon Bluff Marine Sanctuary (17 ha) is located at Barwon Heads, approximately 100 km south-west of Melbourne. The Barwon Bluff Marine Sanctuary Management Plan (Parks Victoria 2007a) identifies the environmental, cultural and social values as:</p> <p>Intertidal reef platforms with a high diversity of invertebrate fauna and flora.</p> <p>Subtidal reefs that support diverse and abundant flora, including kelps, other brown algae, and green and red algae.</p> <p>Calcareneite and basalt reefs extending from The Bluff that are of regional geological significance.</p> <p>Intertidal habitats that support resident and migratory shorebirds, including threatened species.</p> <p>Subtidal habitats that support sedentary and mobile fish and are also used by migratory marine mammals.</p>

Protected Areas
<p>Marine habitats and species that are of scientific interest and valuable for marine education.</p> <p>Underwater recreation, including visits to subtidal communities that are easily accessible from the shore.</p> <p>Coastal vistas, seascapes and underwater scenery.</p> <p>Important landmark and area for gathering fish and shellfish for the Wathaurong people.</p> <p>Strong historic and ongoing connection with marine education.</p> <p>Remnants from the Earl of Charlemont, a heritage-listed shipwreck.</p> <p>Bay of Islands Conservation Park</p> <p>This coastal park has outstanding ocean views and geological features and covers an extensive area of the coastline (~32 km in length and 950 ha), stretching east from Warrnambool to Peterborough. Sheer cliffs and rock stacks dominate the bays, and the heathlands contain wildflowers. Beaches are accessible at some points (Parks Victoria 1998).</p> <p>This park protects the terrestrial environment above the low water mark of this coastline. This Coastal Park is managed under the Port Campbell National Park and Bay of Islands Coastal Park Management Plan (Parks Victoria 1998).</p> <p>Discovery Bay Marine National Park and Coastal Park</p> <p>The Discovery Bay Marine National Park is situated 20 km west of Portland and covering 2,770 ha. It covers part of the largest coastal basalt formation in western Victoria. In deep water (30 – 60 m) there are low reefs from ancient shorelines or dunes. There is a rich diversity of marine life within this park due to the cold, nutrient rich waters of the area. The deep calcarenite reefs support diverse sponge gardens whilst the shallower reefs support the brown alga <i>Ecklonia radiata</i>. The offshore waters support a diverse array of invertebrates including southern rock lobster, black-lip abalone, and gorgonians. The waters also support great white sharks and blue whales during the summer breeding season. The Discovery Bay Marine National Park abuts the Discovery Bay Coastal Park which are managed via the Ngootyoong Gunditj Ngootyoong Mara South West Management Plan (Parks Victoria 2015). The Plan describes some key values of the Discovery Bay Marine National Park and Coastal Park, namely:</p> <p>Important shorebird habitat for migratory species listed under international agreements.</p> <p>Two Important Bird Areas, Lawrence Rocks Wildlife Reserve, which consists of two rocky islets off the coast from Portland with a resident Australasian Gannett population, and the Discovery Bay Coast through to Picaninnie Ponds in South Australia with resident populations of Australasian Bittern, Hooded Plover, Rufous Bristlebird and Striated Fieldwren, and non-breeding Orange-bellied Parrot.</p> <p>The Bonney Coast, which extends from Robe in South Australia to Discovery Bay, is a productive area because of a nutrient rich cold water upwelling, known as the Bonney Upwelling. This high productivity provides an important feeding ground for seabirds, fur seals and whales. It also greatly influences primary productivity and maintains commercially important fisheries species such as Blacklip Abalone and Southern Rock Lobster. The continental shelf and the Bonney Upwelling draws close to the coast near the township of Portland, and this makes the area a highly significant recreational fishery for Southern Bluefin Tuna.</p> <p>Subtidal Reefs with six key natural assets – Brown macroalgae dominated beds, large mobile fish including sharks and rays, motile macroinvertebrates, Giant Kelp Forest communities, sessile invertebrate dominated communities such as thick growths of sponges, ascidians, bryozoans and gorgonians, and mixed red algae sessile invertebrate dominated communities.</p> <p>Great Otway National Park</p>

### Protected Areas

The Great Otway National Park (103,185 ha) is located near Cape Otway and stretches from the low water mark inland on an intermittent basis from Princetown to Apollo Bay (approximately 100 km). Landscapes within the park are characterised by tall forests and hilly terrain extending to the sea with cliffs, steep and rocky coasts, coastal terraces, landslips, dunes and bluffs, beaches and river mouths. There is a concentration of archaeological sites along the coast, coastal rivers and reefs. The park contains many sites of international and national geological and geomorphological significance including Dinosaur Cove (internationally significant dinosaur fossil site), Lion Headland and Moonlight Head to Milanesia Beach (internationally significant coastal geology and fossils).

The park provides habitats for the conservation of the Rufous Bristlebird, Hooded Plover, White-bellied Sea Eagle, Fairy Tern, Caspian Tern and Lewin's Rail and native fish such as the Australian Grayling.

The park contains significant Aboriginal cultural sites adjacent to rivers, streams and the coastline including over 100 registered archaeological sites, particularly shell middens along the coast, as well as non-physical aspects such as massacre sites, song lines, family links and stories. The park also contains four sites listed on the Victorian Heritage Register including the Cape Otway Light Station and several shipwreck features along the coast (Parks Victoria and DSE 2009).

This park protects the terrestrial environment above the low water mark of this coastline. The Park is protected under the Great Otway National Park and Otway Forest Park Management Plan (Parks Victoria and DSE 2009) and relevant values are:

Large area of essentially unmodified coastline, linking the land to marine ecosystems and marine national parks.

Diverse range of lifestyle and recreation opportunities for communities adjacent to the parks – for local permanent residents and holiday homeowners Regionally, nationally and internationally.

Significant tourist attractions, close to access routes and accommodation, such as spectacular coastal scenery along the Great Ocean Road, access to beautiful beaches, clifftop lookouts, picnic areas, historic sites, waterfalls and walking tracks such as the Great Ocean Walk.

Basis for continued growth of nature-based tourism associated with the parks and the region, providing economic opportunities for accommodation providers, food and services providers, and recreation, tourism and education operators.

Lady Julia Percy Island Wildlife Reserve

Lady Julia Percy Island is off the coast of Victoria 22 km south-west of Port Fairy. It is one of the two largest breeding sites for the Australian fur seal species in Australia (DCCEEW 2023h) and provides habitat to migratory seabirds.

Lawrence Rocks Wildlife Reserve

Lawrence Rocks Wildlife Reserve consists of two small islets about 6.8 ha and 1.5 ha in area that lie about 2 km offshore from Point Danger and about 6 km south-east of Portland in western Victoria (BirdLife International 2023). The islets are composed of basaltic and tuff rock. The habitat on the islets consists of exposed rock and some patches of exotic grasses and native and exotic herbs. The Australasian Gannet breeds on both islets in the IBA. Lawrence Rocks supports a small population of the Australian Fur Seal. BirdLife International have deemed Lawrence Rocks an Important Bird Area (BirdLife International 2023).

Marengo Reefs Marine Sanctuary

The Marengo Reefs Marine Sanctuary (12 ha) is in Victorian State waters near Marengo and Apollo Bay, which are on the Great Ocean Road, approximately 220 km south-west of Melbourne. The sanctuary protects two small reefs and a wide variety of microhabitats. Protected conditions on the leeward side of the reefs are unusual on this high wave energy coastline and allow for dense growths of bull kelps and other seaweed. There is an abundance of soft corals, sponges, and other marine invertebrates, and over 56 species of fish have been recorded in and around the sanctuary. Seals rest on the outer island of the reef and there are two shipwrecks (the Grange and Woolamai) in the sanctuary (Parks Victoria 2007).

Protected Areas
<p>The Marengo Reefs Marine Sanctuary Management Plan (Parks Victoria 2007) identifies the environmental, cultural and social values as:</p> <ul style="list-style-type: none"> <li>Subtidal soft sediments, subtidal rocky reefs and intertidal reefs.</li> <li>High diversity of algal, invertebrate and fish species.</li> <li>Australian fur seal haul out area.</li> <li>Evidence of a long history of Indigenous use, including many Indigenous places and objects nearby.</li> <li>Wrecks of coastal and international trade vessels in the vicinity of the sanctuary.</li> <li>Spectacular underwater scenery for snorkelling and scuba diving.</li> <li>Intertidal areas for exploring rock pools.</li> <li>Opportunities for a range of aquatic recreational activities including seal watching.</li> </ul> <p><b>Merri Marine Sanctuary</b></p> <p>The Merri Marine Sanctuary is on the Victorian south-west coast near Warrnambool, approximately 260 km west of Melbourne. Merri Reefs Marine Sanctuary (25 ha) is located at the mouth of the Merri River, west of Warrnambool Harbour. Merri Marine Sanctuary contains a mixture of habitats, including intertidal reef, sand, shallow reef and rocky overhang. These areas provide a nursery for many fish species and a habitat for many algae species, hardy invertebrates and shorebirds. Bottlenose dolphins and fur seals are regular visitors to the shore (Parks Victoria 2007c).</p> <p>The Sanctuary is protected with the Merri Marine Sanctuary Management Plan (Parks Victoria, 2007c) identifies the environmental, cultural and social values as:</p> <ul style="list-style-type: none"> <li>Culturally significant to indigenous communities that have a long association with the area.</li> <li>Merri River, wetlands and islands and headlands provide a variety of habitats.</li> <li>Provision of nursery for many fish species and habitat for algal species, hardy invertebrates and shorebirds.</li> </ul> <p><b>Mornington Peninsula National Park</b></p> <p>Mornington Peninsula National Park is situated about 70 km south of Melbourne. Mornington Peninsula National Park runs along the coast from Point Nepean, at the western tip of the Mornington Peninsula, to Bushrangers Bay, where it turns inland along the Main Creek valley, still as a narrow band, until it joins the more expansive Greens Bush section of the Park. This park protects the terrestrial environment above the low water mark of this coastline. The Park is managed under the Mornington Peninsula National Park and Arthurs Seat State Park Management Plan, which has identified the key environmental, social and cultural values as (Parks Victoria 2016):</p> <ul style="list-style-type: none"> <li>Largest and most significant remaining areas of native vegetation on the Mornington Peninsula. Numerous sites and features of geomorphic significance, particularly along the coast (cliffed calcarenite coast sandy forelands and basalt shore platforms).</li> <li>Only representation in the Victorian conservation reserve system of four land systems formed within the Southern Victorian Coastal Plains and the Southern Victorian Uplands.</li> <li>Many significant native plants and vegetation communities, especially in Greens Bush and former McKellar Flora Reserve, and the most extensive remnant coastal grassy forest habitat on the Mornington Peninsula.</li> <li>Highly scenic landscape values along the ocean coast and at Port Phillip heads and the prominent landscape feature of Arthurs Seat.</li> </ul>

Protected Areas
<p>Many significant fauna species, including populations of the nationally significant hooded plover, over 30 species of State significance and many species of regional significance.</p> <p>High quality marine and intertidal habitats, with some pristine areas within Point Nepean.</p> <p>Nationally significant and fascinating historic sites at Point Nepean.</p> <p>Historic Seawinds Gardens in Arthurs Seat State Park.</p> <p>One of the highest recorded densities of Aboriginal archaeological sites along the Victorian Coast</p> <p>South Channel Fort is an important component of the historic fortification defence system of Port Phillip (and an important bird nesting and roosting site).</p> <p>Spectacular scenery and popular surf beaches associated with a wild and rugged coastline.</p> <p>Local and regional economic benefits.</p> <p>Intensively used recreational nodes, e.g. at Portsea, Sorrento, Cape Schanck and Arthurs Seat.</p> <p>Point Addis Marine National Park, Point Danger Marine Sanctuary and Eagle Rock Marine Sanctuary</p> <p>The three protected areas are managed under the Management Plan for Point Addis Marine National Park, Point Danger Marine Sanctuary and Eagle Rock Marine Sanctuary (Parks Victoria 2005).</p> <p>Point Addis Marine National Park lies east of Anglesea and covers 4,600 hectares. The park protects representative samples of subtidal soft sediments, subtidal rocky reef, rhodolith beds and intertidal rocky reef habitats. The park also provides habitat for a range of invertebrates, fish, algae, birds and wildlife. The world-famous surfing destination of Bells Beach is within the park.</p> <p>Point Danger Marine Sanctuary is 20 km south-west of Geelong, close to the township of Torquay and nearby Jan Juc and covers 25 ha. It extends from the high-water mark at Point Danger offshore for approximately 600 m east and 400 m south, encompassing an offshore rock platform.</p> <p>Eagle Rock Marine Sanctuary is about 40 km south-west of Geelong, close to Aireys Inlet and covers 17 ha. The sanctuary extends from high water mark around Split Point between Castle Rock and Sentinel Rock. It extends offshore for about 300 m and includes Eagle Rock and Table Rock. The main habitats protected by the sanctuary include intertidal and subtidal soft sediment, intertidal and subtidal reefs, and the water column.</p> <p>The management plan identifies the following environmental, cultural, and social values for the parks and sanctuaries:</p> <p>Sandy beaches, subtidal soft sediments, subtidal rocky reefs, rhodolith beds and intertidal reefs.</p> <p>High diversity of algal, invertebrate and fish species.</p> <p>High diversity of sea slugs (opisthobranchs) and other invertebrate communities within Point Danger Marine Sanctuary.</p> <p>Evidence of a long history of Indigenous use, including many Indigenous places and objects adjacent to the park and sanctuaries near dunes, headlands, estuaries and creeks.</p> <p>Surf breaks, including those at Bells Beach, which are culturally important to many people associated with surfing.</p> <p>Coastal seascapes of significance for many who live in the area or visit.</p>

Protected Areas
<p>Recreational and tourism values</p> <p>Spectacular underwater scenery for snorkelling and scuba diving.</p> <p>Intertidal areas for exploring rock pools.</p> <p>Opportunities for a range of recreational activities.</p> <p>Spectacular seascape complementing well-known visitor experiences on the Great Ocean Road.</p> <p>Port Campbell National Park</p> <p>Port Campbell National Park is slightly west of Twelve Apostles Marine National Park and 10 km east of Warrnambool. The park is 1,750 ha that presents an extraordinary collection of wave-sculptured rock formations. Port Campbell National Park is home to various fauna such as the little penguin, short-tailed shearwater, and various whale species (Parks Victoria 1998).</p> <p>Port Phillip Heads Marine National Park</p> <p>Port Phillip Heads Marine National Park is an area of 35.8 km<sup>2</sup> that is located at the southern end of Port Phillip Bay. Many areas within the Port Phillip Heads Marine National Park are popular for a range of recreational activities. The habitats that are found within the park are seagrass beds, sheltered intertidal mudflats, intertidal sandy beaches and rocky shores, subtidal soft substrate and rocky reefs. The bay has a high diversity and abundance of marine flora and fauna that provides a migratory site for wader birds (Visit Victoria 2019). The land adjacent to the Port Phillip Heads Marine National Park is within the Port Nepean National Park.</p> <p>Twelve Apostles Marine National Park and The Arches Marine Sanctuary</p> <p>The Twelve Apostles Marine Park is managed in conjunction with the Arches Marine Sanctuary under the Twelve Apostles Marine National Park and The Arches Marine Sanctuary Management Plan (Parks Victoria 2006).</p> <p>The Twelve Apostles Marine National Park (7,500 ha) is located south-east of Port Campbell between Broken Head and Pebble Point and extends offshore 3 nautical miles to the limit of Victorian waters (Parks Victoria 2006).</p> <p>The area is representative of the Otway Bioregion and is characterised by a submarine network of towering canyons, caves, arches, and walls with a large variety of seaweed and sponge gardens plus resident schools of reef fish. The park contains areas of calcarenite reef supporting the highest diversity of intertidal and sub-tidal invertebrates found on that rock type in Victoria (Parks Victoria 2006).</p> <p>The Arches Marine Sanctuary (45 ha) is approximately 600 m offshore from Port Campbell. It has a spectacular dive site of limestone formations, rocky arches, and canyons. The sanctuary is also ecologically significant, supporting habitats such as kelp forests and a diverse range of sessile invertebrates on the arches and canyons. These habitats support schools of reef fish, seals and a range of invertebrates such as lobster, abalone and sea urchins.</p> <p>The Twelve Apostles Marine Park is managed in conjunction with the Arches Marine Sanctuary under the Management Plan for Twelve Apostles Marine National Park and The Arches Marine Sanctuary (Parks Victoria 2006b) and is classified as IUCN II. The Plan describes the key environmental, cultural, and social values as:</p> <p>Unique limestone rock formations, including the Twelve Apostles.</p> <p>Range of marine habitats representative of the Otway marine bioregion.</p> <p>Indigenous culture based on spiritual connection to sea country and a history of marine resource use.</p> <p>Wreck of the Loch Ard (shipwreck).</p>

Protected Areas
<p>Underwater limestone formations of arches and canyons.</p> <p>Diverse range of encrusting invertebrates.</p> <p>Spectacular dive sites.</p> <p>South Australian Marine and Coastal Conservation Parks</p> <p>Lower South East Marine Park</p> <p>The Lower South East Marine Park Management Plan 2012 (DEWNR 2012) details the following values:</p> <p>High diversity of plants and animals, including blue whales, due to the influence of the Bonney coast upwelling, an ocean current that supplies nutrient-rich water to the area.</p> <p>Diverse range of habitats ranging from high-energy sandy beaches and freshwater springs, various reef types (shore platforms, fringing and limestone),</p> <p>Kelp forests and algal communities and is strongly influenced by natural processes such as the Bonney coast upwelling.</p> <p>Spring lakes such as Ewen Ponds and Piccaninnie Ponds (both Wetlands of National Importance) emerge from the beaches and are unusual in South Australia.</p> <p>Habitat for several threatened or potentially threatened species that require freshwater and marine environments during their lifecycle, including the pouched lamprey, short-headed lamprey and shortfinned eel.</p> <p>Feeding and resting grounds for migratory and resident shorebirds.</p> <p>Recreational activities including fishing, diving and snorkelling.</p> <p>Commercial fisheries including the Southern Zone Abalone Fishery, the Southern Zone Rock Lobster Fishery, the Marine Scalefish Fishery, the Charter Fishery and the Miscellaneous Giant Crab Fishery.</p> <p>Buandig Aboriginal people have traditional associations with areas of the marine park.</p> <p>Douglas Point Conservation Park</p> <p>Douglas Point Conservation Park provides scenic views of the coastline and is home to a rare daisy that is only found in three other sites in Australia. The coastal park features areas of exposed limestone, sea cliffs, small sandy beaches and dense coastal vegetation, and provides for fishing, diving and bushwalking. The park is managed under the Douglas Point Conservation Park Management Plan (DEH 2003).</p> <p>Values of the park (DEH 2003) are:</p> <p>The only reserved population of Sand Ixodia in Australia.</p> <p>Conserves vulnerable (SA) Rufous Bristlebird and rare (SA) Beautiful Firetail, regionally uncommon coast velvet-bush and drooping velvet-bush.</p> <p>Nationally endangered Orange-bellied Parrot recorded in the Park.</p> <p>The Park is located within the traditional lands of the Boandik people. The remains of scattered middens are evidence of Aboriginal habitation in the past.</p> <p>Shipwrecks.</p> <p>Nene Valley Conservation Park</p>

Protected Areas
<p>Nene Valley Conservation Park preserves an area of vegetation typical of sandy coasts in the south-east of South Australia. This vegetation complex has suffered through the effects of clearing and grazing throughout much of its former range.</p> <p>Piccaninnie Ponds Conservation Park</p> <p>The Piccaninnie Pond covers an area of 8.64 km<sup>2</sup>, that has a wide diversity of fauna and flora with 60 bird species and six vegetation communities. Other vegetation found within the park includes reeds, sedge swamp, open heath and tussock grassland.</p> <p>Tasmanian Marine and Coastal Parks and Reserves</p> <p>Black Pyramid Rock Nature Reserve</p> <p>Black Pyramid Rock Nature Reserve, situated on Hunter Island has a land mass of 40 ha. Black Pyramid Rock was proclaimed a Wildlife Sanctuary on 30 June 1964 due to it being the largest known breeding ground for Australasian gannets in Australia (DPIWE 2020). The Nature Reserve is managed under the Small Bass Strait Island Reserves Draft Management Plan (DPIWE 2020).</p> <p>Cape Wickham State Reserve</p> <p>The Cape Wickham State Reserve is on the northern tip of King Island and contains Cape Wickham lighthouse and the gravesites of the crew of Loch Leven, a ship that was wrecked nearby. It is designated as IUCN Category V which is a protected landscape/seascape.</p> <p>Christmas Island Nature Reserve</p> <p>Christmas Island is located off the west coast of King Island. It is designated IUCN 1a which is a strict nature reserve, which allows minimal human use. It is a BIA for both breeding and foraging for the little penguin (Commonwealth of Australia, 2015a). It is also a known nesting site of the Little Tern. Christmas Island Nature Reserve is a priority site for management under the King Island Biodiversity Management Plan (TSS 2012).</p> <p>Councillor Island Nature Reserve</p> <p>Councillor Island Nature Reserve is a 10.53 ha granite reserve east of Tasmania approximately 2.5 km off the mainland coastline of Tasmania within the Bass Strait. The island forms part of the King Island Important Bird Area because of its importance for breeding seabirds and waders.</p> <p>Disappointment Bay State Reserve</p> <p>The Disappointment Bay State Reserve is located on the north coast of King Island near Cape Wickham.</p> <p>Lavinia State Reserve</p> <p>Lavinia State Reserve is located on the north-east coast of King Island. The reserve contains a number of rare birds, including the endangered orange-bellied parrot (DELWP 2016). It includes the Lavinia Ramsar site and two freshwater lakes. Lavinia Beach is a popular location for surfing and fishing. The Lavinia Nature Reserve (Ramsar Site) Management Plan draft (2000) is not available online. The Sea Elephant Estuary which is within the Lavinia State Reserve is a priority site for management under the King Island Biodiversity Management Plan (TSS 2012).</p> <p>Reid Rock Nature Reserve</p> <p>Reid Rocks are situated approximately 21.5 km east-south-east of Stokes Point at the southern extremity of King Island in western Bass Strait. The main islet is approximately 500 m long and rises to 13 m above sea level. Reid Rocks became a Nature Reserve on 5 April 1978 due to their importance as an Australian fur seal breeding colony (DPIWE 2020). The Nature Reserve is managed under the Small Bass Strait Island Reserves Draft Management Plan (DPIWE 2020).</p>

<b>Protected Areas</b>
<p>Seal Rock State Reserve</p> <p>Seal Rock State Reserve is located on the south-east coast of King Island. Species and vegetation communities are seabird rookeries, shining dogwood, triggerplants and coastal complex on King Island. Seal Rock State Reserve is a priority site for management under the King Island Biodiversity Management Plan (TSS 2012).</p>
<b>Predicted Level of Risk</b>
<p>Due to the distance to the South Australian and King Island coastal areas from the Operational Area (~130 km and ~ 70 km respectively) impacts to coastal areas above the low thresholds are not predicted. As the Operational Area is as close as ~7 to the Victorian coast, there is the potential for diesel above the low threshold to be visible on the ocean surface in coastal waters and as a sheen on shoreline areas. Most of the diesel will be concentrated along the high tide mark while the lower/upper parts are often untouched (IPIECA 1995) and expected to be visible.</p> <p>Visible nearshore and shoreline hydrocarbons have the potential to reduce the visual amenity of the area for tourism and discourage recreational activities within protected areas. Due to the low volumes, light nature of marine diesel and substantial wave action with the nearshore areas impacts are likely to be short term and not require intrusive clean-up response.</p> <p>The predicted level of consequence to protected areas and their values from a 250 m3 MDO spill is assessed as moderate as exposure to oil above low thresholds could occur in protected areas nearshore of the Operational Area, though if consequences occurred, they are likely to only affect a small portion of coastal areas or marine areas for a short duration (hours to days) due to the low spill volume and short duration of any exposure, the likelihood is assessed as rare (based on the absence of any reported seismic vessel collisions in Australia) resulting in a predicted level of risk of medium.</p>

## 7 Predicted Levels of Risk

Circumstances resulting in a loss of containment of MDO such as a vessel collision and subsequent fuel tank rupture) are low probability events in open ocean areas without restricted navigation. Though shipping activity is relatively high within the Operational Area, modern navigational aids assist in reducing the likelihood of a collision event.

There have been no vessel collisions during a seismic survey in Australia. While undertaking the survey the seismic and support vessels will be moving at a slow speed of up to 10 km/hr and the seismic vessel will always have at least one vessel with it to observe and respond to any vessels that come to close to the seismic vessel, thereby further reducing the risk of collision with third-party vessels. Therefore, the likelihood of a vessel collision resulting in a loss of a full tank of MDO is rare.

## 8 Comparison of Predicted Level of Risk with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Principles of ESD	Impact result in temporary / reversible, small scale, and/or low intensity environmental damage.	A vessel oil spill is not predicted to occur but if it occurred impacts would be temporary / reversible, small scale, and/or low intensity environmental damage due to the low volumes and light nature of marine diesel.	Yes
	The impact assessment process is based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature and government management plans, recovery plans and conservation advice were used to inform the risk assessment. A vessel oil spill is not predicted. There is high confidence in the prediction of risks from a vessel oil spill.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	Management of the activity is consistent with EPBC Act Management Plans and Recovery Plans as detailed in Annex 1 of this document.	Yes
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	A vessel oil spill is not predicted to occur but if it occurred risks would be temporary / reversible, small scale, and/or low intensity environmental damage due to the low volumes and light nature of marine diesel.	Yes
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	A vessel oil spill is not predicted to occur but if it occurred risks would be temporary / reversible, small scale, and/or low intensity environmental damage due to the low volumes and light nature of marine diesel.	Yes
Economic	Affected persons will not be worse off as a result of the activity.	A vessel oil spill is not predicted to occur but if it occurred impacts would be temporary / reversible, small scale, and/or low intensity environmental damage due to the low volumes and light nature of marine diesel.	Yes
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.	A vessel oil spill is not predicted to occur but if it occurred impacts would be temporary / reversible, small scale, and/or low intensity environmental damage due to the low volumes and light nature of marine diesel.	Yes

Defined Acceptable Level		Predicted Level of Risk	Predicted Level of Risk Below Defined Acceptable level?
Category	Level		
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce the risk of a vessel oil spill.	Yes
	Environmental impacts and risks are consistent with the CCG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.	The predicted consequence ranges from Minor to Moderate depending on the report with the likelihood of rare as a vessel collision would only occur in exceptional circumstance. Thus, the risk level ranges from Low to Medium.	Yes
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the risk.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	Some relevant persons reported finding oily residues and tar balls on beach walks along the Otway coastline. This information has been included in this risk assessment and is expected given the hydrocarbon prone geology of the area.  From relevant person consultation objections and claims have been made regarding:  Impacts to beaches and shorebird nesting areas. This risks assessment shows that impacts to beaches and shorebird nesting area would be temporary / reversible, small scale, and/or low intensity environmental damage due to the low volumes and light nature of marine diesel.  Balls of crude oil along beaches and how these will be disposed. Diesel being a light fuel is not prone to forming crude oil balls.  Notification to the DNP in the event of oil/gas pollution incidences which occur within a marine park or are likely to pose a risk to a marine park as soon as possible. This requirement is covered in the Regia MSS Implementation Strategy and Oil Pollution Emergency Plan.	Yes
	The views of public have been considered in the impact and risk assessment.	To date there has been no views from the public in relation to a vessel oil spill.	Yes

## 9 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure environmental risks will be of an acceptable level and ALARP.

Measure	Justification	Adopted
M#02: Consultation Management System	CGG will implement the Consultation Management System to ensure that pre and during survey communications will be undertaken so that other marine users know when, where and how the Regia MSS will be undertaken so they can undertake their activities in a manner that avoids any interactions or can engage with CGG so that both parties can plan activities in a manner that minimises potential displacement to each party.	Yes
	A simultaneous operations plan will be developed if the seismic vessels or any equipment will enter the 500 m Petroleum Safety Zone of the Thylacine-A platform.	Yes
M#05: CGG Marine Assurance System	Project vessels, as part of the CGG contracting process, will undergo OVID-style inspections to verify the validity and compliance of certificates required by COLREGS, the Navigation Act, SOLAS and various Marine Orders, and the presence of a vessel bunkering procedure and a Shipboard Oil Pollution Emergency Plan (SOPEP), tailored to the vessel's class and operational requirements.	Yes
	CGG Marine Assurance System will ensure vessel materials or equipment that have the potential for spill overboard are within contained/bunded areas.	Yes
	CGG Marine Assurance System will ensure vessels have a bunkering procedure that at a minimum details: Use of certified equipment with checked integrity including dry-break couplings. No bunkering within 50 km of a Commonwealth or State marine parks. Transfer process (e.g. safety, communication, monitoring, inventory, emergency shut down, spill response and incident reporting).	Yes
	CGG Marine Assurance System will ensure vessels have a documented Preventative Maintenance System (PMS) that provides a status on the maintenance of equipment as per the manufacturer's specification for maintenance procedures.	Yes
M#07: Adjustment Protocol	An adjustment process will be implemented if a commercial fisher has a financial loss due to the Regia MSS.  The adjustment process will be developed in consultation with the fishery associations that represent the commercial fishers that fish within the Operational Area.  Other titleholders in the region will be invited to participate in the review, update, and implementation of the adjustment process.	Yes
M#08: Oil Spill Response Plans	CGG will have a NOPSEMA accepted Oil Pollution Emergency Plan (OPEP) and Oil Spill Monitoring Plan (OSMP).  Under the OPGGS (Environmental) Regulations, NOPSEMA require that a petroleum activity (Regia MSS) have an accepted OPEP and OSMP in place before the activity commences. In the event of a vessel loss of containment, the OPEP and OSMP will be implemented.	Yes

## 10 Conclusion

This chapter predicts the levels of risk to environmental receptors within the Environment Planning Area of the Regia MSS. The survey vessels and support vessels will carry an inventory of oils and fuel and though it is unlikely that a spill will occur during operations the risk is part of carrying out the activity. A summary of the outcomes of the risk assessment is provided in Table D4-10-1.

*Table D4-10-1: Summary of Risk Assessment Outcome for Accidental Release of Fuel*

Receptor	Sensitivity	Consequence	Likelihood	Predicted Level of Risk
Water Quality	Medium	Minor	Rare	Low
Sediment Quality	Low	Minor	Rare	Low
Benthic Assemblages	Medium	Moderate	Rare	Medium
Coastal Habitats & Communities	Medium	Moderate	Rare	Medium
Plankton	Low	Minor	Rare	Low
Invertebrates	Low	Minor	Rare	Low
Fish	Low	Minor	Rare	Low
Birds	Medium – seabirds	Minor	Rare	Low – seabirds, aquatic birds
	High – aquatic birds, shorebirds	Moderate	Rare	Medium - Shorebirds
Marine Reptiles	Medium	Minor	Rare	Low
Marine Mammals	Medium	Moderate	Rare	Medium
Coastal Developments	High	Moderate	Rare	Medium
Indigenous Culture	High	Moderate	Rare	Medium
Commercial Fisheries	Medium	Moderate	Rare	Medium
Seaweed Industry	Medium	Minor	Rare	Low
Marine Industries	Medium	Minor	Rare	Low
Tourism (inc. Diving and Recreational Fishing)	High	Moderate	Rare	Medium
Protected Areas	High	Moderate	Rare	Medium

## 11 Recommendations

As demonstrated in this risk assessment, the predicted level of risk to each receptor has either been assessed as medium or low. The predicted levels of risk are clearly below the pre-defined acceptable levels of risk and the mitigation and management measures in place provide reliable prevention to have confidence in the predicted likelihood levels, thus there are no further recommendations.

## 12 Document Control

Date	Revision	Update
6 July 2023	A	Draft prepared for initial comment
23 August 2023	B	Update based on comments and relevant person feedback
11 Sept 2023	0	Approved for release on Regia MSS website
20 Dec 2023	1	EP submission to NOPSEMA

## Annex 1: Legislative and Other Requirements Relevant to Accidental Release of Fuel

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
<b>Commonwealth Legislation</b>			
Australian Maritime Safety Authority Act 1990	The act establishes the Australian Maritime Safety Authority (AMSA), which is responsible for ensuring the safety of vessels and seafarers.	Vessels are required to implement safety requirements as per the Navigation Act and applicable marine orders.  AMSA is the designated Control Agency for oil spills from vessels in Commonwealth waters.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
AMSA Advisory note for the offshore petroleum industry on environmental plans and oil pollution emergency plans	As of 2021, AMSA will no longer be entering into any direct agreements with Titleholders for support with oil spill preparedness and response into the future. AMSA will continue to fulfil its obligations under the National Plan for Maritime Environmental Emergencies for non-ship source pollution incidents on the formal request from the	In the event of an oil spill from a vessel associated with the Regia MSS, AMSA is the Control Agency with CGG providing support and resources as directed by AMSA.	This requirement is met by the implementation of M#08: Oil Spill Response Plans where the NOPSEMA Accepted OPEP details the role of the vessel operator, CGG and AMSA in the event of an oil spill.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	respective Offshore Petroleum Incident Controller/s.		
Marine Order 21 (Safety and Emergency Arrangements)	The marine order provides guidance on the safety and emergency arrangements for vessels.	Vessels are required to have safety and emergency arrangements dealing with life-saving appliances and arrangements, safety of navigation and special measures to enhance maritime safety in accordance with the marine order.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
Marine Order 27 (Safety of Navigation and Radio Equipment)	The marine order provides guidance on the prevention of collisions between vessels.	Vessels are required to have navigation and radio equipment that meets the marine order requirements.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
Marine Order 30 (Prevention of Collisions)	The marine order provides guidance on the prevention of collisions between vessels.	Vessels are required to have onboard navigation, radar equipment, and lighting that meets the International Rules for Preventing Collisions at Sea (COLREGs).	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Marine Order 31 SOLAS and non-SOLAS certification	The marine order provides guidance on the survey, certification, and maintenance of certificates for regulated Australian vessels and certification of foreign vessels.	Vessels are required to have in date certification in accordance with AMSA MO 31: SOLAS and non-SOLAS certification.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
Marine Order 70 (Seafarer Certification)	The marine order provides guidance on the certification of seafarers.	Vessel crew are required to be certified and trained as per the marine order requirements	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
Marine Order 71 (Masters and Deck Officers)	The marine order provides guidance on the certification and training of masters and deck officers for vessels.		
Marine Order 72 (Engineer Officers)	The marine order provides guidance on the certification and training of engineer officers for vessels.		
Marine Order 91 - Marine pollution prevention - oil	Marine Order 91 sets out the requirements for the prevention of marine pollution by oil from ships in Australian waters. The order establishes procedures	Vessels are required to have a Shipboard Marine Pollution Emergency Plan (SMPEP) or Shipboard Oil Pollution Emergency Plan (SOPEP) (according to class) developed based upon the Guidelines for the Development of Shipboard Oil Pollution Emergency Plans and approved by AMSA.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL,

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	for reporting, investigating, and responding to pollution incidents, as well as measures for the clean-up and disposal of spilled pollutants. It also sets out the requirements for pollution emergency plans, contingency planning, and pollution response equipment and training.		COLREGS and Marine Orders.
Marine Order 93 - Marine pollution prevention - noxious liquid substances	Marine Order 93 sets out the requirements for the prevention of marine pollution from liquids and chemicals in Australian waters, including measures to prevent spills, leaks, and discharges of noxious liquids from ships. The order establishes procedures for reporting, investigating, and responding to noxious liquid pollution incidents, as well as measures for the clean-up and disposal of spilled	Vessels are required to prevent spills to the marine environment.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	noxious liquids. It also sets out the requirements for noxious liquids pollution emergency plans, contingency planning, and pollution response equipment and training.		
Marine Order 94—Marine pollution prevention – packaged harmful substances	Marine Order 94 sets out the requirements for the prevention of marine pollution from packaged harmful substances in Australian waters, including management of harmful substances in packaged form, washing substances overboard and notifying and reporting an incident.	Vessels are required to prevent spills to the marine environment.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
National Plan for Maritime Emergencies (AMSA 2020)	The National Plan implements Australia's obligations under the International Convention Relating to Intervention on the High Seas in Cases of Oil Pollution Casualties, 1969; United Nations Convention on the Law	CGG is required to have an Oil Pollution Emergency Plan (OPEP), accepted by NOPSEMA before the Regia MSS can commence.	This requirement is met by the implementation of M#08: Oil Spill Response Plans.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	of the Sea, 1982; the International Convention on Oil Pollution Preparedness, Response and Co-operation, 1990; and the Protocol on Preparedness, Response and Co-operation to Pollution Incidents by Hazardous and Noxious Substances, 2000 with respect to the management of maritime environmental emergencies.		
Navigation Act 2012	Australian implementation of the International Regulations for Preventing Collisions at Sea.	Vessels are required to implement navigation requirements as detailed in the Act and associated marine orders.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.
NOPSEMA Petroleum activities and Australian	The purpose of this guidance note is to provide guidance on the	The Regia MSS EP should evaluate how the activity impacts and risks to AMPs will be of an acceptable level and reduced to as low as reasonably practicable (ALARP).	This requirement is met by this risk assessment that

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Marine Parks Guidance Note	key management arrangements and requirements that are relevant to petroleum and greenhouse gas activities that may affect Australian Marine Parks (AMPs). The intent is to assist titleholders in preparing EPs that comply with regulatory requirements.	There needs to be a clear demonstration that the activity will not be inconsistent with the relevant marine park management plan. When making a case to demonstrate how these requirements are met and to define the acceptable levels of environmental impact and risk, titleholders should have regard to context such as marine park and zone objectives, the marine park values including the representativeness of relevant natural values, and any claims and/or objections made by the DNP during consultation	shows that risks to AMPs from a 250 m <sup>3</sup> MDO spill are predicted to be of an acceptable level short due to the low spill volume and short duration (hours to days) of any exposure.
		In the South-east marine park network oil pollution response, environmental monitoring and remediation activities are allowable under existing authorisations (class approvals) in IUCN category VI zones, when undertaken in accordance with an EP accepted under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Environment Regulations).	This requirement is met by the Regia MSS EP which must be accepted by NOPSEMA prior to the activity commencing.
		The DNP should be made aware of oil spills which occur within AMPs, or are likely to impact marine parks, as soon as possible.	This requirement is met by the implementation of M#08: Oil Spill Response Plans where the NOPSEMA Accepted OPEP details reporting requirements to the DNP in the event of an oil spill.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
			The Regia MSS Implementation Strategy (Appendix B3) also details reporting requirements to the DNP in the event of an oil spill.
Protection of the Sea (Civil Liability for Bunker Oil Pollution Damage) Act 2008	The Protection of the Sea (Civil Liability for Bunker Oil Pollution Damage) Act 2008 is a Commonwealth legislation that provides for civil liability and compensation for damages caused by oil spills from ships' bunkers in Australian waters. The act establishes a regime for the liability of the shipowner and the right to compensation of the affected parties, including the cost of clean-up and restoration of the environment. The act also provides for the limitation of liability of the shipowner in certain circumstances.	Places liability on vessel owner for pollution damage caused by loss of bunker fuel.	NA – as vessels will not be carrying bunker fuel.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Protection of the Sea (Prevention of Pollution from Ships) Act 1983	The act regulates the prevention of pollution from ships, which may be associated with the transportation of personnel and equipment during seismic surveys.	Vessels greater than 400 gross tonnes and above to have pollution emergency plans.	This requirement is met by the implementation of M#05: CGG Marine Assurance System which will verify that vessels have a pollution emergency plans tailored to the vessel's class and operational requirements.
<b>Victorian Legislation</b>			
Emergency Management Act 2013	This act provides for the management of emergencies, including natural disasters and other incidents that threaten public safety, health, or welfare. It establishes a framework for emergency management at the federal, state, and local levels, and sets out the roles and responsibilities of emergency management agencies.	CGG is required to have an Oil Pollution Emergency Plan (OPEP), accepted by NOPSEMA before the Regia MSS can commence.	This requirement is met by the implementation of M#08: Oil Spill Response Plans where the NOPSEMA Accepted OPEP details the role of the vessel operator, CGG, AMSA and the Victorian Combat Agency in the event of an oil spill posing a risk to Victorian waters.
Pollution of Waters by Oil and Noxious Substances Act 1986 (POWBONS)	This act provides measures for preventing, controlling, and cleaning up pollution caused by oil and other noxious	Requires mandatory reporting of marine pollution incidents that could pose a risk to Victorian waters.	This requirement is met by the implementation of M#08: Oil Spill Response Plans where the NOPSEMA Accepted OPEP

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	substances in Australian waters. It aims to reduce the risk of damage to the environment and protect public health and safety.		details reporting requirements in the event of an oil spill.  The Regia MSS Implementation Strategy (Appendix B3) also details reporting requirements in the event of an oil spill.
<b>Tasmanian Legislation</b>			
EPA Tasmania – Offshore Petroleum Industry Guidance Note	The purpose of the guidance note is to inform Offshore Petroleum Titleholders (Petroleum Titleholders) of the Tasmanian emergency management arrangements in respect to Marine Oil Pollution emergencies in State waters. The guidance note outlines Petroleum Titleholders obligations under those arrangements and the Department of Primary Industry Parks Water and Environment – EPA Tasmania (EPA) expectations.	CGG is required to have an Oil Pollution Emergency Plan (OPEP), accepted by NOPSEMA before the Regia MSS can commence.  For any Pollution emergency, it is an expectation that the Petroleum Titleholder will conduct initial response actions in State waters as necessary in accordance with their OPEP/OSCP and continue to manage those operations until incident control can be established by EPA Tasmania.	This requirement is met by the implementation of M#08: Oil Spill Response Plans where the NOPSEMA Accepted OPEP details the role of the vessel operator, CGG, AMSA and the Tasmanian EPA in the event of an oil spill posing a risk to Tasmanian waters.

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Marine-related Incidents (MARPOL Implementation) Act 2020	Under the Act, the Tasmanian EPA is responsible for preparedness for and responding to oil and chemical spills in Tasmania.	CGG is required to have an Oil Pollution Emergency Plan (OPEP), accepted by NOPSEMA before the Regia MSS can commence.	
<b>Guidance Material</b>			
Environmental Management in the Upstream Oil and Gas Industry (IOGP-IPIECA, 2020)	The primary focus of this report is on managing the risk from potential impacts to the natural environment during exploration and production of oil and gas.	<p>Of relevance are:</p> <ul style="list-style-type: none"> <li>• Ensure all facilities/infrastructure has the appropriate navigation lighting and all facilities/infrastructure and subsea infrastructure is gazetted and included on navigational charts.</li> <li>• Issue a 'Notice to Mariners' through the relevant government agencies, detailing the area of operations.</li> <li>• Ensure all vessels adhere to International Regulations for Preventing Collisions at Sea (COLREGS), which set out the navigation rules to be followed to prevent collisions between two or more vessels.</li> </ul>	<p>This requirement is met by this risk assessment and the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders to minimise the likelihood of an oil spill.</li> <li>• M#02: Consultation Management System which details</li> </ul>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
			notification requirements to the AHO and AMSA and to relevant stakeholders as required.
<b>Birds</b>			
Wildlife Conservation Plan for Seabirds (CoA 2020a)	<p>The plan aims to provide a national framework for the research and management of listed marine and migratory seabirds and to outline national activities to support the conservation of listed seabirds in Australia and beyond.</p> <p>Threatened species are not covered by the plan and receive separate, approved conservation advice and, in some cases, a recovery plan which sets out what should be done to stop the decline and support the recovery of the species.</p>	<p>Fuel spills are identified as a threat with the following actions relevant:</p> <ul style="list-style-type: none"> <li>• Manage the effects of anthropogenic disturbance to seabird breeding and roosting areas.</li> <li>• Ensure all areas of important habitat for seabirds are considered appropriately and consistently in the development assessment process.</li> </ul>	<p>This requirement is met by this risk assessment and the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS, Marine Orders and Vessel Pollution Emergency Plan to minimise the likelihood of an oil spill.</li> <li>• M#08: Oil Spill Response Plans with the</li> </ul>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
			<p>NOPSEMA Accepted OPEP to minimise the effects of an oil spill and NOPSEMA Accepted OSMP to monitor for any potential impacts.</p>
Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)	<p>The plan provides a framework to guide the conservation of migratory shorebirds and their habitat in Australia and, in recognition of their migratory habits, outlines national activities to support their appreciation and conservation throughout the East Asian-Australasian Flyway (EAAF).</p>	<p>The conservation plan identifies that migratory shorebirds are not directly affected by oil spills, but important habitat may be affected with the following action relevant to an oil spill:</p> <ul style="list-style-type: none"> <li>• Ensure all areas important to migratory shorebirds in Australia continue to be considered in development assessment processes.</li> <li>• Enhance contingency plans to prevent and/or respond to environmental emergencies that have an impact on seabirds and their habitats.</li> </ul> <p>The conservation plan refers to the EPBC Act Policy Statement 3.21 Industry Guidelines for Avoiding, Assessing and Mitigating Impacts on EPBC Act Listed Migratory Shorebird Species (CoA 2017).</p>	<p>This requirement is met by this risk assessment and the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS, Marine Orders and Vessel Pollution Emergency Plan to minimise the likelihood of an oil spill.</li> <li>• M#08: Oil Spill Response Plans</li> </ul>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
			with the NOPSEMA Accepted OPEP to minimise the effects of an oil spill and NOPSEMA Accepted OSMP to monitor for any potential impacts.
EPBC Act Policy Statement 3.21—Industry Guidelines for Avoiding, Assessing and Mitigating Impacts on EPBC Act Listed Migratory Shorebird Species (CoA 2017)	The purpose of this policy statement is to assist proponents in avoiding, assessing, and mitigating significant impacts on migratory shorebirds listed under the EPBC Act. This policy statement is a key action under the Wildlife Conservation Plan for Migratory Shorebirds.	<p>Thresholds of significance impacts on migratory shorebirds relevant to an oil spill are:</p> <ul style="list-style-type: none"> <li>• Degradation of habitat leading to a substantial reduction in migratory shorebird numbers.</li> <li>• Increased disturbance leading to a substantial reduction in migratory shorebird numbers.</li> <li>• Direct mortality of birds leading to a substantial reduction in migratory shorebird numbers.</li> </ul> <p>The guidelines details that defining substantial reduction is made on a case-by-case basis. Factors to consider include:</p> <ul style="list-style-type: none"> <li>• The number of migratory shorebirds historically using an area (based on surveys and historical data).</li> <li>• Likely resultant changes in bird numbers and species diversity.</li> </ul>	<p>This requirement is met by this risk assessment and the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CCG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS, Marine Orders and Vessel Pollution Emergency Plan to minimise the likelihood of an oil spill.</li> </ul>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
		<ul style="list-style-type: none"> <li>Alterations to the value, quality, geographic extent of the area (for example, will the area still be classed as important habitat).</li> <li>The function and role of the area (roosting, foraging) and likely changes in ecology and hydrology.</li> <li>The regional and local context of the area.</li> <li>The nature, extent, duration and timing of impacts, their likelihood and consequence.</li> </ul>	<ul style="list-style-type: none"> <li>M#08: Oil Spill Response Plans with the NOPSEMA Accepted OPEP to minimise the effects of an oil spill and NOPSEMA Accepted OSMF to monitor for any potential impacts.</li> </ul>
National Recovery Plan for Albatrosses and Petrels (CoA 2022)	<p>The recovery plan provides a national strategy to guide the activities of government, industry, research organisations, and other stakeholders in the protection, conservation and management of listed threatened albatross and petrel species.</p> <p>The plan replaces the previous plan adopted in 2011.</p>	Fuel spills are identified as a threat in the recovery plan with the action to minimise the effects of pollution.	<p>This requirement is met by this risk assessment and the implementation of:</p> <ul style="list-style-type: none"> <li>M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS, Marine Orders and Vessel Pollution Emergency Plan to minimise the</li> </ul>

Conservation advice does not identify oil spills as a threat.	NA
<b>Fish</b>			
Conservation Advice <i>Prototroctes maraena</i> Australian Grayling (TSSC 2021)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify oil spills as a threat.	NA
Commonwealth Listing Advice <i>Seriolella brama</i> Blue Warehou (TSSC 2015)	Recommends that the species be listed in the conservation dependent category under the EPBC Act.	Listing advice does not identify oil spills as a threat.	NA
National Recovery Plan for the Dwarf Galaxias ( <i>Galaxiella pusilla</i> ) (Saddler et al. 2010)	The long-term objective of recovery plan is to minimise the probability of extinction and ensure long-term survival of	The recovery plan does not identify oil spills as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	Dwarf Galaxias in the wild and to increase the probability of important population becoming self-sustaining in the long term.		
Commonwealth Listing Advice on <i>Rexea solandri</i> . Threatened Species Scientific Committee (TSSC 2009)	Recommends listing as conservation dependent.	The recovery plan does not identify oil spills as a threat.	NA
Commonwealth Listing Advice on <i>Thunnus maccoyii</i> (Southern Bluefin Tuna) (TSSC 2010)	Recommends listing as conservation dependent.	Listing advice does not identify oil spills as a threat.	NA
National Recovery Plan for the Yarra Pygmy Perch ( <i>Nannoperca obscura</i> ) (Sadler and Hammer 2010)	The long-term objective of recovery is to minimise the probability of extinction and ensure long-term survival of Yarra Pygmy Perch in the wild and to increase the probability of important populations becoming self-sustaining in the long term.	The recovery plan does not identify oil spills as a threat.	NA
<b>Sharks</b>			

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Commonwealth Listing Advice on <i>Centrophorus zeehaani</i> (southern dogfish) (TSSC 2013a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Does not identify oil pollution as a threat.	NA
Commonwealth Listing Advice on <i>Galeorhinus galeus</i> (TSSC 2009a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Does not identify oil pollution as a threat.	NA
Listing Advice <i>Isurus oxyrinchus</i> shortfin mako shark (TSSC) (2014)	Recommends as not listing.	Listing advice does not identify oil spill as a threat.	NA
Recovery Plan for the White Shark ( <i>Carcharodon carcharias</i> ). (DSEWPac 2013b)	The plan considers the conservation requirements of the species across its range and identifies the actions to be taken to ensure the species' long-term viability in nature and the parties that will undertake those actions.	The recovery plan does not identify oil spill as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
<b>Threatened Ecological Communities</b>			
Conservation Advice for Giant Kelp Marine Forests of South East Australia (TSSC 2012)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Does not identify oil pollution as a threat.	NA
Conservation Advice Subtropical and Temperate Coastal Saltmarsh. Threatened Species Scientific Committee (TSSC 2013)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	The conservation advice identifies coastal saltmarsh as important habitat in all oil spill contingency planning at national and State levels and monitor the application of protocols on the management of spills involving saltmarshes.	<p>This requirement is met by this risk assessment and the implementation of:</p> <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Navigation Act, MARPOL, COLREGS, Marine Orders and Vessel Pollution Emergency Plan to minimise the likelihood of an oil spill.</li> <li>• M#08: Oil Spill Response Plans</li> </ul>

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
			with the NOPSEMA Accepted OPEP to minimise the effects of an oil spill and NOPSEMA Accepted OSMP to monitor for any potential impacts.
Approved Conservation Advice (including Listing Advice) for the Assemblages of species associated with open-coast salt-wedge estuaries of western and central Victoria ecological community (DoEE 2018a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Does not identify oil pollution as a threat.	NA
<b>Turtles</b>			
Recovery Plan for Marine Turtles (DoEE 2017)	The long-term recovery plan objective for marine turtles is to minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so that they can be removed from the	Oil spills are identified as a threat in the recovery plan with the action of: <ul style="list-style-type: none"> <li>• Manage anthropogenic activities to ensure marine turtles are not displaced from identified habitat critical to the survival.</li> <li>• Manage anthropogenic activities in Biologically Important Areas to ensure that biologically important behaviour can continue.</li> </ul>	This requirement is met by this risk assessment and the implementation of: <ul style="list-style-type: none"> <li>• M#05: CGG Marine Assurance System which ensures compliance of contract vessels</li> </ul>

			spill and NOPSEMA Accepted OSMF to monitor for any potential impacts.
<b>Marine Protected Areas</b>			
Ngootyoong Gunditj Ngootyoong Mara South West Management Plan (Parks Victoria 2015)	The Ngootyoong Gunditj Ngootyoong Mara South West Management Plan is a strategic guide for managing and protecting over 130 parks, reserves and Indigenous Protected Areas in south-west Victoria. It takes a multiple park planning approach within a geographic landscape and covers over 116 000 hectares.	Strategies within the plan relevant to oil spill are: <ul style="list-style-type: none"> <li>• Work collaboratively to implement marine emergency contingency plans and arrangements with controlling agencies including for marine pollution, cetacean strandings and wildlife management.</li> <li>• Work with Port of Portland on marine pollution responses within the park and adjacent waters and maintain communications with the petroleum industry and relevant agencies with respect to petroleum activities near the park.</li> <li>• Report and respond to oil spills in and near the park in accordance with the Portland Region Marine Pollution Contingency Plan.</li> </ul>	This requirement is met by the implementation of: M#05: CGG Marine Assurance System which ensures compliance of contract vessels with Vessel Pollution Emergency Plan and M#08: Oil Spill Response Plans, the NOPSEMA Accepted OSEP as these plans detail reporting requirements and will be implemented to respond to an oil spill.
Twelve Apostles Marine National Park and The Arches Marine Sanctuary	The plan provides the basis for the future management of Twelve Apostles Marine National	Marine pollution, especially oil spills, is a significant threat to natural values, aesthetics, and public safety. Response to pollution at sea is guided by the National Plan to	This requirement is met by the implementation of:

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Management Plan (Parks Victoria 2006b).	Park and The Arches Marine Sanctuary	<p>Combat Pollution of the Sea by Oil and other Noxious and Hazardous substances (AMSA 1998).</p> <p>In Victorian waters the Victorian Marine Pollution Contingency Plan (VICPLAN) (MSV 2002) outlines broad response arrangements to a potential oil or chemical spill. Under this plan, the park and sanctuary are within the Port of Portland Region.</p> <p>Actions relevant to oil spills are:</p> <ul style="list-style-type: none"> <li>In accordance with the Portland Region Marine Pollution Contingency Plan, report oil spills in and near the planning area, and respond accordingly.</li> </ul>	<ul style="list-style-type: none"> <li>M#05: CCG Marine Assurance System which ensures compliance of contract vessels with Vessel Pollution Emergency Plan and M#08: Oil Spill Response Plans, the NOPSEMA Accepted OPEP as these plans detail reporting requirements and will be implemented to respond to an oil spill.</li> </ul>

Australian Painted Snipe	Species or species habitat known to occur within area	Endangered			Listed - overfly marine area (as <i>Rostratula benghalensis</i> ( <i>sensu lato</i> ))	None identified	Approved Conservation Advice for <i>Rostratula australis</i> (Australian Painted Snipe) (DSEWPaC 2013)  National Recovery Plan for the Australian Painted Snipe ( <i>Rostratula australis</i> ) (CoA 2022a)
Bar-tailed Godwit	Species or species habitat known to occur within area		Migratory	Migratory Wetlands Species	Listed	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Black-eared Cuckoo	Species or species habitat known to occur within area				Listed - overfly marine area (as <i>Chrysococcyx osculans</i> )	None identified	None identified
Black-faced Cormorant	Breeding known to occur within area				Listed	Breeding Foraging	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Black-faced Monarch	Species or species habitat may occur within area		Migratory	Migratory Terrestrial Species	Listed - overfly marine area	None identified	None identified
Blue-winged Parrot	Species or species habitat known to occur within area				Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Broad-billed Sandpiper	Roosting known to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Cape Gannet	Breeding known to occur within area				Listed	None identified	None identified
Cattle Egret	Species or species habitat may occur within area				Listed - overfly marine area (as <i>Ardea ibis</i> )	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Common Greenshank, Greenshank	Species or species habitat known to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
Common Noddy	Species or species habitat likely to occur within area		Migratory	Migratory Marine Birds	Listed	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Common Sandpiper	Species or species habitat known to occur within area		Migratory	Migratory Wetlands Species	Listed	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Curlew Sandpiper	Species or species habitat known to occur within area	Critically Endangered	Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Conservation Advice <i>Calidris ferruginea</i> Curlew Sandpiper (DoE 2015d)
Double-banded Plover	Roosting known to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Eastern Curlew, Far Eastern Curlew	Species or species habitat known to occur within area	Critically Endangered	Migratory	Migratory Wetlands Species	Listed	None identified	Conservation Advice <i>Numenius madagascariensis</i> Eastern Curlew (DoE 2015c)
Hooded Plover, Hooded Dotterel	Species or species habitat known to occur within area				Listed - overfly marine area (as <i>Thinornis rubricollis</i> )	None identified	None identified
Fork-tailed Swift	Species or species habitat likely to occur within area		Migratory	Migratory Marine Birds	Listed - overfly marine area	None identified	None identified
Great Knot	Roosting known to occur within area	Critically Endangered	Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Conservation Advice <i>Calidris tenuirostris</i> Great knot (TSSC 2016d) Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Great Skua	Species or species habitat may occur within area				Listed (as <i>Catharacta skua</i> )	None identified	None identified
Greater Sand Plover, Large Sand Plover	Species or species habitat likely to occur within area	Vulnerable	Migratory	Migratory Wetlands Species	Listed	None identified	Conservation Advice <i>Charadrius leschenaultia</i> Greater Sand Plover (TSSC 2016b) Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Grey Plover	Roosting known to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Grey-tailed Tattler	Roosting known to occur within area		Migratory	Migratory Wetlands Species	Listed (as <i>Heteroscelus brevipes</i> )	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
Hooded Plover, Hooded Dotterel	Species or species habitat known to occur within area				Listed - overfly marine area (as <i>Thinornis rubricollis</i> )	None identified	None identified
Latham's Snipe, Japanese Snipe	Species or species habitat known to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Lesser Sand Plover, Mongolian Plover	Roosting known to occur within area	Endangered	Migratory	Migratory Wetlands Species	Listed	None identified	Conservation Advice <i>Charadrius mongolus</i> Lesser Sand Plover (TSSC 2016c) Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Little Curlew, Little Whimbrel	Roosting likely to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Little Tern	Species or species habitat may occur within area		Migratory	Migratory Marine Birds	Listed (as <i>Sterna albifrons</i> )	None identified	Commonwealth Listing Advice on <i>Sterna albifrons sinensis</i> (Little Tern (Western Pacific)) (TSSC 2002) Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Magpie Goose	Species or species habitat may occur within area				Listed - overfly marine area	None identified	None identified
Marsh Sandpiper, Little Greenshank	Roosting known to occur within area		Migratory	Migratory Wetlands Species	Listed - overfly marine area	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)
Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit	Species or species habitat known to occur within area	Vulnerable				None identified	Conservation Advice <i>Limosa lapponica baueri</i> Bar-tailed Godwit (western Alaskan) (TSSC 2016a)
Orange-bellied Parrot	Species or species habitat known to occur within area	Critically Endangered			Listed - overfly marine area	None identified	Commonwealth Listing Advice on <i>Neophema chrysogaster</i> (TSSC 2006). National Recovery Plan for the Orange-bellied Parrot, <i>Neophema chrysogaster</i> (DEWLP 2016)
Osprey	Species or species habitat known to occur within area		Migratory	Migratory Wetlands Species	Listed	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
Pacific Golden Plover	Roosting known to occur within area		Migratory	Migratory Wetlands Species	Listed	None identified	Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015)

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (**Regia MSS**) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (**PEIRA**) (Appendix B4) for further assessment. This document also uses information in two preceding studies:

1. Commercial Fisheries Analysis Report (Appendix B6)
2. Cultural Heritage Assessment Report (Appendix B10)

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (**EP**) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table E1-2-1 shows feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table E1-2-1 shows how this feedback has been incorporated into the environmental assessments.

Table E1-2-1 - Relevant person input into the preparation of the EP

Objections and Claims	Feedback ID	Measure adopted because of consultation
Objection through an online survey to seismic surveying due to impacts on SRW and Traditional Owner values.	74	CGG provided information and sought further feedback.
An email received detailing seismic blasting should not occur within 20km of the vicinity of these beaches at any time of the year. These beaches (and others) are utilised all year round by members of our community.	95	CGG will implement a 145 dB threshold exceedance limit at popular beaches.
A response to the interactive map stating no disruption to SRW calving grounds and First Nations values of them.	164	CGG have agreed to implement the following measures: Exclusion of SRW reproductive BIA - adopted. Exclusion of SRW BIA+11.3 km buffer while SRW present - adopted. Policy Statement 2.1 measures, plus others - adopted. Fauna Management Plan - adopted.

Objections and Claims	Feedback ID	Measure adopted because of consultation
Email received regarding "other fishermen that have been displaced by your operations moving into the area I am working in resulting in reduced catch rates".	226	Compensation protocol to be adopted with CPUE adjustment calculation method.
Email received from fishing association requesting the need to understand the overlap of the survey with historical fishing activities.	172	CGG will implement an activity limitation of no acquisition beyond 200 m depth contour.
A member of the public raised an objection regarding the negative impact on marine life and climate	166	CGG will implement the following measures: Exclusion zones for shallower waters with higher biodiversity - adopted 50 m and shallower activity exclusion zone. Activity timing - avoid peak biodiversity in summer months (Jan/Feb/Mar) - adopted. Compensation protocol for commercial fishers - adopted. Policy Statement 2.1 measures, plus others.
Objection raised by Marine Parks regarding the spatial avoidance of fishing grounds and, or temporal avoidance of fishing seasons.	232	CGG will implement a 40m exclusion zone ss this is protective for abalone divers, abalone, and other recreational marine users.
Concern raised at a community session regarding the fur seal colony on Deen Maar.	97	CGG will implement a 10.3 km buffer around Deen Maar.
A member of the public raised a concern through the interactive map regarding the impact of seismic blasts on fur seal colony in Deen Maar and also about the sacred importance of Deen Maar for the indigenous community.	222	Project vessels will not traverse between Lady Percy Julia Island / Deen Maar and the mainland.

## 3 Aspect – Physical Presence of Vessels and Towed Equipment

### 3.1 How the Aspect Occurs

The physical presence of the survey vessel with the towed sound source and streamers and the support vessels operating in marine waters may interfere with other marine users' activities.

The aspect does not cover the risk of a vessel collision with other marine users as this is assessed in the Accidental Release of Fuel section.

### 3.2 Extent and Duration of the Aspect

Duration: 90 days

Extent: Operational Area

The extent of the area where the physical presence of vessels and towed equipment will occur is within the Operational Area and the impact could occur while the activity is undertaken.

### 3.3 Legislative and Other Requirements

Annex 1 of this document describes the legal and other requirements that apply to the physical presence of vessels and towed equipment.

## 4 Cause Effect Pathway

The PEIRA (Appendix B4) identified a cause-effect pathway for the physical presence of vessels and towed equipment for the following environmental components:

- Commercial fishing and aquaculture
- Indigenous culture
- Marine industries
- Diving
- Marine tourism
- Recreational fishing

The PEIRA did not identify any environment components that were ranked as having a negligible level of effect and are not required to be assessed further in this section.

Via relevant person consultation the Department of Defence has confirmed the Operational Area is located outside of any Defence Training Areas and restricted airspace thus no impact is predicted from the physical presence of vessels and towed equipment, and they are not assessed further in this section.

Based on relevant person consultation, an activity limitation (M#01) has been put in place where no seismic acquisition will be undertaken in water depths shallower than 50 m to reduce impacts to commercial and recreational fishers, surfers, swimmers, and coastal users. As recreational diving and diving for commercial fisheries takes place in water depths less than 50 m no impact is predicted from the physical presence of vessels and towed equipment, and they are not assessed further in this section.

The limited manoeuvrability of the seismic survey vessel while towing the source array and streamers means that other marine user may have to avoid the immediate vicinity of the seismic survey vessel and towed equipment. In addition, commercial fishing vessels may be asked to remove fishing gear such as traps and lines to avoid interaction with the seismic survey vessel and towed equipment.

## 5 Description of the Existing Environment that May be Affected by the Activity

As detailed in the Section Extent and Duration of the Aspect, the Operational Area has been adopted as the extent of the area where other marine users' activities may be affected by the physical presence of vessels and towed equipment associated with the Regia MSS.

Other marine users identified within Section 0, are described in this section.

### 5.1.1 Commercial Fishing and Aquaculture

A review of commercial fisheries was undertaken identify Commonwealth and State (Victorian, Tasmanian, and South Australian) fisheries that fish or potentially fish within the Operational Area and is available in Appendix B6: Commercial Fisheries Analysis Report.

The review identified the following commercial fisheries that have catch effort, and hence are likely to be fish within the Operational Area:

- Commonwealth
  - Bass Strait Central Zone Scallop Fishery
  - Eastern Tuna and Billfish Fishery
  - Small Pelagic Fishery
  - Southern and Eastern Scalefish and Shark Fishery following sectors:
  - Shark Hook Sub-Sector

- Shark Gillnet Sub-sector
- Trawl – otter board
- Southern Squid Jig Fishery
- Western Tuna and Billfish Fishery
- Victorian:
  - Giant Crab
  - Multi-species Ocean
  - Octopus
  - Southern Rock Lobster
  - Wrasse
- Tasmania: No fisheries identified.

A summary of these fisheries is provided in Table E1-5-1 with further details in Appendix B6: Commercial Fisheries Analysis Report.

*Table E1-5-1: Summary of Level of Fishing Activity within the Operational Area*

Fishery	Level of Activity within the Operational Area	Summary
Commonwealth Fisheries		
Bass Strait Central Zone Scallop Fishery	The Operational Area overlaps a small area of the fishery where there has been > 5 fishers during 2010 to 2020.	Low
Eastern Tuna and Billfish Fishery	The Operational Area overlaps the fishery where there has been > 5 fishers during 2010 to 2020.	Low
Small Pelagic Fishery (Western sub-area)	The Operational Area overlaps a small area of the fishery where there has been > 5 fishers during 2010 to 2020.	Low
Southern and Eastern Scalefish and Shark Fishery (SESSF) - Shark Hook Sub-sector	The Operational Area overlaps the fishery where there has been > 5 fishers during 2010 to 2020.	Low
Southern and Eastern Scalefish and Shark Fishery (SESSF) - Shark Gillnet Sub-sector	The Operational Area overlaps the fishery where there has been a high level of fishing intensity during 2010 to 2020.	High
Southern and Eastern Scalefish and Shark Fishery (SESSF) - Commonwealth Trawl Sector	The Operational Area overlaps the fishery where there has been a high level of fishing intensity during 2010 to 2020.	High
Southern and Eastern Scalefish and Shark Fishery (SESSF) - Commonwealth Trawl Sector, Danish Seine Sub-sector	The Operational Area overlaps the fishery where there has been > 5 fishers during 2010 to 2020.	Low
Southern and Eastern Scalefish and Shark Fishery (SESSF) - Scalefish Hook Sector	The Operational Area overlaps the fishery where there has been a low level of fishing intensity during 2010 to 2020.	Low
Southern Squid Jig Fishery	The Operational Area overlaps the fishery where there has been a high level of fishing intensity during 2010 to 2020.	High
Western Tuna and Billfish Fishery	The Operational Area overlaps a small area of the fishery where there has been > 5 fishers during 2010 to 2020.	Low

Fishery	Level of Activity within the Operational Area	Summary
Victorian Fisheries		
Giant Crab Fishery	During 2011 to 2021 the maximum number of vessels that fished within the Operational Area was three and the maximum days per year was 24.	Low
Multispecies Ocean Fisheries – Ocean General	During 2011 to 2021 the maximum number of vessels that fished within the Operational Area was five and the maximum days per year was 40.	Low
Octopus Fishery	During 2020 to 2021 the maximum number of vessels that fished within the Operational Area was one and the maximum days per year was one.	Low
Rock Lobster Fishery	During 2011 to 2021 the maximum number of vessels that fished within the Operational Area was ten and the maximum days per year was 316.	High
Wrasse (Ocean) Fishery	During 2011 – 2021 the maximum number of vessels that fished within the Operational Area was three and the maximum days per year was 100.  Activity was within a small number of grids (four) within the Operational Area.	Low

### 5.1.2 Indigenous Culture

Biosis Pty Ltd (**Biosis**) was commissioned by ConocoPhillips to undertake a cultural heritage desktop assessment for the proposed resource exploration in Bass Strait. ConocoPhillips and Biosis gave permission for CGG to utilise this report given the overlap of the study area with the Regia MSS. The report is provided as part of this EP at Appendix B10, and a short summary is included in this document.

The purpose of the report was to explore cultural heritage and cultural heritage landscapes to understand Country, and Sea Country within and surrounding the project area to provide the project a grounding in Aboriginal cultural heritage. The report describes the known cultural environment, include a brief ethnohistory and history, and detailed results of register searches.

The study area includes the proposed permit areas (the location of the exploration zone(s)), where surveys may occur. In general, the permit areas are located south of Port Fairy and the Great Otway National Park, and west of King Island. The study area consists of a large geographical area which is based on stochastic modelling of oil spills, generating a statistical area where impacts may occur under many eventualities.

Due to the significant size of the study area, it is broken into three areas:

1. Primary Stakeholder area (Victoria) – the area directly surrounding the proposed permit areas and adjacent coastlines.
2. Secondary Stakeholder area – the wider area affected by the modelling of oil spills.
3. Primary Stakeholder area (Tasmania) – North and Northwest Tasmania and the Bass Strait islands.

Within the study area, along the Victorian coast, there are 5636 registered Aboriginal places with the most common site types being shell middens, artefact scatters and Low-Density Artefact Distributions (**LDADs**). Shell middens are typically found along the coastline, whereas artefact scatters, while also being found along the coast, are varied, and move inland following freshwater sources, likely to be indicative of past inland-coastal travel routes. LDADs are also typically found further inland than shell middens and artefact scatters, indicative of widespread use of the landscape in the past, rather than concentrations and repeated patterning.

The study concludes that there is a high likelihood for Aboriginal cultural heritage material to be present within the areas subject to potential impact.

CGG notes that the report identifies many cultural sites at coastal areas that will not be affected by the Regia MSS. Rather, the spiritual values and cultural sensitivities are the more likely values and sensitivities affected. The Operational Area is adjacent to Eastern Maar and Gunditjmara Native Title determinations (Appendix B12 MAP-REG-EPM-076). Native Title has not been identified to occur within the operational area.

Appendix B10 provides a description of the cultural heritage values and sensitivities, noting that not all of these will be affected by the Regia MSS. Further research about spiritual connections of First Nations peoples to Sea Country was undertaken during the search for relevant persons. The outcome of this further research is available to NOPSEMA in the sensitive information part of the EP (Appendix C3).

### 5.1.3 Marine Industries

Marine industries within the Operational Area that could be impacted by the physical presence of the survey vessel and towed equipment are the offshore energy and shipping.

#### 5.1.3.1 Offshore Energy

Within the Operational Area is the Beach Energy Otway Development consisting of subsea infrastructure and the Thylacine-A unmanned platform and the Cooper Energy Casino Henry Netherby Development consisting of subsea infrastructure (Appendix B12 MAP-REG-EPM-082). During the Regia MSS design envelope (1 November 2023 to 31 October 2028) there is the potential for exploration and development activities such as infrastructure inspection, maintenance and repairs campaigns, seabed surveys, seismic surveys, drilling, and infrastructure installation to be undertaken with vessels and drill rigs to support the ongoing energy supply of oil and gas and potentially renewables within the Otway Basin.

#### 5.1.3.2 Shipping

The South East Marine Region is one of the busiest shipping regions in Australia and Bass Strait is one of Australia's busiest shipping routes. Commercial vessels use the route when transiting between ports on the east, south and west coasts of Australia, and there are regular passenger and cargo services between mainland Australia and Tasmania. Ports Australia provide statistics for port operations throughout Australia's main commercial ports. Based on the latest information (2021) the majority of commercial shipping traffic transiting to and from Victorian ports were container (3,682), general cargo (2,663), bulk liquid carriers (2,019), dry bulk (1,715), car carrier (1,342), bulk gas (220), other cargo (47) and livestock (9).

### 5.1.4 Marine Tourism

No areas of marine tourism were identified within the Operational Area. Areas where marine tourism occur such as Deen Maar (Lady Julia Percy Island), Australian Marine Parks, Victorian Marine Parks, and Sanctuaries are outside of the Operational Area.

From relevant person consultation undertaken during preparation of the EP, a low level of fishing tour operators (one) was identified to occur within Operational Area.

### 5.1.5 Recreational Fishing

Recreational fishing from vessels including fishing tour operators, may occur within the Operational Area.

Several fishing tour operators operate from coastal towns such as Port Fairy, Warrnambool, Portland, and Port Campbell that fish in offshore waters for species such as Blue Fin Tuna, Shark (Gummy, School and Mako), Yellowtail Kingfish and reef species including Snapper, Morwong, Nannygai.

From relevant person consultation undertaken during preparation of the EP, a low level of fishing tour operators (one) was identified to occur within Operational Area.

## 6 Predicted Levels of Impact

### 6.1.1 Changes to the functions, interests, or activities of other users

The limited manoeuvrability of the seismic survey vessel while towing the source array and streamers means that other marine user may have to avoid the immediate vicinity of the seismic survey vessel and towed equipment.

For vessels that are transiting through the area, such as shipping, they may be required to move around the seismic vessel when the streamers are deployed. This could result in a detour of 10 km and take approximately 16 minutes for a vessel travelling at 20 knots (38 km/hr). However, avoidance of slow-moving vessels or obstacles are normal practice for shipping vessels and impacts can be avoided by Notification to Mariners (M#02) that alert ships to slow moving vessels or obstacles such as the survey vessel.

Areas such as Deen Maar (Lady Julia Percy Island) that hold deep and significant cultural association for Traditional Owners are outside of the Operational Area and hence no impact is predicted from the physical presence of the survey and support vessel. Indigenous fishing has not been identified within the Operational Area and hence no impact is predicted from the physical presence of the survey and support vessel. Impacts to cultural values associated with Sea Country are also not predicted from the physical presence of the survey and support vessel.

Recreation and tourism could be affected by restricted access to an area where recreational fishing or fishing tours occur. The majority of vessel recreational fishing and fishing tours are day tours with no overnight stays. In the event that a recreational fisher or fishing tour operator plans to fish within the Operational Area an area may need to be avoided for a short period of time (hours) while acquisition occurs in the area. From relevant person consultation undertaken during preparation of the EP, a low level of fishing tour operators (one to date) has been identified to occur within Operational Area. Impacts to recreational and fishing tour operators can be minimised via notifications and look-aheads (M#02) as part of planning and undertaking the Regia MSS.

The Beach Energy Otway Development and Cooper Energy Casino Henry Netherby Development are within the Operational Area. Impacts could occur if these companies are undertaking exploration or development activities during the Regia MSS. To ensure impacts to Beach and Cooper and CGG are minimised, planning between the companies is ongoing and, in the event, activities are planned to occur at the same time in the same area a Simultaneous Operations Plan (M#02) will be developed.

As detailed in Commercial Fishery Analysis Report (Appendix B6) and summarised in Table E1-5-1 there are several Commonwealth and Victorian commercial fisheries that have fishing effort within the Operational Area. Most of the activity is low level (> 5 vessels) except for the Victorian Rock Lobster Fishery and Commonwealth Southern and Eastern Scalefish and Shark Fishery Commonwealth Shark Gillnet Sub-sector and Commonwealth Trawl Sector, and Southern Squid Jig Fishery. Commercial fishers may be impacted by having to avoid an area of the Operational Area while acquisition occurs. This may be for hours or days depending on the fishing location within the acquisition area and the type of fishing equipment used, as fishers using pots, nets and traps may need to avoid an area for longer than trawling and squid jigging where the fishing vessel is moving. There is also a risk that fishing equipment such as pots, nets and traps can become entangled with the seismic survey equipment.

The predicted level of effect to the functions, interests, or activities of other marine users from the physical presence of the survey vessel and towed equipment and the support vessels is assessed as moderate as there may be displacement, however impacts are temporary and, in most cases, avoidable based on:

- Pre-survey communications prior to the start of the survey, with daily lookahead information provided during the survey. CGG will work proactively and collaboratively with other marine users so that both parties can plan activities in a manner that minimises potential displacement to each party (M#02).
- When the seismic vessel has equipment deployed it will typically move along pre-determined survey lines in a racetrack pattern at a constant speed of ~ 3-6 knots (~ 5.5 to

11 km/hr) (M#01) that will be communicated to other marine users so they can proactively avoid the area.

- The survey lines are planned to be acquired as three racetracks thus, other marine users would at the worst case, be displaced from a third of the Acquisition Area at a time.
- No marine tourism or diving has been identified to occur within the Operational Area.
- Shipping deviations are predicted to be minor and have a negligible impact on travel times or fuel use. Deviations are normal practice and impacts can be avoided by Notification to Mariners (CM#02) that alert ships to slow moving vessels or obstacles such as the survey vessel.
- Impacts to Indigenous culture and values are not predicted from the presence of the vessels and equipment.
- A low level of fishing tour operators (one to date) has been identified to occur within Operational Area.
- Commercial fishing effort within the Operational Area is of a low level (< 5 vessels) except for the Victorian Rock Lobster Fishery and Commonwealth Southern and Eastern Scalefish and Shark Fishery Commonwealth Shark Gillnet Sub-sector and Commonwealth Trawl Sector, and Southern Squid Jig Fishery.
- CGG will implement an adjustment protocol (M#07) in the event displacement cannot be avoided and there is a financial loss to the marine user.

The uncertainty level for impact of the physical presence of the survey vessel to the functions, interests and activities of other marine users is assessed as low based on:

- Extensive relevant person consultation was undertaken during the preparation of the EP to identify other marine users that may be present within the Operational Area.
- CGG will communicate with marine users prior to and during the survey to ensure other marine users can undertake their activities in a manner that avoids any interactions or can engage with CGG so that both parties can plan activities in a manner that minimises potential displacement to each party.
- There is no predicted impact to marine tourism, divers, or indigenous culture values.
- CGG will implement a compensation process in the event displacement cannot be avoided and there is a financial loss to the marine user.

The predicted level of impact based on the effect (moderate) and uncertainty (low) is assessed as medium. For marine users the predicted level of impact is clearly below the predefined acceptable levels of impact as detailed in the Comparison of Predicted Level and Defined Acceptable Level. The mitigation and management measures detailed in the Identification of Mitigation and Management Measures and Demonstration of ALARP provide sufficient confidence in the predicted effect levels.

## 7 Comparison of Predicted Level of Impact with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Impact	Predicted Level of Impact Below Defined Acceptable level?
Category	Level		
Principles of ESD	Impact result in temporary / reversible, small scale, and/or low intensity environmental damage.	Predicted impacts are temporary, reversible, and small-scale.	Yes
	The impact assessment process is based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature and government data were used to inform the impact assessment. Serious or irreversible environmental damage is not predicted. There is high confidence in the prediction of impacts to marine users.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	Not applicable.	NA
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	Not applicable.	NA
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	Not applicable.	NA
Economic	Affected persons will not be worse off as a result of the activity.	Predicted impacts are temporary and in most cases avoidable. A compensation process will be implemented in the event displacement cannot be avoided and there is a financial loss to the marine user.	Yes
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.	Impacts to cultural features including cultural values, traditions, or practices, are not predicted.	Yes
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce environmental impacts as detailed in the following section.	Yes
	Environmental impacts and risks are consistent with the CGG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.	The predicted effect level is moderate.	Yes

Defined Acceptable Level		Predicted Level of Impact	Predicted Level of Impact Below Defined Acceptable level?
Category	Level		
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the impact.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	<p>Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons as per the stakeholder feedback of:</p> <p>Ensure continued liaison with the Australian Hydrographic Service (AHS) for Notices to Mariners (NOTMAR), ensure that the AHS is notified three weeks prior to the actual commencement of activities. This information is critical to maritime safety and reduces negative impacts on other maritime users. This is addressed by M#02: Consultation Management System.</p> <p>CCG have adopted an adjustment protocol that will ensure that no fisher will be worse off as a result of the Regia MSS and that reasonable, evidence-based claims will be paid. M#07 will be adopted to reflect the arrangements that will give effect to the adjustment protocol.</p> <p>See Section 8 Identification of Mitigation and Management Measures and Demonstration of ALARP, for detailed information on the measure identified.</p>	Yes
	The views of public have been considered in the impact and risk assessment.	No public comments have been received in relation to the physical presence of the vessels and equipment in relation to impacts to marine users.	Yes

## 8 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure environmental impacts will be of an acceptable level and ALARP.

Measures	Justification	Adopted
M#05: CGG Marine Assurance System	Vessel will adhere to the requirements of the International Regulations for Preventing Collisions at Sea 1972 (COLREGS) and Chapter 5 of Safety of Life at Sea (SOLAS) as implemented in Commonwealth Waters through the Navigation Act 2012 and associated Marine Orders 21 Safety and Emergency Arrangements, 30 Prevention of Collisions and 31 SOLAS and non-SOLAS certification including:  Appropriate lighting, navigation, and communication to inform other users.  Use of radar and 24/7 watch.  It is a legislative requirement for vessels to comply with the Navigation Act and Marine Orders.  The CGG Marine Assurance System ensure compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.	Yes
	Streamer tail buoys will be used to mark ends of the streamers so that they can be detected by other vessels.	Yes
M#02: Consultation Management System	CGG will implement the Consultation Management System to ensure that pre and during survey communications will be undertaken so that other marine users know when, where and how the Regia MSS will be undertaken so they can undertake their activities in a manner that avoids any interactions or can engage with CGG so that both parties can plan activities in a manner that minimises potential displacement to each party.	Yes
M#07: Adjustment Protocol	An adjustment process will be implemented if a commercial fisher has a financial loss due to the Regia MSS.  The adjustment process will be developed in consultation with the fishery associations that represent the commercial fishers that fish within the Operational Area.  Other titleholders in the region will be invited to participate in the review, update, and implementation of the adjustment process.	Yes

Measures assessed and not adopted.

Measure	Justification	Adopted
Seasonal timing of the survey to avoid peak fishing seasons.	Fishing activities within the Operational Area occur all year round except for:  Giant crab closed seasons are:  Male: 15 September to 15 November to protect males during moult.  Female: 1 June to 15 November to protect females while breeding and in berry (with eggs attached).  Rock lobster closed seasons.  The closed season for female rock lobsters is from 1 June to 15 November and is designed to protect females in berry (with eggs attached) during the spawning period.  The closed season for male rock lobsters is from 15 September to 15 November and is designed to protect males during the moulting period when soft shells increase their vulnerability.  The survey is not being undertaken during this time to avoid overlapping the period when southern right whales are within the reproductive BIA (May-November).	No

Measure	Justification	Adopted
	With the other measures in place impacts to commercial fishers can be managed to ensure that fishers are not displaced from their fishing areas or where this cannot be avoided there is no financial loss.	

## 9 Conclusions

This impact assessment has demonstrated that the effect of the physical presence of the survey vessels and towed equipment to marine users has a:

- **Predicted level of effect of moderate.**
- **An uncertainty of low.**
- **Predicted level of impact of medium.**

## 10 Recommendations

As demonstrated in this impact assessment the predicted level of impact level is medium. The predicted levels of impact are clearly below the pre-defined acceptable levels of impact and the mitigation and management measures in place provide sufficient confidence in the predicted effect levels, thus there are no further recommendations.

## 11 Document Control

*Table 2 - Revision history*

Date	Revision	Update
20 June 2023	A	Draft prepared for initial comment
30 August 2023	B	Update based on comments and relevant person feedback

## Annex 1: Legislative and Other Requirements Relevant to Physical Presence

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Fisheries Management Act 1991	The Fisheries Management Act 1991 establishes the legislative framework for the sustainable use and conservation of fisheries resources, and for the management of fishing activities by commercial, recreational, and Indigenous fishers.	Commercial and recreational fishing occur within the Operational Area.  No indigenous fishing has been identified to occur within the Operational Area.	This impact assessment and identified measures details that CGG will work collaboratively with other marine users to avoid displacing them from their activities. In the event displacement cannot be avoided and there is a financial loss to the marine user a compensation process will be implemented.
Native Title Act 1993	The main objects of this Act are: to provide for the recognition and protection of native title; and to establish ways in which future dealings affecting native title may proceed and to set standards for those dealings; and  to establish a mechanism for determining claims to native title; and  to provide for, or permit, the validation of past acts, and intermediate period acts, invalidated because of the existence of native title.	Native Title has not been identified to occur within the Operational Area.	Consultation has been undertaken with First Nations Registered Aboriginal Parties.
Offshore Petroleum and Greenhouse Gas Storage Act 2006	The act provides a regulatory framework for offshore petroleum and greenhouse gas storage activities, which includes seismic surveys.	Section 280 requires that a person carrying on activities in an offshore area under the permit, lease, licence, authority or consent must carry on those activities in a manner that does not interfere with navigation or fishing (among others) to a greater extent than is necessary for the reasonable exercise of the rights	This impact assessment and identified measures details that CGG will work collaboratively with other marine users to avoid displacing them from their activities. In the event displacement cannot be avoided and there is a financial loss to the marine user a compensation process will be implemented.
Environmental Management in the Upstream Oil and Gas Industry (IOGP-IPIECA, 2020)	The primary focus of this report is on managing the risk from potential impacts to the natural	Of relevance are:  Develop exclusion zones in consultation with key stakeholders, including local fishing	These requirements have been met by:

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
	environment during exploration and production of oil and gas.	<p>communities; raise awareness of exclusion zones with all stakeholders.</p> <p>Issue a 'Notice to Mariners' through the relevant government agencies, detailing the area of operations.</p> <p>Ensure all vessels adhere to International Regulations for Preventing Collisions at Sea (COLREGS), which set out the navigation rules to be followed to prevent collisions between two or more vessels.</p> <p>Optimise vessel use to ensure the number of vessels required and length of time that vessels are on site is as low as practicable.</p>	<p>The following exclusions zones have been put in place based on consultation with relevant persons:</p> <p>No acquisition in water depths less than 40 m to avoid displacement of divers and other nearshore recreational marine users.</p> <p>No acquisition within 10.3 km of Deen Maar which will avoid displacement of marine tourism operators.</p> <p>M#19: Pre and During Survey Communications includes notification to Australian Hydrographic Service who issue Notices to Mariners.</p> <p>M#04: CGG Marine Assurance System ensure compliance of contract vessels with Navigation Act, MARPOL, COLREGS and Marine Orders.</p> <p>The survey designed has been optimised to ensure the most effective survey design to limit the time the vessels are on site.</p>
International Association of Geophysical Contractors (IAGC) Environment Manual for Worldwide Geophysical Operations (2013)	Provides the industry with information for conducting geophysical field operations in an environmentally sensitive manner.	<p>Of relevance is:</p> <p>Section 8.4 (Travel – water travel) – maintain a lookout for, and establish communications with local fishing boats, tourist diving vessels, etc, where possible to minimise interruption with their operations and equipment.</p>	<p>These requirements have been met by:</p> <p>M#20: Support Vessel where at least one vessel will accompany the survey vessel to identify other marine users and fishing equipment in the area.</p> <p>M#19: Pre and During Survey Communications which includes establishing communications with other marine users to minimise interruption with their operations and equipment.</p>

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (**Regia MSS**) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (**PEIRA**) (Appendix B4) for further assessment. This document also uses information in two preceding studies:

1. Sound Emissions Initial Modelling Report (Appendix B7)
2. Seismic Sound Studies Report (Appendix B8)

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (**EP**) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table E2-2-1 shows the feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table E2-2-1 shows how this feedback has been incorporated into the environmental assessments.

*Table E2-2-1 - Relevant person input into the preparation of the EP*

Objections and Claims	Feedback ID	Measure adopted because of consultation
Feedback from a community session on the impact of seismic blasting on penguins and their food supply	135	CGG included an assessment of zooplankton and food supply in impact assessment.
Email received detailing the negative impact on marine life and climate	166	CGG agreed to implement the following measures: Exclusion zones for shallower waters with higher biodiversity - adopted 50 m and shallower activity exclusion zone. Activity timing - avoid peak biodiversity in summer months (Jan/Feb/Mar) - adopted. Compensation protocol for commercial fishers - adopted. Policy Statement 2.1 measures, plus others.

Objections and Claims	Feedback ID	Measure adopted because of consultation
Email received containing queries demanding for a plan to monitor and reduce the risks and effects of seismic testing on marine species.	199	CGG agreed to implement the following measures: Activity limitations (various). Sail line plan. OPEP protection priority areas added.
Email received regarding a request for decisions to be consistent with the federal government's Threatened Species Recovery Plan	201	CGG agreed to implement the following measures: Light management plan including shrouds. OPEP priority for protection.

### 3 Aspect – Underwater Sound

#### 3.1 How the Aspect Occurs

Impulsive underwater acoustic emissions will result from the seismic source releasing compressed air (seismic pulse) that creates a sound wave that is directed downwards into the seabed.

An overview of underwater sound and studies relevant to seismic is in Appendix B8.

Continuous underwater acoustic emissions are generated by the survey and support vessels and helicopters. Underwater acoustic emissions from vessels are generated by thrusters, engines, and propellers. Underwater acoustic emissions from helicopters are generated via the engine and rotors.

#### 3.2 Extent and Duration of the Aspect

##### *Impulsive Sound*

Duration: 60 days

Extent: Active Source Area + 230 m based on the furthest distance to modelled sound effect criteria.

The seismic source will only be active in the Active Source Area.

##### *Continuous Sound*

Duration: 90 days

Extent: Operational Area

The survey and support vessels and helicopters will be active in the Operational Area for the duration of the survey undertaking support activities and acquisition.

#### 3.3 Legislative and Other Requirements

No legislative or other requirements applicable to plankton and underwater sound were identified.

#### 3.4 Cause Effect Pathway

The PEIRA (Appendix B4) identified a cause-effect pathway for underwater sound for plankton.

There is no scientific information on the potential for underwater sound impacts on phytoplankton and no cause-effect pathway has been established. Thus, the impact assessment focuses on impacts to zooplankton from seismic sound emissions.

In addition, there is no scientific information on the potential for continuous underwater sound impacts to plankton and no cause-effect pathway has been established. Thus, the impact assessment focuses on impacts from impulsive (seismic) underwater sound to zooplankton.

From relevant person consultation, commercial fishers have raised concerns in relation to impacts to commercial fish and invertebrate spawning and recruitment. The assessment of impacts to commercial fish and invertebrate spawning and recruitment is covered by species in the underwater sound Impact assessment sections for invertebrates and fish.

From relevant person consultation, concerns have been raised in relation to impacts to zooplankton, particularly the copepod *Nyctiphanes australis*, generally called krill, which is an important component of the upwelling and productivity systems within the Survey Operational Area. These concerns are assessed in this section.

### 3.5 Underwater Sound Modelling

CGG contracted JASCO Applied Sciences (**JASCO**) to undertake a numerical modelling study of underwater sound levels associated with the initial Regia MSS acquisition lines to assist in understanding the potential acoustic impacts on key regional receptors including plankton.

The modelling methodology considered source directivity and range-dependent environmental properties likely to be encountered within the proposed survey area. The modelling report (Koessler et al. 2023) is available in Appendix B7 and provides an overview of JASCO's specialised airgun array source model and complementary underwater acoustic propagation models, receptor sound effect criteria adopted and the predicted distances to those criteria.

## 4 Description of the Existing Environment that may be Affected by the Activity

Plankton is a collective term for marine organisms that are unable to swim against a current. This group is diverse and includes phytoplankton (plants) and zooplankton (animals).

Plankton is a key component in oceanic food chains and supports nearly all marine life and is the dominant biomass of marine ecosystems (CSIRO 2015). The carrying capacity of marine ecosystems (the biomass of fish resources) and recruitment of individual stocks is strongly related to plankton abundance, timing, and composition.

Plankton communities are highly diverse, with members from almost all phyla. Phytoplankton are the [plant] base of this community, capturing energy through photosynthesis while drifting with the ocean currents. They are grazed by zooplankton which are comprised of meroplankton which spend only the early part of their lives in the plankton (e.g. larval stages of jellyfish, molluscs, invertebrates, and fish) and holoplankton, such as copepods, chaetognaths and salps, which spend their entire life as zooplankton (White 2018).

The small sizes, short lifespans and high abundances of zooplankton enables fast rates of production and turnover of populations. It is advantageous to grow and multiply quickly to maximise access to phytoplankton resources when they become available (White 2018). Zooplankton are the key trophic link converting primary production into a food source for fish, such as sardines, which in turn are consumed by top predators such as tuna, shark and dolphins.

Watson and Chaloupka (1982) reported a high diversity of zooplankton in eastern and central Bass Strait, with over 170 species recorded while Kimmerer and McKinnon (1984) reported only 80 species in their surveys of western and central Bass Strait.

CSIRO's Australian Ocean Data Network which is a primary resource for marine science data does not contain any data collection points within the Active Source Area. The closest data points, located south of Wilson's Promontory, show that zooplankton samples taken at these sites from 2011-2020 contained copepods, appendicularians, chaetognaths, decapods, thaliaceans, cladocerans, amphipods, cirripedes and mysids with copepods the most abundant group in the samples. Surveys of the Eastern Great Australian Bight also highlighted the dominance of copepods in the zooplankton community (Van Ruth & Ward 2009).

### 4.1 Krill - *Nyctiphanes australis*

*Nyctiphanes australis* is a common endemic coastal species of krill in southern Australian waters and plays an important role in the ecological significance of upwelling events in the area (e.g. the Bonney Coast Upwelling). *N. australis* is one of the most important dietary items for Pygmy Blue Whales, Jack Mackerel, Short-tailed Shearwater, Fairy Prion, Australian Salmon, Skipjack Tuna and Tiger Flathead among other abundant fish and seabirds (Nicol and Endo 1997).

The latitudinal range of *N. australis* in Australian waters extends from 31°S–44°S latitude to 132°E–156°E longitude, reaching their highest abundances in shallow waters of the continental shelf, predominantly during night-time vertical migrations (Hosie 1982). This vertical migration pattern is more evident during summer than winter (July to September), when *N. australis* becomes relatively scarce in the upper water column, even during the night. In southeastern Tasmania, highest abundances are found in summer between the surface and 40 m during the night and 30–100 m during the day; however, it is not rare to observe large numbers swimming ("swarming") at the surface during daytime (Lagos 2021, Gill 2002).

*N. australis* has one of the highest production-to-biomass ratios, including moulting and egg production, among all krill genera, about 10 times higher than values found for the Antarctic krill species, *Euphausia superba* (Lagos 2021). Production of *N. australis* ranges from 78.3–84.8 mg m<sup>-3</sup> y<sup>-1</sup> (Ritz & Hosie 1982). It also has the fastest growth rate of the *Nyctiphanes spp.* at 40 d (Haywood & Burns 2003 in Lagos 2021).

As detailed in Butler et al. (2002) *N. australis* live ~ 1 year, reach sexual maturity at 3-4 months, with a maximum length of 20 mm and weight of 40 mg and are known to be omnivorous. The species broods its eggs until they hatch rather than spawning them directly into the water column. There is continuous maturation of ova, with an individual female capable of releasing a total of 1100 eggs in a lifetime, which are deposited as a series of batches into a pair of external ovisacs, every 30 days (Hosie 1982).

There is a main peak of spawning from early spring to late autumn, but reproduction continues through all months with as many as three generations produced each year. Continuous reproduction through the year coupled with a high growth rate means that *N. australis* has very high productivity (UTAS 2003). Gill and Morris (2003) noted that surface swarms of *N. australis* were sighted in all months that aerial surveys have been conducted except September, when no surveys were conducted. Sighting covered shelf waters from near King Island to waters 50 km west of Robe, SA.

## 4.2 Upwelling and Productivity

Upwelling refers to physical processes that lift or entrain subsurface water into the euphotic zone, where it can trigger autotrophic phytoplankton production if nutrient limitation is overcome (Shute et al. 2022). Phytoplankton are the food source underpinning the trophic structure and flow of energy through marine food webs as they are consumed respectively by zooplankton and these in turn are consumed by larger and larger predators (CoA 2015a).

Each year during summer, a number of well-described coastal upwelling centres develop along Australia's southern coastline off the Bonney coast (Lewis, 1981, Schahinger 1987), the southern tip of the Eyre Peninsula (Kämpf et al. 2004), and the west coast Tasmanian shelf (Kämpf 2015). Upwelling also occurs along the Otway Shelf between Portland and King Island (where the Regia MSS will be undertaken). However, upwelling along the Otway Shelf is primarily sub-surface, with only a narrow band of surface upwelling inshore during strong upwelling events (Levings and Gill 2010). These sub-areas of upwelling are recognised as components of a unified upwelling system extending from the eastern Great Australian Bight to western Bass Strait/west coast Tasmania and are referred to as the Great Southern Australian Upwelling System (GSACUS) (Kämpf 2004, 2015).

The GSACUS is active during autumn and summer, driving simultaneous upwelling along the Bonney and Otway Coasts (Levings and Gill 2010). Cool upwelled water from depths of 200-400 m is nutrient rich, enhances subsequent upwelling events and leads to phytoplankton growth in the region (Rogers et al. 2013).

## 4.3 Bonney Coast Upwelling Key Ecological Feature

The Bonney Coast Upwelling (BCU) occurs between Cape Jaffa, South Australia and Portland, Victoria (DCCEE 2023). It is a productivity hotspot, with high densities of zooplankton including the coastal krill (*N. australis*) which is an important food source for fish, birds and whales.

The BCU is driven by the frequent south-easterly winds which are the result of southern migration of the subtropical ridge (Nieblas et al. 2009, Schahinger 1987), during the austral summer. The upwelling occurs via Ekman dynamics, where the ocean surface experiences a steady wind stress resulting in a net transport of water at right angles to the left of the wind direction which brings cold, nutrient rich water to the sea surface.

The Bonney Coast Upwelling has been shown to follow a clear temporal pattern. When the upwelling season starts during late spring and early summer (November and December), the influence of the BCU was found to be often restricted to the coast. During the mid-summer and early autumn (January to March) when the upwelling is the strongest, the upwelling influence often extends to the shelf break before retreating in April (Huang and Wang 2019).

Gill et al (2011) states that the Bonney Coast Upwelling generally starts in the eastern part of the Great Australian Bight and spreads eastwards to the Otway Basin. At the height of the upwelling during February and March, its area of influence often exceeds 12,000 km<sup>2</sup>, while its sea surface temperature anomaly often exceeds 1°C, and its chlorophyll-a concentrations are often >1.5 times adjacent areas (Huang and Wang 2019).

The BCU is one of only two identified seasonal feeding areas for blue whales in Australian coastal waters and is one of 12 known blue whale feeding aggregation areas globally. Sightings of Sei whales and Fin whales in the upwelling indicate this is potentially an important feeding ground for these species also (Gill et al. 2015, Morrice et al. 2004).

The BCU is regionally important as it supports the lucrative local fishing and tourism industry off the Otway towns such as Portland, which annually holds an Upwelling Festival in late October/early November to celebrate the abundance of the Bonney Upwelling, and to begin the summer fishing season (Glenelg Shire 2023).

The Bonney Coast Upwelling is defined as a Key Ecological Feature as it is an area of enhanced pelagic productivity and has high aggregations of marine life (DCCEEW 2023). In addition to whales, many endangered and listed species frequent the area, possibly also relying on the abundance of krill that provide a food source to many seabirds and fish. The high productivity of the Bonney Coast Upwelling is also capitalised on by other higher predator species such as little penguins and Australian fur seals feeding on baitfish (DCCEEW 2023).

The Regia Active Source Area overlaps the eastern end of Bonney Coast Upwelling Key Ecological Feature (Appendix B12 MAP-REG-EPM-003).

## 5 Sound Effect Criteria

Sound exposure guidelines for eggs and larvae have been established by the American National Standards Institute (ANSI) accredited report of Sound Exposure Guidelines for Fishes and Sea Turtles (Popper et al. 2014). The sound exposure guidelines from Popper et al. (2014) are based on references and studies on potential impacts of noise emissions on fish eggs and larvae prior to 2014. Results presented in Day et al. (2016b) for embryonic lobsters and Fields et al. (2019) for copepods align with those presented in Popper et al. (2014), which is that mortality and sub-lethal injury are limited to within tens of metres of seismic sources. Additionally, the Popper et al. (2014) sound exposure guidelines are extrapolated from simulated pile driving signals which have a more rapid rise time and greater potential for trauma than pulses from a seismic source.

For eggs and larvae, the sound exposure guidelines provide sound exposure metrics for:

- Mortality and potential mortal injury.

Within these sound exposure guidelines, there was insufficient data to make a quantitative guideline for:

- Recoverable injury
- Temporary threshold shift (TTS) in hearing
- Behaviour
- Masking

For these impacts, a subjective approach of 'relative risk' (low, moderate, and high) is used to assess risk at three distances from the seismic source (near - tens of metres, intermediate - hundreds of metres, and far - thousands of metres) as detailed in Table E2-51-.

The sound exposure guidelines and predicted maximum distances from the acoustic modelling are detailed in Table E2-51- for mortality and potential mortal injury.

Table E2-5-1: Sound Exposure Guidelines and Predicted Maximum Distance for Plankton

	Mortality/Potential Mortal Injury		Recoverable Injury and TTS		Behavioural	
Threshold Criteria	Few studies to base criteria on, however, Popper et al. (2014) provides acoustic criteria extrapolated from simulated pile driving signals which have a more rapid rise time and greater potential for trauma than pulses from a seismic source.  Popper et al. (2014) does not recommend a timeframe for cumulative sound exposure levels and thus 24 hrs has been used as is current industry practice.		There are currently no acoustic criteria for plankton, fish and invertebrate eggs or larvae, however, a scale of relative risk is provided in Popper et al. (2014). The scale assumes that larvae have similar sensitivity to sound as juvenile and adult fish, and that recoverable injury and TTS are possible.		There are currently no acoustic criteria for plankton, fish and invertebrate eggs or larvae, however, a scale of relative risk is provided in Popper et al. (2014). The scale assumes that a behavioural response is possible.	
Relevance of thresholds adopted	Popper et al. (2014) has been used as this cites many of the current references and studies on potential impacts of noise emissions on fish eggs and larvae, and when compared to other studies the threshold levels are similar to those proposed, e.g., Day et al. (2016a and 2016b) and Fields et al. (2019).  Popper et al. (2014) suggests that injury to larvae resulting from seismic impulses may occur for sound exposures above 207 dB PK or above 210 dB SELcum. However, Popper et al. (2014) suggest that recoverable injury and TTS is likely within tens of metres of a seismic source, which is generally less than the distance associated with their proposed mortal injury threshold, hence there is some discrepancy. The threshold proposed for mortal injury is derived from pile driving impacts to fish and is likely to be conservative. The body of literature indicates that mortality and sub-lethal injury are limited to within tens of metres of seismic sources.  Masking is identified as low at near, intermediate, and far distances.					
Sound exposure guideline	Per pulse	SELcum	Proximity to sound source	Relative risk	Proximity to sound source	Relative risk
	207 dB PK	210 dB SELcum	Near – tens of metres	Moderate	Near (tens of metres)	Moderate
			Intermediate – hundreds of metres Far – thousands of metres	Low	Intermediate – hundreds of metres Far – thousands of metres	Low
Modelled Distance	120 - 230 m	60 - 70 m	NA	NA	NA	NA

## 6 Predicted Levels of Impact

As detailed from the underwater sound and studies relevant to seismic surveys (see the Regia MSS Seismic Studies Summary available in Appendix B8), mortality and injury to plankton has been identified from seismic source sound emissions within proximity to the seismic source. This can have direct impacts to plankton including krill, and fish and invertebrate larvae and indirect impacts to receptors that feed on plankton and recruitment of fish and invertebrate species.

The extent of the area of impact is predicted to be a maximum of 230 m from the sound source during survey acquisition (Table E2-51-).

The predicted effect level on these species is assessed as minor, meaning impacts to plankton are predicted but they will be localised and temporary, with the system having the capacity to recover from the impact in a timescale of days to months given the following:

- Phytoplankton and zooplankton biomass in the oceans varies significantly at spatial scales ranging from hundreds of metres to hundreds of kilometres, and temporal scales of hours, days, seasons and inter-annually, due to tidal and large-scale currents, bathymetry, temperature, salinity, water chemistry parameters and other environmental factors (Gibbons & Hutchings 1996; Holliday et al. 1987; McKinnon et al. 2008; Pearce et al. 2000; Sutton & Beckley 2017). Thus, plankton will be spatially and temporally variable throughout the seismic survey and it follows that predicted impacts will not be ubiquitous to all plankton present within the Active Source Area.
- No impacts to phytoplankton are predicted so they will remain available for zooplankton and other fauna to graze on.
- Zooplankton do not have hearing structures (although they can sense pressure changes) and their bodies are generally the same density as the surrounding water so sudden pressure changes associated with seismic activity are presumed to not cause physical damage (Parry & Gason 2006).
- The Working Group on the Effects of Sound on Fish and Turtles (Popper et al. 2014) detailed (a) there is a low relative risk of plankton experiencing masking impacts at all distances from the seismic source (b) a moderate risk of recoverable injury from TTS behavioural impacts near (tens of metres) to the seismic source (c) a low risk of TTS impacts at intermediate or far distances from the seismic source (Table E2-51).
- Any potential mortality or permanent injury effects to plankton must be assessed in the context of natural mortality rates. Mortality and/or mortal injury impacts to plankton assemblages (including fish eggs and larvae) resulting from seismic surveys are likely to be inconsequential relative to natural daily mortality rates, which can range from 11.6% (average minimum) to 59.8% (average maximum) as reported by Tang et al. (2014). Mean mortality rates for marine fish larvae have been assessed as equivalent to 21.3% per day (Houde and Zastrow 1993). In the experiment undertaken by McCauley et al. (2017) zooplankton mortality rate background levels were 19%. Thus, predicted impacts to zooplankton from the seismic survey are likely to be well within natural mortality rates.
- Sætre and Ona (1996) calculated that under a 'worst-case' scenario, the number of larvae killed during a typical seismic survey was 0.45% of the total population, and they concluded that mortality rates caused by exposure to the seismic source were so low compared to natural mortality that the impact from seismic surveys must be regarded as insignificant.
- Zooplankton have rapid recovery rates given their life-history characteristics as described earlier (e.g Huntley and Lopez 1992, Richardson et al 2017). Richardson et al. (2017) modelled the spatial and temporal impact of a seismic survey on zooplankton on the

North-West Shelf from a large-scale seismic survey, considering the mortality estimates of McCauley et al. (2017), and accounting for typical growth rates, natural mortality rates, and the ocean circulation in the region. Their results illustrated:

- Simulations that included ocean circulation showed that the impact of the seismic survey on zooplankton biomass was greatest in the Survey Region where 22% of the zooplankton biomass was removed, while declines moving to the Survey Region + 15 km were 14% of the zooplankton biomass was removed, and when moving out to the Survey Region + 150 km only 2% of the zooplankton biomass was removed. There was no discernible regional-level effect on the entire Northwest Shelf Bioregion. The time to recovery (to 95% of the original level) for the Survey Region was 39 days (38-42 days) after the start of the survey and 3 days (2-6 days) after the end of the survey.
- Simulations with no ocean circulation showed a much greater impact of the seismic survey on relative zooplankton biomass with 35% of the zooplankton biomass removed for the Survey Region, 22% for the Survey Region + 15 km and 3% for the Survey Region + 150 km. Nevertheless, there was still no discernible effect on the entire Northwest Shelf Bioregion. The time to recovery for the Survey Region from the start of the survey was 64 days (49-100 days) and from the end of the survey was 26 days.
- Though the modelling by Richardson et al. (2017) was done for the North-West Shelf the outcomes provide a reasonable proxy as to the impact and recovery of plankton to a seismic survey in the Otway. Average current speeds within the Otway are within those for the North-West Shelf with the maximum Otway current speed higher than for the Northwest Shelf<sup>1</sup>. Water temperatures are colder in the Otway but during upwellings there is significantly more nutrients to fuel plankton growth. Applying predicted impacts from the Richardson et al. (2017) modelling to a seismic survey in the Otway could result in a loss of zooplankton biomass ranging from 22 – 35% with recovery within 3 to 26 days from the end of the survey. Even under the worst-case scenario of no ocean circulation mortality rates for the whole survey fall within the daily mortality rates of 11.6% (average minimum) to 59.8% (average maximum) as empirically derived by Tang et al. (2014).
- Based on an effect range of 230 m it is estimated ~2% of the zooplankton, including krill, present within the Regia Active Source Area and less than 0.2% of zooplankton present in the Otway bioregion would be impacted per day. This is significantly less than zooplankton daily mortality rates of 11.6% (average minimum) reported by Tang et al (2014).
- From a bioregional perspective, the area where zooplankton may be impacted (assessed on the most conservative areal basis) is localised within the Active Source Area and represents <1% of the Otway bioregion. In addition, there are no recorded significant upwelling zones within the Active Source Area.
- Richardson et al (2017) notes that zooplankton communities can begin to recover in number during a seismic survey, such that a continuous decline in zooplankton throughout the seismic survey is unlikely and parts of the Active Source Area would be replenished with zooplankton as the survey progresses.
- Predicted impacts to zooplankton, including krill, do not remove them from the food web and as such the nutrients and energy they contain are retained within the ecosystem. Even after plankton die, their carcasses remain in the water column for several days where they

---

<sup>1</sup> RPS (2019) details for Otway monthly average surface current speed was 0.16 to 0.25 m/s, maximum surface current speed ranged between 0.60 m/s and 1.22 m/s, and sea surface temperatures ranged from 13.3°C to 18°C. RPS (2019a) details for Scarborough on the North-West Shelf monthly average surface current speed was 0.4 to 0.26 m/s, maximum surface current speed was ~0.70 m/s, and sea surface temperatures ranged from 15°C to 29°C.

remain available for scavengers before any remaining carcasses sink to the seafloor to be consumed by opportunistic benthic organisms (Kirillin et al. 2012, Tang et al. 2014, Dubovskaya et al. 2015). Thus, tangible impacts to primary production and ecosystem function are not predicted.

- While the upwelling season provides the greatest concentration of krill in a defined area, krill swarms are nevertheless prevalent throughout the year and over a broad area as detailed by Gill and Morris (2003) who noted that surface swarms of *N. australis* were sighted in all months that aerial surveys were conducted and that sightings covered shelf waters from near King Island to waters 50 km west of Robe, SA. *N. australis*' main peak of spawning is from early spring to late autumn, but reproduction continues through all months with as many as three generations produced each year (UTAS 2023). Continuous reproduction throughout the year coupled with high growth rates results in very high productivity which confers high levels of resilience to any disturbances.
- The area of predicted impact overlaps the pygmy blue whale high density foraging BIA. Seasonal aggregation for feeding is associated with the timing of the Great Southern Australian Upwelling System, specifically the Bonney Coast Upwelling and the presence of high concentrations of *N. australis* (Australian Krill). Krill is also an important dietary item for other fauna such as Jack Mackerel, Short-tailed Shearwater, Fairy Prion, Australian Salmon, Skipjack Tuna and Tiger Flathead (Nicol and Endo 1997).
- Mortality or mortal injury effects to krill will be confined to the active seismic area. As noted previously effects will be patchy, and relative to the scale of the foraging grounds and the spatial extent of the upwelling the scale of any impacts will be minor. The upwelling is providing an extremely concentrated food source for the food chain which is effectively super-charging the productivity rates of zooplankton and krill, and by extension increasing their resilience to disturbance. It is an unrealistic assumption that the density of food (e.g krill) and the density of feeding animals is completely filling this niche and therefore any changes will tip the system into an alternate state. Any potential changes to plankton populations will not have any measurable effect on the ability of pygmy blue whales and other species being able to feed on them. Any impacts to krill are likely to be within natural mortalities rates thus not effecting the availability of krill for foraging.
- In Summary, impacts to the Bonney Coast Upwelling KEF and the broader Great Southern Australian Upwelling System, that the Regia MSS overlaps, and the role these upwellings play in ecosystem function and productivity, are not predicted as:
  - An activity limitation has been adopted whereby the seismic source will not be discharged within the Bonney Coast Upwelling KEF (M#01).
  - Impacts to the physical upwelling process are not predicted.
  - Impacts to phytoplankton are not predicted and thus they are available to be grazed on by zooplankton and other fauna that increase productivity in the area.
  - Levels of mortality or mortal injury effects to zooplankton will be subsumed by higher natural mortality rates. Plankton communities are patchy in time and space and also highly productive which confers powerful rates of recovery in response to any disturbances not just seismic. Hence, continuous declines of zooplankton throughout the duration of the seismic survey is not anticipated.
  - Mortal injury effects to zooplankton, including krill, will not confer any disadvantage to feeding marine fauna as they will remain available within the water column.

The uncertainty level for impact to plankton is assessed as medium based on:

- There are multiple published studies on seismic sound effects to plankton.

- The impact assessment used all available literature and used peer-reviewed published literature to validate report data where possible.
- There are peer reviewed sound effect criteria for fish eggs and larvae.
- There are several published studies on zooplankton and krill that are relevant to the Otway region.
- The body of peer reviewed literature indicates that mortality and sub-lethal injury are limited to within tens of metres of seismic sources.

The predicted level of impact based on the effect (minor) and uncertainty (low) is assessed as low. For plankton the predicted level of impact is beneath levels of perception and/or within normal bounds of variation. Good industry practice (including legislation and standards) has been applied and therefore these impacts are of an acceptable level without further reduction measures being required.

## 7 Comparison of Predicted Level of Impact with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Impact	Predicted Level of Impact Below Defined Acceptable level?
Category	Level		
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.	Predicted impacts to zooplankton are temporary, reversible, small-scale, and within natural variations in mortality.	Yes
	The impact and risk assessment process are based on sufficient information to understand if: Serious/irreversible environmental damage is predicted; or The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature was used to inform the impact assessment. Serious or irreversible environmental damage is not predicted. There is high confidence in the prediction of impacts which is based on peer reviewed and published literature.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	No EPBC Act Management Plans and Recovery Plans were identified relevant to plankton.	Yes
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	Predicted impacts to zooplankton are temporary, reversible, small-scale, and within natural variations in mortality.	Yes
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	As predicted impacts to zooplankton are temporary, reversible, small-scale, and within natural variations in mortality, impacts to primary production and ecosystem function are not predicted.	Yes
Economic	Affected persons will not be worse off as a result of the activity.	As predicted impacts to zooplankton are temporary, reversible, small-scale, and within natural variations in mortality, impacts to economic receptors are not predicted.	Yes
Cultural	Impacts and risks to cultural features including cultural values, traditions, or	As predicted impacts to zooplankton are temporary, reversible, small-scale, and within natural variations in mortality, impacts to cultural receptors are not predicted.	Yes

Defined Acceptable Level		Predicted Level of Impact	Predicted Level of Impact Below Defined Acceptable level?
Category	Level		
	practices, will be temporary / reversible, small scale, and/or low intensity.		
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce environmental impacts as detailed in Section 8.	Yes
	Environmental impacts and risks are consistent with the CCG impact and risk assessment process such that for an impact or risk the effect/ consequence rating is medium or below.	The predicted effect level is minor.	Yes
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the impact.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	From relevant person consultation the following objections and claims have been made: Impact of the survey on the Bonney Upwelling.	Yes
	The views of public have been considered in the impact and risk assessment.	The impacts of the noise on marine ecosystems, can kill zooplankton. Seismic blasting will kill zooplankton which have a fundamental role for ecological integrity as food for krill and subsequently krill are food for whales. Impacts to zooplankton and the Bonney Coast Upwelling and the role they both plays in ecosystem function and productivity is not predicted as: <ul style="list-style-type: none"> <li>Impacts to phytoplankton are not predicted.</li> <li>Mortality or mortal injury effects to zooplankton are within natural mortality rates and zooplankton communities can begin to recover during the seismic survey such that a continuous decline in zooplankton throughout the duration of the seismic survey is not anticipated and parts of the survey area would be replenished as the survey progressed.</li> <li>Mortality or mortal injury effects to zooplankton, including krill, does not impact on marine fauna being able to feed on them as they will still be available within the water column.</li> </ul>	Yes

## 8 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure environmental impacts will be of an acceptable level and ALARP.

Measure	Justification	Adopted
M#01: Activity Limitation	<p>Data acquisition will follow a 130 orientation, aligning with the modelled approach to minimise environmental impact.</p> <p>Richardson et al (2017) recommends that to reduced impacts to plankton that a seismic survey run perpendicular to prevailing currents, minimising the duration of exposure of plankton to seismic source, as plankton will be moving away from the seismic source not with it.</p> <p>The survey lines have been developed in an east-west orientation to obtain the greatest efficiency to reduce the number of days of acquisition to as low as possible.</p> <p>The Bonney Coast Upwelling occurs along the Bonney coast between Cape Jaffa, South Australia and Portland, Victoria. It displays seasonal and annual variation driven by the prevailing south-easterly winds (DEECCW 2023). These winds drive ocean currents to the north-west along the coast.</p> <p>Thus, the east-west lines though not perpendicular to the currents do not follow the currents therefore minimising the duration of exposure of plankton to seismic source.</p> <p>As impacts to plankton have been assessed as temporary, reversible, small-scale, and within natural variations in mortality they are of an acceptable level. Changing the acquisition line orientation will significantly increase the number of days of acquisition, having an increased impact on other receptors for a limited increased environmental benefit.</p>	Yes
M#01: Activity Limitation	<p>There will be no discharge of the sound source within the Bonney Upwelling KEF.</p> <p>There will be no discharge of the sound source in January, February, March.</p> <p>The Bonney Upwelling is driven by spring-summer winds that blow from the south-east. It can vary from year to year but typically starts during November and December and retreats in April. Most consultations identified that the upwelling events and the associated increase in biodiversity in the area was a high priority. As a result, CCG will avoid the peak upwelling months of January, February, and March.</p>	Yes

## 9 Conclusions

This impact assessment has demonstrated that the effect of underwater sound to plankton has a:

- **Predicted level of effect of minor.**
- **An uncertainty of low.**
- **Predicted level of impact of low.**

## 10 Recommendations

While there is extensive literature about the effects of seismic on plankton there has been a high level of concern throughout the consultations with relevant persons, particularly about the importance of biodiversity increases associated with the summer upwelling events. It is recommended that CGG undertake additional assessment looking at the effects of the activity on plankton and spawning in the context of the upwelling events. This assessment is detailed in the Acceptable Levels Assessment (Appendix F3).

## 11 Document Control

Date	Revision	Update
6 July 2023	A	Draft prepared for initial comment.
23 August 2023	B	Update based on comments and relevant person feedback.
11 Sept 2023	0	Approved for release on Regia MSS website.
20 Dec 2023	1	EP submission to NOPSEMA.

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (Regia MSS) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (PEIRA) (Appendix B4) for further assessment. This document also uses information in two preceding studies:

1. Sound Emissions Initial Modelling Report (Appendix B7)
2. Seismic Sound Studies Report (Appendix B8)

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (EP) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table E3-2-table E3-21 shows the feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table E3-2-1 shows how this feedback has been incorporated into the environmental assessments.

*Table E3-2-1 - Relevant person input into the preparation of the EP*

Objections and Claims	Feedback ID	Measure adopted because of consultation
Email received detailing the negative impact on marine life and climate	166	CGG agreed to implement the following measures:  Exclusion zones for shallower waters with higher biodiversity - adopted 50 m and shallower activity exclusion zone.  Activity timing - avoid peak biodiversity in summer months (Jan/Feb/Mar) - adopted.  Adjustment protocol for commercial fishers - adopted.  Policy Statement 2.1 measures, plus others.
Received from a fisher concerned about the impacts on shark fishery (displacement) and request to table a compensation document.	170	CGG agreed that a adjustment protocol will be implemented.

<b>Objections and Claims</b>	<b>Feedback ID</b>	<b>Measure adopted because of consultation</b>
Fishing associations request the need to understand the overlap of the survey with historical fishing activities.	172	CGG agreed that there will be an activity limitation of no acquisition beyond 200 m depth contour.
Fishing associations suggested a requirement to put a commercial fishing compensation protocol in place for trawl and gillnet fishers.	175	CGG agreed a compensation protocol will be implemented (subject to further input from fishers)
Email received containing queries demanding for a plan to monitor and reduce the risks and effects of seismic testing on marine species.	199	CGG agreed to implement the following measures: Activity limitations (various). Sail line plan. OPEP protection priority areas added.
Email received regarding a request for decisions to be consistent with the federal government's Threatened Species Recovery Plan	201	CGG agreed to implement the following measures: Light management plan including shrouds. OPEP priority for protection.
Email received regarding the interference with Orange Roughy Research Program	213	CGG have agreed there will be a sail line plan put in place.
Email received regarding losing craypots due to being cut off by your vessels during transit.	227	CGG have agreed a compensation protocol to be adopted with a loss of gear clause will be implemented.

## 3 Aspect – Underwater Sound

### 3.1 How the Aspect Occurs

Impulsive underwater acoustic emissions will result from the seismic source releasing compressed air (seismic pulse) that creates a sound wave that is directed downwards into the seabed.

Continuous underwater acoustic emissions are generated by the survey and support vessels and helicopters. Underwater acoustic emissions from vessels are generated by thrusters, engines, and propellers. Underwater acoustic emissions from helicopters are generated via the engine and rotors.

### 3.2 Extent and Duration of the Aspect

#### *Impulsive Sound*

Duration: 60 days

Extent: Active Source Area + 60 m to 7.86 km based on the furthest distance to modelled sound effect criteria.

Seismic acquisition where the seismic source will be active will occur for up to 60 days within the Active Source area.

#### *Continuous Sound*

Duration: 90 days

Extent: Operational Area +1.6 km

The survey and support vessels and helicopters will be active in the Operational Area for the duration of the survey undertaking support activities and acquisition.

The extent (1.6km) of vessel sound that may impact marine receptors is based on the assessment of vessel and helicopter sound.

### 3.3 Legislative and Other Requirements

Annex 1 of this document describes the legal and other requirements that apply to underwater sound and species that may be affected by underwater sound, and how the requirements will be met.

### 3.4 Cause Effect Pathway

The PEIRA (Appendix B4) identified a cause-effect pathway for underwater sound for the following environmental components:

- Fish including eels and sharks.

In addition, indirect impacts to the following were identified via relevant person consultation:

- Commercial fisheries and fishing tour operators

### 3.5 Underwater Sound Modelling

CGG contracted JASCO Applied Sciences (JASCO) to undertake a numerical modelling study of underwater sound levels associated with the initial Regia MSS acquisition lines to assist in understanding the potential acoustic impacts on key regional receptors including fish.

The modelling methodology considered source directivity and range-dependent environmental properties likely to be encountered within the proposed survey area. The modelling report (Koessler et al. 2023) is available in Appendix B7 and provides an overview of JASCO's specialised airgun array source model and complementary underwater acoustic propagation models, receptor sound effect criteria adopted and the predicted distances to those criteria.

## 4 Description of the Existing Environment that may be Affected by the Activity

To identify fish species that may be present within the area affected by underwater sound a PMST search was undertaken using the Active Source Area with an 8 km buffer based on a furthest distance to a sound effect criterion of 7.86 km (Table E3-5-1table E3-51). The PMST Report is available in Appendix B5. Annex 1 provides details on these protected fish species and relevant conservation advice or management plans.

The PMST Report identified the Eastern Dwarf Galaxias and Yarra Pygmy Perch as occurring in the area affected by underwater sound. The Dwarf Galaxias is a freshwater species (Saddler et al. 2010). The Yarra Pygmy Perch occurs in lakes, ponds, and slow flowing rivers (Saddler and Hammer 2010). No impact from underwater sound is therefore predicted to impact freshwater area so these species are not discussed further.

In addition, a review was undertaken of commercial fisheries that are active in the area to identify what fisheries targeted species may be present in the Active Source Area. Also, via stakeholder consultation concerns were raised in relation to the potential impact of seismic sound on eels.

### 4.1 Protected Species

#### 4.1.1 Australian Grayling (*Prototroctes maraena*)

The Australian Grayling is a small to medium-sized, slender, silvery fish with soft-rayed fins lacking any spines. It is endemic to south-eastern Australia, including Victoria, Tasmania, and New South Wales, and is a migratory species that inhabits estuarine waters and coastal seas as larvae/juveniles, and freshwater rivers and streams as adults (Backhouse et al. 2008). Australian Grayling generally migrates downstream to the lower freshwater reaches of rivers to spawn, usually over a two-week period, typically from late-summer to mid-winter (TSSC 2021). Fecundity of the Australian Grayling varies between 25 000 and 68 000 eggs, with an average of 47 000 eggs (TSSC 2021). Eggs hatch between 10 and 20 days after being laid. Larvae emerge at 6.5 mm in length, are buoyant, and while they are free swimming, they are typically swept downstream into marine habitats by river flow (TSSC 2021). A lack of genetic diversity between Australian Grayling collected from coastal rivers in Victoria suggested that a single population occurs in Victoria, as larvae are most likely dispersed during the marine stage of their life cycle (TSSC 2021).

#### 4.1.2 Blue Warehou (*Serirolella brama*)

The Blue Warehou is a medium-sized, deep-bodied fish, reaching a maximum total length of 90 cm and a maximum weight of 7 kg (TSSC 2015). Globally, the Blue Warehou is confined to Australian and New Zealand waters predominantly in coastal shelf, upper continental slope, and seamount waters offshore from New South Wales, Tasmania, Victoria and South Australia (TSSC 2015).

Blue Warehou is a benthic-pelagic species that inhabits continental shelf and slope waters. Adults can be found at depths from 50 - 300 m. Blue Warehou is a schooling fish and usually aggregates close to the seabed. Juveniles can sometimes be found schooling close to the surface in estuaries, often in association with jellyfish (AFMA 2023).

Spawning occurs during winter and early spring. The primary spawning ground is off western Victoria and Tasmania. On average females spawn around three times per season. Females produce 430 000-1 350 000 eggs per spawning event depending on their body size (AFMA 2023).

Blue Warehou is a target species for the Southern and Eastern Scalefish and Shark Fishery and Tasmania Scalefish Fishery.

#### 4.1.3 Little Gulper Shark (*Centrophorus uyato*)

The Little Gulper Shark is listed as Conservation Dependent. Gulper Sharks are targeted by the Southern and Eastern Scalefish and Shark Fishery. They are endemic to Australia, occupying demersal habitats on the upper-slope of the southern continental shelf, between 180 m to 900 m (Williams et al. 2012). There are likely to be three distinct stocks of Gulper Shark:

- An eastern stock along the east coast of Australia down to eastern Tasmania.
- A central stock from western Tasmania through the Great Australian Bight.
- A western stock from the western Great Australian Bight, south Western Australia.

Gulper Sharks have life history characteristics that make them vulnerable to overfishing. These include slow growth, late age-at-maturity, low fecundity, and low natural mortality (TSSC 2013a). Young are born live, and reproduction is continuous and non-seasonal (TSSC 2013a). Estimated foraging range for Gulper sharks is up to 50 nm based on acoustic telemetry data (Williams et al. 2012). They undertake day-night migrations across their depth range from relatively deep day time residence depths (1000 m) to shallower night time feeding depths (to 200 m) (Williams et al. 2012).

#### 4.1.4 Orange Roughy (*Hoplostethus atlanticus*)

Orange Roughy are a deepwater species that inhabits waters over steep continental slopes and ocean ridges. They are usually found dispersed over rough bottoms and steep slopes at depths of 700 - 1400 m (AFMA 2023a). Orange Roughy form dense spawning aggregations in winter, with non-spawning aggregations occurring sporadically in summer and autumn. Aggregations usually occur from 5-10 metres above the seabed, with some extending over 50 metres in height from the sea floor. Aggregations are usually associated with submerged hills or pinnacles. Excluding substantial migrations to spawning grounds, Orange Roughy are a relatively sedentary species (AFMA 2023a).

Orange Roughy reach reproductive maturity at 27-32 years of age. Spawning aggregations form between mid-July and late August. Adult males appear to spawn over a 1-2-week period, with females spawning for up to 1 week. Females produce 10 000-90 000 eggs in a single spawning event each season. The eggs float to the surface after fertilisation before sinking again to hatch close to the sea floor. Hatching is thought to occur 10-20 days after fertilisation. It is likely that females do not spawn every year (AFMA 2023a).

The Orange Roughy is a demersal fish targeted by the Southern and Eastern Scalefish and Shark Fishery. They are widely distributed throughout the world and form dense spawning and feeding aggregations on or near topographic features such as seamounts, canyons, and plateaus (DCCEEW 2023). No spawning or feeding aggregation areas have been identified in the Operational Area.

#### 4.1.5 School Shark (*Galeorhinus galeus*)

The following is from AFMA 2023.

School Shark are a temperate demersal species found on the continental shelf and slope. They can be found to depths of 550 m, and often move up into the water column at night. School shark segregate into schools according to size and sex (AFMA 2023). Size generally increases from inshore to offshore. Pups and juveniles aggregate in shallower 'nursery' waters during the spring and summer. School Shark undertake long migrations of up to 1400 km along the southern coast of Australia, which are thought to be associated with homing to natal mating and pupping grounds.

School Shark are a target species for the Southern and Eastern Scalefish and Shark Fishery.

School Shark is listed as Conservation Dependent. It appears to have undergone a significant reduction in numbers as a result of commercial fishing in southeastern Australian waters (TSSC 2009a). School Sharks move extensively throughout the waters of southern Australia. School Shark is primarily a deep water demersal (bottom-dwelling) species, although individuals have been recorded

undertaking daily vertical migrations, remaining at depths of around 500 m during the day and moving up to around 100 m at night (McLoughlin, 2007). Females and juveniles utilise inshore coastal areas around Victoria, Tasmania, and parts of South Australia for nursery areas (Pogonoski et al., 2002).

School Sharks are highly migratory, with individual migrations of up to 1400 km recorded in southern Australia. These migrations appear to be associated with reproduction (Last and Stevens 1994). However, while extensive migrations within regions have been recorded, studies of different global populations indicate that each region hosts a genetically distinct population. Within regions, it is suspected that there may be localised subpopulations (TSSC 2009a).

#### 4.1.6 Southern Bluefin Tuna (*Thunnus maccoyii*)

Southern Bluefin Tuna can grow to 225 cm in length and 200 kg in weight (TSSC 2010). They are a highly migratory species that occurs globally in waters between 30°S and 50°S. In Australian waters, they range from northern Western Australia, around the southern region of the continent, to northern New South Wales (TSSC 2010). Southern Bluefin Tuna forms a single widely distributed population in the southern, temperate oceans, but with a single known spawning ground in the Indian Ocean, between Java and northern Western Australia (TSSC 2010). Southern Bluefin Tuna are known to be among the fastest ocean swimmers in the world and can travel in speed bursts of up to 70 km/hr while feeding (TSSC 2010).

Southern Bluefin Tuna are a target species for the Southern Bluefin Tuna Fishery and in Australian waters, they are found mainly in the Great Australian Bight (AFMA 2023b) where they are most commonly caught during the summer months (December to April). They are also caught off the New South Wales coastline during winter (AFMA 2023b).

Southern Bluefin Tuna is not commercially caught in the Operational Area. It is sometimes caught recreationally off Victoria.

#### 4.1.7 Syngnathids

Most of the listed marine ray-finned fish species identified in the PMST report are syngnathids, which includes seahorses and their relatives (sea dragon, pipehorse and pipefish). The majority of these species are associated with seagrass meadows, macroalgal seabed habitats, rocky reefs and sponge gardens located in shallow, inshore waters (e.g., protected coastal bays, harbours and jetties) less than 50 m deep (Fishes of Australia, 2015). They are sometimes recorded in deeper offshore waters, where they depend on the protection of sponges and rafts of floating seaweed such as sargassum.

#### 4.1.8 White Shark (*Carcharodon carcharias*)

The White Shark is listed as Vulnerable. White Sharks are long-lived, living for 30 years or more (Bruce 2008), and are found throughout temperate and sub-tropical regions in the northern and southern hemispheres (Last & Stephens 2009). The species is also commonly found in inshore waters in the vicinity of islands, and often near seal colonies (Malcolm et al. 2001). The White Shark foraging BIA within the area that may be impacted by underwater sound above the behavioural threshold for sharks, is centred on Lady Julia Percy Island which is a known seal breeding colony (Appendix B12 MAP-REG-EPM-077). The Operational Area also overlaps the distribution BIA that covers Australian waters from Barrow Island/Montebello Islands, WA to Yeppoon/Swains Reef, Qld (Appendix B12 MAP-REG-EPM-077).

#### 4.1.9 Eels (*Anguilla* spp.)

The Short-finned Eel (*Anguilla australis australis*) and the Long-finned Eel (*A. reinhardtii*) both occur naturally within Victoria and are the target species of the Victorian Eel Fishery. The Eels have differing but overlapping distributions east and south of the Great Dividing Range in estuarine and freshwater catchments (VFA 2023) (Figure E3-4-figure E3-41).

The Short-finned Eel is widespread across the southern parts of the Victoria and occurs occasionally in northern streams draining into the Murray River, while the Long-finned Eel is found within southeast parts of Victoria only (VFA 2023). Both species spend the majority of their life cycle in fresh water or estuaries before travelling to the ocean to spawn once before dying (VFA 2023). The Operational Area or area potentially impact by underwater sound does not overlap habitat associated with the Long-finned Eel (Figure E3-41-) and hence is not discussed further.

Both species migrate to the ocean once matured; male short-finned eels generally mature at 8-12 years of age, whilst females mature at 10-20 years. Migration occurs during late summer to autumn (VFA 2023a). Spawning is thought to occur in the vicinity of the Coral Sea, although no precise spawning location for either species has been identified. Eggs are thought to be pelagic and hatch after about two days. Larvae are transported southwards along the east coast of Australia where they metamorphose into glass eels and swim into coastal bays and estuaries (VFA 2023). Most Short-finned glass eels migrate in the winter and spring, although glass eels may continue to arrive anytime throughout the year (VFA 2017).

The distributions of Short-finned Eels are extensive from subtropical Queensland to western Victoria, Tasmania, and New Zealand (VFA 2023).

Koster et al (2021) tracked the Short-finned Eel spawning migration for the first time in Australia. Sixteen eels were collected and tagged from the Hopkins and Fitzroy River estuaries as they migrated from the river mouths outwards to the Southern Ocean over a sandbar in 2019. They were then released at either Warrnambool Harbour, Hopkins mouth beach or Killarney beach. Of the 16 tags twelve returned data. The results showed that the Short-finned eels exhibit diel vertical migration, where they travel in the top layers of water during the night and travel further down in the water column during the day (Koster et al. 2021). Of the small number of eels that made the entire journey to the spawning location their last movements were recorded in the Coral Sea. Many of the eels (about 30%) migrations were cut short due to predation, suspected by sharks, tuna, or other marine mammals.

Short-finned Eel is listed as 'near threatened' on the IUCN red list, with barriers to riverine movement and freshwater habitat loss being key threats. Additionally changes in ocean currents, primary production, and thermal regimes may also affect eel migration, spawning success, and recruitment (Koster et al. 2021). The long-finned eel is listed as 'least concern' by the IUCN. Short-finned Eel is not listed under the EPBC Act and is fished by the Victorian Eel Fishery.

#### *Victorian Eel Fishery*

Both the Long-finned and Short-finned Eel are the target species for the Victorian eel fishery. The first commercial catches of eel were recorded in 1914, and up until 1950 eel was primarily fished for bait. Export of frozen Short-finned eel to Europe began in the 1960s (VFA 2023a). Eel are harvested in Victorian coastal river basins south of the Great Dividing Range using fyke nets, with a maximum of 18 licences allowed in Victoria. Certain waterways are closed to fishing to allow for eels to escape and spawn (VFA 2023a). Short-finned Eels are the most abundant and the most keenly targeted eel species in Victoria, productivity from the fishery is highly susceptible to short and long term and seasonal environmental variations, particularly drought (VFA 2017).

The eel fishery comprises both a wild catch sector and a culture (stock enhanced) sector. The culture sector has developed strategies for growth consistent with the species life cycle by translocating juvenile eels from other parts of Victoria into lakes and impoundments (culture waters) in western inland Victoria where they continue to grow (VFA 2017). Fishing for glass eels has been of limited success due to the highly variable abundance in Victoria. Most of Victoria's eel catch is taken by commercial fishers and is comprised of adult eels during different stages of their migration.

#### *First Nations Connection to Eels*

Eels were, and continue to be, an important resource for certain First Nation communities. Their use for communal gatherings and for barter and trade was extensive in pre-colonial times. Today, eel remains a popular food for community events (VFA 2017). Short-finned Eels in particular hold a cultural significance to First Nations people. For example, the Gunditjmara people of south-western Victoria built and used sophisticated aquaculture systems throughout the Budj Bim Cultural Landscape to exploit eel migrations at least 7,000 years ago. These systems are outside of the area that may be affected by underwater sound.

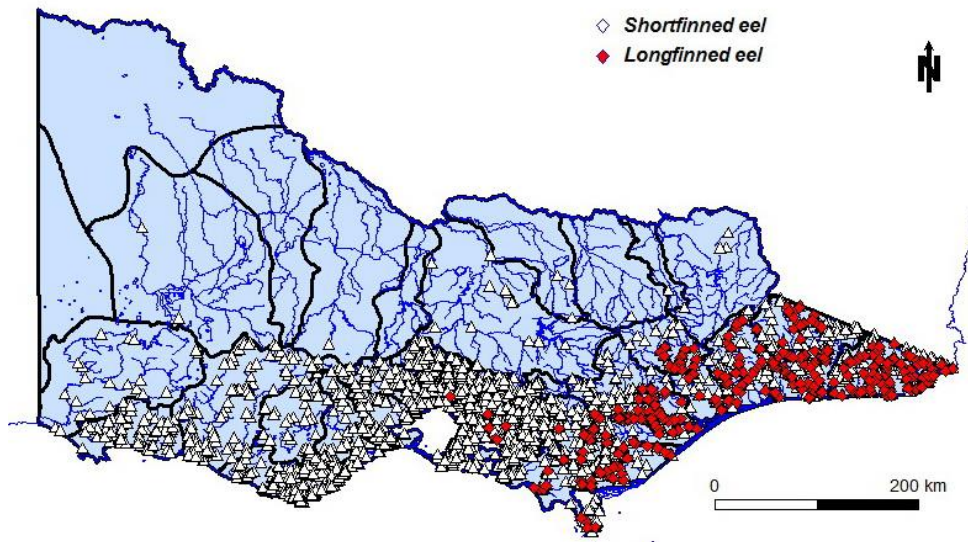

Figure E3-4-1: Distribution of Long-finned and Short-finned Eels in Victoria (VFA 2017)

## 4.2 Commercial Fish Species

The following commercial fish species were identified from the Commercial Fisheries Analysis Report available in Appendix B6 based on the commercial fisheries which have catch effort within the Operational Area.

### 4.2.1 Albacore Tuna (*Thunnus alalunga*)

The following is from AFMA 2023c.

Albacore Tuna is a highly migratory species, swimming continuously over large distances. They are found commonly in eastern Australian waters, but they are also found in the waters of other countries within the Pacific and Indian Oceans. In Australia, Albacore Tuna are caught anywhere along the east coast and is a targeted species by fishers in the Eastern Tuna and Billfish Fishery.

Though Albacore tuna is not commercially caught in the Operational Area it is sometimes caught recreationally off Victoria.

### 4.2.2 Australian Sardine (*Sardinops sagax*)

The following is from AFMA 2023d.

Australian Sardine is found primarily in temperate waters throughout the eastern Pacific Ocean. They are a coastal species that can usually be found from inshore waters to the edge of the continental shelf, down to depths of about 200 m. Australian Sardine is often found in large schools. Feeding is thought to mainly occur during the day.

Spawning occurs during spring-summer in the southern part of its range, and in summer-autumn in the northern part. It was previously thought that Australian Sardine only spawn once or twice in a season, but research on similar species suggests that they may spawn multiple times. Females produce 10 000–45 000 eggs per spawning event depending on their body size.

Australian Sardine is a target species for the Small Pelagic Fishery and the Southern and Eastern Scalefish and Shark Fishery

#### 4.2.3 Bigeye Tuna (*Thunnus obesus*)

The following is from AFMA 2023e.

Bigeye Tuna is a highly migratory species, swimming continuously over large distances. They are found commonly in eastern Australian waters, but they are also found in the waters of other countries within the Pacific and Indian Oceans.

In Australia, Bigeye Tuna is caught anywhere along both the east and west coasts and is a targeted species by fishers in both the Eastern Tuna and Billfish Fishery and the Western Tuna and Billfish Fishery.

Bigeye Tuna is a tropical tuna species and prefers warmer oceanic waters and is not likely to be present in the Otway area of the Operational Area.

#### 4.2.4 Blue Grenadier (*Macruronus novaezelandiae*)

The following is from AFMA 2023f.

Blue Grenadier is a deepwater species that occurs on the continental slope. They can be found at depths of 200 - 700 m. Juveniles often occur in shallower bays and inlets. Blue Grenadier aggregate near the seabed during the day and move up into the water column at night. Spawning occurs in winter and early spring. The main spawning ground for blue grenadier is on the west coast of Tasmania. Females release about 1 million eggs in a single spawning event.

Blue Grenadier is a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.5 Blue Mackerel (*Scomber australasicus*)

The following is from AFMA 2023g.

Blue Mackerel are a schooling pelagic species that occurs in tropical and temperate waters of the Pacific Ocean. They can be found to depths of 200 m over the continental shelf, although juveniles inhabit inshore waters and shallower waters. Blue Mackerel tend to school by size, as well as with other fish such as jack mackerels. Feeding is thought to occur during the day.

Blue Mackerel reach reproductive maturity at about 3 years of age. Spawning occurs in spring and summer in outer continental shelf waters off northern New South Wales and southern Queensland.

Fishing for Blue Mackerel in the Small Pelagic Fishery has historically been focused off southeast NSW, eastern Tasmania, and South Australia. These areas are outside of the Operational Area.

#### 4.2.6 Blue-eye Trevalla

The following is from AFMA 2023h.

The Blue-eye Trevallas are stout-bodied fish with a blunt snout and small scales. The Blue-eye Trevallas are benthic species that are associated with rocky ground on continental slopes often found in continental shelf and upper slope waters at depths from 100–600 m and on seamounts and undersea features. They generally remain close to the seabed during the day and move up into the water column at night. Spawning occurs in summer and autumn. Mature fish are thought to move

into shallower waters and aggregate over specific areas for spawning. Most spawning activity occurs in waters from central New South Wales to north-eastern Tasmania.

Blue-eye Trevallas are a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.7 Broadbill Swordfish (*Xiphias gladius*)

The following is from AFMA 2023i.

Broadbill Swordfish is an oceanic species and is caught worldwide throughout tropical, temperate, and occasionally cold waters. They are commonly found in eastern Australian waters, but they are also found in the waters of other countries within the Pacific and Indian Oceans.

In Australia, Broadbill Swordfish are caught anywhere along both the east and west coasts and it is a targeted species by fishers in both the Eastern Tuna and Billfish Fishery and the Western Tuna and Billfish Fishery.

Broadbill Swordfish are not commercially caught in the Operational Area.

#### 4.2.8 Eastern School Whiting (*Sillago flindersi*)

The following is from AFMA 2023j.

Eastern School Whiting is a benthic species found from shallow tidal flats down to depths of 180 m on the continental shelf. They are usually associated with sandy substrates. Juveniles tend to be found in shallower waters than adults.

Spawning is regionally variable and occurs from October to March in the eastern Bass Strait, late summer in Tasmania, and during winter in northern New South Wales. Females spawn twice each year in deeper waters. Females produce 30 000-110 000 eggs per spawning season depending on their body size.

Eastern School Whiting is a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.9 Elephant Fish

The following is from AFMA 2023k.

Elephant Fish are the common name for Ghost Shark (*Callorhynchus mili*) and Spookfish (*Harriotta haeckeli* and *H. raleighana*)

Ghost Sharks are often found in shallow bays and large estuaries, but also to depths of 200 m on the continental shelf. Juveniles inhabit shallow coastal waters for about three years and gradually move into deeper water as they mature. Ghost Sharks appear to school by gender.

Spookfish are a deepwater species that occurs on the continental slope. They can be found in depths of 380-2600 m. *H. haeckeli* are generally found in deeper water than *H. raleighana*. Little is known about the habitat of spookfish. Adults and juveniles probably occupy different habitats.

Ghost Sharks are oviparous (lay eggs) and it is presumed that spookfish do as well.

Elephant Fish is a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.10 Gummy Shark (*Mustelus antarcticus*)

The following is from AFMA 2023l.

Gummy Sharks are a demersal species that inhabits the continental shelf from the near shore region to depths of 80 - 350 m. They remain either on or near the seabed. Newborn and juvenile Gummy Sharks aggregate in many areas across southern Australia, while young and adult gummy sharks are more widely distributed. Gummy Sharks are oviparous (lay eggs).

Gummy Sharks are a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.11 Jack Mackerel (*Trachurus declivus* and *T. murphyi*)

The following is from AFMA 2023m.

Jack Mackerel are a pelagic schooling species found around the southeast and southern coasts of Australia over the continental shelf and outer shelf margin. They are commonly found at depths of 20 - 300 m. Jack Mackerel school by size. Juveniles tend to be found in shallower waters than adults. Feeding is thought to occur both during the day and at night.

Spawning occurs during late spring to early summer. Spawning begins off the southeast coast of Australia and moves progressively southwards over the summer.

Fishing for Jack Mackerel in the Small Pelagic Fishery has historically focused on the area of waters off South East NSW, Eastern Tasmania and South Australia.

#### 4.2.12 Pink Ling (*Genypterus blacodes*)

The following is from AFMA 2023n.

Pink Ling are a demersal species that inhabits the continental shelf and slope. They can be found at depths of 20 - 1000 m. Juveniles tend to occur in shallower waters than adults. Pink Ling occur over a variety of substrates, from rock ground to soft sand and mud in which they burrow. Aside with some movement associated with spawning, pink ling are thought to be relatively sedentary.

Spawning occurs over an extended period during late winter and spring. Pink Ling are thought to be serial spawners, with egg batches being released in a floating gelatinous mass in each spawning event. Females produce about 333 000 eggs per spawning event depending on body size.

Pink Ling is a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.13 Ribaldo (*Mora moro*)

The following is from AFMA 2023o.

Ribaldo are a temperate deepwater species that occurs on the continental shelf. They can be found near the seafloor at depths of 450 - 2500 m and it appears to be most common at depths of 500-1000 metres. Ribaldo are associated with sea mounts and rough sea beds. Juveniles may be pelagic.

Spawning occurs in winter and early spring. Ribaldo are not thought to form large spawning aggregations.

Ribaldo is a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.14 Sawsharks (*Pristiophorus cirratus* and *P. nudipinnis*)

The following is from AFMA 2023p.

Sawsharks are a common demersal species that inhabits the continental shelf and upper slope. They can be found in depths to 300 m. Sawsharks are sometimes found in large schools or feeding aggregations. Sawsharks are oviparous (lay eggs).

Sawsharks are a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.15 Striped Marlin (*Kajikia audax*)

The following is from AFMA 2023q.

Striped Marlin is an oceanic species caught worldwide throughout tropical, temperate, and occasionally cold waters. They are found commonly in eastern Australian waters, but they are also found in the waters of other countries within the Pacific and Indian Oceans.

In Australia, Striped Marlin are caught anywhere along both the east and west coasts and is a targeted species by fishers in both the Eastern Tuna and Billfish Fishery and the Western Tuna and Billfish Fishery.

Though Striped Marlin is not commercially caught in the Operational Area it is sometimes caught recreationally off Victoria.

#### 4.2.16 Tiger Flathead (*Platycephalus richardsoni*)

The following is from AFMA 2023r.

Tiger Flathead are a demersal species that is found at depths of 10 - 400 m. Juveniles inhabit shallow waters of the continental shelf and move into the deeper outer shelf zone as they reach maturity. They are not an active species and normally rest in areas of mud and sand on the seabed during the day and move into the water column at night to feed. There is evidence that mature fish migrate to shallower waters prior to the spawning period. Spawning occurs over an extended period from spring to autumn, with some variation on the timing of spawning depending on location. Females produce 1.5-2.5 million eggs per spawning season.

Tiger Flathead is a target species for the Southern and Eastern Scalefish and Shark Fishery.

#### 4.2.17 Yellowfin Tuna (*Thunnus albacares*)

The following is from AFMA 2023s.

Yellowfin Tuna is a highly migratory species, swimming continuously over large distances. They are usually found in eastern and western Australian waters but are also found in the waters of other countries within the Pacific and Indian Oceans.

Spawning occurs throughout the year in tropical waters and seasonally in subtropical waters. The peak spawning period in the southern hemisphere occurs in summer. In tropical waters females spawn almost daily. Spawning occurs almost entirely at night. Females can produce over 0.2-8 million eggs per spawning event depending on their body size.

In Australia, Yellowfin Tuna are caught along both the east and west coasts and is a targeted species by fishers in both the Eastern Tuna and Billfish Fishery and the Western Tuna and Billfish Fishery.

Though Yellowfin Tuna is not commercially caught in the Regia MSS area it is sometimes caught recreationally off Victoria.

#### 4.2.18 Wrasse (multiple species)

The following is from (VFA 2023).

The Victorian Wrasse (Ocean) Fishery targets Bluethroat Wrasse and Purple Wrasse, also called Saddled Wrasse (*N. fucicola*). Small catches of Rosy Wrasse, Senator Wrasse and Southern Maori Wrasse are also caught.

Wrasse inhabit depths up to 160 m where individuals tend to remain close to a home reef and are territorial. They are relatively long lived and have a relatively long larval period (Bluethroat Wrasse: 44 to 66 days; Purple Wrasse: 40 to 87 days) leading to potentially wide dispersal that can repopulate depleted areas. The two species are thought to interbreed to produce hybrids.

## 5 Sound Effect Criteria

Although hearing ranges and sensitivities vary substantially between species (Ladich and Fay 2013), all fish species tested to date can detect sound and vibration to some degree (Dale et al. 2015). Fishes have developed two sensory mechanisms for detecting, localising, and interpreting underwater sounds and vibrations: the inner ear, which is tuned to sound pressure detection, and the lateral line system, which allows a fish to detect vibration and water flow. Inter-specific variations in hearing range and sensitivity result from the different adaptations in these systems for perceiving sound pressure and particle motion information (Popper and Fay 2011).

Based on their morphology, Popper et al. (2014) classified fishes into three categories comprising:

- Fishes with swim bladders whose hearing does not directly involve the swim bladder or other gas volumes.
- Fishes whose hearing does directly involve a swim bladder or other gas volume.
- Fishes without a swim bladder that can sink and settle on the substrate when inactive.

The Popper et al. (2014) classifications can be assigned to the following families or species of commercial fish species common in Australian waters:

- Fishes with swim bladders or other gas volumes, but whose hearing does not directly involve the swim bladder, e.g. snappers, emperors, groupers and rock cods (Lutjanids and Lethrinids such as *Pristipomoides* spp., *Lethrinus* spp., *Lutjanus* spp., and family Serranidae), and some species of tuna (*Thunnus* sp.) (Tavolga and Wodinsky 1963, Higgs et al. 2006, Braun and Grande 2008, Engineering-Environmental Management Inc. 2008, United States Department of the Navy 2008, Caiger et al. 2012, Bertrand and Josse 2000, Song et al. 2006).
- Fishes whose hearing does directly involve a swim bladder or other gas volume e.g., family Clupeidae (herrings, sardines, pilchards and shads) and some Haemulidae (grunters and sweetlips) (Nedwell et al. 2004, Braun and Grande 2008, Popper et al. 2014). Eels are included in this group (Jerko et al 1989).
- Fishes without a swim bladder (e.g., mackerel, *Scomberomorus* spp., some species of tuna, *Thunnus* sp. and sharks) (Casper et al. 2012, Popper et al. 2014, Carroll et al. 2017).

The most relevant metric for perceiving underwater sound for most fish species is particle motion (Popper and Hawkins 2019, Popper et al. 2019) but, except for few species (Popper and Fay 2011, Popper et al. 2014), there is an almost complete lack of relevant data on particle motion sensitivity in fishes (Popper and Hawkins 2019).

Most fish species detect sounds from below 50 Hz up to 500-1500 Hz. A smaller number of species can detect sounds to over 3 kHz, while a very few species can detect sounds to well over 100 kHz. The critical issue for understanding whether an anthropogenic sound affects hearing is whether it is within the hearing frequency range of a fish and loud enough to be detectable above threshold. For this impact assessment, it is assumed that all fishes can detect signals below 500 Hz and therefore can 'hear' the seismic source.

Sound exposure guidelines for fish have been established by the American National Standards Institute (ANSI) accredited report of Sound Exposure Guidelines for Fishes and Sea Turtles (Popper et al. 2014). The sound exposure guidelines from Popper et al. (2014) are based on the presence or absence of a swim bladder and ancillary structures which determines the level of susceptibility of fishes to injurious effects from exposure to intense sound. Accordingly, different exposure guidelines were developed for fishes without a swim bladder, fishes with a swim bladder not involved in perception of acoustic signals and fishes that use their swim bladders for hearing.

For fish, the sound exposure guidelines provide sound exposure metrics for:

- Mortality and potential mortal injury
- Recoverable injury
- Temporary threshold shift (TTS) in hearing

Within these sound exposure guidelines, there were insufficient data to make a quantitative guideline for:

- Behaviour
- Masking

For these impacts, a subjective approach of 'relative risk' (low, moderate, and high) is used to assess risk at three distances from the seismic source (near - tens of metres, intermediate - hundreds of metres, and far - thousands of metres) as detailed in TTable E3-5-1table E3-51.

The sound exposure guidelines and predicted maximum distances from the acoustic modelling are detailed in Table E3-5-1table E3-51.

Further information on studies in relation to seismic acoustic emission impacts to fishes is provided in the Regia MSS Seismic Studies Summary available in Appendix B8.

Table E3-5-1: Sound Exposure Guidelines and Predicted Maximum Distance for Fish

	<b>Mortality/Potential Mortal Injury</b>	<b>Recoverable Injury</b>	<b>TTS</b>
Threshold Criteria	<p>No studies to date have demonstrated direct mortality of adult fish in response to seismic emissions, even at close proximity (within 1–7 m; DFO 2004, Boeger et al. 2006, Popper et al. 2014). Carroll et al. (2017) concludes that <i>“For fish, there are few data on the physical effects of seismic airguns (e.g., mortality, barotrauma), and of these none have shown mortality.”</i></p> <p>Though mortality or mortal injury of fish from seismic sources has not been demonstrated it is industry practice to apply the Popper et al. (2014) exposure guidelines as part of the impact assessment process.</p>	<p>The effects of change in pressure (barotrauma – resulting in tissue injury) can result in injury. Recoverable injuries include fin hematomas, capillary dilation, and loss of sensory hair cells. Full recovery from these injuries is possible (Popper et al. 2014).</p>	<p>TTS is a temporary reduction in hearing sensitivity caused by exposure to intense sound. After termination of a sound that causes TTS, normal hearing ability returns over a period that is variable, depending on many factors, including the intensity and duration of sound exposure (Popper et al. 2014).</p> <p>Sound exposure guidelines proposed in Popper et al. (2014) use a cumulative sound exposure level (SEL<sub>cum</sub>) for TTS. Popper et al. (2014) summarises that in all TTS studies considered, fish that showed TTS recovered to normal hearing levels within 18–24 hours. Due to this, a period of accumulation of 24 hours has been applied in this assessment for SEL, which is the same to that applied for marine mammals in Southall et al. (2007) and NMFS (2016).</p>
	<p>Popper et al. (2014) proposes a dual criterion of PK and SEL<sub>24hr</sub> for mortality or potential mortal injury and recoverable injury. For the impact assessment the furthest distance to the criteria is be used. For this impact assessment, the period of 24 hrs is applied to the SEL<sub>cum</sub> metric.</p>		
Relevance of thresholds adopted	<p>Based on the literature review presented in Appendix A, and the indicator commercial species that are present within the CSEP OA (pelagic and demersal fish), Popper et al. (2014) has been adopted as relevant to set the threshold criteria. This American National Standards Institute (ANSI) accredited report by the Working Group on the Effects of Sound on Fish and Turtles undertook a review of experimental findings of sound on fishes, presenting thresholds for mortality, recoverable injury, and TTS in 2014, and is adopted by industry in Australia for the basis of impact assessment.</p>

## 6 Predicted Levels of Impact

As detailed from the underwater sound and studies relevant to seismic surveys (see Regia MSS Seismic Studies Summary available in Appendix B8), mortality and injury to fish are not predicted based on the received sound levels to these species.

### 6.1 Mortality and Potential Mortal Injury and Recoverable Injury

As detailed in Table E3-5-Table E3-51 maximum modelled distance to sound effect criteria for mortality/potential mortal injury and recoverable injury is 60 – 230 m. The predicted effect level on these species is assessed as minor as impacts while predicted to have some effect on fish, are not considered significant or at a level to affect the population given the following:

- Mortality of fish (both immediate and delayed) is not predicted based on lack of documented cases of mortality in free-swimming fish exposed to seismic source emissions under experimental or field conditions (DFO 2004; Boeger et al. 2006; Popper et al. 2014; Popper et al. 2016; Carroll et al. 2017; Popper and Hawkins 2019).
- Injury impacts may occur if the seismic array commences at full power adjacent to fish. However, the implementation of M#03: Fauna Management System requires the seismic source to be slowly ramped up to full power over 30 minutes. This would allow demersal and pelagic species to move away from the source before it is at full power.
- Site-attached fish species are species that rely on the benthic habitat and demonstrate a very high degree of site fidelity to the extent that they are unlikely or unable to flee an approaching seismic source and are likely to remain and/or seek refuge within habitat structures. However, impacts to site-attached fish were studied by Woodside at Scott Reef during the Maxima 3D MSS activities (Miller and Cripps 2013) and no lethal or sub-lethal effects on fish were experienced nor any significant decreases in the diversity and abundance of fish after the seismic survey, compared with the long-term temporal trend before the survey.
- Commercially targeted fishes within the area of impact that are generally considered site attached include a range of commercially targeted species such as Blue-eye Trevalla, Eastern School Whiting, flathead, Gummy Shark, Orange Roughy, Pink Ling, Ribaldo and Sawsharks. Examination and testing of seismic effects on commercial catches of fish, (including flathead and shark species), in the Gippsland Basin region found little evidence for changes induced by seismic surveys for 12 species (Bruce et al. 2018).
- National Recovery Plans and Conservation List Advice for EPBC Act list and migratory for species do not identify underwater sound as a threat to the recovery of fish species.

The uncertainty level for impact to fish causing mortality and potential mortal injury and recoverable injury from seismic sound is assessed as low based on:

- The sound effect criteria used in the impact assessment have been published in peer reviewed journals.
- There is a significant body of published studies that demonstrate no cases of mortality in free-swimming fish exposed to seismic source emissions under experimental or field conditions.

The predicted level of impact based on the effect (minor) and uncertainty (low) is assessed as low thus good industry practice (including legislation and standards) has been applied and therefore these impacts are of an acceptable level without further reduction measures being required.

### 6.2 Temporary Threshold Shift

As detailed in Table E3-5-Table E3-51 maximum modelled distance to sound effect criteria for temporary threshold shift (TTS) is 4.23 – 7.86 km.

The predicted effect level to these species is assessed as minor as impacts are predicted to have some effect on fish, but the effect is not considered significant or at a level to affect the population given the following:

- The Popper et al. (2005) study that informed the Popper et al. (2014) TTS sound exposure guideline, was done using a static source (airgun array) and static receptors (fish in cages at 13-17 m from the array) and is therefore not representative of a marine seismic survey which is a moving source. On this basis, the Popper et al (2005) study represents a worst-case scenario as the source is fixed and not moving (i.e. fish received five pulses of identical intensity over five minutes) and nor are the fish.
- Since the Popper et al. (2014) TTS sound exposure guidelines were developed Professor Popper has provided feedback on the appropriateness of using a 24-hour period to assess SELcum and the potential for TTS and other effects associated with SELcum (Popper 2018). The review considered the potential impacts of cumulative seismic noise from the proposed Santos Bethany 3D seismic survey on fish, including TTS effects, and length of time for recovery and the applicability of a SEL24h metric. Though this information was based on another survey it is applicable to the Regia MSS as the premise for the modelling was a racetrack that brought the vessel back to a similar starting point within 24 hours, thus receiving the closest shots within a 24-hour period. The review noted:
  - It is highly unlikely that there would be physical damage to fishes as a result of the survey unless the animals are very close to the source (perhaps within a few meters).
  - If TTS does take place, the duration of exposure to the most intense sounds that could result in TTS will be over just a few hours. Thus, accumulation of energy over longer periods than a few hours is probably not appropriate.
  - If TTS takes place, its level is likely to be sufficiently low that it will not be possible to easily differentiate it from normal variations in hearing sensitivity. Even if fishes do show some TTS, recovery will start as soon as the most intense sounds end, and recovery is likely to even occur, to a limited degree, between seismic pulses.
  - If TTS takes place, its level is likely to be sufficiently low that it will not be possible to easily differentiate it from normal variations in hearing sensitivity. Even if fishes do show some TTS, recovery will start as soon as the most intense sounds end, and recovery is likely to even occur, to a limited degree, between seismic pulses. Based on very limited data, recovery within 24 hours (or less) is very likely.
  - Little is known about the behavioural implications of TTS in fishes in the wild. However, since the TTS is likely very transitory, the uncertainty of it having a significant impact on fish fitness and survival is very low.
- As detailed above, Popper et al. (2005) reports that fish showing a TTS recovered to normal hearing levels within 18-24 hours, thus any hearing loss and subsequent decrease in fitness would be temporary with recovery taking place in a relatively short timeframe after the seismic source has moved away from the exposed fish, and the sound levels are reduced. Based on this, the potential for impacts to individuals' fitness and survival is limited and impacts to fish community structures are not predicted.

The uncertainty level for impact to fish causing TTS from seismic sound is assessed as medium based on:

- The sound effect criteria used in the impact assessment have been published in peer reviewed journals.
- Published studies show TTS impacts to fish are short lived (up to hours), however there is limited published studies on the effects of seismic sound on fish specifically in the Otway region.
- An absence of long-term monitoring data of the effects of seismic on fish in the presence of frequent seismic surveys, and other anthropogenic sound generating activities, in the region.

The predicted level of impact based on the effect (minor) and uncertainty (medium) is assessed as medium. For fish the predicted level of impact is clearly below the predefined acceptable levels of impact as detailed in Section 7. The mitigation and management measures detailed in Section 8 provide sufficient confidence in the predicted effect levels.

### 6.3 Change in Behaviour

There are currently no quantitative exposure guidelines or criteria for behaviour or masking for fish for impulsive sounds. The Working Group on the Effects of Sound on Fish and Turtles (Popper et al. 2014) found that there was insufficient data available and instead applied a subjective approach using 'relative risk' to assess risk at three distances from the source. These are:

- Behavioural response: high at near (within tens of metres) and intermediate (hundreds of metres) distances from the seismic source and moderate at distances far (thousands of metres) from the source.
- Masking: low at near (within tens of metres) and intermediate (hundreds of metres) distances from the seismic source and moderate at distances far (thousands of metres) from the source.

Thus, the extent of the area of impact is predicted to be within thousands of metres of the seismic source. The predicted effect level to these species is assessed as minor because while the impacts are predicted to have some effect on fish, the effects are not considered significant or at a level high enough to affect the population given the following:

- Meekan et al. (2021) undertook a large-scale experiment that quantified the impacts of exposure of an assemblage of tropical demersal emperors, snappers and groupers targeted by commercial fisheries to a commercial-scale seismic source on the North West Shelf off Western Australia. They did not identify any short-term (days) or long-term (months) effects of exposure on the composition, abundance, size structure, behaviour, or movement of fishes at any exposure sites.
- Shark species are highly vagrant and naturally cover large distances. As such, short-term exposures from the transient seismic source are expected to result in localised behavioural responses and movements of sharks. Research by Bruce et al. (2018), which tagged two commercially targeted shark species (Broadnose Shark and School Shark) and monitored their movements in response to a seismic survey in Australian waters noted that both control sharks and exposed sharks moved freely in and out of the study area which did not indicate any changes in behaviour or distribution because of seismic sound exposure.
- The fishes' awareness of the sound and any resultant behavioural responses may be limited to a few hours as the seismic source approaches from several kilometres away and passes, while significant behavioural responses (startle or avoidance) are more likely to be limited to a short period (less than an hour) when the seismic source passes close by. As the seismic source will be transient (i.e., continuously moving) during seismic data acquisition, demersal fishes will only be exposed to significant sound levels for a relatively short period of time as the seismic survey vessel passes nearby before sailing away again.
- Impacts to site-attached fish were studied by Woodside at Scott Reef during the Maxima 3DMSS activities (Miller and Cripps 2013) and they determined that there was a lack of significant impacts to fish species considered sensitive because of their site-fidelity requirements (i.e., being restricted to reef habitat and unable move far when the seismic sound approaches) based on the following:
  - Behavioural responses were observed at close range with general movement from the water column to the seabed, however normal feeding behaviour returned within 20 minutes of the survey vessel passing and when the vessel was beyond 1.5 km.
  - No significant decreases in the diversity and abundance of fish after the seismic survey were detected compared with the long-term temporal trend before the survey.
- Any behavioural impacts are likely to be short-lived and fish would return to normal behaviours once the vessel has moved away based on research by Miller and Cripps (2013) and Wardle et al. (2001). Behavioural impacts to pelagic fish species are possible but would be temporary, localised, and unlikely to impact at a population level.
- Limited data on biochemical stress indicators in fishes exposed to seismic sound indicate there may not be any discernible change (e.g., McCauley et al. 2000, 2003). However, if

fishes were to experience stress because of sound exposure, levels may return to normal within 72 hours (Santulli et al. 1999).

The uncertainty level for impact to fish causing a change in behaviour from seismic sound is assessed as medium based on:

- Published studies show behavioural impacts to fish are too short lived and fish return to normal behaviour once the vessel has moved away (in some cases within 20 minutes). While there are limited published studies on the effects of seismic sound on fish behaviour specifically in the Otway region there is no reason to expect different behaviour of similar species from different locations.
- An absence of long-term monitoring data of the effects of seismic on fish in the presence of frequent seismic surveys, and other anthropogenic sound generating activities, in the region.

The predicted level of impact based on the effect (minor) and uncertainty (medium) is assessed as medium. For fish the predicted level of impact is clearly below the predefined acceptable levels of impact as detailed in Section 7. The mitigation and management measures detailed in Section 8 provide sufficient confidence in the predicted effect levels.

## 6.4 Change in Commercial Catch

As detailed in the review of Commercial Fisheries (available in Appendix B6) the Operational Area overlaps the following fisheries where there is a low level of fishing effort from 2010 - 2020:

- Eastern Tuna and Billfish Fishery
- Small Pelagic Fishery
- Southern and Eastern Scalefish and Shark Fishery (SESSF) - Shark Hook Sector and Scalefish Hook Sector
- Western Tuna and Billfish Fishery

The main fisheries where there has been a significant fishing effort from 2010 – 2020 are:

- Southern and Eastern Scalefish and Shark Fishery (SESSF) - Shark Net Sub-sector
- Southern and Eastern Scalefish and Shark Fishery (SESSF) - Commonwealth Trawl Sector
- Multispecies Ocean Fisheries – Ocean General
- Wrasse (Ocean) Fishery

Impacts to commercial catch rates can occur if fish are disturbed by the seismic survey and move away from traditional fishing areas. Impacts to fish eggs and larvae from seismic surveys also has the potential to affect fisheries yield and spawning stock in subsequent years.

The predicted effect level to these species is assessed as minor based on impacts to commercial fish species are predicted to have some effect but the effect is not considered to be distinguishable from annual variability in recruitment and catch rates given the following:

- The following commercial fish species do not spawn within the Operational Area, thus impacts to spawning behaviour and egg dispersal are not predicted:
  - Most spawning activity for Blue-eye Trevalla occurs in waters from central New South Wales to north-eastern Tasmania (AFMA 2023h).
  - Blue Mackerel spawning occurs in spring and summer in outer continental shelf waters off northern New South Wales and southern Queensland (AFMA 2023g).
  - Eastern School Whiting spawn in the eastern Bass Strait, Tasmania, and New South Wales (AFMA 2023j).
  - Orange Roughy form dense spawning and feeding aggregations on or near topographic features such as seamounts, canyons, and plateaus (DCCEEW 2023). No spawning or feeding aggregation areas have been identified in the Operational Area. In addition, the Regia MSS will apply a survey limitation such that the seismic

survey will not be activated within the West Tasmanian Canyons Key Ecological Feature (KEF) where features such as seamounts, canyons, and plateaus may be present.

- Jack Mackerel spawn off the southeast coast of Australia moving progressively southwards over the summer (AFMA 2023m).
  - Southern Bluefin Tuna spawn in the Indian Ocean, between Java and northern Western Australia. forming on single global population (TSSC 2010). Though Southern Bluefin Tuna is not commercially caught in the Operational Area it is sometimes caught recreationally off Victoria.
  - Yellowfin Tuna spawn throughout the year in tropical waters and seasonally in subtropical waters (AFMA 2023s). Though Yellowfin Tuna is not commercially caught in the Operational Area it is sometimes caught recreationally off Victoria.
- Spawning occurs over months and is not limited to a single event, with females releasing large numbers of eggs (as detailed below) to balance high natural daily mortality rates up to ~60% as reported by Tang et al. (2014). Predicted impacts to eggs and larva from the seismic survey are therefore predicted to be well within natural mortality rates, as detailed in the impact assessment section for plankton (Appendix E2).
    - Blue warehou females produce 430 000-1 350 000 eggs per spawning event depending on their body size (AFMA 2023).
    - Australian Sardine females produce 10 000-45 000 eggs per spawning event depending on their body size (AFMA 2023d).
    - Blue Grenadier females release about 1 million eggs in a single spawning event (AFMA 2023f).
    - Pink Ling are thought to be serial spawners, with egg batches being released in a floating gelatinous mass in each spawning event. Females produce about 333 000 eggs per spawning event depending on body size (AFMA 2023n).
    - Tiger Flathead spawning occurs over an extended period from spring to autumn, with some variation on the timing of spawning depending on location. Females produce 1.5-2.5 million eggs per spawning season (AFMA 2023r).
  - For commercial fish species that spawn or potentially spawn within the Operational Area, the distribution of eggs and larvae will be over a large area as species identified are not restricted in their habitat and spawning areas. Thus, fish eggs and larvae will be spatially and temporally variable throughout the Operational Area. Thus, predicted impacts will not occur to all fish eggs and larvae if spawning overlaps when the seismic survey is being undertaken.
  - The serial, broadcast spawning strategies of the commercial fish species, by their very nature, offsets potential high natural egg and larvae mortality because of predation or other environmental factors and thereby spreads the risk or potential opportunity for larval settlement over large areas and long timeframes. Subsequent recruitment of fishes to the adult stock also occurs over extended timeframes and is ongoing. Therefore, in comparison, the short-term and localised impacts to spawning because of a seismic survey would have impacts many orders of magnitude smaller than regional scale environmental/climatic events that would affect entire stocks.
  - As detailed in the Regia MSS Seismic Studies Summary, available in Appendix B8, field and desk-top studies on the effects of marine seismic surveys on commercial catch rates have shown highly variable outcomes, ranging from positive effects, no effect, short-term temporary effects (days) and longer-term effects (up to 200 days). The most relevant studies to commercial fisheries in Victorian waters are:
    - Catch studies undertaken as part of a marine seismic survey in the Gippsland Basin found no clear evidence of adverse effects on scallops, fish or commercial catch rates (Przeslawski et al. 2016a; Bruce et al. 2018).

- Preliminary results from three phases of a four-phase study to investigate the effects of a 3D marine seismic survey in eastern Bass Strait on Danish Seine catch rates (Fishwell Consulting 2020) found negative impact of seismic acquisition on whiting catch rates up to ~100 days following the survey and on flathead rates up to ~200 days.
- A study by CSIRO and Geoscience Australia (Thomson et al. 2014) examined fisheries catches (10 species of interest) and catch rates for potential effects from 183 seismic surveys undertaken in the Gippsland Basin (Bass Strait). They found no clear or consistent relationships between seismic surveys and subsequent fisheries catch rates and that if effects occurred, they could not be distinguished from inter-annual changes in stock size or availability to fishing gear resulting from other dynamics.
- Haddon (2017) investigated the effect of the 2015 seismic survey in the Gippsland Basin on deepwater flathead catches and concluded that the significant drop in catch per unit effort was very likely negatively influenced by the seismic survey. However, Haddon (2017) went on to add that the seismic survey did not appear to have had a lasting impact on deepwater flathead catch per unit effort, which returned to typical values in the first month following the seismic survey.

The uncertainty level for impact to fish causing a change in behaviour from seismic sound is assessed as medium based on:

- There have been several field and desktop studies suggesting short term but recoverable effects of seismic surveys on commercial catch.
- Mortality of fish (both immediate and delayed) is not predicted based on no documented cases of mortality in free-swimming fish exposed to seismic source emissions under experimental or field conditions.
- An absence of long-term monitoring data of the effects of seismic on fish in the presence of frequent seismic surveys, and other anthropogenic sound generating activities, in the region.

The predicted level of impact based on the effect (minor) and uncertainty (medium) is assessed as medium. For fish the predicted level of impact is clearly below the predefined acceptable levels of impact as detailed in Section 7. The mitigation and management measures detailed in Section 8 provide sufficient confidence in the predicted effect levels.

## 6.5 Impacts to Eels

Adult Short-finned Eels are likely to migrate through the Operational Area during January to May (Gooley et al. 1998) and Short-finned glass eels during April to October (Gooley et al. 1998), although glass eels may continue to arrive anytime throughout the year (FRDC 2023).

The predicted effect level to these species is assessed as minor as impacts are predicted to have some effect on eels, but the effect is not considered significant or at a level to affect the population given the following:

- Mortality of eels (both immediate and delayed) is not predicted based on no documented cases of mortality in free-swimming fish exposed to seismic source emissions under experimental or field conditions (DFO 2004; Boeger et al. 2006; Popper et al. 2014; Popper et al. 2016; Carroll et al. 2017; Popper and Hawkins 2019).
- Injury impacts may occur if the seismic array commences at full power adjacent to migrating eels. However, the implementation of M#03: Fauna Management System requires the seismic source to be slowly ramped up to full power over 30 minutes. This would allow eels to move away from the source before it is at full power. As detailed below adult Short-finned Eels have been tracked swimming at average speeds of  $30.8 \pm 7.3$  km/day up to 80 km/day so it is feasible that they can swim away from a sound source. Glass eels, which are between 50-60 mm in length, actively swim toward and into the embayments and estuaries of the eastern Australian continent (VFA 2017). Though they

are unlikely to achieve speeds reached by adult eels they can actively swim away from the sound source.

- Adult Short-finned Eels tagged and released from Hopkins River Mouth, Killarney Beach and Warrnambool Harbour, locations in shore of the Operational Area showed that they migrated to access deep water via two main routes: directly east via Bass Strait or south-east around Tasmania (Koster et al 2021). While migrating through the shelf area where the Operational Area is located adult eels achieved an average speed of  $30.8 \pm 7.3$  km/day with one eel swimming at 80 km/day (Koster et al 2021). Thus, temporary impact to hearing from cumulative exposure to the sound source are not predicted as migrating eels will not be moving through the area where the sound source will be active at a rate that does not expose them to cumulative impacts.
- Since 2011 the Victorian Eel Fishery annual catch has continued to vary, averaging 58 t per year with a low of 36 t in 2016–17 and a high the following year of 84 t (FRDC 2023). Commercial fishing is generally confined to lower and estuarine reaches of waters that are open to fishing and predominantly targets migrating eels (FRDC 2023). Thus, even with a level of biomass averaging 58 t per year and predominantly of migrating eels, the fishery is assessed as sustainable, and that the biomass of this stock is unlikely to be depleted and that recruitment is unlikely to be impaired (FRDC 2023). Impacts to adult eels from the seismic survey are not predicted to result in mortality and impediment to migration for spawning thus stock and recruitment would not be affected.

Eels are a relatively long-lived fish, maturing at 8 to 20+ years of age (VFA 2017) thus recruitment of eels to the adult stock occurs over extended timeframes and is ongoing. In comparison, the short-term and localised impacts to glass eels because of a seismic survey would have impacts many orders of magnitude smaller than regional scale environmental/climatic events that would affect entire stocks.

The uncertainty level for impact to eels from seismic sound is assessed as medium based on:

- Migrating eels will not be moving through the area where the sound source will be active at a rate that does not expose them to cumulative impacts.
- Mortality of fish (both immediate and delayed) is not predicted based on no documented cases of mortality in free-swimming fish exposed to seismic source emissions under experimental or field conditions.
- An absence of long-term monitoring data of the effects of seismic on eels in the presence of frequent seismic surveys, and other anthropogenic sound generating activities, in the region.

The predicted level of impact based on the effect (minor) and uncertainty (medium) is assessed as medium. For fish the predicted level of impact is clearly below the predefined acceptable levels of impact as detailed in Section 7. The mitigation and management measures detailed in Section 8 provide sufficient confidence in the predicted effect levels.

## 7 Comparison of Predicted Level of Impact with Defined Acceptable Levels

Defined Acceptable Level		Predicted Level of Impact	Predicted Level of Impact Below Defined Acceptable level?
Category	Level		
Principles of ESD	The petroleum activity results in temporary / reversible, small scale, and/or low intensity environmental damage.	Predicted impacts to EPBC Act listed fish species are temporary / reversible and small scale behavioural response or recoverable temporary threshold shift.  Predicted impacts to fish are low intensity damage at populations levels and within current accepted levels of impact to these species as applied to the commercial fishing industry.	Yes
	The impact and risk assessment process is based on sufficient information to understand if:  Serious/irreversible environmental damage is predicted; or  The application of the precautionary principle is applied in the presence of scientific uncertainty.	Available literature was used to inform the impact assessment.  Serious or irreversible environmental damage is not predicted.  There is high confidence in the prediction of impacts which is based on peer reviewed and published literature.	Yes
	Environmental management of the activity must not be inconsistent with EPBC Act Management Plans and Recovery Plans.	No EPBC Act Management Plans and Recovery Plans identified for fish identified underwater sound as a threat and no actions relevant to the seismic survey were identified.	Yes
Biological	Impacts and risks to biological features will be temporary / reversible, small scale, and/or low intensity environmental damage at population levels.	Predicted impacts to fish are low intensity damage at populations levels and within current accepted levels of impact to these species as applied to the commercial fishing industry.	Yes
Ecological	Impacts and risks to ecological features will be temporary / reversible, small scale, and/or low intensity damage to the overall health, diversity, or functioning of the ecosystem.	Impacts to ecological features are not predicted.	Yes
Economic	Affected persons will not be worse off because of the activity.	Via stakeholder consultation commercial fishers have raised concerns in relation to seismic impacts to commercial fisheries and control measure M#07: Adjustment Protocol, will be implemented to ensure that affected fishers will not be worse off because of the activity.	Yes

Defined Acceptable Level		Predicted Level of Impact	Predicted Level of Impact Below Defined Acceptable level?
Category	Level		
Cultural	Impacts and risks to cultural features including cultural values, traditions, or practices, will be temporary / reversible, small scale, and/or low intensity.	<p>Via consultation, impacts to the Budj Bim Cultural Landscape World Heritage Area eel traps and <i>kooyang</i> (Short-finned Eel) from the seismic survey has been raised. The eel traps are protected under the World Heritage Area listing, the eels themselves are not. No impacts to the World Heritage Area are predicted.</p> <p>The predicted impacts to eels are low intensity at a populations level and within current accepted levels of impact to these eel species as applied to the commercial fishing industry.</p>	Yes
Company	All reasonably practicable measures have been adopted to reduce environmental impacts and risks.	All reasonably practicable measures have been adopted to reduce environmental impacts as detailed in the following section.	Yes
	Environmental impacts and risks are consistent with the CCG impact and risk assessment process such that for an impact or risk the effect/consequence rating is medium or below.	The predicted effect level is minor.	Yes
	The implementation strategy includes specific measures to ensure that measures adopted continue to be effective in managing the impact or risk.	The adopted measures will be implemented and monitored as detailed in the implementation strategy to ensure they are effective in managing the impact.	Yes
Social	Measures have been adopted based on the consultation process to address relevant objections and claims of relevant persons.	<p>From relevant person consultation the following objections and claims have been made:</p> <p>Commercial fishers and some other marine users have raised concerns about the impacts to fish populations and the long-term effects of seismic on the sustainability of the fisheries. The impacts of the Regia MSS have been assessed and the predicted levels of impact to each commercial fish species are all sub-lethal and mostly behavioural. There is no evidence of reduced fecundity nor developmental effects in any fish species, so long-term effects over multiple fishing seasons are not predicted. This has been communicated to the individuals who raised these concerns.</p>	Yes
	The views of public have been considered in the impact and risk assessment.		Yes

## 8 Identification of Mitigation and Management Measures and Demonstration of ALARP

Measures adopted to ensure environmental impacts will be of an acceptable level and ALARP.

Measure	Justification	Adopted
M#01: Activity Limitation	The seismic source will not be operated within the West Tasmania Canyons Key Ecological Feature (KEF). This is protective for fish species associated with this KEF.	Yes
M#03: Fauna Management System	The Fauna Management System includes the requirement from the EPBC Act Policy Statement 2.1 - Interaction between offshore seismic activities and whales, where the seismic source is required to be slowly ramped up to full power over 30 minutes. For demersal and pelagic fish species including eels, they would move away from the source before it is at full power, providing them a level of protection.	Yes
M#07: Adjustment Protocol	An adjustment process will be implemented if a commercial fisher has a financial loss due to the Regia MSS.  The adjustment process will be developed in consultation with the fishery associations that represent the commercial fishers that fish within the Operational Area.  Other titleholders in the region will be invited to participate in the review, update, and implementation of the adjustment process.	Yes

## 9 Conclusions

The conclusion of the effects of seismic sound to fish is summarised below.

Potential Impact	Predicted Level of Effect	Uncertainty	Predicted Level of Impact
Mortality and Potential Mortal Injury and Recoverable Injury	Minor	Low	Low
Temporary Threshold Shift	Minor	Medium	Medium
Change in Behaviour	Minor	Medium	Medium
Change in Commercial Catch	Minor	Medium	Medium

## 10 Recommendations

While there is extensive literature about the effects of seismic on fish there has been a high level of concern throughout consultation with relevant persons, particularly about the importance of commercially important species. It is recommended that CGG undertake additional assessment looking at the effects of the activity on commercially important fish species. This assessment is detailed in the Acceptable Levels Assessment (Appendix F3).

## 11 Document Control

Date	Revision	Update
6 August 2023	A	Draft prepared for initial comment
29 August 2023	B	Update based on comments and relevant person feedback
11 Sept 2023	0	Approved for release on Regia MSS website
20 Dec 2023	1	EP submission to NOPSEMA

## Annex 1: Legislative and Other Requirements Relevant to Underwater Sound and Fish

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Conservation Advice <i>Prototroctes maraena</i> Australian Grayling (TSSC 2021)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Conservation advice does not identify underwater sound as a threat.	NA
National Recovery Plan for the Australian Grayling <i>Prototroctes maraena</i> (Backhouse et al. 2008).	The overall objective of recovery is to minimise the probability of extinction of the Australian Grayling in the wild, and to increase the probability of important populations becoming self-sustaining in the long term.	Recovery plan does not identify underwater sound as a threat.	NA
Commonwealth Listing Advice <i>Serirolella brama</i> Blue Warehou (TSSC 2015d)	Recommends that the species be listed in the conservation dependent category under the EPBC Act.	Listing advice does not identify underwater sound as a threat.	NA
National Recovery Plan for the Dwarf Galaxias ( <i>Galaxiella pusilla</i> ) (Saddler et al. 2010)	The long-term objective of recovery plan is to minimise the probability of extinction and ensure long-term survival of Dwarf Galaxias in the wild and to increase the probability of important population becoming self-sustaining in the long term.	Recovery plan does not identify underwater sound as a threat.	NA
Commonwealth Listing Advice on <i>Thunnus maccoyii</i> (Southern Bluefin Tuna) (TSSC 2010)	Recommends listing as conservation dependent.	Listing advice does not identify underwater sound as a threat.	NA
National Recovery Plan for the Yarra Pygmy Perch ( <i>Nannoperca obscura</i> ) (Sadler and Hammer 2010)	The long-term objective of recovery is to minimise the probability of extinction and ensure long-term survival of Yarra Pygmy Perch in the wild and to increase the probability of important populations becoming self-sustaining in the long term.	Recovery plan does not identify underwater sound as a threat.	NA

Requirement	Description of the Requirement	Relevance to Environmental Management	Demonstration of How the Requirement will be Met
Commonwealth Listing Advice on <i>Centrophorus zeehaani</i> (southern dogfish) (TSSC 2013a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Listing advice does not identify underwater sound as a threat.	NA
Commonwealth Listing Advice on <i>Galeorhinus galeus</i> (TSSC 2009a)	Conservation advice guide recovery planning and identify actions required for conservation and recovery of the threatened species or ecological community.	Listing advice does not identify underwater sound as a threat.	NA
Recovery Plan for the White Shark ( <i>Carcharodon carcharias</i> ). (DSEWPaC 2013b)	The plan considers the conservation requirements of the species across its range and identifies the actions to be taken to ensure the species' long-term viability in nature and the parties that will undertake those actions.	Recovery plan does not identify underwater sound as a threat.	NA

## Annex 2: Underwater Acoustic Sensitive Species

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
<i>Fish</i>							
Australian Grayling	Species or species habitat known to occur within area	Vulnerable				None identified	Conservation Advice <i>Prototroctes maraena</i> Australian Grayling (TSSC 2021)
Blue Warehou	Species or species habitat known to occur within area	Conservation Dependent				None identified	Commonwealth Listing Advice <i>Seriotelella brama</i> Blue Warehou (TSSC 2015)
Eastern Dwarf Galaxias, Dwarf Galaxias	Species or species habitat known to occur within area	Vulnerable				None identified	National Recovery Plan for the Dwarf Galaxias ( <i>Galaxiella pusilla</i> ) (Saddler et al. 2010)
Orange Roughy, Deep-sea Perch, Red Roughy	Species or species habitat likely to occur within area	Conservation Dependent				None identified	None identified
Southern Bluefin Tuna	Species or species habitat likely to occur within area	Conservation Dependent				None identified	Commonwealth Listing Advice on <i>Thunnus maccoyii</i> (Southern Bluefin Tuna) (TSSC 2010)
Yarra Pygmy Perch	Species or species habitat known to occur within area	Vulnerable				None identified	National Recovery Plan for the Yarra Pygmy Perch ( <i>Nannoperca obscura</i> ) (Sadler and Hammer 2010)
<i>Sygnathids</i>							
Australian Smooth Pipefish, Smooth Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
Big-belly Seahorse, Eastern Potbelly Seahorse, New Zealand Potbelly Seahorse	Species or species habitat may occur within area				Listed	None identified	None identified
Brushtail Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Common Seadragon, Weedy Seadragon	Species or species habitat may occur within area				Listed	None identified	None identified
Crested Pipefish, Briggs' Pipefish, Crested Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Deepbody Pipefish, Deep-bodied Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Hairy Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Halfbanded Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Javelin Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Knifesnout Pipefish, Knife-snouted Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
Leafy Seadragon	Species or species habitat may occur within area				Listed	None identified	None identified
Longsnout Pipefish, Australian Longsnout Pipefish, Longsnouted Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Mother-of-pearl Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Port Phillip Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Pugnose Pipefish, Pug-nosed Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Red Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Ringback Pipefish, Ring-backed Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Robust Pipehorse, Robust Spiny Pipehorse	Species or species habitat may occur within area				Listed	None identified	None identified
Sawtooth Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
Short-head Seahorse, Short-snouted Seahorse	Species or species habitat may occur within area				Listed	None identified	None identified
Spiny Pipehorse, Australian Spiny Pipehorse	Species or species habitat may occur within area				Listed	None identified	None identified
Spotted Pipefish, Gulf Pipefish, Peacock Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Tucker's Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish	Species or species habitat may occur within area				Listed	None identified	None identified
<i>Sharks</i>							
Little Gulper Shark	Species or species habitat likely to occur within area	Conservation Dependent (listed as <i>Centrophorus zeehaani</i> )					Commonwealth Listing Advice on <i>Centrophorus zeeha</i> (southern dogfish) (TSSC 2013)
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark	Species or species habitat may occur within area	Conservation Dependent					Commonwealth Listing Advice on <i>Galeorhinus galeus</i> (TSSC 2009a)

Common Name	Presence	Threatened Category	Migratory Status	Migratory Category	Marine Status	Biologically Important Area	Management Plan Conservation Advice Listing Advice
White Shark, Great White Shark	Foraging, feeding, or related behaviour known to occur within area	Vulnerable	Migratory	Migratory Marine Species		Distribution Foraging	Recovery Plan for the White Shark ( <i>Carcharodon carcharias</i> ). (DSEWPac 2013b)

## 1 Introduction

This document presents analysis of an environmental aspect between the Regia Marine Seismic Survey (Regia MSS) and the existing environment that may be affected by that aspect. This environmental aspect was identified by the Preliminary Environmental Impact and Risk Assessment (PEIRA) (Appendix B4) for further assessment. This document also uses information in two preceding studies:

1. Sound Emissions Initial Modelling Report (Appendix B7)
2. Seismic Sound Studies Report (Appendix B8)

This document was first published in draft form to the Document Library of the Regia MSS Consultation Hub on 11 September 2023. This was done to acknowledge that the final full Environment Plan (EP) can be a large document that is difficult for readers to digest in the 30-day public comment period. As such, the public and relevant persons were invited to comment on the document with an explicit request for readers to provide feedback on:

- The accuracy of the described environment that may be affected.
- Any omissions of environmental values and sensitivities relevant to the environmental aspect.
- Any errors or omissions of scientific/peer reviewed literature that should be considered.
- Any errors or omissions of relevant legislation or documents of standing that should be considered.
- Any further mitigation or management measures that should be considered.

Up to 22 December 2023, there were no specific comments received on the content of the document. Table E4-21 -shows the feedback received related to this environmental aspect.

## 2 Aspect Specific Relevant Person Objections and Claims

The following feedback was received during the preparation of the EP and has been used to inform this analysis and the overall assessment of environmental impacts and risks arising from the Regia MSS. The consultation sought to improve the predictive quality of the assessments by encouraging relevant persons and the public to share their environmental values and sensitivities. Feedback was invited and Table E4-2-table E4-21 shows how this feedback has been incorporated into the environmental assessments.

*Table E4-2-1 - Relevant person input into the preparation of the EP*

Objections and Claims	Feedback ID	Measure adopted because of consultation
Received from the interactive regarding impacts to abalone industry.	128	CGG have included information on effects on bivalves to be included in impact assessment.
Relevant person from a community session cited studies regarding harm to scallops and shellfish	132	CGG included the paper mentioned in the impact assessment noting that scallops are not commercially fished in this area indicating an absence of commercial quantities.

Objections and Claims	Feedback ID	Measure adopted because of consultation
Email received detailing the negative impact on marine life and climate.	166	CGG agreed to implement the following measures: Exclusion zones for shallower waters with higher biodiversity - adopted 50 m and shallower activity exclusion zone. Activity timing - avoid peak biodiversity in summer months (Jan/Feb/Mar) - adopted. Compensation protocol for commercial fishers - adopted. Policy Statement 2.1 measures, plus others.
Received from the interactive regarding concern for effects to abalone.	174	The initial assessment adopted 40 m, which was superseded by 50 m depth contour activity limitation.
