

Ngujima-Yin FPSO Facility Operations Environment Plan

Production Division

March 2024

Revision 11

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

TABLE OF CONTENTS

1	INTRODUCTION	19
1.1	Overview.....	19
1.2	Purpose of the Environment Plan.....	19
1.3	Scope of the Environment Plan.....	20
1.4	Environment Plan Summary	20
1.5	Structure of the Environment Plan	20
1.6	Description of the Titleholder	23
1.7	Details of Titleholder, Liaison Person and Public Affairs Contact	23
1.7.1	Titleholder.....	23
1.7.2	Nominated Liaison Person	23
1.7.3	Arrangements for Notifying Change	23
1.8	Woodside Management System	24
1.8.1	Environment and Biodiversity Policy	25
1.9	Description of Relevant Requirements.....	25
1.9.1	Offshore Petroleum and Greenhouse Gas Storage Act 2006.....	25
1.9.2	Environment Protection and Biodiversity Conservation Act 1999 (Cth)	26
1.9.2.1	Offshore Project Proposal.....	28
1.9.2.2	Recovery Plans and Threat Abatement Plans.....	29
1.9.2.3	Australian Marine Parks.....	29
1.9.2.4	World Heritage Properties.....	29
2	ENVIRONMENT PLAN PROCESS	31
2.1	Overview.....	31
2.2	Environmental Risk Management Methodology	31
2.2.1	Woodside Risk Management Process.....	31
2.2.2	Health, Safety and Environment Management Procedure.....	32
2.2.3	Impact Assessment Procedure	32
2.2.4	Process Safety Management Procedure and Process Safety Risk Assessment Procedure	32
2.3	Environment Plan Development Process	33
2.4	Establish the Context.....	35
2.4.1	Define the Activity	35
2.4.2	Define the Existing Environment	35
2.4.3	Relevant Requirements	36
2.5	Impact and Risk Identification	36
2.6	Impact and Risk Analysis.....	37
2.6.1	Decision Support Framework.....	37
2.6.1.1	Decision Type A.....	38
2.6.1.2	Decision Type B.....	38
2.6.1.3	Decision Type C	38
2.6.1.4	Decision Support Framework Tools	39
2.6.1.5	Decision Calibration.....	39
2.6.2	Control Measures (Hierarchy of Controls).....	39

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.6.3	Impact and Risk Classification	40
2.6.3.1	Impact Rating Process.....	41
2.6.3.2	Risk Rating Process.....	41
2.6.3.3	Select the Consequence Level	41
2.6.3.4	Select the Likelihood Level	41
2.6.3.5	Calculate the Risk Rating.....	42
2.7	Classification and Analysis of Major Environment Events	43
2.7.1	Major Environment Event Identification	43
2.7.2	Major Environment Event Classification	43
2.7.3	Bowtie Analysis.....	43
2.7.4	Major Environment Event Register.....	45
2.7.5	Safety and Environment Critical Elements and Technical Performance Standards	45
2.7.6	Safety-critical Management System Barriers.....	46
2.8	Impact and Risk Evaluation.....	46
2.8.1	Demonstration of As Low As Reasonably Practicable	46
2.8.2	Demonstration of Acceptability.....	46
2.9	Recovery Plan and Threat Abatement Plan Assessment	47
2.10	Environmental Performance Outcomes, Environmental Performance Standards, and Measurement Criteria	47
2.11	Implement, Monitor, Review and Report	48
2.12	Consultation.....	48
3	DESCRIPTION OF THE ACTIVITY	49
3.1	Overview.....	49
3.2	Location	50
3.3	Operational Area.....	53
3.4	Timing.....	55
3.5	Facility Layout and Description	55
3.5.1	Topsides	55
3.5.2	Wells and Reservoirs	56
3.5.2.1	Vincent Reservoir	56
3.5.2.2	Laverda Canyon Reservoir	56
3.5.2.3	Norton-over-Laverda Reservoir.....	56
3.5.2.4	Cimatti Reservoir	56
3.5.2.5	Well Configuration.....	56
3.5.2.6	Water Injection Wells & Production Wells Permanently Plugged with Wellhead in Place	57
3.5.3	Flowline and Riser System.....	57
3.5.3.1	Vincent.....	57
3.5.3.2	Greater Enfield.....	57
3.5.4	Subsea Infrastructure.....	57
3.5.5	Submerged Turret Production and Mooring System.....	60
3.5.5.1	Disconnection of Floating Production, Storage and Offloading Facility from the Submerged Turret Protection Mooring	61
3.5.5.2	Reconnection of Floating Production, Storage and Offloading Facility from the Submerged Turret Protection Mooring	61
3.6	Operational Details	62
3.6.1	Manning.....	62

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.6.2	Floating Production, Storage and Offloading Facility Sailaway for Maintenance	62
3.6.3	Process Description	62
3.6.3.1	Gas Compression Systems.....	64
3.6.3.2	Flare Systems.....	64
3.6.3.3	Normal Operations.....	65
3.6.3.4	Intermittent Process Upsets and Activities	65
3.6.3.5	Emergency Blowdown	65
3.6.3.6	Transient Operations	65
3.6.3.7	Subsea Flowline Depressurisation	66
3.6.4	Flaring for Liquids Management.....	66
3.6.5	Subsea Well Work-over or Clean-up.....	66
3.6.6	Depressurisation for Maintenance Activities.....	66
3.6.7	Unplanned Events	66
3.6.8	Produced Water Treatment and Disposal	66
3.6.8.1	Oil and Water Separation.....	66
3.6.8.2	Produced Water Reinjection	67
3.6.9	Customised Water Flood System.....	67
3.6.9.1	Discharge of Clean Customised Water Flood Stream	69
3.6.9.2	Summary of All Chemicals Used in the Customised Water Flood Package.....	69
3.6.10	Drainage Systems.....	70
3.6.10.1	Open Drains.....	70
3.6.10.2	Closed Drains	71
3.6.10.3	Machinery Space Bilges	71
3.6.10.4	Floating Production, Storage and Offloading Facility Slops Tank Management.....	71
3.6.10.5	Deck Drain Overflow System	72
3.6.10.6	Cargo Tanks	72
3.6.10.7	Ballast System	73
3.6.11	Offloading System and Offtake Tanker Mooring.....	73
3.6.12	Utility Systems	74
3.6.12.1	Facility Lighting	74
3.6.12.2	Heating, Ventilation and Air Conditioning System	74
3.6.12.3	Nitrogen System/Generation.....	74
3.6.12.4	Steam System	74
3.6.12.5	Seawater System.....	75
3.6.12.6	Potable Water	75
3.6.12.7	Inert Gas System	76
3.6.12.8	Power Generation.....	76
3.6.12.9	Fuel Gas System	77
3.6.12.10	Safety Features and Emergency Systems.....	78
3.6.12.11	Accommodation Facilities.....	78
3.6.12.12	Sewage and Putrescible Wastes	78
3.6.12.13	Sand Management	79
3.6.12.14	Diesel Fuel System	79
3.6.13	Facility Operations	79
3.6.13.1	Lifting Operations.....	79
3.6.13.2	Lifting from Facility Support Vessels	80
3.6.13.3	Lifting Around the Facility.....	80
3.6.13.4	Operational Lifting (Non-crane Based).....	80
3.6.13.5	Special Lifts	81

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.6.14	Diesel Bunkering.....	81
3.7	Support Vessel Operations	81
3.7.1	Facility Support Vessels.....	81
3.7.2	Other Support Vessels.....	82
3.8	Helicopter Operations	82
3.9	Hydrocarbon and Chemical Inventories and Selection	82
3.9.1	Hydrocarbons	82
3.9.2	Chemical Usage	85
3.9.2.1	Operational Process Chemicals	85
3.9.2.2	Operational Non-process Chemicals.....	85
3.9.2.3	Facility Maintenance Chemicals.....	85
3.9.2.4	Indicative Chemical Inventories.....	85
3.9.3	Environmental Consideration During Selection, Assessment and Approval of Chemicals.....	86
3.9.3.1	Environmental Selection Criteria	86
3.9.3.2	Background Overview of Offshore Chemical Notification Scheme	87
3.10	Subsea Inspection, Monitoring, Maintenance, and Repair Activities.....	88
3.10.1	Inspections	88
3.10.2	Monitoring.....	89
3.10.3	Maintenance	90
3.10.4	Repair.....	90
3.10.5	Subsea Chemical Usage.....	91
3.10.6	Intervention Isolations	91
3.10.7	Pressure and Leak Testing	92
3.10.8	Flushing and Pigging Operations	92
3.10.8.1	Pre-disconnect Flushing	92
3.10.8.2	Post-disconnect Flushing	93
3.10.8.3	Pigging.....	93
3.10.9	Marine Growth Removal	93
3.10.10	Sediment Relocation.....	93
3.10.11	Corrosion Protection	93
3.10.12	Span Rectification, Flowline Protection and Stabilisation	94
3.10.12.1	Grout Bags.....	94
3.10.12.2	Mattresses.....	94
3.10.12.3	Rock Placement	95
3.10.13	Cycling of Valves	95
3.10.14	Choke Changeout.....	95
3.10.15	Subsea Control Module Changeout	95
3.10.16	Jumper and Umbilical Replacement.....	95
3.10.17	Multiphase Flow Meter Changeout.....	96
3.10.18	Multiphase Pump Changeout.....	97
3.10.19	Tree Cap Changeout	97
3.10.20	Chemical Injection Throttle Valve Changeout.....	97
3.10.21	Logic Plate/Cap Changeout	97
3.10.22	Accumulator Skid (Barrier Fluid Top-up)	98
3.10.23	Spool Repair, Replacement and Recovery	98

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.11	Well Management and Maintenance Activities	99
3.11.1	Well Unloading and Clean-up	99
3.11.2	Prolonged Period of Ngujima-Yin Floating Production, Storage and Offloading Facility Sailaway	99
3.12	New Well Start-up and Hot Commissioning.....	99
4	DESCRIPTION OF THE EXISTING ENVIRONMENT	101
4.1	Overview.....	101
4.2	Regional Context	104
4.3	Matters of National Environmental Significance (Environment Protection and Biodiversity Conservation Act)	106
4.4	Physical Environment	106
4.5	Habitats and Biological Communities.....	108
4.6	Protected Species.....	112
4.6.1	Fish, Sharks and Rays.....	112
4.6.2	Marine Reptiles.....	117
4.6.3	Marine Mammals	127
4.6.4	Seabirds and Migratory Shorebirds.....	139
4.6.5	Seasonal Sensitivities for Protected Species	152
4.7	Key Ecological Features	154
4.8	Protected Places.....	156
4.9	Cultural Features and Heritage Values	163
4.9.1	Background	163
4.9.2	First Nations Peoples.....	163
4.9.3	Coastally Adjacent First Nations Groups.....	165
4.9.4	Marine Parks.....	170
4.9.5	Sea Country Values.....	172
4.9.6	Desktop Assessment of Sea Country Values.....	173
4.9.6.1	Cultural Features and Heritage Values Identified in Publicly Available Literature	173
4.9.7	Studies of Cultural Features and Heritage Values.....	192
4.9.7.1	First Nations Archaeological Heritage Assessment.....	192
4.9.8	Consultation Feedback to Inform Existing Environment	192
4.9.8.1	Summary of Values Raised During Consultation.....	192
4.9.9	Further Context: Intangible Cultural Heritage	201
4.9.9.1	Songlines.....	201
4.9.9.2	Creation/Dreaming Sites, Sacred Sites and Ancestral Beings.....	201
4.9.9.3	Cultural Obligations to Care for Country.....	202
4.9.9.4	Knowledge of Country/Customary Law and Transfer of Knowledge	202
4.9.9.5	Connection to Country	202
4.9.9.6	Access to Country.....	202
4.9.9.7	Restriction on Access to Country	202
4.9.9.8	Kinship Systems and Totemic Species	202
4.9.9.9	Resource Collection.....	203
4.9.10	Further Context: Marine Ecosystems and Species.....	203
4.9.10.1	Marine Mammals	203
4.9.10.2	Marine Reptiles.....	203

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.10.3	Fish.....	203
4.9.10.4	Benthic Habitats.....	204
4.9.10.5	Shoreline Habitats.....	204
4.9.10.6	Natural Environment Interests.....	204
4.9.11	Heritage Listed Places.....	204
4.10	Socio-cultural Environment.....	204
4.10.1	Commercial Fisheries.....	204
4.10.2	Traditional Fisheries.....	217
4.10.3	Historic Sites of Significance.....	217
4.10.4	Underwater Heritage.....	217
4.10.5	World, National and Commonwealth Heritage-Listed Places.....	218
4.10.6	Tourism and Recreation.....	220
4.10.7	Commercial Shipping.....	221
4.10.8	Oil and Gas.....	223
4.10.9	Defence.....	225
5	CONSULTATION	227
5.1	Summary.....	227
5.2	Consultation – General Context.....	228
5.3	Identification of Relevant Persons for Consultation.....	231
5.3.1	Regulations 25(1)(a), (b) and (c).....	231
5.3.1.1	Identification of relevant persons under regulations 25(1)(a), (b) and (c).....	232
5.3.2	Regulation 25(1)(d).....	233
5.3.2.1	Identification of relevant persons under regulation 25(1)(d).....	234
5.3.3	Regulation 25(1)(e).....	240
5.3.3.1	Identification of relevant persons under regulation 25(1)(e).....	240
5.3.4	Persons or Organisations Woodside Chooses to Contact.....	240
5.3.5	Assessment of Relevant Persons for the Proposed Activity.....	241
5.4	Consultation Material and Timing.....	241
5.4.1	Sufficient Information.....	241
5.4.2	Reasonable period for consultation.....	244
5.4.3	Discharge of Regulation 25.....	245
5.5	Context of Consultation Approach with First Nations.....	246
5.5.1	Approach to Methodology – Woodside’s Interpretation of Tipakalippa.....	246
5.5.2	Consultation Method.....	247
5.5.2.1	Identification of Relevant Persons.....	248
5.5.2.2	Opportunity to Self-identify and Identifying Other Individuals.....	249
5.5.3	Sufficient Information.....	250
5.5.3.1	Reasonable Period for Consultation.....	251
5.5.3.2	Discharge of Regulation 25.....	251
5.6	Providing Feedback and Assessment of Merit of Objections or Claims.....	251
5.7	Ongoing Consultation.....	252
6	ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA	253
6.1	Overview.....	253

6.2	Analysis and Evaluation	253
6.2.1	Cumulative Impacts	258
6.3	Environmental Performance Outcomes, Standards and Measurement Criteria	258
6.4	Presentation.....	258
6.5	Environment Risk/Impacts not Deemed Credible	260
6.6	Planned Activities	261
6.6.1	Physical Presence: Disturbance to Marine Users.....	261
6.6.2	Physical Presence: Disturbance to the Seabed.....	268
6.6.3	Routine Acoustic Emissions: Generation of Noise During Routine Operations.....	274
6.6.4	Routine and Non-routine Discharges: Discharge of Hydrocarbons and Chemicals During Subsea Operations and Activities	286
6.6.5	Routine and Non-routine Discharges (Utility Systems): Discharge of Sewage, Putrescible Waste, Greywater, Bilge Water, Drain Water, Cooling Water and Brine	292
6.6.6	Routine and Non-Routine Atmospheric and Greenhouse Gas Emissions	302
6.6.7	Routine Light Emissions: Light Emissions from Ngujima-Yin Floating Production, Storage and Offloading Facility, Vessel Operations and Operational Flaring	323
6.7	Unplanned Activities (Accidents, Incidents, Emergency Situations)	329
6.7.1	Unplanned Discharge: Release of Hydrocarbons or Chemicals During Transfer, Storage and Use	329
6.7.2	Unplanned Discharges: Hazardous and Non-hazardous Waste Management	335
6.7.3	Physical Presence: Interaction with Marine Fauna	340
6.7.4	Physical Presence: Introduction of Invasive Marine Species.....	344
6.8	Unplanned Activities (Accidents, Incidents, Emergency Situations) – Major Environmental Events.....	354
6.8.1	Quantitative Spill Risk Assessment Methodology.....	354
6.8.1.1	Hydrocarbon Characteristics.....	355
6.8.1.2	Environment that May Be Affected and Hydrocarbon Contact Thresholds	360
6.8.2	Major Environmental Events Overview.....	361
6.8.3	Unplanned Hydrocarbon Release: Loss of Well Containment (MEE-01).....	363
6.8.4	Unplanned Hydrocarbon Release: Subsea Flowline and Riser Loss of Containment (MEE-02)	413
6.8.5	Unplanned Hydrocarbon Release: Topsides Loss of Containment (MEE-03).....	426
6.8.6	Unplanned Hydrocarbon Release: Offloading Equipment Loss of Containment (MEE-04)	439
6.8.7	Unplanned Hydrocarbon Release: Floating Production, Storage and Offloading Facility Cargo Tank Loss of Containment (MEE-05).....	452
6.8.8	Unplanned Hydrocarbon Release: Loss of Structural Integrity (MEE-06)	466
6.8.9	Unplanned Hydrocarbon Release: Loss of Marine Vessel Separation (MEE-07)	481
6.8.10	Unplanned Hydrocarbon Release: Loss of Control of Suspended Load (MEE-08).....	491
6.8.11	Major Environmental Event Common Cause Event Failure Mechanisms: Safety and Environmental Critical Equipment Failure CCE-01 and Human Error CCE-02	499
6.9	Recovery Plan and Threat Abatement Plan Assessment	508
6.10	Cultural Features and Heritage Values Assessment	519
7	IMPLEMENTATION STRATEGY	528
7.1	Systems, Practice and Procedures	528

7.1.1	Woodside Management System Operate Processes	528
7.1.1.1	Operate Plant.....	528
7.1.2	Maintain Assets	529
7.1.3	Process Safety Management	530
7.1.4	Woodside Safety Culture Framework.....	530
7.1.5	Risk Management.....	531
7.1.6	Management of Risks – Contracting and Procurement	531
7.1.7	Management of Risks – Subsea Activities	532
7.1.8	Management of Risks – Major Projects.....	532
7.1.9	Management of Risks – Well Integrity.....	533
7.1.10	Management of Risks – Marine Services.....	533
7.1.11	Management of Risks – Emissions and Energy Management.....	533
7.1.11.1	Production Optimisation and Opportunity Management	534
7.1.11.2	Flare Target Setting	534
7.1.12	Management of Risks – Indirect Emissions Management	535
7.1.12.1	Annual Review.....	535
7.1.13	Management of Human Factor Related Risks.....	536
7.1.14	Change Management	536
7.1.15	Technical Change Management	536
7.1.16	Environment Plan Management of Change and Revision	537
7.1.17	Oil Pollution Emergency Plan Management of Change	537
7.1.18	Management of Safety and Environment Critical Element Technical Performance Standards and Management System Performance Standards.....	538
7.1.19	Management System Performance Standards.....	538
7.1.20	Safety and Environment Critical Element Technical Performance Standards.....	538
7.2	Woodside Decommissioning Framework	540
7.2.1	Decommissioning in Operations.....	541
7.2.2	Facility Decommissioning Planning.....	541
7.2.3	Ngujima-Yin Asset Decommissioning Phasing.....	542
7.2.3.1	Phase 1: Planning for Decommissioning – Key Activities	544
7.2.3.2	Phase 2: Decommissioning/Plug & Abandonment – Execution Activities	545
7.3	Organisation Structure	545
7.4	Roles and Responsibilities	546
7.5	Unexpected Finds Procedure.....	553
7.6	Training and Competency	553
7.6.1	Inductions for Offshore Facility Workers and Visitors	554
7.6.2	Operations Competency Framework Training	554
7.6.3	Permit to Work System Training.....	555
7.6.4	Emergency and Hydrocarbon Spill Response Training	555
7.6.5	Subsea Inspection, Monitoring, Maintenance and Repair Activity Environmental Awareness.....	555
7.7	Monitoring, Auditing, Management of Non-conformance and Review	556
7.7.1	Monitoring.....	556
7.7.2	Management of Knowledge	557

7.7.3	Management of Newly Identified Impacts and Risks	557
7.7.4	Auditing.....	559
7.7.5	Operations Assurance	559
7.7.6	Annual Offshore Inspection/Desktop Review	559
7.7.7	Subsea Support Vessel Environment Inspection.....	559
7.7.8	Marine Assurance.....	559
7.7.9	Management of Non-conformance (Internal).....	560
7.7.10	Review.....	561
7.7.11	Environmental Risk Review	561
7.7.12	Key Performance Indicator Review	561
7.7.13	Learning and Knowledge Sharing	561
7.7.14	Continuous Improvement.....	562
7.8	Record Keeping	562
7.9	Reporting.....	562
7.9.1	Overview.....	562
7.9.2	Routine Reporting (Internal).....	562
7.9.2.1	Daily Reports	562
7.9.2.2	Performance Reporting.....	563
7.9.3	Routine Reporting (External).....	563
7.9.3.1	Environmental Performance Review and Reporting	563
7.9.3.2	End of the Petroleum Activities Program Notification	563
7.9.3.3	End of the Environment Plan	563
7.9.4	Incident Reporting (Internal).....	564
7.9.5	Incident Reporting (External) – Reportable and Recordable	564
7.9.6	Reportable Incidents.....	564
7.9.6.1	Notification	564
7.9.7	Recordable Incidents	565
7.9.7.1	Notification.....	565
7.9.8	Other External Reporting Requirements and Notifications	565
7.10	Ongoing Consultation	566
7.11	Emergency Preparedness and Response.....	568
7.11.1	Overview.....	568
7.11.2	Emergency Response Training.....	569
7.11.3	Emergency Response Preparation	570
7.11.4	Initial Response to Facility Incident.....	570
7.11.5	Oil and Other Hazardous Materials Spill	571
7.11.6	Emergency and Spill Response	571
7.11.7	Emergency and Spill Response Drills and Exercises	571
7.11.8	Hydrocarbon Spill Response testing of Arrangements	572
7.11.9	Testing of Arrangements Schedule	572
7.11.10	Cyclone and Dangerous Weather Preparation	575
8	REFERENCES	576
9	LIST OF TERMS AND ACRONYMS	590

APPENDIX A	WOODSIDE ENVIRONMENT AND BIODIVERSITY POLICY	598
APPENDIX B	RELEVANT REQUIREMENTS	599

LIST OF TABLES

Table 1-1: Environment Plan summary	20
Table 1-2: Environment Plan process phases, applicable environment regulations and relevant section of Environment Plan	21
Table 1-3: Relevant requirements of the Offshore Petroleum and Greenhouse Gas Storage Act 2006.....	26
Table 1-4: Conditions from Greater Enfield (Vincent) Petroleum Field (EPBC 2005/2110) relevant to the Petroleum Activities Program	27
Table 1-5: Relevant management principles under Schedule 5 – Australian World Heritage management principles of the Environment Protection and Biodiversity Conservation Act	30
Table 2-1: Example of the environment values potentially impacted which are assessed within the Environment Plan.....	36
Table 2-2: Example of layout of identification of risks and impacts in relation to risk sources	37
Table 2-3: Woodside Risk Matrix (environment and social and cultural) consequence descriptions	41
Table 2-4: Woodside Risk Matrix likelihood levels.....	42
Table 2-5: Summary of Woodside’s Criteria for ALARP Demonstration	46
Table 2-6: Summary of Woodside’s criteria for acceptability	47
Table 3-1: Approximate location details for the Petroleum Activities Program, including all relevant infrastructure.....	52
Table 3-2: Routine discharge streams from the customised water flood.....	68
Table 3-3: Non-routine discharges from the customised water flood (cleaning/maintenance fluids)	69

1 INTRODUCTION

1.1 Overview

Woodside Energy Limited (Woodside), as Titleholder under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Cth)* (referred to as the Environment Regulations), on behalf of the Joint Venture detailed in **Section 1.6**, is operator of the Ngujima-Yin Floating Production, Storage and Offloading (FPSO) facility (known hereafter as the NY facility).

The NY facility is located offshore, approximately 43 km north of Western Australia's North West Cape. The NY facility commenced operation in 2008. Well fluids are recovered from four fields via wells, a rigid flowline and subsea infrastructure. Crude oil produced from these reservoirs is processed on the FPSO, and the processed stabilised crude oil is then offloaded to offtake tankers direct for export.

The following activities are proposed to occur within Permit Area WA-28-L, WA-59-L and WA-28-PL:

- routine production and associated activities from 19 existing subsea wells
- routine production and associated activities from up to two future subsea wells
- crude oil offloading activities
- routine and non-routine inspection, monitoring, maintenance and repair (IMMR) of the FPSO and associated subsea infrastructure
- well unloading and clean-up of up to two new wells to the FPSO
- disconnection and sailaway of the NY FPSO with the submerged turret production (STP) mooring and subsea infrastructure remaining in place
- non-routine and unplanned activities and incidents associated with the above.

These activities will hereafter be referred to as the Petroleum Activities Program and form the scope of this Environment Plan (EP). A more detailed description of the activities is provided in **Section 3**.

This EP has been prepared as part of the requirements under the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA). In accordance with the requirements of regulation 41 of the Environment Regulations, Woodside has submitted this revision of the Ngujima-Yin FPSO Facility Operations EP to NOPSEMA at least 14 days before the end of the five-year period from the previous acceptance under regulation 35 of the Environment Regulations.

1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- the potential environmental impacts and risks (planned (routine and non-routine) and unplanned) that may result from the Petroleum Activities Program are identified
- appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable
- the Petroleum Activities Program is carried out in a manner consistent with the principles of ecologically sustainable development (as defined in Section 3A of the *Commonwealth Environment Protection and Biodiversity Conservation Act 1999 (Cth)* (EPBC Act)).

This EP describes the process and resulting outputs of the risk assessment, whereby impacts and risks are managed accordingly.

The EP defines activity-specific environmental performance outcomes (EPOs), environmental performance standards (EPSs), and measurement criteria (MC). These form the basis for monitoring, auditing, and managing the Petroleum Activities Program to be undertaken by Woodside and its contractors. The implementation strategy (derived from the decision support framework tools) specified in this EP provides Woodside and NOPSEMA with the required level of assurance that impacts and risks associated with the activity are reduced to ALARP and are acceptable.

1.3 Scope of the Environment Plan

The scope of this EP covers the activities that define the Petroleum Activities Program, as described in **Section 3**, for a period of up to five years. The Operational Area, as defined in **Section 3.3**, defines the spatial boundary of the Petroleum Activities Program.

This EP addresses potential environmental impacts from planned activities and potential unplanned risks that originate from within the Operational Area. Transit to and from the Operational Area by project vessels, as well as port activities associated with these vessels, are not within the scope of this EP. Vessels supporting the Petroleum Activities Program operating outside the Operational Area (e.g. transiting to and from port) are subject to applicable maritime regulations and other requirements and are not managed by this EP.

1.4 Environment Plan Summary

An EP summary will be prepared based on the material provided in this EP. **Table 1-1** summarises the content that will be provided within the EP summary, as required by regulation 35(7).

Table 1-1: Environment Plan summary

EP summary material requirement	Relevant section of this EP containing EP summary material
The location of the activity	Section 3
A description of the receiving environment	Section 4
A description of the activity	Section 3
Details of the environmental impacts and risks	Section 6
The control measures for the activity	Section 6
The arrangements for ongoing monitoring of the titleholder’s environmental performance	Section 7.7
Response arrangements in the oil pollution emergency plan (OPEP)	Section 7.11
Consultation already undertaken and plans for ongoing consultation	Section 5
Details of the titleholder’s nominated liaison person for the activity	Section 1.7.2

1.5 Structure of the Environment Plan

The EP has been structured to reflect the process and requirements of the Environment Regulations, as outlined in Table 1-2.

Table 1-2: Environment Plan process phases, applicable environment regulations and relevant section of Environment Plan

Criteria for acceptance	Content Requirements/Relevant Regulations	Elements	Section of EP
Regulation 34(a): is appropriate for the nature and scale of the activity	Regulation 21: Environmental Assessment Regulation 22: Implementation strategy for the environment plan Regulation 24: Other information in the environment plan	The principle of 'nature and scale' applies throughout the EP	Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 34(b): demonstrates that the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable	Regulation 21(1)–21(7): 21(1) Description of the activity 21(2)(3) Description of the environment 21(4) Requirements 21(5)(6) Evaluation of environmental impacts and risks 21(7) Environmental performance outcomes and standards	Set the context (activity and existing environment) Define 'acceptable' (the requirements, the corporate policy, relevant persons) Detail the impacts and risks Evaluate the nature and scale Detail the control measures – ALARP and acceptable	Section 1 Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 34(c): demonstrates that the environmental impacts and risks of the activity will be of an acceptable level	Regulation 24(a)–24(c): A statement of the titleholder's corporate environmental policy A report on all consultations between the titleholder and any relevant person		
Regulation 34(d): provides for appropriate environmental performance outcomes, environmental performance standards and measurement criteria	Regulation 21(7): Environmental performance outcomes and standards	EPOs EPSs MC	Section 6
Regulation 34(e): includes an appropriate implementation strategy and monitoring, recording and reporting arrangements	Regulation 22: Implementation strategy for the environment plan	Implementation strategy, including: <ul style="list-style-type: none"> • systems, practices and procedures • performance monitoring • OPEP and scientific monitoring • ongoing consultation. 	Section 7

Criteria for acceptance	Content Requirements/Relevant Regulations	Elements	Section of EP
<p>Regulation 34(f): does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the EPBC Act</p>	<p>Regulation 21(1)–21(3): 21(1) Description of the activity 21(2) Description of the environment 21(3) Without limiting [Regulation 21(2)(b)], particular relevant values and sensitivities may include any of the following: (a) the world heritage values of a declared World Heritage property within the meaning of the EPBC Act (b) the national heritage values of a National Heritage place within the meaning of that Act (c) the ecological character of a declared Ramsar wetland within the meaning of that Act (d) the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act (e) the presence of a listed migratory species within the meaning of that Act (f) any values and sensitivities that exist in, or in relation to, part or all of: a Commonwealth marine area within the meaning of that Act, or Commonwealth land within the meaning of that Act.</p>	<p>No activity, or part of the activity, undertaken in any part of a declared World Heritage property</p>	<p>Section 3 Section 4 Section 6</p>
<p>Regulation 34(g): (i) the titleholder has carried out the consultations required by Section 25 (ii) the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate</p>	<p>Regulation 25: Consultation with relevant authorities, persons and organisations, etc. Regulation 24(b): A report on all consultations between the titleholder and any relevant person</p>	<p>Consultation in preparation of the EP</p>	<p>Section 5</p>
<p>Regulation 34(h): complies with the Act and the regulations</p>	<p>Regulation 23: Details of the Titleholder and liaison person Regulation 24(c): Details of all reportable incidents in relation to the proposed activity.</p>	<p>All contents of the EP must comply with the Act and the regulations</p>	<p>Section 1.6 Section 7.9</p>

1.6 Description of the Titleholder

Woodside is the Titleholder and operator for this activity on behalf of a Joint Venture including Woodside Energy Ltd and Mitsui E&P Australia Pty Ltd.

Woodside's mission is to deliver affordable energy solutions and superior outcomes for stakeholders by being society's trusted energy partner. Woodside's strategy is to provide the low cost, lower carbon energy our world needs. We have significant opportunities to prosper and grow. Our three pillars – oil, gas and new energy – each have a role to play in our future. Wherever Woodside works, it is committed to living its values of one team, we care, innovation, results matter, and we build and maintain trust.

Woodside's operations are characterised by strong safety and environmental performance in remote and challenging locations.

Through collaboration, Woodside leverages its capabilities to progress its growth strategy. Since 1984, the company has been operating the landmark Australian project, the North West Shelf (NWS), and it remains one of the world's premier liquefied natural gas (LNG) facilities. In 2012, Woodside added the Pluto LNG Plant to its onshore operating facilities.

Woodside has an excellent track record of efficient and safe production. Woodside strives for excellence in safety and environmental performance and continues to strengthen relationships with customers, partners, co-venturers, governments and communities. Further information about Woodside can be found at <http://www.woodside.com.au>.

1.7 Details of Titleholder, Liaison Person and Public Affairs Contact

In accordance with regulation 23 of the Environment Regulations, details of the titleholder and liaison person and arrangements for the notification of changes are described below.

1.7.1 Titleholder

Woodside Energy Limited
11 Mount Street
Perth, Western Australia
T: 08 9348 4000
ACN: 63 005 482 986

1.7.2 Nominated Liaison Person

Andrew Winter
Corporate Affairs Manager
11 Mount Street
Perth, Western Australia
T: 08 9348 4000
E: feedback@woodside.com.au

1.7.3 Arrangements for Notifying Change

If the titleholder, titleholder's nominated liaison person, or the contact details for the titleholder or the liaison person change, then NOPSEMA will be notified of the change in writing within two weeks or as soon as practicable.

1.8 Woodside Management System

The Woodside Management System (WMS) provides a structured framework of documentation to set common expectations governing how all employees and contractors at Woodside will work. Many of the standards presented in **Section 6** are drawn from the WMS documentation, which comprises four elements: Our Values and Policies; Expectations; Processes and Procedures; and Guidelines, as outlined below (and illustrated in **Figure 1-1**):

- **Our Values and Policies:** Set the enterprise-wide direction for Woodside by governing our behaviours, actions, and business decisions and ensuring we meet our legal and other external obligations.
- **Expectations:** Set essential activities or deliverables required to achieve the objectives of the Key Business Activities and provide the basis for developing processes and procedures.
- **Processes and Procedures:** Processes identify the set of interrelated or interacting activities that transforms inputs into outputs, to systematically achieve a purpose or specific objective. Procedures specify what steps, by whom, and when required to carry out an activity or a process.
- **Guidelines:** Provide recommended practice and advice on how to perform the steps defined in Procedures, together with supporting information and associated tools. Guidelines provide advice on: how activities or tasks may be performed; information that may be taken into consideration; or, how to use tools and systems.

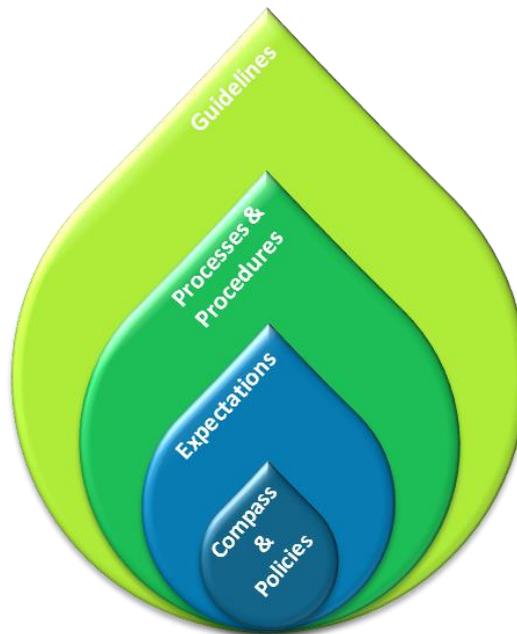

Figure 1-1: The four major elements of the Woodside Management System Seed

The WMS is organised within a Business Process Hierarchy based upon Key Business Activities to ensure the system remains independent of organisation structure, is globally applicable and scalable wherever required. These Key Business Activities are grouped into Management, Support, and Value Stream activities, as shown in **Figure 1-2**. The Value Stream activities capture, generate and deliver value through the exploration and production lifecycle. The Management activities influence all areas of the business, while Support activities may influence one or more value stream activities.

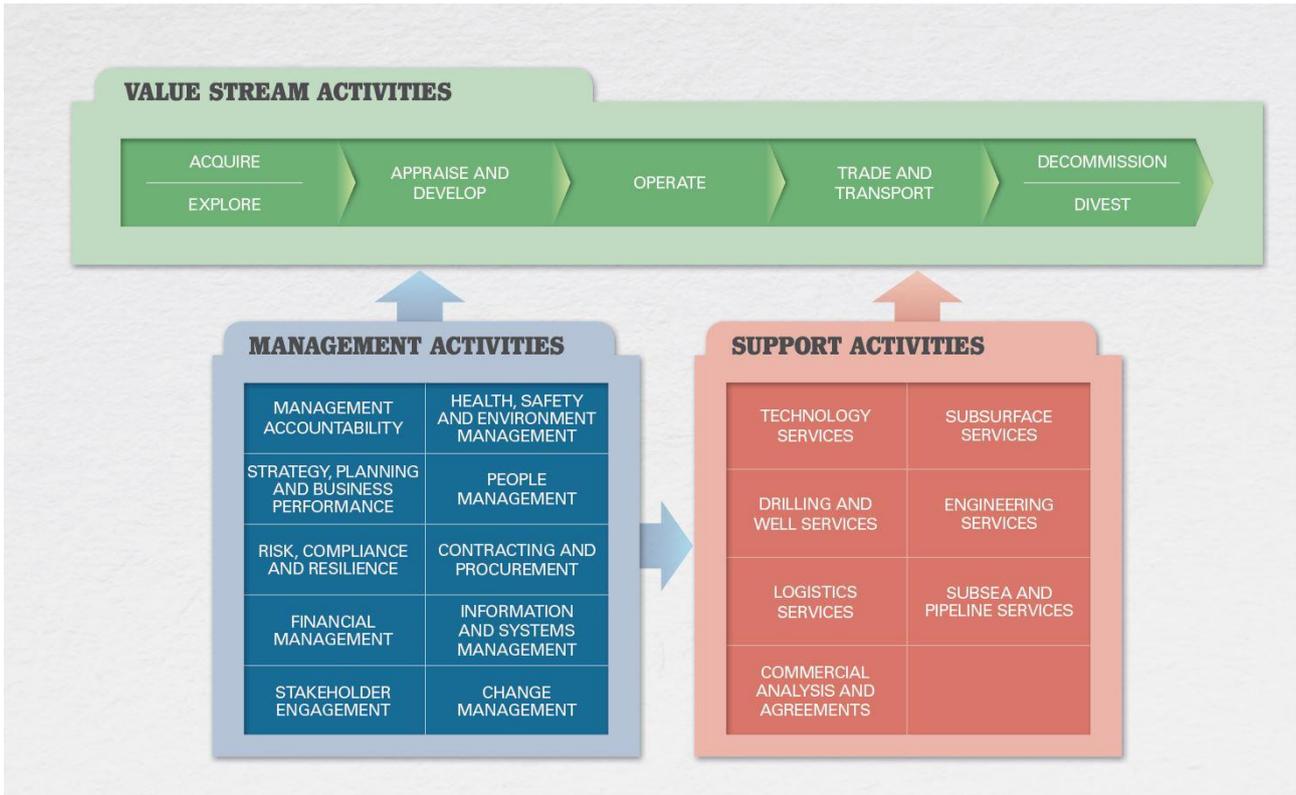

Figure 1-2: The Woodside Management System business process hierarchy

1.8.1 Environment and Biodiversity Policy

In accordance with regulation 24(a) of the Environment Regulations, Woodside’s Environment and Biodiversity Policy is provided in this EP.

1.9 Description of Relevant Requirements

In accordance with regulation 21(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the activity and are relevant to the management of risks and impacts of the Petroleum Activities Program are detailed in this EP. This EP will not be assessed under the Western Australia (WA) *Environment Protection Act 1986* as the activity does not occur on State land or within State Waters.

1.9.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006

The Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act) controls exploration and production activities beyond three nautical miles (nm) of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone at 200 nm.

The relevant requirements in section 572 of the OPGGS Act are detailed in **Table 1-3**.

Table 1-4: Conditions from Greater Enfield (Vincent) Petroleum Field (EPBC 2005/2110) relevant to the Petroleum Activities Program

Condition Number	Condition	Relevant section of the EP
1 ¹	<p>The person taking the action must submit, for the Minister's approval, a plan (or plans) for managing the offshore impacts of the action. The plan (or plans) must include measures for:</p> <p>c) Operations:</p> <ul style="list-style-type: none"> - trading tanker vetting procedures - produced formation water and naturally occurring radioactive materials (NORMs) monitoring and management - interaction procedures for supply vessels and aircraft that are consistent with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000 - monitoring of noise effects of operations on cetaceans - cetacean and whale shark sightings reporting - individual offshore activities may not commence until the plan (or plans) for that specific activity has been approved. The approved plan (or plans) must be implemented. 	<p>Section 7.1.5 and 7.7.4 Section 3.6.3 and 6.7.2 Section 6.6.3 and 6.7.3 Section 6.6.3 Section 7.7.1 and 7.9.3</p>
2	<p>The person taking the action must submit, for the Minister's approval, an oil spill contingency plan to mitigate the environmental effects of any hydrocarbon spills. The oil spill contingency plan must include:</p> <ul style="list-style-type: none"> • the types of dispersants, protective booms, clean up gear and related equipment to be used in an oil spill and the storage arrangements • a demonstrated capacity to deploy oil response equipment within 12 hours • training of staff in oil spill response measures • identification of sensitive areas, in particular Ningaloo Marine Park, and specific response measures for these areas • details of the insurance arrangements that have been made in respect of the costs associated with repairing any environmental damage arising from potential oil spills • the reporting of oil spill incidents. <p>Offshore construction may not commence until the plan is approved. The approved plan must be implemented.</p>	<p>Woodside's emergency preparedness and response arrangements (refer to Section 7.11, and associated documents).</p>
3	<p>Woodside Energy Limited must submit a decommissioning plan (or plans) for approval by the Minister one year prior to decommissioning the floating production, storage and offtake vessel, and three months prior to decommissioning any subsea wells, flowlines or any associated infrastructure. The plan (or plans) must consider the complete removal of all structures and components above the sea floor. The approved plan must be implemented.</p>	<p>Decommissioning beyond the scope of the EP.</p>

¹ Condition 1a) and 1b) (not shown) have been met through previous plans.

Condition Number	Condition	Relevant section of the EP
6	If the person taking the action proposes to undertake any subsea tie-in not included in approved plans pursuant to conditions 1, 2 and 3, the person taking the action must revise such plans or submit a new plan or plans so as to address the activities associated with, and potential environmental impacts of, the subsea tie-in. Activities associated with subsea tie-ins may not be commenced until each such plan or revised plan has been approved by the Minister. Each plan or revised plan that has been approved by the Minister must be implemented.	The implementation of this EP is considered to meet this Condition (i.e. this EP is submitted as the 'revised plan' to address aspects of conditions 1, 2 and 3 applicable to the subsea tie-in operation).
10	A plan required by condition 1, 2, 3 or 6 is automatically deemed to have been submitted to, and approved by, the Minister if the measures (as specified in the relevant condition) are included in an environment plan (or environment plans) relating to the taking of the action that: <ul style="list-style-type: none"> • was submitted to NOPSEMA after 27 February 2014 and either: <ul style="list-style-type: none"> • is in force under the OPGGS Environment Regulations, or • has ended in accordance with regulation 25A of the OPGGS Environment Regulations. 	The implementation of this EP is considered to meet this Condition.
10A	Where a plan required by condition 1, 2 or 6 has been approved by the Minister and the measures (as specified in the relevant condition) are included in an environment plan (or environment plans) that: <ul style="list-style-type: none"> • was submitted to NOPSEMA after 27 February 2014 and either: <ul style="list-style-type: none"> • is in force under the OPGGS Environment Regulations, or • has ended in accordance with regulation 25A of the OPGGS Environment Regulations. The plan approved by the Minister no longer needs to be implemented	The implementation of this EP is considered to meet this Condition and supersedes previously approved plans.
10B	Where an environment plan, which includes measures specified in the conditions referred to in conditions 10 and 10A above, is in force under the OPGGS Environment Regulations that relates to the taking of the action, the person taking the action must comply with those measures as specified in that environment plan.	The implementation of this EP is considered to meet this Condition.

1.9.2.1 Offshore Project Proposal

An OPP is not required for operating the NY facility as it has already received approval under the EPBC Act (see **Section 1.9.2** (EPBC Act)).

The EPBC referral 2005/2110 and EIS includes provision for future expansion activities including additional production wells and possible tie-backs within the Greater Enfield (Vincent) development area. The accepted development approach includes an initial development of six production wells as well as one to two water re-injection and one to two gas re-injection wells, followed by future expansion comprising around 14 to 28 additional production wells, as well as two to four additional water re-injection wells and one to two additional gas re-injection wells. The proposed additional two new wells fall within this approved development description as currently there are 19 production wells.

The notional Greater Enfield (Vincent) development area is defined in EPBC 2005/2110 as a 25 km radius surrounding the Vincent-1 well site. The two new wells would be within this area. The two new wells are therefore within the scope of the EPBC referral and EIS approved by the Minister for the Environment and an OPP is not required. The drilling, installation, tie-back and cold commissioning activities of the two new well(s), if developed, would be the subject of a separate EP. Well start-up and hot commissioning activities are described within this EP.

1.9.2.2 Recovery Plans and Threat Abatement Plans

Under s139(1)(b) of the EPBC Act, the Environment Minister must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the Act. Similarly, under s268 of the EPBC Act:

“A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.”

In relation to offshore petroleum activities in Commonwealth waters, these requirements are now administered by NOPSEMA in accordance with commitments set out in the Programs. Relevant recovery plans or threat abatement plans relevant to the scope of this EP have been assessed in **Section 6.9**.

1.9.2.3 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs), formally known as Commonwealth Marine Reserves, are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP) is responsible for managing AMPs (supported by Parks Australia) and is required to publish management plans for them. Other parts of the Commonwealth Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans (s362 of the EPBC Act). Relevant AMPs are listed in **Section 4.8**. The North-west Marine Parks Network Management Plan describes the requirements for management.

1.9.2.4 World Heritage Properties

Australian World Heritage management principles are prescribed in Schedule 5 of the EPBC Regulations 2000. Management principles that are considered relevant to the scope of this EP are provided in **Table 1-5**.

Table 1-5: Relevant management principles under Schedule 5 – Australian World Heritage management principles of the Environment Protection and Biodiversity Conservation Act

Number	Principle	Relevant Section of the EP
3	<p>Environmental impact assessment and approval</p> <p>3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not).</p> <p>3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process.</p> <p>3.03 The assessment process should:</p> <ul style="list-style-type: none"> • identify the World Heritage values of the property that are likely to be affected by the action • examine how the World Heritage values of the property might be affected • provide for adequate opportunity for public consultation. <p>3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</p> <p>3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</p> <p>3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.</p>	<p>3.01 and 3.02: Assessment of significant impact on World Heritage values is included in Section 6. Principles are met by the submitted EP.</p> <p>3.03 (a) and (b): World Heritage values are identified in Section 4 and considered in the assessment of impacts and risks for the Petroleum Activity in Section 6.</p> <p>3.03 (c): Relevant stakeholder consultation and feedback received in relation to impacts and risks to the Ningaloo World Heritage Property are outlined in Section 5.</p> <p>3.04, 3.05 and 3.06: Principles are considered to be met by the acceptance of this EP.</p>

Note that sections 1 – General Principles and 2 – Management Planning of schedule 5 are not considered relevant to the scope of this EP and, therefore, have not been included.

2 ENVIRONMENT PLAN PROCESS

2.1 Overview

This section outlines the process taken by Woodside to prepare this EP, once the activity was defined as a petroleum activity. The process describes the activity, the existing environment, followed by the environmental risk management methodology used to identify, analyse and evaluate risks to meet ALARP levels and acceptability requirements, and develop EPOs and EPSs. This section also describes Woodside's risk management methodologies as applied to implementation strategies for the activity.

Regulation 21(5) of the Environment Regulations requires the EP to include details of the environmental impacts and risks for the Petroleum Activities Program, and an evaluation of all the impacts and risks, appropriate to the nature and scale of each impact and risk. The objective of the risk assessment process described in this section is to identify risks and associated impacts of an activity, so they can be assessed, and appropriate control measures applied to eliminate, control or mitigate the impact/risk to ALARP, and to determine if the impact or risk level is acceptable.

Environmental impacts and risks include those directly and indirectly associated with the Petroleum Activities Program, and include potential emergency and accidental events:

- **Planned activities** have the inherent potential to cause environmental impacts.
- **Environmental risks** are unplanned events with the potential for environmental impact (termed risk 'consequence').

In this section, potential impacts from planned activities are termed 'impacts', and 'risks' are associated with unplanned events with the potential for environmental impact (should the risk be realised), with such impacts termed potential 'consequences'.

2.2 Environmental Risk Management Methodology

2.2.1 Woodside Risk Management Process

Woodside recognises risk is inherent to its business and effective management of risk is vital to delivering on company objectives, success and continued growth. Woodside is committed to managing risk proactively and effectively. The objective of Woodside's risk management system is to provide a consistent process for recognising and managing risks across Woodside's business. Achieving this objective includes ensuring risks consider impacts across these key areas of exposure: health and safety, environment, finance, reputation and brand, legal and compliance, and social and cultural.

The environmental risk management methodology used in this EP is based on Woodside's Risk Management Procedure. This procedure aligns to industry standards, such as International Organization for Standardization (ISO) 31000. Woodside's WMS risk management procedures, guidelines and tools provide guidance of specific techniques for managing risk, tailored for particular areas of risk within certain business processes. Procedures applied for environmental risk management include:

- Health, Safety and Environment Management Procedure
- Impact Assessment Procedure
- Process Safety Management (PSM) Procedure.

The risk management methodology provides a framework to demonstrate that risks and impacts are continually identified, reduced to ALARP and assessed to be at an acceptable level, as required by the Environment Regulations. The key steps of Woodside's risk management process are shown in

Figure 2-1. A description of each step and how it is applied to the scopes of this activity is provided in **Section 2.2** to **Section 2.11**.

Figure 2-1: Woodside’s risk management process

2.2.2 Health, Safety and Environment Management Procedure

The Health, Safety and Environment Management Procedure provides the structure for managing health, safety and environment (HSE) risks and impacts across Woodside, defines the decision authorities for company-wide HSE management activities and deliverables, and supports continuous improvement in HSE management.

2.2.3 Impact Assessment Procedure

To support effective environmental impact and risk assessment, Woodside’s Impact Assessment Procedure (**Figure 2-2**) provides the steps to meet the required environment, health and social standards by ensuring impact assessments are undertaken appropriate to the nature and scale of the activity, the regulatory context, the receiving environment, interests, concerns and rights of stakeholders, and the applicable framework of standards and practices.

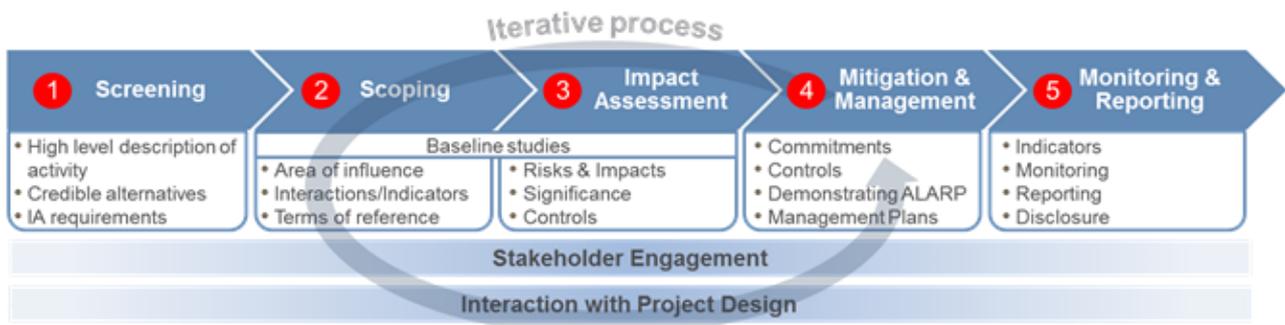

Figure 2-2: Woodside’s impact assessment process

2.2.4 Process Safety Management Procedure and Process Safety Risk Assessment Procedure

Due to the nature and scale of petroleum activities, Woodside’s PSM Procedure establishes Woodside’s framework for PSM (**Section 7.1.3**). This framework includes the Process Safety Risk Assessment Procedure (PSRA). The PSRA is a key part of Woodside’s PSM framework for

managing the integrity of systems and processes that handle hazardous substances over the exploration and production lifecycle. The PSRA sets out methods to ensure that process safety risks are understood and controlled, including that all process safety hazards are systematically identified, assessed and treated so that the associated risks are reduced to a level that is tolerable and ALARP.

2.3 Environment Plan Development Process

The EP development process is illustrated in **Figure 2-3**. Each element of this process is discussed further in **Section 2.5** to **Section 2.10**.

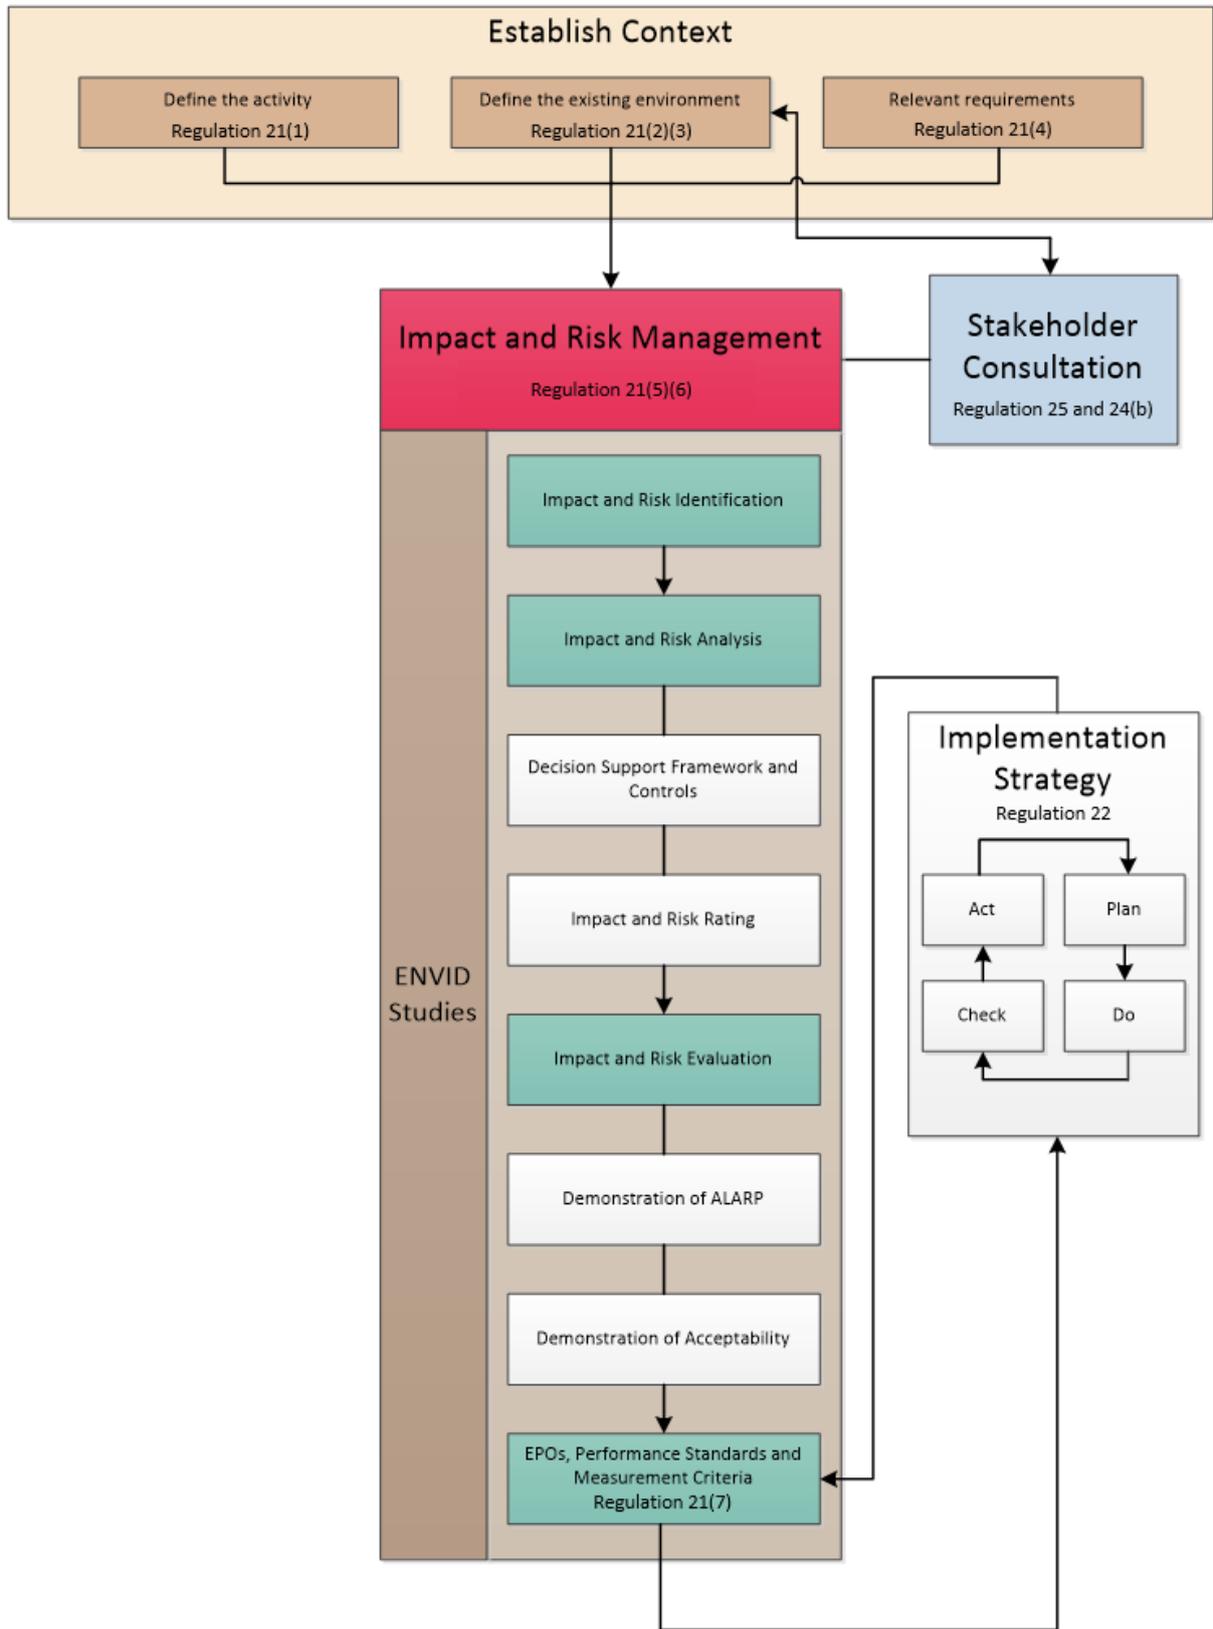

Figure 2-3: Environment Plan development process

2.4 Establish the Context

2.4.1 Define the Activity

This first stage involves evaluating whether the activity meets the definition of a 'petroleum activity' as defined in the Environment Regulations. The activity is described in relation to:

- the location
- what is to be undertaken
- how it is planned to be undertaken, including outlining operational details of the activity and proposed timeframes.

The 'what' and 'how' are described in the context of 'environmental aspects'² to inform the risk and impact assessment for planned (routine and non-routine) and unplanned (accidents, incidents and emergency conditions) activities.

The activity is described in **Section 3** and is referred to as the Petroleum Activities Program.

2.4.2 Define the Existing Environment

The context of the existing environment is described and determined by considering the nature and scale of the activity (size, type, timing, duration, complexity, and intensity of the activity), as described in **Section 3**. The purpose is to describe the existing environment that may be impacted by the activity, directly or indirectly, by planned or unplanned³ events.

The Existing Environment (**Section 4**) is structured into subsections defining the physical, biological, socio-cultural and cultural attributes of the area of interest, in accordance with the definition of environment in regulation 5(a) of the Environment Regulations. These subsections make particular reference to:

- The environmental, and social and cultural consequences as defined by Woodside (refer to **Table 2-3**), which address key physical and biological attributes, as well as social and cultural values of the existing environment. These consequence definitions are applied to the impact and risk analysis (refer **Section 2.2**) and rated for all planned and unplanned activities. Additional detail is provided for unplanned hydrocarbon spill risk evaluation.
- EPBC Act MNES, including listed Threatened species and ecological communities and listed Migratory species. Defining the spatial extent of the existing environment is guided by the nature and scale of the Petroleum Activities Program (and associated sources of environmental risk). This considers the Operational Area and wider environment that may be affected (EMBA), as determined by the hydrocarbon spill risk assessments presented in **Section 6.8**. MNES, as defined under the EPBC Act, are addressed through Woodside's impact and risk assessment (**Section 6**).
- Relevant values and sensitivities, which may include world or national heritage listed areas, listed Threatened species or ecological communities, listed Migratory species, or sensitive values.

By grouping potentially impacted environmental values by aspect (as presented in **Table 2-1**), the presentation of information about the receiving environment is standardised. This information is then

² An environmental aspect is an element of the activity that can interact with the environment.

³ For each source of risk, the credible worst-case scenario in conjunction with impact thresholds is used to determine the spatial extent of the EMBA. The worst-case unplanned event is considered to be an unplanned hydrocarbon release, further defined for each activity through the risk assessment process. Interpretation of stochastic oil spill modelling determines the EMBA for the release, which defines the spatial scale of the environment that may be potentially impacted by the Petroleum Activities Program and in turn provides context to the 'nature and scale' of the existing environment.

consistently applied to the risk evaluation section to provide a robust approach to the overall environmental risk evaluation and its documentation in the EP.

Table 2-1: Example of the environment values potentially impacted which are assessed within the Environment Plan

Environmental Value Potentially Impacted						
Regulations 13(2)(3)						
Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitats	Species	Socio-economic

2.4.3 Relevant Requirements

The relevant requirements in the context of legislation, other environmental approval requirements, conditions and standards that apply to the Petroleum Activities Program are identified and reviewed.

2.5 Impact and Risk Identification

Relevant environmental aspects and hazards were identified that support the process to define environmental impacts and risks associated with an activity.

The environmental impact and risk assessment presented in this EP has been informed by recent and historic hazard and environmental risk identification studies (e.g. HAZID/ENVID), consequence modelling studies for high consequence, low probability environmental risks, bowtie risk assessments for Major Environmental Events (MEEs) as required by Woodside’s PSRA processes, desktop reviews and studies associated with the Petroleum Activities Program. Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in **Section 3**), the existing environment (**Section 4**) and the outcomes of Woodside’s stakeholder engagement process (**Section 5**). The environmental outputs of applicable risk and impact workshops and associated studies are referred to as ENVID in this EP.

An environmental impacts and risks identification and assessment workshop was undertaken by multidisciplinary teams comprising relevant operational and environmental personnel with sufficient breadth of knowledge, training and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified, during the workshop, for both planned (routine and non-routine) activities and unplanned (accidents/incidents/emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

Impacts and risks were evaluated and tabulated for each planned activity and unplanned events respectively. Environmental impacts and risks were recorded in an environmental impacts and risk register. The output of the workshop is used to present the risk assessment and form the basis of EPOs, EPSs, and MC. This information is presented in **Section 6**, following the format presented in **Table 2-2**.

Table 2-2: Example of layout of identification of risks and impacts in relation to risk sources

Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-cultural	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Summary of source of impact/risk														

2.6 Impact and Risk Analysis

Risk analysis further develops the understanding of a risk by defining the impacts and assessing appropriate controls, as well as considering previous risk assessments for similar activities, relevant studies, past performance, consultation feedback, and the existing environment.

These key steps were undertaken for each identified risk during the risk assessment:

- Identify the Decision Type in accordance with the decision support framework.
- Identify appropriate control measures (preventive and mitigation) aligned with the Decision Type.
- Assess the risk rating.

2.6.1 Decision Support Framework

To support the risk assessment process and Woodside’s determination of acceptability (**Section 2.8.2**), Woodside’s HSE risk management procedures include the use of a decision support framework based on principles set out in the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This concept is integrated into the environmental impacts and risks identification and assessment workshop to determine the level of supporting evidence that may be required to draw sound conclusions regarding risk level and whether the risk is acceptable and ALARP (**Figure 2-4**). Application of the decision support framework confirms:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks and impacts based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher order environmental impacts are subject to further evaluation/assessment).

The framework provides appropriate tools commensurate to the level of uncertainty or novelty associated with the risk/impact (referred to as Decision Type A, B, or C). The Decision Type is selected based on an informed discussion around the uncertainty of the risk/impact and is documented in impact and risk register worksheets.

This framework enables Woodside to appropriately understand a risk and determine if the risk or impact is acceptable and can be demonstrated to be ALARP.

2.6.1.1 Decision Type A

Decision Type A risks and impacts are well understood and established practice. They are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and utilise professional judgment.

2.6.1.2 Decision Type B

Decision Type B risks and impacts typically involve greater uncertainty and complexity; and can include potential higher-order impacts/risks. These risks may deviate from established practice or have some lifecycle implications and therefore require further engineering risk assessment to support the decision and ensure that the risk is ALARP. Engineering risk assessment tools may include:

- risk-based tools such as cost-based analysis or modelling
- consequence modelling
- reliability analysis
- company values.

2.6.1.3 Decision Type C

Decision Type C risks and impacts typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty therefore requiring the adoption of the precautionary approach. The risks may result in significant environmental impact, significant project risk/exposure, or may elicit negative stakeholder concerns. For these risks or impacts, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external consultation as part of the risk assessment process.

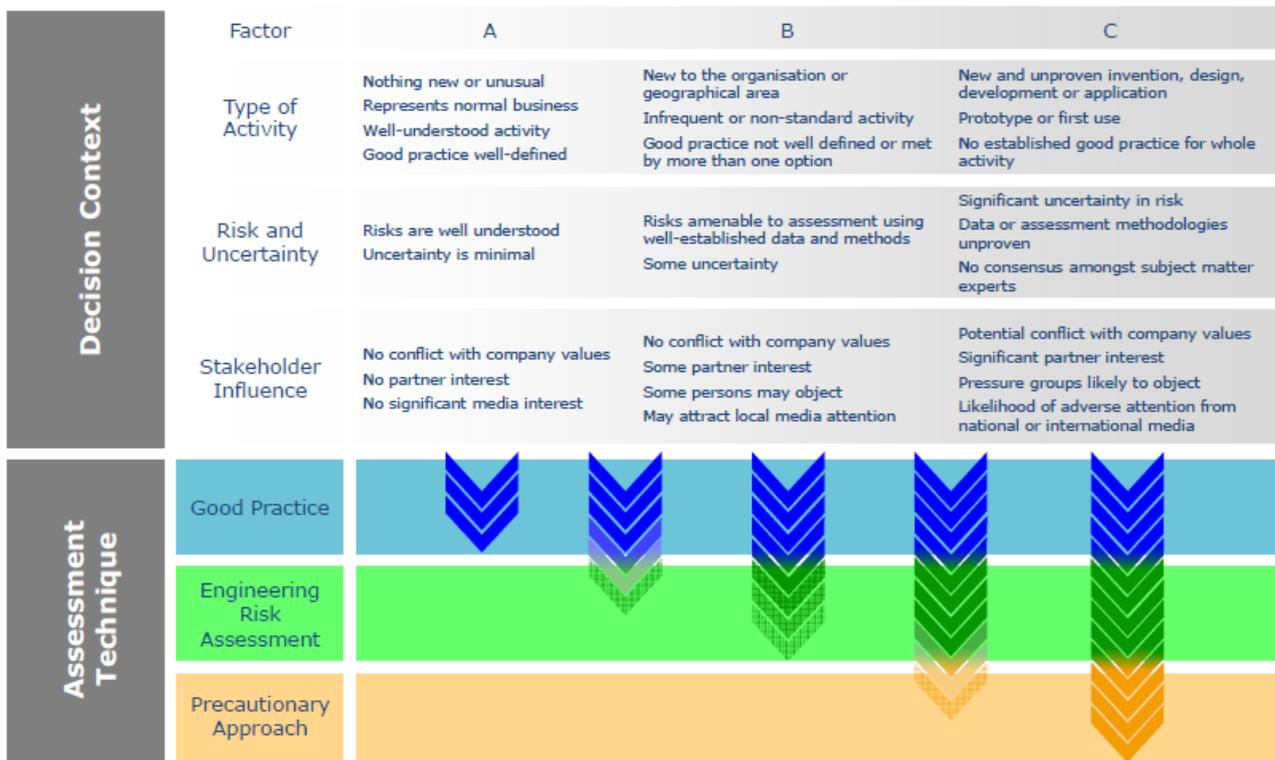

Figure 2-4: Risk-related decision-making framework (Oil and Gas UK, 2014)

2.6.1.4 Decision Support Framework Tools

These framework tools are applied, as appropriate, to help identify control measures based on the Decision Type described above:

- **Legislation, Codes and Standards (LCS)** – identifies the requirements of legislation, codes and standards that are to be complied with for the activity.
- **Good Industry Practice (GP)** – identifies further engineering control standards and guidelines that may be applied by Woodside above that required to meet the LCS.
- **Professional Judgement (PJ)** – uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- **Risk-based Analysis (RBA)** – assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost–benefit analysis to support the selection of control measures identified during the risk assessment process.
- **Company Values (CV)** – identifies values in Woodside’s code of conduct, policies and Our Values. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- **Societal Values (SV)** – identifies the views, concerns and perceptions of relevant stakeholders and addresses relevant stakeholder views, concerns and perceptions.

2.6.1.5 Decision Calibration

To determine that the alternatives selected and control measures applied are suitable, these tools may be used for calibration (i.e. checking) where required:

- **LCS/Verification of Predictions** – Verification of compliance with applicable LCS and/or good industry practice.
- **Peer Review** – Independent peer review of PJs, supported by RBA, where appropriate.
- **Benchmarking** – Where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk.
- **Internal Consultation** – Consultation undertaken within Woodside to inform the decision and verify company values are met.
- **External Consultation** – Consultation undertaken to inform the decision and verify societal values are considered.

Where appropriate, additional calibration tools may be selected specific to the Decision Type and the activity.

2.6.2 Control Measures (Hierarchy of Controls)

Risk reduction measures are prioritised and categorised in accordance with the hierarchy of controls, where risk reduction measures at the top of the hierarchy take precedence over risk reduction measures further down:

- **Elimination** of the risk by removing the hazard.
- **Substitution** of a hazard with a less hazardous one.
- **Engineering Controls** include design measures to prevent or reduce the frequency of the risk event, or detect or control the risk event (limiting the magnitude, intensity and duration) such as:
 - prevention: design measures that reduce the likelihood of a hazardous event occurring

- detection: design measures that facilitate early detection of a hazardous event
 - control: design measures that limit the extent/escalation potential of a hazardous event
 - mitigation: design measures that protect the environment if a hazardous event occurs
 - response equipment: design measures or safeguards that enable clean-up/response after a hazardous event occurs.
- **Procedures and Administration** includes management systems and work instructions used to prevent or mitigate environmental exposure to hazards.
 - **Emergency Response and Contingency Planning** includes methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

2.6.3 Impact and Risk Classification

Environmental impacts and risks are assessed to determine the potential impact significance/consequence. The impact significance/consequence considers the magnitude of the impact or risk and the sensitivity of the potentially impacted receptor (**Figure 2-5**).

The impact and risk information, including classification and evaluation information as shown in the example (**Table 2-2**), are tabulated for each planned activity and unplanned event.

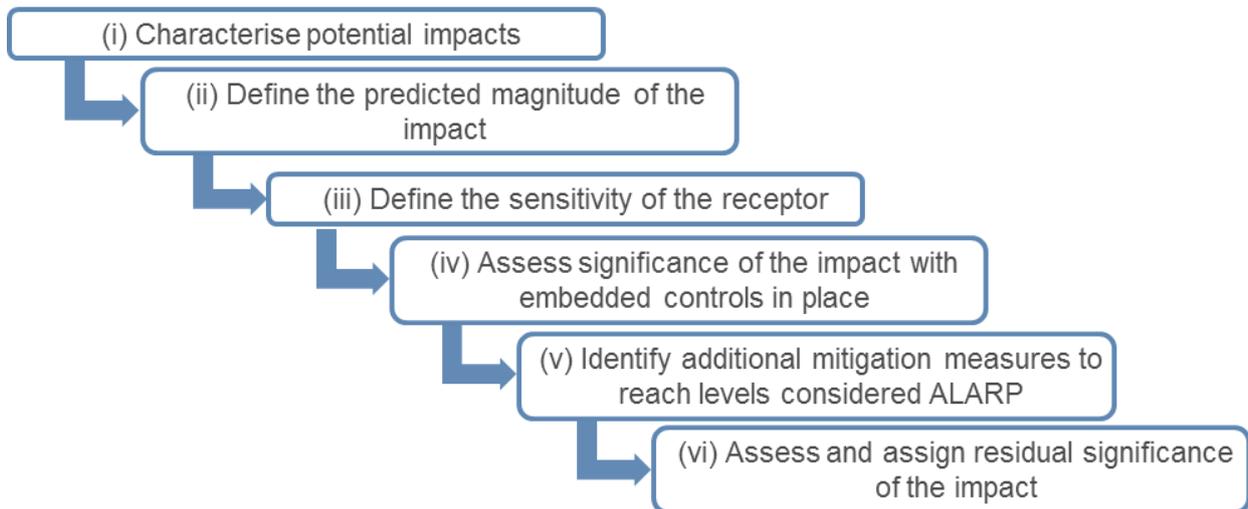

Figure 2-5: Environmental risk and impact analysis

2.6.3.1 Impact Rating Process

Impacts are classified in accordance with the consequence (**Table 2-3**) outlined in Woodside’s Risk Management Procedure.

Table 2-3: Woodside Risk Matrix (environment and social and cultural) consequence descriptions

Environment	Social and Cultural	Consequence Level
Catastrophic, long-term impact (>50 years) on highly valued ecosystem, species, habitat or physical or biological attribute.	Catastrophic, long-term impact (>20 years) to a community, social infrastructure or highly valued area/item of international cultural significance.	A
Major, long-term impact (10 to 50 years) on highly valued ecosystem, species, habitat or physical or biological attribute.	Major, long-term impact (5 to 20 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	B
Moderate, medium-term impact (2 to 10 years) on ecosystem, species, habitat or physical or biological attribute.	Moderate, medium-term impact (2 to 5 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	C
Minor, short-term impact (1 to 2 years) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	Minor, short-term impact (1 to 2 years) to a community or highly valued area/item of cultural significance.	D
Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	Slight, short-term impact (<1 year) to a community or area/item of cultural significance.	E
No lasting effect (<1 month). Localised impact not significant to environmental receptor.	No lasting effect (<1 month). Localised impact not significant to area/item of cultural significance.	F

2.6.3.2 Risk Rating Process

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence and likelihood. The assigned risk rating is determined with controls in place, therefore; the risk rating is determined after identifying the Decision Type and appropriate control measures.

The risk rating process considers the potential environmental consequences and, where applicable, the social and cultural consequences of the risk. The risk ratings are assigned using the Woodside Risk Matrix (refer to **Figure 2-6**). Risks are assessed qualitatively and/or quantitatively in terms of both likelihood and consequence in accordance with this matrix.

The risk rating process is undertaken using the steps described in the subsections below.

2.6.3.3 Select the Consequence Level

Determine the worst-case credible consequence (**Table 2-3**) associated with the selected event, assuming all controls (preventive and mitigative) are absent or have failed. If more than one potential consequence applies, select the highest severity consequence level.

2.6.3.4 Select the Likelihood Level

Determine the description that best fits the chance of the selected consequence occurring, assuming reasonable effectiveness of the prevention and mitigation controls (**Table 2-4**).

Table 2-4: Woodside Risk Matrix likelihood levels

Likelihood Description						
Frequency	1 in 100,000 to 1,000,000 years	1 in 10,000 to 100,000 years	1 in 1000 to 10,000 years	1 in 100 to 1000 years	1 in 10 to 100 years	>1 in 10 years
Experience	Remote: Unheard of in the industry	Highly Unlikely: Has occurred once or twice in the industry	Unlikely: Has occurred many times in the industry but not at Woodside	Possible: Has occurred once or twice in Woodside or may possibly occur	Likely: Has occurred frequently at Woodside or is likely to occur	Highly Likely: Has occurred frequently at the location or is expected to occur
Likelihood Level	0	1	2	3	4	5

2.6.3.5 Calculate the Risk Rating

The risk rating is derived from the consequence and likelihood levels above, in accordance with the Woodside Risk Matrix shown in **Figure 2-6**. A likelihood and risk rating are only applied to environmental risks, not environmental impacts from planned activities.

This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk as an output of the ENVID studies.

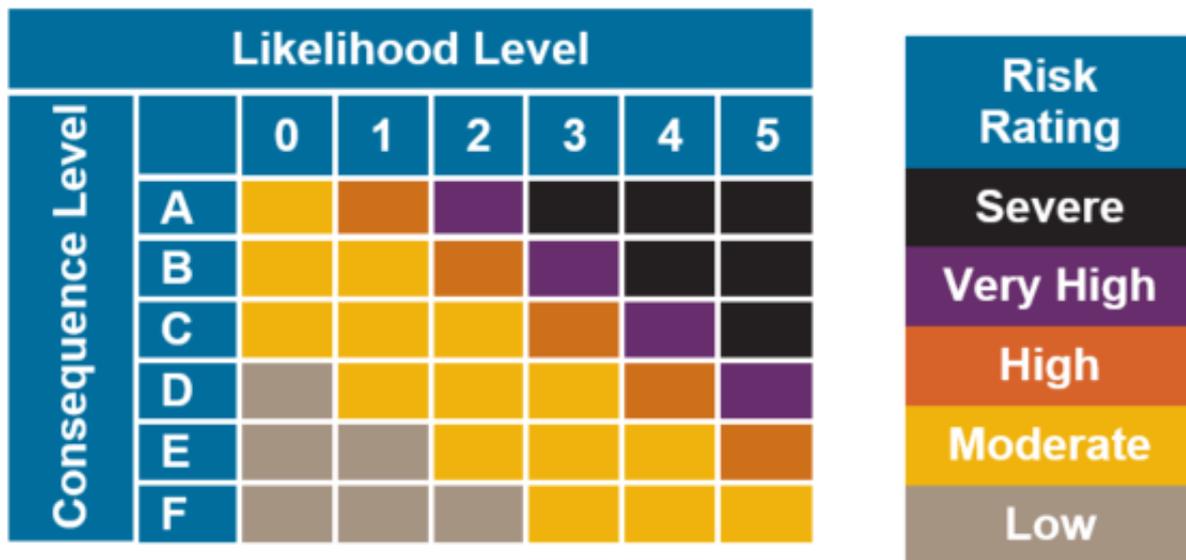

Figure 2-6: Woodside Risk Matrix risk rating

To support ongoing risk management (as a key component of Woodside’s PSM Framework – refer to the implementation strategy in **Section 7**), Woodside uses the concept of ‘current risk’ and applies a Current Risk Rating to indicate the current or ‘live’ level of risk, considering controls that are currently in place and effective on a day-to-day basis. The Current Risk Rating is effective in articulating potential divergence from baseline risk, such as if certain controls fail or could potentially be compromised. Current Risk Ratings aid in communicating and making visible the risk events and ensure the continual management of risk to ALARP by identifying risk reduction measures and assessing acceptability.

2.7 Classification and Analysis of Major Environment Events

For Woodside’s production facilities, a further level of analysis is undertaken to identify, classify and analyse MEEs. This extra level of rigour is applied to ensure sufficient controls are in place for risks with potential Level B and above consequences. In the health and safety area, Major Accident Events (MAEs) are identified using a similar process, which supports consistency in managing key risks within Woodside in accordance with Process Safety Risk Management Procedures.

Woodside defines a MEE as an event with potential environment, reputation (pertaining to environment events), social or cultural consequences of level B or higher as per Woodside’s Risk Matrix (**Figure 2-6**). MEEs are evaluated against credible worst-case scenarios that may occur when all controls are absent or have failed.

2.7.1 Major Environment Event Identification

The ENVID process identifies numerous sources of risk with differing consequence levels. These risks are screened for those risk events that meet the MEE criteria, and MEE risks are analysed further through detailed consequence modelling and probability/frequency studies and examined for ‘appropriateness’ of controls in a bowtie risk assessment.

Environmental risks that do not meet the MEE definition, although screened out of the MEE process, are still evaluated for ALARP and risk acceptability using the methodology described in **Section 2.8**. Some low/moderate consequence events that do not meet the MEE consequence threshold may still undergo additional consequence and probability assessment where they could have a high adverse impact on the company’s reputation or relationships with stakeholders, beyond requirement to demonstrate ALARP and acceptable risk levels following application of controls.

2.7.2 Major Environment Event Classification

A standard naming convention has been established for MEEs which is based around ensuring the MEE titles reflect the cause of the event (e.g. ‘subsea system loss of containment’) rather than the event itself (e.g. significant hydrocarbon spill to the marine environment). The MEEs are assigned a unique identification code (e.g. MEE-01, MEE-02, etc).

2.7.3 Bowtie Analysis

MEEs are subject to more detailed analysis using the bowtie risk assessment technique, which illustrates cause outcome pathways for each MEE and controls in place to prevent the ‘top event’ or mitigate the consequences (outcomes). The key drivers for adopting the bowtie technique for MEEs are that it:

- identifies the controls (prevention and mitigation barriers) necessary to ensure the risk is acceptable and ALARP
- supports the process of demonstrating ALARP (described in **Section 2.8.1**)
- enables verification of and linking to the relevant sections of the WMS that supports barriers
- improves the capacity for lessons learnt and incident prevention by being able to directly relate causes of an incident to those controls that failed
- ensures greater visibility and granularity in the assessment process and enables complex risk scenarios to be presented in an easy-to-understand format.

The bowtie technique (an example bowtie diagram is shown in **Figure 2-7**) shows the relationships between the ‘Causes’ that may lead to a particular unwanted event (‘Top Event’), together with the range of potential escalation paths that can lead to a variety of ‘Outcomes’ (or consequences). A bowtie also shows the preventive barriers that may prevent a Top Event from occurring specific to each Cause, and the mitigation barriers in place to limit the potential effects once the Top Event has been realised, specific to each credible MEE Outcome.

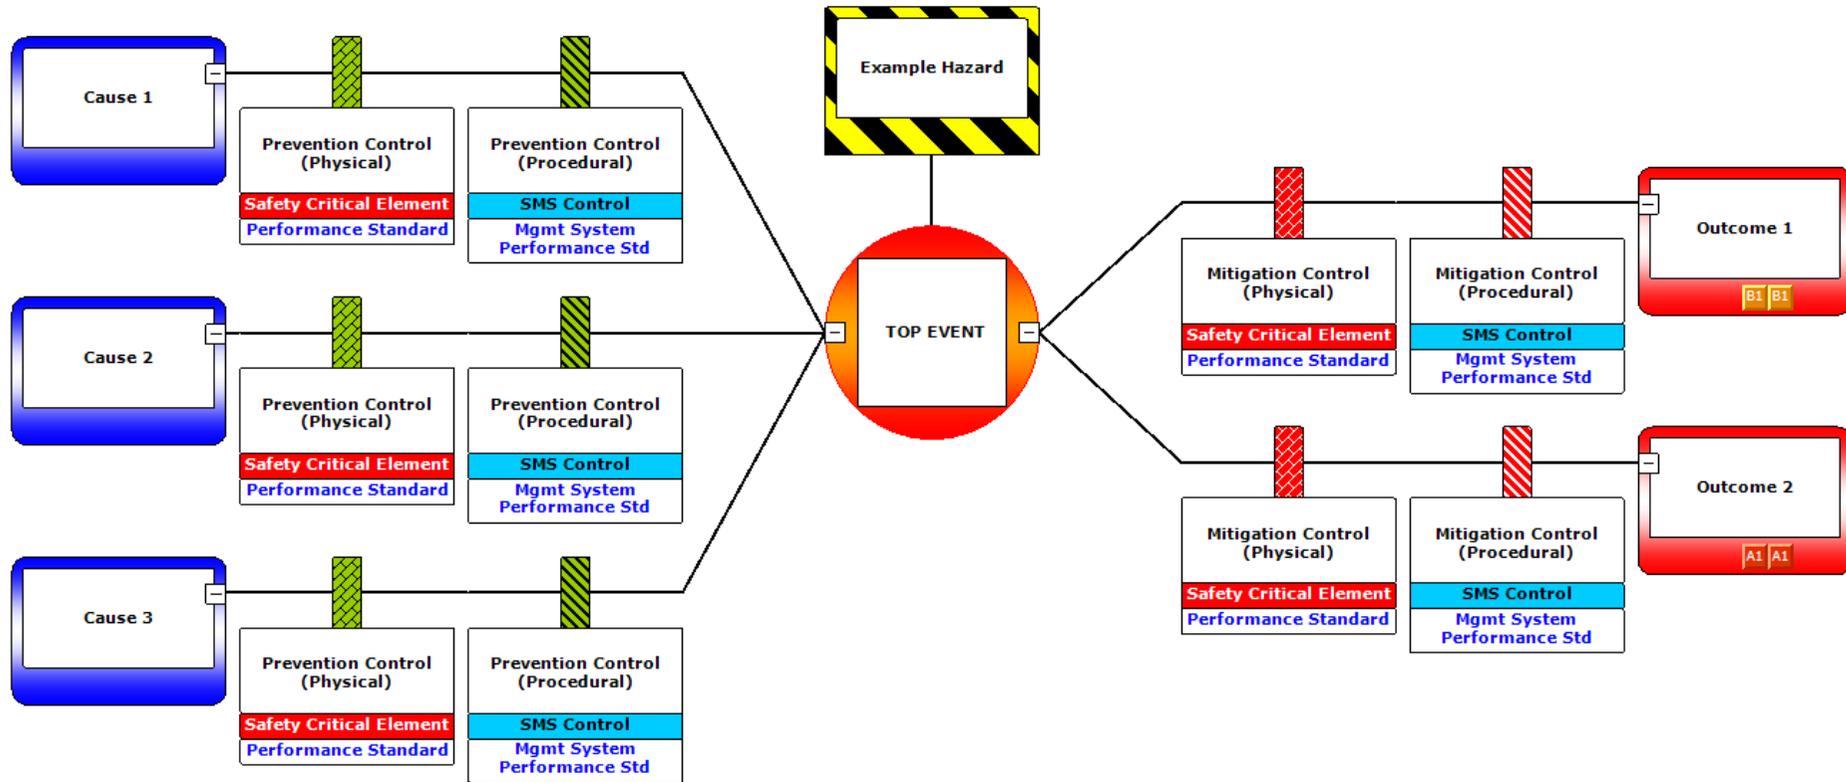

Figure 2-7: Example of bowtie diagram structure

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.7.4 Major Environment Event Register

A MEE Register is prepared for each production facility after completing the bowtie diagrams. The purpose of the MEE Register is to record the MEE identification process, groupings, bowtie diagrams and datasheets in a consolidated format. Datasheets are prepared for each MEE, which summarise the hazard description, hazard management, emergency response, ALARP summary and a list of critical barriers identified on the bowties (known as safety and environment critical elements (SCEs)).

Potential common causes that contribute to MAEs/MEEs, or that can result in failure or degradation of the controls in place to protect against MAEs/MEEs, include some generic mechanisms of SCE failure and generic human error. These are represented in bowties applicable to multiple MEEs and identified in the MEEs applicable to this EP.

2.7.5 Safety and Environment Critical Elements and Technical Performance Standards

Woodside identifies and manages SCE technical and management system performance standards (MSPS) in accordance with PSM Procedures, Risk Management Procedures and Change Management Procedures (further described in the implementation strategy in **Section 7**). SCEs are identified for MAEs and MEEs. An SCE is a hardware control, the failure of which could cause or contribute substantially to, or the purpose of which is to prevent or limit the effect of a MAE, MEE or Process Safety Event. In addition, Woodside defines Safety and Environment Critical Component (SCC) as an item of equipment or structure forming part of a hardware SCE that supports the SCE in achieving the safety function⁴.

Once an SCE is identified as an MEE barrier for the operated facility, technical performance requirements are developed for the facility SCE in accordance with the Global SCE Performance Standards and process described in the SCE Management Procedure and form the SCE Facility Performance Standard. Each SCE Performance Standard represents a statement of the performance required of an SCE (e.g. functionality, availability, reliability, survivability). SCE Performance Standard requirements are used to establish agreed assurance tasks for each SCE, support the management of operations within acceptable safety and/or environment risk levels, and ensure continuous management of risk to ALARP. An assurance task is an activity carried out by the operator to confirm that the SCE meets, or will meet, its SCE Performance Standard. Examples of assurance tasks include inspection routines, maintenance activities, test routines, instrumentation calibration, and reliability monitoring.

SCE Facility Performance Standards do not always align directly with EPSs. They are used in conjunction with the WMS to identify and treat potential step-outs from expected controls performance or integrity envelopes and ensure SCE performance can be optimised. Woodside's HSE Event Reporting Guideline describes the process for identifying 'Failure to meet Facility Performance Standard', which is when the SCE does not meet the goal as stated in the relevant Performance Standard. (see **Section 7.1.18**). Situations where SCEs fail to meet Facility Performance Standards represent a potential increase in risk that, if not addressed immediately, have the potential to result in a process safety event, or worsen the consequences of one. Recording SCE Failure to Meet Performance Standard Events into the Event Reporting Database is important to highlight risk, investigate causes, ensure risks are managed and meet potentially applicable external reporting requirements. For applicable SCEs, 'Failure to meet Facility Performance Standard' represent scenarios that may fail to achieve an EPS presented in this EP.

The results of the MEE classification and analysis for NY facility operations are presented in **Section 6.8** of this EP. More detail on the SCE and Performance Standards process, and the interrelationships to other parts of the SCE Management Procedures, is described in **Section 7.1.18**.

⁴ Note: Not all individual equipment items that comprise a SCE are safety-critical.

2.7.6 Safety-critical Management System Barriers

For each MEE, Safety-critical Management System specific measures are also identified. These are management system components (generally WMS processes) that are key barriers to, or measures for, managing MEEs.

2.8 Impact and Risk Evaluation

Environmental impacts and risks cover a wider range of issues, differing species, persistence, reversibility, resilience, cumulative effects, and variability in severity than safety risks. Determining the degree of environmental risk, and the corresponding threshold for whether a risk/impact has been reduced to ALARP and is acceptable, is evaluated to a level appropriate to the nature and scale of each impact or risk. Evaluation includes considering the:

- decision type
- principles of ecological sustainable development – as defined under the EPBC Act
- internal context – ensuring the proposed controls and risk level are consistent with Woodside policies, procedures and standards (**Section 7**)
- external context – the environment consequence (**Section 6**) and stakeholder acceptability (**Section 5**)
- other requirements – ensuring the proposed controls and risk level are consistent with national and international standards, laws and policies.

In accordance with regulation 34(a), 34(b), 34(c) and 21(5)(b), Woodside applies the process described in the subsections below to demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

2.8.1 Demonstration of As Low As Reasonably Practicable

The descriptions in **Table 2-5** articulate how Woodside demonstrates that different risks, impacts and Decision Types identified within the EP are ALARP.

Table 2-5: Summary of Woodside’s Criteria for ALARP Demonstration

Risk	Impact	Decision Type
<i>Low and Moderate</i>	<i>Negligible, Slight, or Minor (D, E or F)</i>	<i>A</i>
Woodside demonstrates these risks, impacts and Decision Types are reduced to ALARP if: <ul style="list-style-type: none"> • identified controls meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines, or • further effort towards impact/risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained. 		
<i>High, Very High or Severe</i>	<i>Moderate and above (C, B or A)</i>	<i>B and C</i>
Woodside demonstrates these higher-order risks, impacts and Decision Types are reduced to ALARP where it can be shown good industry practice and RBA have been employed, if legislative requirements are met, societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.		

2.8.2 Demonstration of Acceptability

The descriptions in **Table 2-6** articulate how Woodside demonstrates how different impacts and risks are identified with this EP are Acceptable.

Table 2-6: Summary of Woodside’s criteria for acceptability

Risk	Impact	Decision Type
<i>Low and Moderate</i>	<i>Negligible, Slight, or Minor (D, E or F)</i>	<i>A</i>
Woodside demonstrates these risks, impacts and Decision Types are 'Broadly Acceptable' if they meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines. Further effort towards risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.		
<i>High, Very High or Severe</i>	<i>Moderate and above (C, B or A)</i>	<i>B and C</i>
Woodside demonstrates these higher order Risks, Impacts and Decision Types are 'Acceptable if ALARP' if it can be demonstrated using good industry practice and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In undertaking this process for Moderate and High risks, Woodside evaluates: <ul style="list-style-type: none"> • the Principles of ecological sustainable development as defined under the EPBC Act • the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, procedures and standards • the external context – consideration of the environment consequence (Section 6) and stakeholder acceptability (Section 5) are considered • other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies and consideration of applicable plans for management and conservation advices, conventions and significant impact guidelines (e.g. MNES). Additionally, Very High and Severe risks require 'Escalated Investigation' and mitigation. If after further investigation the risk remains in the Very High or Severe category, the risk requires appropriate business engagement with increasing involvement of senior management in accordance with Woodside’s Risk Management Procedure to accept the risk. This includes due consideration of regulatory requirements.		

2.9 Recovery Plan and Threat Abatement Plan Assessment

To support the demonstration of acceptability, a separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans (refer **Section 1.9.2.2**). The steps in this process are:

- Identify relevant listed threatened species and ecological communities (**Table 6-22**).
- Identify relevant recovery plans and threat abatement plans (**Section 6.9**).
- List all objectives and (where relevant) the action areas of these plans, and assess whether these objectives/action areas apply to government, the Titleholder, and the Petroleum Activities Program (**Section 6.9**).
- For those objectives/action areas applicable to the Petroleum Activities Program, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action (**Section 6.9**).

2.10 Environmental Performance Outcomes, Environmental Performance Standards, and Measurement Criteria

EPOs, EPSs and MC are defined to address the potential environmental impacts and risks. These are explored in **Section 6**.

2.11 Implement, Monitor, Review and Report

An implementation strategy for the Petroleum Activities Program describes the specific measures and arrangements to be implemented for the duration of the program. The strategy is based on the principles of Australian Standard/New Zealand Standard (AS/NZS) ISO 14001 Environmental Management Systems, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the Petroleum Activities Program to ALARP and Acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the Petroleum Activities Program are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies
- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the activity.

The implementation strategy is presented in **Section 7**.

2.12 Consultation

A stakeholder assessment is undertaken to identify relevant people (as defined under regulation 25 of the Environment Regulations) to whom an activity update is issued electronically. Reasonable consultation periods are included. Further details and information are provided to a stakeholder if requested.

A summary and assessment of each stakeholder response is undertaken and a response, where appropriate, is provided by Woodside.

The consultation completed in the preparation of the EP, along with the process for ongoing engagement and consultation throughout the activity, is presented in **Section 5**. A copy of the full text correspondence with relevant people is provided.

3 DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with regulation 21(1) of the Environment Regulations, and describes the activities to be undertaken as part of the Petroleum Activities Program under this EP. It includes the location of the Petroleum Activities Program, general details of the facility's layout, the operational details of the Petroleum Activities Program, and additional information relevant to consideration of environmental risks and impacts.

The NY FPSO (**Figure 3-1**) is a conversion of the Ellen Maersk, a very large crude carrier from the Maersk fleet (type E). It was constructed in 2000 then converted to an FPSO facility at Keppel shipyard in Singapore during 2007–2008. It has a double hull, with dimensions 332 m long and 58 m wide, and a displacement of 308,490 dwt.

The NY FPSO topside processing facilities include oil, water and gas separation systems, water injection and gas compression, plus injection equipment. The topsides are designed to process 120,000 bbl/d oil, 230,000 bbl/d water, 250,000 bbl/d total liquids and up to 55 million standard cubic feet per day (MMscfd) of free gas production.

The NY facility produces crude oil from the Vincent reservoir (VIN), Norton over Laverda (NOL), Laverda Canyon Reservoir (LAV) and Cimatti fields (CIM). The three NOL, LAV and CIM fields are collectively referred to as the Greater Enfield Development. The NY facility consists of processing and separation facilities for oil, water and gas, and gas compression facilities. Under normal operations, surplus gas and produced water (PW) is disposed by reinjection back into the reservoir. Gas reinjection also provides artificial lift for the CIM field. For the Greater Enfield (GE) wells, treated sea water produced by topsides via a dedicated treatment system is reinjected via dedicated water injection wells for pressure support. After processing, the stabilised crude oil is offloaded to trading tankers for export.

Future activities for this field may include production from up to an additional two wells targeting the Vincent reservoir and tied back to Drill Centre B (DCB).

Figure 3-1: Ngujima-Yin floating production, storage and offloading facility

3.2 Location

The NY FPSO and subsea infrastructure is located in Commonwealth waters of the Exmouth Sub-Basin of Western Australia (WA), in Production Licence Areas WA-28-L and WA-59-L. The Greater Enfield rigid production flowline operates under pipeline licence WA-28-PL. The NY FPSO is located approximately 43 km north of the North West Cape of Western Australia (**Figure 3-2**).

The NY FPSO is marked on nautical maps and is surrounded by a 500 m petroleum safety zone (PSZ). The subsea infrastructure is also marked on nautical charts. The coordinates, water depths and permit areas of the NY FPSO and associated infrastructure are presented in **Table 3-1**.

1: This table was correct at the time of EP submission.

2: Location for second new well is unconfirmed at the time of submission and location provided is based on DCB manifold. Actual location of the well may be within ~500 m. Location will be within the Operational Area described below.

3.3 Operational Area

The Operational Area defines the spatial boundary of the Petroleum Activities Program, as described, risk-assessed and managed by this EP.

The area includes:

- the NY FPSO and an area extending out to 1500 m to allow for offtake activities
- the subsea infrastructure, including wells, flowlines and associated infrastructure, and an area within 1500 m around the infrastructure
- an area of 3000 m around the DCB, to allow for the proposed location of up to two new wells.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Vessels conducting related activities within the Operational Area are required to comply with this EP. Vessels supporting the Petroleum Activities Program when outside the Operational Area adhere to applicable maritime regulations and other requirements. The Operational Area is presented in **Figure 3-2**.

3.4 Timing

The NY facility commenced production in 2008. The facility operates 24 hours a day, 365 days a year. Supporting activities, such as inspection, maintenance, monitoring and repair (IMMR), take place as required.

The Petroleum Activities Program currently has an estimated end of field life (EoFL) anticipated for 2028 subject to reservoir performance and life extension studies.

Tie-back opportunities are continuously being reviewed for Woodside's offshore facilities, which have the potential to extend the life of the field. One opportunity has been identified, with up to two new wells potentially being drilled and tied back to the existing infrastructure within the life of this EP.

The two new wells are likely to be drilled over two separate campaigns with nominal timing for the first well targeting 2025, and the second well in 2026-2028. Drilling, installation, cold commissioning, tie-back activities associated with the two wells would be the subject of separate EP(s). This EP covers well start-up and hot commissioning of each of the wells.

This EP is intended to remain in force for up to five years from EP acceptance by the regulator.

3.5 Facility Layout and Description

This section provides a high-level overview of the NY FPSO and associated infrastructure as relevant to consideration of the environmental risks and impacts of the Petroleum Activities Program.

3.5.1 Topsides

The NY FPSO has an overall length of 332 m and breadth of 58 m. The topsides comprise 11 pre-assembled primary process modules elevated above the NY FPSO deck, with a plated lower deck and grated upper decks. Each module has its own primary structure, equipment, associated piping, valves and instrumentation. The topsides consist of seven main modules and some skid-based modules. The topside module designations that have been used are:

- M10: HP oil separation
- M11: LP oil separation and water injection
- M20: Manifold
- M30: HP flare
- M40: Customised water flood (CWF)
- M60: HP gas compressor and dehydration (HPC)
- M70: LP gas compressor and utility (LPC)
- M71: LP flare and drain skid
- M72: Sand cleaning skid
- M85: Power generation
- M99: Pipe rack.

In addition to these primary processing modules, there are several more modules in the topsides areas. The process control module (PCM) is located above the starboard side forward of module M60, and contains the control systems for the subsea multiphase pumping stations (MPPs) including the variable speed drives, and control and barrier fluid systems. In addition, the submerged turret production (STP) utility container is located on the port side of the STP compartment, forward of module M20, and contains the hydraulic power units and control equipment for the STP system. A

production laboratory, stores and electrical and mechanical workshops are located aft of the main laydown area on the port side.

3.5.2 Wells and Reservoirs

The wells from the four reservoirs (VIN, NOL, LAV and CIM) are managed in accordance with the Ngujima-Yin Well Operations Management Plan (WOMP). The WOMP describes control measures in place to ensure the risks to the well integrity are reduced to ALARP, including during periods of non-operation, before permanent abandonment.

3.5.2.1 Vincent Reservoir

Oil from the VIN reservoir is produced through 13 subsea production wells. The VIN reservoir is characterised by low pressure and strong aquifer support, as a result production is supported by reinjection of produced water and gas into dedicated wells via two production manifolds (Drill Centre A (DCA) and Drill Centre B (DCB)) connected to the NY FPSO. The additional two new wells are currently targeted to be drilled into the VIN reservoir and connected back to DCB.

The two water re-injection wells are daisy-chained configuration on a dedicated flexible flowline from the NY FPSO. An umbilical runs between the water reinjection wells and the DCA manifold.

The single gas re-injection well also has a dedicated flexible flowline from the NY FPSO, and an umbilical runs between the well and the DCA manifold.

3.5.2.2 Laverda Canyon Reservoir

Fluids from the LAV reservoir are produced from two subsea production wells and pumped to the NY FPSO via the rigid production flowline. A gas cap is present in the upper sand of the LAV reservoir, and both the upper and lower sands are connected to a small aquifer, inadequate to provide pressure support, thereby necessitating water injection for maximum recovery.

Three customised water flood injection wells are daisy chained via flexible flowlines, with injection water supplied from the NY FPSO by the rigid water injection flowline.

3.5.2.3 Norton-over-Laverda Reservoir

Fluids from the NOL reservoir are produced from three subsea production wells and pumped to the NY FPSO via the rigid production flowline (also used for fluids from the LAV and CIM reservoirs). A gas cap is also present in the NOL reservoir, with strong pressure support expected from a large subcropping aquifer. As a result, no water is injected into the NOL reservoir.

3.5.2.4 Cimatti Reservoir

Fluids from the CIM reservoir are produced from a single subsea production well and transported to the NY FPSO via a tie-in to the rigid production flowline (also used for fluids from the LAV and NOL reservoirs). No significant pressure support is expected from the CIM aquifer; therefore, water injection is required for pressure maintenance, sweep and maximising recovery.

Three customised water flood water injection wells supplied by the rigid water injection flowline are used to inject water into the CIM reservoir.

3.5.2.5 Well Configuration

Each well is completed with a subsea X-mas tree (XT) incorporating wellhead controls for opening and closing the valves to isolate and regulate flow. The primary down-hole safety system is surface controlled subsurface safety valves (SCSSVs) on each well, which are installed in the production tubing at approximately 100 m below the seabed.

The facility Integrated Control and Safety System operates all subsea XT and manifold valve functions. It also monitors all XT mounted instrumentation and the multi-phase flow meter (MPFM) located at each manifold.

3.5.2.6 **Water Injection Wells & Production Wells Permanently Plugged with Wellhead in Place**

There are two wells with wellheads identified in **Table 3-1** that are not tied back to the NY facility and have no associated infrastructure (i.e. no xmas tree (XT)). The wells are permanently plugged and abandoned, and therefore are no longer the subject of a WOMP. The wellheads remain in-situ and flagged for removal (base case) at the end of field life. Removal of the wellheads during operational life is not considered to be ALARP as they are within close proximity to live subsea infrastructure:

- VNC-W1 is located approximately 30 m from live well VNC-W3 and approximately 50 m from live well VNC-W2.
- VNA H6 is located approximately 20 m from live well VHA-H6A and approximately 20 m from live well VNA-H2.

3.5.3 Flowline and Riser System

3.5.3.1 **Vincent**

For the VIN production system, there are two 1.7 km, 10-inch' flowlines extending from the wells to the risers connected to the NY FPSO. There is also one 3.8 km, 10-inch water reinjection flowline with riser and one 1.9 km 6" gas injection flowline with riser.

3.5.3.2 **Greater Enfield**

The Greater Enfield system (for the LAV, NOL and CIM reservoirs) consists of a ~31 km, 16-inch carbon steel rigid production flowline (the GE production flowline) and associated 14-inch flexible and 10-inch flexible production riser. The GE production flowline runs between the MPP station (which provides pressure boost) to the riser base and riser connecting to the FPSO STP buoy.

A ~31.6 km, 10-inch carbon steel rigid water injection flowline and an 8-inch inner diameter (ID) flexible riser provides water injection for pressure support. The system also includes:

- a six-inch ID flexible gas lift flowline for artificial lift of CIM well
- eight-inch ID flexible production flowlines connecting production wells to the MPP Station (LAV and NOL), and six-inch flexible from CIM well to the rigid flowline inline tee
- eight-inch flexible flowlines for water injection
- eight-inch ID flexible flowlines to facilitate flowback of water injection wells via the production system.

3.5.4 Subsea Infrastructure

The main components of subsea infrastructure include wells, wellheads, manifolds, flowlines and umbilicals, collectively referred to as 'the NY facility subsea infrastructure'. The layout of the NY facility subsea infrastructure is shown in **Figure 3-3**.

The NY facility subsea infrastructure consists of:

- trees/wells (**Section 3.5.2**)
- manifolds
- rigid spools

- flying leads
- power and control umbilicals
- flowlines and risers (**Section 3.5.3**)
- umbilical termination assembly (UTA)
- turret and mooring system
- MPPs
- subsea pig launch and receipt facility
- subsea support structures (e.g. parking stands, anti-walking structures).

The NY facility subsea infrastructure is typically controlled from the NY FPSO through the following components:

- umbilicals which provide hydraulic services, electrical power and control services, and chemical injection services as required
- valves which control subsea operations and processes
- chokes which control pressure and flow rates from the production and water injection wells
- subsea control modules (SCM), which are sealed and pressure compensated electro hydraulic units (typically found on the manifolds and/or XT) and link the surface and subsea controls.

A number of subsea valves may be overridden manually from a remotely operated vehicle (ROV).

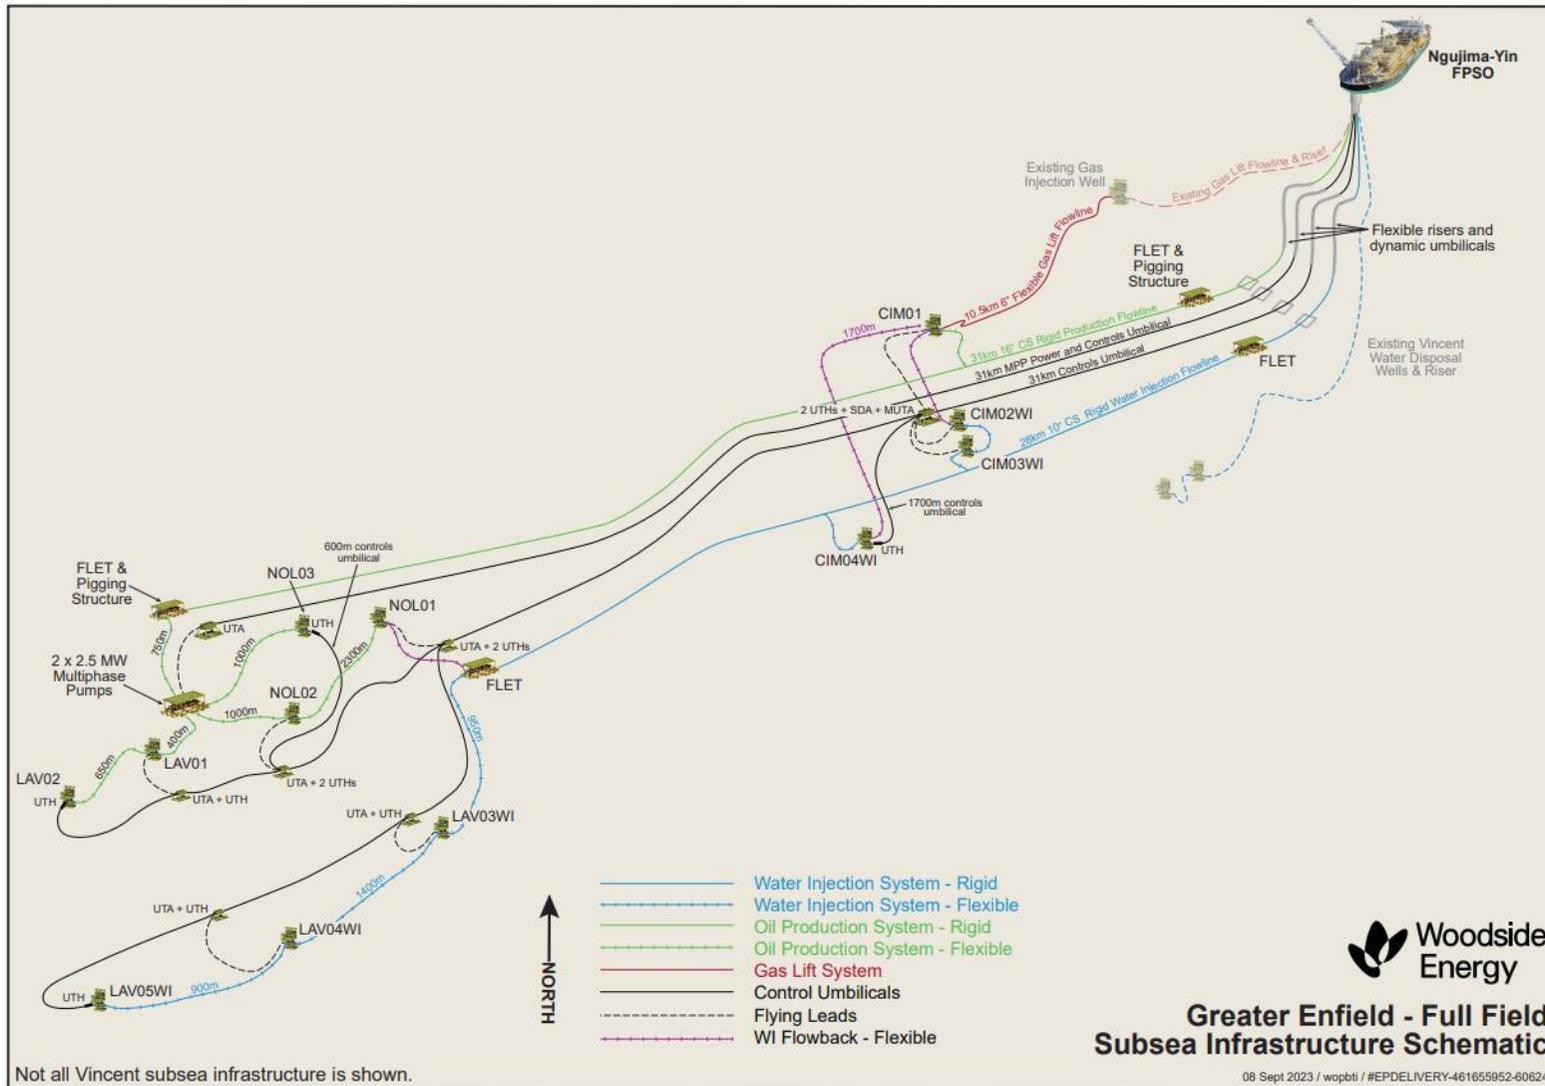

Figure 3-3: Ngujima-Yin facility subsea infrastructure layout (not to scale)

3.5.5 Submerged Turret Production and Mooring System

The NY FPSO is moored to the east of the Vincent field centre. The STP and mooring system enables the NY FPSO to freely weathervane, while allowing production from the reservoirs through the fluid swivel stack. In weather conditions which may exceed the design limits for the connected system, or planned maintenance is required at a shipyard, the NY FPSO can be disconnected from the risers, umbilicals and mooring system to enable sail away from the field under its own power.

The mooring system comprises three groups of three mooring lines. Each mooring line is composed of chain and wire segments, and a mooring line buoyancy element is located between the upper and lower wire rope segments. Clump weights are attached to the chain segment of the three most loaded lines to reduce vessel offset and line and anchor tension during extreme weather.

Production fluids from the reservoirs are transferred from the risers to the topsides processing system via the swivel stack fluid transfer system. This also allows PW, CWF water and gas from the topsides to be re-injected into reservoirs. The swivel also provides electrical power hydraulics and chemicals to the subsea infrastructure.

The NY FPSO's disconnectable STP system comprises the:

- STP buoy, which provides the interface between the NY FPSO hull and the mooring system and risers. The STP buoy comprises a buoyancy cone and turret, through which pass the risers and umbilicals. The STP buoy is moored to the seabed by mooring chains and anchors which are fixed to the lower turret structure and connected to the hull by the locking mechanisms in the STP compartment.
- STP compartment, which is cylindrical in shape and built into the NY FPSO's former cargo tank No. 1 centre. The compartment houses the STP equipment, including the swivel system and the locking mechanisms and chemical distribution panels. The lower part of the STP compartment is the 'mating cone module' and forms the interface between the hull and the outer part of the STP buoy. The STP compartment is shown in **Figure 3-4**.

The turret structure is geostationary (i.e. fixed in position relative to the seabed). The risers and umbilicals are also fixed to the seabed and pass through the turret structure. The turret comprises the lower turret and the upper turret. The lower turret is the external structure below the buoyancy cone. The upper turret passes through the void in the centre of the buoyancy cone. The buoyancy cone is designed to rotate around the turret structure through the upper and lower turret bearings.

When the NY FPSO is connected to the mooring, the STP buoy is located inside the mating cone module in the lower part of the STP compartment (**Figure 3-4**). The buoyancy cone is fixed to the cone module by locking mechanisms, and in this configuration is fixed to the NY FPSO, with the FPSO and buoyancy cone rotating around the turret structure to weathervane.

When disconnected from the NY FPSO, the STP buoy floats at approximately 28 m below the sea surface.

Figure 3-4: Representation of the Ngujima-Yin hull with the submerged turret production compartment cut away

3.5.5.1 *Disconnection of Floating Production, Storage and Offloading Facility from the Submerged Turret Protection Mooring*

The connection and disconnection of the NY FPSO from the STP buoy is conducted in accordance with specific procedures. To prepare for disconnection, production is shut down and the topsides, risers and flowlines are depressurised via the flare system. The risers are depressurised to a nominated safe pressure before closing the riser emergency shutdown valves (ESDVs) and isolation valves. The piping within the STP compartment and swivel are drained, flushed and purged before disconnection.

The risers and umbilicals are disconnected from the swivel, and the swivel stack is moved on the swivel trolley. This is to allow free access to the top of the buoy and a clear route for the pull-in rope connection between the buoy and the winch. The STP buoy is then released and lowered from the hull.

To complete a disconnection, the STP compartment is flooded with seawater to equalise water level prior to disconnection. Individual hydraulically operated locking mechanisms installed around the circumference of the upper mating ring are then released, and the vessel sails away under its own power.

3.5.5.2 *Reconnection of Floating Production, Storage and Offloading Facility from the Submerged Turret Protection Mooring*

The first stage of the reconnection procedure involves pulling in the STP buoy using the STP winch. Cameras in the STP compartment are then used to monitor position during the pull-in, as well as a

satellite navigation positioning system which provides the relative position of the mating cone and the STP buoy. Once the STP buoy is inside the hull, the locking mechanisms within the mating cone module are engaged. Positive engagement is verified on the control system. The mating cone seal is activated from the STP utility container. The STP compartment is then drained using the NY FPSO ballast pumps and STP compartment drains system.

The blinds are then reinstated on the STP compartment filling valves and swivel, and the pipework and umbilicals are reconnected (in reverse to the disconnection procedure).

3.6 Operational Details

This section describes the main operations associated with the NY facility.

3.6.1 Manning

The total overnight personnel on board (PoB) capacity for the NY FPSO is 80 people. The central control room (CCR) is manned 24 hours a day. Activities which affect manning levels are:

- crew change
- FPSO disconnection for cyclone avoidance
- engineering projects
- campaign maintenance
- inspections/audits
- planned facility shutdowns.

Woodside's philosophy to the number of PoB is to minimise the number of people, while maintaining a safe and efficient operation. Hence, equipment and process controls have been selected on the NY FPSO to be routinely, safely and efficiently operated with the minimum of personnel.

3.6.2 Floating Production, Storage and Offloading Facility Sailaway for Maintenance

The NY FPSO has retained its functionality as a self-propelled seagoing vessel. As a result, it can disconnect from its mooring, and sail to a shipyard to complete maintenance. If this is to occur, the NY FPSO will be disconnected as per the procedure described in **Section 3.5.5**.

Prior to sailaway, the wells will have XT valves shut and tested, as per WOMP requirements.

3.6.3 Process Description

The NY FPSO receives well fluids (crude oil, gas and associated PW) from the production wells for topside processing, including:

- separation of the well fluids into gas, crude oil and water
- gas compression and reinjection to the reservoir
- PW treatment and reinjection to the reservoir.

The NY FPSO directly exports processed, stabilised crude oil via offloading to offtake tankers. The first stage of processing crude oil is separation of the well fluids in the two HP separators (A and B). The fluids are then further separated in the LP separator then the electrostatic coalescer to achieve crude oil export specifications. The crude is then cooled and transferred into the NY FPSO oil storage tanks for export.

A schematic of the NY FPSO process is provided in **Figure 3-5** and is described in more detail in the below sections.

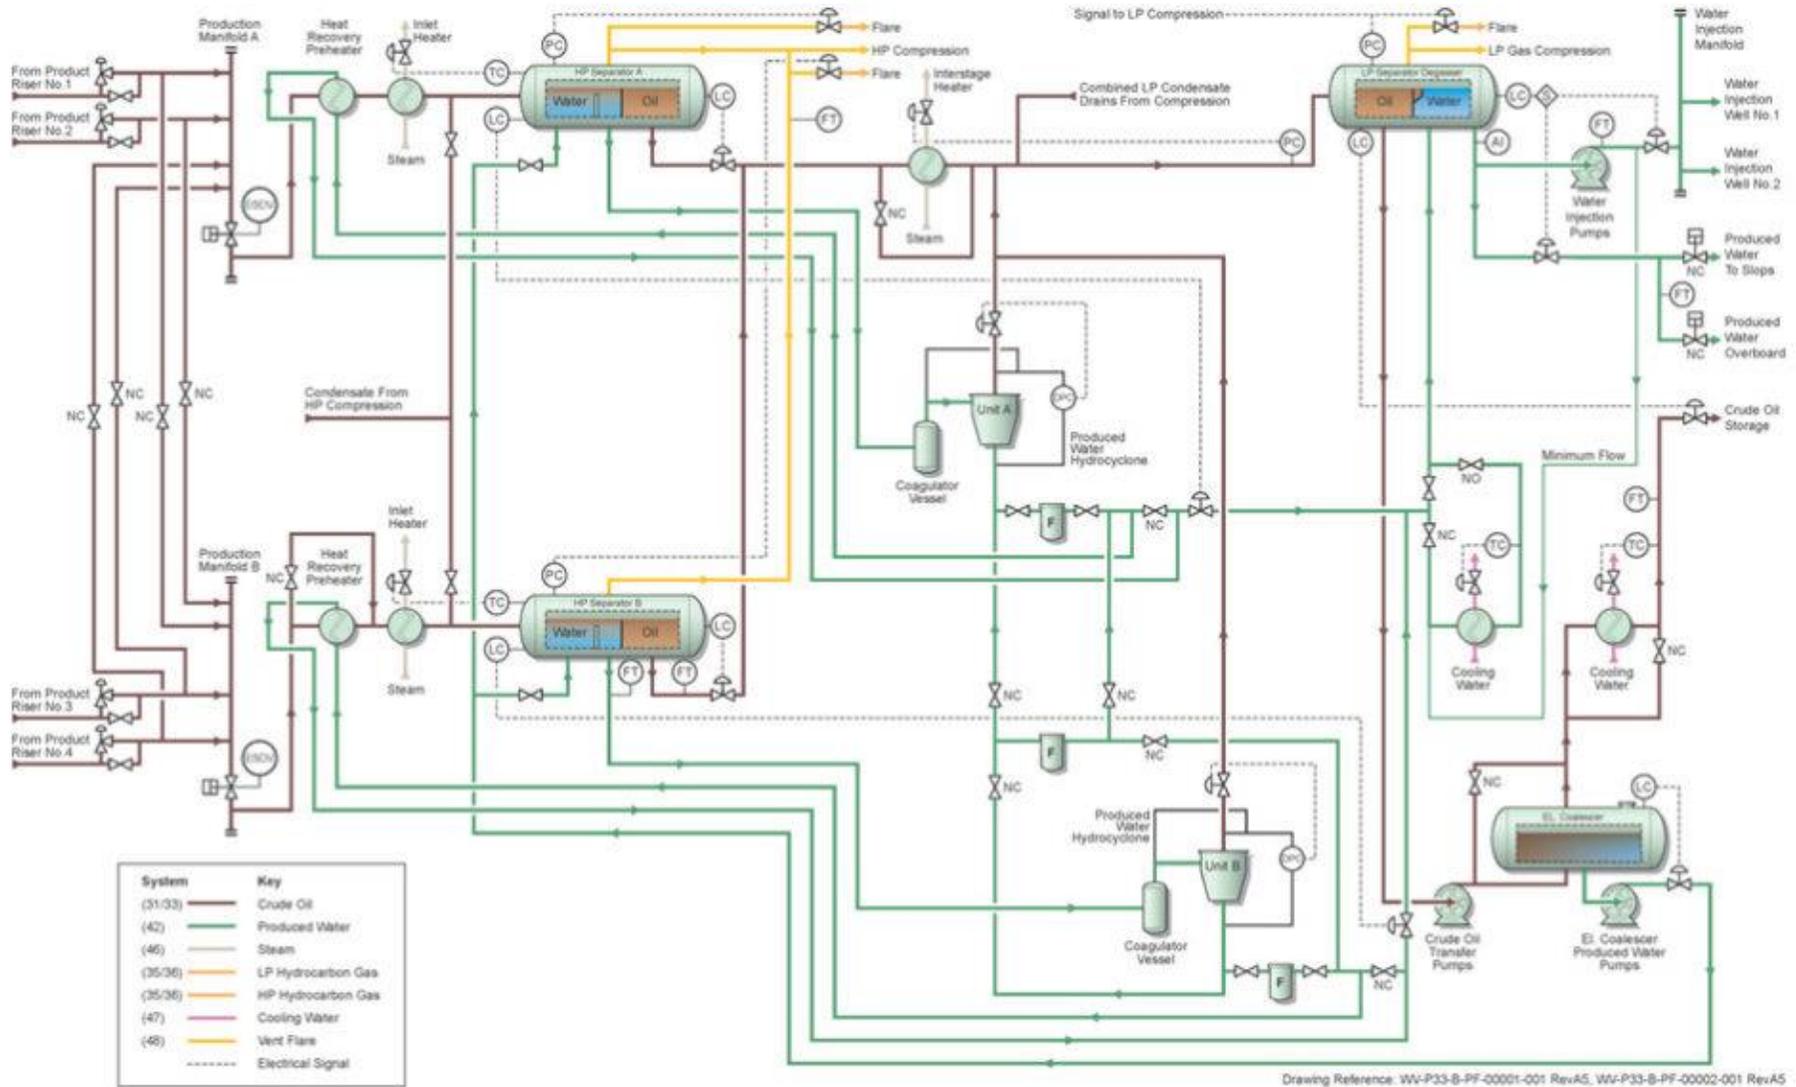

Figure 3-5: Ngujima-Yin floating production, storage and offloading facility process flow diagram

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.6.3.1 Gas Compression Systems

The 'flash gas' (gas that is released in the processing and separation process) is captured and routed to the gas compression systems for use as fuel gas and reinjection into the reservoir during normal operations or disposed to the flare system during process upsets.

There are two compression systems: a low pressure (LP) gas compression system, which receives gas routed directly from the LP separator/degasser; and a high pressure (HP) gas compression system which receives gas from the HP separators. The HP gas compression system also receives the gas from the LP gas compression system.

The gas compression systems have the capacity to inject up to 55 MMscfd. Flare and reinjection volumes are discussed below.

3.6.3.2 Flare Systems

The NY FPSO has two flare systems, the HP flare and the LP flare. Their main purposes are to safely discharge gas streams during an emergency depressurisation, or when the compression systems are unavailable. However, there are some process streams which continuously pass gas to the flare, such as stripping gas used in the glycol regeneration process. Other streams intermittently flow to the flare, such as during process upsets, maintenance activities and when storage vessels are depressurised. The flow of gas through each of the HP and LP flare networks is measured using separate ultrasonic flow meters.

The HP flare system collects hydrocarbons from process and utility systems, with design pressure of 1000 kPa (g) or greater. Hydrocarbons are vented to the HP flare from process safety valves (PSVs), rupture discs, pressure control valves (PCVs), manual valves and blowdown valves (BDVs). The main HP flare header is routed to the HP flare knock-out drum, which is designed to separate all liquid droplets greater than 600 microns by gravity. Liquids collected in the drum are pumped to the LP separator. Vapours from the flare drum are disposed at the flare tip.

The LP flare system collects vented hydrocarbons from process and utility equipment with design pressures below 1000 kPa (g). There are two separate LP headers, one to accommodate low temperature relief streams and the other to accommodate venting at ambient or higher temperatures. The two LP headers are routed to the LP flare knock-out drum, which is designed to separate out all liquid droplets greater than 150 microns by gravity. The closed drain header terminates in the sump of the LP flare knock-out drum. Liquids collecting in the drum are pumped to the LP separator.

All HP and LP flare pipework are continuously purged with nitrogen or fuel gas, to prevent the possibility of an explosive mixture developing within the system.

The flare tip is equipped with three pilot burners that provide a constant source of ignition. The flare tip is common for the HP flare and LP flare, and produces low radiation, normally smokeless combustion. The pilot flame is monitored by thermocouples located in each pilot nozzle head.

The flare tower is at the bow of the NY FPSO and has a total height of 110 m above sea level (based on deck height above sea level of 20 m and flare tower height of 90 m).

Flaring is expected to occur during the operational events of:

- normal operational activities, including flare purge/pilot and process waste streams
- emergency blowdown as part of process safeguarding
- transient operations such as start-up or process upsets
- depressurisation of subsea flowlines for hydrate management, integrity management or cyclone disconnect
- flaring for liquids management

- flaring associated with subsea well work-over or clean-up
- depressurisation for maintenance activities.

The key operational flaring events are explained in further detail in the following sections. Estimates have been derived using historical records of operational flaring (such as process flow set points and instrumentation), and estimates associated with production planning, reservoir gas production, reliability assumptions and process design information.

3.6.3.3 Normal Operations

During normal operations, the majority of gas produced from the production process is reinjected into the reservoir. A relatively small quantity of gas must be continuously flared, associated with purge and pilot of the flare system and disposal of waste streams which are not recovered to the process.

The continuous flows to the LP flare include:

- flare pilot
- LP flare header and storage tank purges
- glycol regeneration process, including still column overheads.

The continuous flows to the HP flare include:

- flare pilot
- HP flare header purges.

Leakage past PSVs, PCVs, manual valves and BDVs may also result in a continuous flow; however, this is usually minor.

3.6.3.4 Intermittent Process Upsets and Activities

During planned process upsets and activities, the process control valves on the main process equipment are designed to open to relieve excess pressure to flare. Sources include ESD testing, compressor outage, strainer changeout, non-routine flowline dewatering, and cyclone disconnect interruptions.

3.6.3.5 Emergency Blowdown

The topsides equipment and piping are divided into isolatable sections, each with a dedicated fail open actuated BDV, which allow blowdown of the entire facility inventory. During an ESD, each section is separately depressurised to the HP or LP flare.

3.6.3.6 Transient Operations

During process upsets, the pressure control valves on the main process equipment are designed to open to relieve excess pressure to the HP flare.

During start-up operations, the pressure control valves on the main process equipment can open to manage pressure or composition.

3.6.3.7 Subsea Flowline Depressurisation

The fluid in the subsea flowlines (which carry hydrocarbons from the subsea wells to the NY FPSO) may need to be routed to the flare system to allow pressure in the flowlines to be reduced. The flowlines may require depressurisation for the reasons of:

- production flowline maintenance and critical leak-off testing (LOT)
- facilitation of remediation in an unplanned hydrate blockage in the subsea flowlines
- flowline hydrate management
- cyclone disconnect
- prevention of over-pressurisation of flowlines above integrity limit
- suspension of redundant flowlines.

3.6.4 Flaring for Liquids Management

During fuel gas production mode, periods of increased gas flow (which is flared) is required to reduce the quantity of accumulated liquids.

3.6.5 Subsea Well Work-over or Clean-up

Specific subsea activities like well work-over or well clean-up will require flaring of hydrocarbons.

3.6.6 Depressurisation for Maintenance Activities

Manual depressurisations will result in intermittent flaring of hydrocarbons, triggered by routine and non-routine equipment maintenance, planned testing and/or depressurisation of equipment and piping to remove the equipment from service. Equipment must be depressurised before draining, as the closed drains system is not intended for HP service.

3.6.7 Unplanned Events

Unplanned events such as process and reliability upsets (including compressor train outages), ESDs and requirements to blow down process and flowlines are depressurised to the HP or LP flare.

3.6.8 Produced Water Treatment and Disposal

Produced water (PW) is brought to the surface from the reservoir and is separated from the hydrocarbon components during the production process. PW may consist of formation water (derived from a water reservoir below the hydrocarbon formation) and condensed water (water vapour present within crude oil which condenses when brought to the surface).

Separation of PW from reservoir fluids is not 100% effective; separated water often contains small amounts of naturally occurring contaminants including dispersed oil, dissolved organic compounds (aliphatic and aromatic hydrocarbons, organic acids and phenols) and inorganic compounds (e.g. soluble inorganic chemicals, dissolved metals, etc).

The process for oil and water separation and disposal of PW during routine and non-routine operations are outlined below.

3.6.8.1 Oil and Water Separation

PW treatment to remove the oil from the water begins in the HP separator (A or B), where the combination of chemical injection, residence time and temperature promotes the separation of the water from oil. The water separates to the bottom of each HP separator, then enters a coagulation vessel and through to a hydrocyclone unit. The rejected oil from the hydrocyclone is returned to the process.

From the hydrocyclone, the PW is directed through one of the PW filters to remove particulates. The filtered water continues on through to the PW degasser. The degasser is fitted with an internal oil skimming facility to remove residual oil build up in the degasser vessel. This completes the oil and water separation process.

3.6.8.2 Produced Water Reinjection

After leaving the degasser, the primary PW disposal method is through the water injection pumps (A, B and C) to the water injection wells. These are dedicated wells to the reservoir, described in **Table 3-1**.

The primary disposal method may not be available for use in certain circumstances such as when the reinjection system is unavailable, oil-in-water re-injection criteria cannot be achieved, or there has been a trip of the water injection pumps. In this situation, PW may be directed to a temporary holding tank.

PW directed to the holding tank can then be disposed of by pumping the liquid back into the PW process, when it becomes available. This is done using the closed drain drum pumps to direct the PW into the HP separators and directed back into the PW system for reinjection as per the primary disposal method.

No routine discharge of PW to the marine environment is proposed in this EP and therefore PW is not described further.

3.6.9 Customised Water Flood System

The customised water flood (CWF) produces ultra-filtered sea water, which is injected into the LAV and CIM oil fields to maintain reservoir pressure. The reservoir pressure, which is higher than the static pressure, is the key driving force for the production stream from the reservoir to the FPSO. Replacing the volume of oil with water will avoid this decrease in reservoir pressure.

The CWF function is to cleanse seawater to reinject whilst preventing souring of the reservoir. Various stages of filtration, sulphate removal and deaeration are followed by high pressure pumping to reach the reservoir reinjection pressures.

There are routine and non-routine discharges from the CWF process are outlined in **Table 3-2** and **Table 3-3**.

Table 3-2: Routine discharge streams from the customised water flood

Activity	Purpose	Volume (Approximate)	Frequency	Composition
Air scour and forward flush	Back wash of the coarse filter elements to remove collected solids.	<150 m ³ /hour	2 minutes/hour, each hour	Residual solids collected in the coarse filters that all originate from local seawater.
Chemically enhanced back flush (CEB) of the 7 UF trains	Uses sodium hypochlorite within the feed water to soak into the fibre and remove organic and bio-accumulated foulants.	10 m ³ /day seawater (x7)	Daily, for 30 to 60 minutes each train	Seawater with Sodium Hypochlorite (approximately 400 mg/L).
Flush cleaning of Ultra filtration unit	Uses air and water to clean filter fibres.	As required	As required	Water with dislodged residue (fine seawater particles, bacteria, viruses, etc., that all originate from local seawater).
Normal SRU Reject	Reject stream with elevated concentration of sulphates, calcium and magnesium the re-injection reservoir.	Ratio of 1:4 inflow to outflow (max of 177m ³ /hour)	Continuous	Seawater with elevated concentration of ions, (e.g. Ca, Mg) and Sulphate. No change to salt composition.
Lube oil	Lube oil is positively pressured into the submerged CWF/seawater intake caisson pump. A small and acceptable loss is up to 70 mL/h before classification of a seal failure and intervention required.	Designed impact of up to 70 mL per pump (x3), total 210 mL and 80 000 m ³ /d volume is a concentration of up to 0.05 mg/L OIW.	Continuous	Seawater with lube oil (at a concentration of 0.05 mg/L).

Due to the large volumes and continuous nature of the routine discharge streams, they are routed to the existing seawater disposal caisson where the streams first mix with the seawater cooling reject stream, before being discharged to the marine environment.

Table 3-3: Non-routine discharges from the customised water flood (cleaning/maintenance fluids)

Activity	Purpose	Volume	Frequency	Composition
UF clean-in-place (CIP)	Performed on the UF package to return the fibres to their baseline condition.	20 m ³	Each of the 7 trains are cleaned approximately once every 2 months (7 x 6 = approx. 42 events per year)	Freshwater, dosed with either citric acid or sodium carbonate.
SRU CIP	Undertaken to clean SRU membranes when there is a decrease in performance observed or increase in vessel dP.	20 m ³	Each of the 3 trains cleaned approximately once every 6 months. (3 x 2 = approx. 6 events per year)	Freshwater, dosed with either citric acid or sodium carbonate.
System preservation	Preserve the membrane system in the event it is required to be shut down (e.g. when the FPSO is offline such as cyclone disconnect).	65 m ³	Variable. Typically expected to occur 5 times per year.	Freshwater, dosed with sodium bi-sulphite.

3.6.9.1 Discharge of Clean Customised Water Flood Stream

The CWF produces up to 530 m³/day of ultra-filtered water.

Unplanned events such as a PSV release may also occur. In this event, any water within the CWF would be discharged to the environment via the seawater caisson or an emergency relief valve. The water during a relief event would comprise up to 65 m³ of water as described in **Table 3-2** and **Table 3-3** in addition to the clean CWF process stream.

During start-up, turndown and injection well testing operations, there is also continuous over boarding of the clean CWF process stream via pump minimum flows and SRU product dump lines, with the addition of a chemical residual oxygen scavenger. The waste stream may also include anti-foam which is used to dose the stream from time to time. This is an infrequent activity and represents effluent streams described under the non-routine discharges section above.

3.6.9.2 Summary of All Chemicals Used in the Customised Water Flood Package

To maintain the CWF injection system a chemical dosing regime is required. Upstream of the SRU HP feed pumps, scale inhibitor is dosed for precipitation control, chlorine scavenger to protect the membranes from oxidation and a non-oxidising biocide is dosed intermittently for biological control of the membranes. Sodium hypochlorite is provided for the ultra-filtration trains. Antifoam is also provided for dosing upstream of the deaerator if required. Oxygen scavenger is dosed into the sump of the deaerator to chemically reduce the oxygen content to the required levels.

A summary of all chemicals used as part of the CWF package, and their design dosage rates are shown in **Table 3-4**.

Table 3-4: Summary of all chemicals used by the customised water flood package

Chemical	Injection Location	Estimated Dosage (mg/L)
Hypochlorite	UF CEB	400
Scale Inhibitor	Upstream SRU	6
Chlorine Scavenger	Upstream SRU	4.2
Oxygen Scavenger	Deaerator	2.25
Antifoam	Deaerator	The deaerator has been designed with a low flux such that antifoam dosing should not be required
Non-oxidising Biocide	Upstream SRU	25
Subsea Corrosion Inhibitor	Subsea Users	-
Topsides Corrosion Inhibitor	Topside Users	-
Acid Cleaner (Liquid)	CIP Tank	2% v/v
Alkali Cleaner (Liquid)	CIP Tank	2% v/v

3.6.10 Drainage Systems

The NY facility has two separate drainage systems: process drainage system and the marine drainage system.

The process drain systems collect hydrocarbon-based and other liquid wastes (rain and wash water, etc) from all process areas across the facility. This is achieved via segregated sub-systems of:

- hazardous open drains
- non-hazardous open drains
- closed drains.

The marine drains are located throughout the machinery spaces, on the main deck and in the accommodation. The marine drains' contents are eventually discharged to the slops tanks (see **Section 3.6.10.4**).

The various components of the NY facility drainage systems are described in detail below.

3.6.10.1 Open Drains

The NY facility's process open drain systems collect water and hydrocarbons which are at atmospheric pressure (e.g. deck water). The open drain systems are independent of each other and are categorised as:

- hazardous
- non-hazardous or
- chemical injection package.

The process hazardous open drains system is designed to remove and collect any oily water from hazardous areas on the NY FPSO, including wash down water, some maintenance activities discharges and spillage of liquids on process decks, equipment drip trays or banded areas. The hazardous open drain contents are directed to the hazardous open drains tank located on M71. The contents of the hazardous open drains tank are discharged to the slops tank.

The process hazardous open drains tank has the capability to discharge to a tote tank for transporting and disposing the tank contents to an onshore waste treatment facility.

The turret hazardous drains system discharges the liquids from the turret hazardous drain collection vessels to the process hazardous open drains tank on M71.

The process non-hazardous open drains system is located on M85 (power generation). The drain system is designed to collect rain water, wash down water and liquids spilled to deck. The liquids are collected in the non-hazardous open drain tank and pumped to the slops tanks.

A liquid seal arrangement is provided between the slops tank and the open drains.

The open drains system is configured such that extreme rainfall or fire water deluge on the topsides modules is discharged directly overboard. The system is designed to route the initial run off to the hazardous open drain tank to collect any hydrocarbons which may have accumulated in the process equipment bunds and operates only in the case of excessive water flows; refer to additional details below on the deck drain overflow system.

3.6.10.2 Closed Drains

The closed drains system is used for draining volatile hydrocarbon residue from all enclosed process equipment.

The closed drains system is combined with the LP flare system and consists of an LP flare knockout/closed drain drum and transfer pumps. The hydrocarbon liquid drained from the process equipment is drained by vessel pressure and gravity to the LP flare/closed drains drum. The closed drains drum liquids are discharged from the closed drain transfer pumps to the LP separator, where it is returned to the separation process.

The vent line on the LP flare/closed drain drum ensures the operating pressure in the tank is close to atmospheric pressure. The vapour in the drum flows to the LP flare header for flaring.

The STP closed drain system is designed to collect hydrocarbon residue resulting from flushing and draining prior to disconnection. The system also supports the swivel barrier leakage tanks, which collect the fluid residue from the turret. The residue from the collection and leakage tanks is automatically discharged to the closed drains header via drain pumps.

After a reconnection, the STP compartment is drained of seawater using the ship's ballast pumps. Drain sumps and pumps are used to assist with final dewatering of the STP compartment, and act as the STP compartment open drain recovery system.

3.6.10.3 Machinery Space Bilges

The NY FPSO machinery space includes the ship's main engine and other auxiliary machinery. Oily water mixtures and hydrocarbon residue generated in this area are drained to the machinery space bilge tank. When required, the contents of the bilge tank are pumped to the NY FPSO slops tank.

3.6.10.4 Floating Production, Storage and Offloading Facility Slops Tank Management

In addition to the drainage processes discussed above, the NY FPSO slops tank may receive other less frequent sources of drainage water, primarily from marine operational activities. This includes activities such as CWF clean in place, cargo tank de bottoming, cargo tank stagger test water (for tank integrity testing), water washing of cargo tanks, and heavy weather ballasting where the cargo tanks may need to be used for ballast.

During normal operations, liquid from the port/starboard slops tank can be returned to the topside process and subsequently re-injected into the reservoir during normal operations. The No 5 crude oil tank can also accept produced water and return it to the topside process for separation and re-injection. Slops including waste oil could also be disposed of via transfer to a cargo tanker.

3.6.10.5 Deck Drain Overflow System

The overflow system is designed to collect fire water deluge demand for deck modules, or in some cases extreme rainfall, and discharge the accumulated water directly overboard or to the marine collection system (break tank). To collect the overflow from the modules, decks are bunded and provided with drain gullies, with an overboard drain connection.

The overflow system is designed to collect extreme rainfall or water deluged onto the FPSO in the event of a fire. To collect the overflow from the modules, main deck drains are bunded (100 mm high) and provided with drain gullies. Each drain gully contains an open drain pipe (connected to the open drain system) and a connection to the vessel's deck.

From the main deck, the water is collected on the main deck area then routed via the overboard header(s) to the marine environment. The water during a relief event would comprise up to 65 m³ of water as described in **Table 3-2** and **Table 3-3** in addition to the clean CWF process stream. This system applies for modules M10, M11, M20, M60, M70 and M85.

The drain system is provided with rodding points for all the main headers, to ensure any blockage that may occur can be cleared.

3.6.10.6 Cargo Tanks

The NY FPSO cargo tanks are designed to receive cooled stabilised crude oil from the topsides process system and includes 14 centre and port and starboard wing tanks. The individual storage tanks capacity range in size, with a total operational storage capacity of 1.2 million bbls.

The cargo pumps transfer the crude to offtake tankers and are located forward of the engine room, in a dedicated pump room, driven by a three-stage impulse steam turbine. The pumps are each equipped with an automatic unloading system. The export rate with a single pump is 530,000 bbls (84,270 m³) per day (refer to **Section 3.6.12.3** for further detail).

The cargo oil system is capable of inter tank transfer of crude and offloading simultaneously with either loading, crude oil washing or internal cargo transfer, as well as full slop tank functions dealing with oily water mixtures (sourced from either topsides or cargo operations).

Cargo loading and discharge is controlled from the CCR, where the aspects that can be controlled and monitored are:

- cargo planning using the vessel loading computer program
- cargo pumps and valves
- cargo tank levels, pressures and temperatures
- inert gas quality and pressure
- gas leakage into the ballast tanks via the gas detection system
- tank high level overfill alarm system.

An independent overfill alarm is fitted to each cargo and slop tank and activated when the liquid level reaches a set point (normally 98% by volume). The cargo tanks are fully inerted during all cargo handling operations, with all tanks common onto the main inert gas header. An ESDV is incorporated in the rundown line from the process plant.

Details of cargo offloading operations are provided below in **Section 3.6.11**.

3.6.10.7 Ballast System

The NY FPSO sea water ballast system is used to counteract sheer force and bending movement stresses on the FPSO's hull, caused by the loading and offloading of crude oil in the cargo tanks. Ballasting is also required to control the trim and heel of the vessel, to ensure stability remains within the design limits.

The vessel complies with MARPOL Protocol 73/78, with the ballast system completely segregated from the crude oil storage system. Segregated ballast is carried in the fore and aft peaks of the NY FPSO, and in five pairs of wing tanks arranged the entire length of the cargo tank area. The total capacity of the segregated ballast tanks is approximately 100,007 m³. The ballast pumps are interconnected to permit flexibility of operation.

The volumes of the main ballast tanks are controlled by two centrifugal pumps, one steam turbine driven and one electrically driven. The pumps are in the pump room and provided with their own sea chest. The pumps are connected to an overboard discharge line which ends approximately 0.5 m above the deepest water ballast line on the port side.

The ballast valves on the NY FPSO are hydraulically operated and can either be controlled remotely or with local hand-pumps as backup. The ballast system is also used for draining the STP compartment following a reconnection.

3.6.11 Offloading System and Offtake Tanker Mooring

The NY FPSO has a tandem offloading system, providing handling facilities to non-dedicated tankers of up to Suezmax (150,000 T) size, in accordance with Oil Companies International Marine Forum (OCIMF) requirements.

Before gaining Woodside's acceptance for offloading from the NY FPSO, export tankers are assessed for their performance, quality (historic performance or incidents, documentation, systems and procedures) and operational compatibility with the facility. Additional quality assurance of tankers is provided by external bodies with access to extensive databases, which ensures thorough evaluation (for example, the Shell 'SAFE-T' system). A tanker will only be accepted by Woodside for offloading if it passes the assessment. This requirement applies to each tanker offload, irrespective of the tanker flag, operator, or the date of the last visit to a Woodside terminal.

Once accepted for offloading, the tanker must comply with requirements under the NY Technical Systems Manual (TSM) – Offloading Systems which contains rules, information and operations guidelines. The manual also describes the operations and approach to the NY facility's cautionary and safety zone, and the rules that apply in each area. Approach to the facility must first be approved by the NY Offshore Installation Manager (OIM), then occurs under supervision of a Woodside Pilot in accordance with the IMO and International Maritime Pilots Association Guidelines.

While the offtake tanker is making its approach to the NY FPSO, a support vessel runs the messenger rope to the stern mounted mooring hawser, and then assists in the berthing operation as directed by the pilot, including transferring the hose to the offtake tanker connection. After the hose is connected, line up for cargo operations begins under the direction of the pilot, with communications continuously maintained between the offtake tanker, NY FPSO and facility support vessel. Separation between the NY FPSO and the offtake tanker is maintained by the support vessel on static tow at the stern of the offtake tanker, which also controls movement of the tanker.

Crude is offloaded to the offtake tanker via a 16" diameter 291 m long floating hose. It comprises a heavily reinforced material in sections approximately 11.8 m long, with flanged and bolted connections between sections. This allows each section to be independently tested and replaced if necessary. A double dry break coupling is fitted approximately 30 m from the offtake rail end of the hose, which will release at a predetermined tension. Oil spillage is minimised by closing the valves in each half of the parted dry break coupling.

Offloading operations from the NY FPSO take place as required, based on production rates. Offtakes are currently every 17 to 19 days and will decline in frequency as production rates drop over time. Trading tankers have an oil storage capacity of up to 120,000 m³; a full loading operation is expected to take up to 30 hours. Initial loading rates are approximately 700 m³/hr; however, once safety and override checks are satisfactory, the rate is increased to suit offtake tanker requirements, to a maximum loading rate of 4200 m³/hour.

Offloading to tankers is monitored by the NY FPSO's approved stress and stability program, which continuously calculates the stresses in the hull based on measured liquid levels and densities within the tanks and provides alarms if hull stresses exceed the allowable envelope.

The offtake hose is stored on a stern mounted hose reel when not in use. This reduces the likelihood of hose damage during handling or impact by vessel and subsequent hydrocarbon release.

3.6.12 Utility Systems

3.6.12.1 Facility Lighting

The NY FPSO has appropriate lighting to ensure a safe working environment during 24-hour operations, including normal, emergency and escape lighting on the hull and topsides. Lighting is split between emergency and normal lighting and comprises LED, fluorescent and HP sodium luminaries. The flare tower is illuminated by narrow beam floodlights. The lighting design of the NY FPSO complies with the International Association of Lighthouse Authority requirements for offshore facilities.

Unless required to support over the side activities (such as refuelling and lifting operations), lighting on the NY FPSO is directed to the work area, which limits light spill to the marine environment. Lights directed towards the water for the crane and loading/offloading operations are switched off when not required.

3.6.12.2 Heating, Ventilation and Air Conditioning System

The heating, ventilation and air conditioning (HVAC) system comprises HVAC equipment, ductwork and associated pipework. It provides independent and interdependent subsystems with pressurised, conditioned, purge and exhaust air services to various areas including accommodation, and various modules which can be operated as required and others continuously.

3.6.12.3 Nitrogen System/Generation

The NY facility nitrogen system consists of a nitrogen generation package, nitrogen bottle rack package and nitrogen distribution. It is in module M70.

The compressed air is passed through the nitrogen generation package to produce nitrogen which is used for compressor sealing, system blanketing, flare header purging and maintenance purging. The nitrogen generation package is a membrane separation system. The nitrogen bottle rack package consists of ten bottles of nitrogen, which has capacity to meet the nitrogen demands in case nitrogen is unavailable from the nitrogen generation package.

3.6.12.4 Steam System

The NY facility steam generating plant consists of two auxiliary boilers and a medium pressure and LP system.

Saturated steam is taken from both auxiliary boilers into a common steam main, with the normal pressure of the steam 1765 kPa. Steam is branched off the main line through reducing valves to supply the LP service systems. A reducing valve unit, complete with bypass valve, supplies steam to the 980 kPa system, and another reducing valve unit supplies the 686 kPa system.

The main steam line of the medium pressure steam system supplies the three cargo oil pump turbines, ballast pump turbine and the inert gas pressure control valve (dump valve). The inert gas system control valve dumps steam to the vacuum condenser, to allow the boilers to remain on a minimum of 30% load to maintain an acceptably low oxygen reading in the inert gas supply (less than 5% oxygen). Excess steam pressure at other times is managed by dumping steam to the atmospheric condenser.

The medium pressure system also supplies the topsides for process heating via a pressure reducing valve, located in the engine room. Crude oil from the topsides medium pressure steam system returns to the cascade tank in the engine room via a break tank on topsides, with condition monitoring to prevent contamination of the steam with process fluids (gas).

The LP steam systems provide all the necessary heating and general-purpose steam services throughout the vessel, and for the heated freshwater generators located in the engine room.

3.6.12.5 Seawater System

The primary function of the NY facility seawater system is to provide process and HVAC cooling. Two main seawater systems are provided, one for the hull system and utilities and the second for the topsides. A third smaller system provides cooling to topsides utilities when the main power generator is not available. The seawater system also supplies seawater to the CWF system. Refer to the section above for more information on the CWF system (**Section 3.6.9**).

The hull seawater cooling system draws water through the sea chests located on either side of the machinery room. The water is then pumped to the hull central coolers (heat exchangers), where the closed loop freshwater cooling system transfers the waste heat from the hull machinery and utilities to the sea water. This system cools the main engine, generators, HVAC, and steam plant. The heated seawater is then discharged back to sea via the overboard caisson.

The topsides seawater system cools the closed freshwater system. The closed loop freshwater system primarily supplies cooling water to maintain the optimum operating conditions for the process and topsides utility systems. The topsides seawater system draws water from the seawater lift caissons in the starboard ballast tank. Seawater is discharged to sea via the overboard caisson.

Average discharge rates from the topsides cooling system and hull cooling system are 80,000 m³/day and 56,000 m³/day respectively, at an average temperature of 20°C above the ambient sea (inlet) temperature, up to a maximum of 50°C during summer. Based on both systems operating the typical volume of cooling water discharged is 136,000 m³/day. The maximum potential discharge based on the integrity limit of the equipment is 224,500 m³/day. The overboard discharge line is provided with a vent to route to a safe location any hydrocarbon gas separated from the seawater due to cooler tube leak (HP compressors).

The seawater cooling system is segregated from the crude oil processing system, so there is minimal risk of crude oil contaminating the cooling water discharge.

The only additives to the seawater cooling systems are copper ions for the topsides seawater cooling system, and aluminium and copper ions for the hull seawater cooling system generated to suppress growth of fouling organisms. Dosing rate is dependent on the seawater flow rate.

3.6.12.6 Potable Water

Fresh water is generated for use on the facility via two reverse osmosis units and one distillation unit. The fresh water is stored in two 90 m³ potable water tanks. The unit is supplied with a seawater feed of up to 190 m³ a day. Up to 100 m³ of brine is discharged to the ocean from the unit each day, discharged via an overboard caisson approximately 3 m below the waterline (with the exact depth varying depending on ballast volumes). The salinity of the discharge water is approximately double that of the feed seawater.

A hydrophore system with pressurised tanks, pumps, filters, sterilisers and a calorifier provide the accommodation potable water distribution system with a pressurised hot and cold water supply.

The topsides freshwater distribution system is in module M70, and consists of a freshwater tank and pump, and is used for distribution of fresh water to safety showers, topside utility stations for deck wash/general use, and to the STP compartment for flushing of flow lines.

3.6.12.7 Inert Gas System

Inert gas on the facility is used to maintain a positive pressure in the vapour space of the cargo tanks, to prevent air ingress during offloading to an export tanker. The inert gas is also used in the slop tanks and in the ballast tanks as required.

Inert gas is produced on the facility by the main gas/diesel fired boilers. The flue gases pass through a scrubber demister unit, which cools and cleans the exhaust gas from the boiler exhaust before being fed to the cargo tanks.

The inert gas is supplied to the tanks by fans via a mechanical non-return valve, deck water seal and distribution piping. If the inert gas supply pressure is lost, the water immediately falls back and closes the seal, thereby preventing any back-flow of vapour from the tanks. The main inert gas and primary vent gas header pressure is controlled by two pressure relief valves on the flare tower.

The inert gas system is monitored and controlled in the CCR, including the oxygen content of the gas supplied to the cargo tanks. An oxygen content higher than 5% triggers an alarm in the CCR and closes the supply of gas to the tanks.

During loading of the cargo tanks, the inflow of crude oil displaces the inert gas which is vented to atmosphere from the forward riser on the flare tower. The system is also capable of purging and gas freeing cargo tanks for maintenance and inspection purposes. The gas is purged through the vent header to a safe location. The vent header operates in conjunction with the purge gas supply header. Inert gas fans are used in fresh air mode to displace the gas to prepare for inspection or hot work.

3.6.12.8 Power Generation

The main power for the NY facility is supplied by three 12,500 kW gas turbine driven generators, generating 11 kV/60 Hz. The generators are in topside module M85 and supply power to process, utility and marine consumers, including power for the sewage treatment plant and accommodation.

A fourth dedicated gas turbine is installed on M60 to drive the HP compressor.

A fifth dedicated gas turbine driven generator is installed on M40 to provide power for the CWF system.

The turbine generator units can operate on fuel gas or diesel, with normal operations currently on fuel gas. Diesel may be used at start-up if fuel gas is not available and is also generally used in a production outage and/or restart or when the vessel is disconnected from the STP mooring.

The facility currently has sufficient produced gas from reservoir (production) fluids to meet facility fuel gas demands. Reservoir modelling indicates that facility produced gas will continue to decline, to a point where fuel gas demand can no longer be met by produced gas.

When the facility can no longer meet fuel gas demand from produced gas, the facility is expected to first backflow gas from the VIN reservoir gas cap via the existing gas injection line to meet fuel gas demand. This is most likely to occur in 2024, but could occur in years before or after dependent on actual reservoir outcomes. The drilling and tie-back of up to two additional wells may also provide the additional fuel gas needed to meet demand.

Emergency power is supplied by a 440 V/60 Hz/1500 kW emergency generator. The emergency generator is equipped with both battery and hydraulic independent starting systems. The generator

is connected to the hull emergency switchboard, which has two tie-ins to the topsides emergency switchboard and the original ships emergency switchboard.

The emergency generator can be synchronised to the main turbine generator and can also run in parallel with the main turbine generators. This occurs by manual load sharing when transitioning between seagoing and production modes (and vice versa) during loss of main power recovery or black start, and for load testing the emergency generator.

The emergency generator is designed to withstand credible fire and explosion events and is located in a closed room. The emergency generator starts automatically if main power is lost. If this occurs, power is expected to be restored to the emergency switchboard within 30 seconds, providing necessary power to run system critical equipment.

Should the emergency generator system fail, an independent uninterruptible power supply (UPS) is provided for the hull and topside systems, STP compartment and PCM system.

A 440 V/60 Hz/250 kW black start generator is connected to the original ship's emergency switchboard. The black start generator provides auxiliary equipment (pre-lube and starting air) to black start the facility by starting the ship's marine generators. These generators can also be black started by the starboard emergency generator.

The power management system (PMS) is divided into two parts, one for the topsides systems and one for the vessel systems. The topsides PMS controls each of the turbine generators and load shedding and blocking start of heavy consumers in the prioritised order of:

1. non-essential services required for lighting and utilities
2. essential services required to maintain production
3. vital services required for safety, provided with a primary and secondary power supply (navigational aids, foam pumps, emergency lighting, etc).

The vessel PMS operates in periods when the main gas turbines are out of operation or when the topside 440 V switchboard is fed from the main switchboard. The vessel PMS is designed to manage the three marine diesel loads by sequencing generators on and off the switchboard and providing load sharing between marine generators.

3.6.12.9 Fuel Gas System

The main purpose of the facility's fuel gas system is to use off-take gas from the process or direct from the reservoir as fuel gas and/or blanketing gas. Fuel gas is used in the power generation turbines, gas compression turbines and steam generation boilers. The system also supplies purge gas to the HP flare system and fuel gas to the flare ignition panel/flare tip pilot burners.

The fuel gas system receives dehydrated gas from the glycol contactor on module M60, or directly from the reservoir via the reservoir fuel gas heater in cases when the HP compression system is not available. The reservoir fuel gas heater is provided to allow for potential fuel gas deficits from the production off gas later field life.

The fuel gas system includes a fuel gas scrubber, superheater, reservoir fuel gas heater and filters. Fuel gas supply pressure is maintained by regulating the incoming fuel gas flow rate to the fuel gas scrubber. A selector switch and pressure controller are used to regulate the inlet flow rate from either downstream from the glycol contactor or the reservoir back flow.

HP fuel gas consumers are HP compressor gas turbine B, CWF package turbine and power generator gas turbines A, B and C. The consumers of LP fuel gas are the steam boilers, glycol regeneration package, and the HP and LP flare tip pilot.

The HP compressor, CWF package turbine, power generation gas turbines and boilers have the capacity to operate on dual fuels, (fuel gas or diesel). Diesel is used in case of system start-up, when fuel gas is not available, or in an upset in the fuel gas system or the HP compressor system.

Total fuel gas consumption on the facility is metered by a fuel gas flow transmitter. The average power consumption from maximum topsides power demand and others is approximately 20 MW and will be 29 MW nearing end of field life. It will be relatively constant throughout field life.

3.6.12.10 Safety Features and Emergency Systems

A range of safety features and emergency systems have been integrated into the design and operation of the NY FPSO to manage safety risk. Maintenance and operation of these systems is key to ensuring safe operability of the facility.

Specific safety systems include:

- control and detection systems
- process control system
- central control room and bridge
- fire and gas detection system
- emergency and process shutdown systems
- emergency relief and depressurisation systems
- LP and HP flare systems
- ignition control
- emergency alarms and communications
- cargo hazard management
- evacuation and rescue facilities and equipment
- collision avoidance systems
- passive and active fire protection.

3.6.12.11 Accommodation Facilities

The NY FPSO accommodation area is located at the stern of the facility and is a refurbishment and extension of the original ship's accommodation. The accommodation comprises:

- temporary refuge, including CCR and dining station
- galley
- cabins
- offices
- medical station
- laundry
- heli-administration area
- recreation and leisure facilities.

3.6.12.12 Sewage and Putrescible Wastes

A biological sewage treatment and pumping unit is provided on the NY FPSO, with the capacity to treat black water and grey water flow for 80 people. Wastewater is discharged from the system via the hull discharge line (below the water line).

Putrescible waste (principally food scraps) is either ground to less than 25 mm diameter and disposed overboard or bagged and transported ashore for disposal as domestic waste, in accordance with the requirements of Woodside's Waste Management Plan for Offshore Facilities.

3.6.12.13 Sand Management

The NY FPSO production system and subsea facilities are designed to manage the rates of sand production from all reservoirs described in this EP. Sand produced from the reservoir is managed in accordance with the Vincent and Greater Enfield Sand Management Plan. The plan aims firstly to minimise sand production as far as practicable through a combination of well design features, and then to manage the sand which reaches the topside facilities. Specifically, the measures which minimise sand production include:

- premium sand screens in place on the wells to provide a mechanical barrier to sand production
- sand detectors installed on production trees and the topsides production headers
- upon detection of excessive sand production from a well, rate of production reduced until sand rates fall to acceptable levels, with failure to achieve acceptable levels triggering shut-in of the well.

Sand production is managed through a combination of detection, monitoring and subsea and topsides handling activities. Sand produced to the NY facility collects in the process system topsides and can be cleaned out manually during facility shutdown.

3.6.12.14 Diesel Fuel System

The NY FPSO's main engine, the marine and emergency generators, firewater pumps, lifeboats and man overboard boat use only diesel fuel. The turbine driven generators, turbine driven HP compressors and boilers (including pump drivers, heating medium and inert gas system) use fuel gas as their primary fuel, and have dual fuel capabilities, with diesel used as a secondary fuel.

The major components of the diesel system on the NY FPSO are the:

- hull main diesel storage tanks (five main tanks) – total volume 4239 m³
- topside diesel service tanks (three in total) – total volume 560 m³
- auxiliary diesel tanks (four in total) – total volume 25 m³.

Low-sulphur diesel is transferred to the NY FPSO in bulk from supply vessels. Diesel usage on the facility is monitored and metered.

3.6.13 Facility Operations

3.6.13.1 Lifting Operations

Lifting operations on the NY facility include:

- lifting from support vessels
- lifting around the facility
- special lifts using the various cranes
- non-crane based operational lifting.

Further details of the types of lifting activities are provided below.

The NY FPSO is equipped with six rotating cranes, one overhead crane, as well as numerous local handling/lifting provisions. There are also numerous dedicated laydown areas for materials, chemicals and provisions, located to optimise the lifting handling arrangement and reduce manual

handling. The location of the NY FPSO main laydown areas is shown in **Figure 3-6**, and details of external cranes are provided below:

- The No. 1 STP crane is located on the port side of the STP compartment, with an electrohydraulic hoist capacity of 20 t at 21 m. The crane provides lifting to and from the NY FPSO's STP compartment and forward equipment areas including the PCM, STP utility container and forward fire pump.
- The No. 2 port midship crane is located on the port side midship. This crane is an electrohydraulic pedestal mounted crane supported between tank sections No. 2 and 3. The hoist capacity is 15 t at 45 m and 5 t at 50 m with a whip hoist. The crane is intended to handle materials to/from supply vessels, transfer containers, chemicals, lubricants, equipment and spares, well service equipment, and to lift within the process areas.
- The No. 3 accommodation stores crane is a hydraulic pedestal mounted offshore deck crane located on the port side near the accommodation. The crane main hoist capacity is 15 t at 25 m and is used to transfer and handle consumables, galley provisions and other equipment to/from supply vessels. The crane is certified for man riding.
- The No. 4 starboard side deck crane is an electrohydraulic crane with capacity of 20 t at 21 m. The crane is elevated to service the seawater lift pumps in caissons and equipment on the starboard side of the process area.
- The No: 5 Palfinger marine crane is an electro hydraulically driven engine room crane is located port side aft. Crane No. 5 is rated for 10 tonnes at 17 m and can plumb the engine room hatch and is suitable for handling the heavier lifts from the machinery spaces.
- The No. 6 M40 crane is located on the port side near the new M40 module. This crane was installed as part of GE to service M40 and will also be used for general lifting activities.
- The overhead crane in the engine room travels longitudinally and transversely on overhead beams in the machinery space to facilitate main engine overhauls and lifting of stores and heavy machinery within the engine room.

3.6.13.2 Lifting from Facility Support Vessels

Lifting operations primarily include transferring stores and equipment between a support vessel and the facility. Lifts can be conducted from any of the main cranes, depending on weather conditions. The types of 'lifted equipment' may vary but generally include containers or skips of various sizes. The stores and equipment required by the facility are secured inside the skip or container. ISO containers for supply of monoethylene glycol (MEG) and corrosion inhibitor are also commonly lifted. In all cases the equipment will be appropriately rated for offshore lifting.

After offloading from the supply vessel, the facility will then backload to the supply boat any items to be returned to shore. These primarily include empty skips or containers or skips containing waste for onshore disposal.

3.6.13.3 Lifting Around the Facility

Once lifted to the laydown area, equipment may need to be repositioned at various locations throughout the facility for operational purposes. This includes lifting stores or equipment to various landing areas throughout the facility for unloading or use, moving waste bins to required areas, or relocating ISO containers.

3.6.13.4 Operational Lifting (Non-crane Based)

There is also a requirement to undertake operational lifting using other lifting appliances and lifting gear. This lifting is primarily undertaken for maintenance or repairs, and involves lifting and removing equipment such as valves, spools, and motors.

3.6.13.5 Special Lifts

There may be occasions where equipment may need to be lifted to support the NY facility operations using specifically prepared lift plans. On these occasions, the equipment will be packed up in a container or an approved lifting frame. All relevant lifting procedures will be adhered to, including preparation of an appropriate lift plan.

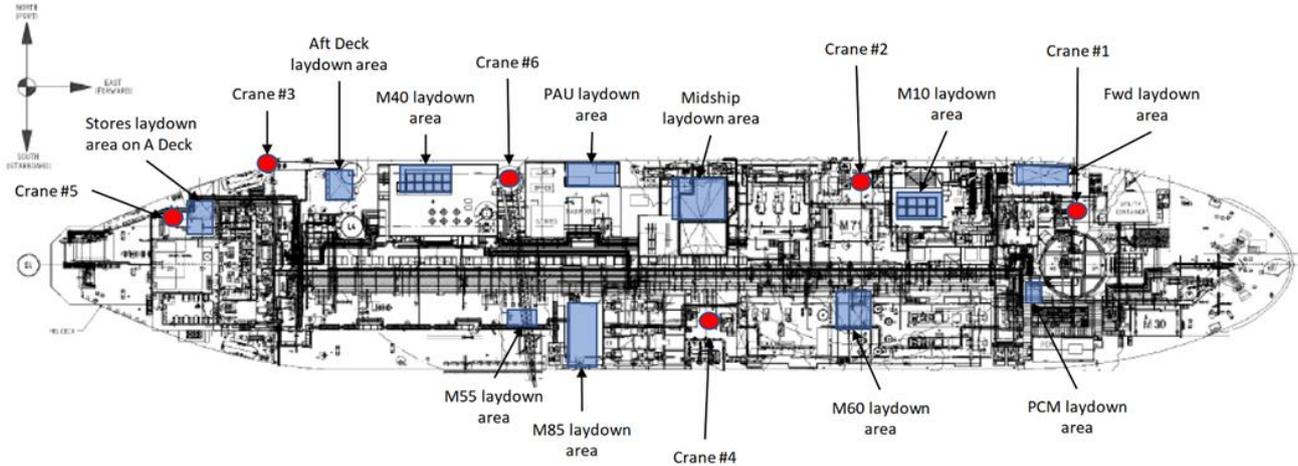

Figure 3-6: Ngujima-Yin floating production, storage and offloading facility main laydown areas

3.6.14 Diesel Bunkering

Low-sulphur diesel is transferred to NY FPSO in bulk from supply vessels via a hose reel and bunker connection, located on the port side of the FPSO’s main deck, forward of the accommodation. The bunker hose is handled by the port aft engine room crane. Diesel oil is stored in tanks located in the hull of the NY FPSO.

The diesel is purified and held in settling and service tanks prior to distribution for use. Diesel from the settling tank is transferred via the purifiers to the diesel service tanks for use in the topsides gas turbines, generator engines and (when required) the main engine. Outlet valves from the diesel tanks are fitted with pneumatically actuated, quick-closing valves remotely operated from the ship’s fire control station.

Bunkering of diesel fuel from supply vessels into the diesel storage tanks on the NY FPSO is governed by Woodside’s permit to work system. Bunkering is planned to mostly occur during daylight hours; however, it could also occur overnight if operationally required.

3.7 Support Vessel Operations

Vessels either LNG or diesel powered are used in a support capacity for transferring personnel in emergency scenarios, material and equipment to and from the facility. Vessels are also used for project field work. All support vessels are required to undergo a Woodside Marine Assurance Inspection to review compliance with marine laws and Woodside safety and environment requirements.

3.7.1 Facility Support Vessels

Specifications of the facility support vessel *Siem Thiima* (Figure 3-7) are presented in Table 3-5 as an example and represent the typical specifications of a support vessel. Vessels supporting the facility vary depending on vessel schedules and availability. While in the field, the vessel also backloads materials and segregated waste for transport back to the King Bay Supply Facility (KBSF) in Karratha.

Figure 3-7: Typical facility support vessel (*Siem Thiima*)

Table 3-5: Indicative facility support vessel specifications (*Siem Thiima*)

Attribute	Details
Type	Facility Support Vessel
Length overall (LOA)	89.2 m
Breadth	19.0 m
Draft	7.4 m
Dead weight tonnage (DWT)	5,500 tonnes
Accommodation	Berthing for 25 personnel

3.7.2 Other Support Vessels

Other support vessels such as subsea support or project vessels (crewed or remotely operated) are used for field work such as subsea IMMR and new well start-up and commissioning activities. Vessels supporting the activities may vary depending on operational requirements, vessel schedules, capability, and availability.

Typical support vessels use a DP system to allow manoeuvrability and avoid anchoring when undertaking works, due to the close proximity of subsea infrastructure. However, vessels are equipped with anchors which may be deployed in an emergency.

3.8 Helicopter Operations

Helicopters are the primary means of transporting passengers and/or urgent freight to/from the facility and support vessels. They are also the preferred means of evacuating personnel in an emergency. Helicopter support is principally supplied from Learmonth Airport.

3.9 Hydrocarbon and Chemical Inventories and Selection

3.9.1 Hydrocarbons

The main hydrocarbon inventories associated with major topside process systems are summarised in **Table 3-6**.

Table 3-6: Topsides process hydrocarbon inventories

Module/ Area	Isolatable Section	Fluid	Pressure (kPa)	Temperature (°C)	Volume (m ³)
M10	HP Separator Gas	Gas	800	70	100.1
M10	HP Separator Oil	Oil	800	70.1	33.1
M10	HP Separator 2-Phase	2-Phase	800	109.9	59.6
M10	Methanol Storage	Methanol	50	24	40
M11	LP Separator Gas	Gas	180	95	96.1
M11	LP Separator 2-Phase	2-Phase	180	95.5	90
M11	Electrostatic Coalescer Oil	Oil	400	95	428
M20	Manifold	2-Phase	1201	109.9	13
M30	HP Flare System	Gas	230	90	95.9
M60	HP Compressor 1st Stage Gas	Gas	1834	147	41.3
M60	HP Compressor 1st Stage Oil	Oil	700	50	1.5
M60	HP Compressor 2nd Stage Gas	Gas	5087	155	41.3
M60	HP Compressor 2nd Stage Oil	Oil	1834	50	0.8
M60	HP Glycol Inlet Scrubber Gas	Gas	5007	45	30.7
M60	HP Glycol Inlet Scrubber Oil	Oil	4997	45	2.9
M60	HP Compressor 3rd Stage Gas	Gas	15,700	50	7.5
M60	HP 3rd Compressor 3rd Stage Oil	Oil	4897	45	0.5
M70	Fuel Gas Fuel	Gas	3120	38.2	37.1
M71	LP Flare System	Gas	50	90	94.9
M85	Diesel System Generator	Diesel	20	24	0.1
M99	Fuel Gas to Main Power Module	Fuel Gas	800	56	37.1
M99	Fuel Gas to Boiler	Fuel Gas	800	56	3.5
M99	Fuel Gas to HP Compressor	Fuel Gas	800	56	37.1
Turret	Riser Production	2-Phase	1201	109.9	13
Turret	Riser Gas Reinjection	Gas	12,100	50	2.1
Turret	Inboard Gas Reinjection	Gas	12,100	50	4.3

In addition to the above inventories, crude oil and diesel oil are stored in tanks around the facility along with reservoir fluids in the production/test flowlines. The inventories of diesel oil and crude oil are presented in **Table 3-7** and **Table 3-8** respectively.

Table 3-7: Diesel oil and seal/lube oil in bulk storage and various day tanks

Diesel Oil Tank Description	Volume (m ³)
Inner fuel bunker tank (port)	1649
Fore fuel bunker tanks (starboard)	1233
Aft fuel bunker tank (starboard)	984
Diesel oil settling tank	197
No. 1 fuel service tank	139
No. 2 fuel service tank	128
MDO storage tank (port)	147
MDO storage tank (starboard)	185
Fuel service tank	96
Diesel oil overflow tank	41
Black start generator day tank	2
Emergency generator	7
Forward/aft fire water pumps	8
Swivel barrier fluid circulation tank (STP seal oil)	1
Swivel barrier fluid system tank (STP seal oil)	2
Turbine lube oil storage tank	~3.5
Main lube oil storage tank	~79
Main lube oil settling tank	~53
G/E lube oil storage tank	~13
G/E lube oil settling tank	~5

Table 3-8: Cargo tank crude oil volumes

Crude Oil Tank	Volume (m ³)
2C	30,697
3C	31,248
4C	31,248
5C	31,462
1p/s wings	16,648
2p/s wings	20,053
3p/s wings	20,414
4p/s wings	20,414
5p/s wings	14,679
Port slops	3514
Starboard slop	3514

3.9.2 Chemical Usage

Chemicals are used on the NY facility for a variety of purposes and can be divided into the following categories:

- operational process chemicals
- operational non-process chemicals
- facility maintenance chemicals.

Note, chemicals used in IMMR activities are described in **Section 3.10.5**.

3.9.2.1 *Operational Process Chemicals*

A process chemical is the active chemical added to a process or static system, which provides functionality when injected in produced fluid, utility system streams or for flowline treatment. These chemicals may be present in routine or non-routine discharge streams from the NY facility. Examples include corrosion inhibitors, biocides, scale inhibitors, demulsifiers, glycols and hydrate inhibitors.

3.9.2.2 *Operational Non-process Chemicals*

Non-process chemicals include chemicals which do not fall into the category described above but which may be required for operational reasons and, by virtue of their use, may be intermittently discharged or have the potential to be discharged (e.g. required as a result of maintenance or intervention activities). Examples include IMMR chemicals such subsea control fluids and dyes.

3.9.2.3 *Facility Maintenance Chemicals*

Maintenance chemicals include chemicals which are required for general maintenance or 'housekeeping' activities and are critical for overall maintenance of the facility and its equipment. These may include paints, degreasers, greases, lubricants, and domestic cleaning products. They may also include chemicals required for speciality tasks, such as laboratory testing and analysis. Maintenance chemicals generally present negligible risk to the environment as they are not discharged as a result of their use (e.g. paint), or are used intermittently and discharged in low volumes (e.g. domestic cleaning products).

3.9.2.4 *Indicative Chemical Inventories*

An indicative list of bulk chemicals commonly used on the NY facility, and estimated storage quantities, is summarised in **Table 3-9**. In addition to the chemicals listed, the NY facility may also maintain small volumes of various operational chemicals and facility maintenance chemicals as previously described.

Table 3-9: Indicative bulk inventories of chemicals

Material	Storage Means	Storage Capacity (m ³)
Methanol	Methanol storage tank	50
Crude antifoam	Dedicated storage tank	8
Subsea demulsifier	Dedicated storage tank	8
Production users demulsifier	Dedicated storage tank	8
Water clarifier	Dedicated storage tank	8
Subsea scale inhibitor	Dedicated storage tank	16
Process biocide	Dedicated storage tank	8
Slops tank biocide (storage tank in M10)	Dedicated storage tank	7.4
PW system corrosion inhibitor (storage tank in M10)	Corrosion Inhibitor tank	7.4 (storage vessel) 15 (working volume)
CWF system corrosion inhibitor (storage tank in M40)	Dedicated storage tank	30
Alcohol-resistant aqueous film-forming fighting foam (3% AR-AFFF) – process foam tank and deck foam tanks	Foam tanks for turret/process	2.5 and 4.4 (turret) 18 (process)
Aqueous film-forming fire-fighting foam (3% AFFF) – helideck foam tank	Foam Tank	<1

3.9.3 Environmental Consideration During Selection, Assessment and Approval of Chemicals

Operational chemicals required by the Petroleum Activities Program are selected and approved in accordance with Woodside’s process for selecting and assessing chemicals. This process is used to demonstrate that the potential impacts of the chemicals selected are acceptable and ALARP, and that they meet Woodside’s corporate requirements, which requires chemicals to be selected with the lowest practicable environmental impacts and risks, subject to technical constraints.

A summary of the environmental requirements of the Chemical Selection and Assessment Environment Guideline is outlined below.

3.9.3.1 Environmental Selection Criteria

Woodside’s process for selecting and assessing chemicals follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS), which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands (background on the OCNS scheme is provided below).

Operational chemicals are selected/assessed in compliance with the Woodside’s process for selecting and assessing chemicals, specifically:

- Where operational chemicals with an OCNS rating of Gold/Silver/E/D and no OCNS substitution or product warning are selected, or a substance is considered to pose little or no risk to the environment, no further control is required. Such chemicals do not represent a significant impact on the environment under standard use scenarios and therefore are considered ALARP and acceptable.
- If other OCNS-rated or non-OCNS-rated operational chemicals are selected, the chemical is assessed as follows:
 - If there is no planned discharge of the operational chemical to the marine environment, written technical verification of the ‘no discharge’ fate is provided and no further assessment is required.

- If there is planned discharge of the operational chemical to the marine environment, a further assessment and ALARP justification is conducted.

The ALARP assessment considers chemical toxicity and biodegradation and bioaccumulation potential, using industry standard classification criteria (Centre for Environment, Fisheries and Aquaculture Science scheme criteria). If a product has no specific ecotoxicity, biodegradation, or bioaccumulation data available, these options are considered:

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical.
- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

If no environmental data is available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical are investigated, with preference for options with a hazard quotient (HQ) band of Gold or Silver, or in OCNS Group E or D with no substitution or product warnings.

If no more environmentally suitable alternatives are available, further risk-reduction measures (e.g. controls related to use and discharge) are considered for the specific context and implemented where relevant to ensure the risk is ALARP and acceptable.

Once the further assessment/ALARP justification has been completed, confirmation that the environmental risk as a result of chemical use is ALARP and acceptable is obtained from the relevant manager.

3.9.3.2 Background Overview of Offshore Chemical Notification Scheme

The OCNS applies the requirements of the Oslo–Paris Convention for the Protection of the Marine Environment of the North East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances listed on the OCNS list of registered products have an assigned ranking based on toxicity and other relevant parameters (e.g. biodegradation, bioaccumulation), in accordance with one of two schemes (as shown in **Figure 3-8**):

- **Hazard Quotient (HQ) Colour Band:** Gold, Silver, White, Blue, Orange, and Purple (listed in order of increasing environmental hazard), or
- **OCNS Grouping:** E, D, C, B, or A (listed in order of increasing environmental hazard). Applied to inorganic substances, hydraulic fluids, and pipeline chemicals only.

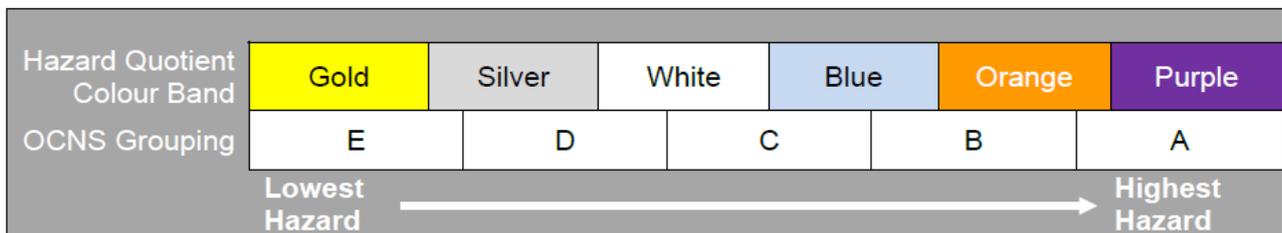

Figure 3-8: Offshore Chemical Notification Scheme ranking

3.10 Subsea Inspection, Monitoring, Maintenance, and Repair Activities

Subsea infrastructure is designed not to require significant intervention. Inspection and maintenance are undertaken to ensure the integrity of the infrastructure and identify problems before they present a risk of loss of containment. Intervention may be required to repair identified problems.

To manage subsea threats (risks) the IMMR process requires an appropriate response to be selected to manage specific equipment risks. This is typically one of: inspection, maintenance, monitoring or repair.

The IMMR process for subsea infrastructure, including any redundant equipment (**Section 3.10.4**), maintains equipment in good condition and repair, for production and to enable future removal.

Subsea activities are typically undertaken from a subsea support vessel or uncrewed surface vessel (USV) and may use ROV with transponders to inspect equipment.

Maintenance and repair activities may require the deployment of frames/baskets which are temporarily placed on the seabed. These typically have a perforated base with a seabed footprint of about 15 m². This equipment is removed from field via recovery to the support vessels at the completion of IMMR activities.

3.10.1 Inspections

Inspection of subsea infrastructure is the process of physical verification and assessment of components to detect changes to the as-installed location and condition by comparison to initial state following installation and previous inspections. Details of typical subsea infrastructure inspections/surveys and frequencies are provided in **Table 3-10**. Actual scope and frequency of subsea equipment (operational or redundant) and flowline inspections are determined using a risk-based inspection (RBI) methodology and associated plans.

RBI is commonly used within the industry as a method for determining inspection frequencies (Energy Institute, 2009; DNV, 2019). RBI for redundant/replaced subsea systems that have been wet-parked inherently pose less risk to the environment and may drive a less frequent inspection frequency.

Table 3-10: Typical subsea infrastructure inspections/surveys and frequencies

Type of Inspection/Survey	Subsea Infrastructure	Purpose	Approximate Frequency
General visual inspections (GVI)	Structure, wellheads, spools, flowlines and risers	Check general infrastructure integrity.	Varied – every 1 to 9 years. Typically 4 yearly.
Close visual inspections (CVI)	All subsea infrastructure	Investigate certain subsea infrastructure components.	Varied – every 1 to 9 years. Typically 4 yearly.
Cathodic protection (CP)	All subsea infrastructure	Check for corrosion.	Varied – every 1 to 9 years. Typically 4 yearly.
Wall thickness surveys	Production and crossover manifolds and flowlines	Monitor the condition of subsea infrastructure (i.e. ultrasonic testing).	Typical: Once every 25 years.
Side scan sonar (SSS) and/or multibeam sonar (MBES) and/or laser profiling	Flowlines and wellheads	Identify buckling, movement, scour and seabed features in survey area. Low frequency/intensity sonar pulses directed to seafloor, undertaken for approximately five days every four years.	Varied – every 1 to 8 years. Typically 4 yearly.
Sub-bottom profiling (SBP)	Around subsea components	Use low frequency echo sounder to identify returns of metals under the seabed. Only lower penetration SBP sounders are required.	Triggered inspection only, risk based.
Non-destructive testing (NDT)	Flowlines and manifolds (if required)	Evaluate the properties of material/ items using electromagnetic, radio graphic, ultrasonic, acoustic resonance testing (ART), or magnetic equipment.	Typical: Once every 25 years.
Seabed sampling surveys including minor grabs/cores	NA	Identify benthic fauna, sediment, etc. Grabs/cores typically 0.1 m ² per sample.	Typical: Once every 25 years.
Anode inspections and/or replacement	Production and crossover manifolds, trees and flowlines	Take samples of anode materials for testing.	Typical: Once every 25 years. Worst Case: Once every 25 years.
Marine growth sampling	All subsea infrastructure	Take samples of marine growth for testing.	Typical: Once every 25 years. Worst Case: Once every 25 years.
Pigging	Rigid flowline	Inspection, maintenance, repair or to facilitate modifications.	Typical: Once every 4 years, conducted on a corrosion risk basis.

3.10.2 Monitoring

Monitoring of subsea infrastructure refers to the process of surveillance of the physical and chemical environment that a subsea system or component is exposed to, to determine if and when damage may occur, and (where relevant) predict the rate or extent of that damage. Monitoring activities may include process composition testing, acoustic sand detectors, erosion probes, metocean and geological seismic monitoring, and cathodic protection testing.

3.10.3 Maintenance

Planned maintenance activities on subsea infrastructure are undertaken to prevent deterioration or integrity failure of infrastructure. Typical maintenance activities are described in **Table 3-11**.

Table 3-11: Typical subsea maintenance activities

Type of Maintenance	Subsea Infrastructure	Purpose	Approximate Frequency
Cycling of valves via control system	Well	Test functionality of technical integrity valves	Every 6 months
Marine growth removal	Production and cross-over manifolds and retrieval components (e.g. chokes)	Reduce weight or gain visual access	Based on outcomes from visual inspections (Table 3-12) and marine growth trends on regional infrastructure
Flushing of chemical hydraulic fluid lines	Hydraulic fluid lines	For repair scenarios	When required for repair
Leak and pressure testing	All subsea infrastructure	Test integrity of subsea infrastructure	Following installation of subsea infrastructure components after a repair of intervention, prior to return to service

3.10.4 Repair

Repair activities are those required when a subsea system or component is degraded, damaged or has deteriorated to a level outside of acceptance limits. Damage sustained may not necessarily pose an immediate threat to continued system integrity but may present an elevated level of risk to environment or production reliability. Due to the design of subsea infrastructure and materials used, repairs are undertaken on an as needs basis. The requirements and frequency of these repairs are dictated by the outcome of the inspection and maintenance regimes described in **Section 3.10.1** and **Section 3.10.3**. Typical subsea repair activities include:

- subsea choke replacement
- chemical injection metering valve insert replacement
- subsea control module (SCM) or control distribution unit (CDU) replacement
- hydraulic flying lead (HFL) replacement
- electrical flying lead (EFL) replacement
- tree cap changeout
- logic plate/cap changeout
- flowline or spool support with grout bag or mattress
- spool disconnection and/or replacement
- umbilical jumper replacement and/or relocation
- flowline replacement
- scour prevention installation
- cathodic protection system replenishment/repair.

When equipment is replaced, the redundant equipment, may remain in situ or be removed from the field. The location of redundant subsea infrastructure items is recorded as part of the ROV as left survey and input into a database for the inventory associated with each title (refer **Section 6.6.2**). The inventory is used to track equipment on the seabed to enable planning for future removal.

3.10.5 Subsea Chemical Usage

Planned chemical discharges may occur during a range of subsea system operation and IMMR activities. However, these are either small volumes, or discharged intermittently. Operational chemicals to be used in the NY subsea infrastructure are selected and assessed using Woodside's chemical selection and assessment guideline, as detailed in **Section 3.9.2**. Typical chemicals which are used in the NY subsea infrastructure and may be released during IMMR activities include:

- Control fluid – the subsea control fluid presently used in the subsea systems is Oceanic HW443. HW443 is a water-based product, with the major component ethylene glycol.
- Methanol is used to prevent/remove hydrates in the subsea system. Methanol is classified as a PLONOR chemical in the North Sea (i.e. it poses little or no risk).
- Demulsifier is used to counteract the natural surfactants present, wetting agents or other chemicals used to help separate water-in-oil emulsions. Demulsifier is injected continuously, with injection points at the subsea manifolds, production headers and pump stations.
- Scale inhibitor is used to prevent scale formation in the oil, PW and water injection systems. Scale inhibitor is injected continuously, with injection points provided at each subsea wellhead and the PW injection pump suction.
- Corrosion inhibitor is generally used to manage and prevent corrosion within pipelines and flowlines.
- Hydrate control – MEG and TEG are used for hydrate control.
- Biocide is used to prevent the bacterial growth of sulphate reducing bacteria in the water injection pump (WIP), slops tank and production header. Hydrogen sulphide formation poses safety risk to personnel and infrastructure integrity (e.g. enhanced corrosion).
- Dye – chemical dyes (fluorescein liquid dye for example) are used to identify the source of a flow or flowline leak.
- Acid – where removal of calcium deposits is required, Woodside typically uses sulphamic (or equivalent) acid. Alternatives such as citric acid or calcium wash may be used.
- Barrier fluid is used to protect motors and subsea equipment against process fluids and seawater, as well as provide cooling and lubrication.
- Oxygen scavenger is used to reduce/de-oxygenate the flowlines and prevent corrosion and aerobic bacterial growth.
- Surfactants are formulated to remove water and organic deposits from flowlines.
- Grout – the material used in grout, mattresses and rock is typically concrete-based.
- Staurolite products – used for abrasive/sand blasting to clean and remove marine growth, the main component is staurolite, which is a naturally forming mineral.

3.10.6 Intervention Isolations

There are planned environmental discharges during subsea IMMR activities, for example during pressure/leak testing or flushing. Where practicable, flushing is performed prior to disconnection of a subsea component to reduce residual hydrocarbon or chemical releases to the subsea environment upon disconnection. The flushing chemicals used for this activity may be supplied from either the facility or a chemical package via a downline from a support vessel. Where possible, flushed fluids are returned to the FPSO and be processed and treated through the production system. **Table 3-12** shows typical discharge volumes during different IMMR activities.

Table 3-12: Typical discharge volumes during different inspection, maintenance, monitoring and repair and subsea activities

Activity	Description
Pressure/leak testing	Chemical dye estimated <10 L.
Flushing	Residual hydrocarbon or chemical release (corrosion inhibitor and oxygen scavenger) volume is dependent upon injection port size, component geometry and pumping rates.
Hot stab changeout	Hydrocarbons or control fluid estimated <10 L.
SCM changeout	A typical release of diluted acid is estimated to be 400 L and of control fluid is estimated to be 10 L.
Jumper and umbilical replacement	Typical releases of hydraulic fluid, MEG and corrosion inhibitor are estimated to be <40 L each, typical acid release of <80 L.
Choke changeout	Release of hydrocarbons <10L and a typical release of MEG is estimated to be 280 L, typical acid release of <80 L.
Tree cap changeout	Release of hydrocarbons estimated <50 L and a typical release of MEG is estimated to be <50 L.
Logic plate changeout	Release of hydrocarbons estimated <20 L and a typical release of MEG is estimated to be <20 L.
Flowline or spools repair, replacement and recovery	Typical release of hydrocarbon or other chemicals depends on equipment configuration and flushing ability. This will be subject to an ALARP determination for the activity, as per normal practice.

3.10.7 Pressure and Leak Testing

Pressure testing is completed to test the integrity of subsea infrastructure, isolations and identify any leaks. Pressure is usually applied to the component from the NY FPSO but can also be applied via a downline or ROV from a support vessel.

Pressure in the isolated section of flowline or subsea component is monitored to check for any drop in pressure, and/or visually inspected to determine the location of any leaks.

A typical release of chemical dye during leak testing is estimated to be two litres. The worst case is estimated to be approximately ten litres. This volume may already be pre-dosed within the subsea control fluid, in which case the chemical dye component within the total chemical volume will remain <10 L.

3.10.8 Flushing and Pigging Operations

During flowline lifecycle, there may be a need to conduct flushing and/or pigging for a variety of reasons (e.g. inspection, maintenance, repair, facilitate modifications or to remove hydrocarbons in preparation for decommissioning).

3.10.8.1 Pre-disconnect Flushing

The flushing chemicals used for this activity may be supplied from either the facility or a chemical package via a downline from a support vessel. However, flushed fluids will return to the NY FPSO and be processed and treated through the production system.

Flushing will take place at a predetermined rate, volume and/or duration, designed to reduce the volume of residual hydrocarbons or chemicals within the component and adjoining structures to ALARP prior to disconnection. The displacement effectiveness of pre-disconnect flushing depends upon a range of limiting factors such as injection port size, component geometry and pumping rates, which can limit the velocity and mixing of flush fluids in the component. After disconnection, the residual hydrocarbon or chemical volume and the flushing medium is released to the subsea environment.

3.10.8.2 Post-disconnect Flushing

Post disconnection, residual hydrocarbons and chemicals may remain in the component due to the limiting factors discussed above. Before lifting the component onboard a support vessel, a secondary higher velocity flush may be required to ensure the component meets safety requirements for storage on the support vessel deck. If so, it will typically be flushed to the subsea marine environment with seawater (treated with biocide, oxygen scavenger and surfactant supplied from a chemical package) up to ten times the volume of the component, via a downline from a support vessel.

3.10.8.3 Pigging

Should pigging of the rigid flowline be required, provision has been made for the installation/recovery of temporary subsea/topsides pig launcher and receivers. The entire flowline pigging system, including the launcher, receiver and the respective flowlines is designed for maximum operation pressure of the production system.

It is not expected that the pigging activity will result in discharges to the ocean other than a minor release of fluids to the environment during installation of a pig launcher/receiver. Discharges would be consistent with the order of magnitude of release that occur during other IMMR activities, such as MPP changeout.

3.10.9 Marine Growth Removal

Due to the relatively high rate of marine growth in the vicinity of the NY FPSO, it is often necessary to remove excess growth prior to undertaking many subsea IMMR activities. Marine growth removal is undertaken with an ROV or diver. The different techniques are described in **Table 3-13**.

Table 3-13: Marine growth removal techniques

Activity/Equipment	Description
Water jetting	Uses high pressure water to remove marine growth
Brush systems	Uses brushes attached to an ROV to physically remove marine growth
Acid (typically sulphamic acid)	Chemically dissolves calcium deposits on subsea infrastructure
Sand/abrasive blasting	Additional cleaning to allow close visual inspections

3.10.10 Sediment Relocation

If sediment builds up around a flowline or other subsea infrastructure, an ROV-mounted suction pump/dredging unit may be used to relocate the sediment to allow inspection/works to be undertaken. This activity is limited to relocating small amounts of sediment material in the immediate vicinity of the subsea infrastructure (i.e. within the existing footprint). Sediment relocation typically results in minor seabed disturbance and some localised turbidity.

3.10.11 Corrosion Protection

Without protection, corrosion of the NY subsea infrastructure is likely to occur.

Surveys may be undertaken using probes (e.g. electrical resistance probes) to assess the effectiveness of these techniques. If a survey identifies the corrosion protection layer requires repairs, appropriate remediation options will be investigated.

If additional anode skids are required, they will be placed on the seabed using a support vessel crane. A typical anode skid will have a seabed footprint of approximately 8 m². It is necessary to remove marine growth around the point where the anode skid is to be connected to establish good continuity through clamping and/or welding.

No chemical release is anticipated for these activities; however, they may result in some minor disturbance due to placement of skids, removal of marine growth, sediment relocation, and placement of ROV tool baskets and DP transponders on the seabed.

3.10.12 Span Rectification, Flowline Protection and Stabilisation

Due to tidal currents or other scouring processes, sections of flowlines, spools jumpers and umbilicals may become unsupported by the seabed (span), and/or become unstable on the seabed. Spanning or instability may expose the component to the risk of stress beyond design parameters, increasing the risk of failure.

A number of techniques may be used for span rectification or component stabilisation and protection, including grout bags, mattresses, anchors or rock dumping. All techniques require a support vessel crane to deploy the material and a ROV to ensure it is accurately placed on the seabed. In addition, a subsea component may require protection (e.g. from supply vessel lifts onto the NY FPSO and flowline crossings).

3.10.12.1 Grout Bags

Span rectification typically involves placing a grout bag with anti-scouring skirts under the spanned component. Grout is pumped into the grout bag from a support vessel via a downline. Once the bag is inflated, it acts as a pillow, with the pipe resting on top (**Figure 3-9**). Typical grout volumes will depend on the size of the span and may vary from 200 kg to greater than 2000 kg.

Figure 3-9: Grout bags in position

3.10.12.2 Mattresses

Mattresses are typically made of concrete and may be used for span rectification or flowline protection and stabilisation. An example of a mattress over a flowline is provided in **Figure 3-10**. Mattresses are typically 3 m x 6 m in size, therefore may disturb 18 m² of the seabed.

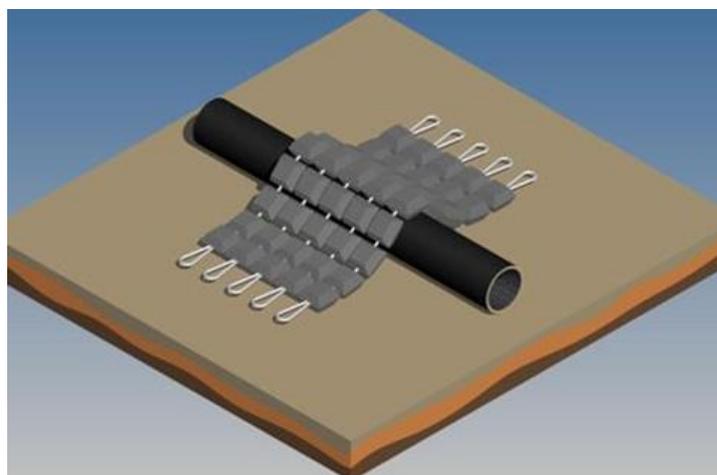

Figure 3-10: Concrete mattress for span rectifications or flowline protection or stabilisation

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.10.12.3 Rock Placement

Rock placement for span rectification is typically small scale. It involves using one tonne bulker bags filled with rock, with the number of bags varying to suit the application. This activity will cause seabed disturbance due to placement of material on the seabed; however, the area of seabed affected will be small and localised and is unlikely to extend beyond the area originally impacted during the laying of the flowline.

In addition, the activity may result in some minor disturbance from removing marine growth, relocating sediment, and placing ROV tool baskets and DP transponders on the seabed.

3.10.13 Cycling of Valves

The NY facility subsea infrastructure contains valves that are operated remotely from the NY FPSO (using subsea control fluid), and manually operated valves that require direct manipulation by ROV. Regular opening and closing of subsea valves ensures mechanical elements remain lubricated and do not seize, which may occur if left untouched for extended periods of time. Valve cycling is undertaken annually for critical valves.

There are no planned discharges associated with ROV-operated valve cycling.

3.10.14 Choke Changeout

Subsea chokes are located on pump stations and XTs to control the flow of fluids in the subsea system. A choke may require replacement over the life of the field. During a choke changeout, there may be a small release of residual hydrocarbons. A typical release of hydrocarbons during a choke changeout is estimated to be 10 L, and a typical release of methanol during a choke changeout is estimated to be 300 L.

3.10.15 Subsea Control Module Changeout

SCMs are the link between surface and subsea controls. An SCM is a retrievable module located on a subsea wellhead or manifold. SCM changeout includes cleaning using acid. Acid (typically sulphamic acid) may be used to remove calcium deposits from the SCM-wellhead interface. This acid will be released to the marine environment. A typical release of acid associated with SCM changeout is estimated to be 400 L, and the worst case is estimated to be approximately 1000 L. A typical release of control fluid during an SCM changeout is estimated to be 10 L; the worst case is estimated to be approximately 100 L.

3.10.16 Jumper and Umbilical Replacement

Subsea umbilicals provide hydraulic and electrical power, communications, and chemical supplies to and between subsea assets through a number of cables and tubes (**Figure 3-11**). Jumpers (short umbilical sections) connect subsea assets over short distances.

Figure 3-11: Subsea umbilical

If an umbilical or jumper fails during field life, it will require repair or replacement. Some seabed disturbance will result from parking the jumper on the seabed, with the largest NY facility jumper having a seabed footprint of 200 × 0.5 m (100 m²).

Details of typical and approximate worst-case chemical releases associated with a hydraulic umbilical/jumper repair/replacement are provided in **Table 3-14**.

Table 3-14: Typical releases associated with a hydraulic umbilical/jumper repair/replacement

Component	Hydraulic Fluid		MEG		Inhibitor	
	Typical	Worst Case	Typical	Worst Case	Typical	~ Worst Case
Jumper	<50 mL	10 L	<50 mL	5 L	<50 mL	5 L
Umbilical	<5 L	40 L	<2 L	25 L	<2 L	25 L

3.10.17 Multiphase Flow Meter Changeout

An MPFM is a device used to measure the individual phase flow rates of hydrocarbons and water. An MPFM is located on each NY facility subsea manifold, as well as on each GE flowbase/tree assembly.

An MPFM may require replacement over the life of the field. During an MPFM changeout, there may be a small release of residual hydrocarbons and other chemicals as listed in **Table 3-15**.

Table 3-15: Typical releases associated with an multiphase flow meter changeout

Chemical	Volume (L)	
	Typical	Worst Case
Hydrocarbons and PW	<5	50
Methanol	<2	20
Barrier fluid	<2	20
Demulsifier	<2	20
Scale inhibitor	<2	20

3.10.18 Multiphase Pump Changeout

MPPs are designed to transport hydrocarbon and water mixtures from the well to topside processing facilities. A pump may require replacement over the life of the field. During a changeout there may be a small release of residual hydrocarbons and barrier fluids as listed in **Table 3-16**.

Table 3-16: Typical releases associated with multiphase pump changeouts

Chemical	Volume (L)	
	Typical	Worst Case
Hydrocarbon PW mix	<50	350
Barrier fluid	<5	10
Corrosion inhibitor	<5	10
Methanol or MEG	<500	900

3.10.19 Tree Cap Changeout

The tree cap protects the top of the wellhead from the subsea environment. A tree cap may require replacement over the life of the field. During a tree cap changeout, there may be a small release of residual hydrocarbons and/or chemicals as listed in **Table 3-17**.

Table 3-17: Typical releases associated with tree cap changeout

Chemical	Volume (L)	
	Typical	Worst Case
HCs and PW	<5	50
Methanol	<2	20
Demulsifier	<2	20
Scale inhibitor	<2	20

3.10.20 Chemical Injection Throttle Valve Changeout

A chemical injection throttle valve (CITV) is a restriction type valve designed for subsea use. It controls the chemical flow rates in subsea systems. The CITV is remotely operated from the surface and replaceable by ROV. A typical CITV repair/replacement program only results in minor seabed disturbance. There are no planned discharges associated with this activity.

3.10.21 Logic Plate/Cap Changeout

A logic plate/cap is a removable hydraulic plate that is typically found on subsea manifolds. It receives communications and hydraulic services from the UTA and distributes them to multiple users such as trees, manifolds, pumping and boosting stations, and infield tie-ins.

A logic plate is designed to be easily recoverable for repair and/or replacement. During changeout there may be a small release of hydraulic fluids and MEG as listed in **Table 3-18**.

Table 3-18: Typical releases associated with logic changeout

Chemical	Volume (L)	
	Typical	Worst Case
Hydraulic fluid	<5	20
MEG	<5	20

3.10.22 Accumulator Skid (Barrier Fluid Top-up)

Temporary accumulator skids are installed adjacent to the multiphase pumps while NY is off station, to preserve barrier fluid within the pumps. These skids are designed to maintain multiphase pump barrier fluid pressure above ambient, preventing seawater ingress into the pumps. Installed temporarily on the seabed, there is one accumulator skid tied in to each of the two pumps.

Each skid is roughly 6 m x 6 m and contains accumulator bottles filled with barrier fluid (typically Shell Morlina 5). The accumulator skids and barrier fluid system may be recharged using a downline from an intervention vessel when required.

3.10.23 Spool Repair, Replacement and Recovery

The NY facility subsea infrastructure has spools for tie-in of the wellheads to the production flowlines. Spools transport reservoir hydrocarbons and any process chemicals injected subsea (for example, hydrate and scale inhibitors) from the wellheads to the manifolds. Spools are designed to accommodate a variation in temperature and flowrates due to hydrocarbons being produced in conjunction with the different operating modes (i.e. shut down, commissioning, etc). Spools have a tie-in connection system at each end to facilitate installation and disconnection.

Spools may need to be repaired and/or replaced throughout the life of the field.

The replacement spool will be transported prefilled with biocide/corrosion inhibitor, MEG and dye. During installation, there may be a small associated discharge when the caps are removed.

Potential discharges associated with spool activities are difficult to accurately determine without detailed engineering and activity specific planning which incorporates risk reduction and mitigation considerations. Notwithstanding, typical releases may be approximately 100 L of hydrocarbons associated with a spool replacement.

A detailed internal risk assessment will be performed before such activities, considering health, safety and environmental implications. Any potential discharges associated with this activity, where unavoidable, will be reduced and controlled to demonstrate ALARP using techniques such as flushing. This process will also include an assessment to ensure the activity is undertaken in compliance with this EP.

Details of typical and worst-case releases associated with spool retrieval/installation are provided in **Table 3-19**.

Table 3-19: Typical chemical releases associated with spool retrieval/installation

Fluid	Typical	Worst case	Discharge point
Spool Disconnection			
Hydrocarbons	2 L oil and 9 kg gas	4 L oil and 12 kg gas	Subsea discharge (at tree and manifold)
MEG	1 L	1 L	Subsea discharge (at tree and manifold)
MEG – if secondary flushing is employed	900 L – assumes 50 m spool MEG filled and flushed	1200 L – assumes 75 m spool MEG filled and flushed	Subsea discharge (through flushing cap)
Spool Installation			
MEG and dye mix, potentially including corrosion inhibitor and biocide	1 L	1 L	Subsea discharge (at tree and manifold)

When equipment is replaced, the redundant equipment, may remain in situ or be removed from the field. The location of redundant subsea infrastructure items is recorded as part of the ROV as-left

survey and input into a database for the inventory associated with each title. The inventory is used to track equipment on the seabed to enable planning for future removal.

3.11 Well Management and Maintenance Activities

NY facility subsea well interventions, workovers and well kills require a suitable vessel or drill rig to accommodate and support intervention packages. Therefore, these activities do not form part of the scope of this EP. Unloading and clean-up from subsea wells via the NY FPSO may be required from time-to-time as described below.

3.11.1 Well Unloading and Clean-up

After well construction, subsea interventions, workovers and well kills, the well may be unloaded and flowed via the process facilities to be cleaned of any remaining chemicals and fluids in the wellbore or reservoir. This includes the hot commissioning (initial start-up) activities of the additional two new wells and associated subsea infrastructure. During this phase, the products may be processed as follows:

- Gas will be routed into the production process where possible, or flared if unsuitable.
- Well clean up will be as per normal process by flow to the HP Separator, liquids may not be separated and flow as a combined oil/water/well clean up fluids stream to the cargo tanks.
- Wastes (may include fluids and sand/solids) will be managed as appropriate based on composition. Solids will be separated for onshore disposal.

Before production from the two new wells commences, these fluids require dewatering which will be undertaken via the NY FPSO (**Section 3.12**).

3.11.2 Prolonged Period of Ngujima-Yin Floating Production, Storage and Offloading Facility Sailaway

During potential periods of extended FPSO sailaway (e.g. when NY FPSO is disconnected and sailed away to the shipyard) normal well monitoring from the FPSO is unavailable. During these periods wells are shut-in and leak off tested in accordance with the accepted Ngujima-Yin Well Operations Management Plan (WOMP). By managing well integrity through ensuring that the wells barriers are verified, wells are left in a safe state, and the risk of loss of containment is reduced to ALARP.

3.12 New Well Start-up and Hot Commissioning

It is assumed the new production wells will have been drilled, completed and suspended (cold commissioned) as part of the drilling and installation EP. Suspension with either solids-free fluid (brine) or a combination of brine and diesel in the well bore is used to protect the integrity of the infrastructure. These fluids are to be cleaned-up via the FPSO before start-up of production (hot commissioning). It is estimated a new production well clean-up will take approximately six days to complete.

Brine used for suspension is typically to achieve approximately <70 NTU and/or <0.05% TSS. When the two new wells are cleaned up, certain topside equipment (i.e. Train A water treatment system, inter-stage heater, electrostatic coalescer, crude oil cooler) maybe isolated/bypassed to avoid contaminating these systems with well clean-up fluids, and to minimise the impact of solids on equipment where blockage could occur. The two new production wells will be cleaned up to HP Separator A, with GE wells being simultaneously produced to HP Separator B. At this time, GE production maybe ramped back to minimum stable rates, and only wells with low PW production rates may be online.

All PW is planned to be injected into the disposal wells, either directly if the PW treatment systems are online and PW quality is met or indirectly if the PW is rundown with crude oil to the off-spec cargo

tank and then separated and sent to slops, or if the PW does not meet the injection water quality it gets directed to slops. From slops the PW is recycled back to the process trains for re-processing and injection into the disposal wells. Consideration is also given to shutting in high PW wells if the slops water volume is getting high.

The solids produced during unloading and clean-up are expected to be predominately filter cake from the completion, which is composed of low hardness calcium carbonate. The majority of solids deposit in topsides process vessels and in the off-spec cargo tank.

To ensure process stability, a minimum number of low water cut wells in the Vincent field are expected to also be online during new well clean up, with fluids from these wells being directed to HP Separator A.

Gas is directed to the HP compressor, as this should be online throughout well clean-up. If it is not online or sufficient gas is not available, the gas will be flared. LP Compression should be brought online when there is sufficient gas for stable operation. It is possible that there will not be sufficient gas for normal fuel gas supply. In this case, fuel gas is expected to be supplied by fuel gas blending or sole supply from backflow of Vincent gas injection system. If the Vincent gas injection well is depleted, users are planned to be on a mix of diesel and fuel gas. During well unloading and clean-up of the subsea and topsides, acoustic sand detectors are planned to be used to monitor and trend the solids content of the produced fluids.

4 DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with regulations 21(2) and 21(3) of the Environment Regulations, this section describes the existing EMBA by the activity (planned and unplanned parts of the activity, as described in **Section 3**), including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The EMBA is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the combined potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the event of the following scenarios (**Section 6.8.3**):

- Scenario 1: A long-term (77-day) uncontrolled subsea release of 258,549 m³ of Vincent Crude from the Vincent Infill Well (VNBH4-ST2).
- Scenario 2: A short-term (16-hour) surface release of 40,828 m³ of NY Topsides Blend caused by a vessel collision with the FPSO.

The ecological impact thresholds used to delineate the EMBA are defined in **Table 4-1**. The EMBA also includes any areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations. The EMBA is shown in **Figure 4-1**.

The EMBA presented does not represent the predicted coverage of any one hydrocarbon spill or a depiction of a slick or plume at any particular point in time. Rather, the areas are a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

Table 4-1: Hydrocarbon spill thresholds used to define the environment that may be affected for surface and in-water hydrocarbons

Hydrocarbon Type	EMBA ¹	Socio-economic EMBA ¹	Planning Area for Scientific Monitoring
Surface	10 g/m ² This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.	1 g/m ² This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-economic impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for scientific monitoring (NOPSEMA guidance note: A652993, April 2019).	
Dissolved	50 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-economic receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-economic impacts may occur.		10 ppb This low exposure value establishes the planning area for scientific monitoring (based on potential for exceedance of water quality triggers) (NOPSEMA guidance note: A652993, April 2019). In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold.
Entrained	100 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As entrained hydrocarbons are within the water column and not visible, impacts to socio-economic receptors are associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-economic impacts may occur.		
Shoreline	100 g/m ² This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m ² This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur.	N/A

¹ Further details including the source of the thresholds used to define the EMBA in this table are provided in **Section 6.8.1**.

4.2 Regional Context

The Operational Area is located in Commonwealth waters within the North-west Marine Region (NWMR), as defined under the Integrated Marine and Coastal Regionalisation of Australia (IMCRA v4.0) (Commonwealth of Australia, 2006), in water depths ranging from 340 to 850 m. Within the NWMR, the Operational Area lies across the Northwest Province, Central Western Shelf Transition and the Northwest Shelf Province (**Figure 4-2**).

The combined EMBA further extends to the South-west Marine Region (SWMR) and marginally to the North Marine Region (NMR, shared Northwest Shelf Transition bioregion). Provincial Bioregions within the combined EMBA for the NMR, NWMR and SWMR include the:

- Northwest Shelf Transition (NMR and NWMR)
- Timor Province
- Northwest Shelf Province
- Christmas Island Province
- Cocos (Keeling) Island Province
- Northwest Transition
- Northwest Province
- Central Western Shelf Transition
- Central Western Transition
- Central Western Shelf Province
- Central Western Province
- Southwest Shelf Transition
- Southwest Transition
- Southwest Shelf Province
- Southern Province.

Woodside's Description of Existing Environment summarises the characteristics for the relevant marine bioregions.

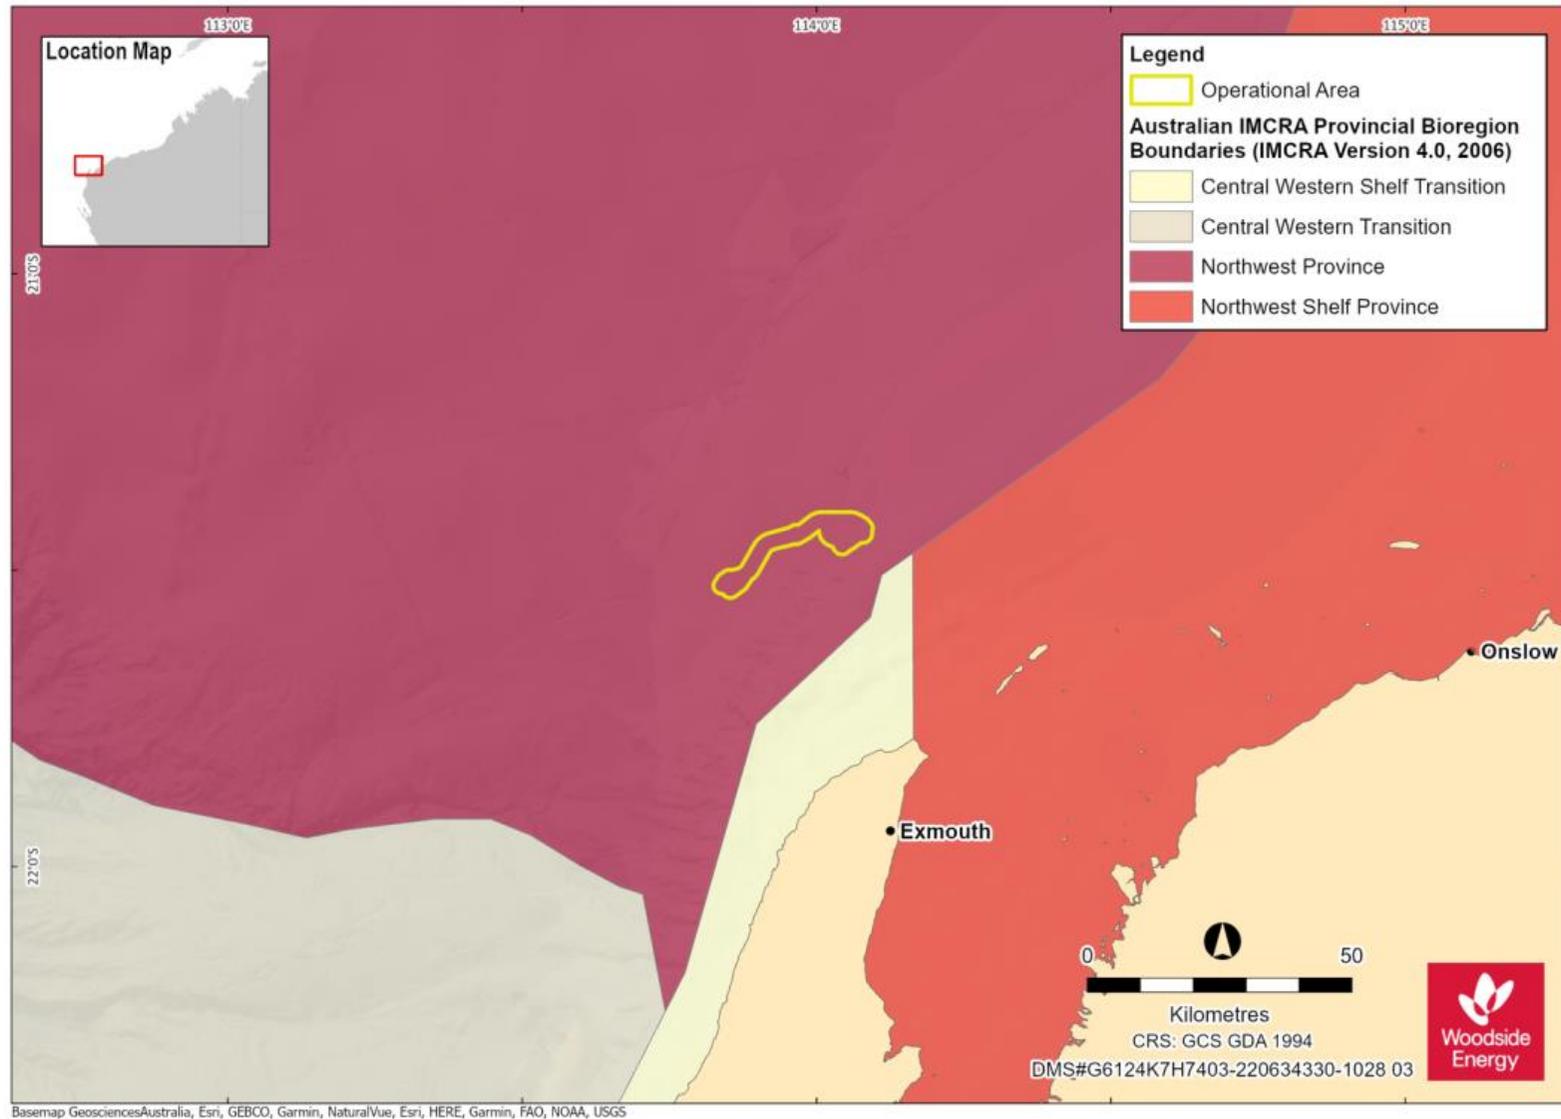

Figure 4-2: Location of the Operational Area and relevant marine provincial bioregions

4.3 Matters of National Environmental Significance (Environment Protection and Biodiversity Conservation Act)

Table 4-2 summarises the Matters of National Environmental Significance (MNES) overlapping the Operational Area and EMBA, according to the Protected Matters Search Tool (PMST). It should be noted the EPBC Act PMST is a general database that conservatively identifies areas in which protected species have the potential to occur.

Table 4-2: Summary of matters of national environmental significance identified by the Environment Protection and Biodiversity Conservation Act Protected Matters Search Tool as potentially occurring within the Operational Area and environment that may be affected

MNES	Operational Area	EMBA	Relevant Section
World Heritage Properties	0	3	Section 4.10.5
National Heritage Places	0	10	Section 4.10.5
Wetlands of International Importance (Ramsar)	0	9	Section 4.10.5
Commonwealth Marine Area	1	21	Section 4.10.5
Listed Threatened Ecological Communities	0	7	Section 4.10.5
Listed Threatened Species	26	68	Section 4.6
Listed Migratory Species	41	111	Section 4.6

4.4 Physical Environment

The Operational Area lies on the continental shelf in waters approximately 340 to 820 m deep (**Figure 4-3**). The north-western part of the Operational Area consists of a relatively flat and featureless seabed. Within the southern part of the Operational Area lies a Key Ecological Feature (KEF), the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula is intersected. Part of this deep-water canyon system, the North and South Enfield Canyons are overlapped by the south-western portion of the Operational Area. Within the Operational Area, the Canyons exhibit relatively low topographic relief (20 to 30 m), with only isolated boulders observed (BMT Oceanica, 2016). A broader description of the KEF and its values is provided in **Section 4.7**.

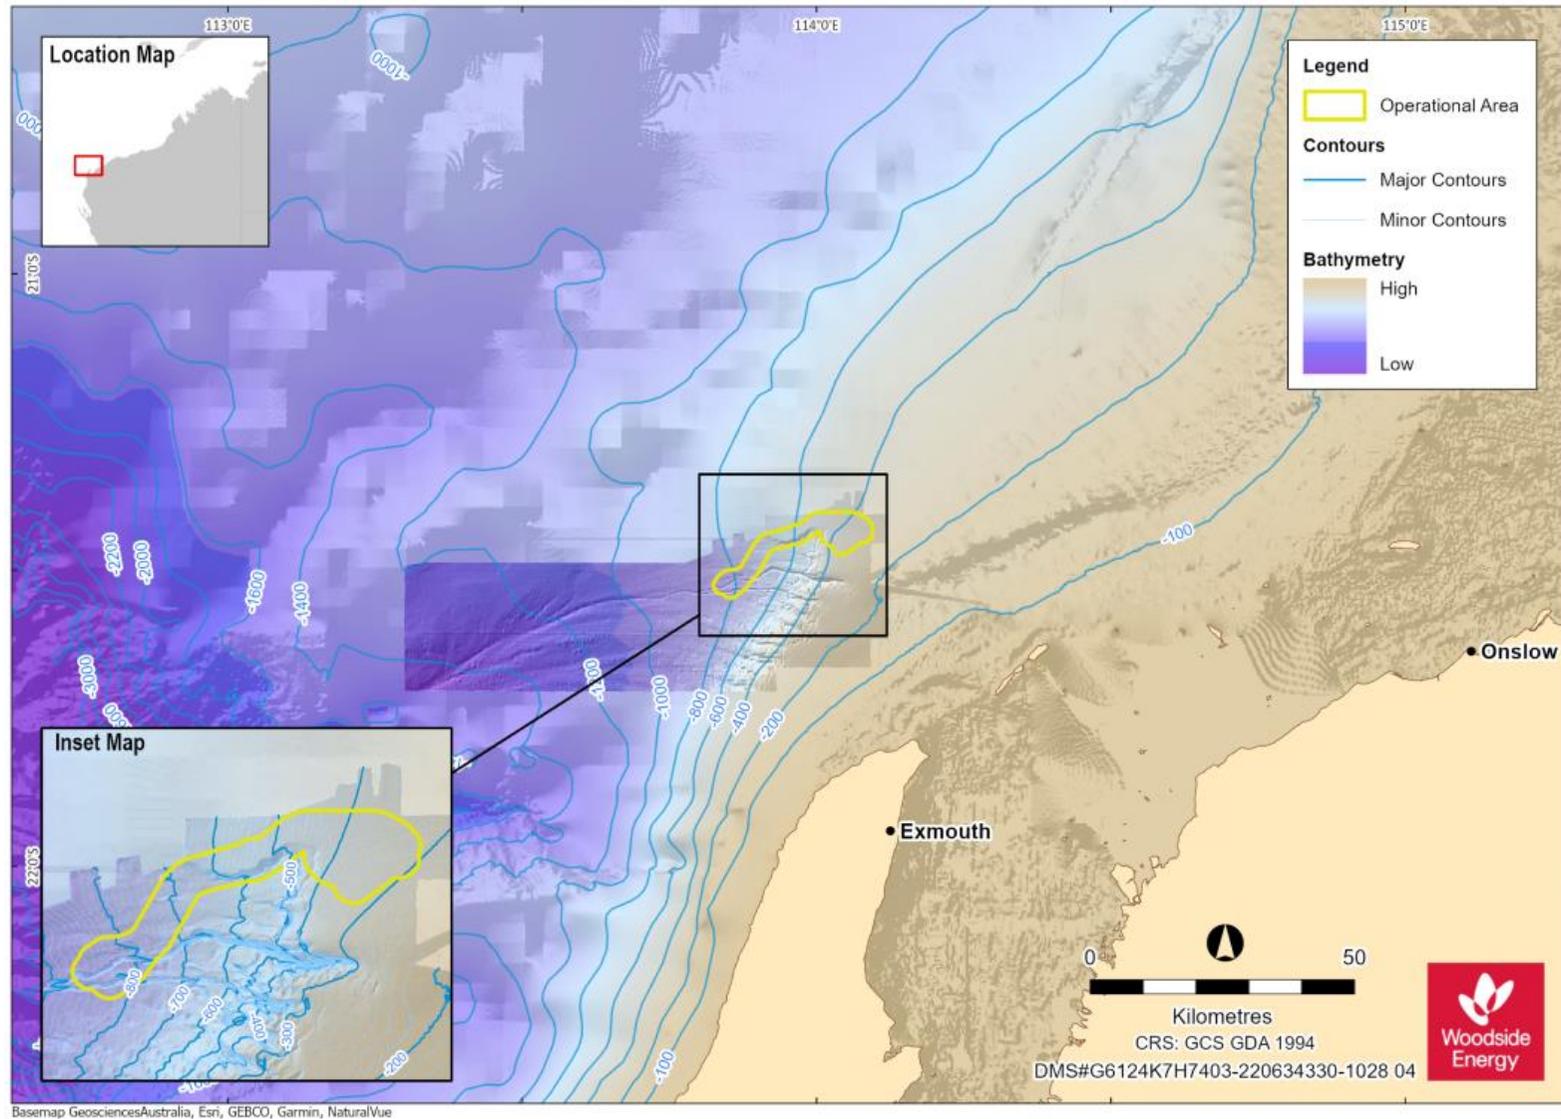

Figure 4-3: Bathymetry of the Operational Area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.5 Habitats and Biological Communities

Sediments in the north-western portion of the Operational Area are broadly consistent with those in the NWS Province, which are characterised by fine to medium sediment (silts and sands), with patches of coarser sediments (shells/gravels) (Woodside Energy Limited, 2005). Sediment investigations within the Enfield Canyon indicate that the upper slope habitat (200 to 500 m depth) is typically composed of coarser and more consolidated sediments as compared to the mid-slope (500 to 1000 m) (BMT Oceanica, 2016).

While hard substrates are known to occur within the Operational Area, specifically as isolated boulders within the Enfield Canyon, all were found to be featureless (BMT Oceanica, 2016). However, within the region hard substrates occur more broadly and can host more diverse benthic communities. Hard substrate may also be associated with the Ancient Coastline at 125 m Depth Contour KEF (**Section 4.7**), which is located within the EMBA.

Key habitats and ecological communities within the EMBA are identified in **Table 4-3**.

Table 4-3: Habitats and communities within the environment that may be affected

Habitat/Community	Key Locations Within the EMBA
<i>Marine primary producers</i>	
Coral	<ul style="list-style-type: none"> • Ningaloo Coast (8.6 km south-east) • Muiron Islands (16 km south-east) • Barrow Island (136 km north-east) • Montebello Islands (177 km north-east) • Shark Bay (315 km south-west) • Rowley Shoals (640 km north-east) • Houtman Abrolhos islands (721 km south-west) • Rottneest Island (1,158 km south-east) • Christmas Island (1,510 km north-west)

Habitat/Community	Key Locations Within the EMBA
Seagrass beds and macroalgae	<ul style="list-style-type: none"> • Ningaloo Coast (8.6 km south-east) • Muiron Islands (16 km south-east) • Exmouth Gulf (55 km south-east) • Barrow Island (136 km north-east) • Montebello Islands (177 km north-east) • Shark Bay (315 km south-west) • Jurien Bay (943 km south-west) • Busselton (1316 km south)
Mangroves	<ul style="list-style-type: none"> • Ningaloo Coast (8.6 km south-east) • Exmouth Gulf (55 km south-east) • Montebello Islands (177 km north-east) • Dampier (306 km north-east) • Carnarvon (319 km south) • Port Hedland (492 km north-east) • Broome (947 km north-east)
Other communities and habitats	
Plankton	<p>Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR.</p> <p>Peak primary productivity within the EMBA occurs in late summer/early autumn, along the shelf edge of the Ningaloo Reef. It also links to a larger biologically productive period in the area that includes mass coral spawning events, peaks in zooplankton and fish larvae abundance (CALM, 2005a), with periodic upwelling throughout the year. Further detail regarding productivity at other notable locations within the EMBA (e.g. North West Cape) is provided.</p>

Habitat/Community	Key Locations Within the EMBA
Pelagic and demersal fish populations	<p>Pelagic and demersal fish populations within the Operational Area and EMBA are expected to be representative of the NWMR).</p> <p>Particular features within the EMBA that are known to support pelagic and demersal fish populations include the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula (overlapping the Operational Area), the Continental Slope Demersal Fish Communities KEF (overlapping the Operational Area), the Ancient Coastline at 125 m Depth Contour KEF, Commonwealth Waters Adjacent to Ningaloo Reef, Western Demersal Slope and Associated Fish Communities, Glomar Shoals, Mermaid Reef and Commonwealth waters surrounding Rowley Shoals, etc.</p> <p>Notably, the presence of subsea infrastructure associated with the NY facilities has resulted in the development of demersal fish communities that would otherwise not occur in the Operational Area due to the generally featureless, soft substrate that is present (McLean et al., 2017).</p>
Epifauna and infauna	<p>Filter feeders such as sponges, ascidians, soft corals, and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA, 2008). Filter feeders within the EMBA are expected to be representative of the NWMR, with notable areas of high sponge diversity occurring in the Commonwealth waters of Ningaloo Marine Park.</p> <p>Discrete areas of hard substrate hosting sessile filter feeding communities may also be associated within the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, which overlaps the Operational Area.</p> <p>Several surveys of benthic filter feeder communities have been undertaken within the Operational Area. Isolated areas of hard substrate within the Enfield Canyon were sampled and found to be characterised by featureless isolated boulders with no different biota observed compared to the other surveyed areas of the canyon (BMT Oceanica, 2016). Results are consistent with previous surveys within the region which found species composition to have no observable differences between assemblages within and beyond the canyon (Heyward et al., 2001b)</p> <p>Filter feeder communities within the Operational Area are present on the subsea infrastructure within the development, which provides hard substrate for attachment in an otherwise generally featureless, soft and sandy substrate.</p>

4.6 Protected Species

A total of 143 EPBC Act listed species considered to be MNES were identified as potentially occurring within the EMBA, of which a subset of 48 species were identified as potentially occurring within the Operational Area. These results inform the assessment of impacts from planned and unplanned events (**Section 6.6 to 6.8**). It should be recognised that the PMST is a general database that conservatively identifies areas in which protected species have the potential to occur.

Biologically important areas (BIAs) are defined by the Marine Bioregional Plan for the North-west Marine Region as areas of spatial aggregation of individuals within a species known to demonstrate biologically important behaviour (DCCEEW, 2023). Examples of such behaviours include breeding, foraging, resting or migration.

Threatened and/or Migratory species identified as potentially occurring within the Operational Area and EMBA, and BIAs or Habitat Critical to their Survival (Habitat Critical) that overlap the Operational Area and EMBA, are listed in **Table 4-4** to **Table 4-12**.

Figure 4-4 to **Figure 4-9** show the spatial overlap of the Operational Area with relevant BIAs and Habitat Critical areas.

4.6.1 Fish, Sharks and Rays

A total of 14 EPBC-listed Threatened and Migratory fish, shark and ray species have been identified to potentially occur within the Operational Area. An additional 11 EPBC-listed Threatened and Migratory fish, shark and ray species within the wider EMBA (**Table 4-4**).

A foraging BIA for the Whale Shark overlaps the Operational Area as shown in **Figure 4-4** and described in **Table 4-6**.

An additional four species of fish, shark and ray have BIAs within the wider EMBA (**Table 4-6**).

Table 4-4: Threatened and Migratory fish, shark and ray species predicted to occur within the Operational Area and environment that may be affected

Species Name	Common Name	Threatened Status	Migratory Status	Potential for Interaction	
				Operational Area	EMBA
<i>Carcharodon carcharias</i>	White shark	Vulnerable	Migratory	Species or species habitat known occur within area	Species or species habitat likely to occur within area

4.6.2 Marine Reptiles

A total of six EPBC-listed Threatened and Migratory marine reptile species have been identified to potentially occur within the Operational Area and an additional three occurring in the wider EMBA (**Table 4-6**).

BIAs for the flatback turtle, green turtle, hawksbill turtle and loggerhead turtle overlap the Operational Area, as described in **Table 4-7** and shown in **Figure 4-5**.

Habitat critical to the survival of the Green Turtle, Loggerhead Turtle, Leatherback Turtle and the Hawksbill Turtle is overlapped by, or adjacent to the Operational Area as shown in **Figure 4-6** and described in **Table 4-8**.

An additional 24 listed Marine species occur in the EMBA, which do not have Threatened or Migratory status. The majority of these are sea snake species.

Table 4-6: Threatened and Migratory marine reptile species predicted to occur within the Operational Area and environment that may be affected

Species Name	Common Name	Threatened Status	Migratory Status	Potential for Interaction

4.6.3 Marine Mammals

A total of 12 EPBC-listed Threatened and Migratory marine mammal species have been identified to potentially occur within the Operational Area, and an additional 5 occur in the broader EMBA (**Table 4-9**).

The Pygmy Blue Whale BIA (migration) overlap the Operational Area (**Figure 4-7**), as does the Humpback Whale migration BIA (**Figure 4-8**). A number of other marine mammal BIAs occur throughout the EMBA, which are listed in **Table 4-10**.

Table 4-9: Threatened and Migratory marine mammal species predicted to occur within the Operational Area and environment that may be affected

Species Name	Common Name	Threatened Status	Migratory Status	Potential for Interaction	
				Operational Area	EMBA
<i>Balaenoptera musculus</i>	Blue whale	Endangered	Migratory	Migration route known to occur within area.	Migration route known to occur within area
<i>Eubalaena australis</i>	Southern right whale	Endangered	Migratory	Species or species habitat likely to occur within area.	Breeding known to occur within area
<i>Balaenoptera borealis</i>	Sei whale	Vulnerable	Migratory	Species or species habitat likely to occur within area.	Species or species habitat likely to occur within area
<i>Balaenoptera physalus</i>	Fin whale	Vulnerable	Migratory	Species or species habitat likely to occur within area.	Species or species habitat likely to occur within area
<i>Balaenoptera edeni</i>	Bryde's whale	N/A	Migratory	Species or species habitat likely occur within area.	Species or species habitat likely to occur within area
<i>Balaenoptera bonaerensis</i>	Antarctic minke whale	N/A	Migratory	Species or species habitat likely occur within area.	Species or species habitat likely to occur within area
<i>Megaptera novaeangliae</i>	Humpback whale	N/A	Migratory	Breeding known to occur within area.	Breeding known to occur within area
<i>Orcaella heinsohni</i>	Australian snubfin dolphin	N/A	Migratory	Species or species habitat may occur within area.	Breeding known to occur within area
<i>Orcinus orca</i>	Killer whale	N/A	Migratory	Species or species habitat may occur within area.	Species or species habitat may occur within area
<i>Physeter macrocephalus</i>	Sperm whale	N/A	Migratory	Species or species habitat may occur within area.	Foraging, feeding or related behaviour known to occur within area
<i>Sousa sahulensis</i>	Australian humpback dolphin	N/A	Migratory	Species or species habitat may occur within area.	Breeding known to occur within area
<i>Tursiops aduncus</i> (Arafura/Timor Sea populations)	Spotted bottlenose dolphin	N/A	Migratory	Species or species habitat known to occur within area.	Species or species habitat known to occur within area
<i>Neophoca cinerea</i>	Australian sea-lion	Endangered	N/A	Species or species habitat known to occur within area.	Species or species habitat known to occur within area
<i>Xeromys myoides</i>	Water mouse, false water rat, yirrkoo	Vulnerable	N/A	Species or species habitat known to occur within area.	Species or species habitat known to occur within area

4.6.4 Seabirds and Migratory Shorebirds

A total of 16 EPBC listed and migratory marine or coastal bird species have been identified to potentially occur within the Operational Area. An additional 76 EPBC-listed Threatened and Migratory seabird and shorebird species within the wider EMBA, listed in **Table 4-11**. A number of other bird species were detected by the PMST, as occurring within the wider EMBA due to the graticule search method applied. Based on the biological requirements and attributes of these species (i.e. non-marine dependant), they were not considered likely to be affected by the EMBA and have not been considered further in the EP.

Breeding BIAs for the wedge-tailed shearwater and fairy tern overlapped and adjacent to the Operational Area or within the EMBA as shown in **Figure 4-9** and described in **Table 4-12**.

Table 4-11: Threatened and Migratory marine seabird and shorebird species predicted to occur within the Operational Area and environment that may be affected

Species Name	Common Name	Threatened Status	Migratory Status	Potential for Interaction	
				Operational Area	EMBA
<i>Calidris ferruginea</i>	Curllew sandpiper	Critically Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Numenius madagascariensis</i>	Eastern curlew	Critically Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Calidris canutus</i>	Red knot	Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Macronectes giganteus</i>	Southern-giant petrel	Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Phaethon lepturus fulvus</i>	Christmas Island white-tailed tropicbird	Endangered	N/A	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Thalassarche carteri</i>	Indian yellow-nosed albatross	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Pterodroma mollis</i>	Soft-plumage petrel	Vulnerable	N/A	Species or species habitat may occur within area	Foraging, feeding or related behaviour likely to occur within area
<i>Sternula nereis nereis</i>	Australian fairy tern	Vulnerable	N/A	Foraging, feeding or related behaviour likely to occur within area	Species or species habitat may occur within area
<i>Actitis hypoleucos</i>	Common sandpiper	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Anous stolidus</i>	Common noddy	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat likely to occur within area
<i>Ardenna carneipes</i>	Flesh-footed shearwater	N/A	Migratory	Species or species habitat may occur within area	Breeding known to occur within area
<i>Calidris acuminata</i>	Sharp-tailed sandpiper	N/A	Migratory	Species or species habitat may to occur within area	Roosting known to occur within area
<i>Calidris melanotos</i>	Pectoral sandpiper	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species Name	Common Name	Threatened Status	Migratory Status	Potential for Interaction	
				Operational Area	EMBA
<i>Calonectris leucomelas</i>	Streaked shearwater	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat known to occur within area
<i>Fregata ariel</i>	Lesser frigatebird	N/A	Migratory	Species or species habitat likely to occur within area	Breeding known to occur within area
<i>Phaethon lepturus</i>	White-tailed tropicbird	N/A	Migratory	Species or species habitat known to occur within area	Breeding known to occur within area
<i>Calidris tenuirostris</i>	Great knot	Critically Endangered	Migratory	N/A	Roosting known to occur within area
<i>Limosa lapponica menzbieri</i>	Northern Siberian bar-tailed godwit, Russkoye bar-tailed godwit	Critically Endangered	N/A	N/A	Species or species habitat known to occur within area
<i>Charadrius mongolus</i>	Lesser sand plover	Endangered	Migratory	N/A	Roosting known to occur within area
<i>Diomedea amsterdamensis</i>	Amsterdam albatross	Endangered	Migratory	N/A	Species or species habitat likely to occur within area
<i>Diomedea dabbenena</i>	Tristan albatross	Endangered	Migratory	N/A	Species or species habitat likely to occur within area
<i>Diomedea sanfordi</i>	Northern royal albatross	Endangered	Migratory	N/A	Species or species habitat may occur within area
<i>Fregata andrewsi</i>	Christmas island frigatebird	Endangered	Migratory	N/A	Foraging, feeding or related behaviour known to occur within area
<i>Thalassarche cauta</i>	Shy albatross	Endangered	Migratory	N/A	Foraging, feeding or related behaviour likely to occur within area
<i>Botaurus poiciloptilus</i>	Australasian bittern	Endangered	N/A	N/A	Species or species habitat likely to occur within area
<i>Hypotaenidia philippensis andrewsi</i>	Buff-banded rail (Cocos (Keeling) Islands), Ayam Hutan	Endangered	N/A	N/A	Species or species habitat known to occur within area

Table 4-12: Seabird and shorebird biologically important areas overlapping the environment that may be affected

Species	BIAs ¹			
	Resting	Foraging	Breeding	Aggregation
Wedge-tailed shearwater	No Resting BIA identified within the EMBA	Ranging in western seas between 12°00'S and 33°20' (468 km north-west) (high abundance)	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (overlaps)	No Aggregation BIA identified within the EMBA
White-faced storm petrel	No Resting BIA identified within the EMBA	Offshore areas of the south-west marine region and into the adjacent south-east marine region and the north-west marine region to north of Shark Bay (621 km south-west) (high abundance)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
White-tailed-tropic bird	No Resting BIA identified within the EMBA	No Foraging BIA identified within the EMBA	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (550 km north-east)	No Aggregation BIA identified within the EMBA
Australian lesser noddy	No Resting BIA identified within the EMBA	Houtman Abrolhos Islands (746 km south-west) (provisioning young)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Black-faced cormorant	No Resting BIA identified within the EMBA		Recherche Archipelago, west of Esperance to Hopetown (1521 km south-east)	No Aggregation BIA identified within the EMBA
Bridled tern	No Resting BIA identified within the EMBA	West coast of Western Australia and around to Recherche Archipelago including offshore waters (468 km south-west) (high abundance)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Brown booby	No Resting BIA identified within the EMBA		Kimberley and northern Pilbara coasts and islands also Ashmore Reef (505 km north-east)	No Aggregation BIA identified within the EMBA
Caspian tern	No Resting BIA identified within the EMBA	In Western Australia found on most coasts, mainly islands (as far offshore as Adele, Bedout, Trimouille and the Houtman Abrolhos) and at Lake Argyle, Lake Gregory and Lake MacLeod; accidental elsewhere in the interior (678 km south-west) (provisioning young)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIAs ¹			
	Resting	Foraging	Breeding	Aggregation
Common noddy	No Resting BIA identified within the EMBA	Around Houtman Abrolhos Islands (723 km south-west) (provisioning young)	Common noddy	No Resting BIA identified within the EMBA
Fairy tern	No Resting BIA identified within the EMBA	Lower north-west coast (north to Dampier Archipelago), west coast (south to Peel Inlet) and south coast (from Flinders Bay east to Israelite Bay), including islands (as far offshore as Trimouille Island and Houtman Abrolhos Island) (714 km north-east) (high abundance)	Pilbara and Gascoyne coasts and islands (27 km south-east)	No Aggregation BIA identified within the EMBA
Flesh-footed shearwater	No Resting BIA identified within the EMBA	Foraging from Cape Naturaliste to Eyre, 1 to 150 km offshore (1327 km south-east) (high abundance)	No Breeding BIA identified within the EMBA	Foraging from Cape Naturaliste to Eyre, 1-150km offshore (1,158 km south-east)
Greater frigatebird	No Resting BIA identified within the EMBA		Kimberley and Ashmore Reef (1,045 km north-east)	No Aggregation BIA identified within the EMBA
Great-winged petrel	No Resting BIA identified within the EMBA	Offshore south of Shark Bay, extending around south-west corner of WA and east past Kangaroo Island (1302 km south-east) (provisioning young)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Indian yellow-nosed albatross	No Resting BIA identified within the EMBA	Offshore waters of south-west marine region, north to Shark Bay and extending east into Bass Strait (1417 km south-east) (high abundance)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Lesser crested tern	No Resting BIA identified within the EMBA		Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (54 km north-east)	No Aggregation BIA identified within the EMBA
Lesser frigatebird	No Resting BIA identified within the EMBA		Kimberley and Pilbara coasts and islands also Ashmore Reef (449 km north-east)	No Aggregation BIA identified within the EMBA
Little penguin	No Resting BIA identified within the EMBA	Perth to Bunbury (1159 km south-east) (provisioning young)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Little shearwater	No Resting BIA identified within the EMBA	From Kalbarri to Eucla including offshore waters (629 km south-west) (high abundance)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIAs ¹			
	Resting	Foraging	Breeding	Aggregation
Little tern	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (645 km north-east) Roebuck Bay Ramsar site		Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (631 km north-east)	No Aggregation BIA identified within the EMBA
Pacific gull	No Resting BIA identified within the EMBA	West coast and islands from Point Quobba south to Wedge Island (679 km south-east) (high abundance) South coast and islands, west to Cape Leeuwin. Common around Albany and Esperance and in the Archipelago of the Recherche (high abundance) GAB and Port Lincoln (high abundance)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Red-footed booby	No Resting BIA identified within the EMBA		North west Kimberley and Ashmore reef (1045 km north-east)	No Aggregation BIA identified within the EMBA
Roseate tern	Eighty-mile Beach (northern end) (788 km north-east)	North-western and west coasts and islands from Sir Graham Moore Island, south to Mandurah and as far offshore as Ashmore Reef, Bedout Island and the Houtman Abrolhos (881 km south-east) (provisioning young)	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (79 km north-west) North-east and North-west Twin Islets near the mouth of King Sound Low Rocks and Stern Island in Admiralty Gulf	No Aggregation BIA identified within the EMBA
Short-tailed shearwater	No Resting BIA identified within the EMBA	Found in the archipelago of the Recherche and ranging west to the lower west coast north to 33°40'S (1618 km south-east)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA
Soft-plumage petrel	No Resting BIA identified within the EMBA	In WA found in seas north to 21°30'S (842 km south-west)	No Breeding BIA identified within the EMBA	No Aggregation BIA identified within the EMBA

4.6.5 Seasonal Sensitivities for Protected Species

Seasonal sensitivities for EPBC Listed threatened migratory species identified as potentially occurring within the Operational Area or EMBA are identified in **Table 4-13**. Movement patterns of all protected species identified in **Section 4.6**.

Table 4-13: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area and/or environment that may be affected

Species	January	February	March	April	May	June	July	August	September	October	November	December
Fish, sharks and rays												
Whale shark – northern and southern migration (NWMR) (TSSC, 2015d)												
Whale shark – foraging/ aggregation (Ningaloo Coast) (TSSC, 2015d)												
Great white shark – northern migration (to North West Cape) (DSEWPaC, 2013a)												
Green sawfish – foraging (DSEWPaC, 2012)												
Green sawfish – nursing/ pupping (DSEWPaC, 2012)												
Dwarf sawfish – foraging (Department of the Environment, 2015a)												
River sawfish – non-breeding season (Department of the Environment, 2023)												
Marine reptiles¹												
Flatback turtle, Pilbara Coast genetic stock – nesting												
Flatback turtle, Pilbara Coast genetic stock – hatching												
Green turtle, NWS genetic stock – nesting												
Green turtle, NWS genetic stock - hatching												
Hawksbill turtle Western Australia genetic stock – nesting												
Hawksbill turtle Western Australia genetic stock – hatching												
Leatherback turtle – nesting												
Leatherback turtle – hatching												

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	January	February	March	April	May	June	July	August	September	October	November	December
Mammals												
Fin whale						Yellow	Yellow	Yellow	Yellow	Yellow		
Humpback whale – northern migration (Double et al., 2010; DSEWPaC, 2012)						Yellow	Orange	Orange	Yellow			
Humpback whale – southern migration (Double et al., 2010; DSEWPaC, 2012)									Orange	Orange	Yellow	
Sei whale – migration (DEH, 2005)						Yellow	Yellow	Yellow	Yellow	Yellow		
East Indian Ocean (EIO) pygmy blue whale – northern migration (Double et al., 2012; 2014)				Yellow	Orange	Orange	Yellow					
East Indian Ocean (EIO) pygmy blue whale – southern migration (Double et al., 2012; 2014)	Yellow									Yellow	Orange	Orange
Southern right whale – migration (DSEWPC, 2012b)						Yellow	Yellow		Yellow	Yellow	Yellow	
Seabirds and shorebirds												
Red knot – non-breeding season (NWMR) (TSSC, 2016a)	Yellow	Yellow	Yellow	Yellow				Yellow	Yellow	Yellow	Yellow	Yellow
Eastern curlew – non-breeding (NWMR) (2014 2015d)	Yellow	Yellow	Yellow	Yellow			Yellow	Yellow	Yellow	Yellow	Yellow	Yellow
Curlew sandpiper – non-breeding season (NWMR) (DoE, 2015)	Yellow	Yellow	Yellow	Yellow				Yellow	Yellow	Yellow	Yellow	Yellow
Southern giant petrel – non-breeding season (Australia) (DCCEEW, 2022c)	Yellow	Yellow	Yellow	Yellow				Yellow	Yellow	Yellow	Yellow	Yellow
Indian yellow-nosed albatross – non-breeding season (Australia) (ACAP, 2012)					Yellow	Yellow	Yellow					
Wedge-tailed shearwater – various breeding sites (DSEWPaC, 2012c; Environment Australia, 2002)	Yellow	Yellow	Yellow	Yellow				Yellow	Yellow	Yellow	Yellow	Yellow
Yellow	Species may be present in the Operational Area											
Orange	Peak period. Presence of animals is reliable and predictable each year

4.7 Key Ecological Features

Two KEFs overlap the Operational Area and an additional three occur nearby (**Figure 4-10**). KEFs within the Operational Area and EMBA are identified in **Table 4-14**.

Table 4-14: Key ecological features within the Operational Area and environment that may be affected

Key Ecological Feature	Approximate Distance and Direction from Operational Area (km)
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	Overlaps
Continental Slope demersal fish communities	Overlaps
Ancient coastline at 125 m depth contour	0.6 km south-east
Commonwealth waters adjacent to Ningaloo Reef	8.6 km south-east
Exmouth Plateau	65.9 km north-west
Glomar Shoals	319.8 km north-east
Western demersal slope and associated fish communities	468.3 km south-west
Wallaby Saddle	481.8 km south-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	639.9 km north-east
Western rock lobster	678.7 km south-west
Ancient coastline at 90 to 120 m depth	680.2 km south-west
Perth Canyon and adjacent shelf break, and other west coast canyons	703 km south-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	718.4 km south-east
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	720.7 km south-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	951.6 km north-east
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	1134.1 km north-east
Commonwealth marine environment within and adjacent to Geographe Bay	1305.7 km south-east
Naturaliste Plateau	1313.1 km south-west
Cape Mentelle upwelling	1322.8 km south-east
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	1384.4 km north-east
Albany Canyons group and adjacent shelf break	1514.6 km south-east
Pinnacles of the Bonaparte Basin	1727 km north-east
Carbonate Bank and terrace system of the Sahul Shelf	1511.8 km north-east

Ia: Strict Nature Reserve

Ib: Wilderness Area

II: National Park

III: Natural Monument or Feature

IV: Habitat/Species Management Area

V: Protected Landscape/Seascape

VI: Protected area with sustainable use of natural resources – allow human use but prohibits large scale development.

IUCN categories for the marine park are provided and, in brackets, the IUCN categories for specific zones within each Marine Park as assigned under the North-west Marine Parks Network Management Plan 2018 and South-west Marine Parks Network Management Plan 2018.

Protected Area	Description	Conservation Values
Murchison River (Lower Reaches)	The river mouth is at Kalbarri on the Indian Ocean coast; the upstream limit of the site is 42 km east south-east of Kalbarri. The site comprises the estuary of the Murchison River and pools in the lower reaches and extends into the Kalbarri National Park.	Cultural values, including registered and expected multiple other Aboriginal archaeological and ethnographical sites. The area meets criteria 1 and 6 for inclusion on the Directory of Important Wetlands in Australia.
Pulu Keeling National Park	Description of the protected area is contained in Section 4.	The area meets criteria 1, 3, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia.
Roebuck Bay	Description of the protected area is contained in Section 4.	The area meets criteria 1, 2, 3, 4, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia.
Swan-Canning Estuary	Description of the protected area is contained in Section 4.	The area meets criteria 1, 2, 3, 4, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia.
Vasse-Wonnerup Wetland System	Description of the protected area is contained in Section 4.	The area meets criteria 2, 3, 4, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia.
Willie Creek Wetlands	The site consists of two spring-fed and tidally inundated wetlands, Nimalaica Swamp and an unnamed crescent-shaped lake 2 km to the north. They are on tidal flats of Willie Creek estuary.	Socio-cultural values, containing areas of special significance including ancient food-gathering, corroboree and burial sites. The area meets criteria 1, 3, and 6 for inclusion on the Directory of Important Wetlands in Australia.
Yalgorup Lakes System	Description of the protected area is contained in Section 4.	The area meets criteria 1, 2, 3, 4, 5 and 6 for inclusion on the Directory of Important Wetlands in Australia.

4.9 Cultural Features and Heritage Values

4.9.1 Background

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places
- the social, economic and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of the Operational Area and EMBA are described.

In line with The Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance (ICOMOS, 2013) (Burra Charter) and associated practice notes, Woodside understands heritage value to refer to the cultural significance of a place to an individual or group. A cultural feature, by contrast, is understood to be comparable to the Burra Charter term “fabric” and refer to a place’s elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible and intangible dimensions (ICOMOS, 2013).

Through consultation with relevant persons, Woodside recognises the deep spiritual and cultural connection to the environment that First Nations people hold.

4.9.2 First Nations Peoples

As a starting point for understanding cultural features of the environment for First Nations groups, Woodside uses the existing systems, such as native title, to identify First Nations groups that may

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

have functions, interests or activities that may be affected. To that end, Woodside identifies native title representative bodies and nominated representative entities, as well as native title claims, determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA overlaps. Native title claims, determinations and ILUAs are defined under the *Native Title Act 1993* (Cth). While acknowledging that cultural features and heritage values may exist outside of the native title framework, Woodside considers this to be the broadest extent over which First Nations groups have claimed native title rights and interests.

Native title claims are applications made to the Federal Court under the *Native Title Act* for a determination or decision about native title in a particular area. A claim is made by a native title claim group which asserts it holds native title rights and interests in an area of land and/or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so that its native title rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area (National Native Title Tribunal).

A requirement to establishing a positive determination of native title in court is proving that there is an organised society that occupied the land and/or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of *Mabo v Queensland (No 2)* [1992] HCA 23; (1992) 175 CLR 1 ('Mabo'). Justice Toohey had the following to say (at 187):

“it is inconceivable that indigenous inhabitants in occupation of land did not have a system by which land was utilised in a way determined by that society. There must, of course, be a society sufficiently organized to create and sustain rights and duties...”

Therefore, Woodside understands native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which First Nations groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found to either exist or not exist. Where native title rights or interests are determined to exist, they will be held by a Registered Native Title Body Corporate (section 57, *Native Title Act 1993*) in trust or as agent for native title holders.

ILUAs are voluntary agreements between native title parties and other people or bodies about the use and management of land and/or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area, or
- a native title claim has been made, or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders (National Native Title Tribunal).

The *Native Title Act* also provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the *Native Title Act* within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details on the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

For the activity in this EP, there are no native title claims or determinations and no ILUAs overlapping the Operational Area; however, 26 native title claims and 44 ILUAs overlap the EMBA (see **Figure 4-11**). A summary of native title claims, determinations and ILUAs which overlap the EMBA or are coastally adjacent to the EMBA is set out in **Table 4-17**. Claims and determinations have not

been differentiated in this table, as it is acknowledged that rights and interests may exist within either of these.

4.9.3 Coastally Adjacent First Nations Groups

Woodside understands that First Nations groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth, 2007). To identify cultural features and heritage values which may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to be consulted (see **Table 4-17**).

That said, Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas which those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for First Nations groups and individuals. This may also, over time, build expectations in the broader First Nations community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge. Woodside also acknowledges that a First Nations group's relative proximity to the Operational Area or EMBA is not necessarily a meaningful indicator of the connection of First Nations groups to the area, and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

A summary of native title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA is set out in **Table 4-17**. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

4.9.4 Marine Parks

Woodside acknowledges Commonwealth and State Marine Park Management Plans have sought to recognise cultural values of First Nations groups. Australian Marine Parks (AMP) describe this framework in the following way: ‘when making decisions about what can occur in marine parks and what action we will take to protect marine parks, we take values into account’. AMP summarises these values as natural values, cultural values, heritage values and socio-economic values.

Woodside is triggered to undertake an assessment of cultural values within Marine Park Management Plans where the operational area or EMBA overlaps an AMP. Woodside considers the

management plans of marine parks that overlap the Operational Area and EMBA to determine whether cultural features and heritage values have been identified and whether there are specified representative bodies referenced to contact regarding potential cultural features and heritage values.

The Operational Area does not overlap any Commonwealth Marine Parks. The EMBA overlaps with 19 AMPs managed under the South-West Marine Parks Network Management Plan 2018, North-West Marine Parks Network Management Plan 2018 and North Marine Parks Network Management Plan 2018, as well as the Christmas Island AMP and Cocos (Keeling) Island AMP for which management plans are still being developed. No First Nations groups or cultural values are identified for these two AMPs in their respective values statements (DNP, 2022a; DNP, 2022b). The Operational Area does not overlap any State Marine Parks however, the EMBA overlaps 15 State Marine Parks. Where the plans for these marine parks specify identifiable representative bodies who may hold knowledge of heritage values or cultural features—including but not limited to Registered Native Title Bodies Corporate—these bodies are consulted. Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. Nine identifiable representative bodies were specified for the AMPs overlapped by the EMBA (see **Table 4-18**).

The marine park management plans did note across the various AMPs that Yamatji Marlpa Aboriginal Corporation (YMAC), Kimberley Land Council (KLC), South West Aboriginal Land and Sea Council (SWALSC) are the relevant Native Title Representative Bodies or Native Title Service Providers. YMAC and KLC were requested to identify Traditional Custodians who may hold knowledge of heritage values or cultural features. SWALSC ceased to be a Native Title Service Provider in 2021 (SWALSC, 2023), and Woodside consults with relevant Regional Corporations formed under the South West Native Title Settlement (see **Appendix F**).

4.9.5 Sea Country Values

'Sea Country' can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. It has been noted that "the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as 'saltwater country' or 'sea country'. 'Country' refers to more than just a geographical area:

it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area.” (Smyth, 2007). “Sea country is valued for Indigenous cultural identity, health and wellbeing” (DNP, 2018b). Cultural identity is understood to refer to the fact that “essence of being a 'Saltwater' person is ontological rather than merely technological. That is, it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people” (McDonald and Phillips, 2021).

In terms of seascape extent, McNiven (2004) suggests that “for those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20 to 30 km out to sea, out to the horizon and the limit of human visibility. However, in some coastal places, clouds that can be seen well over 100 km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon.” While there is some evidence of traditional watercraft in Australia’s North West, the recorded evidence is limited to travel across inland rivers (e.g. Barber and Jackson, 2011) or travel between coastal islands (Paterson et al., 2019).

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government’s Indigenous Protected Areas Program. The Indigenous Protected Areas program provides for “areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation...IPAs deliver environmental benefits...Managing IPAs also helps Indigenous communities protect the cultural values of their Country for future generations...” (DCCEEW, 2023). This intrinsic link concept is also described by MAC (2021) as it relates to the values of the marine environment that are of cultural importance to MAC based on engagement with their Elders and Murujuga Land and Sea Unit Rangers. Elders were clear that all living things in Mermaid Sound are connected and that Mermaid Sound and Dampier Archipelago (Murujuga) are considered one place where the entire environment and all ecosystems hold both cultural and environmental value, with these types of values (cultural and environmental) intrinsically linked (MAC, 2021 as cited in Woodside, 2023a).

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple First Nations language groups. Some species may travel as far as 5000 km from Antarctica to the Kimberley region of Western Australia (Double et al., 2010, 2012), passing First Nations language groups along the entire west coast of Australia. Distribution and migratory patterns of migratory species are described in **Section 4.6**.

Sea Country values have been defined through desktop assessment of Sea Country values from publicly available sources and consultation with First Nations groups and individuals.

The process for identifying First Nations groups who may have interests and connection in Sea Country are set out in **Section 5**. The scope of advice Traditional Custodians were encouraged to provide through project consultation was not limited by reference to any particular boundaries or limits of Sea Country.

4.9.6 Desktop Assessment of Sea Country Values

4.9.6.1 *Cultural Features and Heritage Values Identified in Publicly Available Literature*

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the EMBA or Operational Area. Where cultural features or Sea Country values were identified these are summarised in **Table 4-20** according to the First Nations groups (where identified or inferable) who hold these values. Documents reviewed included Healthy Country Plans; a number of these plans across the Kimberley mention concerns regarding ecological impacts of petroleum activities, particularly in relation to unplanned hydrocarbon releases. Except where specific references are made to cultural values, these are considered to be addressed through the management of environmental values and are not summarised in this section.

Table 4-19: Cultural features and heritage values identified in publicly available literature

First Nations Group	Features and Values	Source	Potential for Overlap	
			Operational Area	EMBA
Balanggarra	Feature: Resources including black bream (amalat), another fish that looks like black bream (goongomari), cat fish, barramundi, wungalbut (rifle fish), turtle.	Balanggarra Aboriginal Corporation Registered Native Title Body Corporate v Valperlon Bulk Commodities Pty Ltd and Another [2014] NNTTA 113	No	Possible
Bardi and Jawi	Feature: The offspring of Bardi and Jawi men inhabit the phenomenal world as incarnations of pre-existent spirit beings called ray or raya which live in specific locations throughout Bardi and Jawi territory including waterholes, springs, trees and rocks on the land or in the sea.	Sampi on behalf of the Bardi and Jawi People v State of Western Australia [2010] FCAFC 26	No	Possible (unspecified)
	Feature: Mythologically important places.		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including dugong, turtle and trochus shell.		No	Possible
	Value: Activities of mythological beings in the sea area.		Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge of the sea and the features within.		Possible (unspecified)	Possible (unspecified)
	Value: The lands and seas and cultural forms and practices making up the body of customary law were created and bequeathed via generations of human forebears by supernatural beings, inamunonjin, who had occupied and/or traversed the Dampier Peninsula-Buccaneer Archipelago region prior to direct human experience of the world.			Possible (unspecified)
	Value: The inamunonjin shaped features of the physical environment and imbued them with their eternal numinal essence. They named sites and set the boundaries of traditional territories and introduced the religious resources such as songs, dances, designs, objects, myths and rituals through which their activities would continue to be celebrated and affirmed. They instituted the basic rules of customs regulating social order.		No	Possible (unspecified)
Value: The offspring of Bardi and Jawi men inhabit the phenomenal world as incarnations of pre-existent spirit beings called ray or raya which live in specific locations throughout Bardi and Jawi territory including waterholes, springs, trees and rocks on the land or in the sea.	No	Possible (unspecified)

First Nations Group	Features and Values	Source	Potential for Overlap	
			Operational Area	EMBA
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for hunting and fishing.		No	Possible
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for travelling.		No	Possible
	Value: Nobody may access Alarm Shoals as this includes a very significant sacred site and is a very dangerous spiritual place.		No	Possible
	Value: Lalariny, a rock feature in the vicinity of Thomas Bay, has a close association with a particular spiritual being and "nobody should go there"; people who do may be afflicted by a form of physical discomfort.		No	Possible
	Interest: Environmental characteristics of the sea.		Possible (unspecified)	Possible (unspecified)
Gnulli (Baiyungu, Thalanyji, Yinggarda)	Feature: Resources including marine animals. Value: Traditional knowledge holds that ancestors live on the land and in the water. Therefore, people have obligations to access and care for these places (e.g. keeping them clean).	Peck on behalf of the Gnulli Native Title Claim Group v State of Western Australia [2019] FCA 2090	Possible (unspecified)	Possible (unspecified)
	Feature: Resources including mangrove crabs, gastropods, shellfish, dugong, turtle).	Morse 1993	Possible (turtle; Table 4-6) No (other resources)	Possible (turtle; Table 4-6) No (other resources)
Jabirr Jabirr and Ngumbarl	Feature: Dreaming stories relating to inland areas associated with the headwaters of creeks running west through Jabirr Jabirr country.	National Native Title Tribunal. Registration Test Decision. Rita Augustine & Ors v State of Western Australia (Jabirr Jabirr). NNTT number WC2013/007	No	No
	Feature: During Bugarrlgarra (the Dreaming), a snake travelled from Nurrugun (Carnot Bay) in Jabirr Jabirr country down to Ngumbarl country and across into Yawuru country. When this snake crossed Willie Creek, he changed his name and his kinship group ("skin").		No,	Possible
	Value: Sites along the coast point to protracted economic and spiritual use of the land and include artefact scatters, middens, burials and/or ceremonial sites, sites of mythological and historical significance, fish traps and gender-restricted sites.		No	Possible (unspecified)
	Value: Coastal areas used for hunting, fishing and camping.		No	Possible (unspecified)
	Value: Traditional knowledge of the 'changes in seasons which rests on the relationships between the living things within a particular area'.		No	Possible (unspecified)

Kariyarra	Value: Traditional knowledge recalls that a salt water serpent lives in the sea and brings fish to shore.	Zaunmayr, 2016	Possible (unspecified)	Possible (unspecified)
Malgana	Feature: Resources including bobtail, long-tail, kangaroo, emu, pinkgrey galah, mull-hawk, bird eggs (shags [cormorants], seagull, divers), turtle eggs, dugongs, turtle, mullet, bluebone, whiting, snapper, oysters, mussels, crabs, prawns, scallops, cockles, little 'redies', black snapper and mallee fowl.	Oxenham on behalf of the Malgana People v State of Western Australia [2018] FCA 1929	Possible (unspecified)	Possible (unspecified)
	Value: Access to Country.		No	Possible (unspecified)
	Feature: Resources including dugong, green and loggerhead turtles and sharks.	Statton et al., 2021	Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge maintains records of freshwater seeps in the submerged landscape.		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including fish, shellfish, turtles and dugong.	Briggs and Green, 2008	Possible (unspecified)	Possible (unspecified)
	Feature: Archaeological sites.		No	Possible
	Feature: Green sea turtles, dugongs, shags and bottlenose dolphins are species of cultural significance.	Malgana Land and Sea Management et al., 2021	No	Possible
Value: Sharing and controlling the sharing of knowledge.	Lyons et al., 2021	Possible (unspecified)	Possible (unspecified)	
Mayala	Feature: Resources including turtle and dugong, stone at Yalun or Cone Bay, gulngarriny or yams and madilang tubers at Long, Mermaid, Pascoe and other islands, trochus, clams, oysters, fish and sugarbag (native honey).	Mayala #2 registration decision NNTT File No WC2018/020-1	No (stone)	Possible (stone)
	Feature: Spiritual beings [term withheld] live on the islands who have a role in protecting country and to whom visitors must introduce themselves.		No	Possible
	Value: Right to access, utilise and speak for buru or dambi (sea/land estates).		No	Possible
	Value: Caring for Country in buru or dambi 'corresponding duty to protect their country, particularly its spiritual aspects and environmental health; and to protect strangers from its spiritual dangers'.		No	Possible
	Value: Access to country through numurr or 'saltwater highways'.		No	Possible

First Nations Group	Features and Values	Source	Potential for Overlap	
			Operational Area	EMBA
	Value: Shells are sold overseas for profit.		No	Possible
	Value: Access to/travel between islands.		No	Possible
	Value: Access to "the deep sea" among the islands.		No	Possible
	Value: Access to Brue Reef as a source of trochus, fish and turtle.		No	Possible
	Value: Continuation of traditional Law.		Possible	Possible
	Value: Caring for Country to "make sure that our country isn't ruined in any way".		No	Possible
	Value: Passing on traditional knowledge including collecting aarlngir or trochus.		No	Possible (unspecified)
Miriuwung and Gajerrong	Feature: Resources including food, medicinal plants, wild tobacco, timber, stone, resin and natural water.	Attorney-General of the Northern Territory v Ward [2003] FCAFC 283	Possible (migratory food sources – unspecified) No (other)	Possible (unspecified)
	Value: Access to Country to access resources.		No	Possible (unspecified)
	Value: Hunting, fishing and gathering the natural resources.		Possible (unspecified)	Possible (unspecified)
	Value: Access to Country for ceremonial and religious purposes.		No	Possible (unspecified)
	Value: Caring for Country including protection of sacred sites.		Possible (unspecified)	Possible (unspecified)
Nanda	Value: Access to Country resulting in physical and mental health.	Drury on behalf of the Nanda People v State of Western Australia [2018] FCA 1849	No	Possible (unspecified)
	Value: Water serpents must not be disturbed in pools.		No	No
	Value: Traditional knowledge recalls that a water serpent swam down the Murchison River towards the sound of the ocean's waves and created a tunnel to the sea. Scared by the waves, the serpent swam back up the Murchison.	Kalbarri Visitor Centre, 2023	No	No
	Value: Traditional knowledge recalls that the turtle used to live on the land, but became trapped in the sea due to its greed for berries in the water.	Capewell, 2020	Possible	Possible
	Value: Traditional knowledge recalls that creation ancestors danced at the mouth of the river at Kalbarri and established the Law.	Murdock, 2010	No	Possible (unspecified)

			Operational Area	EMBA
Nimanburr	Feature: Places of cultural importance, including Yarp, Flora, Dora Springs, Jinardi (Turtle Point), Repulsive Point. Piridi, Patterson, Milli Milli Lakes, Common Ground at Bungaduk and top of Milli Milli, Lake Louisa, Valentine Island, Tower Hill, Reserve Hill, Bobbie's Creek, La Djardarr Bay and Old Mission, and Ladogen Pool.	Marshall. M. (2020) Living Heritage: Protecting the Aboriginal Cultural Heritage of the Dampier Peninsula for all. Western Australian Department of Planning Lands and Heritage (DPLH)	No	Yes (to extent of HAT)
	Value: Valentine Island is a culturally significant site for Nimanburr people. Only Traditional Owners and community members should be going to this island as there are concerns for the cultural integrity of the site and the cultural safety of the unauthorised visitors.		No	Yes
Nyangumarta and Karajarri	Feature: Resources including Pirrala (Threadfin Salmon), Ulu (Bluebone Groper), Yilany (Mangrove Jack), Wangkaja (Mudcrab), Janga (Oyster) and Riji/Jakuli (Pearl Shell) which has important cultural and ceremonial value. Karajarri coastal waters contain great numbers of wild pearl shell.	Karajarri Traditional Lands Association (2014) Karajarri Healthy Country Plan 2013–2023: Palanapayana Tukjana Ngurra'Everybody looking after country properly'	No	Possible
	Feature: Saltwater habitats, including Wintirri (sandy beaches, dunes and cliffs), Wangku (rocky headlands), Puntu (intertidal mudflats/freshwater seepages), Parnany (reefs) and Wankurru (deep sea), hold cultural importance.		No	Possible
	Value: Saltwater habitats, including Wintirri (sandy beaches, dunes and cliffs), Wangku (rocky headlands), Puntu (intertidal mudflats/freshwater seepages), Parnany (reefs) and Wankurru (deep sea), provide resources including food resources. An integral part of keeping people healthy on country and maintaining elements of traditional lifestyle is the sustainable harvesting of food resources from Jurrar (coastal country).		No	Possible
	Value: Management of access to coastal areas prevents degradation to landscapes, cultural sites and biodiversity values.		No	Possible
	Value: There is a desire to educate visitors and inform them of the importance of coastal areas.		No	Possible
	Value: Beaches, tidal creeks, bays, reefs and sea-grass beds are breeding and feeding grounds for threatened and migratory sea turtle species such as the Olive Ridley, Hawksbill Turtle, Loggerhead Turtle and Green Turtle. Dugongs and Snubfin Dolphin inhabit the near-shore areas.		Possible	Possible

4.9.7 Studies of Cultural Features and Heritage Values

4.9.7.1 First Nations Archaeological Heritage Assessment

Woodside understands communal cultural connection may exist between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that First Nations people have occupied the Australian continent for at least 65,000 years (Clarkson et al., 2017) and in many places maintain a strong continuing connection that is said to extend back in First Nations cosmology to the beginning of time.

It is understood that the sea level has risen significantly during the 65,000 years of First Nations occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth et al., 2019; UWA, 2021). Woodside also understands that, at its lowest level during First Nations occupation, sea level was between 125 m (O’Leary et al., 2020; Veth et al., 2019; Williams et al., 2018) and 130 m below current levels (Benjamin et al., 2020; Benjamin et al., 2023; UWA, 2021). Archaeological material preserved on the Ancient Landscape has the potential to provide further information about the earliest periods of human occupation (Veth et al., 2019; UWA, 2021).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited, and can retain archaeological material from this time (Benjamin et al., 2020; Benjamin et al., 2023; see Ward et al., 2021 for an opposing view).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline KEF (see **Table 4-14**) as an area where potential First Nations archaeological material may exist on the seabed, as this covers the full extent of this possible First Nations occupation. The Operational Area does not overlap the Ancient Landscape; however, the EMBA does.

Known First Nations heritage places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or *EPBC Act 1999*. However, these Acts only extend protection to First Nations heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is no First Nations archaeology known to exist anywhere within Commonwealth waters, and no areas subject to declarations or prescriptions for First Nations cultural heritage under these Acts are located within the EMBA.

For this EP, a search of DPLH’s Aboriginal Cultural Heritage Inquiry System was undertaken, which showed 315 registered Aboriginal sites in the EMBA.

Where First Nations archaeological material is identified within the EMBA, Woodside will discuss the management of this material with appropriate Traditional Custodian group(s), starting with any adjacent Native Title Body Corporate.

4.9.8 Consultation Feedback to Inform Existing Environment

4.9.8.1 Summary of Values Raised During Consultation

A summary of the topics/interests and values raised by First Nations groups through consultations on this Petroleum Activities Program, or raised in context of other activities are provided in **Table 4-20**. It should be noted that no interests or cultural values were raised specifically in relation to this Petroleum Activities Program, and the information presented in **Table 4-20** was shared during consultation on other Environment Plans.

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that “Aboriginal and Torres Strait Islander heritage is managed...according to community ownership” (Heritage Chairs of Australia and New Zealand 2020). Dhawura Ngilan also specifically notes that “Aboriginal and Torres Strait Islander...intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community.” Through

consultation, Registered Native Title Bodies Corporate and nominated representative corporations have identified or raised topics relating to environmental values of cultural interest. Woodside recognises the deep spiritual and cultural connection to the environment⁶ that First Nations people hold.

⁶ Definition of 'Environment' in regulation 5 of the OPPGS (Environment) Regulations are defined as:

- a) ecosystems and their constituent parts, including people and communities
- b) natural and physical resources
- c) the qualities and characteristics of locations, places and areas
- d) the heritage values of places, and includes
- e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d).

4.9.9 Further Context: Intangible Cultural Heritage

Intangible cultural heritage has been identified through consultation with First Nations people as culturally important. Cultural knowledge, as expressed through songlines, dreaming, dance and other cultural practices, can be associated with tangible objects and physical sites that are culturally important to First Nations people (Adler, 2021; Bursill et al., 2007). Intangible cultural heritage can also be embodied in the practices, representations, expressions, knowledge, uses and skills associated with physical sites (UNESCO, 2003). As a result, physical features may have intangible dimensions (ICOMOS, 2013).

4.9.9.1 Songlines

Oral Songlines are often described by First Nations people as the law of the land and make up part of the Dreaming (Neale and Kelly, 2020:30). Songlines are viewed in Western academia as a framework for relating people to land and consist of a series of invisible, interconnected routes across the landscape that mark significant sites for First Nations people (Higgins, 2021:723). Songlines demonstrate First Nations peoples' strong connections to land by revealing sacred knowledge that is place-specific (Roberts, 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through, and interacted with, the physical landscape leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include inter alia: rocks, mountains, rivers, caves and hills (Higgins, 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale and Kelly, 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge.

In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of First Nations communities across the land (Neale and Kelly, 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country make mention of mythical events occurring around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country; for example. connections to nearby islands that they once inhabited in their songlines (Smyth and Isherwood, 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins, 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines in order to communicate sacred knowledge that assists in safe navigation of the ocean (Neale and Kelly, 2020:83-84).

The routes of any songlines in the EMBA have not been provided by Traditional Custodians through consultation.

4.9.9.2 Creation/Dreaming Sites, Sacred Sites and Ancestral Beings

The only sources located by Woodside with detailed descriptions of the location ancestral beings or creation/dreaming/sacred sites placed these on land or within inland water sources such as rivers or pools. However, some ancestral beings are noted to live within or originate from the sea generally, and some creation stories talk to the creation of features from or in the sea. Additionally, every place on shore or at sea must be assumed to have been created on some level in First Nations cosmology.

4.9.9.3 Cultural Obligations to Care for Country

Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. In the literature reviewed by Woodside, caring for Country was noted to include, but is not limited to, maintenance of the physical environment and ecosystem. It may also have cultural, spiritual and ritual dimensions such as caring for ancestral beings or ensuring cultural safety. Thalu are places where increase ceremonies are performed to enhance or maintain populations of plants, animals or phenomena. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where, for example, a thalu relates to marine species populations.

4.9.9.4 Knowledge of Country/Customary Law and Transfer of Knowledge

Knowledge of and familiarity with the features of Sea Country is itself a value. The inherent potential for restricted or secret knowledge makes this difficult to assess even through consultation with Traditional Custodians. However, aspects such as limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. Further, connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald and Phillips, 2021).

Transfer of knowledge includes continuing traditional practices to pass on practical skills. This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003).

4.9.9.5 Connection to Country

Connection to Country describes the multi-faceted relationship between First nations people and the landscape, which is envisioned as having personhood and spirit. It is also an aspect of personal identity for many First nations people. In the case of Sea Country this can mean identifying as a Saltwater person, where "essence of being a 'Saltwater' person is ontological... it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people" (McDonald and Phillips, 2021).

4.9.9.6 Access to Country

Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Being on Country can be an important way of expressing or maintaining connection to Country (Australian Indigenous HealthInfoNet n.d.). Access is also a value in its own right, as a continuation of traditional Sea Country access and use.

4.9.9.7 Restriction on Access to Country

Some areas of Sea Country identified through the literature review include areas that should not be accessed, or are otherwise subject to access restrictions including requiring ceremonies or being accessed only by people of the correct gender. Failure to comply with these obligations may result in risks to cultural or spiritual safety for those individuals or for Traditional Custodians.

4.9.9.8 Kinship Systems and Totemic Species

Individuals may have kinship to specific species (Smyth, 2008; Juluwarlu, 2004) and/or a responsibility to care for species (Muller, 2008). Kinship arises from totemic associations within First Nations "skin group" systems. It is forbidden for an individual to kill or eat a species who is from the same "skin group" (Juluwarlu, 2004). They may also have certain obligations linked to the discussion of caring for Country below. It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that "skin group" from hunting or eating that same species (Juluwarlu, 2004).

4.9.9.9 Resource Collection

A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

4.9.10 Further Context: Marine Ecosystems and Species

4.9.10.1 Marine Mammals

Whales, and in particular humpback whales, have been identified through consultation with First Nations people as culturally important species, with totemic importance including their populations, biodiversity, and migration patterns. Cultural ceremonies associated with communicating with dolphins have also been raised by MAC through consultation.

Whale symbology expressed through stories, music, and dance can reflect a group's connections with the sea, as well as marine fauna, which then comprise a group's cultural values (Ardler, 2023; Bursill et al., 2007; Cressey, 1998). Whales also speak to a broader connection that exists between First Nation people and their surrounding environment. Beyond mythology and symbolism, whales can be connected with various economic and social functions associated with everyday life. Cultural knowledge of whales, whale migration, behaviour and the related marine environment may all be important in ensuring the continuation of these socio-economic functions and other related activities that remain valuable to First Nations people (Fijn, 2021:47).

Details pertaining to whales and dolphins, their distribution, migration patterns and populations are described in **Section 4.6.3**.

4.9.10.2 Marine Reptiles

Turtles and sea snakes have been identified through consultation with First Nations people as culturally important species, with turtles identified as a resource. First Nations people that identify marine reptiles as species of totemic importance or integral to songlines may place high cultural value on their protection. No marine reptiles related songlines have been identified as per **Section 4.9.9** that have the potential to interact with the Operational Area or EMBA. Note the only songline related to marine reptiles (turtles) was shared by MAC, and was geographically restricted from Fortescue to Withnell Bay, in Mermaid Sound (MAC, 2021).

Turtle symbology expressed through stories, music, and dance can reflect an individual or group's connections with the sea, as well as marine fauna, and comprise First Nations' cultural values (Ardler, 2023; Bursill et al., 2007). Beyond mythology and symbolism, turtles can be connected with various economic and social functions associated with everyday life including hunting and settlement location. Turtles speak to a broader connection that exists between First Nation people and their surrounding environment, including cultural values associated with food security (Delisle et al., 2018:250).

Cultural knowledge of turtles at a population level (turtle migration, behaviour and the related marine environment) may all be important in ensuring the continuation of cultural functions and activities that remain valuable to First Nations people (Fijn, 2021:47; Delisle et al., 2018). Details pertaining to marine reptiles, their distribution, and populations are described in **Section 4.6.2**.

4.9.10.3 Fish

Fish have been identified through consultation with First Nations people as a culturally important species, with fish generally being identified as a resource.

First Nations may identify cultural values associated with fish species as important to maintaining both tangible (physical cultural sites) and intangible (cultural knowledge) cultural heritage. Tangible

cultural heritage associated with fish can include important cultural sites such as midden sites, fish traps and thalu sites. Traditional fish traps require traditional knowledge of the surrounding environment and may involve specialised techniques which have been developed in adaptation to location conditions over time (Fijn, 2021:63).

Intangible cultural heritage associated with fish include songlines, dreaming, art, song and dance. Cultural values relating to fish, and other marine fauna, can collectively capture 'Sea Country' which refers to a seascape that Traditional Custodians view, interact with or hold knowledge of. As a result, fish may be culturally value in relationship with broader marine environmental values that are of cultural importance to First Nations people (Smyth, 2007).

Details pertaining to fish, sharks and rays are described in **Section 4.6.1**.

4.9.10.4 Benthic Habitats

Through consultation, First Nations groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important resource for dugongs. Additionally, coral is valued by MAC for its aesthetic values. Details pertaining to benthic habitats and communities, including their distribution, are described in **Section 4.5**.

4.9.10.5 Shoreline Habitats

Through consultation, First Nations groups identified shoreline habitats as valuable for their ecological values, including coastal vegetation such as mangroves which provide shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli. Details pertaining to shoreline and coastal habitats, including their distribution, are described in **Section 4.5**.

4.9.10.6 Natural Environment Interests

First Nations people have advised through consultation that they have a general interest in environmental management and ecosystem health, including understanding changes in water quality as a result of the Petroleum Activities Program and potential resultant effects on marine species and benthic communities in the Operational Area and EMBA. This includes marine mammals, marine reptiles, fish, seabirds, plankton and subtidal soft bottom communities, which are described in context of their distribution and populations in **Section 4.6.4**.

4.9.11 Heritage Listed Places

No listed world, national or commonwealth heritage places overlap the Operational Area or EMBA.

A search of the Australasian Underwater Cultural Heritage database, which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters indicated that there are no underwater heritage sites or shipwrecks within the Operational Area, however there are shipwrecks and other underwater heritage sites within the EMBA. Shipwrecks within 50km of the Operational Area are listed in Table 4-22.

4.10 Socio-cultural Environment

4.10.1 Commercial Fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area and EMBA. The Annual Fishery Status Reports published by the Australian Bureau of Agricultural and Resource Economics and Sciences (ABARES) were used to identify if Commonwealth managed fisheries that have fished within the Operational Area in the last five years.

FishCube data were also requested from the WA Department of Primary Industries and Regional Development (DPIRD) for the most recently available five-year period of fishery catch and effort data (2018–2022) to analyse the potential for interaction with State managed fisheries within the Operational Area (DPIRD, 2022). Data from FishCube and ABARES was reviewed from the last five years as a subset of past fishing effort. This was deemed an appropriate period to represent potential future fishing effort over the lifecycle of this EP (five years). **Table 4-21** provides an assessment of the potential interaction.

Table 4-21: Commonwealth and State managed commercial fisheries overlapping the Operational Area and/or environment that may be affected

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Commonwealth Managed Fisheries			
✓ = overlap with fishery; blue shading = possibility for interaction with the Operational Area			
North West Slope Trawl Fishery	✘	✓	The North West Slope Trawl Fishery management area, encompasses waters off north-western Australia from 114°E to 125°E, roughly between the 200 m isobath and the outer boundary of the Australian EEZ, and overlaps the Operational Area and EMBA. Fishery Status Reports indicate less than 6 active vessels were active in the fishery during the 2020–2021 season (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.
Northern Prawn Fishery	✘	✓	The Northern Prawn Fishery overlaps the EMBA, extending from Cape York, across the Gulf of Carpentaria to Cape Londondern, past the border between WA and NT. The majority of the fishing during the 2020-2021 season takes place around the coast of NT (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.
Small Pelagic Fishery	✘	✘	The Small Pelagic extends from the QLD/NSW border around to the 31° south latitude line near Lancelin, Perth. The management area is split into western, eastern and sardine subareas. Fishery Status Reports indicate the maximum area fished between 2020–2021 occurred outside of the EMBA (ABARES, 2021). Accordingly, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Southern and Eastern Scalefish and Shark Fishery (SESSF): Great Australian Bight Trawl Sector	✘	✘	The SESSF: Great Australian Bight Trawl Sector extends along the south coast of WA and SA to Kangaroo Island. Fishery Status Reports indicate the maximum area fished between 2020–2021 occurred outside of the EMBA (ABARES, 2021). Accordingly, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Southern Bluefin Tuna Fishery	✘	✘	The Southern Bluefin Tuna Fishery spans the Australian Fishing Zone. However, since 1992, the majority of Australian catch has concentrated in south-eastern Australia (ABARES, 2021). Accordingly, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Western Deepwater Trawl Fishery	✘	✓	The Western Deepwater Trawl Fishery overlaps the Operational Area and EMBA. The fishery is limited to 11 fishing permits and operates in water deeper than 200 m off the coast of Western Australia from Exmouth to Augusta. Fishery Status Reports indicate most recent activity within the EMBA during the 2020–2021 season (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Western Skipjack Tuna Fishery	✘	✘	The Western Skipjack Tuna Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (ABARES, 2021). Accordingly, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Western Tuna and Billfish Fishery	✘	✓	The Western Tuna and Billfish Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. However, in the last five years (2016–2021), fishing effort has concentrated south of Carnarvon (ABARES, 2021). Accordingly, Woodside considers it a possibility that interaction with this fishery and the Petroleum Activities Program.
Christmas Island Line Fishery	✘	✓	The Christmas Island Line Fishery management area overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
State Managed Fisheries			
✓ = potential for interaction, blue shading = spatial overlap for EMBA			
Abalone Managed Fishery (Area 3-8)	✘	✓	The Abalone Fishery management area overlaps the EMBA (Area 3-8). The fishery is only active within the EMBA, with 60 NM Catch and Effort System (CAES) block reporting 3 to 15 registered vessels for Greenlip and Brownlip Abalone Fishery. More recently, active vessel numbers were 3 to 10 across the 2021–2022 seasons, (Strain et al., 2023). The Abalone Fishery is primarily based in shallow, coastal waters (<40 m depth) (Strain et al., 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Abrolhos Islands and Mid-West Trawl Managed Fishery	✘	✓	The Abrolhos Islands and Mid-West Trawl Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting between 3 and 6 vessels across the 2017 to 2022 seasons (Kangas et al., 2023b, with no active vessels in the 2021–2022 financial year. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Broome Prawn Managed Fishery	✘	✓	The Broome Prawn Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting three active vessels undertaking trial fishing activities to investigate whether catch rates were sufficient for commercial fishing across the 2021–2022 seasons, resulting in negligible landings of western king prawns with no by-product (Kangas et al., 2023a). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Cockburn Sound Managed Fishery	✘ (Crab)	✘	The Cockburn Sound (Crab) Fishery management area overlaps the EMBA. The Cockburn Sound Crab Managed Fishery has been closed since 2014 (Johnston et al., 2020). If the fishery were to resume, Woodside only considers it a possibility that interactions with the fishery would occur only in the EMBA.
	✘ (Fish Net)	✓	The Cockburn Sound (Fish Net) Fishery management area overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
	x (Line and Pot)	✓	The Cockburn Sound (Line and Pot) Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting between 6 and 8, consistently active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
	x (Mussel)	x	The Cockburn Sound (Mussel) Fishery management area overlaps the EMBA. There has been no reported catch in the period between 2014–2022 (DPIRD, 2023). If the fishery were to resume, Woodside only considers it a possibility that interactions with the fishery would occur only in the EMBA.
Cocos (Keeling) Islands Marine Aquarium Fish Fishery	x	✓	The Cocos (Keeling Islands Marine Aquarium Fish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with only 2 people reportedly employed during the 2019–2020 (Newman et al., 2021). The fishery also harvests from shallow, coastal waters between 15 m to 70 m (Newman et al., 2021). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Exmouth Gulf Beach Seine and Mesh Net Managed Fishery	x	✓	The Cockburn Sound (Fish Net) Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Exmouth Gulf Prawn Managed Fishery	x	✓	The Exmouth Gulf Prawn Managed Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting 6 consistently active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The CAES reporting block overlaps the Operational Area (indicating fishing effort within the Operational Area), the fishery is limited to the spatial extent within the Exmouth Gulf and Muiron Islands. Therefore, Woodside only considers it a possibility that interactions with the fishery may occur only in the EMBA.
Gascoyne Demersal Scalefish Fishery	x	✓	The Gascoyne Demersal Scalefish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three and 12 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). FishCube data reported no fishing effort at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers there to be potential for interaction with the fishery within the EMBA.
Hermit Crab Fishery	x	✓	The Hermit Crab Fishery area overlaps the Operational Area and the EMBA. There has been no reported fishing effort in the Operational Area at the 10 NM or 60 NM CAES reporting blocks. The collection method for the fishery is hand-catch, on shorelines, and therefore the potential for interaction with the Operational Area is not considered possible. Less than 3 licences have been active in the fishery within the EMBA, during the 2017–2022 period Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Joint Authority Southern Demersal Gillnet and Demersal Longline Fishery	x	✓	The Joint Authority Southern Demersal Gillnet and Demersal Longline Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 3 and 11 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Kimberley Crab Managed Fishery	x	✓	The Kimberley Crab Fishery management area overlaps the EMBA. The fishery is active in the EMBA, with an allocation of 1200 units (600 traps) to license holders and an equivalent allocation of 600 traps to Traditional Owner groups, with 7 people employed in 2021-2022 season (Johnston et al., 2023). Accordingly, Woodside considers there to be a potential for interaction with this fishery in the EMBA
Kimberley Gillnet and Barramundi Fishery	x	✓	The Kimberley Gillnet and Barramundi Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Kimberley Prawn Managed Fishery	x	✓	The Kimberley Prawn Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting 3 to 14 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Woodside considers there to be potential for interaction with the fishery in the EMBA.
Mackerel Managed Fishery	✓	✓	The Mackerel Managed Fishery overlaps the Operational Area and EMBA. FishCube data for the Mackerel Managed Fishery is not provided at the 10 NM scale; however, effort reported in the 60 NM CAES block reporting between 3 and 7 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent in the years since 2012. Woodside considers there may be potential for interaction with the fishery in the Operational Area and EMBA.
Mandurah to Bunbury Developing Crab Fishery	x	✓	The Mandurah to Bunbury Developing Crab Fishery overlaps the EMBA. The fishery is active within the EMBA, but was closed in 2022 (Johnston et al., 2023). Therefore, if the fishery reopens, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Marine Aquarium Fish Managed Fishery	x	✓	The Marine Aquarium Fish Managed Fishery overlaps the Operational Area and EMBA. FishCube data for the Marine Aquarium Fish Managed Fishery is not provided at the 10 NM scale, however effort reported in the 60 NM CAES block reporting between 3-5 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent in the years since 2017. The Marine Aquarium Fish Managed Fishery generally collects fish for display in water depths <30m. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Nickol Bay Prawn Limited Entry Fishery	x	✓	The Nickol Bay Prawn Limited Entry Fishery management area overlaps the EMBA. The fishery is active in the EMBA, with 60 NM CAES block reporting between 3-8 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
North Coast Shark Fishing	x	x	The North Coast Shark Fishing area overlaps EMBA. The northern shark fisheries comprise of the North Coast Shark Fishery in the Pilbara and Western Kimberley (closed since 1998), and the Joint Authority of Northern Shark Fishery in the eastern Kimberley, which has not been active since the 2008–2009 season (AFMA, 2021). Therefore, Woodside considers there to be no interaction with the fishery and the Petroleum Activities Program.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Northern Demersal Scaefish Managed Fishery	x	✓	The Northern Demersal Scaefish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 3 and 7 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Northern Territory Aquaculture Managed Fishery	x	x	The Northern Territory Aquaculture Managed Fishery management area overlaps the EMBA. The fishery primarily operates in shallow coastal waters (Northern Territory Government, 2023c). However, there has been no catch effort from 2017-2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Northern Territory Aquarium Managed Fishery	x	x	The Northern Territory Aquarium Managed Fishery management area overlaps the EMBA. There were up to 5 active licences between 2019 and 2022, with the number of licences capped at 12 (DCCEEW, 2022b). While the fishery is permitted to fish in the EMBA, there has been no catch effort from 2017 to 2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program
Northern Territory Demersal Managed Fishery	x	x	The Northern Territory Demersal Managed Fishery management area overlaps the EMBA. There are currently 16 licences and 7 vessels issued in the fishery and permitted to fish 15NM from the low water mark to the outer boundary of the Australian fishing zone, excluding the area of the Timor Reef Fishery (Northern Territory Government, 2023a). Given that the fishery area overlaps the EMBA, there has been no catch effort from 2017 to 2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Northern Territory Mollusc Managed Fishery	x	x	The Northern Territory Mollusc Managed Fishery management area overlaps the EMBA. The fishery collects molluscs by hand and are permitted to harvest in intertidal waters from the high to low water mark (Northern Territory Government, 2023b). Given that the fishery is permitted to operate, there has been no catch effort from 2017 to 2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Northern Territory Mud Crab Managed Fishery	x	x	The Northern Territory Mud Crab Managed Fishery management area overlaps the EMBA. The fishery is restricted to 49 individual licences, with each licence entitled to 30 pots (DSEWPC, 2012a), and cannot fish for mud crabs in waters that are not subject to tidal influence (DITT, 2006). While the fishery is permitted to operate in the EMBA, there is no catch effort from 2017 to 2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.
Northern Territory Offshore Net and Line Managed Fishery	x	x	The Northern Territory Offshore Net and Line Managed Fishery management area overlaps the EMBA. The fishery operates in Northern Territory and Commonwealth waters from the low water mark to the extent of the Australian Fish Zone (DCCEEW, 2022). However, even though the fishery is permitted to fish in the EMBA, there is no catch effort captured from 2017 to 2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Northern Territory Spanish Mackerel Managed Fishery	x	x	The Northern Territory Spanish Mackerel Managed Fishery management area overlaps the EMBA. The fishery is not permitted to fish in Marine Parks and with a limit of 12 unrestricted licences and 3 restricted licenses (DITT, 2020). While the fishery is permitted to operate in the EMBA, there has been no catch effort from 2017 to 2022 within the EMBA. Therefore, Woodside considers it unlikely for any potential for interaction with this fishery and the Petroleum Activities Program
Octopus Interim Managed Fishery	x	✓	The Octopus Interim Managed Fishery management area overlaps the EMBA. The fishery is active within the EMBA, 60 NM CAES block reporting between 3 and 9 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Onslow Prawn Limited Entry	x	✓	The Onslow Prawn Limited Entry Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The CAES reporting block for the fishery overlaps the Operational Area (indicating fishing effort within the OA), however, the fishery is limited to the spatial extent and boundaries of the fishery. At the nearest point the fishery could only be active at a distance >45 km from the Operational Area. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Open Access in the North Coast	x	✓	The Open Access in the North Coast Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 3 and 7 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pearl Oyster Managed Fishery	x	✓	The Pearl Oyster Managed Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 3 and 6 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). At the nearest point the fishery could only be active at a distance >45 km from the Operational Area. The Pearl Oyster Managed Fishery fishing effort is mostly focused in coastal waters (10 to 15 m depth) with a maximum depth of 35 m (Lulofs et al., 2002). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Crab Managed Fishery	x	✓	The Pilbara Crab Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The Pilbara Crab Managed Fishery covers inshore waters (<50 m) from Onslow to Port Hedland, with most activity around Nickol Bay (Johnston et al., 2020). However, areas of the fishery north and east of Exmouth and nearshore are currently closed as per Schedule 2 of the Draft Management Plan for the Pilbara Crab Managed Fishery (DPIRD, 2018b). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Fish Trawl (Interim) Managed Fishery	x	✓	The Pilbara Fish Trawl (Interim) Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 3 and 4 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The Pilbara Fish Trawl (Interim) Managed Fishery is divided into 2 zones and an area governed by Schedule 5 (prohibited to trawling) (Newman et al., 2020). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Pilbara Line Fishery (condition)	✓	✓	The Pilbara Line Fishery (condition) licensees are permitted to operate anywhere within Pilbara waters (Newman et al., 2021), overlapping the Operational Area and the EMBA. The fishery is active in the EMBA, with one 60 NM CAES block reporting up to 5 licences across the 2017 to 2022 seasons (DPIRD, 2023). FishCube data for the Pilbara Trap Fishery is not provided at the 10 NM scale. Therefore, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and/or the EMBA.
Pilbara Trap Managed Fishery	✘	✓	The Pilbara Trap Fishery management area overlaps the EMBA. The fishery is active with the overlapping 60 NM CAES block reporting <3 vessels across the 2017 to 2022 seasons (DPIRD, 2023). FishCube data for the Pilbara Trap Managed Fishery is not provided at the 10 NM scale. Fishing effort at this level has been consistent for the previous 10-year catch report. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Beach Seine and Mesh Net Managed Fishery	✘	✓	The Shark Bay Beach Seine and Mesh Net Managed Fishery management area overlaps the EMBA. The fishery operates in the EMBA and uses both beach seine and mesh net gears with approximately 7 licenses active (WAFIC, 2023b). Given the methods, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Crab Managed Fishery	✘	✓	The Shark Bay Crab Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 17 and 23 consistently active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Prawn Managed Fishery	✘	✓	The Shark Bay Prawn Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 16 and 18 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Scallop Managed Fishery	✘	✓	The Shark Bay Scallop Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 24 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Crustacean Managed Fishery	✘	✓	The South Coast Crustacean Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 5 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Estuarine Managed Fishery	✘	✓	The South Coast Estuarine Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 13 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Line and Fish Trap Managed Fishery	✘	✓	The South Coast Line and Fish Trap Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 19 active vessels across the 2021–2022 season (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
South Coast Nearshore Net Managed Fishery	x	✓	The South Coast Nearshore Net Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 10 active vessels across the 2021–2022 season (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Purse-Seine Managed Fishery	x	✓	The South Coast Purse-Seine Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 6 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Salmon Managed Fishery	x	✓	The South Coast Salmon Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 4 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Coast Beach Net Fishery (order)	x	✓	The South West Coast Net Fishery (order) area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 9 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Coast Salmon Fishery	x	✓	The South West Coast Salmon Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The fishery primarily uses haul, beach seine and gill netting for catching targeted species, which typically occurs in depths <100 m (Duffy et al., 2022). Given the depth of the Operational Area (340 m), Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Trawl Fishery	x	✓	The South West Trawl Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Specimen Shell Managed Fishery	x	✓	The Specimen Shell Managed Fishery management area overlaps the Operational Area and EMBA. The fishery is active within 60 NM CAES block overlapping the Operational Area, with <3 licences active during the 2019–2022 season. FishCube data reported <3 licences at the 10 NM CAES block overlapping the Operational Area (DPIRD, 2023), with the only activity occurring for a duration of four months in the 2017–2018 season. Although there is overlap with the Operational Area and the CAES reporting block, given the depth and offshore location of the Operational Area and the collection methods of the fishery, it is highly unlikely interactions would occur. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Trochus Fishery	x	✓	The Trochus Fishery management area overlaps the Operational Area and the EMBA. The Trochus Fishery is a small fishery operated by the Bardi Jawi and Maula and harvested by hand on reef tops during low tide (WAFIC, 2023a). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
Warnbro Sound Crab Managed Fishery	✘	✓	The Warnbro Sound Crab Managed fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60 NM CAES. However, the fishery was closed in 2022 (Johnston et al., 2023). If the fishery were to reopen, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast (Beach Bait Fish Net) Managed Fishery	✘	✓	The West Coast (Beach Bait Fish Net) Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Deep Sea Crustacean Managed Fishery	✓	✓	The West Coast Deep Sea Crustacean Managed Fishery is permitted to fish in waters deeper than the 150 m isobath, overlapping the Operational Area and EMBA. The fishery may be active in the Operational Area, with one 60 NM CAES block reporting <3 vessels in the 2021–2022 season (DPIRD, 2023). FishCube data reported no fishing effort at 10 NM CAES blocks in the last five years overlapping the Operational Area (DPIRD, 2023). Woodside considers there to be potential for interaction with the fishery in the Operational Area or EMBA.
West Australian Sea Cucumber Fishery	✘	✓	The West Australian Sea Cucumber Fishery management area overlaps the Operational Area and EMBA. The fishery is active in the EMBA with 60 NM CAES block with <3 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. FishCube data reported no fishing effort at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2023). Fishing primarily occurs from the Exmouth Gulf to the Northern Territory border, with Shark Bay being fished for the second time in the 2020–2021 (Hart et al., 2022). The fishery is a commercial only fishery, collecting targeted species by diving and wading, which typically occur in nearshore, shallow waters (Hart et al., 2021). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Demersal Gillnet and Demersal Longline	✘	✓	The West Coast Demersal Gillnet and Demersal Longline Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to 4 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Demersal Scalefish (Interim) Managed Fishery	✘	✓	The West Coast Demersal Scalefish (Interim) Managed Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to 16 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Estuarine Managed Fishery	✘	✓	The West Coast Estuarine Managed Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to 11 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort reducing to 7 vessels in the 2020-2022 seasons. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

Fishery	Potential for Interaction		
	Operational Area	EMBA	Description
West Coast Purse Seine Fishery	*	✓	The West Coast Purse Seine Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to 4 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort reducing to <3 vessels in the 2018–2022 seasons. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Rock Lobster Fishery	*	✓	The Western Rock Lobster Fishery management area overlaps the EMBA (DPIRD, 2023). The fishery is active in the EMBA with 60 NM CAES block with up to 94 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), Vessel numbers in the fishery have steadily declined over the 5-year period with up to 80 and 74 vessels active during the 2020 and 2022 seasons respectively. Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
Charter based commercial operators ✓ = overlap with fishery; blue shading = possibility for interaction with the Operational Area			
Tour Operators	✓	✓	Fishing Tour Operators are permitted to operate across WA state waters and are required to report monthly logbook records of client fish catches. FishCube data reports consistent fishing effort across the 60 NM CAES block that overlaps the EMBA (DPIRD, 2023). Fishing effort was reported by a maximum of 12 licence holder during the 2018–2019 season, with licence numbers varying between <3 and 12 overall during the 2017 to 2022 seasons (DPIRD, 2023). FishCube data reported <3 active tour operators at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2023), which were only active during the 2020–2021 period. FishCube data indicate tour operator fishing effort highest around Ningaloo and Murion Islands and at Barrow Island and the Montebello Islands, east of the EMBA. Woodside considers there to be potential for interaction with the fishery in the Operational Area or EMBA.

4.10.2 Traditional Fisheries

There are no identified traditional or customary fisheries within the offshore waters of the Operational Area and EMBA, as these are typically restricted to shallow coastal waters and/or areas with structure such as reef.

A key feature of the north-west marine region is the large tidal range in this part of the Australian coast with daily fluctuations up to 12 meters resulting in vast areas of intertidal land and reef flats available for marine resource harvesting (Smyth, 2007). Further, the tidal range also results in strong tidal currents, especially between islands and at the entrance to embayment's that First Nations people used to travel long distance on rafts and canoes between mainland and the reefs and islands (Smyth, 2007). There are no traditional or customary fisheries within the Operational Area, as these are typically restricted to shallow coastal waters and/or areas with structures such as reefs. However, it is recognised that Barrow Island, Montebello Islands and Ningaloo Reef, all within the wider EMBA, have a known history of fishing when areas were occupied (as from historical records) (CALM, 2005).

A Memorandum of Understanding was established with Indonesian fisheries for parts of the Australia Fishing Zone and Continental Shelf (MoU 74). Currently, Scott Reef is the principal reef in the MoU 74 box. This MoU allows Indonesian fishers to participate in traditional fishing activities using traditional methods and is used seasonally. The Operational Area is located outside of the MoU 74 Box; however, it is overlapped by the EMBA.

4.10.3 Historic Sites of Significance

There are no known sites of historic heritage significance within the Operational Area.

It is understood that Indigenous Australian people have a strong continuing connection with the area that extends back some 50,000 years. Woodside acknowledges this unique connection between Aboriginal peoples and the land and sea in which the company operates. Woodside also understands that while marine resources used by Indigenous people are generally limited to coastal waters for activities such as fishing, hunting and maintenance of culture and heritage, many Aboriginal groups have a direct cultural interest in decisions affecting the management of deeper offshore waters. In particular, the Yinggarda, Baiyungu and Thalanyji People have direct interest in the operation and impacts of the Petroleum Activities Program as Traditional Owners of the area overlapped by the EMBA (potential for shoreline accumulation along the Gascoyne coast).

4.10.4 Underwater Heritage

A search of the Australian National Shipwreck Database which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters indicated that there are no sites within the Operational Area, however, numerous shipwrecks exist within the EMBA. **Table 4-22** lists shipwrecks within 50 km of the Operational Area.

Table 4-22: Recorded shipwrecks within the environment that may be affected and within 50 km of the Operational Area

Vessel Name (ID number)	Year Wrecked	Latitude	Longitude
Gem (4144)	1893	-21.6166667	113.9833333
Beatrice (3731)	1899	-21.6166667	113.9833333
Emlyn Castle (4037)	1960	-21.78472167	114.165
Mildura (4516)	1907	-21.784092	114.167735
Lady Ann (4359)	1983	-21.400000	114.200000
Veronica (5061)	1928	-21.683333	114.383333
Fairy Queen (4088)	1875	-21.817150	114.189117
Nellie (4567)	1893	-21.750000	114.083333
Kapala (4318)	1964	-21.750000	114.083333
Ellen (4021)	1893	-21.750000	114.083333
Wild Wave (5112)	1875	-21.750000	114.083333
Sea Queen (4788)	1893	-21.750000	114.083333
Ruby (4749)	1893	-21.750000	114.083333
Lily of the Lake (4403)	1875	-21.750000	114.083333
Unidentified Lugger (5001)	1893	-21.750000	114.083333
Elizabeth (4013)	1893	-21.750000	114.083333
Bell (3736)	1893	-21.750000	114.083333
Agnes (3623)	1893	-21.750000	114.083333
Leave (4385)	1893	-21.750000	114.083333
Lamareaux (4369)	1893	-21.750000	114.083333
Mabel (4427)	1893	-21.750000	114.083333
Smuggler (4824)	1893	-21.750000	114.083333
Pearl (4628)	1896	-21.750000	114.083333
Olive (4598)	1893	-21.750000	114.083333
Florence (4111)	1893	-21.750000	114.083333

4.10.5 World, National and Commonwealth Heritage-Listed Places

No listed heritage places overlap the Operational Area. World, National and Commonwealth heritage places within the EMBA are identified in **Table 4-23**.

Table 4-23: World Heritage Properties and National/Commonwealth Heritage Listed Places within the environment that may be affected

Listed Place	Distance and Direction from Operational Area to Listed Place (km)
World Heritage Properties	
Ningaloo Coast	8.6 km south-east
Shark Bay, Western Australia	357 km south-west
National Heritage Places	
Ningaloo Coast	8.6 km south-east
Dampier Archipelago (including Burrup Peninsula)	257 km north-east
Shark Bay, Western Australia	357 km south-west
Dirk Hartog Landing Site 1616 – Cape Inscription Area	445.3 km south-west
HMAS Sydney II and HSK Kormoran Shipwreck Sites	578.1 km south-west
Batavia Shipwreck Site and Survivor Camps Area 1629 – Houtman Abrolhos	761.4 km south-west
The West Kimberley	855.4 km north-east
Christmas Island Natural Areas	1503.1 km north-west
Great Western Woodlands of Western Australia	1641.9 km south-east
Barrow Island and the Montebello-Barrow Islands Marine Conservation Reserves	128.2 km north-east
Cape Riche	1517.1 km south-east
Commonwealth Heritage Places	
Ningaloo Marine Area – Commonwealth waters	8.6 km south-east
Learmonth Air Weapons Range Facility	92.6 km south-west
HMAS Sydney II and HSK Kormoran Shipwreck Sites	578.1 km south-west
Mermaid Reef – Rowley Shoals	746 km north-east
Lancelin Defence Training Area	1030.2 km south-east
Scott Reef and Surrounds – Commonwealth Area	1146.8 km north-east
Garden Island	1180.2 km south-east
Cliff Point Historic Site	1184 km south-east
Ashmore Reef National Nature Reserve	1384.4 km north-east
Christmas Island Natural Areas	1502.6 km north-west
Settlement Christmas Island	1515.5 km north-west
Oceania House and Surrounds	2128.9 km north-west
North Keeling Island	2151.4 km north-west
Cape Leeuwin Lighthouse	1420.5 km south-east

4.10.6 Tourism and Recreation

Year end March 2023 WA saw 11.7 million overnight (domestic and international) visitors who contributed \$15.9 billion into the economy, \$7.3 billion of which was spent in regional WA (Tourism Research Australia, 2023):

- Australia's South West accounted for approximately 3.1 billion.
- Australia's Coral Coast accounted for approximately 1.1 billion.
- Australia's North West accounted for approximately 1.9 billion.
- Australia's Golden Outback accounted for approximately 1.1 billion (Tourism WA, 2023).

The Operational Area is located offshore of the North West tourism region which includes parts of the Gascoyne region, the Pilbara region, the Kimberley region. Tourism is concentrated in the vicinity of population centres such as Broome, Dampier, Exmouth, Coral Bay and Shark Bay. Population centres closest to the Operational Area are the towns of Onslow (~93 km) and Exmouth (~39 km). Onslow is a coastal town offering easy access to tourists, vacationers and recreational fishers to the Mackerel Islands, a group of ten islands 22 km offshore. Exmouth has become a significant tourist centre with Cape Range National Park, Ningaloo Marine Park and adjacent inshore waters. In 2018–2019, the Ningaloo region (Ningaloo Reef and the surrounding coastal region Exmouth Gulf, communities of Exmouth and Coral Bay, and adjacent proposed southern coastal reserves and pastoral leases) contributed an estimated \$110 million in value added to the WA economy (DCBA, 2020).

Peak tourism in the North West occurs from April to October coinciding with winter or the dry season. Marine-based activities are typically concentrated around infrastructure such as boat ramps and camping areas (Smallwood, 2009). Marine facilities, including boat launching ramps, jetties, marinas, etc., near the Operational Area are limited, with most located along the Exmouth Gulf side of the peninsula, including:

- Port of Onslow, Beadon Creek
- Point Murat naval supply jetty (restricted access)
- Bundegi – facilities include a concrete launching ramp, car park and public toilets
- Exmouth Marina – provides launching, mooring, fuelling and supply facilities for commercial fishing, charter fishing, tourist and commercial/private vessels.

Boat ramps on the Ningaloo side are located at:

- Tantabiddi Creek – facilities include a concrete launching ramp, car park and public toilets
- Coral Bay – concrete launching ramp.

Recreational fisheries and charter boat operators are managed by the Western Australian Department of Primary Industries and Regional Development. With an estimated 740,000 people fishing recreationally in WA, it makes a significant contribution to the economy and attracts vast numbers of visitors to the region each year (Department of Fisheries, 2014). The Ningaloo Marine Park (~9 km from the Operational Area) also provides high-quality fishing for species such as spangled emperor, Spanish mackerel and coral trout. The Muiron Islands are ~36 km from the Operational Area and are used recreationally for swimming, snorkelling and scuba diving. Further, the Montebello Islands ~178 km from the Operational Area are used for recreational activities including camping, fishing, diving and boating.

4.10.7 Commercial Shipping

The Australian Maritime Safety Authority (AMSA) has introduced a network of marine fairways across the NWMR off WA to reduce the risk of vessel collisions with offshore infrastructure. The NY FPSO Operational Area within Petroleum Licence WA-28-L and WA-59-L lies outside of these declared and charted shipping fairways.

Refer to **Figure 4-13** for vessel density within the Operational Area and EMBA.

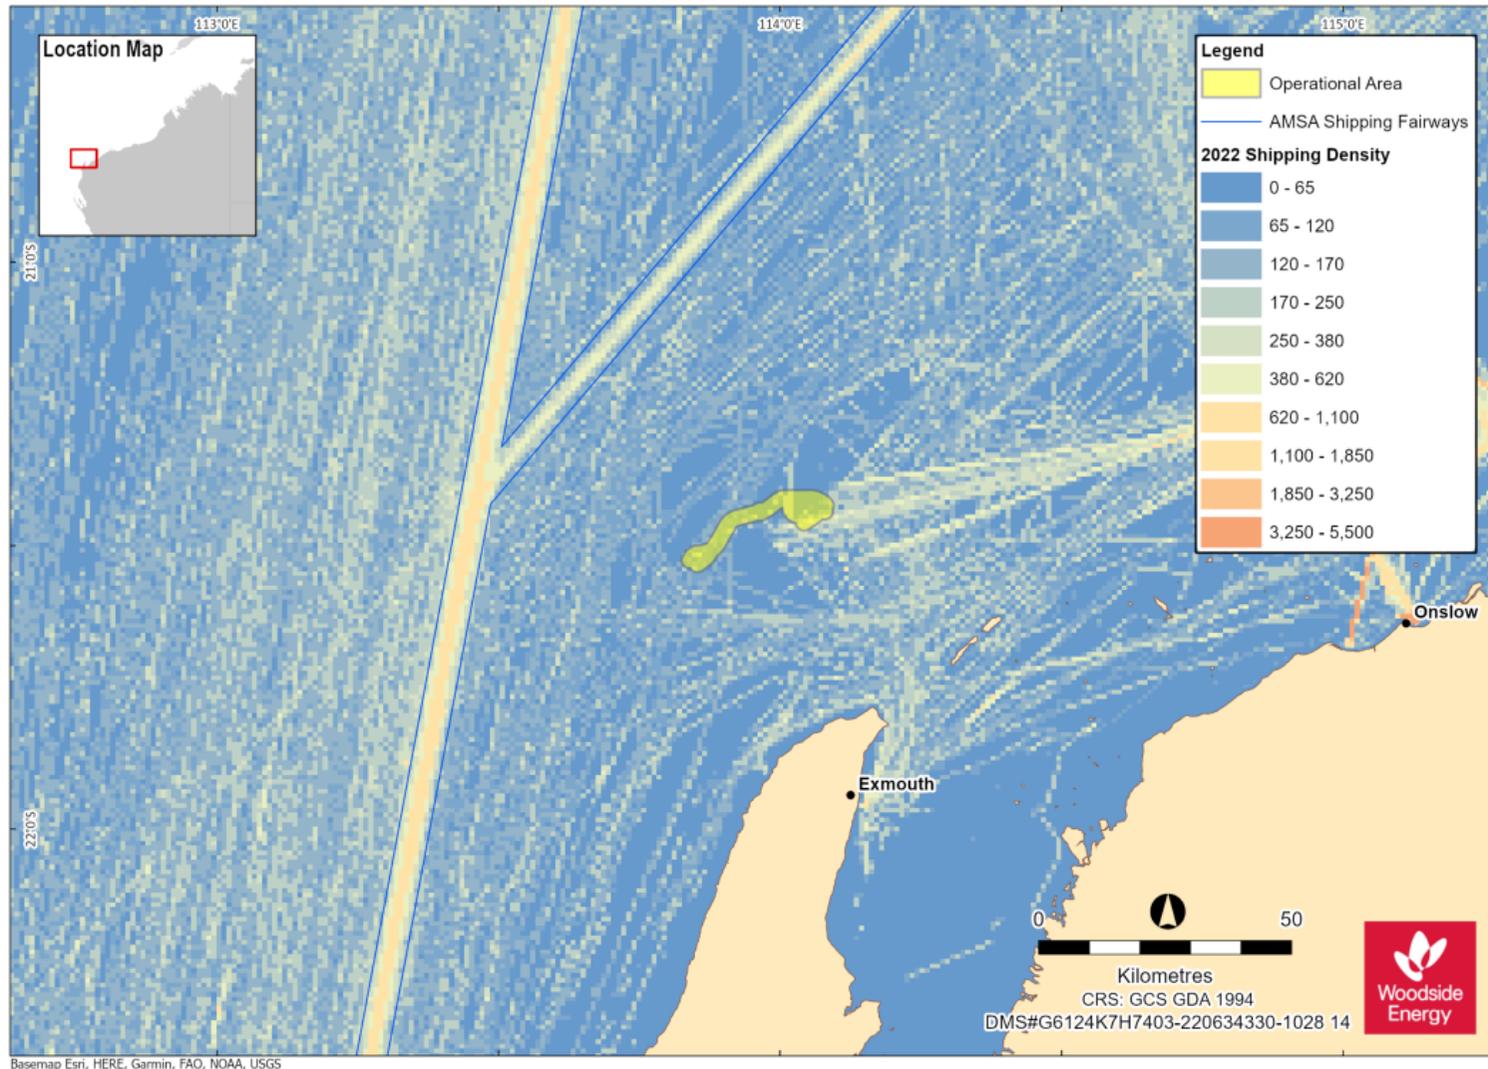

Figure 4-13: Vessel density map for the Operational Area and environment that may be affected, derived from Australian Maritime Safety Authority satellite tracking system data (vessels include cargo, liquefied natural gas tanker, passenger vessels, support vessels and others/unnamed vessels)

4.10.8 Oil and Gas

The Operational Area is located within an area of established oil and gas operations within the North West Marine Region. **Table 4-24** details other oil and gas facilities located within 50 km of the Operational Area.

Table 4-24: Other oil and gas facilities located within 50 km of the Operational Area

Facility Name and Operator	Distance and Direction from Operational Area to the Facility (km)
Santos Van Gogh/Coniston/Novara Development (Ningaloo Vision FPSO)	1 km north-east
Woodside Pyrenees Facility (Pyrenees FPSO)	2 km south-east
Woodside Macedon Subsea Gas Field	2 km south-east

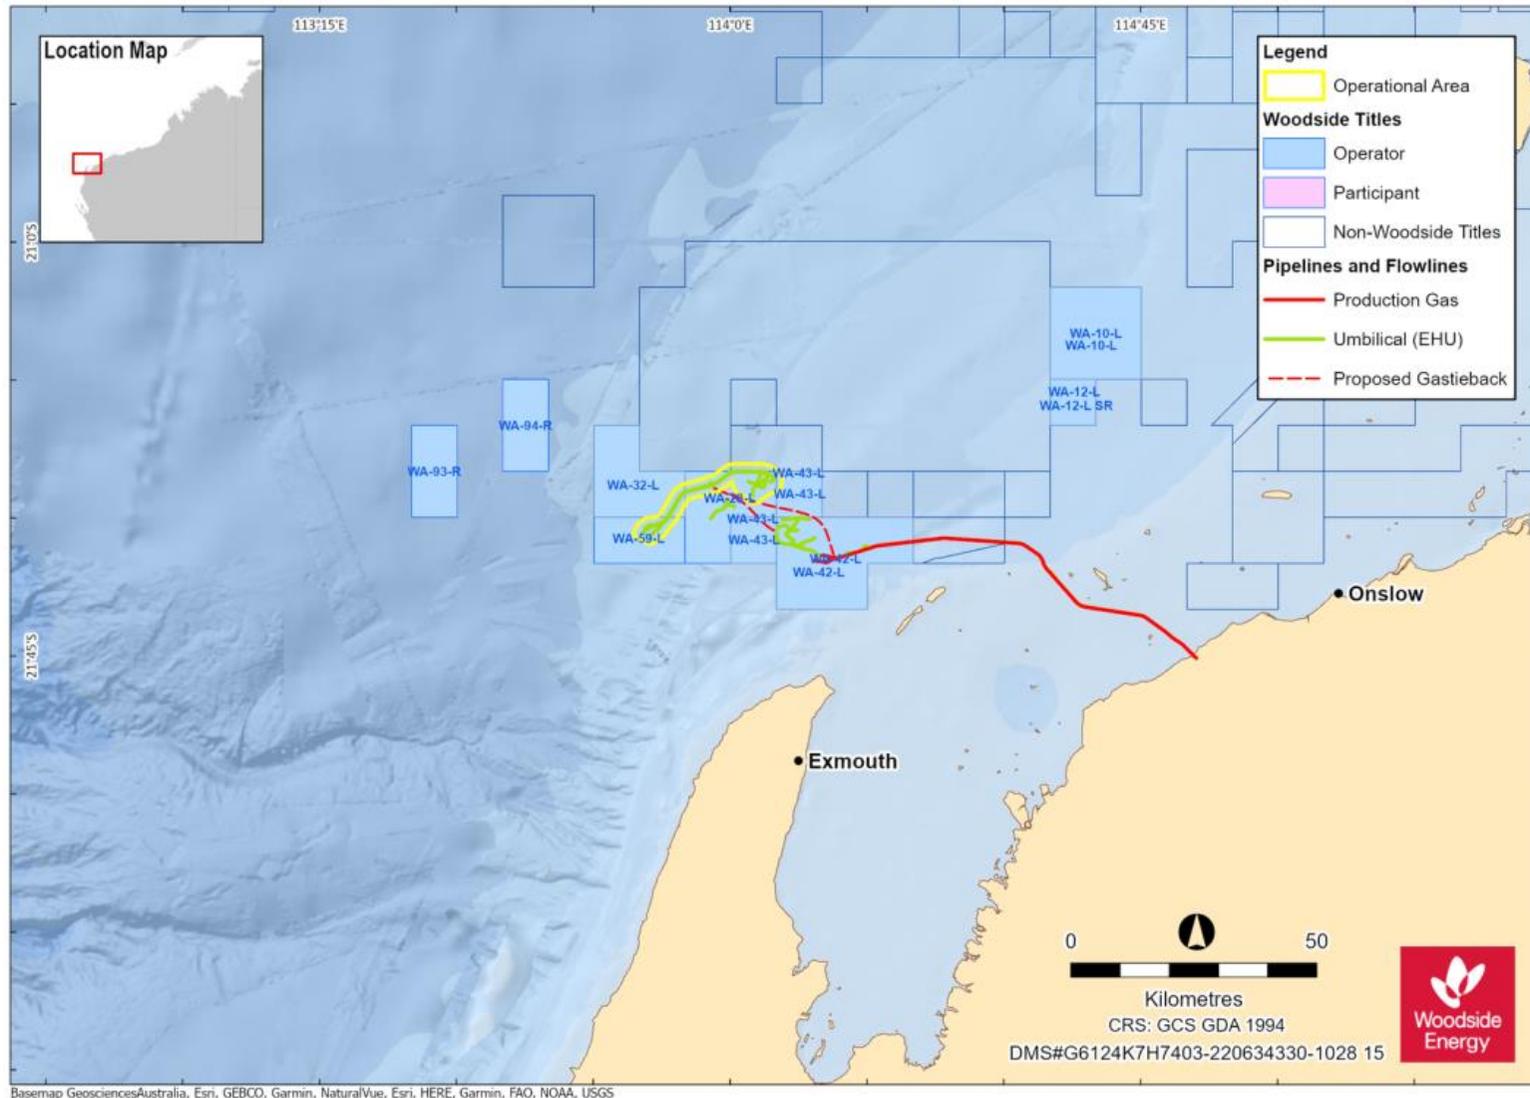

Figure 4-14: Oil and gas Infrastructure within the Operational Area and environment that may be affected

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10.9 Defence

Department of Defence (DoD) areas, facilities and UXOs overlapping the Operational Area and EMBA are outlined in **Table 4-25**. The Learmonth air training area is the only DoD area that overlaps the Operational Area, but there are a wide range of others throughout the broader EMBA.

Table 4-25: Defence areas, facilities and unexploded ordnances overlapping the Operational Area and/or environment that may be affected

Defence area/facility	Presence	
	OA	EMBA
Learmonth Air Weapons Range Facility.		✓
Learmonth air training area (associated with the Learmonth Air Weapons Range Facility).	✓	✓
Naval Communications Station Harold E. Holt.		✓
UXO SDG096 Sea Dumping: Anchor Island. This site is an area used for the dumping at sea of ordnance and other items.		✓
Potential Depth Charge UXO DEP022: Northwest of Bessieres Island. This site was an area where Depth Charges were used in WWII and where some depth charges failed to function.		✓
UXO 793 and 794: Exmouth Gulf: Prior to WWII, RAN bombarded both land and sea targets on and near the peninsula.		✓
UXO 1018: Exmouth Gulf: Allied WWII base high explosive ordnance were stored and fired.		✓
UXO 1019: Exmouth Gulf: Aerial bombing in the Rough Range area during WWII. Two depth charges were lost overboard in the Bay of Rest area. Artillery fired on land and sea targets.		✓
UXO 940: Onslow. Anti-aircraft artillery live firing practices using high explosive ammunition during WWII. Aerial bombing also highly likely.		✓
Potential Depth Charge UXO DEP027: East of Montebello Islands. This site was an area where Depth Charges were used in WW2 and where some depth charges failed to function.		✓
UXO SDG082: Sea Dumping – Ningaloo. This site is an area used for the dumping at sea of ordnance and other items.		✓
UXO SDG129 and 116 Sea Dumping – Indian Ocean. This site is an area used for the dumping at sea of ordnance and other items.		✓
Geraldton Seaward – artillery fired seaward during WWII and small quantities of high explosive ammunition were dumped at sea off Geraldton during the 1950s.		✓
Oakajee Air Gunnery Range Geraldton – danger area shown seaward of coast. Probable ordnance impacted on land.		✓
Rangeway – live fire anti-armour exercises.		✓
Narngulu – areas most likely to contain UXO are the sand dunes to the west, south-west and south of Meru.		✓
Separation Point – artillery unit fired from vicinity of Wonthella to beach area of Separation Point in 1942.		✓
Mouth of Greenough River & Southgate Dunes – artillery and anti-armour firings into sand dunes.		✓
Jurien Bay Bombing Range – high explosive aerial bombing and strafing.		✓
UXO SDG097 Sea Dumping – Coastal WA – Nambung. Area used for the dumping at sea of ordnance and other items.		✓
Flat Rock – area used since 1940 as a high explosive bombing target.		✓
Wedge Island – RAAF/Allied Air Forces used Wedge Island as an aerial bombing target during WWII.		✓
Ran Gunnery Range Lancelin – area of Ocean west of current Naval Gunnery Range.		✓

Defence area/facility	Presence	
	OA	EMBA
Lancelin Moore River Artillery Range – used as a high explosive target area by Army from WWII until 1975.		✓
Moore River RAAF Armament Range – used as RAAF air to air gunnery training area.		✓
Rottneest Seaward Firing – site is one of many that was used for dumping at sea of ammunition and other items after WWII.		✓
Cockburn Sound Seawards Firing – WWII live firing of mortars. Post WWII use by army firing 81mm high explosive ammunition, anti-armour rockets and grenades.		✓
UXO Sea Dumping sites West of Rottneest Island. Area used for the dumping at sea of ordnance and other items. SDG090, SDG092, SDG117, SDG114, SDG113, SDG118, SDG100, SDG115, SDG098, SDG119, SDG086, SDG124, SDG120, SDG084, SDG094, SDG095, SDG083.		✓
Potential Depth Charge UXO North West of Rottneest Island: DEP024, DEP028, DEP029.		✓
Albany Seaward – Slight potential of shells on the Harbour floor following the end of WWII, live ammunition was dumped into the channel at Point King.		✓
Albany – slight potential of artillery and mortar live fire from 1890–1993.		✓
Gardner River – slight potential of high explosive mortars and grenades following the end WWII.		✓
Cape Mantelle – RAAF aircraft used Cow Rock Island as a bombing target during WWII.		✓
Margaret River – live fire mortar shoot from 1944.		✓
Dunsborough – possible live firing mortar practice in 1994.		✓
Gardner River – slight potential of high explosive mortars and grenades following the end WWII.		✓
Cape Mantelle – RAAF aircraft used Cow Rock Island as a bombing target during WWII.		✓
Margaret River – live fire mortar shoot from 1944.		✓
Wonnerup Air Gunnery Area – air-to-ground gunnery range was gazetted in 1942.		✓
UXO SDG126 – Sea Dumping – Coastal WA – Margaret River. This site is an area used for the dumping at sea of ordnance and other items.		✓
UXO SDG116 – Sea Dumping – Indian Ocean. This site is an area used for the dumping at sea of ordnance and other items.		✓
Scarborough Seawards Firing – Reports of anti-aircraft battery firing seaward.		✓
Red Peak – Army artillery group conducted training exercises in 1942.		✓
UXO SDG096 – Anchor Island. This area is used for the dumping at sea of ordnance and other items.		✓
Potential Depth Charge UXO DEPO20 and 21 – Yampi Sound. This site was an area where depth charges were used in WWII and where some depth charges failed to function.		✓
Potential Depth Charge UXO DEP036 and 38 – Timor Sea. This site was an area where Depth Charges were used in WWII and where some depth charges failed to function.		✓
UXO 1111 – Darwin Area. Former Air-to-Air Weapons Range.		✓

5 CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 25 of the Environment Regulations. Consultation is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests and activities, to enable titleholders to consider and adopt appropriate measures in response to objections or claims received from relevant persons. Consistent with regulation 4 of the Environment Regulations, consultation also supports the objective to ensure that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to ALARP and will be of an acceptable level.

Woodside acknowledges a titleholder's approach to consultation is to be informed by both the Environment Regulations and the findings of relevant Courts, including the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 (Tipakalippa Appeal) (see **Sections 5.2** and **5.5.1**) delivered on 2 December 2022.

For this Petroleum Activities Program, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in **Section 5.2**). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from the Petroleum Activities Program (see **Section 4**).

Woodside's consultation methodology is divided into two parts:

1. The first section (**Section 5.2 to 5.5**) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 25(1) of the Environment Regulations to identify relevant persons.
2. The second section (**Section 5.6 to Section 5.7**) details Woodside's approach to accepting feedback and assessment of the merit of each objection or claim, and engaging in ongoing consultation for this EP.

Woodside's consultation record includes:

- assessment and identification of relevant persons
- consultation information provided to relevant persons, feedback received and Woodside's assessment of the merits of objections or claims
- engagement with persons or organisations that Woodside chose to contact who are not relevant persons for the purposes of regulation 25(1) of the Environment Regulations (see **Section 5.3.2.1**)
- opportunities provided to persons or organisations to be aware of Woodside's proposed EP and participate in consultation, including individual Traditional Custodians.

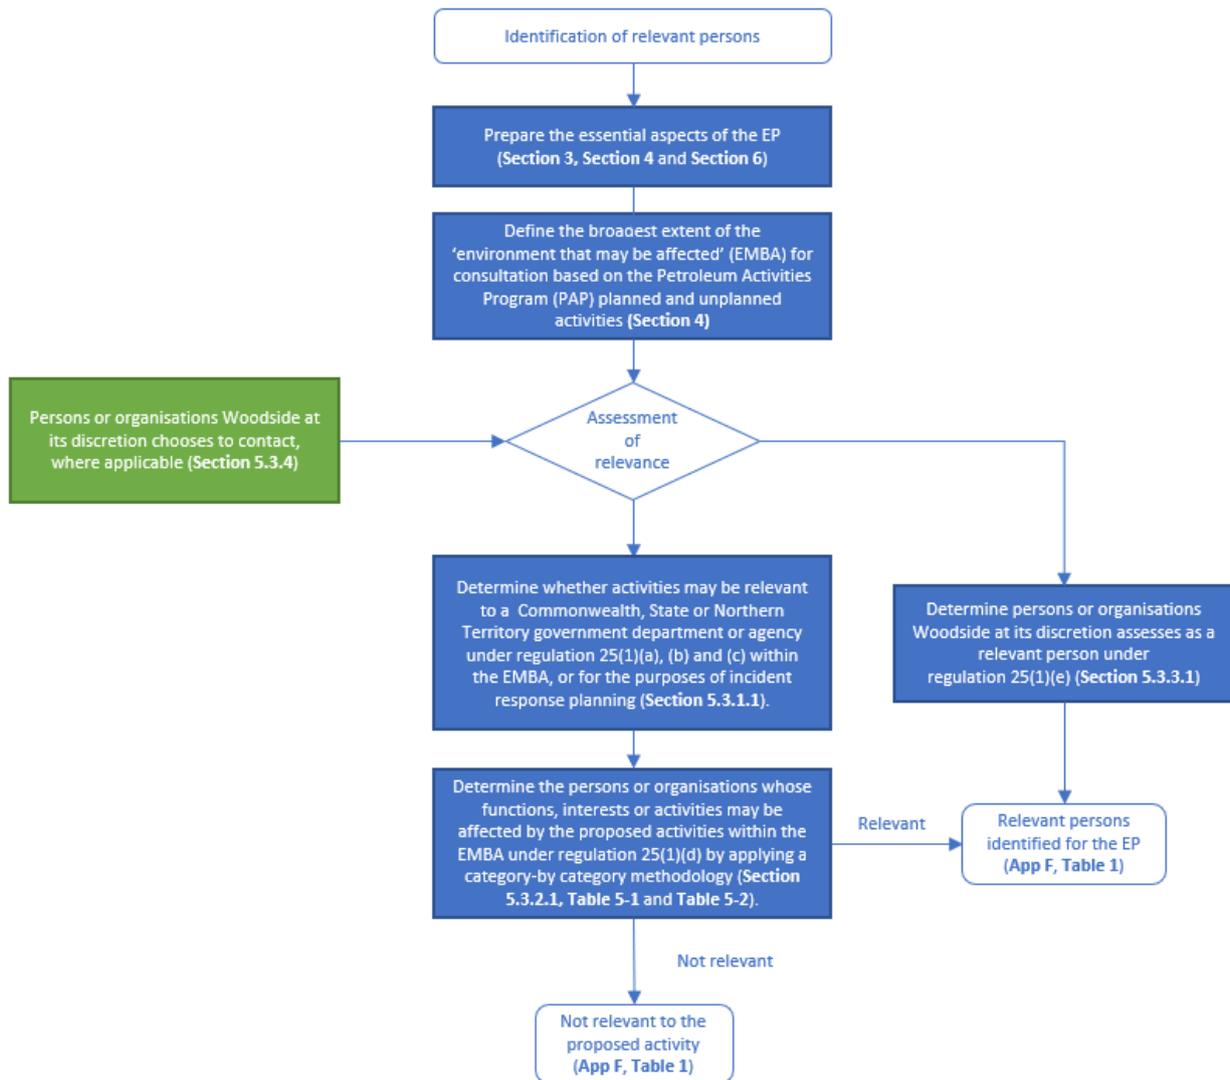

Figure 5-1: Overview of Woodside’s methodology to identify relevant persons

5.2 Consultation – General Context

Woodside has a portfolio of quality oil and gas assets and more than 30 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations to understand the potential risks and impacts from our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult, but rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a proposed petroleum activity. The information in the consultation list has been captured from years of experience, it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's Guideline on *Consultation in the course of preparing an environment plan* (12 May 2023) as well as judicial guidance in the Tipakalippa Appeal on the intent of consultation as follows:

- At paragraph 54 of the appeal decision: ... *provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- At paragraph 89 of the appeal decision: ...*its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The Tipakalippa Appeal has also been further considered in the context of specific methods for consultation with First Nations relevant persons (**Section 5.5.1**).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) of the Environment Regulations (**Section 5.3**). This methodology is consistent with NOPSEMA's guideline and demonstrates that, to meet the requirements of regulation 34 (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see **Section 3.3**)
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in **Section 4.1** and assessed in **Section 6.8**).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 25 of the Environment Regulations, which requires a titleholder to:

- consult with each of the following (a **relevant person**) in the course of preparing an environment plan:
 - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the environment plan may be relevant;
 - if the plan relates to activities in the offshore area of a State – the Department of the responsible State Minister;
 - each Department or agency of a State or the Northern Territory to which the activities to be carried out under the EP, or the revision of the EP, may be relevant
 - if the plan relates to activities in the Principal Northern Territory offshore area – the Department of the responsible Northern Territory Minister;
 - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP; and
 - any other person or organisation that the titleholder considers relevant (regulation 25(1)).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (regulation 25(2));
- allow a relevant person a reasonable period for the consultation (regulation 25(3));

- tell each relevant person that the titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development set out in Section 3A of the EPBC Act – see **Section 2**
- is intended to reduce the environmental impacts and risks from the activity to ALARP (regulation 4 of the Environment Regulations);
- seeks to ensure that the environmental impacts and risks of the activity will be of an acceptable level (regulation 4 of the Environment Regulations);
- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the petroleum activity;
- is collaborative. Woodside respects that for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside collaborates with the relevant person with the aim of seeking genuine and meaningful two-way dialogue;
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to **Section 5.7** and **Section 7.10**).

An overview of Woodside’s consultation approach is outlined at **Figure 5-2**.

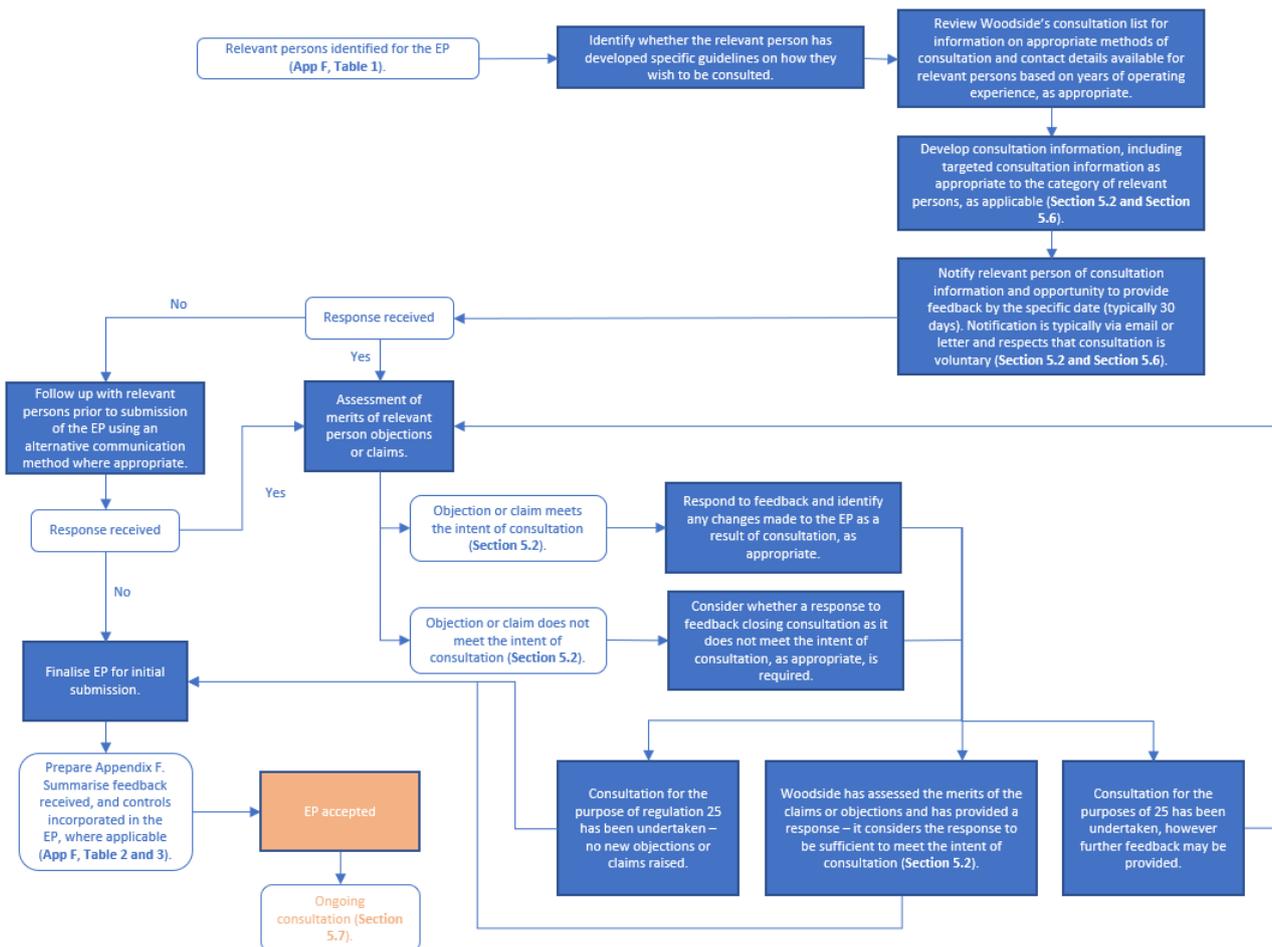

Figure 5-2: Overview of Woodside’s consultation approach.

5.3 Identification of Relevant Persons for Consultation

5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons within the description of regulations 25(1)(a) and (b) of the Environment Regulations is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government

departments and agencies relevant to the EP are also listed. In accordance with regulation 25(1)(c) of the Environment Regulations, Woodside consults with the department of the relevant State Minister.

5.3.1.1 Identification of relevant persons under regulations 25(1)(a), (b) and (c)

Woodside’s methodology for identifying relevant persons under regulations 25(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities in the EMBA to be carried out under the EP may be relevant. This list of relevant department and agencies is formulated by reference to the responsibilities of the government departments as set out on their websites, in NOPSEMA’s *GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area* guideline (January 2023), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating in relation to the departments and agencies which Woodside has historically consulted over the years. This list is revised from time to time, for example, for the purposes of accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.
- Woodside has categorised government department or agency groups as follows:

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the marine environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies and determines whether those responsibilities overlap with potential risks and impacts specific to the proposed petroleum activity in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry and AHO is responsible for maritime safety and Notices to Mariners. To undertake the Petroleum Activities Program in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the Petroleum Activities Program. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.
- The list of those government departments and agencies assessed as relevant is set out in **Table 1**.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at **Table 2 and Table 3** as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the proposed petroleum activity in the EMBA or would not be involved in incident response planning.

5.3.2 Regulation 25(1)(d)

To identify a relevant person for the purposes of regulation 25(1)(d) of the Environment Regulations, the meaning of “functions, interests or activities” needs to be understood. In regulation 25(1)(d) of the Environment Regulations, the phrase “functions, interests or activities” should be construed broadly and consistently with the objects of the Environment Regulations (regulation 4) and the objects of the EPBC Act (section 3A).

In developing its methodology for consultation, Woodside acknowledges that the guidance on the definition of functions, interests and activities is as follows in accordance with NOPSEMA’s *GL2086 – Consultation in the course of preparing an environment plan* guideline (May 2023):

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of ‘interest’ in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of ‘activity’ in regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside’s methodology for determining ‘relevant persons’ for the purpose of regulation 25(1)(d) of the Environment Regulations includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation’s functions, interests or activities may be affected by Woodside’s proposed planned or unplanned activities.

On the topic of consulting outside of Australia’s jurisdiction, when assessing potential impacts from planned and unplanned activities for this EP, it was determined there was an extremely low probability of an unplanned hydrocarbon release entering international waters (**Section 6.8.3**), specifically Indonesian and Timor Leste waters. Consideration has been given to the functions, interests or activities that may be affected by the activities to be carried out should a worst-case scenario eventuate, noting that modelling completed to predict the extent of potential impact is based on there being no mitigative controls in place. The more realistic scenario is that appropriate mitigation controls set out in Woodside’s Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans would be in place or will be implemented.

The obligation to consult must be construed in a practical and pragmatic way that makes this process reasonable and workable,⁷ and capable of being discharged within a reasonable time.⁸ The obligation to identify relevant persons for the purpose of consultation must be capable of practicable and reasonable discharge. The Regulations require relevant persons, and their interests, to be readily ascertainable to the titleholder.⁹ In the case of Indonesia and Timor Leste, which comprises extensive coastlines and potentially remote communities, Woodside considers potential relevant persons within these communities are not readily ascertainable, for reasons including that there are limited electronic records and public records which allow for the identification of potential functions, interests or activities, e.g. fisheries, tourism licences and permits.

For example, there are no known licensing requirements either in Australia or in Indonesia or Timor Leste for traditional fishers, therefore, no publicly available information to identify and make contact with persons for consultation purposes. The logistics of access to these fishers, the nature of their activities and distance and remoteness from the Operational Area of this activity of over 1300

⁷ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [89], [109], [136], [138], [141]

⁸ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [136].

⁹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 [136], [147], [153]

kilometres makes international consultation impractical to discharge from a reasonable time and efforts perspective.

Given the extremely low probability of potential impacts, the difficulty of identifying international individuals, and the impracticality of engaging where feedback on unplanned impacts is highly unlikely to inform proposed activities, consultation with international individuals is not required or the activities described in this EP.

Having regard to nature and scale and given the extremely low probability of potential impacts (which are the highly unlikely occurrence of spill traversing international waters), the current processes in place with Department of Foreign Affairs and Trade (DFAT) and the processes and consultation triggers set out in the Woodside's Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans provide a mechanism for consultation in international waters that will be complied with at the appropriate time, if an incident occurs. In such circumstances, consultation with the DFAT discharges the requirement for consultation with international persons.

Woodside will continue to consult the DFAT for proposed activities outside of Australia's jurisdiction including in the event of a hydrocarbon spill that is likely to traverse international waters as described in the Oil Pollution Emergency Plan – Appendix H of this EP. The process for working with DFAT to manage activities and consultation in the highly unlikely event of a hydrocarbon spill that may traverse international waters is described in the Oil Pollution Emergency Plan – Appendix H of this EP.

5.3.2.1 Identification of relevant persons under regulation 25(1)(d)

Relevant persons under regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under this EP (described in **Section 3**)
- the EMBA by unplanned activities (identified in **Section 4** and assessed in **Section 6**).

To identify relevant persons who fall within regulation 25(1)(d), Woodside adopts the following methodology, and then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and current literature.

Further, to assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities proposed to be carried out under the EP. The broad categories are identified in **Table 5-1** and identification methodology applied as set out in **Table 5-2**.

The list of those persons or organisations assessed as relevant and persons or organisations Woodside separately chose to contact is set out in **Table 1**.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in **Table 5-2**, as appropriate.

Feedback from relevant persons is summarised at **Table 2**. Feedback from persons assessed as not relevant but whom Woodside chose to contact or self-identified and Woodside assessed as not relevant are summarised at **Table 3**.

Table 5-1: Categories of relevant persons

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the Commonwealth <i>Fisheries Management Act 1991</i> and Western Australian <i>Fish Resources Management Act 1994</i> , which may be amended from time to time. Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.
Titleholders and Operators	Registered holder of an offshore petroleum title or GHG title governed by the <i>OPGGs Act</i> and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are First Nations Australians who hold cultural rights and interests, or have cultural functions or perform cultural activities over particular lands and waters. Where a First Nations person, group or entity self-identifies and/or asserts cultural rights, functions, interests or activities they will be included in the definition of Traditional Custodian for the purpose of this EP.
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians' nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the <i>Native Title Act 1993</i> by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the <i>Native Title Act 1993</i> (NTA) with prescribed functions, set out in Part 11 of the <i>Native Title Act 1993</i> , which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Historical heritage groups or organisations	Legislated or government enlisted groups or organisations responsible for the management of marine heritage.
Local government and recognised local community reference/liaison groups or organisations	Local government governed by the <i>Local Government Act 1995</i> (WA) which is responsible for representing the local community. Recognised local community reference/liaison group or organisation in relation to oil and gas matters.
Other non-government groups or organisations	Non-government organisation with public website material targeting the proposed activity.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-2: Methodology for identifying relevant persons within the environment that may be affected undertaken under subcategory 25(1)(d) – by category

Category	Relevant Person Identification Methodology
<p>Commercial fisheries (Commonwealth and State) and peak representative bodies</p>	<p>Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • Define the parameters having regard to timing, location and duration of the proposed petroleum activity. • Confirm whether the EMBA overlaps with the fisheries management area (i.e. the spatial area the fishery is legally permitted to fish in) (see Section 4.10). <p>Woodside acknowledges WAFIC’s consultation guidance¹⁰ (accessed on 2 February 2023), that Titleholders develop separate consultation strategies for significant unplanned events (for example oil spill) where Titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC’s guidance is that consultation on unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs.</p> <p>For Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA ABARES and DPIRD FishCube data within the Operational Area and EMBA (see Section 4.10).</p> <p>Assessment of Relevance</p> <p>State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10) are assessed as relevant to the proposed activity. Woodside acknowledges WAFIC’s consultation guidance¹ (see above) and applies this by:</p> <ul style="list-style-type: none"> • directly consulting fishery licence holders that are assessed as having a potential for interaction in the Operational Area • consulting fisheries that are assessed as having a potential for interaction in the EMBA via WAFIC. <p>Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10) are assessed as relevant to the proposed activity.</p> <p>If Woodside has identified that a Commonwealth or State fishery is a relevant person, then Woodside also consults the fisheries relevant representative body. For example, WAFIC represents the interests of State fisheries in Western Australia. If a State fishery is identified as relevant, Woodside would also identify WAFIC as relevant. Recognised Commonwealth fishery representative bodies are identified by AFMA via its website. WAFIC is the only recognised State fishery representative body.</p>
<p>Recreational marine users and peak representative bodies</p>	<p>Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. From Woodside knowledge and operating experience, knowledge of recreational marine users in the area. This assessment is both activity and location based. 2. Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. 3. Assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD FishCube data to assess whether there has been activity within the EMBA in the past 5 years. <p>Assessment of Relevance</p> <ol style="list-style-type: none"> 1. Recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons. 2. If Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers. These representative bodies are identified via Woodside’s existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.

¹⁰ [Consultation Approach for Unplanned Events - WAFIC.](#)

Category	Relevant Person Identification Methodology
<p>Titleholders and Operators</p>	<p>Woodside assesses relevance for other Titleholders and operators using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. Using WA Petroleum Titles (DMIRS-011) to determine overlap with other Titleholders or Operators permit areas within the EMBA. 2. From Woodside knowledge and operating experience, knowledge of other operators in the area. 3. Woodside produces a map showing the outcome of this assessment. <p>Assessment of Relevance</p> <p>Titleholders and Operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.</p>
<p>Peak industry representative bodies</p>	<p>Woodside assesses relevance for peak industry representative bodies using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. Review peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside's proposed activities within the EMBA. 2. Review Woodside's existing consultation list. 3. Search websites to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside's proposed activities within the EMBA. <p>Assessment of Relevance</p> <p>Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside's proposed activities within the EMBA are assessed as relevant.</p>

Category	Relevant Person Identification Methodology
<p>Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations</p>	<p>Consistent with its understanding of the matters discussed in Section 4.9, to identify Traditional Custodian groups or individuals, Woodside:</p> <ul style="list-style-type: none"> • uses existing systems of recognition to identify First Nations groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under native title or cultural heritage legislation, or marine park management plans, or identification by other First Nations groups or entities) • notifies and invites consultation with First Nations people through their nominated representative corporation (for example PBCs); or, in the case of native title, and where appropriate, the Native Title Representative Body • requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders) • requests advice as to other First Nations groups or individuals that should be consulted • advertises widely so as to invite self-identification and consultation by First Nations groups and/or individuals. <p>Further detail to Woodside’s methodology is as follows.</p> <p>Woodside uses the databases of the National Native Title Tribunal to understand whether there are any:</p> <ul style="list-style-type: none"> • Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA • relevant Indigenous Land Use Agreements (ILUA), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. <p>Where there is a positive determination of native title, Woodside contacts the PBC or, where their representative is a Native Title Representative Body, contacts the Native Title Representative Body.</p> <p>Where appropriate, Woodside contacts the relevant Native Title Representative Body to request a list of any First Nations groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA.</p> <p>Woodside reviews Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values.</p> <p>Woodside contacts First Nations groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body.</p> <p>Woodside requests the PBC to distribute consultation materials through its membership. Woodside is unable to contact this membership through any other means.</p> <p>Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self-identify.</p> <p>Individuals that consider their functions, interests or activities may be affected by a proposed activity are provided an opportunity to self-identify for each EP. Woodside does not presume that self-identification for an activity, covered by another EP, automatically means an individual(s) functions, interest and activities may be affected by other activities where EMBA’s overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess any risks and impacts to their values, and enable individuals to self-identify.</p> <p>Assessment of Relevance</p> <p>Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.</p>

Category	Relevant Person Identification Methodology
<p>Native Title Representative Bodies</p>	<p>Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology:</p> <p>A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the <i>Native Title Act 1993</i> (NTA) with prescribed functions set out in Part 11 of the <i>Native Title Act</i>, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.</p> <p>Woodside reviews National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA.</p> <p>Assessment of Relevance</p> <p>Where the area for which a Native Title Representative Body is recognised under the <i>Native Title Act</i>, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.</p>
<p>Historical heritage groups or organisations</p>	<p>Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. Use the Australasian Underwater Cultural Heritage Database to assess any known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see Section 4.9). <p>Assessment of Relevance</p> <p>Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.</p>
<p>Local government and recognised local community reference/liaison groups or organisations</p>	<p>Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. Review Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries My Council database and WA Local Government Association (WALGA) Local Government Directory maps) to assess any overlap between the local government's defined area of responsibility and the EMBA. 2. Hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. 3. Review the community reference/liaison group's terms of reference to determine its area of responsibility and any overlap with the EMBA. For example, the Exmouth Community Liaison Group's area of responsibility in relation to Woodside's operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e. onshore). <p>Assessment of Relevance</p> <p>The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant.</p> <p>The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.</p>

Other non-government groups or organisations	<p>Woodside assesses relevance for other non-government groups or organisations using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. Review Woodside's existing consultation list. 2. Search websites of registered non-government groups or organisations (i.e. registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website material specific to the proposed activity at the time of development of the EP. 3. Look for the organisation's publicly available mission statement (or purpose) that clearly describes their collective functions, interests or activities. 4. Review current website material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with planned activities. <p>Assessment of Relevance</p> <p>Registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation will be assessed as relevant.</p>
Research institutes and local conservation groups or organisations	<p>Woodside assesses relevance for research institutes and local conservation groups or organisations using the following next steps in its methodology:</p> <ol style="list-style-type: none"> 1. Review Woodside's existing consultation list. 2. Search websites for research institutes that may operate within the EMBA. This assessment is both activity- and location-based. 3. Search websites for local conservation groups or organisations that regularly conduct conservation activities within the EMBA. <p>Assessment of Relevance</p> <p>Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant.</p> <p>Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.</p>

5.3.3 Regulation 25(1)(e)

In addition to assessing relevance under regulation 25(1)(d) of the Environment Regulations, Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 25(1)(e).

5.3.3.1 Identification of relevant persons under regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 25(1)(e).

5.3.4 Persons or Organisations Woodside Chooses to Contact

In addition to undertaking consultation with relevant persons under regulation 25(1) of the Environment Regulations, there are persons or organisations that Woodside chooses to contact, from time to time, in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to regulation 25(1) but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with
- that are 'not relevant' pursuant to regulation 25(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator

- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is required to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisations relevance as it does during its initial assessment (as described in **Figure 5-1** and **Section 5.3**). The result of Woodside's assessment of relevance during the development of the EP is outlined at **Table 1**.

5.3.5 Assessment of Relevant Persons for the Proposed Activity

The result of Woodside's assessment of relevant persons in accordance with regulation 25(1) of the Environment Regulations is outlined at **Table 1** and **Appendix F, Table 2**.

Persons or organisations that Woodside assessed as not relevant but chose to contact at its discretion in accordance with **Section 5.3.2.1** or self-identified and Woodside assessed as not relevant are summarised at **Table 1** and **Appendix F, Table 3**.

5.4 Consultation Material and Timing

Regulation 25(2) provides that a titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) provides that the titleholder must allow a relevant person a reasonable period for the consultation.

As set out in **Section 5.2**, Woodside notifies relevant persons, of the proposed activities, respecting that consultation is voluntary (for the relevant person) and collaborates on a consultation approach where further engagement is sought by the relevant person. Woodside understands that the consultation process should be appropriate for the category of relevant persons and that not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Petroleum Activities Program. Woodside recognises published guidance for good practice consultation relevant to different sectors and disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

5.4.1 Sufficient Information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes a description of the proposed petroleum activity, the Operational Area, where the activity will take place, the timing and duration of the activity, a location map of the Operational Area and EMBA, a description of the EMBA, relevant exclusion zones as well as a summary of relevant risks and mitigation and/or management control measures relevant to the proposed petroleum activity. It also sets out contact details to provide feedback to Woodside.

Woodside recognises that the level of information necessary to assist a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and, also may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Woodside also acknowledges NOPSEMA's brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which advises consultees that they may inform titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes the name of the EP Woodside is seeking feedback on, an overview of the activity, the consultation feedback date and the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the *Native Title Act* for native title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with **Section 5.5.1** to determine relevance and evidenced in **Table 1** as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of:

- Consultation Information Sheet available on Woodside’s website
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside’s website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters
- phone calls
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate
- maps outlining a persons or organisations defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area
- community meetings, as appropriate.

Woodside recognises information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that as part of genuine two-way dialogue, these forms of communication may evolve, including for example due to changes to organisation representation, as relationships are further established, or an alternative form of communication is expressed by a person or organisation. Woodside acknowledges there might be limitations in how it can consult with relevant persons.

Typical forms of communication for categories of relevant persons are set out in **Table 5-3**.

Table 5-3: Forms of communication

Category of Relevant Person	Typically Accepted Form of Communication
Government departments/ agencies – marine	Woodside applies NOPSEMA’s guideline for engagement with Commonwealth government departments or agencies in line with GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023 by using email for its consultation unless another form of communication is requested.
Government departments/ agencies – environment	
Government departments/ agencies – industry	Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Category of Relevant Person	Typically Accepted Form of Communication
Commercial fisheries and peak representative bodies	Commonwealth commercial fisheries: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Recreational marine users and peak representative bodies	<p>State commercial fisheries and recreational marine users: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the <i>Fish Resources Management Act 1994</i> and <i>Aquatic Resources Management Act 2016</i>, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder’s discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p> <p>Peak representative bodies: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p>
Titleholders and Operators	Email is used as the primary form of communication between titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Traditional Custodians and nominated representative corporations	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Native Title Representative Bodies	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Historical heritage groups or organisations	NOPSEMA’s guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023) for engagement with government departments or agencies is used as a reference for Woodside’s approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Local government and recognised local community reference/liaison groups or organisations	<p>Local government: NOPSEMA’s guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023) for engagement with local government is used as a reference for Woodside’s approach for communicating with historical heritage groups or organisations.</p> <p>Community reference/liaison groups and chambers of commerce: Email is used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.</p>
Other non-government groups or organisations	Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Research Institutes and Local conservation groups or organisations	Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at **Table 2**.

Table 3 sets out the information which is provided to persons or organisations that are not relevant for the purposes of regulation 25 of the Environment Regulations but which Woodside has chosen to contact.

When engaging in consultation, Woodside notifies relevant persons that, in accordance with regulation 25(4), the relevant person may request that particular information the person or organisation provides in the consultation not be published and that information subject to that request will not be published.

5.4.2 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its Environment Plan. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the EP.

Woodside considers its methodology allows relevant persons a reasonable period for consultation (regulation 25(3) of the Environment Regulations). A reasonable period for all relevant persons, including Traditional Custodian relevant persons, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Regulation 30 of the Regulations sets out a public consultation period of 30 days.
- The Department of Mines and Petroleum “Guidelines for Consultation with Indigenous People by Mineral Explorers” directs a period of 21 to 30 days of consultation with traditional owners.
- While repealed, guidance taken from the Aboriginal Cultural Heritage Act 2021—Consultation Guidelines (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period of time to allow identification, contact, and response, from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation).

This period of consultation demonstrates that Woodside has provided a “reasonable period” for relevant persons to consult in accordance with regulation 25(3) of the Environment Regulations. Commentary in the *Tipakalippa Appeal* judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

“it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time.”¹¹

Woodside seeks feedback in order to support preparation of its environment plan. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to enable a reasonable period for consultation is as follows:

- Advertise in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected.

¹¹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [136].

- Provide consultation materials directly to identified relevant persons as well as persons who are not relevant but Woodside chose to contact, and provide a target date for feedback. Woodside acknowledges feedback may be received from relevant persons after the target date.
- Acknowledge the way in which Woodside provides consultation information may vary depending on the relevant person or organisation, and may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements.
- Follow up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person.
- Engage in two-way dialogue with relevant persons or organisations where feedback is received.

Table 2 and Table 3 sets out a history of consultation and demonstrates that a reasonable period of consultation has been afforded for each relevant person.

Woodside considers that the “reasonable period” of consultation for this EP has closed.

As detailed in **Section 5.6**, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate, at all stages during the life of the EP as per Woodside’s ongoing consultation approach as described in **Section 5.7**.

5.4.3 Discharge of Regulation 25

The Full Federal Court made clear in the Tipakalippa Appeal that consultation should be approached in a “reasonable”, “pragmatic” and “not so literal” way, so that consultation obligations were capable of being met by titleholders (**Section 5.5.1**).¹² Consultation is a “real world activity” and must be capable of reasonable discharge.¹³ The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.¹⁴

When the titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, the regulation 25 consultation requirements are met.¹⁵ Meeting these obligations requires the evaluative judgment to determine reasonable satisfaction of the consultation obligation, and as such, the regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted, and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.¹⁶

The titleholder is not required to obtain consent from a consultee to engage in the activity or confirmation from a consultee that consultation is complete. A titleholder is required to provide an opportunity to consult - the Federal Court has commented that a “reasonable opportunity” for consultation must be afforded to relevant persons.¹⁷ A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed all steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities, and sufficient time to provide relevant feedback for Woodside to assess relevant persons’ objections or claims and action the assessment and response. Woodside has also provided a

¹⁷ Cooper v National Offshore Petroleum Safety and Environmental Management Authority (No 2) [2023] FCA 1158 at paragraph [11]; Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at [153].

reasonable opportunity for there to be genuine two-way dialogue on environmental impacts and concerns.

Woodside has discharged its duty under regulation 25 of the Environment Regulations. Woodside considers that consultation under regulation 25 is complete.

Table 2 and Table 3 of this EP sets out the history of consultation under regulation 25. To the extent a relevant person says that it has further information to share or claims that consultation under regulation 25 has not been completed, **Table 2 and Table 3** provide reasons specifically why Woodside considers consultation under regulation 25 has been met in relation to that relevant person.

5.5 Context of Consultation Approach with First Nations

To comply with regulation 25 of the Environment Regulations, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an Environment Plan.

5.5.1 Approach to Methodology – Woodside’s Interpretation of Tipakalippa

Woodside has implemented a consultation methodology consistent with regulation 25 and guidance provided in the Tipakalippa Appeal (**Section 5.2**). Woodside’s consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (**Section 5.5.2.1 to 5.5.3.2**).

Woodside notes the Full Federal Court discussed several *Native Title Act 1993* (Cth) (**NTA**) cases in response to a submission made in that case that a requirement under regulation 25 to consult “each and every” relevant person would be “unworkable”. The reference to native title cases dealt with how decision-making processes under the NTA requiring “all” members of a group to be contacted for communal approval are interpreted by courts in a “reasonable”, “pragmatic” and “not so literal” way,¹⁸ and how obligations to consult “each and every” person under regulation 25 should be interpreted in a similarly pragmatic way so that consultation is workable. The reference to NTA authorities was made by analogy:

“It can be seen that the terms of [the native title legislation] are somewhat absolute – “all”. However, [the native title legislation] has consistently been construed in a way that is not so literal ... The cases concerning [the native title legislation] ... have reiterated ... that [the native title legislation] does not require that “all” of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting.”¹⁹

*“We consider the authorities in relation to processes under the NTA to be **illustrative** of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner”²⁰ (emphasis added).*

“there is no definition of what constitutes “consultation for the purpose of ref 11A.. A titleholder will need to “demonstrate” to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons”²¹ (emphasis added).

The Judgment in the Tipakalippa Appeal makes it clear that a Titleholder will have some decisional choice in identifying which natural person(s) are to be approached, how the information will be given to allow the “relevant person” to assess the possible consequence of the proposed activities on their

¹⁸ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95], [98], [103]-[104] and [109].

¹⁹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [98].

²⁰ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96].

²¹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [104].

functions, interests or activities, and how the requisite consultation is undertaken.²² Woodside takes this to mean that consultation is not fixed to a rigid process, and indeed, will need to be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 25 requirements through its consultation methodology (**Section 5.5.2**).

Consistent with the Tipakalippa Appeal, Woodside considers NTA-style “full group” meetings are not the only way for there to be compliance with regulation 25 in relation to Traditional Custodian relevant persons. Nominated representative corporations (such as Prescribed Bodies Corporate (PBCs) established under the NTA) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. We do not consider it appropriate for titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.2 Consultation Method

Woodside's First Nations team has experience in engaging and working with First Nations organisations and individuals, including having worked within the Commonwealth native title and cultural heritage systems and state and territory cultural heritage and land rights systems, for several decades. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with First Nations groups' established channels of communication and methods of consultation. The First Nations team exercises its professional judgement and is deeply respectful of long-standing relationships (where in place) when considering consultation with First Nations groups. The First Nations team's approach is also informed by the established systems of recognition for First Nations groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with First Nations groups in the Northern Territory tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976* (Cth)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them. By contrast, recognition for First Nations groups and their nominated representative corporations in Western Australia falls under the *Native Title Act 1993* (Cth) because the vast majority of the Western Australian coastline is settled under the native title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to Native Title Representative Bodies and PBCs. Native title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA, and also help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgment in the Tipakalippa Appeal endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.²³ Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective First Nations communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of

²² Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [47] and [48].

²³ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95],[104],[153].

our activities, to self-identify (**Section 5.5.2.2**), and to provide feedback to inform the management of environmental impacts and risks.

Using these tools, Woodside communicates information about Environment Plans by:

- advertising in relevant newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian.
- creating carefully considered Consultation Summary Sheets with information developed by an Indigenous member of the First Nations Team to remove jargon and provide relevant information for people to have informed understandings about the activities.
- direct contact through nominated representative corporations.
- utilising social media (i.e. Facebook/Instagram), texts and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and on that basis used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. First Nations woman, Professor Bronwyn Castle through 10 years of research found “Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations” (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018)).
- For ongoing consultation post regulation 25 consultation, Woodside introduced a Program of Ongoing Engagement with Traditional Custodians which sets out Woodside's commitment to ongoing engagement and support to care for and manage country, including Sea Country. The program was developed in response to Traditional Custodian feedback.
- Woodside has members of its First Nations team who are based in Karratha and Roebourne and who serve as on-Country points of contact for First Nations organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including encouraging First Nations attendance and involvement at Woodside's information sessions and Community roadshows. Team members on the ground engage in a great deal of preparatory work including by distributing information and providing notice to the community to support First Nations attendance at information sessions and Community roadshows.
- From the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and whom to appropriately consult with (such as elders).
- Holding meetings on country at a place and time agreed with the Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate).
- Providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

5.5.2.1 Identification of Relevant Persons

In order to undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) of the Environment Regulations (**Section 5.2 and 5.3**).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been

implemented by Woodside through consultation with a nominated representative corporation where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (**Section 5.5.3.2**). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporations. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in **Section 5.5.3.2**, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act 1993* (Cth), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which aims to seek, from members, authorisation of agreements and native title/compensation claims under the *Native Title Act*²⁴.

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their members. However, Woodside recognises the process is voluntary and it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.2.2 Opportunity to Self-identify and Identifying Other Individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (**Section 5.5.2.1**). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an Environment Plan is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Owners' authorised representative entities.
- Recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their

²⁴ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193, at [104].

members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so nor seek to audit the representative entities for compliance with any request.

- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. Most nominated representative corporations to date have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and elders outside of this process due to requirements imposed in Environment Plan consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

5.5.3 Sufficient Information

Woodside recognises the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and also may depend on the degree to which a relevant person is potentially affected.

Woodside produces a Consultation Information Sheet for each Environment Plan which is provided to relevant persons and organisations to provide the opportunity for feedback on the activity (**Section 5.4.1**). In response to Traditional Custodians' feedback, Woodside has tailored effective consultation methods for its activities, specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Consultation Summary Sheet was developed and reviewed by Indigenous representatives so that content is appropriate to the intended recipients, is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face to face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians' location of choice (where practicable) and with their nominated attendees. Key project personnel, environmental and First Nations relations experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and

requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

5.5.3.1 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its Environment Plan. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (**Section 5.4.2**).

5.5.3.2 Discharge of Regulation 25

Woodside's consideration and approach to discharging regulation 25 of the Environment Regulations for all relevant persons is discussed in **Section 5.4.3**. In addition to this, Woodside has considered the application of regulation 25 specifically to First Nations based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 25 of the Environment Regulations. Woodside considers that consultation under regulation 25 is complete (**Section 5.4.3**).

5.6 Providing Feedback and Assessment of Merit of Objections or Claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An environment plan feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in **Section 5.2**. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the environment plan and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under regulation 34(g) of the Environment Regulations, there is no requirement for a relevant person to agree or confirm that they have been adequately consulted.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in **Section 5.2**, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see **Section 5.3.4**). This information is summarised in **Table 2 and**

Table 3 and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with regulation 26(8) of the Environment Regulations, sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 25 of the Environment Regulations, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

5.7 Ongoing Consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to **Section 7.10**), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the intended outcome of consultation, Woodside will apply its Management of Change and Review process as appropriate (see **Section 7.1.16**).

6 ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA

6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MC for the Petroleum Activities Program, using the methodology described in **Section 2**.

6.2 Analysis and Evaluation

As required by regulation 21(5) and 21(6) of the Environment Regulations, the analysis and evaluation demonstrate that the identified risks and impacts associated with the Petroleum Activities Program are reduced to ALARP, are of an acceptable level and consider all operations of the activity, including potential emergency conditions.

Impacts and risks identified during the ENVID (including Decision Type, current risk level, acceptability of risk and tools used to demonstrate acceptability and ALARP) have been divided into two broad categories:

1. planned (routine and non-routine) activities
2. unplanned events (accidents, incidents or emergency situations).

Within these categories, impact and risk assessment groupings are based on environmental aspect²⁵ (e.g. emissions, physical presence, etc). For all hazardous events considered, the worst credible consequence was assumed.

The ENVID identified 18 impacts and 16 risks associated with the Petroleum Activities Program. Planned activities and unplanned events are summarised in **Table 6-1** and **Table 6-2**. The assigned risk ratings were determined with controls in place as described in **Section 2.6.3**.

The analysis and evaluation for the Petroleum Activities Program indicate that current environmental risks and impacts associated with the activity are reduced to ALARP and are of an acceptable level, as discussed further in **Section 6.6** to **Section 6.8**.

²⁵ An environmental aspect is an element of the activity that can interact with the environment.

Table 6-1: Environmental impact and risk analysis summary table – planned activities

Aspect	EP Section	Source of Impact	Key Potential Environmental Impacts (refer to relevant EP section for details)	Controlled Impact Classification	Residual Impact Level (ALARP controls in place)	Acceptability of Impact	
Planned Activities (Routine and Non-routine)							
Physical presence: disturbance to marine users	6.6.1	Presence of NY FPSO and subsea infrastructure excluding and/or displacing other users from Petroleum Safety Zone and Operational Area respectively.	Potential isolated social impact potentially resulting from interference with other sea users, including the exclusion of other users, such as: <ul style="list-style-type: none"> shipping: no shipping lanes overlap operational area, localised exclusion of shipping traffic commercial fishing: low levels of fishing, minor to no potential for interaction tourism and recreation: expected to be infrequent. 	F	Socio-cultural – No lasting effect (<1 month). Localised impact not significant to environmental receptors.	Broadly acceptable	
		Presence of vessels excluding and/or displacing other users.					
Physical presence: disturbance to seabed	6.6.2	Presence of subsea infrastructure (including moorings and redundant infrastructure remaining infield until Facility EOFL) disturbing marine habitats.	Localised modification of seabed habitat within Operational Area. Potential slight, localised modification of seabed habitat within Operational Area with slight potential for impacts to water quality and benthic communities.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable	
		Subsea operations, inspection, maintenance and repair activities resulting in disturbance to seabed.		E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable	
Routine acoustic emissions: generation of noise during routine operations	6.6.3	Noise generated within the Operational Area from: <ul style="list-style-type: none"> operation of NY FPSO (including flaring) operation of subsea infrastructure vessels (including IMMR) helicopters. 	Potential localised physical or behavioural impacts to marine fauna.	F	Environmental – No lasting effect (<1 month). Localised impact not significant to environmental receptors.	Broadly acceptable	
Routine and non-routine discharges: discharge of hydrocarbons and chemicals during subsea operations and activities	6.6.4	Discharge of subsea control fluids.	Localised, short-term decrease in water quality around subsea system within the Operational Area. Potential slight short-term, localised decrease in water quality at release location during IMMR activities.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable	
		Discharge of hydrocarbons remaining in subsea pipeworks and equipment as a result of subsea intervention works (including pigging).		E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable	
		Discharge of chemicals remaining in subsea pipe works and equipment or the use of chemicals for subsea IMMR activities.		E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable	
		Discharge of minor fugitive hydrocarbons from subsea equipment.		E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable	
Routine and non-routine discharges (utility systems): discharge of sewage, putrescible waste, greywater, bilge water, drain water, cooling water and brine	6.6.5	Discharge of sewage, grey water and putrescible waste from vessels and NY FPSO to the marine environment.	Potential slight, short-term, localised ongoing increase in nutrients and oxygen demand around FPSO and vessels.	F	Cumulative E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable
		Discharge of deck water from NY FPSO and bilge water from vessels to the marine environment.	Potential slight, short-term localised decrease in water quality at discharge location.	F		Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable
		Discharge of RO brine from vessels and NY FPSO, and CWF effluent from NY FPSO, to the marine environment.	Potential slight, localised increase in salinity at the discharge location.	F		Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable

Aspect	EP Section	Source of Impact	Key Potential Environmental Impacts (refer to relevant EP section for details)	Controlled Impact Classification	Residual Impact Level (ALARP controls in place)	Acceptability of Impact
		Discharge of cooling water from vessels and NY FPSO to the marine environment.	Potential slight, localised increase in water temperature, and short-term water quality changes around discharge location.	F	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable
Routine and non-routine atmospheric and greenhouse GHG emissions	6.6.6	NY FPSO and vessel fuel combustion emissions, NY FPSO operational flaring and fugitive emissions.	Potential to result in localised, temporary reduction in air quality, generation of dark smoke, and contribution to greenhouse gas emissions.	F	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable
		NY emissions associated with third party transport of products, refining and combustion	Potential to result in localised, temporary reduction in air quality, generation of dark smoke, and contribution to greenhouse gas emissions.	F	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable
Routine light emissions: light emissions from NY FPSO, vessels operations and operational flaring	6.6.7	Light emissions from NY FPSO and vessels.	Potential for short-term, localised behavioural disturbance of phototactic species in close proximity to FPSO and vessels.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable
		Light emissions from NY FPSO during flaring.	Potential for short-term, localised behavioural disturbance of phototactic species in close proximity to FPSO and vessels.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	Broadly acceptable

Table 6-2: Environmental impact and risk analysis summary table – unplanned events

Aspect	EP Section	Source of Risk	Key Potential Environmental Impacts (Refer to relevant EP section for details)	Risk Rating			Acceptability of Risk	
				Consequence Classification	Residual Impact Level (ALARP controls in place)	Likelihood		Residual Risk Rating
Unplanned Events (Accidents/Incidents)								
Unplanned hydrocarbon or chemical release: hydrocarbon and chemical during transfer, storage and use	6.7.1	Accidental spill of hydrocarbons to the environment during bunkering/refuelling.	Potential for localised water column pollution and adverse effects to marine biota as a result of minor chemical/hydrocarbon discharges.	D	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	2	M	Broadly acceptable
		Accidental discharge of chemicals to the marine environment from storage, use or transfer.		E		2	M	Broadly acceptable
Unplanned discharges: hazardous and non-hazardous waste management	6.7.2	Incorrect disposal or accidental discharge of non-hazardous and hazardous waste to the marine environment.	Potential for temporary impacts to the surrounding environment, water quality and marine sediments with slight potential for short-term impacts to marine fauna.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	2	M	Broadly acceptable
Physical presence: interaction with marine fauna	6.7.3	Physical presence of vessels resulting in collision with marine fauna.	Potential injury or death of marine fauna (single animal), including protected species.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes.	1	L	Broadly acceptable
Physical presence: introduction of invasive marine species (IMS)	6.7.4	Invasive species in vessel ballast tanks or on vessels/submersible equipment.	Potential introduction of IMS possibly resulting in an alteration of the localised environment. Potential short-term interference with or displacement of other sea users.	E	Environment – Slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attributes. Socio-cultural – Slight, short-term impact (<1 year) to a community or area/item of cultural significance.	1	L	Broadly acceptable

Aspect	EP Section	Source of Risk	Key Potential Environmental Impacts (Refer to relevant EP section for details)	Risk Rating			Acceptability of Risk	
				Consequence Classification	Residual Impact Level (ALARP controls in place)	Likelihood		Residual Risk Rating
Unplanned Events (Accidents/Incidents) – MEEs								
Unplanned hydrocarbon release: Loss of well containment (MEE-01)	6.8.3	Release of hydrocarbons resulting from loss of subsea well containment.	Long-term impacts to habitats including sensitive nearshore areas of offshore islands and coastal shorelines. Localised reduction in water quality with potential for acute toxic response over localised area. Disruption to marine fauna, including protected species. Potential medium-term interference with or displacement of other sea users.	A	Environment – Catastrophic, long-term impact (>50 years) on highly valued ecosystem, species, habitat or physical or biological attribute. Socio-cultural – Catastrophic, long-term impact (>20 years) to a community, social infrastructure or highly valued area/item of international cultural significance.	1	H	Acceptable if ALARP
Unplanned hydrocarbon release: subsea flowline and riser loss of containment (MEE-02)	6.8.4	Loss of hydrocarbons to the marine environment due to a subsea flowline and riser loss of containment	Long-term impacts to sensitive nearshore areas of offshore islands and coastal shorelines. Disruption to marine fauna, including protected species. Potential medium-term interference with or displacement of other sea users.	B	Environment – Major, long-term impact (10 to 50 years) on highly valued ecosystems, species, habitat or physical or biological attributes Socio-cultural – Major, long-term impact (5 to 20 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	2	H	Acceptable if ALARP
Unplanned hydrocarbon release: topsides loss of containment (MEE-03) ²⁶	6.8.5	Hydrocarbon release from topside process equipment to the marine environment and atmosphere	Potential moderate medium-term impacts to the marine environment: including disruption to marine fauna, including protected species and impacts to water quality.	C	Environment – Moderate, medium-term impact (2 to 10 years) on ecosystems, species, habitat or physical or biological attributes.	1	M	Broadly acceptable
		Hydrocarbon release from topsides non-process equipment to the marine environment	Potential medium-term interference with or displacement of other sea users.	C	Socio-cultural – Moderate, medium-term impact (2 to 5 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	1	M	Broadly acceptable
Unplanned hydrocarbon release: offloading equipment loss of containment (MEE-04)	6.8.6	Hydrocarbon release from NY FPSO offloading equipment to the marine environment and atmosphere.	Potential long-term impacts to the marine environment. Long-term impacts to sensitive nearshore areas of offshore islands and coastal shorelines. Disruption to marine fauna, including protected species. Potential medium-term interference with or displacement of other sea users.	B	Environment – Major, long-term impact (10 to 50 years) on highly valued ecosystems, species, habitat or physical or biological attributes. Socio-cultural – Major, long-term impact (5 to 20 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	1	M	Broadly acceptable
Unplanned hydrocarbon release: fpso cargo tank loss of containment (MEE-05)	6.8.7	Hydrocarbon release caused by a cargo tank loss of containment.	Potential long-term impacts to the marine environment. Long-term impacts to sensitive nearshore areas of offshore islands and coastal shorelines. Disruption to marine fauna, including protected species. Potential long-term interference with or displacement of other sea users.	A	Environment – Catastrophic, long-term impact (>50 years) on highly valued ecosystem, species, habitat or physical or biological attribute. Socio-cultural – Catastrophic, long-term impact (>20 years) to a community, social infrastructure or highly valued area/item of international cultural significance.	1	H	Acceptable if ALARP
Unplanned hydrocarbon release: loss of structural integrity (MEE-06)	6.8.8	Hydrocarbon release caused by a loss of structural integrity of the FPSO hull, leading to: <ul style="list-style-type: none"> MEE-02 – Subsea flowline and riser loss of containment MEE-03 – Topsides loss of containment MEE-04 – Offloading equipment loss of containment, or MEE-05 – FPSO cargo tank loss of containment 	Potential long-term impacts to the marine environment. Long-term impacts to sensitive nearshore areas of offshore islands and coastal shorelines. Disruption to marine fauna, including protected species. Potential long-term interference with or displacement of other sea users.	A	Environment – Catastrophic, long-term impact (>50 years) on highly valued ecosystem, species, habitat or physical or biological attribute. Socio-cultural – Catastrophic, long-term impact (>20 years) to a community, social infrastructure or highly valued area/item of international cultural significance.	1	H	Acceptable if ALARP

Unplanned hydrocarbon release: loss of control of suspended load (MEE-08)	6.8.10	Dropped object causing damage to the flowlines and riser that results in a hydrocarbon release to the marine environment and atmosphere.	Potential significant impacts to the marine environment. Long-term impacts to sensitive nearshore areas of offshore islands and coastal shorelines. Disruption to marine fauna, including protected species. Potential long-term interference with or displacement of other sea users.	B	Environment – Major, long-term impact (10 to 50 years) on highly valued ecosystems, species, habitat or physical or biological attributes	1	M	Broadly acceptable
		Dropped object causing damage to the topsides equipment that results in a hydrocarbon release to the marine environment and atmosphere.		B	Socio-cultural – Major, long-term impact (5 to 20 years) to a community, social infrastructure or highly valued area/item of national cultural significance.	1	M	Broadly acceptable
MEE common failure mechanisms: SCE failure and human error	6.8.11	Generic SCE failure. There are a number of causes which contribute to failures of SCEs and other systems which might protect against a MEE. These include: <ul style="list-style-type: none"> • maintenance errors • defects • electrical supply failure • hydraulic supply failure • adverse environmental conditions. 	See MEE-01 to MEE-08.	N/A	N/A	N/A		

6.2.1 Cumulative Impacts

Woodside has assessed the cumulative impacts of the Petroleum Activities Program in relation to other relevant petroleum activities or facilities, which could realistically result in overlapping temporal and spatial extents. There are other offshore petroleum facilities in close proximity to the Operational Area, as described in **Section 4.10.8**. Cumulative impacts are discussed for sources of risk and impacts where such impacts were deemed to be credible.

6.3 Environmental Performance Outcomes, Standards and Measurement Criteria

Regulation 21(7) of the Environment Regulations requires that an EP includes EPOs, EPSs and MC that address legislative and other controls to manage the environmental risks and impacts of the activity to ALARP and Acceptable levels.

EPOs, EPSs and MC for the Petroleum Activities Program have been identified to allow Woodside’s environmental performance to be measured and through the implementation of this EP, to determine whether the EPOs and EPSs have been met.

The EPOs, EPSs and MC specified are consistent with legislative requirements and Woodside’s standards and procedures. They have been developed based on the legislation, codes and standards, good industry practices and professional judgment outlined in **Section 2.6.1.4** and **Section 2.8**, as part of the acceptability and ALARP justification process.

The EPOs, EPSs and MC are presented throughout this section. A breach of these EPOs or EPSs constitutes a ‘Recordable Incident’ under the Environment Regulations (refer to **Section 7.9.4**).

6.4 Presentation

The analysis and evaluation (ALARP and acceptability), EPOs, EPSs and MC are presented in tabular form throughout this section, as shown in the sample below. Non-bold italicised text in this example table denotes the purpose of each part of the table, with reference to the relevant sections of the Regulations and/or this EP.

6.5 Environment Risk/Impacts not Deemed Credible

The ENVID identified a source of environmental risk/impact that was assessed as not being applicable (not credible) within or outside the Operational Area as a result of the Petroleum Activities Program, and therefore, which was determined to not form part of this EP. This is described in the following sections for information only.

Shallow/Near-shore Activities

The Ngujima-Yin FPSO is located in water depths of approximately 340 m (LAT) at a distance of 43 km from the North West Cape of WA, at nearest landfall. Anchoring in the case of emergency situations has been considered within the Petroleum Activities Program. It is noted the Operational Area overlaps the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula and the Continental Slope Demersal Fish Communities KEFs. Given the water depths within the Operational Area and the highly unlikely potential for anchoring activities to potentially occur, risks/impacts associated with shallow/nearshore activities such as anchoring and vessels grounding were not assessed as credible.

²⁸ Where impact/consequence descriptors are capitalised and presented within EPOs in **Section 6**; performance level corresponds with those aligned with the Woodside Risk Matrix (refer **Section 2.6.3**).

6.6 Planned Activities

6.6.1 Physical Presence: Disturbance to Marine Users

Context														
Facility Layout and Description – Section 3.5 Support Vessel Operations – Section 3.7 subsea inspection, monitoring, maintenance and Repair Activities – Section 3.10				Socio-cultural Environment – Section 4.10				Consultation – Section 5						
Impacts and Risks Evaluation Summary

	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Presence of NY FPSO and subsea infrastructure excluding and/or displacing other users from PSZ and Operational Area respectively.							✓	A	F	-	-	LCS GP PJ	Broadly Acceptable	EPO 1
Presence of vessels excluding and/or displacing other users.							✓	A	F	-	-			
Description of Source of Impact														
<p>The NY FPSO and subsea infrastructure has been in operation since 2008 and has been marked on nautical charts since that time. The NY FPSO lies within a Petroleum Safety Zone. The Petroleum Safety Zone was gazetted on 13 October 2017 (Notice A575120), and remains in place until revoked. The Petroleum Safety Zone comprises the area within a 500 m radius of the STP mooring system. The 500 m Petroleum Safety Zone is shown as a “Restricted Area” on navigation charts. NOPSEMA prohibits all vessels, other than vessels or classes of vessels specified in the notice and vessels operated by authorised people, from entering or being present in the area of petroleum safety zones without the consent in writing of NOPSEMA. The Petroleum Safety Zone is a critical safety control intended to reduce the likelihood of interactions between vessels and the NY FPSO, which increases safety for both vessels and the FPSO. The NY FPSO is highly visible under most conditions (see Figure 3-1) and is well lit, and the nature of the NY FPSO (Suezmax class steel hull) ensures a clear radar return to alert ships fitted with anti-collision radars.</p> <p>The physical footprint of subsea infrastructure is highly localised and entirely contained within the Operational Area. The Australian Hydrographic Office (AHO) has been notified of the location of subsea infrastructure for marking on nautical charts. Water depths of subsea infrastructure range between approximately 340 m and 849 m (Table 3-1).</p> <p>Routine vessel activities associated with the Petroleum Activities Program are concentrated within the Petroleum Safety Zone (e.g. support vessels at the NY FPSO). Subsea support vessels may undertake activities (e.g. IMMR activities) within the Operational Area at any time, including the Operational Area beyond the Petroleum Safety Zone (1500 m around the infrastructure). The duration and location of these activities will vary depending on the activity being undertaken but vessels will only intermittently be present in the Operational Area, outside the Petroleum Safety Zone. Woodside ensures vessels undertaking the Petroleum Activities Program meet maritime requirements, including appropriate lights and shapes, and communication with other vessels.</p>

Impact Assessment

Exclusion and Displacement of Other Users

Interaction with other marine users due to the physical presence of in the Petroleum Activities Program may result in localised changes to the functions, interests or activities of other users. The duration of change will be for the period of the Petroleum Activities Program.

Commercial Fishing

Low levels of fishing have been observed since the NY FPSO began operating.

The Operational Area overlaps five Commonwealth and ten State managed commercial fisheries management areas. Fisheries data indicate that no Commonwealth managed and only three State managed fisheries have the potential for interaction with the Petroleum Activities Program, demonstrated by reported, active fishery effort (2017–2022) (**Section 4.10**). The three State-managed fisheries are the Mackerel Managed Fishery, Pilbara Line Fishery (condition) and West Coast Deep Sea Crustacean Managed Fishery (**Table 4-21**).

The Mackerel Managed Fishery reported three to seven active fishers between the 2017–2022 seasons, with consistent fishing effort since 2012 concentrated in coastal Pilbara reefs north-east of the Operational Area.

The Pilbara Line Fishery (condition) showed no active fishing effort within the Operational Area, however, has been active within in the wider EMBA, with up to five licences active within 60 nautical miles across the 2017-2022 seasons.

The West Coast Deep Sea Crustacean Managed Fishery reported less than three vessels may have been activity within or near-by (within 60 nautical miles) of the Operational Area.

Given the overlap of the Operational Area with the fishing block and the annual fishing effort, interactions with the Mackerel Managed, Pilbara Line (condition) and West Coast Deep Sea Crustacean Managed may occur.

For assessment of charter-based fishing for tourism, refer to Tourism and Recreation below.

As outlined above, historical fisheries status reports indicate that there is very little or no activity associated with these fisheries within the Operational Area. The presence of subsea infrastructure could present a hazard to bottom trawl fisheries, due to the risk of equipment entanglement and subsequent equipment damage/loss therefore these activities are likely to be permanently displaced by the presence of the subsea infrastructure. The North West Slope Trawl Fishery and the Western Deepwater Trawl Fishery overlap the Operational Area and use bottom trawls, although effort in these fisheries has not historically occurred within the Operational Area. Therefore, displacement or exclusion of commercial fisheries as a result of the Petroleum Activities Program is unlikely.

Consultation with fishing industry participants did not indicate any claims or objections from commercial fishers to the Petroleum Activities Program (**Section 5**).

The impact to commercial fishers as a result of the Petroleum Activities Program is the potential for highly localised displacement of effort, and of no lasting effect. As no trawling effort is expected to occur in the Operational Area, the potential for trawling gear to be snagged on subsea infrastructure is considered remote.

Traditional Fishing

Traditional fishing in the region is restricted to nearshore waters of the Australian mainland and islands (e.g. Barrow Island). No traditional fishing effort is known to occur in the Operational Area. Impacts such as displacement of traditional fishing effort are not expected to credibly occur as a result of the Petroleum Activities Program.

Tourism and Recreation

Tourism and recreation activity in the Operational Area is expected to be infrequent. There are no emergent features or natural values within the Operational Area that are considered tourist attractions. Recreational and charter fishing from vessels are the only tourism and recreation activities identified as potentially occurring in the Operational Area (**Section 4.10.6**). Fishing effort for Tourism Charter Operators were reported at the 10 NM reporting blocks overlapping the Operational Area, with up to three vessels active during the 2020–2021 season.

The annual GAMEX fishing tournament (usually run in March by the Exmouth Game Fishing Club) may result in increased offshore recreational fishing during this period. Operational experience to date has not indicated adverse interactions with recreational fishers occurs during GAMEX. Woodside's experience gained from operating the Nganhurra and NY FPSOs has shown that very little recreational (including charter) fishing takes place in the vicinity of the Operational Area. This is consistent with consultation outcomes (**Section 5**).

Given the distance from boating facilities (nearest established boat ramps and marina are at Tantabiddi, approximately 42 km from the Operational Area), lack of natural attractions and water depth of the Operational Area, very little interaction with tourism and recreational activities is expected to occur during the Petroleum Activities Program. As such, impacts to recreational and charter fishing are expected to be localised and of no lasting effect.

Shipping

Considerable commercial shipping occurs in the region (**Figure 4-2**), with commercial shipping traffic comprising vessels such as:

- offtake tankers
- support vessels for offshore oil and gas activities
- cargo traffic in shipping fairway to the west of the Operational Area.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The presence of support vessels could potentially cause temporary disruption to commercial shipping. The Operational Area is subjected to vessel traffic that is likely to be associated with oil and gas support infrastructure, including support vessels for FPSOs in the area. No recognised shipping lanes overlap the Operational Area; the nearest fairway lies approximately 35 km north-west of the Operational Area. Most vessel activity in the vicinity of the Operational Area is associated with nodes such as offshore facilities (e.g. FPSOs) and ports; no such nodes occur within the Operational Area, other than the NY FPSO. Additionally, the NY FPSO has been operational since 2008, and the AHO has been notified of the location of subsea infrastructure for marking on nautical charts. Operational history of the NY FPSO indicates unauthorised commercial vessels enter the Petroleum Safety Zone very rarely.

The presence of the NY FPSO, associated subsea infrastructure and support vessels, is not expected to result in impacts to commercial shipping beyond a localised exclusion of shipping traffic from the Petroleum Safety Zone, and the temporary displacement of commercial shipping from subsea support vessels as a result of vessels undertaking activities in the Operational Area. This is considered a localised impact, and of no lasting effect.

Oil and Gas

The nearest other oil and gas facilities are:

- Ningaloo Vision FPSO (Santos), approximately 1 km from Operational Area
- Pyrenees Venture FPSO (Woodside), approximately 10 km from Operational Area
- Macedon Subsea Gas Field (Woodside), approximately 10 km from Operational Area.

The Operational Area overlaps the following titles (**Figure 4-13**):

- WA-35-L: Santos is the titleholder of WA-35-L, which is associated with the Ningaloo Vision FPSO. No subsea infrastructure of the NY facility overlaps WA-35-L, nor does the Petroleum Safety Zone associated with the NY facility overlap WA-35-L. The Operational Area does not overlap any production wells in WA-35-L.
- WA-32-L: Woodside is the titleholder of WA-32-L, which is associated with the Stybarrow field (the Stybarrow Venture FPSO is no longer on station). Subsea infrastructure associated with the NY facility overlapping WA-32-L consists of the rigid flowlines and control umbilicals. The Petroleum Safety Zone around the NY FPSO does not overlap WA-32-L. The Operational Area does not overlap any production wells in WA-32-L.
- WA-42-L & WA-43-L: Woodside is the titleholder of WA-42-L & WA-43-L, which is associated with the Pyrenees Venture FPSO and the Macedon Subsea Gas Field. No subsea infrastructure of the NY facility overlaps WA-42-L or WA-43-L, nor does the Petroleum Safety Zone associated with the NY facility overlap these titles. The Operational Area does not overlap any production wells in WA-42-L or WA-43-L.

Santos did not raise any concerns or objections during consultation in relation to this EP (**Section 5**). Woodside routinely consults with other titleholders where activities may affect their functions, interests and activities; no issues were raised by oil and gas stakeholders consulted in relation to this EP. Operational history of the NY FPSO has shown that interactions with other titleholders has not been an issue to date.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
<p>ALARP Statement:</p> <p>On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the potential impacts of the physical presence of the NY FPSO, subsea infrastructure and vessels on other users. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>The impact assessment has determined that, given the adopted controls, the physical presence of the NY FPSO, subsea infrastructure and vessels represents a negligible impact with no lasting effect and a localised impact that is not considered a significant threat to commercial fishing, recreational fishing and/or shipping. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders, and expectations of AMSA and AHO provided in consultation with stakeholders. Further opportunities to reduce the impacts and risks have been investigated above.</p> <p>The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of physical presence of the NY facility and support vessels to a level that is broadly acceptable.</p>

Subsea operations, inspection, maintenance and repair activities resulting in disturbance to seabed.		✓	✓		✓			A	E	-	-			
Description of Source of Impact														
<p>Seabed disturbance associated with the Petroleum Activities Program can occur during operations and other activities, including from:</p> <ul style="list-style-type: none"> physical presence of the NY FPSO mooring system and subsea infrastructure (operational and redundant) subsea IMMR activities (Section 3.10) possibility of vessel anchoring (during emergency conditions) installation of mattresses for flowline protection. <p>The physical presence of subsea infrastructure may result in localised scouring around the infrastructure due to currents, subsurface waves, and seabed sediment fluid dynamics. Operational experience indicates scour around subsea infrastructure associated with the Petroleum Activities Program is localised with negligible impact to environmental receptors. Scour around subsea infrastructure may necessitate IMMR activities as part of integrity management practices.</p> <p>Flowline movement may occur as per design and within integrity margins along the flowline corridor. Normal flowline operational movement occurs due to factors such as flowline buckling, walking and varying metocean conditions. Lateral movement can occur within the flowline corridor. The extent of any flowline buckling and walking would be restricted to the Operational Area, and for safety reasons, Woodside will manage buckling and walking to within design limits. In order to maintain the integrity of subsea infrastructure, Woodside may be required to undertake routine subsea IMMR activities, as described in Section 3.10. IMMR activities may impact upon the seabed in the vicinity of the activity including (but are not limited to):</p> <ul style="list-style-type: none"> inspections – minor, localised sediment resuspension by ROV 														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- marine growth removal – minor, localised resuspension of sediment; removal of marine biota from subsea infrastructure
- sediment relocation – minor, localised modification of benthic habitat and sediment resuspension
- span rectification flowline protection and stabilisation – minor, localised modification of benthic habitat within footprint of area subject to rectification/protection/stabilisation
- jumper and umbilical replacement – minor, localised modification of benthic habitat in the vicinity of the jumper/umbilical
- spool repair/replacement – minor, localised modification of benthic habitat in the vicinity of the spool.
- temporary laying of tools on seabed (e.g. seabed baskets).

The area of benthic habitat predicted to be impacted varies depending on the nature and scale of the IMMR activity. Span rectification activities are IMMR activities with the greatest potential to modify benthic habitats, due to the alteration of the existing soft sediment habitat to hard substrate. Woodside’s operational experience on the NWS indicates these activities are typically restricted to relatively short (tens of meters) linear sections of flowline, with areas of up to approximately 100 m² impacted.

Under routine operations, anchoring of vessels undertaking IMMR is avoided in the Operational Area but there may be non-routine activities that require anchoring for safety reasons.

Impact Assessment

Water and Sediment Quality

Seabed disturbance may include localised and temporary decline in water quality due to an increase in suspended sediment concentrations and sediment deposition caused by IMMR activities, particularly for cleaning activities where marine growth or scale becomes suspended in the water column and settles to the seabed. However, sediment loads are not expected to be significant due to the relatively small footprint for each activity (IMMR activities described above, and in **Section 3.10**).

Each discrete IMMR activity near the seabed is likely to cause a brief disturbance which may result in a transient plume of suspended sediment. This plume will subsequently be deposited down current as particles resettle. Such localised and short-term events may affect small areas of the seabed and consequently, impact the associated biota (typically sparsely distributed infauna and sessile epifauna). Such impacts are expected to be minor (e.g. ingestion of suspended sediment); impacts such as smothering of sessile biota are not expected to occur.

Benthic Habitats

The benthic habitat within the Operational Area is predominately soft sediment with sparsely associated epifauna which is broadly represented throughout the NWS Province (**Section 4.5**). Benthic communities of the soft sediment seabed are characterised by burrowing infauna such as polychaetes, with biota such as sessile filter feeders occurring on areas of hard substrate (such as subsea infrastructure). The infauna communities are also representative of the NWS province; being of low abundance and dominated by polychaetes and crustaceans (RPS Environment and Planning, 2012).

IMMR activities may result in potential impacts that may be categorised as:

- direct physical disturbance of benthic habitat
- indirect disturbance to benthic habitats from sedimentation.

Scour may result in localised impact to soft sediment benthic habitats, typically on the scales of meters to tens of meters. Subsequently, any impacts to benthos from scour around subsea infrastructure are expected to be localised, with no significant impacts to benthic habitats within the Operational Area.

As mentioned, flowline movement is limited to within design and integrity envelopes and may result in slight, localised impact to soft sediment benthic habitats, typically on the scales varying between meters to tens of meters laterally along the flowline corridors.

Direct seabed disturbance, including permanent modification of benthic communities, may result as a consequence of IMMR activities such as span rectification, flowline protection and stabilisation. These activities will typically disturb a small area (typically <100 m²) of soft sediment habitat, which is broadly represented in the Operational Area and wider NWS region. This habitat will be replaced by hard substrate (e.g. concrete mattresses, rocks etc) which is generally uncommon in the middle and outer NWS region.

Over time, this hard substrate is expected to be colonised by sessile benthic biota (e.g. sponges, gorgonians etc), which may support higher biodiversity benthic fauna (such as fish assemblages), than soft sediment habitats. The estimated overall extent of such direct seabed disturbance is extremely small in relation to the extent of the soft sediment habitats which are broadly represented within the Operational Area and the wider NWS province.

Key Ecological Features

Canyons Linking the Cuvier Abyssal Plain

The Operational Area overlaps 2.3% of the Canyons KEF, in the upper easternmost portion of the KEF (**Section 4.7**). Sections of the KEF have been shown to host relatively more diverse and abundant biota when compared to the

surrounding seabed beyond the canyons. Given the nature and scale of the Petroleum Activities Program, no adverse impacts to the ecological values of the KEF are expected to occur.

Continental Slope Demersal Fish Communities

A small portion of the southern extent of the Continental Slope Demersal Fish Communities KEF overlaps the Operational Area (**Figure 4-10**). As outlined in the discussion on benthic habitats above, changes to demersal fish communities as a result of the Petroleum Activities Program are expected to result in a localised increase in diversity and abundance of fish in the immediate vicinity of subsea infrastructure. No impacts to the ecological values of the Continental Slope Demersal Fish Communities KEF will occur as a result of the Petroleum Activities Program.

Ancient Coastline at 125 m Depth Contour

The Operational Area is approximately 500 m from the Ancient Coastline. The Operational Area represents a 1500 m radius buffer around the NY subsea infrastructure to facilitate vessel operations; the potential for seabed disturbance is much more localised (i.e. within tens of metres is the subsea infrastructure).

Benthic habitat surveys in the region (including within the Ancient Coastline at 125 m depth contour KEF) indicate that benthic habitats within the KEF are characterized by sand interspersed with areas of rubble and outcroppings of limestone pavement (AIMS, 2014a; RPS, 2011). Such habitats are widely distributed in the NWS Province. The geomorphic feature the KEF is associated with is represented worldwide and represents the coastline during a previous glacial period. Therefore, any potential impacts to this regional-scale KEF are expected to be negligible.

Description of Source of Impact

The NY FPSO, subsea infrastructure, vessels, IMMR activities and helicopters generate noise both in the air and underwater, due to the operation of machinery, propeller movement, etc. Typical underwater noise for these sources are provided in **Table 6-3**. These noises contribute to and can exceed ambient noise levels, which range from around 90 dB re 1 µPa (root square mean sound pressure level [rms SPL]) under very calm, low wind conditions, to 120 dB re 1 µPa (rms SPL) under windy conditions (McCauley, 2005).

Table 6-3: Indicative source characteristics of underwater noise associated with the Petroleum Activities Program (JASCO Applied Sciences, 2010)

Acoustic Noise Sources	Estimated Sound Pressure Level (dB re 1 µPa rms SPL)	Frequency Range (kHz)
Vessels (continuous)		
FPSO	174	Broadband
Support vessel using DP	182	Broadband
Wellhead, Flowlines and Subsea Infrastructure (continuous)		
Wellhead	113	Broadband
Choke Valve	155	Broadband
IMMR Activity Noise (Impulsive)

Multibeam Echo Sounder	214	200–300
Side Scan Sonar	226	120–410
Sub-bottom Profiler (CHIRP)	205	1–12
Sub-bottom Profiler (Pinger)	214	2–12
Sub-bottom Profiler (Boomer)	212	0.5–5

Helicopter operations are discussed below.

Vessels

The main source of noise from vessels (both supply and support vessels) relates to using DP thrusters (i.e. cavitation from thruster propellers). Thruster noise is typically high intensity and broadband in nature, with sound pressure levels of 137 dB re 1 µPa at 405 m from a typical offshore support vessel holding station in strong currents (McCauley, 1998). McCauley (2005) measured underwater broadband noise up to approximately 182 dB re 1 µPa at 1 m (rms SPL) from a support vessel holding station in the Timor Sea; it is expected that noise levels up to this level may be generated by vessels using DP during the Petroleum Activities Program. Thruster noise from vessels holding station is typically the most intense underwater noise source from vessel activities; other sources from vessels (e.g. main engines when underway, machinery noise transmitted through the hull, etc) are typically considerably lower intensity noise (McCauley, 1998). Note that vessels undertaking the Petroleum Activities Program inherently minimise the use of DP, and there is little potential to further reduce DP use.

IMMR Activities

IMMR activities will generate different types of underwater noise, the loudest being acoustic emissions from survey equipment. Acoustic surveys that may be undertaken as part of IMMR activities including SSS, MBES and SBP surveys. These methods are typically used infrequently (e.g. SSS generally used for up to five days every four years); these acoustic sources are not constantly active during these infrequent IMMR activities.

Noise from the support vessel undertaking the IMMR activity would also contribute to the noise profile. Noise from the IMMR support vessels would be below those from the IMMR survey equipment and therefore is not considered further. Indicative source characteristics for typical acoustic survey equipment and from the support vessel conducting the IMMR activities are provided in **Table 6-3**.

Helicopters

Helicopter engines and rotor blades are recognised as a source of noise emissions. Activities relevant to the Operational Area will relate to the landing and take-off of helicopters on the NY facility and potentially subsea support vessels. During these critical stages of helicopter operations, safety is the highest priority. Helicopter noise is emitted to the atmosphere during routine helicopter flights. Noise levels for typical helicopters used in offshore operations (Eurocopter Super Puma AS332) at 150 m separation distance has been measured at a maximum of 90.6 dB (BMT Asia Pacific, 2005). Helicopter flights are at their lowest (i.e. closest point to the sea surface) during periods of take-off and landing from helidecks, which constitutes a relatively short phase of routine flight operations.

Wellhead, Flowlines and Subsea Infrastructure

The noise produced by an operational wellhead was measured by McCauley (2002a). The broadband noise level was very low, 113 dB re 1 µPa, which is only marginally above rough sea condition ambient noise. For a number of nearby wellheads, the sources would have to be in very close proximity (<50 m apart) before their signals summed to increase the total noise field (with two adjacent sources only increasing the total noise field by 3 dB). Hence, for multiple wellheads in an area, the broadband noise level in the vicinity of the wellheads would be expected to be of the order of 113 dB re 1 µPa. This would drop very quickly to ambient conditions on moving away from the wellhead, falling to background levels within <200 m from the wellhead.

Based on the measurements of wellhead noise discussed in McCauley (2002a), which included flow noise in flowlines, noise produced along a flowline may be expected to be similar to that described for wellheads, with the radiated noise field falling to ambient levels within a hundred metres of the flowline.

Woodside has undertaken acoustic measurements on noise generated by operating choke valves associated with the Angel platform (JASCO Applied Sciences, 2015). These measurements indicated choke valve noise is continuous, and the frequency and intensity of noise emitted depends on the rate of production from the well. Noise intensity at low production rates (16% and 30% choke positions) were approximately 154–155 dB re 1 µPa, with higher production rates (85% and 74% choke positions) resulting in lower noise levels (141–144 dB re 1 µPa). Noise from choke valve operation was broadband in nature, with most noise energy concentrated above 1 kHz. Subsea gas wells, such as those in the Angel study, experience higher flow velocities compared to oil wells; as such, the above noise intensity ranges are considered a conservative approximation for NY facility operations.

FPSO Machinery

The NY FPSO may use its main engines when manoeuvring on, or disconnected from, the STP mooring, which will generate underwater noise from hull vibrations and propeller cavitation. These activities are typically of short duration (hours to days). Machinery such as topside processing equipment may generate noise emissions. Noise emitted by topsides equipment is considered unlikely to contribute significantly to underwater noise levels. However, topsides

equipment and other machinery may contribute to hull vibrations, which may then be transmitted into the sea through the NY FPSO hull acting as a transducer. Such noise is typically constant during routine operations.

Measurement of underwater sound taken at the NY FPSO during 2010 during normal operations under calm conditions recorded average broadband source levels of 174 dB re 1 µPa. It was also observed that the NY FPSO was quieter than support vessels that were operating nearby (JASCO Applied Sciences, 2010). Source levels from the NY FPSO were comparable to source levels recorded from the Cossack Pioneer FPSO during normal operations, which ranged up to 181 dB re 1 µPa² m². This included measurements when its propeller was in use (slowly turning) (McCauley, 2002b). This higher source level recorded at Cossack Pioneer is considered representative of the source level at NY FPSO at intermittent times when there is a requirement to use its main engine and propeller.

Flaring (from FPSO)

The HP and LP flare system will generate noise from combustion. Noise from flaring represents a health and safety risk to personnel, and was considered in the design of the NY FPSO to manage the associated occupational health and safety risks (e.g. height specification of flare tower). Noise from flaring is emitted at the top of the flare tower, which is approximately 90 m above the main deck. Noise from the tip of the flare is not constrained and will spread spherically in all directions.

Received levels from airborne propagation modelling were used to ascertain the underwater received levels during flaring activities for a drilling and subsea installation activity (Woodside, 2019). Only a very small fraction of the acoustic energy produced from flaring will transmit through the air/water boundary due to the surface of water acting as a reflective plane and a significant component of acoustic energy reflecting into the air. While underwater received sound pressure level during flaring is estimated to be 136 dB re 1µPa at 1m (SPL) below the sea surface it is estimated to attenuate to ambient levels within a very short distance (e.g. metres) and therefore is not considered further in the impact assessment.

Impact Assessment

The Petroleum Activities Program is in waters between approximately 340 and 849 m deep. The values potentially impacted by acoustic emissions are predominantly pelagic species of fish, and migratory species such as whale sharks and cetaceans present in the area seasonally. Elevated underwater noise can affect marine fauna including cetaceans, fish, turtles, sharks and rays in three main ways (Richardson et al., 1995):

- by causing direct physical effects on hearing or other organs, including:
 - mortality/potential mortal injury resulting from exposure to noise (not considered credible given the noise sources associated with the Petroleum Activities Program)
 - permanent threshold shift (PTS) – permanent reduction in the ability to perceive sound following exposure to noise
 - temporary threshold shift (TTS) – temporary reduction in the ability to perceive sound following exposure to noise, with hearing returning to normal.
- by masking, or interfering with, other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey)
- through disturbance leading to behavioural changes or displacement from important areas.

The potential impacts of anthropogenic noise on marine mammals have been the subject of considerable research; reviews are provided by Richardson et al. (1995), Nowacek et al. (2007), Southall et al. (2007), Weilgart (2007) and Wright et al. (2007).

To inform the assessment, the impact thresholds provided in **Table 6-4**, * The 120 dB threshold may be adjusted if background noise levels are at or above this level.

Table 6-5 and **Note**: a range of sound units are provided in the table above, reflecting the range of studies from which the data has been derived. The difference in units presents difficulty in reliably comparing threshold values. Where practicable, the threshold values have been compared with indicative sound sources levels of the same sound unit types. The sound units provided in the table above include:

- *M-weighted sound exposure level (SEL): a weighted sound metric that emphasises the audible frequency bands for the receptor groups – low, mid and high frequency cetaceans. SEL units are time integrated and best suited for continuous noise sources, such as vessels holding station or continuous machinery noise.*
- *Root mean square (rms) sound pressure level (SPL): root mean square of time-series pressure level is useful for quantifying continuous noise sources (as per SEL point above).*

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Table 6-6 were considered in relation to the credible sources of acoustic emissions.

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Vessel Noise

Using the thruster noise measured by McCauley (1998) as an indicative value for the potential thruster noise generated by vessels during the Petroleum Activities Program and the thresholds presented in * The 120 dB threshold may be adjusted if background noise levels are at or above this level.

Table 6-5, the potential for noise-induced mortality, PTS and TTS of cetaceans, fish, sea turtles and eggs/larvae is not considered credible.

However, masking and behavioural impacts may occur in close proximity (e.g. <1000 m) to the noise source. Using a simple cylindrical geometric spreading equation to estimate transmission loss (TL) of thruster noise at 182 dB re 1 µPa at 100 Hz (Table 6-7), potential impacts may include:

- cetaceans: potential behavioural disturbance out to approximately 1 km from noise source for low frequency cetaceans (e.g. humpback whales) and 10 km for mid and high frequency cetaceans (e.g. coastal dolphins)
- fish: potential masking and behavioural disturbance at near and intermediate range; likelihood of TTS is considered not to be credible given fish would move away from the source – demersal fish are not expected to be exposed to underwater noise above impact thresholds
- turtles: potential masking and behavioural disturbance at intermediate and far range.

Note the estimates in * The 120 dB threshold may be adjusted if background noise levels are at or above this level.

Table 6-5 are considered to under-estimate transmission loss, and are inherently conservative, due to:

- use of low frequency (100 Hz) component of thruster noise signature; note thruster noise is typically broadband in nature, with much of the noise energy at frequencies >100 Hz, which are absorbed more rapidly in seawater
- use of high intensity thruster noise (i.e. thruster operating at full power); most time using thrusters is at lower than full power, with concomitant reduction in cavitation noise intensity
- use of a cylindrical spreading model, which may underestimate the effect of geometric spreading.

All support vessels are required to comply with EPBC Regulation 2000 – Part 8 Interacting with cetaceans to reduce the likelihood of collisions with cetaceans (refer to Section 6.7.3). Implementing this control may incidentally reduce the noise generated by vessels in proximity to cetaceans, as vessels are travelling slower; slower vessel speeds may reduce underwater noise from machinery (main engines) and propeller cavitation. Fauna such as cetaceans, fish, and turtles are capable of moving away from potential noise sources, and there are no constraints to the movement of these fauna within the Operational Area.

Table 6-7: Estimated sound transmission loss for a 182 dB re 1 µPa source at 100 Hz frequency

Range (m)	Transmission Loss	Received
100	40.1	141.9
500	54.4	127.5
1000	61.0	121.0
2000	68.0	114.0

5000	79.0	103.0
10 000	90.0	92.0

Cetaceans

As the migration corridor BIAs for pygmy blue whales and humpback whales overlap the Operational Area, there is the potential for these species to be exposed to underwater noise levels that may alter their behaviour when they are present in the region during seasonal migrations. Tagging studies of pygmy blue whales have shown the migratory pathway appears to be in deeper water to the west of the Operational Area, and pygmy blue whales have not been observed from the NY FPSO (unlike humpback whales). Given the underwater noise levels that may credibly be generated during the Petroleum Activities Program, and the low likelihood of pygmy blue whales being present in the Operational Area, the potential for impact is considered highly unlikely.

Aerial surveys of humpback whales off North West Cape did not observe any apparent displacement of humpback whales from the area around the NY FPSO (RPS Environment and Planning, 2010a). The majority of humpback whales observed during these surveys were east of the NY FPSO, which is consistent with other surveys showing the majority of humpback whales migrate within continental shelf waters along Western Australia (Double et al., 2010, 2012a). Received noise levels are expected to reduce to 121 dB re μ Pa within 1 km of the NY FPSO, which is just above the threshold for behavioural impacts for low frequency cetaceans (120 dB re μ Pa) (McCauley, 1998).

Humpbacks are regularly observed in close proximity to the NY FPSO and vessels. Given the maximum source of noise is below TTS and avoidance behaviour is not observed, it is considered unlikely humpbacks are adversely impacted by noise from the operation of the NY FPSO. Hence, pygmy blue and humpback whales are considered unlikely to be impacted by underwater noise generated during the Petroleum Activities Program.

Mid and high frequency cetaceans (e.g. dolphins) are known to show behavioural disturbance at a range of received noise levels (Southall et al., 2007). Mid and high frequency cetaceans may exhibit short-term behavioural responses to increased levels of underwater noise, such as avoidance or attraction.

Several other FPSOs operate in the region (**Section 4.10.8**). Noise emissions from these may overlap with noise from the NY FPSO, but observations in the area do not suggest that the area is avoided by cetaceans.

Fish

Demersal and pelagic fish species are present in the Operational Area, including fish communities associated with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula and the Continental Slope Demersal Fish Communities KEFs. Vessels holding station using DP are expected to produce sound equivalent to about 182 dB re 1 μ Pa SPL at 1 m. Modelling undertaken by McPherson et al. (2019) of sound produced by facility and vessel operations found that recoverable injury to some types of fish would only be possible if they remained within a distance of less than 10 m for 48 hours, and TTS if fishes remained within 10 m for at least 12 hours. Pelagic fish are highly mobile and the types of demersal fishes known to occur in the vicinity of the NY FPSO (e.g. snappers, emperors, cods and groupers) will exhibit some fidelity to the area but are still relatively free-swimming and are not constrained to such close ranges (i.e. 10 m). Therefore, free-swimming fish remaining in close range to sound sources for periods that subject themselves to TTS and injury is not considered to be a credible scenario.

Potential noise impacts to fish (including whale sharks) are expected to be restricted to masking and behavioural disturbance. Fish may temporarily be displaced from the immediate vicinity of a noise source; however, they would be expected to behave normally once the noise emissions ceased. Benthic species with site fidelity are not likely to be affected by the activity due to the depths to likely habitats and noise attenuation.

A foraging BIA for whale sharks overlaps the Operational Area and this species may be seasonally present (particularly between March and July) during their annual migration to, and from, the aggregation area off Ningaloo Reef. Whale sharks are not considered to be particularly vulnerable to underwater noise, as they do not have a swim bladder (considered to increase the vulnerability of a fish to noise related impacts). Received noise levels are expected to reduce to 103 dB re 1 μ Pa within 5 km of the Operational Area (McCauley, 1998). Currently, there are no quantitative sound exposure thresholds relevant to whale sharks. It is expected that the potential effects of noise on whale sharks are the same as for other fish species, resulting in minor, localised and temporary behavioural change such as avoidance. Noise attributed to the activity is not likely to interfere with the movement of whale sharks to and from the foraging area at the Ningaloo Reef, given the location is not confined and would not prevent the species from passing through. Therefore, impacts to whale sharks from the NY FPSO or support vessels are expected to have no lasting effect on the species.

Turtles

Vessels holding station are considered to be the predominant noise source related to the activity, with source levels of approximately 182 dB re 1 μ Pa SPL at m from a support vessel holding station considered to be representative of noise levels generated by vessels used for the Petroleum Activities Program. Turtles may occur in the Operational Area (**Section 4.6.2**) as the area contains internesting BIAs and defined Habitat Critical.

Although there are no quantitative sound exposure thresholds for impacts on marine turtles resulting from continuous noise sources, the relative risk for behavioural response is expected to be high within tens of metres of the source, medium within hundreds of metres and low within kilometres from the source (refer * The 120 dB threshold may be adjusted if background noise levels are at or above this level.

Table 6-5). PTS and TTS thresholds for turtles are 220 dB re 1 $\mu\text{Pa}^2 \text{ s}$ (SEL weighted) and 200 dB re 1 $\mu\text{Pa}^2 \text{ s}$ (SEL weighted), respectively (refer **Note**: a range of sound units are provided in the table above, reflecting the range of studies from which the data has been derived. The difference in units presents difficulty in reliably comparing threshold values. Where practicable, the threshold values have been compared with indicative sound sources levels of the same sound unit types. The sound units provided in the table above include:

- *M-weighted sound exposure level (SEL): a weighted sound metric that emphasises the audible frequency bands for the receptor groups – low, mid and high frequency cetaceans. SEL units are time integrated and best suited for continuous noise sources, such as vessels holding station or continuous machinery noise.*
- *Root mean square (rms) sound pressure level (SPL): root mean square of time-series pressure level is useful for quantifying continuous noise sources (as per SEL point above).*

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Table 6-6). Typical noise levels generated by the FPSO and a support vessel using DP would not exceed these levels (except at extremely close ranges to the source), and prolonged exposure of transient marine turtles at close range is not considered a credible scenario.

Such disturbances are not expected to have any significant effect on individual turtles. As such, no significant impacts to marine turtles from underwater noise are expected.

IMMR Activity Noise

IMMR activities may generate a range of acoustic emissions; however, the most significant is expected to be from the use of underwater survey equipment. Therefore, this impact assessment is based on the use of MBES and SSS, all other routine IMMR activities are expected to cause lower impacts than those discussed herein.

Underwater noise from MBES and SSS will attenuate rapidly in the water column due to the relatively high frequency of noise emissions from these sources. The operating frequencies of MBES (12–700 kHz) and SSS (75–900 kHz) are well above the hearing range of turtles (1–2 kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2–30 kHz) may be audible to turtles, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Modelling of impulsive sub-bottom profiler sound emissions by Mathews and Zykov (2013) and McPherson et al. (2017) indicates that the 166 dB re 1 μPa (SPL) behavioural disturbance threshold for turtles may only be exceeded within metres or tens of metres of the survey instruments. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound energy is produced at frequencies outside the peak hearing frequency range of turtles. No significant impacts to sensitive fauna are expected to occur as a result of these sources.

Sub-bottom profilers are typically lower frequency than multibeam echo sounders or side scan sonar, and acoustic emissions from sub-bottom profilers may propagate further in the water column. Based on typical source levels and frequencies for sub-bottom profilers (**Table 6-3**), and the geometric spreading equation present in vessel noise above, received levels from a sub-bottom profiler will attenuate to 160 dB re 1 μPa rms SPL within approximately 250 m of the source. This is comparable to the noise potentially produced by thrusters (refer to vessel noise section above for a discussion of potential impacts), although sub-bottom profiler emissions are impulsive rather than continuous. Potential impacts to cetaceans from MBES, SSS and sub-bottom profiler may, therefore, include behavioural disturbance if in close proximity to the survey instruments, but ranges to disturbance are less than or equivalent to disturbance ranges for the IMMR vessel itself. PTS or TTS are not considered credible, given individuals would need to be directly next to the noise sources for prolonged duration.

Helicopter Noise

Water has a very high acoustic impedance contrast compared to air, and the sea surface is a strong reflector of noise energy (i.e., very little noise energy generated above the sea surface crosses into and propagates below the sea surface (and vice versa) – most of the noise energy is reflected). The angle at which the sound path meets the surface influences the transmission of noise energy from the atmosphere through the sea surface, angles $>13^\circ$ from vertical being almost entirely reflected (Richardson et al., 1995). The Operational Area overlaps a breeding BIA for the wedge-tailed shearwater. The Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020) considers risks to seabird populations from aircraft (including helicopters) as “Low”, with frequency, approach and height as the potential issues for nesting seabirds. Considering the distance to nearest seabird roosting habitat (Gascoyne Marine Park, 7.7 km SW) and the typical characteristics of helicopter flights within the Operational Area (duration, frequency, altitude, and air speed), the opportunity for noise levels that may result in behavioural disturbance to marine fauna are not considered credible.

Wellheads, Flowlines and NY FPSO Machinery Noise

Given the low levels of noise emitted by subsea infrastructure such as wellheads, choke valves, flowlines and the NY FPSO hull, no impacts to marine fauna from these noise sources are expected. Measurements of noise generated by choke valves indicated it is relatively high frequency (>1 kHz), and hence will attenuate over relatively short distances in the water column; significant impacts to marine fauna are not considered credible.

Flare noise, like helicopter noise, is generated in the atmosphere and has limited potential to propagate in the sea due to the high acoustic impedance of water. Additionally, the height of the flare tower and the unconstrained propagation

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

of noise from the flare in the atmosphere means the potential for impacts to fauna at or near the sea surface is inherently highly unlikely. Receptors above the water, such as birds, may be exposed to noise from the flare. Operational experience indicates birds routinely roost at a range of locations on the NY FPSO and do not experience any discernible behavioural disturbance due to noise from the flare. As such, impacts to sensitive receptors from flare noise will have no lasting effect and will be highly localised.

Cumulative Impacts

While several FPSOs are located in the vicinity of the NY FPSO, the potential for significant cumulative impacts is considered to be not credible. In-field underwater measurements of FPSO noise off North West Cape indicated noise levels were lower than predicted and did not exceed 130 re 1 dB μ Pa beyond 500 m from the FPSO (JASCO Applied Sciences, 2010). This study concluded that propeller noise was the greatest component of underwater noise; given the FPSO is held on station by moorings, its potential to generate noise is relatively low.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
<p>EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures³¹:</p> <ul style="list-style-type: none"> Support vessels will not travel greater than 6 knots within 300 m of a cetacean or turtle (caution zone) and not approach closer than 100 m from a whale. Support vessels will not approach closer than 50 m for a dolphin or turtle and/or 100 m for a whale (with the exception of animals bow riding). If the cetacean or turtle shows signs of being disturbed, support vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots. Support vessels will not travel greater than 8 knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark. 	<p>F: Yes CS: Minimal cost. Standard practice.</p>	<p>Implementation of these controls is primarily intended to reduce the likelihood of a collision between a cetacean, whale shark or turtle occurring. However, implementation may also provide some reduction in the potential for exposure of these fauna to sound levels in direct proximity to vessels.</p>	<p>Controls based on legislative requirements – must be adopted.</p>	<p>Yes C 3.1</p>

³¹ For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited manoeuvrability; e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Maintain helicopter separation from cetaceans as per EPBC Regulations 2000 Part 8 Division 8.3 (Regulation 8.07) which includes the following measures: Helicopters shall not operate lower than 1650 feet or within a horizontal radius of 500 m of a cetacean known to be present in the area, except for take-off and landing.	F: Yes CS: Minimal cost. Standard practice.	Reduces likelihood of disturbance to cetaceans by maintaining separation distance.	Controls based on legislative requirements – must be adopted.	Yes C 3.2
Good Practice				
Vary the timing of the Petroleum Activities Program to avoid migration periods.	F: No. The Petroleum Activities Program occurs continuously over a 5-year period, modifying the timing of the Petroleum Activities Program is not feasible. CS: Not considered, control not feasible.	Not considered, control not feasible.	Not considered, control not feasible.	No
Implementing a shutdown zone around MBES, SSS and SBP for the following fauna: <ul style="list-style-type: none"> whales marine turtles whale sharks. 	F: Yes. However, as equipment is underwater, effective implementation of zones is challenging from topside observation. CS: Moderate. Requires the provision of a dedicated suitably trained crew member to undertake Marine Fauna Observations.	Limited. The areas of disturbance for these devices are limited to within about 290 m of the source. In addition, it is noted that for MBES, the frequency range of these devices are outside the estimated frequency hearing range of identified protected species (whales, turtles and whale sharks).	The source levels and frequency range of these devices are outside the estimated frequency hearing range of identified protected species (whales, turtles and whale sharks), so costs are considered disproportionate to benefits.	No
Have a dedicated experienced and trained Marine Fauna Observer (MFO) onboard vessels to undertake marine fauna observations.	F: Yes, however additional cost for dedicated and experienced MFO to be present during IMMR. CS: Moderate, requires the provision of a dedicated experienced MFO to undertake Marine Fauna Observations.	Use of an MFO may detect fauna in the area, however control provides limited benefit when managing impacts associated with vessel noise alone.	Given limited benefit associated with the management of vessel noise impacts and costs associated with control implementation an experienced MFO is not considered necessary.	No

Discharge of subsea control fluids.		✓	✓		✓			A	E	-	-	LCS GP PJ	Broadly Acceptable	EPO 4		
Discharge of hydrocarbons remaining in subsea pipeworks and equipment as a result of subsea intervention works (including pigging).		✓	✓		✓			A	E	-	-					
Discharge of chemicals remaining in subsea pipe works and equipment or the use of chemicals for subsea IMMR activities.		✓	✓		✓			A	E	-	-					
Discharge of minor fugitive hydrocarbons from subsea equipment.			✓					A	E	-	-					
Description of Source of Impact																
<p>Hydrocarbons and chemicals may be discharged as a result of planned routine and non-routine operations and activities, such as:</p> <ul style="list-style-type: none"> • operational discharges, including: <ul style="list-style-type: none"> – discharge of subsea control fluids - subsea control fluid is used to control subsea and well-head valves remotely from the facility. it is an open-loop system, designed to release control fluid from the subsea system – discharge of subsea control fluids from downhole valves – potential non-routine hydraulic fluid discharge associated with umbilical system losses/weeps – discharge of minor fugitive hydrocarbon from subsea equipment (e.g. seal weeps/bubbles). • IMMR activities, including: <ul style="list-style-type: none"> – discharge of residual hydrocarbons in subsea lines and equipment as a result of subsea IMMR activities – discharge of hydrocarbons from subsea equipment due to isolations, testing, subsea changeouts 																

³² Defined as ‘No lasting effect (< 1 month); localised impact not significant to environmental receptors’ as in **Section 2.6.3, Table 2-3.**

³³ For safety reasons, the specified distances requirements are not applied for a vessel holding station or with limited manoeuvrability (e.g. loading, back-loading, close standby cover for overside working and emergency situations).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- discharge of chemicals in subsea lines and equipment, or the use of chemicals for subsea IMMR activities (including installation of pig launcher/receiver).

Unplanned (accidental) discharges of hydrocarbons and chemicals are considered in **Sections 6.7** and **6.8**.

Subsea Control Fluids

Subsea control fluid is used to control well-head valves remotely from the facility. Control fluid is supplied to valves via an open-loop system, designed to release control fluid during operation (e.g. upon valve actuation) up to ~2 m³/day use across the subsea system. Subsea control fluid may also be discharged during IMMR activities (e.g. leak detection and SCM changeouts – refer to **Section 3.10** for further information).

Subsea control fluids are selected in conformance with the chemical selection process outlined in **Section 3.9**. The subsea control fluid currently in use at the NY facility is HW443ND, which is water-based and has an OCNS rating of E and is listed as PLONOR. Leak detection fluorescent dye is also added for leak detection.

Hydrocarbons

Potential discharges associated with spool or subsea valve replacement activities are difficult to accurately determine without detailed engineering and activity specific planning which incorporates risk reduction and mitigation considerations. Notwithstanding, and for the purposes of the risk assessment, a potential release associated with MPP changeout may be approximately 350 L of hydrocarbon. IMMR activities may also result in small gas releases associated with isolation testing and breaking into containment. During operations there is the potential for discharge of minor fugitive hydrocarbons (predominantly gas bubbles) from subsea equipment such as from umbilicals/control lines, well equipment, valves, and flowline seals.

Chemicals

Chemicals may be introduced into subsea infrastructure during IMMR activities. These chemicals are used and discharged intermittently in small volumes. Small quantities of chemicals may remain in the flushed infrastructure, which may be released to the environment after disconnection. Operational chemicals may be introduced into subsea infrastructure and production stream, either as process or non-process chemicals (e.g. corrosion inhibitors, biocides, scale inhibitors, etc). The use of operational chemicals is restricted to what is needed to complete a required task. All operational (process and non-process) chemicals are selected in accordance with the requirements of the chemical selection process, described in **Section 3.9**. Where operational chemicals enter the production systems, there is potential for them to apportion to the water phase; however, this is normally managed by reinjection with the PW stream (refer to **Section 3.6.8**).

Impact Assessment

There is potential for slight, short-term localised decrease in water quality and sediment quality, and adverse effects on marine biota and habitats at the discharge location resulting from routine and non-routine hydrocarbon and chemical discharges. However, planned discharges of hydrocarbons and chemicals are infrequent and are minimised as far as practicable via flushing off the lines back to the facility. Discharge locations are either the subsea valves (subsea control fluid), disconnection points in subsea infrastructure or the NY FPSO.

Subsea Control Fluids

Subsea control fluids are discharged from subsea valves at or near the seabed in relatively small volumes. Once released, control fluids are expected to mix rapidly in the water column and become diluted. Impacts from the release of subsea control fluids are localised to the immediate vicinity of the release location and will not have any lasting effect, based on the:

- relatively small volumes of discharges
- low sensitivity of the receiving environment
- rapid dilution of the release.

Given the nature of the control fluid, the receiving environment and the potential for bioaccumulation, the potential impacts to fauna, sediments and water quality are considered minor.

Hydrocarbons

The small quantities of hydrocarbons that may be released during operations and IMMR activities that break containment are buoyant and will float towards the surface. Given the water depth, pressure, and the small volumes released, these hydrocarbons are not expected to reach the sea surface. Rather, the release will disperse and/or dissolve within the water column. While recognising the potential ecotoxicity and physical effects of released hydrocarbons (refer to **Section 6.8** for a discussion of the potential environmental impacts of hydrocarbon releases), the low release volumes for routine activities, dispersion and dissolution is expected to result in hydrocarbon contamination decreasing to background levels rapidly. As such, impacts from routine releases of hydrocarbons will have no lasting effect and are highly localised. Infrequent non-routine IMMR activities with increased volumes discharged (e.g. MPP changeout) are not expected to result in impacts greater than slight, short-term localised decrease in water quality at discharge location.

Chemicals

Routine and non-routine discharges of chemicals are localised to the immediate vicinity of the release location and will not have any lasting effect. This is based on the:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- low potential for toxicity and bioaccumulation
- relatively small volumes of discharges
- intermittent nature of the discharges
- low sensitivity of the receiving environment
- rapid dilution of the release.

Residual operational chemicals are injected with PW; no credible impacts will result from planned activities.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)³⁴	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
None identified.				
Good Practice				
Chemical Selection and Assessment Environment Guideline: <ul style="list-style-type: none"> • Where Gold/Silver/E/D OCNS rating (and no OCNS substitution or product warning), chemicals are selected – no further control required. • If chemicals with a different OCNS rating, sub warning or non-OCNS rated chemicals are required, chemicals will be assessed in accordance with the guideline prior to use. 	F: Yes. Routinely implemented to the chemical selection process for Woodside facilities. CS: Minimal cost. Standard practice.	Selection and assessment of chemicals in accordance with the Woodside process, reduces environmental impacts associated with planned chemical discharge.	Benefits outweigh cost/ sacrifice.	Yes C 4.1
Subsea infrastructure flushed and appropriately isolated where practicable during IMMR disconnection activities to reduce volume/ concentration of hydrocarbons released to the environment.	F: Yes. The subsea infrastructure has been designed such that much of the hydrocarbon-containing elements can be flushed back to the NY FPSO. CS: Minor. Flushing may prolong the cessation of production required for subsea IMMR activities, leading to reduced production.	Flushing reduces the volumes/concentration of hydrocarbons released to the environment.	Benefit outweighs cost/ sacrifice.	Yes C 4.2

³⁴ Qualitative measure.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)³⁴	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Implement Woodside Engineering Operating Standard (Subsea Isolation). Proven isolation in place for relevant IMMR activities.	F: Yes CS Minimal cost. Standard practice	Maintaining and testing the ability to isolate wells and pipelines will ensure barriers are in place and verified limiting the volume of hydrocarbon released.	Control is WMS requirement, must be adopted.	Yes C 4.3
Monitor subsea control fluid use, investigate material discrepancies, and use control fluid with dye marker to help identify potential integrity failures.	F: Yes. The use of control fluid is monitored to maintain adequate fluid in the system. CS: Minimal cost.	Limits the volumes of subsea control fluid discharge to the marine environment.	Benefit outweighs cost sacrifice.	Yes C 4.4
Professional Judgement – Eliminate				
None identified.				
Professional Judgement – Substitute				
Install closed-loop subsea valve control system.	F: Yes. Closed-loop subsea valve control systems can be installed, however, they may not perform as quickly/reliably as open-loop systems. CS: Significant. The design, procurement and retrofitting of a closed-loop valve control system would result in considerable offshore logistics, exposure to safety hazards during installation, and significant financial burden through direct costs and lost production.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location, and types of fluid discharged in an open-ocean environment, and avoiding the discharges would provide little or no environmental benefit.	When considering the negligible effect from the release of control fluids, the risk and costs of retrofitting a closed-loop subsea valve control system is considered to be grossly disproportionate to the environmental benefit.	No
Professional Judgement – Engineered Solution				
Route hydrocarbons to vessel during disconnection of subsea infrastructure.	F: Yes. However, to do so would introduce significant safety risks to the vessel crew (fire, explosion, asphyxiation). CS: Significant. Equipping and training crew onboard subsea support vessels to safely route hydrocarbons to the vessel would result in significant additional costs (in addition to the increased safety risk identified above).	Small environmental benefit from preventing low concentration hydrocarbon discharge.	Given the increased safety risk and the very low environmental impact from hydrocarbon releases during subsea IMMR activities, the cost of routing hydrocarbons to the vessel is grossly disproportionate to the environmental benefit.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)³⁴	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Decrease frequency of valve actuation.	<p>F: Yes. However, decreasing the frequency of valve may adversely impact the safe functionality and reliability of valves.</p> <p>Reducing the performance of subsea valves may introduce operability impacts, and increased safety and environmental risk associated with loss of containment events.</p> <p>CS: Minimal cost.</p>	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location, and types of fluid discharged in an open-ocean environment, and reducing the number of discharges would provide little or no environmental benefit.	Decreasing the frequency of valve actuations would lead to a potential decrease in safe functionality and reliability of valves. When considering the potential safety and environmental risks from such a performance degradation, along with the minor impact from the release of control fluids, the cost of decreasing the frequency of valve actuations is considered to be grossly disproportionate to the environmental benefit.	No

ALARP Statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine hydrocarbon and chemical discharges. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

Demonstration of Acceptability

Acceptability Statement:

The impact assessment has determined that, given the adopted controls, planned routine and non-routine subsea hydrocarbon and chemical discharges are unlikely to result in a potential impact greater than slight impacts to water quality, marine sediment and ecosystem habitat with rapid temporal recovery expected. Further opportunities to reduce the impacts have been investigated above. Any impact from the Petroleum Activities Program from planned routine and non-routine subsea hydrocarbon and chemical discharges would only have a slight, short-term impact (<1 year), without any lasting effect on ecosystem function. Fluid discharges from the subsea system during operations and IMMR activities are routine in the oil and gas industry. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine hydrocarbon and chemical discharges to a level that is broadly acceptable.

Discharge of cooling water from vessels and NY FPSO to the marine environment.			✓					A	F		-	-			
Description of Source of Impact															
<p>Sewage, Putrescible Waste and Grey Water</p> <p>Sewage and grey-water is treated onboard the NY FPSO by a biological sewage treatment plant, which includes maceration, biological treatment and disinfection. The treatment process is consistent with secondary sewage treatment and the requirements of IMO Marine Protection Environment Committee 2 (VI) criteria. The sewage treatment plant onboard the NY FPSO is capable of handling inputs from up to 80 PoB, which is adequate for routine and non-routine personnel levels onboard the FPSO. Sewage treatment onboard facility support and subsea vessels</p>															

will vary. Treatment systems may require routine maintenance or repair during operations, which may necessitate infrequent, short periods in which sewage is directly discharged overboard.

Putrescible wastes (e.g. food scraps) from the NY FPSO and support vessels may be macerated prior to being discharged overboard. Putrescible wastes may also be retained onboard and disposed onshore.

The volume of sewage, grey-water and putrescible waste generated is estimated to be in the order of 6 m³ per day (based on an average volume of 75 L/person/day) from the NY FPSO. The actual volume of discharge will vary depending on personnel levels on the NY FPSO and vessels. Discharge of treated sewage and grey water from the NY FPSO is directly to the sea via a pipe below the sea surface. Discharge locations from vessels may vary but are typically at or near the water surface.

Slops, Drain and Bilge Water

Operational non-process discharges, process maintenance drainage and flushing discharges, washdown water and potential spills are contained in the non-hazardous and hazardous open drain systems onboard the NY FPSO. These systems drain to the slops tank and do not drain to the environment. Machinery space bilges on the NY FPSO also drain to the slops tank.

Chemicals used onboard the NY FPSO may be introduced to the drains system, including:

- deck washdown, maintenance drainage of treated water systems (e.g. tempered water), and other cleaning/flushing activities
- mandatory annual testing of the active fire deluge and foam system for safety requirements
- marine growth treatment of drain caisson.

Mandatory testing of the active fire deluge and foam system onboard the FPSO is undertaken for safety requirements. This discharge is directed overboard to prevent foam contamination of the slops tank (which would decrease the effectiveness of gravity separation of hydrocarbons). Rainwater on the FPSO is also directed overboard instead of to the slops tanks.

Vessels routinely generate and discharge relatively small volumes of bilge water. Bilge tanks receive fluids from many parts of the vessel, including machinery spaces. Bilge water can contain water, oil, detergents, solvents, chemicals, particles and other liquids, solids or chemicals. Water sources could include rainfall events and/or deck activities such as cleaning/wash-down of equipment/decks.

Brine

The RO and distillation plants onboard the NY FPSO are used to produce potable water, with the brine produced discharged to the marine environment at the FPSO. Brine is generally 55–60 parts per thousand salt, with up to approximately 100 m³ of brine produced per day. Small quantities of anti-scaling and cleaning chemicals may also be discharged with the brine. Small quantities of reverse osmosis (RO) brine may be generated by support or subsea vessels.

CWF Effluent

The CWF intakes seawater via the topsides seawater system, which is treated and injected to enhance hydrocarbon production. The CWF system is expected to generate approximately 4300 m³/day of routine process effluent (**Section 3.6.3**). The effluent contains concentrated sulphates, calcium and magnesium that occur naturally in seawater, as well as a scale inhibitor. For short durations, the effluent will contain small concentrations of either sodium hypochlorite or biocide, as described in **Section 3**. The routine discharge stream is at ambient temperature and is routed to the existing seawater disposal caisson where the stream is diluted with the seawater cooling reject stream by approximately 18 times, before being discharged to the marine environment.

Non routine discharges from the CWF package, described in **Section 3**, include periodic cleaning/maintenance discharges originating from the CIP package. These may include up to 20 m³ of freshwater dosed with either citric acid or sodium carbonate, or fluids used to preserve the system when not in use, which comprises 65 m³ of seawater dosed with sodium bi-sulphate. These chemicals are considered PLONOR. The primary disposal route for these discharges is to the slops tanks, with their fate being reinjection into the disposal reservoir. Due to operational reasons, it may not be possible to direct these non-routine discharges to the slops for reinjection from time to time in this case the non-routine discharge may be over boarded via the existing seawater disposal caisson. During start-up, turndown operation and injection well testing operations, there is also continuous overboarding of the filtrated CWF stream via pump minimum flows and SRU product dump lines, which includes residual oxygen scavenger and may include anti-foam.

Seawater Systems Flow (including Cooling Water)

The seawater systems are routinely used onboard the NY FPSO for process and machinery cooling which is returned to the sea via the seawater disposal caisson or marine sea chests. Seawater used for cooling, is dosed with copper ions to inhibit marine growth. The average discharge rate of sea water from the topsides cooling system and hull cooling system are approximately 80,000 m³/day and 56,000 m³/day respectively. The hull cooling system operates as required for engine cooling. The topsides cooling system is considered to represent worst case discharge scenario due to the larger volume. Seawater system discharge temperature is, on average, approximately 20°C above ambient seawater temperature (approximately 23°C), with a maximum discharge temperature of 50°C.

Impact Assessment

Sewage, Putrescible Waste and Grey Water

The main environmental impact associated with ocean disposal of sewage, grey water and putrescible waste is eutrophication. Eutrophication occurs when the addition of nutrients, such as nitrates and phosphates, causes adverse changes to the ecosystem, such as oxygen depletion and phytoplankton blooms. Environmental receptors that may be exposed to sewage, grey water and putrescible waste discharges include plankton, marine reptiles, marine mammals and pelagic fish. No significant impacts from the planned (routine and non-routine) discharges to environmental receptors are anticipated because of the minor quantities involved, the expected localised mixing zone, and high level of dilution into the open water marine environment of the Operational Area. Water quality monitoring in the mixing zone around the NY FPSO indicated nutrients (e.g. ammonia, total nitrogen (TN) and total phosphorous (TP)) are consistent with background levels within 200 m of the discharge location (BMT Oceanica 2015a). This is consistent with other studies monitoring sewage discharges, which have demonstrated that a 10 m³ sewage discharge reduced to approximately 1% of its original concentration within 50 m of the discharge location (Woodside, 2008). The Operational Area is located more than 12 nm from land, exceeding the exclusion zones required by Marine Order 96 (Marine pollution prevention – sewage) 2018 and Marine Order 95 (Marine pollution prevention – garbage) 2013.

Vessels are typically moving when in the Operational Area, which facilitates the mixing of sewage, putrescible wastes and grey water from vessels. The impact of nutrients associated with discharge of sewage, grey-water and putrescible waste is considered to have a localised impact, with no lasting effect due to the discharge mass and the assimilative capacity of the receiving environment.

Slops, Drain and Bilge Water

The slops tank receives drainage water from a range of sources, including:

- NY FPSO drain systems
- CWF periodic cleaning/maintenance effluent.

Slops tank water may contain small quantities of dissolved and residual hydrocarbons, and other chemicals such as detergents and cleaning agents. Given slops tank water is reinjected during normal operations, no impacts from slops tank water will occur.

Water foaming agents used in fire-fighting foam may be harmful to aquatic organisms within freshwater environments like ponds and streams. This effect of the chemical release is greatly diminished in the offshore environment (due to wave and wind action) and does not present the same risks to pelagic fish and other marine life as is rapidly dispersed.

Nevertheless, the planned release of these materials is restricted to testing activities and using the minimum amount required to ensure safe and effective operation of the system in an emergency. Stagger test water will be clean seawater and the discharge will have no environmental impact.

RO Brine

Sodium hypochlorite and other chemicals within the RO brine stream are expected to readily dissociate and break down once discharged into the environment. Monitoring at other Woodside facilities with comparable water discharges did not indicate the pH within the mixing zone differs from the surrounding environment (BMT Oceanica, 2015b); given sodium hypochlorite is basic, the monitoring suggests that sodium hypochlorite concentrations diminish rapidly following discharge. Other chemicals in these discharges, such as biocides and scale inhibitors, are expected to occur at low concentrations and mix rapidly.

Brine plumes discharged from the RO plant may result in osmotic stress to marine biota that rely on gills or diffusion across cell membranes to maintain osmotic pressure within cells. Mobile fauna such as fish may move away from the brine plume; hence impacts are restricted to planktonic and sessile organisms.

Once discharged into the marine environment, the brine plume is expected to sink due to its relatively high density. Sinking of the plume will facilitate turbulent mixing, as will surface currents and waves. Recent water quality monitoring at the NY FPSO indicated the brine plume mixed rapidly once released and was not readily detectable within 50 m of the discharge location (the seawater disposal caisson) (BMT Oceanica, 2015a). On this basis, the RO brine plume is expected to mix rapidly. Impacts from RO brine discharge will have no lasting effects on the environment and are highly localised to the discharge location.

CWF Effluent

The main environmental impact associated with disposal of CWF is reduction in water quality. The routine CWF discharge stream is at ambient seawater temperature therefore no impacts from temperature are anticipated. The concentrated sulphates, calcium and magnesium in the effluent, which occur naturally in seawater, are not considered contaminants of concern and are not anticipated to have any impacts. Additives to the CWF discharge stream are either naturally occurring in seawater (and therefore soluble in seawater) or are low toxicity, water soluble chemicals dosed at low rates.

The CWF discharge stream is expected to readily dilute by co-mingling with the cooling water discharge stream, by approximately 18 times prior to discharge. No credible impacts from the planned (routine and non-routine) discharges to environmental receptors are anticipated because of the minor quantities involved, low toxicity, the expected localised mixing zone, and high level of dilution into the open water marine environment of the Operational Area.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Seawater Systems Flow (including Cooling Water)

The main environmental impact is temperature change potentially affecting open water receptors (fish and plankton populations). Elevated seawater temperatures may cause a variety of effects on both fish and plankton, ranging from behavioural response (including attraction and avoidance behaviour) and minor stress for prolonged exposure. Fish are unlikely to be impacted by the elevated temperatures other than through behavioural changes (avoidance and attraction). While impacts to plankton may include mortality, given the rapid turnover of plankton communities and mixing of adjacent populations, populations are expected to recover rapidly once discharge ceases.

Discharged cooling water (typically 80,000 m³/day) is typically 20°C warmer than the ambient seawater. Given higher temperature, cooling water is expected to be buoyant compared to the receiving seawater and form a plume in near surface waters down current from the seawater disposal caisson. Modelling of a similar discharge rate, of cooling water was previously conducted for the proposed Browse Upstream LNG Development (DHI, 2011) using Cornell Mixing Zone Expert System (CORMIX 6.0). This modelling assumed a cooling water discharge rate of 90,000 m³/day at a temperature of 45°C at 20 m depth through a 1.2 m downward-facing caisson which is comparable to the discharge of topsides cooling water (largest discharge from the FPSO, **Table 6-8**). Based on a review of current speeds in the Exmouth basin metocean conditions are expected to be similar, with typical currents speeds of ~0.2 m/s (measured speeds ranged from 0.005 m/s to 0.52 m/s). Therefore, the modelling is representative of below sea surface cooling water discharges expected from the FPSO cooling water.

Table 6-8: Modelling results from Browse development and North Rankin C cooling water discharge and the characteristics of the cooling water discharges from the Ngujima-Yin floating production, storage and offloading facility

<i>Characteristic</i>	<i>Browse Modelling</i>	<i>NY Topside System</i>	<i>NRC Modelling</i>
Flow rate (m ³ /day)	90,000	80,000	295,200
Pipe diameter (m)	1.2; 1.2; 1.6 (per caisson)	1.2; 1.2; 1.6 (per caisson)	1.6 (per caisson)
Port exit velocity (m/s)	0.92	0.72	-
Caisson elevation (m below surface)	-20	-5	-15
Excess salinity	0	0	0
Excess temperature (°C)	Excess temperature +19 (absolute 45)	+20 (absolute 50)	45
Ambient temperatures (°C)	28 (based on range of 26- 30)	23 to 30	19 to 30
Ambient salinity (ppm)	34.2	35.2 to 35.7	34

The Browse model found that under varying set tidal current speeds the thermal plume cooled to within 3°C of ambient within a short distance from the caisson. Using worst case (0.1 m/s) and typical current speeds (0.22 m/s) the thermal plume cooled to 3°C of ambient, within 15 m and 8 m of the discharge caisson respectively. These model results indicate that the temperature of topsides cooling water discharge plume would be reduced to less than 3°C above ambient within those same distances. As described previously, the cooling water discharge rate is typically of 80,000 m³/day, which is less than the 90,000 m³ discharge rate modelled. The lower volumes result in more effective near-field dilution reducing the distance required to achieve dilution to ambient temperatures.

Modelling was also undertaken for 295,200 to 405,600 m³/day of cooling water (discharged from two discharged points) at NRC (SKM, 2008). Given the two discharges from the FPSO combined (80,000 m³/day and 56,000 m³/day) are much smaller than the lower end of rates modelled at NRC this modelling is considered conservative. The NRC modelling found that under varying set tidal current speeds the thermal plume cooled to within 3°C of ambient within 200 m from the caisson. These model results support the assessment that the temperature of the combined topsides and hull seawater cooling system based cooling water discharge plumes would be reduced to less than 3°C above ambient well within 200 m. Based on current facility design, it is not possible to significantly increase the throughput of cooling water or the discharge temperature without significant equipment and process changes. Therefore, any increase in cooling water discharge rates or temperature beyond those considered above are not considered credible.

Water quality monitoring in the mixing zone around the NY FPSO could not detect elevated temperatures (SKM, 2010), indicating that temperatures returned to ambient within 10 m of the discharge point which is consistent with modelling. No significant impacts from the planned discharges to environmental receptors are anticipated because of the localised mixing zone, and high level of dilution into the open water marine environment.

The only additive to the seawater used in the seawater and cooling water systems is copper ions, which are generated to suppress growth of fouling organisms. Most copper ions will react and be neutralised within the cooling water system. Levels of copper from anti-biofouling systems have been measured by the US Uniform National Discharge Standards (UNDS) Program. Their research has shown that the concentration of copper discharged from antibiofouling systems is between 0.52 and 0.69 ppb (µg/L). In these low concentrations and on discharge into the

marine environment, two or three dilutions are required to reduce residual copper concentration below ANZECC/Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) guideline values (99% species protection trigger level for copper is 0.3 µg/L). At these low concentrations, copper is rapidly diluted to ambient background levels on discharge into the marine environment. Copper is an essential trace nutrient, and marine organisms (including mammals, fish, molluscs and crustaceans) have evolved mechanisms to regulate concentrations of free copper ions in their tissue received from ambient water, sediment or food (Neff, 2002). These mechanisms are able to continue to operate, and only break down when copper concentrations reach near-lethal concentrations (Neff, 2002). The discharge of copper ions in cooling water is not expected to result in significant bioaccumulation effects. The level of copper ions generated is controlled by the design of the system and anticipated to have no lasting effects on the environment and are highly localised to the discharge location.

Cumulative Impacts

Given the activities that may be conducted during the Petroleum Activities Program, there is the potential for cumulative impacts from routine discharges due to:

- repeated/ongoing discharges at the same location (NY FPSO) over the course of the Petroleum Activities Program
- cumulative discharges from differing point sources (NY FPSO and vessels).

Given the nature of these routine discharges, the localised spatial extent of impacts and the well mixed receiving environment, the cumulative impacts from these discharges are not considered to result in impacts more than slight short-term impact. Given the highly localised nature of the impacts of routine discharges, no cumulative impacts from similar discharges from other production facilities (e.g. Nganhurra and Ningaloo Vision FPSOs) will occur.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Professional Judgement – Substitute				
Long term transport of potable water from shore for NY FPSO and vessels.	F: Yes. Potable water can be sources from onshore water supplies. CS: Significant. The long-term costs and operational complexity associated with potable water bunkering outweigh cost and negligible environmental footprint associated with offshore RO supply.	The potential environmental impact is ranked as having negligible effect; Eliminating RO brine the discharge would provide negligible environmental gain.	When considering the negligible impact from the discharge of RO brine reliance on bunkering of potable water and incremental support vessel activities is disproportionate to the environmental impact.	No
Professional Judgement – Engineered Solution				
Sewage from NY FPSO processed by sewage treatment plant prior to discharge under normal operations.	F: Yes CS: Minimal cost. Standard practice.	Treating and macerating sewage is standard industry practice, ensuring the substance disperses in the receiving environment with minimal effects to water quality.	Benefits outweigh cost sacrifice.	Yes C 5.4
Facility process area drain systems maintained to return routine drain flows inboard to slops.	F: Yes CS: Minimal cost. Standard practice.	The open hazardous drain system will be maintained to support appropriate disposal of environmentally hazardous liquids.	Benefits outweigh cost sacrifice.	Yes C 5.5
Upgrade existing sewage treatment system by retrofitting a disinfection system.	F: Yes. However, disinfection of sewage is intended to reduce pathogenic bacterial loads and hence will have no impact on nutrient concentrations. CS: Significant. Installation of a disinfection system would incur design, procurement, installation and ongoing operational costs. Additional chemicals may also be required, introducing an additional source of environmental risk.	Minor reduction in impacts due to treatment of sewage, given offshore environment and high natural mixing which would occur.	Given the installation of a disinfection system does not reduce the environmental impact of sewage discharge, along with the potential for additional chemical use, the cost is considered to be grossly disproportionate to the environmental benefit.	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Reassessment of impact of cooling water discharges if significant equipment and/or process changes occur on the facility, with the potential to increase: <ul style="list-style-type: none"> • volume • temperature. 	F: Yes CS: Minimal cost. Standard practice.	Maintains confidence that environmental impact from cooling water discharge stream continues to meet Woodside's Environmental Performance Procedure. Based on current facility design, it is not possible cooling water discharge plumes would exceed 3°C above ambient at 200 m without significant equipment and process changes. Given the concentration of copper discharged from antibiofouling systems is between 0.52 and 0.69 ppb (µg/L) it is not considered credible that the either the 95% or 99% species protection trigger level for copper (0.3 and 1.3 µg/L respectively) could be exceeded at 500 m without significant equipment and process changes.	Benefits of reassessment outweigh cost sacrifice.	Yes C 5.6

ALARP Statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of discharge of sewage, putrescible waste, grey water, bilge water, drain water, cooling water, CWF effluent and brine. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

Demonstration of Acceptability

Acceptability Statement:

The impact assessment has determined that, given the adopted controls, impacts from the discharge of sewage, putrescible waste, grey water, bilge water, drain water, cooling water, CWF effluent and brine is unlikely to result in a potential impact greater than slight and short-term changes above background levels within a localised mixing zone, with rapid temporal recovery expected. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet legislative requirements under Marine Orders 91, 95 and 96. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of these discharges to a level that is broadly acceptable.

Description of Source of Impact

Atmospheric emissions are generated from the NY FPSO and support vessels during the Petroleum Activities Program. Sources include emissions from internal combustion engines (including equipment and generators), flares, fugitives and process vents. Vessel emissions include those from internal combustion engines, fugitives and onboard incinerators. Emissions and combustion products will typically include CO₂, water vapour, NO_x, SO₂, methane, refrigerant gases (including ozone depleting substances), particulates and Volatile Organic Compounds (VOCs).

In this section greenhouse gases are estimated using the National Greenhouse and Energy Reporting (NGER) Measurement Determination 2008 (as amended including 100-year Global Warming Potential).

Direct Atmospheric and GHG Emissions

Direct emissions generated from the NY FPSO during the Petroleum Activities Program include emissions from gas turbines (that can also run on diesel), flares, fugitives and process vents. Direct emissions and combustion products typically include CO₂, water vapour, NO_x, SO₂, particulates, Volatile Organic Compounds (VOCs).

Fuel Emissions

Fuel gas consumption for compression and power generation is the predominant source of combustion emissions from the NY FPSO, primarily from the three 12,500 kW gas turbine generators, the CWF turbine generator and high-pressure reinjection compressor. The turbines may run on fuel gas or diesel. Emergency diesel generators may also be used as required. Diesel is used for firewater pumps, emergency generators, cranes and back-up fuel for the turbine generators. The main engines on the NY FPSO also use diesel fuel.

Based on historical and forecasted data, it is estimated that NY will consume approximately 80,000 tonnes of fuel gas, the combustion of which equates to about 213,368 tonnes of CO₂ equivalents. Diesel use is more variable and may be up to 6500 m³ per year (excluding support vessels), the combustion of which equates to 17,613 tonnes of CO₂ equivalents (CO₂-e).

The estimated annual emissions from fuel combustion have been estimated using emissions factors (as per National Greenhouse and Energy Reporting (NGER) (Measurement) Determination 2008 and National Pollutant Inventory (NPI) Emission Estimation Techniques (EET)) and are presented in **Table 6-9**.

Table 6-9: Estimated annual emissions from fuel combustion (excluding support vessels)

<i>Emission Type</i>	<i>Estimated annual emissions from fuel gas combustion (t)</i>	<i>Estimated annual emissions from diesel combustion (t)</i>
CO ₂ (t CO ₂ -e)	212,830	17,538
CH ₄ (t CO ₂ -e)	414	25
N ₂ O (t CO ₂ -e)	124	50
Total t CO₂-e	213,368	17,613
NO _x (tonnes)	852	345
CO (tonnes)	218	91

Flaring

During normal operations, hydrocarbon gas is flared via the HP and LP flare systems. Gas flaring emits gases to atmosphere and consumes natural gas, a non-renewable resource. Emissions and combustion products include CO₂, NO_x, SO₂, methane, particulates and VOCs. Incomplete combustion under certain scenarios may also generate dark smoke.

The release of hydrocarbon gas to atmosphere by flaring is an essential practice, primarily for safety requirements.

Operational flaring is comprised of two elements:

- normal operational flaring associated with flare system purge, pilot and process flows
- non-routine, non-operational flaring that may result from activities such as planned shutdowns and ESD testing, and unplanned shutdowns and ESDs, production restarts, equipment outage/failures, subsea flowline depressurisation, well start up and remediation activities.

The flaring volume is impacted by reliability of the compression system (LP compressor and HP compressor). Historically, improvements have been made on the reliability of the HP compressor, with a subsequent reduction in flaring volumes. During flaring, the burnt gas generates mainly water vapour and CO₂.

Based on historical performance, it is estimated that about 32,000 tonnes of gas is flared per year including water vapour, inert gas and hydrocarbon gas in routine and non-routine activities. Flaring volumes vary with production rates, non-routine activities, outages and shutdowns. The estimated annual emissions from flaring have been calculated using the NGER measurement determination and NPI EET (**Table 6-9**).

Table 6-10: Estimated annual emissions from flaring

Component	Estimated Annual Emissions (tonnes)¹
Flared gas (tonnes)	32,0001
CO ₂ (t CO ₂ -e)	89,600
CH ₄ (t CO ₂ -e)	29,856
N ₂ O (t CO ₂ -e)	832
Total t CO₂-e	120,288
NO _x (tonnes)	48
CO (tonnes)	278

¹ Estimate only from historical performance from last two years. Future performance may differ due to variety of reasons such as upset conditions, change in field production, etc.

Non-routine Venting of Process Hydrocarbons via Flare System

During normal operations, hydrocarbon gas is flared via the HP and LP flare systems. These systems are maintained to effectively combust hydrocarbons as a critical component for the safe operation of the NY facility. In the unlikely event that the flares are extinguished (for example during a tropical cyclone) or unavailable (such as following a major shutdown prior to system ramp-up), the hydrocarbon gas discharged via the flare system may initially not be combusted during the period required to purge the flare system and re-establish flare ignition. This may result in the short term (minutes) low-rate release of hydrocarbon gas to the atmosphere. Intermittent venting from the NY facility represents a minor source of atmospheric emissions and is not considered to pose a risk beyond the routine air emissions described in this section.

Cargo Tank Inert Gas Venting

The inert gas system supplies inert gas to maintain a positive pressure in the vapour space of cargo tanks to prevent the ingress of air. Hydrocarbon vapour will form in the cargo tanks as volatile hydrocarbons evaporate from the stored crude oil. This vapour is displaced from the cargo tanks as they are filled and vented to the atmosphere. Maintaining inert gas in cargo tank vapour spaces is required for the safe operation of the facility.

Fugitive Emissions

Fugitive emissions can occur from pressurised equipment, and are inherent in design, required for infrequent operational activities, or can be caused by unintentional equipment leaks. Sources can include from valves, flanges, pump seals, compressor seals, relief valves, vents, sampling connections, process drains, open-ended lines, casing, tanks and other potential leakage sources from pressurised equipment. Fugitive emissions are, by their nature, difficult to quantify.

As much of the safe operation of the NY facility relies on the effective containment of hydrocarbons, the volumes of routine and non-routine fugitive emissions are considered small. The National Greenhouse and Energy Reporting (Measurement) Determination provides methodology for estimating fugitive emissions. Using these estimation techniques, the NY FPSO reported 4985 tonnes of CO₂ equivalents lost through fugitive emissions over the 2022–2023 reporting period. This is expected to remain relatively constant over the EP period.

Discrete, relatively small volumes of packed gases and charged systems including refrigerant gases are used across the NY FPSO and vessels, which have potential for small volume leaks (typically less than 100 kg per isolatable inventory). Such gases are used in the HVAC and refrigerant systems onboard the NY FPSO and vessels.

Indirect Emissions

Emissions from Vessels and Helicopters

GHG and Atmospheric emissions are generated by vessels and helicopters supporting NY activities. Atmospheric and GHG emissions from support vessels vary depending on the nature of activities being undertaken; for example, travelling or “steaming” to a destination at low speed uses less fuel and generates lower atmospheric and GHG emissions than high speed steaming. Emissions generated during safety related vessel standby activities, holding station using DP during loading and unloading of materials to the facility or undertaking subsea IMR work also vary.

Anticipated annual emissions for vessel and helicopter activities have been estimated to be:

- 3,000 tCO₂-e for support vessels, based on historical support vessel diesel consumption in 2021.
- 320 tCO₂-e for helicopters, based on number of flights in 2022.

Indirect emissions from these sources are expected to be relatively constant throughout the EP period and until EOFL.

Emissions from Shipping, Refining and End-Use Attributable to NY

Indirect emissions associated with NY result from shipping, refining and combustion/end use of hydrocarbons. Indirect GHG emissions associated with NY operations were estimated using historical and forecasted production rates (Table 6-11). Key influences impacting indirect greenhouse gas emissions from NY include: total production – indirect emissions are proportional to total production, which varies with shutdown activity, new field tiebacks or gradual reservoir decline.

Based on historical and forecasted production rates, the indirect emissions associated with NY from end use of hydrocarbons are estimated to be approximately 3.30 MtCO₂-e per annum. These annual emissions are likely to continue through this EP period. This estimate may vary, particularly the timeframe beyond this current EP period, as it is subject to many factors, such as reservoir performance. Woodside’s current forecast is that the reservoirs produced via NY will decline toward EOFL. Other reservoirs may be discovered and/or tied-back to NY to mitigate the decline, but overall, the trend of hydrocarbon production from NY and associated indirect emissions from end use of hydrocarbons are expected to also decline.

Table 6-11: Summary of direct and indirect emissions attributable to Ngujima-Yin facility

Source of Impact	Annual Estimated Emissions (MtCO ₂ -e)	Total Possible Emissions for EP Period (MtCO ₂ -e)
Direct Emissions		
Fuel, flaring and fugitives	0.36	1.78
Indirect Emissions		
Vessels and helicopters	0.003	0.02
Third party transport of products, refining and combustion ¹	3.30	16.48

¹ Transport and refining based on Oil-Climate Index factors for Australia Cossack. Combustion factors aligned with UN’s 2006 IPCC Guidelines for National Greenhouse Gas Inventories

Impact Assessment

Global efforts to reduce greenhouse gas emissions in order to meet climate goals are changing the way the world produces and consumes energy. This energy transition is uncertain and there is a wide range of potential demand for oil, gas and new energy including in pathways consistent with limiting global temperature rise. Today, Woodside has a portfolio of oil and gas assets. We are also developing a portfolio of new energy products and lower carbon services. Across our portfolio we seek to match the pace, scale and needs of our customers as they determine their own decarbonisation pathways. We see an ongoing role for natural gas from the NY facility to support our customers’ plans to secure their energy needs, while they reduce their emissions.

Air Quality

Facility and vessel routine and non-routine emissions, predominantly routine fuel combustion and flaring, have the potential to result in localised, temporary reduction in air quality, generation of dark smoke, and contribution to greenhouse gas emissions. Potential impacts of emissions depend on the nature of the emissions, as well as the location and nature of the receiving environment.

NY FPSO design (including the rapidly dispersive characteristics of the gas turbine exhausts, flare and other emissions), the estimated level of pollutants in the emissions, and the absence of elevated background ambient levels have been considered in estimating the potential for interaction with human and environmental sensitivities. The NY facility and Operational Area is in a remote offshore location, with no expected adverse interaction with populated areas or sensitive environmental receptors associated with air emissions.

There is a foraging BIA for the wedge-tailed shearwater overlapping the Operational Area; as such, wedge-tailed shearwaters may occur nearby to the facility airshed. The nearest potential seabird roosting habitat, Muiron Islands, lies approximately 35 km south of the Operational Area at the closest point. Given the highly dispersed nature of air emissions from the Petroleum Activities Program, no adverse impacts to wedge-tailed shearwaters are anticipated due to air emissions.

Potential impacts are expected to be short-term, localised air quality changes, limited to the airshed local to the NY FPSO. Air emission impacts are not expected to have direct or cumulative impacts on sensitive environmental receptors.

The flare and potential black smoke resulting from emissions may impact visual amenity. The offshore location of the NY FPSO is not directly visible from the nearest point of the mainland (North West Cape, 43 km south of the Operational Area at the closest point). Hence, no impacts to visual amenity for residential communities are expected. Visual amenity impairment to tourism activities is not expected.

Greenhouse Gas Emissions

This impact assessment considers the potential impacts of climate change on sensitive receptors, including MNES within Australian jurisdictions. Climate change impacts cannot be directly attributed to any one activity, as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution started. They do not take into account the net impact of each project or activity. There is no direct link between greenhouse gas emissions from the NY facility and climate change impacts.

Impacts relating to climate change associated with the emission of GHG (direct and indirect) have been assessed in this EP in accordance with the EPBC Act Policy Statement - 'Indirect consequences' of an action: Section 527E of the EPBC Act (DSEWPAC, 2013).

Climate change impacts upon Australian receptors cannot be linked to the NY facility but are instead the result of the accumulation of net greenhouse gas emissions in the atmosphere. The accumulation of net greenhouse gas emissions in the atmosphere is, in turn, influenced by global energy demand and the composition of the global energy mix. Although the NY FPSO operations cannot be linked to climate change impacts, the following contextual evaluation is provided. This contextual evaluation assessment considers the potential impacts of climate change on sensitive receptors, including MNES within Australian jurisdictions.

Climate science is a rapidly evolving field in which new observations continue to deepen understanding of the current and potential impacts of global warming, and the possible pathways for mitigation and adaptation (Woodside 2023a).

The IPCC is the United Nations body for assessing the science related to climate change and is finalising the Sixth Assessment Report (AR6) which consists of three Working Group contributions and a Synthesis Report. The outcomes of the working group contributions were summarised in Woodside's (2023a) Climate Report:

- The AR6 Working Group I (AR6-WG1) report stated that it is unequivocal that there is human-induced warming. It also stated that increased atmospheric carbon dioxide (CO₂) levels, generated by human activity, are the largest driver of warming over the longer term, and that there are a range of factors, including emissions of methane, which increase warming in the short-term.
- The AR6-WG2 report stated that human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability. It stated that global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans. The report noted that societal choices and actions implemented in the next decade will determine the extent to which medium- and long-term pathways will deliver climate resilient development.
- The AR6 Working Group III (AR6-WG3) report provided an updated global assessment of climate change mitigation progress and pledges and examined the sources of global emissions. It explained developments in emissions reduction and mitigation efforts and assessed the impact of national climate pledges in relation to long-term emissions goals. More than 2,000 quantitative emissions pathways were submitted to the IPCC, of which 1,202 scenarios included sufficient information for assessing the associated warming. The report found that there are many pathways in the literature that likely limit global warming to 2°C with no overshoot, or to 1.5°C with limited overshoot. These variations occur because, while climate science is able to calculate a 'carbon budget' of net emissions before any particular temperature outcome is reached, the allocation of this budget between different human activities requires additional judgements about for example technology, economics, consumer preferences and policy choices.

The AR6 Working Group I (AR6-WGI) report states "[c]limate change is a global phenomenon, but manifests differently in different regions" (IPCC 2021b). IPCC projections for climate change in Australia from the AR6 Working Group II (AR6-WGII) report include:

- further climate change is inevitable, with the rate and magnitude largely dependent on the emission pathway (*very high confidence*)³⁷
- ongoing warming is projected, with more hot days and fewer cold days (*very high confidence*)
- further sea level rise, ocean warming, and ocean acidification are projected (*very high confidence*)
- less winter and spring rainfall is projected in southern Australia, with more winter rainfall in Tasmania, less autumn rainfall in southwestern Victoria and less summer rainfall in western Tasmania (*medium confidence*), with uncertain rainfall changes in northern Australia.
- more extreme fire weather is projected in southern and eastern Australia (*high confidence*)
- increased drought frequency is projected for southern and eastern Australia (*medium confidence*)
- increased heavy rainfall intensity is projected, with fewer tropical cyclones and a greater proportion of severe cyclones (*medium confidence*) (Lawrence et al. 2022).

The AR6-WGII report identified nine key climate risks for the Australasian region:

- loss and degradation of coral reefs and associated biodiversity and ecosystem service values in Australia due to ocean warming and marine heatwaves (*very high confidence*)
- loss of alpine biodiversity in Australia due to less snow (*high confidence*)
- transition or collapse of alpine ash, snowgum woodland, pencil pine and northern jarrah forests in southern Australia due to hotter and drier conditions with more fires (*high confidence*)
- loss of kelp forests in southern Australia due to ocean warming, marine heatwaves, and overgrazing by climate-driven range extensions of herbivore fish and urchins (*high confidence*)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- loss of natural and human systems in low-lying coastal areas due to sea level rise (*high confidence*)
- disruption and decline in agricultural production and increased stress in rural communities in south-western, southern and eastern mainland Australia due to hotter and drier conditions (*high confidence*)
- increase in heat-related mortality and morbidity for people and wildlife in Australia due to heatwaves (*high confidence*)
- cascading, compounding and aggregate impacts on cities, settlements, infrastructure, supply-chains and services due to wildfires, floods, droughts, heatwaves, storms and sea level rise (*high confidence*)
- inability of institutions and governance systems to manage climate risks (*high confidence*) (Lawrence et al. 2022).

An earlier report by Australia's Biodiversity and Climate Change Advisory Group summarised the potential impacts of climate change to marine and terrestrial species, habitats and ecosystems across Australia (Steffen et al. 2009). The 2009 report identified examples of observed changes in Australia's biota that were considered consistent with the emerging climate change 'signal', as genetic constitution, geographic ranges, life cycles, populations, ecotonal boundaries, ecosystems, and disturbance regimes (Steffen et al. 2009). The report also stated:

- "Biodiversity is one of the most vulnerable sectors to climate change"
- "Australia's biodiversity is not distributed evenly over the continent but is clustered in a small number of hotspots with exceptionally rich biodiversity", and that these "include the Great Barrier Reef, south-west Western Australia, the Australian Alps, the Queensland Wet Tropics and the Kakadu wetlands"

Further, it was stated that "many of the most important impacts of climate change on biodiversity will be the indirect ones at the community and ecosystem levels, together with the interactive effects with existing stressors (Steffen et al. 2009). Future climate change (e.g. increased temperature and decreased, but more variable, rainfall) has the potential to have a range of impacts on ecological factors and threaten biodiversity in the Australian mediterranean ecosystem (CSIRO 2017).

Extensive modelling and monitoring studies over the last twenty years provide considerable evidence that global climate change is already affecting and will continue to affect species (Hoegh-Guldberg et al. 2018) however these impacts are likely to be highly species-dependent and spatially variable. The most frequently observed and cited ecological responses to climate change include species distributions shifting towards the poles, upwards in elevation and shifts in phenology (earlier and later autumn life-history events) (M. Dunlop et al. 2012). Climate change may not only change species distribution patterns but also life-history traits such as migration patterns, reproductive seasonality and sex ratios (Steffen et al. 2009).

Impacts of climate change such as altering temperature, rainfall patterns and fire regimes, are likely to lead to changes in vegetation structure across all terrestrial ecosystems within Australia (M. Dunlop et al. 2012; Steffen et al. 2009). Increases in fire regimes will impact Australian ecosystems altering composition structure, habitat heterogeneity and ecosystem processes. Changes in climate variability, as well as averages, could also be important drivers of altered species interactions, both endemic and invasive species (M. Dunlop et al. 2012). Climate change could result in significant ecosystem shifts, as well as alterations to species ranges and abundances within those ecosystems (Hoegh-Guldberg et al. 2018).

The 'loss of climatic habitat caused by anthropogenic emissions of greenhouse gases' has been listed as a key threatening process under the EPBC Act (DCCEEW 2021). The threatening process consists of reductions in the bioclimatic range within which a given species or ecological community exists due to emissions induced by human activities of greenhouse gases (DCCEEW 2021). The process is considered to have a continental distribution, including both terrestrial and marine areas. Ecosystems in which the process occurs include: alpine habitats, coral reefs, wetlands and coastal ecosystems, polar communities, tropical forests, temperate forests, and arid and semi-arid environments (DCCEEW 2021).

Coral reefs were recognised by both IPCC and the Australian Government as being at risk of climate change (Lawrence et al. 2022; DCCEEW 2021). Protected coral reef areas in Australia include those within World Heritage listed sites, such as Ningaloo Coast, Shark Bay, or the Great Barrier Reef. Climate change has been identified as a threat for each of these World Heritage areas, with potential risks to coral reef as well as other environmental values (such as marine fauna) within these ecosystems (IUCN 2020b; 2020c; 2020a).

Climate variability and change has been identified as a threat to some EPBC Act protected species, including marine turtles, whales, seabirds and migratory shorebirds:

- the Recovery Plan for Marine Turtles in Australia (CoA 2017) states that "[c]limate change is of particular concern to marine turtles because it is likely to have impacts across their entire range and at all life stages. Climate change is expected to cause changes in dispersal patterns, food webs, species range, primary sex ratios, habitat availability, reproductive success and survivorship".
- the Conservation Management Plan for the Blue Whale (CoA 2015a) states: "[c]limate change is expected to cause changes in migratory timing and destinations, population range, breeding schedule, reproductive success and survival of baleen whales, including blue whale species and subspecies"

³⁷ A level of confidence is expressed using five qualifiers: very low, low, medium, high, and very high. For a given evidence and agreement statement, different confidence levels can be assigned, but increasing levels of evidence and degrees of agreement are correlated with increasing confidence (Lawrence et al. 2022).

- the Wildlife Conservation Plan for Seabirds (CoA 2022) states that “[c]onsequences to seabirds could include negative impacts from an increase in extreme weather events, reduced or changed prey abundance and distribution, and decrease in nesting habitat”
- the Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015) states that “[s]uch changes have the potential to affect migratory shorebirds and their habitats by reducing the extent of coastal and inland wetlands or through a poleward shift in the range of many species”.

The North-west Marine Parks Network Management Plan 2018 (DNP 2018) identifies climate change as a pressure that may impact marine park values. The management plan states that “[t]he impacts of climate change on the marine environment are complex and may include changes in sea temperature, sea level, ocean acidification, sea currents, increased storm frequency and intensity, species range extensions or local extinctions, all of which have the potential to impact on marine park values” (DNP 2018).

Within the Marine Bioregional Plan for the NWMR (DSEWPac 2012), pressures related to climate change are assessed as ‘of potential concern’ for species of marine turtle, inshore dolphins, sawfish, sea snakes, whale shark, dugong, and seabird and shorebird, as well as the KEFs and shipwrecks known to occur in the NWMR.

As described above, human-induced climate change may impact a range of climatic variables, and if the impacts occur, they may impact individual species, ecosystems, and ecosystem services.

Greenhouse gas emissions from the NY FPSO facility are, taking into account global greenhouse gas sinks, considered to be a *de minimis* amount in relation to gross global greenhouse gas emissions and there is no direct link between greenhouse gas emissions from the NY FPSO facility and climate change impacts upon Australian receptors.

It is not possible to link GHG emissions from NY FPSO with climate change or any particular climate related impact given:

- It is the net global GHG concentrations that cause climate change and climate related impacts.
- Estimated scope 1 and scope 3 emissions associated with NY FPSO are negligible in the context of existing and future predicted global concentrations.
- The inability to precisely predict the amount of total future global GHG emissions.
- The inability to predict future national and international initiatives on climate change and the impact they will have on total future global GHG emissions, including NY FPSO emissions.

Ecosystems that are particularly susceptible to adverse effects of climate change include alpine habitats, coral reefs, wetlands and coastal ecosystems, polar communities, tropical forests, temperate forests and arid and semi-arid environments (DoEE, 2019). In Australia, this includes coral reefs, alpine regions, rainforests, arid and semi-arid environments, mangroves, grasslands, temperate forests and sclerophyll forests. Future climate change (increased temperature and decreased, but more variable, rainfall) has the potential to have a range of impacts on ecological factors and threaten biodiversity in the Australian Mediterranean ecosystem (CSIRO, 2017).

Ecological Impacts

Redistribution and reorganisation of natural of natural systems, driven by climate-change, is a major threat to biodiversity (Chapman et al., 2020). A report by Australia’s Biodiversity and Climate Change Advisory Group summarises the potential impacts of climate change to marine and terrestrial species, habitats and ecosystems across Australia (Steffen et al., 2009).

Extensive modelling and monitoring studies over the last twenty years provide considerable evidence that global climate change is already affecting and will continue to affect species (Hoegh-Guldberg et al., 2018); however, these impacts are likely to be highly species-dependent and spatially variable. The most frequently observed and cited ecological responses to climate-change include species distributions shifting towards the poles, upwards in elevation and shifts in phenology (earlier and later autumn life history events) (Dunlop et al., 2012). Climate change may not only change species distribution patterns but also life-history traits such as migration patterns, reproductive seasonality and sex-ratios.

Impacts of climate change such as altering temperature, rainfall patterns and fire regimes, are likely to lead to changes in vegetation structure across terrestrial ecosystems within Australia (, Dunlop et al., 2012). Increases in fire regimes will impact Australian ecosystems altering composition structure, habitat heterogeneity and ecosystem processes. Changes in climate variability, as well as averages, could also be important drivers of altered species interactions, both native and invasive species (Dunlop et al., 2012). Climate change could result in significant ecosystem shifts, as well as alterations to species ranges and abundances within those ecosystems (Hoegh-Guldberg et al., 2018).

The IPCC Special Report describes impacts of warming above pre-industrial levels to key receptor groups including terrestrial ecosystems, mangroves, warm-water corals, unique and threatened systems, and arctic regions (Hoegh-Guldberg et al., 2018). These receptor groups show varying sensitivity to warming conditions, with a range of responses shown at 1 °C warming; from corals suffering moderate impacts, to mangroves not showing any impacts that are detectable and attributable to climate change (Hoegh-Guldberg et al., 2018). Once warming reaches 1.5 °C, all receptor groups show impacts attributable to climate change with severity ranging from moderate impacts that are detectable and attributable to climate change (mangroves), to impacts that are severe and widespread (warm-water corals) (Hoegh-Guldberg et al., 2018). At the point where global temperature rise, due to climate change, reaches

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2°C, increasing numbers of receptor groups suffer impacts which are high to very high, and likely to be irreversible (terrestrial ecosystems, warm-water corals, unique and threatened systems, and arctic regions) (Hoegh-Guldberg et al., 2018). Some key impacts are discussed further in sections to follow.

Terrestrial Ecosystems

All terrestrial ecosystems are likely to be impacted by a changing climate (Steffen et al., 2009; Hughes, 2010; Dunlop et al., 2012; Hoegh-Guldberg et al., 2018). The predicted impact of climate change on these ecosystems is highly variable, both between ecosystems and within individual ecosystems (Dunlop et al., 2012). Below is a summary of impacts to key terrestrial ecosystems.

Tropical Rainforests

Projections of future climate changes in the wet tropics of Australia under different scenarios are outlined by McInnes (2015). It is likely that temperatures in the wet tropics will become hotter and potentially fires and cyclones will be more intense. Consequently, there is an increased probability of fires penetrating into rainforest vegetation resulting in a shift from fire-sensitive vegetation to communities dominated by fire-tolerant species; and changing rainforest disturbance regime as cyclones become more intense) (Hughes, 2011; Steffen et al., 2009). Changes in the timing of seasons (e.g. extended summer) could cause change in the seasonal response of plants, and alterations to species ranges and abundances (Hoegh-Guldberg et al., 2018).

Alpine/Montane Areas

Alpine systems are generally considered to be among the most vulnerable to future climate change (Hughes, 2003). The extent of true alpine habitat in Australia is very small (0.15% of the Australian land surface) with limited high-altitude refuge (Hughes, 2003).

Australian alpine regions are home to a variety of alpine vertebrates who rely on snow cover for their survival. There is evidence of a reduction in populations of dusky antechinus, broad-toothed rats and the mountain pygmy possum. The first two species are active under the snow throughout winter and are therefore subject to increased predation by foxes when snow is reduced (Hughes, 2003). The pygmy possum depends upon snow cover for stable, low temperatures during hibernation (Hughes, 2003).

Marine Ecosystems

Sea surface temperatures have increased across the globe over recent decades which poses a significant threat to marine ecosystems including changes to species abundance, community structure and increased frequency and intensity of thermally induced coral bleaching events (CSIRO, 2017).

Between 1901 and 2018, Global mean sea level is estimated to have risen by 0.2 m with a rate of rise that has accelerated to on average 3.7 mm per year (2006–2018) due to climate change with ice sheet and glacier mass loss being the primary contributors during this period (IPCC, 2021). In addition to changes in sea level, oceanic warming has also served to alter ocean currents around Australia. In response to both ocean warming and stratospheric ozone depletion the East Australian Current has increased in strength by about twenty percent since 1978 (Cai and Cowan, 2006).

Sea-surface temperatures are projected to continue to increase, with estimates of warming in the Southern Tasman Sea of between 0.6 to 0.9°C and between 0.3 to 0.6°C elsewhere along the Australian coast by 2030 (Church et al., 2006). Sea levels are projected to increase by 28 to 55 cm by 2100 under the lowest emissions scenario modelled by the IPCC in response to both thermal expansion and melting of ice-sheets (IPCC, 2021). This will lead to some coastal inundation affecting mangroves, salt marshes and coastal freshwater wetlands. Furthermore, as CO₂ is gradually absorbed by oceans and fresh water, the water becomes more acidic, which increases the solubility of calcium carbonate, the principal component of the skeletal material in aquatic organisms (Steffen et al., 2009). Below is a summary of potential climate change impacts to two key ecosystems - mangroves and coral reefs.

Mangroves

Mangrove ecosystems in Australia will face higher temperatures, increased evaporation rates and warmer oceans (McInnes, 2015) as well as an associated sea-level rise (Hoegh-Guldberg et al., 2018). Modelling indicates an increased likelihood of future severe and extended droughts across parts of Northern Australia (Dai, 2013). Consequently, mangrove ecosystems may increase their southern range as a result of warmer temperatures. However, higher temperatures and evaporation rates, and extended droughts could lead to die-offs in northern Australia and a change in mangrove distribution and abundance (Duke et al., 2017). Mangrove systems should cope with rising sea-level by accumulating more peat or mud which will give them the opportunity to adjust to a rising sea level (Field, 1995).

Coral Reefs

Climate change has emerged as a threat to coral reefs, with temperatures of just 1°C above the long-term summer maximum for an area over 4–6 weeks being enough to cause mass coral bleaching and mortality (Baker et al., 2008; Hoegh-Guldberg, 1999; Hughes et al., 2017; Spalding and Brown, 2015). Coral mortality or die-off following coral bleaching events can stretch across thousands of square kilometres of ocean (Gilmour et al., 2016; Hoegh-Guldberg, 1999; Hughes et al., 2017). The impacts associated with a warming ocean, coupled with increasing acidification, are expected to undermine the ability of tropical coral reefs to provide habitat for fish and invertebrates, which together provide a range of ecosystem services (e.g. food, livelihoods, coastal protection) (Hoegh-Guldberg et al., 2018).

Social Impacts

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Changes to climate can result in impact to social receptors that have values which include the ecological receptors (discussed above). This includes KEFs and AMPs. Climate change also impacts on the functions, interests or activities of other users which rely on ecological value, including commercial and recreational fisheries and tourism.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)³⁸	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
NY FPSO (when disconnected) and contract vessels compliant with Marine Order 97 (Marine Pollution Prevention – Air Pollution).	F: Yes CS: Minimal cost. Standard practice.	Marine Order 97 is required under Australian regulations; implementation is standard practice for commercial vessels as applicable to vessel size, type and class.	Control based on legislative requirements – must be adopted.	Yes C 6.1
National Greenhouse and Energy Reporting Scheme and National Pollutant Inventory (NPI) reporting – estimation of greenhouse gas, energy and criteria pollutants.	F: Yes CS: Minimal cost. Standard practice.	Control based on legislative requirements to provide the national reporting framework for the reporting and dissemination of information related to emissions, hazardous wastes, greenhouse gas emissions, greenhouse gas projects, energy consumption and energy production to meet the objectives and desired outcomes of the legislation(s) such as: <ul style="list-style-type: none"> • the maintenance and improvement of air and water quality, minimisation of environmental impacts associated with hazardous wastes; and an improvement in the sustainable use of resources • act as the single framework to inform policy, meet reporting requirements, avoid duplication, and to ensure that facility net greenhouse gas emissions are managed within applicable baselines. 	Control based on legislative requirements – must be adopted.	Yes C 6.2

³⁸ Qualitative measure.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)³⁸	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Apply for and manage net direct and indirect GHG emissions to within the relevant baseline under the <i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</i> .	F: Yes CS: Minimal cost. Standard practice.	Control based on legislative requirement utilising the national reporting framework for the reporting of information related to GHG emissions. The Safeguard Mechanism requires Operators to offset carbon emissions in excess of the relevant baseline using Australian Carbon Credit Units (ACCUs).	Control based on legislative requirements – must be adopted.	Yes C 6.3
Good Practice				
Forecast, measure, monitor and or estimate facility fuel and flare emissions (in accordance with NGRS/NPI) to inform optimisation management practices and minimise environmental impact of direct NY and indirect emissions.	F: Yes CS: Minimal cost. Standard practice.	Minimises environmental impact of emissions through planning, ongoing review, governance and optimisation. It combines with good operating practice to maximise production, reduce fuel gas use and emissions to manage cost, which improves energy intensity (e.g. cleaner production), optimising emissions from NY. Fuel and flared gas are potential product streams, as such, Woodside applies routine short and long term optimisation and opportunity management framework to identify and prioritise enhancement opportunities which includes improvements through energy efficiency, reduced fuel and flare gas usage (e.g. reduced flare purge rates). Annual fuel and flare target setting followed by monthly reporting enables review of performance, investigation of trends and insights to improve overall energy intensity.	Control is WMS requirement – must be adopted.	Yes C 6.4
Implement the <i>Methane Guiding Principles Management Guideline</i> at NY Facility.	F: Yes CS: Some cost associated with implementation of a new WMS guideline on an offshore facility. Can be managed by proving technology application and process at onshore facilities and sharing learnings.	Methane reduction activities are aligned with environment, social and governance expectations. Reduction of methane fugitives reduces facility GHG emissions with high short term global warming potential and aligns with commitments under Methane Guiding Principles.	Control is a WMS requirement – must be adopted.	Yes C 6.5

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)³⁸	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Professional Judgement – Eliminate				
Eliminate flaring by venting un-combusted hydrocarbons.	F: No. Routine hydrocarbon venting is not considered good industry practice; as unburnt hydrocarbons pose potential for greater environment impact compared to combustion emissions. The ability to flare hydrocarbons is a key safety feature on the facility. Removing the ability to flare hydrocarbons may result in unacceptable safety risks on the NY facility. CS: Not assessed, control not feasible.	Not assessed, control not feasible.	Not assessed, control not feasible.	No
Professional Judgement – Substitute				
Use fuel gas derived from subsea wells in preference to diesel fuel for power generation.	F: Yes, fuel gas is the primary fuel source on NY. CS: Cost effective.	Diesel substitution reduces CO ₂ emissions for a given unit of power and reduces spill risk associated with fuel bunkering activities.	Cost effective. Opportunities minimise fuel bunkering transfer risks.	Yes C 6.6
Professional Judgement – Engineered Solution				
Maintain flare to maximise efficiency of combustion and minimise venting, incomplete combustion waste products and smoke emissions.	F: Yes. CS: Minimal cost. Standard practice.	Flare tip integrity and ignition system functionality minimises potential for venting, incomplete combustion waste products and smoke emissions.	Control is WMS requirement – must be adopted.	Yes C 6.7

- Woodside Risk Management Policy
- Woodside Climate Change Policy which includes the following principles that are implemented company-wide:
 - Setting science-based near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned[3] scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated.
 - Developing and operating oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
 - Investing in new energy products and lower carbon services to reduce customers' emissions (part of Woodside's Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
 - Publishing transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.
- Aligning advocacy to the principles of the Climate Policy. Setting clear targets, to reduce net equity emissions below a starting base representative of annual average gross equity emissions for 2016 to our 2020 (Woodside 2023a). Woodside has announced an aspiration of net zero equity Scope 1 and GHG emissions by 2050 or sooner. (Woodside 2023a). WMS requirements such as the GHG emissions and Energy Management Procedure, Production Optimisation and Opportunity Management Procedure and Methane Guiding Principles Management Guideline, which require continuous improvement and demonstration of ALARP in the context of the asset. This is achieved by implementing tools to identify, evaluate, implement, and review emissions reductions projects and develop, govern and report on plans to reduce methane fugitive emissions.

External Context

Woodside recognises that our license to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. GHG emissions are a global concern, and as such Woodside has undertaken an impact assessment of GHG associated with the NY facility and identified key measures to address this issue.

According to Wood Mackenzie Energy Research Consultancy, LNG from Woodside operated facilities is amongst the lowest carbon intensity in the world delivered into North Asia.³⁹The global consensus on climate change led to the implementation of the Paris Agreement. The aim of the Paris Agreement, as stated in the Article 2.1(a), is to hold the increase in global average temperature to well below 2°C above pre-industrial levels. The Agreement also aims to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising that this would significantly reduce the risks and impacts of climate change.

Paris Agreement text extract⁴⁰:

“Article 2

1. This Agreement, in enhancing the implementation of the Convention, including its objective, aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by:

(a) Holding the increase in the global average temperature to well below 2 °C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5 °C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change;”

This was reaffirmed in December 2023 in the COP28 decision text on the First global stocktake.⁴¹ The text further recognized that the transition away from fossil fuels in energy systems is to be done in a just, orderly and equitable

⁴¹ FCCC/PA/CMA/2023L.17 (Draft decision distributed 13 December 2023) First global stocktake text extracts https://unfccc.int/sites/default/files/resource/cma2023_L17_adv.pdf (Section I, Clause 3)

manner accelerating action in this critical decade, so as to achieve net zero by 2050 in keeping with the science.⁴² It also recognises that transitional fuels can play a role in facilitating the energy transition while ensuring energy security⁴³. The Paris Agreement establishes a framework where countries make Nationally Determined Contributions (NDCs) to manage and reduce their own emissions.

Australia has ratified the Paris Agreement and has set a target to reduce emissions by 43 per cent below 2005 levels by 2030 and to reach net-zero emissions by 2050. Australia’s emissions projections under a ‘with additional measures’ scenario is projected to be 43% below 2005 levels by 2030 and to reach net zero emissions by 2050 (DISER 2022a). Australia’s emissions projections demonstrate that it is on track to reduce emissions by up to 43% below 2005 levels by 2030 (DCCEEW 2022; DISER 2022a).

Woodside considers that a stable energy transition will be one in which energy is affordable and reliable, as well as lower carbon. The NY FPSO facility will provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life. Woodside considers that this development is aligned with their goals for supporting the energy transition and is compatible with the Paris Agreement goal to limit global warming to below 2°C.

Woodside is a signatory to the Methane Guiding Principles (MGP 2022), which is a voluntary, international multi-stakeholder partnership between industry and non-industry organisations that has a focus on reducing methane emissions across the natural gas supply chain, from production to final customer. As part of the WMS, Methane Guiding Principles Management Guideline will be developed and implemented at the NY facility (refer to Internal Context above, and key control measure.

Other requirements (includes laws, polices, standards and conventions):

Legislation and other requirements considered relevant for this aspect, and a demonstration of how these requirements are met, are described below.

Requirement Demonstration	Requirement Demonstration
Marine Order 97 Gives effect to Annex VI of MARPOL 73/78	The requirements of Marine Order 97 are incorporated into the key control measures.
National Greenhouse and Energy Reporting (NGER) scheme Annual GHG reporting for facilities	The requirements of NGER reporting scheme are incorporated into the key control measures.
National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015 Emission intensity for reservoir carbon from new gas fields	The requirements of NGER Safeguard Mechanism are incorporated into the key control measures.
National Pollutant Inventory (NPI) Reporting Annual air pollutant reporting	The requirements of annual NPI reporting are incorporated into the key control measures.
Conservation Management Plan for the Blue Whale 2015–2025 Management action A3.1: Continue to meet Australia’s international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica Conservation Advice Balaenoptera borealis Sei Whale Conservation action: Continue to meet Australia’s international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica Conservation Advice Balaenoptera physalus Fin Whale Conservation action: Continue to meet Australia’s international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica	As described above, the predicted atmospheric and GHG emissions from the NY facility are considered de minimis, with no link to climate change impacts on Australian or International receptors. Therefore, the NY facility is not considered to be inconsistent with the Conservation Management Plan for the Blue Whale 2015–2025 (CoA, 2015a), Conservation Advice for Sei Whale (TSSC 2015a), Conservation Advice for Fin Whale (TSSC, 2015b), Conservation Management Plan for the Southern Right Whale (DSEWPaC, 2012a), or the Recovery Plan for Marine Turtles in Australia (CoA, 2017).

Acceptability Statement: Greenhouse Gas Emissions

As per Section 2.8.2 decision type B, GHG emissions are acceptable if “ALARP” is demonstrated using good industry practice and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In addition, acceptability is assessed against the above criteria. Further opportunities to reduce the impacts have been investigated (refer ALARP demonstration discussion). Indirect GHG emissions associated with the NY facility are managed to an acceptable level by meeting (where they exist) legislative requirements, industry codes and standards, applicable company requirements, and industry guidelines, and these have been adopted as key controls.

The adopted controls are considered good oil-field practice/industry best practice and are consistent with Woodside’s internal requirements. The potential impacts are considered acceptable if ALARP is demonstrated. As described above, the predicted GHG emissions associated with the NY FPSO facility are considered de minimis and as such, below the acceptable levels and will not materially or substantially contribute to Australia’s net GHG emissions or net Global GHG emissions levels

6.6.7 Routine Light Emissions: Light Emissions from Ngujima-Yin Floating Production, Storage and Offloading Facility, Vessel Operations and Operational Flaring

Context															
Operational Details – Section 3.6 Support Vessel Operations – Section 3.7 Subsea Inspection, Monitoring, Maintenance and Repair Activities – Section 3.10				Biological Environment – Section 4.5				Consultation – Section 5							
Impacts and Risks Evaluation Summary															
Source of Risk	Environmental Value Potentially Impacted							Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome	
Light emissions from NY FPSO and vessels.						✓		A	E	-	-	LCS GP	Broadly Acceptable	EPO ⁸	
Light emissions from NY FPSO during flaring.						✓		A	E	-	-				
Description of Source of Impact															
<p>Lighting is used to allow safe operations and to communicate the presence of the NY FPSO and vessels to other marine users (i.e. navigation lights), and cannot reasonably be eliminated. External lighting is located over the entire NY FPSO deck, as well as vessels, with most external lighting directed towards working areas such as the topsides of the FPSO, or the back deck of vessels. This limits light spill to the environment. External lighting on vessels is typically lower than the NY FPSO lights, with vessel lighting usually reduced to improve night vision of bridge crew.</p> <p>During IMMR activities, underwater lighting is generated over short periods of time while ROVs are in use, as well as from deck lighting. Given the typical low intensity of ROV lights and the attenuation of light in seawater, light from ROVs is localised to the vicinity of the ROV and vessels. All IMMR activities will occur within the Operational Area.</p> <p>A relatively small quantity of gas is required to be continuously flared associated with purge and pilot of the flare system and disposal of waste streams which are not recovered to the process. Intermittent flaring may occur during operational activities and are further described in Section 3.6.3.2. With the top of the flare tower (the highest point of the facility) approximately 90 m above the deck, the distance to the horizon at which components of the NY FPSO is directly visible can be estimated using the formula below:</p> <p><i>horizon distance = 3.57 × √height</i></p> <p>In this formula “horizon distance” is the distance to the horizon at sea level in kilometres, and “height” is the height above sea level of the light source in metres. Using this formula, the maximum distance at which the flare tower tip is visible at sea level is approximately 37 km from NY FPSO.</p>															
Impact Assessment															
<p>Lighting from the facility and vessels may appear from direct unshielded light sources or through skyglow. Where direct light falls upon the ocean, this area of light is referred to as light spill. Skyglow is the diffuse glow caused by light that is screened from view, but through reflection and refraction creates a glow in the atmosphere. The distance at which direct light and skyglow may be visible from the source is dependent on the lighting on the facility/vessel and environmental conditions.</p> <p>Receptors that have important habitat present within a 20 km buffer of the Operational Area were considered as having potential for interaction, based on recommendations of the <i>National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (NLPG)</i>. The 20 km threshold provides a precautionary</p>

limit based on observed effects of sky glow on marine turtle hatchlings (15 to 18 km) and fledgling seabirds grounded in response to artificial light 15 km away (Commonwealth of Australia, 2020).

Light emissions can affect fauna in two main ways:

- Behaviour: many organisms are adapted to natural levels of lighting and the natural changes associated with the day and night cycle, as well as the night-time phase of the moon. Artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.
- Orientation: marine turtles and birds may also use lighting from natural sources to orient themselves in a certain direction at night. In instances where an artificial light source is brighter than a natural source, the artificial light may act to override natural cues, leading to disorientation.

Potential fauna are predominantly pelagic fish and zooplankton, with a low abundance of transient species such as marine turtles, whale sharks and large whales transiting through the Operational Area. Habitat critical to the survival of the green turtle, loggerhead turtle, leatherback turtle and the hawksbill turtle is overlapped by, or adjacent to the Operational Area (**Section 4.6.2**). There are no other known critical habitats within the Operational Area for EPBC listed species, although there are BIAs listed in **Section 4.5** that overlap the Operational Area.

Seabirds

Artificial lighting can attract and disorient seabird species resulting in species behavioural changes (circling light sources or disrupting foraging, injury or mortality near the light source as a result of collision (Gaston et al., 2014).

The most vulnerable life stages for seabirds and migratory shorebirds are nesting adults or fledglings. Nesting or fledgling seabirds and migratory shorebirds are vulnerable to artificial lighting within 20 km of the nesting location (Commonwealth of Australia, 2020). There is a breeding BIA for the wedge-tailed shearwater overlapping the Operational Area; as such, wedge-tailed shearwaters may occur within the Operational Area. Nearby seabird roosting habitats include Ningaloo Marine Park (8.6 km SE), Gascoyne Marine Park (7.7 km SW) and Muiron Islands Marine Management Area (10.4 km SE).

Adult shearwaters are vulnerable to artificial lighting during the breeding cycle, when returning to and leaving the nesting colony to maintain nesting sites or forage. Foraging wedge tailed shearwaters may be attracted to sources of light emissions to feed on fish drawn to the light; however, the species feeds predominantly during the day, in association with pelagic predators (Catry et al., 2009,). The majority of foraging trips are short, with single day foraging trips significantly more common than any other length trip, with birds returning to nesting/roosting sites between trips. The numbers of wedge-tailed shearwaters present in the Operational Area at night is expected to be low given the primarily diurnal foraging behaviour, and behavioural impacts to the species are considered to be highly unlikely. Given the foraging behaviours of roosting shearwaters, artificial light from the Operational Area, is not predicted to disrupt critical breeding behaviours within important nesting habitat or displace seabirds from nesting habitat.

Fledgling shearwaters are predominantly impacted by onshore lighting sources, which can override sea finding cues and attract fledglings further inland, preventing them from reaching the sea (Mitkus et al., 2018). Artificial light can also impact important behaviour of nesting adults (e.g. adult nest attendance, maintaining nest sites) or confuse shearwater species, resulting in injury or mortality as a result of birds colliding with structures (Cianchetti-Benedetti et al., 2018). Given the offshore location of the Operational Area, approximately 7kms from the nearest roosting site, impacts to the survivability of fledglings from artificial lighting are not expected.

In a study of offshore oil platforms in the North Sea, Poot et al. (2008) observed that migrating seabirds can be attracted to the lights and flares of offshore oil platforms, particularly on cloudy nights and in between the hours of midnight and dawn. Migratory shorebirds travelling the East Asian-Australasian Flyway may transit through the Operational Area in the vicinity of the NY FPSO and vessels en-route to staging areas, before moving onto the mainland south in the spring or Indonesia in the north in the autumn. It is possible that many of the birds on migration may also take advantage of ships and offshore facilities in the area to rest. Migrating birds in the region are at, or near, the end of their migration (or staging area), and if attracted will not be facing long-distance journeys directly upon leaving the facility. Although the migratory diversion is not expected to impact negatively on the birds, if there are identified maintenance, safety and health risks associated with guano from the birds it may be necessary to deter them from resting on NY FPSO. No lasting effect is anticipated from seabirds attracted to the light, and hence, diverted from their migratory pathway.

Marine Turtles

The Operational Area is within the internesting BIA for the flatback, green, hawksbill and loggerhead turtle and within 20 km of nesting BIAs for green, hawksbill and loggerhead turtle species, signifying the presence of turtles within the region and its biological significance. Further the Operational Area overlaps or is adjacent to habitat critical to the survival of the green, loggerhead, leatherback, and the hawksbill turtle species. The relevant Recovery Plan considers light pollution a threat to hatchling orientation, survivability/predation, and sea finding behaviours and can inhibit nesting from mature females.

Hatchlings

The nearest potential nesting sites in relation to the NY FPSO are the Muiron Islands (15 km south east), North West Cape (20.8 km southwest) and the Ningaloo coast (19 km south). Lighting and the tip of the flare tower onboard the NY FPSO may be visible from these areas. Hatchlings generally show a preference of moving towards horizons which are low and bright, and moving away from horizons that are dark and elevated, using these cues to navigate towards

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

the shoreline (Limpus and Kamrowski, 2013). Once hatchlings are in the water, navigation and direction is expected to be influenced by wave motion, currents and earth magnetic field, rather than artificial light. Additionally, the nature of the light emitted from the NY FPSO and vessels, offshore direction, and distance the potential for hatchling turtles to become disoriented by artificial lighting is considered not credible.

Adults

Artificial lighting may affect the location where turtles nest, the success of nest construction, whether nesting is abandoned, and even the seaward return of adults (Salmon et al., 1995a, 1995b; Salmon and Witherington, 1995).

The interesting period is the duration between each successive clutch during that season. The females remain close to rookeries or beaches, and therefore are designated and defined as buffer zones immediately seaward from nesting beaches. Individuals present in the Operational Area may migrate and forage (during the interesting period). Marine turtles do not use light cues to guide these behaviours (PENV, 2020). Further, PENV (2000) found no evidence, published or anecdotal, to suggest that foraging or migrating turtles are impacted by light from offshore facilities and vessels. As such, light emissions from the facility and vessels are unlikely to result in displacement of, or behavioural changes to individuals in these life stages (PENV, 2020).

For nesting females, the presence of lighting amongst other factors is a key factor site selection when laying clutches (Windle et al., 2018), preferring more dimly lit areas. Given the distance (approximately 40 km) between the NY FPSO to nesting beaches, it is considered highly unlikely artificial lighting from the flare-tip or the NY FPSO deck lighting would result in the behavioural displacement of nesting females at these locations.

Light emissions generated by IMMR activities within the Operational Area, may be closer to nesting beaches (~17 km). These activities will be short-term and temporary, and likely to be from a single vessel during most standard IMMR campaigns. Given the distance to potential nesting locations, vessel lighting intensity and duration of lighting, it is considered unlikely the IMMR activities will have any impact to turtle species.

Fish

Lighting from the presence of the facility or a vessel may result in the localised aggregation of fish. These aggregations of fish are considered localised and temporary and any long-term changes to fish species composition or abundance is considered highly unlikely. This localised increase in fish extends to those comprising the whale shark's diet. However, given that a large proportion of the diet comprises krill and other planktonic larvae, it is considered unlikely that a light source would lead to a significant increase in whale shark abundance in the vicinity of the facility or vessels. Similarly, any localised impacts to marine fish are not expected to impact on any commercial fishers in the area. No significant cumulative impacts over the life of the Petroleum Activities Program or in relation to other operations and activities in the region (**Section 6.2.1**) are expected, considering the controls implemented for the Petroleum Activities Program.

Values and Sensitivities

The Ningaloo WHA hosts a range of marine fauna, which are an environmental value of the WHA. Fauna in the Ningaloo WHA may be impacted by light emissions; refer to the section above for an assessment of the potential impacts of artificial light on marine fauna. Given the distance offshore of the NY FPSO, light from the flare is unlikely to be directly visible, and hence is not considered to result in any impact to the aesthetic values of the Ningaloo WHA.

6.7 Unplanned Activities (Accidents, Incidents, Emergency Situations)

6.7.1 Unplanned Discharge: Release of Hydrocarbons or Chemicals During Transfer, Storage and Use

Context														
Operational Details – Section 3.6 Subsea Inspection, Monitoring, Maintenance and Repair Activities – Section 3.10				Physical Environment – Section 4.4 Biological Environment – Section 4.5				Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Accidental discharge of hydrocarbons to the environment during bunkering/refuelling.			✓			✓		A	D	2	M	LCS GP PJ	Broadly Acceptable	EPO ⁹
Accidental discharge of chemicals to the marine environment from storage, use or transfer.			✓			✓		A	E	2	M			
Description of Source of Risk														
<p>A range of chemicals and hydrocarbons are routinely transferred to, and stored on, the NY FPSO and support vessels. Indicative inventories onboard the NY FPSO are provided in Section 3.9. The quantity of stored chemicals is generally limited to the volumes practically required to meet operational needs of the NY FPSO or support vessels. Operational chemicals used during the Petroleum Activities Program are assessed and selected in accordance with the process described in Section 3.9.3.</p> <p>Marine Diesel Transfer</p> <p>Marine diesel fuel is transferred to the NY FPSO by bunkering. This mostly occurs during daylight hours but may also occur overnight if required. Two key scenarios for the loss of containment of marine diesel during bunkering operations were identified:</p> <ul style="list-style-type: none"> • Partial or total failure of a bulk transfer hose or fittings during bunkering, due to operational stress or other integrity issues, could spill marine diesel to the deck and/or into the marine environment. This would be in the order of less than 500 L, based on the likely volume of a bulk transfer hose (assuming a failure of the dry break and complete loss of hose volume). • Partial or total failure of a bulk transfer hose or fittings during bunkering or refuelling, combined with a failure in Procedure to shutoff fuel pumps, for a period of up to 15 minutes, results in approximately 38 m³ marine diesel loss to the deck and/or into the marine environment. <p>Marine diesel is typically not transferred to support vessels in the Operational Area; support vessels refuel in port (i.e. beyond the scope of this EP).</p> <p>Operational and Facility Maintenance Chemicals</p> <p><u>Transfer</u></p> <p>Operational process chemicals, non-process and facility maintenance chemicals are transferred to the NY FPSO in containers. Spills may occur during transfer of chemicals to the NY FPSO. Given the small volumes being handled, the credible release volumes are relatively small (e.g. largest typical chemical transfer via container is approximately 3.8 m³).</p>

Storage and Use

Chemicals are used for a variety of purposes (refer to **Section 3.9.2**). Spills of chemicals (including non-process hydrocarbons such as marine diesel) can originate from hydrocarbons/chemicals or equipment on the NY FPSO, support vessel decks or subsea (refer to **Section 6.6.4** for an assessment of the impacts of planned chemical discharges).

Operational process chemicals on the NY facility which are kept in larger quantities are stored in dedicated vessels which have similar controls as those related to mitigating hydrocarbon spills (e.g. dedicated tanks, permanent piping to the process, isolatable by valves, etc). The process chemical with the largest inventory on the NY FPSO is methanol (50 m³). Methanol is considered to be PLONOR and has an OCNS ranking of E. Operational non-process chemicals and facility maintenance chemicals on the NY facility and support vessels are typically held in low quantities (usually less than 50 L). The NY FPSO has dedicated chemical storage areas onboard, which are sufficiently bunded to retain the loss of the contents of an entire container stored within.

Chemical storage areas are typically set up in cabinets or bunded storage areas to contain any releases to deck from transportable containers (e.g. IBCs, barrels, drums, pails, etc). Releases from equipment are predominantly from the failure of hydraulic hoses or minor leaks from process components, or spills during refuelling of equipment, which can either be located within bunded/drained areas or outside of bunded/drained areas (e.g. over grating on cranes).

Support vessels undertaking IMMR activities may store quantities of chemicals for subsea use. Subsea chemical use is described in **Section 3.10.5**; they are subject to the chemical selection process outlined in **Section 3.9**. Accidental releases of small quantities of subsea chemicals may occur (e.g. deck spills). Operational experience indicates potential volumes of such spills is small (<20 L). ROV hydraulic fluid is supplied through hoses containing approximately 20 L of fluid. Hydraulic lines to the ROV arms and other tooling may become caught, resulting in minor leaks to the marine environment. Small volume hydraulic leaks may occur from equipment operating via hydraulic controls subsea (subsea control fluid). These include the diamond wire cutter, bolt tensioning equipment, ROV tooling, etc.

The primary diesel storage location onboard the NY FPSO and support vessels is dedicated bunker tanks within vessel hulls. Further quantities of marine diesel are stored topsides in the diesel oil settling tanks, service and storage tanks, and fuel tanks for equipment (e.g. generators) (see **Table 3-7**). Credible spills of marine diesel during use are typically small (<50 L) compared to potential releases during bunkering. Mechanisms are available to capture diesel from process/piping associated with bunkering and fuel transfers, which can be routed to the drainage system, where the spill can be contained.

The assessment of the potential consequences associated with much larger diesel spills are presented in MEE-03 (topside loss of containment, **Section 6.8.4**) and MEE-07 (loss of marine vessel separation, **Section 6.8.9**). Further detail on consequences specific to a spill of marine diesel from a bunkering loss are provided below.

Consequence Assessment

Marine Diesel

The biological consequences of a small volume spill on identified open water sensitive receptors relate to the potential for slight consequences to megafauna, plankton and fish populations (surface and water column biota). Impacts to plankton may include acute toxicity resulting in mortality of planktonic organisms. Given the rapid turnover of plankton communities, these impacts will be short-lived (hours to days). Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by a marine diesel spill from a bunkering incident. Impacts to larger fauna such as cetaceans and marine turtles are expected to be light fouling, potentially resulting in irritation of sensitive membranes such as the eyes, mouth and digestive system (Helm et al., 2015). Mortality of larger fauna is not expected to occur.

No impacts to Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula or Continental Slope Demersal Fish Communities KEFs are expected, as although the Operational Area overlaps these KEFs the features of these KEFs are mostly benthic and therefore will not be affected by a small surface release.

Given the lack of commercial fishing in the Operational Area, no impacts to commercial fishers (e.g. displacement of fishing effort, loss of catch due to taint, etc) are expected to occur. On the basis of the potential impacts described above, the consequence of a marine diesel spill from a bunkering incident are considered minor and short-term.

Chemicals – Operational and Maintenance

Woodside’s preference for low toxicity operational chemicals planned for discharge is integrated into Woodside’s chemical selection process (**Section 3.9**). The chemical selection process describes the steps required to approve a chemical for use and discharge which is not low toxicity, including detailed assessment using chemical and environmental data, and an ALARP justification.

The chemical stored in the largest volume on the NY FPSO is methanol, which is considered PLONOR and is OCNS rated E, and is miscible in water. TEG (triethylene glycol) is miscible in water and is considered PLONOR (**Section 3.10.5**). A maximum credible spill of methanol (or other operational chemical) is expected to mix with the offshore receiving environment, with no lasting environmental impact.

Accidental releases of chemicals are expected to decrease the water quality in the immediate area of the release (i.e. surface waters at the release location); however, the consequence is expected to be temporary and localised due to water depths, the open ocean mixing environment and relatively low credible release volumes. Depending on the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

chemical released, the toxicity and/or potential to bioaccumulate may potentially result in impacts to sediment quality, pelagic fish or other marine species in the vicinity of the discharge.

The potential consequence from a decrease in water quality could include mortality of plankton. Given the rapid turnover of plankton communities and nature and scale of the credible releases, these impacts will be short-lived (hours to days). Impacts to fish from a decrease in water quality are not expected to have lasting effects, as fish species are mobile and expected to avoid the area affected by an accidental chemical spill. Impacts to air-breathing fauna such as cetaceans, birds and marine turtles, are expected to be restricted to irritation of sensitive membranes such as the eyes, mouth and digestive system.

Therefore, the risk of an accidental chemical release is unlikely to result in consequences greater than a minor and short-term impact on species or minor impact to water quality.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)⁴⁷	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
Contract vessels compliant with Marine Order 91 (Marine pollution prevention – oil) for safe vessel operations. NY FPSO drainage system in place to contain and dispose leaks and spills of hazardous liquids, to avoid harm to the environment.	F: Yes. The NY FPSO has been designed with an integral drains system that can be used to contain liquid spills in hazardous and non-hazardous areas. CS: Minimal. Inherent feature of NY FPSO design.	The drains system can be used to contain a spill before it reaches the environment.	Benefit outweighs cost sacrifice.	Yes C 9.5
ALARP Statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of accidental spills of hydrocarbons or chemicals from bunkering/refuelling, storage, use and transfer. As no reasonable additional/alternative controls were identified that would further reduce the consequences and risks without grossly disproportionate sacrifice, the risks are considered ALARP.				

Demonstration of Acceptability

Acceptability Statement:

The consequence assessment has determined that, given the adopted controls, accidental spills from chemical and marine diesel bunkering/refuelling, storage, transfer and use represent a moderate risk rating that is unlikely to result in a consequence greater than minor, with impacts limited to the short-term without any effect on ecosystem function. Further opportunities to reduce the risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders. The potential risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of accidental releases of chemicals and hydrocarbons from bunkering/refuelling, storage, transfer and use to a level that is broadly acceptable.

6.7.2 Unplanned Discharges: Hazardous and Non-hazardous Waste Management

Context														
Operational Details – Section 3.6				Physical Environment – Section 4.4 Biological Environment – Section 4.5				Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Incorrect disposal or accidental discharge of non-hazardous and hazardous waste to the marine environment.		✓	✓			✓		A	E	2	M	LCS GP	Broadly Acceptable	EPO 10
Description of Source of Impact														
<p>Non-hazardous and Hazardous Waste</p> <p>Normal operations on the NY FPSO and vessels result in a variety of hazardous and non-hazardous wastes. However, these materials could potentially impact the marine environment if incorrectly disposed or discharged in significant quantities.</p> <p>Non-hazardous wastes include domestic and industrial wastes, such as aluminium cans, bottles, paper and cardboard and scrap steel. Hazardous wastes include recovered solvents, excess or spent chemicals, oil-contaminated materials (e.g. sorbents, filters and rags), batteries and used lubricating oils (see Section 6.7.2) for unplanned chemical releases). Hydrocarbon production may result in naturally occurring radioactive material (NORMs) being deposited in scale within hydrocarbon-containing infrastructure (e.g. flowlines), or contained within produced sand. Monitoring to date has not indicated the presence of NORMs hydrocarbon-containing infrastructure or produced sands. Although no NORMS have been identified to date, if NORMS are detected in the later stages of operations, NORMS will be managed in accordance with the relevant requirements, so that there are no impacts on the environment.</p> <p>Sand, sludges and wastes may also be periodically generated during well clean-up operations, de-sanding and vessel maintenance. Waste materials generated on the NY FPSO which are not suitable for discharge to the environment, including hazardous wastes, are transported to shore for disposal or recycling by a licensed waste contractor.</p>														
Impact Assessment														
<p>Non-hazardous and Hazardous Waste</p> <p>The potential impacts of liquid and solid wastes accidentally discharged to the marine environment include direct pollution and contamination of the environment, potentially resulting in decreased water or sediment quality. Secondary impacts due to potential contact with individual marine fauna includes entanglement or ingestion, which may lead to injury and/or death. The temporary or permanent loss of hazardous or non-hazardous waste materials into the marine environment is not likely to have a significant environmental impact, based on the location of the Operational Area, the types, size and frequency of wastes generated, and the species present.</p>

ALARP Statement:				
On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of accidental discharge of non-hazardous and hazardous wastes. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability
Acceptability Statement:
The consequence assessment has determined that, given the adopted controls, the accidental discharge of non-hazardous waste and hazardous waste represent a moderate-risk rating, unlikely to result in a consequence greater than minor, short-term impacts to surrounding water quality, habitats or fauna. These potential impacts are considered to have no lasting effect and are not considered to be significant. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders and ARPANSA guidelines. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of accidental discharge of non-hazardous and hazardous waste to a level that is broadly acceptable.

6.7.3 Physical Presence: Interaction with Marine Fauna

Context														
Support Vessel Operations – Section 3.7				Protected Species – Section 4.6				Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Physical presence of vessels resulting in collision with marine fauna.						✓		A	E	1	L	LCS	Broadly Acceptable	EPO 11
Description of Source of Impact														
<p>The vessels operating in the Operational Area may present a potential hazard to cetaceans and other protected marine fauna, such as whale sharks and marine reptiles. Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement and reproduction), and mortality.</p> <p>The factors that contribute to the frequency and severity of impacts due to collisions include vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth) and the type of animal potentially present and their behaviours.</p>														
Consequence Assessment														
<p>The likelihood of vessel–whale collision being lethal is influenced by vessel speed; the greater the speed at impact, the greater the risk of mortality (Jensen and Silber, 2004; List et al., 2001). Vanderlande and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. According to the data of Vanderlin and Taggart (2007), it is estimated that the risk is less than 10% at a speed of 4 knots. Vessel–whale collisions at this speed are uncommon and, based on reported data contained in the US National Ocean and Atmospheric Administration database, there only two known instances of collisions when the vessel was travelling at less than 6 knots. Both of these were from whale watching vessels that were deliberately placed among whales (Jensen and Silber, 2004).</p> <p>Vessels undertaking the Petroleum Activities Program within the Operational Area typically travel less than 8 knots; much of the time vessels are holding station. Therefore, the risk of a vessel collision with protected species resulting in death is inherently low.</p> <p>The Operational Area overlaps the outer portion of the humpback whale migration BIA (Section 4.6.3); humpback whales are seasonally abundant within this corridor during their annual migrations. Aerial surveys undertaken by Woodside indicate that the majority of humpback whales migrating in the region typically occur east of the Operational Area; the majority of the whales occurred in depths less than 500 m, with the greatest density of whales concentrated in water depths of 200 to 300 m (RPS Environment and Planning, 2010a). Humpback whales have also been observed in the Operational Area during their seasonal migration by personnel onboard the NY FPSO. As such, humpback whales occur in the Operational Area during their seasonal migration period. However, harmful interactions between vessels and humpback whales in the Operational Area are considered highly unlikely due to the slow speed of vessels in the Operational Area.</p> <p>A pygmy blue whale migration BIA also overlaps the Operational Area. Analysis of underwater noise logger data indicated pygmy blue whales are present in waters off North West Cape between October to December (northbound</p>														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

migration) and April to August (southbound migration) (McCauley and Jenner, 2010). Satellite tagging studies have shown pygmy blue whales migrating along the Western Australian coast near the Operational Area in water depths between 200 m and 1000 m, which includes the depth range of the Operational Area (approximately 340 to 849 m). Pygmy blue whales were not recorded in a series of whale monitoring flights between July and September (RPS Environment and Planning, 2010a), although these flights were intended to record humpback whales and did not extensively sample deeper waters preferred by pygmy blue whales. Observations of whales by personnel onboard the NY FPSO have not confirmed the presence of pygmy blue whales in the Operational Area.

Given the seasonality of humpback whales in the Operational Area, and seasonality and low density of pygmy blue whales recorded in the Operational Area, harmful interactions between vessels and whales during the Petroleum Activities Program are considered unlikely. Given the typical speeds of vessels within the Operational Area, any collision between vessels and whales is not expected to result in mortality.

Whale sharks are at risk from vessel strikes when feeding at the surface, or in shallow waters where there is limited option to dive. Whale sharks may traverse offshore waters, including the Operational Area, during their migrations to and from Ningaloo Reef, and a BIA for foraging whale sharks lies approximately 6 km from the Operational Area. However, it is not expected whale sharks would occur in large numbers within the Operational Area, given there is no main aggregation area within the vicinity of the Operational Area, and their presence would be transitory and of a short duration. There are no constraints preventing whale sharks from moving away from vessels (e.g. shallow water or shorelines).

With consideration of the absence of potential nesting or foraging habitat for turtles (i.e. no emergent islands, reef habitat or shallow shoals) and the water depth, it is considered that the Operational Area is unlikely to represent important habitat for marine turtles. No marine turtle BIAs overlap the Operational Area. The outer portion of a critical nesting habitat for flatback turtles identified in the Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017) overlaps the Operational Area; however, marine turtles (including flatback turtles) are considered unlikely to be present due to the distance from shore and water depth (approximately 340 to 849 m). Individual turtles have been infrequently observed by personnel onboard the NY FPSO, but turtles are not regularly seen. Individual turtles may infrequently transit the area. It is acknowledged that there are significant nesting sites along the mainland coast and islands of the region.

The typical response from turtles on the surface to the presence of vessels is to dive (a potential “startle” response), which decreases the risk of collisions (Hazel et al., 2007). As with cetaceans, the risk of collisions between turtles and vessels increases with vessel speed (Hazel et al., 2007). Given the low speeds of vessels undertaking the Petroleum Activities Program, along with the expected low numbers of turtles within the Operational Area, interactions between vessels and turtles are considered highly unlikely. It is unlikely that vessel movement associated with the Petroleum Activities Program will have a significant impact on marine fauna populations, given:

- the low presence of transiting individuals
- avoidance behaviour commonly displayed by whales, whale sharks and turtles
- low operating speed of the activity support vessels (generally less than 8 knots or stationery, unless operating in an emergency).

Activities are considered unlikely to result in a consequence greater than minor short-term disruption to individuals or a small proportion of the population, and no impact on critical habitat or fauna activity.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)⁵⁴	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans will be implemented to reduce the likelihood of collision with marine fauna.	F: Yes CS: Minimal cost. Standard practice.	Reductions in speed around protected fauna reduce the likelihood of collision.	Controls based on legislative requirements – must be adopted.	Yes Refer to C 3.1 Section 6.6.3.

ALARP Statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of vessel collision with marine fauna. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability
Acceptability Statement: The risk assessment has determined that, given the adopted controls, vessel collision with marine fauna represents a low risk rating with any potential impact to fauna populations being slight and short-term having no impact on critical habitat or activities. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice, and meet the requirements of Part 8 (Division 8.1) of the EPBC Regulations 2000. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of vessel collision with marine fauna to a level that is broadly acceptable.

6.7.4 Physical Presence: Introduction of Invasive Marine Species

Context														
Facility Sailaway for Maintenance – Section 3.6.2 Support Vessel Operations – Section 3.7				Biological Environment – Section 4.5				Consultation – Section 5						
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Invasive species in vessel ballast tanks or on vessels/ submersible equipment.					✓	✓	✓	A	E	1	L	LCS GP	Broadly Acceptable	EPO 12
Description of Source of Impact														
<p>The NY facility relies on vessels to service routine operations, offtake cargo, and IMMR. Vessels are potential vectors for the introduction of invasive marine species (IMS) to the Operational Area during the Petroleum Activities Program, and include:</p> <ul style="list-style-type: none"> • facility support vessels: typically sourced from Australian waters and generally considered to be low risk, these vessels are the most commonly used vessels in the Operational Area • offtake tankers: typically from international waters and generally considered to be low risk, with approximately 12 offtakes expected for 2024 (~once per month), with offtake frequency declining as production rates decline; offtake operations may take up to 30 hrs to complete • subsea support vessels or USVs – may be sourced from Australia or overseas, depending on requirements and vessel availability. <p>The NY FPSO may leave the Operational Area to avoid dangerous weather and undergo modifications and repairs. This may include spending short periods of time in areas that are considered high risk for the presence of potential IMS, such as ports beyond Australian waters.</p> <p>IMS may be introduced to the Operational Area through:</p> <ul style="list-style-type: none"> • the discharge of ballast water • release of IMS propagules/fragments from biofouling. <p>Potential IMS can be drawn into ballast tanks during on-boarding of ballast water as cargo is unloaded or to balance vessels under load. Offtake tankers use ballast water to maintain vessel stability. This ballast is discharged when loading crude oil from the NY FPSO during offtake operations. The NY FPSO may require ballast water to operate safely when detached from the STP mooring. Ballast water taken on within the Operational Area (i.e. prior to detachment) is considered unlikely to host IMS due to the offshore location and deep water (approximately 340 to 849 m water depth). When returning from beyond Australian waters, the NY FPSO routinely undertakes ballast water exchanges to achieve low risk ballast water. Ballast water exchanges are not typically required by facility support or subsea vessels. All support and subsea vessels are required to have low risk ballast water on-board prior to being contracted to Woodside.</p> <p>All vessels are subject to some level of marine fouling. Organisms attach to the vessel hull, particularly in areas where organisms can find a good surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests, etc). Biofouling organisms can become established in an area through the release of propagules (e.g. eggs or larvae), or by attaching to substrate after becoming detached from the host vessel.</p>

Consequence Assessment

Non-indigenous Marine Species (NIMS) have been introduced into a region beyond their natural biogeographic range and can survive, reproduce and establish founder populations. Not all NIMS introduced into an area will thrive or cause demonstrable impacts. Indeed, the majority of NIMS around the world are relatively benign; few have spread widely beyond sheltered ports and harbours. Only a subset of NIMS that become abundant and impact social/cultural, human health, economic and/or environmental values can be considered IMS. IMS have historically been introduced and translocated around Australia by a variety of human means, including biofouling and ballast water.

Species of concern are those that are:

- not native to the region
- likely to survive and establish in the region
- able to spread by human mediated or natural means.

Species of concern vary from one region to another depending on various environmental factors such as water temperature, depth, salinity, nutrient levels and habitat type. These factors dictate their survival and invasive capabilities. IMS are typically species that occur in shallow water, and hence are unlikely to survive in much of the Operational Area; the NY FPSO hull, the STP mooring and sections of risers near the sea surface are the only substrates considered suitable for establishment of potential IMS.

Introducing IMS into the local marine environment may alter the ecosystem, as IMS have characteristics that make them superior (in a survival and/or reproductive sense) to indigenous species. They may prey upon local species which had previously not been subject to this kind of predation, and therefore not have evolved protective measures against the attack. They may outcompete indigenous species for food, space or light, and can also interbreed with local species, creating hybrids such that the endemic species is lost.

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas, once established. If the introduction is captured early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

Despite the potential high consequence of the establishment of a marine pest within a high value environment as a result of introduction, unlike coastal or sheltered nearshore waters, the deep offshore open waters of the Operational Area are not conducive to the settlement and establishment of IMS. The Petroleum Activities Program is undertaken in an open ocean, offshore location away from shorelines and/or critical habitat, more than 12 nm from a shore and in waters approximately 340 to 849 m deep. The impacts of introducing a marine pest in this offshore location would have a lower consequence than introduction within a nearshore location, as the introduction of IMS and associated establishment is considered highly unlikely.

When examining the potential impacts from translocation of marine pests to the NY facility itself, interactions with the facility and any support vessels (most likely Australian sourced) and tankers are limited, with time within the 500 m Petroleum Safety Zone around the facility limited to support vessel transfers/bunkering. However, the risk of this occurring is considered manageable, given the ballast water and biofouling controls which are implemented for the Petroleum Activities Program.

Summary of Potential Impacts to Environmental Value(s)

In support of Woodside’s assessment of the impacts and risks of IMS introduction associated with the petroleum activity program, risk and impact evaluations of the different aspects of marine pest translocation associated with the activity are undertaken. The results of this assessment are presented in **Table 6-12**.

As a result of this assessment Woodside has presented the highest potential consequence as a E (Environment) and likelihood as Highly Unlikely (1), resulting in an overall Low risk following the implementation of identified controls.

Table 6-12: Assessment of the impacts and risks of IMS introduction associated with the Petroleum Activity Program.

IMS Introduction Aspect	Credibility of Introduction	Consequence of Introduction	Likelihood
Transfer of IMS from infected vessel to Operational Area and establishment on the seafloor or subsea infrastructure.	Not Credible The deep offshore open waters of the Operational Area, away from shorelines and/or critical habitat, more than 12 nm from a shore and in waters 320–849 m deep are not conducive to the settlement and establishment of IMS.		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>Transfer of IMS from infected vessel to and subsequent establishment on the NY FPSO.</p>	<p>Credible There is potential for the transfer of marine pests to occur.</p>	<p>If IMS were to establish this would potentially result in fouling of intakes (depending on the pest introduced), and would likely result in the quarantine of the NY FPSO until eradication could occur (through cleaning and treatment of infected areas), which would be costly to undertake. Minor (D) – Reputation and Brand Such introduction would be expected to have minor (D) impact to Woodside’s reputation and brand, and close scrutiny of asset level operations or future proposals. Slight (E) – Environment Environmental consequence of introduction of IMS to the NY FPSO is considered slight (E), localised and would relate to habitat directly on the NY FPSO.</p>	<p>Highly Unlikely (1) Interactions between the NY FPSO and support vessels will be limited during the petroleum activity program, with a 500m safety exclusion zone being adhered too. Offtake tankers are considered to present a low IMS risk do not directly contact the NY FPSO and are within the Operational Area for short periods of time (typically <36 hrs). Spread of marine pests via ballast water or spawning in these open ocean environments is considered highly unlikely (1).</p>
<p>Transfer of IMS to NY FPSO while disconnected and returns to Operational Area from shipyard.</p>	<p>Credible There is potential for the transfer of marine pests to occur.</p>	<p>If IMS were to return on the FPSO and establish, this would potentially result in fouling of intakes (depending on the pest introduced), and likely result in the quarantine of the NY FPSO until eradication could occur (through cleaning and treatment of infected areas). This would be costly to undertake. Slight (E) – Environment Environmental consequence of introduction of IMS to the NY FPSO is considered slight (E), localised, and would relate to habitat directly on the NY FPSO. Minor (D) – Reputation and Brand Such introduction would be expected to have minor (D) impact to Woodside’s reputation and brand, and close scrutiny of asset level operations or future proposals.</p>	<p>Highly Unlikely (1) Interactions between the NY FPSO and support vessels will be limited during the Petroleum Activities Program, with a 500 m Petroleum Safety Zone being adhered to. In addition, controls will be implemented (refer to ALARP discussion below) on return of NY from the shipyard to limit likelihood of IMS translocation. Spread of marine pests via ballast water or spawning in these open ocean environments is considered highly unlikely (1).</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

<p>Transfer of IMS from infected vessel to a subsequent establishment on NY FPSO, then transfer of IMS to a secondary vessel from the NY FPSO.</p>	<p>Not Credible</p> <p>Risk is considered so remote that it is not credible for the purposes of the Petroleum Activities Program.</p> <p>The transfer of a marine pest from an infected activity vessel to the NY FPSO was already considered highly unlikely, given the offshore open ocean environment. Furthermore, if this was to happen controls would be implemented to respond to the transfer, before many other vessels had opportunities to interact with the FPSO.</p> <p>For a marine pest to then establish into a mature spawning population on the NY FPSO and then transfer to another support vessel is not considered credible (i.e. beyond the Woodside risk matrix).</p> <p>The NY FPSO is in an offshore, open ocean, deep environment. Support vessels only spend short periods of time alongside the NY FPSO (i.e. during backloading or bunkering activities).</p> <p>There is also no direct contact (i.e. they are not tied up alongside) during these activities.</p> <p>It's also noted that Woodside has been conducting marine vessel movements between the NY FPSO and WA ports (such as Dampier) for a long period of time, and no IMS has been detected in these ports (DoF, 2017).</p>

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
IMS Inspection of all vessels.	F: Yes. Approach to inspect vessels is feasible. CS: Significant cost and schedule impacts. Thorough inspections require vessels to be removed from the sea (e.g. slipped or dry docked) and examined by an IMS expert. This process incurs significant financial and schedule sacrifices. Timely vessel based support is integral to the safe and efficient operation of the NY FPSO and subsea infrastructure.	Reduction in the likelihood that a vessel will host IMS.	Disproportionate. The cost/sacrifice is grossly disproportionate to the benefit gained.	No
Inspection of NY FPSO by IMS Inspector prior to return from international sailaway.	F: Yes. Approach to inspect vessels is feasible. CS: Significant cost and schedule impacts. Thorough inspections require vessels to be removed from the sea (e.g. slipped or dry docked) and examined by an IMS Inspector. This process incurs significant financial and schedule sacrifices.	Reduction in the likelihood that the FPSO would host IMS on return to Operational Area from international sailaway.	Although the inspection of all vessels associated with NY operations is considered disproportionate (rejected control above), considering the implementation of Woodside's IMSMP (C 14.2, the inspection of the NY FPSO itself by an IMS Inspector is considered appropriate given the added level of confidence it provides.	Yes C 12.4

Professional Judgement – Engineered Solution

None identified.

ALARP Statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS introduction and establishment. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

Demonstration of Acceptability

Acceptability Statement:

The risk assessment has determined that, given the adopted controls, introduction of IMS represent a low risk rating that is highly unlikely to result in an environmental consequence greater than slight impact on marine communities within the Operational Area. Further opportunities to reduce the risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of invasive marine species to an acceptable level.

6.8 Unplanned Activities (Accidents, Incidents, Emergency Situations) – Major Environmental Events

The risks considered in this section have been identified as MEEs due to the potential for significant consequence. These sources of risk are subject to additional consideration in accordance with the process described in **Section 2.7**.

6.8.1 Quantitative Spill Risk Assessment Methodology

Quantitative hydrocarbon spill modelling was undertaken by RPS, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, Spill Impact Mapping and Analysis Program (SIMAP), which is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces.

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates hydrocarbon releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form OIW emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each of the particles (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

Hydrocarbon spill modelling assessments undertaken by RPS undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

6.8.1.1 Hydrocarbon Characteristics

As part of the risk identification process, Woodside identified the range of credible hydrocarbon spill scenarios that may occur from the NY FPSO, associated wells, subsea infrastructure and vessels. These scenarios are considered in the risk assessments of MEEs (Sections 6.8.3 to 6.8.10). Table 6-13 summarises the characteristics of the hydrocarbons used as the basis for the modelling studies to inform the assessment of MEEs.

Table 6-13: Characteristics of the hydrocarbon types used for modelling and ecotoxicological studies

Hydrocarbon Type	Initial Density (g/cm ³) at 15°C	Viscosity (cP)	Component	Volatile (%)	Semi-volatiles (%)	Low volatility (%)	Residual (%)	Aromatic (%)
			Boiling Point (°C)	<180°C	180 to 265°C	265 to 380°C	>380°C	Of Whole Product <380
Vincent Crude	0.9502	132.07 at 40°C	% total	0	6.3	35.2	58.5	8.7
NY Topsides Blend	0.927	96.7 at 20°C	% total	3.3	14.8	51.1	30.8	15.0
Marine Diesel	0.829	4.0 at 20°C	% total	6	34.6	54.4	5	3

Vincent Crude

Vincent crude comprises of semi and low volatile compounds with highly volatile components being absent. In general, 6.3% of the oil mass should evaporate within the first 24 hours (180°C < BP < 265°C); and a further 35.2% should evaporate over several days (265°C < BP < 380°C). Consequently, 58.5% of the oil is shown to be persistent. The aromatic content of the oil is approximately 8.7%.

The heavier (low volatility) components of the oil tend to entrain into the upper water column due to wind-generated waves but can subsequently resurface if wind-waves abate. Therefore, the heavier components of this oil can remain entrained or on the sea surface for an extended period, with associated potential for dissolution of the soluble aromatic fraction.

Additionally, the higher viscosity of the oil is notable in terms of the potential to break up and entrain into the water column under forces generated by breaking waves. The residual component of the oil would have boiling points too high to evaporate under ambient conditions. This proportion of the oil made up of long carbon chain compounds, could then persist in the marine environment for extended amounts of time until biodegraded.

Figure 6-1 shows the weathering characteristics of Vincent Crude in the 'constant-wind' case. In this case, approximately 6.4% of the oil is predicted to evaporate within 24 hours. Under these calm conditions, most of the remaining oil will stay on the water surface and will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 6-2) where the winds are of greater strength, levels of entrainment into the water column are forecasted to become significant, with a resultant decrease in

the mass of oil floating on the surface and subject to atmospheric weathering. Approximately 24 hours after the spill, around 49.5% of the oil mass is forecast to have entrained and a further 6.5% is forecast to have evaporated, leaving around 37.6% of the oil floating on the water surface.

The increased level of entrainment in the variable-wind case will result in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 2.5% per day with an accumulated total of ~18.7% after seven days, in comparison to a rate of ~1.84% per day and an accumulated total of 11.9% after seven days in the constant-wind case. Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons should decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration will extend the area of potential effect, requiring the break-up and dispersion of the slicks and droplets to reduce concentrations below the thresholds considered in this study.

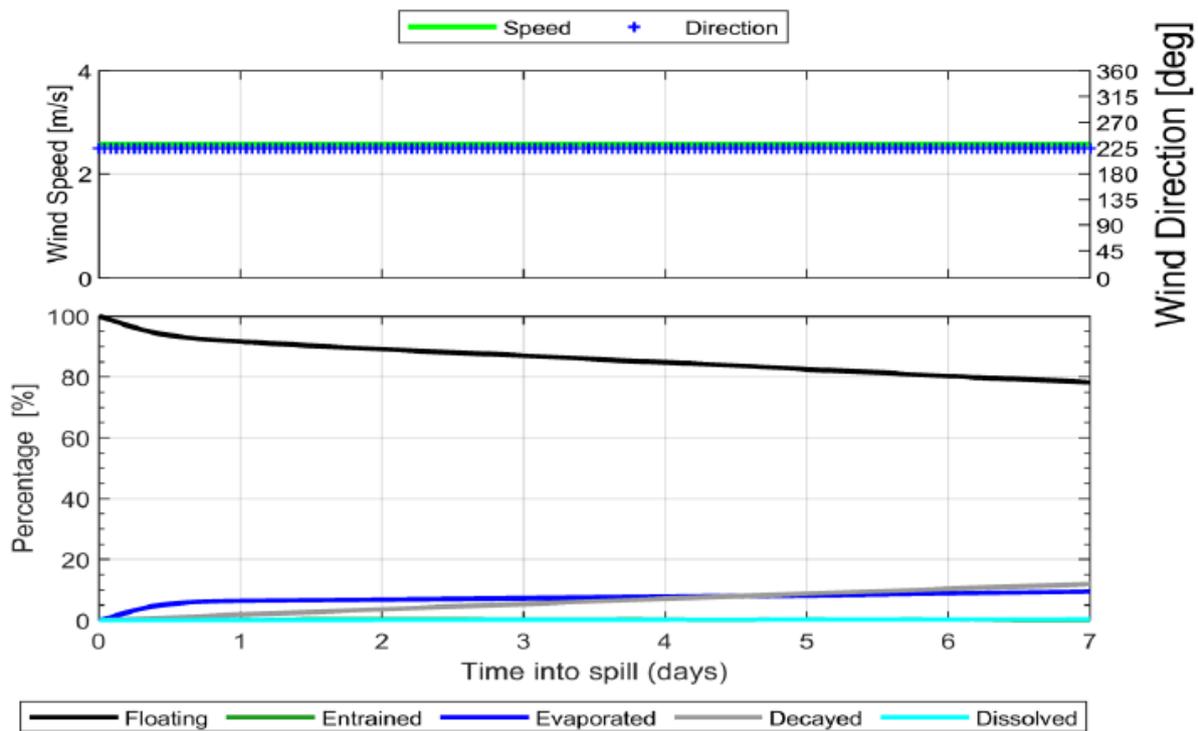

Figure 6-1: Proportional mass balance plot representing the weathering of Vincent Crude spilled onto the water surface as a one-off release (50 m³) and subject to a constant 5 kn (2.6 m/s) wind at 27°C water temperature and 25°C air temperature

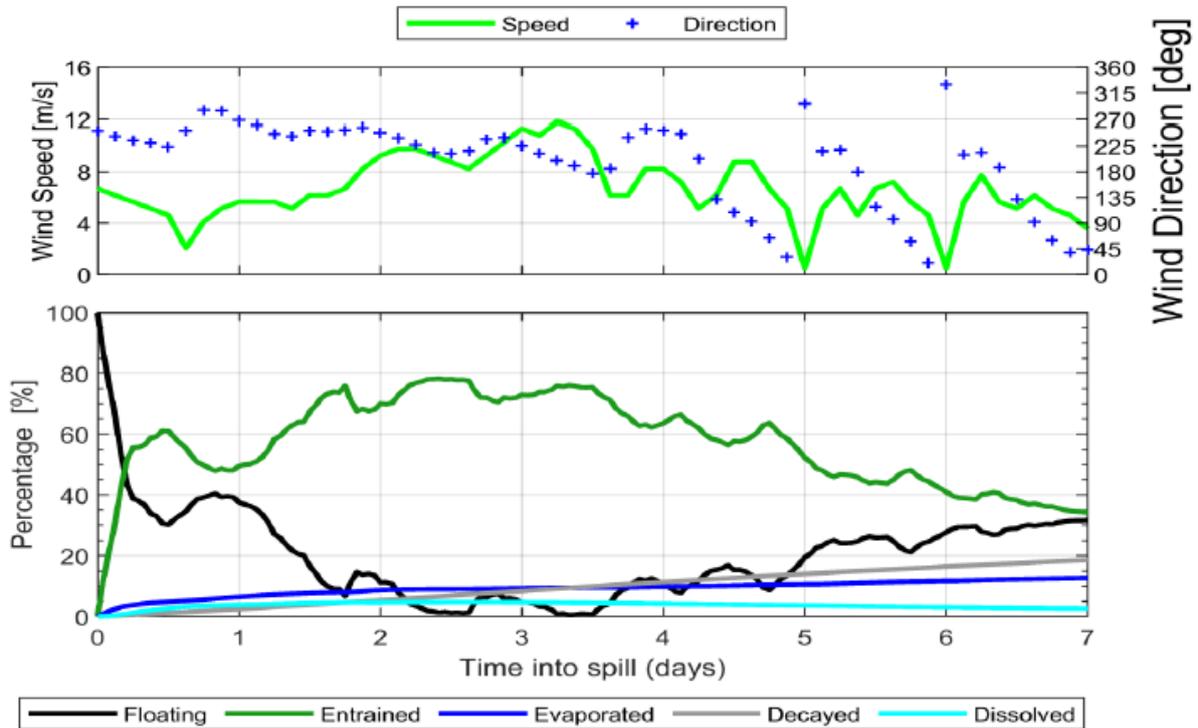

Figure 6-2: Proportional mass balance plot representing the weathering of Vincent Crude spilled onto the water surface as a one-off release (50 m³) and subject to variable wind at 27 C water temperature and 25°C air temperature

Ngujima-Yin Topside Blends

NY topsides blend crude contains a relatively high proportion (~31% by mass) of hydrocarbon compounds that will not evaporate at atmospheric temperatures. These compounds will persist in the marine environment. The unweathered mixture has a high dynamic viscosity (96.7 cP). The pour point of the whole oil (<27°C) ensures it will remain in a liquid state over the annual temperature range observed on the NWS.

The mixture is composed of hydrocarbons that have a wide range of boiling points and volatilities at atmospheric temperatures, and which begin to evaporate at different rates on exposure to the atmosphere. Evaporation rates will increase with temperature, but in general about 3.3% of the oil mass should evaporate within the first 12 hours (BP <180°C); a further 14.8% should evaporate within the first 24 hours (180°C < BP <265°C); and a further 51.1% should evaporate over several days (265°C < BP <380°C).

Selective evaporation of the lower boiling-point components is expected to lead to a shift in the physical properties of the remaining mixture, including an increase in the viscosity and pour point. This may result in solidification and/or sinking of the weathered hydrocarbon over time.

The whole oil has low asphaltene content (<0.2%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle.

Soluble aromatic hydrocarbons contribute approximately 15% by mass of the whole oil, with a large proportion (12.3%) in the C16–C20 range of hydrocarbons. These compounds should evaporate slowly, leaving the potential for dissolution of a proportion of them into the water.

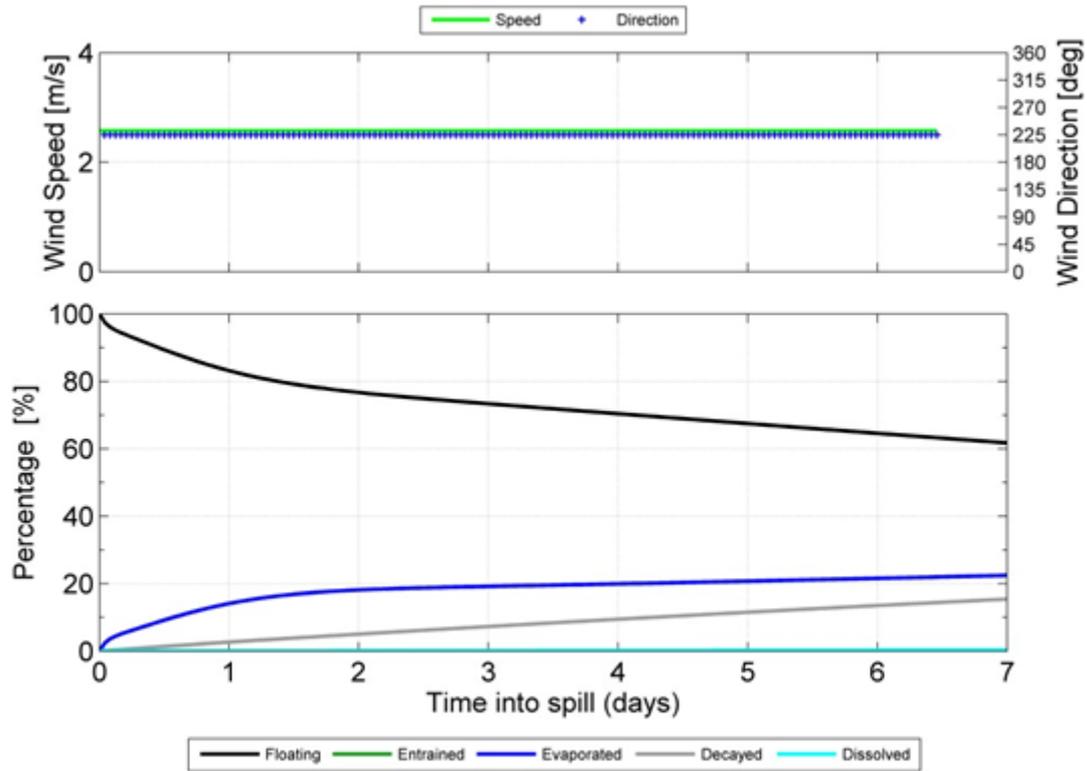

Figure 6-3: Proportional mass balance plot representing the weathering of Ngujima-Yin topsides blend crude spilled onto the water surface as a one-off release (50 m³ over one hour) and subject to a constant 5 kn (2.6 m/s) wind at 27°C water temperature and 25°C air temperature

Marine Diesel

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. In general, about 6% of the oil mass should evaporate within the first 12 hours (BP <180°C); a further 35% should evaporate within the first 24 hours (180°C < BP <265°C); and a further 54% should evaporate over several days (265°C < BP <380°C). Approximately 5% of the oil is shown to be persistent. The aromatic content of the oil is approximately 3%.

If released in the marine environment and in contact with the atmosphere (i.e. surface spill), approximately 41% by mass of this oil is predicted to evaporate over the first couple of days depending upon the prevailing conditions, with further evaporation slowing over time. The heavier (low volatility) components of the oil tend to entrain into the upper water column due to wind-generated waves but can subsequently resurface if wind-waves abate. Therefore, the heavier components of this oil can remain entrained or on the sea surface for an extended period, with associated potential for dissolution of the soluble aromatic fraction.

The mass balance forecast for the constant-wind case for marine diesel shows that approximately 40% of the oil is predicted to evaporate within 36 hours. Under these calm conditions the majority of the remaining oil on the water surface would weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case, where the winds are of greater strength, entrainment of marine diesel into the water column is indicated to be significant. Approximately two days after the spill, around 50% of the oil mass is forecast to have entrained and a further 45% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<2%). The residual compounds

will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

Biological and photochemical degradation is predicted to contribute to the decay of the floating slicks and oil droplets in the water column at an approximate rate of around 0.50% per day, for an accumulated total of about 3-4% after seven days in each wind case. However, given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration will extend the area of potential effect, requiring the break-up and dispersion of the slicks and droplets to reduce concentrations below the thresholds considered in this study.

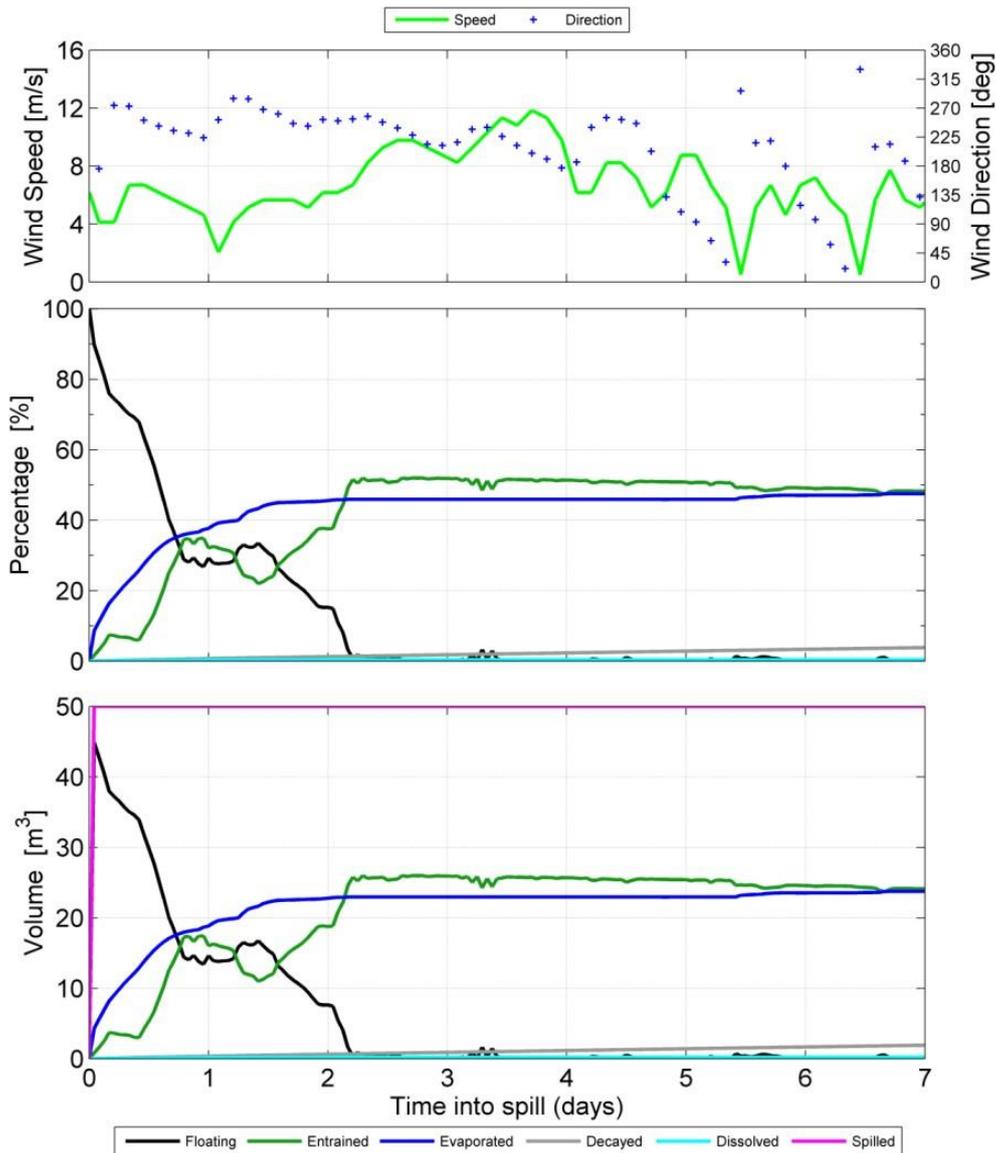

Figure 6-4: Mass balance plot representing, as proportion (middle panel) and volume (bottom panel), the weathering of marine diesel spilled onto the water surface as a one-off release (50 m³ over one hour) and subject to variable winds (top panel) at 27°

6.8.2 Major Environmental Events Overview

Section 2.7 outlines the process for additional analysis and evaluation of MEEs. Sections 6.8.3 to 6.8.11 present the bowtie output for each MEE identified (Table 6-15).

Table 6-15: Major environmental events for the Ngujima-Yin facility

Reference	Hazard	Top Event
MEE-01 (Section 6.8.3)	Hydrocarbons in reservoir, wells, wellheads and Xmas trees	Subsea loss of well containment
MEE-02 (Section 6.8.4)	Hydrocarbons conveyed in subsea equipment (including flowlines, manifolds and risers) to the NY FPSO	Subsea flowline and riser loss of containment
MEE-03 (Section 6.8.4)	Liquid hydrocarbons in the NY FPSO process modules, elements or non-process items of equipment	Topsides loss of containment
MEE-04 (Section 6.8.5)	Liquid hydrocarbons in the NY FPSO offloading system	Loss of containment during offloading
MEE-05 (Section 6.8.7)	Hydrocarbons in NY FPSO cargo tanks	Cargo tank loss of containment
MEE-06 (Section 6.8.8)	Liquid hydrocarbons in the NY FPSO and associated infrastructure	Loss of structural integrity
MEE-07 (Section 6.8.9)	Liquid hydrocarbons associated with the subsea flowlines and risers and NY FPSO topsides equipment (including FPSO offloading facilities and storage tanks)	Loss of marine vessel separation
MEE-08 (Section 6.8.10)	Lifting activities associated with NY FPSO operations	Loss of control of suspended load

Each section includes the summary of the hazard description, hazard management, emergency response, ALARP summary and a list of SCE barriers identified on the bowties.

The generic SCE failure bowtie and the generic human error bowties are presented in Section 6.8.11. They illustrate the causes, outcomes and the controls/barriers in place to manage potential common cause event (CCE) failure mechanisms for MEE controls associated with generic SCE equipment failure (CCE-01), and also human error (CCE-02). Controls and specific measures are listed for both bowties. Human Error is managed via the Woodside Management System; the Generic Human Error bowtie is included in the MEE section for completeness.

Woodside has developed a tailored ALARP position for hydrocarbon spill response, including EPOs, EPs and MCs for preparedness and response. The response arrangements are a mitigative control that is applicable to all MEEs where a hydrocarbon release may credibly occur.

ALARP is demonstrated through controls and barriers being analysed for selection, based on their independence. They are then prioritised in accordance with hierarchy of controls, where controls further up the hierarchy take precedence over controls further down, and further analysed to consider the type of effect the control provides. Controls presented for MEE bowties are labelled in accordance with the type of effect classification presented in Table 6-16.

Table 6-16: Barrier hierarchy and type of effect

Type of Effect	Legend	Description
Elimination (Technical)		Elimination controls form the 'first line of defence'. They eliminate the underlying hazard and therefore are the most effective category of control measure. If practicable, they should be selected in preference to any other type, as their existence removes the need for any other controls (e.g. a corrosion-resistant metal could replace the original material of construction).
Elimination (Administration)		
Prevention (Technical)		Prevention controls are intended to remove certain causes of incidents or reduce their likelihood. The corresponding hazard remains, but the frequency of incidents involving the hazard is lowered (e.g. introduction of regular maintenance programs can prevent the development of events involving the hazard). Where hazards and causes could not be 'eliminated', controls are required to prevent them from leading to unwanted events and consequences.
Prevention (Administration)		
Detection (Technical)		Detection controls are those that identify a potentially hazardous scenario (e.g. a change in operating parameters), allowing initiation of procedures or systems to prevent the cause occurring. Controls that detect the occurrence of events are often critical to being able to respond with other control measures that reduce the propagation of the events. Detection controls themselves often provide no actual control other than the awareness of the need to respond.
Detection (Administration)		
Reduction/Control (Technical)		Reduction controls are intended to limit the scale and consequence of incidents. They include systems that detect incidents and take some action (e.g. to reduce the rate of leakage of a toxic gas) and also aspects such as inter-unit separation that prevent escalation of fire and explosion incidents. As there is always potential for controls to fail, additional measures are required to limit the scale and severity of any unwanted event or outcome that may arise, by providing the ability to intervene and limit the propagation of the events.
Reduction/Control (Administration)		
Mitigation (Technical)		Mitigation controls take effect in response to an incident. They include controls that lessen the significance or damage caused by an unwanted event. Such controls only take effect after the hazardous event and outcomes occur. Mitigation controls are generally those designed to protect personnel against the consequences of a hazard or to aid in recovering from the effects of the hazard.
Mitigation (Administration)		

6.8.3 Unplanned Hydrocarbon Release: Loss of Well Containment (MEE-01)

Context														
Facility Layout and Description – Section 3.5 Subsea Inspection, Monitoring, Maintenance and Repair Activities – Section 3.10				Physical Environment – Section 4.4 Biological Environment – Section 4.5 Protected Places – Section 4.8 Socio-cultural Environment – Section 4.10					Consultation – Section 5					
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation

Release of hydrocarbons resulting from loss of subsea well containment.		✓	✓	✓	✓	✓	✓	B	A	1	H	LCS RBA CV SV	Acceptable if ALARP	EPO 13
Description of Source of Risk														
<p>A loss of well containment can lead to an uncontrolled release of reservoir hydrocarbons or other well fluids to the environment. Woodside has identified a loss of well containment (LOWC) as the scenario with the worst case credible environmental outcome as a result of this event. The causes of a loss of well containment may include, but are not limited to:</p> <ul style="list-style-type: none"> • internal corrosion • external corrosion • erosion • overpressure of the annuli • fatigue • loss of control of suspended load from vessel (operating near subsea wells). <p>A number of common failure causes due to human error and SCC failures are presented in the generic Human Error and SCE failure bowties in Section 6.8.11.</p> <p>Loss of Well Containment – Credible Scenario</p> <p>The Petroleum Activities Program includes production from a series of subsea wells. The worst-case credible hydrocarbon spill scenario involves a long-term (77-day) uncontrolled subsea release of 258,549 m³ of Vincent Crude from the Vincent Infill Well (VNBH4-ST2). The credible worst-case subsea release was based on the maximum credible release volume from the highest flow rate subsea well, which if the Vincent Infill Well is developed (under a separate future EP), would be that well.</p> <p>The loss of well containment scenario was assumed to have a duration of 77 days. This duration is based on the estimated time required to successfully drill an intervention well. The characteristics of the release scenario is summarised in Table 6-17. The characteristics of Vincent Crude was used as the basis for modelling the loss of well containment scenario; refer to Section 6.8.1 for additional information on modelling methods, hydrocarbon characteristics and environmental impact thresholds.</p>														

Table 6-17: Summary of worst-case loss of well containment hydrocarbon release scenario

Scenario	Hydrocarbon	Average Rate (m ³ /day)	Duration (days)	Depth (BMSL)	Latitude (DMS)	Longitude (DMS)	Total Hydrocarbon Release Volume (m ³)
Subsea release	Vincent Crude	3,358	77	393	21° 26' 01.66" S	114° 01' 59.41" E	258,549

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in well design, construction and operation. In the company’s 60-year history, it has not experienced any well integrity events that have resulted in significant releases or significant environmental impacts. The NY facility has never experienced a worst-case loss of well containment in its operational history.

Decision Type

A decision type ‘B’ has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.6.3**) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation. The release of hydrocarbons as a result of well loss of containment is considered an MEE (MEE-01). The hazard associated with this MEE is hydrocarbons in subsea wells tied-back to the NY FPSO.

Quantitative Spill Risk Assessment Stochastic spill modelling of the worst-case credible loss of well containment spill scenario was undertaken by RPS APASA, on behalf of Woodside, to determine the fate of hydrocarbons released in each scenario based on the assumptions in **Section 6.8.1**. Stochastic modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volumes for all loss of well containment scenarios.

Quantitative Spill Risk Assessment

Spill modelling of the worst-case credible loss of well containment spill scenario was undertaken by RPS, to determine the fate of hydrocarbons released based on the assumptions in **Section 6.8.1**. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volumes for all loss of well containment scenarios.

Hydrocarbon Characteristics

Hydrocarbon characteristics are provided in described in more detail in **Section 6.8.1**.

Subsea Plume Dynamics

The loss of well containment scenarios will result in a buoyant plume of hydrocarbons, which has been modelled using the OILMAP-Deep numerical model.

Likelihood

In accordance with the Woodside Risk Matrix, a worst-case loss of well containment has been defined as a ‘highly unlikely’ event as it ‘has occurred once or twice in the industry’ (experience-based likelihood) and aligns with a frequency of a ‘1 in 10,000 to 1 in 100,000 year’ event. Information to support this likelihood determination is outlined below. This assessment considers the likelihood of the worst-case credible scenario occurring.

A review of industry statistics indicates that the probability of a loss of well containment for production wells is low (10.6% of 292 recorded blowouts), relative to other activities in other hydrocarbon provinces (Gulf of Mexico and the North Sea), such as exploration drilling (31.5% of blowouts), development drilling (23.6% of blowouts) and well workovers (20.5% of blowouts) (SINTEF, 2017). Separate analysis of blowout data collected between 1991 and 2010 in the North Sea and the US Gulf of Mexico shows that only ten blowouts occurred during the production phase at a frequency of 1.36 × 10⁻⁵ blowouts per well year, with all of these events occurring in the US Gulf of Mexico and none occurring in the North Sea (Scandpower, 2013). North Sea standards of well design and operation are considered to be aligned with those applied by Woodside, as outlined in the NY Well Operations Management Plan (WOMP). This data quantitatively supports the likelihood ranking as described above.

When considering likelihood from an ‘Experience’ perspective and considering the likelihood of the environmental consequence of the blowout event, historic blowouts that have had catastrophic impact to the environment (‘A’ consequence rating) are infrequent in the industry, which further supports the likelihood ranking of ‘Highly Unlikely’.

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbons were considered during the impact assessment for the identified worst-case loss of well containment scenario (presented in the following section). These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS

APASA, available information on environmental sensitivities that may credibly be impacted in the event of either worst-case spill event, and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environment that May be Affected

Surface Hydrocarbons

The stochastic modelled floating hydrocarbon EMBA from both loss of well containment is forecast to drift in all directions, reflecting the competing influence of both surface currents and winds across the wide area in which a large and persistent slick could travel over the long duration of the release. At the surface threshold of 10 g/m², floating oil is forecast to potentially occur up to approximately 950 km from the release site. The potential contact above impact thresholds at a number of receptors.

Entrained Hydrocarbons

Stochastic modelling indicated entrained hydrocarbons are forecast to potentially drift in all directions, with the most likely directions of travel being to the south-west of the release site, due to the influence of the NWMR seasonal currents. The modelling indicated that the entrained hydrocarbon EMBA above the 100 ppb threshold concentrations could potentially occur up to 1550 km for the loss of well containment scenario; contact above impact thresholds was forecast at a range of receptors.

Dissolved Hydrocarbons

In the event of a loss of well containment scenario, a plume of dissolved hydrocarbons would potentially drift in all directions, with the most likely directions of travel being to the south-west of the release site, due to the influence of the NWS seasonal currents. Stochastic modelling results indicated contact above impact thresholds may occur at a range of receptors. The dissolved plume from the loss of well containment was forecast to potentially extend approximately 1250 km.

Accumulated Hydrocarbons

There is considerable potential for shoreline accumulation above impact thresholds at a number of receptors. Modelling indicated potentially large volumes of hydrocarbons may be stranded on shorelines as far as the Indonesian coastline and the Abrolhos Islands.

Summary of Potential Impacts to Environmental Value(s)

Table 6-18 presents the full extent of the EMBA for loss of well containment (within which all other credible hydrocarbon spill EMBA are contained), i.e. the sensitive receptors and their locations that may be exposed to hydrocarbons (surface, entrained, dissolved and accumulated) at or above the set threshold concentrations in the unlikely event of a loss of well containment during the Petroleum Activities Program. Details of these receptors are outlined in **Section 4**. The potential biological and ecological impacts of an unplanned hydrocarbon release as a result of a loss of well containment during the Petroleum Activities Program are discussed in the following sections.

Environmental Setting	Receptor	Environmental, Social, Heritage and Economic Aspects presented as per the Environmental Risk Definitions (Woodside's Risk Management Procedure)																								Probability of Hydrocarbon Contact and Fate (%)

Summary of Potential Impacts to Environmental Value(s)

Open Water Environment (Near Spill Area)

Air Quality

A hydrocarbon release during a loss of well containment has the potential to result in localised, temporary reduction in air quality and contribution of greenhouse gases to the global concentration of these gases in the atmosphere.

There is potential for human health effects on workers in the immediate vicinity of atmospheric emissions. The ambient concentrations of VOCs released from diffuse sources is difficult to accurately quantify, although their behaviour and fate is predictable in open offshore environments, as it is dispersed rapidly by meteorological factors such as wind and temperature. VOC emissions from a hydrocarbon release in such environments are rapidly degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals.

Due to the unlikely occurrence of a well loss of containment, the temporary nature of any VOC emissions (from either gas surfacing or weathering of liquid hydrocarbons from a loss of well containment), the predicted behaviour and fate of VOCs in open offshore environments, and the significant distance from the Operational Area to the nearest sensitive air shed (town of Exmouth approximately 51 km away), the potential impacts are expected to be minor and short term.

Water Quality

Water quality would be affected due to hydrocarbon contamination above impact thresholds. These are defined by the EMBA descriptions for each of the entrained and dissolved hydrocarbon fates and their predicted extent. Furthermore, water quality is predicted to have minor long term and/or significant short-term hydrocarbon contamination above background, compared to background water quality.

Marine Sediment Quality

Floating, entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Hydrocarbons may accumulate (at or above the ecological threshold) at a range of nearshore receptors. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

Studies of hydrocarbon concentrations in deep sea sediments in the vicinity of a catastrophic well blowout indicated hydrocarbon from the blowouts can be incorporated into sediments (Romero et al., 2015). Proposed mechanisms for hydrocarbon contamination of sediments include sedimentation of hydrocarbons and direct contact between submerged plumes and the seabed (Romero et al., 2015).

In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, the extent of potential impacts to the seabed area at and surrounding the release site would be largely confined to a localised footprint. Marine sediment quality would be reduced as a consequence of hydrocarbon contamination for a small area within the immediate release site for a long to medium term, as hydrocarbons in sediments typically undergo slower weathering and degradation (Diercks et al., 2010; Liu et al., 2012).

There is the potential for floating and entrained hydrocarbons to sink following extensive weathering and adsorption of sediment particles, which may result in the deposition of hydrocarbons to the seabed in areas distant from the release location. Such hydrocarbons are expected to be less toxic due to the weathering process.

Summary of Potential Impacts to Environmental Value(s)

Benthic Fauna Communities

In the event of a major release at the seabed, the stochastic spill model predicted hydrocarbons droplets would be entrained, rapidly transporting them to the sea surface. As a result, the low sensitivity benthic communities associated with the unconsolidated, soft sediment habitat and any epifauna (filter feeders) associated with the Canyon KEFs, and the Continental Slope Demersal Fish Communities KEF, refer to **Section 4.7** within and outside the Operational Area are not expected to have widespread exposure to released hydrocarbons. Impacts are expected to be restricted to a localised area relating to the hydrocarbon plume at the point of release, which would result in a small area of seabed and associated epifauna and infauna exposed to hydrocarbons.

Heterotrophic, filter feeding organisms, such as sponges and gorgonians, have been identified as potentially occurring in the canyon features located within the wider EMBA. In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, hydrocarbon exposure to these deep-water filter-feeding communities is unlikely, and exposure at concentrations of ecological consequence is not expected to occur where these heterotrophic communities exist.

Evidence from the Deepwater Horizon spill in the Gulf of Mexico recorded low taxa richness and high nematode/harpacticoid-copepod ratios within 3 km of the release location and moderate impacts up to 17 km away (Montagna et al., 2013). The communities were likely exposed to dispersed hydrocarbons as the response included subsea dispersant application. A loss in benthic biodiversity has been correlated to a decline in deep-water ecosystem functioning (Danovaro et al., 2008). The location of the petroleum activity and the EMBA largely affect continental shelf waters, which are shallower than the Deepwater Horizon spill, and as such may host more diverse infauna communities, although the impacts are considered to be similar. Therefore, a loss of well containment may result in localised but long-term effects on community structure.

Demersal and Pelagic Fish Populations

Fish mortalities are rarely observed to occur as a result of hydrocarbon spills (International Tanker Owners Pollution Federation, 2011b). This has generally been attributed to the possibility that pelagic fish are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Fish that have been exposed to dissolved aromatic hydrocarbons are capable of eliminating the toxicants once placed in clean water, so individuals exposed to a spill are likely to recover (King et al., 1996). Where fish mortalities have been recorded, the spills (resulting from the groundings of the tankers Amoco Cadiz in 1978 and the Florida in 1969) have occurred in sheltered bays.

Laboratory studies have shown that adult fish are able to detect hydrocarbons in water at very low concentrations, and large numbers of dead fish have rarely been reported after hydrocarbon spills (Hjermann et al., 2007). This suggests that juvenile and adult fish are capable of avoiding water contaminated with high concentrations of hydrocarbons. However, sub-lethal impacts to adult and juvenile fish may be possible, given long-term exposure (days to weeks) to polycyclic aromatic hydrocarbon (PAH) concentrations (Hjermann et al., 2007), which are typically the most toxic components of hydrocarbons. Light molecular weight aromatic hydrocarbons (i.e. one- and two-ring molecules) are generally soluble in water, which increases bioavailability to gill-breathing organisms such as fish. While modelling of the loss of well containment indicates the potential EMBA for dissolved hydrocarbons is extensive, no time-integrated exposure metrics were modelled; given the oceanographic environment within the wider EMBA, PAH exposures in the order of weeks for pelagic fish are not considered credible.

The effects of exposure to oil on the metabolism of fish appears to vary according to the organs involved, exposure concentrations and route of exposure (waterborne or food intake). Oil reduces the aerobic capacity of fish exposed to aromatics in the water and, to a lesser extent, affects fish consuming contaminated food (Cohen et al., 2005). The liver, a major detoxification organ, appears to be the organ where anaerobic activity is most impacted, probably increasing anaerobic activity to facilitate the elimination of ingested oil from the fish (Cohen et al., 2005).

Fish are perhaps most susceptible to the effects of spilled oil in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Contact with oil droplets can mechanically damage feeding and breathing apparatus of embryos and larvae (Fodrie and Heck, 2011). The toxic hydrocarbons in water can result in genetic damage, physical deformities and altered developmental timing for larvae and eggs exposed to even low concentrations over prolonged timeframes (days to weeks) (Fodrie and Heck, 2011). More subtle, chronic effects on the life history of fish as a result of exposure in early life stages to hydrocarbons include disruption to complex behaviours such as predator avoidance, reproductive and social behaviour (Hjermann et al., 2007). Prolonged exposure of eggs and larvae to weathered concentrations of hydrocarbons in water has also been shown to cause immunosuppression, and allows expression of viral diseases (Hjermann et al., 2007).

PAHs have also been linked to increased mortality and stunted growth rates of early life history (pre-settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen et al., 2017). However, the effect of a hydrocarbon spill on a population of fish in an area with fish larvae and/or eggs, and the extent to which any of the adverse impacts may occur, depends greatly on prevailing oceanographic and ecological conditions at the time of the spill and its contact with fish eggs or larvae.

Summary of Potential Impacts to Environmental Value(s)

The Continental Slope Demersal Fish Communities and the Canyons linking the Cuvier Abyssal Plain and the Cape Range KEF overlap the Operational Area. Species found on the continental slopes of these key ecological features been shown to host high levels of endemism (BMT Oceanica, 2016). Additionally, demersal species are associated with the Ancient Coastline KEF (~0.6 km from the Operational Area).

Mortality and sub lethal effects may impact populations located close to the well blow out and within the EMBA for entrained/dissolved aromatic hydrocarbons (≥ 100 and ≥ 50 ppb, respectively). Additionally, if prey (infauna and epifauna) surrounding the well location and within the EMBA is contaminated, this can result in the absorption of toxic components of the hydrocarbons (PAHs), potentially impacting fish populations that feed on these. These impacts may result in localised medium/long term impacts on demersal fish habitat (e.g. seafloor).

Hydrocarbons above ecological thresholds may subsequently impact populations located near to the release location for the worst-case spill scenario, with lethal impacts not considered likely in this offshore environment.

Protected Places

Receptors

The Australian Marine Parks (AMPs) listed in **Section 4.8** may be affected by a worst-case spill scenario. The AMPs were predicted to potentially be contacted by hydrocarbons in the event of a worst-case spill scenario include Ningaloo AMP, Gascoyne AMP, Montebello AMP, Dampier AMP, Shark Bay AMP, etc.

Impacts

The Gascoyne Marine Park is the closest AMP to the Operational Area (7.7 km) predicted to be contacted by hydrocarbons. Impacts to this AMP are discussed below. Impacts to the natural, cultural, heritage and socio-economic values of the other AMPs predicted to be contacted by hydrocarbons in a worst-case spill scenario are expected to be similar, however, of varying severity and duration due to their varying distances from the Operational Area (see Section 4.8).

Gascoyne Marine Park

The Gascoyne Marine Park comprises an area about 81,766 km², The Marine Park is assigned IUCN category IV and includes three zones assigned under this plan: National Park Zone (II), Habitat Protection Zone (IV) and Multiple Use Zone (VI). The AMP ranges in water depths from less than 15 m up to 6000 m.

The Gascoyne Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Shelf Transition, Central Western Transition, and Northwest Province. It overlaps with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, Commonwealth waters adjacent to Ningaloo Reef KEF, continental slope demersal fish communities KEF, and the Exmouth Plateau KEF (see 'Key Ecological Features' above for a discussion of impacts to KEFs).

The AMP includes some of the most diverse continental slope habitats in Australia, in particular the continental slope area between North West Cape and the Montebello Trough. Canyons in the Marine Park link the Cuvier Abyssal Plain to the Cape Range Peninsula and are important for their role in sustaining the nutrient conditions that support the high diversity of Ningaloo Reef. The specific values of the AMP and associated impacts are summarised here.

- **Natural values** – The AMP includes diverse benthic and pelagic fish communities and ancient coastline thought to be an important seafloor feature (KEF) and a migratory pathway for humpback whales (BIAs). The AMP supports a range of species including species listed as threatened, migratory, marine or cetacean under the EPBC Act. Biologically important areas within the Marine Park include. BIAs within the AMP include breeding habitat for seabirds, internesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat and migratory pathway for pygmy blue whales.
- **Cultural values** – There is limited information about the cultural significance of this AMP, however, it is noted that sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. Potential impacts to cultural values of the AMP will closely tie in with the impacts to the natural values of the Marine Park, as addressed above and below; and range from moderate mid-term potential impacts to major long-term potential impacts.
- **Heritage values** – There are no World, National or Commonwealth heritage listings within the AMP. However, the Ningaloo Coast World Heritage Property, the Ningaloo Marine Area (Commonwealth waters), and the Ningaloo Coast National Heritage areas are located adjacent to the Gascoyne AMP. Five historic shipwrecks are located within the Marine Park. Impacts to shipwrecks are discussed below under 'Cultural Heritage'.
- **Social and economic values** – Commercial fishing, mining and recreation are important activities in the AMP. These activities contribute to the wellbeing of regional communities and the prosperity of the nation. A worst-case hydrocarbon spill scenario has the potential to result in impacts to these AMPs that range from moderate, medium-term to major, long-term, with the consequence severity dependent on the actual timing, duration and extent of a spill.

Summary of Potential Impacts to Environmental Value(s)

Key Ecological Features

KEFs potentially impacted by the hydrocarbon spill from a loss of well containment event are provided in **Section 4.7**. Although these KEFs are primarily defined by seabed geomorphological features, they are described to identify the potential for increased biological productivity and, therefore, ecological significance.

The consequences of a hydrocarbon spill from a loss of well containment event are predicted to result in moderate impacts to values of the KEFs affected (for the values of each KEF, see **Section 4.7**).

Potential impacts include contamination of sediments, impacts to benthic sediment fauna and associated impacts to demersal fish populations, and reduced biodiversity as described above and below. Most of the KEFs within the EMBA have relatively broad-scale distributions and are unlikely to be significantly impacted. KEFs within the EMBA that are not associated with broad-scale distributions are not expected to be impacted by floating hydrocarbons and contact with entrained and dissolved fractions is predicted to be very low/no contact. Hence, the environmental values of these KEFs are not expected to be impacted.

Protected Species

Cetaceans

A range of cetaceans were identified as potentially occurring within the Operational Area and wider EMBA (**Section 4.6.3**). In the event of a loss of well containment, surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations may drift across habitat for oceanic cetacean species and the migratory routes and BIAs of cetaceans considered to be MNES, including humpback whales, southern right whales, sperm whales, pygmy blue whales (north- and southbound migrations), Australian snubfin dolphins, Indo-Pacific humpback dolphin and Indo-Pacific/spotted bottlenose dolphins.

Cetaceans that have direct physical contact with surface, entrained or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (from prey, water and sediments), aspiration of oily water or droplets, and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts and organs, impairment of the immune system, neurological damage (Helm et al., 2015), reproductive failure, adverse health effects (e.g. lung disease, poor body condition) and potentially mortality (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016).

Given the relatively low volatile fractions of the hydrocarbons, the area where potential impacts from inhalation may occur is expected to be localised around the release location. In a review of cetacean observations in relation to large scale hydrocarbon spills, it was concluded that exposure to oil from the Deepwater Horizon resulted in increased mortality to cetaceans in the Gulf of Mexico (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). Long-term population level impacts to killer whales have been linked to the Exxon Valdez tanker spill (Matkin et al., 2008). Geraci (1988) has identified behavioural disturbance (i.e. avoiding spilled hydrocarbons) in some instances for several species of cetacean, suggesting that cetaceans have the ability to detect and avoid surface slicks.

However, observations during spills have recorded larger whales (both mysticetes and odontocetes) and smaller delphinids travelling through and feeding in oil slicks. During the Deepwater Horizon spill, cetaceans were routinely seen swimming in surface slicks offshore (and nearshore) (Aichinger Dias et al., 2017).

Cetacean populations that are resident within the EMBA may be susceptible to impacts from spilled hydrocarbons if they interact with an area affected by a spill. Such species are more likely to occupy coastal waters (refer to the Mainland and Islands section below for additional information). Suitable habitat for oceanic toothed whales (e.g. sperm whales) and dolphins (e.g. spinner dolphin) is broadly distributed throughout the region and as such, however impacts are unlikely to affect an entire population. Other species identified in **Section 4.6.3** may also have possible transient interactions with the EMBA.

Pygmy Blue Whale and Humpback Whale

Pygmy blue whales and humpback whales are known to migrate seasonally through the wider EMBA, and the migration BIAs in the region for both species overlap the Operational Area. A major spill in May to November would coincide with humpback whale migration through the waters off the Pilbara, North West Cape and Shark Bay (**Figure 4-8**). A major spill in April–August or October–January would coincide with pygmy blue whale migration (**Figure 4-7**). Both pygmy blue and humpback whales are baleen whales, so are most likely to be significantly impacted by toxic effects when feeding. However, feeding during migrations is low level and opportunistic, with most feeding for both species in the Southern Ocean.

The entrained hydrocarbon EMBA includes pygmy blue whale foraging BIAs (closest being the Ningaloo Coast (approximately 17 km from Operational Area), humpback whale resting BIA at Exmouth Gulf (approximately 23 km away), southern right whale calving BIA at Perth coast (approximately 1108 km away), and sperm whale foraging BIA at Perth Canyon (approximately 1120 km away). Furthermore, the foraging, breeding and calving BIAs for the Australian snubfin dolphin, Indo-Pacific humpback dolphin and Indo-Pacific/spotted bottlenose dolphins (closest being Roebuck Bay for all, approximately 910 km) were identified within the entrained hydrocarbon EMBA. Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Summary of Potential Impacts to Environmental Value(s)

risk of ingestion of hydrocarbons is low. Migrations of both pygmy blue whales and humpback whales are protracted through time and space (i.e. the whole population will not be within the EMBA), and as such, a spill from the loss of well integrity is unlikely to affect an entire population). The humpback whale resting area in Exmouth Gulf and the calving area in Camden Sound are not predicted to be contacted by surface, entrained or dissolved hydrocarbons above threshold concentrations.

A loss of well containment resulting in a well blowout could disrupt a significant portion of the humpback or pygmy blue whale populations. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, death. However, such disruptions or impacts are not predicted to impact the overall population viability of cetaceans, given the global distribution of these species.

Physical contact with hydrocarbons to these species is likely to have biological consequences, however, it is unlikely to affect an entire population and not predicted to impact on the overall population viability. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Entrained hydrocarbons may also be ingested, particularly by baleen whales which feed by filtering large volumes of water.

Dugongs

There are no BIAs or known areas of aggregation in the offshore waters of the EMBA for the dugong.

Summary

A worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts to offshore cetacean species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Pinnipeds

Australian sea lions are found on and around the Arolohos Islands, distant from the Operational Area, but within the wider EMBA. Given the considerable distance from the Operational Area to these receptors, and the time for floating and entrained hydrocarbons to contact (32 and 25 days respectively), entrained and floating hydrocarbons that do reach this area are likely to be weathered. There is the potential for sea lions to interact with floating and stranded hydrocarbons. This may result in diminished ability to thermoregulate due to the loss of insulation, potentially resulting in mortality. Potential impacts are expected to be minor and temporary at a population scale.

Marine Turtles

Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (National Oceanic and Atmospheric Administration, 2010). Contact with surface slicks, or entrained hydrocarbon, can therefore result in hydrocarbon adherence to body surfaces (Gagnon and Rawson, 2010) causing irritation of mucous membranes in the nose, throat and eyes, leading to inflammation and infection (National Oceanic and Atmospheric Administration, 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al., 1995). A stress response associated with this exposure pathway includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of their salt gland (Lutcavage et al., 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe and inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours which are the most toxic component of the hydrocarbon spill (Milton and Lutz, 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia and neurological impairment (National Oceanic and Atmospheric Administration, 2010). Contact with entrained hydrocarbons can result in hydrocarbon adherence to body surfaces, causing irritation of mucous membranes in the nose, throat and eyes and leading to inflammation and infection (Gagnon and Rawson, 2010).

Due to the absence of potential nesting habitat and location offshore, the Operational Area is unlikely to represent important habitat for marine turtles.

It is acknowledged that foraging marine turtles may be present foraging within the EMBA, and the EMBA would overlap with the BIAs identified in **Section 4.6.2** and **Table 4-7**, in particular the inter-nesting BIAs and critical habitats for flatback turtles which extend for ~80 km from known nesting locations. It is noted by Woodside that the Petroleum Activities Program will overlap nesting seasons for marine turtles in the region.

In the event of a well blowout, there is potential that surface, entrained and dissolved hydrocarbons exceeding threshold concentrations will be present in offshore waters extending up to 950 km, 1550 km and 1250 km, respectively, from the release site. Therefore, a hydrocarbon spill may disrupt a portion of the population; however, there is no anticipated threat to overall population viability.

Potential impacts to nesting and inter-nesting marine turtles are discussed in the Mainland and Islands (nearshore) impacts discussion.

Summary

In the event of a loss of well containment, there is potential that surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations will be present in offshore waters. Therefore, a hydrocarbon

Summary of Potential Impacts to Environmental Value(s)

spill may disrupt a portion of marine turtle populations for the green, flatback, hawksbill, loggerhead and/or leatherback turtle. However, there is considered to be no threat to overall population viability given the non-persistent nature of predicted hydrocarbons.

Seasnakes

Impacts to seasnakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles. They may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation, 2011a). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

In general, seasnakes frequent the waters of the continental shelf area around offshore islands and potentially submerged shoals (water depths <100 m; see Submerged Shoals below). It is acknowledged that seasnakes may be present in the Operational Area and are present in the wider EMBA; however, their abundance is not expected to be high in the deep water and offshore environment. Therefore, a hydrocarbon spill may disrupt a portion of seasnake populations, but there is no threat to overall population viability given their widespread distribution in tropical waters.

Sharks and Rays

Hydrocarbon contact may affect whale sharks through ingestion (entrained/dissolved hydrocarbons), particularly if feeding. Whale sharks may transit offshore open waters when migrating to and from Ningaloo Reef, where they aggregate for feeding from March to July (see Mainland and Islands (nearshore waters) below).

Whale sharks may also carry out opportunistic feeding in offshore waters and the Operational Area. The EMBA overlaps the whale shark migration and foraging BIA identified in **Section 4.6.1** and **Table 4-4**, within which whale sharks are seasonally present between April and October. Therefore, individual whale sharks that have direct contact with hydrocarbons within the spill-affected area may be impacted, but the consequences to migratory whale shark populations are likely to be minor. White sharks have foraging BIAs within the South-West region which may be impacted by hydrocarbon EMBA.

Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs, either through direct contact or via the food chain (consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange). In the offshore environment, it is probable that pelagic shark species are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Therefore, any impact on sharks and rays is predicted to be minor and only a temporary disruption.

Seabirds

Offshore waters are potential foraging grounds for seabirds associated with the coastal roosting and nesting habitat (e.g. Ningaloo, Muiron Islands and the Barrow/Montebello/Lowendal Island Group). There are confirmed foraging grounds off Ningaloo and the Barrow/Montebello/Lowendal Island Group. A BIA for the wedge-tailed shearwater (peak use August–April) overlaps with the Operational Area.

There are also a number of BIAs for seabirds and migratory shorebirds that overlap with the wider EMBA, as provided in **Section 4.6.4** and **Table 4-11**.

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may mat feathers. This may lead to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed, 2011). Seabirds generally do not exhibit avoidance behaviour to floating hydrocarbons. Physical contact of seabirds with surface slicks is by several exposure pathways, primarily immersion, ingestion and inhalation. Such contact with hydrocarbons may result in plumage fouling and hypothermia (loss of thermoregulation), decreased buoyancy and potential to drown, inability to fly or feed, anaemia, pneumonia and irritation of eyes, skin, nasal cavities and mouths (Australian Maritime Safety Authority, 2013; International Petroleum Industry Environmental Conservation Association, 2004), and result in mortality due to oiling of feathers or the ingestion of hydrocarbons. Longer term exposure effects that may potentially impact seabird populations include a loss of reproductive success (loss of breeding adults) and malformation of eggs or chicks (Australian Maritime Safety Authority, 2013).

A hydrocarbon spill may result in surface slicks disrupting a significant portion of the foraging habitat for seabirds, including BIAs identified for foraging birds which are generally associated with breeding habitat, and seabirds foraging in waters in proximity to these sites. Seabird distributions are typically concentrated around islands, so hydrocarbons in proximity to nesting/roosting areas may result in increased numbers of seabirds being impacted, with many species of seabirds, such as the wedge-tailed shearwater and species of tern, forage relatively close to breeding islands/colonies. This may lead to impacts upon foraging seabirds in the offshore environment; however, this is not expected to result in a threat to the overall population viability, given the relatively broad distributions of the seabird species.

Summary of Potential Impacts to Environmental Value(s)

Nearshore Waters (Mainland and Islands)

Marine Sediment Quality

Entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Shoreline hydrocarbons may also reach a number of islands. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

Protected Species

Cetaceans

The full list of EPBC listed cetacean species identified by the PMST search with potential to occur within the EMBA), coastal populations of small cetaceans are known to reside or frequent nearshore waters, including the Ningaloo Coast, Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern and Northern Island Groups, Shark Bay, and a number of other nearshore and coastal locations including coastal areas of the Indonesian archipelago which may be potentially impacted by surface, entrained and dissolved hydrocarbons exceeding threshold concentrations in the event of a loss of well containment.

The predicted EMBA for surface, entrained and dissolved hydrocarbons extends past Exmouth Gulf and Shark Bay. These areas are known humpback whale aggregation areas during their annual southern migration (September to December); therefore, humpbacks moving into these aggregation areas may be exposed to hydrocarbons above thresholds levels. However, surface, entrained and dissolved hydrocarbons concentrations above thresholds are not expected within Exmouth Gulf itself. No floating hydrocarbon contact at or above threshold concentrations is expected for Camden Sound, an important calving area for humpback whales.

The potential impacts of exposure are as discussed previously in Offshore – Cetaceans. However, nearshore populations of cetaceans are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning.

Nearshore dolphin species (e.g. spotted bottlenose dolphins) may exhibit higher site fidelity than oceanic species, although Geraci (1988) observed relatively little impacts beyond behavioural disturbance. Resident cetacean populations (e.g. numerous dolphin species) known to inhabit nearshore waters with the EMBA for surface hydrocarbons, such as the Laut Sawu Marine National Park, may experience impacts on feeding habitats that could disrupt a portion of the local population, but is not predicted to result in impacts on overall population viability of either dugongs or resident/coastal cetaceans.

A hydrocarbon spill may disrupt a portion of a migratory cetacean population in Indonesian waters, including blue whale and sperm whale populations. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation) and, in rare circumstances, death. However, such disruptions or impacts are not predicted to impact on the overall population viability of migratory cetaceans within Indonesian waters.

Dugongs

Potential environment impacts may include the potential for dugongs to ingest hydrocarbons when feeding on oiled seagrass stands, or indirect impacts to dugongs due to loss of this food source due to dieback in worse affected areas. Furthermore, nearshore populations of dugongs are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning.

Hydrocarbon spill modelling indicates that surface hydrocarbons exceeding threshold concentrations may extend into the Lesser Sunda and Southern Java ecoregions of Indonesia, potentially exposing migratory and resident dugongs.

Summary

A hydrocarbon spill may have an impact on feeding habitats and disrupt a significant portion of the local population, but it is not predicted to result in impacts on overall population viability of either dugongs or coastal cetaceans.

Pinnipeds

Australian sea lions are found in the Houtman Abrolhos Islands Nature Reserve and Ngari Capes Marine Park, distant from the Operational Area but within the wider EMBA. Given the considerable distance from the Operational Area to these receptors, and the lengthy time for surface and entrained hydrocarbons to contact (minimum 25 days for the Abrolhos Islands), surface or entrained hydrocarbons that do reach this area are likely to be weathered.

Hydrocarbons accumulating on shorelines at haul-out locations may result in oiling of sea lions. Oiling may inhibit the ability for sea lions to thermoregulate, potentially resulting in mortality through hypothermia. Oiled sea lions may also ingest hydrocarbons when attempting to clean themselves, potentially resulting in toxic effects.

Summary of Potential Impacts to Environmental Value(s)

Marine Turtles

Several marine turtle species utilise nearshore waters and shorelines for foraging and breeding (including inter-nesting), with significant nesting beaches along the mainland coast and islands in potentially impacted locations such as the Ningaloo Coast, Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Islands (Northern and Southern Island Groups), Shark Bay, Scott Reef, Ashmore Reef and the southern Indonesian archipelago. There are distinct breeding seasons as detailed in **Section 4.6.2**. The nearshore waters of these turtle habitat areas may be exposed to surface, entrained or dissolved hydrocarbons exceeding threshold concentrations, and accumulated hydrocarbons above threshold concentrations.

The behaviour and biology of marine turtles makes these species relatively vulnerable to population-scale impacts compared to other fauna, such as dugongs. All species of marine turtles exhibit high nesting site fidelity by females, with gene flow between populations primarily mediated by movements of male turtles (FitzSimmons et al., 1997). Additionally, marine turtles rely on nesting beaches to reproduce, which makes them vulnerable to impacts from spilled hydrocarbon accumulations on shorelines through oiling of nesting females and emergent hatchlings, and disturbance of nests from spill response activities (Lauritsen et al., 2017). A spill during nesting and hatching season poses an increased risk to marine turtle populations.

A number of BIAs have been identified for marine turtles, including aggregation, nesting, inter-nesting, mating and foraging areas. A hydrocarbon spill above impact thresholds in these areas may result in impacts to biologically important behaviours. During the breeding season, turtle aggregations near nesting beaches within the wider EMBA are most vulnerable due to greater turtle densities, and potential impacts may occur at the population level of some marine turtle species.

The islands within the Lesser Sunda and Southern Java Ecoregions provide habitat for marine turtles, with the Laut Sawu Marine National Park in particular identified as providing habitat for five species of marine turtles – green, leatherback, olive ridley, loggerhead and flat back turtles. The potential impacts to marine turtles in Indonesian waters contacted by the surface hydrocarbon EMBA and those contacted by accumulated hydrocarbons on shorelines are likely to be similar to those described above for Offshore – Marine Turtles and Mainland and Islands (nearshore waters) – Marine Turtles.

The potential impacts of exposure are as discussed previously in Offshore – Marine Turtles. In the nearshore environment, turtles can ingest hydrocarbons when feeding (e.g. on oiled seagrass stands/macroalgae), or can be indirectly affected by loss of food source (e.g. seagrass due to dieback from hydrocarbon exposure) (Gagnon and Rawson, 2010). In addition, hydrocarbon exposure can impact turtles during the breeding season at nesting beaches. Contact with gravid adult females or hatchlings may occur on nesting beaches (accumulated hydrocarbons) or in nearshore waters (entrained hydrocarbons) where hydrocarbons are predicted to make shoreline contact.

Results from studies of nesting beaches subject to extensive oil pollution from the Deepwater Horizon spill indicated a significant reduction (approximately 44%) in turtle nest density during the nesting season immediately following the spill (Lauritsen et al., 2017). Lauritsen et al. (2017) partially attributed this reduction to direct (e.g. direct mortality of adults due to oiling or toxicity) and indirect (e.g. shoreline disturbance from response activities) impacts from the spill. There was a significant increase in nesting density in the years immediately following the spill, with nesting density returning to levels comparable to pre-spill densities within two nesting seasons (Lauritsen et al., 2017). This indicates that adult female turtles that avoided mortality may have deferred nesting during the spill until subsequent years. The significant decline in nesting density observed following the Deepwater Horizon spill represents a decline of approximately 36% of reproductive output of the turtle population in the study area (Lauritsen et al., 2017); given turtles may take over a decade to reach sexual maturity, the effects of such a reduction in reproductive output may take over a decade to appear in nesting related metrics (which are commonly used to monitor turtle populations).

Based on the deterministic modelling results and the potential for impact and recovery of turtles, a worst-case hydrocarbon spill from a loss of well containment may result in reduced turtle numbers and nesting density; however, it would not be expected to result in elimination of a population. Impacts and subsequent recovery may take decades to occur. To date, no oil spills have been demonstrated to have resulted in elimination of a turtle population at any scale (Yender and Mearns, 2010). Disastrous spills impacting important turtle habitat (including nesting areas) have not been shown to eliminate turtle populations, although direct and indirect impacts have been documented (e.g. Lauritsen et al., 2017; McDonald et al., 2017; Stacy et al., 2017; Vander Zanden et al., 2016). Turtle populations have been shown to be able to recover, even when populations have been reduced to small sizes after experiencing significant declines (Mazaris et al., 2017). As such, population scale impacts to marine turtles from a worst-case loss of well containment would be expected to exhibit recovery, although may take several decades to reach pre-impact population levels due to the relatively long lifespan and late sexual maturity of marine turtle species.

Sea snakes

Impacts to sea snakes for the mainland and island nearshore waters from direct contact with hydrocarbons may occur and may include potential damage to the dermis and irritation to mucous membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation, 2011a).

Summary of Potential Impacts to Environmental Value(s)

Fish

Fish (and other commercially targeted taxa) in their early life stages (eggs, larvae and juveniles) are at their most vulnerable to lethal and sub-lethal impacts from exposure to hydrocarbons, particularly if a spill coincides with spawning seasons or reaches nursery areas close to the shore (e.g. seagrass and mangroves) (International Tanker Owners Pollution Federation, 2011a). Fish spawning (including for commercially targeted species such as snapper and mackerel) occurs in nearshore waters at certain times of the year, and nearshore waters are also inhabited by higher numbers of juvenile fishes than offshore waters.

Modelling indicated that, in the unlikely event of a major spill, there is potential for entrained or dissolved hydrocarbons to occur in the surface water layers above threshold concentrations in nearshore waters (e.g. Ningaloo Coast, the Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern and Northern Islands Groups, Shark Bay and the Abrolhos Islands). This has the potential to result in lethal and sublethal impacts to a portion of fish larvae in areas contaminated above impact thresholds, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. Although there is the potential for spawning/nursery habitat to be impacted (e.g. mangroves and seagrass beds, discussed above), losses of fish larvae in worst affected areas are unlikely to be of major consequence to fish stocks compared with significantly larger losses through natural predation, and the likelihood that most nearshore areas would be exposed is low (i.e. not all areas in the region would be affected). This is supported by a recent study in the Gulf of Mexico which used juvenile abundance data, from shallow-water seagrass meadows, as indices of the acute, population-level responses of young fishes to the Deepwater Horizon spill. Results indicated that there was no change to the juvenile cohorts following the Deepwater Horizon spill. Additionally, there were no significant post-spill shifts in community composition and structure, nor were there changes in biodiversity measures (Fodrie and Heck, 2011). Any impacts to spawning and nursery areas are expected to be minor and short term, as would flow-on effects to adult fish stocks into which larvae are recruited.

Sharks and Rays

Whale sharks and manta rays are known to frequent the Ningaloo Reef system and the Muiron Islands (forming feeding aggregations in late summer/autumn). The Indonesian islands of Komodo and Nusa Penida, Bali are also known to host significant manta ray populations.

Whale sharks and manta rays generally transit along the nearshore coastline and are vulnerable to surface, entrained and dissolved aromatic hydrocarbon spill impacts, with both taxa having similar modes of feeding. Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman and Wilson, 2004). Whale sharks at Ningaloo Reef have been observed using two different feeding strategies, including passive sub-surface ram-feeding and active surface feeding (Taylor, 2007). Passive feeding consists of swimming slowly at the surface with the mouth wide open. During active feeding, sharks swim high in the water with the upper part of the body above the surface with the mouth partially open (Taylor, 2007). These feeding methods would result in the potential for individuals that are present in worst affected spill areas to ingest potentially toxic amounts of surface, entrained or dissolved aromatic hydrocarbons into their body. Large amounts of ingested hydrocarbons may affect their endocrine and immune system in the longer term. The presence of hydrocarbons may displace whale sharks from the area where they normally feed and rest, and potentially disrupt migration and aggregations to these areas in subsequent seasons. Whale sharks may also be affected indirectly by surface, entrained or dissolved aromatic hydrocarbons through the contamination of their prey. The preferred food of whale sharks are fish eggs and phytoplankton which are abundant in the coastal waters of Ningaloo Reef in late summer/autumn, driving the annual arrival and aggregation of whale sharks in this area. If the spill event were to occur during the spawning season, this important food supply (in worse spill affected areas of the reef) may be diminished or contaminated. The contamination of their food supply and the subsequent ingestion of this prey by the whale shark may also result in long term impacts as a result of bioaccumulation.

There is the potential for other resident shark and ray (e.g. sawfish species identified in **Section 4.6.1**) populations to be impacted directly from hydrocarbon contact or indirectly through contaminated prey or loss of habitat. However, it is probable that shark species will move away from the affected areas.

Shark populations displaced or no longer supported due to habitat loss would be expected to redistribute to other locations. Therefore, the consequences to resident shark and ray populations (if present) from loss of habitat, may result in a disruption to a significant portion of the population; however, it is not expected to impact the overall viability of the population.

Summary of Potential Impacts to Environmental Value(s)

Seabirds

There is the potential for seabirds, and resident, non-breeding overwintering shorebirds that use the nearshore waters for foraging and resting, to be exposed to surface, entrained and dissolved hydrocarbons. This could result in lethal or sublethal effects. Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in waters near their breeding colony. This results in relatively higher seabird densities in these areas during the breeding season, making these areas particularly sensitive in the event of a spill.

Pathways of biological exposure that can result in impact may occur through ingestion of contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs). Ingestion can also lead to internal injury to sensitive membranes and organs (International Petroleum Industry Environmental Conservation Association, 2004). Whether the toxicity of ingested hydrocarbons is lethal or sublethal will depend on the weathering stage and its inherent toxicity.

Exposure to hydrocarbons may have longer term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks, affecting survivorship and loss of adult birds.

Important areas for foraging seabirds and migratory shorebirds are identified in **Section 4.6.4**. Suitable habitat or seabirds and shorebirds are broadly distributed along the mainland and nearshore island coasts within the EMBA. Of note are important nesting and resting areas, including (refer to **Section 4.6.4** for additional information, including BIAs within the wider EMBA):

- Muiron Islands
- Ningaloo Coast
- North West Cape
- Montebello/Barrow/Lowendal Islands Group (including known nesting habitats on Boodie, Double and Middle Islands)
- Pilbara Islands North and South Island Group
- Shark Bay
- Abrolhos Islands
- Ashmore Reef.

Therefore, a hydrocarbon spill may impact key feeding habitat and disrupt a significant portion of the habitat; however, this is not expected to threaten the overall population viability of seabirds or shorebirds.

Submerged Shoals and Banks

Protected Species

Marine Turtles

There is the potential for marine turtles to be present at submerged shoals such as Ningaloo Reef, Exmouth Reef Montebello Shoals, Barrow Island and Rowley Shoals. These shoals and banks may, at times, be foraging habitat for marine turtles, given the coral and filter feeding biota associated with these areas. Satellite tracking of individual green turtles in the nearshore environment of the NWS did not indicate any overlap of the tracked post-nesting migratory routes and the Operational Area. It is, however, acknowledged that individual marine turtles may be within the surrounding areas. Therefore, a hydrocarbon spill may have a minor disruption to a portion of the population (see offshore description above); however, there is no threat to overall population viability.

Seasnakes

There is the potential for seasnakes to be present at submerged shoals such as Exmouth Reef and Barrow Islands Reefs and Shoals. The potential impacts of exposure are as discussed previously in Offshore – Seasnakes.

A hydrocarbon spill may disrupt a portion of the population but there is no threat to overall population viability. Seasnake species in Australia generally show strong habitat preferences (Heatwole and Cogger, 1993); species that have preferred habitats associated with submerged shoals and oceanic atolls may be disproportionately affected by a hydrocarbon spill affecting such habitat.

Summary of Potential Impacts to Environmental Value(s)

Sharks and Rays

There is the potential for resident shark and ray populations to be impacted directly from hydrocarbon contact, or indirectly through contaminated prey or loss of habitat. Spill model results indicate potential impacts to the benthic communities of Barrow Islands Reefs and Shoals and Ningaloo Reef (modelling showed contact by entrained or dissolved hydrocarbons above threshold concentrations).

Pelagic sharks and rays are expected to move away from areas affected by spilled hydrocarbons. Impacts to such species are expected to be limited to behavioural responses/displacement. Shark and ray species that have associations with submerged shoals and oceanic atolls may not move in response to such habitat being contacted by spilled hydrocarbons. Such species may be more susceptible to a reduction in habitat quality resulting from a hydrocarbon spill. Impacts to sharks and rays are likely to be localised, as they are comparable to other Australian reefs and the NWMR submerged shoals and banks. It is expected that there will be no impacts at the population level.

All Settings

Coral Reefs

Receptors

The quantitative spill risk assessment and EMBA indicate there would be potential for coral reef habitat to be exposed to surface, dissolved and entrained hydrocarbons. There would be potential for surface, entrained and dissolved hydrocarbons above threshold concentrations to reach reef habitat along the Ningaloo coast and at identified offshore islands such as the Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern Islands Group, Shark Bay, Abrolhos Islands, Ashmore Reef and southern Indonesian islands.

Impacts

The shallow coral habitats are most vulnerable to hydrocarbon coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are also known to cause high coral mortality via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species) (Shigenaka, 2001). The duration of surface slick contact with the reef flat may be reduced, as the slick will likely be lifted off the reef by the flooding tide; however, exposure will be prolonged where hydrocarbons adhere. There is significant potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos, with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. This particularly applies to branching corals, which are reported to be more sensitive than massive corals (Shigenaka, 2001).

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons (≥ 100 and ≥ 50 ppb, respectively) has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column, including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities (with reference to Ningaloo Coast). Mortality in a number of coral species is possible, and this would result in the reduction of coral cover and change in the composition of coral communities. Sub-lethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates, and impaired reproduction (Negri and Heyward, 2000). This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Muiron Islands, Barrow/Montebello/Lowendal Islands, Pilbara Southern and Northern Island Groups and Abrolhos Islands) and also the mainland coast (e.g. Ningaloo Coast and Shark Bay).

With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained and dissolved hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon, creating a pressure gradient that drives water in a strong outward flow through channels. These channels are across as much as 15% of the length of Ningaloo Reef (Taylor and Pearce, 1999).

Shoreline Accumulation

As mentioned, shoreline accumulation was modelled to occur at a number of receptors. Shallow coral habitats (i.e. nearshore and intertidal waters) are most vulnerable to hydrocarbons through coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are known to cause high coral mortality (Shigenaka, 2001) via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species). There is, therefore, potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos by entrained hydrocarbons, with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. These impacts are particularly applicable to branching corals which are reported to be more sensitive than massive corals (Shigenaka, 2001).

Recruitment/Spawning

In the unlikely event of a spill occurring at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward, 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Summary of Potential Impacts to Environmental Value(s)

some non-coral species may be affected via direct contact with entrained and dissolved aromatic hydrocarbons, resulting in sub-lethal impacts and in some cases mortality. This is with particular reference to the early life-stages of coral reef animals (reef attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide-ranging fish species. The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo Reef system) will be entirely dependent on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities.

Over the worst affected sections of reef habitat, coral community live cover, structure and composition is predicted to reduce, manifested by loss of corals and associated sessile biota. Recovery of these impacted reef areas typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding, with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities (Underwood, 2009). Recovery at other coral reef areas may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour et al., 2013).

Therefore, a hydrocarbon spill may result in large-scale impacts to coral reefs, particularly Ningaloo Reef, with long-term effects (recovery >10 years) likely.

Submerged Shoals

The waters overlying the submerged Ningaloo Reef, North West Reef and Tryal Rocks have medium to high probability to be exposed to entrained hydrocarbons above threshold concentrations (at or greater than 100 ppb). These permanently submerged habitat represents sensitive open water benthic community receptors, extending from deep depths to relatively shallow water. Potential biological impacts could include sub-lethal stress and, in some instances, total or partial mortality of sensitive benthic organisms such as corals and the early life stages of resident fish and invertebrate species. Other submerged shoals and banks within the wider EMBA (e.g. Barrow Island Reefs and Shoals, Exmouth Reef, Montebello Shoals) are also predicted to be exposed to entrained or dissolved hydrocarbons above threshold concentrations, just at a lower probability. These submerged shoals and banks are also likely to be exposed to floating hydrocarbons above impact thresholds. Although the waters above these shoals may be contacted by surface slicks, any entrainment of surface hydrocarbons is likely to be restricted to the first few metres of the water column and is considered to pose limited potential for impact to marine primary producer habitats at these locations.

Non-biogenic Reefs

The reef communities fringing the Pilbara region (e.g. Pilbara islands) may be exposed to surface or entrained hydrocarbons (at or above threshold concentrations), and consequently exhibit lethal or sub-lethal impacts resulting in partial or total mortality of keystone sessile benthos, particularly hard corals; thus, potential community structural changes to these shallow, nearshore benthic communities may occur. If these reefs are exposed to entrained or dissolved hydrocarbons, impacts are expected to result in localised long-term effects.

Summary of Potential Impacts to Environmental Value(s)

Productivity

Primary production by plankton (triggered by sporadic upwelling events in the offshore waters) is an important component of the primary marine food web. Planktonic communities are generally mixed, including phytoplankton (cyanobacteria and other microalgae), secondary consuming zooplankton (e.g. copepods), and the eggs and larvae of fish and invertebrates (meroplankton).

Exposure to hydrocarbons in the water column can result in changes in species composition, with declines or increases in one or more species or taxonomic groups (Batten et al., 1998). Phytoplankton may also experience decreased rates of photosynthesis (Tomajka, 1985). For zooplankton, direct effects of contamination may include suffocation, changes in behaviour, or environmental changes that make them more susceptible to predation. Impacts on plankton communities are likely to occur in areas where surface, entrained or dissolved aromatic hydrocarbon threshold concentrations are exceeded, but communities are expected to recover relatively quickly (within weeks or months). This is due to high population turnover, with copious production within short generation times that also buffers the potential for long-term (i.e. years) population declines (International Tanker Owners Pollution Federation, 2011a).

Nearshore waters and adjacent offshore waters surrounding the offshore islands (e.g. Muiron Islands, Montebello/Barrow/Lowendal Islands Group) and to the west of the Ningaloo Reef system are also known locations of seasonal upwelling events and productivity. The seasonal productivity events are critical to krill production, which supports megafauna aggregations such as whale sharks and manta rays in the region. This has the potential to result in lethal and sub-lethal impacts to a certain portion of plankton in affected areas, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. The submerged shoals of Ningaloo Reef and North West Reef are areas associated with sporadic upwelling and associated primary productivity events. Stochastic spill model results predict entrained hydrocarbons (at or above the 100 ppb threshold) may reach these shoals. However, recovery would occur. Therefore, any impacts are likely to be temporary and on exposed planktonic communities present in the EMBA.

Hydrocarbon contact during the spawning seasons for resident shoal community benthos and fish (meroplankton), particularly exposure to in-water toxicity effects to biota, may result in the loss of a discrete cohort population, but would not affect the longer-term viability of resident populations. Therefore, any impacts to resident shoal community benthos and fish (meroplankton) are likely to be temporary and localised at the shoals.

Filter Feeders

Hydrocarbon exposure to filter-feeding communities (e.g. deepwater communities 20–200 m) and nearshore filter feeders that are present (shallower water <20 m) in may potentially be impacted by entrained/dissolved hydrocarbons.

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons (≥ 100 and ≥ 50 ppb, respectively) has the potential to result in lethal or sub-lethal toxic effects. Sub-lethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White et al., 2012). Any impacts may result in localised long-term effects to community structure and habitat.

Offshore filter-feeding communities, include such as communities around Ningaloo Reefs or on hard substrate associated with the Canyons linking the Cuvier Abyssal Plain and Continental Slope Demersal Fish Communities KEF or other locations may be impacted depending on the depth of exposure. Nearshore filter feeder communities identified within the Ningaloo Marine Park (approximately 8 km from the Operational Area) may be exposed to hydrocarbons. Such impacts may result in localised, long-term effects to community structure and habitat.

Seagrass Beds, Macroalgae and Mangroves

Spill modelling has predicted that surface, entrained and dissolved hydrocarbons above threshold concentrations have the potential to contact a number of shoreline sensitive receptors, such as those supporting biologically diverse, shallow subtidal and intertidal communities. The variety of habitat and community types, from the upper subtidal to the intertidal zones support a high diversity of marine life and are used as important foraging and nursery grounds by a range of invertebrate and vertebrate species. Depending on the trajectory of the surface and entrained/dissolved plume, macroalgal/seagrass communities including the Ningaloo Coast (patchy and low cover associated with the shallow limestone lagoonal platforms), Muiron Islands (associated with limestone pavements), the Barrow/Montebello/Lowendal Islands, Shark Bay, the Pilbara Southern Island Group (documented as low and patchy cover), the Northern Island Group, the Abrolhos Islands, the Kimberley Coast, Ashmore Reef and southern Indonesian islands have the potential to be exposed.

Seagrass in the subtidal and intertidal zones have different degrees of exposure to hydrocarbon spills. Subtidal seagrass is generally considered much less vulnerable to surface oil spills than intertidal seagrass, primarily because freshly spilled hydrocarbons, including crude oil, float under most circumstances. Dean et al. (1998) found that oil mainly affects flowering, therefore, species that are able to spread through apical meristem growth are not as affected (such as *Zostera*, *Halodule* and *Halophila* species).

Seagrass in the intertidal zone is particularly vulnerable, as it may come into direct contact with surface hydrocarbons, as well as entrained components, which can smother and kill seagrasses if it coats the leaves and stems (Taylor and Rasheed, 2011). This conclusion is supported by Howard et al. (1989) who noted that surface hydrocarbon spills

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Summary of Potential Impacts to Environmental Value(s)

which become stranded on the seagrass and smother it during the rise and fall of the tide can result in reduced growth rates, blackened leaves and mortality. Wilson and Ralph (2011) concluded that long-term impacts to seagrass are unlikely unless hydrocarbon is retained within the seagrass meadow for a sustained duration.

Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al., 2010). The potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should serve to lower the content of soluble aromatic components before contact occurs. Exposure to entrained/dissolved aromatic hydrocarbons may result in mortality, depending on actual entrained/dissolved aromatic hydrocarbon concentration received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sub-lethal stress, causing reduced growth rates and a reduction in tolerance to other stress factors (Zieman et al., 1984).

Mangrove habitat and associated mud flats and salt marsh at Ningaloo Coast (small habitat areas), the Pilbara islands, the Montebello Islands and southern Indonesian islands were identified within the EMBA. Hydrocarbons coating prop roots of mangroves can occur from surface hydrocarbons when hydrocarbons are deposited on the aerial roots. Hydrocarbons deposited on the aerial roots can block the pores used to breathe or interfere with the trees' salt balance, resulting in sub-lethal and potential lethal effects. Mangroves can also be impacted by entrained/dissolved aromatic hydrocarbons that may adhere to the sediment particles. In low energy environments such as in mangroves, deposited sediment-bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (National Oceanic and Atmospheric Administration, 2014). The hydrocarbons comprise a proportion of persistent residual fractions; therefore, deposited hydrocarbons are likely to persist in the sediment, potentially causing chronic sub-lethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from oil spills can take 20–30 years (National Oceanic and Atmospheric Administration, 2014); therefore, recovery from any impacts would be long-term (>10 years).

Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rocky Shores

Shoreline exposure for the upper and lower areas differ. The upper shore has the potential to be exposed to surface slicks, while the lower shore is subjected to dissolved or entrained oil.

Potential impacts may occur due to surface hydrocarbon contact with intertidal areas, including sandy shores, mudflats and rocky shores. Hydrocarbons at sandy shores are incorporated into fine sediments through mixing in the surface layers from wave energy, penetration down worm burrows and root pores (International Petroleum Industry Environmental Conservation Association, 2000). Hydrocarbons in the intertidal zone can adhere to sand particles; however, high tide may remove some or most of the hydrocarbons back out of the sediments. Typically, hydrocarbons are only incorporated into the surface layers to a maximum of 10 cm (International Petroleum Industry Environmental Conservation Association, 2000). It is predicted that a number of sandy shores along the coastline may have accumulated hydrocarbons $\geq 100 \text{ g/m}^2$. As described earlier, accumulated hydrocarbons $\geq 100 \text{ g/m}^2$ could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat. The persistence of the hydrocarbons will be dependent on the wave exposure, but can be months to years.

The impact of oil on rocky shores is largely dependent on the incline and energy environment. On steep/vertical rock faces on wave exposed coasts, there is likely to be no impact from a spill event. However, a gradually sloping boulder shore in calm water can potentially trap large amounts of oil (International Petroleum Industry Environmental Conservation Association, 2000). The impact of the spill on marine organisms along the rocky coast will be dependent on the toxicity and weathering of the hydrocarbon. Similar to sandy shores, accumulated hydrocarbons $\geq 100 \text{ g/m}^2$ could coat the epifauna along rocky coasts and impact the reproductive capacity and survival. Intertidal mudflats are susceptible to potential impacts from hydrocarbons, as they are typically low energy environments and therefore trap oils. Intertidal mudflats have been identified in the EMBA along the Ningaloo coast, Pilbara coastline and as far north as Indonesia. The extent of oiling is influenced by the neap and spring tidal cycle, and seasonal highs and lows affecting mean sea level. Potential impacts to tidal flats include heavy accumulations covering the flat at low tide; however, it is unlikely that oil will penetrate the water-saturated sediments. However, oil can penetrate fine sediments through animal burrows and root pores. It has been demonstrated that infaunal burrows allow hydrocarbons to enter subsurface sediments, where it can be retained for months.

The toxicity of stranded surface hydrocarbons and the in-water toxicity of the entrained or dissolved hydrocarbons reaching the shorelines will determine impacts to marine biota such as sessile barnacle species and/or mobile gastropods and crustaceans such as amphipods. Lethal and sub-lethal impacts may be expected where the entrained or dissolved hydrocarbon concentration threshold is ≥ 100 or ≥ 50 ppb, respectively. Impacts may result in localised changes to the community structure of these shoreline habitats, which would be expected to recover in the medium term (2–5 years).

Summary of Potential Impacts to Environmental Value(s)

Indonesian Waters

All Settings

Coral Reef

The fringing coral reefs of the islands of the Lesser Sunda and Southern Java ecoregions may be impacted by surface and accumulated hydrocarbons at or above threshold levels in the event of loss of well containment. The potential impacts on shallow water coral reef systems are discussed above for Mainlands and Islands (Nearshore Waters) – Coral Reef. There is the potential for lethal impacts due to the physical hydrocarbon coating of coral reef systems, with likely mortality of corals (adults, juveniles and established recruits) at areas contacted by surface hydrocarbons above threshold concentrations.

Seagrass Beds/Macroalgae and Mangroves

Seagrass meadows, macroalgae and mangroves in the intertidal and subtidal habitats of the islands of the Lesser Sunda and Southern Java ecoregions all have the potential to be contacted by surface hydrocarbons exceeding threshold levels, in the unlikely event of a loss of well containment. The potential impacts on these habitats and communities are discussed above for Mainland and Islands (Nearshore Waters).

Open Water – Productivity/Upwelling

Floating hydrocarbons are the only fraction identified by stochastic modelling as potentially reaching Indonesian waters above impact thresholds. Given the distance between the release location and sensitivities in Indonesia, any hydrocarbons reaching Indonesian waters will be highly weathered. The majority of soluble and volatile components of the hydrocarbon will have been lost prior to reaching Indonesian waters.

The Lesser Sunda and Southern Java ecoregions of Indonesia experience seasonal upwellings that support megafauna such as migratory cetacean species. The potential impacts to cetaceans from surface hydrocarbons are discussed above in Offshore – Cetaceans and Mainland and Islands (nearshore waters) – Cetaceans.

Mantra rays and whale sharks attracted to seasonal upwellings may experience indirect impacts if the spill was to coincide with a seasonal event such as plankton aggregations. However, surface slicks that have not entered the water column by entrainment or dissolution are unlikely to have a significant impact on plankton populations, as only a small proportion of the population will be close to the surface. The main pathways for direct exposure and contamination of plankton are digestion and transport of hydrocarbon particles through the gut (Gajbhiye et al., 1995), and exposure to OIW emulsions which adhere to the external body wall or gills. Both these pathways are unlikely to result from surface hydrocarbons. Therefore, significant impacts on open water productivity and upwelling in Indonesian waters are considered unlikely.

Spawning/Nursery Areas

As discussed for Indonesia – Pelagic Fish, there is the potential for intertidal nursery areas such as mangroves and seagrass meadows to be contacted by surface hydrocarbons at or above threshold concentrations, potentially leading to impacts such as smothering of mangroves and seagrasses. Impacts to mangroves and seagrasses may result in indirect impacts to early life stages of marine fauna species (such as fish species targeted by local fishers) using these habitats. Given the nature of the hydrocarbon (highly weathered, soluble and volatile components significantly diminished, etc) and the sporadic nature of shoreline/shallow water contact, impacts are expected to be localised, with no population- or ecosystem-scale impacts expected.

Nearshore Filter Feeders

Potential impacts to nearshore filter feeders in Indonesian waters are unlikely, given the lack of entrained or dissolved hydrocarbons, and the limited potential for surface slicks to entrain into the water column.

Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rocky Shores

The islands of the Lesser Sunda and Southern Java ecoregions have the potential to be contacted by surface hydrocarbons and accumulated hydrocarbons above threshold levels. The potential impacts to shoreline habitats are discussed above for Mainland and Islands (nearshore waters) – Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rock Shores.

Prolonged stranding of surface hydrocarbons, particularly for low energy environments such as mudflats, may lead to localised changes to the community structure of these shoreline habitats (International Tanker Owners Pollution Federation, 2011a) which would be expected to recover in the medium term (2–5 years).

Summary of Potential Impacts to Socio-economic Values

operate from shallow inshore water to water depths up to 200 m, targeting demersal and pelagic finfish species and prawns. In the unlikely event of a major hydrocarbon spill, there is the potential for the targeted fish species to be exposed to entrained and/or dissolved aromatic hydrocarbons in the water column. However, the potential for direct impact would be reduced, as target species such as mackerel and snapper are likely to avoid the surface water layer underneath oil slicks. Demersal species (such as finfish and crustaceans) have limited mobility, and therefore will not be able to easily move away from a spill. Mortality/sub-lethal effects may impact populations located close to the well blowout location. The demersal and crustacean (prawn) fisheries are located over 20 km from the location of a potential well blowout. Populations in these areas are less likely to be impacted significantly, as hydrocarbons at this distance are likely to be entrained/dissolved or weathered and confined in the upper water column. A major loss of hydrocarbons from the Petroleum Activities Program may lead to an exclusion of fishing from the spill-affected area for an extended period.

A number of other State and Commonwealth fisheries, further afield in the EMBA, may also be affected by a major spill; however, the impacts to these far field fisheries will be similar to those described below for 'General Fisheries Impacts'.

Summary

Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration which removes hydrocarbons from tissues by metabolic processes, although it is dependent upon the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons, while crustaceans (such as prawns) have a reduced ability (Yender et al., 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential contamination of seafood can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender et al., 2002). A major spill would result in the establishment of an exclusion zone around the spill affected area. There would be a temporary prohibition on fishing activities for a period of time, and subsequent potential for economic impacts to affected commercial fishing operators.

Tourism and Recreation

Recreational fishers predominantly target tropical species, such as emperor, snapper, grouper, mackerel, trevally and other game fish. Recreational angling activities include shore-based fishing, private boat and charter boat fishing, with the peak in activity between April and October (Smallwood et al., 2011) for the Exmouth region. Limited recreational fishing takes place in the offshore waters of the Operational Area. Impacts on species that are recreationally fished are described above under 'Summary of Potential Impacts to Other Species'.

A major loss of hydrocarbons from the Petroleum Activities Program may lead to exclusion of marine nature-based tourist activities, resulting in a loss of revenue for operators. Tourism is a major industry for the region, and visitor numbers would likely reduce if a hydrocarbon spill were to occur based on the perception of hydrocarbon spills and associated impacts resulting in moderate, medium term (5–10 years) impacts to community and highly valued areas.

Offshore Oil and Gas Infrastructure

In the unlikely event of a major spill, surface hydrocarbons may affect production from existing petroleum facilities (platforms and FPSOs), as well as activities such as drilling and seismic exploration. For example, facility water intakes for cooling and fire hydrants could be shut off, which could in turn lead to the temporary cessation of production activities. Spill exclusion zones established to manage the spill could also prohibit activity support vessel access as well as offtake tankers approaching facilities off the North West Cape. The impact on ongoing operations of regional production facilities would be determined by the nature and scale of the spill and metocean conditions. Furthermore, decisions on the operation of production facilities in the event of a spill would be based primarily on health and safety considerations. The closest production is the Nganhurra FPSO (operated by Woodside). Other nearby facilities include the Santos-operated Ningaloo Vision FPSO and the Woodside-operated Pyrenees Venture FPSO. Operation of these facilities is likely to be affected in the event of a well blowout spill.

Summary of Potential Impacts to Socio-economic Values

Nearshore Island and Mainland Coastal Areas (Nearshore Waters)

Fisheries – Commercial

In the unlikely event of a loss of well containment, there is the possibility that target species in some areas utilised by a number of state fisheries could be affected, including pearl aquaculture in the North West Cape (including Exmouth Gulf) and wild oysters in the Pearl Oyster Managed Fishery that are within the nearfield EMBA, and further afield the Western Rock Lobster Fishery and a number of west coast and south coast fisheries (refer to for fisheries within the wider EMBA). Targeted fish, prawn, mollusc and lobster species and pearl oysters could experience sub-lethal stress, or in some instances mortality, depending on the concentration and duration of hydrocarbon exposure and its inherent toxicity. In addition, there is also the potential for commercial and artisanal Indonesian fisheries and aquaculture (e.g. seaweed farming) to be impacted (see above for potential impacts to seagrasses).

Prawn Managed Fisheries

In the event of a major spill, the modelling indicated the surface, entrained and dissolved EMBA may extend to nearshore waters closest to the mainland Pilbara and Gascoyne coasts, including the actively fished areas of the designated Onslow Prawn Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Broome Prawn Managed Fishery, Kimberley Prawn Managed Fishery, Nikol Bay Prawn Limited Entry Fishery and the Shark Bay Prawn and Scallop Managed Fishery, and managed prawn nursery areas. Note that the majority of the demarcated area for the prawn managed fishery in the Exmouth Gulf (proper) is outside the EMBA.

Prawn habitat utilisation differs between species in the post-larval, juvenile and adult stages (Dall et al. 1990) and direct impacts to benthic habitat due to a major spill have the potential to impact prawn stocks. For example, juvenile banana prawns are found almost exclusively in mangrove-lined creeks (Rönnbäck et al., 2002), whereas juvenile tiger prawns are most abundant in areas of seagrass (Masel and Smallwood, 2000). Adult prawns also inhabit coastline areas, but tend to move to deeper waters to spawn. In the event of a major spill, a range of subtidal habitats that support juvenile prawns may be exposed to hydrocarbons above impact thresholds, including:

- Muiron Islands
- Montebello Islands
- Barrow Island
- Lowendal Islands
- Pilbara Northern and Southern Island Groups
- Shark Bay
- Ningaloo Coast.

Localised loss of juvenile prawns in worst spill affected areas is possible. Whether lethal or sub-lethal effects occur will depend on duration of exposure, hydrocarbon concentration and weathering stage of the hydrocarbon, and its inherent toxicity. Furthermore, seafood consumption safety concerns and a temporary prohibition on fishing activities may lead to subsequent potential for economic impacts to affected commercial fishing operators.

Fisheries – Traditional

The wider EMBA intersects the formally recognised “MoU Box” covering Scott Reef and surrounds, Montebello Island and Ashmore Reef. Indonesian traditional fishers target trochus, sea cucumbers (holothurians), abalone, green snail, sponges, giant clams and finfish, including sharks. Impacts would be similar to those identified for commercial fishing, in the form of a potential exclusion zone and contamination/tainting of fish stocks. This may result in discarding of catch, or reduced fishing effort due to fishery closure.

Tourism and Recreation

In the unlikely event of a major spill, the nearshore waters of the Ningaloo coast and shorelines further south and north (including Indonesia) could be reached by surface slicks, entrained hydrocarbons and dissolved hydrocarbons, depending on prevailing wind and current conditions. As these locations offer a number of amenities such as fishing, swimming and using beaches and surrounds, they have a recreational value for local residents and visitors (regional, national and international). If a well blowout event resulted in hydrocarbon contact, there could be restricted access to beaches for a period of days to weeks, until natural weathering, tides, currents or oil spill response (e.g. shoreline clean-up if safe to do so) removes the hydrocarbons. In the event of a well blowout, tourists and recreational users may also avoid areas due to perceived impacts, including after the oil spill has dispersed.

Typically, a hydrocarbon spill that results in visible slicks in coastal waters and on shorelines will disrupt recreational activities, particularly tourism and its supporting services. In the unlikely event

Summary of Potential Impacts to Socio-economic Values	
	<p>of a well blowout, hydrocarbons may accumulate on shorelines (at or above a set threshold), and there is potential for visible surface slicks (<10 g/m²) (i.e. a rainbow sheen) to reach sensitive receptor locations, for example, key tourist areas of the Ningaloo Coast (see 4.8) or the full list of receptors). As a result of surface slicks in nearshore waters and potential accumulation on beaches, it is expected that there will be a temporary cessation of all marine-based tourism activities on the spill-affected coast and wider coastal area for a period of weeks or longer, until natural weathering or tides and currents remove the hydrocarbons or clean-up operations remove beached oil.</p> <p>A temporary prohibition on charter boat recreational fishing trips and any other marine nature-based tourism trips to locations such as the Ningaloo Reef, Exmouth Reef Rowley Shoals, Montebello Islands may be put into effect, depending on the trajectory of the plume, resulting in a loss of revenue for operators.</p> <p>There is the potential for stakeholder perception that this environment will be contaminated over a large area and for the longer term, resulting in a prolonged period of tourism decline. Oxford Economics (2010) assessed the duration of hydrocarbon spill related tourism impacts and found that, on average, it took 12 to 28 months to return to baseline visitor spending. There is likely to be significant impacts to the tourism industry, wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism. Recovery and return of tourism to pre-spill levels will depend on the size of the spill, effectiveness of the spill clean-up, and change in any public misconceptions regarding the spill (Oxford Economics, 2010).</p>
Indonesian Waters	<p>Fisheries – Commercial</p> <p>Within the Lesser Sunda and Southern Java ecoregions, aquaculture, encompassing a variety of species and methods, contributes significantly to local employment and food production. The main species farmed are seaweed, prawns and fish. If surface hydrocarbons at or above threshold levels contact aquaculture operations, impacts are likely to include shutdown of production, contamination/tainting of product, and, in the case of seagrass potentially exposed at low tides, smothering and dieback. Indirect impacts are likely to include loss of income and economic impacts to coastal communities.</p>
	<p>Fisheries – Traditional</p> <p>The Lesser Sunda and Southern Java ecoregions of Indonesia are a productive area for Indonesian artisanal fisheries. The potential impacts to these fisheries from surface hydrocarbons at or above threshold levels would be similar to those described above for Offshore and Mainland and Islands traditional and commercial fisheries and would be likely to include exclusion zones and the potential tainting/contamination of catch. Indirect impacts may include impacts to local economies of coastal communities.</p>
	<p>Tourism and Recreation</p> <p>Tourism is a major industry within the Lesser Sunda and Southern Java ecoregions, with the islands of Bali, Flores, Lombok, Komodo and the Gili Islands particularly important popular tourist destinations, with beach and coastal activities primary attractions. Contact with surface or accumulated hydrocarbons above threshold levels with these areas is likely to result in similar impacts to those described above for Mainland and Islands (nearshore waters) – Tourism and Recreation and would include restricted access to beaches for a period of days to weeks or longer, and the potential for tourist perception that this environment will be contaminated over a large area and for the longer term. This could result in a potential prolonged period of tourism decline. Indirect impacts are likely to include loss of income and economic disruption to a portion of the Lesser Sunda and Southern Java ecoregions.</p> <p>There is also the potential for the following Indonesian Marine National Parks and National Parks to be contacted by surface and accumulated hydrocarbons at or above threshold levels:</p> <ul style="list-style-type: none"> • Laut Sawu Marine National Park • Tanjung Tampa Nature Recreation Park. <p>Impact on the protected areas is discussed in the sections above for ecological values and sensitivities. Additionally, such hydrocarbon contact may alter stakeholder understanding and/or perception of the protected marine environment, given these represent areas largely unaffected by anthropogenic influences and contain biologically diverse environments.</p>

MEE-01 Well Loss of Containment – Risk Analysis

A bowtie risk analysis was undertaken to assess MEE-01; refer to the below figures (**Figure 6-5** to **Figure 6-7**) for bowtie diagrams which were an output of Woodside’s risk analysis process.

Risk-Based Analysis				
<p>For risks identified as MEEs, a more detailed risk-based Bowtie Analysis (as outlined in Section 2.7.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles, and consider independence of each barrier and their type of effect in controlling the hazardous event.</p> <p>Application of Woodside’s Risk Management Procedures and implementation of the WOMP ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:</p> <ul style="list-style-type: none"> • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability • wells integrity codes and standards. Well intervention activities are carried out to address maintenance issues with the wells but offer the potential for Loss of Containment from the wells. These activities are carried out using equipment specific to the task by specialist personnel under the Safe Work Control practices. <p>For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards, which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity.</p> <p>A quantitative spill risk assessment was undertaken (refer Section 6.8.1 for details of the method used).</p>				
Company Values				
<p>Corporate values require all personnel at Woodside to comply with appropriate policies, standards, procedures and processes while being accountable for their actions and holding others to account in line with Our Values. As detailed above, the Petroleum Activities Program will be undertaken in line with these policies, standards and procedures that include suitable controls to prevent loss of well containment, and response should a loss of well containment occur.</p>				
Societal Values				
<p>Due to the Petroleum Activities Program’s proximity to sensitive receptors (e.g. Ningaloo coast) and the potential extent of the wider EMBA, the loss of well containment risk rating presents a Decision Type B in accordance with the decision support framework described in Section 2.6.1. Extensive consultation was undertaken for this program to identify the views and concerns of relevant stakeholders, as described in Section 5.</p> <p>Woodside has sent an Activity Factsheet to all identified relevant stakeholders regarding the Petroleum Activities Program (Section 5). Woodside has consulted with AMSA and WA DoT on spill response strategies. In accordance with the Memorandum of Understanding between Woodside and AMSA, a copy of the Oil Pollution First Strike Plan was provided to AMSA.</p>				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

MEE-01 Well Loss of Containment – Demonstration of ALARP				
ALARP Control Measures				
<i>Hierarchy</i>	<i>Control/Barrier</i>	<i>SCE/Management System Reference</i>	<i>Type of Effect</i> <i>(Refer to Table 6-16)</i>	<i>Control Adopted</i>
<p>ALARP Statement:</p> <p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood unplanned hydrocarbon release as a result of a loss of well containment.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of well integrity, and ensuring the wells are operated within their design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the WOMP, SCE management procedures including performance standards for SCEs, and Management System Performance Standards (MSPSs) for Safety Critical Management System Controls.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the WOMP ensures the continuous identification of hazards, systematic assessment of risks, and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:</p> <ul style="list-style-type: none"> • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the technical performance standards, which define requirements to be suitably maintained such that they retain effectiveness, functionality, availability and survivability • wells integrity codes and standards. <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, it is considered that MEE risk associated with loss of well containment is managed to ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Statement:</p> <p>Loss of well containment has been evaluated as having a 'high' (A1) current risk rating. As per Section 2.6, Woodside considers 'high' (A1) risk ratings as acceptable if ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.</p> <p>Acceptability is demonstrated with regard to the considerations below.</p> <p><u>Principles of Ecologically Sustainable Development</u></p> <p>Woodside is a proud Australian company that is here for the long term. Woodside has a strong history of exploration and development of oil and gas reserves in the north west of Western Australia, with an excellent environmental record while providing revenue to State and Commonwealth Governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore, with the aim of uncovering and developing resources. It is under the lease agreement that Woodside has determined the potential to develop the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations.</p> <p>Woodside has established a number of research projects in order to understand the marine environments in which they operate, notably in the Exmouth Region and the Kimberley Region, including Rankin Bank, Glomar Shoals, Enfield Canyon and Scott Reef. Where scientific data does not exist, Woodside assumes a pristine natural environment exists and therefore implements all practicable steps to prevent damage. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions.</p> <p>Woodside looks after the communities and environments in which it operates. Risks are inherent in petroleum activities; however, through sound management and systematic application of policies, standards, procedures and processes, Woodside considers that despite this risk, the extremely low likelihood of loss of well containment is acceptable.</p> <p><i>Internal Context</i></p> <p>The Petroleum Activities Program is consistent with Woodside corporate policies, standards, procedures, processes, and training requirements as outlined in the Demonstration of ALARP and EPOs, including:</p> <ul style="list-style-type: none"> • Woodside Environment and Biodiversity Policy • the SCE Performance Standards developed and implemented for the NY facility • hydrocarbon spill preparedness and response strategies are considered applicable to the nature and scale of the risk, and associated impacts of the response are reduced to ALARP.
<p>This document is protected by copyright. Refer to electronic version for most up to date information.</p>

Woodside corporate values include working sustainably, with respect to the environment and communities in which we operate, listening to internal and external stakeholders, and considering HSE when making decisions. Consultation, outlined below, has been undertaken prior to the Petroleum Activities Program.

External Context – Societal Values

Woodside recognises that its licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. Consultation, outlined below, has been undertaken prior to the Petroleum Activities Program:

- Woodside has consulted with AMSA and WA Department of Transport (DoT) on spill response strategies. In accordance with the Memorandum of Understanding between Woodside and AMSA, a copy of the Oil Pollution First Strike Plan was provided to AMSA and DoT.
- Other relevant persons were consulted (**Section 5**) and their feedback incorporated into this EP where appropriate.
- By providing hydrocarbon spill response measures that are commensurate with the risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes this addresses societal concerns to an acceptable level.

Other Requirements (includes Laws, Policies, Standards and Conventions)

The Petroleum Activities Program is consistent with laws, policies, standards and conventions, including:

- accepted Safety Case (as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009
- mutual aid MoU for relief well drilling is in place
- accepted WOMP as per the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011
- notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with **Section 7.7**.

The Petroleum Activities Program is consistent with the objectives in the Ningaloo management plans (Management Plan for Ningaloo Marine Park and Muiron Islands Marine Management Areas, Ningaloo Marine Park Management Plan) in relation to water quality, coral, shoreline and intertidal, macroalgal, seagrass, mangroves, seabirds and social and economic values.

6.8.4 Unplanned Hydrocarbon Release: Subsea Flowline and Riser Loss of Containment (MEE-02)

Context														
Facility Layout and Description – Section 3.5 Operational Details – Section 3.6 Subsea Inspection, Maintenance and Repair Activities – Section 3.10			Physical Environment – Section 4.4 Biological Environment – Section 4.5 Protected Places – Section 4.8 Socio-cultural – Section 4.10				Consultation – Section 5							
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Loss of hydrocarbons to the marine environment due to a subsea flowline and riser loss of containment		✓	✓		✓	✓	✓	B	B	2	H	LCS RBA CV SV	Acceptable If ALARP	EPO 14
Description of Source of Impact														
<p>Background</p> <p>The Vincent field subsea systems comprise two subsea production manifolds tied into a total of thirteen subsea production trees. The Vincent subsea system also includes two water injector trees and one gas injector tree. There are two 250 mm flowlines extending from Vincent Field wells to the risers connected to the NY FPSO. The total riser capacity is two 250 mm production risers, one 250 mm water disposal riser and one 150 mm gas injection riser.</p> <p>The GE production system comprises six production wells tied back to the NY FPSO via a 31 km 16" wet insulated carbon steel flowline. Flexible flowlines are used to gather production from the five individual Laverda Canyon (LC) and NOL wells and deliver the fluids to the suction side of a MPP. A Cimatti production well ties in via a flexible spool to a tee in the rigid flowline approximately 16.5 km (by flowline length) downstream of the MPP. This well uses gas for artificial lift. The GE subsea system also includes six water injector wells, as well as a water injector flowline and associated riser.</p> <p>A subsea loss of containment from these components may result in minor weeps through to the release of large volumes of hydrocarbon inventory. Due to the potential consequences, a subsea flowline and riser loss of containment is considered to be an MEE (MEE-02). The potential hazard sources that could instigate a loss of containment from the NY flowlines and risers are:</p> <ul style="list-style-type: none"> • internal corrosion • external corrosion • erosion • overpressure or under pressure • low temperature • equipment fatigue/stress • flowline stability and free spans • anchor impact/dragging 														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- loss of control of suspended load from visiting vessel.

Escalation from other MEEs can cause flowline and riser loss of containment:

- loss of structural integrity (MEE-06) (**Section 6.8.8**)
- loss of marine vessel separation (MEE-07) (**Section 6.8.9**)
- loss of control of suspended load from facility lifting operations (MEE-08) (**Section 6.8.10**).

A number of common failure causes due to human error and SCC failures are presented in the generic Human Error and SCE failure bowties in **Section 6.8.11**.

Subsea Rigid Production Flowline and Riser Loss of Containment – Credible Scenarios

The credible worst-case subsea flowline and riser loss of containment scenario identified for the Petroleum Activities Program is a loss of hydrocarbons from the GE rigid production flowline. This is considered to be the worst-case release of all subsea flowlines and risers, as it contains the greatest volume (260 m³ of GE crude, a mix of hydrocarbons from Norton, Laverda and Cimatti wells) of isolatable hydrocarbon in the subsea infrastructure. The loss of hydrocarbons from the GE rigid production flowline assumes complete loss of the inventory of the flowline over one hour, and a 30-minute operator response time, which is the time selected as a reasonable estimate for the NY FPSO to become aware of the leak and intervene to isolate the compromised infrastructure. The subsea flowline and riser loss of containment fluid release characteristics are summarized in **Table 6-19**.

Table 6-19: Summary of worst-case subsea flowline and riser loss of well containment hydrocarbon release scenarios

Scenario	Hydrocarbon	Duration	Depth (m)	Latitude (D°M'S'')	Longitude (D°M'S'')	Total Hydrocarbon Release Volume (m ³)
Rigid production flowline and riser loss of containment	GE crude	1 hour	529	21° 26' 24" S	113° 57' 55" E	2200

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in subsea production system design, construction and operation. In the company's 60-year history, it has not experienced any subsea infrastructure integrity events that have resulted in significant environmental impacts. The NY facility has never experienced a worst-case subsea flowline and riser loss of containment in its operational history.

Decision Type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.7**) and hydrocarbon spill modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation.

The release of hydrocarbons as a result subsea flowline and riser loss of containment is considered an MEE (MEE-02). The hazard associated with this MEE is hydrocarbons in subsea flowlines and risers.

Quantitative Spill Risk Assessment

Spill modelling of worst case credible subsea flowline and riser loss of containment scenario was undertaken by RPS APASA, on behalf of Woodside in 2018. The simulation was a release based on the assumptions in **Section 6.8.1**. Modelling was undertaken over all seasons to address year-round operations. MEE-01 hydrocarbon spill modelling provided as a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volume for the PAP.

Subsea Plume Dynamics

The loss of hydrocarbons from the GE rigid production flowline is predicted to result in a buoyant plume of hydrocarbons, which has been modelled using the OILMAP-Deep numerical model.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance, infrastructure marked on marine charts), the likelihood has been taken as 2 (Unlikely). Woodside has also considered industry data for pipeline and riser release frequencies in informing the likelihood assessment (PARLOC 2015). This data indicates a large loss of containment from a flowline with similar attributes as the GE flowline (i.e. material, length and diameter) could occur once every 1000 to 10,000 years. Such a release frequency also corresponds to a 2 (Unlikely) on the Woodside Risk Matrix.

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a worst-case subsea or riser loss of containment (presented in the following section). These

considerations were informed primarily by the outputs from the modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environment that May Be Affected

Surface Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for surface hydrocarbons from the loss of hydrocarbons from the GE rigid production flowline. As described in **Section 6.8.1**, the EMBA depicted in these figures are a summary of all the locations where environmental thresholds could be exceeded for the modelled scenario.

The modelled floating hydrocarbons from the loss of hydrocarbons from the GE rigid production flowline are forecast to drift in all directions (primarily along a southwest-northeast axis), reflecting the competing influence of both surface currents and winds across the wide area in which a slick could travel. At the surface threshold of 10 g/m², floating oil is forecast to potentially occur up to approximately 1100 km from the release site. Contact above impact thresholds was forecast at several receptors.

Entrained Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for entrained hydrocarbons for the loss of hydrocarbons from the GE rigid production flowline. Entrained hydrocarbons above impact thresholds are likely to drift south-west from the release location, then southwards along the Ningaloo Coast. Transport of entrained hydrocarbons reflects the prevailing current regime in the area. Entrained hydrocarbon concentrations above impact thresholds may occur up to 1000 km from the release location. Stochastic modelling results indicated contact above impact thresholds at a number of locations.

Dissolved Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for dissolved hydrocarbons for the loss of hydrocarbons from the GE rigid production flowline. In the event of a subsea flowline and riser loss of containment scenario occurring, stochastic modelling results indicated a plume of dissolved hydrocarbons would potentially behave as per the entrained hydrocarbon plume, due to the influence of the NWS prevailing currents. Stochastic modelling results indicated contact above impact thresholds may occur at a range of receptor. Dissolved hydrocarbon concentrations above impact thresholds may occur up to 150 km from the release location.

Accumulated Hydrocarbons

No accumulation above impact thresholds from the loss of hydrocarbons from the GE rigid production flowline was predicted to occur along any shorelines.

Consequence Assessment Summary

The credible worst-case hydrocarbon spill scenario that may arise from MEE-2 may impact upon a range of environmental receptors. Potential impacts of a hydrocarbon spill to these receptors are considered in MEE-01; refer to **Section 6.8.3** for a description of potential impacts.

The credible worst-case hydrocarbon volumes that can credibly be released by MEE-02 are significantly smaller than the credible worst-case loss of well containment volumes considered in MEE-01 (**Section 6.8.3**). Additionally, the credible release durations are significantly shorter. These considerations are reflected in the significantly smaller EMBA.

MEE-02 Subsea Flowline and Riser Loss of Containment – Risk Analysis

Bowtie risk analysis was undertaken to assess MEE-02; refer to **Figure 6-8** to **Figure 6-11** for bowtie diagrams.

Risk-Based Analysis				
<p>For risks identified as MEEs, a more detailed risk-based bowtie analysis (as outlined in Section 2.7) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and considers independence of each barrier and their type of effect in controlling the hazardous event.</p> <p>Application of Woodside’s Risk Management Procedures and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:</p> <ul style="list-style-type: none"> • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability. <p>For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity.</p> <p>A quantitative spill risk assessment was undertaken (refer Section 6 for details of the method used).</p>				
Company Values				
Refer to Company Values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
Societal Values				
Refer to Societal Values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
ALARP Statement:				
<p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a low likelihood unplanned hydrocarbon release from subsea flowline and riser loss of containment.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the subsea flowlines and risers and ensuring the infrastructure is operated within the design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the NY FPSO Safety Case, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP.</p> <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural controls, it is considered that MEE risks associated with loss of containment from subsea flowline and risers are managed to ALARP.</p>				

Demonstration of Acceptability

Acceptability Statement:

Subsea flowline and riser loss of containment has been evaluated as having a 'moderate' (B2) risk rating. As per **Section 2**, Woodside considers 'moderate' (B2) risk rating as broadly acceptable if the adopted controls are implemented. Due to the consequence associated with MEE-02, Decision Type B has been applied, and ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.

Acceptability is demonstrated with regard to the considerations described in **Section 6.8.3** (MEE-01) (the considerations include principles of ESD, internal context, external context and other requirements (includes laws, policies, standards and conventions)).

6.8.5 Unplanned Hydrocarbon Release: Topsides Loss of Containment (MEE-03)

Context														
Topsides – Section 3.5.1 Process Description – Section 3.6.3 Hydrocarbon and Chemical Inventories and Selection – Section 3.9				Physical Environment – Section 4.4 Biological Environment – Section 4.5 Protected Places – Section 4.8 Socio-cultural – Section 4.10					Consultation – Section 5					
Impacts and Risks Evaluation Summary														
Source of Risk	Environmental Value Potentially Impacted							Evaluation						
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Hydrocarbon release from topsides process equipment to the marine environment and atmosphere.			✓	✓	✓	✓	✓	B	C	1	M	LCS RBA CV SV	Broadly Acceptable	EPO 15
Hydrocarbon release from topsides non-process equipment to the marine environment.			✓	✓	✓	✓	✓	B	C	1	M		Broadly Acceptable	
Description of Source of Impact														
<p>The NY Facility has a range of topsides process and non-process equipment within 11 pre-assembled modules. Release of process (i.e. gas and crude) and non-process hydrocarbons (of which diesel is the largest inventory) from the NY Facility topsides has the potential to release significant quantities of hydrocarbons to the marine environment. Hydrocarbon spill modelling for a 1,000m³ release of processed crude oil as a result of an offloading hose rupture is discussed in Section 6.8.5 (MEE-04). The results of this modelling can be considered to be a very conservative estimate of the worst-case topsides process loss of containment of rupture of the electrostatic coalescer, which holds a maximum isolatable inventory of 428m³ of oil. The potential impacts of the topsides process release are therefore, discussed in Section 6.8.5 (MEE-04).</p> <p>The following hazards could lead to loss of containment from the NY FPSO topsides:</p> <ul style="list-style-type: none"> • internal corrosion • external corrosion • erosion • overpressure • low temperature • overstress of topsides equipment • equipment fatigue • rotating equipment failure/uncontrolled transfer. <p>Escalation from other MEEs can cause topsides loss of containment:</p> <ul style="list-style-type: none"> • loss of structural integrity (MEE-06) (Section 6.8.8) • loss of marine vessel separation (MEE-07) (Section 6.8.9) • loss of control of suspended load from facility lifting operations (MEE-08) (Section 6.8.10). <p>A number of common failure causes due to human error and SCC failures are presented in the generic Human Error and SCE failure bowties in Section 6.8.11.</p>

Topsides Loss of Containment – Credible Scenarios

The worst case credible topsides process release scenario is a loss of containment of approximately 428m³ of crude oil from the electrostatic coalescer. A release due to this scenario was modelled, as the release from an offtake hose loss of containment (MEE-04, **Section 6.8.5**) (1000m³) was used to inform the risk assessment. Refer to **Section 6.8.5** for an assessment of a surface release of crude oil.

The worst case credible non-process release from NY is a loss of containment of the diesel oil settling tank. This tank has a maximum inventory of approximately 197 m³. Woodside has commissioned modelling for a number of diesel spills, including a 371 m³ surface release of diesel at the location of the NY FPSO. This modelling has been used to inform the risk assessment of the diesel component of topsides diesel loss of containment scenario (197 m³). This is considered to be suitable given the consistent release location and hydrocarbon type. The modelled volume is larger than the credible diesel spill component, which is likely to overestimate the size of the spill, making the assessment inherently conservative.

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in FPSO design, construction and operation. In the company’s 60-year history, it has not experienced any topsides integrity events that have resulted significant environmental impacts. The NY facility has never experienced a worst-case topsides loss of containment in its operational history.

Decision Type

A decision type ‘B’ has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.7**) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation.

The release of hydrocarbons from a topsides process loss of containment is considered an MEE (MEE-03). The hazard associated with this MEE is hydrocarbons contained within topsides process equipment. Note that Woodside has assessed the environment consequence of a worst-case credible loss of containment from topsides equipment as “C” as per the Woodside Risk Matrix. Woodside has also assessed the reputational and brand consequences associated with this release, and concluded that the event results in a “C” level consequence, and hence meets Woodside’s definition of an MEE (refer to **Section 2.6.3**).

Quantitative Spill Risk Assessment

Stochastic hydrocarbon spill modelling for the offloading equipment loss of containment was used to inform the risk assessment for a topsides process loss of containment (refer to credible scenarios detailed above). Stochastic spill modelling of worst-case credible topsides diesel loss of containment scenario was undertaken by RPS APASA, on behalf of Woodside. The simulations were an instantaneous release based on the assumptions in **Section 6.8.1**. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volume for a topsides loss of containment.

Hydrocarbon Characteristics

Hydrocarbon characteristics are provided in described in more detail in **Section 6.8.1**.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance, infrastructure marked on marine charts), the likelihood of a topsides loss of containment has been taken as 1 (highly unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a topsides loss of containment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environment that May Be Affected

Surface Hydrocarbons

As described in **Section 6.8.1**, the EMBA depicted in these figures are a summary of all the locations where environmental thresholds could be exceeded for stochastic modelled scenarios.

The stochastic modelled floating hydrocarbon EMBA from the topsides diesel loss of containment scenario is forecast to drift primarily to the south-west, reflecting the competing influence of both surface currents and winds across the wide area in which a slick could travel. Modelling did not indicate contact with any sensitive receptors; therefore, no tabular summary of contact with sensitive receptors is provided for the topsides loss of containment scenario.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Entrained Hydrocarbons

Stochastic modelling results indicated entrained hydrocarbons above impact thresholds are likely to drift south-west from the release location, covering a smaller area than the surface EMBA. Stochastic modelling did not indicate contact with any sensitive receptors; therefore, no tabular summary of contact with sensitive receptors is provided for the topsides diesel loss of containment scenario.

Dissolved Hydrocarbons

The stochastic hydrocarbon spill modelling results did not indicate dissolved hydrocarbon concentrations above impact thresholds at sensitive receptors would occur.

Accumulated Hydrocarbons

Stochastic modelling results indicated no accumulation above impact thresholds from the topsides diesel loss of containment scenario was predicted to occur along any shorelines.

Consequence Assessment Summary

The credible worst-case hydrocarbon spill scenario that may arise from MEE-03 may impact upon environmental receptors; refer to MEE-04 (**Section 6.8.5**) for an assessment of a surface release of crude oil (consistent with a topsides process release). The credible crude oil volume from a topsides loss of containment (MEE-03) is smaller than the scenario presented in MEE-04; as such the potential to impact upon sensitive receptors may be lower. Receptors potentially impacted by crude oil from MEE-03 are expected to be a subset of those identified in MEE-04. The nature of the hydrocarbon is considered to be the same, as is the potential nature of contact (e.g. weathering, time to contact, contact concentration).

A topsides non-process release of marine diesel is expected to result in the potential for surface and entrained hydrocarbons above impact thresholds. Floating and entrained hydrocarbons may extend into the multiple use zone of the Gascoyne Commonwealth Marine Park. The EMBA for the diesel loss of containment overlaps the Continental Slope Demersal Fish Communities and Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KFEs. Given the nature of the release and the water depth overlapping these KFEs, no impacts to the environmental values of the KFEs are expected to occur. There is the potential for impacts to socio-economic receptors, such as oil and gas facilities (e.g. decreased water quality affecting water intakes such as cooling) and fisheries (displacement of fishing effort). These potential impacts are considered to be isolated and of no lasting effect. Marine fauna within the EMBA may be impacted, particularly fauna associated with surface waters such as seabirds. Given the non-persistent nature of diesel and the relatively small EMBA, no population-scale impacts are expected.

On this basis, the consequence ratings for topsides process and non-process loss of containment to the atmosphere and marine environment are considered to be C (**Table 6-2**).

MEE-03 Topsides Loss of Containment – Risk Analysis

Bowtie risk analysis was undertaken to assess MEE-03; refer to **Figure 6-12** to **Figure 6-13** for bowtie diagrams.

MEE-03 Topsides Loss of Containment – Demonstration of ALARP				
ALARP Control Measures				
Hierarchy	Control/Barrier	SCE/Management System Reference	Type of Effect	Control Adopted
Demonstration of Acceptability				
<p>Acceptability Statement:</p> <p>Topsides loss of containment has been evaluated as having a ‘moderate’ (C1) risk rating. As per Section 2, Woodside considers ‘moderate’ (C1) risk rating as broadly acceptable if the adopted controls are implemented. Due to the consequence associated with MEE-03, Decision Type B has been applied, and ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.</p> <p>Acceptability is demonstrated with regard to the considerations described in Section 6.8.3 (MEE-01) (the considerations include principles of ecologically sustainable development, internal context, external context and other requirements (includes laws, policies, standards and conventions)).</p>

Offloading Equipment Loss of Containment – Credible Scenarios

The worst case credible scenario for an offloading loss of containment modelled is considered to be approximately 1425 m³ of NY blend crude oil, which includes the loss of the entire inventory of the offtake hose and the release associated with continued pumping at the maximum rate of 5,500 m³/hour for 15 minutes. This scenario assumes the 24-hour watch would not immediately identify the incident, and instead assumes a worst-case credible time of 15 minutes for detection and then activation/actuation of shutdown systems. The characteristics of the offloading equipment loss of containment scenario are summarised in Table 6-20.

Table 6-20: Summary of the worst-case offloading equipment loss of containment release scenario

Scenario	Hydrocarbon	Duration (minutes)	Depth (m)	Latitude (D°M'S'')	Longitude (D°M'S'')	Total Hydrocarbon Release Volume (m ³)
Offloading equipment loss of containment	NY topsides blend crude	15 minutes	Surface	21° 26' 02.661" S	114° 04' 01.325" E	1450

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in FPSO design, construction and operation. In the company's 60-year history, it has not experienced any offloading loss of containment events that have resulted in significant environmental impacts.

Decision Type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.7**) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation.

The release of hydrocarbons from an offloading equipment loss of containment is considered an MEE (MEE-04). The hazard associated with this MEE is hydrocarbons contained within the offloading equipment.

Quantitative Spill Risk Assessment

Stochastic spill modelling of worst-case credible offloading equipment loss of containment scenario was previously undertaken by RPS APASA, on behalf of Woodside. The simulation was 15 minutes release based on the assumptions in **Section 6.8.1**. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volume for an offloading equipment loss of containment.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood has been taken as 1 (highly unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon was considered during the impact assessment for an offloading equipment loss of containment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environment that May Be Affected

Surface Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for surface hydrocarbons from the offloading equipment loss of containment scenario. As described in **Section 6.8.1**, the EMBA depicted in these figures are a summary of all the locations where environmental thresholds could be exceeded for modelled scenarios.

Stochastic modelling indicated floating hydrocarbons from the offloading equipment loss of containment scenario are forecast to drift in all directions, reflecting the competing influence of both surface currents and winds across the wide area in which a slick could travel. At the surface threshold of 10 g/m², floating oil is forecast to potentially occur up to approximately 910 km from the release site. Contact above impact thresholds was forecast along the Ningaloo Coast.

Entrained Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for entrained hydrocarbons for the offloading equipment loss of containment scenario. Entrained hydrocarbons above impact thresholds are likely to drift in all directions from the release location, which is consistent with entrainment of a surface release being influenced by surface currents.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stochastic modelling results indicated entrained hydrocarbon concentrations above impact thresholds may occur up to 250 km from the release location. No entrained hydrocarbon contact above impact thresholds with sensitive receptors was predicted.

Dissolved Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for dissolved hydrocarbons for the offloading equipment loss of containment scenario. In the event of an offloading equipment loss of containment scenario occurring, a plume of dissolved hydrocarbons would potentially extend in all direction, primarily along a north-east – south-west axis. Stochastic modelling results indicated dissolved hydrocarbon concentrations above impact thresholds may occur up to 60 km from the release location. No dissolved hydrocarbon contact above impact thresholds with sensitive receptors was predicted.

Accumulated Hydrocarbons

The stochastic hydrocarbon spill modelling indicated the potential for shoreline accumulation above impact thresholds. There is a potential for accumulation of oil on shorelines, with a maximum accumulated volume of 330 m³ forecast at Ningaloo Coast Middle WHA and a maximum local accumulated concentration on shorelines of 6.1 kg/m² forecast at Ningaloo Coast Middle WHA.

Consequence Assessment Summary

The credible worst-case hydrocarbon spill scenario that may arise from MEE-4 are impacts upon the Ningaloo Coast, Muiron Islands and Montebello Islands. Potential impacts of a hydrocarbon spill to these receptors are considered in MEE-01; refer to **Section 6.8.3** for a description of potential impacts.

The credible worst-case hydrocarbon volumes that can credibly be released by MEE-04 are significantly smaller than the credible worst-case loss of well containment volumes considered in MEE-01 (**Section 6.8.3**). Additionally, the credible release durations are significantly shorter. These considerations are reflected in the significantly smaller EMBA.

MEE-04 Offloading Equipment Loss of Containment - Risk Analysis

Bowtie analysis was undertaken to assess MEE-04; refer to **Figure 6-16** to **Figure 6-19**.

Societal Values				
Refer to Societal Values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
ALARP Statement:				
<p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a low likelihood unplanned hydrocarbon release from an offloading equipment loss of containment.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the offloading system and ensuring the equipment is operated within the design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the NY FPSO Safety Case, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP.</p> <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural controls, it is considered that MEE risk associated with offloading equipment loss of containment is managed to ALARP.</p>				

Demonstration of Acceptability

Acceptability Statement:

Offloading equipment loss of containment has been evaluated as having a 'moderate' (B1) risk rating. As per **Section 2**, Woodside considers 'moderate' (B1) risk ratings as broadly acceptable if the adopted controls are implemented. Due to the consequence associated with MEE-04, Decision Type B has been applied, and ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.

Acceptability is demonstrated with regard to the considerations described in **Section 6.8.3** (MEE-01) (the considerations include principles of ecologically sustainable development, internal context, external context and other requirements (includes laws, policies, standards and conventions)).

Description of Source of Impact

Background

The NY FPSO maintains a total useable cargo tank storage volume of at least 1,200,000 barrels (excluding slops tank space), which is distributed among 14 cargo tanks. A loss of containment from a cargo tank may result in a significant volume of hydrocarbons (NY topsides blend crude) being released to the marine environment. Due to the potential consequences, a cargo tank loss of containment is considered an MEE (MEE-05). The potential hazard sources that could instigate a cargo tank loss of containment are:

- corrosion
- overpressure or under pressure
- tank leakage/over filling
- equipment fatigue
- loss of containment between cargo tanks
- loss of cargo tank atmosphere control
- cargo tank vacuum.

Escalation from other MEEs can cause NY FPSO cargo tank loss of containment includes:

- loss of structural integrity (MEE-06) (**Section 6.8.8**)
- loss of marine vessel separation (MEE-07) (**Section 6.8.9**)
- loss of control of suspended load from facility lifting operations (MEE-08) (**Section 6.8.10**).

A number of common failure causes due to human error and SCC failures are presented in the generic Human Error and SCE failure bowties in **Section 6.8.11**.

FPSO Cargo Tank Loss of Containment – Credible Scenarios

A cargo tank loss of containment could result in a release of between 14,679 m³ and 31,462 m³ of stabilised NY topsides blend crude if a single cargo tank lost its entire inventory when full. However, Woodside has determined there is a credible loss of containment scenario caused by bulkhead damage resulting in the loss of two adjacent cargo tanks during off-take operations. As such, the worst-case credible loss of containment scenario from a cargo tank spill on NY is taken as 40,828 m³ of NY topsides blend crude. This volume is based on the complete release of the maximum volumes of the two largest port or starboard wing tanks. The cargo tank loss of containment scenario assumes the initial release of half of the maximum credible spill volume within 20 minutes, with the remaining hydrocarbons released over the following 16 hours. A loss of containment of diesel fuel stored within the vessel hull

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

due to vessel collision is also a credible event. The single largest inventory of diesel within the hull is the Port Inner Diesel Oil Bunker Tank (1683.3 m³). The cargo tank loss of containment event has been selected to inform the risk assessment due to the larger potential release volume. Release characteristics for cargo tank loss of containment scenario are summarised in (Table 6-21).

Table 6-21: Summary of worst-case cargo tank loss of containment scenario

Scenario	Hydrocarbon	Duration (hours)	Depth (m)	Latitude (D°M'S'")	Longitude (D°M'S'")	Total Hydrocarbon Release Volume (m ³)
FPSO cargo tank loss of containment	NY topsides blend crude	20,414 m ³ in first 20 minutes, remainder in next 16 hours	Surface	21°26'02.661"S	114° 04' 01.325"E	40,828

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in FPSO design, construction and operation. In the company's 60-year history, it has not experienced any cargo tank integrity events that have resulted in significant releases or significant environmental impacts. The NY facility has never experienced a worst-case cargo tank loss of containment in its operational history.

Decision Type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in Section 2.6.3) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation.

The release of hydrocarbons from an NY FPSO cargo tank loss of containment is considered an MEE (MEE-05). The hazard associated with this MEE is hydrocarbons within the NY FPSO cargo tanks.

Quantitative Spill Risk Assessment

Stochastic spill modelling of the maximum credible spill for NY FPSO cargo tank loss of containment scenario was undertaken by RPS APASA, on behalf of Woodside. The simulation was a phased release (20,414 m³ over 20 minutes, with 20,414 m³ released over the following 16 hours) based on the assumptions in Section 6.8.1. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volume for an NY FPSO cargo tank loss of containment.

Hydrocarbon Characteristics

The NY topsides crude is considered to be representative of the hydrocarbons that may credibly be stored within the NY FPSO cargo tanks. Refer to Section 6.8.1.1 for the characteristics of NY topsides blend crude.

Weathering Characteristics

The mass balance forecast for the constant-wind case (Figure 6-20) for NY Topsides Blend shows that approximately 18.1% of the oil is predicted to evaporate within 24 hours. Under these calm conditions, most of the remaining oil will remain on the water surface and will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 6-21), where the winds are of greater strength, levels of entrainment into the water column are forecasted to become significant, with a resultant decrease in the mass of oil floating on the surface and subject to atmospheric weathering. Approximately 24 hours after the spill, around 69.7% of the oil mass is forecast to have entrained and a further 11.2% is forecast to have evaporated, leaving around 5.8% of the oil floating on the water surface.

The increased level of entrainment in the variable-wind case will result in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 3.2% per day with an accumulated total of ~23.5% after 7 days, in comparison to a rate of ~1.1% per day and an accumulated total of 7.2% after 7 days in the constant-wind case. Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration will extend the area of potential effect, requiring the break-up and dispersion of the slicks and droplets to reduce concentrations below the thresholds considered in this study.

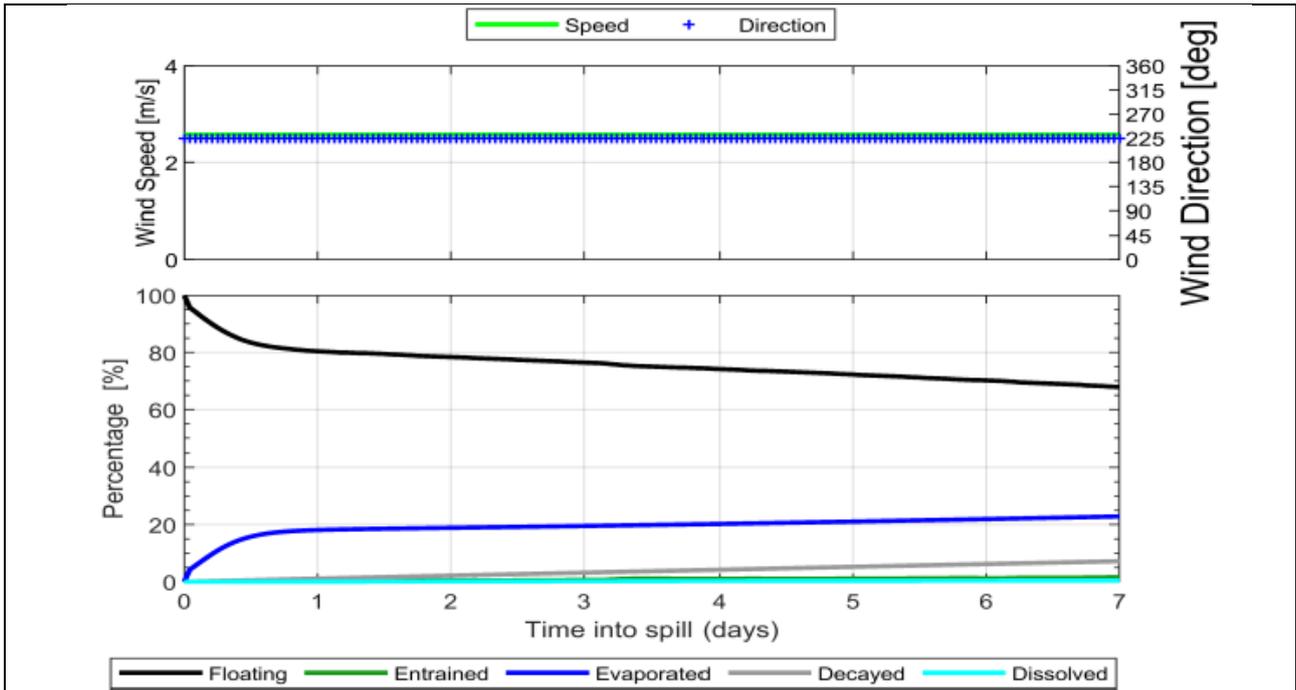

Figure 6-20: Proportional mass balance plot representing the weathering of Ngujima-Yin Toppides Blend spilled onto the water surface as a one-off release (50 m³) and subject to a constant 5 kn (2.6 m/s) wind at 27°C water temperature and 25°C air temperature

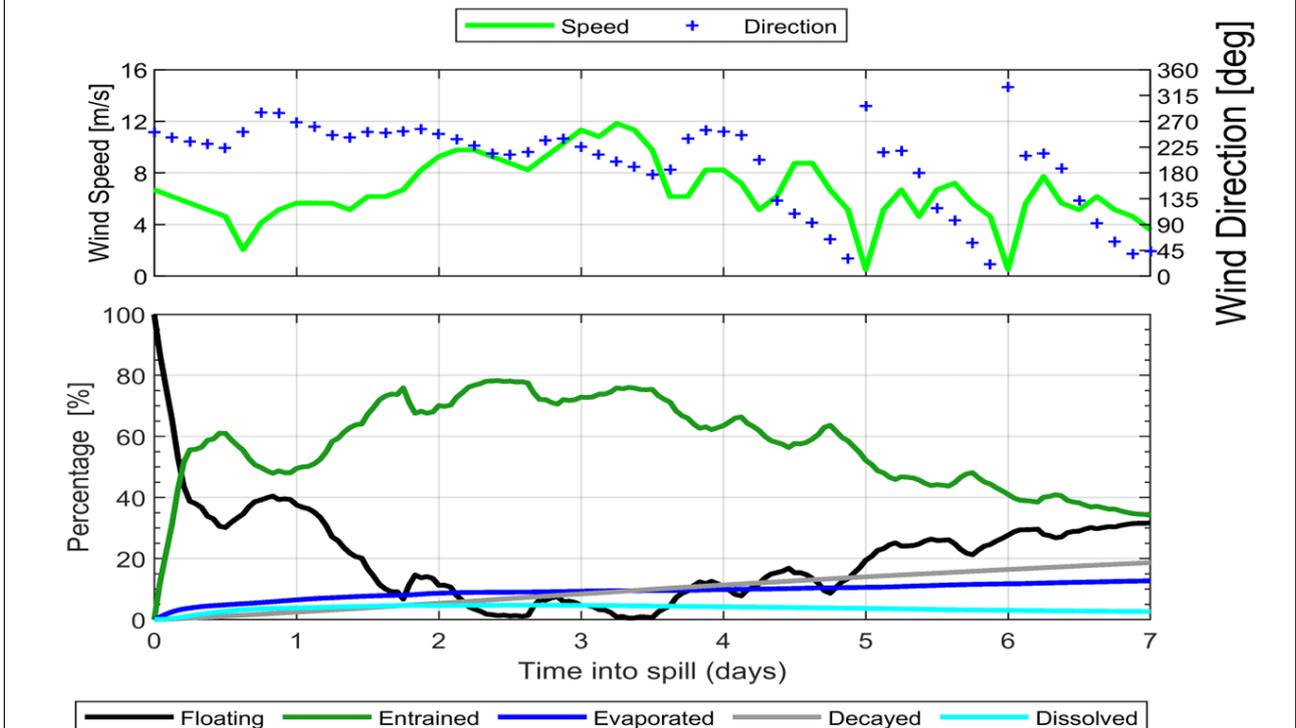

Figure 6-21: Proportional mass balance plot representing the weathering of Ngujima-Yin Toppides Blend spilled onto the water surface as a one-off release (50 m³) and subject to variable wind at 27°C water temperature and 25°C air temperature

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood has been taken as 1 (highly unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from NY FPSO cargo tank loss of containment (presented in the following section). These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environment that May Be Affected

Surface Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for surface hydrocarbons from the NY FPSO cargo tank loss of containment scenario.

As described in **Section 6.8.1**, the EMBA depicted in these figures are a summary of all the locations where environmental thresholds could be exceeded for modelled scenarios.

The stochastic modelling results indicated floating hydrocarbons from the NY FPSO cargo tank loss of containment scenario are forecast to drift in all directions, reflecting the competing influence of both surface currents and winds across the wide area in which a slick could travel. At the surface threshold of 10 g/m², floating oil is forecast to potentially occur up to approximately 980 km from the release site. Potential contact above impact thresholds was forecast at a range of receptors.

Entrained Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for entrained hydrocarbons for the NY FPSO cargo tank loss of containment scenario. Entrained hydrocarbons above impact thresholds are likely to drift in all directions from the release location, with an entrained plume extending a considerable distance to the south. Stochastic modelling results indicated entrained hydrocarbon concentrations above impact thresholds may occur up to 1000 km from the release location. Potential contact above impact thresholds was forecast at a range of receptors.

Dissolved Hydrocarbons

The stochastic hydrocarbon spill modelling EMBA for dissolved hydrocarbons for the NY FPSO cargo tank loss of containment scenario. In the event of an offloading equipment loss of containment scenario occurring, a plume of dissolved hydrocarbons would potentially extend in all directions, with a plume most likely to extend south from the release location. Dissolved hydrocarbon concentrations above impact thresholds may occur up to 715 km from the release location. Potential contact above impact thresholds was forecast at a range of receptors.

Accumulated Hydrocarbons

The stochastic hydrocarbon spill modelling results indicated the potential for shoreline accumulation above impact thresholds was high. Modelling indicated a maximum local accumulation of 16 kg/m² (15,999 g/m²) at Cape Range, Exmouth, Ningaloo Coast WH and MP (State) Ningaloo Coast. Shoreline accumulation was also forecast for a range of other receptors above impact thresholds at lower accumulation levels.

Consequence Assessment Summary

The credible worst-case hydrocarbon spill scenario that may arise from MEE-05 may impact upon a number of environmental receptors. Potential impacts of a hydrocarbon spill to these receptors are considered in MEE-01; refer to **Section 6.8.3** for a description of potential impacts.

The credible worst-case hydrocarbon volumes that can credibly be released by MEE-05 are considerably smaller than the credible worst-case loss of well containment volumes considered in MEE-01 (**Section 6.8.3**). Additionally, the credible release durations are significantly shorter. These considerations are reflected in the significantly smaller EMBA.

MEE-05 FPSO Cargo Tanks Loss of Containment – Risk Analysis

Bowtie analysis was undertaken to assess MEE-05; refer to **Figure 6-22, Figure 6-23, Figure 6-24 and Figure 6-25.**

Refer to Societal Values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
ALARP Statement:				
<p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a low likelihood unplanned hydrocarbon release from an NY FPSO cargo tank loss of containment.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the NY FPSO and ensuring the equipment is operated within the design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the NY FPSO Safety Case, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP.</p> <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural controls, it is considered that MEE risk associated with NY FPSO cargo tank loss of containment is managed to ALARP.</p>				

MEE-05 FPSO Cargo Tanks Loss of Containment – Demonstration of ALARP Control Measures				
Hierarchy	Control/Barrier	SCE/Management System Reference	Type of Effect (Refer to Table 6-16))	Control Adopted
Demonstration of Acceptability				
<p>A cargo tank loss of containment has been evaluated as having a ‘high’ (A1) risk rating (via the consideration of applicable MEEs). As per Section 2, Woodside considers ‘high’ (A1) risk ratings as acceptable if managed to ALARP. Due to the consequence associated with MEE-05, Decision Type B has been applied, and ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.</p> <p>Acceptability is demonstrated with regard to the considerations described in Section 6.8.3 (MEE-01) (the considerations include principles of ESD, internal context, external context and other requirements (includes laws, policies, standards and conventions)).</p>

	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/Habitat	Species	Socio-economic	Decision Type	Consequence/Impact	Likelihood	Risk Rating	ALARP Tool	Acceptability	Outcome
Hydrocarbon release caused by a loss of structural integrity of the FPSO hull, leading to: <ul style="list-style-type: none"> • MEE-02 – Subsea Flowline and Riser Loss of Containment • MEE-03 – Topsides Loss of Containment • MEE-04 – Offloading Equipment Loss of Containment • MEE-05 – FPSO Cargo Tank Loss of Containment. 		✓	✓	✓	✓	✓	✓	B	A	1	H	LCS RBA CV SV	Acceptable if ALARP	EPO 18
Description of Source of Risk														
<p>Background</p> <p>The NY FPSO contains hydrocarbons in a range of infrastructure, including cargo tanks, process inventory, non-process inventory, flowlines and risers.</p> <p>Woodside has identified the potential for hydrocarbon release due to the extreme environmental conditions or other causes which result in an exceedance of the design criteria and a catastrophic failure of the facility and individual</p>														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

equipment (e.g. cranes, flare, etc) which could cause damage to adjacent equipment, leading to hydrocarbon releases to the environment.

Extreme environmental conditions (cyclone) could result in loss of structural integrity of the NY FPSO resulting in significant oil spill to the environment (from risers, cargo tanks and/or topsides equipment).

There is also the possibility of NY FPSO capsize or foundering caused by strong winds and extreme waves. This may induce pipework fatigue and loose/dislodged objects/projectiles causing impact to equipment/pipework resulting in loss of containment. Structural failures could be localised, or could, in more extreme situations, result in loss of containment from multiple storage locations on the NY FPSO.

Extreme environmental conditions may also result in movement of the vessel and result in releases from flowlines/risers (MEE-02) or topsides equipment or storage (MEE-03 to MEE-05). The worst-case environmental consequence ranking is a 'A' for these events related to Loss of Structural Integrity.

The release of hydrocarbons as a result of loss of structural integrity is considered a Major Environment Event (MEE-06). The hazard associated with this MEE is hydrocarbons in the NY facility.

The following hazards could lead to loss of containment from the NY FPSO topsides:

- internal and external corrosion
- extreme weather
- mooring system failure
- vessel stresses through loading and stability
- fire or explosion escalation to structure (including events captured in MEE-02 to MEE-05).

A number of common failure causes due to human error and SCE failures are presented in the generic Human Error and SCE bowties in **Section 6.8.11**.

Loss of Structural Integrity – Credible Scenarios

A loss of structural integrity could result in a significant release of hydrocarbons. A loss of structural integrity may result in credible spill scenarios consistent with a subsea flowline and riser loss of containment (MEE-02, **Section 6.8.4**), topsides loss of containment (MEE-03, **Section 6.8.5**), offloading equipment loss of containment (MEE-04, **Section 6.8.6**) and NY FPSO cargo tank loss of containment (MEE-05, **Section 6.8.7**). The worst-case credible spill scenarios associated with these MEEs are discussed in the relevant sections above; refer to these sections for further information.

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in FPSO design, construction and operation. In the company's 60-year history, it has not experienced any loss of structural integrity events that have resulted in significant releases or significant environmental impacts. The NY facility has never experienced a worst-case loss of containment in its operational history.

Decision Type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.7**) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation.

The release of hydrocarbons from a loss of structural integrity is considered an MEE (MEE-06). The hazard associated with this MEE is hydrocarbons contained within the NY FPSO and associated infrastructure.

Quantitative Spill Risk Assessment

Credible worst case stochastic spill modelling for the scenarios associated with MEE-01 (**Section 6.8.3**), MEE-02 (**Section 6.8.4**), MEE-03 (**Section 6.8.4**) and MEE-05 (**Section 6.8.7**) has been undertaken. Results of these modelling studies have been used to inform the consequence assessment for these MEEs; these assessments are applicable to the consequence assessment for a loss of structural integrity event.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood has been taken as 1 (highly unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a loss of structural integrity. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

MEE-06 Loss of Structural Integrity – Risk Analysis

Bowtie analysis was undertaken to assess MEE-06; refer to **Figure 6-26** to **Figure 6-29**.

Risk-Based Analysis				
<p>For risks identified as MEEs, a more detailed risk-based Bowtie Analysis (as outlined in Section 2.7) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and considers independence of each barrier and their type of effect in controlling the hazardous event.</p> <p>Application of Woodside’s Risk Management Procedures and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:</p> <ul style="list-style-type: none"> • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability. <p>For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity.</p> <p>A quantitative spill risk assessment was undertaken (refer Section 6.8.1 for details of the method used).</p>				
Company Values				
Refer to Company Values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
Societal Values				
Refer to Societal Values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
<p>ALARP Statement:</p> <p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood of a loss of structural integrity.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the NY FPSO and ensuring the equipment is operated within the design envelope through operating practices and assurance through maintenance and inspection. If a loss of structural integrity occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the NY FPSO Safety Case, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP.</p> <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural control of NY FPSO operations, it is considered that MEE risk associated a loss of structural integrity is managed to ALARP.</p>				

Demonstration of Acceptability

Acceptability Statement:

A loss of structural integrity has been evaluated as having a 'high' (A1) risk rating (via the consideration of applicable MEEs). As per **Section 2**, Woodside considers 'high' (A1) risk ratings as acceptable if managed to ALARP. Due to the consequence associated with MEE-06, Decision Type B has been applied, and ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.

Acceptability is demonstrated with regard to the considerations described in **Section 6.8.3** (MEE-01) (the considerations include principles of ESD, internal context, external context and other requirements (includes laws, policies, standards and conventions)).

Hydrocarbon release from topsides equipment, offloading equipment or cargo tanks to the marine environment and atmosphere.		✓	✓	✓	✓	✓	✓	B	A	1	H			
Description of Source of Impact														
<p>A loss of marine vessel separation between a vessel and the NY FPSO may result in a loss of hydrocarbon containment from the facility and/or the release of fuel from the vessel. A vessel collision with the NY FPSO has been identified as a potential MEE (MEE-07). Vessel collisions can arise from:</p> <ul style="list-style-type: none"> visiting vessel collisions associated with support vessels and offloading tankers – ships which are visiting can accidentally collide with the NY FPSO during approach to, or while manoeuvring or stationed alongside, the FPSO errant passing vessel collision – ships which are not visiting the NY FPSO (i.e. passing vessels) can, for one reason or another, move off-course and collide with the FPSO. <p>The different collision hazards involve significantly different sized vessels and collision speeds, hence, differing impact energies and consequences, and have been assessed.</p> <p>Visiting Vessels</p> <p>Visiting vessels are defined as those which are routinely used to service, or offtake cargo from, the NY FPSO. Operating procedures will dictate how vessels are operated, loaded and unloaded, but it will generally occur so that the prevailing winds move the vessel away from the facility. The primary causes of visiting vessel collisions are failure to follow safe procedures and communication errors between the marine vessels and facility operations. These errors could be worsened by station keeping failures or operations in adverse weather conditions.</p> <p>The following design features and procedures are in place to reduce the likelihood of a major collision or mitigate the consequences from a visiting vessel impact:</p> <ul style="list-style-type: none"> facility marine operating procedures 														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- marine assurance activities
- supply or standby vessel contractor selection and management
- third party maintenance and inspection
- third party position keeping equipment
- weather monitoring.

Errant Passing Vessels

Errant passing vessels are defined as third party vessels that enter the facility 500m Petroleum Safety Zone, but do not call at installations (i.e. not supply or standby vessels). The collision can be powered or drifting. Either has the potential to cause significant damage to the NY FPSO. The causes of errant passing vessel collisions include: failure of propulsion or steering systems; adverse weather conditions resulting in poor visibility or rough seas or human error.

Woodside implements the following controls to help prevent passing vessels entering the NY FPSO 500 m Petroleum Safety Zone:

- facility marked on Marine Charts
- collision warning system
- visual navigation aids (NAVAIDS) as well as flares and lighting to make the facility highly visible to approaching vessels
- marine radio package (critical communications)
- facility marine procedures.

A number of common failure causes due to human error and SCC failures are presented in the generic Human Error and SCE failure bowties in **Section 6.8.11**.

Loss of Marine Vessel Separation – Credible Scenarios

A loss of marine vessel separation could result in a significant release of hydrocarbons. Hydrocarbon releases will result in a spill to the marine environment as described in **Section 6.8.4** (MEE-02 – subsea flowline and riser loss of containment), **Section 6.8.5** (MEE-03 – Topsides loss of containment), **Section 6.8.5** (MEE-04 – offloading equipment loss of containment) and **Section 6.8.7** (MEE-05 – FPSO cargo tank loss of containment). Worst case hydrocarbon release scenarios that could result from loss of marine vessel separation are discussed in the relevant sections referenced above. Relevant trajectory modelling, as applicable to these scenarios, is also discussed in the relevant sections. In addition, vessel cargo, including marine diesel inventory, could be spilled if the cause of the loss of facility integrity was a collision from a support vessel.

A loss of vessel separation may lead to the accidental release of marine diesel from the fuel tanks on the vessel(s) involved. For a vessel collision to result in the worst-case scenario of a hydrocarbon spill potentially impacting an environmental receptor, several factors must align as follows:

- the identified causes of vessel interaction must result in a collision
- the collision must have enough force to penetrate the vessel hull
- the collision must be in the exact location of the fuel tank
- the fuel tank must be full, or at least of volume which is higher than the point of penetration.

The probability of the chain of events described above aligning, to result in a breach of fuel tanks resulting in a spill that could potentially affect the marine environment is considered remote. Given the offshore location of the Operational Area, vessel grounding in relation to the Petroleum Activities Program is not considered a credible risk.

A collision between the NY FPSO or subsea support vessel with a third-party vessel (i.e. commercial shipping, other petroleum related vessels and commercial fishing vessels) was considered the only credible event that could release a significant quantity of marine diesel to the environment. This was assessed as being credible but highly unlikely given:

- the facility support vessels typically operate close to the NY FPSO (an area avoided by commercial shipping and fishing)
- the presence of subsea vessels in the Operational Area is typically temporary (e.g. while undertaking IMMR activities)
- vessels undertaking the Petroleum Activities Program typically operate of low speeds or are stationary
- the standard vessel operations and equipment in place to prevent collision at sea, and the construction and placement of storage tanks.

The largest tank of a facility support or subsea support vessel is unlikely to exceed 105 m³. As such, the worst-case credible spill of marine diesel from a vessel is considered to be an instantaneous loss of the contents of a 105 m³ tank.

The marine diesel component of the topsides loss of containment MEE described in **Section 6.8.5** is considered a suitable surrogate for the risk assessment of a 105 m³ release of marine diesel from a vessel for the following reasons:

- the volume is considerably larger, making the assessment inherently conservative
- the release location (the NY FPSO) is the area where vessels undertaking the Petroleum Activities Program most commonly occur
- the hydrocarbon type (marine diesel) is consistent with fuel used by vessels undertaking the Petroleum Activities Program.

Refer to **Section 6.8.9** for a description of the surrogate marine diesel release scenario and environmental risk assessment.

Decision Type, Risk Analysis and ALARP Tools

Woodside has a good history of implementing industry standard practice in FPSO design, construction and operation. In the company's 60-year history, it has not experienced any loss of vessel separation events that have resulted in significant releases or significant environmental impacts. The NY facility has never experienced a worst-case hydrocarbon release from a loss of vessel separation in its operational history.

Decision Type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.7**) and hydrocarbon spill trajectory modelling. Company values and societal values were also considered in the demonstration of ALARP and acceptability through peer review, benchmarking and consultation.

A loss of marine vessel separation is considered an MEE (MEE-07). The hazard associated with this MEE is the hydrocarbon inventory of the NY FPSO, subsea flowlines and riser, and fuel onboard vessels.

Quantitative Spill Risk Assessment

Credible worst-case hydrocarbon scenarios for MEE-02, MEE-03, MEE-04 and MEE-05 are considered to apply to a loss of marine vessel separation, as they may credibly arise from damage to the NY facility and loss of vessel fuel. Refer to **Sections 6.8.4, 6.8.5 and 6.8.7** for additional information on quantitative spill risk assessments for these scenarios.

Hydrocarbon Characteristics

Hydrocarbon characteristics are provided in described in more detail in **Section 6.8.1**.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance, infrastructure marked on marine charts), the likelihood has been taken as 1 (Highly Unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a loss of vessel separation. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

MEE-07 Loss of Marine Vessel Separation – Risk Analysis

Bowtie risk analysis was undertaken to assess MEE-07, refer to **Figure 6-30** and **Figure 6-31** for bowtie diagrams.

**MEE-07 Loss of Marine Vessel Separation – Demonstration of ALARP
ALARP Control Measures**

<i>Hierarchy</i>	<i>Control/Barrier</i>	<i>SCE/Management System Reference</i>	<i>Type of Effect</i> <i>(Refer to Table 6-16)</i>	<i>Control Adopted</i>
<p>ALARP Statement:</p> <p>On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood of a loss of marine vessel separation.</p> <p>The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the NY FPSO and ensuring the equipment is operated within the design envelope through operating practices and assurance through maintenance and inspection. If a loss of marine vessel separation occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.</p> <p>The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the NY FPSO Safety Case, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.</p> <p>The application of Woodside Risk Management Procedures, and implementation of the NY FPSO Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP.</p> <p>Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural control of NY FPSO operations, it is considered that MEE risk associated a loss of marine vessel separation is managed to ALARP.</p>				

Demonstration of Acceptability

<p>Acceptability Statement:</p> <p>A loss of marine vessel separation has been evaluated as having 'moderate' (B1) and 'high' (A1) risk ratings (via the consideration of applicable MEEs). As per Section 2, Woodside considers 'moderate' (B1) and 'high' (A1) risk ratings as acceptable if managed to ALARP. Due to the consequence associated with MEE-07, Decision Type B has been applied, and ALARP is demonstrated using good industry practice, consideration of company and societal values and risk-based analysis, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained.</p> <p>Acceptability is demonstrated with regard to the considerations described in Section 6.8.3 (MEE-01) (the considerations include principles of ESD, internal context, external context and other requirements (includes laws, policies, standards and conventions)).</p>

Dropped object causing damage to the topsides equipment that results in a hydrocarbon release to the marine environment and atmosphere.		✓	✓	✓	✓	✓	✓	B	B	1	M		Broadly Acceptable	
Description of Source of Risk														
<p>Lifting activities on the NY FPSO can take place from several cranes located on the FPSO. Lifts may occur between supply vessels and laydown areas, or between laydown areas. Lifting operations performed using the NY FPSO or visiting vessel cranes could potentially lead to dropped objects impacting assets (topside equipment, subsea infrastructure) inside the NY FPSO 500 m Petroleum Safety Zone. This may lead to a hydrocarbon loss of containment from topsides or subsea infrastructure. Loss of suspended load has been identified as an MEE (MEE-08). A loss of suspended load may arise from:</p> <ul style="list-style-type: none"> lifting equipment failure facility lifting operations. <p>A number of common failure causes due to human error and SCC failures are presented in the generic Human Error and SCE failure bowties in Section 6.8.11</p> <p>Loss of Control of Suspended Load – Credible Scenarios</p> <p>The potential outcome of a loss of control of a suspended load is a topsides and/or subsea flowlines and risers' loss of containment. Refer to Section 6.8.4 and Section 6.8.4 for a description of subsea and topsides loss of containments scenarios, respectively.</p>														

Decision Type, Risk Analysis and ALARP

Woodside has a good history of implementing industry standard practice in FPSO design, construction and operation. In the company’s 60-year history, it has not experienced any loss of control of suspended load events that have resulted in significant releases or significant environmental impacts.

Decision Type

A decision type ‘B’ has been applied to this risk under the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications, should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in **Section 2.7**) and hydrocarbon spill trajectory modelling. Company values were also considered hydrocarbon inventory of subsea flowlines and risers, or topsides process and non-process hydrocarbons.

Quantitative Spill Risk Assessment

Credible worst-case hydrocarbon scenarios for MEE-02 and MEE-03 are considered to apply to a loss of control of suspended load, as they may credibly arise from damage to hydrocarbon containing subsea infrastructure within the 500 m Petroleum Safety Zone and NY FPSO topsides infrastructure. Refer to **Section 6.8.4** and **Section 6.8.4** for additional information on quantitative spill risk assessments for these scenarios.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood has been taken as 1 (highly unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbons were considered during the impact assessment for a loss of vessel separation. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (**Section 6.8.3**) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence Assessment

Environment that May Be Affected

As discussed under Description of Source of Risk, the potential impacts from hydrocarbon release caused by a loss of structural integrity are those which would result from:

- Well Loss of Containment, **Section 6.8.3** (MEE-01)
- Subsea Loss of Containment, **Section 6.8.4** (MEE-02)
- Topsides Loss of Containment, **Section 6.8.4** (MEE-03)
- Loss of Marine Vessel Separation, **Section 6.8.9** (MEE-07).

The potential impacts are therefore discussed in the above mentioned sections.

MEE-08 Loss of Control of Suspended Load – Risk Analysis

Bowtie risk analysis was undertaken to assess MEE-08; refer to **Figure 6-32** and **Figure 6-33** for bowtie diagrams.

Hazard Description	Generic Safety Critical Equipment failure (CCE-01)
Hazard Description	
<i>Hazard Overview and Scope</i>	
<p>There are a number of causes which contribute to failures of SCEs and other systems which might protect against an MEE. These include:</p> <ul style="list-style-type: none"> • maintenance errors • defects • electrical supply failure • hydraulic supply failure • adverse environmental conditions. <p>The Generic SCE failure bowtie (Figure 6-34) illustrates the causes, outcomes and the controls in place to manage these failure mechanisms.</p>	

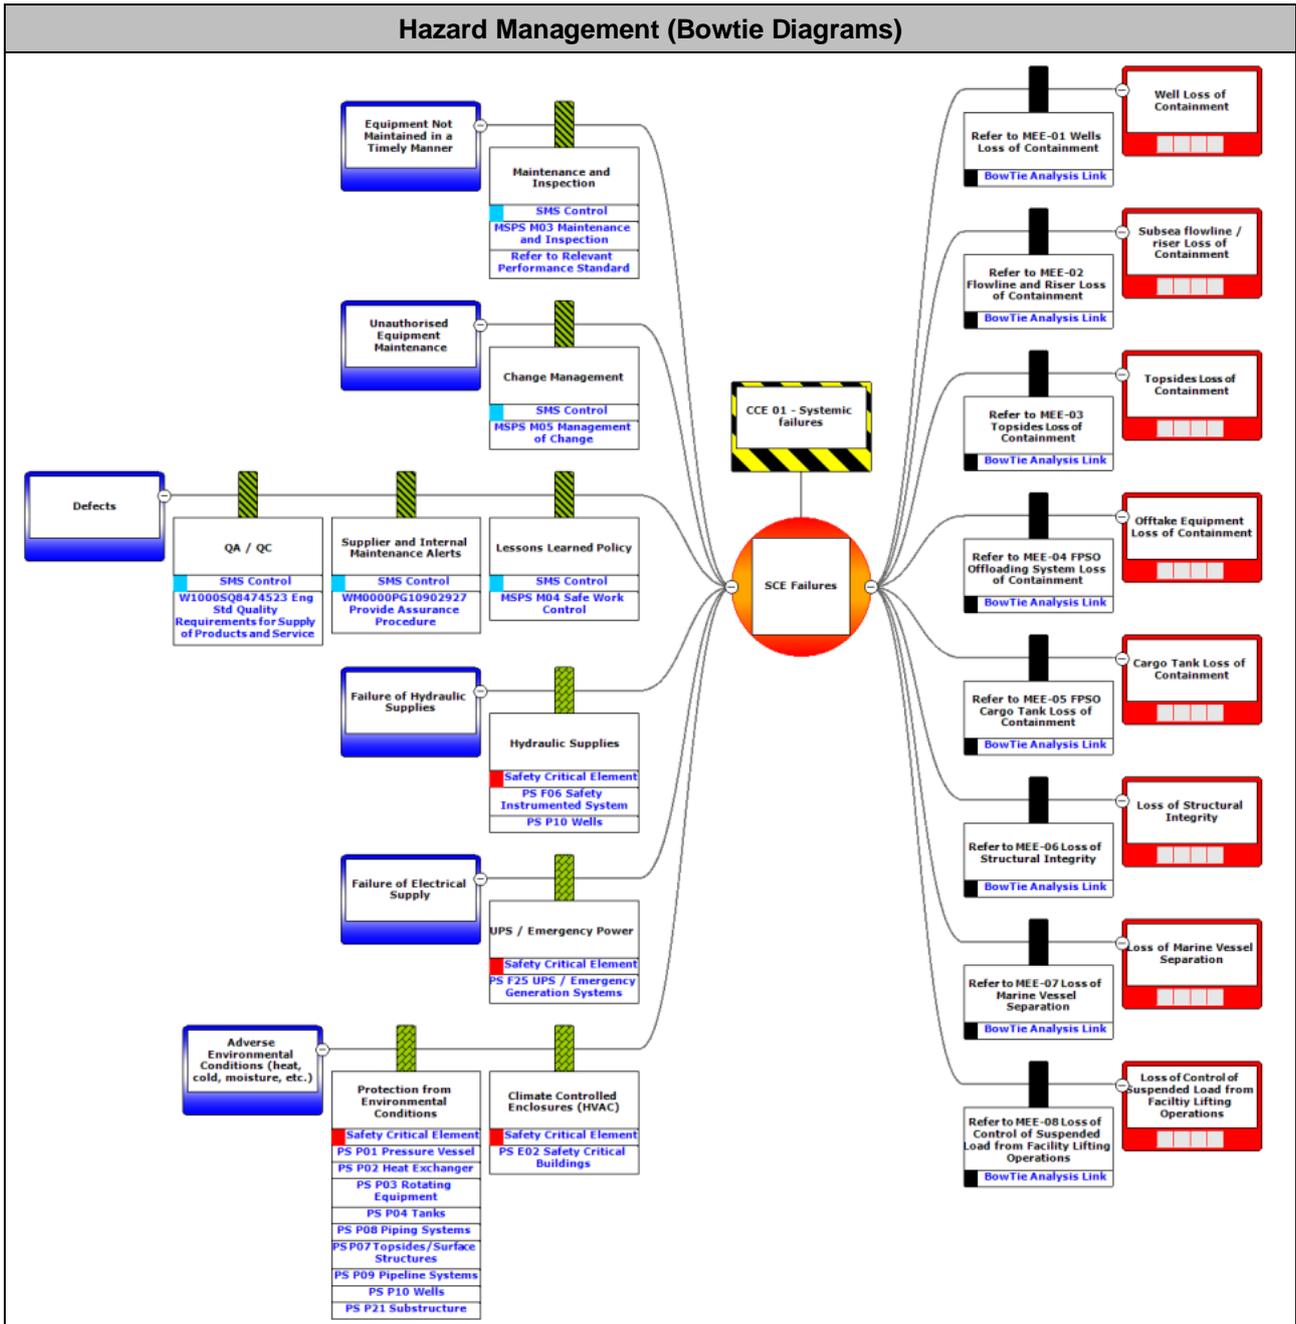

Figure 6-34: Generic bowtie – safety critical equipment failures

Ngujima-Yin: Major Environmental Event Datasheet	
MEE Number	All
Hazard Description	Generic Human Errors – Degradation Factors
Hazard Description	
Hazard Overview and Scope	
<p>There are a number of causes of human errors which contribute to MEEs, or which can result in failure or degradation of the controls in place to protect against MEEs. These are presented in the following bowtie pages and include:</p> <ul style="list-style-type: none"> • task issues, e.g. poor task design; time pressures, task complexity • poor physical interfaces/working environment • provision of inappropriate tools for the task • communication errors, i.e. poor-quality information, lack of clarity in instructions • operator failings, e.g. competence, fitness, impairment or fatigue • organisational issues, e.g. peer pressure, poor safety culture, inadequate supervision, lack of clarity on roles and expectations. <p>The Generic Human Errors bowties illustrate the causes, outcomes and the controls in place for these failure mechanisms (Figure 6-35, Figure 6-36 and Figure 6-37).</p>	
Hazard Management (Bowtie Diagrams)

6.9 Recovery Plan and Threat Abatement Plan Assessment

This section describes the assessment that Woodside has undertaken to demonstrate that the Petroleum Activities Program is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017)
- Conservation Management Plan for the Blue Whale 2015–2025 (Commonwealth of Australia, 2015a)
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) 2014 (Commonwealth of Australia, 2014b)
- Sawfishes and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b)
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (Commonwealth of Australia, 2018)
- Conservation Management Plan for the Southern Right Whale (Commonwealth of Australia, 2012).

Table 6-22 lists the objectives and (where relevant) the action areas of these plans, and also describes whether these objectives/action areas are applicable to government, the Titleholder, and/or the Petroleum Activities Program. For those objectives/action areas applicable to the Petroleum Activities Program, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the activity are not inconsistent with that action. The results of this assessment against relevant actions are presented in **Table 6-23** to **Table 6-28**.

Table 6-22: Identification of applicability of recovery plan and threat abatement plan objectives and action areas

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
Marine Turtle Recovery Plan			
Long-term recovery objective: Minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so they can be removed from the EPBC Act threatened species list.	Y	Y	Y
Interim Recovery Objectives			
1. Current levels of legal and management protection for marine turtle species are maintained or improved, both domestically and throughout the migratory range of Australia’s marine turtles.	Y		
2. The management of marine turtles is supported.	Y		
3. Anthropogenic threats are demonstrably minimised.	Y	Y	Y
4. Trends in nesting numbers at index beaches and population demographics at important foraging grounds are described.	Y	Y	
Action Areas			
A. Assessing and addressing threats:			
A1. Maintain and improve efficacy of legal and management protection.	Y		
A2. Adaptively manage turtle stocks to reduce risk and build resilience to climate change and variability.	Y		
A3. Reduce the impacts of marine debris.	Y	Y	Y
A4. Minimise chemical and terrestrial discharge.	Y	Y	Y
A5. Address international take within and outside Australia’s jurisdiction.	Y		
A6. Reduce impacts from terrestrial predation.	Y		
A7. Reduce international and domestic fisheries bycatch.	Y		
A8. Minimise light pollution.	Y	Y	Y
A9. Address the impacts of coastal development/infrastructure and dredging and trawling.	Y	Y	
A10. Maintain and improve sustainable Indigenous management of marine turtles.	Y		
B. Enabling and measuring recovery:			
B1. Determine trends in index beaches.	Y	Y	
B2. Understand population demographics at key foraging grounds.	Y		
B3. Address information gaps to better facilitate the recovery of marine turtle stocks.	Y	Y	Y
Blue Whale Conservation Management Plan			
Long-term recovery objective: Minimise anthropogenic threats to allow for their conservation status to improve so that they can be removed from the EPBC Act threatened species list.	Y	Y	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
Interim Recovery Objectives			
1. The conservation status of blue whale populations is assessed using efficient and robust methodology.	Y		
2. The spatial and temporal distribution, identification of BIAs, and population structure of blue whales in Australian waters is described	Y	Y	Y
3. Current levels of legal and management protection for blue whales are maintained or improved and an appropriate adaptive management regime is in place	Y		
4. Anthropogenic threats are demonstrably minimised	Y	Y	Y
Action Areas			
A. Assessing and addressing threats:			
A.1: Maintain and improve existing legal and management protection.	Y		
A.2: Assess and address anthropogenic noise.	Y	Y	Y
A.3: Understand impacts of climate variability and change.	Y		
A.4: Minimise vessel collisions.	Y	Y	Y
B. Enabling and measuring recovery:			
B.1: Measure and monitor population recovery.	Y		
B.2: Investigate population structure.	Y		
B.3: Describe spatial and temporal distribution and define biologically important habitat.	Y	Y	Y
Grey Nurse Shark Recovery Plan			
Overarching Objective			
To assist the recovery of the grey nurse shark in the wild, throughout its range in Australian waters, with a view to: <ul style="list-style-type: none"> • improving the population status, leading to future removal of the grey nurse shark from the threatened species list of the EPBC Act • ensuring that anthropogenic activities do not hinder the recovery of the grey nurse shark in the near future, or impact on the conservation status of the species in the future. 	Y	Y	Y
Specific Objectives			
1. Develop and apply quantitative monitoring of the population status (distribution and abundance) and potential recovery of the grey nurse shark in Australian waters.	Y		
2. Quantify and reduce the impact of commercial fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range.	Y		
3. Quantify and reduce the impact of recreational fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range.	Y		
4. Where practicable, minimise the impact of shark control activities on the grey nurse shark.	Y		
5. Investigate and manage the impact of ecotourism on the grey nurse shark.	Y		
6. Manage the impact of aquarium collection on the grey nurse shark.	Y		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
7. Improve understanding of the threat of pollution and disease to the grey nurse shark.	Y	Y	Y
8. Continue to identify and protect habitat critical to the survival of the grey nurse shark and reduce the impact of threatening processes within these areas.	Y	Y	
9. Continue to develop and implement research programs to support the conservation of the grey nurse shark.	Y	Y	
10. Promote community education and awareness in relation to grey nurse shark conservation and management.	Y		
Sawfish and River Sharks Recovery Plan			
Primary Objective			
To assist the recovery of sawfish and river sharks in Australian waters with a view to: <ul style="list-style-type: none"> • improving the population status leading to the removal of the sawfish and river shark species from the threatened species list of the EPBC Act • ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future. 	Y	Y	Y
Specific Objectives			
1. Reduce and, where possible, eliminate adverse impacts of commercial fishing on sawfish and river shark species.	Y		
2. Reduce and, where possible, eliminate adverse impacts of recreational fishing on sawfish and river shark species.	Y		
3. Reduce and, where possible, eliminate adverse impacts of Indigenous fishing on sawfish and river shark species.	Y		
4. Reduce and, where possible, eliminate the impact of illegal, unregulated and unreported fishing on sawfish and river shark species.	Y		
5. Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species.	Y	Y	Y
6. Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life.	Y	Y	Y
7. Reduce and, where possible, eliminate any adverse impacts of collection for public aquaria on sawfish and river shark species.	Y		
8. Improve the information base to allow the development of a quantitative framework to assess the recovery of, and inform management options for, sawfish and river shark species.	Y		
9. Develop research programs to assist conservation of sawfish and river shark species.	Y	Y	
10. Improve community understanding and awareness in relation to sawfish and river shark conservation and management.	Y		

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
Marine Debris Threat Abatement Plan			
Objectives			
1. Contribute to long-term prevention of the incidence of marine debris.	Y	Y	
2. Understand the scale of impacts from marine plastic and microplastic on key species, ecological communities and locations.	Y	Y	Y
3. Remove existing marine debris.	Y		
4. Monitor the quantities, origins, types and hazardous chemical contaminants of marine debris, and assess the effectiveness of management arrangements for reducing marine debris.	Y		
5. Increase public understanding of the causes and impacts of harmful marine debris, including microplastic and hazardous chemical contaminants, to bring about behaviour change.	Y		
Southern Right Whale Conversation Management Plan			
Long-term recovery objective: The long-term recovery objective is to minimise anthropogenic threats to allow the conservation status of the southern right whale to improve so that it can be removed from the threatened species list under the EPBC Act.	Y	Y	Y
Specific Objectives			
1. Demonstrate that the number of southern right whales occurring off south-west Australia (nominally south-west Australian population) is increasing at or near the maximum biological rate	Y		
2. Demonstrate that the number of southern right whales occurring off south-east Australia (nominally south-east Australian population) is showing signs of increase	Y		
3. The nature and degree of difference between the south-eastern and south-western Australian populations of southern right whales is clearly understood.	Y		
4. Current levels of legal and management protection for southern right whales are maintained or improved and an appropriate adaptive management regime is in place	Y		
5. Anthropogenic threats are demonstrably minimised.	Y	Y	Y
Action Areas			
A. Assessing and addressing threats:			
A.1: Maintain and improve existing legal and management protection.	Y		
A.2: Assess and address anthropogenic noise (shipping, industrial and seismic).	Y	Y	Y
A.3: Reduce commercial fishing entanglements.	Y		
A.4: Address impacts of climate variability and change.	Y		
A.5: Address vessel collisions.	Y	Y	Y
A.6: Address infrastructure and coastal development impacts.	Y		
B. Measuring recovery:			
B.1: Measure and monitor population recovery.	Y		
B.2: Investigate the two-population model.	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Titleholder	Petroleum Activities Program
B.3: Understand offshore distribution and migration,	Y	Y	Y
B.4: Characterise behaviour and movements.	Y	Y	Y

Table 6-23: Assessment against relevant actions of the Marine Turtle Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Marine Turtle Recovery Plan	Action Area A3: Reduce the impacts from marine debris.	Action: Support the implementation of the Marine Debris Threat Abatement Plan (TAP). Priority actions at stock level: <ul style="list-style-type: none"> G-NWS – Understand the threat posed to this stock by marine debris. LH-WA – Determine the extent to which marine debris is impacting loggerhead turtles. F-Pil – No relevant actions. 	Refer Section 6.7.2 . Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to marine turtles. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the petroleum activities program.	EPO 10 C 10.1 to 10.4, C 9.5 PS 10.1 to 10.3, PS 9.5
	Action Area A4: Minimise chemical and terrestrial discharge.	Action: Ensure spill risk strategies and response programs adequately include management for marine turtles and their habitats, particularly in reference to 'slow to recover habitats', e.g. nesting habitat, seagrass meadows or coral reefs. Priority actions at stock level: <ul style="list-style-type: none"> G-NWS – Ensure that spill risk strategies and response programs include management for turtles and their habitats. LH-WA & F-Pil – Ensure that spill risk strategies and response programs include management for turtles and their habitats, particularly in reference to slow to recover habitats, e.g. seagrass meadows or corals. 	Refer Sections 6.6.5, 6.7, and 6.8 . Not inconsistent assessment: The assessment of accidental release of chemicals/ hydrocarbons has considered the potential risks to marine turtles. Spill risk strategies and response program include management measures for turtles and their nesting habitats.	Refer Sections 6.6.5, 6.7, and 6.8 Detailed oil spill preparedness and response EPOs, EPSS and MC for the Petroleum Activities Program are presented.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	<p>Action Area A8: Minimise light pollution.</p>	<p>Action: Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats.</p> <p>Priority actions at stock level:</p> <ul style="list-style-type: none"> • G-NWS – As above. • LH-WA – No relevant actions. • F-Pil – Manage artificial light from onshore and offshore sources to ensure biologically important behaviours of nesting adults and emerging/dispersing hatchlings can continue. 	<p>Refer Section 6.6.7.</p> <p>Not inconsistent assessment: The assessment of light emissions has considered the potential impacts to marine turtles. Internesting, mating, foraging or migrating turtles are not impacted by light from offshore vessels. Based on the frequency and nature of IMMR activities, the impacts to adult turtles moving through the Operational Area from vessel lighting are expected to be localised and temporary with no lasting effect.</p>	<p>EPO 8 C 8.1 PS 8.1</p>
	<p>Action Area B1: Determine trends at index beaches.</p>	<p>Action: Maintain or establish long-term monitoring programs at index beaches to collect standardised data critical for determining stock trends, including data on hatchling production.</p> <p>Priority actions at stock level:</p> <ul style="list-style-type: none"> • G-NWS – Continue long-term monitoring of index beaches. • LH-WA – Continue long-term monitoring of nesting and foraging populations. • F-Pil – no relevant actions. 	<p>Not inconsistent assessment: Woodside contributes to Action Area B1 via its support of the Ningaloo Turtle Program.</p>	<p>N/A</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area B3: Address information gaps to better facilitate the recovery of marine turtle stocks.	Action: Understand the impacts of anthropogenic noise on marine turtle behaviour and biology. Priority actions at stock level: <ul style="list-style-type: none"> G-NWS – Given this is a relatively accessible stock that is likely to be exposed to anthropogenic noise, investigate the impacts of anthropogenic noise on turtle behaviour and biology and extrapolate findings from the NWS stock to other stocks. LH-WA – No relevant actions. F-Pil – No relevant actions. 	Refer Section 6.6.3. Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to marine turtles. IMMR related noise is not expected to result in behavioural response, injury or mortality of individuals, or any other lasting effect.	EPO 3 C 3.1 PS 3.1

Assessment Summary:

The Marine Turtle Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan.

Table 6-24: Assessment against relevant actions of the Blue Whale Conservation Management Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Blue Whale Conservation Management Plan	Action Area A.2: Assessing and addressing anthropogenic noise.	Action 2: Assessing the effect of anthropogenic noise on blue whale behaviour. Action 3: Anthropogenic noise in BIAs will be managed such that any blue whale continues to use the area without injury ² , and is not displaced from a foraging area.	Refer Section 6.6.3. Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to pygmy blue whales. Acoustic emissions from project vessels will not cause injury to any pygmy blue whale. There are no known or possible foraging areas for pygmy blue whales within or adjacent to the Operational Area. If the Petroleum Activities Program within the Operational Area overlaps with an individual northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration.	EPO 3 C 3.1 PS 3.1

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area A.4: Minimising vessel collisions.	Action 3: Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented.	Refer Section 6.7.3. Not inconsistent assessment: The assessment of vessel collision with marine fauna has considered the potential risks to pygmy blue whales. If the Petroleum Activities Program within the Operational Area overlaps with an individual northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration. Vessel collisions with pygmy blue whales are highly unlikely to occur, given the low operating speed of support vessels.	EPO 11 C 11.1 PS 11.1
	Action Area B.3: Describing spatial and temporal distribution and defining biologically important habitat.	Action 2: Identify migratory pathways between breeding and feeding grounds. Action 3: Assess timing and residency within BIAs.	Not inconsistent assessment: Woodside contributes to Action Area B3 via its support of targeted research initiatives (e.g. satellite tracking of pygmy blue whale migratory movements ³).	N/A
Assessment Summary: The Blue Whale Conservation Management Plan has been considered during the assessment of impacts and risks, and the Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-25: Assessment against relevant actions of the Grey Nurse Shark Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Grey Nurse Shark Recovery Plan	Objective 7: Improve understanding of the threat of pollution and disease to the grey nurse shark.	Action 7.1: Review and assess the potential threat of introduced species, pathogens and pollutants.	Refer Section 6.7.2. Not inconsistent assessment: This EP includes an assessment of the impacts from accidental release of solid wastes as well as planned discharges of drilling waste on marine species.	N/A

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
			Refer Sections 6.6.5, 6.7, and 6.8. Not inconsistent assessment: The assessment of accidental release of chemicals/hydrocarbons has considered the potential risks to grey nurse sharks. Spill risk strategies and response program include management measures, as identified and required.	Refer Sections 6.6.5, 6.7, and 6.8 Detailed oil spill preparedness and response EPOs, EPSs and MC for the Petroleum Activities Program are presented.
Assessment Summary: The Grey Nurse Shark Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-26: Assessment against relevant actions of the Sawfish and River Shark Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Sawfish and River Shark Recovery Plan	Objective 5: Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species.	Action 5c: Identify risks to important sawfish and river shark habitat and measures needed to reduce those risks.	Refer Sections 6.6.5, 6.7, and 6.8. Not inconsistent assessment: The assessment of accidental release of chemicals/hydrocarbons has considered the potential risks to sawfish and river shark. Spill risk strategies and response program include management measures, as identified and required.	Refer Sections 6.6.5, 6.7, and 6.8 Detailed oil spill preparedness and response EPOs, EPSs and MC for the Petroleum Activities Program are presented.
	Objective 6: Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life.	Action 6a: Assess the impacts of marine debris including ghost nets, fishing gear and plastics on sawfish and river shark species.	Refer Section 6.7.2. Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to sawfish. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the petroleum activities program.	N/A

<p>Assessment Summary: The Southern Right Whale Management Plan has been considered during the assessment of impacts and risks, and the Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan.</p>				

6.10 Cultural Features and Heritage Values Assessment

As described in **Section 4**, the identification of cultural values associated with cultural heritage as well as the social, economic and cultural features important to First Nation’s people is integral to understanding the environment and any potential impacts and risks to the environment.

In line with its First Nations Communities Policy (Woodside, 2022), Woodside seeks to avoid damage or disturbance to cultural heritage (including intangible heritage) and, if avoidance is not possible, minimise and mitigate the impacts, in consultation with First Nation communities and Traditional Custodians. Mitigation can include any measure or control aimed at ensuring the viability of the intangible cultural heritage and its intergenerational transmission. This can include reducing impacts and risks to environmental features that are associated with intangible cultural heritage (UNESCO, 2003; ICOMOS, 2013).

It is important to note that not all topics raised by First Nations groups/individuals through consultation are considered values for the purpose of the cultural features and heritage values impact assessment below. A number of topics were raised as a general interest in environmental management and ecosystem health, where the group/individual was seeking further information about potential impacts and risks from the Petroleum Activities Program on the receptor. As these interests relate to the maintenance of the natural environment, these are adequately addressed through impact and risk assessments described in **Sections 6.6, 6.7 and 6.8** respectively and not further assessed below.

Aspect	Cultural Features and Heritage Values			
Description of Source Impact/ Risk	<p>The physical presence of the FPSO and vessels and associated movements in the Operational Area, as well as physical presence of subsea infrastructure, have the potential to impact or be a risk to cultural features and heritage values.</p> <p>The NY FPSO and subsea infrastructure has been in operation since 2008 and has been marked on nautical charts since that time. Inspection, monitoring, maintenance and repair activities may also be conducted on any of the wells within in Production Licence Areas WA-28-L and WA-59-L.</p> <p>The Petroleum Activities Program includes production from a series of subsea wells. The worst-case credible hydrocarbon spill scenario involves a long-term (77-day) uncontrolled subsea release of 258,549 m3 of Vincent Crude from the Vincent Infill Well (VNBH4-ST2) and forms the basis of the EMBA.</p>			
Receptor sensitivity	<p>Cultural features and heritage values: High value</p> <p>Marine mammals: High value species</p> <p>Marine reptiles: High value species</p> <p>Fish: High value species</p>			
Planned Activities	The potential environmental impact to species that have a cultural feature or heritage value have been summarised below to provide the context of a potential impact significance level to those species to understand any cumulative impact on the cultural feature or heritage value.

Impact and Risk Assessment	<p>The Petroleum Activities Program has the potential to impact cultural features and heritage values through the following ways:</p> <p><u>Intangible Cultural Heritage</u></p> <ul style="list-style-type: none"> • Songlines: Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale and Kelly, 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas infrastructure exists in many areas of the North West Shelf, and that songlines are still acknowledged and recognised. It is inferred that if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. “weaken” a songline) rather than binary or absolute (i.e. destroy a songline). • Creation/dreaming sites; sacred sites; ancestral beings: Activities that physically alter landscape features may be assumed to potentially impact values of creation/dreaming sites, sacred sites or ancestral beings. • Cultural obligations to care for Country: Environmental impacts may be assumed to impact rights and obligations to care for Sea Country. Exclusion of Traditional Custodians from Sea Country (e.g. by restricting access) or decision-making processes (e.g. by not conducting ongoing consultation) are other potential sources of impact. • Knowledge of Country/customary law and transfer of knowledge: Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population. Therefore, the transmission of these skills is expected to be impacted where there are impacts at the species/population level. Limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. 			

Aspect	Cultural Features and Heritage Values
	<ul style="list-style-type: none"> • Connection to Country: Where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge this may damage connection to Country (McDonald and Phillips, 2021). • Access to Country: Impacts to access to Country may be classified as temporary (e.g. where exclusion zones exist around activities for safety reasons) or permanent (e.g. where infrastructure obstructs access or navigation). Impacts to access to Country can only occur in areas that were traditionally accessed by Traditional Custodians. As described in Section 4.9.3 this is anticipated to be focussed on areas adjacent to the coast. • Restrictions on Access to Country: Access to the operational area has not been identified as a cultural issue, however some areas within the EMBA may not be culturally appropriate to access. Impacts to this value may occur where spill response access areas that are not appropriate, or in ways that are not consistent with traditional law. • Kinship systems and totemic species: It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu, 2004). It is therefore inferred that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. • Resource collection: Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, marine species (as resources) will be impacted where there is an impact at the species/population level. <p><u>Marine Ecosystems and Species:</u></p> <ul style="list-style-type: none"> • Marine ecosystems may hold both cultural and environmental value (see Section 4.9), with cultural and environmental values intrinsically linked (DCCEEW, 2023; MAC, 2021 as cited in Woodside, 2023a). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country—the seascape which Traditional Custodians view, interact with or hold knowledge of. <p><u>Coastal landforms</u></p> <ul style="list-style-type: none"> • Coastal landforms may have cultural values either through association with intangible values described above (e.g. as features of a songline, physical manifestations of ancestor beings etc.) or as archaeologically prospective locations (e.g. water sources with increased habitation/use, dunes used for burials etc.) <p>Intangible Values</p> <p><u>Songlines</u></p> <p>Management of intangible cultural heritage can include reducing impacts and risks to tangible features that are associated with intangible cultural heritage (UNESCO, 2003; ICOMOS, 2013). Impacts to marine plants, animals and other cultural features associated with songlines might impact the intergenerational transmission of knowledge of songlines when individuals can no longer witness or interact with the cultural features tied to songlines on Country. Therefore, managing songlines may require environmental controls to minimise potential impact to marine fauna at a population level, including migratory routes. Refer to species specific assessment below for further information, in addition to the impact and risk assessment in Section 6.6, 6.7 and 6.8 respectively.</p> <p>Physical features comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. Songlines can become lost, fragmented, or broken when there is a loss of Country or impact to culturally important physical features (Neale and Kelly, 2020:30). No specific details of songlines within the EMBA have been provided by relevant persons during consultation for this Activity, and no landforms typical of songlines (e.g. rocks, mountains, rivers, caves and hills (Higgins 2021:724)) are anticipated to be impacted by the Activity.</p> <p><u>Creation/Dreaming Sites; Sacred Sites; Ancestral Beings</u></p> <p>Woodside has undertaken all reasonable steps to identify creation and dreaming sites, sacred sites, and places associated with ancestral beings within the EMBA. No such sites have been identified. A review of relevant literature has been undertaken which has identified creation, dreaming and ancestral narratives related to the sea more broadly without confirming where (if</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aspect	Cultural Features and Heritage Values
	<p>anywhere) these overlap the EMBA. These references are of a general nature, and do not identify any features or values requiring specific protection or management from the proposed activities.</p> <p>In the literature reviewed, sea serpents or water serpents are common in Aboriginal creation narratives, and several references were identified. The majority of these refer to serpents residing within inland rivers or pools outside of the EMBA (Barber and Jackson, 2011, Hayes v Western Australia [2008] FCA 1487, Juluwarlu, 2004; Water Corporation, 2019). In some versions, the serpent originates from the sea or coast and creates the rivers as it heads inland. Areas of the current coastline and past coastlines at various points along the Ancient Landscape—where the Serpent would have emerged onto the land—are within the EMBA. Areas of the broader ocean where the serpent may have originally lived are not specified. Barber and Jackson (2011) also recount a story where a freshwater serpent pushes a sea serpent back into the ocean where it presumably continues to reside. This does not provide the specificity required to determine the location of sea serpents within the sea, and it is possible that the ocean as a whole (out to and beyond other continents) should be viewed generally as housing the sea serpent(s). Consultation with Traditional Custodians and ethnographic surveys have not identified impacts on sea serpents from the Petroleum Activities Program. However, by analogy to other water serpent narratives across Australia, possible impact pathways may include interruption of its path by blocking or reducing flows of water, damaging sacred sites such as thalu or rock art sites or depleting water sources.</p> <p>No impacts to water flows (either tidal movement or ocean currents) or depletion of water sources are anticipated from this Petroleum Activities Program.</p> <p><u>Cultural Obligations to Care for Country</u></p> <p>Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. Lack of access to coastally located cultural sites that carry songlines or remain ceremonially important can impact First Nations people’s livelihoods and impact their ability to carry out cultural obligations on Country.</p> <p><u>Knowledge of Country/Customary Law and Transfer of Knowledge</u></p> <p>Cultural knowledge about Sea Country/customary law and the intergenerational transmission of knowledge are important values identified through consultation, assessments and the literature review. Transfer of knowledge includes continuing traditional practices to pass on practical skills.</p> <p>Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population—for example traditional fishing methods require the survival of traditional fish resources. Therefore, ensuring the transmission of cultural knowledge may require environmental controls protecting species and migratory pathways at a population level. Refer to species specific assessment below for further information, in addition to the impact and risk assessment in Section 6.6, 6.7 and 6.8 respectively.</p> <p><u>Connection to Country</u></p> <p>Connection to Country describes the multi-faceted relationship between First Nations people and the landscape, which is envisioned as having personhood and spirit. No impacts to connection to country are anticipated as a result of exclusion or displacement of Aboriginal communities. Access to Country is discussed below.</p> <p><u>Access to Country</u></p> <p>Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Access is also a value in its own right, as a continuation of traditional Sea Country access and use.</p> <p>Access to areas within the Operational Area may be limited where exclusion zones are established around vessels for safety purposes. Further the exclusion zones around drilling activities are temporary and presence of subsea infrastructure are not anticipated to affect navigation, particularly given the water depth. Access to Country within the EMBA is also not expected to be affected in the highly unlikely event of an unplanned hydrocarbon release. However relevant cultural authorities will be engaged in the event of a spill that may affect them.</p> <p><u>Restrictions on Access to Country</u></p> <p>No information was received which suggested any part of the Operational Area cannot be accessed in a culturally appropriate way. However, some areas of the EMBA may be subject to cultural restrictions on access, or may be culturally dangerous to access in any respect. Access to these areas would only be required in response to an unplanned impact.</p>

Kinship Systems and Totemic Species

Individuals may have kinship to specific species (Smyth, 2008; Juluwarlu, 2004) and/or a responsibility to care for species (Muller, 2008). These relationships are understood to impose obligations on Traditional Custodians. It is understood that these obligations do not impose restrictions on other people generally, but it is considered that impacts to species at a population level may inhibit Traditional Custodians with kinship relationships' ability to perform their obligations where this results in reduced or displaced populations. It is therefore considered that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. As such, impacts to individual marine fauna is not expected to impact on the totemic or kinship cultural connection. Refer to species specific assessment below for further information, in addition to the impact and risk assessment in **Section 6.6, 6.7 and 6.8** respectively.

Resource Collection

A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these communities may be impacted where there is an impact at the species/population level. Refer to species specific assessment below for further information, in addition to the impact assessment in **Section 6.6**.

Relevant cultural authorities will be engaged in the event of a spill that may affect them.

Marine Species

Marine Mammals

There are increase ceremonies/rituals for species of animals and plants, important to First Nations, to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where, for example, the thalu relates to marine species populations. As thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals—for example the thalu site on Murujuga which “brings in whales to beach” will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, 2021). First Nations groups have expressed interest about whale migratory routes and studies (**Table 4-20**). Inter-generational transmission of cultural knowledge (including songlines) relating to marine mammals may be impacted where changes to population or behaviour at a population level results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003).

As described in the relevant environmental impact and risk assessment **Section 6.6, 6.7 and 6.8** respectively, potential impacts to whales are limited to behavioural disturbance to transient individuals, which are not considered to be ecologically significant at a population level, and hence not expected to impact the value of marine mammals, including the transmission of cultural knowledge. The Operational Area does overlap the BIAs for Migration for the Pygmy Blue Whale and Humpback Whale. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Marine Reptiles

Turtles and their eggs have been identified through consultation and existing literature as an important resource, particularly as food sources (**Table 4-19; Table 4-20**). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) will be impacted where there is an impact at the species/population level.

Intangible cultural heritage may also include the transmission of cultural knowledge about marine reptiles, such as nesting areas, hunting areas and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, 2021). First Nations groups have expressed an interest regarding turtle monitoring programs and migration patterns (**Table 4-20**). Activities that impact turtle populations and their marine environment may have an indirect impact on some Aboriginal

Aspect	Cultural Features and Heritage Values
	<p>communities as this can limit access to cultural sites or deplete hunting areas that would threaten local food security (Delisle et al., 2018:251). Inter-generational transmission of cultural knowledge (including Songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003).</p> <p>As described in the relevant environmental impact and risk Section 6.6, 6.7 and 6.8 respectively, potential impacts to marine reptiles are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts will not occur to significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. Further, the Operational Area and EMBA do overlap marine turtle BIAs. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.</p> <p><u>Fish</u></p> <p>Fish have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) will be impacted where there is an impact at the species/population level.</p> <p>During consultation, fish were identified as important agents in the management of the broader ecosystem in Mermaid Sound, which is outside of the EMBA, but is assumed to also apply general to marine environments Inter-generational transmission of cultural knowledge relating to fish may be impacted where changes to population/behaviour results in reduced sightings (e.g. through population decline). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). Intangible cultural heritage associated with fish, including inter-generational knowledge regarding fishing techniques and migratory patterns, can be managed by reducing impacts to fish in nearshore marine environments to which this cultural knowledge is intrinsically connected.</p> <p>As described in the relevant environmental impact and risk Section 6.6, 6.7 and 6.8 respectively, it is expected that fish, sharks and rays may demonstrate avoidance or attraction behaviour however, potential impacts are not considered to be ecologically significant at a population level. The Operational Area and EMBA do not overlap any whale shark BIAs. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.</p> <p><u>Benthic habitats (coral, seagrass)</u></p> <p>Through consultation, First Nations groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important habitat for dugongs. Additionally, coral is valued by MAC for its aesthetic values.</p> <p>As described in the relevant environmental impact assessments in Section 6.6, the potential impacts from the Petroleum Activities Program on benthic habitats is assessed to be no lasting effect. Potential environmental impacts to benthic communities have been assessed in Section 6.6.</p> <p>In terms of risk, as described in Sections 6.7.1 and 6.8, a change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, rapid weathering, short-term exposure, as well as the response strategies planned to be deployed, an unplanned release is not expected to result in a level of exposure to coral and seagrass that would cause an adverse impact on marine ecosystem functioning or integrity results. As such, cultural values and intangible cultural heritage associated with benthic habitats are expected to be maintained.</p> <p><u>Shoreline Habitats (coastal vegetation, mangroves)</u></p> <p>Through consultation, First Nations groups identified shoreline habitats as valuable for their ecological values, including coastal vegetation such as mangroves which provide shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli.</p> <p>There is no overlap between the Operational Area and shoreline habitats, and no planned impacts to shoreline habitats from the Petroleum Activities Program. In terms of risk, as described in Sections 6.7.1 and 6.8, a change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, rapid weathering, as well as the response strategies planned to be deployed, an unplanned release is</p>

Aspect	Cultural Features and Heritage Values
	<p>not expected to have a substantial adverse impact on marine ecosystem functioning or integrity. As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained.</p> <p>Coastal Landforms</p> <p>There is no overlap between the Operational Area and coastal landforms, and no planned impacts to coastal landforms from the Petroleum Activities Program. For coastal landforms beyond the Operational Area, the EMBA is driven by an unplanned hydrocarbon release. There is no anticipated impact pathway from the presence of marine diesel on the physical existence of coastal landforms such as hills, waterways or dune systems. Access to Country within the EMBA is also not expected to be affected in the highly unlikely event of an unplanned hydrocarbon release. However relevant cultural authorities will be engaged in the event of a spill that may affect them.</p> <p>As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained.</p> <p>Conclusion</p> <p>The impact and risk assessment has determined that the planned activities are unlikely to result in an impact greater than negligible⁶¹ (F) and unplanned activities are assessed to have a residual risk rating of moderate (or lower).</p> <p>Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.1.14 of this EP).</p>

Demonstration of ALARP				
Control considered	Feasibility (F) & Cost/Sacrifice (Cs)	Benefit in Impact/Risk Reduction	Proportionality	Adopted
Apply a 'living heritage' ⁶² management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes. CS: Minimal.	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 22.1

⁶¹ Noting that as the receptor sensitivity is high, the impact significance level is Slight (E).

⁶² Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation, and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness.

Demonstration of ALARP				
Control considered	Feasibility (F) & Cost/Sacrifice (Cs)	Benefit in Impact/Risk Reduction	Proportionality	Adopted
<p>C 3.1 EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures⁶³:</p> <ul style="list-style-type: none"> Project vessels will not travel greater than 6 knots within 300 m of a cetacean (caution zone) and not approach closer than 100 m from a whale. Project vessels will not approach closer than 50 m for a dolphin and/or 100 m for a whale (with the exception of animals bow riding). If the cetacean shows signs of being disturbed, project vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots. 	<p>F: Yes. CS: Minimal.</p>	<p>Implementation of controls for reduced vessel speed around marine fauna can potentially reduce the underwater noise footprint of a vessel and reduces the likelihood of impact or influence on whale activity. Where this control prevents impacts to whales at a population level, it maintains a culturally significant resource to a level that results in no observable change to coastal communities (migratory pathways maintained).</p>	<p>Benefits outweigh cost/sacrifice.</p>	<p>Yes C3.1</p>
<p>Should it be identified, that relevant cultural authorities may be affected in the unlikely event of a spill, Woodside will engage with those parties as appropriate and in alignment with the OSPRMA.</p>	<p>F: Yes. CS: Minimal.</p>	<p>Engaging with relevant cultural authorities that may be impacted by a spill will allow the Traditional Custodians to identify areas of concern. This will also allow Traditional Custodians to confirm areas where access is not culturally appropriate so these can be considered for avoidance, or advice of the necessary requirements to access such areas (such as the gender of respondents or necessary ceremonies).</p>	<p>Benefits outweigh cost/sacrifice.</p>	<p>Yes Adopted.</p>
<p>As marine ecosystems may hold both cultural and environmental value (see Section 4.10), with cultural and environmental values intrinsically linked, in addition to the above controls, the controls in Section 6.6, 6.7 and 6.8 will reduce impacts to cultural features and heritage values.</p>				

⁶³ For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited manoeuvrability; e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

Demonstration of ALARP				
Control considered	Feasibility (F) & Cost/Sacrifice (Cs)	Benefit in Impact/Risk Reduction	Proportionality	Adopted
ALARP Statement				
<p>On the basis of the impact and risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A). Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.</p>				
Demonstration of Acceptability				
Acceptability Statement:				
<p>The impact and risk assessment has determined that, given the adopted controls, planned activities are unlikely to result in an impact greater than negligible (F)⁶⁴ and unplanned activities are assessed to have a residual risk rating of moderate (or lower).</p> <p>The Petroleum Activities Program and the EMBA do not overlap the Ancient Landscape and they are not anticipated to have a significant impact on MNES (Section 4.7 including marine fauna with a First Nations connection with, or traditional use in nearshore areas as defined in Section 4.9.5). Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable if ALARP.</p>				

Environmental Performance Outcomes, Standards and Measurement Criteria related to Cultural Features and Heritage Values ⁶⁵			
EPO	Adopted Control(s)	EPS	MC
EPO 22 No Impact to cultural features and heritage values, as state in Table 4-20, great than a consequence level of F from the PAP	C 22.1 Apply a 'living heritage management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledge across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	PS 22.1.1 Woodside will continue to give voice to Traditional Custodians to identify interests, transmit information and express concern	MC 22.1.1 Records demonstrate Change Management and Management of Knowledge processes have been followed where new controls or management
		PS 22.1.2 Woodside will assess and where deemed practicable will implement appropriate cultural protocols by Traditional Custodians	MC 22.1.2 Records demonstrate Woodside implemented cultural protocols as requested.

⁶⁴ Noting that as the receptor sensitivity is high the impact significance level is Slight (E).

⁶⁵ As marine ecosystems may hold both cultural and environmental value (see Section 4.9.1), with cultural and environmental values intrinsically linked, in addition to the specific controls for cultural features and heritage values, the controls and performance standards in section 6.7 and 6.8 will reduce impacts to cultural features and heritage values.

7 IMPLEMENTATION STRATEGY

Regulation 22 of the Environment Regulations requires an EP to contain an implementation strategy for the activity. The implementation strategy for the Petroleum Activities Program confirms fit-for-purpose systems, practices and procedures are in place to direct, review and manage the activities so that environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and EPSs outlined in this EP are achieved.

Woodside, as Operator, is responsible for ensuring that the Petroleum Activities Program is managed in accordance with this implementation strategy and the WMS (see **Section 1.8**).

7.1 Systems, Practice and Procedures

All operational activities are planned and performed in accordance with relevant legislation and internal environment standards and procedures identified in this EP (**Section 6**).

Processes are implemented to verify controls to manage environmental impacts and risks to:

- a level that is ALARP and acceptable
- meet EPOs
- comply with EPSs defined in this EP.

The systems, practices and procedures that will be implemented are listed in the EPSs contained in this EP. Document names and reference numbers may be subject to change during the statutory duration of this EP; this is managed through a change register and management of change (MoC) process (**Section 7.1.14**). Further information regarding some of the key systems, practices and procedures relevant to implementation of this EP is provided below.

7.1.1 Woodside Management System Operate Processes

Under the WMS Operate Activity (see **Section 1.8** for an overview of the WMS), there are four overarching processes; those directly relevant to the implementation of this EP and environmental management during the Petroleum Activities Program are described below (Operate Plant Process and the Maintain Assets Process).

7.1.1.1 Operate Plant

The objective of the Operate Plant Process is to ensure production is carried out in a safe, efficient, reliable and economic manner, and that all required process variables are within allowable limits. This ensures the potential for unplanned (accident/incident) events that may impact the environment are minimised.

The Operate Plant Process develops key activities to support ongoing production activities to ensure the facility is operated within the Basis of Design. The process also identifies required production routines, routine execution, recording of data gathered and formulation of remedial activities. The Operate Plant Process includes the Integrated Safe System of Work (ISSoW) system (described below).

In addition, the Operating Practice MSPS (M02) is in place to assure operating practices are in place, such that:

- integrity critical operating procedures are available, accurate, up to date, understood and used
- safe operating and technical integrity limits are defined, understood and the process is managed within these limits.

Integrated Safe System of Work

The ISSoW Procedure outlines the key activities required to achieve effective management of permit-controlled work on the facility. The ISSoW process is a management system for all work and is a key element in ensuring the safety of personnel, protection of the environment and technical integrity of the facility.

Work within the facility 500 m PSZ and operations within the vicinity of the connected flowlines is controlled in accordance with ISSoW.

The ISSoW system takes a risk-based approach to activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control. The ISSoW system also allows for low-risk routine tasks to be carried out with adequate but minimal administration. The prime objective of ISSoW is to ensure work other than normal operations is properly planned, risk assessed, controlled, coordinated and safely executed. It provides a methodical approach to identifying hazards, assessing risks, and creating and supporting permits to work and associated certificates.

In keeping with ALARP principles, this system is critical to ensuring the appropriate level of hazard identification and risk assessment is carried out for activities performed on the facility.

In addition, the Safe Work Control MSPS (M04) is in place to assure effective safe work control, permit to work and task risk management arrangements are in place and followed to control the risks arising from work activities.

7.1.2 Maintain Assets

The Maintain Assets Process aims to improve the reliability and availability of plant and equipment (which includes that required for safe operation) through well managed and planned execution of maintenance that promotes a proactive maintenance culture.

Maintenance, inspection and testing systems and procedures are in place to safeguard the integrity of the facility. The maintenance strategy for the facility is based on optimising safety, minimising environmental impact and maximising production. Maintenance practices used to establish well managed maintenances strategies, planned execution and improvement are described in the Maintenance of Assets Procedure.

A risk-based approach is used as the basis for establishing and prioritising inspection, maintenance and testing requirements at the facility. Equipment is assessed to establish equipment criticality with respect to the consequences and likelihood of equipment failure. This informs determination of appropriate maintenance and inspection activities. Maintenance activities are allocated risk rankings according to the criticality of equipment, to ensure high risk maintenance work orders are completed as a priority.

A computerised maintenance management system (CMMS) provides a database called SAP-PM that contains facility registers, equipment details, spare parts data and associated planned maintenance tasks. This system is used to plan, monitor and record maintenance activities. The system provides a variety of reports that enable monitoring and assessment of maintenance activities.

SCE Technical Performance Standards identify SCEs and associated assurance activities. These activities are identified in the CMMS and given the appropriate priority (Technical Integrity status). Refer to **Sections 2.7.5** and **7.1.18** for more detail on SCE Technical Performance Standards and how they differ from EPSs required by the Environment Regulations. SCE Technical Performance Standards form a key component in the processes and systems implemented by Woodside to maintain safety and environment critical plant and equipment.

In addition, the Maintenance and Inspection MSPS (M03) is in place to assure that the necessary inspection and maintenance requirements are identified and carried out to maintain the integrity of Safety and Environmental Critical Components (SCCs).

7.1.3 Process Safety Management

To ensure that Woodside protects the safety, security and health of its employees, contractors, the environment and assets, Woodside has adopted the Energy Institute’s PSM framework within its PSM Procedure which sets out a disciplined framework for managing the integrity of systems and processes that handle hazardous substances over the production (and exploration) lifecycle. It deals with the prevention and control of events that have potential to release hazardous materials and energy.

PSM consists of four main focus areas. Each focus area contains a number of PSM requirements that define key aspects required to ensure that PSM is integrated through the organisation. There are 20 PSM requirements. The focus areas and requirements are shown in **Figure 7-1**.

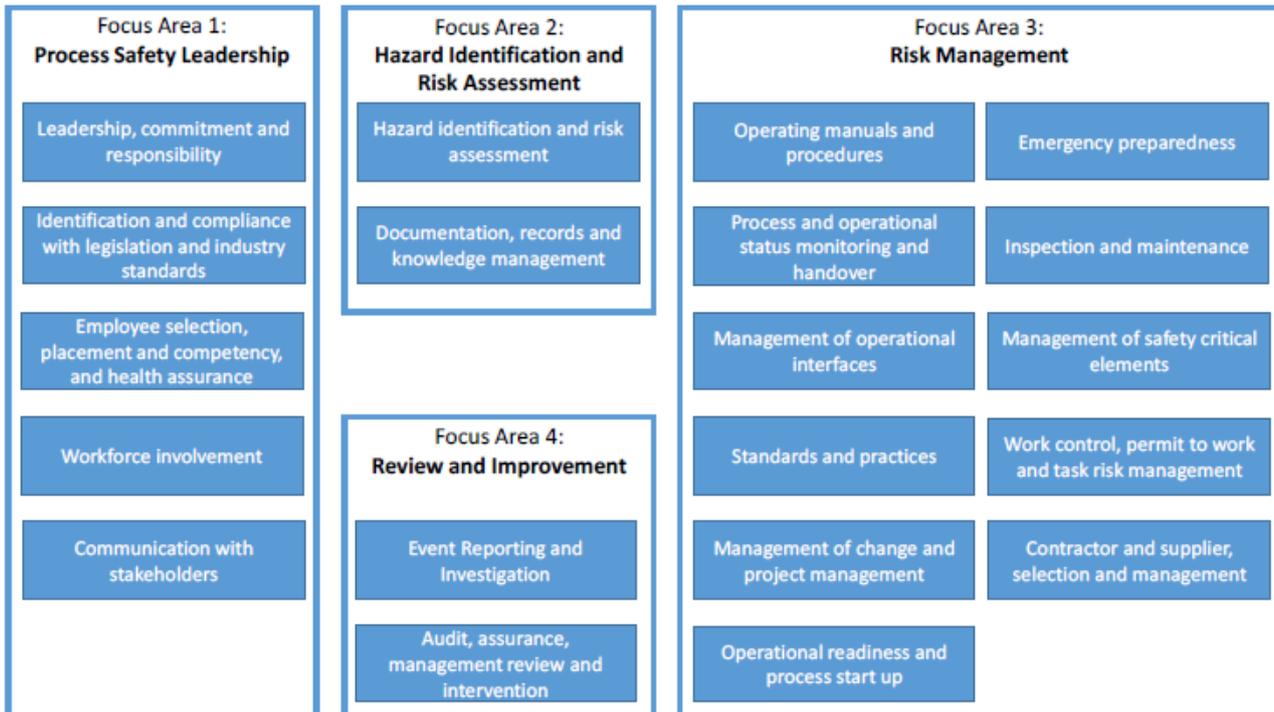

Figure 7-1: Process safety management focus area

7.1.4 Woodside Safety Culture Framework

Woodside’s ‘Our Safety Culture’ framework (shown in **Figure 7-2**) promotes a strong HSE culture and is a key enabler for effective PSM. This framework outlines the expected behaviours for everyone including supervisors and managers/executives, and is openly discussed as part of inductions, training and development.

Theme	Everyone	Supervisors	Managers/Executives
Standards	Follow rules	Ensure compliance	Set high standards
Communication	Speak up	Encourage the team	Communicate openly
Risk management	Be mindful	Promote risk awareness	Confront risk
Involvement	Get involved	Involve the team	Involve the workforce

Figure 7-2: Woodside ‘Our Safety Culture’ framework

7.1.5 Risk Management

Risk management processes and practices are applied on an ongoing basis to design, production and maintenance activities at the NY facility to manage risks to personnel, assets and the environment.

Potential environmental consequences and impacts from the NY facility are risk assessed and controlled in accordance with the Woodside risk management processes described in **Section 2.2** of this EP (Environmental Risk Management Methodology).

The results of the NY facility ENVID are described in **Section 6** and in the facility Environmental Impacts and Risk Register. This register, in conjunction with the EP, provides a demonstration that environmental risks have been identified, and that appropriate controls are in place to manage those risks to a level that is acceptable and ALARP throughout the life of the facility.

A number of other risk management tools and techniques are used by the NY facility to manage environmental and other risks on a routine basis during operational, maintenance and inspection tasks. Examples include:

- the processes outlined in **Section 2**
- risk management tools including: ISSoW tools, e.g. Hazard Identification and Risk Assessments and Level 2 Risk Assessments, Operational Risk Assessments, the technical MoC system (**Section 7.1.14**), and Step back 5 x 5
- integrity review studies, HAZIDs and hazard operability studies.

These tools, risk and integrity management practices are described further in the NY Facility Safety Case, WOMP, and the Control of Operational Risk Procedure.

In addition, other risk sub-processes and practices are also applied within Woodside on an ongoing basis to manage different types of risk. A summary of those relevant to the Petroleum Activities Program is provided below. Woodside’s risk management processes (refer to **Section 2.2.1**), along with the supporting risk sub-processes and practices discussed in this section, ensure the environmental impacts and risks of the activity continue to be identified and reduced to a level that is ALARP.

7.1.6 Management of Risks – Contracting and Procurement

Suppliers and contractors play a significant role in meeting the resource needs of Woodside’s operations, including the facility operations. Effective management of environmental risks in

contracts is achieved by setting clear expectations and managing environmental risks throughout the duration of the contract. Environmental risks in contracts are managed under the Contracting and Procurement Procedure supported by the Health, Safety and Environment in Contracting Guideline. The guideline provides a risk-based approach to contractor selection and management, and is aligned with 'HSE Management – Guidelines for Working Together in a Contract Environment' International Association of Oil and Gas Producers, Report No. 423.

The Engineering Standard Quality Requirements for Supply of Products and Services defines specific quality requirements for engineering contracts and purchase orders. The specified quality control requirements in the Standard are required to be complied with as applicable to the scope of supply.

7.1.7 Management of Risks – Subsea Activities

Subsea activities are managed in line with the Subsea and Pipelines Integrity Management Procedure which defines the practices and technical requirements that must be applied to deliver and safeguard integrity of the subsea equipment and pipelines during the facility lifecycle. It provides the relationship between the PSM Framework (including MoC) and Subsea and Pipelines Group services processes.

IMMR activities are managed under the Manage IMMR Work Procedure. Risk assessments are conducted as required under this procedure.

These requirements are supported by implementation of the Subsea Construction and Inspection, Maintenance and Repair Environment Screening Questionnaire tool. The screening questionnaire is used to understand the scope of the activity, potential environmental impact and if additional regulatory approvals are required. To achieve this, the questionnaire captures key project information such as seabed disturbance, chemical usage and waste. This information is used by an environment focal point to determine if further assessment is required. For projects that have the potential for environmental impact, an assessment is undertaken against this EP and other Woodside environmental requirements. If determined by the Subsea and Pipeline Environment Screening Questionnaire process, an EP MoC review (as per **Section 7.1.14**) is undertaken to confirm if the level of environmental risk warrants revision and resubmission of an EP. Environmental questionnaires are maintained in the Subsea and Pipeline (SSPL) Environment Project Register.

Key environmental requirements and regulatory commitments are communicated to project teams and incorporated into key project documentation where applicable and required (i.e. not addressed via existing Woodside practices).

7.1.8 Management of Risks – Major Projects

Major projects are required to follow the Appraise and Develop Management Procedure and the Opportunity Management Framework. This procedure defines the requirements to deliver a commercially valuable production facility or modify to an existing facility. The process workflow requires integration of work from various functions utilising their people and processes, including Environment, for example HSE philosophy and regulatory approval requirements.

These requirements are supported by implementation of the Brownfields Environment Screening Questionnaire tool. The screening tool is used to determine if a project has the potential for environmental impact or requires additional regulatory approvals. For projects that have the potential for environmental impact, an environmental focal point is assigned and the risks and impacts assessed against the facility EP and other Woodside environmental requirements.

Key environmental requirements and regulatory commitments are communicated to project teams and incorporated into key project documentation where applicable and required (i.e. not addressed via existing Woodside practices). Where it is identified that the project scope has the potential to result in significant modification or change to the facility description provided in the EP, or where potential significant new environmental risks or impacts or significant increases in an existing

environmental risk or impact are identified, an EP MoC review (as per **Section 7.1.14**) is undertaken to confirm if the level of environmental risk warrants revision and resubmission of an EP.

7.1.9 Management of Risks – Well Integrity

Wells are managed throughout their lifecycle in line with the Well Lifecycle Management Procedure. This procedure provides the basis for ensuring well integrity in accordance with the PSM Procedure.

In addition, wells are required to have a regulator accepted WOMP to demonstrate that well integrity risks are managed to ALARP levels. Wells tied back to the facility and ETA wells are managed under a WOMP.

Management of operating wells can be formally transferred from Operations to the D&C Function for activities such as well intervention and workover. Where activities are undertaken by the D&C Function, the risks are managed under the D&C Risk Management Procedure, which specifically addresses the risk of loss of containment from a well or well related equipment. This procedure supplements the Woodside Risk Management Procedure.

7.1.10 Management of Risks – Marine Services

Woodside's Marine Services teams provides a platform for the conduct of safe and efficient Marine Operations across Woodside through the Marine Services Management. A set of procedures that support vessel assurance and management (including HSE and quality management) are in place to ensure marine operations are conducted in a safe and efficient manner, and in accordance with regulatory requirements. Management of subsea activities on subsea support vessels is managed by the SSPL Function.

More details on vessel assurance and the communication of environment requirements to vessels are provided in **Section 7.7.4**.

Vessel masters are required to request clearance from the facility Offshore Installation Manager (OIM) or delegate prior to entering the 500 m PSZ.

7.1.11 Management of Risks – Emissions and Energy Management

Emissions generation and energy use is managed in line with the GHG Emissions and Energy Management Procedure which defines the minimum mandatory requirements to manage and deliver continuous improvement in energy efficiency and reduction in GHG emissions. The procedure supports the implementation of the Climate Change Policy and aligns with the requirements of the Environmental Performance Procedure, applicable to assets in Operate phase. It supports the "operate out" component of limiting net emissions, as shown in the Woodside Climate Change Strategy.

Implementation of the GHG Emissions and Energy Management Procedure assists in meeting external expectations, such as Woodside's 2025 (-15%) and 2030 (-30%) net emissions reductions targets and aspiration to be net zero by 2050. It also aligns with corporate commitments, such as Zero Routine Flaring Initiative for oil assets and the Methane Guiding Principles. The WMS Methane Guiding Principles Management Guideline aims to continually reduce methane through leak detection and repair, accountability and governance, improving methane emissions data and increasing transparency through reporting. The Woodside Flare Framework is a WMS tool that seeks to improve awareness of flaring-related issues and influence for reduced flaring.

The GHG Emissions and Energy Management Procedure links to the annual review of opportunities to improve energy performance through identification and evaluation as described in the Production Optimisation and Opportunity Management Procedure. It also requires measurement, analysis and communication of energy performance across the Operations Division and consideration of actual or potential impacts to energy efficiency in company decision making, such as management of change, operational decisions, issue resolution options analysis and facility optimisation plans.

The Environmental Performance Procedure requires that assets measure, monitor or estimate direct air and GHG emissions, and that such emissions and energy intensities are minimised to ALARP. The requirement to set, measure and track fuel and flare targets for assets help manage the emissions to meet the EPS requirements in **Section 6.6.6**.

7.1.11.1 Production Optimisation and Opportunity Management

Woodside’s Production and Opportunity Management Procedure outlines the process for identification, prioritisation and management of production opportunities that maximise production revenue or reduce emissions intensity across Woodside operated assets. Opportunities are identified throughout the year in various meetings, forums and teams. In addition, formal opportunity identification takes place through annual workshops, which complement the identification of improvement opportunities. These opportunities are prioritised and managed according to the workflow shown in **Figure 7-3**.

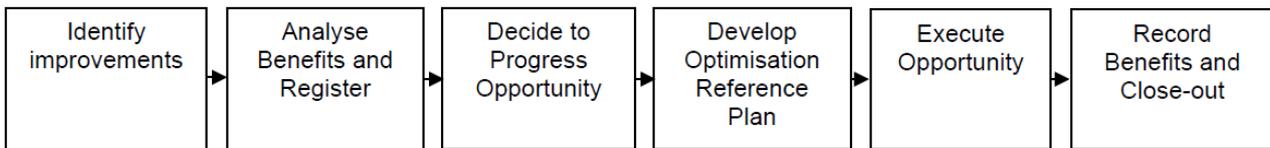

Figure 7-3: Opportunity management workflow

Production opportunities are evaluated and progressed based on value and confidence of return, within the constraints of technical feasibility, cost and other factors. Implemented opportunities are validated and recorded before closeout.

7.1.11.2 Flare Target Setting

In demonstrating the risks and impacts relating to flaring have been reduced to ALARP, flare targets for the facility are set annually in accordance with Woodside’s Greenhouse Gas, Energy and Flare Target Setting Guideline. Targets are estimated based on operating experience and forecast activities; e.g. shutdowns. Consideration is also given to the flaring estimates contained within this EP.

The flare target is tracked against flare performance through the year. Where achieving a flare target is in question, an internal flare target deviation is developed, which requires an ALARP justification. A flare target deviation considers EP flare estimates. If the estimate is likely to be exceeded, an EP management of change assessment (see **Section 7.1.14**) is undertaken to determine if a revision and resubmission is required.

7.1.12 Management of Risks – Indirect Emissions Management

Woodside is committed to actively supporting the global transition to a lower carbon future, as outlined in the Climate Change Policy. To support this policy Woodside undertakes the following measures:

- Set science-based⁶⁶ near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned⁶⁷ scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated.⁶⁸
- Develop and operate oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
- Invest in new energy products and lower carbon services to reduce customers' emissions (part of Woodside's Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- Publish transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.
- Align our advocacy to the principles of this Climate Policy.

These measures will be amalgamated into a cohesive program to monitor market developments related to the contribution of hydrocarbons in the energy transition and support suppliers and customers to reduce their GHG emissions. The program will be managed by the Climate Team and implementation will be in Q1 2024. The progress against each of the measures will be tracked and reported, as part of Woodside's climate-related disclosures.

7.1.12.1 Annual Review

The measures proposed will be Woodside Corporate initiatives targeting indirect emissions which are attributable to production from Woodside operated facilities as a whole. Via the annual review process and consideration of the controls, if they are deemed to be effective at a Corporate implementation level then it will also be deemed that specific impacts and risks at an Asset contribution level (i.e. proportion attributable to NY production) is also being managed appropriately.

The review process will also undertake an assessment of the NY attributable indirect emissions and consider the EP indirect emission estimates (**Section 6.6.6**). This assessment will include both a review of the total CO₂e estimates and also the methods used to derive the estimates. If the estimate is exceeded, an EP management of change assessment (see **Section 7.1.14**) is undertaken to determine if a revision and resubmission is required.

⁶⁶ Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "science-based" (published 2021) which states "targets are considered 'science-based' if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement—limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See <https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures-prototype.pdf>

⁶⁷ Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "Paris-aligned scenarios" (published 2021) which states "scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See <https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures-prototype.pdf>

⁶⁸ Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside's ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside's ownership interest.

7.1.13 Management of Human Factor Related Risks

The term ‘human factors’ is used to describe the consideration of people as part of complex systems. Woodside defines ‘human factors’ as follows: ‘human factors uses what we know about people, organisation and work design to influence performance’.

As outlined in **Section 6.8.7**, human factors can contribute to MEEs, or result in failure or degradation of the controls in place to protect against MEEs. The WMS includes a number of procedures designed to manage human factors related risks and prevent incident causation.

7.1.14 Change Management

Woodside’s Change Management Procedure describes Woodside’s requirements for change management at Woodside owned or controlled operations/sites.

Change management is used where there is no existing approved business baseline, such as a process, procedure or accepted practice, or where conformance with an approved baseline is not possible or intended; for example, due to equipment fault or failure or a recently discovered issue which will take time to rectify. Change management is also used when the baseline is changed (e.g. the process is modified). It applies to management of temporary, permanent, planned or unplanned change encompassing one or more of the following:

- plant: equipment, plant, technology, facilities, operations or materials
- projects: budget, schedule
- people: organisation structure, performance, roles
- process: WMS content, processes, procedures, standards, legislation, information.

Woodside’s change management process hierarchy is depicted in **Figure 7-4**. The hierarchy has been developed with sub-processes to address the different types of change performed at Woodside.

Figure 7-4: Change management hierarchy

To help manage the day-to-day operation of the facility, Woodside has developed a Golden Safety Rules Booklet, which provides a summary of mandatory requirements for safety in the workplace and includes guidance for managing changes that have a Health, Safety, Integrity and/or Environment impact.

7.1.15 Technical Change Management

Technical changes within the Operations Division are managed using the MoC – Assets Procedure. The objective of the MoC – Assets Procedure is to ensure HSE risks associated with both realised and potential changes, including any failure to meet the facility SCE Technical Performance Standards, are identified, assessed and reduced to ALARP (**Section 7.1.18** provides further information on management of SCE Technical Performance Standards).

Assessed changes must be recommended, agreed and decided upon based on the assessed current level of risk, as defined by Woodside’s Technical Decision Authority matrices.

The MoC requirements contained in the PSM Procedure and Management System Performance Standard M05 MoC are considered when conducting any changes with the potential to impact process safety.

The Engineering Management Procedure specifies key requirements of engineering-related changes, and requires that engineering Technical Decisions are agreed, recommended and decided at the appropriate engineering authority level according to the risk. Change management and risk assessment include consideration of applicable legislation/regulation.

Change is also managed under management system requirements set out as part of major projects (Brownfields), wells integrity, subsea and pipelines integrity management and marine management system. Change management includes consideration of regulatory requirements, managed in accordance with the Regulatory Compliance Management Procedure.

In addition, the MoC MSPS (M05) is in place to assure process safety risks arising from change (temporary and permanent) are systematically identified, assessed and managed.

7.1.16 Environment Plan Management of Change and Revision

Woodside's Environmental Approval Requirements Australia Commonwealth Guideline provides guidance on the Environment Regulations that may trigger a revision and resubmission of the EP to NOPSEMA. The document also provides guidance on what may constitute as new source-based or receptor-based impacts and risks, or a significant increase in an existing source of environmental risk (to provide context in determining if EP resubmission is required under regulations 19 and 39 of the Environment Regulations).

Minor EP changes, where a review of the activity and the environmental risks and impacts of the activity shows the changes do not trigger regulatory requirements to resubmit the EP, will be considered a 'minor revision'.

Changes with potential to influence minor or technical changes to the EP text are tracked in MoC records, project records, or the Production EP Updates Register, and incorporated during internal updates of the EP or the five-yearly revision.

In accordance with the requirements of regulation 41 of the Environment Regulations, Woodside will also submit to NOPSEMA a proposed revision to this EP at least 14 days before the end of each period of five years, commencing on the day on which the original and subsequent revisions of the EP are accepted under regulation 35 of the Environment Regulations.

7.1.17 Oil Pollution Emergency Plan Management of Change

Relevant documents from the OPEP will be reviewed in the circumstances of:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks change.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against regulation 26 to determine if EP, including OPEP, resubmission is required.

7.1.18 Management of Safety and Environment Critical Element Technical Performance Standards and Management System Performance Standards

7.1.19 Management System Performance Standards

Woodside ensures safety-critical management processes function as required through the application of MSPS. MSPS are developed and owned at non-facility specific level (i.e. pan Woodside) and include assurance checks for the key requirements of the applicable management system.

Individual facilities demonstrate conformance against the MSPS through the conduct of reviews. Non-conformances against an MSPS are internally managed in accordance with the WMS.

7.1.20 Safety and Environment Critical Element Technical Performance Standards

An SCE is defined by Woodside as a hardware barrier, the failure of which could cause or contribute substantially to, or the purpose of which is to prevent or limit the effect of a MAE/MEE, or Process Safety Event.

Woodside identifies/develops, implements, monitors/assures and verifies/optimises SCEs by applying SCE technical Performance Standards as described in the Safety and Environment Critical Element Management Procedure. Key elements of the procedure are summarised in **Table 7-1**.

Table 7-1: Safety and Environment Critical Element Management Procedure summary

Identify/Develop	<p>Identify SCE – SCEs must be identified from the facilities PSRAs (e.g. Formal Safety Assessments) (Section 2.2). The identification of SCEs for which Performance Standards are required are part of the formal safety and environmental risk assessment processes. Woodside’s Global Performance Standards (based on industry and Woodside Standards) should be used for preliminary selection of SCEs.</p> <p>Complete Engineering Design Studies – Engineering design studies must be completed to demonstrate that SCE Performance Criteria specified in the global Performance Standard and/or determined by PSRA will be met by the facility design, allowing for normal SCE degradation in operation. The studies must establish the testing and inspection tasks required to assess performance against the criteria. The scope and frequency of SCE Assurance Tasks are guided by the Global Performance Standard and may require designated Engineering Design Studies. Studies should include Reliability Centred Maintenance, Risk Based Inspection and Safety Instrumented Function studies to determine the Assurance Task scope and frequencies, RBI plans, and classification and implementation requirements for instrumented safeguarding.</p> <p>Develop Performance Standards – Facilities must develop Performance Standards for all SCEs by:</p> <ul style="list-style-type: none"> • selecting the applicable Global Performance Standard (including Assurance Tasks) • considering facility specific requirements and applicable regulatory requirements • adding the specific data from the facility Engineering Design Studies and PSRA to compile scope and frequency of SCE assurance activities.
Implement	<p>Identify SCE in Asset Register – SCEs must be uniquely identified on the asset register and assigned Performance Standard flags.</p> <p>Develop Testing, Inspection and Maintenance Programs – SCE assurance tasks are developed into maintenance procedures.</p> <p>Implement Testing, Inspection and Maintenance Programs – SCE testing, inspection and maintenance requirements must be implemented in the CMMS.</p>
Maintain/Assure	<p>Execute Testing, Inspection and Maintenance Programs – On completion of SCE assurance tasks, results must be recorded with all relevant detail, assessed for conformance with the Performance Criteria and any follow-on correction work identified.</p> <p>Conduct Fitness for Service (FFS) Assessment – In some instances, an engineering FFS assessment may be required to determine whether equipment has failed its performance standard requirements, e.g. assessment of corrosion defects following inspection of piping. Detailed results of FFS assessment may be recorded out of CMMS.</p> <p>Response to SCE Failure – SCE failure (technical Performance Standard non-conformance) is a failure to achieve the given Performance Criteria. SCE failures must be managed in accordance with a structured review process. This process may require the application of the facility Manual of Permitted Operation (MOPO) which provides prescriptive guidelines to be followed in the event of a reduction in the performance of an SCE, or managed in accordance with the MoC – Assets Procedure (Section 7.1.14).</p> <p>Internal Reporting – SCE failure/damage and SCE demands must be reported in accordance with the Health Safety and Environment Event Reporting and Investigation Procedure (Section 7.9.4).</p> <p>External Reporting – External notification obligations for SCE failure/damage must be understood (i.e. based on local regulatory requirements). External communications must be in accordance with the health safety and environment event reporting and investigation procedure (Section 7.9.5).</p> <p>Manage and Analyse Results – The results from assurance tasks must be accurately recorded to support data analysis. Analysis will enable appropriate action to be taken to minimise future failure recurrences, and enable assessment of overall system performance and reliability to verify SCE effectiveness in revealing failures and to allow predictive maintenance.</p>
Verify/Optimise	<p>Review SCE Performance – SCE performance reviews must be conducted to ensure requirements for maintaining SCE performance are being met.</p> <p>Manage Change – Any change to the Performance Standards must be conducted in accordance with the Change Management Procedure (Section 7.1.14).</p>

SCE Facility Performance Standards are a statement of the performance required of an SCE (e.g. functionality, availability, reliability, survivability), which is used as the basis for establishing agreed assurance tasks and managing the hazard. An assurance task is an activity to confirm that the SCE

meets, or will meet, its SCE Performance Standard. Examples of assurance tasks include inspection routines, maintenance activities, test routines, instrumentation calibration and reliability monitoring.

These assurance tasks are identified in the CMMS, flagged against their associated Performance Standard, and given the appropriate priority (defined as Technical Integrity). Management systems are in place to manage the completion of maintenance including that required for Technical Integrity assurance.

Events where the SCC/SCE have not met their specified performance criteria must be managed in accordance with a structured review process. This process may require the application of the facility MOPO which provides prescriptive guidelines to be followed in the event of a reduction in the performance of an SCE in specific defined circumstances; or, if the MOPO does not cover the event, according to procedures for the assessment and management of operational risk.

Internal notification of SCC failures must be made in accordance with maintenance management workflows. Failures to meet a Facility Performance Standard occur where SCC events lead to the functional objectives (goal and/or key requirement statements) of the facility Performance Standard for the SCE not being met (i.e. lost or unavailable), taking into account any redundancy inherent within the SCE. These events are reported in the Event Reporting Database as potential SCE Failure to Meet Facility Performance Standard Events.

These are internally reported as Hazard Events. Where 'Failure to meet a Facility Performance Standard' leads to a loss of hydrocarbon containment, or a release of energy, it is internally reported (and externally where relevant) as a Loss of Primary Containment or Environmental Spill event, depending on the nature of the release.

Additionally, confirmed 'Failure to meet a Facility Performance Standard' events for the SCEs identified in the MEE bowties may equate to a breach of EPOs and/or EPSs. The review to identify such events for external reporting considers whether the hazard event is relevant to environmental SCE functional objectives (goal and/or key requirements) of the SCE Facility Performance Standard and whether the event poses a risk to achieving EPOs and EPSs. The WMS Regulator Event Reporting Guideline provides additional information regarding external SCE related reporting obligations.

There may also be planned changes/deviations from SCE Technical Performance Standards, these are managed via procedures for the assessment and management of operational risk, and endorsed in accordance with the engineering management procedures (described further within **Section 7.1.14**). This management process ensures risks (including environment) are managed so that the planned change/deviation does not result in unacceptable impact or risk, remains ALARP and regulatory requirements are met.

7.2 Woodside Decommissioning Framework

Decommissioning is a planned activity for the offshore oil and gas industry. Current best practice is for decommissioning to include:

- designing for decommissioning during the development phase of projects/facilities
- removing property, equipment and infrastructure, such as a facility or a pipeline, and plugging and abandoning (P&A) wells associated with a petroleum activity
- assessing decommissioning options and opportunities during the operational life of the facility leading up to cessation of production
- selecting, developing and planning the selected decommissioning option
- executing decommissioning plans
- restoring the marine environment.

This is aligned with Section 572 (3) of the OPGGS Act, which requires titleholders to remove property from the title area when it is neither used, nor to be used, in connection with the operations. Planning for complete removal is generally the base case for offshore decommissioning operations. Section 572 (7) and section 270 (3) of the OPGGS Act provide scope for in situ decommissioning or other arrangements to be made where it can be demonstrated that the risks and impacts are ALARP and acceptable. If complete removal or other arrangements for decommissioning are planned, the proposed alternative presented in an EP must comply with all other Acts and legislation.

7.2.1 Decommissioning in Operations

Asset specific decommissioning plans are typically developed prior to cessation of production. Planning includes redundant infrastructure as well as structures coming to the end of production and decommissioning critical systems to enable, as a base case, full removal.

7.2.2 Facility Decommissioning Planning

Decommissioning planning generally commences two to ten years prior to Cessation of Production (CoP) (Figure 7-5). The timeframe selected for decommissioning planning depends on the complexity of the facility and infrastructure requiring decommissioning.

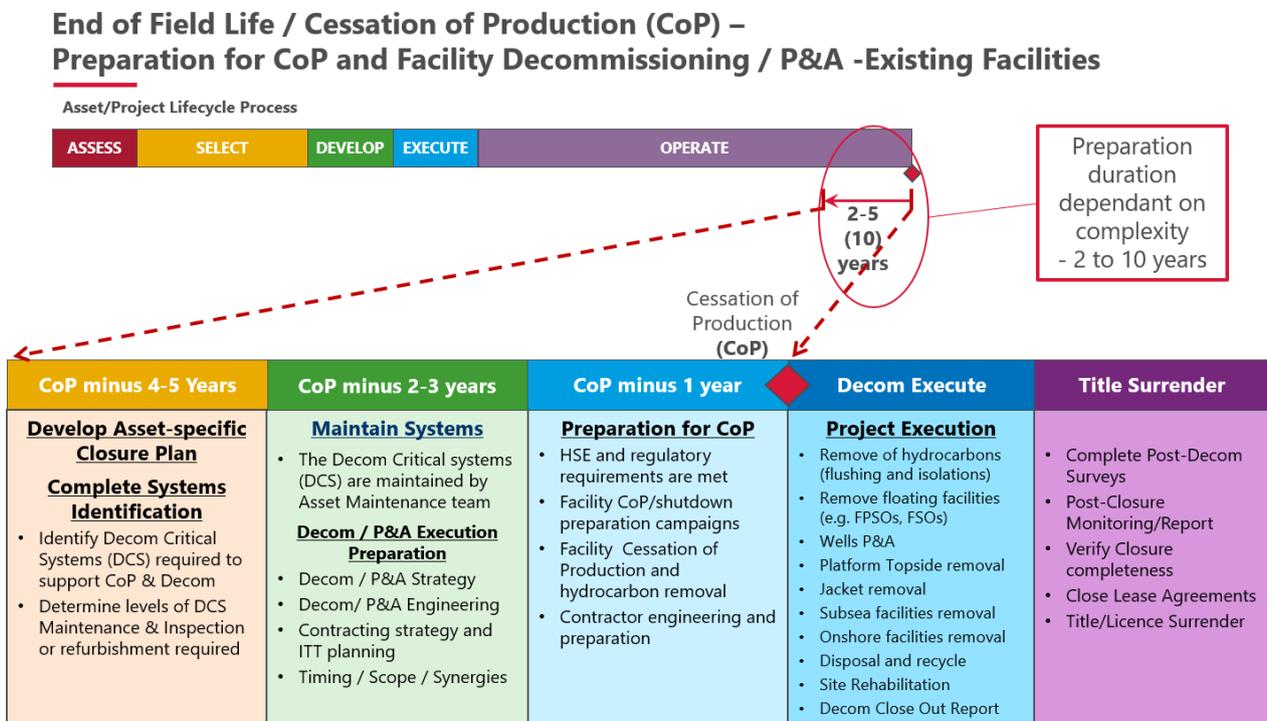

Figure 7-5: Woodside’s process for decommissioning planning

1.1.3 Ngujima-Yin Asset Decommissioning Strategy

The base plan for decommissioning consists of permanent plugging and abandonment of wells, removal of trees, wellheads and other subsea equipment. Buried anchors and mattresses are envisaged as suitable to be left in situ. Removal of the wellheads, manifolds and ridged pipelines located in the water depth above 600 m are subject of the ongoing and future studies to determine ALARP position for decommissioning of these equipment.

After flushing and cleaning of the subsea equipment to ALARP, the FPSO and the STP will be removed out of the field for disposal or divestment.

The subsequent Define/FEED phase works will further define and optimise decommissioning/P&A strategy, scope, and the schedule for the P&A of the wells, decommissioning of the FPSO, STP and decommissioning of the associated subsea infrastructure.

7.2.3 Ngujima-Yin Asset Decommissioning Phasing

Decommissioning of the Ngujima-Yin Asset facilities has been planned in two phases:

- Phase 1 – planning for decommissioning/P&A of the Ngujima-Yin Asset offshore facilities
- Phase 2 – execution of decommissioning/P&A of the Ngujima-Yin Asset offshore facilities.

The expected CoP for the Ngujima-Yin asset (Vincent & Grater Enfield Development) fields is around 2028. This CoP date does not account for asset life extension, which is subject of ongoing studies.

Currently Woodside is also progressing studies in support of the preparations for the future decommissioning activities to optimise the scope and strategy to deliver safe and effective decommissioning outcome.

The key envisaged activities related to the decommissioning are outlined in the target Ngujima-Yin decommissioning schedule is shown in **Figure 7-6**.

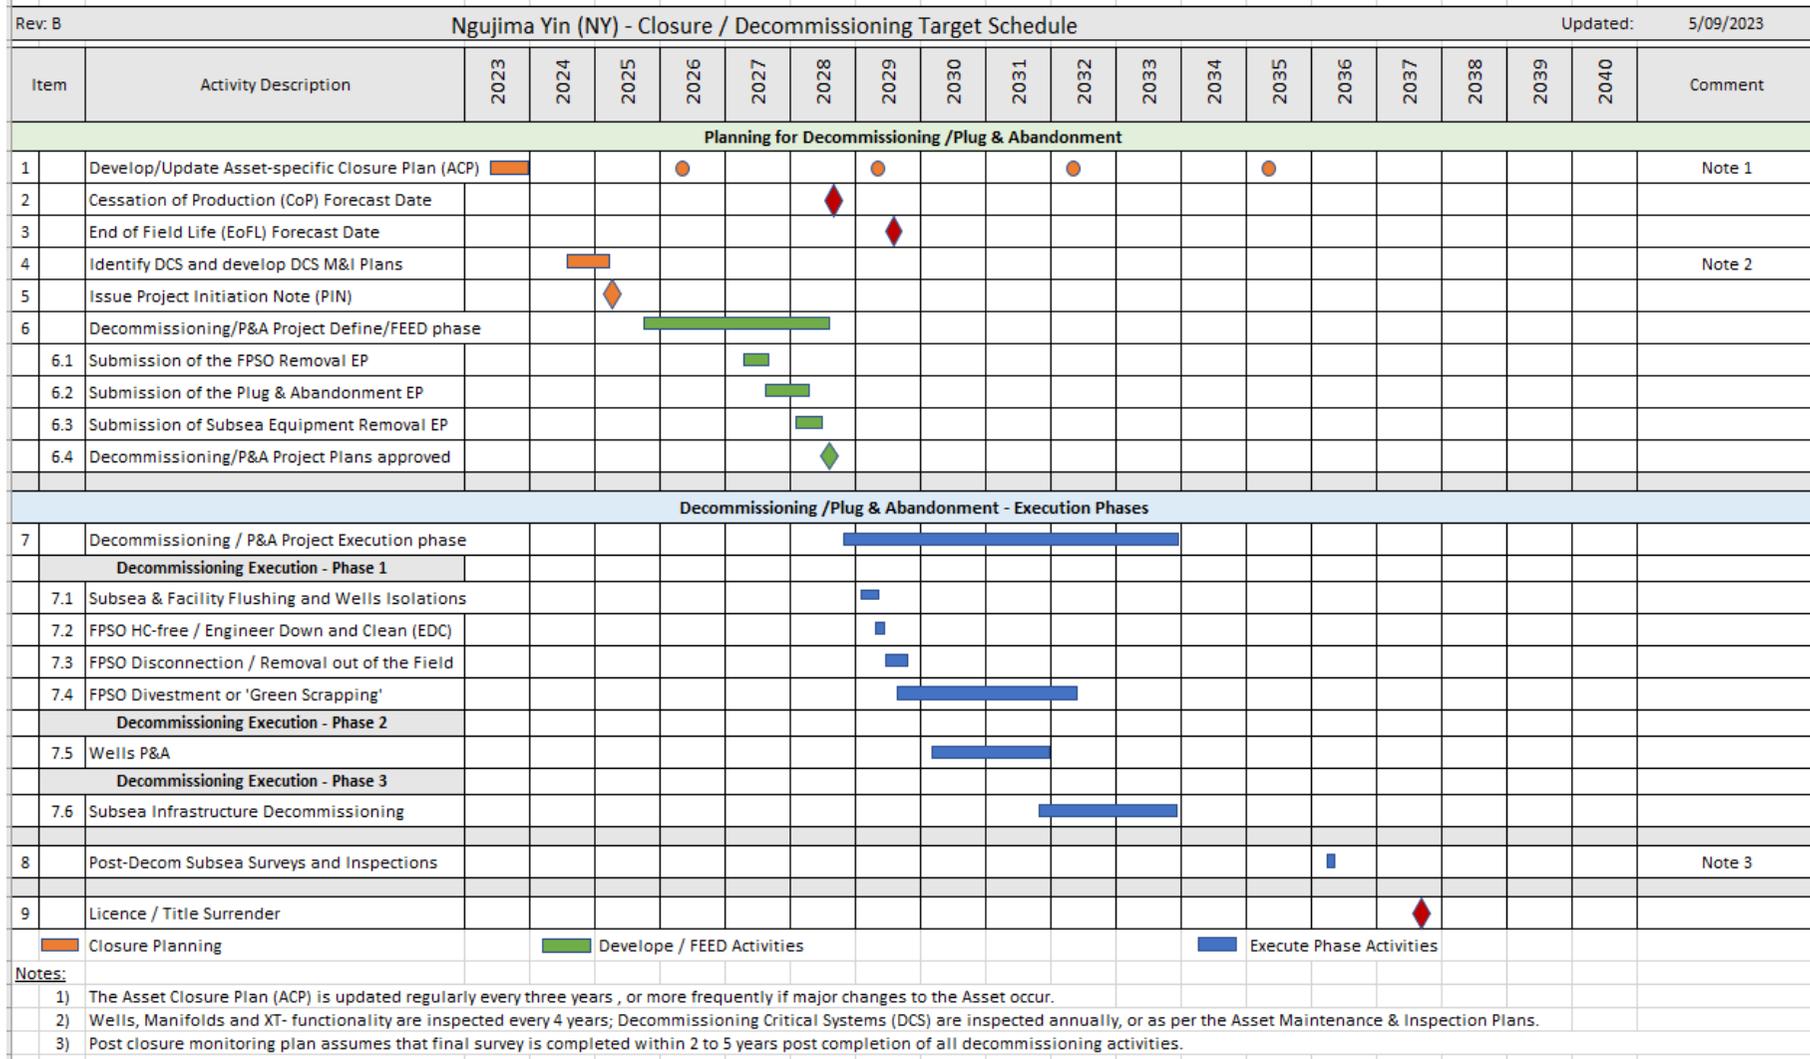

Figure 7-6: Ngujima-Yin asset decommissioning/plug and abandonment target schedule

7.2.3.1 Phase 1: Planning for Decommissioning – Key Activities

2023: Develop Asset-specific Closure Plan (ACP) – (the ACP will be updated regularly to reflect changes to the asset infrastructure, or to address major changes in Regulator requirements).

2024/2025: Complete Systems Identifications:

- Identify Decommissioning Critical Systems (DCS), the systems whose integrity and functioning are needed to support planned decommissioning activities.
- Determine if any additional Maintenance & Inspection, or refurbishment activities would be required to maintain Ngujima-Yin Asset DCS systems functional until decommissioning activities are completed.
- Update the Asset Maintenance and Inspection Plans (if required).
- Issue Project Initiation Note to initiate Define/FEED works.

2025 to 2028: Undertake Define/FEED Phase works to define decommissioning/P&A scopes and to develop Invitation to Tender (ITT) documentation:

- Complete engineering and planning for the permanent P&A of the Vincent & GE subsea wells.
- Complete technical and environmental studies in support to optimise removal, flushing and well isolations options.
- Complete works to define methodology and strategy for disconnection and removal the FPSO out of the field and the strategy to manage the FPSO and STP disposal.
- Optimise decommissioning/P&A strategy and the implementation timing to maximise execution synergies by combining NY decommissioning/P&A activities with other assets.
- Develop Contracting Strategy Project Execution Plan, permissioning documents, cost and schedule and manage Final Investment Decision (FID) approvals for the decommissioning/P&A project execute phase.
- Submission of the Environment Plan(s) for the activities related to:
 - Flushing of the FPSO, STP, subsea lines and equipment and isolations/separation of the wells from the flushed subsea infrastructure.
 - P&A of the wells.
 - Decommissioning and removal/disposal of the FPSO and STP.
 - Decommissioning/removal of the subsea equipment (e.g. trees, wellheads, flowlines, umbilicals, manifolds offshore gathering pipeline, flexibles, offshore umbilical, manifold etc).
 - Contracting and procurement activities to support targeted execution windows.

2027/2028: Execute asset CoP activities – (**managed by the Ngujima-Yin Asset Operations Team as part of the regular asset's operations activities):

- Ensure HSE and regulatory requirements to support CoP and Engineer Down and Clean (EDC) activities are met.
- Manage CoP and EDC contractor engineering and preparations.
- Develop plans for facility CoP/shutdown campaigns.
- Execute Facility CoP and EDC activities.

7.2.3.2 Phase 2: Decommissioning/Plug & Abandonment – Execution Activities

2028 to 2033: Execute offshore decommissioning and P&A scopes:

- Finalise contracting and procurement activities to support targeted execution windows.
- Complete FPSO and STP removal out of the field.
- Complete wells P&A activities.
- Complete decommissioning/removal of the relevant subsea equipment.
- Issue the Final Ngujima-Yin Asset Decommissioning Close Out Report.
- Complete post-removal survey inspection.

7.3 Organisation Structure

The following Woodside organisational structure provides leadership and direction for operation of the NY facility and environmental performance:

- The Executive Vice President Australian Operations (EVP Aus Ops) reports to the Chief Executive Officer.
- The Executive Vice President (EVP) Australian Operations reports to the Chief Executive Officer.
- The FPSOs and Macedon Vice President (VP) report to the EVP.
- The Asset Manager reports to the VP FPSOs and Macedon.
- The NY Offshore Installation Manager (OIM) reports to the Asset Manager.
- The Reliability & Integrity Manager reports to the VP FPSOs and Macedon.
- The functional support teams report to the corresponding Business Unit VP.
- Production facilities are supported by a team of environmental professionals who report to the Environment Manager – Australian Operations.
- Facilities are supported by other Woodside functional teams, including:
 - **HSE** – provides specific guidance and access to specialist HSE resources including assistance for governance and training, as well as guidance on Woodside HSE standards.
 - **Global Wells and Seismic** – ensures the safe planning and execution of drilling (note drilling is excluded from the scope of this EP), completion and work over operations.
 - **Projects** – responsible for the engineering, construction and execution of small projects on operational facilities to ensure ongoing integrity and safe operation.
 - **Marine Group** – responsible for chartering vessels to support Woodside’s offshore production facilities including vessels to aid emergency response.
 - **Aviation Group** – provides personnel transport, material transport, emergency evacuation and search and rescue capabilities.

A simplified chart of the structural organisation of the NY facility is shown in **Figure 7-7**.

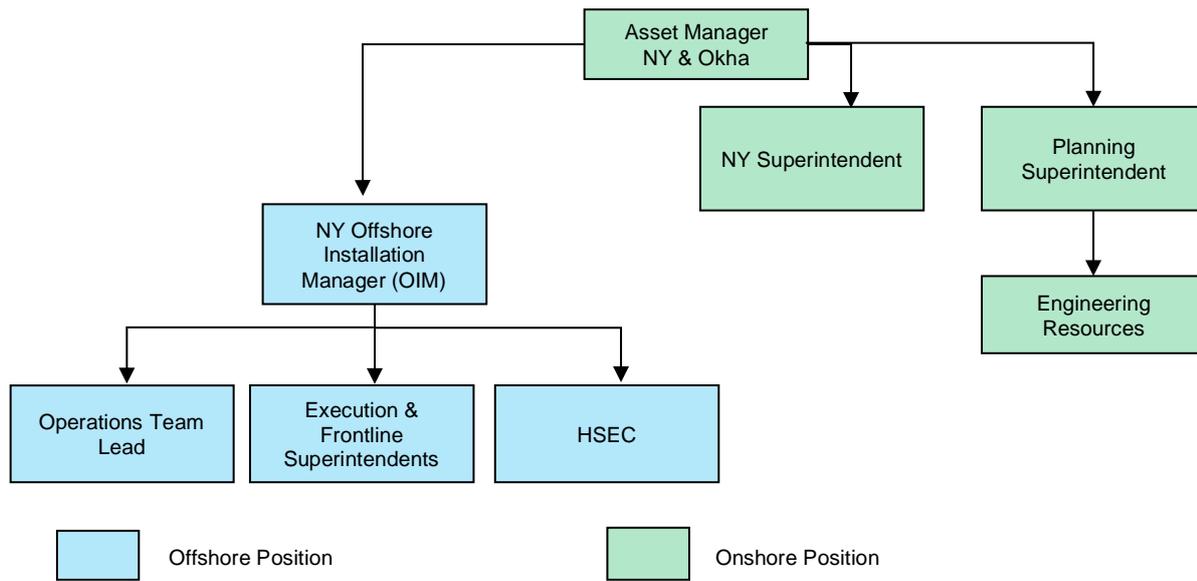

Figure 7-7: Operations Division organisational structure (simplified to show key relevant roles)

7.4 Roles and Responsibilities

As required by regulation 22(4), this section of the implementation strategy establishes a clear chain of command that sets out the roles and responsibilities of personnel in relation to the implementation, management and review of the EP, ranging from senior management to operational personnel on the NY facility and support vessels.

Key roles and responsibilities for Woodside and Contractor personnel in relation to the implementation, management and review of this EP are described in **Table 7-2**. Roles and responsibilities for hydrocarbon spill preparation and response are outlined in **Table 7-2** and the Woodside [Oil Pollution Emergency Arrangements \(Australia\)](#). Roles and responsibilities for facility emergency response are outlined in the NY Facility Safety Case and are consistent with the NY Emergency Response Plan (ERP).

It is the responsibility of all Woodside employees and contractors to apply the Woodside Environment and Biodiversity Policy in their areas of responsibility.

Table 7-2: Roles and responsibilities

Title (Role)	Environmental Responsibilities
All Personnel	
All facility-based personnel and onshore support personnel	<ul style="list-style-type: none"> • Understand the Woodside standards and procedures that apply to their area of work. • Understand the environmental risks and control measures that apply to their area of work. • Carry out assigned activities in accordance with approved procedures and the EP. • Follow instructions from relevant supervisor with respect to environmental protection. • Cease operations which are deemed to present an unacceptable risk to the environment. • Participate in environmental assurance activities and inspections as required. • Prompt reporting of environmental hazards/incidents to their supervisor and assist in event investigation.
Office-based Personnel	
Asset Manager	<p>Systems, Practices and Procedures:</p> <ul style="list-style-type: none"> • Accountable for ensuring all necessary regulatory approvals are in place to operate. • Approve (decide on) the content to be contained in the EP. • Accountable for managing the asset throughout its operations in accordance with legislative/regulatory requirements (including this EP) and WMS requirements. • Responsible for continuous improvement of operations of the facility, including environmental performance. • Responsible for the operation of the facility in accordance with legislative/regulatory requirements (including this EP) and the WMS. • Decide on technical decisions where required based on assessed current level of risk. • Accountable for aspects of integrity management. <p>Monitoring, Auditing, Non-conformance and Emergency Response:</p> <ul style="list-style-type: none"> • Decide on technical decisions where required based on assessed current level of risk. • Accountable for incident notification, reporting and investigation in line with regulatory requirements, the WMS and EP requirements. • Communicate changes relevant to the EP to the Production Environment team. • Accountable for conformance to production Operations processes including ISSoW.
Maintenance Engineering Team Leader (METL)	<p>Systems, Practices and Procedures:</p> <ul style="list-style-type: none"> • Responsible for safeguarding process safety with respect to the asset. • Ensure technical integrity risks are identified, managed and reduced to ALARP.

7.5 Unexpected Finds Procedure

In the event of the discovery of what appears to be underwater cultural heritage (defined as ‘any trace of human existence that has a cultural, historical or archaeological character and is located under water’); the following Unexpected Finds Procedure will apply:

1. All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage including any imagery, description and location.
2. Person who discovers the heritage object must inform the Activity Supervisor.
3. Activity Supervisor must notify Woodside’s Principal Heritage Adviser.
4. Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.
5. No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside’s Principal Heritage Adviser.
6. Woodside’s Principal Heritage Adviser must notify a qualified maritime archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.
7. If the potential Underwater Cultural Heritage appears to be Aboriginal Underwater Cultural Heritage, Woodside’s Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.
8. If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the UCH Act, Woodside’s Principal Heritage Adviser must notify the Minister responsible for the UCH Act, the DCCEEW underwater archaeological section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.
9. If the suspected heritage object includes human remains, Woodside’s Principal Heritage Adviser must also notify:
 - the Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains
 - the Office of the Federal Environment Minister in accordance with Section 20 of the ATSIHP Act.
10. Work must not recommence in the vicinity of the heritage object until Woodside’s Principal Heritage Adviser provides written approval. Woodside’s Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

7.6 Training and Competency

As required by regulation 22(5), this section of the implementation strategy includes measures that ensure all personnel associated with operating the NY facility are aware of their EP related responsibilities, and that all relevant personnel have appropriate competencies and training.

Environmental training is undertaken to ensure employees and contractors whose work may impact on the environment have the necessary awareness, knowledge and competence appropriate for their role.

Different levels of training are undertaken in relation to managing environmental risks and impacts for the production offshore facilities and associated subsea support vessel based IMMR activities, specifically:

- inductions for offshore facility workers and visitors
- operations competency framework training
- permit to work training (ISSoW)
- production environmental leadership training and environment awareness training
- emergency and hydrocarbon spill response training
- inductions for subsea IMMR (vessel based) personnel.

Records for Woodside production personnel, in relation to the above listed training, are maintained in Woodside's learning management system. Contractor training records are also maintained.

Competence of operations personnel can be reviewed via online dashboards.

7.6.1 Inductions for Offshore Facility Workers and Visitors

A comprehensive induction process is in place for personnel working on or visiting Woodside's offshore production facilities. The induction process is designed to equip personnel with the HSE awareness and skills necessary for them to manage their own safety and environmental performance and contribute to others working around them. The induction process includes:

- **Common Production Induction** – All employees and contractors who have not accessed a production facility within twelve months are required to undertake this induction prior to mobilisation. It includes Woodside's values, HSE and Process Safety, continuous improvement, risk management and ISSoW.
- **Facility Specific Induction** – All employees and contractors that have not accessed the production facility within six months are required to undertake this induction on arrival at the facility. This induction covers the HSE and emergency response issues specific to each facility. For environment, this induction covers the Facility EP, prevention of spills, waste management, fauna interactions, hazard identification and risk assessment, and incident reporting.
- **Production Offshore Environmental Leadership Training** – Key operations leadership roles (as specified within the Operations Competency Framework) are required to complete this competency on commencement of the new role and three yearly thereafter. The training covers Woodside's policies and standards, environmental legislative requirements, the EP, key environmental risk and impacts, environmental reporting, environmental management tools (e.g. improvement planning, compliance reviews and audits), hydrocarbon spill response and environmental accountabilities.
- **Production Offshore Environmental Awareness Training** – All new offshore operational personnel are required to undertake this online training on commencement of the new role and two yearly thereafter. This training covers environmental legislative requirements, the facility EP, key environmental hazards and control measures (including waste management, spill prevention, chemical storage, wildlife interactions), environmental management tools, hazard and incident reporting, spill response, and environmental responsibilities.

7.6.2 Operations Competency Framework Training

The Operations Competency Guideline defines a framework to make sure all personnel on operating facilities are competent to perform their work and that competency is managed. By doing this, the potential for unplanned (accident/incident) type events that could result in environmental impact is minimised.

Operational Area Licence to Operate (LTO) roles are those roles related to oil and gas processing, equipment maintenance, marine regulations, emergency response and any other roles involved with safeguarding the facility integrity, including all roles where high-risk work licences are required. Additionally, roles mandated by Woodside such as HSEC and helicopter landing officer are included in the LTO roles process.

The requisite competency and training for each LTO role has been defined. Competencies for these LTO roles are stipulated by the governance group for each respective position and are based on the relevant Australian or International standards which apply. In cases where no Australian or International standards are available or applicable, training is based on the relevant Woodside Standard as determined by the respective governance group.

Contractors working on Woodside facilities are required to verify the competency of their personnel through the contractor's own verification systems. Additionally, contractor personnel working on Woodside facilities are required to be registered in Woodside's Contractor Verification Service (CVS) beforehand. Personnel registered in CVS have had their skills and qualifications independently verified on behalf of Woodside thereby confirming that contractor personnel hold the required competencies before mobilisation to the facility.

The LTO Roles Report (available online on the Woodside Competency Reporting Dashboard on the Production Academy Intranet page) provides the conformance status of the facility against the LTO roles requirements.

7.6.3 Permit to Work System Training

The ISSoW permit to work system (see **Section 7.1.1**) is a key element in ensuring that all necessary steps are taken to ensure the safety of personnel, protection of the environment and technical integrity of the facility. The ISSoW system takes a risk-based approach to all activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control.

All members of the workforce that are required to work with ISSoW (**Section 7.1.1**) receive training commensurate with the level of authority and responsibility they hold in ISSoW.

7.6.4 Emergency and Hydrocarbon Spill Response Training

All operations personnel involved in crisis and emergency management are required to commit to ongoing training, process improvement and participation in emergency and crisis response (both real and simulated), including emergency drills specific to potential incidents at the NY facility. Training includes task-specific training and role-based training and 'on the job' experience (i.e. participation in crisis or emergency management exercises).

An overview of Woodside's hydrocarbon spill response training and competency requirements are provided in dashboards for key responder roles. The roles are consistent with Woodside's crisis and emergency management incident control structure.

Woodside Hydrocarbon Spill Preparedness Advisor(s) are responsible for maintaining hydrocarbon spill preparedness competency. This includes the identification and development of approved competency and non-competency-based courses, identification of relevant personnel required to undertake training, and ensuring training records are maintained. Minimum Woodside capabilities will continue to be identified and documented.

7.6.5 Subsea Inspection, Monitoring, Maintenance and Repair Activity Environmental Awareness

At the beginning of, and during a new subsea IMMR activity, the subsea support vessel crew including contractor crew, Woodside representatives and other relevant personnel are required to undertake a vessel induction before commencing work. This induction covers HSE requirements for

the vessel and IMMR activities, and as required environmental information specific to the activity location. The induction may cover the environmental information of:

- adherence to standards and procedures, and the use of Job Safety Analysis and permit to work hazard identification and management process
- spill management including prevention, response and clean-up, location of spill kits and reporting requirements
- waste management requirements and location of bins
- reporting of marine fauna, location of forms and charts
- chemical management requirements.

All personnel who undertake the project induction are required to sign an attendance sheet which is retained.

Regular HSE meetings are held on Subsea Support Vessels with crew. During these meetings, any environmental incidents are reviewed, and environmental awareness material presented.

7.7 Monitoring, Auditing, Management of Non-conformance and Review

Regulation 22(6) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself.

This Section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental risks and impacts of the NY facility against the EPOs, EPSs and MCs, with a view to continuous improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

7.7.1 Monitoring

Woodside and its Contractors undertake a program of periodic monitoring during the Petroleum Activities Program. This information will be collected using the tools and systems outlined below based on the EPOs, controls, EPSs and MCs in this EP. Environmental aspects are integrated into Woodside-wide functional and asset review and assurance processes, which deliver effective governance. This integration of environmental controls into appropriate parent systems and processes includes PSM (**Section 7.1.3**), contractor management (**Section 7.1.5**) and marine assurance (**Section 7.7.8**), and provides multi-faceted assurance of routine implementation.

The tools and systems collect, as a minimum, the data (evidence) referred to in the MCs in **Sections 6.6 to 6.8**. The collection of this data will form part of the record of compliance maintained by Woodside and form the basis for demonstrating that the EPOs and EPSs are met. Compliance is summarised in a series of routine reporting documents (refer to **Section 7.9**).

The following tools and systems to monitor environmental performance, (including collection of evidence of compliance with controls), where relevant, include:

- environmental emissions/discharge reporting systems that record volumes of planned discharges to ocean and atmosphere, e.g. via the Production Allocation System and process historian database – a summary of emissions and discharges monitoring that is undertaken during the Petroleum Activities Program is provided within **Table 7-3**
- monitoring of progress against the Production Function scorecard for KPIs (**Section 7.7.1**)
- routine internal reporting (as described in **Section 7.9.2**) and routine external annual compliance reporting (as described in **Section 7.9.3**)
- internal auditing and assurance program (as described in **Section 7.7.4**).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Collectively, these systems/tools involve collection of evidence of compliance with controls. Throughout the Petroleum Activities Program, Woodside continues to identify new source-based risks and impacts through the Monitoring and Auditing systems and tools described above and within **Section 7.7**.

Other examples of assurance tasks implemented through the EP include:

- start of shift operator walk arounds
- permit to work hazard, risk management check list, area sign-on, and permit audits (ISSoW – **Section 7.1.1**)
- technical integrity SCE performance reviews (daily, weekly, monthly) (**Section 2.7.5**)
- ongoing maintenance performance assurance (e.g. conformance dashboard)
- management system performance audits reviews (e.g. MSPSs) (**Section 7.7.4**)
- data gathering and governance dashboard presentations (e.g. Woodside Integrated Risk and Compliance System).

7.7.2 Management of Knowledge

Review of knowledge relevant to the existing environment is undertaken in order to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). Relevant knowledge is defined as:

- environmental science supporting the description of the existing environment
- socio-cultural environment and stakeholder information
- environmental legislation.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of MoC are documented in the WMS EP Guideline.

Under the Oil Spill Scientific Monitoring Program preparedness, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Environment Science Team and tracked via the Corporate Environment Baseline Database.

7.7.3 Management of Newly Identified Impacts and Risks

New sources of receptor-based impacts and risks identified through monitoring and auditing systems and tools and the Woodside Environment Knowledge Management System are assessed using the Change Management Process (**Section 7.1.14**).

Table 7-3: Summary of emissions and discharges monitoring for the Petroleum Activities Program

Category	Parameter to be Monitored/Reported	Monitoring Frequency	Monitoring Equipment/Methodology	EP Reference
Planned Emissions				
Atmospheric emissions from fuel combustion	Greenhouse, energy and criteria pollutants	Normally continuous process metering/annual reporting	NGERS and NPI reporting estimation methods (e.g. fuel/flare flow meters, throughput meters, process estimation)	Section 6.6.6
	Fuel gas and flare intensity	Normally continuous process metering/monthly reviews	Fuel and flare flowmeters inform intensity profiles – tracked against optimisation targets	Section 6.6.6
Planned Discharges				
Discharge of subsea control fluids during well actuations	Subsea control fluid consumption	Normally continuous process indication/monthly review	Subsea control fluid consumption surveillance. Process indication for gross leaks/ruptures	Section 6.6.4
Discharge of hydrocarbons and chemicals during subsea IMMR activities	Volumes of hydrocarbons and chemicals released subsea	As required, during IMMR activities (activity specific)	Estimates based on known volumes pumped and ROV observation	Section 6.6.4
Discharge of cooling water	Total Residual Chlorine	Periodically	Total Residual Chlorine testing	Section 6.6.5
Waste recycling and disposal	Quantities of solid and liquid wastes disposed of onshore	Ongoing	Facility waste manifest	Section 6.7.2
Unplanned Emissions and Discharges				
Unplanned emissions and discharges	Nature of release	As required	HSE Event Reporting System (First Priority)	Section 6.8

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.7.4 Auditing

7.7.5 Operations Assurance

To provide confidence, based on evidence commensurate with risk, that business objectives are met, business activities are performed and risks are managed, assurance is performed as described in the Provide Assurance Procedure and the Provide Assurance Guideline. The Guideline aims to explain how the Operations Division Assurance Team implement WMS Assurance requirements, while concurrently satisfying the Operations Division's specific objectives.

Operations Assurance Assignments are contained within the Operations Division Integrated Assurance Assignment Plan.

Environmental assurance activities are conducted on a regular basis to help:

- verify environmental risks and potential impacts are being managed in accordance with the EPOs and EPSs detailed in this EP
- monitor, review and evaluate the effectiveness of the performance outcomes and standards detailed in this EP
- verify effectiveness of the EP implementation strategy
- identify potential non-conformances.

The outputs of the assurance process are corrective actions that feed the improvement process. Therefore, assurance is a key driver of continuous improvement.

7.7.6 Annual Offshore Inspection/Desktop Review

An inspection/review of the facility is undertaken every calendar year by the Production Environment Team, via either an offshore inspection or desktop review. Selected risk areas/activities are inspected to review environmental performance against the EPOs and EPSs, and verify that control measures are effective in reducing the environmental risks and impacts of the activity to an ALARP and acceptable level.

The inspection/review also includes review of conformance with selected aspects of the EP implementation strategy. All risk sources/activities applicable to the offshore facility will be reviewed over a three-year rolling period. Records of findings and records of close-out of any corrective or improvement actions are maintained (closeout is tracked in Woodside's action tracking system).

7.7.7 Subsea Support Vessel Environment Inspection

Environmental inspections of subsea support vessels are undertaken. This involves annual and ongoing inspections of subsea support vessels to ensure that any subsea support vessel is compliant with both the EP and the approved Contractor Management system. Inspections are conducted in line with the SSPL contractor implementation package, however, may include additional requirements for project specific inspection items.

Vessel inspection findings are captured within a closeout report. Actions arising from subsea support vessel environmental audits are added to the relevant Environmental Commitments and Actions Register (eCAR) within the Subsea Construction, IMMR Environment Project Register. This eCAR is used to track support vessel compliance with EP commitments, including any findings and corrective actions.

7.7.8 Marine Assurance

Woodside's marine assurance is managed by the Marine Assurance Team in accordance with Woodside's Marine Offshore Vessel Assurance Procedure. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry

organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

Woodside's Marine Offshore Assurance process is mandatory for all vessels (other than Tankers and Floating Production Storage and Offloading vessels) that are chartered directly by or on behalf of Woodside, including for short term hires (i.e. <3 months in duration).

It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust Safety Management System.

The process is multi-faceted and encompasses the marine assurance activities of:

- safety management system assessment
- dynamic positioning (DP) system verification
- vessel inspections
- project support for tender review, evaluation and pre/post-contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard.

The Marine Assurance team may determine that, due to a vessel's risk ranking relative to the defined scope of work, a formal risk assessment may be sufficient and negates the requirement for a vessel inspection.

Vessel inspections may be carried out by Woodside personnel or by an appointed independent third party. Methods of vessel inspection may include:

- Woodside Marine Vessel Inspection
- OCIMF OVID Inspection
- IMCA CMID Inspection
- Marine Warranty Survey.

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval.

Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, an opportunity exists to further scrutinise the proposed vessel. This involves a vessel inspection conducted by the Woodside Assurance Specialist or their delegate, which may include an independent third party.

7.7.9 Management of Non-conformance (Internal)

Woodside employees and Contractors are required to internally report all environmental incidents and hazards, including potential non-conformances with EPOs and EPSs in this EP.

The Health, Safety and Environment Event Reporting and Investigation Procedure defines how incidents and hazards are internally reported. Key requirements are set out through the use of an Event Report Form, which includes details of the event, immediate action taken to control the situation, and corrective actions to prevent reoccurrence. An internal online database called First Priority is used for the recording and reporting of these events. Corrective actions are monitored using First Priority and closed out in a timely manner.

Detailed investigations are completed for incidents with an actual impact of A, B or C, and high potential environmental incidents and hazards. The classification, reporting, investigation and

actioning of environmental incidents and hazards is undertaken in accordance with the Health, Safety and Environment Event Reporting and Investigation Procedure supported by the HSE Event Reporting Guideline. Event bulletins may be used for communication of learnings from significant events.

Non-conformances with EPOs and EPSs are also internally reported and investigated in accordance with Regulatory Compliance Management Procedure, supported by the Regulatory Compliance Management Guideline.

External regulatory reporting requirements for this activity are outlined in **Section 7.9** of this EP.

7.7.10 Review

7.7.11 Environmental Risk Review

Woodside risk management processes include risk review, are described in **Sections 2.2.1** and **7.1.5** and are applied on a day-to-day basis. The Facility Environmental Impacts and Risk Register must be reviewed and updated every five years.

Monitoring (**Section 7.7.1**), assurance (**Section 7.7.4**) and review (**Section 7.7.10**) are also used to identify potential new information that may arise during the activity and ensure that performance outcomes and standards are being met and EP environmental control measures are effective. Whilst conducting these activities, qualified, experienced environment advisors, in consultation with experienced Operational and/or Engineering personnel use their professional judgement, to identify potential new control measures that have potential to improve environmental outcomes or reduce risk. As various monitoring/assurance/review processes are used there is not an overarching procedure/checklist that is suitable to contain a prompt for consideration of new environmental controls.

In addition, Woodside's risk management practices and processes are systematically applied on an ongoing basis to activities provided for within the EP (as summarised within **Section 7.1.5**). Via these processes and practices, new risk controls for individual planned and unplanned events may be selected and implemented (proportional to risk levels). When such risk controls are identified by environmental advisors as being relevant to the overarching EP sources of risk, these may also be added as new EP control measures. Any new or improved EP environmental controls or specific measures (that have the potential to improve environmental outcomes or reduce risk), can be tracked within the production EP updates register for incorporation into the EP at its next revision. The EP may be internally revised to reflect these changes without resubmission.

Where review processes identify new or improved controls relevant to environmental risks identified in this EP (that have the potential to improve environmental outcomes or reduce risk), the EP may be internally revised to reflect these changes without resubmission.

7.7.12 Key Performance Indicator Review

Key performance indicators (KPIs) are developed annually and agreed with senior management (i.e. NY Asset Manager). Progress against the environment KPIs is tracked within Asset Scorecards.

Reviews of hydrocarbon spill arrangements and testing are routinely carried out.

7.7.13 Learning and Knowledge Sharing

Learning and knowledge sharing occurs via a number of different methods, including for example:

- operations learnings meetings
- event investigations
- event bulletins

- engineering and technical authorities discipline communications and sharing.

7.7.14 Continuous Improvement

Continuous improvement (CI) projects to improve production or environmental performance that involve refurbishment, modification or major maintenance on the facility are typically managed by Brownfields Engineering and required to follow appraise and develop management procedures. The Procedure requires that all projects be managed in accordance with the Opportunity Management Framework, which supports the progressive maturation of an opportunity through value creation in the Assess and Select Phases and the maintenance of value in the Develop and Execute phases.

To support the accountable executive to make a decision on whether a CI Project should proceed to the next phase in the Opportunity Management Framework, it is sometimes necessary to conduct a trial of the modification to determine the outcomes that can be expected if the modification is implemented. Due to prioritisation of resources, the phased progress of opportunities, competition between different solutions and long-term strategic and financial considerations, it is not possible to set quantitative success criteria to determine whether a modification will be implemented based on the results of trials. Instead, the results of a trial are used to inform a decision on whether to progress the CI Project to the next phase in the Opportunity Management Framework. Decisions are typically made with two key considerations; whether the business is ready to proceed which has a technical/functional focus and whether there is a business case for progressing to the next phase. The business case may consider the ALARP position for the CI Project, if relevant.

7.8 Record Keeping

Compliance records (outlined in MCs in **Section 6**) are maintained. Record keeping is in accordance with regulation 22(7) that addresses maintaining records of emissions and discharges such that the records can be used to assess whether EPOs and EPSs are being met (refer to **Section 7.7.1** and **Table 7-3** for a summary of records that are retained).

7.9 Reporting

7.9.1 Overview

In order to meet the EPOs and EPSs outlined in this EP, Woodside undertakes reporting at a number of levels. These reporting arrangements are outlined below.

7.9.2 Routine Reporting (Internal)

7.9.2.1 Daily Reports

The following daily reports, containing environmental performance information, are issued:

- Pan-Woodside Daily Production Report – The report includes facility performance information on production and a log of any HSE events.
- Subsea support vessel Daily Progress Report(s) – During subsea IMMR activities, daily reports are issued by the Woodside Site Representative. The reports provide performance information on HSE events, diesel use, together with equipment information, current and planned work activities.

7.9.2.2 Performance Reporting

A number of routine performance reports are developed in support of the facility operational activities. These reports cover HSE, production and process safety performance. Information included in these reports, relevant to the EP, includes:

- summary of environment incidents
- current and planned work activities, significant events (e.g. shutdowns, failures)
- integrity status and process safety metrics
- status of subsea IMMR activities.

7.9.3 Routine Reporting (External)

7.9.3.1 Environmental Performance Review and Reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information on environmental performance to the appropriate regulator.

Routine regulatory reporting requirements are summarised in **Table 7-4**. The requirements include that Woodside will develop and submit an annual Environmental Performance Report to NOPSEMA, with the first report submitted within 12 months of the commencement of activities covered by this EP (as per the requirements of regulation 22(7)) (i.e. by 30 April the following year).

Table 7-4: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Report	NOPSEMA	Monthly, by 15th of each month	As required by regulation 50, details of recordable incidents that have occurred under the EP for the previous month. Refer to Section 7.9.5 for more detail.
Annual EP Performance Report	NOPSEMA	Annual, by 30 April of the year following reporting period	As required by regulation 22(2) and 51 the report will report compliance with the EPOs and EPSs outlined in Section 6 of this EP. The reporting period is 1 January to 31 December each year.
NPI Report	DCCEEW	Annual, by 30 September each year	Summary of the emissions to land, air and water including those from the facility. Reporting period 1 July to 30 June each year.
National Greenhouse and Energy Reporting (NGERS)	Clean Energy Regulator	Annual, by 31 October each year	Summary of energy use and greenhouse gas emissions including those from the facility. Reporting period is 1 July to 30 June each year.

7.9.3.2 End of the Petroleum Activities Program Notification

In accordance with regulation 54, Woodside will notify NOPSEMA within ten days of the completion of the Petroleum Activities Program. The Petroleum Activities Program is not expected to end within the five-year life of this EP.

7.9.3.3 End of the Environment Plan

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activities Program has ended, all the obligations identified in this EP have been completed, and NOPSEMA has accepted the notification, in accordance with regulation 46 of the Environment Regulations. As noted above, the Petroleum Activities Program is not expected to end within the five-year life of this EP.

7.9.4 Incident Reporting (Internal)

All Woodside employees and contractors are required to report environmental incidents and non-conformances with this EP. Incidents are reported using an Event Report Form which includes details of the event, immediate action taken to control the situation, and corrective actions to prevent reoccurrence.

7.9.5 Incident Reporting (External) – Reportable and Recordable

Woodside's regulatory reporting requirements are outlined within the Regulator Event Reporting Procedure supported by the Regulator Event Reporting Guideline.

7.9.6 Reportable Incidents

A reportable incident is defined under regulation 5 of the Environment Regulations as 'an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage'.

A reportable incident for the Petroleum Activities Program is:

- an incident that has caused environmental damage with a Consequence Level of Moderate C+ or above (as defined under Woodside's Risk Table; refer to **Section 2.6**)
- an incident that has the potential to cause environmental damage with a Consequence Level of Moderate C+ or above (as defined under Woodside's Risk Table; refer to **Section 2.6**).

The environmental risk assessment (**Section 6**) for the Petroleum Activities Program identifies those risks with a potential consequence level of C+ for environment. The incidents that have the potential to cause this level of impact include hydrocarbon loss of containment events to ocean resulting from either:

- subsea loss of well containment (MEE-01)
- subsea flowline and riser loss of containment (MEE-02)
- topsides loss of containment (MEE-03)
- loss of containment during offloading (MEE-04)
- cargo tank loss of containment (MEE-05)
- loss of structural integrity (MEE-06)
- loss of marine separation (MEE-07)
- loss of control of suspended load (MEE-08).

Any such incidents represent potential events which would be reportable incidents. Reporting of incidents is undertaken with consideration of NOPSEMA (2023) guidance stating, 'if in doubt, notify NOPSEMA', and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the regulations.

7.9.6.1 Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of regulations 47, 48 and 49 of the Environment Regulations. Woodside will:

- orally notify NOPSEMA of all reportable incidents to the regulator as soon as practicable, but within two hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator (NOPTA) and the Department of the responsible State Minister (Department

of Energy Mines, Industry Regulation and Safety [DEMIRS]) as soon as practicable after the oral notification of the incident

- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0929 – Reportable Environment Incident which must be submitted to NOPSEMA as soon as practicable, but within three days of the incident or of its detection by Woodside
- provide a copy of the written report to NOPTA and DEMIRS, within seven days of the written report being provided to NOPSEMA.

7.9.7 Recordable Incidents

A recordable incident is defined under regulation 5 of the Environment Regulations as a ‘breach of an EPO or EPS, in the EP that applies to the activity, that is not a reportable incident’.

Any breach of the EPOs or EPSs (as presented within **Section 6**) will be raised as a recordable incident and managed as per the notification and reporting requirements outlined below and internal requirements outlined in **Section 7.9**.

7.9.7.1 Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of regulation 50. Woodside will:

- provide a written record not later than 15 days after the end of the calendar month using a format consistent with the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report.

7.9.8 Other External Reporting Requirements and Notifications

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, the following incident reporting requirements also apply in the Operational Area if the spill originates from a vessel:

Any oil pollution incidents in Commonwealth Waters will be reported (by the vessel master) to AMSA RCC as per Article 8 and Protocol I of MARPOL within two hours via the national emergency 24-hour notification contacts, and a written report within 24-hours of the request by AMSA. (This requirement is included in the NY Oil Pollution First Strike Plan).

If the ship is at sea, reports are to be made to:

Free call: 1800 641 792

Phone: 08 9430 2100 (Fremantle).

Any spills greater than ten tonnes in Commonwealth Waters must be reported (by the vessel master) to AMSA within one hour. (This requirement is detailed in the NY Oil Pollution First Strike Plan). Reports are to be made via the national 24-hour emergency notification contacts (AusSAR: RCC):

Rescue Coordination Centre Australia (RCC Australia)

Phone: 02 6230 6811

Facsimile: 02 6230 6868

Telex: 62349

Free call: 1800 641 792

AFTN: YSARYCYX.

A hydrocarbon spill incident with potential to significantly impact MNES must be reported to DCCEEW.

If the activity described within this EP results in the unintentional death of or injury to a fauna that constitute MNES (i.e. species listed as Threatened or Migratory under the EPBC Act), and the activity was not authorised by a permit, the Secretary of the DCCEEW should be notified within seven days of becoming aware of the results of the activity:

The Secretary

DCCEEW

Hotline: 1800 803 772

Email: protected.species@environment.gov.au.

For hydrocarbon spill incidents, other agencies and organisations will be notified as appropriate to the nature and scale of the incident as per procedures and contact lists in the Oil Pollution Emergency Arrangements (Australia) and the NY Oil Pollution First Strike Plan, including:

- a hydrocarbon spill incident with the potential to significantly impact MNES must be reported to DCCEEW.

7.10 Ongoing Consultation

In accordance with regulation 22(15) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside proposes to undertake the engagements with directly impacted relevant persons and additional persons listed **Table 7-5**. Any relevant new information identified during ongoing consultation will be assessed using the EP Management of Knowledge (refer to **Section 7.7.2**) and Management of Change Process (refer to **Section 7.1.14**).

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives are from community and industry and include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations.

Woodside has developed a Program of Ongoing Engagement with Traditional Custodians, directly informed by feedback from Traditional Custodians. It provides a mechanism for ongoing dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback on its activities.

Relevant persons, additional persons and those who are interested in the activities, can remain up to date on this activity through subscribing to our website.

Table 7-5: Ongoing consultation engagements

Report/Information	Recipient	Purpose	Frequency	Content
Program of Ongoing Engagement with Traditional Custodians	Relevant cultural authorities	Identification, assessment and consideration of cultural values relevant to the Operational Area or EMBA	Ongoing	Assessment of cultural values Any relevant new information on cultural values will be assessed using the EP Management of Knowledge (refer to Section 7.7.2) and Management of Change Process (refer to Section 7.1.14)

Report/Information	Recipient	Purpose	Frequency	Content
Notification (email)	AHO	Notify of location of new permanent infrastructure to enable update of maritime charts.	As required.	PS 1.2 (Section 6.6.1)
Notification (email)	AFMA Individual fishery licence holders that have the potential to be directly impacted by planned activities in the Operational Area Recfishwest WAFIC CFA DPIRD DAFF – Fisheries	Notification of significant change	As appropriate	Notification of significant change Any relevant new information will be assessed using the EP Management of Knowledge (refer to Section 7.7.2) and Management of Change Process (refer to Section 7.1.14).
Notification (email)	Eni	Notification of significant change	As appropriate	Notification of significant change Any relevant new information will be assessed using the EP Management of Knowledge (refer to Section 7.7.2) and Management of Change Process (refer to Section 7.1.14).
Notification (email)	All Relevant Persons and Additional Persons for the Proposed Activity	Notification of significant change	As appropriate	Notification of significant change Any relevant new information will be assessed using the EP Management of Knowledge (refer to Section 7.7.2) and Management of Change Process (refer to Section 7.1.14).
Emails/Meetings	Persons or organisations who provide feedback to Woodside post EP submission	Identification, assessment and consideration of feedback, claims and/or objections	As appropriate	Assessment of claims and/or objections Relevant new information will be assessed using the EP Management of Knowledge (refer to Section 7.7.2) and Management of Change Process (refer to Section 7.1.14).

Report/Information	Recipient	Purpose	Frequency	Content
Notification (email)	WA Museum (as requested during EP consultation) Australasian Underwater Cultural Heritage Database Any other stakeholders as required in the Unexpected Finds Procedure (Section 7.5)	Report any unexpected finds of potential Underwater Cultural Heritage	If triggered by Unexpected Finds Procedure (Section 7.5)	Refer to Unexpected Finds Procedure (Section 7.5)

At the time of EP submission, a number of specific activities as part of ongoing consultation regarding the activity are planned with Traditional Custodian Relevant Persons.

If any of these activities result in cultural values or heritage features being newly identified, EPO 28 will be implemented to ensure potential impacts are reduced to Acceptable and ALARP Levels.

7.11 Emergency Preparedness and Response

7.11.1 Overview

Under regulation 22(8), the implementation strategy must contain an OPEP and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

A summary of how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements is shown in **Table 7-6**.

Table 7-6: Oil pollution preparedness and response overview

Content	Environment Regulations Reference	Document/Section Reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 21(5), 22(2)	Oil Spill Preparedness and Response Mitigation Assessment.
Describes the OPEP	Regulation 22 (8)	EP: Section 7.10. Woodside's OPEP has the following components: <ul style="list-style-type: none"> • Oil Pollution Emergency Arrangements (Australia) • NY Oil Pollution First Strike Plan • Oil Spill Preparedness and Response Mitigation Assessment. In accordance with Regulation 56 of the Environment Regulations the Woodside Oil Pollution Emergency Arrangements (Australia) was provided with the Scarborough Drilling and Completions EP, accepted by NOPSEMA on 1 December 2023.
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22(9)	Oil Spill Preparedness and Response Mitigation Assessment. NY Oil Pollution First Strike Plan.
Details the arrangements for updating and testing the oil pollution response arrangements	Regulation 22 (8), (12), (13), (14)	EP: Section 7.11.9. Oil Spill Preparedness and Response Mitigation Assessment.
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22(10)	Oil Spill Preparedness and Response Mitigation Assessment.
Demonstrates that the oil pollution response arrangements are consistent with the national system for oil pollution preparedness and control	Regulation 22(11)	Oil Pollution Emergency Arrangements (Australia) .

7.11.2 Emergency Response Training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk-based training needs analysis on positions required for effective oil spill response (**Table 7-7**).

Table 7-7: Emergency response training requirements

IMT Position	Minimum Competency
Corporate Incident Management Team (CIMT) Incident Commander and deputy Incident Commander	<ul style="list-style-type: none"> • IMT Fundamentals Course (internal course) or equivalent • ICS 100/200 • IMO3 or equivalent spill response specialist level with an oil spill response organisation (OSRO) • Participation in L2 activation, exercise or skills maintenance
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	<ul style="list-style-type: none"> • IMT Fundamentals Course or equivalent • ICS 100/200 • Oil spill theory • Participation in L2 activation, exercise or skills maintenance

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Environment Unit Leader	<ul style="list-style-type: none"> • IMT Fundamentals Course • ICS 100/200 • IMO2 or equivalent spill response specialist level with an OSRO • Participation in L2 activation, exercise or skills maintenance
Note on Competency/Equivalency	
<p>In 2023 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Crisis and Emergency Management training and the oil spill response training requirements for CIMT roles.</p> <p>The revised IMT Fundamentals training Program aligns with the performance requirements of the <i>PMAOM0R418 - Coordinate Incident Response</i>.</p> <p>In 2023, Woodside took the decision to align its global incident command arrangements to the Incident Command System (ICS). As such all rostered members of the Incident Management Team are trained up to ICS 200.</p> <p>In addition to baseline incident management training, all rostered members of the CIMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course (OSREC) which involves the completion of two online AMSA Modules (Introduction to National Plan and Incident Management; and Introduction to Oil Spills) and face-to-face training.</p> <p>Woodside Learning Services (WLS) are responsible for collating and maintaining personnel training records. The HSP Dashboard reflects the competencies required for each oil spill role (IMT/operational).</p>	

7.11.3 Emergency Response Preparation

The CIMT based in Woodside’s head office in Perth, is the onshore coordination point for an offshore emergency. The CIMT is staffed by an appropriately skilled team available on call 24 hours a day. The purpose of the team is to coordinate incidents, maintain the safety of personnel, minimise damage to the environment and facilities, and to liaise with external agencies. A description of Woodside’s Incident Command Structure and arrangements is further detailed in the Woodside Oil Pollution Emergency Arrangements (OPEA)(Australia). Roles and responsibilities for facility emergency response are outlined in the NY Safety Case are consistent with the NY ERP.

Woodside has a number of ERP in place, which detail the actions and resources available in the event of various emergency scenarios. Electronic copies of the ERPs are available on the facility Virtual Bookshelves and the intranet. Hard controlled copies are available on the facilities.

In addition, the Emergency Preparedness MSPS (M06) is in place to assure that in the event of an incident, the organisation is appropriately prepared for all necessary actions which may be required for the protection of People, Environment, Asset, Reputation and Livelihood.

7.11.4 Initial Response to Facility Incident

The facility is equipped with emergency shutdown systems designed to protect personnel, the facility and the environment from unsafe operating conditions and catastrophic situations.

Emergency shutdown systems are provided as a means of isolation in response to process upsets and facility conditions (including associated flowlines and risers) that could result in loss of hydrocarbon inventories, or to reduce the potential impact from a hydrocarbon loss of containment event on the facility. Provision has been made for process and facility alarm systems to provide early indication of any process upset conditions and potential hazardous events, including fire and gas alarms.

The key ERP relevant to the facility and subsea infrastructure is the NY ERP. This plan covers health, safety, asset and environmental risks (including fire, structural integrity, sabotage, etc) to ensure the range of occupational, asset and environmental risk exposures from incidents have been considered and plans are in place for their management. The plan provides specific details on the initial response required during events with potential significant environmental consequences such as a hydrocarbon spill, subsea hydrocarbon leak or potential collision.

The NY Oil Pollution First Strike Plan provides immediate actions required to commence a response. Vessels have SOPEPs in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The NY Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the Petroleum Activities Program.

7.11.5 Oil and Other Hazardous Materials Spill

A significant hydrocarbon spill during the Petroleum Activities Program is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. The Woodside OPEA (Australia) document, supported by the NY Oil Pollution First Strike Plan which provides tactical response guidance to the activity/area and Error! Reference source not found. of this EP, cover spill response for this Petroleum Activities Program.

The Security and Emergency Management Function is responsible for the management of Woodside's hydrocarbon spill response equipment and for the maintenance of hydrocarbon spill preparedness and response documentation. In the event of a major spill, Woodside will request that AMSA (administrator of the National Plan) provides support to Woodside through advice and access to equipment, people and liaison. The interface and responsibilities, as defined under the National Plan, are described in the OPEA (Australia). AMSA and Woodside have a MoU in place to support Woodside in the event of a hydrocarbon spill.

7.11.6 Emergency and Spill Response

Woodside categorises incidents in relation to response requirements as follows:

- **Level 1 Incident** – A Level 1 incident can be resolved through the use of existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site/regionally based teams using existing resources and functional support services.
- **Level 2 Incident** – A Level 2 incident is characterised by a response that requires external operational support to manage the incident. It is triggered in the event the capabilities of the tactical level response are exceeded. This support is provided to the activity via the activation of all, or part of, the responsible CIMT.
- **Level 3 Incident** – A Level 3 incident or crisis is identified as a critical event that seriously threatens the organisation's People, the Environment, company Assets, Reputation, or Livelihood. At Woodside, the Crisis Management Team (CMT) manages the strategic impacts to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation, etc). The CIMT may also be activated as required to manage the operational incident response requirements.

7.11.7 Emergency and Spill Response Drills and Exercises

Testing of Woodside's capability to respond to incidents will be conducted in alignment with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in **Table 7-8**. Woodside's emergency response testing regime is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards/risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are the reference point for emergency management and crisis management exercise schedule development. External participants may be invited to attend exercises, such as government agencies, specialist service providers, oil spill response organisations or industry members with which we have mutual aid arrangements.

The overall objective of exercising is to test procedures, skills and teamwork of the Emergency Response and Command Teams in their ability to respond to major incidents. After each exercise, the team holds a debrief session, during which the exercise is reviewed. Any lessons learnt or areas for improvement are identified and incorporated into revised procedures where appropriate.

Table 7-8: Testing of response capability

Response Category	Scope	Response Testing Frequency	Response Testing Objective
Level 1 Response	Drills are asset specific	Two comprehensive Level 1 'First Strike' drills conducted per year, per asset. Additional Level 1 emergency drills routinely conducted (approximately one per fortnight).	<ul style="list-style-type: none"> Comprehensive drill test elements of the NY Oil Pollution First Strike Plan for a Level 1 incident. Emergency drills are scheduled by each asset to test other aspects of their ERP.
Level 2 Response	Exercises are relevant to all Woodside assets	A minimum of one Emergency Management exercise is conducted biennially.	<ul style="list-style-type: none"> Testing both the facility IMT response and/or that of the CIMT following handover of incident control.
Level 3 Response		The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the VP of Security and Emergency Management.	<ul style="list-style-type: none"> Test the ability of the company to respond to and manage a crisis level incident.

7.11.8 Hydrocarbon Spill Response testing of Arrangements

There are a number of arrangements which, in the event of a spill, will underpin Woodside's ability to implement a response across its petroleum activities. In order to ensure these arrangements are adequately tested, the Capability Development Team within Security and Emergency Management ensures tests are conducted in alignment with the Hydrocarbon Spill Testing of Arrangements Schedule.

Woodside's arrangements for spill response are common across Australian operating assets and activities to ensure controls are consistent. The overall objective of testing these arrangements is to ensure Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities
- test response arrangements and actions to validate response plans
- ensure lessons learned are incorporated into Woodside processes and procedures and improvements made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly.

In addition to the testing of response capability described in **Table 7-8**, up to eight formal exercises are planned annually, pan-Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

7.11.9 Testing of Arrangements Schedule

Woodside's Testing of Arrangements Schedule (**Figure 7-8**) aligns with international good practice for spill preparedness and response management; the testing is compatible with the International Petroleum Industry Environmental Conservation Association (IPIECA, 2004) Good Practice Guide and the Australian Emergency Management Institute Handbook. If a spill occurs, enacting these

arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

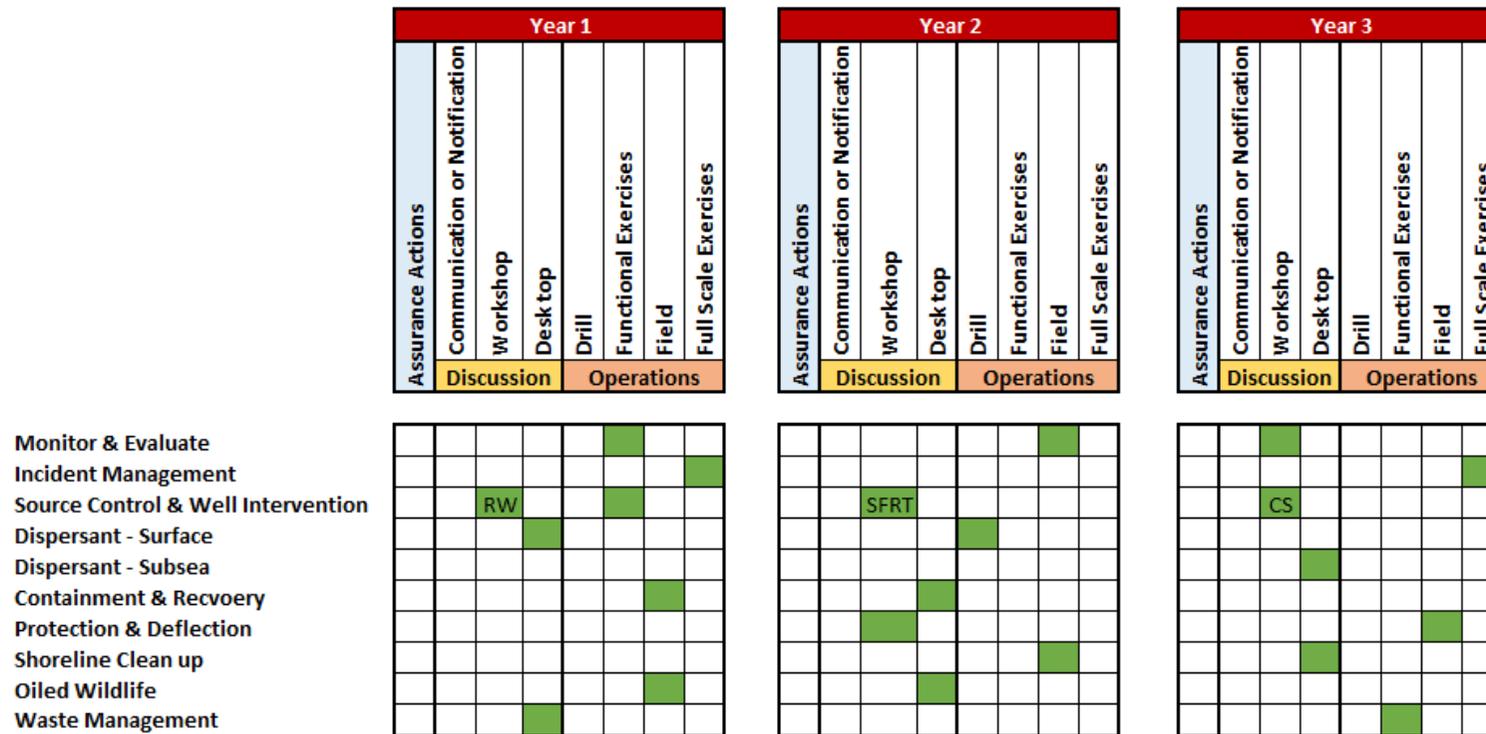

Figure 7-8: Indicative three-yearly testing of arrangement schedule

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside's regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g. capability, equipment and personnel). For example, an arrangement could be to test Woodside's personnel capability for conducting scientific monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment.

The vertical columns relate to how hydrocarbon spill arrangements will be tested over the three-year rolling schedule. The sub-heading for the column describes the standard method of testing (e.g. discussion exercise, desktop exercise), and the green filled cells indicate the arrangements that could be tested for each method.

Some arrangements in the schedule are tested across multiple exercises (e.g. critical arrangements) or via other 'additional assurance' methods outside of the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g. audits, no-notice drills, internal exercises, assurance drills).

7.11.10 Cyclone and Dangerous Weather Preparation

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

Subsea support vessels receive regular forecasts from the Bureau of Meteorology (BoM). If a cyclone (or severe weather event) is forecast, the path and its development will be plotted and monitored using the BoM data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activities Program, the asset Cyclone Contingency Plan and the vessel's Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

9 LIST OF TERMS AND ACRONYMS

Acronym	Description
@	at
~	approximately
<	less/fewer than
>	greater/more than
≤	less than or equal to
≥	greater than or equal to
°C	degrees Celsius
2TL	second trunkline
3D	three-dimensional
ABF	Australian Border Force
ABN	Australian business number
ACN	Australian company number
AFMA	Australian Fisheries Management Agency
AHO	Australian Hydrographic Office
AIMS	Australian Institute of Marine Science
ALARP	as low as reasonably practicable
AMOSC	Australian Marine Oil Spill Centre
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
APPEA	Australian Petroleum Production and Exploration Association
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ARPANSA	Australian Radiation Protection and Nuclear Safety Agency
ART	acoustic resonance testing
AS/NZS	Australian Standard/New Zealand Standard
BESS	battery energy storage system
BDV	blow-down valve
BIA	biologically important area
BoM	Bureau of Meteorology
BTAC	Buurabalayji Thalanyji Aboriginal Corporation
Ca	Calcium
CAES	catch and effort system
CALM	Department of Conservation and Land Management
CCE	common cause event
CCR	central control room
CDU	control distribution unit
CEB	chemically enhanced backflush
CFA	Commonwealth Fisheries Association
CI	continuous improvement

Acronym	Description
CICC	Corporate Incident Communication Centre
CIM	Cimatti Fields
CIP	clean-in-place
CITV	chemical injection throttle valve
cm	centimetre
cm ³	cubic centimetre
CMMS	computerised maintenance management system
CMT	Crisis Management Team
CO	carbon monoxide
CO ₂	carbon dioxide
CoP	cessation of production
cP	centipoise
CP	cathodic protection
CS	cost sacrifice
CV	company value
CVI	close visual inspection
CVS	Contractor Verification Service
CWF	customised water flood
DAA	Department of Aboriginal Affairs
DAFF	Department of Agriculture, Fisheries and Forestry
DAWE	Department of Agriculture, Water and the Environment
DBCA	Department of Biodiversity, Conservation and Attractions
dB re 1 µPa	decibels relative to one micropascal; the unit used to measure the intensity of an underwater sound
D&C	drilling and completions
DCA	Drill Centre A
DCB	Drill Centre B
DCCEEW	Department of Climate Change, Energy, the Environment and Water
DEHWA	Department of the Environment, Water, Heritage and the Arts
DISER	Department of Industry, Science, Energy and Resources
DEMIRS	Western Australian Department of Energy, Mines, Industry Regulation and Safety
DNP	Director of National Parks
DoD	Department of Defence
DoEE	Commonwealth Department of the Environment and Energy
DoT	Western Australian Department of Transport
DP	dynamic positioning
DPIRD	Western Australian Department of Primary Industry and Regional Development
DWT	dead weight tonnage
eCAR	Environmental Commitments and Actions Register
EET	emission estimation techniques

Acronym	Description
EFL	electrical flying lead
EIO	East Indian Ocean
EMBA	environment that may be affected
ENVID	environment identification (study)
EoFL	end of field life
EP	Environment Plan
EPBC Act	<i>Commonwealth Environment Protection and Biodiversity Conservation Act 1999</i>
EPO	environmental performance objective
EPS	environment performance standard
ERP	Emergency Response Plan
ESD	emergency shutdown
ESDV	emergency shutdown valve
ETA	exploration wells temporarily abandoned
FFS	fitness for services
FPSO	floating production, storage and offloading facility
g	gram
GE	Greater Enfield system (for the LAV, NOL and CIM reservoirs)
GHG	greenhouse gas
GP	good practice
GVI	general visual inspection
GWA	Goodwyn Alpha
HAZID	hazard identification (study)
HFL	hydraulic flying lead
HP	high pressure
HQ	hazard quotient
HSE	health, safety and environment
HSEC	health, safety and environment coordinator
HVAC	heating, ventilation and air conditioning
Hz	hertz
ICLDP	Incident and Crisis Leadership Development Program
ICOMOS	International Council on Monuments and Sites
ILUA	Indigenous Land Use Agreement
IMCRA	Integrated Marine and Coastal Regionalization of Australia
IMMR	inspection, maintenance, monitoring and repair
IMO	International Maritime Organisation
IMS	invasive marine species
IMSMP	Invasive Marine Species Management Plan
IPIECA	International Petroleum Industry Environmental Conservation Association
ISO	International Organization for Standardization

Acronym	Description
ISSoW	integrated safe system of work
IUCN	International Union for Conservation of Nature
JRCC	Joint Rescue Coordination Centre
KEF	key ecological feature
KBSF	King Bay Supply Facility
kg	kilogram
KGP	Karratha Gas Plant
kHz	kilohertz
km	kilometre
kn	knot
KO	knock out (drum)
kPa	measurement for air pressure
KPI	key performance indicator
kW	kilowatt
L	litre
LACHS	Local Aboriginal Cultural Heritage Service
LAV	Laverda Canyon Reservoir
LC	Laverda Canyon
LCS	legislation, codes and standards
LNG	liquefied natural gas
LOA	length overall
LOT	leak-off testing
LOWC	loss of well containment
LP	low pressure
LTO	licence to operate
LTP	long-term plan
m	metre
m/s	metres per second
m ²	square metre
m ³	cubic metre
MAE	major accident event
MARPOL	the International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978
MBES	multibeam sonar
MC	measurement criteria
MCS	master control station
MEE	major environmental event
MEG	monoethylene glycol
METL	maintenance engineering team leader
MFO	marine fauna observer

Acronym	Description
mg	milligram
Mg	magnesium
ml	millilitre
Mm	millimetre
MMscfd	million standard cubic feet per day
MNES	matters of national environmental significance
MoC	management of change
MOPO	Manual of Permitted Operation
MoU	Memorandum of Understanding
MPA	Marine Protected Area
MPFM	multi-phase flow meter
MPP	multi-phase pumping
MSPS	Management System Performance Standards
MW	megawatt
n.d.	no date
N/A	not applicable
N ₂ O	nitrous oxide
NAC	Ngarluma Aboriginal Corporation
NAVAIDS	navigation aids
NDT	non-destructive testing
NGERS	National Greenhouse and Energy Reporting Scheme
NIMS	non-indigenous marine species
nm	nautical mile
NOEC	no observable effect concentration
NOL	Norton over Laverda
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NOPTA	National Offshore Petroleum Titles Administrator
NORM	naturally occurring radioactive material
NO _x	oxides of nitrogen
NPI	National Pollutant Inventory
NRC	North Rankin Complex
NTA	<i>Native Title Act 1993</i>
NTGAC	Nganhurra Thanardi Garrbu Aboriginal Corporation
NWMR	North-west Marine Region
NWS	North West Shelf
OCIMF	Oil Companies International Marine Forum
OCNS	Offshore Chemical Notification Scheme
OIM	offshore installation manager
OIW	oil in water

Acronym	Description
OPEA	Oil Pollution Emergency Arrangements (Australia)
OPEP	Oil Pollution Emergency Plan
OPGGGS Act	<i>Commonwealth Offshore Petroleum and Greenhouse Gas Storage Act 2006</i>
OSPAR	Oslo–Paris Convention for the Protection of the Marine Environment of the North East Atlantic
OSREC	Oil Spill Response Skills Enhancement Course
OSRO	Oil Spill Response Organization
PAH	polycyclic aromatic hydrocarbon
PBC	Prescribed Body Corporate
PCM	process control module
PCV	pressure control valves
pH	measure of acidity or basicity of a solution
PJ	professional judgement
PLONOR	pose little or no risk to the environment
PMS	power management system
PMST	Protected Matters Search Tool
PoB	personnel onboard
PPA	Pearl Producers Association
ppb	parts per billion
ppm	parts per million
PSE	rupture discs
PSM	process safety management
PSRA	process safety risk assessment
PSV	pressure safety valves
PSZ	petroleum safety zone
PTS	permanent threshold shift
PW	produced water
RATSIB	Representative Aboriginal/Torres Strait Islander Bodies
RBA	risk-based analysis
RBI	risk-based inspection
RCC	Rescue Coordination Centre
rms	root mean square
RO	reverse osmosis
ROV	remotely operated vehicle
SBP	sub-bottom profiling
SCC	safety and environment critical component
SCE	safety and environmental critical element
SCM	subsea control module
SCC	safety and environmental critical component
SCSSV	surface controlled subsurface safety valves

Acronym	Description
SIMAP	spill impact mapping and analysis program
SEL	sound exposure level
SKM	Sinclair Knight Merz (company)
sm ³	standard cubic metres
SMPEP	Shipboard Marine Pollution Emergency Plan
SO ₂	sulphur dioxide
SOLAS	Safety of Life at Sea
SOPEP	Ship Oil Pollution Emergency Plan
SO _x	sulfur oxides
SPL	sound pressure level
SRU	sulphate removal unit
SSPL	subsea and pipelines
SSS	side scan sonar
STP	submerged turret production
SV	societal value
SVP	Senior Vice President
T	tonne
TAP	Threat Abatement Plan
TEG	triethylene glycol
TL	transmission loss
TN	total nitrogen
TP	total phosphorous
TPH	total petroleum hydrocarbons
TRH	total recoverable hydrocarbon
TSM	Technical Systems Manual
TTS	temporary threshold shift
UF	ultrafiltration
UK	United Kingdom
UNDS	United States Uniform National Discharge Standards
UPS	uninterrupted power supply; battery power system
USV	unscrewed surface vessel
UTA	umbilical termination assembly
VIN	Vincent reservoir
VOC	volatile organic compound
VP	Vice President
WA	Western Australia
WAC	Wirrawandi Aboriginal Corporation
WAF	water accommodated fraction
WAFIC	Western Australian Fishing Industry Council

WALGA	Western Australia Local Government Association
WGS84	Word Geodesic System 1984
WIP	water injection pump
WLS	Woodside Learning Services
WMS	Woodside Management System
Woodside	Woodside Energy Limited
WOMP	Well Operations Management Plan
XT	x-mas tree
YAC	Yinggarda Aboriginal Corporation
YMAC	Yamatji Marlpa Aboriginal Corporation
EMBA	environment that may be affected

APPENDIX A WOODSIDE ENVIRONMENT AND BIODIVERSITY POLICY

WOODSIDE POLICY

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new exploration or development of hydrocarbons within the boundaries of natural sites on the UNESCO World Heritage List (as specified at 1 December 2022). Existing activity may continue if compatible with maintenance of the listed outstanding universal values.
- Not undertaking new exploration or development of hydrocarbons within IUCN Protected Areas (as specified at 1 December 2022) unless compatible with management plans in place for the area. Existing activity may continue if compatible with management plans in place for the area.
- Achieving net zero deforestation¹ associated with new projects that take a Final Investment Decision (FID) after 1 December 2022.
- Developing Biodiversity Action Plans for all new major projects (CAPEX >USD\$2 billion) that take a FID after 1 December 2022.
- Supporting positive biodiversity outcomes in regions and areas in which we operate.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Approved by the Woodside Energy Group Ltd Board in December 2022.

¹ Definition of Forest: 'trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared'.

APPENDIX B RELEVANT REQUIREMENTS

The below table refers to Commonwealth Legislation related to the project.

Commonwealth Legislation	Legislation Summary
<i>Aboriginal and Torres Strait Islander Heritage Protection Act 1984</i>	<p>The Act seeks to “preserve and protect places, areas and objects of particular significance” to Aboriginal people. Under the Section 9 and 10 provisions of the Act, the Minister for the Environment may declare significant Aboriginal areas temporarily or permanently protected if they are considered under threat. Similar declarations regarding Aboriginal objects can be made under Section 12.</p> <p>Under Section 22 of the Act, the contravention of any of these declarations is an offence. Additionally, the discovery of any Aboriginal remains must be reported to the Minister under Section 20.</p> <p>Damage or interference with Aboriginal objects or places is not an offence under the ATSIHP Act except within Victoria under Section 21U.</p>
<p><i>Air Navigation Act 1920</i> <i>Air Navigation Regulations 1947</i> <i>Air Navigation (Aerodrome Flight Corridors) Regulations 1994</i> <i>Air Navigation (Aircraft Engine Emissions) Regulations 1995</i> <i>Air Navigation (Aircraft Noise) Regulations 1984</i> <i>Air Navigation (Fuel Spillage) Regulations 1999</i></p>	<p>This Act relates to the management of air navigation.</p>
<i>Australian Maritime Safety Authority Act 1990</i>	<p>This Act establishes a legal framework for the Australian Maritime Safety Authority (AMSA), which represents the Australian Government and international forums in the development, implementation and enforcement of international standards including those governing ship safety and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters.</p>
<i>Australian Radiation Protection and Nuclear Safety Act 1998</i>	<p>This Act relates to the protection of the health and safety of people, and the protection of the environment from the harmful effects of radiation.</p>
<p><i>Biosecurity Act 2015</i> <i>Quarantine Regulations 2000</i> <i>Biosecurity Regulation 2016</i> <i>Australian Ballast Water Management Requirements 2017</i></p>	<p>This Act provides the Commonwealth with powers to take measures of quarantine, and implement related programs as are necessary, to prevent the introduction of any plant, animal, organism or matter that could contain anything that could threaten Australia’s native flora and fauna or natural environment. The Commonwealth’s powers include powers of entry, seizure, detention and disposal.</p> <p>This Act includes mandatory controls on the use of seawater as ballast in ships and the declaration of sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers.</p>
<p><i>Environment Protection and Biodiversity Conservation Act 1999</i> <i>Environment Protection and Biodiversity Conservation Regulations 2000</i></p>	<p>This Act protects matters of national environmental significance (NES). It streamlines the national environmental assessment and approvals process, protects Australian biodiversity and integrates management of important natural and culturally significant places.</p> <p>Under this Act, actions that may be likely to have a significant impact on matters of NES must be referred to the Commonwealth Environment Minister.</p>

Commonwealth Legislation	Legislation Summary
<p><i>Environment Protection (Sea Dumping) Act 1981</i> Environment Protection (Sea Dumping) Regulations 1983</p>	<p>This Act provides for the protection of the environment by regulating dumping matter into the sea, incineration of waste at sea and placement of artificial reefs.</p>
<p><i>Industrial Chemicals (Notification and Assessment Act) 1989</i> Industrial Chemicals (Notification and Assessment) Regulations 1990</p>	<p>This Act creates a national register of industrial chemicals. The Act also provides for restrictions on the use of certain chemicals which could have harmful effects on the environment or health.</p>
<p><i>National Environment Protection Measures (Implementation) Act 1998</i> National Environment Protection Measures (Implementation) Regulations 1999</p>	<p>This Act and Regulations provide for the implementation of National Environment Protection Measures (NEPMs) to protect, restore and enhance the quality of the environment in Australia and ensure that the community has access to relevant and meaningful information about pollution.</p> <p>The National Environment Protection Council has made NEPMs relating to ambient air quality, the movement of controlled waste between states and territories, the national pollutant inventory, and used packaging materials.</p>
<p><i>National Greenhouse and Energy Reporting Act 2007</i> National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</p>	<p>This Act and associated Rule establishes the legislative framework for the NGER scheme for reporting greenhouse gas emissions and energy consumption and production by corporations in Australia.</p>
<p><i>Navigation Act 2012</i> Marine Order 12: Construction – subdivision and stability, machinery and electrical installations Marine Order 30: Prevention of collisions Marine Order 47L Offshore Industry units Marine Order 57: Helicopter operations Marine Order 91: Marine pollution prevention – oil Marine Order 93: Marine pollution prevention – noxious liquid substances Marine Order 94: Marine pollution prevention – packaged harmful substances Marine Order 96: Marine pollution prevention - sewage Marine Order 97: Marine pollution prevention – air pollution</p>	<p>This Act regulates navigation and shipping including Safety of Life at Sea (SOLAS). The Act will apply to some activities of the FPSO and project vessels.</p> <p>This Act is the primary legislation that regulates ship and seafarer safety, shipboard aspects of marine environment protection and pollution prevention.</p>
<p><i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i> Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011 Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009</p>	<p>This Act is the principal Act governing offshore petroleum exploration and production in Commonwealth waters. Specific environmental, resource management and safety obligations are set out in the Regulations listed.</p>
<p><i>Ozone Protection and Synthetic Greenhouse Gas Management Act 1989</i> Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995</p>	<p>This Act provides for measures to protect ozone in the atmosphere by controlling and ultimately reducing the manufacture, import and export of ozone depleting substances (ODS) and synthetic greenhouse gases, and replacing them with suitable alternatives. The Act will only apply to Woodside if it manufactures, imports or exports ozone depleting substances.</p>
<p><i>Protection of the Sea (Powers of Intervention) Act 1981</i></p>	<p>This Act authorises the Commonwealth to take measures for the purpose of protecting the sea from pollution by oil and other noxious substances discharged from ships and provides legal immunity for persons acting under an AMSA direction.</p>

Commonwealth Legislation	Legislation Summary
<p><i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994</p> <ul style="list-style-type: none"> • Marine Order 91: Marine pollution prevention – oil • Marine Order 93: Marine pollution prevention – noxious liquid substances • Marine Order 94: Marine pollution prevention – packaged harmful substances • Marine Order 95: Marine pollution prevention – garbage • Marine Order 96L Marine pollution prevention – sewage <p><i>Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007</i> MARPOL Convention</p>	<p>This Act relates to the protection of the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances.</p> <p>The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 nm off the coast out to the end of the Australian Exclusive Economic Zone (200 nm). It also applies within the 3 nm of the coast where the State/Northern Territory does not have complementary legislation.</p> <p>All the Marine Orders listed, except for Marine Order 95, are enacted under both the <i>Navigation Act 2012</i> and the <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i>.</p> <p>This Act is an amendment to the <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i>. This amended Act provides the protection of the sea from pollution by oil and other harmful substances discharged from ships.</p>
<p><i>Protection of the Sea (Harmful Antifouling Systems) Act 2006</i> Marine Order 98: Marine pollution – anti-fouling systems</p>	<p>This Act relates to the protection of the sea from the effects of harmful anti-fouling systems. It prohibits the application or reapplication of harmful anti-fouling compounds on Australian ships or foreign ships that are in an Australian shipping facility.</p>
<p><i>Underwater Cultural Heritage Act 2018</i> Underwater Cultural Heritage Guidance for Offshore Developments DRAFT Guidelines to Protect Underwater Cultural Heritage</p>	<p>This Act prescribes penalties for damage to protected underwater cultural heritage without a permit under Section 30 or in contravention of a permit in section 28. Protected Underwater cultural heritage is prescribed in section 16 to automatically include the remains and associated artefacts of any vessel or aircraft that has been in Australian waters for 75 years, whether known or unknown. This protection is also extended to underwater cultural heritage in Commonwealth waters specified by the Environment Minister under section 17. Without a declaration under this section, Aboriginal underwater cultural heritage is not protected under the UCH Act.</p>

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	26
Listed Migratory Species:	41

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	64
Whales and Other Cetaceans:	30
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	42
Key Ecological Features (Marine):	3
Biologically Important Areas:	9
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Carcharias taurus (west coast population) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species [\[Resource Information \]](#)

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		

Scientific Name	Threatened Category	Presence Text
Anous stolidus Common Noddy [825]		Species or species habitat may occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat may occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Congregation or aggregation known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Congregation or aggregation known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Sousa sahalensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short- bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribbioned Pipehorse, Ribbioned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat may occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Congregation or aggregation known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Congregation or aggregation known to occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Continental Slope Demersal Fish Communities	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Seabirds		
Ardena pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	2
National Heritage Places:	7
Wetlands of International Importance (Ramsar)	3
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	5
Listed Threatened Ecological Communities:	9
Listed Threatened Species:	160
Listed Migratory Species:	106

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	65
Commonwealth Heritage Places:	8
Listed Marine Species:	198
Whales and Other Cetaceans:	43
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	49
Habitat Critical to the Survival of Marine Turtles:	5

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	123
Regional Forest Agreements:	1
Nationally Important Wetlands:	14
EPBC Act Referrals:	438
Key Ecological Features (Marine):	18
Biologically Important Areas:	116
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [\[Resource Information \]](#)

Name	State	Legal Status
Shark Bay, Western Australia	WA	Declared property
The Ningaloo Coast	WA	Declared property

National Heritage Places [\[Resource Information \]](#)

Name	State	Legal Status
Historic		
HMAS Sydney II and HSK Kormoran Shipwreck Sites	EXT	Listed place
Batavia Shipwreck Site and Survivor Camps Area 1629 - Houtman Abrolhos	WA	Listed place
Dirk Hartog Landing Site 1616 - Cape Inscription Area	WA	Listed place

Indigenous

Dampier Archipelago (including Burrup Peninsula)	WA	Listed place
--	----	--------------

Natural

Shark Bay, Western Australia	WA	Listed place
The Ningaloo Coast	WA	Listed place
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [\[Resource Information \]](#)

Ramsar Site Name	Proximity
Becher point wetlands	Within 10km of Ramsar site
Peel-yalgorup system	Within Ramsar site
Roebuck bay	Within 10km of Ramsar site

Commonwealth Marine Area [\[Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Listed Threatened Ecological Communities

[[Resource Information](#)]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Aquatic Root Mat Community 1 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community 3 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community 4 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community in Caves of the Swan Coastal Plain	Endangered	Community known to occur within area
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community likely to occur within area
Empodisma peatlands of southwestern Australia	Endangered	Community may occur within area
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community likely to occur within area
Sedgeland in Holocene dune swales of the southern Swan Coastal Plain	Endangered	Community known to occur within area
Tuart (<i>Eucalyptus gomphocephala</i>) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community likely to occur within area

Listed Threatened Species

[[Resource Information](#)]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.

Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Aphelocephala leucopsis Southern Whiteface [529]	Vulnerable	Species or species habitat likely to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat likely to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Calyptorhynchus banksii naso Forest Red-tailed Black-Cockatoo, Karrak [67034]	Vulnerable	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat likely to occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Malurus leucopterus edouardi White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
Malurus leucopterus leucopterus White-winged Fairy-wren (Dirk Hartog Island), Dirk Hartog Black-and-White Fairy-wren [26004]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Polytelis alexandrae Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Turnix varius scintillans Painted Button-quail (Houtman Abrolhos) [82451]	Endangered	Species or species habitat known to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
Zanda baudinii listed as Calyptorhynchus baudinii Baudin's Cockatoo, Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Breeding known to occur within area
Zanda latirostris listed as Calyptorhynchus latirostris Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area

CRUSTACEAN

Scientific Name	Threatened Category	Presence Text
Engaewa pseudoreducta Margaret River Burrowing Crayfish [82674]	Critically Endangered	Species or species habitat may occur within area
Engaewa reducta Dunsborough Burrowing Crayfish [82675]	Critically Endangered	Species or species habitat may occur within area
Kumonga exleyi Cape Range Remipede [86875]	Vulnerable	Species or species habitat known to occur within area

FISH

Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Milyeringa veritas Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
Nannatherina balstoni Balston's Pygmy Perch [66698]	Vulnerable	Species or species habitat known to occur within area
Ophisternon candidum Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area

INSECT

Hesperocolletes douglasi Douglas' Broad-headed Bee, Rottnest Bee [66734]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur Barrow and Boodie Islands subspecies Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
Bettongia lesueur lesueur Burrowing Bettong (Shark Bay), Boodie [66659]	Vulnerable	Species or species habitat known to occur within area
Bettongia penicillata ogilbyi Woylie [66844]	Endangered	Species or species habitat known to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat likely to occur within area
Dasyurus geoffroii Chuditch, Western Quoll [330]	Vulnerable	Translocated population known to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Isoodon auratus barrowensis Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Lagorchestes conspicillatus conspicillatus Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus bernieri Rufous Hare-wallaby (Bernier Island) [66662]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus Central Australian subspecies Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
Lagorchestes hirsutus dorrae Rufous Hare-wallaby (Dorre Island) [66663]	Vulnerable	Species or species habitat known to occur within area
Lagostrophus fasciatus fasciatus Banded Hare-wallaby, Merrnine, Marnine, Munning [66664]	Vulnerable	Species or species habitat known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Mesembriomys gouldii gouldii Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat may occur within area
Myrmecobius fasciatus Numbat [294]	Endangered	Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Osphranter robustus isabellinus Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Parantechinus apicalis Dibbler [313]	Endangered	Species or species habitat known to occur within area
Perameles bougainville Shark Bay Bandicoot [278]	Endangered	Species or species habitat known to occur within area
Petrogale concinna monastria Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Petrogale lateralis lateralis Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat likely to occur within area
Pseudocheirus occidentalis Western Ringtail Possum, Ngwayir, Womp, Woder, Ngoor, Ngoolangit [25911]	Critically Endangered	Species or species habitat known to occur within area
Pseudomys fieldi Shark Bay Mouse, Djoongari, Alice Springs Mouse [113]	Vulnerable	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Setonix brachyurus Quokka [229]	Vulnerable	Species or species habitat known to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
OTHER		
Westralunio carteri Carter's Freshwater Mussel, Freshwater Mussel [86266]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Andersonia gracilis Slender Andersonia [14470]	Endangered	Species or species habitat may occur within area
Androcalva bivillosa Stragglng Androcalva [87807]	Critically Endangered	Species or species habitat likely to occur within area
Anigozanthos viridis subsp. terraspectans Dwarf Green Kangaroo Paw [3435]	Vulnerable	Species or species habitat may occur within area
Banksia mimica Summer Honeypot [82765]	Endangered	Species or species habitat may occur within area
Banksia squarrosa subsp. argillacea Whicher Range Dryandra [82769]	Vulnerable	Species or species habitat may occur within area
Beyeria lepidopetala Small-petalled Beyeria, Short-petalled Beyeria [18362]	Endangered	Species or species habitat likely to occur within area
Caladenia barbarella Small Dragon Orchid, Common Dragon Orchid [68686]	Endangered	Species or species habitat may occur within area
Caladenia bryceana subsp. cracens Northern Dwarf Spider-orchid [64556]	Vulnerable	Species or species habitat known to occur within area
Caladenia caesarea subsp. maritima Cape Spider-orchid [64856]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Caladenia elegans Elegant Spider-orchid [56775]	Endangered	Species or species habitat known to occur within area
Caladenia excelsa Giant Spider-orchid [56717]	Endangered	Species or species habitat likely to occur within area
Caladenia hoffmanii Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat likely to occur within area
Caladenia huegelii King Spider-orchid, Grand Spider-orchid, Rusty Spider-orchid [7309]	Endangered	Species or species habitat likely to occur within area
Caladenia lodgeana Lodge's Spider-orchid [68664]	Critically Endangered	Species or species habitat known to occur within area
Caladenia viridescens Dunsborough Spider-orchid [56776]	Endangered	Species or species habitat known to occur within area
Caleana dixonii listed as Paracaleana dixonii Sandplain Duck Orchid [87944]	Endangered	Species or species habitat may occur within area
Calectasia cyanea Blue Tinsel Lily [7669]	Critically Endangered	Species or species habitat may occur within area
Chamelaucium lullfitzii listed as Chamelaucium sp. Gingin (N.G.Marchant 6) Gingin Wax [92777]	Endangered (listed as Chamelaucium sp. Gingin)	Species or species habitat likely to occur within area
Chorizema humile Prostrate Flame Pea [32573]	Endangered	Species or species habitat may occur within area
Chorizema varium Limestone Pea [16981]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Diuris drummondii Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat may occur within area
Diuris micrantha Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat known to occur within area
Diuris purdiei Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat may occur within area
Drakaea concolor Kneeling Hammer-orchid [56777]	Vulnerable	Species or species habitat known to occur within area
Drakaea elastica Glossy-leafed Hammer Orchid, Glossy-leafed Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat likely to occur within area
Drakaea micrantha Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat likely to occur within area
Drummondita ericoides Morseby Range Drummondita [9193]	Endangered	Species or species habitat may occur within area
Eleocharis keigheryi Keighery's Eleocharis [64893]	Vulnerable	Species or species habitat may occur within area
Eucalyptus argutifolia Yanchep Mallee, Wabbling Hill Mallee [24263]	Vulnerable	Species or species habitat known to occur within area
Eucalyptus beardiana Beard's Mallee [18933]	Vulnerable	Species or species habitat may occur within area
Eucalyptus cuprea Mallee Box [56773]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eucalyptus x phylacis Meelup Mallee [87817]	Endangered	Species or species habitat known to occur within area
Gastrolobium papilio Butterfly-leaved Gastrolobium [78415]	Endangered	Species or species habitat may occur within area
Hemiandra gardneri Red Snakebush [7945]	Endangered	Species or species habitat likely to occur within area
Kennedia lateritia Augusta Kennedia [45985]	Endangered	Species or species habitat likely to occur within area
Lambertia echinata subsp. occidentalis Western Prickly Honeysuckle [64528]	Endangered	Species or species habitat may occur within area
Leucopogon obtectus Hidden Beard-heath [19614]	Endangered	Species or species habitat may occur within area
Macarthuria keigheryi Keighery's Macarthuria [64930]	Endangered	Species or species habitat may occur within area
Marianthus paralius [83925]	Endangered	Species or species habitat known to occur within area
Melaleuca sp. Wanneroo (G.J. Keighery 16705) [89456]	Endangered	Species or species habitat known to occur within area
Minuria tridens Minnie Daisy [13753]	Vulnerable	Species or species habitat known to occur within area
Pterostylis sinuata Northampton Midget Greenhood, Western Swan Greenhood [84991]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Stachystemon nematophorus Three-flowered Stachystemon [81447]	Vulnerable	Species or species habitat likely to occur within area
Wurmbea calcicola Naturaliste Nancy [64691]	Endangered	Species or species habitat known to occur within area
Wurmbea tubulosa Long-flowered Nancy [12739]	Endangered	Species or species habitat may occur within area

REPTILE

Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Ctenotus lancelini Lancelin Island Skink [1482]	Vulnerable	Translocated population known to occur within area
Ctenotus zasticus Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Lerista neviniae Nevin's Slider [85296]	Endangered	Species or species habitat known to occur within area
Liasis olivaceus barroni Olive Python (Pilbara subspecies) [66699]	Vulnerable	Species or species habitat known to occur within area
Liopholis pulchra longicauda Jurien Bay Skink, Jurien Bay Rock-skink [83162]	Vulnerable	Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharias taurus (west coast population) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Breeding likely to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

SPIDER

Idiosoma nigrum Shield-backed Trapdoor Spider, Black Rugose Trapdoor Spider [66798]	Vulnerable	Species or species habitat known to occur within area
--	------------	---

Listed Migratory Species

[[Resource Information](#)]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
Ardenna grisea Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area

Migratory Marine Species

Scientific Name	Threatened Category	Presence Text
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahalensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Species or species habitat known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Commonwealth Lands [\[Resource Information \]](#)

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species	[Resource Information]	
Scientific Name	Threatened Category	Presence Text

Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Ardena carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
Ardena grisea as Puffinus griseus Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardena pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Species or species habitat known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding likely to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area overfly marine area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Pterodroma macroptera Great-winged Petrel [1035]		Foraging, feeding or related behaviour known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Puffinus assimilis Little Shearwater [59363]		Breeding known to occur within area
Puffinus huttoni Hutton's Shearwater [1025]		Foraging, feeding or related behaviour known to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Species or species habitat known to occur within area overfly marine area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Acentronura australe Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus subelongatus West Australian Seahorse [66722]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Mitotichthys meraculus Western Crested Pipefish [66259]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Longsnout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Breeding known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus fuscus Dusky Seasnake [1119]		Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus pooleorum Shark Bay Seasnake [66061]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia inornata as Hydrophis inornatus Plain Seasnake [87379]		Species or species habitat may occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
<i>Eretmochelys imbricata</i> Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
<i>Hydrelaps darwiniensis</i> Black-ringed Seasnake [1100]		Species or species habitat may occur within area
<i>Hydrophis atriceps</i> Black-headed Seasnake [1101]		Species or species habitat may occur within area
<i>Hydrophis elegans</i> Elegant Seasnake [1104]		Species or species habitat may occur within area
<i>Hydrophis macdowelli</i> as <i>Hydrophis mcdowelli</i> Small-headed Seasnake [75601]		Species or species habitat may occur within area
<i>Lapemis curtus</i> as <i>Lapemis hardwickii</i> Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
<i>Leioselasma coggeri</i> as <i>Hydrophis coggeri</i> Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area
<i>Leioselasma czeblukovi</i> as <i>Hydrophis czeblukovi</i> Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
<i>Leioselasma pacifica</i> as <i>Hydrophis pacificus</i> Large-headed Seasnake, Pacific Seasnake [87378]		Species or species habitat may occur within area
<i>Lepidochelys olivacea</i> Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
<i>Natator depressus</i> Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
<i>Pelamis platurus</i> Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area

Current Scientific Name	Status	Type of Presence
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahalensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Albany Canyons group and adjacent shelf break	South-west
Ancient coastline at 125 m depth contour	North-west
Ancient coastline at 90-120m depth	South-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Cape Mentelle upwelling	South-west
Carbonate bank and terrace system of the Sahul Shelf	North-west
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	South-west
Commonwealth marine environment within and adjacent to Geographe Bay	South-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	South-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Pinnacles of the Bonaparte Basin	North-west
Western demersal slope and associated fish communities	South-west
Western rock lobster	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dolphins		

Scientific Name	Behaviour	Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging likely	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Likely to occur

Scientific Name	Behaviour	Presence
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat - unknown behaviour	Likely to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Calving	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging	Known to occur
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging	Likely to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Migration likely	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Caretta caretta Loggerhead Turtle [1763]	Internesting	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur

Scientific Name	Behaviour	Presence
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Juvenile	Known to occur

Scientific Name	Behaviour	Presence
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Nursing	Likely to occur
Pristis pristis Freshwater Sawfish [60756]	Pupping	Likely to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Nursing	Known to occur
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		
Anous stolidus Common Noddy [825]	Foraging	Known to occur
Anous stolidus Common Noddy [825]	Foraging (provisioning young)	Known to occur
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Foraging (provisioning young)	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Aggregation	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Foraging (in high numbers)	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Ardena pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging (provisioning young)	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Hydroprogne caspia Caspian Tern [808]	Foraging (provisioning young)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Former Range
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Known to occur
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Pterodroma macroptera macroptera Great-winged Petrel (macroptera race) [1035]	Foraging (provisioning young)	Known to occur

Scientific Name	Behaviour	Presence
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging (provisioning young)	Known to occur
Sterna dougallii Roseate Tern [817]	Resting	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sternula nereis Fairy Tern [82949]	Foraging (in high numbers)	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging (in high numbers)	Known to occur

Scientific Name	Behaviour	Presence
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Seals		
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Likely to occur
Neophoca cinerea Australian Sea Lion [22]	Foraging (male and female)	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (abundant food source)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (high density)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (on migration)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging Area (annual high use area)	Known to occur

Scientific Name	Behaviour	Presence
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur
Physeter macrocephalus Sperm Whale [59]	Foraging (abundant food source)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 11-Sep-2023

[Summary](#)

[Details](#)

[Matters of NES](#)

[Other Matters Protected by the EPBC Act](#)

[Extra Information](#)

[Caveat](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	29
Listed Migratory Species:	41

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	1
Listed Marine Species:	34
Whales and Other Cetaceans:	38
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	7
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	21
Key Ecological Features (Marine):	4
Biologically Important Areas:	8
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Listed Migratory Species [[Resource Information](#)]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat may occur within area
Ardeenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardeenna grisea Sooty Shearwater [82651]		Species or species habitat may occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Foraging, feeding or related behaviour may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phoebastria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area

Scientific Name	Threatened Category	Presence Text
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat likely to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat likely to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat may occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Key Ecological Features

[\[Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Naturaliste Plateau	South-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Wallaby Saddle	North-west
Western demersal slope and associated fish communities	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Seabirds		

Scientific Name	Behaviour	Presence
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Pterodroma macroptera macroptera Great-winged Petrel (macroptera race) [1035]	Foraging (provisioning young)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 11-Sep-2023

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	19
Listed Migratory Species:	34

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	28
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	3
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	50
Key Ecological Features (Marine):	2
Biologically Important Areas:	2
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area

[\[Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Exmouth Plateau	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 11-Sep-2023

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	19
Listed Migratory Species:	34

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	63
Whales and Other Cetaceans:	26
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	3
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	25
Key Ecological Features (Marine):	2
Biologically Important Areas:	5
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Matters of National Environmental Significance

Commonwealth Marine Area

[\[Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 11-Sep-2023

[Summary](#)

[Details](#)

[Matters of NES](#)

[Other Matters Protected by the EPBC Act](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	3
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	7
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	36
Listed Migratory Species:	42

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	88
Commonwealth Heritage Places:	21
Listed Marine Species:	76
Whales and Other Cetaceans:	25
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	2
Australian Marine Parks:	6
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	3
EPBC Act Referrals:	94
Key Ecological Features (Marine):	1
Biologically Important Areas:	8
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Wetlands of International Importance (Ramsar Wetlands) [\[Resource Information \]](#)

Ramsar Site Name	Proximity
Hosnies spring	Within Ramsar site
Pulu keeling national park	Within Ramsar site
The dales	Within Ramsar site

Commonwealth Marine Area [\[Resource Information \]](#)

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Key Ecological Features

[\[Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Continental Slope Demersal Fish Communities	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
-----------------	-----------	----------

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 11-Sep-2023

[Summary](#)

[Details](#)

[Matters of NES](#)

[Other Matters Protected by the EPBC Act](#)

[Extra Information](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	3
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	7
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	36
Listed Migratory Species:	42

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Ninox natalis Christmas Island Hawk-Owl, Christmas Boobook [66671]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat known to occur within area
Turdus poliocephalus erythropleurus Christmas Island Thrush [67122]	Endangered	Species or species habitat likely to occur within area

FISH

Scientific Name	Threatened Category	Presence Text
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Crocidura trichura Christmas Island Shrew [86568]	Critically Endangered	Species or species habitat likely to occur within area
Pteropus natalis Christmas Island Flying-fox, Christmas Island Fruit-bat [87611]	Critically Endangered	Species or species habitat known to occur within area
PLANT		
Asplenium listeri Christmas Island Spleenwort [65865]	Critically Endangered	Species or species habitat known to occur within area
Pneumatopteris truncata fern [68812]	Critically Endangered	Species or species habitat known to occur within area
Tectaria devexa Cave Fern [14767]	Endangered	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Cryptoblepharus egeriae Christmas Island Blue-tailed Skink, Blue-tailed Snake-eyed Skink [1526]	Critically Endangered	Species or species habitat likely to occur within area
Cyrtodactylus sadleiri Christmas Island Giant Gecko [86865]	Endangered	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Lepidodactylus listeri Christmas Island Gecko, Lister's Gecko [1711]	Critically Endangered	Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area
Ramphotyphlops exocoeti Christmas Island Blind Snake, Christmas Island Pink Blind Snake [1262]	Vulnerable	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area
Listed Migratory Species [Resource Information]		
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area

Migratory Marine Species

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Commonwealth Lands

[\[Resource Information \]](#)

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species	[Resource Information]	
Scientific Name	Threatened Category	Presence Text

Bird		
------	--	--

Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Fish		
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys sculptus Sculptured Pipefish [66197]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Cosmocampus maxweberi Maxweber's Pipefish [66209]		Species or species habitat may occur within area
Doryrhamphus baldwini Redstripe Pipefish [66718]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus macrorhynchus Whiskered Pipefish, Ornate Pipefish [66222]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus mataafae Samoan Pipefish [66223]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys heptagonus Madura Pipefish, Reticulated Freshwater Pipefish [66229]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippichthys spicifer Belly-barred Pipefish, Banded Freshwater Pipefish [66232]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Micrognathus brevirostris thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Leioselasma coggeri as Hydrophis coggeri Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [[Resource Information](#)]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Ginkgo-toothed Beaked Whale, Ginkgo-toothed Whale, Ginkgo Beaked Whale [59564]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features

[\[Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Continental Slope Demersal Fish Communities	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
-----------------	-----------	----------

Scientific Name	Behaviour	Presence
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	None
Listed Migratory Species:	None

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None

Details

Matters of National Environmental Significance

Other Matters Protected by the EPBC Act

Extra Information

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	16
Listed Migratory Species:	28

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 11-Sep-2023

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	29
Listed Migratory Species:	41

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	1
Listed Marine Species:	34
Whales and Other Cetaceans:	38
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	7
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	21
Key Ecological Features (Marine):	4
Biologically Important Areas:	8

Mammal		

Current Scientific Name	Status	Type of Presence
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour may occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Ginkgo-toothed Beaked Whale, Ginkgo-toothed Whale, Ginkgo Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features

[\[Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Naturaliste Plateau	South-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Wallaby Saddle	North-west
Western demersal slope and associated fish communities	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Seabirds		

Scientific Name	Behaviour	Presence
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Pterodroma macroptera macroptera Great-winged Petrel (macroptera race) [1035]	Foraging (provisioning young)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

APPENDIX D CULTURAL HERITAGE SEARCHES

List of Aboriginal Cultural Heritage (ACH) Directory

Search Criteria

No Aboriginal Cultural Heritage (ACH) Directory in Shapefile - New NY OA. Warning: Search area complex so results may be inaccurate. Contact DPLH for assistance.

Disclaimer

The *Aboriginal Cultural Heritage Act 2021 (Act)* recognises, protects, conserves, and preserves Aboriginal cultural heritage (ACH), and recognises the fundamental importance of ACH to Aboriginal people and its role in Aboriginal communities past, present and future. The Act recognises the value of ACH to Aboriginal people as well as to the wider Western Australian community.

Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported to the ACH Council or exists on the Directory.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you email the details to the Department at AboriginalHeritage@dplh.wa.gov.au and we will make every effort to rectify it as soon as possible.

List of Aboriginal Cultural Heritage (ACH) Directory

Terminology

ID: Reported ACH is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH places on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- Boundary Reliable (Yes/No): Indicates whether the location and extent of the ACH boundary is considered reliable.
- Boundary Restricted = No: ACH location is shown as accurately as the information submitted allows.
- Boundary Restricted = Yes: To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- Culturally Sensitive = No: Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- Culturally Sensitive = Yes: Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact AboriginalHeritage@dplh.wa.gov.au.
- Culturally Sensitive Nature:
 - No Gender / Initiation Restrictions: Anyone can view the information.
 - Men only: Only males can view restricted information.
 - Women only: Only females can view restricted information.

Status:

- ACH Directory: Aboriginal cultural heritage place or cultural landscape.
- Pending: Aboriginal cultural heritage place or cultural landscape with information in a verification stage.
- Historic: Aboriginal heritage places determined to not meet the criteria of Section 5 of the Aboriginal Heritage Act 1972. Includes places that no longer exist as a result of land use activities with existing approvals.

ACH Type:

- Cultural Landscape: a group of areas interconnected through the tangible elements of Aboriginal culture heritage present.
- Place: an area in which tangible elements of Aboriginal cultural heritage are present.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

Legacy Place Status: A status determined under the previous Aboriginal Heritage Act 1972:

- Registered Site: the place was assessed as meeting Section 5 of the Aboriginal Heritage Act 1972.
- Lodged: Information was received in relation to the place, but an assessment was not completed to determine if it met section 5 of the Aboriginal Heritage Act 1972.
- Stored Data/Not a Site: The place was assessed as not meeting Section 5 of the Aboriginal Heritage Act 1972.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Coordinates

Map coordinates are based on the GDA 94 Datum.

Disclaimer

The Aboriginal Cultural Heritage Act 2021 (Act) recognises, protects, conserves, and preserves Aboriginal cultural heritage (ACH), and recognises the fundamental importance of ACH to Aboriginal people and its role in Aboriginal communities past, present and future. The Act recognises the value of ACH to Aboriginal people as well as to the wider Western Australian community.

Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported to the ACH Council or exists on the Directory.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you email the details to the Department at AboriginalHeritage@dplh.wa.gov.au and we will make every effort to rectify it as soon as possible.

List of Aboriginal Cultural Heritage (ACH) Directory

Terminology

ID: Reported ACH is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH places on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- Boundary Reliable (Yes/No): Indicates whether the location and extent of the ACH boundary is considered reliable.
- Boundary Restricted = No: ACH location is shown as accurately as the information submitted allows.
- Boundary Restricted = Yes: To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- Culturally Sensitive = No: Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- Culturally Sensitive = Yes: Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact AboriginalHeritage@dplh.wa.gov.au.
- Culturally Sensitive Nature:
 - No Gender / Initiation Restrictions: Anyone can view the information.
 - Men only: Only males can view restricted information.
 - Women only: Only females can view restricted information.

Status:

- ACH Directory: Aboriginal cultural heritage place or cultural landscape.
- Pending: Aboriginal cultural heritage place or cultural landscape with information in a verification stage.
- Historic: Aboriginal heritage places determined to not meet the criteria of Section 5 of the Aboriginal Heritage Act 1972. Includes places that no longer exist as a result of land use activities with existing approvals.

ACH Type:

- Cultural Landscape: a group of areas interconnected through the tangible elements of Aboriginal culture heritage present.
- Place: an area in which tangible elements of Aboriginal cultural heritage are present.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

Legacy Place Status: A status determined under the previous Aboriginal Heritage Act 1972:

- Registered Site: the place was assessed as meeting Section 5 of the Aboriginal Heritage Act 1972.
- Lodged: Information was received in relation to the place, but an assessment was not completed to determine if it met section 5 of the Aboriginal Heritage Act 1972.
- Stored Data/Not a Site: The place was assessed as not meeting Section 5 of the Aboriginal Heritage Act 1972.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Coordinates

Map coordinates are based on the GDA 94 Datum.
